Cercis, in Gardening, contains hardy deciduous trees of the following kind; of which the species are the common Judas-tree (C. Siliqua trium), and the Canada Judas-tree, or Red-bud tree (C. Canadensis). The first in its native place rives with an upright trunk to the height of twenty feet, covered with a dark brown bark, dividing upwards into many irregular branches, with the leaves placed irregularly on the branches, on long footstalks; they are of a pale green on their upper, and of a greyish colour on their under side, and fall off in autumn. The flowers come out in the spring, with the leaves, on every side the branches, and many times from the stem of the tree in large clusters, arising from the same point, on short peduncles; and are of a very bright purple colour, being in full beauty before the leaves have attained half their size; and the wood is very beautifully veined with black and green, taking a fine polish. It is a native of the Levant, &c.

It has varieties with white flowers; with flesh-coloured flowers, but without the beauty of the first, and with broader pods.

The second sort grows to a middling size in the places where it is a native; but it has in this climate rarely rises with a stem more than twelve feet high, but branches out near the root. The branches are weaker than in those of the first sort; the leaves are downy and terminate in points. The flowers are also smaller; but the trees are equally hardy, thriving in the open air. It is a native of North America, where it is known by the name of Red-bud, from the appearance of the flower-buds in spring before the leaves come out. And the wood is of the same colour and texture as in the first kind.

Method of Culture. These plants are raised by sowing the seeds in the spring season, as about March, in beds of common ground, to the depth of half an inch. When the plants appear, they should be kept clean, and occasionally watered; and when of sufficient growth to be removed into the nursery, planting them in rows at the distance of one foot, and two feet between the rows. After they have remained in this situation for two or three years, they become proper for planting out in the shrubbery parts of pleasure grounds.

They are also capable of being raised by layers and cuttings; but they seldom succeed in well in these ways as in the former. They have a highly ornamental effect when planted out in the clumps, borders, and other quarters, among hardy, flowering, deciduous trees of other kinds in the garden or pleasure-grounds.

CERCITAE, in Ancient Geography, a people placed by Ptolemy in Attica Smyrna.

CERCITAE, Grand Circle, in Military Language, is that which the fregisants and, behind them, the corporals, formed every evening at an appointed hour, to receive orders. After the grand circle, a small one was formed in each regiment, were the orders were renewed or repeated to the fregisants of each regiment, who communicated them to the officers of their respective companies. This form was observed under the old government of France.

CERCODIA, in Botany, Soland. La Mareck, Juss. Gart. See Ulmogatis.

CERCOPHII, in Ancient Geography, a name given by Ovid to the inhabitants of the island of Paphaeus.—Alfo, a name given to banditti or robbers, who occupied part of the coast of Aegina, near the Melampygian rocks, on the confines of the territories of Locera and Melis. See Herodot. lib. viii. c. 216.

CERCOPHII, a town of Asia, in the Greater Phrygia. Ptolomy.

CERCOPITHECUS, in Zoology, a name given by Aldrovandus, Maregrave, and other writers, to several species of the monkey tribe. GneUins forms a distinct f-chion, in the Simia genus, of the Cercopitheci, or those with elongated tails, after the name of Aristeus, Simia cyno-furus,
furus, Hamadryas, Veter, and nearly twenty other species are of this family. See Simia.

CERCOPONEDRAS, in Ancient Geography, a kind of rod or palse in Greece, between mount Oeta and the country of the Trachinians, according to Herodotus; which was occupied by the Cercopi. It was by this palse that the Persians advanced to surprize the Greeks who defended Thermopylae. This palse commenced at Afopus, continued through an opening of the mountain called Anopaeus, and having reached the summit of the mountain, terminated near the town of Alpen, the first in the country of the Locrians, on the borders of the Mieans, near the rock called Melampus, where was the habitation of the Cercopi. Count de Choiseul-Gouffier discovered this path in his passage from Athens to Larissa.

CERCOLOS, in Medicine, a preternatural extension and tumidity of the female clitoris, so as to project beyond the labia pudendi.

CERCUS, in Ancient Geography, a hill of Asia Minor, in Bithynia.

CERCY LA TOUR, in Geography, a town of France, in the department of the Nievre, and district of Nevers; 8 miles E.N.E. of Decize.

CERDA, John-Lewis de la, in Biography, a native of Toledo, who entered among the Jeluius in 1574. His literary fame reached Italy, and gained him the particular edicem of pope Urban VIII. His "Commentary on Virgil," 3 vols. fol. has been several times reprinted, and is a work of minute research, and great accuracy, but devoid of taste. His "Commentary on Tertullian's Works," begun in 2 vols. but not completed, is a work of similar character to the former. Cerdà died in 1643.

CERDAINE, La, a country of the Pyrenees, situated partly in Spain, in the province of Catalonia, and partly in France, in the territory formerly called Roufllon; Puy-lerda is the capital of the former, and Mont-Louis of the latter.

Sp. C. — A large tree. Leaves alternate, petiolated, oblong, acute, entire, even, shining. Flowers white, with red veins, in much branched terminal panicles. A native of Peru. The wood, when the tree is first cut down, has an extremely fetid smell, resembling that of a fox's urine; it afterwards changes to that of garlic, and finally assumes an agreeable pungent odour. The dried leaves and bark are used by the Peruvians as articles of cookery.

CERIDESORA, in Ancient Geography, the name of the place where Cerdic the Saxon leader landed, when he invaded Britain in 495, and where he found the Britons drawn up in battle-array to oppose him. This place, according to Camden, was on the coast of Norfolk; but as this is improbable, some learned men have supposed it to be Callith or Calldhore at the entrance of Southampton river. Others again seek for it at Charford; and Carte thinks, nor is his opinion improbable, that it was Charmouth in Dorsetshire; a place afterwards famous for hostile invasions.

CERDON, in Geography, a town of France, in the department of the Ain; four leagues S.E. of Bourg en Bresse.

CERDONIA, in Ancient Geography, Cerdonia, a place of Italy belonging to the Hirpiini.

CERDONIANS, in Ecclesiastical History, a sect who maintained most of the errors of Simon Magus, Saturninus, and the Manichees.

They took their name from their leader Cerdo, a Syrian, who came to Rome in the time of pope Hyginus, about the year 140; and there abjured his errors, but he did this in appearance only; for he was afterwards convicted of perfiling in them, and accordingly was cast out of the church again. Cerdo affected two principles, the one good, and the other evil: between these, he imagined an intermediate kind of deity, of a mixed nature: this half, according to him, was Creator of the world, and the God that appeared under the old law. To his jurisdiction the Jews were subject; and idolatrous nations were under the empire of the evil principle. The good Being, whom he called unknown, was the father of Jesus Chrifti, who, he taught, was only incarnate in appearance, and was not born of a Virgin; nor did he suffer death, but in appearance. He was a great admirer of virginity, and recommended it to his followers. He rejected or despised the Old Testament; but probably received the books of the New Testament as other Christians did. Marcion, his disciple, succeeded him in his errors: whence the Marcionites.

CERYLUM, in Ancient Geography, a place on the confines of Thrace and Macedonia, near a maritime burgh, in the country of the Argiliani, and in the vicinity of the town of Amphipolis, according to Thucydides and Lyco- phon.

CERE, Cera, in Ornithology. See Ornithology.

CERE, St. in Geography. Cere, a town of France, in the department of the Lot, and chief place of a canton, in the district of Figeac; 10 leagues N.E. of Cahors. The place contains 3798, and the canton 12,169 inhabitants: the territory includes 235 kilometres, and 12 communes. N. lat. 44° 52'. E. long. 1° 47'.

CERE-CLOTH, found of cere, cera, wax, and cloth, denotes cloth impregnated with glutinous matter, for the purpose of being applied to wounds or bruises, or for other uses.

CEREA, in Geography, a town of Italy, in the Venetore, belonging to the lalte of Venice; 4 miles W. of Legnano. At this place a battle was fought, in 1796, between the Austrians and French; in which the latter kept the field, and the former lost 100 men killed and 350 prisoners.

CEREALES edile, two officers of ancient Rome, appointed under Julius Cæsar, to have the superintendency of the corn and grain for the provision of the city. They also presided in the cerealia. See Edile.

CEREALES ludi, solemn sports held in honour of Ceres, wherein the matrons represented the grief and lamentation of Ceres for the los of her daughter Proserpine, and her travels to find her again.

CERALIA, in Antiquity, feasts of Ceres instituted by Triptolemus, son of Celeus, king of Eleusine, in Attica, in gratitude for his having been instructed by Ceres, who was supposed to have been his nurse, in the art of cultivating corn and making bread.

There were two feasts of this kind at Athens; the one called Eleusinia, the other Thesmophoria.

What both agreed in, and was common to all the Cereal- lla was, that they were celebrated with a great deal of regi- mony and purity; so that it was esteemed a great pollution to meddle, on those days, in conjugal matters.

It was not Ceres alone that was honoured here, but also Bacchus.
CER

Cereus. The victims offered were hogs, because of the waste they make in the products of the earth. Whether there was any wine offered, or not, is matter of much debate among the critics. Plautus and Macrobius seem to countenance the negative side; Catu and Virgil, the positive.

The cerealia passed from the Greeks to the Romans: Q. Memmius' edile, being the first who introduced these rites into Rome, as appears from a coin of this magistrate, on which is the figure of Ceres, holding in one hand three ears of corn, in the other a torch, whiff her left foot trod on a serpent; with this inscription, "Memmius Edilis Cerealia primus fecit." The Romans held them for eight days successively: commencing, as generally held, on the fifth of the ides of April. The women alone were concerned in the celebration, and were all dressed in white: the men, likewise in white, were only spectatores. They eat nothing till after fun-fet; in memory of Ceres, who, in search after her daughter, took no repast but in the evening. The festival closed with a banquet and public horse-races.

After the battle of Cuma the festival was so great at Rome that there were no women to celebrate this feast because they were all in mourning, so that it was omitted that year; but after the second Punic war, it was celebrated with an acclam of splendid gifts, presents, paintings of chariots, crowns, and rich plunder taken from the enemy, being carried in the procession. According to Macrobius, an egg made part of the feast, being an emblem of Ceres.

Cerealia femina, an appellation given by some to what we call leguminos, or pulse. Dr. Cullen (Med. Med. vol. i. p. 274.) refers several farinaces to three different heads, under the titles of Cerealia, Leguminos, and Nutes oleo. By this appellation, he saies they may be distinguished as containing more or less of succarino and only matter, or as there are in proportion to one another. In the cerealia he supposes the farago to be larger in proportion to the oil; in the leguminos, the oil to be somewhat larger in proportion to the farago; and in the nutes oleo, the proportion of the oil to be ill greater. But he is of opinion, that in the several farinaces the nourishment they afford is in proportion to the oil they contain. Under the title of cerealia are commonly included the seeds of the several graminaceae or culmiferous plants, that are employed as the food of men. To this head he refers barley, rye, millet, rice, oats, maize, and wheat; subjoining to his account of each appropriate reflection, and he then enumerates other farinaceous substances which are not of the tribe of gramina, but very much of the same farinaceus nature with those, such as buckwheat, fago, falop, potato, and chestnut. See each of these articles.

Cerebelli inferior, in Anatomy, is an artery, which comes off from the vertebrai. See Arteries.

Cerebelli superior, is a branch of the basilar artery. See Arteries.

Cerebellica, in Ancient Geography, Clelethle, a place of Gaul, between Valenica and Anguilla.

Cerebellum, in Anatomy, that portion of the contents of the cranium, which is contained in the lower fissure of the occipital bone, and covered by the tentorium. See Brain.

Cerebri anterior, is the anterior branch of the internal carotid artery. See Arteries.

Cerebri media, is the large posterior branch of the internal carotid artery, which runs in the sifura Sylvii. See Arteries.

Cerebri posterior, or profunda, is a branch of the basilar artery. See Arteries.

Cerbites of Knorr, in Zoology, one of the syno- nyma of Madrepora Areola, which see.

Cerebrum, in Anatomy. This term in common language denotes the brain in general; but anatmilists confine it to that part of the encephalon, which occupies all the upper part of the cranium: indeed by far the largest portion of the cavity. See Brain.

Cerebrum jovis, in Isidoryology, a name given by Ennius the post to a peculiar fill of the labros kind, called by the generality of authors cornus; it is distinguished by Artedi from the other species of the same genus, by the name of the labros, qui surus autem ab o. See Anatomy.

Cereolium, in Botany, folio glutinos, Hall. See Scandix cereolium.

Cereolium annuum nodosum, Morif. See Scandix nodos.

Cereolium folia triplicato-pinnatis, Hall. See Chero- phyllum folio.

Cereolium laetifolium bifurum, Mor. See Chero- phyllium bifurum.

Cereolium rugofolis folio, Bocc. See Chero- phyllum arcentum.

Cereolium folis bifuratis, Hall. See Chero- phyllum aurum.

Cereis, in Botany, a name used by some authors, and supposed to have been used by the ancients for the filguatrum, or 'Judas's tree. See Ceriis.

Cerejae, a composition of wax and oil.

Some also give the same denomination to the oleum cerea, otherwise called butter of wax.

Cerements, cloths dipped in melted wax, with which dead bodies were infolded when they were embalmed. Thus the term is used by Shakspeare:

"Let me not burn in ignorance, but tell
Why canopied bones, buried in earth,
Hve we burn their ceremonies?"

Ceremonial is used for the set or system of rules and ceremonies which custom has introduced for regulating our behaviour; and which persons of each, either out of duty, decency, or civility.

Ceremonial, in a more particular sense, denotes the manner wherein princes and their ambassadors use to receive and treat one another. The ceremonial is a kind of law introduced by compact, custom, prescription, &c. which sovereigns and their ambassadors are to observe at their interviews, that none of them may either receive more or less marks of respect than they are entitled to. Some distinguishing three occasions on which the ceremonial is to take place: viz. when princes meet in person; when they write to each other, and when they send ambassiodors. There are endless disputes among sovereigns about the ceremonial: some endeavouring to be on a level, and some to be superior, to others. Numerous schemes have been proposed for fixing the piece and rank of each prince; but they have not been accepted of by any, except some alternate princes, as they are called in Germany. See Precedency.

Ceremonial is more particularly useful in speaking of the laws and regulations given by Moses, relating to the worship of God among the ancient Jews.

In which sense, it amounts to much the same with what we otherwise call Levitical law; and stands contradistinguished from the moral, as well as the mundane.

It is disputed, whether the observation of the sabbath be a ceremonial or a moral law. See Sabbath.

The ceremonial law prescribed the forms, usages, rites, &c. relating to sacred places, utensils, priests, levites, prophets, congregations, garments, feasts, sacrifices, sabbaths, &c.

Molt
CER

Most of the ceremonial laws of the Jews had some relation to those idolatrous customs which had been established among them before the publication of the levitical law.

CEREMONIALE, a book in which is prescribed the order of the ceremonies to be observed in certain actions and occasions of solemnity and pomp.

The ceremonial of the Roman church is called ordo Romani. The Roman ceremonial was first published by the bishop of Coreya in 1510; at which the college of cardinals were in faudizand, that some of them voted to have the author as well as book burnt, for his tenacity in exposing the sacrilegious ceremonies to the eyes of the profane people.

CEREMONIEUX MILITAIRES, military ceremonies or ceremonial. See Chevaliers.

CEREMONY, an assemblage of several actions, forms, and circumstances, tending to render a thing more magnificent and solemn. The word comes from the Latin ceremonia, quali Cereris munia, on account of the great ceremonies used in making the offerings to Ceres; or because the first religious ceremonies were those of Ceres. Hence Cicero calls "Ceremon antiquissimum religiosisimum principem omnium factorum quo spiritum gentis hunts."

We have an ample and magnificent account of the religious ceremonies and customs of all the nations in the world, represented in figures designed by Floris, with historical explanations, and divers curious illustrations, &c. Ceremonies & Coutumes Religieuses de tous les Peuples du Monde, 6 tom. fol. Amst. 1735.

M. Porree, in 1646, published a history of ancient ceremonies; tracing the rise, growth, and introduction of each rite into the church, and its gradual advancement to superstition therein. Traité des Anciennes Ceremonies. Amst. 1646, 12mo.

Many of them were borrowed from Judaism; but more, as it should seem, from Paganism.

Dr. Middleton has given a fine discourse on the conformity between the popish and pagan ceremonies; which he exemplifies in the use of incense, holy water, lamps and candles before the shrines of the saints, votive gifts or offerings round the shrines of the deceased, &c. In effect, the altars, images, croffes, processions, miracles, and legends; nay, even the very hierarchy, pontificate, religious orders, &c. of the present Romans, he shews, are all copied from their heathen ancestors. Who then can doubt of the idolatry of popery, when we see the profane people of Rome worshipping at this day in the same temples, at the same altars, sometimes the same images, and always with the same ceremonies, as the old Romans? See Middleton's Letter from Rome, and Prefatory Discourse in his Works, vol. iii.

Ceremony is also applied to those expressions or tokens of respect and honour which people pay to each other, out of mere civility and good breeding.

Ceremony, habi of, denotes the ornaments and external badges of a profession, dignity, or office.

Ceremony, officers of, those whose business is to see the customary ceremonies duly observed in actions of pomp and solemnity. Such are marshals, serjeants at arms, &c.

In our court is a master and attendant of the ceremonies: the French have a grand master of the ceremonies, as well as a master and attendant.

The master of the ceremonies is an officer instituted by King James I. for the more honourable reception of ambassadors and strangers of quality. He wears about his neck a chain of gold, with a medal under the crown of Great Britain, having on one side an emblem of peace, with this motto, "Berti pacifici," and on the other an emblem of war, with "Dieu et mon droit." His salary is 300l. per annum. The attendant of the ceremonies executes the office of master in all respects, whenever the master of the ceremonies is absent. He has a salary of 141l. 13s. 4d. per annum. The dignity of the ceremony is an officer subordinate to both the others, with a salary of 10l. per annum. There are also several officers of ceremonies in public places, and in private families, &c. whose business it is to direct and prevent the arrangements that are necessary for preserving a due regard to rank and decorum.

In churches of the Roman communion there are also masters of the ceremonies, to see that every thing be performed as prescribed in the ritual.

Ceremony, in the Royal Navy, the form used in receiving the principal officers on board, or in passing any of his majesty's ships; which is as follows. All flag officers are to be received on board his majesty's ships with a guard of arms and heat of drum; which, for the admiral, or flag-officer commanding in chief, is to be a marshal; for an admiral, three flags; for a vice-admiral, two; for a rear-admiral, one; but the first captain to the admiral, or commander in chief of the fleet or squadron, is to be received on board by a guard only. If any of those officers present one of his majesty's ships with his flag at the head of his boat, the same ceremony is to be observed.

Cerences, or Cerance, in Geography. A town of France, in the department of the Manche and Channel, and diocese of Coutances, 24 leagues N. of Coutances.

Cerens, a town of France, in the department of the Sarthe; 10 miles S. of Le Mans.

Cerenzza, or Gerenzza, a town of Naples, in the province of Calabria, seated on a rock, with a bishop's seat; 10 miles N. of St. Severina. N. lat. 39° 43'. E. long. 17° 12'.

Cereolium, in Botany. A name used by Pliny to express the gingidium, an embellishitious plant of the nature of the chervil or cereolium; and it is very probable that this name is only a false spelling of that word. Columbia makes the cereolium and gingidium different; but it may only be that in different ages they applied these names to different species of the same genus of umbelliferous plants. Neoplatonists tell us, that the gingidium of the ancients was called by the latter writers bassiaum; a name very well expressing its seeds, which are long and slender, and are pointed at both ends.

Ceres, in Astronomy, a new primary planet, discovered on the 1st of January 1801, by M. Piazzi, astronomer royal at Palermo in Sicily. This is an intermediate planet between the orbits of Mars and Jupiter, and appears as a star of the 8th magnitude, being probably about the size of the moon. Its distance from the sun is about 23 times that of the earth, and its periodical time nearly 4 years and 2 months. Since the arc of its orbit through which this planet runs during the period it was observed by Piazzi was but small, no great degree of accuracy can be expected in stating the elements of its theory: the following, however, communicated by Dr. Hutton of Woolwich to Mr. O. Gregory, and published in his "Treatise on Astronomy," 1803, are the most exact yet known:

Place of the ascending node - - 2° 20' 59" 50'
Inclination of the orbit - - 10° 47
Place of the aphelion - - 2° 39' 57"

Time of the passage through the aphelion - - January, 1801. 1:33:2

Eccentricity - - 0.0304
Log. of the greater semi-axis - - c.4156586
Time of the sidereal period - - 4.13 years.

These
Ceres.

Thefe particulars are deduced from calculations made by Dr. Burchardt at Paris on the orbit of this planet confidered as an ellipse, and communicated to the celebrated astronomer M. Von Zach, on the 21st of June 1801. This ellipse, he fays, represents, within a few seconds, the latitudes and longitudes of five obervations; and he adds, it would have been easy to obtain a greater degree of accuracy; but he thought it quite fuperfluous, as the arc run through is fo small.

Dr. Herchel, who classifies this planet, as well as that difcovered by Dr. Olbers of Bremen (see Pallavis), under the new denomination of Afteroids (which he has published, in the Phil. Trans. for 1802, part 2., a variety of obervations which he made on these two celestial bodies. Calculating from the obervation, in which he had great reafon to confide, he inferred that the angle under which Ceres appeared, in the circumstances which he minutely defcribed, was only **φ**2159 or **φ**2.

The mean distance of Ceres from the fun, according to the moft recent information, and which he admits as sufficiently accurate for his purpofe, is 2.0624; and its geocentric longitude and north latitude at the time of his obervation (April 1802), were about 28° 26' 15" 20'. With these data, Dr. Herchel proceeded to calculate the distance of Ceres from the earth at the time of obervation, partly by the usual method, and, when the elements were wanting, by a graphical process, sufficiently accurate for his purpofe. The computed distance of Ceres was 1.674; and thence he found, that its diameter, at the mean distance of the earth from the fun, would subtend an angle of **φ**35127, and that, consequently, its real diameter is 161.6 miles. When we confider the size of this new star, there can be no great reafon to expect that it should have any fatellite. Dr. Herchel made many obervations, with a view of ascertaining this point; from the refult of which he infers, that two very small ftars which he observed may be fatellites; but the supposed fatellites are fo small, that, with a 20-feet telescope they require a power of 300 to be seen; and the planet fhould be hidden behind a thick wire, placed a little out of the middle of the field of view, which must be left open to look for the supposed fatellites. However, the retention of a fatellite in its orbit, it is well known, requires a proper mafs of matter in the central body, which it is evident these newly difcovered ftars do not contain. The colour of Ceres is reddily, but not very deep; though it is much more reddily than Pallavis.

The name of Ceres was given to this planet by M. Piazzi, its difcoverer. But other names have been fuggected as more appropriate. Some have propofed the name of Venera; alliziing to the god who fabricated the arms of Achilles in the heavens near the god of war. Prof. Reimar of Hamburg is of opinion, that it fhould be called Cupid; for he would be the nearest (reckoning downwards from Venus) to Mars, the lover of Venus. Others fuggected that the name of Cupid would be proper, because it conveys an idea of blindfefs; for the new star has the appearance of a ftar only of the 8th magnitude, and cannot be seen by the unaided eyes of men. In Italy it will perhaps retain the name of Ferdinandum Sidus, and in France that of Planetz Piazzi, till time and circumstances shall have otherwife decided. A friend of M. Von Zach expreffed the order of the eight planets (Pallas not being difcovered) in the following lines:

"Mercurius primus; Venus altera; Terra deiné; Mars pothea; quin tam incendé vis vidiscit Hera. Jupiter hanc ultra effe. Sequitur Saturnus; et illum Uranus egregidet; non autum dicere fummus."

Mr. Macaulay, and other philosophers, expreffed, about Vol. VII.

Sicily, Attica, Crete, and Egypt claim the honour of her birth; but general fuffrage favours Sicily, where she had her ordinary residence in a delightful part of the island called "Enna," in which were beautiful meadows watered with perpetual springs. Accordingly, Le Clerc fays, (Bibl. Univ.) that the name of Ceres was Did, and that she was queen of Sicily, where she rendered her reign illustrious by teaching her fubjects the art of agriculture, as well as by eftablifhing feveral laws concerning policy and the property of lands, that every one might reap what he had fown without molestation: and from these circumstances this queen acquired the honourable difiinction of being confidered as the goddess of corn and of the earth. In her youth she was extremely beautiful, and as fable reports, her brother Jupiter fell in love with her; and the fruit of the amour, obtained by the deception of transforming himfelf into the figure of a bull, was Plerephata, Proferpine, or Hecate. Pluto, falling in love with Proferpine, took her away, and mounting his chariot drawn by four borches, purfued his way direcdy to hell, in oppofition to the remonfances of Minerva, who vainly endeavoured to difuade him from the defign. Ceres, apprized of this circumstance, traversed sea and land in search of her daughter; and after having travelled by day, she lighted a torch, as it is faid, in the volcano of Mount Etna, and continued her fearch by night. In her fruitless rambles the fame near the lake of Syracuse, and perceiving her daughter's veil floating upon the water, she concluded that her ravithers must have made their escape that way. At length she was informed by Arethusa, the nymph of a fountain, whose waters flowing from Elia into Sicily, glide under the bottom of the sea and in the confines of Styx, that she had seen Proferpine, and that she had been ravished by Pluto, who had made her queen of hell. She intreated her at the fame time not to indulge any further refentment againft the earth, which had become barren since she had withdrawn her precious gifts. Upon this intelligence Ceres mounted her chariot, and traversing the immense regions of the air, arrived at Olympus, and prefenting herfelf at the foot of Jupiter's throne, demanded of him her daughter. Jupiter having appeased the anger of Ceres by affuring her that the match of Proferpine with Pluto..."
CERES.

Pluto was not disadvantageous to her, and by decrees, that Proserpine should remain six months of the year with her husband, and the other six months with her mother, she bethought herself how she might avenge the calamities occasioned by licentious and famine. As Attica had been more distressed than other countries, she went to Eleusis, where, after having shivered Triptolemus, the son of Cecrops, sovereign of the country, and having instructed him in every thing that related to agriculture, she left him her chariot, and ordered him to travel through the earth in order to teach its inhabitants this necessary and useful art. Triptolemus, having traversed Europe and Asia, arrived in Scythia at the court of Lyconus, a tyrannical prince, who, for attempting to affright his children, was transfixed into a lynx, an animal which was the symbol of cruelty. The ancient historians agree with the poets in their account of several particulars above recited. Strabo (i. vii.) mentions the meadows of Enna whence Proserpine was carried off; and Cicero (in Verri.) seems to admit the fact, and has given us an elegant and ornamented description of this place. Diodorus Siculus also says, that Sicily, of all the countries on earth, had been most distinguished by the favours of Ceres, and that the goddess had fixed her ordinary residence in this island. "The Sicilians," says he (lib. v. c. 2.), "hold by tradition from their ancestors, that their island is consecrated to Ceres and her daughter Proserpine; some poets have written, that at the marriage of Pluto with their princesses, Jupiter gave them Sicily for a perpetual present; and the historians, who are accustomed the most faithful, say, that it was in Sicily that Ceres and Proserpine showed themselves to men for the first time, and that this island is the first in the world where corn grew." Homer, the most celebrated of the poets, has followed this tradition, when he says, speaking of Sicily:

"The soil until'd a ready harvest yields,
With wheat and barley wave the golden fields,
Spontaneous wines from weighty clusters pour,
And love defends in each profuse show."

Pope's Odyss. ix. 123.

This author proceeds to give a description of the fields of Enna, whence Proserpine was carried off; and relates all the other circumstances of this fable much in the same manner as we have above stated them. He also adds, that the Syracusans have a custom of offering oblations every year, each according to his abilities, near the fountain Cyane, which Pluto made to spring up, when in that place he opened a way to himself with a blow of his trident; and that after those private sacrifices they make a public offering of bulls, whole blood they shed over the same fountain. As Attica, says the vase author, was the country, which, next to Sicily, was most honoured with the favours of Ceres, the Athenians intuited, from respect to her, not only sacrifices, but the Eleusinian mysteries, which became venerable for their sanctity and antiquity. See Eleusinia. The Sicilians also, besides the sacrifices which they offered at the fountain Cyane, instituted feasts in honour of Ceres and Proserpine; and they celebrated them in a manner suitable to a people on whom these goddesses had conferred so many distinguishing tokens of regard. These feasts they placed in different feasts of the year, in allusion to the different appearances of the corn. The rape of Proserpine was celebrated about the time of harvest, and the search of Ceres in seed time. The latter lasted fix days, with splendid and magnificent accompaniments. Whilst this feast continued, it was also customary to intermix in conversation some wanton expressions, because by such kind of intercourse Ceres had been diverted from her affections for the loss of her daughter. Besides the cultivation of corn, Diodorus informs us that Ceres had given laws to the Sicilians; and for that reason she was deemed by the Egyptians by the people. "It was not wonderful," adds the historian, "that she could have given men two more valuable pretexts than the supply of the necessaries of life and instructions how to live virtuously. The rape of Proserpine has been represented by most mythologists merely as an allegory, which had an obvious relation to agriculture. However, some ingenious authors, in the number of whom we may reckon Don Pelezon and Le Clerc, relying upon the authority of Diodorus Siculus, have referred this event to real history. Several chronologists, and particularly the celebrated sir Isaac Newton, confining in the relations of Greek writers, have endeavoured to fix the time when Ceres lived; to determine the date of her expedition from Sicily to Athens; and to mention the year of her death, and the worship that was paid to her not long after. Banier, however, notwithstanding these authorities, is perfused that we are not to look in Greece for any other Ceres than the Isis of the Egyptians, nor for other mysteries beside those of that goddess. We are unquestionably certain, he says, that almost all the gods of the Greeks and their worship came from the eastern countries, and especially from Egypt, with the colonists that had peopled Greece at different times; and if there be any concerning whose transportation we may be confident, they are Bacchus or Isis, and Ceres or Isis. Accordingly he thus accounts for the origin of the fable. Greece was infested with a severe famine under the reign of Ezechtheus, as we learn from Diodorus Siculus (lib. xviii.), and also from Ovid, who has amply and beautifully described it. The Athenians, whose soil was not very fertile, were more distracted by it than their neighbours. Ezechtheus, on this occasion, sent to Egypt for corn; and his messengers brought back with them, not only a supply of corn, but the worship and ceremonies of the divinities who preceded over agriculture. The distress they had suffered and the dread of its renewal induced them to adopt the mysteries of a goddeess, who was thought competent to secure them from it. Triptolemus at the same time received that worship into Eleusis. Ambitions of being the first priest of Ceres or Isis, he not only enjoyed plenty himself, but took care to afflit his neighbours by teaching them the mysteries in which he had been instructed. Sicily had adopted these mysteries some time before, and hence it was said that Ceres had come from Sicily to Athens. It was added, that her daughter had been ravished, because the corn and fruit, indicated by her name, had ceased for some time to yield subsistence. Moreover, it was said that Pluto had carried her away to hell, because the same fruits had remained all that time as it were buried in the earth; and Jupiter's decision of the quarrel between Ceres and Pluto intimated that the earth was again covered with new harvests.

This is the account that is given of the introduction of the mysteries of Ceres into Sicily and Greece. If, however, some learned men, with Diodorus Siculus, incline to maintain, that there really was a Ceres in Italy, who gave instructions and regulations relating to agriculture, we may suppose, for the satisfaction of such, that she, having left her daughter, and come to Attica in quest of her, taught Triptolemus the mysteries of Isis; and that the Greeks having ranked her afterwards among the deities, her worship was thus at length confounded with that of the goddesses of the Egyptians. As Triptolemus was one of those who gave the best entertainment to Ceres when she arrived in Attica, it was hence fabled that this goddeess had taught him the art of agriculture, and sent him in her chariot drawn by winged dragons, to propagate this art among mankind. It
was added, that she nursed him with her own milk; thus intimating the care she had taken in the education of this prince. All these mysterious fables, as well as the arrival of Ceres in Attica, which is so finely represented upon a marble tomb, ingeniously explained by M. de Boze, in a dissertation published in the 4th volume of the Memoirs of the Academy of Belles Lettres, have no other foundation, as Banier conceives, but the introduction of the worship of Ceres into Greece, and especially into Attica. Triptolemus, who reigned there, came to Eleusis by sea, in order to carry corn into different countries, where at the same time he taught the mysteries of Ceres, of which he himself was priest. Before he set out, he had sown corn in a field of Attica, as we learn from the 10th of the Arundel Marbles; this, according to the author now cited, (Mythology, &c. b. iv. c. 10.) is the key and solution of this whole fable; for it refers to the time when the worship of Ceres, so ancient in Egypt, was received in Greece; and not to that of agriculture, which had been known there long before; unless we choose to understand it of a new method of cultivating the ground, which the Greeks learned in their travels into Egypt, and reduced to practice at this time. The marbles now quoted fix this date under the reign of Erechtheus; that is, according to the commentators on these marbles, 1426 years B.C. or about 280 before the Trojan war. The Arundelian marbles, however, point out three dates of these events, which are not ranged in the same manner with that of other authors who speak of them. In the first of those eras, viz. the 12th, they represent Ceres as coming into Attica; in the 13th, they say that Triptolemus began to sow corn in the fields of Eleusis; and in the 14th they mention the rape of Proserpine; so that the arrival of Ceres at Athens precedes the rape of her daughter ten years. Blair, in his Chronological Tables, refers the arrival of Ceres in Athens to teach the inhabitants the art of growing corn, and her sending her son Triptolemus through the roll of Greece, to the year 1283, B.C. Newton, in his "Chronology," refers it to the year 1590, B.C. The hazard to which Triptolemus was exposed in his travels gave rise to the fable of Lyceus, already mentioned; and that of his being drawn in a chariot by winged dragons is taken from an ambiguity in the Phenician language; in which the word used in this history signifies either winged dragons or a ship adorned with iron hooks, as we are told by Bochart (Hieroz. l. 3. c. 14.), and after him by M. Le Clerc. Banier, however, inclines to the opinion of Philochorus, cited by Ennius, who says, that this ship was taken for a flying dragon, because it had upon its prow the figure of a dragon.

Before the amour of Ceres with her brother Jupiter, fable reports, that she had another with Neptune, the fruit of which was the famous horse Arion, or as the Thelphusians and Phigalians relate, a daughter, called by the Arcadians Hera. In reference to this circumstance Paunofias says, (Arcad. lib. viii.) that upon mount Elaius, in Arcadia, 30 stadia from Phigala, Ceres had a cave into which she retired, clad in mourning, so that she was called black Ceres, and that the Phigalians dedicated to her memory on this spot a wooden image, having the body of a woman, and the head of a horse, and bearing in one hand a dolphin, and in the other a dove. When this statue was accidentally burnt, the Phigalians forgot the worship of Ceres, and neglected her feasts; upon which the gods punished them with a severe drought. In this distress they consulted an oracle, which informed them, that if they did not re-establish the worship of Ceres, a famine would prevail to such a degree as to oblige them to eat their own children. At length Pan, as he hunted inArcadia, discovered her retreat, and acquainted Jupiter with it; and the god, by the intercession of the Parcae, appeased her, and restored her again to the world; in consequence of which, as the fable reports, the earth produced corn and fruits. He fed (in Theogon.) informs us, that Ceres had another amour with the hero Jasion, by whom she had a son, named Plutos, who was born in the island of Crete, and became very powerful both by sea and land; and who, having brought agriculture to perfection, as the means of acquiring wealth, was called the god of riches.

Ceres was distinguished by a great variety of appellations, the principal of which were "Magna Mater," and "Mater Maxima," and the was honoured in many places with feasts and sacrifices. The most customary offerings presented to this goddess were a pregnant sow and a ram; and they also consecrated to her the crane, the turtle-dove, the sea-fish, called Sumbelat, and the winged serpent. Of vegetables, corn was the most usual offering to her, and with this they decorated her images, and her garlands were formed of navette and rape-seed; but flowers were prohibited, because Proserpine was carried away whilst she was gathering them. The poppy was faced to her, not only because it grew among corn, but because in her diftresses Jupiter gave it her to eat, that she might sleep and forget her troubles. In spring they crowned her images with the stems of graminous plants; and in her sacrifices they made oblations of wine to her. Cicero mentioned an ancient temple dedicated to her at Catania in Sicily, in which the offices were performed by matrons and virgins only; no male being admitted on this occasion. Ceres, according to the abbe Banier, was usually represented of a tall majestic stature, fair complexion, languishing eyes, and yellow or flaxen hair; her head crowned with a garland of poppies, or ears of corn; her breasts full and swelling; holding in her right hand a bunch of the same materials with her garland, and in her left a lighted torch. When feated in a car or chariot, she is drawn by lions, elephants, or winged dragons. Mr. Spence, in his "Polymetis," observes, that the face of Ceres is a very pretty one, and from some expressions in the poets, he concludes, that she was a beauty of the brummell kind. Her head, he says, is often crowned either with corn or poppies, and her robe falls down to her feet, which, in the language of the flattery, denotes dignity. There is one objection that may be made, says this writer, to the beauty of Ceres; as the figures of her which he has seen generally represent her breasts as none of the smallest. Virgil, in his Georgics, gives us an idea of Ceres, as regarding the laborious husbandman from heaven, and blessing the work of his hands with success. Ceres has been no where exhibited with more beauty than on a medal of Metapontum, in Magna Graecia, and another found at Naples, in the collection of the duke of Castiglione, with the common reverence of an ear of corn, and a mace on its blade. On these coins, the goddess appears with her veil thrown behind her vellum; her head, besides the ears and blades of corn, crowned with an elevated diadem in the manner of Juno; and her hair over her forehead, in beautiful disorder, falling in front, and hanging freely, as if to indicate her affliction for the rape of Proserpine. She sometimes holds in her hand a vase, and with this vase is a name, which the she was worshipped by the Achaeans, under the name of "Nemesis." (Athens. Dict. xii. p. 461.) The drapery of Ceres, in allusion to ripe corn, should be yellow; more especially as the is distinguished by Homer by a corresponding epithet. Ceres is found winged on ancient monuments; with a head-dress in the form of a turban a little elevated, called "Pall." She is thus exhibited on a mutilated statue in her temple at Eleusis, bearing on her head, according to Po-coke, a circular ornament about two feet in height. Ceres is often seen accompanied by the horse Arion; and she is frequently
frequently found, not only with torches in her hands, but with a modius, the symbol of fertility, and the mycic calathus, placed either on her head or at her sides. On an enameled bronze in the collection of Stothard, she is represented in an erect posture over the head of an ox, holding in her left hand a ear of corn, and in her right the head of a ram.

The general character of this goddess, Ceres or Damater, says Bryant (Anal. Anc. Mythol. vol. ii. p. 335) is innocent and rural, that it might be imagined nothing cruel could proceed from her shrine. Nevertheless, there was a time, when some of her temples were as much dreaded as those of Selene and the Cyclopi. They were courts of justice; whence she is often spoken of as a lawgiver. (Ovid. Metam. i. 5. v. 351.) She is joined by Cereus (Orat. in Verr. 5. sect. 2.) with Libera; and the name of the deities, "a quibus initia vitae, atque victus, legum, morum, manufactudinis, humanitatis, exempli hominibus, et civitudinis, ac diphera effe dicantur." The deity, to whom she was a succitator, continues Bryant, was Ex, the fun; who was primarily worshipped in their temples. Accordingly Ceres was the deity of fire, according to this learned author; and hence at Cithæ she was called Coryæ, Ceres, a title of the fun. Her Roman name Ceres, exemplified by Herchius Coryæ, was by the Dorians more properly rendered Carys; and it was originally the name of a city, called Naxos; as many of the deities were erroneously called by the names of the places where they were worshiped. Chios is Charis, the city of fire. Hence, as a personage, Ceres is made the wife of Vulcan, on account of her relation to fire. Her title of Damater was equally foreign to Greece; and came from Babylonia, and the east. Hence it should seem extraordinary, that she should ever be esteemed the goddess of corn. This notion, says Bryant, arose in part from the Grecians not understanding their own mythology. The towns of Ceres were Plautain, or Pyrdæae; so called from the fires, which were perpetually preferred in them. The Grecians interpreted this name Pyrdæae; and rendered what was a temple of Cronus, a granary of corn. Hence they made it a repository of grain; but this was a secondary use to which these places were appropriated. They were properly sacred houses, where a perpetual fire was preserved. Many of these temples were dedicated to the deity under the name of Persephone, or Proserpine, the supposed daughter of Ceres. The persons who resided in these temples are represented as persons of great strength and stature; and hence the Cereyanides, whose name was derived from Cereyia, Ker-Coryæ, signifying the temple of the deity, and who were famous for many achievements, such as wrestling, &c. were the priests of Ceres or Damater, who seem to have been tired of their servitude, and glad to get rid of them, as we are informed by the poet. (Ovid, Hes. v. 431.)

Ceres represenations in Sculpture. Herodotus in Ethiopia, after describing the gods of Egypt, affirms his opinion that Homer and Hesiod first among the Greeks, gave names and forms, employments and honors to the gods of their country. That this popular theology had its beginning about the time affirmed by Herodotus, seems very likely, in a variety of collateral evidence. The learned Fabricius, in his EUB. Grec., begins by observing that no Greek writer's work is extant, older than Homer. The theology of Homer and Hesiod is totally different from that of the ancients, and their prejudices in philosophy; and rush of the Orphics remains as bear any resemblance to it, as are considered more modern. The art of sculpture affords testimonies of the time kind; many small bronze statues of early Greek worship were barbarous imitations of common nature; and, although it is to be supposed some of them are intended for divinities, few are accompanied by symbols. When writing began to be used, sculpture improved its representations; and the divinities were supplied with emblems of their offices, not very distant from the time mentioned by Herodotus. There appears of this early sculpture in the valuable collection of Mr. Paley Knight, one of which appears to be a Ceres, with the modius or calathus on her head. This goddess is also represented on a Greek ivory-carving lately in the Villa Althami, published in Wirckelman's Monumenta Inedita with the calathus on her head, the sceptre in her left hand, and the ear of corn and poppy in her right hand. She is represented on various bas-reliefs, and on the Greek vases, with two torches, in relation to the search for Persephone.

The noble fragment of this goddess's stature, anciently worshipped in her renowned temple at Eleusis, has been brought to England, and placed in the university of Cambridge, by the zeal and perseverance of our countryman Dr. Clark. The fragment is one piece of marble, seven feet high from the top of the calathus, which rests on the head, to the bottom, which terminates at the girdle, a little below the breasts. The height of the calathus is about two feet; the head is one foot six inches; the calathus is ornamented with folds of corn, the hoists, leaves of vine, and a vase. The features of the face are obliterated. The hair is collected in one large braid, which is tied and falls between the shoulders; her tunic is secured by a bandage, crossed between the breasts, and buttoned with a Medusa's head; the zone a little lower terminates the fragment. Strabo says, the temple of Ceres was built by Ictinos, who also built the parthenon or temple of Minerva, in the citadel of Athens, and was the cotonarius of Phidias. The fragment perfectly agrees with this account, and is of the grandest style of Greek sculpture.

CERESIUS, in Antiqu. Geography, Tyra, a river of Italy in the territory of the Leponiti.

CERES IUS, Lago di Lugano, a lake of Italy in the same territory.

CERESIOL, in Geography, a town of Italy, in the district of Mantua, 13 miles N.W. of Mantua.

CERESSUS, in Antiqu. Geography, a fortified place of Greece in Beotia, according to Pausanias; belonging to the Thespians.—Allo, a town of Spain in the Tarragona, in the country of the Jastani, according to Pocelyn.

CERET, in Geography, a town of France, and principal place of a district in the department of the Eastern Pyrenees, situated at the foot of the Pyrenees on the river Tech, over which is a bridge of one arch, supposed to be the highest and broadest in France. The place contains 289 houses, and the district 625 inhabitants; the territory comprehends 441 square kilometres and 15 communes. At this place the commissioners of France and Spain met, in 1665, to settle the bounds of the two kingdoms. Ceret is 5 leagues S.W. of Perpignan. N. lat. 42° 28' E. long. 2° 46'.

CERETAPA, in Antiqu. Geography, a town of Alba Minor, in Picatia, P. L. 23. This town began to strike imperial Greek medals, under the authority of its praetor, in honour of Antonine, M. Aurelius, Commodus, and Severus. Dr. Hunter possessed an autonome medal of bronze, with the legend KEPTALION, which Dr. Combe ascribes to Ceretapa.

CERETIA, in Botany. Thik. See Hymenaea.

CERIUS, in P. L. 21, 22. Bauh. See CACTUS.

CERIS, in Gard.ot. See CACTUS.
CERFENNIA, a place of Italy on the Valerian way, between Alba Fucens and Corfinium, according to the Itinerary of Antonine.

CERIGLANO, or Cigliano, in Geography, a town of Naples, in the province of Bariacena; 15 miles S. of Tricario.

CERIGNA, A. L., a town of Naples, situated on a lofty ground, in the province of Capitanata; famous for a victory obtained here, in 1709, by Condulma over the victor of Nemours, who was slain in the commencement of the battle; 20 miles S. of Minturno. It contains about 12,000 inhabitants. Between 50 and 60 years ago an earthquake almost totally destroyed it, and it is not yet thoroughly rebuilt; the streets are crooked and dirty, and the houses are all low, as the owners dare not raise them high for fear of another check. The eighty-first columna milliaria, inscribed with the name of Trajan, is the only fragment of antiquity observable in this town. The commodities of the place are sheep, horses, and corn; the breed is black and gristy, but well-tailed. The present possessor of this town is Pignatelli, count of Egmont. refident in France, who farms it out at 150,000 ducats a year (2 fold.).

CERIGO, in Geography, an island of the Greek Archipelago, well known under the ancient appellation of Cythera. is separated from the Morea by a narrow strait. It is dry, and mountainous, and produces neither corn, wine, nor wine, sufficient for the inhabitants; some of the valleys, however, are fertile, and it abounds with sheep, horses, goats, turtles, and falcons. Although it had formerly few good towns, it now chiefly furnishes a rendezvous for pirates. The circumference is about 50 miles; and the inhabitants are Christian Greeks, subject to the Venetians, who charge the produce every two years. By the treaty of Campo Formio, in 1797, it was surrendered to the French, together with other Venetian islands. See CYPHALONIA.

Cerigo, according to Thucydides, (Voyage, t. i. p. 22.) was called Porphyry by the ancients, on account of the quantities of porphyry found in it.

Cerigo, a town of the above island. seated on its western coast on a sharp rock, surrounded by the sea, and defended by a castle. It has a small harbour, and is the seat of a Greek bishop. N. lat. 36° 20'. E. long. 23° 11'.

Cerigo, in Natural History, a name by which many authors have called that remarkable American animal called the Opossum.

The Americans in some places call this animal, in their language Caricpaya; and it is probable that this name Cеризо is only a corruption of that word, though not be received generally in the world as a proper name, and used as such by M. de Buffon, Barzanka, Nermenberg, and many others.

CERIGOTTO, in Geography, a small uninhabited island in the Greek Archipelago, between Cerigo and Candia; commonly called Regina; about 5 miles in compass. N. lat. 36° 21'. E. long. 23° 13'.

CERILLI, in Ancient Geography, a place of Italy in that part of Magna Graecia, called Bruttium, situate on the sea-coast, at a small distance S.W. from Pandataria.

CERILLUM, a place of Italy in the district of Manifesti, 17 miles W. of Messina. This place contains 1,400, and the county 1,784 inhabitants; the territory includes 624 kilometres, and 14 communes.

CERINES, the ancient Cerica, a foot-port town of the island of Cyprus, with decayed walls, defended by a castle; the see of a bishop, suffragan of Nocera. N. lat. 35° 22' E. long. 35° 24'.

CERINI, Giovanni Domenico, in Biography, an historical painter, was born at Perugia in 1596, and studied under Guido and Domenichillo; from whom he acquired a very beautiful tone of colouring, and a graceful disposition of his figures; and he particularly excelled in giving elegant and noble airs to his heads. He died in 1681. Pillington.

CERINTH, among the Ancients, was used by some to express the rudeness called by others and barbarians and barbarous, and by some crude. See Wax.

Gen. Ch. Nat. Perinthus deeply five-cleft, permanent; segments oblong, equal. Cer. monopetalous, campanulate; tube short, thick;ifice naked and produced; border tubular, swollen, a little thicker than the tube, five-cleft at the summit. Stam. Filaments five, very short; anthers acute, long, two-celled, bilab at the base. Fil. Germ, two-cleft; style filiform, the length of the filaments; stigma obtuse. Pericarp. the permanent calyx. Nuts two, bony, juicy, somewhat egg-shaped, outwardly gibbous, two-celled. Seeds one in each cell.

described by Allioni under the name of *maculata*, and said by him to be perennial.

**Cerinthus maritima procumbens**, Dill. Elt. See *Pulmonaria maritima*.

**Cerinthus echoides**, Scop. See *Onosma echoides*.

**Cerinthus** in Gardening, furnishes a plant of the ornamental, hardy, flowering annual kind; of which the species cultivated is the great honeywort (*C. major*), which rises with stems eighteen inches high, and more, round, smooth, branching, and leafy; the leaves are glaucous, becoming blue by age, smooth, without prickles, but dilated about the edge, and dotted with white; the branches are lacy and nodding, with flowers among the leaves, hanging on long peduncles. It is a native of Italy, flowering in June. It has varieties, with smooth leaves and purple flowers, and with prickly leaves and yellow flowers.

**Method of Culture.** These plants may be raised by sowing the seeds annually in the autumn or early spring months in patches, in the borders, clumps, or other parts. The autumn sowings should be made as early as possible. They also often arise from the full-blown seeds; and should be managed as other hardy annuals. They are proper for being planted out about the apiary, or in the small beds or borders in the shrubbery or other parts of pleasure-grounds, where they produce variety.

**CERINTHANS**, in Ecclesiastical History, called also *Marinians*, a sect that took its name from *Cerinthus*, contemporary with St. John, towards the close of the first or commencement of the second century; said to have been a native Jew, educated at Alexandria, and to have lived at Antioch; who formed a singular system of doctrine and discipline, by combining the doctrines of Christ with some of the opinions and errors of the Jews and Gnostics. Some learned moderns have represented Cerinthus as a vicious pervert; but Dr. Lardner is of a different opinion; and he says, that nothing of this kind is charged upon him by the writers of heresies; not by Irenæus, nor Epiphanius, nor Theodoret, nor the rest. Cerinthus abridged the creation of the world, and the legislation of the Jews, to a created being, who derived from the Supreme God extraordinary virtues and powers, but afterwards became apostate and degraded. He supposed that *Iēsous* was a mere man, born of Joseph and Mary; but that, in his baptism, the Holy Ghost, or the Christ, who was one of the *Deos*, descended upon him in the form of a dove; and that he was commissioned to oppose the degenerate god of the Jews, and to destroy his empire. In consequence of which, by his meditation, the man *Iēsous* was fixed and crucified; but *Christ* ascended up on high, without fulfilling at all. He recommended to his followers the worship of the Supreme God in conjunction with his Son; he required them to abandon the lawgiver of the Jews; and though they were permitted to retain circumcision and the rites of the Mosaic law, and, according to Irenæus, this was the principal error of Cerinthus, that he was for joining the law with the gospel; yet they were to make the precepts of Christ the rule of their conduct. For their encouragement, he promised them the resurrection of the body; after which the millennium was to commence: under the government of *Christ* united to the man *Iēsous*; and this he represented as consisting in eating and drinking, mirthful entertainments, and other festivities.

Some authors ascribe the book of the Apocalypse to Cerinthus, adding, that he put it off under the name of St. John, the better to authorize his revenues touching Christ's reign in the flesh: but it is observed by the bishop of London, in his third Pastoral Letter, p. 58, that his millenary date was not the life of saints, as the Apocalypse represents it, but the life of libertines: and it is even certain that he published some works of this kind, under the title of *Apocalypses*.

That Cerinthus was a Millennium is affirmed by Theodoret, though neither Irenæus nor Epiphanius makes any mention of it. Nevertheless, Le Clerc seems barely convinced that this error is rightly imputed to him. If there be any truth in the accounts of his being a Millennium, it is highly probable (says Dr. Lardner) that he respected the apostle John, if the Revelation be a work of that apostle. Several writers, who did not like the Millennium doctrine received by many Catholics, affirmed the book of Revelation, upon which they chiefly built, to be a work not of St. John, but of Cerinthus. Theodoret says, that whether he wrote himself in the name of John, or only appealed to it in support of his opinions, it is a proof of his having respected that apostle: and if he did, it is probable he received 'is dipel', and the epistle generally ascribed to him. Irenæus says, that John wrote his gospel to contain the doctrine lately taught by Cerinthus, and long before by the Nicolaitans; and St. Irenæus has somewhat to the like purpose concerning the occasion of St. John's writing his gospel. Some have asserted, that the Cerinthians received the gospel of St. Matthew to counteract their doctrine of circumcision, from Christ's having been circumcised; but that they omitted the genealogy. This latter assertion is founded on an erroneous interpretation of a passage in *Epiphanius*; whereas the true meaning of the said passage is, that the Cerinthians preferred this gospel to the others, because of the genealogy; from whence they thought they could prove Christ to be really a mere man, born of Joseph and Mary. It has been said also, on the authority of *Epiphanius*, that they disapproved the epistles of St. Paul, because that apostle held circumcision abolished. Of the truth of this there may, however, be some reason to doubt, from what *Epiphanius* himself states elsewhere. For he informs us that there was a tradition, that when some of them had died without baptism, others were baptized for them, but at the time when they should have hereafter rised up at the general resurrection, they should be punished for that omission. And it was supped that St. Paul refers to it in 1 Cor. xv. 29. He afterwards argues against them from *Habakuk*, and from St. Luke's and St. John's gospels, which seems to imply, that they rejected these parts of scripture, as well as the gospel of St. Matthew, some part of St. Paul's writings, and the Revelation of St. John. Upon the whole, says Dr. Lardner, it is certain, that the Old Testament, and several of the books of the New Testament, were received by Cerinthus. This candid and impartial writer questions whether the opinions of the Cerinthians concerning the person of Jesus be rightly represented. They might speak of Jesus as a man only, though they thought him to be born of a virgin. That they allowed this may be argued with considerable force, if they received St. Matthew's genealogy, as it is probable they did. They allowed the Holy Ghost to have descended upon Jesus at his baptism; which is agreeable to our gospels. But by the Holy Ghost they probably did not mean a person but a power, as *Epiphanius* expresseth it; and as to what is said that the Holy Ghost, or the Christ, was imp flible, and left Jesus to suffer aloce, their real opinion may have been only and no more than this, that the divine nature in Jesus, or the power that came down upon him at baptism, by which he wrought miracles, did not suffer. A story has been related concerning Cerinthus, of which we shall subjoin to this article a brief account. There are some, says Irenæus, who have heard Polycarp say, that John, the disciple of the Lord, going to bathe at Ephesus, and seeing Cerinthus already in the bath, came out again in
haste without bathing, saying to those who were with him, "Let us flee hence, lest this bath should fail, while Cerinthus the enemy of the truth is within." The same story is told with different circumstances by Epiphanius. But the truth of it has been questioned. It is observable, that Irenæus, though personally acquainted with Polycarp, does not say that he had it from him; but that there were some who heard him say as much. It is not at all likely, that the apostle John should go to a public bath; and, therefore, Epiphanius says, in order to account for this impropriety, that John was moved by the Spirit to go thither; and Theodoret affirms, that he went thither on account of some indiscretion under which he laboured. Irenæus and Theodoret say, it was Cerinthus; Epiphanius that it was Ebon, who was in the bath. There are other different circumstances in the relations of this matter, and also other objections against the whole story; and, indeed, some of the ancients who mention it speak of it only as an uncertain report, particularly Theodoret. Mothias's E. H. vol. i. Cave, H. L. vol. p. 36. Lardner's Works, vol. ii. p. 86. vol. ix. p. 316, &c.

CERINTHUS, in Ancient Geography, a town of Greece, in the island of Euboea, situated on the eastern coast, N.E. of Chalcis.

CERISAY, in Geography, a town of France, in the department of the Two Æres, and chief place of a canton in the district of Thionas; 24 leagues S.S.E. of Chatillon-sur-Sarthe. The place contains 930, and the canton 5,444 inhabitants; the territory includes 217 1/2 square kilometres and 13 communes.

CERISIERS, a town of France, in the department of the Yonne, and chief place of a canton in the district of Joigny; 4 leagues N.E. of St. Florentin. The place contains 1,221, and the canton 9,398 inhabitants; the territory includes 207 1/2 square kilometres and 9 communes.

CERISY-la-Salette, a town of France, in the department of the Channel, and chief place of a canton in the district of Cuxances; 2 leagues E. of Cuxances. The place contains 2,045, and the canton 14,958 inhabitants; the territory includes 140 kilometres and 11 communes.

CERITE, in Conchology, Achatus's name of Muræx alcea. See Murex.

CERITES, in Ancient Geography, a people of Italy, inhabiting Ceri, in Etruria. They received into their cities the Vestals who fled from Rome on the arrival of the Gauls; and the Romans granted them the right of freedom, without that of suffrage.

CERITES, the wax-stone, a name used by some old authors for that yellow agate usually called caracates.

Sp. C. - Root annual. Stem five or six feet high. Leaves alternate, petiolate, large, lanceolate, almost entire. Flowers white, peduncled, in long, simple, straight, terminal spikes; bracteoles oblong. A native of Cochinchina, in cultivated ground.

CERLIER, in Geography. See Eriach.

CERMENATI, John Dr., in Biography, a man of letters and historian, was a notable and famed of Milan, and flourished in the earlier part of the 14th century. In 1312 he was deputed by his countrymen as envoy to Guisarni, vicar of the emperor Henry VII. His history of his native city, comprehending, besides its origin, situation, and the character of its inhabitants, all the occurrences in it from 1307 to 1313, is written with uncommon force and precision, and in a style of unusual elegance for that period. We have two editions of it by Muratori, the last in the 9th volume of his Collection of Italian historians, 1790. Cermenati was living in 1337. Mont. Tiraboschi.

CERMORUS, in Ancient Geography, the name of a gulf and small town of Macedonia, on the frontiers of Thrace; placed by Phryn between Amphipolis and Philidium.

CERNA, in Geography, a river of Piedmont, which runs near the Seina, 3 miles N.W. of Vercell.

CERNACHE, a town of Portugal, in the province of Beira; 4 miles S. of Coimbra.

CERNAY, a town of France, in the department of the Upper Rhine, and chief place of a canton in the district of Belfort; 5 leagues N.E. of Belfort. The place contains 1,858, and the canton 9,111 inhabitants; the territory includes 140 kilometres and 13 communes.

CERNAY-en-Dormois, a town of France, in the department of the Marne; 10 miles N. of St. Menehould.

CERNE, in Ancient Geography, an island near which Hanno cast anchor, situated on the coast of Africa, in the Atlantic Ocean. He says, in his Periplo, that it was at an equal distance from the shores of the Colonnes, and from the coast of Carthage. On this island he is said to have built a fort, and established a colony. In the time of Scylax the island of Cerne became a term in navigation for large buildings. The colony of Hanno maintained itself in this island, and it was always the depot of the Carthaginians on the south of Africa. The situation of this island, however, is not clearly ascertained; so that ancient authors have much differed with regard to its position.

CERNES, a town of Ethiopia, near the ocean, according to an ancient chronicle, cited by Cafaubon in his notes on Strabo.

CERNE, or Cerna-Albus, in Geography, a small town in Dorsetshire, England, conflating of four or five indifferently built streets, is situated in a pleasant valley, surrounded by steep hills, and watered by the river Cerne, from which it derives its name. A market (Wednesday) was granted in the fifteenth of king John, and is well frequented. Three fairs are held here. The trade of the town is chiefly confined to matting and brewing, though some bands are employed in a silk manufacture. The beer brewed here is equal, if not superior, to any in the kingdom. Cerne is only remarkable for the remains of its abbey, which, according to William of Malmsbury, Camden, and some others, was founded by St. Augustine, whose zeal in the conversion of the Saxons to the Christian faith is said to have induced him to visit these parts, where, according to the monkish legends, he performed several miracles. There does not appear, however, any decisive evidence that Augustine ever travelled so far from Kent, or that any missionary arrived in the west of England before Birinus, which was 32 years after the time of the English apostle. The most early intimation of any religious foundation here that can be depended upon occurs about the year 570, when Eadwald, or Edwaid, brother of St. Edmund the martyr, king of the East Angles, greatly affected by the murder of his unhappy brother by the Danes, declined the crown, and committed himself, fixing his retreat near this place, where Almer afterwards founded a monastery of the Benedictine order. A gate-house, and some few fragments of the abbey only remain. Cerne is 120 miles W. from London: the population was, under the late act, returned at 8,479, number of houses 1,057.
From this town ascends an immense chalk hill, which is
toumed by a very large entrenchment, called Tredle hill; on
the declivity of this eminence may be traced a gigantic
figure, cut in the chalk, in the manner of the famous white
horse in Berkshire: though whether of a similar origin and
antiquity is doubtful. It represents a man holding a club in
his right hand, and extending the other; the whole figure
measures about 180 feet in height. Hutchins's History of
Dorsetshire. fol.

CERNETANI, in Ancient Geography, a people of Italy
in Campania, mentioned by Pliny.

CERNETZ, in Geography, a town of Switzerland, in
Lower Engadine, situated on a small rich plain, bounded by
two ridges of mountains converging at both extremities, and
producing wheat, barley, flax, and abundance of rich pasture;
24 miles S.E. of Coire.

CERNIA, in Ancient Geography, a town of Cyprus, on
the northern coast, N.E. of Salamis.

CERNIN, S.r., in Geography, a town of France, in the
department of the Cantal, and chief place of a canton in the
district of Aurillac. The place contains 4141, and the can-
ton 8429, inhabitants; the territory includes 233 square
and 6 communes.

CERNITIS PALUS, in Ancient Geography, a kind of
marsh situated in Thrace, near the mouth of the Styron.
CERON, in Geography, a town of France, in the de-
partment of the Marne, and district of Chalons; 8 miles S.
of Chalons.

CERNU, a town of Africa, in the kingdom of Morocco;
7 miles from Safia.

CERNUA, in Ichthyology, the name of a small fresh water
fish of the perch genus, better known by the titles of the
ruff, or ruff, and pope, and among the old writers by that
of aperoth and perca minor. It is caught in several of the
English rivers, though far more local than the common
perch. This is the perca cerina of modern naturalists. See
Perca.

CERNOUS, in Botany, drooping, a term applied by
Linnaeus to the peduncle of a flower. It denotes a greater
and more determinate degree of downward curvature than is
expressed by nutans, or nodding; as in bidens radiata and
helianthus annuus. See.

CERO, in Geography, a town of Italy, in the Veronese;
6 miles N.E. of Verona.

CEROHYTHOS, in Antiquity, a method of painting in
wax, tinted and coloured with pigments for the purpose,
and applied with pencils.

The word is compounded of κερός, cero, ceras, and χέω,
fundo, I melt down. Plin. Hist. Nat. lib. xxxv. cap. 11. and
lib. xvi. cap. 14.

CEROCONA, in Entomology, the name of one of the
Fabricius genera of coleoptera insects. See Meloe.

CEROMA, originally denoted a mixture of oil and
wax, with which the ancient wrighters rubbed themselves,
not only to make their limbs more fleck, and less capable
of being laid hold of, but more pliable, and fit for exercise.
The name ceroma is sometimes applied by ancient phy-
icians to a crepe or creceloth.

The champions, ready to engage in the palestra, having
frilled themselves naked, were first anointed with oil, then
fired over with dust, to which was halfly added wax.
From this last ingredient, this composition was denominated
ceroma, from cero, ceras.

CEROMANTIA, an ancient method of divination, by
means of wax melted over a vessel of water, and let drop in
three distinct spaces; observing the figure, situation, dilance,
and concretion of the drops.

CERON, in Ancient Geography, a country of Asia in Af-
syria, famous for its odoriferous trees. Josephus says that
in his time it presented remains of Noah's ark.—Alfo,
A fountain of Greece, in the Erythée; a country of Thet-
falys, according to Pliny.

CERONE, DOMINICO PEDRO, in Biography, maestro di
cappella to the vicerey of Naples, while that city and kingdom
were in the possession of the Spaniards: though himself an Ita-
larian, and born in the Venetian state, he published, in the Spa-
nish language, the most ample, correct, and useful myrnai-treat-
tises that appeared in any country during the 17th century;
entitled "El follejado yスタッfoe," Naples, 1613, not 1619, as
Walter says. See Dominican Bibliography, p. 279. It was
copied at Antwerp in folio, 1619. This scarce and truly
valuable work for counterpoint, and all the arcana of fugue,
canon, double counterpoint, augmentation, diminution, &c.
occurs in nearly 1000 folio pages. Though his rules for dou-
ble counterpoint are good, we shall recommend to the musi-
cal student the instructions on this subject given by Pedro
Martius, as more accessible, if not more clear; and the examp-
les given by Salvi, of whom we shall speak hereafter, as most in-
telligible and elegant. The study of this species of com-
position is strongly recommended by regular bred musicians,
and practiced by composers of the first clafs.

CERONES, in Ancient Geography, probably the same
people with the Crones mentioned by Plutonii as
inhabitants of the isle of Albion, were, according to Hor-
ley, the most ancient inhabitants of Lochabar, and of part
of Koffe.

CERONIA. See Cerine.

CEROPEgium, in Botany, (from κερός, keiros, a cand-
delabrum or lamp-stand) Linn. gen. 302. Schr. 431. Wild.
Gen. Ch. Cal. five-toothed, or five-leaved, permanent.
Cor. monopetalous, tubular or campanulate, sometimes
ovarian at the base; border five-cleft, converging. Stam.
Filaments five, in the base of the corolla, small. Pfyl. Style
searcly apparent; iligmas two. Peric. Follicles two, very
long, cylindrical, erect, one celled, one-valved. Steds nu-
umerous, imbricated, crowned with a pappus.
Eff. Ch. Contortae. Follicles two, erect; seeds fra-
thery on the border of the corolla converging.

Wild 1. (Notta-noden-vallii; Rheed. Med. 9. tab. 16.)
"Leaves egg-shaped, mucronate; umbels pendulous;
flowers erect." Stam. twining, slender, round, green or
redish. Leaves opposite, petioled, egg-shaped, thick,
soft, smooth. Flowers reddish, in axillar umbels, at first
pendulous, afterwards erect, the common peduncles
continuing pendulous. A native of the East Indies. 2. C.
tuberosa, Wild. 2. Roxb. Cor. 1. tab. 9. "Leaves egg-
shaped, acute, umbels erect; root creeping, tuberoso; 
A native of waste ground in the East Indies. 3. C.
bullosa, Wild. 3. Roxb. Cor. 1. tab. 7. "Leaves obo-
veeves, elliptical, culipdate; umbels erect; root bulbous; 
Distinct from the preceding. Leaves large and different in
form. Flowers only half the size. Bulb solitary, depreiied.
A native of dry woods in the East Indies. 4. C. hybro-
ner, Linn. Sp. 2. Mart. 2. Lam. 2. Wild. 4. "Leaves egg-
shaped; peduncles two-flowered." Stem scabose;
Leaves opposite, quite entire. Peduncles axillary, most frequently
two-flowered. Flowers opposite to the peduncle, not re-
exed but extended in a right line. A native of the island
of Ceylon. 5. C. annua, Wild. 5. Roxb. Cor. 1. tab. 10.
"Leaves lanceolate, fertile peduncles with about two
flowers;

CEROPHEL, in Ancient Geography, a place of Thrace, being one of the places which the Romans assigned to the Goths for their dwelling.

CEROPHEL, a people placed by Ptolemy in Africa Propria.

CEROSUSUS, a place in the Ionian sea, between the island of Melita and Macedonia, in the Adriatic sea.

CEROSTRATUM, in Ancient Writers, denotes a sort of picture composed of pieces of horn; answering to what among us is called MOSAIC WORK. Some write the word cerosstratum, and suppose it primarily to denote a sort of pavement composed of pieces of wood, inlaid and joined with slips of horn, variously coloured and figured. Sallustus will have cerosstrata to denote a method of painting, or enamelling with wax, otherwise called CEROCYHTOS.

CEROU, in Geography, a river of France, which runs into the Aveiron.

CERQUOZZI, Michael Angiolo, called M. A. delli Bartogic, in Biography, a painter of battles, formed himself with regard to Hyle and the telection of his subjects on Bamboccio, but differed from him as to the character and phnyography of his figures, painting those of Italy more Dutch or Flemish sorts. The tints of both are strong and vivid. Whilt Bamboccio excels Cerquozzi in landscape, the latter is superior in the spirit of his figures. His principal work is in the palace Spada at Rome, in which he has represented an army of fanatic Lazzaroni floating appeals to Mafo Ancio. He died in 1663, at the age of 60 years. Filkington by Pufeli.

CERRATO, Paul, a Latin poet, descended of a noble family, was born at Alba in Monteferrant, in 1434; and though by profession a lawyer, he acquired very great literary reputation. Several editions were printed of his epithalamion, written in Latin verse, on the nuptials of William marquis of Monteferrant and Anne d'Aletton in 1593; but his principal performance was a poem "De Virginitate," in three books, heroic measure. Scaliger the elder reckons Cerrato among the first pocts in Italy, though he says he had so much accustomed himself to the lofty style, that he could not defend to the familiar, but would describe a fly in terms as elevated as he would a hero. His works are inserted in the "Delicte Pétarum;" and the last separate edition of them, with an elegant bibliographical memoir prefixed, was given by Signor Joseph Vernazza at Vercelli in 1758. Merci, Tiraboschi.

CERRETANI, in Ancient Geography, an ancient people of Spain, who dwelt along the Pyrenees, near the Vasc. They are mentioned by Strabo, Ptolemy, and Pliny; the latter of whom distinguishes them into Juliani and Aug. Julius Cesar gave them the right of freedom, and Augustus incorporated them into a smalllination, and extended their borders to those of the Vasc. CERRI glono, and CERRETO, in Botany, J. Bau. Park. and Ray. See QUERCUS AGLENA.

CERRETO, in Geography, a town of Italy in the province of Umbria; 15 miles W. of Nurnia.

CERRITO, a town of Naples, in the province of La- vora, the residence of the bishop of Telefa, with a cathedral and collegiate church, and three convents; 18 miles N.N.W. of Benevento.

CERRO, a town of Italy, in the duchy of Milan; 18 miles W. of Como.

CERRUS, in Botany. See CERRI glono.

CERRUS, in Ichthyology, a name given by some old writers, Pliny, Martial, and others, to a fish called by other writers *fiaris*, and *mela candida*. They speak of it as being distinguished from the rest of the fishes in the same tribe, by having a black foot in the middle of each side, and the pectoral and tail fins being red. As the fish is certainly of the *sparus* genus, this description left us by the ancients is not entirely satisfactory, there being at least thirty distinct fishes of this genus, which pollute the characteristic lateral spot they mention. Artedi describes the cerasus as *sparus macula nigra* in utroque latere medio, pinnis pectoralibus caeruleus rubricus. It is generally believed that the cerasus, and the *sparus fiaris* of modern ichthyologists are the fame species. See SPARUS FIARIS.

CERSUMUN, in Ancient Geography, a town placed by Ptolemy in the interior of the island of Curieca.

CERSUS, or CERSEUS, a river of Aisa, which ran between the defiles of Syria, according to Xenophon.

CERTAINTY. See CERTITUDE.

CERTITUDE, in Law, denotes a plain, clear, and dilineated setting down of things, so that they may be understood. 1 Rep. 121. A convenient certainty is required in writs, declarations, and pleadings, &. But if a writ abate for want of it, the plaintiff may have another writ; it is otherwise if a deed become void by uncertainty, as the party may not have a new deed at his pleaure. 11 Rep. 25. 121. Dyer. 83. That has certainty enough, which may be made certain; but not like what is certain of itself. 3 Rep. 97. See PLEADING. See also DRY, FINE, and WILL.
CERTHIA, a genus of birds among the "wee, which has the bill arched, slender, somewhat trapezoidal, and pointed; tongue acute; feet formed for walking.

This is the common character of its genus as it stands in the last edition of the Linnean System. In General Synopsis by Dr. Latham it is defined rather differently; that writer describes it as having the bill flender, incurved, and sharp pointed; nostrils small in general, but sometimes pretty large and covered with a membrane; toe in have uncertain legs, and black feet, toes placed three before and one behind; back too large, claws hooked and long; and tail confined of twelve feathers. The character of the genus confinna in Index Ornithologists corresponds more closely with that assigned it by Gmelin, namely, bill bent, flender, and pointed; toe variety; feet formed for walking; tail composed of twelve feathers.

The main tribe of this tribe bear a near resemblance in a variety of particulars, and distinctly in the plumage, and beauty of plumage, to the Trechus or humming-birds. Some authors have united them as forming only one particular family. This has been objected to because the groups are not confined to any climate, being found in all parts of the world, while the humming-bird is most with only in the warmer parts of America, the species, besides, feed on nectar, and is often in the Humming-birds only of the nectarine flowers which it extracts from flowers. There are, indeed, a few species of creepers that have the tongue long and tubular as in the humming-birds, but the greater part of them have the tongue short and pointed; in form it is rather long, and flat, as at the tip, and in others the sides of the tongue are divided. Their habits and modes of life are different; the creepers, feeding chiefly on insects, are almost constantly observed creeping gaily up and down trees in search of their food, while the humming-birds hover on the wing over the flowers which furnish it food like the bee; the creepers breed in the hollows of trees and lay many eggs; the humming-birds, on the contrary, vary little more than two eggs, and build the nests very differently; preferring the covert of a bush to the hollow of a tree; their nests are generally observed perched on a branch of a tree or among the flowers, and sometimes among grass and other low herbage.

CERTHIA Familiaris is one of the most universally distributed species of this genus, though generally believed to be no where common, it is found in Asia and America, and in most parts of Europe. The species is a brownish color, beak white, tail feathers, and face marked with a white edge. Toon. Brit. Stoc.

This is the common or European creeper, it is sometimes called the French author, a bird is often observed in this country; and in the north, yet, generally well known as a British species. It is described under various names by authors. Krzeczak in 1749 described it as C. flavifrons; Kenn. and Latham describe it as C. flavifrons and Bodd. and Buffon Le Général Cert. 2. Our species Cert. is about five inches and a half in length. The bill is flender than the upper mandible brown, and the lower white; head and upper part of the neck brown, breast with black; wings covertes varied with brown and black; breast and belly dull white, tail long, and confiding of twelve feathers that slope off to a point; legs and claws grey. It feeds preferably on insects, which it finds in the crevices, and holes, in trees, and branches of trees. The nest is usually built in the hollow of a tree, and consists five or more eggs of light yellow, marked at the end with spots and streaks of a dark wine color.

This species is described by Scopoli as being nearly the same size as the common form, of which he supposes it may be only a local difference or a variety. We may rather conclude, if his description is correct, that it is not a local difference of the same, but it may be a variety, and not necessarily a distinct species. He mentions a blue; it stands from the base of the bill, and deliquesces down the back of the neck: and a rudimentary spot on the throat: the head brown, and the legs black. Habit. Caracas.

This length of the species is five inches and a half; the bill is dull brown, and dull: the upper parts of the head, back, and body are green with a gloss of violet on the head; beneath black: the vent brown; the sides of the wings are green on the wing-coverts. This was first described by Dr. Latham from a specimen in the British Museum.

Length eight inches. Bill an inch and three quarters, brown, red at the base: legs black brown. Described from a specimen in the late Leveque Museum that was brought from the Friendly Islands in the South Seas. It is in motion in the left voyage of Captain Cook under the name of Hoolow.

The length of this bird is seven inches. Bill an inch and three quarters long, black and very much curved; the under mandible a quarter of an inch shorter than the upper. The bill and eye a pale brown flesh-colored plumage white; pyle olive green, palest green, and somewhat yellowish; legs dusky brown, with the feathers just above the knees, white. This species inhabits the Sandwich islands, and is one of these birds the fathers of which are employed by the natives in the manufacture of the celebrated velvets of their cloaks. An elegant check at this definition formed of the feathers of this kind of creeper, and decorated with a deep border of red and yellow feathers, was brought by our back navigators from Oehyon, and deposited among the artificial rattles in the late Leveque Museum. There is understood to have been the only article of dress formed of the truth of this bird by the English, although slow and other velvets of feathers were worn on all sorts of great public occasions by the chiefs in the Sandwich islands. A similar kind of dress is not so cheap that as it be worth reporting to know what the value these ibloedeas attach to the articles of cloaks composed of the cloaks of this bird, while those composed of red and yellow feathers were to be exchanged on easy terms. The cloak was the property of one of the
chieftain warriors of Owylhice who among others were tempted by curiosity on board English ships; its beauty attracted the notice of an officer in the expedition, Lieutenant Williamson, who wished to purchase it, but the chick being considered by the owner as extremely valuable, his proposals were rejected. The officer offered him a double barrelled gun for it, which was refused; and he afterwards offered his regimental coat which was refused. Some time after, however, the owner of the chick observed in the corner of the cabin a bottle and basin of common white or Queen's ware, and was so struck with the novelty that he hastily fetched them up in his arms, and throwing his cloak upon the floor without further ceremony jumped overboard, and swam ashore with his prize, which very fortunately he bore off unbroken.

**Coccinea.** Scarlet: wings, and tail black. Formerly, some species inhabit the Sandwich Islands, the feathers of which are chiefly employed by the natives in the formation of their fine lace-like cloaks, and other parts of dresses; and in their grotesque feathered ideas. The length is six inches. Bill three quarters of an inch long, and much curved, the colour pale brown. Some birds have the fore-head buff colored, and a mixture of buff and dusky black about the head and neck which are supposed to indicate thiofe not yet arrived at their perfect plumage. Obs. This is called by Born Polyommus. Cercis viridaria, Lath. 

**Sovi-manga.** Green, beneath yellowish; rump olive; breast brown; with two transverse bars, one brown, the other blue; tail black. Genl. Cercis. Makingaria violacea, and le Grimpereau violet de Madagascar, Brill. 

**Sovi-manga.** Size of a woodpecker, Length above four inches; bill three quarters of an inch long and black; tongue rather longer than the bill, and black. The head, throat, neck, upper part of the back, scapulars, and wing-covers, are shining green, with an olive gloss; lower part of the back, rump, and upper tail coverts olive brown; breast brown, with a blue band, and below that another of chestnut; belly and under tail coverts pale yellow. On the shoulders a spot of deep yellow; tail black. The feathers edged with green, except the outer feather, which is grey brown for half its length, and the next tipped at the end with the same. Legs and claws black. The female is smaller than the male, and has the upper parts olive-brown: the under parts yellow with a tinge of olive. Inhabits Madagascar.

**Manillensis.** Green, glossed with blue and violet; beneath greyish olive; neck barred with green, blue, violet, and yellow; wings fuscous. Genl. A native of Manilla; scarcely four inches long. Obs. There are two yellow spots between the shoulders, and the upper wing-coverts are black. This is considered as a mere variety of coccineus by Latham. Ind. Onl. Dufau calls it norn-manga de Louisiane.

**Boroncosa.** Green and fuscous; beneath varied with grey; rump yellow; wings and tail blackish. Genl. Le Sou-manga à la pointe de Bay Am. Buff. Grimpereau à la pointe de Bay Am. P. clad. Yellow capped creeper of Louisiana. The length of this bird is about five inches. The bill black; upper part of the head and body greyish brown; the crown black, inclining to olive; under parts grey and yellow variegated; sides fuscous; tail blackish; legs black. Inhabits the hill of Bounbon.

**Violacea.** Two middle tail-feathers very long; body glossed with violet: breast and abdomen pale yellow. Genl. Cercis violacea. Linn. Cercis longicauda minor capitis bona, Buff. Sou-manga à la queue et à capicion violet, Buff. Petit grimpereau à longue queue du cap de bonne efeance, Buff. Pl. cula. Violate-headed creeper, Lath. This is rather more than six inches in length. Bill blackish, and near an inch long. The head, neck, upper parts of the back, scapulars, lesser wing-coverts bright violet, glossed with green; lower part of the neck bluish, lower part of the back, rump, and upper tail coverts, olive brown; breast, belly, and under tail coverts bright oranges; sides of the body orange; with a mixture of olive; tail blackish brown, wedge-shaped, with the two middle tail-feathers an inch longer than the rest; the colour blackish brown, edged on the outside with olive; legs and claws blackish.

**Inhabits the Cape of Good Hope.** The nest, which consists of materials of a silky nature, is constructed with great art. Lev. Muf.

This is a large species. Length nine inches. The bill an inch and a quarter; the plumage is green, with a gloss of coppery; between the bill and eyes a black velvety stripe; under the shoulders a fine yellow spot; greater wing-coverts and quills blackish, edged with green; tail black, two middle feathers exceed the rump by two inches and a half in length, and are edged with gold, and coppery on both sides; claws and legs black. The female has the head and upper parts of the body of a greenish brown, with a mixture of bright green; rump green, with the quills and tail black; body beneath yellowish, with a mixture of green feathers on the breast; two middle tail-feathers nearly as long as in the male, but so narrow as almost to resemble a thread. A native of the Cape of Good Hope.

Length near seven inches and a quarter. Bill two-thirds of an inch, and blackish. The head, neck, back, rump, belly, sides, scapular, upper and under tail-coverts, and upper wing-coverts are of a fine golden green, glossed with copper, and the breast is a beautiful red; on the lower part of the belly is a mixture of white. The greater wing-coverts and tail are brown; tail blackish, edged on the outside with green gold; two middle tail-feathers rather more than two inches and a half longer than the rest, and very little rounded at the end; legs blackish. The plumage of the female is tinged with brown above, beneath yellowish, mixed with brown, the middle tail-coverts white, sprinkled with brown and blue. This species inhabits S. negl.

**Philipina.** Two middle tail-feathers very long; body greenish grey, beneath yellowish white. Genl. Linna, &c. Cercis philippina, Brill. Grimpereau des Philippines, Buff. Cercis grimpereau de l'île de Lunes et Surleg, in Wel. Philippine creeper, Lath. Length near five inches. Bill three quarters of an inch and three quarters; bill and legs, with the clasping black; tongue tubular; two middle tail-feathers black, glossed with gold; the rest blackish, and white at the tip.

**Cyana.** Blue, with the under part, shoulders, wings, and tail black; legs fuscous. Genl. Cercis Brunniceps caerulea, Buff. Chalcisicalis Marwnt. Caille bleu, Buff. T. 12
Aurantia. Green, beneath yellowish; throat orange; wings and tail black. Gmel. Orange-breasted creeper, Lath.

Discovered by Smeathman in Africa. The length is four inches. Bill about three quarters of an inch long, curved, and black. The head, throat, hind part of the neck, back, and wing coverts green; quills and tail dull-black; legs black.

This kind inhabits Ceylon. The length is four inches and a quarter. Bill nearly an inch long, curved, and black; upper part of the head, eyes, and back of the neck, and back green; chin, throat, and breast, deep blue; blue on the belly paler; on each side the neck, between the blue and green, yellowish white; quills and tail black; legs yellow, with black claws.

Inhabits Surinam. This is about half the size of the common creeper. The head, back, wings, and tail are green.

Aucalis. Black; head, collar, breast, and lower middle of the back red; tail equal. Gmel. Cardinal creeper, Lath.

Described from a specimen in the Leverian museum. It is the same size as our common creeper. Bill the length of the head, and curved, black, and white at the base; tongue long, and eliuated half way down from the tip; between the bill and eye a streak of black which encircles the eyes; wings and tail black; legs lead coloured, claws black. Inhabits the cultivated parts of the island of Tanna, and is known there by the name of kyameta. It subsists on the nectarious juices of flowers like the humming-bird.

Carpentaria. Olivaceous; chin and throat orange; breast ferruginous; abdomen ash-coloured; at the base of the lower mandible on each side a yellow wattle. Gmel. Whispered creeper, Lath.

A specimen of this singular species brought by our navigators from Tonga-Tabou, or Amsterdam Isle in the South seas, was preserved in the late Leverian museum. The length was seven inches and three quarters. Bill an inch long, and rather bent; tongue longer than the bill, and divided or hal its length into four segments like threads; wattle at the base of the bill surrounded by a patch of yellow feathers which extends under the eye; the plumage brownish olive-green, darkish on the middle of the black; belly inclining to ash-coloured; legs blue black; claws black.

The length of this bird is six inches. The bill is an inch long; moderately bent and dark brown; with a pale orange spot in the middle. General colour of the plumage brown; belly very pale brown; tail brown and even at the end; legs black, claws long and hooked. Inhabits islands in the South seas.

Inhabits the south of Europe and Asia. Frequent old walls in search of insects, especially spiders; is solitary and migrates in autumn.

Length three inches and a half. A black streak extending...
from the bill to the eye; quill feathers edged with 
braffy. This inhabits the Cape of Good Hope.

Capeensis. Fuscous; tail feathers blackish; outer ones 
fringed with white on the outside. Gmel. Certhia capitis 
longi sp. Briff.

Caracarica. Olivaceous, beneath yellow; tail fea-

Inhabits the Philippine isles. Length four inches. Bill 
three quarters of an inch long, and black; tongue forked.

Body above olivaceous; under parts yellowish white, deepest 
on the breast; down the middle of the neck as far as the 
breast a deep violet stripe; upper wing-coverts violet; quills 
white; tail feathers black; edged with rufous, and 
whitish at the tips; legs and claws black.

Jugularis. Somewhat griscous; beneath yellow; throat 
violaceous; two exterior tail feathers yellowish at the tip. 

Length three inches and a half. Inhabits the same coun-
try as the last, and is suppos'd by some writers to be only a 
variety of it.

Olivacea. Olivaceous; beneath fuscous; orbits whitish. 
Gmel. Certhia olivacea madagascariensis, Briff. Soui-manga 
olive a gorge pourpre, Buff. Grimpereau olive de Madagascar, 

Length four inches. Bill above half an inch long, and 
black; colour of the upper parts, from the forehead to the 
rump, dull olive green, inclining to brown on the forehead 
and crown; the under parts grey brown; round the eyes 
whitish; quills and tail brown, with a tinge of olive green; 
the two outer feathers white at the end; legs pale brown. 
Inhabits Madagascar.

Dr. Latham supposes this may be the female of the 
Ceylonese creeper, certhia zeylonica.

Carula. Blue; ocular band, throat, wings and tail-
feathers black. Linn. Scopoli, &c. Certhia ceylonica caru-
a, Briff. Aoeo bicornis, papiloto vaoca Seba. Certhia of 

A native of Cayenne, where, according to Seba it makes 
its nest with great art in the shape of a retort, which is 
upended from some weak twig at the end of a branch of a 
tree, with the opening downward. The nest at the en-
trance is a foot in length, the nest itself being quite at 
the top, so that this bird has to climb up this funnel-shaped 
opening to gain access to its nest. The nest being so flat-
found is secure; neither monkeys, snakes, nor lizards, daring 
to venture at the weak extremity of the branch to the nest 
as it would not support them. The outside of the nest is 
composed of dry filks of grass, the lining of foister 
materials. This bird is four inches in length. The bill is three 
quarters of an inch long, and black; the head fine blue; legs 
yellow, claws black.

Brasiliaca. Black; crown of the head gold-green; 
rump, chin, and throat violaceous; breast purple-tawny. 
Gmel. brasiliense violacea. Briff. Guit-guit vert et violet, 
Buff. Black and violet creeper, Lath.

This kind inhabits Brazil. Length three inches and a 
quarter. Bill rather exceeding half an inch, and black; 
crown of the head is fine green gold; tides of the head, hind 
part of the neck, back and scapulars deep velvets black; 
lower part of the back and rump, rufous wing, and upper tail 
coverts violet, with a glows like polished steel; belly black; 
throat chestnut brown; quill black; tail black edged with 
violet.

Variegata. Varied with blue, black, yellow, and 
white; beneath fialron coloured; crown red; hind head 
blue. Gmel. Certhia americana varie, Briff. Guit-guit varie, 
Buff. Variegated creeper, Lath.

This species inhabits America. The length is five inches. 
Bill three quarters of an inch in length. The cheeks, and 
below the eyes are blue and white mixed; hind part of the 
neck, back, and rump undulated with blue, black, yellow, 
white; scapulars, under-wing, and tail coverts, quills, 
and tail the same.

Cayana. Glosby-green, beneath friated with white; tail 
feathers greenish, the lateral ones blackish within. Gmel. 
Certhia viridis cayennensis, Briff. Certhia corpore fupina viridis, 
gult latens, Buff. Trans. Guit-guit vert tachet, Buff. Ca-
yenne creeper, Lath.

Length four inches. Bill three quarters of an inch and 
black; upper part of the head, neck, back, and rump, fine 
peafh green; scapulars, upper wing and tail coverts the same 
throat, and a small spot between the nostrils and eye rufous; 
the back, each feather margined on both sides with green; 
under parts of the body green, with a mixture of blue; 
two middle tail-feathers wholly green, the red black-
ished, edged with green; legs and claws grey. The female 
leg the plumage more omissible, and is deliante both of the 
rufous spot between the nostril and eye, and that on the 
throat. Inhabitats Cayenne.

Chalybea. Glosby-green; breast red, with a fleec blue 
Soui-manga a collier, Buff. Grimpereau du cep de bonne so-
quence, Buff. pl. enl. Purple Indian creeper, Edwards. Col-
lared creeper, Lath.

Length four inches and a half. Bill near an inch long 
and black. The head, neck, throat, and upper parts of the 
body green gold, glossed with coppery; breast a beautiful 
red, neck green, and separtated from the red by a fleec-blue 
collar, changeable to green. The belly, sides, thighs, and 
under tail coverts grey, with a mixture of yellowish on the 
lower parts of the rump and sides; tail shining black; outer 
margin of the ten middle tail feathers green gold, and all 
tipped with grey; legs and claws black. The female differs 
in having yellow flaps on the sides according to Briffon. 
Buffon thinks this may be a young bird of the Limnene 
Certhia fumigalenis, and suppose's further the Limnene 
Certhia capensis may be the female. It is a native of the 
Cape of Good Hope.

Negalandia. Violaceous-black; crown of the head 
and chin green gold; breast scarlet. Gmel. Linn. &c. 
Certhia fumigalenis violacea. Briff. Soui-manga violet a poilure 
grande, Buff. Senegal creeper, Lath.

This species is five inches in length; bill nearly an inch 
and black; top of the head and throat green gold, glossed 
with coppery; ret of the body above and beneath violet; 
feathers on the neck and breast greenish, tipped with red; 
thighs violet brown; greater wing-coverts, quills, and tail 
brown; legs and claws blackish. A native of Senegal.

Afra. Green; abdomen white; breast red; rump blue. 
Gmel. Soui manga vert a gorve rouge, Buff. Red-breasted 

Length about four inches and a half; the bill an inch 
long, and dullky; head, neck, back, and wing-coverts thin-
green, glossed with burnish'd gold and copper; on the 
breast a bar of red; upper tail-coverts blue; greater wing-
feathers and tail dark brown; belly, thighs, and under tail-
coverts white; legs black. Inhabits the Cape of Good 
Hope.

There are two or three varieties of this species, one having 
the abdomen cincereus; a yellow tuft under the wing; and 
the tip of the tongue blw; and another has the chin, throat, 
and breast blue-purple, with a pectoral red band. Latham 

confiers
CERTHIA.

considers the Ceylonian *Ficedula rubra* as a variety of this species.

Length six inches; bill three-quarters of an inch long, and black, with the white tip; tongue fuscated; head short, and foie part of the neck glov-round; last part of the neck, back, and feathers pendant; -head; last part of the back, upper tail-coverts, violet changeable to green and gold; lower part of the belly yellowish olive; tail black, with a steel-like gloss, edged externally with violet, and glossed with greenish-gold; legs and claws brown. Female olive-green above, beneath olivaceous yellow. This species inhabits all the Philippine islands, and has a note like that of the whirengale.

Obi. There is a variety of this bird with a violet color, &C. *gula violacea* of Gmelin. It is called by Somner *Grinnelum tristis* de *L'isle de l'Olonese,* and by Bouillon *Sommangia a gage violacea et poilure rouge.*

Size of a chaffinch; length five inches and a quarter; bill three-quarters of an inch long and white; head and throat; velvety black; hind part of the neck, back, rump, feathers, upper wings, and tail-coverts, and quills fine green; fore part of the neck, breast, belly, sides, and under tail-coverts blue; tail deep green. This species inhabits America, and seems liable to vary considerably; the three following are described as different varieties of this species.

*Certhia fissa,* Gmel. Green, with the cap black. This is the fissa of the first, and has the upper mandible blackish, the lower white, and both yellow at the base. In this the throat is not black as in the first, the black passing downwards just below the eye on each side, and as far as the nape behind; legs lead colour. Inhabits Surinam, Briss., and Guiana. Damer it calls this the *Green black cap flycatcher.*

7. Green, with white chin, and crown of the head blue. *Gainulit vert et bleu a gorger bleue,* Buff. *Blue-headed green flycatcher, Edwards.* Size of the hat, but the tip of the head, and back wings, are blue; the throat white; plumage above green; legs yellowish; and claws black. Inhabit some country as the hall.

8. **Entirely green:** *Gainulit toute vert,* Buff. *Grinnell vert et CABAN,* Buff. *Entire green creeper, Edwards.* This is not less than the rest, it is in the head longer, and rather more incurved than black, and somewhat paler at the base; plumage above green, beath paler; found in Cavendish, and other parts of South America.

Inhabit Virginia. Length four inches and a half; bill one inch and a half long. This bird is said to fly well.

Length five inches. Bill as much long, and black; fore part of the head, upper part of the neck, and rump of the body black; brown wings; rufous red at the tip; tail black. Inhabit Brazil.

This bird inhabits Bengal; the length is three inches and a quarter; bill short and black; quills and tail blackish; legs black.

*Sangüineus.* Deep red; wings, and tail black; abdomen dull; vent white. *Gmel. Grinnell cervin,* Latth. *Length five inches, inhabits the Sandwich Islands. This is the old,* and the following, tillit is the female of *Certhia philippia.*

*RUNDA.* Red; wings and tail black; vent white. *Gmel. Stark's creeper, Latth.*

Inhabits the islands of the South seas. Length scarcely four inches; the bill half an inch long, very little bent, and black. General colour of the plumage scarlet; except the wings and tail; lower part of the belly and vent white; legs and claws black. *Lev. Muf.*

This bird inhabits Jamaica. Size of a wren; bill black; head, throat, neck, back, feathers, upper wing and tail-coverts fine black; from the base of the bill extends a white stripe passing over the eyes to the end part of the head; breast upper part of the belly, sides, edges of the wings, and rump fine yellow; lower part of the belly, with the tingals, and under tail-coverts white; tail black, with all the feathers, except the two middle ones, with white tips; legs and claws black. The yellow beaked creeper of Edwards is supposed to be the female. Gmelin makes it a var. f.

Several varieties of this bird are described by authors, one of which, the *Bulauna tingamy of Catchby, Certhia babamjfi,* Briss. is rather larger than the first described kind. General colour fuscous, pale yellow beneath, with at pale; lower part of the abdomen and vent brownish; eye-brow white. This inhabits the Bahama islands; and there is another *Certhia obsoloteana,* Muf. Carls. of a length rounded above, beneath yellow; eye-brow yellow; in general purple green; vent white; bill, legs, wings, and tail fulvous. Length five inches. The birds inhabiting the sweet places of the lego-mastics, which they extract through the crevices of the rocks.

*CINNAMONICA.* Cinnamon colour; beneath white. *Gmel. Cinamena creper,* Latth. *Length five inches; bill rather long and black; tail formed as in *Certhia famandica*; legs dull.

Length
Length four inches and a half. Inhabits India. The bill and tail are black.

_Anisurus_. Cinerous; beneath green; head and collar yellow; breast red; wings black. _Gmel. Polytmus ambiguiorys._

The length of this bird is four inches and a half; bill nearly one inch and pale yellow; upper part of the head light shining red; throat and fore part of the neck green; tail deep red; legs and claws pale yellow. Supposed to inhabit New Spain. Schæs mentions a variety of this bird with a black head, avicula de tatacex Nova Hispania; Grimperau rouge à tête noire du mexique.

_Cineréa._ Cinerous; rump and wing-coverts green; wingsfuscous, abdomen yellow with; vent white; tail black. _Gmel. Cineréus creper._ Lath. Inhabits the Cape of Good Hope. Length nine inches.

_Nové Hollandiae._ Black; beneath streaked with white; eye-brows and spot near the ears white; quills and tail-feathers edged with yellow. Lath. Ind. Orn. A native of New Holland.

_Size of the Nightingale._ Bill dusky pale at the tip; nostrils covered with a membrane; tail rounded, with the two outer tail-feathers tipped within with white; legs pale. White's Hist. New Holland.

_Incana._ Somewhat fuscous; neck and wings hoary. Inhabits New Caledonia and is of a small size. Anderon.

_Peregrina._ Olive, beneath yellow; wings with a pale billid band; tail somewhat fuscated; two outer tail-feathers tipped within with white. Lath. Ind. Orn. Obf. This is of the middle size, and has the bill, wings, and tail dusky. Lear. _Muf._

_Verticalis._ Olivaceous green; beneath all coloured; crown green; wings and tail fuscous. Lath. Ind. Orn. 

_Grisea._ Greyish; beneath reddish; tail cuneated; a middle feathers brown, lateral ones grey; and all barred with black at the tip. Lath. Ind. Orn. Inhabits China. The bill and legs are yellow.

_Pratincoleps._ Black; fore part of the neck purple; wings and tail yellowish green. Muf. Carf. &c.

_Venus._ Gold-green; fore-head, chin, broad peafowl band, and rump violet; wings brown; belly yellow. Shaw. Nat. Mife. Inhabits Sierra Leona.

_Tabacina._ Two middle tail feathers very long; head, neck, and upper part of the body fuscous-coloured, beneath green; tail blackish green. Lath. Ind. Orn. Length eight inches and a half.

CERTIFICANDO de recognitio stipule, in Lath. is a writ commanding the mayor of the staple to certify to the lord chanceller a full tape taken before him, where the party himself detains it, and refuseth to bring in the same. Reg. Ord. 132. There is the like writ to certify a full tape merchant; and in divers other causes. Br. 144. 155, &c.

CERTIFICATE, a testimony given in writing, to assure and notify the truth of any thing to a court of justice, or the like. See Testimonial.

A certificate is sometimes made by an officer of the court, where matters are referred to him, or a rule of court is obtained; containing the effect and tenor of what is done. The clerks of the crown, affix, peace, are to make certificates into B. R. of the tenor of incumbrances, convictions, &c. under penalties by stat. 34 & 35 Hen. VIII. c. 14. 3 W. & M. c. 9.

CERTIFICATE of Ayle, in Lath. See Assise and Certification of Ayle, &c.

Certificate for offends, relates to the cause of the plaintiff, who, in an action of trespass, is allowed no more costs than damages, when the jury give less damages than 40s. unless the judge certify under his hand that the proceed or title of the land came chiefly in question. To this rule there are two exceptions: the one is grounded on stat. 8 & 9 W. III. c. 11. whereby the plaintiff obtains half costs, if the judge certify that the trespass was willful and malicious. The other exception is by stat. 4 & 5 W. & M. c. 23. which gives full costs against any inferior trademans, apprentices, or other disdinate person, who is convicted of a trespass in hawking, hunting, fishing, or bowing another's land. Blackst. Com. vol. iii. p. 214.

Upon this state it has been adjudged, that if a person be an inferior trademans, as a clothier for instance, it matters not what qualification he may have in point of estate; but, if he be guilty of such trespass, he shall be liable to pay full costs. Ld. Raym. 149.

CERTIFICATE into Chancery. If a question of mere law arises in the course of a cause in Chancery, as whether by the words of a will, an estate for life, or in tail, is created, or whether a future interdict, devised by a tenant, shall operate as a remainder or an executory devise, it is the practice of this court to refer it to the opinion of the judges of King's Bench or Common Pleas, upon an advising dated for that purpose; wherein all the material facts are admitted, and the point of law is submitted to their decision, who then upon hear it solemnly argued by counsel on both sides, and certify their opinion to the chancellor. And upon such certificate the decree is usually founded. Blackst. Com. vol. iii. p. 453. See Case settled, &c.

CERTIFICATE of Bankrupcy. See Bankrupt.
Certificate, trial by, is a mode of trial allowed in such cases, where the evidence of the person certifying is the only proper criterion of the point in dispute.

Thus, 1. If the issue be whether A was absent with the king in his army out of the realm in time of war, this shall be tried by the certificate of the marshal of the king's host in writing under his seal, which shall be sent to the judges. Litt. 6102.

2. If, in order to avoid an outlawry, or the like, it was alleged that the defendant was in prison, ultra mare, at Bordeaux, or in the service of the mayor of Bordeaux, this should have been tried by the certificate of the mayor; and the like of the captain of Calais. But when this was law (2 Roll. Abr. 584.), those towns were under the dominion of the crown of England. And therefore, by a party of respon, it should now hold that in similar cases, arising at Jamaica or other places belonging to the crown of England, the trial should be by certificate from the governor respectively.

3. For matters within the realm; the customs of the cities of London shall be tried by the certificate of the mayor and aldermen, certified by the mouth of their recorder; upon a sum from the party alleging it, that the custom ought to be thus tried; or else it must be tried by the country. As the custom of distributing the effects of freemen deceased; of enrolling apprentices; or that he who is free of one trade may use another; or if any of these points or others similar to them, come in issue. This rule, however, admits of an exception, where the corporation of London is party, or interested, in the suit; as in an action brought for a penalty inflicted by the custom; which shall be determined by a jury, and not by the mayor and aldermen, certifying by the mouth of their recorder. Co. Litt. 74. 4 Burr. 248. Bro. Abr. 2 trial, pl. 69. Hob. 85. But see 1 Term Rep. 423. If the recorder shall have once certificated a custom, the court is in future bound to take notice of it. Doug. 380.

4. In some cases, the sheriff of London's certificate shall be the final trial, as if the issue be, whether the defendant be a citizen of London or a foreigner, in case of privilege pleaded to be sued only in the city courts. Co. Litt. 74. Of a nature somewhat similar to this is the trial of the privilege of either university, when the chancellor claims cognizance of the cause, because one of the parties is a privileged person; in which case, the charters, confirmed by act of parliament, direct the trial of the question, with regard to privilege, to be determined by the certificate and notification of the chancellor under seal; to which it has been usual to add an affidavit of the fact: but if the parties be at issue between themselves, whether A is a member of the university or not, or on a plea of privilege, the trial shall be by jury, and not by the chancellor's certificate. 2 Roll. Abr. 5485.

5. In matters of ecclesiastical jurisdiction, as marriage, general bailiary, excommunication, and orders, these and other like matters, shall be tried by the bishop's certificate. As if it be pleaded in abatement, that the plaintiff is excommunicated, and issue is joined thereon; or if a man claims an estate by defeasance, and the tenant alleges the defendant to be a bailiff; or if in a writ of dower the heir pleads no marriage; or if the issue in quare impedit be, whether or not the church be full by subscription;—all these, being matters of mere ecclesiastical cognizance, shall be tried by certificate from the ordinary. But in an action on the case for calling a man a bailiff, the defendant having pleaded in justification that the plaintiff was really so, this was directed to be tried by a jury; because, whether the plaintiff be found either a general or special bailiff (see B新冠疫情下的医疗问题）the justification will be good; and no question of special bailiary shall be tried by the bishop's certificate, but by a jury. Co. Litt. 74. 2 Lev. 279. Hob. 179. Dyer, 79. Ability of a clerk pre-entitled, admission, institution, and deprivation of a clerk, shall also be tried by certificate from the ordinary or metropolitan; because of these he is the most competent judge; but induction shall be tried by a jury, because it is a matter of public notoriety, and is likewise the corporal avulsion of the temporal profits. Rejection of a benefice may be tried either way; but it seems most properly to fall within the bishop's cognizance. 2 Inst. 632. Shaw P. C. 88. 2 Roll. Abr. 573. &c. Dyer, 339.

The trial of all customs and practice of the courts shall be by certificate from the proper officers of those courts respectively; and what return was made, on a writ by the sheriff or under-sheriff, shall be certified by his own certificate. Blackfi. Com. vol. iii. p. 323, &c.

Certificate, in the Royal Navy, a certain written instrument, signed by the proper officer or officers, to substantiate, at any time, the validity of any civil transaction on board a ship of war, without having recourse to personal evidence which in all cases would be troublesome, and in many impracticable. The captain gives certificates to the several officers under his command, stating the time they have served on board his ship, or under him, and their behaviour during that period; other certificates are signed by the captain and master captain, master and boatwain, doctor and the purser, &c.

Certificate of assize of novel disseisin, in law, a writ granted for re-examining a matter passed by affize before justices. It was used where a person appeared by his bailiff to an affize, brought by another, and has lost the cause; but having something more to plead for himself, not tried by his bailiff, he obtained a writ to the sheriff to call both the party from whom the affize passed, and the jury that was impounced on the same, before the said justices at a certain day and place, to be re-examined. It was called a certificate, because mention is made in it to the sheriff, that upon the party's complaint of defective examination, as to the affize passed, the king hath directed his letters patent to the justices for the better certifying of themselves, whether all points of the said affize were duly examined. Reg. orig. 860. F. N. B. 181. Bradton, lib. iv. c. 13. Horn's Misc. lib. iii. This writ is now wholly superseded by the remedy afforded by means of new trials. See Assise.

Certificate's military certificates. There are of various kinds according to the several objects or purposes they relate to; and the different descriptions of persons empowered to grant them, in order to verify or give undeniable proofs of facts, whether they be governors, commanding officers, commissaries of war, officers of detail, staff officers, paymasters, officers of cities, or communities, &c. They are chiefly reducible, however, to the following heads, viz.

A certificate from a field-officer to the commander in chief affirming the eligibility of a young man to a commission in his majesty's service.

The certificate of an officer upon honour, that he does not exceed the regulation in the purchase of his commission.

The certificate of a general officer to affirm and prove the lollies, which officers under him may have sustained in the field.

The certificates of colonels of regiments to the board for the admission of proper officers to the hospital at Chelsea.
Certificates from magistrates to identify the persons of recruits, and to affirm that they have enlisted themselves voluntarily into the service, and that the articles of war have been read to them.

Certificates from regimental surgeons, whether men when they join are fit and proper objects to be enlisted.

Certificates from ditto of men's being fit objects to be discharged.

Certificates of commanding officers for furs, &c.

Certificates of surgeons and apothecaries to prove that they have paid proper examinations.

CERTIMA, in Ancient Geography, a very strong town of Spain, in Celtiberia, which was taken by Crassus.

CERTIORARI, or CERTIORARI FACTAS, in Law, an original writ issuing out of the court of chancery or K. B. directed in the king's name to the judges or officers of inferior courts commanding them to certify, or to return the records of a cause there depending, to the end that the party complaining may have the more sure and speedy justice before the king, or justices assigned by him for determining the cause. Fitz. N. B. fol. 212. This writ is either returnable in the king's bench, and then hath these words, nobismittis, "fend to us;" or in the common bench, and then hath juticiarists neniae de banco, "to our justices of the bench;" or in the chancery, and then it has in cancellariae nenia, "in our chancery, &c." or into the court of parliament, or into that of the lord high steward of Great Britain, in case of indictments against a peer.

A writ of certiorari may be had at any time after indictment found and before trial, to certify and remove indictments, with all the proceedings on them, from any inferior court of criminal jurisdiction into the court of King's-bench, the sovereign ordinary court of justice in causes criminal.

And this is frequently done for one of these four purposes: either, 1. To consider and determine the validity of appeals or indictments, and the proceedings thereon; and to quash or confirm them as there is cause: or, 2. In order to have the prisoner or defendant tried at the bar of the court of King's-bench, or before the juries of Nisi Prius, where it is certified that a partial or insufficient trial will probably be had in the court below: or, 3. In order to plead the king's pardon in the court of K. B.'s; or, 4. To issue process of outlawry against the offender, in those counties or places where the process of the inferior judges will not reach him. 2 Hal. P. C. 210. It is at this stage of the prosecution, that indictments found by the grand jury against a peer must in consequence of a writ of certiorari be certified and transmitted into the court of parliament, or into that of the lord high steward of Great Britain; and that in places of exclusive jurisdiction, as the two universities, indictments must be delivered, (upon challenge and claim of cognizance,) to the courts therein established by charter, and confirmed by act of parliament, to be there respectively tried and determined.

A certiorari may be granted at the instance of either the prosecutor or the defendant; the former as a matter of right, the latter as a matter of discretion; and therefore it is seldom granted to remove indictments from the judges of gaol-delivery, or after issue joined on confession of the fact in any of the courts below. On indictments of perjury, forgery, or for heinous misdemeanors, the court will not generally grant a certiorari to remove at the instance of the defendant. But in particular cases, the court will use their discretion to grant a certiorari; as, if the defendant be of good character, or the prosecution be chargeable or attended with oppressive circumstances. 2 Hawk. P. C. c. 27. 4 Burr. 749. Lord Raym. Vol. VII.
Geo. II. c. 17, against reducing artificers, Nor on 25 Geo. II. c. 30, against brothe houses. Nor on 29 Geo. II. c. 42, against bailing, &c. Nor in 32 Geo. II. c. 21, for preserving fish in the Thames. Nor on 30 Geo. II. c. 24, for selling garbage in public houses, Nor on 31 Geo. II. c. 26, for regulating broad. Nor on 2 Geo. Ill. c. 28, for preventing thieving boatmen. Nor on 3 Geo. III. c. 16, against dog-lieners. See on this subject 2 Hawk. P. C. c. 7.

By lat. 11 and 2 D. and M. c. 13, no artificer shall be granted to remove any accounts, unless laid by the chief justice, or, in case of the failure, by one of the other judges. By 5 and 6 W. and M. c. 11, and 8 and 9 W. III. c. 53, a certiorari may be granted in vacation time by any of the judges of B. R. and security is to be found before it is issued. In case of certiorari granted in vacation, the name of the judge and party applying shall be indorsed on the writ. See Hamb. Co. 92. No judgment or order to be removed by certiorari without a notice found to the amount of 50l. 5 Geo. II. c. 19. Certiorari to remove convicts, orders, or processings of justices, must be applied for within six calendar months, and upon 6 days' notice to the justices; 15 Geo. II. c. 18, Str. 91.

A writ of certiorari, when issued and delivered to the inferior court for removing any record or other proceeding, as well upon indictment as otherwise, supersedes the jurisdiction of such inferior court, and makes all subsequent proceedings therein erroneous and illegal: unless the court of B. R. remands the record to the court below, to be theretried and determined. But if a certiorari for the removal of an indictment before justices of peace be not delivered before the jury be sworn for the trial of it, the justices may proceed. And they may set a time to complete their judgment after a certiorari delivered. 2 Hawk. P. C. c. 27. Ld. Raym. 1515. A certiorari removes all things done between the telle and return. Ld. Raym. 835, 1935. And as it removes the record itself out of the inferior court, therefore if it remove the record against the principal, the necessary cannot be tried there. 2 Hawk. P. C. c. 29. And if the defendant be convicted of a capital crime, his pernmu be removed by Hamb Corpus, in order to be prefer in court, if he will move in arrest of judgment. And herein the cause of a conviction differs from that of a special verdict. Burr. 930. Although on a Hamb Corpus to remove a pern, the court may bail or discharge the prisoner; they can give no judgment upon the record of the indictment against him, without a certiorari to remove it, but the same stands in force as it did, and new pleas may be filed upon it. 21 P. C. 211. If an indictment be out, but the offence is illegal, where four persons are indicted together; a certiorari to remove this indictment again two of them removes it not as to the others, but as to them the record remains below. 2 Hale's Hil. 214.

If a cause be removed from an inferior court by certiorari, the pledges in the court below are not discharged, because a defendant may bring a certiorari, and thereby the plaintiff may lose his pledges. Skin. R, p. 244, 245. A certiorari from K. B. is a superficid to restitution in a forcible entry. 1 Hawk. P. C. c. 64.

The return of a certiorari is to be under seal; and the person to whom a certiorari is directed may make what return he pleases, and the court will not stop the filling of it, on affidavit of its falsity, except when the public good requires it: the remedy for a false return is action on the cafe, at the suit of the party injured; and information, &c. at the suit of the king. 2 Hawk. P. C. c. 27. If the person to whom the certiorari is directed, do not make a return, than an affidavit of the fact, at the suit of the person, is awarded, and then an attachment. Comp. r. 165. Blue comm. vol. iv. Jacob's Law Dictionary by Tomlin.

CERTIFICATE, or Certissions, is a special and particular action in a town. For instance, in the town of Dunncroft, a certiorari to try a man for being drunk. CERTITUDE, or Certainty, is clearly a quality of the judgment, imparting an opinion in the mind to the proposition we affirm, or the strength with which we adhere to it.

Certitude is of the same nature with the evidence that produces it: the evidence being the things that the mind sees and considers, i.e., when the idea of certitude is in the judgment, which the same makes of these things.

The following distinguish two kinds of certitude: the one of speculation, arising from the evidence of the things; the other of adhesion, which arises from the importance of it: which last they apply to matters of faith.

Further, the scholons distinguish there other kinds of certitude, with regard to the three different kinds of evidence, in which they are.

Certitude, metaphysical, is that arising from a metaphysical evidence: such is that which a geometricalian has of the truth of this proposition. 'That the three angles of a triangle are equal to two right ones.'

Certitude, physical, is that arising from physical evidence: such is that which a man has, that there is fire on his hand, when he feels it blaze and feels it burn.

Certitude, moral, is that founded on moral evidence: such is that which a person has, that he has got, or hold a cause, when his attorney and friends lend him an expost notice of it, or a copy of the judgment, &c.

Moral certitude is frequently equivalent to metaphysical certitude. Thus a criminal who hears his sentence read, frequently makes no doubt either of his condemnation or execution; and yet has nothing, here, beyond a moral certitude; for metaphysical certitude he has none; neither has he any physical certitude, except as to what relates to the reading of the sentence, and to the action of the executioner, when he takes him into his possession.

It is observed by Mr. Kirk in his "Essay on Human Liberty," (Irith Trans. vol. vii. p. 575.) that certainty differs from necessity in this, that what is necessary cannot, and what is certain will not, fail to happen. What is necessary is certain, but not vice versa. Whilst that is said to be morally necessary, whole non-existence is contrary to the laws which moral agents could rightly and powerfully govern their conduct; we, on the other hand, call that future object certain, which will not fail to come to pass. He further observes, that certainty is an ambiguous term; as it at times denotes the reality of an object, at times the firm perception of the mind of the reality of an object. In the first it is opposed to imperfection or non-existence; in the third, it is opposed to uncertainty or more probability. See PROBABILITY AND CHANCE. See also Liberty and Necessity.

In the "Philosophical Transactions," for 1669, (vol. xxii. p. 359-365,) we have an algebraic calculation of the degrees of moral certitude, arisit from human testimony in all its cases; whether immediate, mediate, conversing, oral, or written.

The author thereof shews, that if the report pass through several reporters' hands before it arrive, each conveying 1/4 of certitude; after twelve transmissions, it will only be an equal lay, whether it be true or not: if the proportion of certitude be
CERT-MONEY, Head-money, a common fine, paid yearly, by the chiefs of several nations to the lords thereof; and sometimes to the hundred, pro certo lete, for the certain keeping of the cet.—This, in ancient records, is called cerum lete.

CERTONIUM, in Ancient Geography, a town of Asia Minor, between Aradymium and the river Caicus, according to Xenophon.

CERVANTES DE Saavedra, Miguel, in Biography, universally recognized as the author of Don Quixote, was born probably of an honorable family, as some say in the province of Andalufia in Spain, or according to others at Madrid, in the year 1549. He seems to have had every advantage of education, and to have been a matter in polite learning. But in other respects fortune was not very indulgent to him. He served many years in the army of Mark Antony Colonna in no higher station than that of a private soldier. In that capacity he fought at the battle of Lepanto, under Don John of Austria, in 1571, where he had the misfortune, or, as he rather thought it, the honour to lose his left hand. In this expedition, or in his service as chamberlain to cardinal Aquinava at Rome, he amassed a certain portion of wealth; for in his captivity at Algiers, during 5½ years, which commenced in 1574, when he was taken by a Barbary corsair, he was then well furnished with money, which he liberally distributed among his fellow-captives. The high price of his ransom and his frequent free manner of living exhausted his dote and reduced him to the distresses of penury. However, his reputation for poetic talents had been already established in his own country; and it derived such accessions by the publication, in 1584, of his first part of Don Quixote, a poem in six books dedicated to Alonzo Colonna. About the same time he wrote many dramatic pieces, which were acted with applause on the Spanish theatre, and which acquired him both money and fame. But though his supplies were considerable, his want of economy and unbounded generosity disdained them as they occurred; and he had also married a wife, which involved him in additional expense. Accordingly, he was actually confined in prison for debt, when he composed the first part of "The History of Don Quixote;"—a work which every body admires for its humour; but which ought also to be considered as a most useful performance, that brought about a great revolution in the manners and literature of Europe, by banishing the wild dreams of chivalry, and reviving a taste for the simplicity of nature. In this view, the publication of Don Quixote forms an important era in the history of mankind. Don Quixote is represented as a man, whom it is impossible not to esteem, and who has cut through understanding, and the goodness of his heart; but who, by his own thought and day upon old romances, had impaired his reason to such a degree, as to mistake them for history, and form the design of traversing the world, in the character, and with the accompaniments, of a knight-errant. His distempered fancy takes the most common occurrences for adventures similar to those he had read in his books of chivalry. And thus, the extravagance of these books being placed, as it were, in the same group as the appearances of nature and the real business of life, the hideous disproportion of the former becomes so glaring by the contrast, that the most attentive reader cannot fail to be struck with it. The perfom, the pretentions, and the exploits, of the errant-knight, are held up to view in a thousand ridiculous attitudes. In a word, the humour and fature are irreducible; and their effects were instantaneous. This work no sooner appeared than chivalry vanished. Manhood awoke as from a dream. They laughed at themselves for having been so long impeded on by absurdity; and wondered they had not made the discovery sooner. They were astounded to find, that nature and good sense could yield a more exquisite entertainment than they had ever derived from the most sublime phrenzies of chivalry. This, however, was the case; and that Don Quixote was more read, and more relished, than any other romance had ever been, we may infer from the sudden and powerful effects it produced on the sentiments of mankind, as well as from the declaration of the author himself; who tells us, that upwards of 12,000 copies of the first part (printed at Madrid in 1605) were circulated before the second could be ready for the press; an amazing rapidity of sale, at a time when the readers and purchasers of books were but an inconsiderable number compared to what they are in our days. "The very children (says he) handle it, boys read it, men understand, and old people applaud the performance. It is no sooner laid down by one than another takes it up: some reading, some laughter, and some wounding for a fight of it. In fine (continues he) this history is the most delightful, and the least prejudicial entertainment, that ever was seen; for, in the whole book, there is not the least shadow of a dishonorable word, nor one thought unworthy of a good catholic." Don Quixote occasioned the death of the old romance, and gave birth to the new. Fiction from this time divulged herself of her gigantic fize, tremendous aspect, and frantic demeanour: and, descending to the level of common life, converted man as his equal, and as a polite and cheerful companion. Not that every subfrequent romance-writer adopted the plan, or the manner of Cervantes; but it was from him they learned to avoid extravagance and to imitate nature. And now probability was as much praised, as it had been formerly neglected. The publication of the first part of this work appears to have been the means of liberating the author from prison and obtaining for him from the great a considerable degree of patronage. Nevertheless, the court and kingdom of Spain have by no act of solid bounty exasperated them-

Clas. and ord. pentamia monogynia.

Gen. Ch. Cad. perianth bell-shaped, five-clawed. Cor. zone. Five scales inserted into the middle of the calyx. Pyl. germ superior; stigma saccate. Pet. nut egg-shaped, one celled, surrounded by the calyx, which has increased in size and become fleshy. A shrub; native of Peru. Cavaniès, pl. 475, has figured another specie with alternate, petaled, oblong leaves, covered with rust-coloured hairs and small white flower, in terminal and axillary panicles.

CERVARIA, in Ancient Geography, a promontory at the extremity of Gallia Narbonensis, on the coast of Spain. Its present name is Cerrevo.

CERVARIA, Boafr. Pin. See Trachemium cerervum.

CERVARO, in Geography, a town of Naples, in the province of Principato Citra; 9 miles E.N.E. of Policastro.

CERVELIERE, in Military Language, a sort of casque, helmet, or defensive armour for the head.

CERVELLE, a French word, literally signifying brains. The French make use of the phrase, manie fans cerevelle, when the miner works in earth too loose and devoid of cohesion, that it will neither stand nor support itself at the sides, nor at the top of the gallery, and he is under the necessity of having recourse to contrivances to obviate this defect.

CERVERA, in Geography, a river of Spain, which runs into the Segre, a little above Lerida, in Catalonia. Also, a city of Spain, and capital of a vency, to which it gives name, in the province of Catalonia. It is situated in a mild, delightful vallay, which is extremely fertile, and surrounded by hills, on one side of chalk, on the other of lime stone. This part of the country, between the Noya, which runs into the Lobregat, and the Segre, which joins the Ebro, is the highest land in this part of Catalonia. The university in this city was founded by Philip V. A. D. 1725, and has commonly about 900 under-graduates, chiefly designed for employment in the church and at the bar, with few for medicine. Cervera is about seven leagues N.W. of Tarragona. Also, a town of Spain, in the province of Catalonia, shored on the coast of the Mediterranean, between Roses and Collioure. Also, a town of Spain, in New Cadis; 6 leagues from Cenca. Also, a cape of Spain, on the coast of Catalonia: and another on the coast of Valencia.

CERVETTO, the elder, in Biography, an Italian performer on the violincello, of great merit, who arrived in England in 1738; and was remarkable from several circumstances besides his professional abilities. He was an honest Jew, had the largest note, and wore the finest diamond ring on the forefinger of his right hand; had a son (who is still living) who, during childhood, surpassed his father in tone and expression on the violincello; and who, in later years, was as much noticed at the opera for his manner of accompanying recitative, as the vocal performers of the principal characters for singing the airs. The rivalry between the admirable Croll detail and the younger Cervetto, in their youth, did them as much good in their struggles for excellence, as in later years their friendship has done honour to their hearts. Another remarkable circumstance in the history of the elder Cervetto, so long and so well known at Drury-lane play-houfe, is, that he extended his existence to 160 years complete, with the character, not only of a good musician, but a good man.

CERVI, in Geography, a small island of the Grecian Archipelago, near the coast of the Morea, on the south side of the entrance into the gulf of Kolokitha; 6 miles N. of Cerigo.

CERVI CORNIA. See HART'S HORN.

CERVIA, in Geography, a modern built town in the state of the church, and province of Romagna, near the Adriatic sea, about half-way between Caffarnatico and Savio, which, at the beginning of the last century, entirely changed its situation, on account of the infalubrity of the air, having formerly stood a quarter of a mile dillace from the sea. The new city is built with beautiful broad streets, which, for the greatest part, are under covering. By an inscription over one of the gates it appears, that popes Innocent XII. and Clement XI. removed the city of Cervia for the benefit of a more falubrrious air in the year 1703. Without this gate, suate on the side of the city opposite to Savio or Ravenna,
is a beautiful and broad canal, through which, in June, July, and August, (when the seafon is hottest and driest), the water is let out into a low piece of ground covered with rushes and weeds, about half a mile in length, and in some places as broad. Here the heat of the sun totally exhausts the water, and the salt remains at the bottom and sides, to the great profit of the court of Rome. The papal provinces Urbino, Ferrara, Ancona, Bologna, and Romagna, that lie near the Apennine mountains, derive from these salt-works the greatest part of the salt they use. Cervia is the seat of a bishop, suffragan of Ravenna, from which it is distant S.S.E. 15 miles, and 144 N. of Rome.

CERVICAL arteries, in Anatomy, some arteries which are distributed about the neck. See ARTERIES.

Cervical nerves, those which come off from the medulla spinalis, where it is lodged in the vertebrae of the neck. See NERVES.

Cervicalis, or Cervicis Descendens, is a slender muscle at the root of the neck, closely connected to the upper part of the faculolumbaris. It arises from the three or four upper ribs, near their tuberces, and is inserted into the same number of transverse processes of the lower cervical vertebrae. It extends the neck, and at the same time twits it to one side. This muscle is the transversalis gracilis of Winslow.

Cervicara, in Zoology. See Antelope Hygargae, the white-faced antelope.

Cervicaria, in Botany, a term used by some authors to express the thysia of the sheep, or fletter libanotis of Theophrastus.

Cervicaria, is also a name given by fome to the tracheium.

Cervicus transversus, in Anatomy, a small muscle at the back of the neck, connected to the upper end of the longissimus dorsi, and lying close to the cervicalis descendens. It arises from the transverse processes of the four or five upper dorsal vertebrae, and is inserted into as many of those of the neck. It is generally connected with the cervicis descendens and tracheo-mallolens. Winslow calls it transversalis collis major. It carres the neck backwards, and at the same time twits it towards its own side.

Cervieres, in Geography, a town of France, in the department of the Rhone and Loire; 6 leagues S.W. of Roanne.

Cervinara, a town of Naples, in the province of Principato Ultra; 12 miles S.W. of Benevento.

Cervine Antelope, of Pennant, antelope bulalis, in Zoology, Herpado; of Osipyan and Arvidus, bubulus of Pliny, Gfetor, Aldrov, and Jovit, yacchum of the Bible, bucephalus of Cej. op. Gefu. quad. and Ray, capra dorcas of Hortuyn, antelope bubulus of Pallas, bubulus of Buffon, vache de barbante de Axt. Parif, and Valent, is a species of antelope, whose horns are thick, twisted spirally, annulated, bent in form of a lyre, almost straight, and upright at their ends; the head and tail are somewhat lengthened. Pall. Sp. Zool. Erkell Lib. Mam. This animal inhabits Africa, especially Barbary, and is also found near the Cape of Good Hope, and in Arabia. It is about four feet high, having an appearance between the general form of the deer and ox tribes, with its head resembling that of an ox; its horns are about 20 inches long, very strong and black, almost close at their bases, and distant at the points; the general colour is a reddish brown, the belly, inner side of the thighs, and a space about the rump are white, with a dark coloured band on the ridge of the back, the upper part of the fore-legs, and hinder parts of the thighs; the tail is about a foot long, terminated by a tuft of whitish hairs, and resembles that of an ase. It feeds solitarily, gallops heavily, and yet very swiftly, and fights on its knees: its flesh is reckoned rather dry. This species, according to Mr. Pennant, is the animal called "Hart-beed," at the Cape; and Sparman describes it under the same name in the Stockholms Transactions; though the figure of the hart-beed, in his journey to the Cape, differs very considerably in the form of the horns, which bend much backward, at their ends, from which it is more probably the species called Antilope Koba.

Cervini, in Ancient Geography, a people placed by Poelen by on the western coast of the island of Corsica.

Cervione, in Geography, a town of the island of Corsica, or French department of Golo; 20 miles E. of Corté.

Cervix, in Anatomy, is a Latin term denoting that part of the body which we call the neck. The adjective derived from this term is applied to several parts about the neck, as cervical arteries, cervical nerves, &c.

The word cervix is also used in the anatomical description of various parts of the body, where it indicates some contract or diminution in size; as cervix of the femur, of the humerus, of the bladder, of the uterms, &c.: for which we refer to the individual articles.

Cerumen, a thick, viscid, bitter, excrementitious humour, separated from the blood by proper glands placed in the meatus auditory, or outer passage of the ear.

This is also called cerumen auritum; in English, ear-wax. See an account of experiments on cerumen, to discover the belt method of disolving it; with the cause of deafness. Lond. Med. Obserr. &c. vol. iv. p. 193.

It is by some ranked in the class of medicines; especially that species of it obtained from the human ears, and which is used both internally and externally.

Cervocamelus, in Zoology. See Camelus glama.

Cervon, in Geography, a town of France, in the department of the Niévre, and district of Clamecy; 3 miles E. of Corbigny.

Ceruse, Cerussa, or White Lead. The mode of manufacturing this article was long made a particular secret, and it still continues so with some manufacturers; the following account is obtained from a visit to the works of a respectable house in that line.

The first operation in making ceruse is melting the blue or white lead, (the former quality is the better for this work,) into a cauld or mould which shall form each sheet nearly two feet long, about five inches broad, and about the sixteenth of an inch thick, that it may with convenience roll spirally up so as to leave the space of half an inch or an inch between each coil, and thus be placed vertically in earthen pots in shape like garden pots, and capable of containing from 1 pint to six pints each; these pots are made with one projection or more riling within on the middle, so as to prevent the lead rolling on the bottom; on the base the coil is placed perpendicularly, and upon its top edge, another piece near one foot across is laid horizontally: about half, or a whole pint, wine meurere, according to the size of the pots, of strong vinegar, or other acid liquor, is poured into each pot, but care ought to be taken that it does not quite touch the lower edge of the leaden spiral; the principle acted on here being to exposer as much surface as possible to the action of the acid vapour: each pot ought to hold about 21 pounds avoirdupois weight, and having also a cover of the same metal placed tight upon its mouth, by which means nearly the whole of the item will have an ob-
Many manufacturers have a pair of horizontal flumes like those of the flour-mill for the purpose of grinding it in oil.

A patent was obtained in this business by Mr. Richard Pitcock, of Newcastp upon Tyne, to prevent him from the
advantage of substituting exhausted tenant's back in the place of horse-litter, or mixing a proportion of th., one with
the other.

Cerussa makes a beautiful white colour, and is much used by the painter, both in oil and watercolours. It makes the
principal ingredient in the Esmalts used by the ladies for the
compotier. Taken inwardly, it is a dangerous poison; it
loses its pungency, spoiling the health of teeth and
hardening wrinkles, and all the symptoms of old age.

The exterior use of it as a paint or enamet, for it is said
that it has been fo used, is attended with very disagree-
able, and, in the end, with fatal consequences. Its
effects in nervous affections are terrible; witness the case of Mr.
Bartholomew, See a curious account of it, in the
Hist. Trad., vol. i. part i. N. 2. an. 1754.

Cerussa is the only white hitherto found fit for painting in
oil; the discovery of some other white for this purpose is
defirable, not only from the faults of cerussa as a paint, but
also from its injuring the health of its manufacturers, and
producing a dreadful diftance, which lead all its preparations
frequent occasion, called the Colic of
minerals, or the Colic of painters.

The Chinese make an use of this preparation of lead,
which it is easier to see the advantages of than to comprehend
the manner in which they are brought about.
The China vessels when they have been baked and finished as to
the matter, and even covered with their varnish, will yet receive
into their very substance, the colours which those people
mix up with an addition of cerussa, and, as some of the
old accounts say, of copperas and salt-petre; but though
these latter ingredients had been to add, the cerussa
alone supplies their place at this time, at least in very many
things. It would be worth while to try an admixture of cerussa
with the colours used in the painting of glass; and this,
after a second baking, might perhaps be found to incor-
porate itself in the same manner that it does into China
ware, and recover the long secret of letting in the finest colours,
without hurting the transparency.

CERUSSE of antimony is a perfect oxyz of antimony, pre-
pared by nitre. See ANTIMONY.

CERUSSE, CERUSA ACETATA, in Pharrnacy. Both the
cerussa, and particularly the acetated cerussa are largely
employed in medicinal purposes. An acetated oxyz of lead,
formed different from the fugar of lead, forms the common
COUMAR'S Extract. For an account of the different pharma-
cutical preparations of this metal with their respective uzes, see
the article LEAD.

CERUTI, Frédéric, in Biography, an Italian philolo-
gist, was born at Verona in 1541, educated in France,
and at first followed the profession of arms. But being taken
to Rome by his first patron the bishop of Agen, who
wished to promote him in the church, he declined that mode of
life and returned to his native place, where he married,
and opened a school, which was much frequented. He
became one of the heads of the academy of Moderati, and
maintained a correspondence with several persons of the most
eminent literary characters. In 1585, he published at Ver-
a an edition of Horace, with a paraphrase, and, in 1597, a
similar edition of the fatares of Petrus and Juvenal. He
likewise published a Latin dialogue "On Comedy," and
another "De recta Adolescuentorum Institutione," and
a collection of Latin poems. He left in MS. a translation of the
"Anthologia." Ceruti died in 1579.
CERVULA, or CERVULUS, in Middle Age Writers, a kind of sport, celebrated by pagans, and after their example by the Christians, on New-Year's day; when they ran about in masquerade, dressed in imitation of deer, and other beasts. We find divers customs of the fathers, and decrees of councils against the observance of this ceremony. Even hares were composed, and falling preferred for that day, ad octavum quadragesimae confessurium. D-Cange.

CERVUS, in Fazification, a sort of forked leaf; as paliade, planted sometimes in the middle of the ditch, sometimes in the bottom of the lane, close to the foot of the inner slope thereof, sometimes on the bank between the inner edge of the ditch and the part of the retrenchment to prevent the approach and ascent of the enemy, and to annoy and围绕 him in attempting to force or carry such a work. Cervi were also sometimes planted in holes, or terres de boeuf at some little distance, to impede and prevent the attack of an enemy. Caesar made use of cervi near Alesia, as appears from the c., 72, of the 7th book of his commentaries De Bello Gallico.

Cervus, in zoology, a genus of quadrupeds, in the order Perissodactyla. The horns are solid, branched, thick-at tip, covered while young with a downy skin, and annual; front teeth in the lower jaw eight; tails none, or sometimes one solitary on each side, in the upper jaw.

Species.

This is truly an alpine species, inhabiting for the most part the woody summits of the mountains of Hircania, Russia, and Siberia, in the summer; and descending into the plains only in winter. It is larger than the red-buck, and is observed to become hairy in winter. At other times the body is of a deep reddish-brown, with the lower part and limbs paler; round the nose, and on the sides of the lower lip black; the tip of the lip, and also the rump, are white. The horns are tuberculated at the base. Ears white, and villous within, fringed with a few long black hairs; and instead of tail, a broad cutaneous excrescence.

Should the elk of Europe and Asia, and the moose deer of America be the same animal, it will rank as the largest species of the cervine tribe extant at this time, to our knowledge, either in the old or new continent. It has been usual with writers to consider the history of the two kinds together; and, for the sake of perspicuity, it will not be amiss to follow their example, referring ourselves hereafter an opportunity of stating, in a few words, how far we differ from this generally received opinion. The elk, when full grown, is scarcely inferior to a horse in size. In shape it is much less elegant than the rest of the deer kind, having a very short and thick neck, a large head, horns dilating almost immediately from the base into a broad palmated form; a thick, broad, heavy upper lip, hanging very much over the lower very high shoulders, and long legs. The colour is a dark greyish-brown, much paler, or whiten on the legs, and beneath the tail. The hair is of a strong, coarse, and elastic nature, and is much longer on the top of the shoulders, and ridge of the neck, than on other parts, forming together a kind of buffish mane; beneath the neck also the hair is of considerable length, and in some specimens of the animal, a foot of caruncle, or excrescence, covered with long hair, is pendent from beneath the throat; a circumstance spoken of by Linnaeus as part of the specific character of the animal, but which is more visible at some particular seasons than at others, and is sometimes wanting. The eyes and ears are large; the hoofs broad, and the tail extremely short. According to Pennant, the greatest height of the elk is about seven hands; and the weight of such an animal about 1229 pounds. The horns have been known to weigh 56 pounds, and to measure each 32 inches in length. The female is rather smaller than the male, and has no horns. This applies only to the American moose, which is observed to arrive at a greater magnitude than the European kind.

The elk of Europe and Asia is found abundantly in Sweden and Norway, in the woody tracts of the Russian dominions, and in Siberia; but not in the flat countries of the Arctic regions, nor in Kamtschatka. The American moose inhabits the Isle of Cape Breton, Nova Scotia, the western side of the bay of Fundy, Canada, and the country surrounding the great lakes, almost as far south as Ohio; both in the old and new continent these animals preferring the colder climates. The elk refedes principally in the midst of forests, for the convenience of browsing the boughs of trees; because it is prevented from grazing with facility on account of the shortness of the neck, and disproportionate length of the legs. They often have recourse to aquatic plants, which they can readily obtain by wading into the water. Sarmatin tells us they are very fond of the flowering trefoil, Anagrysa fistuta, and will uncover the snow with their feet to procure it. When passing through the woods, they raise their heads to a horizontal position to prevent their horns from being entangled among the branches. Their gait is remarkable; their general pace is described to be a high, shambling, but very swift trot, the feet being lifted up very high, and the hoofs clattering much during their motion, as is the case also with the rein-deer; in their common walk they lift their feet very high, and will, without difficulty, step over a gate five feet high. They feed principally in the night, and whenever they graze are observed to choose an ascending ground, for the greater convenience of reaching the surface with their lips. They ruminate like an ox. The rotting season is in autumn. The female brings forth two young at a birth, in the month of April, which follow the dam a whole year. During the summer they keep in families. In deep snows they collect in the forests of plains, for protection from the inclemency of the weather, under the shelter of those evergreens. The elk, though naturally of an inoffensive and peaceable disposition, displays a considerable share of courage when suddenly attacked, defending himself with great vigour not only with his horns, but also by lashing violently with his hoofs and feet, in which he is so dextrous, as easily to kill a dog, or even a wolf, at a single blow. The flesh of the moose is extremely sweet and nourishing: the Indians say, that they can travel three times farther after a meal of moose, than after any other animal food. The tongues are excellent, but the nose is said to be perfectly narrow, and is considered the greatest delicacy in Canada. The skin makes excellent buff, being soft, strong, and light. The Indians dyes the hide, and after soaking it for some time, fibrtech and render it supple by a lather of the brains in hot water. They not only make their snow-shoes of the skin, but after the chace cover the hull of their canoes with it, in which they return home with the spoils of their chase.

The hair on the neck, withers, and hams of a full grown elk is of considerable use in making mattresses and faddles; and the palmated parts of the horns are further excavated by the Indians,
Cervus.

Indian, and converted into ladies, and other culinary articles.

The chase of the moose deer forms an important occupation among the natives of North America, and is performed by them in various methods. The first is the most simple, and is conducted in the following manner. Before the lakes and rivers are frozen, multitudes of the fowges assemble in their canoes, and form with them a vast crescent, each horn touching the shore. Another party perform their share of the chase among the woods, surrounding an extensive tract, letting loose their dogs, and preying towards the water with loud cries. The animals alarmed by the noise, fly before the hunters, and plunge into the lake, where they are killed by the other fowges in their boats, who are prepared to receive them with clubs and lances. Another method pursued at times by the hunters is more artful. They enclose a large space of ground with fakes hedged with branches of trees, and forming two hides or a triangle. The bottom space opens into a second space completely triangular. At the opening are hung numbers of fakes made of flaps of raw hides. The Indians, as before, assemble in great troops, and with all kinds of noxes drive into the first enclosure not only the mooses, but the other kinds of deer, which abound in that country. Some foregoing their way into the last iift triangle, are caught in the fakes by the neck or horns; and those which escape the fure and pass the opening find their fate from the arrows directed at them from all quarters. They are often killed with the gun. When first dislodged, the animal falls down, or squats, as if disabled, for a moment or two, at which instant the hunter fires; if he misses, the moose gets off at a swift trot, making at the same time a prodigious clattering with the hoofs, like the rein deer, and will oftentimes run 20 or 30 miles before he comes to bay, or takes to the water. The usual time for this diversion is the winter. The hunters avoid entering on the chase till the fun is strong enough to melt the frozen crust with which the snow is covered, otherwise the animal can run over the firm surface: they wait till it becomes soft enough to impede the flight of the moose, which makes up to the shoulders, flounders, and gets on with difficulty, while the sportsman pursues at his pace on his broad rackets, or snow-shoes, and makes a ready prey of the disfutted animal. A ncient superstition has prevailed that the elk is naturally subject to the epoplely, and that it finds its cure by scratching its ear with the hoof till it draws blood; and in consequence of this notion the hoofs of the elk form an article of the ancient materia medica. A piece of the hoof was anciently set in a ring, and worn as a preservative against the complaint above mentioned; and sometimes the hoof was held in the patient's hand, or applied to the pulse, to the left ear, or suspended in such a manner from the neck as to touch the breath. The hoof has been used by the Indians in the making of matches; they apply it to the heart of the person afflicted, and make him hold it in his left hand, and rub his ear with it. They also use it in the colic, vertigo, pleurisy, and purple fever, paltering the hoof, and drinking it in water.

It should be farther mentioned, that, although the synonyms referred to by naturalists for Cervus alces are repeated in the above account, we wish to impress on the reader our distrust of their accuracy in some leading points. Perhaps on further investigation, the European elk and the moose deer of America may prove, as we suspect, to be two distinct species. With regard to the enormous palmated, full-sided horns that are sometimes dug up in Ireland and other parts of Britain, a more positive opinion may be advanced; they are certainly not the horns of the moose deer, as most writers imagine. In point of size they vary far exceed the horns of the largest moose, and in their appearance differ so materially that they could not possibly be belonged to that animal; they have long beams to support the palmated part instead of short ones, as in the moose; they are also stronger and thicker, and are commonly from 10 to 12, or sometimes 15 feet from tip to tip. It requires no argument to prove that such stupendous horns cannot be referred to any species of the Cervine race at present known, and that they must of course have belonged to some species either totally extinct, or hitherto undiscovered.

The Rein Deer, when full grown, according to Peemant, is four feet six inches in height, the body of a somewhat thick and square form, and the legs shorter in proportion than those of the common stag. The general color is brown above, and white beneath, but as it advances in age it often becomes of a greyish white, and sometimes almost entirely black; the hair on the under part of the neck is of much greater length than the rest, and forms a kind of hanging beard in that part. Both sexes are furnished with horns, but the horns of the male are much larger, and more of the male the female. The hoofs are long, large, and black, as are also the falk or secondary hoofs behind; and these latter while the animal is running, by flapping against each other, make a remarkable clattering sound that may be heard at a considerable distance. No animal of this tribe appears to vary so much in the form and length of the horns as the rein deer. In general the horns are remarkable for their great length, and funderdeds in proportion, and are furnished at the base with a pair of brow antlers, and at the extremity with widely expanded and palmated tips directed forwards; towards the middle the horn rises another large branch, which turns upwards, and is branched at the tip; the remainder of the horn runs on to a great length in a backward direction, and is more or less ramose at the extremity. In the young and middle aged rein deer the horns are remarkably slender. Geffner gives the figure of a full grown male rein deer, which Linnaeus has pronounced to be a good representation of the animal, and in this, the horns which extend horizontal along the back even project beyond the tail.

The height of the domesficated rein deer is about three feet; of the wild ones, four. It lives to the age of sixteen years. The female goes with young thirty three weeks. The male calls his horns annually at the end of November, the female not till the fawns about the middle of May.

The rein deer is celebrated for its services to the simple and harmless inhabitants of Lapland, who, undisturbed by the founds of war, or the troubles of commerce, lead a kind of pastoral life even within the frozen limits of the arctic circle, and have no other cares than those of providing for the rigours of their long winter, and of rearing and supporting their numerous herds of rein deer, which may be said to constitute almost their whole wealth; and which are used not only for the purposes of food, but for travelling occasionally over that frozen country during winter. To the Laplander this animal is considered as at once the substitute of the horse, the cow, the sheep, and the goat. The milk affords them cheese, the flesh food, the skin cloathing, the teadons bow-frings, and whenipl, thread, the horns glue, and the bones spoons. During winter it supplies the want of a horse and draws their sledges with amazing swiftness over the frozen lakes and rivers, or over the snow which at that season covers the
the whole country. A rich Laplander is sometimes poiffed of a thousand rein deer. In autumn they seek the highest hills to avoid the Lapland gad-fly, which at that time deposits its eggs in their skin, and in many instances proves fatal to the animal. So dreadful is this scourge, that the moment a single fly appears, the whole herd perceive it, and betray every symptom of terror by their gestures, flinching, and toffing their heads, and running about for shelter, or to avoid the stroke of their diminutive but cruel enemy. The chief food of the rein deer is a species of lichen, commonly called the rein deer moss, which covers vast tracts of the northern regions, and on which these animals particularly delight to browse. In summer they readily procure it in vast plenty, and in winter dig with their feet and brow antlers through the snow to obtain it. The Lapanders devote their whole care to the management of these useful animals, occasionally housing and nursing their herds during winter; and attending them in summer to the tops of the mountains.

The mode of travelling in flegdes drawn by the rein deer deserves mention. There are in Lapland two races of the rein deer, the wild and the tame. The latter are preferable for drawing the fledge, to which the Laplander accustoms them betimes, yoking them to it by a strap which goes round the neck and comes down between the legs. The fledge is extremely light, and covered at the bottom with the skin of a young deer, the hair turned to slide on the frozen snow. The person who sits on this guides the animal with a cord, fastened round the horns, and encourages it to proceed with his voice, and drives it with a goad. The wild breed are by far the strongest, but these often prove refractory, and turn upon their drivers, who have then no other resource but to cover themselves with the fledge, and let the animal vent its fury upon that. But it is otherwise with those that are tame; no creature can be more active, patient, and willing; when hard pushed they will trot nine or ten Swedish miles, it is said, or between fifty and sixty English miles at one stretch; but in such a case the poor obedient creature fatigues itself to death, and if not killed, to relieve it from misery, will die in a day or two after. In general they can go about thirty miles without halting, and without any great or dangerous effort. This, which is the only mode of travelling in Lapland, can be performed to advantage only when the snow is glazed over with the ice; and though it be a speedy method of conveyance, it is inconvenient, dangerous, and troublesome. The Samoieds consider them as animals of draught. The Korekij, a nation of Kamtschatka who keep immense herds of rein deer, also train them to the fledge. They usually harness two to each carriage, and it is said they will travel 150 versts in one day, a distance equal to about 112 English miles.

The rein deer is a native of the northern regions. In Europe its chief residence is in Norway and Lapland. In Asia it frequentes the north coast as far as Kamtschatka, and the inland parts as far as Siberia. In America it occurs in Greenland and does not extend farther north than Canada. The Samaeds, the Edquamaus, and the Greenlanders, all of whom poiffes this animal, consider it principally as an object of chase. Among the two half people the flesh constitutes their chief article of food. They eat it either raw, dried fresh, or dried and smoked with the frow lichen. The weared hunters will drink the raw blood, but it is usually dressed with the berries of the heath. The skin dressed with the hair on is soft and pliant, and is employed in making their drës, the inner lining of their tents, or as blankets. The tendons serve for bow-stringes, and when split are the threads with which they sew their jackets.

Before the Greenlanders became acquainted with fire arms

Vol. VII.

they were accustomed to take the rein deer by what was called the clapper-hunt; in which the women and children surrounded a large space, and, where people were wanting, fit up poles capped with a turf in certain intervals to terrify the animals; they then with great noise drove the rein deer into the narrow diles, where the men lay in wait, and killed them with harpoons and darts. But they are now become scarce in Greenland. The rein-deers are found in the neighbourhood of Hudfon's bay in amazing numbers. Columns of eight or ten thousand are seen annually passing from north to south in the mouths of March and April, driven out of the woods by musktoes. They go to rut in September, and the males soon after shed their horns; they are at that season very fat, but so rank and musky as not to be eatable. The females bring forth their young in June, in the muff feuelted spots they can find, and then they likewise lose their horns. In autumn the deer with their fawns migrate northward. The Indians are very attentive to their motions, for these animals constitute the chief part of their dres, as well as food. They often kill numbers for the sake of their tongues only; at other times they separate the flesh from the bones, and preserve it by drying it in the smoke. The fat which they also save, they sell to the English in bladders, who use it for frying instead of butter. The skins also are an article of extensive commerce with the English. The Indians kill great numbers of them in the winter, and during the migratory seasons, lying in watch in their canoes, and ipearing them while swimming over the rivers, or from one island to another. Authors make several varieties of the rein deer; what is called the Greenland Buck, and Greenland deer, has the horns round, and covered with a hairy skin; Capra groenlandica, Ray, and var. greenlandicus, Gmel. Another variety, the Caribou of Hudfon's bay, has the horns straight with one branch at the bafe turned backwards, \gamma Caribou. Gmel.

The flag is a native of almost all the temperate parts of Europe as well as Asia. It also occurs in some few parts of Africa, and pretty generally in North America; in which latter country it occasionally arrives at a larger size than in the whole continent, with the exception of Siberia, where Pennant informs us it is found of a gigantic magnitude. The flag varies in different countries very considerably, so much indeed as to induce us to believe that travellers and other writers have oftentimes confounded animals of very different species under this general title in speaking of the productions of distant countries. Most commonly the flag is about three feet and a half high, and of a reddish brown colour, beneath white. Sometimes it is of a very dark or blackish brown; sometimes of a pale or yellow brown; and, lastly, infallile occurs of flags being entirely white, which last are mentioned both by Aristotle and Pliny, but as rare. The horns also vary as to the size and number of ramifications, according to the age of the animal. Erxleben mentions three distinct varieties of the flag (Cervus Elephas) independent of the common European kind, namely, Tiffel, Hippelapus B. Larger, with the hair on the neck longer. Cervus G. german, C. Brill. \gamma Eraphus, Aristotle. Tippalam. Pliny. Tragelaphus, Gemin. Hippelaphus, &c. Gmel. Second, Cerfis, \gamma C. C. minor. Salis. Enl. Cerf de Cerfs, Buff. This is smaller than the last and has the body fucous. Third, C. Canadensis, C. Gmel. C. cervus amphihipus. Enl. with very ample horns. Cervus Canadensis, Brill. Stag of Virginia, Dale. Stag of Carolina, Lawton. Stag of America.
Cervus. The histories of all these varieties are to intimately blended with each other by writers that they can only be considered under one general head. The flag, says the ingenious Buffon, is one of those innocent and peaceable animals that seem designed to embellish the forest, and animate the solitude of nature. The elegance of his form, the lightness of his movements, the strength of his limbs, and his branchy horns, with which his head is decorated, contrive to give him a high rank among quadrupeds, and to render him worthy the admiration of mankind. The size and stature of these animals differ according to the places they inhabit: those which frequent the valleys, or the hills abounding in grain, are larger and taller than those which feed upon dry and rocky mountains. The latter are low, thick, and short; neither are they equally swift, though they run longer than the former: they are also more vicious, and have longer hair on their heads; their horns are commonly short and black, like a hunted tree, the bark of which is always of a darker colour, but the horns of the flags which feed in the plains are high, and of a clear reddish colour, like the wood and bark of trees that grow in a good foil. These little flags never frequent the lofty woods but keep constantly among the coppices, where they can more easily elude the pursuit of the dogs. The Cornish race appears to be the smallest of these mountain flags. This kind is fearfully more than half the height of the ordinary fawn, and may be regarded as a terrier among flags. His colour is brown, his body short, and his legs short. Buffon seems convinced, however, that the size and stature of the Cornish flag, and of flags in general, depend on the quantity and quality of their food, for, having reared one of this breed at his house, and fed him plentifully for four years, he was much taller, thicker, and plumper at the age than the oldest flags in his woods, though those were of a very good size. The flag appears to have a fine eye, an acute smell, and an excellent ear. Like that of the cat and the owl, the eye of the flag contracts in the light and dilates in the dark, but with this difference, that the contraction and dilatation are horizontally, while in the first mentioned animals they are vertically. When the flag billets, he raises his head, erects his ears, and perceives the sound from a great distance. When going into a coppice, or other half-covered place, he stops to look round him on all sides, and scents the wind to discover if any object be near that might disturb him. Though rather timid, he has curiosity and cunning. If any one whistles or calls to him from a distance, he stops short, gazes attentively, and with a kind of admiration; and if those who disturb him have neither dogs nor offensive weapons, he commonly paws along quietly, and without altering his pace. He appears to listen with great tranquillity and delight to the shepherd's pipe, and the hunters sometimes make use of this instrument to embolden and deceive them. They will follow the sounds of music for miles, proceeding while they hear it, halting the moment the players cease, and again advancing when the music recommences. In general the flag is lees afraid of men than of dogs, and is never suspicion, or uses any art of concealment, but in proportion as he is disturbed. He eats slowly, selecs his food with care, and, after his stomach is full, seeks a place to lie down and ruminate at leisure. He seems to perform the act of rumination with less facility than the ox, and it appears only by violent efforts he can cause the food to rise from his first stomach. This difficulty arises from the length and direction of the passage through which the aliment must pass: the neck of the ox is short and straight, but that of the flag is long and arched, and therefore greater efforts are required in rumination.

In winter and spring the flag does not drink, the dews with which the tender herbages is surcharged being then sufficient to satisfy his thirst, but during the parching heats of the summer he frequents the brooks, marshes, and bountains, and in autumn is so over-heated that he laches every where for water to bathe and refresh his body. He then swins with more care than at any other time, on account of his latines, and has been observed cooling very large rivers. It has been affered, that in the feation of love, flags will throw themselves into the sea, and pass from one island to another at the distance of several leagues in search of the hinds. Pontoppidan tells us that the Norwegian flags, which are only in the dioceses of Bergen and Drothenheim, have been seen to swim in numbers across the limits from the continent to the adjacent islands, resting their heads upon each others cruppers, and that when those who lead are fatigued they retire behind, and the most vigorous take their places. The flag leaps still more nimbly than he swims, and, when pursued, can readily clear a hedge or paling of six feet height. The alimento of the flags differs according to the seasons. In autumn they search for the buds of green shrubs, the flowers of the heath, and leaves of barmiles. In the winter, during the snow, they strip the bark off the trees, and feed upon that, and the mosses which they find on the trees; and in mild weather they browse in the corn fields. In the beginning of spring they go in quest of the cattens of the trembling poplar, willow, and hazel, and the flowers and buds of cornel. In summer, when they have abundance and variety, they prefer rye to all other grain, and the black berry bearing alder (ramnas frangula) to all other wood.

Stags, in general, call their horns sooner or later in the spring, in proportion to their ages. It seldom happens that both horns fall off at the same time, the one generally preceding the other by a day or two. The old flags call their horns first, which takes place about the middle of February, or beginning of March: those in the seventh year or upwards, do not call their horns before the middle of March: a flag of six years sheds his horns in April: young flags, or those from three to five years old, shed their horns in the beginning, and those which are in the second year not till the middle or end of May. But in all this there is much variety: for some the old flags sometimes call their horns sooner than those which are younger; and besides, the shedding of their horns is advanced by a mild, and retarded by a severe and long winter. As soon as the flags call their horns, they separate from each other, the young ones only keeping together. They no longer haunt the deep recesses of the forest, but advance into the cultivated country, and remain among brush-wood during the summer, till their horns are renewed. In this season they walk with their heads low, to avoid rubbing their horns against the branches. The horns of the old flags are not half completed in the middle of May, and acquire their full size and hardeness before the end of July. Those of the young flags are in proportion later both in shedding and renewing their horns. When full grown, the animals rub them strongly against the boughs of trees, or any other convenient object in order to free them from the skin which covers them, and is then become useless; and by the beginning of Augt they begin to affine the full strength and confidence which they retain throughout the remainder of the year.

Soon after the flag has cleared off the exuberant skin from the horns, he evinces an inclination for the female. By the end of Augst, or beginning of September, they leave the coppice, return to the forest, and begin to search out their favourite hinds; they cry with a loud voice, their neck and
CERVUS.

throat swell, they grow refillics, traverse the fallow grounds and plains in open day, and dart their horns against the trees and hedges. In a word, they seem transported with fury, and range from place to place till they have found their females, whom they have to pursue and overcome, before they submit to their pleasure. If two flags approach the same hind at this time a combat ensues: if their strength be nearly equal, they threaten, plough up the earth with their paws, make a terrible noise, and dart upon each other with the utmost fury. Their battles are carried on to such extremities, that they often inflict mortal wounds with their horns; nor is the combat ever concluded but by the complete defeat or flight of one of them, when the conqueror enjoys the fruit of his victory, unless another male happens to appear, and then a second combat is sure to ensue. The oldest flags are commonly victorious, because they are fcerer, and possessed of greater strength than the young ones. The old flags are the most ardent and Inconfluent, having commonly several females at the same time, and when they have but one they remain attached to her but a few days before they go in search of a second, with whom they remain a still shorter time, and then wander to others. The rutting season lasts about three weeks, during which period they cat but little, and are strangers to all repose; night and day they are on foot, ranging about, fighting with the males, or enjoying the females, and of course when the rutting season is over are fo wafled, meagre, and fatigued, that they require a length of time to recover their strength. They then retire to the borders of the forest, and graze on the bell cultivated lands, where they find food in abundance, and where they continue till their strength is restored. The rutting season, among the old flags, commences about the 1st, and concludes about the 20th of September; with those of fix or seven years old it begins in the middle of September, and ends the beginning of October; with the young flag it begins about the 20th of September, and lasts to the 15th of October, by the end of which month the rutting is all over, except among the prickets, who, as well as the young hinds, are the latest in coming into season: thus, by the beginning of November, the rutting time is entirelyfinished, and, at that period, the flags, being in the weakest condition, are most easily hunted down. In those seasons, when acorns are plentiful, they recover in a very short time, and a second rut will take place towards the end of October, but this is always of a much shorter duration than the first. In warmer climates, as the seasons are more forward, the rutting season begins sooner. Aristotle tells us, in Greece it commences the beginning of August, and concludes towards the end of September. The hinds go with young eight months and a few days, and seldom produce more than one fawn, which they bring forth in May or the beginning of June. They take the greatest care to conceal their fawns, and will even present themselves to be chained in order to draw off the dogs, and afterwards return to take care of their young. All hinds are not prolific, and some of them are even barren: these kinds are more gross and fat than the others, and are sooner in heat. It is also said some hinds have horns like the flags. The young are not called fawns after the first month, then the knobs begin to appear, and they take the name of knobs, which they bear till their horns lengthen into spears, and then they are called hinds and pricket. Though they grow very fast, they do not quit the mother all the first summer. In the winter they all report together, and their hinds are more numerous as the flags is more severe. In the spring they divide, the hinds retiring to bring forth; and they are only the prickets and young flags which then keep together. In general the flags are inclined to associate, and it is only from fear or necessity that they are ever found dispersed. At the age of eighteen months the flags are capable of engendering, for those brought forth in the spring of the preceding year will couple with the hinds in autumn. The flag continues to increase in size till he has completed his eighth year. As the flag is very quick at first in his growth, a year does not pass before this redundancy will itself. If birth brought forth in May, the horns begin to appear in May following, and continue to increase till the end of August, by which time they are full grown. The longevity of the flag, which became proverbial among the ancients, is in some degree a vulgar error, for though the animal, compared with many quadrupeds, may be fully considered as long lived, since it is suppos'd in some instances to arrive at the age of 35 or 40 years, yet it is by no means possible of the longevity ascribed to it by some of the ancients. Ariftotle discontributes this silly prejudice; but it was, as Buffon observes, again revived in the days of ignorance, and supported by the story of a flag that was taken by Charles VI. in the forest of Sens, with a collar upon the neck bearing this inscription, "Caesar hoc me donavit!" the people rather choosing to believe this flag had lived a thousand years, and had received his collar from a Roman emperor, than that he came from Germany, where the emperors assumed the name of Caesar. In Britain the flag is become less common than formerly; its excessive victuallings during the rutting season inducing most people to disperse with this species, and rear the fallow deer, which is of a more placid nature, in its stead. Some attempts have been made to render the flag domestic, by treating them with the same gentleness as the Laplanders do their rein-deer: and it appears, in the Isle of France, where the Portuuguese had introduced the European breed, they had so far succeeded by degrees as to render them quite domestic, many of the inhabitants keeping large flocks of them. But when the French took possession of that island they destroyed most of those domesticated flags, Valmont de Bro- mare asserts that he saw in Germany a few, or "attelage," consisting of a fix flags, that were perfectly obedient to the curb, and active to the stroke of the whip; and in the magnificent stables of Chantilly, in the year 1626, were fifteen flags that were occasionally harnessed to a small chariot, in which they carried two persons. The flesh of the old flags is very bad; that of the female is not amiss, but the flesh of the young fawns is still better. The skin and the horns are the most useful parts of this animal. The skin makes a pliable and durable leather, and the horns, being extremely compact, solid, hard, and weighty, make excellent handles for knives, and other instruments... Stags are still found wild in the Highlands of Scotland, in herds of four or five hundred together, ranging at full liberty over the vall hills of the north, some of which grow to a great size. Pennant says, upon the authority of Mr. Farquharson, that one of these wild flags weighed 344 pounds, exclusive of the entrails, head, and skin. Formerly the great Highland chieftains used to hunt with the magnificence of eastern monarchs, affumbling four or five thousand of their clan, who drove the deer into the toils, or to the fixation their hinds had placed themselves in. But as this pretense was frequently used to collect their vassals for rebellious purposes, as act was passed prohibiting any allusion of this kind. Stags are like the wives met with on the moors that border on Cornwall and Devonshire; and in Ireland on the mountains of Kerry, where they add greatly to the magnificence of the romantic scenery of the lake of Killarney. Pennant is persuaded that the flag is not a native of America, and considers the deer known to...
in that country by the name of flag, as a distinct species. It has been already mentioned that the American flag is a variety, C. canadenis, of Eirichelen. The Americans hunt and shoot these animals, not so much for the sake of the flesh as of the fat, which serves as tallow in making candles, and the skins, which they dispose of to the Hudson's Bay company. They are caught principally in the inland parts, near the vicinity of the lakes.

The fallow deer is considerably smaller than the flag, and is of a brownish-bay colour, varying, in different individuals, to deeper or paler, and is spotted on the back with white; and sometimes, though rarely, the whole of the back is white. Colour beneath, and on the insides of the limbs, whitish. Tail rather longer in proportion than that of the common flag, white beneath, and commonly banded on each side by a defining streak of black; but the principal mark of distinction between this species and the flag is the form of the horns, which, as in the flag, are peculiar to the male, and are erilated at the upper part, and palmated or divided into processes which are continued to a considerable distance down the horn. An antler or simple flander proceeds from the base of each, and a similar one at some distance above this, which pointing somewhat forwards. In its general form the animal resembles the flag, but is smaller, and of a more gentle disposition.

The manner of the fallow deer resembles those of the flag, but he is observed to be less delicate in the choice of his food, eating a variety of vegetables which are refused by the other. He also prefers his venison better, and even after the rutting season he does not appear exhausted, but continues in nearly the same state throughout the year. He browses closer than the flag, and is for that reason more prejudicial to young trees. At the second year the fallow buck seeks the female, and like the flag is inoffensive in his attachments. The doe goes with young eight months and some days. She commonly produces one fawn, sometimes two, and very rarely three. They are capable of engendering from two years of age till fifteen or sixteen, and seldom live more than twenty.

The horns of the fallow buck, like those of the flag, are shed every year, but at a somewhat later period, happening about fifteen days later. At their first appearance they resemble a pair of soft, turned knobs, or tubercles, and are covered with a villous skin; they gradually enlarge, lengthen, and widen at the tops, and when fully grown, the skin which had served to protect and nourish the young horn becoming withered, is rubbed off by the animal, the impression of the blood vessels still remaining on the complete horn, in the form of so many ramified furrows. During the rutting season they are neither so furious nor so violent in their action as the common flag. They never quit their own pastures in search of the females, though they will dispute and fight furiously for the possession of them. It often happens when there is a number in one park, that they will divide into two parties, and engage each other with much resolution; but these contests generally occur from a wish they both have to graze upon some particular spot. Each of these parties has its chief; these head on the engagement, and the rest follow under their direction. One victory is not sufficient, neither party yielding upon a single defeat; but as the battle is renewed daily, the weakest are at last compelled to retire to some secluded part of the park, and be content with the worst palurage. This animal is not so universal as the common flag, and is even rare in some parts of Europe, as in France and Germany. They abound in England, but are chiefly confined to parks. In Spain it is said to arrive at a tree near equal to that of the common flag. It is found in Greece, Palestine, the north of China, and in Persia. The fallow deer in America have been introduced there from Europe; for the animal called the American fallow deer is of a very different kind, and is peculiar to the new continent.

This animal resembles the fallow deer, but is taller, has a longer tail, and is of a lighter colour; the horns are more slender with numerous branches on the inside, and has no brow antlers. The general colour is a light cinnemon brown, the head of a deeper cast, and the belly, sides, shoulders, and thighs white, mottled with brown; the tail, which is about ten inches long, is dully above, and white below. This kind of deer inhabits all the provinces south of Canada, but in greatest abundance in the vail savannas contiguous to the Mississippi, and the great rivers that flow into it, grazing in innumerable herds along with the flags and buffaloes. This species is supposed by some to extend as far as Guinea, and to be the back of that species, which is said to be about the size of an European buck, with short horns bending forward at their extremities. This opinion is erroneous, the backi being now ascertained to be a very distinct animal (*Cervus mexicanus,* Grmel). The Virginia deer are sometimes tamed and used by the Indians, after being properly trained, to decoy the wild, especially at the rutting season, within the range of the hunters' markets. Both bucks and does breed from September to March, after which the does secrete themselves to bring forth, and are found with difficulty. From this time the bucks keep separate till the rutting season in September following. The deer begin to feed about twilight; and sometimes in the day-time, but then only in the rainy season, otherwise they rarely venture to quit their haunts. These animals are very vivis and always in motion. Those which live near the shores are lean and bad, and are greatly troubled with worms in their head and throat, the larve to doubt of various insects that like the toban, and esfiri, or gad-fly, deposite their eggs in the flesh of the animal. Those which frequent the hills and savannas are better, but the venison of these is dry. In hard winters they are offered to feed much on the different species of yucca or liring-molls, which hang from the trees. Thes, in common with the other cloven-footed quadrupeds of America, are very fond of salt, and resort eagerly to the places impregnated with it; they are also always seen in great numbers licking the earth in the spots where the ground has been torn by torrents or other accidents. Such spots are called licking places in America, and the hunters are sure to find plenty of game in those situations; for notwithstanding they are so often disturbed they soon return again in droves to their favourite haunts.

The deer are of the first importance to the Indians. The skins form the greatest branch of their traffic, by which they procure from the colonists in exchange many of the articles of life. The flesh is their principal food throughout the year, which they prepare by drying it over a clear gentle fire, after cutting it into small pieces, and, in this state, it is not only capable of long preservation, but is very portable in their sudden excursions, especially when reduced to powder.
powder. That the skins form an article of very extensive commerce will not admit of doubt; so long ago as the year 1764, no less than 25,007 skins were imported, according to Mr. Pennant, from New York and Pennsylvania. The trade is at present still more considerable.

**Axis.** Horns ramose, round, and erect; summit bind; body sottied with white. Erxleb. Schreber, &c. *Axis,* Phil. Ray, &c.

This animal, which is known by the name of the Ganges flag, is one of the most beautiful species of this genus. Its size is nearly that of the fallow-deer, and its colour an elecraf light russet brown, dhotly and beautifully marked with numerous white spots; the under parts are paler, and a line of white generally separates the colour of the upper from the lower parts; the tail resembles that of the fallow-deer, and is reddish above and white beneath. The species is said to be very common in some parts of India, about the banks of the Ganges, and in the island of Ceylon. It is described by Pliny, among the animals of India, and is said to have been ferred to Baeceus. It has been introduced into Europe, and is occasionally seen in parks and menageries. They are readily tamed and seem to suffer little from a change of climate.

Pennant makes two varieties of the spotted Axis, the middle Axis and great Axis. The middle Axis is described as being of a light russet colour, but never spotted. Sometimes, however, it is said to vary into white, and in that state is considered as a great rarity. It inhabits dry hilly forests in Ceylon, Borneo, Celebes, and Java, where it is found in very numerous herds. The flesh is much esteemed by the natives, and is dried, and salted for use. The existence of the great Axis is ascertained from a pair of horns in the British Museum, resembling those of the former in shape, but of a larger size. They measure two feet nine inches in length, are of a whitish colour, and strong, thick, and rugged. Pennant conjectures they were brought from Ceylon or Borneo, having been informed by Mr. Loten, who had long resided in the former of those islands, that a very large kind of flag as tall as a horse, and of a reddish colour, with tritifurcated horns, existed there as well as in Borneo. In the latter island, where they are said to frequent low marshy tracts, they are called water flags.

**Porcine.** Horns slender, trifurcated: body above fulvous, beneath cinereous, Schreber. *Porcine deer,* Penn.

The length of this animal is three feet and a half; height two feet and a half; horns thirteen inches long, and the tail eight inches. The body is thick and clumsy, the legs fine and slender; the colour on the upper part of the neck, body, and sides brown; of the belly and rump lighter. Mr. Pennant's description of this species was taken from a specimen in the collection of the late Lord Clive, and was brought from Bengal. It is also said to be found in Boreas, where it is called the hog-deer from the thickness of its body. Of their feet, Mr. Pennant says, are made tooth-boppers in the same manner as those of the smaller kinds of antelopes and minks.

This animal, which is described by Buffon under the name of Cerf-cochon or Hog-deer, is a native of the Cape of Good Hope. Dr. Shaw considers it as a probable variety of C. Porcine, and the French writers of the present day think it only a variety of the common flag. If the depictions of this little known animal be correct, we should however rather incline to admit it as a distinct species, and under this idea name it Africanus. It is the same fize as the flag, but the limbs are not fine and slender as in that animal; they are on the contrary short and thick; the legs and hoofs are very small; the fur fawn coloured, darklet on the back, and spotted like the Axis with white; the eyes are black; and the upper eyelids furnished with long black hairs; the nose is black; head reddish-white intermixed with grey; ears large with white hairs within; and the tail fawn-coloured above, beneath white.

This species is the size of the common or European Roe buck, and of a reddish colour, but when young, is often spotted with white. The horns are thick, strong, and rugged; they bend forward, are about ten inches long, and trifurcated at the upper part, but vary sometimes in the number of processes. The head is large: eyes large and bright, and the neck thick. The flesh is said to be far inferior to the venison of Europe. This inhabits Mexico, Guiana, and Brazil.

The flag, says Buffon, as being the noblest inhabitant of the wood, occupies the most secret thodes of the forest, and the elevated ridges of mountains, where the spreading branches form a lofty covert, while the roe, as if an inferior species, is content with an humbler residence, and is seldom found but among the thick foliage of the younger trees, and brack wood. But if he is inferior to the flag in dignity, strength, and stature, he is endowed with more grace, vivacity, and courage. He is superior in gaiety, restfulness, and sprightliness. His figure is more elegant and handom: his eyes more brilliant and animated. His limbs are more supple, his movements quicker, and he bounds seemingly without effort, with equal vigour and agility. His coat or hair is always clean, smooth, and glossy. He never wallows in the mire, like the flag. He delights in dry and elevated places, where the air is pure. He polishes also more cunning and fine, conceals himself with greater address, is more difficult to trace, and derives superior resources from inutility, for though he has the misfortune to leave behind him a stronger scent than the flag, which redoubles the armor and appetite of the dog, he knows how to withdraw himself from their pursuit by the rapidity with which he begins his flight, and by his numerous doublings. He never delays, like the flag, to protract his address till his strength fails him, but as soon as he finds the first efforts of a rapid chase unsuccessful, he repeatedly returns by his former tracks, and after confounding by these opposite movements the direction he has taken, after intermixing the last emanations to those of the former course, he flies from the earth by one great bound, retreats to one side, where he lies down flat on his belly, and in this situation allows the whole troop of his deceived pursuers to pass close to him without attempting to move.

The roe differs from the flag and fallow deer, in disposition, temperament, manners, and almost every natural habit.

Instead
Instead of herding together, they live in separate families; the
fire, dam, and young form a little community, and never ad-
mit a stranger into it. They are covetous in their amours,
and never unfaithful like the flag. During the period in
which they are engaged in the task of nurturing a new family,
they drive off the former brood, as if to oblige them to
yield their place to those which are to succeed, and to form
new families for themselves; but when this feast is passed,
the fawns again return to their mother, and remain with her
some time; after which they separate entirely, and remove
to a distance from the place which gave them birth.

The female goes with young five months and a half,
and brings forth about the end of April or beginning of
May. The hinds, or female flags, on the contrary, go with
young above eight months, and this difference is alone suffi-
cient to prove that these animals are to remote from each
other in species as to prevent their ever intermixing or pro-
ducing an intermediate race. By this difference, as well as
that of figure and size, they approach the goat, as much as
they recede from the flag, and go with young nearly the
same time. The female, when about to bring forth, retires
to the deep recesses of the forest. In ten or twelve days
the fawns acquire sufficient strength to enable them to fol-
low her. When threatened with danger, the hides them in
a close thicket, and to preserve them herself to be the
object of pursuit. But notwithstanding all her care and anx-
ity, the young are sometimes carried off by men, dogs,
or wolves. This is, indeed, the time of their greatest de-
struction. As the rose loves hills, or plains on the tops
of mountains, they never stay long in the deep recesses of
the forest, nor in the middle of extensive woods, but give the
preference to the skirts of woods which are surrounded with
cultivated fields, and to open coppices which produce the
berrv-bearing alder.

About the end of the first year, when the fawns are sepa-
rated from their parents, the first horns begin to appear, in
the form of two knobs, much less than those of the flag.
Contrary to those of the flag, which are cast in the spring
and renewed in the summer, the horns of the roe fall off at
the end of autumn, and are replaced in the winter. When
the roe-buck has renewed his horns, he rubs them against
the trees, like the flag, in order to free them from the velvet
skin with which they are covered, and this commonly happens about
the month of March, before the trees begin to shoot. The second horns of the roe have two or three antlers on each side; the third three or four; the fourth four or five, and after this their horns are seldom furnished with a farther
number of antlers. The horns of the old ones are dif-
tinguished after this by the thickness of their ftems, the
largetnes of the bar, pearlings, &c. As long as the horns
continue soft, they are extremely feifiable: of this Buffon
describes a striking example. The young fount of a roe-
buck's horn was carried off by a hawk, the animal was
stunned, and fell down as if he had been dead. The shoot-
er, who was near, seized him by the foot; but the roe-buck
suddenly recovering his senses and strength dragged the
man, though he was strong and alert, thirty paces into the
wood. After killing him with a knife, it was discovered
that the roe had received no other wound.

As the female roe goes with young only five months and
a half, and as the growth of the fawn is more rapid than that
of the flag, the duration of her life is much shorter, seldom
extending perhaps beyond twelve or fifteen years. They
are delicate in their choice of food, and require a great deal of
exercise, free air, and much room, which is the reason
they are unable, after the first year of their growth, to reful
the inconvenience of domestic life. They may be tamed,
but can never be rendered obedient or familiar. They al-
ways retain a portion of their natural wildness, are easily
terrified, and then run with fuch violence against the walls
that they often break their limbs. However tame, they
may be apparently, they are not to be tamed, and the males
are subject to dangerous caprices; they take averse to certain perons, and make furious attacks with
their horns, the blows of which are sufficient to throw a
man on the ground, after which they continue to trample on
him. The roe-buck bellows, but largely than the flag, neither is his voice so strong or loud. The young ones
utter a short and plaintive cry, mi mi, by which they indicate
their want of food. This sound is easily imitated, and
the mother, deceived by the call, will come up to the very muz-
dle of the hunter's gun.

In winter the roes frequent the thickest coppices, and
feed upon Bramble, broom, heath, and the catkins of
the hazels and willows. In spring they repair to the more open
brush-wood, and eat indiscriminately the buds and young
leaves of other trees. They never drink except in the very
height of summer, when the weather is hot in the extreme,
the moit dews with which the herbage at other times
abound being sufficient to alylay their thirst. The flesh
of the roe is excellent when in good order, but the quality of
the venison depends much on the country they inhabit;
and even the bell countries produce good and bad kinds.
The flesh of the brown roe is preferred to that of the red
fort. All the males after the age of two years have the
flesh hard and ill-taile, but that of the females though far-
ter advanced in age is more tender. That of the fawns,
when very young, is fofe and soft, but at the age of eigh-
teen months, it is in the highest state of perfection. Those
which live in plains and valleys are not good; those which
come from moit countries are ftil worfe: those brought up
in parks are inupid; and, lastly, there are no good roes but
those of dry elevated countries, interapered with hills,
woods, cultivated and fallow land, where they enjoy plenty
of air, food, freedom, and solitude; for those which have
been often disturbed are meagre, and the flesh of those which
have been often hunted is inupid.

The roe was formerly very common in Wales, in the North
of England, and in Scotland, but at present the species exists in
no other part of Great Britain but the Scottish Highlands,
and even there are far from common at this period. In
France they were more frequent, but for the last fifty years
their numbers have been rapidly diminishing. They are
found in Italy but very rarely, and they are much scarcer in
Sweden and Norway than formerly. According to Pen-
nant, the fift that are to be met with in Great Britain are
in the woods on the south side of Loch Rannoch, in Perth-
shire; and the last in those of Langwell, on the southern
borders of Caithness, but they are most numerous in the beautiful
forests of Invercauld, in the middle of the Grampian hills.
In Ireland they are unknown.

The usual size of the roe is three feet nine inches from
the nose to the tail; the height before two feet three inches, but
behind two feet seven inches. The tail is about an inch
long; the horns fix or eight inches long; the general colour
of the animal reddish brown, with the romp white. Like
other quadrupeds it is sometimes found perfectly white, and
Buffon mentions, upon the authority of Count Neillis,
a race of cold black roes that exists in a very small German
district called the forest of Luca, in the dominions of the
King of England as duke of Lunenburg. This variety is
said to be contantly the same, resembling the common fift
in size, and every other particular except in colour.

C E S

vi\nAm on this occasion to his own counsel. Of his letters, orations, and disputations, many are published in the acts of the councils to which they belong. Du Pin’s E. H. of the 17th century, vol. xii. p. 87. Moreri.

Cesarini, Virgilio, the descendant of a noble family, was born at Rome in 1595, and at an early age perfected himself in almost every kind of literature, so that he was regarded as a universal genius. He was not only learned in the Greek and Latin languages, but profoundly skilled in philosophy, astronomy, history, geography, medicine, jurisprudence, oratory, and poetry. Cardinal Bellarmino compared him to the famous Pico della Mirandola, and he was honoured with a medal which bore the head of Pico and his own united under a crown of laurel. He was a very distinguished member of the academy of Lyceum, and intimate with prince Frederic Cesi, its founder. Urban VIII. made him one of his chamberlains, and designed him for the cardinalate; but his course of honour terminated in 1624, at the early age of 30 years. His admirable intellectual qualities were united with modesty, civility, and private worth. His only publication was a collection of Latin and Italian poems, the former of which display singular elegance and amenity, though the style was not rendered perfect for want of time. Several of them are printed in a collection, entitled “Septem Illustrium Virorum Poemata.” Antwerp, 1602, and since reprinted. At the request of cardinal Bellarmino, he had undertaken an ample demonstration of the immortality of the soul, which, with some other works, remained incomplete. His bult, in marble, was placed in the capital with a pompous eulogy. Favorite, a learned prelate, wrote his life. Moreri. Gen. Biog.

Cesario, Sr. in Geography, a town of Naples, in the province of Otranto; four miles W.S.W. of Lecce.

Cesara, in Ancient Geography, a town of Spain, between Arrico and Seguina, in the itinerary of Antolino. Petlemy, who calls it Cesara, says, that it was a town of Celtiberia, in the Tarragonensis.

Cesedium, a temple of Asia, in Pamphylia. Polybius says, that it was dedicated to Jupiter, and that it served as a citadel to the town of Scylas.

Cesum, a town of Asia, in Cilicia, according to Piny.

Cesena, in Geography, a town of Italy, in the province of Romagna, seated on the road from Rimini to Ravenna, on the river Savio, at the foot of a hill, on which stands a ruined citadel, the seat of a bishop suffragan of Ravenna. It has good churches and convents, and the houses are generally well built; 18 miles S. of Ravenna. Near it, on a hill, stands a Benedictine convent, to which belongs the church of Sta. Maria del Monti de Cefena.

Cesena, an ancient town of Gallia Cispadana, situate to the S.E. of Forum Lanci. It is said to have been founded by the Galli Senones, 301 years B. C. It remained under the power of the Heruli, and was beleaguered without effect by Theodoric. This prince, however, gained possession of it after the death of Odoacer, when Lovere, the commandant, surrendered it to him, A D. 491. Having suffered much in different wars, it was partly consumed by a fire.

Cesenatico, a small sea-port of Italy, inhabited chiefly by fishermen, in the Adriatic, in the province of Romagna, which has an excellent harbour and commodious canal, with a bridge, erected in 1516, near which are two fine marble pillars of the Corinthian order; 8 miles N.E. of Cefena.

Cesi, a town of Italy, in the province of Umbria; seated on the edge of a lofty mountain, or rock, exposed to the sun during its whole course from its rising to its setting.

Cesion, or Cesena, in Ancient Geography, a town of Julia, in the tribe of Isflachar, according to the book of Joshua. It was given to the Levites of this tribe, who were of the family of Gerben.

Cesius, in Botany, a name by which some authors express the common daceu flesihitis, wild carrot, or bird’s nest.

Cesules, in Geography, a town of Hungary; 5 leagues N. N.E. of Stul-Wielenburg.

Cespedes, Pablo (Paulo or Paul) de, in Biography, an eminent historical painter of Spain, was born at Cordova, of which he was afterwards dignitary, between the years 1530 and 1542. He was a man of extensive talents and profound erudition, so that, by the Spanish writers, he has been extolled as an universal genius. He travelled twice to Rome in order to perfect himself in the art of painting, to which he was peculiarly addicted; and he formed his style after that of Michael Angelo, whom he also imitated in uniting architecture and sculpture with painting. During his residence at Rome, he supplied a flat to a famous antique trunk of Seneca in white marble; and when the original head was afterwards discovered, that of Cefpedes was thought to be superior. He also painted in fresco at the Trinita Monti at Rome and in other places. On his return to Spain he adorned with his performances the churches of Seville and other cities in Andalusia; but his principal pictures are found at Cordova. His Last Supper in the cathedral is singularly famous, both for variety of expression and tone of colouring, in which last quality he is thought to have approached the manner of Correggio. His drawing, anatomy, and perspective, are eminently correct. The element in which he was held by federico Zuccari isexcused by the following anecdote. When this artist was applied to by the bishop and chapter of the cathedral of Cordova for an altar piece, he peremptorily declined the commission, alleging that while Pablo de Cefpedes was in Spain, there would be no occasion to send into Italy for pictures. As an author, Cefpedes wrote a treatise on the antiquities of the church of Cordova, proving it to have been a temple of Janus. Some of his works on painting are lost. His moral character was exemplary. He died at his native place in 1608, and was buried in the cathedral. Piglinton by Fuseli, Cumberland’s Anc. of Spanish Painters, vol. i.

Cespitose, in Botany, producing several items from the same root, so intermingled and matted together as to form a turf.

Cessaress, in Geography, a territory northward of Patagonia in South America, in the 54th degree of S. lat. inhabited by a mixed tribe of that name, descended from the Spaniards, being the crews of three ships that were wrecked on this coast in 1540.

Cessat Exeunt, in Law. In trespass against two persons, if it be tried and found against one, and the plaintiff takes his execution against him, the writ will abate as to the other; for there ought to be a cesso exequior, till it is tried against the other defendant; 1 K. B. iv. 11.

Cession, the act of intermitting, discontinuing, or interrupting the course of any thing, work, action, or the like.

Cession of arms, in a Military Sense, signifies a total discomfiture or suspension of warrlike operations or acts of hostility for a limited time during a state of warfare. See Captitation.

Cession, Cessatio a divinis, in the Roman Church, is a penalty inflicted for any notorious injury to the church, by putting a stop to all divine offices, and the admission of
of the sacraments, and by depriving Christians of church-burial.

CESSAVIT, in Law, a writ, which lies by the statute of Gloucester, 6 Edw. I. c. 4, and of Wellm. 2, 13 Edw. I. c. 21 and 24:1 when a man who holds lands of a lord by rent or other services, neglects or ceases to perform his services for two years together; or when a religious house has given it, on condition of performing some certain spiritual service, as reading prayers or giving alms, and neglects it: in either of which cases, if the ceftor or negliger have continued for two years, the lord or donor and his heirs shall have a writ of cessavit to recover the land itself. F. N. B. 228.

This, in some instances relating to religious houses, is called cessavit de contario. By the statute of Gloucester, the cessavit does not lie for lands let upon fee-farm rents (cessavit de foro), unless they have been void and uncultivated two years, and there be not sufficient diligence upon the premises; or unless the tenant hath so enclosed the land, that the lord cannot come upon it to distrain. T. N. B. 209. 2 Inst. 298.

For the law prescribes the simple and ordinary remedies, by dillref, &c. to this extraordinary one of forfeiture for a cessavit; and therefore the same statute has provided further, that upon tender of arrears and damages before judgment, and giving security for the future performance of the services, the proceed shall be at an end, and the tenant shall retain his land; to which the statute of Wellm. 1, conforms, so far as may stand with convenience and reason of law. 2 Inst. 401. 402.

The statute 4 Geo. II. c. 28 (which permits landlords who have a right of re-entry for non-payment of rent, to serve an ejectment on their tenants, when half a year's rent is due, and there is not sufficient diligence upon the premises) is in some measure copied from the ancient writ of cessavit; especially as it may be satisfied and terminated in a similar manner, by tender of the rent and costs within six months after. And the same remedy is, in substance, adopted by statute 14 Geo. II. c. 16, § 10, which enacts, that where any tenant at rack-rent shall be one year's rent in arrear, and shall defect the demised premises, leaving the same uncultivated or unoccupied, so that no sufficient diligence can be had; two judgments of the peace (after notice affixed on the premises for 14 days without effect) may give the landlord possession thereof; and thenceforth the lease shall be void. By Stat. Wellm. 2. § 2, the heir of the demandant may maintain a cessavit against the heir or assigns of the tenant. But in other cases, the heir may not bring this writ for cessavit in the time of his ancestor; and it only lies for annual service, rent, and such like; and not for homage or scutage. Terms de la ley. New Nat. Brev. 463, 464.

The lord shall have a writ of cessavit against tenant for life, where the remainder is over in fee to another; but the donor of an estate-tail shall not have a cessavit against the tenant in tail; though if a man make a gift in tail, the remainder over in fee to another, or to the heirs of the tenant in tail, the lord of whom the lands are held in immediate, shall have a cessavit against the tenant in tail, because he is tenant to him. Ibid. If the lord distrains, pending the writ of cessavit against his tenant, the writ shall abate. The writ cessavit is directed to the sheriff, "to command A. B. that, &c. he render to C. D. one meagre which he holds by certain services, and which ought to come to the said C. by force of the statute, &c. because the said A. in doing these services had ceased two years, &c." Blackl. Comm. vol. iii. p. 252. Jacob's Dict. by Tomlins.

Cesse, signifies an affliction or tax, and is mentioned in the Stat. 22 Hen. VIII. c. 3. Cesse, or Cesse, in Ireland, is an exaction of viatuals, at a certain rate, for soldiers in garrison. Vol. V. 71.

Cessenon, in Geography, a town of France, in the department of Herault, and district of St. Pons; 3 leagues N. of Beziers.

Cessero, in Ancient Geography, a town of Gallia Narbonensis, on the frontiers of the Lectesages, according to Pliny. This town was built in a valley, near the river Aravis or Erault.

Cessieux, in Geography, a town of France, in the department of the Ile-de-France, and district of La Tour-du-Pin; 27 miles W.S.W. of Lyons.

Cessio Benimiris, in Scots Law, the name of that action by which an insolvent debtor may apply for liberation from prison, upon making over his whole real and personal estate to his creditors.

Cession, in a Legal Sense, an act whereby a person surrenders up and transmits to another person, a right which belonged to himself.

Cession is a general term; the species whereof are a surrendor, relinquuiment, transfer, and subrogation; which see.

Cession is particularly used in the Civil Law, for a voluntary and legal surrender of a person's effects to his creditors, to avoid imprisonment.

This practice still obtains in France and other countries; and is done by virtue of letters patent granted in favour of the poor and honest. The cession originally carried with it a mark of infamy, and obliged the person to wear a green cap or bonnet; at Lucca, an orange one: to neglect this, was to forfeit the privileges of the cession. This was originally intended to signify, that the cessionary was become poor through his own folly.

The Italian lawyers describe the ceremony of cession to consist in flinging the bare breech three times against a stone, called lypis virgariis, in the presence of the judge. Formerly it consisted in giving up the girdles and keys in court. The ancients used to carry at their girdles the chief utensils wherewith they got their living; as the lvnter his escritoire, the merchant his bag, &c.

The form of cession among the ancient Romans and Gauls was as follows. The cessionary gathered up duit in his left hand, from the four corners of the house; and, flinging on the threshold, holding the door-post in his right hand, threw the duit back over his shoulders; then stripping to his shirt, and quitting his girdle and bag, he jumped with a pole over a hedge; hereby letting the world know, that he had nothing left, and that when he jumped, all he was worth was in the air with him.

The judicial cession is that which is made by a merchant or trader, who is actually kept in prison by his creditors, and who being absolutely incapable to satisfy them, petitions a court of judicature for leave to make cession. This judicial cession is certainly compulsory on the part of the creditors; since the debtor is commonly allowed the benefit of a cession by an order from the judges, notwithstanding the opposition made by the creditors to prevent it; which renders this cession more infamous than that which is voluntary. See Bankrupt.

Cession, in the Ecclesiastical Laws, is one manner of vacating or voiding an ecclesiastical benefice.

Cession is an implicit kind of resignation, under which a person does some act, or takes on himself some charge, which is inconsistent with his holding the benefice of which he was before possessed.

By statute 21 Hen. VIII. c. 13, if a clerk have one benefice of 81. per annum, or upwards (according to the present valuation in the king's books), and takes another, of what value soever, with care of souls, and without dispensa-
tion; the former living is, ipso facto, void; and this kind of voidance of a living is called cession. See Dispensation.

In case of a cession under the statute, the church is so far void upon institution to the second living, that the patron may take notice of it, and prevent if he pleases: but it seems that a lease will not expire from the time of institution against the patron, unless notice be given him; but it will from the time of inducement. 2 Hild. 202. 3 Brev. 1564.

What is called cession in other benefices, is called consecration in relation to a bishoprick; for if an incumbent be made a bishop, his benefice is said to be void by consecration; and to such benefice or benefices the king shall present for that time, whoever is patron of them; in other cases the patron may prevent. See Consecration.

CESSIONARY, a bankrupt. Sometimes it denotes an assignee.

CESSITANUS, in Ancient Geography, an episcopal town of Africa, in Mauritania Cæsariaca.

CESSOR, in Law, one dilatory and delinquent in his duty, or service, and who thereby incurs the danger of the law, and is liable to have the writ cessevi brought against him. When it is said the tenant cessevi, it is meant, he cessevi to do his duty, or service, to which he is bound.

CESTAROLLS, in Geography, a town of France, in the department of the Tarn; 3 leagues N. of Alby.

CESTRI, il PAPA MARC' ANTONIO, d'Arzo Minor Conventual e Cavalliero dell' Imperatore, in Biography, an Italian vocal composer of music, of considerable eminence in the 17th century. He set an opera for Venice, in 1641, called Orontea, which was revived at Milan, with the same music, in 1662; at Venice, 1666; at Bologna, 1669; and again at Venice, 1683; always colsa Musica fissa, during 34 years!

It has been extremely difficult to find any of the music of the early operas that was not printed. Luckily, a scene of Cesti's celebrated opera of Orontea, composed in 1641, and afterwards so frequently revived, was found in the music-book of Salentorina, in that painter's own handwriting. (See Hist. Mus. vol. iv. p. 67.) This air is supposed to have been the first strain in measured melody that was introduced at the termination of a scene of recitative.

Ces is said to have been a disciple of Cardinari, which is hardly reconcilable with the date of this opera, as Cardinari did not begin to be known at Rome till after the year 1642. Adami says, that Cesti was admitted as a tenor singer in the Pope's chapel, in 1660; and that "the most celebrated of all his operas, of which five were composed for Venice, was La Doria, il lumi maggiore del sec Teatro." This opera first appeared at Venice, 1665, and was not only revived there in 1667, and 1667, but frequently performed with great applause in the other principal cities of Italy. Songs have, since these times, been so much composed to display the peculiar talents and abilities of singers, that operas can never be successfully revived but where the same performers, who sang in them originally, happen to survive, and to be engaged at the same theatre: which is not likely to happen at the distance of many years. Indeed, if, contrary to the chances against it, such a concurrence of circumstances should take place, twenty or thirty years generally make such havoc with fine voices, fine taste in singing, and fine feelings in judging, that it is by no means certain that they would then please the same critics as much as formerly.

The number of cantatas that Cesti produced, seems incalculable; as in every old library or collection of Italian old vocal music, that we have examined abroad and at home, we find more of his cantatas than of any other author. At Chrift Church, Oxford, in the collection of Dr. Aldrich, in the British Museum, in the d'Arcy collection of the late Earl of Hakluyt, in that of Lord Keeper North, of Sir Roger L'Estrange, and of all the ancient families who cultivated music in the 17th century, we found innumerable cantatas by Cesti; and it appears in these cantatas, that he was a great impoyer of recitative. See Opere, Cantata, and Recitative.

CESTILLI, in Ancient Geography, a town of Italy, in Lomia, at a small distance E. of Quadrata, and N. of Riconagius.

CESTISSA, a town of Lower Pannonia, according to Ptolemy. The Itinerary of Antoninus marks it on the route from Lomia to Sirmium, between Leuconium and Ghibe.

CESTRATUM, a work enamelled, or painted with a cession. The word is also written cestredum and cestrema.

CESTREUS, or rather Cestus, in Idiodyogy, the name of a fish described by old writers as being of the mullet kind, but having a much smaller and narrower head, and its sides variegated with much shorter longitudinal lines. From this description we suppose the Gmelian Cannabis Girusnovi must be intended, a fish which Ray describes as a mullet (Mytilis americanus), and Klein as Cestus ausurus, gibusus intertextis, osculis ellipticis, pinis albicantibus, pinna dorso maxima. See Cannabis Girusnovi.

CESTRI, in Ancient Geography, an episcopal town of Afa, in Iauria.

CESTRINA, a small country of Epirus.

CESTRON, in Antiquity, the infrument wherewith they painted or enamelled, in horn, or ivory.

CESTROPHEONODUS, or rather Cestrophi Helenus, of Aetides, or of Tereus, tragula, and Cydonus, funda, a sort of military engine with a fling, for throwing barbed darts or javelins. Also, the dart or javelin itself, which took its name from the fling with which it was thrown, and is said to have been balanced with feathers as an arrow, and pointed at both extremities. It was made use of by the Macedonians, under Perseus, against the Romans.

CESTROS, or Cestrius, in Ancient Geography, a river of Pamphylia.

Gen. Ch. Cal. one-leaved, tubular, very short, toothed, erect. Cor. monopetalous, funiculo-shaped; tuba cylindrical, very long, slender, orifice roundish; border five-leaved, spreading, short; segments equal. Stam. filaments five, bifidum, attached longitudinally to the tube of the corolla, in some species furnished with a little tooth in the middle or towards the base; anthers roundish, within the tube. Pyl. germ superior, cylindrical, egg-shaped; the length of the calyx; style filiform, the length of the flaments or longer; stigma thickish, obtuse. Peric. berry egg-shaped, one celled. Linn. sect. two celled, Adamson, Lam. Seeds several, angular, affixed to a thick receptacle in the middle of the berry.

Obf. Cestrum observes, that though there may possibly be two cells in the germ, there are no traces of a partition...
in the ripe berry. It appears to us that La Mareck considers the receptacle as a partition, which he ought not to have done, unless that receptacle had been so extended through the middle of the berry, as to cut off all communication between its sides.

Sp. 1. C. notatum, Lam. Sp. Pl. 1. Lam. Encycl., and Ill. i. Pl. 112. fig. 1. Mart. 2. Wild. 2. Gart. tab. 77. fig. 9. (f. jucinifolius, Dill. Elih. tab. 153. fig. 185.) "Flowers peduncled, somewhat racemous, greenish; filaments toothed; berries white." A shrub from six to nine feet high, branched in its upper part. *Branches* cylindrical, fleshy, dotted, generally inclining to one side. *Leaves* near four inches long, linear and a half broad, alternate, petioled, ovate-lanceolate, smooth, green, sometimes spotted with yellowish white. *Flowers* in axillary bunches. *Berries* a little smaller than a pea. A native of the island of Cuba, flowering in August and September, where, on account of its yielding a pleasant smell in the evening, it is called the *Lati of the Night*. Cultivated long since by the Dukes of Beaufort at Badminton, and thence known by the name of Badminton Jasmine. It does not ripen its berries in England. 2. C. Parqui, Mart. 7. Lam. Ill. 2. Wildl. 3. L'Herit. Stirp. 4. tab. 36. (C. Jamaicaefae, B. Lam. Encycl. Parqui. Vahl. Fenn. obs. 3. tab. 32.) "Leaves narrow-lanceolate, filigule; flowers somewhat racemous, falcate, yellowish green; berries brown." A fett shrub, about six feet high. *Stems* several, upright, round; *branches* alternate, spreading, round, with a few tubercles. *Leaves* alternate, lanceolate, very acuminate at each end, entire, somewhat waved, smooth, bright green on both surfaces, spreading; petioles very short; *filaments* linear. *Flowers* fimbriate or nearly so, smelling sweet in the night; bracte linear, acute, spreading; calyx two lines long, smooth, persisting; corolla inserted into the receptacle, almost naked; tube eight lines long, club-shaped at the top; *filaments* of the border lanceolate, acuminate, spreading and finally turned back; flowers closing the tube with their teeth, pubescent at the base, the length of the tube; *anthers* two-celled, yellow; stigma oblate-lingulate, exca-vated, large. *Berry* small, egg-shaped. *Seeds* three or four, angular. A native of Cutili. Introduced at Paris from seeds sent by Dombey. 3. C. auriculatum, Mart. 6. Lam. Ill. 5. Wildl. 4. L'Herit. Stirp. tab. 35. (C. he-diiuma, Lam. Encycl. 2. Hediium, Vahl. Fenn. obs. 23. fig. 3.) "Flowers pedunculated, somewhat panicled; filigules carse, surrounding the branch." A fett shrub, about fifteen feet high. *Branches* round, olive green or ash-colour, almoat linoace. *Leaves* alternate, four inches long, one inch and a half broad, petioled, oblong-lanceolate, acute, smooth, entire, green, but paler underneath; *filaments* axillary, of the same form with the leaves. *Flowers* greenish, with a tuige of dull red, nearly feathery, in terminal and axillary clusters; bracteae few, linear; calyx somewhat hairy, pitted clove; corolla somewhat hairy on the outside; tube swelling at the top; divisions of the border linear-lanceolate, very sharp, two-furrowed, spreading; *filaments* very short, without teeth. *Berry* with about five seeds. A native of Peru, where it is used externally to cleanse foul ulcers, and internally in the venereal disease. It is also regarded as a pectoral. According to Father Feni, it yields, during the night, a pleasant smell, resembling that of myrrh, which, as soon as the sun rises, is changed into a highly offensive colour, and so continues during the whole day. Dombey observed it in wet places about Lima. It was introduced into this country about 1774, but has rarely flowered, and never bore fruit. It flowers in winter.

4. C. vespertinum, Lam. Mutt. 226. Mart. 2. Lam. Ill. 4. Wildl. 6. (C. Jamaicaefae, Lam. Encycl. 2. Jatrinium, Burm. Amer. tab. 77. fig. 1. Ixora alternifolia, Jacq. Amer. tab. 177. fig. 8.) "Flowers fimbriate, nearly 1. file; border acute; berries ovate-shape, dark violet." A tree, twelve feet high. *Stem* not very strong. *Leaves* alternate, on short petioles, length double the breadth, acute, quite entire, green on both sides, concave, with the edges raked and waved. *Flowers* crowded, in nearly sessile filiculae, greenish-white, often tinged with purple or violet, alternate, separated by ovate-elongate bracteae; tube very slender; border with five acute expanding segments; *filaments* without a tooth. *Berries* resembling an olive, but only half the size, nearly black. *Seeds* four, oblong. A native of the West Indies. Cultivated by Miller in 1779. 5. C. pallidum, Lam. Encycl. 4. Ill. 5. (Jatrinum buonis folins, Sloan. Hist. jam. 2. p. 96. tab. 204. fig. 2. Syringa laureola Jamaicaefae, Plum. Alm. 329. tab. 64. fig. 3.) "Racemes compound, axillary; flowers small, pale; berries inversely egg-shaped, dark blue." The synonyms are referred by Linnéus to C. notilum, but La Mareck asserts, that it is a perfectly distinct species resembling C. lurifolium in the form of its leaves, and C. vespertinum in the colour of its fruit, and clearly distinguished from all the three by the smallness of its flowers. A shrub, seven or eight feet high. *Branches* smooth, thick let with leaves near the summit. *Leaves* alternate, petioled, oval-acute, an inch and half broad, smooth, dark green. *Flowers* scarcely fix lines long, pale or yellowish, smooth; border expanded; segments short, rather acute. A native of Jamaica, described by La Mareck from a dried specimen in the herbarium of Jullieu. 6. C. falciflorum, Wild. 5. Vahl Eclog. 1. p. 24. "Filaments toothed; leaves egg-shaped, attenuated, smooth; racemes axillary, somewhat compound; *branches* climbing." A native of St. Martha. 7. C. bir-

...
labeled, incumbent, half within the tube; germ superior, egg-shaped, five-channeled, smooth, on a rather large five-corned receptacle; style somewhat thickened at the top, rather shorter than the stamina; stigma obtuse, imprest. Dr. Smith and La Mark. 10. C. venenatum, Willd. 8. Thumb. prod. 35. "Leaves lanceolate-oblong, coriaceous; flowers filiform." It seems nearly allied to the preceding, but distinct. Willd. 11. C. tomentosum, Linn. jnn. frimp. 150. Mart. 4. Lam. Enc. 7. Ill. 8. Willd. 9. "Flowers crowded, terminal, filiform; branches, leaves, and calyxes downy." The form of the flowers and leaves bear the same as C. diurnum, but, in addition to the difference expressed in the specific character, the calyxes are larger, the corollas coloured, the tube shorter, and the border more ample. 3. C. diurnum, Lam. Sp. 11. 2. Mart. 5. Lam. Encyc. 8. Ill. 9. Willd. 7. L'Herit. flrmp. nov. 74. (Jasminoides, Dill. eth. 156. tab. 154. fig. 165.) "Petals pedunculated; corolla white; border obtuse, reflexed; leaves ovate-lanceolate." Stem from ten to twelve feet high, slender, with a cinerea bark, dividing at the top into many smaller branches. Leaves alternate, petiolate, near three inches long, one and a half broad, oval-oblong, acute, smooth, deep green above, pale under, shining, evergreen, in confluence resembling those of spurge laurel. Flowers small, white, smelling sweet in the day-time, and thence called Lady of the Day, growing almost in umbels; common peduncles axillary, from one to three inches long; corolla five lines long; segments four, oval, reflexed, waved, and almost crimped at their edges; filaments toothless. A native of Chili and the West Indies. 13. C. epiphyllum, Linn. 11. 112. fig. 2. flowers ill-drawn. "Leaves opposite, lanceolate, nervous, somewhat coriaceous; flowers falcate, filiform, axillary." A native of Africa, observed by Sonnerat. 14. C. nervosum, Mart. 9. Miller 5. "Leaves opposite, lanceolate, with translucent nerves; peduncles branched." Stem fimbriate, five or six feet high, covered with a brown bark, and dividing at top into very small branches. Leaves about four inches long, little more than one broad, smooth, light green. Flowers white, axillary, towards the ends of the branches, four or five on each peduncle, without scent; tube of the corolla fimbriate at the base just above the calyx, contracting towards the mouth; segments of the border broad, flat. Sent to Mr. Miller from Carthagena in New Spain. Nearly allied to the preceding, if not the same.

Cestrum, in Gardening, affords plants of the shrubby exotic flowering kind, of which the species are the night-smelling Cestrum, (C. nocturnum,) and the day-smelling Celatum, or Ballard Jasminae, (C. diurnum); and other more tender species may be cultivated for variety.

The first of these rises with an upright stalk, about fix or seven feet high, covered with a greyish bark, and divides upward into many slender branches, which generally incline to one side, and are garnished with leaves placed alternate, near four inches long, and one and a half broad, smooth on their upper side, of a pale green, and, on their under side, they have several transverse veins, and are of a sea-green colour, having short foot-stalks; the flowers are produced at the ends of the leaves, in small clusters hanging upon short peduncles, each flatening four or five flowers, of an herbaceous colour, appearing in Angulf, but which are not succediced by berries in this climate. It is a native of the island of Cuba, &c.

And the second species rises with an upright stalk, to the height of ten or twelve feet, being covered with a smooth light green bark, dividing at top into many smaller branches, with smooth leaves near three inches long, and one and a half broad, of a lively green colour, and the consistence of those of the spurge laurel; these are ranged alternately on the branches. Towards the upper part of the flowers come out the flowers from the wings of the leaves, blanding in clusters close to the branches, which are very white, shaped like those of the first sort, and smnel sweet in the day-time, whence it had the appellation of Lady of the Day. The berries are smaller than in the first sort. It flowers in the autumn, and is a native of the Havannah, &c.

Method of culture. In these plants the mode of increase is either by seeds or cuttings; but as the former cannot be easily procured, the latter is the more common method of practice. The seeds should be sown in pots filled with light friable fresh earth in the early spring season, and plunged in a gentle hot-bed. After the plants are sufficiently strong, they should be removed into separate pots, shade and a little water being given occasionally, till they are well rooted again, and become perfectly established.

The cuttings must be made from the side shoots, to the length of five or six inches, and be planted in pots of fresh earth in the former season, plunged them in a bark hot-bed, a little water and shade being given till they have taken firm root; and in both methods the plants require to be kept afterwards in pots filled with light earth in the stove of the hot-hose.

The evergreen flowered nature and fragrance of these plants afford a fine effect, when placed in assamblage with other shrub exotics.

CestuU, a French term, literally signifying he or him; frequently used in our law writings. Thus,

Cestu que truff, he is in truth for whom, or to whose use or benefit, another person is enfeoffed or seized of lands or tenements. By Stat. 29 Car. II. c. 3. lands of cestus que truff may be delivered in execution.

Cestu que vis, one for whose use any lands or tenements are granted.

Cestu que vis, he to whose use another man is enfeoffed of land or tenements. 1. Rep. 135.

Feeholders to ueses were formerly deemed owners of the lands; but now the possession is adjudged in cestus que vis, and without any entry he may bring affile, &c. Stat. 27 Hen. VIII. c. 10. Cro. Eliz. 46. See Usc.

Cestus, among Ancient Poets, a fine embroidered girl dressed worn by Venus, to endow with a faculty of charming, and conciliating love. The abbe Winkelman observes, that this goddes, when dreffed, has always two cintures; one immediately beneath the breast, and the other round the lower part of the body, above the hips. In proof of this observation, he refers to the Venus of the Capitol, and the statue of the goddes in the possession of lord Egmont. It is the lower cinture which is properly the cestus of Venus. When Juno, wishing to inflame the heart of Jupiter, solicited and obtained the loan of this mysterious girdle, she put it, according to Homer, not upon the ordinary cinture, immediately under her breast, but where Venus wore it, below: for that such is the true sense of the word cintura. (ll. 1. 149. v. 216.) Is evident from the context, which informs us, that Juno was already encompassed with a zone, profusely adorned with fringe. (v. 181.) Of this mystic cestus 11omer has given the following description, (l. 14. v. 215—217,) which we shall here subjoin in the words of his translator:

In it was ev'ry art, and ev'ry charm,
To win the wifh, and the coldelt warm:
Fond love, the gentle vow, the gay defire,
The kind deceit, the full-reviving fire.
Persuasive speech, and more persuasive signs, 
Silence that spoke, and eloquence of eyes."—Pope.

This fiction, which is extremely beautiful, has been happily imitated by Tasso, in his magic cincture of Armida.

The cincture of virginity, *sona virginea*, or *cingulum virgineum*, which was worn at Rome by females newly married, before they surrendered themselves to their husbands, was also called *cifius*. It was formed of wool, and served as the symbol and defence of the modesty of the married female; and it was reserved for the bride-groom to untie this mystical cincture. Whence *sonam solvere* was used to denote being married. Thus Catullus (iv. 14.):

"Quod polliit sonam solvere virgineum."

The expression of untying the cincture signified, among the Greeks, the first mutual acros of the married pair. Accordingly, the scholiast of Apollonius, (Argon. i. 281.) lays, that the females of Athens consecrated at this period their cinctures to Dana, who had in this city a temple, where she was honoured under the title of *λατερη*, or the deity who united the cincture.

The word is also written *cifum*, and *cifon*; it comes from *συγγερ*, a girdle, or other thing embrodered, or wrought with a needle; derived, according to Servius, from *κυται*, punzere; whence also *inclusus*; a term used at first for any indecency by undoing the girdle, &c. but now restrained to that between persons near akin. See *Incerc*.

*Cestus, Cestus, Ceste*, in *Antiquity*, a large leathern gauntlet loaded with lead or other metal, which the ancient Athlete used in their exercises for disputing the prize of pugilism. The Greeks had four kinds of celtus. The fist was of an ox hide not dried, and dried, and was called *τύρα*, or *τυραννικός*. The second was loaded with metal, and called *μυμφυκτές*. The third was made of fine and soft thongs, leaving the fist and fingers uncovered. And the fourth was the large globular gauntlet fist mentioned, and called *Στάσις*. See *Cestus*.

*Cesure*, or *Cesura*, in *Poetry*. See *Cesura*.

*Cetaceous Animals*, in *Zoology*. See *Cete*.

*Cetuum*, in *Ancient Geography*, a promontory of India, in that part which was S.E. of the island of Taprobana, according to Ptolemy.

*Cetaria*, a town placed by Ptolemy on the western coast of Sicily.

*Cete*, in *Zoology*, the seventh order of mammalia, in the Linnaean System of Animals, including the four genera, *Monodon*, narwhal; *Balaena*, whale; *Physeter*, cachalot; and *Delphinus*, dolphin. The cetaceous tribe has one or more spinales placed on the fore part of the skull; no feet; pectoral fins without nails, and tail horizontal.

It is well observed by the late Mr. Hunter, in one of his papers on the whale (Phil. Trans.), that the cetaceous order of animals has nothing peculiar to itself, except living in the same element, and being endowed with the same powers of progressive motion as those fishes which are intended to move with considerable velocity. The popular idea of cetaceous animals being fishes is so strongly impressed on the public mind, that it can never, perhaps, be entirely removed, for the critical observations of naturalists appear too subsite to be generally examined, and of consequence to be commonly understood. The cetaceous tribes live in the same element as fishes, and, partaking somewhat of their external figure, will ever be considered as appertaining to that class of animals by the less informed portion of mankind. Ray and Willughby, and, after their example, Pennant, are the only writers of any moment who acquiesce in this popular prejudice, with the exception of the earlier authors. The writings of Ray and Willughby appeared before the time of Linnaeus, or it is likely they would have been reconciled to the arrangement of the latter: it was through the observations of Linnaeus chiefly that the world became acquainted with the true distinction between the animals of the cetaceous tribe, and fishes, as founded on anatomical investigation. Pennant was acquainted with the circumstances that induced Linnaeus to place them with the mammals, but notwithstanding considered it more natural to follow Ray, and place them in the rank of fishes, because, as Ray observes, "the form of their bodies agrees with that of fish: they are entirely naked, or covered only with a thin skin; and they live entirely in water, and have all the actions of fish." Much as we respect the talents of our illustrious countryman, Ray, it is difficult to perceive, in the present instance, sufficient reasons for preferring his arrangement to that of Linnaeus. The fish is founded on a vague resemblance in external figure between cetaceous animals and fishes, without regard to their internal organization, while the latter relies on an unshaken basis; it was the result of much anatomical investigation, and a due consideration of the nature, habits, and affinities of these two tribes of animals. We need only add, on this point, that the recent observations of that great comparative anatomist, Mr. Hunter, have perfectly eviscerated the accuracy of the Linnaean distribution of these animals, and that it has obtained the further countenance of Dallas, Schrifer, Fabricius, Mulker, Bonnaterre, and many other naturalists of distinguished celebrity in Europe at the present day.

Cetaceous animals, or, as Dr. Shaw expresses them, "fish-formed mammalia," have lungs, intestines, and other internal organs formed on the same principle as in quadrupeds; and, indeed, on strict comparison, the principal differences that exist between them will not be found very considerable; one of the most material seems to consist in their want of posterior legs, the peculiar structure of the tail supplying that defect; this being extremely strong and tendinous, and divided into two horizontal lobes, but which has no internal bones. Like quadrupeds, they have a heart furnished with two auricles, and two ventricles, and their blood is warm and red: they breathe by their lungs, and not by means of gills, as in true fishes. In their amours they agree with quadrupeds: the female produces her young alive, which rarely happens among fishes, and she suckles them with her teats, as in the true mammalia. The structure of their brain, their sexual organs, flomach, and liver resemble those of mammiferous animals. Their skin is smooth, or not covered with scales; and their tail is placed in a position the very reverse of fishes, in being always flat and horizontal, instead of vertical. The cetaceous animals of the cachalot and dolphin genera have the mouth armed with conic teeth; the whales with horny laminate in the upper jaw; and the narval with teeth, or tuls of enormous length. They are neither singular nor ferocious. Their stomachs are large, and divided into chambers to the number of five, as in the whale and porpess, or even seven, as in the narval. In the last particular they seem to constitute an intermediate link between carnivorous and herbivorous animals, approaching nearly to ruminating quadrupeds; but differ in subliming on animal food, as they live chiefly on animex, medusae, and other zoophytes, on cetaceous animals, and on small fish. See the articles *Monodon*, *Balaena*, *Physeter*, and *Delphinus*.

*Ceterach*, in *Botany*, Bough. Pin. See *Aspleniun ceterach*.
CETRACH, in the Male in Molise, an official, agglutinative plant; the same with what is otherwise denominated opilium and solpoderion. See Aspernum.

This plant flanks recommended as an excellent diuretic, and a promoter of the menstrum. The whole plant is to be used, and should be gathered in the month of September. It is given by force in jaundices, in quartan agues, and in obstructions of the spleen; but it is much neglected in the present practice. In some parts of Ellice, where it is common on the walls of their churches, and on the tombs in the church-yards, the common people tell us wonders of its effects in the stone.

CETERIS paribus. See CETERIS paribus.

CETIAH, in Ancient Geography, a river of Asia, in Carmania.

CETII, a people of Asia Minor, in Media; mentioned by Homer, and Strabo. The latter says, that Eurytipius, their king, had his territories about the Caicus, near Cilicia. They probably took their name from the river Cetios, which traversed their country, and discharged itself into the Caicus.

CETINA, in Geography, a town of European Turkey, in Dalmatia; 32 miles S.W. of Modlar.

CETIS, or CETTS, in Ancient Geography, a country of Asia Minor, in Cilicia-Trachis. It was the seat of a priest-hood founded by Apos, son of Teucer, and of which the pontiff was also the sovereign.

CETIUM, a place of Norica, between Carnagieus and Adraste, according to the Itinerary of Antonine.

CETUS, a mountain of Norica, according to Ptoleomy, and in the Itinerary of Antonine marked between Vindobona and Adraste. Bucshing luppis that the ancient Cetin is a ridge extending from near the source of the river Save, towards the Danube, about 6 English miles on the well of Vienna, where it is called Leopoldsburg. The general name is the Kalenberg; which see.

CETODRIGA, SERVAIA, denoting the town of fishers, and inhabited by fishermen, belonged to Laustria. Without tracing the origin of this city, with some fanciful antiquities, to Tubal, who say that he came into Spain in the year from the creation, 5521, we may affirm, with greater probability, that it had suffered much about 22 years B.C. by an African pirate or sovereign (Bogud), who, having landed at Portus Aemebali, and pillaged the adjacent dwellings, founded the Prontomontium Saecum (Cape St. Vincent), and took possession of the town by surprise. The inhabitants were put to the sword, without distinction of age or sex; and the town was then sacked, its walls destroyed, and its buildings set on fire. Other Portuguese authors say, that Marcus Portus Cato, after having conquered the Spaniards, destroyed Cetubriga. Another opinion has prevailed, which attributes the destruction of this ancient city to an earthquake. In its vicinity, to the extent of more than a league, there have been found the ruins of many buildings, and abundance of antiquities; and as no medals have been found belonging to the period immediately subsequent to that of Heraclea, it is probable that Cetubriga was destroyed either in his time or from aet. 1.

CETON, in Geography, a town of France, in the department of the Orne, and district of Montargis; 10 miles S.E. of Bailleul.

CETRA, in Ancient History Language, a short brickier or short figure target, which was very light, and used by the Athenians and Spartans, and was made, as some fays, of the lath-fish; and as others of elephant's skin, but occasionally, it is probable, of both. From the great reman-

CEVA, in Geography, a city and fortress of Italy, in the
principality of Piedmont, and called Aosta, the capital of a
marquisate, situated on the Tanaro; a plain surrounded by
hills, at the extremity of the country, which extends from
the Apennines to the Tanaro, and from thence to the
northern part of the martm-Alps. It was anciently cele-
brated for its cheese, made of ewe's milk. This cheese,
called by the Italians "Rubiola," is much esteemed, even
at present, and sold not only into Piedmont and the Milanese,
but other more distant parts. The hills about Ceva also
produce excellent wine; great quantities of chestnut grow
at the foot of the mountains, and excellent truffles are found
on the neighbouring plains. It was formerly an indepen-
dent state; but in 1395 a great part of the domain was
sold to the town of Aili, whence, in 1571, it came to the
house of Savoy. In 1543, it was besieged unsuccessfully by
the French; and in 1584, a sudden inundation beat down a
great part of the walls, destroyed the bridges, houses, and
churches, and drowned many of its inhabitants; and in
1625, and the five following years, a pestilential disease car-
ried off the greater number of the inhawtants. Ceva was
taken by the French, in the month of April, 1795. It has
one collegiate church, and three convents. It is distant 40
miles from Genoa, and 25 S.E. from Turin. N. lat.
44° 20'. E. long. 7° 51'.

CEVADILLA, SERADILLA, or SARADELLA, i.e. Horde-
dulum, little barley, in Brittany, the South American name of
the Hordeum exoticae cauculium of Caspar Bawin, taken
up by him, Ray, and Perkins, on the authority of Nicho-
las Monardes, who attributes to it the habi of the Euro-
pean barley, with a seed not larger than that of the com-
mon flax, but possessed of highly acrid qualities, of which
the inhabitants of New Spain avail themselves in the cure of
gangrene and other foul ulcers. He says they have the
same effects as corrosive sublimate, or the actual cau>
try; and that the mode of using them is to sprinkle a little of
the powdered seed upon the part, or for the greater safety, to
dilute it with watery liquors, and apply that mixture
in the mixture.

IN limnus's "Anteqnates Academici," they are said to be the most effectual of all medicines for destroying
venereal and other cutaneous infections in children. In our country they are very
rarely met with, but in France they have been ranked among the officinals and obtained the name of the Capuchin
powder. They have been administered internally for the expulsion of worms; but caution is necessary in the use of
166, &c.

CEUDUM, or CEVELUM, in Ancient Geography, a place of
Battic Gaul, marked in the table of Pliny on the
route from Noviomagus to Attacac or Attacac, and sup-
poited by M. D'Anville to be the present Cuyi.

CEVENNES, in Geography, the principal center of
the primitive mountains of France, arising to the level of
the Rhone, seeming to run from north to south, and sending out
various branches towards the east and west. The principal
branch runs along the river Ardeche towards Ales. An-
other traverses the Rhone, on the side of Tournon and
Vicane, towards the plains of Dauphiné. Another branch
forms the mountains of Beaujolais, passing by Tarare, Au-
tun, &c. till it be lost at Avallon. This is about 70 leagues
in length; but in breadth sometimes not more than a league;
it contains the copper mines of Chevi and St. Bel, and some
lead mines. Coal is also found in the desolations. A fourth
branch separates the basin of the Loire from that of the
Allier, and forms the mountains of Poitou. It passes Roanne
on the one side and Thiens on the other, and is lost to-
wards St. Pierre le Montier. The plain of Montriflon
is bounded by this and the last granite branches. A fifth
branch separates the basin of the Allier from that of the
Cer, and passes by Clermont to Montlucon. A fifth
stretches towards Limoges; another from the Dordogne
towards the Garonne; and an eighth branch divides Don-
tin, with the counting of the Cevennes from the
rally dry and barren, and are most entirely formed of steep
rocks; and yet skill and industry have converted them into
fertile lands, so that a soil which, in past ages, would not have
afforded subsistence for one family of savages, does at this
moment support two or three hundred thousand
inhabitants. M. Chapital has described two processes, which are prac-
tised for this purpose. It is a well known fact that the wa-
ters which flow down the sides of a mountain carry the
earth along with them, and wear furrows or ravins of a
greater or less depth, according to the hardnees of the rock
and steepness of the descent. By a series of these progres-
seve degradations the harder rock is laid bare, deep ravins
are cut in the face of it, and every source of which the cul-
tivator might avail himself is utterly destroyed. The inha-
bitates of the Cevennes have found means to correct this
double effect of the waters. In order to fill up a ravin,
they begin by razing at the foot of the mountain a wall
consisting of loose stones quite across the ravin,
and of a height corresponding to its depth. This wall
forms a kind of dyke, opposing its brink to the current of
the waters, and suffering them to pass through while they are
clear; but when, after a storm or sudden shower, they become
turbid, and bring down earth and stones, these substances
are deposited against the wall, while the waters escape through
the stones nearly pure. By the continuance of this proc-
ees, the triangular space above the wall at length is filled.
At the other extremity of this plat of new formed ground,
another such wall as the first is built, and this in the same
manner detains the earth and vegetable mould, thus forming
a second piece of ground. By a succession of similar oper-
atons, other platforms are produced; till at length the
whole ravin is inverted, even to the summit of the moun-
tains, into a number of platforms of good ground, forming
steps one above the other. Under these circumstances, the
waters no longer run in destructive torrents down the sides
of the mountains, but flow gently along the level ground,
or are filtered through the porous earth deposited against
the walls that detain and support it. Thus the mountain,
which formerly preferted to view a scene of desolation, is
made to exhibit amphitheatres of vegetable ground capable
de the richest cultivation. When these natural difficul-
ties are overcome, the husbandman plants the vine against the
upper part of the wall; on the small platforms above de-
scribed he plants mulberry-trees, and cultivates potatoes, In-
dian corn, and every kind of grain; varying his culture to
the greatest advantage on this virgin soil, which is well wa-
tered, and in general of the highest fertility. The vines,
trees, and other vegetable products render the ground firm,
and defy the floods of subsequent times.

By another process the inhabitants of the Cevennes give
fertility to the slope of a calceous mountain. Most of
these mountains are formed by beds of stone about half a
yard in thickness; and the different strata constitute strata
one above another, corresponding to the strata of the
mountain. The cultivator, in order to render all these layers
of equal bread, breaks away the rock, and employs
the fragments in contructing a low wall on the edge of the
platform itself. He then fills the cavity with a bed of vege-
table earth, taken out of the cliffs of the rock, or con-
veyed
veyed on his back from the foot of the mountain, where it has been gradually depopulated by the waters. In this man- ner, under unremitting labour, the soil of the mountain becomes covered with low walls parallel to each other, which confine beds of vegetable earth from one to three yards in width. When these beds of earth are removed, and the walls over-torn by a violent storm of wind or rain, the inhabitant of the Ceylon exerts himself, in preventing or repairing the destructive ravages of the elements. At the first indications of an approaching storm, he clothes himself in a long garment of oil cloth, with an enormous hat of tinned iron, firmly fixed by means of straps. Thus defended, with a mattock in his hand, he drains the water to the feet of his trees, and collects the fruits in cavities, which he had previously formed in the rock itself. By these laborious exertions he constantly prevents inundations, and procures water for his grounds at times when the burning heats rendered them necessary. Such instances of agricultural exertion are not frequent in the Ceylonese; and by such methods one of these mountains is converted, from a flate of arid barrenness, to a high degree of fertility, and covered from its base to the summit with trees, fruits, grain, and other useful productions. This practice of converting the sides of mountains into platforms for the purposes of agriculture is common in China, and gives a singular aspect to the country around Canton; but by the inhabitants of the Ceylones the barren mountains themselves, instead of being left in a state of nature, are rendered fertile.

CEVERTA, a town of Naples in the province of Calabria, Italy; 10 miles N.N.E. of Bova.

CEURAWATH, the name of a particular sect of Danians in the East Indies, who hold the metempsychosys with so much superstition, that they will not kill the leaf insects; their pricks carry a piece of them over their mouth, that no flies may enter. All the other sects of Danians have an aversion for this; and continually exhort their auditors to fling all discord and contention with them. See DANIANS.

CEUTA, in Geography, a sea port town of Africa, in the kingdom of Fez, and province of Gibr, on the south coast of the Mediterranean, belonging to the Spaniards, and serving as a harbour for small vessels. It is the seat of a bishop, suffragan of Lisbon. This place corresponds with the Ethiopia of Polybius, and probably with the Septant of Pliny, who intimates, as others have done, that this latter name was derived from the seven hills in its neighbourhood, called by Mel Sepun Towers. It has been conjectured, that it was built by the Carthaginians, and afterwards belonged to the Romans, by whom it was colonised. In the time of the Greeks it was a station of great eminence; being the metropolis of the places which they held in the Transsahara. It was afterwards abandoned to the Arabs and the Moors by Count Julian; and taken from the Moors in 1499 by J. de la con, king of Portugal, and continued annexed to that crown till the revolution in 1642, when it fell to Spain, and was finally ceded to that country by the treaty of Lisbon in 1598. It has been no less considerable for its advantageous situation at the entrance of the Mediterranean on a rising ground, which is the nearest point to the Spanish coast; than for the beauty of its public buildings and the strength of its walls and outworks; and it has still a good palace and noble cathedral. The Moors laid siege to it in 1697, and have occasionally kept it in a state of blockade since that time. It is distant from Gibraltar about 5 leagues. N. lat. 35° 49'. W. long. 5° 23'.

CEYLON, an island of the East Indian ocean, that lies between 7° 51' and 6° 52' N. lat.; and between 79° 52' and 31° 56' E. long. It is situated at the entrance of the bay of Bengal, by which it is bounded on the north. On the north-west it is separated from the Coromandel coast by the gulf of Mannar, a narrow strait, full of islets, and impassable by large ships. It is distant about 60 leagues from Cape Comorin, the southern point of the peninsula of India, which divides the Coromandel and Malabar coasts. Its circumference is computed to be about 900 miles; and its length from point Pedro at the northern extremity (9° 51' N. lat.) to Donderhead or Dunderhead at the southern (5° 51' N. lat.) is about three hundred miles. Its breadth is very unequal, being in some parts only from 40 to 50 miles, while in others it extends to 60, 70, and even 100. Towards the southern parts it is much broader than in the northern, and nearly resembles a land in shape; and the peninsula of Jafnapatham has received from the Dutch the name of "Hamiled," and point Pedro they call "Ham- erle." Point Major Rennell (See Memoir, p. 449.) has collected a variety of observations, tending to ascertain the true figure of this island.

Ceylon is the Taprobana of the ancients; though they very much differed in fixing its position. Prior to the age of Alexander the Great, the name of Taprobane was unknown in Europe. In consequence of the active curiosity with which he explored every country that he visited, some information concerning it seems to have been obtained. From his time almost every writer on Geography has mentioned it; but their accounts of it are so various, and often contradictory, that we can scarcely believe that they are describing the same island. Strabo, the earliest writer now extant, who has given any particular account of it, affirms that it was as large as Britain, and situated at the distance of 7 days according to some reports, and according to others, of 2 days' sailing from the southern extremity of the Indian peninsula; from which, contrary to what is known to be its real position, he describes it as stretching toward the coast above 500 stadia. (Geog. ii. 124, 183, 192, 1. xv. 101.) Pomponius Mela, the author next in order of time, (De Situ Orbis l. iii. c. 7,) is uncertain whether he should consider Taprobana as an island, or as the beginning of another world; but as no person, he says, had ever visited it, he seems to incline toward the latter opinion. Ptolemy (Nat. Hist. l. c. 22.) though his description of this island is more ample, involves every thing relating to it in additional obscurity. After enumerating various and discordant opinions of Greek writers he informs us, that ambassadors were sent by a king of that island to the emperor Claudius, from whom the Romans acquired the knowledge of several particulars, which were formedly unknown; particularly that there were 500 towns in the island, and that in the center of it there was a lake 155 miles in circumference. These ambassadors were astonished at the sight of the Great Bear and Pleiades, which were conceptions that did not appear in their sky, and were still more amazed when they beheld their shadows pointing towards the north, and the sun rising on their left hand and setting on their right. They also affirmed, that in their country the moon never went until the eighth day after the change, and continued to be visible only to the sixteenth. Such are the particulars, some of which are totally groundless, which Ptolemy relates, and in which he acquiesces without a dissenting observer. Ptolemy, though living near the age of Ptolemy, seems to have been altogether unacquainted with his description of Taprobana, or with the Embassy to the emperor Claudius. He places that island opposite to Cape Comorin, at no great distance from the continent, and delineates it as stretching from N. to S. no less than 15 degrees, of which he supposes to be S. of the equator; and it's representation of its dimensions had been just, it was well entitled from
from its magnitude to be compared with Britain. (Ptol. i. viii. c. 4.) Agathemerus (ibid. ii. c. 8. apud Hudson. Geogr. Minor. vol. ii.) who wrote after Ptolemy, and was well acquainted with his geography, considers Taprobana as the largest of all islands, and aligns to Britain only the second place. Milled by these accounts of the ancient geographers, the moderns have entertained very different sentiments concerning the island in the Indian ocean, which was to be considered as the same with the Taprobana of the Greeks and Romans, and therefore some learned men have erroneously maintained that Sumatra was the island corresponding to the description of Ptolemy and Pliny. The opinion more generally received, is, that the Taprobana of the ancients is the island of Ceylon; and not only its vicinity to the continent of India, but the general form of the island, as delineated by Ptolemy, as well as the position of several places in it, mentioned by him, establish this opinion with a great degree of certainty. Under the emperor Justinian, Colinas, an Egyptian merchant, in the course of his traffic, made some voyages to India, whence he acquired the name of Indiscoulite; and from him we learn, that the island of Tap oobana, which he supposed to lie at an equal distance from the Persian gulf in the west, and the country of the Sinu on the east, had become, in consequence of the commercial situation, a great stock of trade; that into it were imported the silk of the Sinu and the precious spices of the Eastern countries, which were conveyed thence to all parts of India, to Peria, and to the Arabian gulf. To this island he gives the name of "Sickleda" (ibid. xi. 3:36) nearly the same with that of "Scandia" or "Serendib," by which it is still known all over the east. Colinas further informs us, that in most of the cities in India he found christian churches established, in which the functions of religion were performed by priests ordained by the archbishop of Seleucia, the capital of the Persian empire, and who continued subject to his jurisdiction. According to his account, however, none of these strangers settled in India, were accustomed to visit the eastern regions of Asia, but were satisfied with receiving their silk, their spices, and other valuable productions as they were imported into Ceylon, and conveyed thence to the various parts of India. These churches were established by the Nestorians, who sent mercenaries from Persia into India, and particularly into Ceylon. Our knowledge of this island, and other parts of India, was further extended by means of the commercial spirit and successive voyages of Marco Polo, a Venetian of noble family, who, about the middle of the 13th century, explored many regions of the east, which no European had ever visited. He also visited in person Java, Sumatra, and several islands contiguous to them, the island of Ceylon, and the coast of Malabar as far as the gulf of Cambay; to all which he gives the names they now bear.

In the traditionary accounts which are current among the Ceylonese, nothing occurs besides a mere catalogue of some of their princes, accompanied by a long list of high foundling titles, and some uninteresting details of their petty wars and commotions. From some of these accounts, which have been recorded in MS. we learn, that Lankaw Petti Mahadasin, or the much beloved offspring of the always moving fun, who lived at a distant period, was sovereign of the whole island. His two grandsons, however, quarrelled about the possessions which had been allotted to them; and at last compromised their disputes by dividing the island between them: to the one were allotted the interior parts which form the present kingdom of Candy (Candy), and to the other the whole of the low country bordering on the sea-coasts. This division gave rise to a long series of civil wars, and has the example of partitioning the kingdom among the children of the sovereign; and hence we find that there were not less than six or seven princes who reigned at the same time over separate divisions of Ceylon. After a variety and succession of quarrels between its princes, Ziraale Darnu Seria Adaileen disbursed all his competitors, and firmly established himself as its sole monarch. He married his cousin, who was famed for her personal charms, as to acquire the name of "Rone Wandigge," or the beautiful queen. From this union sprang the princes who ruled over Ceylon, when it was first visited by the Portuguese.

The carthell period at which we can look for any authentic or interesting information, is that of the arrival of the Portuguese under Almeida, in the year 1505 or 1506. Being accidentally forced by storms of weather into one of the harbours of Ceylon, he was hospitably received by the inhabitants; and perceiving the advantages that might result from the situation of the island, and its valuable productions, he thought it an object worthy of his attention to cultivate a closer connection with the natives, to which they were also inclined, with the view of defending themselves against the attacks of the Arabs. Almeida, upon being introduced to the king of Ceylon, found it difficult in persuading him to pay an annual tribute to the Portuguese, on condition of their protecting his coasts from external invasion, with which he was then threatened by the Zamarins of Cochim on the Malabar coast, and a rajah who reigned on that part of the Coromandel coast opposite to Ceylon. At this time the inhabitants consisted of two distinct races of people. The savage Bolas (see Cothmus) then occupied, as they do now, the large forests, particularly in the northern parts; and the rest of the island was in the possession of the Cinglefe. The towns of the sea-coast were not ravished from the latter people by foreign invaders; and their king held his court at Columbo (see Coteuse), which is now the European capital of Ceylon. Cinnamon was even then the principal product, and the staple commodity of the island, as appears by the tribute paid by the king to the Portuguese, which consisted of 250,000 pounds weight of cinnamon. Almeida, whose attention was attracted by the rich harvest which the cinnamon of Ceylon presented to commerce, soon endeavoured to secure these advantages by forming a Portuguese settlement on the island; but this conduct roused the jealousy and indignation of the native princes. The reigning sovereign was a Brahmin, and encouraged a trade which his subjects then carried on with the Moors and Malabars of the continent; and they, fearing lest their traffic should be cut off by these strangers, began to foment jealou5ies between the king and the Europeans. Although Almeida had obtained the monarch's permission to traffic with the natives, and to build a fort at Columbo, the Moors contrived to induce the king to repel his grants, and to revoke them. After a vigorous contest, and in consequence of some internal troubles which then distracted Ceylon, the king was obliged, in 1522, to renew the original treaty, and to grant full permission to build a fortres at Columbo. A contest, however, ensued, in which the Ceylonese were completely defeated: and the Europeans acquired fuel superiority, that the king, despairing of recovering Columbo, only thought of preventing the Portuguese from extending their possessions. With this view he erected a strong fortres at Sittavavea, 35 miles from Valentia, and fortified the palls of Cuddavelli and Gara-waddil, which led into the interior of his dominions. The Portuguese, on the other hand, began to foment internal discontents among the natives. The king was weak and irresolute; and as the encroachments of the Portuguese increased, and they began to treat the natives with great cruelty, as ambitious

Vol. VII.
ambitious person of low birth, named Raja Singa, feized the advantage of the moment, and by his talents and intrepidity rose to the highest rank and power. Such was his ascendency over the king, that none of the nobles were undaunted in order to satisfy his jealousy and ambition; and he terminated his career by murdering the king himself; and usurping the throne. Raja Singa gratified the people by a long course of implacable hostilities against the Portuguese; but the natives themselves soon found that the cruelty of this usurper knew no bounds. At length his subjects of the low lands, exasperated by his barbarities, sought relief from the Portuguese, who readily availed themselves of the occasion. It was at this time they had at first an opportunity of exploring the N.W. parts of the island. Among those who fought the protection of the Portuguese, were two sons of Viana, who, in consequence of an interregnum excited by him against Raja Singa, had made himself master of several of the internal provinces. These young men, having escaped the usurper, were kindly treated by the Portuguese, converted to their own religion, and baptised under the names of Don Juan and Don John. One of them was to be appointed king, and the other generalissimo; and in return for these promised benefits, they were to marry Portuguese ladies, and to own subjection to the crown of Portugal. In the mean while it was publicly announced, that Don Juan was to marry Donna Catherina, the daughter of the late king Adafeyn, who had been murdered by Raja Singa. As this prince was the lawful heir of the whole empire, the Portuguese, who were his odious and avowed protectors, were enabled to form a powerful party among the natives against the usurper, and to obtain over him a decisive victory. Upon this, they immediately crowned Don Juan king, and put him in possession of Candy. Don John, however, offended by this preference of his brother, contrived to poison him, and to seize the royal authority. The Portuguese auxiliaries were soon summoned to quit the dominions of Candy; and Raja Singa taking the field, threatened Don John and his adherents with the most cruel death. A desperate battle was fought between the two usurpers, and the issue was the complete overthrow of Singa, who soon after died. After his death, Don John found another competitor in his minister Janiere undaan, who, having taken possession of his master's domains, proclaimed himself king, and applied to the Portuguese for succours, which were readily granted him. The Portuguese, who had received a reinforcement from Goa, marched against Don John, gave him a complete overthrow, and obliged him to take refuge in the woods. In consequence of this advantage, they began to tamper with the inferior princes, and attempted to persuade the Ceylonese to acknowledge the sovereignty of the king of Portugal; but the natives were unanimous and urgent in their request, that Donna Catherina, the daughter of their beloved emperor, should be placed on the throne. The Portuguese contented this proposal, hoping that her youth would allow them to exercise an uncontrouled government under the mask of her authority. During the festivities that took place on her return from Mannaar to Candy, Don John, in the disguise of a beggar, attempted to set fire to Candy; but frustrated in his object, a reward was offered for apprehending him, and he escaped with difficulty. The Portuguese thinking their power secure, renewed the exercise of their wonted pernicious and cruel policy. The natives, incensed by the injuries they suffered, formed a league against their oppressors, at the head of which was Janiere, who had been seduced by the Portuguese with the promise of marrying Donna Catherina, after she had been quietly seated on the throne; and who resented the delusion by opening a negotiation with Don John, to whom he offered the dominion of the low lands, provided he was allowed to retain an undisturbed possession of the interior. The Portuguese, on discovering their correspondence, caused Janiere and his attendants to be murdered in the palace of Candy, where he then resided; upon which all the other princes, with their troops, immediately fled from the Portuguese camp, and the young queen halted her company, threatening the Portuguese with the effects of their treachery. Accordingly the Portuguese, against whom the natives combined, were obliged to leave Candy, and to retreat towards the coast. They were pursued, however, by the Ceylonese, and in the end overpowered. Don John, availing himself of the victory, made himself master of the forts of the interior; compelled the princes, who had joined the Portuguese, to sue on their knees for mercy; and completed his career by marrying Donna Catherina, then 12 years of age. After many fruitless conquests, the Portuguese were overpowered by the natives; but they had contrived at an early period to secure the most important part of the island, viz. the sea-coasts, where the valuable spices were produced. Under Albuquerque, the successor of Almeida, the rich low lands around Colombo and to the northward of it already formed a part of their dominions, and the natives from that time forward only obtained possession of them during some accidental incursions. Albuquerque extended his views to other parts of India; and Ceylon, instead of being made the centre and guardian of the Portuguese possessions in that part of the globe, continued to be cultivated by them chiefly on account of its own natural productions. The Portuguese conducted their government in a manner that abanoned instead of conciliating the attachment of the natives; and beside other acts of insult and oppression, they treated their religious opinions with contempt, and persecuted those who held them with the most wanton cruelty. At length the religious bigotry of the Portuguese completely triumphed over their real interests; and the Cinglee regarded with horror strange gods, who seemed to delight in blood, and chose rather to leave the tea-coasts to their enemies, and to seek refuge for themselves and their grotesque idols in the mountains of the interior. Thither they were pursued by their tyrannical invaders, and in return the Cinglees made frequent incursions on the tea-coasts, and often destroyed the richest plantations. This defultory warfare continued for almost a century, with much bloodshed, and no real advantage to either party. As the jurisdiction of the interior was at this time parcelled out among a variety of petty princes, each of whom was the sovereign of his particular tribe, or separate valley, the policy of the Portuguese led them to stir up animosities among them, and to prevent their making a common cause for the deliverance of their country. By acts of this kind they gradually extended their dominions into the interior of the island; and wherever they became masters, their avarice and bigotry prompted them to perpetrate such cruelties as have ever since rendered the name of an European hateful to the ears of a Cinglee. In this state of disaffection, the Cinglees were offered powerful assistance by the Dutch, whose admiral, Spilbergen, in the year 1622, ventured to approach the coasts of Ceylon; and the natives, from their hatred of the Portuguese, gave him a very favourable reception. At the time of their arrival, Don John was looked upon as emperor of the island; and to him Spilbergen was introduced, with the assurance that he and his countrymen were the invertebrates of the Portuguese, and that they would effectually aid the Ceylonese in expelling the Portuguese from their island. The king of Candy received this proposal with great joy: "Tell your countrymen,"
CEYLON.

said he, "that if they will only be willing to build a fort in this island, myself, my wife, and my children will be the first to supply them with the necessary materials." The Dutch lost no time in availing themselves of the advantages that were offered; and next year Schaad de Wert and Van Warneck arrived with seven ships, and in a conference with the king, proposed to conclude a treaty. A serious dispute, however, occurred, and Don John, under the sudden impulse of resentment, caused the Dutch commander, De Wert, and his attendants, to be instantly murdered. The king soon repented of this rash act; and it is said that to the day of his death, which happened soon after, he lamented the murder of the Dutch. After the death of Don John, the inferior princes, hitherto awed by his authority, began to assert their independence; and the prince of Ouvé, the most powerful among them, openly applied to the supreme dominion. The capreolus Donna Caterina, however, soon succeeded, by her activity and address, in reducing those disturbances. She rejoined an alliance with the Portuguese, and afterwards married Converrat, a kinsman of the late king, and sent a deputation to the Dutch, requesting their alliance against the Portuguese. The Dutch expressly complied; and in 1612 Marcellus de Bouchover arrived at Ceylon as ambassa-
dor from the States of Holland, and was received with every possible mark of distinction; a chair of gold being prepared for him, and also robes of white, which is the royal colour. He concluded with the king a treaty, consisting of 33 articles. Among other stipulations, it was agreed that a per-
manent peace should be established between the Dutch and Candians; and in case of an attack by the Portuguese, the Dutch agreed to reftitute with them all their forces. In return, the king allowed the Dutch to build a fort at Cottaram. They were also allowed to erect at Candy warehouses for goods. The king likewise engaged to convey all the mer-
chandise of the Dutch to Candy, and whatever they pur-
chased in his dominions to Cottaram at his own charge. All his subjects were to be at liberty to traffic with the Dutch, who were allowed to export all sorts of merchandise free of duty. He also engaged to deliver to them all the cinnamon grown in his country, to be paid for in goods at the usual exchange rate. The king stipulated further not to grant free commerce to any European nation, without the express consent of the Dutch. The cumbens agreed upon by both parties were to be shared equally by the contracting powers. The king agreed to furnish the Dutch with tim-
ber, and other materials for ship-building, at a moderate rate, and he obliged himself to dispose of all his precious flowers and pearls to the Dutch, at a fair rate; and they, on their part, stipulated to supply him with fett jewels and other valu-
able ornaments. The king alone was to have the power of coinin money, or to fix its value; and any subjects of either power who were convicted of coining base money were to be put to death. All the officers of the Dutch company were to be exempt from his majesty's jurisdiction, and to be tried for any offence by their own countrymen; and the same privilege was reciprocally extended to the subjects of the king. All prizes taken on the coasts of Ceylon were to be shared equally between the contracting parties, provided the prisoners be ransomed and not put to death. Prizes were to be granted by the Dutch officers to such of his ma-
Jesty's subjects as intended to trade in the parts possessed by the company, and the same from the king to the Dutch sub-
jects intending to traffic in his dominions; and all who traded without such prizes were liable to be feized, and to have their goods confiscated. The contracting parties engaged to do their utmost to preserve inviolate the stipulations of this treaty, the principal of which have been above recited, and to give full satisfaction for any damages incurred by the violation of them, as well as to inflict severe punishments on those who were guilty of infringing them. This treaty, which was concluded in the name of the king of Candy and the prince of Orang out, displayed much seeming moderation on the part of the Dutch; and it would have been happy even for their own interest, if they had maintained the same moderation in their transactions with the natives, after hav-
ing gained a firm footing in the island, while they were attempting to obtain a settlement by the arts of seduction. The Portuguese were alarmed at this alliance, and attempted to prevent its effect; but their efforts, though renewed with vigour for several successive years, proved ultimately unsuccess-
ful. In 1656 the Portuguese were reduced to the neces-
sity of surrendering Columbo to the Dutch, after a siege of seven months, and a loss to the combatants of not fewer than 3000 lives. By the fall of this place, an end in fact was put to the dominion of the Portuguese, about a century and a half after their first arrival. In 1658 the Dutch, under Vander Gocs, took Manzar, and the Portuguese were flung up in Jaffnapatam, the only fort remaining in their po-
fession. At length, after another futile defence, a Portuguese fleet, which attempted to relieve the place, being defeated, and no hope of succour being left, the garrison surrendered, and the Portuguese were thus totally driven from the island.

The joy of the Ceylonese, on being rescued from the yoke of these tyrannical invaders, and their gratitude to their deliverers, at first knew no bounds. The king of Candy voluntarily paid the expenses of their armaments in cinnamon; and conferred upon his new allies the principal possessions, from which he had by their alliance expelled the Portuguese. Among these were the port of Trincomalee, and the fortresses of Columbo. The former of these, which lies on the N.E. part of the island, is that harbour which renders Ceylon the most valuable station in the Indian Ocean. Columbo was originally built by the Portuguese in the S.W. of the island, in the heart of that tract most cele-
brated for the production of cinnamon, as the most commodi-
dous for collecting that staple production of the country. Along with this port, the king of Candy also bestowed on the Dutch the towns of Nigumbo and Point de Galie in the same quarter, together with a large tract of rich land ad-
joining to them. The Dutch appeared exceedingly grateful to the Candian monarch for all these concessions; they as-
fumed only the humble appellation of "Guardians of his couls;" and began to fortify the different stations put into their hands, merely, as they said, for his security; and the Candians were so well convinced of the good intentions of their new allies, that they affidled them to the utmost of their power in completing their operations. The Dutch took this opportunity of increasing the strength of their principal port at Columbo; enlarging the town and render-
ing the fortifications as complete as possible. Their port of Trincomalee they also endeavoured to secure against any attack either from an external or a domestic enemy. Their numbers in the mean while were daily increasing by the ac-
sess of new adventurers from Europe. The parts assigned to them were the best fitted for cultivation in the island; and they lost no time in turning them to the best account. By means of these prudent measures, and persevering industry, the colony was soon brought into a flourishing state, and was able to depend upon its own internal resources. During this period, they maintained the most friendly intercourse with the natives, and this conduct, besides favouring the un-
interrupted prosecution of their plans of improvement, was also of very considerable benefit to their commerce. If the

Dutch
Dutch had professed in the same wife and moderate policy, it is probable that Ceylon would, in process of time, have become as profitable to them from their intercourse with the natives, as if it had been wholly possessed by Dutch settlers. But the ruling passion of the Dutch, their avarice, soon began to over-reach itself; and by rapaciously seizing every opportunity of gain, they quickly dishonied and alienated the natives. By pushing their polls farther and farther into the interior, and fixing upon every spot that seemed to be fit for cultivation; and at the same time by increasing their demands on the king for the protection they afforded him; the king soon found that all the cinnamon which grew in his dominions was insufficient to gratify the “Guardians of his coals.” At length, enraged by their repeated exortions, he fell suddenly upon their settlements, and committed the greatest devastations. This breach between the Candians and the Dutch was succeeded by a long course of hostilities, which occasioned the shedding of much blood, and afforded no permanent advantage to either party. The Dutch, however, were the greatest losers. Their affairs in the interior, amidst woods and desarts, were dearly purchased; whilst the incursions of the natives into their cultivated poffessions on the coasts, though in general easily repulsed, often destroyed the labour of years. Several of the Dutch governors were induced by these considerations to attempt the restoration of tranquility, rather by conciliating the natives than by measures of violence and force with them. Accordingly they sent ambassadors to the Candian king, with rich presents, and with various expressions of respect. They wrapped their letters to him in silk embroidered with gold and silver, and their ambassador carried them all way on his head, the highest token of respect known in that country; and in these letters, they dignified the king with the high-founding titles usually conferred upon an eastern monarch. Such conciliating measures, though not often adopted, produced effect. The renewed oppressions of the Dutch were the confident signal for the renewal of hostilities between them and the natives, in which the Dutch were frequently great sufferers; though European discipline and Dutch perseverance generally surmounted all difficulties, occasioned by the woods and forftesses to which the natives retired. The Dutch, however, suffered much from the climate, which, in the interior parts, is exceedingly unhealthy to Europeans. See CANDY. Indeed, the behaviour of the foreign nations, which have successively invaded Ceylon, has tended greatly to nourish sentiments of independence and of allegiance and attachment to their native kings among the inhabitants, and the crudities of the Portuguese and Dutch have so exasperated them against all Europeans, that it will require much pains to reconcile their minds to far as that any confidence can be rep fed in them. These and similar causes combined to frustrate the attempts of the Dutch at forming a settlement in the interior of the island; whilst the difficulties which they encountered made them affect to despise the advantages which they could not attain. But notwithstanding they seem to have been convinced that it was impracticable to retain possession of the interior, yet their own misfortunes had shown to many of jealousy between them and the Candians, that they were often obliged to have recourse to arms. The last great war which they carried on with the natives was about the middle of the 18th century. In 1764 they penetrated into the heart of the king’s dominions, and made themselves masters of Candy. But after experiencing great hardships from the climate, and from the activity of the natives, they were at last obliged to evacuate the capital. Notwithstanding the disasters which they suffered, they continued to harass the king of Candy; and, particularly, by depriving him of salt at pleasure, they compelled him to comply with all their demands. In 1866, he was under a necessity of acceding to a treaty which greatly curtailed his dominions, and reduced him almost to the condition of a prisoner at large in those that remained to him. All those parts of the in-coal, which had not formerly belonged to the Dutch, were now ceded to them, with the addition of several other advantageous tracts. They insisted that the king should have no intercourse with any other power, and that he should deliver up all foreigners or subjects of other princes, who should happen to come into his dominions. All cinnamon which grew on the coasts was deemed as exclusively Dutch property; and the natives, by way of special privilege, were allowed quietly to cut and carry it to the several Dutch factories in the island. The cinnamon that grew in the woods was allowed to be, in some degree, the property of the natives; they were obliged to peel and sell it to the Dutch at a six-fold per pound; that is, a coin of nominal value, which exchanged for about the worth of two flings' weight of their copper money. Independently of cinnamon, the other productions of the island were not over-looked; but the king of Candy was also obliged to stipulate, that his subjects should gather the pepper, cardamoms, coffee, and cotton growing in the interior, and sell them to the Dutch at certain very low prices. A certain proportion of elephant’s teeth, areca nut, and betel leaf, together with a share of the precious stones found in the country, formed part of the tribute imposed on the natives. The number of elephants to be delivered up was so in the two seassons, which the Dutch transported to the eofficial coast of the continent, and fold to the native princes there at very high prices, as the elephants of Ceylon are accounted superior to all others. The pearl fisheries on the west and north-west shores, where the pearl-banks are situated, formed another acquisition to the Dutch by this treaty. Several persons from the Malabar coast, and other parts of the continent, had established cotton manufactories in the northern towns of the island, particularly at Jaffnapatam; all of which were now given up to the Dutch. In return for these valuable acquisitions, the Dutch acknowledged the king of Candy to be the emperor of Ceylon, with a long file of otherounding titles, which served only by their mockery to aggravate his mortification; and under which magnificant appellations, they engaged, as his dutiful subjects, to pay him a tribute, and to send ambassadors yearly to his court. The most important stipulation, on the part of the Dutch, was that of supplying his people with salt, free of expense, and in such quantity as to equal their consumption. The article of tribute was soon infringed; and, indeed, scarcely one stipulation of the treaty was fulfilled with good faith. By this treaty the Dutch obtained a monopoly of all the valuable productions of the island, and left to the king and his subjects only the hard condition of aiding them in availing themselves of their acquisitions. Such degrading and harsh terms naturally exasperated the Candians and cherished, in their breasts, the most rooted and inveterate hatred to their oppressors. The consequence was a renewal of hostilities; and about 20 years ago the Dutch again penetrated into the king’s country; but they were so vigorously attacked by the natives that general de Moun, then a colonel in the Dutch service, narrowly escaped being cut off with a large detachment near Sattvav, and got back to Caledonia. At length hostilities, which were unravelling, were discontinued by mutual consent. The Dutch were chiefly anxious to prevent any connexion from being formed between the natives and foreign; and the king of Candy was resolved, to prevent any intercourse between his subjects and a nation, which
which he found ready on every occasion to deprive him of his rights in order to gratify their own avarice. A few articles of no great value, such as betel-leaf, araca, and coconuts, were occasionally smuggled by the natives down to the Dutch provinces; but these practices, when discovered, were severely punished by the king.

Such was the situation in which affairs stood between the Dutch and the native Ceylonese, towards the commencement of the late war. It was now about 140 years since the Portugueze had been finally expelled, and no other European power had since that time been able to acquire a permanent footing on the island. Soon after the expulsion of the Portugueze, about the year 1672, the French seem'd inclined to dispute the possession of Ceylon. Accordingly they appeared off the island with a large fleet, entered into a treaty with the native prince, and avowed their determination to expel the Dutch. But their enterprise planned without wisdom was executed without spirit, and imaginary obstacles prevented the French from even attempting to gain a settlement on the island. Towards the conclusion of the American war the English made a more formidable attempt against the power of the Dutch in Ceylon. A fleet, under the command of Sir Edward Hughes, having on board a detachment of land-forces, commanded by Sir Hector Munro, was dispatched about the beginning of the year 1782, to attempt the reduction of this island. This enterprise, which commenced prosperously, by gaining possession of fort Ollenburg, a strong fort in the vicinity of the bay of Trincomalee, afforded an encouraging prospect of speedily reducing the whole island; and Lord Macartney, then governor of Madras, determined to lose no time in securing and improving this valuable acquisition. But dilatory measures, always incompatible with success in military operations, afforded to the French admira Suffren an opportunity of taking possession of Trincomalee, and of mooring in the bay a fleet of thirty-fee of the line. Although the British fleet, after being refitted in the roads of Madras, arrived off Trincomalee, and notwithstanding its inferiority in numbers, attacked and routed the French; the latter found a secure retreat under the cannon of these forts, which their activity, and the want of precaution on the part of their enemies, in not leaving a garrison and stores sufficient to undergo a siege, had suffered to fall into their hands. Thus, the attempts of the English to attain possession of Ceylon were, for this time, frustrated. As the harbour of Trincomalee, which is equally secure at all seasons, offered to the English the means of obviating disadvantages to which the coast of Coromandel is subject, it must be evident, that, on the final rupture with the Dutch, our countrymen would again attempt to gain possession of it. Accordingly, the junction of the Dutch with the French republic in the late war was the signal for the commencement of our operations against their colonies in the East. In 1795, a body of troops was detached for the conquest of Ceylon; and this enterprise was crowned with success, after a course of military operations which will be detailed in describing the several places where they were carried out.

After this abridgment of the history of Ceylon, we shall now proceed to give a particular account of the island itself; which is become of peculiar importance to this country, since, by the fifth article of the treaty of Amiens in 1802, the Dacian republic has ceased and guaranteed, in full property and sovereignty, to his Britannic majesty, all the possessions and establishments in the island of Ceylon, which, previous to the war, belonged to the republic of the United Provinces, or to the Dutch East India Company.

In approaching this island from the sea, it presents to view a frither green, and more fertile appearance than most parts of the Malabar and Coromandel coasts. All the flat tracts on the sea-shore are bounded by beautiful tropic, or groves of cocoanut trees, while the intermitive plain is covered with rich fields of rice; and the prospect commonly terminates in woods, which cover the sides of the mountains, and display a verdant foliage through every season of the year. The eastern coast appears bold and rocky, and a few reefs of rocks run out into the sea on the S.E. between Point de Galle and Batacoo. The deep water on the eastern shore admits the access of the largest vessels in safety; and if that side of the island be the least fertile, its other defects are amply compensated by the harbours of Trincomalee and Batacoo. The north and north-west coast from point Pedro to Columbo is flat, and indented with considerable inlets of the sea; the largest of which extends almost quite across the island from Manilappatt to Jaffnapatam, on the N.W. point of the island, forming the peninsula of Jaffnapatam. Several of these inlets form small harbours, accessible to vessels of small size. The interior of the island abounds with steep and lofty mountains, covered with forests and full of almost impenetrable jungles. The woods and mountains completely surround the dominions of the king of Ceylon; and the island is divided by the most lofty range of mountains nearly into two parts, to completely separated from each other, that both the climate and feasons on either side are essentially different. These mountains also terminate the effect of the monsoons, which set in periodically from their opposite sides; so that not only the opposite sea-coast, but the whole country in the interior, suffers very little from these storms. The monsoons set in much sooner on the western than on the eastern side of the island. On the west side, the rains prevail in the months of May, June, and July; and this is the season when they are felt on the Malabar coast. This monsoon is very violent, being accompanied with dreadful storms of thunder and lightning, together with vall torrents of rain, and violent south-west winds. In the meanwhile, the northern parts of the island are very little affected, and are even generally dry. In the months of October and November, when the opposite monsoon sets in on the Coromandel coast, the north of Ceylon is affected, and scarcely any impression is felt in the southern parts, with the exception of some particular rains. These monsoons pass slightly over the interior of the country, which nevertheless experience dreadful storms. During its own periodical season, in March and April, the rain descends in torrents, and the thunder and lightning are extremely awful. The days and nights in this island, lying near the equator, are of nearly equal length; the variation, during the two seasons, not exceeding fifteen minutes. The feasons are more regulated by the monsoons than by the course of the sun; the cool season being at the summer solstice, while the western monsoon prevails. The spring commences in October, and the hottest season is from January to the beginning of April. The heat, in the day, is much the same throughout the whole year; but in the rainy season, the nights are much cooler. Upon the whole, the climate is much more temperate than on the continent of India; as the heat is lessened by the constant sea-breezes, and it is not annoyed by the hot and suffocating land-winds. The shade of the bushes furnishes a tolerably cool retreat. In the interior of the country, however, where thick and close woods and the hills crowd upon each other, the heat is greater by many degrees than on the sea-coast, and the climate is often very sultry and sulthorious.

The principal harbours in the island for large ships are Trincomalee and Point de Galle; and they also anchor, and
CEYLON.

from the beginning of December to the latter end of March, moor securely, in the roads of Columbo. Smaller coastering vessels find shelter in several other inferior ports; i.e., as Batacalo, Matura, Dambat, and Cultura, on the S.W.; and on the N. and W., Negombo, Chilaw, Colombo, Mannar, and Point Pedro. At all these ports are rivers of greater or less magnitude, that empty themselves into the bay; and these rivers, which are very shallow, deep, and navigable to some distance for small craft, are very beneficial to the inhabitants of the parts that are adjacent to the several ports, as they furnish a cheap and easy conveyance of their produce and merchandise to places where the European vessels wait to receive them. See Candy. Defides the rivers with which Ceylon abounds, it has many lakes and canals of considerable extent, communicating with them, particularly in the neighbourhood of Columbo and Negombo. Along the coasts there are roads and stations for travellers; but they are, in many places, rugged and steep, and accommodated with large tracts of heavy sand; and, besides, they are rendered dangerous by the multitude of wild hogs, buffaloes, and elephants, which infest them. These animals are met with particularly from Chilou to Mannar on the west side of the island, and from Matura to Batacalo on the east. Since the English have had possession of the island, the roads have been greatly improved. The soil of Ceylon is, in general, sandy, with a small mixture of clay. In the S.W. parts, however, particularly about Columbo, there is much sandy ground, very rich and productive; which is chiefly occupied with cinnamon plantations. The island does not produce rice enough for the use of its inhabitants, but requires annual supplies from Bengal, and other places on the continent. The culture of rice, however, has increased since March 1802; and many tracts on the west coasts, hitherto wild, marshy, and uncultivated, have been applied to this purpose.

The island of Ceylon was originally divided into a number of distinct petty kingdoms, separated by rivers and mountains, and subject each to its own independent sovereignty. In process of time it was reduced under the dominion of the king of Candy, who divided it into a few large provinces, from which the native titles which he still retained. These provinces were Candy, Colton, Matura, Dambool, and Siutucca, which included the rich districts on the west coast. The chief of these was Candy, which is. These provinces were subdivided into districts, known by the name of "Corlas," and corresponding to our shires or counties. These subdivisions are still continued in the parts wrested from the natives by the Dutch, and the government of each is given to the civil and military officers, who hold posts in their vicinity. The great divisions of the island are now reduced to two; the one comprehending those parts that are under the dominion of Europeans, and the other those which still remain in the possession of the natives. The European dominions, it is ob- served, like a ring, completely encircle the territories of the king of Candy. The capital of the European dominions is Columbo; which is, though Trincomalle (see Trincomalee) is of much superior importance, on account of its excellent harbour. The next port to Trincomalle on the N.W. is Malecote; which is; and beyond, in the northern direction, the extremity of the island is flanked out into an oblong peninsula, by a branch of the sea, which penetrates across the island, except that a small strip of land remains, which is very mantled at high water. This district is named Jaffna-patam; which is. Dependent upon this district or Jaffna, and at a small distance in the N. to the N.W. of Point Pedro, are several small islands, which the Dutch have named Delit, Hearum, Leyden, and Amsterdam. These islands they employed in breeding horses and cattle, as from their excellent pasturage they are better adapted to this purpose than any part of Ceylon; and the English government has adopted the same system. The woods, towards the interior, separating this district and others from the king of Candy's dominions, are inhabited by a race of savages, supposed to be the aboriginal inhabitants of the country, and from them which fed. The narrow strip which lies between this side of the island and the continent is called the gulf of Mannar; which is. Between Manner and Badulla (which is. the Coromandel coast, is a line of sand-hills, called "Adam's bridge," (see Colombo), and Ramas bridge, in a tradition that the god of this name came by this way into Ceylon. This tradition is connected with a variety of others that sublimate among the natives, who universally believe that Ceylon was either the paradise in which the inhabiter of the human race resided, or the spot on which he first trod on being expelled into the celestial paradise. Accord. Adam's bridge, is, in their opinion, the way by which he passed over to the continent; and force imagine, that the gulf of Mannar, like the Red Sea, in scripture history, closed after him to prevent his return. But these traditionary tales, it is an almost universally received opinion, that Ceylon at some distant period formed a part of the continent, and was separated from it by a vast great convulsion of nature. Nor is this improbable, if we consider the narrowness of the intervening space, and the numberless shallows with which it abounds. Defides, the appearance of the soil and the surface of the country, on the west coasts of Ceylon, and the opposite continent, very much resemble one another. A tract of flat calcareous rocks seems to run quite across Adam's bridge; and it is found to the water's edge on both shores, and in the low islands that lie on the passage. In proceeding along the coast of Ceylon from Mannar, the country is sandy, wild, and barren; equally deficient in accommodation and provisions. The woods are too much infected with wild animals, that it is very dangerous to travel this way without a proper guard. Here are none of those lofty eminences which diversify the landscape of S. E. India; and the scenery is much less varied than the tract of low flat land; but farther in land there are rice and paddy fields, with some scattered hedges. This appearance continues about 50 miles to the southward of Mannar, when the wood and jungle again begin to approach the shore, and to cover the whole surface of the country, till at Colombo the cinnamon woods show the commencement of the district of Negombo. About twelve miles onward from Mannar is the village of Arippo, where the civil and military officers who attend the pearl-fisbery reside during the season. For their accommodation they have built here a "Choultry," or line-barracks, which also serves for the reception of occasional travellers. Arippo is the only place in this quarter where good water can be procured. Here is also a chapel for persons of the Roman Catholic persuasion, consisting chiefly of the Parawas and Malabars, who resort hither during the season of the pearl fisbery. It is their custom devoutly to offer up their vows and offerings before they commence diving for the oysters. In the neighbourhood of Arippo the woods are full of deer and wild fowl, which are brought by the Cingle-seafarers to the officers flat-shie during the season of the fisbery. About twelve miles from Mannar lies the bay of "Covelong"; which is. In sailing along from Mannar to Columbo, a distance of about 150 miles, the coast presents in general nothing but the most drear and barren appearance, except where it is covered by almost impenetrable jungles. Detachments are posted in some
some few places for the protection of travellers; but the road is far for the great part extremely bad, and the country is much infested with buffaloes and elephants. At Pomparró in a broad lake, which cannot be passed during the rainy season; and besides, there occur in the way two or three broad rivers, as the Mofalere and Mahâragh, which rise from the mountains in the interior. The first post at which you arrive is Culpenten; which fee. For an account of Puttalam, Chilas, and Nigumbo; see the extracts. From Nigumbo southward the road is extremely pleasant; being shaded the whole way, and provided with a number of resting places for travellers. About half-way to Colombo is a very large "Chouletry," or bazaar, to which the officers of the garrison frequently resort on shooting parties. It is situated on a very delightful spot in the midst of a picturesque country, abounding with fiphe and several species of game. For an account of Colombo, the capital of the Dutch dominions in Ceylon; see Colombo. The country round this capital is, for several miles, flat and very rich; diversified with fields of rice and pasture, and a variety of groves, in which the cocoa-tree is most copious; and embellished with gentle eminences, together with a number of small rivers, lakes, and canals. shady roads everywhere intersect the country, which prevails to view country fests and gardens; and on the banks of the river Mutwal is an elegant building, in which the governor resides; and there are also on the fame banks and in the adjoining groves several temples of the natives. Cinnamon trees abound, both wild in the woods and cultivated in the gardens. The road from Colombo lies by the sea-side for six miles, as far as Gal-kettie, a small village, in which a church for the accommodation both of the Dutch and Cingalese; and from hence to Pantura, a distance of 12 miles, the road is well shaded, and agreeably diversified by a part of the cinnamon gardens, which crosses this tract. From Pantura to Colomera, (which fee), an interval of 10 miles, the whole country seems to be one delightful grove; and the road appears like a broad walk through a shady garden. In tracing the easterm coast, we find Barbareen and Bentot, (see Colomera), and at length arrive at Point de Galle, for an account of which, fee that article. About 20 miles to the south is Billigamne or Bolligam, seated on a bay formed by an indenture of the coast, well inhabited by fishermen; and at the distance of 10 miles from Point de Galle lies Matura; and about four miles from Matura is the most southern point of Ceylon, called Dondre-bead. See Matura and Dondre-bead. For an account of the principal places in the European dominions on the easterm side of the island; see Batticalo and Trincomalee.

It appears, from the survey of this island, made by captain R. Percival, and delineated in a manner no less entertaining than instructive in his "Account of the Island of Ceylon," which has enabled us to enrich this article with interesting information, that the internal wealth, as well as the population of the European dominions," lies on the west and south-west coasts; while that lucrative station for shipping, which renders Ceylon of so much importance to our other East Indian dominions, lies at the opposite side, and in the most barren quarter of the island. The present state of the roads is such as almost entirely to preclude all intercourse by land between the opposite sides of the island, which are thus prevented from imputing their advantages to each other. In time, however, these defects may in a great measure be remedied; and many beneficial plans have already begun to be executed by the intelligent officers who at present command in the island. It is probable also, that in time the poorer lands in the north and east parts may be employed to raise the necessaries of life, while the rich plains around Colombo are entirely devoted to its valuable spices.

The inhabitants of the sea-coasts of Ceylon are composed of a variety of different races. At Colombo, in particular, the natives of every country in India appear to have their representatives; and the manners and customs of these distinct tribes are such as belong to their native countries. Besides the native Ceylonese, who live under the domination of the Europeans, and who are denominated Cingalese, the coasts are chiefly inhabited by Dutch, Portuguese, and Malays. The Dutch, who are born and reared in India, are very different in their habits and modes of life from those of Europe. The chief trait that distinguishes their original Dutch character is their fondness for gin, and tobacco. In other respects they adopt the customs and little habits of the country. A Ceylonese Dutchman refers to his situation, and begins the day either with a walk, or with sitting down by his door in a loose robe and night-cap to smoke a pipe. This, with a glass of gin, fills up the first hour. At 7, a dish of coffee is handed to him by his slaves, and his lounging posture and pipe are again resumed. He afterwards drolies, and either goes to business or to pay visits, in which he usually takes a pipe and glasses at every hour where he calls; and in his salutations on these occasions he is very ceremonious. If he prolongs his visit, he throws aside part of his dress, and puts on a night-cap, and then he and his companions smoke and talk till noon. At 12 he sits down to dinner, regaling himself with very gross and heavy food. After dinner he refines his smoking in an undress, and then sleeps for an hour. As soon as he is again dressed, he pays his visits abroad or receives company at home; and this, with another pipe, occupies the interval till the hour of nine announces supper. Capt. Percival represents them as proverbially indolent and lazy, ignorant and stupid, without capacity, and without desire of acquiring excellence by exertion. Their children are commonly neglected, and committed to the care of slaves. Their own minds become selfish and contracted, callous to the feelings of humanity, and prone to treat their slaves with severity upon the slightest provocation, and often from mere caprice. Their women are generally treated with neglect; nor can it be expected that, in such circumstances, they should much contribute to the art of pleasuring. In the forenoon their drees is flowing, but at their evening parties they appear decked out in abundance of finery. The culture of their minds occupies as little of their attention as the adorning of their persons; their education is disregarded; and from their infancy they imbibe manners and superfluities monstrous to the female slaves to whose management they are entrusted, of which they can never afterwards divest themselves. Neglected by the men they associate with their slaves; and thus their morals are in a state of dignity or virtue, as their manners are of politeness. After marriage, much as they are disregarded by the men, they treat their husbands with great veneration and affection; consider their careness as a high honour, and are therefore extremely jealous of their favour. The Dutch ladies, while young and unmarried, drees well, and are tolerable in their persons, and many among them are pretty, and even handsome; but afterwards they contract such indelicate habits that they become coarse, corpulent, and dirty in their persons; and their drees during the day is slovenly and negligent to excess. In such a climate as that of Ceylon, and with such habits, we must not look for the bloom of health and the red and white of European complexes. There are for the most part of a pale deadly white, with some exceptions. Those who have a mixture of the native blood,
Fond, are easily distinguished by a tinge in the colour of the skin, and their strong thick black hair; marks which are not removed in the course of many generations. The women of this mixed race, of whom there are many in the Dutch settlements, sooner begin to look old than those who are wholly of European extraction. The Dutch ladies have a custom of cracking their joints, and rubbing them over with oil, which renders them uncommonly supple. The principal amusement of the younger females is dancing; and that of the married and elderly ladies consists in paying formal and ceremonious visits; on which occasions they are attended by a number of slave girls, dressed for the purpose, and walking after them, with their betel boxes, or bearing umbrellas over their heads. Their chief care consists in the female attendants, and their splendour is estimated by the number of them which they can afford to keep. Neither the persons nor the apartments of the women are in general very cleanly. Many of the elderly ladies, and most of the lower orders, chew the betel-leaf and areca nut, with a mixture of 'chunam' or lime made of burnt flesh, in order to render it hotter and more pungent to the taste. In every house, therefore, there is a number of brai seale which are used as guttering pots for the women who chew these substances, and for the men when they broke. The women are generally very neat and exact in the arrangement of their dressing-rooms, and when they receive company, these are kept remarkably clean, and the tiled floors are highly polished: but their inner apartments, and other parts of their house, are quite the reverse.

Another clafs of the inhabitants of Ceylon consists of a race known by the name of Portuguese. They are not the descendants of the European nation whose appellation they bear; but they derive their name from the hospitable descendants of that people by native women, who were scattered in great numbers over this island and all their other settlements in India. But both the manners and colour of these original Indian Portuguese are now equally lost among that race which now bears their name. The present Portuguese of Ceylon are a mixture of the spurious descendants of the several European possessors of that island, by native women; joined to a number of Moors and Mahalas. A colour more approaching to black than white, with a particular mode of dress, half Indian and half European, is sufficient to procure the appellation of a Portuguese. These people are found in all the European settlements in India, particularly in those belonging to the Dutch, who often form intermarriages with them. The manners of the Portuguese inhabitants differ from those of the Moors, Mahalas, and other Mahometans. They affect to adopt those of the Europeans. Although the black Portuguese universally profess the Christian religion, and are commonly Roman Catholics, they nevertheless retain many Pagan customs, and their religion may be considered as a compound of both. The Dutch have allowed priests and other missionaries to go among them; and many of them profess the Protestant religion and frequent the churches of the Dutch. They are in general somewhat fairer than the Moors and Mahalas; but complexions of all sorts are found among this mongrel race, from a jetty black to sickly yellow, or tawny hue. Their hair, which is black or dark brown, is worn long, and usually hid, contrary to the custom of the Mahometans. Some of their women are pretty, and much admired for their figure. The men are about the middle size, slender, lank, and ill-made. They are fond to exceed of food and wine in their dress, and never sit out without putting on their best clothes. They are lazy, treacherous, effeminate, and passionate to excess; and retain so much of the character of their boated progenitors, as to be distinguished for a ridiculous pride. They have no regular call, and are usually exempted the work race of people in India. Originally a furious and outcast brood, they retain only the blemishes which tarnished the characters of their ancestors; and they combine all the vices of the Europeans and Indians, without any of their virtues. In these black Portuguese were derived the troops, now known by the name of "Topakas," so called from their wearing hats instead of turbans, the word fez or chapeau, meaning to be a corruption of the French chef-d'oeuvre, being used in their language for a hat. They were never reckoned good soldiers, being neither so hardy nor so brave as the Scopas, and therefore they were seldom employed in the English service: the French, however, had very generally corps of them at Pondicherry, and in their other settlements.

The Malays are another race, who form a considerable proportion of the inhabitants of Ceylon. This ferocious race is widely scattered over the eastern parts of India. Their original empire lies in the peninsula of Malacca (which see); and they have extended themselves thence over Java, Sumatra, the Moluccas, and Philippines, and a great number of other islands in the Archipelago of India. The era of their first introduction into Ceylon is not easily ascertained; but the Dutch have been so allowed for many years to introduce them to this and their other settlements in Asia and Africa, for the purpose of carrying on various branches of trade and manufactures, and also to employ them as falchiers and servants. The religion, laws, manners, and customs of the Malays, as well as their dress, colour, and persons, differ very much from those of all the other inhabitants of Asia. Those of the various islands or settlements differ also among themselves, according to the habits and appearance of the nations among which they are dispersed. For, although they intermarry with the Moors and other castes, particularly in Ceylon, and thus acquire a much darker colour than that which is natural to a Malay, their characteristic features are still so strikingly predominant, that they cannot be mistaken. Those who are born and brought up in the European colonies naturally contract more of the habits of civilized society; but they never entirely get rid of their natural ferocity, though they become much less cruel and vindictive than those of their race who reside in the peninsula of Malacca and their other native possessions. The men are of a middling stature, remarkably well proportioned, and of a strong and muscular constitution. Their legs and arms are particularly well-shaped and very slender at the wrists and ankles. They are of a light brown or yellow colour, approaching, in old age, or when much exposed to the sun, to a copper hue. Their forehead is broad and flat; their eyes are small, black, and very deep sunk in their orbits: their nose is flat. Their hair is black, coarse, and black, and always moistened with a quantity of cocoa-nut oil; some of the poorer fort bind it up with a coloured handkerchief. The Malays of a higher rank wear a wide Mohriit cloth or gown, called baldjur, resembling our dressing-gowns, and composed of rich flowered silk, or party-coloured cotton, and their under dress is a veil of silk or calico, called baldjur, worn close to the body, with loose wide drawers of the same stuff. The dresses of their head is of a singular shape, and is often elaborately ornamented. Their flours or fardals are like those of the Moors. The dresses of the poorer fort consists of a piece of cotton wrapped round their waists, with one end drawn between their legs, and tucked up at the lower part of the back: the arms are left completely bare. Some
Ceylon.

wear a kind of vest or jacket without sleeves; but most of the sashes in the service of Europeans, instead of the piece of cloth, wear breeches of coarse stuff. None of the Malays suffer their beards to grow, but, in conformity to their religion, pluck out the hairs as soon as they appear. That of the poorer classes of the women consists merely of a large piece of coarse calico, or cotton, called a Saree; which is folded and wound round the body above the bosom, and reaches down to the ankle, or middle of the leg; the upper part is tucked up and fastened under the arm-pits. Their hair is twined up like that of the men, and fastened with a fillet or with pins or skewers, called coudes. The drefs of women of a superior station is decorated with taffe, and is very splendid. Instead of the upper garment, called badjou, resembling that of the men, some use the faledang, which is a piece of silk or muslin about five feet long, thrown loosely around the neck and shoulders, falling down before, and brought across the waist backwards. On the crown and back part of the head are stuck three or four tortoise-shell combs with plates of gold. About their necks and arms they wear chains or filagree, and are provided with earrings. The Malays make very beautiful filagree work in gold, which they use as ornaments for their persons.

The faces of the Malays are generally very ugly; and their features indicate their ferocious, treacherous, and revengeful dispositions. Some, however, have comely countenances; and many of the women might be considered as beautiful, if they were not much exposed to the sun, and had not their noses compressed. It is a common practice among them to break by compression the gristle of the upper part of their noses in infancy; a flat nose being regarded as a symbol of beauty. The men are extremely jealous, particularly of the decided preference which the women give to Europeans; nor do they ever pardon infidelity in a wife. The passions of the women are so less violent than those of the men, and they are equally capable of taking the most terrible revenge; either by stabbing the objects of their resentment, or dispatching them by poison. The Malays go naked till about 12 years of age, and are soon after married. As they are of the Mahometan religion, those of the higher castes marry as many wives as they can maintain, while the poverty of those of the lower classes restricts them to one wife. Their usual food consists of fowl, fish, rice, and vegetables. The better sort eat also beef and mutton, when killed by one of their own race, and prepared in their own manner. They hold wine in such abhorrence, agreeable to the prejudices of their religion, that they will not so much as touch their flith; nor will several of the Malay castes carry a plate which has ham or bacon on it. Their common drink is water, or the juice of the palmyn; though some will not endure to drink arrack when they can procure it. They are constantly chewing betel, or penang, and they smoke bang, from which herb they extract a kind of opium, that is used by them in great quantities for exciting their spirits.

The amusements of the Malays are limited to their dispositions, and are either bold, vicious, or ferocious. Both men and women are much addicted to bathing, which they use several times in a day. Their select amusements are gaming and cock fighting; and they are so inordinately fond of gaming, that the poorer sort will sell themselves and their families to procure the means of gratifying their passion for play; and after having lost their last flake, they often sacrifice themselves and their lucky antagonist to their despair.

The Malays have a great variety of musical instruments, which are usually employed in a band or concert, at their religious ceremonies, their marriages, and their feasts. One of their principal instruments is the gong-gong, which consists of a hollow plate of a compound metal, so contrived as to emit a very loud noise when struck. The tom tom is a drum of a peculiar form; and they have other instruments, made of bamboos bound together with iron wire, somewhat in the shape of a dulcimer.

The Malays universally profess the Mahometan religion; though with regard to some inferior points and duties, the several classes differ among themselves. They have temples and mosques dedicated to their saints and their dead, where they attend with great devotion. They value themselves much on their skill in medicinal herbs, and the application of them in the cure of diseases; and they are fond of gardening, to which they are addicted from their infancy, and in which they excel. In all sorts of cave-work, and in rattanizing couches and chairs, they are singularly ingenious; and they are accounted capital builders of bungalows, or houses of the cocoa-tree. In other respects, such as the manner of eating their viandals, and their modes of salutation, they much resemble the natives of the Malabar and Coromandel coasts; though they are sufficiently distinguished from the other natives of India, by the difference of their constitutions, and the peculiar ferocity of their dispositions.

The government, under which the Malays live in their own country, resembles in some degree the ancient feudal institutions of Europe; and, consequently, war is the business of the nation. Their arms are all suited to their savage and fanatical dispositions. These consist of a kind of dagger, called a kreefe, or Canisse (which see), in the use of which they are particularly dextrous. Before they enter upon any desperate enterprise, or act of revenge, the Malays take a quantity of opium, or, as they express it, bang themselves. (See Bangue.) Having thus previously prepared themselves, and poisoned their critics, they rush headlong into the street, stabbing every one indiscriminately that comes in their way, and at the same time vociferating amok, amok, or kill, kill, whence this horrid mode of revenge is termed by Europeans "running a muck." (See Amok.) This ferocious practice was repressed by the Dutch government at Ceylon, by the severest punishments; a reward of one or two hundred rix-dollars has been offered for the detraction or capture of those who ran a muck, and those who were taken alive having been put to death with the most execratory torments. Since the arrival of the English at Ceylon, this barbarous practice has been almost unknown; and a few private murders committed on the Sepoys and black people in the Pettah, were the only crimes of this nature attributed to the Malays during Capt. Percival's stay at Colombo. The Malays, however, in their present state are, from their ideas of morality, almost incapable of being admitted into socia life; they have no idea of revenge being a crime, and they triumph in shedding blood on such an occasion. It is hoped that the introduction of Christianity among these people will mitigate their disposition; and it is consequently of great moment that the Malays in our settlements should embrace this religion. It would serve, not only to soften their temper, but to unite them by the firmest bond with this country. The Dutch government of Ceylon had always a regiment of Malayan in their service; and this corps constituted the strength of their garrisons, as they were the only troops which maintained discipline, or displayed any fort of bravery in the field. They seemed, however, to have imbibed, by the ungenerous policy of the Dutch, such a rooted aversion from the English, that there was at first little appearance of their ever becoming our friends. Soon after the arrival of governor North on the island, he new-modelled this corps, and put it on a larger and more respectable establishment;
CEYLON.

and it has now obtained a place among our other regiments of the line. The Malay troops are armed and clothed much in the same manner as the European, with the exception of shoes, the wearing of which is contrary to their religion; instead of these they use a particular sort of sandal; both with their other arms they always wear their kreefes by their sides; and in the heat of an engagement they often throw down their muskets and bayonets, and, rushing upon the enemy with these kreefes, carry terror and destruction wherever they come. The patience with which the Malays submit to the sentence of their courts martial, compiled by the new regulations introduced among them, of their own native officers, who are acquainfed with their language and customs, and their refraining from revenge when they are assured that justice is intended them, afford reason for concluding, that mild and generous treatment will in the end have the effect of subduing their natural ferocity.

The far greater proportion of the inhabitants of Ceylon consists of the native Cingalese, who have submitted to the dominion of the Europeans. They retain their original appellation of "Cingalese," while those who live in other parts which acknowledge only the authority of their native princes, are distinguished by the name of "Candians," from the country they inhabit. In most parts these two classes continue to re semble each other, though they are respectively distinguished by some peculiar characteristics. Whether the Cingalese were the original inhabitants of the island, or from what other country they came, and at what period they settled there, are points of which we have no distinct account, either from them or from other persons. The distance is so small between Ceylon and the continent, that it is the most probable, and the most generally received opinion, that it was peopled either from the Coromandel or Malabar coasts. Some circumstances, however, are suggested by Capt. Percival, which seem to indicate that they have migrated from a greater distance. Their complexion, features, language, and manners are so similar to those of the Maldivians, as to afford reason for concluding that both were of the same stock. The Maldivian islands are only two or three days' sail from Ceylon; and from the dissimilarity of the habits found among them to those of the Indians on the continent, it might be argued that the natives of these islands have not directly originated from those of Hindostan.

The Ceylonese are of a middling stature, about five feet eight inches, and taller in complexion than the Moors and Malabars on the continent; but they are neither so well made nor so strong, and in appearance much riperable the Maldivians. The Candians are taller, better formed, and sleeker than the Cingalese in our service. The women are proportionably less tall than the men, are much fairer, and approach to a yellow or mulatto colour. They continually among them bides with cocoa-nut oil, with which they oil their hair. Both sexes are remarkably clean and neat in their persons and their houses; and in dressing their vessels they are scrupulously neat. In order to wash touching the vessel in which they drink with their lips, they hold it at some distance over their heads, and pour the liquor down their throats. In their diet, they are very shicklish; fruits and rice constituting the chief articles of their food. They use some fish when it is abundant, but flesh is scarcely ever where eaten. They are courteous and polite in their demeanour, and in many qualities much superior to other Indians. They neither ride nor lie; their disposition is generally mild; but when their anger is roused, it is proportionably furious and violent. Their hatred is execrable and invariable, infomuch that they will frequently defend themselves in order to obtain the destruction of the object they desire. If a Ceylonese cannot obtain victory due to his warlike nature, he goes out of his way to kill himself, if he is not in danger. This threat, sometimes executed, obliges the debtor to comply immediately, or if he be in his power, as by their law, if any man causes the loss of another's life, his own is the forfeit. "An eye for an eye, and a tooth for a tooth," is a proverbial expression which is continually in their mouths. This dreadful spirit of revenge is still cherished among the Candians; but it is mitigated, in a great degree, among the Cingalese by their intercourse with Europeans. Among the Ceylonese the distinction of rank is maintained with temperate exactness; and extends to the dimensions and appearance of their houses; so that the Candians are not allowed to whiten their houses, nor to cover them with tiles, which is a royal privilege, and reserved solely for the great king. The Ceylonese never employ nails in their houses, either from the remnant of a tyrannical prohibition, or a superstitious arising from the danger of the electrical fire in their climate. Their hats are small and low, consisting of one florio, and fastened with withies of ratten or coya rope. They are constricted of slender pieces of wood or bamboo, dashed over with clay, or covered with rice-straw, or leaves of the cocoa-tree. Round the walls are banks or trenches of clay, on which they sit and sleep; and these benches, as well as the floors of their houses, are covered with cow-dung for keeping away vermin, and preserving the surface smooth and clean. Their furniture is of the most simple kind; consisting of a few earthen pots for cooking their rice, and one or two brafs bason out of which they eat it; a wooden mortar and pestle for grinding it, with a flat stone on which to pound pepper, turmeric, and chillies for their curries; a bottle, or kind of grater, being an iron instrument like the ravel of a spur fixed on a piece of wood like a boot-jack, and used in rasping their cocoa-nuts. They use neither tables, chairs, nor spoons; but placing themselves on the ground, eat their food with their hands. The houses of the Candians are nearer and better constructed than those of the Cingalese, whose minds have been reduced to an abject state, by the successive tyranny of the Portuguese and Dutch. Their villages and towns appear like a number of distinct huts scattered in the midst of a thick wood or forest. When they are in danger of being attacked with rocks, tiles, or overthrown by inundations, they erect their huts on the run of high rocks, or on the tops of high trees. Some of them fix piles in the ground, and place upon them a fort of hurdles, which leaves room for their habitation. In order to preserve themselves from the extreme heat of the sun, they have universally the large leaf of the taproot-carried over their heads.

The Ceylonese are extremely polite and ceremonious: and as a token of respect and friendship, present each other with the betel leaf, which is chewed by persons of all ranks, and supplies the thirst in all their enterainments. They mix with it tobacco, areca-nuts, and the lime of betel root. The black flavoured occasioned by this mixture, which is indelible on the mouth, lips, and teeth, is considered as an addition to their beauty; but it renders them toothless at an early age. The Ceylonese manifest a surprising degree of gravity in conversation, even among relations and intimate friends; sitting for a long time motionless and chewing betel leaf. In their festivities they very punctually use the form common among the Indians of bringling the palms of the hands to the forehead, and then making a ferum or low bow. The natives of Ceylon are more continent with regard
regard to women than the other Asiatic people, and they treat their females with greater attention. Mr. Knox has drawn a picture of their total disregard of chastity, or any bounds to sexual intercourse, which is extremely abhorrent to the ideas not only of an Asiatic, but even to the inhabitants of the most dilute metropolis in Europe: and Captain Percival is convinced, from his own observations among the Cinglfe, and from all the accounts which he could obtain of the Cannids, that he has not in many instances exaggerated their licentiousness.

A Cingle husband is neither jealous of his wife, nor particularly offended at her infidelity, unless he be caught in the fact; in which case he thinks himself warranted in executing the rights of an Asiatic husband. Many of the men have only one wife, while others are greatly affected by the introduction of foreign words, so that it has lost in a great degree that melody and force, which are attributed to the language of the interior. In the pronunciation of the Ceylonefe there is something peculiar, as they hurry out the first part of a sentence without commanding any attention, and dwell with a loud and long accent on the concluding syllables. To or ah forms the last syllable of a great number of their words, and with this they are fond of closing. The language universally spoken among the Cinglefes who have any intercourse or connection with Europeans is the low Portuguese; and this is also spoken by the Moor and Mahabuv servants.

The Ceylonefe divide their time nearly as we do: except that their year commences on the 25th of March, and they allow for leap-year or any odd portions of time by beginning this year a day sooner or later, or by adding a day to the former year. Their months, like ours, are divided into weeks of 7 days: Wednesday and Saturday are the days on which they perform their religious ceremonies. The day, which is reckoned from Fun-tiie to Fun-fet, is divided into 15 hours, and the night also into as many; and they cut the length of the day and night subject to a little variation.

Before the arrival of the Europeans on the island, it does not appear that the Ceylonefe had contrived even the rudest species of dial. On any particular occasion, they employed a vellum with a hole in the bottom, that let out the water with which it was filled in one hour according to their division; but this rude instrument was seldom employed except at court ceremonies. The learning of the Ceylonefe confines chiefly in some pretended skill in astrology; although it appears from certain inscriptions on the ruins of some of their temples, that they formerly possessed some literature, as well as a certain refinement in the arts. Reading and writing are no ordinary accomplishments among the natives of Ceylon. Among the Cannids: they are chiefly confined to the learned men of the sect called "Gonies," who are retained by the king to execute all the writings of state, and thefe which respect religious affairs: and the Arabic is the character employed on these occasions. For writing, as they do not understand the manufacture of paper, they use the leaf of the tapis tree, and from these leaves, which are very large, they cut slips about a foot in length and a half in breadth, and about two inches broad. These slips are powdered; and the letters or characters are marked on them with a fine pointed lead pencil, like a bodkin, set in a wooden or ivory handle; and in order to render the characters more visible and distinct, they are rubbed over with oil mixed with charcoal powder. Several of these slips are strung together by a piece of twine called "Gannon." Some of the tappet-books or files, called by the natives "Oddars," are richly ornamented, and bound in burnished boards of ivory, or

 CEYLO.

is most nearly allied to the Maldivian. Of this language there are two dialects, which differ considerably from each other and have each a separate grammar. The poetic or court language, called the "Candian Sanscrit," or more properly the "Paulee" or "Mangada," is retained in those places, where the language may be supposed to have been prefered in its greatest purity; it contains a considerable mixture of Arabic, and is accounted the most elegant as well as the most smooth and famous. Among the Cannids it is a current opinion, that Arabic is their original language, and that some mixture of the Sanscrit was introduced by a colony who came over by Adam's bridge from the continent of India. Among the Cinglefe on the coasts, the vulgar dialect, denominated "Cingle," is spoken; and it appears to have been greatly corrupted by the introduction of foreign words, so that it has lost in a great degree that melody and force, which are attributed to the language of the interior.

In the pronunciation of the Ceylonefe there is something peculiar, as they hurry out the first part of a sentence without commanding any attention, and dwell with a loud and long accent on the concluding syllables. To or ah forms the last syllable of a great number of their words, and with this they are fond of closing. The language universally spoken among the Cinglefe who have any intercourse or connection with Europeans is the low Portuguese; and this is also spoken by the Moor and Mahabuv servants.

The Ceylonefe divide their time nearly as we do: except that their year commences on the 25th of March; and they allow for leap-year or any odd portions of time by beginning this year a day sooner or later, or by adding a day to the former year. Their months, like ours, are divided into weeks of 7 days: Wednesday and Saturday are the days on which they perform their religious ceremonies. The day, which is reckoned from Sun-tiie to Sun-fet, is divided into 15 hours, and the night also into as many; and they cut the length of the day and night subject to a little variation.

Before the arrival of the Europeans on the island, it does not appear that the Ceylonefe had contrived even the rudest species of dial. On any particular occasion, they employed a vellum with a hole in the bottom, that let out the water with which it was filled in one hour according to their division; but this rude instrument was seldom employed except at court ceremonies. The learning of the Ceylonefe confines chiefly in some pretended skill in astrology; although it appears from certain inscriptions on the ruins of some of their temples, that they formerly possessed some literature, as well as a certain refinement in the arts. Reading and writing are no ordinary accomplishments among the natives of Ceylon. Among the Cannids: they are chiefly confined to the learned men of the sect called "Gonies," who are retained by the king to execute all the writings of state, and thefe which respect religious affairs: and the Arabic is the character employed on these occasions. For writing, as they do not understand the manufacture of paper, they use the leaf of the tapis tree, and from these leaves, which are very large, they cut slips about a foot in length and a half in breadth, and about two inches broad. These slips are powdered; and the letters or characters are marked on them with a fine pointed lead pencil, like a bodkin, set in a wooden or ivory handle; and in order to render the characters more visible and distinct, they are rubbed over with oil mixed with charcoal powder. Several of these slips are strung together by a piece of twine called "Gannon." Some of the tappet-books or files, called by the natives "Oddars," are richly ornamented, and bound in burnished boards of ivory, or
even silver and gold. Letters or dispatches sent by the king formerly to the Dutch, and now to the English governor, are enclosed in leaves of beaten gold like those of the cocoa-leaf, rolled up in a cover richly ornamented, and almost hid in a profusion of pearls and other precious stones. The whole is enclosed in a box of silver or ivory, which is sealed with the Emperor's great seal.

The progress of the Ceylonese in the other arts of life bears proportion to their literature. Their agriculture remains in the rudest state; and the Ceylonese are naturally indolent in the extreme. Their soil, where it can be watered, yields, with little cultivation, a sufficient quantity of rice for their subsistence, and with this they are satisfied. Their ploughs consist merely of a crooked piece of wood, shaped so that one end serves for a handle, while the other, shod with iron, ploughs, or rather tears up the ground. After a first ploughing, the fields are flooded, and some time after they are again ploughed. The other tools employed in their agriculture are a board for smoothing their fields, which is dragged over them edgewise with their oxen; and a piece of board fastened to the end of a long pole, which serves instead of rakes. At the season of ploughing, each village makes it a common concern; every one attending with his plough and his oxen till the whole of the field belonging to that society is finished. The same method is pursued in reaping the corn. Seed-time and harvest are fea-
sons of general industry and good fellowship. The women are not employed in either of these laborious operations; their business is to gather the corn after the reapers, and to affilt in sowing it. Oxen are employed both in ploughing and in treading out the corn. For unshukling their rice, they beat it in a mortar, or more frequently on a hard floor; and if it be of a brittle kind, they boil it before they beat it. The only manure they think requisite is water. Although the labour required for the cultivation of their rice is incon-
siderable, many of them let their ground to their neighbours, less indolent than themselves, for a certain proportion of grain, which is commonly about one-third of the produce. A considerable proportion of grain is carried off by the priests for the service of their temples, or is offered up for protection and thanksgiving, both on account of the blessings they have received, and in the hope of farther affil-
ance.

The religion of the Ceylonese forms a very prominent and delfignifying feature of their character; and there are few people, if any, that are more under the influence of superstiti-
ous fears. Omens regulate their whole conduct, and even determine their destiny from their birth. When a child is born, they immediately call the astrologer, who pronounces whether it is destined to be fortunate or unfortunate. If he declares that it was born to misfortune, they often anticipate its future evils by destroying it. By various omens they de-
termine whether the business they undertake will be prosper-
ous or unsuccessful. A white man, or a woman with child, when they present themselves in the morning, are very fa-
vourable omens; but a biggar or deformed person is ac-
counted a grievous mischance, and the sight of him will prevent their proceeding on that day with any business pro-
posed, if it be in their power to avoid it. By the im-
pression of superstitious fears, the poor Ceylonese confides in the protection of all the Demon that is supposed to have the power of interfering with their affairs. When a demon is supposed to have interfered with the course of events, they say that the island is abandoned to the dominion of devils. The Ceylonese conceive fires without number to be hovering round them, and they ascribe every disease or trouble that afflicts them to the immediate agency of the demons that are sent to punish them; while, on the other hand, they regard every blessing and every instance of success, as coming directly from the hands of the beneficent and su-
preme God. In order to guard themselves against the power of inferior deities, whom they consider as wicked spirits, they wear various amulets, and employ charms and spells, imagining that they may thus ward off the influence of witchcraft and enchantments by which they think them-
seves beset on all sides. Many even of those who have been converted to Christianity, still labour under their original terror, though they believe them to be delusions. Some of the Cinglele, when their desires are disappointed and their prayers disregarded, quarrel with their deities, revile them, and even trample their images under foot. The inhabitants of the more mountainous parts of the country are distressed by their superstitious fears to such a degree, as to be driven to madness by their disturbed imaginations. The progress of civilization, and the removal of these superstitious fears, are greatly opposed by the interested arts of their priests, who contrive to direct their operation to their own emol-
mument. The devotion of the Ceylonese towards supernatural beings derives its peculiar character from their superstitious fears, and confits of various ceremonies created by them. With regard to what may be properly termed their religion, a difference of opinion has prevailed. Some have said that with a slight variation of names and forms, it is the same with that of the Hindoos; but there is little reason to ques-
tion its being founded on a different system of idolatry from that practised among the Hindoos. Many of their notions seem to be borrowed from the latter, and with these they have blended a confiderable mixture of Mahometanism. In one point, it is said, they agree with both, as well as with Christians; viz. in acknowledging one Supreme Being who made and governs all things; but they differ from the Ma-
hooncans and rigid Hindoos in another respect; for though they are unable to conquer their original superstitions, they entertain the highest reverence for the Christian religion, and some of the Cinglele have been converted without incurring fearlessly any censure from others for their apostacy. Never-
thelss, whilst these people adore one Supreme Being, more powerful than all others, they offer up their devotion to devils, animals, and the very productions of the earth. Besides the one Supreme Being, who is worshipped as the creator and ruler of heaven and earth, the Ceylonese acknowledge a number of inferior deities, as well as tormenting demons: the former, who watch over them for their good, are sup-
possed to be the souls of good men, and the demons the spirits of the wicked; but both are regarded as acting by the permision of the Supreme Being. The object of their immediate worship is Buddho, or Bouddha (which see), who is represented under a variety of different forms and images. Some have supposed that the worship of Buddho was intro-
duced into Ceylon about 40 years after the Christian era; at which time, as it is said, a violent quarrel took place be-
tween the Brahmins and the votaries of Buddho, who then formed one of the religious sects on the continent. The Brahmins, as they say, prevailed, and the Buddistes were com-
pelled to take refuge in Ceylon. The Buddistes are said to have been originally a clafs of hermits, who led a wandering solitary life, remarkable for chastity, renouncing all the pursuits of the world and all attention to property, and contented with the practice of devotion amidst the extremest poverty. Others, however, have traced the religion of Buddho to a much higher antiquity; and pretend that it was intro-
duced in the reign of Vegirajah, who came with his people to Ceylon in the 6th century before Cruill; and that

Coutama
Goutama Buddhō, the figure that is now worshipped, was supposed to have made his appearance 542 years before the birth of Chrili. Accordingly it has been supposed, that the worship of Buddhō originated in Ceylon, and that it forced from thence to ancient Hindooistan to, exterior India, Tibet, and even to China and Japan. See Boono. Between the priests of Buddhō and the Brahmins, there are principal distinctions have been noted; they lay down the priesthood; they eat flesh, but will not kill the animal; and they form no call or tribe, but are selected from the mafs of the people.

The priests of Buddhō and Buddhō are in Ceylon accounted superior to all others. They are called "Triunanes," and are held in high estimation at the court of Candy, where they are entitled with the chief management of affairs. The king has no authority over them, but endeavours to gain their good will by respecting their immunities, and conferring upon them numerous distinctions. The followers of Buddō believe in the immortality of the soul, and its transmigration into various bodies before it reaches Nimban or the region of eternity. The perfons of the Triunanes are held sacred; and the king of Candy, although his power be absolute, cannot take away their lives, or in any way punish them even for confounding against his own life. They chuse their own superiors; and their chief priest is invested with the prerogative of settling all religious disputes. They are exempted from all taxes; but they are totally debauched from wine or women. They never eat meat, or any thing that has had life. To their girdles they suspend firings of beads made of a brownish or black wood; and matter prayers as they go along. Their drefts consists of a large loose piece of yellow cloth thrown over their left shoulder, and fastened round the waist by a girdle of the same. The right shoulder, the arms, the head, and the feet, are completely bare. In one hand they carry a painted cane, and in the other an umbrella of the broad end of the talipot leaf. The temples of Buddhō are superior to those of all the other deities; for they never dedicate temples to the Supreme Being, nor represent him by any image. In the temples of Buddhō, are figures of men habitl like his priests, and placed in various postures: some of them are seen fitting crofs-legged on the ground with long burly heads of hair like their womens, while others recline at full length on the ground. In various parts of the island a number of images of the god Buddhō are found, which by their extraordinary size indicate the great reverence in which he is held. It would be endless to describe these images, and the various temples in which they are found. He has a temple at Caleme, 6 miles N.E. of Columbo; another at Ootulbodda, 6 miles from Colturna, which is much frequented; and in Bilbande Core it is an immense figure of a man 6 yards high, which stands about 10 miles N. from Matura, and is said to represent the Cotta Raja, an ancient prince who taught them the planting and use of the cocoa-nutt, and instructed them in its various salutary qualities. In the interior of Ceylon, there are many ruins of pagodas and temples, of hewn stone, and of much superior workmanship to those in the lower parts of the country. Several of them are in a state of perfect preservation; and when compared with those that have been erected in later times, they afford the strongest proof either that the Ceylonese had formerly attained a much higher state of civilization, or that the island had anciently been inhabited by a different race from its present posCifers. But many of them have suffered much from the ravages of the Portuguese.

The temples dedicated to the inferior gods are poor, mean, and contemptible, being usually constructed of clay and wood; and mere huts, one story high, without windows, and covered with cocoanut leaves. Without are elephants' heads of earthen ware, little pots, &c. in which paf- fengers deposit their oblurations; and at the doors is a pole or flag, near which sits a priest who remains there the whole day; and within are "swamis" or sacred images of different construction, such as gigantic figures of men with boars' heads, representations of bears, birds, and pieces of conccrned armour, and some very indecent figures of men and women. The priests of the inferior deities, called "Ganes," are easily diftinguished from the Triunanes by the little respect that is paid to them. They are continually met with in their wandering excursions over the island, and are a set of lazy, impudent vagabonds, who live well on the extortions which they practice on the people.

The superlition of the Ceylonese supplies ample provision for the support of their religious establishments. The Can- dians allow certain portions of land and particular taxes to maintain their priests and religious houses; whilst the inferior priests support the temples and themselves by their own dexterity. A11 divines are accounted immediate indications of the divine wrath, a time of sickness is the season when the temples are thronged, and when the priests expect their principal harvest. There are several particular festivals which are held by the Ceylonese in honour of their gods, and for the purpose of conciliating their favour. In the month of June or July at the new moon, called "perah," a solemn and general concourse takes place to the various religious reforts on the island. At Candy this festival is celebrated with great pomp, and is attended by the king with his whole court. In November, at the time of full moon there is another festivál, which is celebrated in the night. These festivals, which are more solemn and splendid in the dominions of Candy than among the Cinglese of the coast, are very numerous, amounting in the whole to 48. Thole in honour of Buddhō are not held in the temples, where he is unformly worshipped, but on a high hill, called "Hammalka," or Adam's peak, one of the highest in Ceylon, and at the distance of about 30 miles to the N.E. of Colombo, and at a consecrated tree, denominated the "Bo- gaha," which see. Notwithstanding the many religious ceremonies and superflitions that prevail among the Ceylo- nese, they are far from being such devotees and zealots as any of the sect on the continent. They are firm believers in the doctrine of the immortality of the soul, and the resur- rection of the body. It is their opinion, that the souls of the just are immediately after death admitted into the ranks of gods, and that their ancient prophets and good kings are long since employed in exercising the powers of this station; while, on the other hand, the souls of the wicked, particularly of unjust tyrants and impious priests, are supposed to have been cast into wild beasts and reptiles. The Ceylonese are rigid pre- ductarians, and believe that people are born to their peculiar deities, whether good or bad, which they are incapable of avoiding by sober living. They imagine, however, that their calamities may be alleviated by spells and charms, and they place considerable reliance on giving alms; and hence the Ceylonese are very liberal in the distribution of charity. Prefents to their priests and alms to their beggars are considered by them as essential acts of goodness. The Cinglese in our service, whilst natural ferocity is in a great measure subdued, reserve a certain proportion of their food for the poor; nor do they withhold relief from the Malabar or Moor who asks it. They extend their compassion even to the brute creation, so that during certain festivals or feasts of devotion, they refrain from killing any living creature, and subsist wholly on herbs and fruits. The Cinglese, who are naturally abstemious, frugal, and free from covetousness, are
are never tempted by idleness to purloin the property of their neighbours; but the Cadians, though endued with much more pride and spirit, are by no means so condescending or hasty. The burial among the Ceylonese are not attended with any particular religious solemnity. Mr. Knox states, that in his time it was customary to burn the dead, particularly the bodies of persons of distinction. But this practice, if it still continues in any part of Ceylon, has escaped the researches of Captain Percival; and it must therefore be rare, and confined to the remote parts of the interior. The ceremonial of burial is very simple; the body being wrapped in a mat or piece of cloth, and carried to some unfrequented spot, where it is deposited.

Captain Percival has pointed out, with his accurate discrimination, some particular shades of difference which arise between the Cadians and Cinglese, both from the nature of the country they respectively inhabit, and from the more frequent intercourse of the latter with foreigners. These chiefly relate to their political situation, and their forms of administering justice, which, among the Cinglese, are of course considerably affected to those of the people who hold them in subjection. The Cinglese, he says, are a quiet inoffensive people; exceedingly grave, temperate, and frugal. In their application to labour, though their bodies partake of the indolence of their minds, they are capable, when roused, of considerable active exertion; but being less robust than the Moor or the Mahbar race, they never make good palankeen bearers, or cookies to carry burdens. They are gentle, charitable, and friendly, and have fearlessly any of the faulty, treacherous, and designing arts, which are often found among the Cadians. The countenance of the Cadian is erect, his looks haughty, his men lofty, and his whole carriage marked by the pride of independence. The humble yielding deportment of the Cinglese, on the other hand, with the patient or rather abrupt endurance which is depicted in their faces, plainly denotes the dependent and helpless state to which they are reduced. A mild and equitable government, with a strict administration of justice, cannot fail to conciliate the minds of these people who have already been trained to submission, and an unbounded reverence for Europeans. As the natural diffidence of the Cinglese are mild and humane; their morals except in the promiscuous intercourse of the sexes, are far from being depraved. The Cadians, who have acquired warlike habits, are thus induced to look with contempt on the Cinglese, who are almost entirely unacquainted with the use of arms.

The dress of the poorer sorts of the Cinglese indicates their indolence and wretchedness; and the women of this clafs are employed in performing all kinds of drudgery work, and in bringing the fruits and vegetables to market. Persons of superior rank pay particular attention to their drees. They wear a piece of calico wrapped round their waists, which either hangs loose down to their ankles, or is drawn together between the legs, in the form of wide trousers. The body is covered by a jacket with faws, having the appearance of a shirt and waistcoat, and is buttomed at the neck and wrists. The buttons are numerous, and they are either of silver, gold, or precious stones. To their ears they fix enormous earrings, which are adapted for receiving them by applying pieces of wood to the orifices in their infancy. The shoulders and body are left completely bare. On their heads they wear caps of various shapes, and others of them coloured handkerchiefs, as fancy fuggests, or the rules of their caste prescribe. The dress of the higher rank of women is similar to that worn by the black Porouilfe ladies; and that of the young Cinglese females is so elegant, nor are their appearance and manners disagreable.

The Cinglese are ingenious and expert artisans, and display their dexterity in gold, silver, and carpenters' work. The number of persons employed in all sorts of handcraft work renders furniture, and other similar articles, both good and cheap. The Cinglese supply the English garrisons with beef, fows, eggs, and other such articles, at a very moderate rate, as they seldom use them for their own consumption: beef, in particular, they never talle, as the cow is an object of their worship. Some of them drink arrack, and all ranks use toddy both as a medicine, and for the sake of the liquor itself. The vessels which they use for holding the juice of the palm-leaf and cocoa-tree is a kind of the betel-tree, resembling in colour and texture bleached sheepskin, and being as strong and better adapted for retaining liquor. Fows are plentiful, and sold at from 4d. to 8d. each; eggs at 2d. a dozen; and a good dish of fish may be bought at from 1d. to 1d.

As the Cinglese live under the protection of the British government, they are subject to our laws and forms of administering justice, except in very few points, with regard to which they are permitted to retain their ancient customs. The same laws of inheritance remain among all the Ceylonese; the hands defend to the eldest son, if the father makes no will; but a certain proportion of the property must always be appropriated to the maintenance of the widow and the younger children. The Cinglese under the British dominion are governed by the native magistrates, the controlling power residing always in the servants of the British government. All our possessions in the island are divided into coves and districts, the subordinate superintendence of which is assigned to the "Moodelers," or native magistrates, who are always chosen from among the chiefs of the nobles styled "Hondrews," and "Mahondrews." The nobles, or "Mahot-drews," from whom the Moodelers are chosen, form a particular casta completely distinct from the others, and their appearance, dress, and manners indicate superiority to the rest of the natives. These Mahondrews are rather than the other Cinglese, from their being left exposed to the sun; when they go abroad, they are entitled, by their rank and wealth, to be carried in coolies or palankeens; or when they go on foot, their attendants hold over their heads the leaf of the talipot. In public their servants carry their umbrellas and betel-boxes, which latter are usually made of ivory, tortoise-shell, silver, or calamander wood inlaid. In their own hands, they carry a small silver box, like a watch, to hold their elman. In their manners they are very affable, and much more polite and engaging than the natives of the continent of India. They are partial to the Europeans, who have been accustomed to treat them with confidence and gentleness; and on all occasions they have manifested a desire of copying the manners of the Europeans. Their dress is very rich, and combines the ancient European with the Asiatic. They are fond of magnificence, and particularly at their wedding-feasts they are anxious to exhibit their splendour.

Many of the Cinglese have been converted to the Christian faith; and whilst some profess to be Roman Catholics, others attend the Calvinist and Lutheran worship; but the fundamental principles of Christianity are understood by fearfully any one of them. The natives of Ceylon, says Capt. Percival, belonging to our settlements, are already become much attached to the English; and there is every reason to expect that their prejudices against foreigners will soon be done away by our liberal conduct towards them. For an account of the Cadians, see CANDY. Of another clafs of the inhabitants of Ceylon, a brief account has already been given under the article Bedahs. These Bedans, or Vaddas, are scattered over
CEYLON.

over the woods in different parts of the island; but they are
moll numerous in the province of Bintan, which lies to the
N.E. of Cundy in the direction of Trincomalee and Batticalo.
Here they are completely savage, and have never entered into
tangue or intercourse with the native, or have fiercely
ever been seen by them. They acknowledge no authority
before that of their own chiefs and religious men. Thole
that border on the district of Jafrapatam, and the tribes that
inhabit the W. and S.W. quarters of the island, between
Adam's peak and the Raygam and Pсадam corles, are the
only Bedahs who have been seen by Euro peans; and they are
much less wild and ferocious than those who live in the forests
of Bintan. The Bedahs, as they acknowledge no power
but that of their own chiefs, adhere, from generation to gen-
oration, to their own laws and customs, without the slightest
variation. They subfiit entirely by hunting deer and other
animals, with which their forests supply them. The flesh
of these animals, and the fruits that grow spontaneously,
comprise their whole food. They sleep either in trees, or at
the foot of them; and in the latter cafe secure themselves
from wild beasts by placing thorns and bushes all round them.
As soon as the leafy noife mules the apprehension of a Be-
dah, he climbs up the tree with the utmost expertness and
celerity. The dogs of the Bedahs are remarkable for their
fugacity, and not only readily trace out game, but also dif-
tinguish one species of animals from another. Those faith-
ful animals constitute their chief riches. When their daugh-
ters are married, hunting-dogs form their portion; and a Bed-
dah is as unwilling to part with his dog as an Arabian with
his horse. Thole Bedahs who converse with the other natives
are represented to be courteous, and in address far beyond
their rate of civilization. Their religion is little known;
they have their inferior deities, corresponding to the demons
of the Cinglee, and observe certain festivals. On these occa-
sions vacuums of various forts are placed at the root of a tree,
and the ceremonies of the festival coniit in dancing around
them. Their origin has never been traced; but they are
supposed to have been the aboriginal inhabitants of the
island, who, upon being overwhelmed by their Cinglee in-
vaders, preferred the independence of savages to a tame sub-
milion. For another account of them, see BEADAH.

At the head of the clans of quadrupeds in this island, and
superior to those of the same species found in any other part
of the world, are its elephants. See ELEPHANT. Of the
animals applied to domestic purposes Ceylon produces but
few. The horse and sheep are not natives of this island, and
can scarcely be made to thrive when imported. The hor-
sest, which are bred on the small islands beyond Jafrapa-
tam are a mixture of the Arab and the common horse of the
Carnatic. They are chiefly used for drawing gigs and other
light vehicles for pleasure; the Manilla, Pygu, and Atcheen
horses are also used for these purposes. Sheep, as well as
horses, are much dearer here than in any other part of In-
dia. Sheep, in particular, sometimes fetch 10 and even 20
times the price they bear on the opposite coast of Comor-
del. In Ceylon horses are never employed in servile work, or
for drawing burdens. As they are scarcely ever castrated,
they are so spirited and vicious as in some degree to be un-
it for these purposes. The oxen of Ceylon are remarkably
small, generally of a black colour, and fearlessly exceed in
size our calves of a year old; the beef, however, is fat, and
tolerably good. The price of an ox is about 11, 5s. fler-
ling. These bullocks, though small, are very useful, and
are employed in drawing artillery, and conveying burdens
which are too large for the coolies to carry, and which they
draw in cartes, known in the island by the name of "barlies.
They are long, narrow, clumsy vehicles, with the body
reling on a beam, which projects like the pole of a car-
rriage, to the end of which is attached cross-wise a piece of
wood, very thick, and about six feet long. Under it are
hoops for the necks of the oxen, which are kept fast
quiry, so that the whole weight of the load rests on the
neck and shoulders of the cattle, while they drag the cart
along. The sides of the cart are composed of thin boards,
the fins of buffaloes, or split bamboos; while a strong
polt of wood is placed at each of the four corners to give it
shape or hold it firm. The bottom is formed of boards, or
interwoven bamboos: the axle tree and wheels resemble
those of the thirf trucks, or cars, being blocks of wood
rounded. Buffaloes, which are much larger and stronger
than the oxen, are much more frequently employed in draw-
ing burdens. Thole animals are found in great numbers
on the island, both wild and in a tame state, and are all of
the same species and appearance. See BUFFALO. The
markets of Ceylon are well supplied with pigs, which may
be always had at a moderate price from 5s. to 10s. The
forests of this island are rendered dangerous by beiges of
prize and noxious reptiles of various kinds. Varieties of
deer and elk are every where met with in the woods and
jungles. Hares, like the common ones of Europe, abound
in every quarter of the island. The wild hog is more ef-
teated than the tame; and the wild bears, which are large
and fierce, add much to the dangers of the Ceylonic forests.
The smaller species of tiger infests the woods; but the lar-
ger kind, called the royal tiger, is not an inhabitant of the
island. Ceylon has also the tiger-cat, the leopard, jackals,
the hyena and bear, great number of monkeys of different
species, and a variety of porcupines, racoons, armadillos,
fquirrels and mungooses; the ichis unum, iloroune, orifling,
fox, several species of rats, and the ant-eater are also animals
found in this island. The birds of Ceylon form a very nu-
merous clafs. All forts of our domestic poultry, turkics
excepted, are natives of this island; and there are few birds
found in our marshes that do not abound here. Ducks,
goose, pheasants, parrots, and parroquets, are found in great
numbers, both wild and tame, and usually in flocks. Snipe
are also plentiful in the wet season, which is the bait time for
fleeting them. The florican, which is a species of the crane
kind, about the size and weight of a large capon, lives among
the woods, and is esteemed excellent for food. The banks
of the rivers and lakes abound with florks, cranes, herons,
and water-fowl of various descriptions. Wood-peckers
are also found with beautiful top-knots of a golden colour.
Dodos, both wild and tame, form a principal part of the
birds of Ceylon and the cinnamon pigeon, in particular,
which is of a beautiful green colour, and as large as our
common fowl, forms in Ceylon at all seasons of the year.
There are a few partridges of the small red-legged kind, which
are found on the fell coats between Nigumbo and Manar.
Among a great variety of smaller birds, the honey bird and
tailor bird attract particular notice. The crows are here,
as in every other part of India, exceedingly impudent and
troublesome, and are with difficulty excluded from the
houses. Here are also kites and vultures, the Indian roller,
the yellow-crowned species of peacock, and the jungle-fowl,
which resembles our common bow, but prefers a
much more beautiful plumage and is distinguished by its
double purrs. The reptiles and insects of Ceylon are very
numerous, and there are several species very liitle known.
Serptents also abeut to the great annoyance of the inhabi-
tants; among whom we may reckon the cobra capello or
hooded snake, from 6 to 15 feet long, the cobra manila,
the most dreadful of all snakes, about two feet long,
whose bite proves instantly fatal; the whip-snake and gals-
ashes,
snakes, both poisonous, the water-snake, wood-snake, and a few other species among old ruins that are perfectly harmless. The rock-snake extends to 50 feet in length, and inhabits chiefly the rocky banks of rivers. Alligators of an immense size infest all the rivers of Ceylon, and render them every where very dangerous. The guana resembles the alligator, but is perfectly harmless. It lives in holes in the ground, is esteemed good food by the natives, and makes excellent cur, or rich foap. An immense number of toads, lizards, blood-fuckers, chameleons, and a variety of others of the same class, abound every where throughout the island. Besides the lecches which are employed in the materia medica, there is another species which infests the woods and swampy grounds of Ceylon, particularly in the rainy season, to the great annoyance of palngers. The insects of Ceylon are very numerous; but the most mischievous is a species of ant, called the white ant, which is equally destructive in the fields and the dwelling houses. Land tortoises abound in many parts of the island. The black scorpion of Ceylon is a very dangerous insect, and its sting is frequently mortal. The centipedes, or common large picers, and an overgrown beetle, called the carpenter, from its boring large holes in timber, are met with in Ceylon. Fish of every sort, in great abundance, are found in the lakes and rivers of Ceylon, as well as in the surrounding seas. Many excellent kinds of fish are caught all round the coasts of this island, and form a principal article of the food and traffic of the natives. Ceylon is particularly prolific in plants. Except in one or two species, the mangoes of Madaggen, and the mandarine orange of China, this island maintains an undeniable supe-

riority over all our settlements on the continent of India. Among the fruits which grow spontaneously are found pine-apples, oranges, pomegranates, citrons, limes, melons, plums, pumpkins, water-melons, squashes, figs, almonds, mulberries, raisins, bilberries, bog-berries, &c. We might also mention Mango, Shaddock, Malacca rose-apple or Malacca apple, the cuhho apple, the katapa resembeling our walnut, the papua or papaya of the fize of a melon, and resemb-

ling it in taffe and smell, the cudard appo, the tama-

rend, the plantain, two species of the braud-fruit tree, the cocoa tree, the betz-l-tree, several sorts of pepper, cardamoms, coffee, the palm or palmyra tree, the finger-

tree, the tea-plant, the talpot-tree, the bnyan tree, the cotton-tree, the tickwood tree, or oak of Ceylon, nando wood, fatin-wood, calalamo, manijapamcan, morinda, fndric-mal, used by the natives to supply the want of cloths, as it continues open from four in the evening till four in the morning, and remains shut during the other twelve hours, limes, the manchas tree, the true chonby, zambogo, amber- gris and coral, gum-brac, the fugar-can, the nepenthes, known among the Cinglefe by the nam of Badura, the champaca, rice, corocan, which is a small ted, like our muf-
tard, beat in a mortar and formed into cakes, and tanna, a prolific grain that requires hardly any cultivation. But the most valuable and important of all the vegetable productions of Ceylon is its cinnamon. See CI NAMON. Ceylon has long been famous for its purestextones, of which it furnishes no less than 20 different sorts. The ruby, topaz, and diamond of Ceylon or Matura, are not to valuable as those of Golconda or the Brazilis: but he sapphire, ame-
thyl, aquamarine, and tourmalin are equal to those of any other country. To the clafs of minera we may refer the diamond, the ruby, the hyacinth, garnet, cinnamon-tone, agate, amethysts, fardonex, emerald, Jasper, tourmalin, red, green, blue, and yellow, topaz, blue and green sapphire, blood fone, nephrytus, or kidney fone, white, yellow, brown, and black cryfals, cat’s eye, and cornelians. For the pears of this island; see Pearl. Lead, tin, and iron ores are found in the interior, but they are never wrought or applied to any purpose. Several mines of quickfire were wrought by the Dutch in Ceylon. Mineral waters of various kinds are supplied by springs and wells in this island. The revenue of Ceylon is an article of great importance to the British government. In 1795, the expence of Ceylon to Holland was $5,934. Berling. But this deficiency was easily made up by the cinnamon, cardamoms, coffee, and other articles sent from the island to Europe, as well as by the profits of the pearl-fishe, and the imports laid on the several articles imported into Ceylon from other parts of India. As to the sources of the revenue of the island, Capt. Percival observes, that the cinnamon and pearl fishe together produce an annual revenue of about 350,000l. Berling. All calices, cottons, and other Indian manufactures, must be exempted from importation into the island, and pay a duty of 5 per cent. The fisheries, the betel-nut, and the manufac-
ture of arrack are annually farmed out to the black mer-
chants, and the revenue derived from them amounts to at least 50,000l. per annum. From pepper, cardamoms, ele-
phants, ivory, precious fones, and a few other articles of native produce, such as cocoa-nut oil, coya-robe, &e. go-
vernment derives an annual revenue of about 800,000l. Something is also derived from a tax imposed on the rice imported for the use of the troops. Out of this revenue the salaries of the civil officers and the pay of the troops are defrayed, as well as the other incidental expences of the island, such as the erection and repair of public works. The natural strength of the island of Ceylon, and the few points at which it can be fately approached, seem to prevent it a great degree of security; nevertheless a confid-

terable military establishment is necessary to protect it com-
pletely against the powerful or an enterprizing enemy. The force formerly maintained by the Dutch on the island con-

sisted of about 3000 Europeans, and 2000 Malays, Topa-

fess, and native Cinglefs. This military establishment, rarely exceeding 5000 men, was found sufficient to repel the at-
tacks of the native princes, and from the nature of the coun-
try, of baffling the attempts of any European force that did not much exceed in number the troops stationed at any par-
ticular point. But it is not merely the defence of the island itself, that renders it necessary to maintain a powerful force here. Its fituation is such, that it affords the best points for flating those troops that are defined to protect our several establishments in India, and to act as a collant check on the native princes. Troops may be sent to any of our poiffions in the peninsula of India from Ceylon at a few ex-

cence, and in much shorter time, than from either of the pre-

ficiencies of Bombay or Madras. The smallest establish-
ment, as Captain Percival apprehends, which can be ap-
pointed to this island, must consist of at least three Euro-
pian regiments, and seven or eight battalions of native troops for the garrisons of Trincomalee, Cumburo, and the Point de Galle alone; without including the fort of Jaffa-
patam, Managan, and the other subordinate posts round the island, which will require garrifions proportioned to their importance. The tranquility and prosperity of the island, after it has been sufficiently secured by a proper military establishment, must depend upon the arrangement of the civil department, and the due administration of justice. Whilffe it remained in subjection to the Dutch, its government was absolute with regard to the affairs of the island, but sub-
ordinate to the governor of Batavia, who was considered as the governor-general of all the Dutch settlements in India. The governor of Ceylon was affixed by a council, composed of the most respectable Dutch gentlemen residing at Col-

umbo.
lumbo. The members of this council were nominated by the governor, and confirmed in their appointments by the government of Holland. For the administration of justice, a high court was established at Colombo, to which the ultimate decision in all capital cases belonged. At Trincomalee, Jaffnapatam, and Point de Galle, there were subordinate civil magistrates. And in all the inferior forts and stations through the island, there were petty courts called "Landarchs," for the more speedy administration of justice, and matters of less importance. In these the military commanders of the district usually presided. An appeal lay from all these inferior courts to the high court of justice at Colombo. The whole Dutch civil establishment, independent of the military who acted as civil magistrates, was computed to amount to 450 persons, comprehending all who were anywhere attached to it. According to the estimate of the Dutch, Ceylon ranked only as their eighth Indian government. For some time after the English took possession of Ceylon, the government was necessarily a military one, till the arrival of governor North, when the civil establishment took place. He abolished the office of provost-marshal, and the jurisdiction of the military courts, and restored the civil establishment nearly to the same form which it bore under the dominion of the Dutch. He re-established the supreme court of justice at Colombo, with a civil magistrate to superintend the police of the fort, and another in the Black Town. The various officers necessary for these departments were also appointed at the same time; and similar regulations were adopted through the other parts of the island. The petty courts in the distant parts of the country still continue to be presided over by the commanding officers of the nearest post. The government of Ceylon was for some time dependent on that of Madrid, but is now only subject to that of the mother country, and entirely uninconnected with the East India Company. For the conduct of military affairs, there is a military board established at Colombo, consisting of six members selected from the commanding officers of the several corps stationed in Ceylon. The commander in chief of the forces in the island is president of this board, and the commander of Colombo for the time being, vice-president. To it are attached a secretaries, clerks, &c. with suitable salaries. Robertson's Itinerary Description concerning India, 1799. Perevaux's Account of the Island of Ceylon. 4to. 1805. Asiatic Researches, vol. vi.

CEYAS, a town of France, in the department of Herault; 7 miles E. of Lodève.

CEYERIAT. See CEZERIAT.

CEYERIEU, a town of France, in the department of the Ain, and district of Bellay; 5 miles N. of Bellay.

CEYSSAC, a town of France, in the department of the Gironde, and district of Blaye; 7 miles S. E. of Blaye.

CEZ, a river of France, which runs into the Rhone, 2 miles W. of Cadours.

CEZIMBRA, a small sea-port town of Portugal, seated on the Atlantic, in a hollow surrounded by steep, rocky, naked summits, and close to the sea; 10 miles well of St. Carlos. The harbour is small and badly protected; and close behind the town is an old castle situated on a mountain and visible to a great distance. The town is supported by the fisheries, and yields a great quantity of fish to Lisbon. In former times, Cezimbra was more considerable.

CEZ, a town of France, in the department of the Yonne, and district of Joigny; 3 miles N. W. of Joigny.

CHA, in Commerce, a silk stuff very thin and light, made in China, which most commonly serves the inhabitants.

for a summer dress; it is somewhat like our taffeties, or lutingis.

CHA in Geography, a town of China of the third rank, in the province of Fo-kien; 25 miles S. S. W. of Yen-ping.

CHABALON, in Botany, Bank. Pin. See THEA.

CHA, in Ancient Geography, a town of Peloponnesus in Triphyila, towards the N. W. of Macilus. It was pretended in the time of Strabo, that it was inhabited by Phœrus and that it was the subject of a war between the Achaeans and Pylans.

CHAAL, a town of Arabia Felix. Strabo.

CHALDON, in Geography. See CHALONS for More.

CHALON, in Ancient Geography, a town of Cappadocia, placed by Strabo in the country called Silice.

CHALON, in the town of Avalon, according to Ptolomy.

CHALON, or CHALE, a town of Peloponnesus, placed by Josephus S. of Tyre, and in the vicinity of Ptolomy.

CHALON, a town of France, in the department of the Charante, and chief place of a canton, in the district of Confolus; three leagues S. of it. The place contains 1,441 and the canton 10,346 inhabitants. The territory comprehends 310 kilometres and eleven communes.

CHABANON, M. in Geography, a dovem member of the Aeady of Inscrip. et Bibles Litteratur Paris: apostle and uniuscous writer on various subjects of literature and criticism. But we allow him a place here only as a writer on music. In 1780 he published a work of considerable merit, entitled, Observations fur la musique et principalement fur la metaphysique de l'art. "Observations on music, and chiefly on the metaphysics of the art." This was only the first part of his plan; but in 1785 the work came out entire, under the following title: De la musique considérée en elle-même, dans ses rapports avec la poésie, les langues, la poésie, & c. le théâtre: "Concerning music, considered in itself, and in its connexion with speech, languages, poetry, and the theatre." In which he disposes of refined taste, nice discrimination, much meditation and knowledge of the subject, and an uncommon spirit of investigation.

Though our sentiments are not always in tune with the opinions and reasoning of M. de Chabanon, yet there are such enlarged views and luminous and elegant observations in analysing the sensations which music excites, in assigning reasons for the pleasures which this art communicates to ears that vibrate true to musical intervals and consonant sounds, that its useful will generate reflections on the art, and let the mind of a musician at work, who had never before regarded music but as a mere object of sense.

M. Chabanon as proved that music has its metaphysics, as well as philosophy and languages. This work therefore requires less knowledge of practical music in the reader than a mind accustomed to reflection. The author himself says that "he writes more for intelligent readers, ignorant of music, than for musicians; who neither know how to reflect nor how to think," and we are sure there are such to be found sometimes, even among greater performers.

M. Chabanon informs us, that he has studied music theoretically and practically—execution and composition—has played out of the same books with the greatest masters of all countries; and has reflected on the subject more than 30 years. Indeed, his work seems to have been the fruit of long experience and observation, and so totally independent of the variations which music has experienced of late years, that the changes in taste, and the execution leave it unaffected.
The author confers his reasoning to what he calls the most essential part of music, melody; perhaps too pertinaciously, as music now can never be regarded as complete but by the union of melody and harmony. By his definition of music, he seems to regard harmony as unnecessary to its existence. This ingredient, so essential in modern music, though deemed unnecessary in high antiquity, and though still unknown in three-quarters of the globe, would doubtless be called for in Europe, by obscure northern ears (according to Rosset) which want stimulants to put them in vibration, awaken attention, and excite pleasure.

When the author says it is impossible to conceive an agreeable melody, whence a base and chords may not be deduced, we cannot entirely agree with him: for melody is so far from always arising from harmony, that the contrary is frequently true. There are many delicate and pleasing passages in melody that cannot receive an accompaniment without injury. The Italians, whole talk and feeling in music seem more refined and acute than the people of any other country, are so sensible of this, that they frequently leave a voice thin rather than crowd it with notes of no other effect than to destroy the beauty and expression of the melody.

The superiority which the author gives to melody over harmony will please the extremes of ignorance and refinement; but the middle claths of half-bred judges and exclusive lovers of harmony, will be scandalized at the impurity of the decision which annihilates the chief merit of their favourite arts, and communicates phlegmody from good music, if not from the church.

The author discusses the question, whether music is an imitative art? and whether its original object was imitatio? but throws a doubt on its power of imitation, as well as confuses the attempt, except in some very few inferences. Nothing so true as that situation gives energy and meaning to dramatic music, which takes out of its niche seems inapert or absurd. In a theatre the scenes, drets, action, and previous business, prepare the mind of an auditor and spectator tor illusion, and enable it to afford the poet, composer, painter, and performer to deceive itself.

We can subdivide this author's opinions, refinements, and metaphysics, concerning music, and allow them to be not only ingenious, but just; except when, in order perhaps to flatter his nation, he prefers French fagging to Italian. While he confined himself to instrumental music, he reasoned like a man of knowledge, taste, and candour; but in speaking of singing, his opinions are so totally different from those of every nation in Europe, except France, that we cannot help regarding them as national prejudices. "The Italians (he says) either in swelling their tones, or by a stronger aspiration, introduce that exaggeration in their singing with which we are so much displeased. I remember having heard 20 years ago Yli amanti, when first sung a Paris by Signora Piccinelli, to the original Italian words, so splendid to such, that the audience murmured at a muile so barbarous, or at least so different from our own; till French words were ingeniously applied to the same air which had so displeased before; when it soon became, by a more sober and mitigated manner, when sung by a native of Paris, so familiar art popular, that we began to doubt whether it could ever have been sung to Italian words." All this defence of French vocal expression, or rather attack of the Italian, is a proof that this ingenious author, with all his study, practice, and experience in instrumental music, was very ill qualified to erect the public opinion concerning vocal.

M. Chabanon's book was written in the midst of the war of musical opinions between the Ghisults and Piccinelli. The author, who died in 1800, had hird very little good singing, and was left able to judge with decision on that art than of any other musical faculty or excellence. He is said to have been not only an excellent judge of instrumental composition and performance, but, among dilettanti, to have ranked high as a performer on the violin.

CHABAQUIDIC Ile, in Geography, an island of America, belonging to Duke's county in the Massachusetts. It lies near, and extends across the end of Martha's vineyard island.

CHABETUL, or CHABENUL, a town of France, in the department of the Gironde, and chief place of a canton, in the district of Libourne; 2 leagues S.S.W. of Libourne. The place contains 3,300, and the canton 11,107 inhabitants; the territory includes 383; kilometres, and 12 communes.

CHAGERIS, or CHABERIS, in Ancient Geography, a river of India, in the peninsula on this side of the Ganges, according to Ptolemy; which discharged itself by a great number of branches into the sea on the eastern side, N. of the promontory of Caligicum, and near it. See CHABERIS, Caveri-Patnam, a town of India, in the eastern part of the peninsula, on this side of the Ganges, and at the northern mouth of the river of the same name, according to Ptolemy.

CHABINUS, a mountain wholly covered with wood, according to Diodorus Siculus, who places it in Arabia Felix, upon the coast of the Red Sea.

CHABIS, in Geography, a town of Peru, in the province of Kerman, at the edge of a desert, on the confines of Segetia; 115 miles N. of Sirgan.

CHABLEAU, duchy of, a province of Savoy, which stretches along the southern bank of the lake of Geneva, as far as the Valais, which bounds it on the east; on the south it is bounded by Faucigny; and on the west by the republic of Geneva. The country, though mountainous, exhibits a delightful variety of fields, meadows, vineyards, and woods, and is well cultivated and populous. Its capital is Thonon.

CHABLAIS, in Ancient Geography, a people of Arabia Felix, who inhabited a district in the vicinity of the Nabor-naxes.

CHABLEAU, a middle-sized rope for tracking and drawing bateaux up rivers. It is impossible to row large boats loaded with provisions, &c., up violent rapids such as those of the river St. Lawrence above Montreal, or to take them up, indeed, with setting poles. Each bateau, therefore, employed in carrying provisions, ammunition, &c. from La Chine, about 12 miles higher up that river than Montreal, to the upper parts, has a rope fastened to its bow. And as it is extremely difficult for the crew of one boat to take her up some of the rapids with the assistance both of the rope and setting-poles, the bateaux, when loaded, generally start from that place in divisions or brigades, and when they reach the foot of a bad rapid, the crews of two or three of them join together, and first take up one of them, then another, and so on.

CHABLE, to stuff a heavy parcel, bundle, burthen, or weight to a rope, in order to haul and raise it up, as they do in flou-houfes and work-houfes.

CHABLES, in Geography, a town of France, in the department of the Yonne, and chief place of a canton, in the district of Auxerre, celebrated for its excellent white wine; 3 leagues E. of Auxerre. The place contains 2223, and the canton 77,566 inhabitants; the territory includes 184; kilometres, and 11 communes.

CHADNAM, or Cosea, in Commerce, a kind of muffin or cotton linen, very clear and fine: it comes from the East Indies, particularly from Bengal.
Hunting in the palestine; 68 miles N.E. of Zytomiers.

CHABON, or Chabon, in Ancient Geography, a town of Palestine, so called by Eusebius and Jerom, who place it in the tribe of Juda.

CHABONS, in Geography, a town of France, in the department of the Tierre, and district of La Tour-du-Pin; 30 miles S.E. of Lyons.

CHABOR, or Chabora, in Ancient Geography, a strong place of Alia, in Mesopotamia, situated at the confluence of the Chabor and Euphrates, according to Ptolomy.

CHABORAS, or Chaboras, Khabor, a river of Asia, in Mesopotamia, springing, according to Ptolomy, from mount Matus. It ran towards the S.W., passed near the town of Amenias, and discharged itself into the Euphrates, in the strait on which were situated the towns of Chabor and Ceresaon. Julian is said to have crossed this river on a bridge of boats. Strabo and Ammianus Marcellinus call this river Aboras. See ABORAS.

CHABORA, a town of Mesopotamia, placed by Ptolomy near the Euphrates.

CHABORAS, a mountain of Assyria, which, according to Ptolomy, lay on the borders of Media.

CHABOT, in Ichthyology, the common French name of the small fish, vaguely called by the English fisherman the miller's thumb. See COTTUS GIBBA.

CHABOTTES, in Geography, a town of France, in the department of the Aube, and district of Gap, 7 miles N. of Gap.

CHABRIA, a town of Perza, 60 miles N.E. of Afraha.

CHABRILLAND, a town of France, in the department of the Drôme, and district of Cret; 3 miles W. of Cret.

CHABRIS, a town of France, in the department of the Indre, and district of Ifournon; 7½ leagues N.N.W. of Ifournon.

CHABRIUS, in Ancient Geography, a river of Macedonia, which had its source in mount Berfouur, ran towards the south, watered the town of Anthemias, and discharged itself into the sea, Ptolomy.

CHABURA, a fountain of Alia in Mesopotamia, mentioned by Paulinias, Athenesus, and Pliny; the latter of whom says that its waters were naturally perfumed.

CHACA-HAMAR, in Geography, a town of Chine Tartary, N. lat. 44° 50', E. long. 92° 37'.

CHACAL, in Zoology, the French name of the animal we denominate jackal, canis mesomelas, Linn. Buffon calls it chacal, and hiswife calls the canis aureus of Schircher and Gmel. chocal alve.

CHACAMEL, in Ornithology, the name given by Buffon to the crying curassaw, curass vexillum. Gmel. It is also called chachalacameil in the Hift. New Spain. Fernand. &c.

CHACANGA, in Geography. See CHICANGA.

CHACA-TENGASO, a town of Alia, in the country of Ombri, 2 miles N.E. of Pochomra.

CHACAO, a port town of South America, in the island of Chiloé, where the governor usually resides.

CHACE. See CHASE.

CHACE, La Chaffe, French. Alu Cacita, Ital. in Musa, all equally imply a hunting piece, or movement, in which the French horn, fife, and flute chiefly prevail. "With early horn," an admirable long in the hunting piece, composed by Gallard for a pantomime entertainment at Covent Garden, 60 years ago, was in such favour during the middle of the 17th century, that Beards and Lew hardly ever escaped being called upon every night, for a long time, to sing it at the theatres between the acts, or in the play and farce. One of the most animated and pleasing of Haydn's symphonies is called "La Chaffe," Schobert, Kotzebue, Clementi, Duffe, Steibelt, Cramer, and other great players and eminent com¬posers for the harpsichord and piano forte, have severally published a chaffe that has never failed to please whenever well played. See RUSSIAN MUSIC.

In the "Almanac de Gotha" for 1775, there is an abridged history of music in Russia, well drawn up, and allowed by the natives themselves to be authentic. In this sketch of musical history we have an account of a band which attends some of the grandees of that empire in the chase of fo extraordinary a kind, that it was long regarded as fabulous by the rest of Europe, till the late coronation of the present emperor Alexander, at Moscow, at which splendid solemnity many of our countrymen were present, who have lent and brought hither a description of the extraordinary performance of this band, which exactly tallies with, and confirms that in the Gotha almanac 30 years ago.

We shall, therefore, under the present article on the music of the chase, give our readers, in our own language, a transcript of this part of the history of Russian music.

The lovers of the chase in Russia formerly knew no other musical instrument than an ordinary brazen horn of a spiral conical form, a little curved.

These clumsy and ill-shaped horns in themselves resembled each other in length and calibre, and, consequently, produced the same tone in tuning them together. It was not music which they produced, but a kind of frightful scream, fit at first to terrify and start game. The grand vizier, Narifkin, undertook to reform this music, or, at least, to render its effects less barbarous. With this view, he applied to one of the huntsmen of the court, named Marzich, a name which ought to be recorded in the history of music. This inventive spirit began by having 37 horns made of the same kind, but of different length and diameter, so that by each producing a different tone, he acquired a series of sounds, extending to three complete octaves. These 37 horns were distributed to as many young men of the hunt, who were taught to blow them in such a manner as to produce the clearest and sweetest tone possible. After this, they were taught musical measures, and to count the time not only of sounds but of silences, so as to know precisely when the tone of their instrument would be wanted, and for what duration, in proportion to the measure of the air or piece of music that was to be executed. This was certainly the most difficult part of the task; but the Russias accustomed to discipline and obedience, and manifesting docility, and a disposition for so pleasing an art, by a little patience on the part of the master, and great perseverance in the pupil, the undertaking was crowned with success. The reat was the business of the composer, who distributed the several parts to the performers of each note, with the reeds in whole bars and fractions, which they had to count between every two notes in their part. From this singular invention, in a short time, these young chaffurs were able to perform whatever was put before them, and they are at present in such high practice, that they play marches, airs, entire symphonies, with their allegros, andantes, and preludes, executing with alacrity and precision the most difficult compositions, embellished with fortissimis, and even demisemiquavers. During performance every one holds a paper in his hand, on which the notes, or rather the repetition of the single tone of his instrument is marked, as well as the reeds which he has to count, in order to be ready at the instant his
tow is wanted, either loud or soft, short or long, according to the pleasure of the author.

"The ear of the auditor is so deceived, that he imagines passages to be played by one instrument, which, if no one note is repeated, is performed by as many different instruments as there are notes in the melody.

"This music has the most astonishing effect, particularly in the open air, where it has room to expand without the vibration being reflected back by the echoes which these numerous instruments excite. The effect is at once grand, melodic, and pleasing; indeed, it is impossible to form an accurate idea of it without hearing it. Twenty-four or thirty common French-horns may, perhaps, if united, something approach to the same effect; but always of an inferior kind to the adjoining harmony of these Ruffian-horns, which, by the undulation and vibration of each full and round tone, which no one instrument can produce in succession with that equal force, at once amplies the ear and the heart."

At Petersburg, this music is often heard in a fine evening on the Neva, where it generally precedes the barges of the court; and we have been surprised by good judges of music with the fear now, that they have not discovered, till they were told, how this music was produced; and that, as in a belly, where no ringer has more than one bell or note to enflame, so here a man's whole life is devoted to one and the same sound or note.

CHACE of a gun. See CANNON.

CHACE, order of, or grand order of of Wartenberg, was instituted by Eberard, Duke of Wartenberg, in 1704, in allusion to his being grand master of the empire. The ensign is a cross of gold of eight points, emblazoned red, with an eagle displayed, and burslet horns. On the centre is the letter W, and over a ducal hat of the empire. The cross is worn pendent to a scarlet ribbon, from the left shoulder to the right side; as the left breast of the coat is a silver star, and the motto in a green circle is "Amicitia virtutique fides.,"

CHACE, in Geography, a town of France, in the department of the Maye and Loire, and district of Saumur; one league S. of Saumur.

CHACHALACAmetl, inORNITHOLOGY. See CACAMEL and CUCO varipes.

CHACHAPOYAS, in Geography, a jurisdiction of South America, in Peru, in the district of Trujillo. As lies without the Cordilleras, its temperature is hot, and towards the east its territories have a low situation. It is of great extent and thinly inhabited; and the products of the earth are only taken as partially furnish in such a climate. The Indians here are very ingenious in making cottons, particularly tapestry, which, by the dyes of the colours, and different of the work, exhibit an elegant appearance; the cloths, together with the flax, yield great profits to the country, as they are highly valued in the other provinces.

CHACING. See CHASING.

CHACK, in the Mongol, is taken in the same sense as but upon the hand; it is a appeal to a horse when his head is not ready; but he tucks up his nose, and makes at all of a sudden, to avoid the subjection of the bridle. Turkish horses have this fault frequently. We say, they beat upon the hand; and never the belts, nor the belt hand, can ever fix their heads. Croats, or Caucasian horses, are also subject to beat upon the hand; which proceeds from this, that the bars are too sharp and ridged, or edged, so that they cannot bear the pressure of a bit, though very so gently. If a horse had not too sensible, or too tender a mouth, he would not beat upon the hand; but in order to fix and secure his head, you need only put under his nose-band a small flat band of iron, bent archwise, which answers to a martingale. This will hinder him to beat upon the hand, but will not break him of the habit; for as soon as the martingale is taken off, he will fall into the same vice again.

CHACO, l., in Geography, a province of South America, in the country of Buenos Ayres, reckoned 200 leagues in length, and 15 broad, on the west side of the river La Plata, and bounded on the east by a chain of mountains: it is inhabited by Indian nations that are little known.

CHACONNE, French, a serious and splendid dance to music formerly written on a ground base; but that reprise has late been given up. The measure, however, is invariably that of 2, and there are frequent returns to the subject and final strain, after episodes and excursions into new modulations and styles.

The word is formed of the Spanish chacona, which may probably be derived from the Persian chace, a king, thus intimating, that this might have been a royal dance; not, as others pretend, from the Italian cacone, a blind man, the inventor.

CHACRELAS, the name of a race of people, according to Buffon, who, like the Beulas of Ceylon, are of a white colour, and inhabit the island of Java. Similar to these are the white Indians of the island of Darien, and the white negroes of Africa. Some have supposed that these people are a distinct race, inhabiting the islands of Darien, the negro country, and the island of Ceylon, all which are under the same parallel. Others imagine, that they are individuals who have accidentally degenerated from their original stock. To this last opinion Buffon inclines. The production of whites by negro parents, he says, which sometimes happens, adds great force to this theory. In the history of the French Academy we have descriptions of two of these white negroes; and Buffon adds, that they are very frequent among the negroes of Africa. This variation of nature, which is a singular circumstance, takes place from black to white only, and not vice versa: and it is no lesser singular, that all the people in the East Indies, in Africa, and America, where these white men appear, are under the same latitude.

CHACTAW Hills, in Geography, hills of America, situate in the N. W. corner of Georgia river.

CHACAWS, or flat-heads, a powerful, hardy, fat, e, and intrepid race of Indians, who inhabit a fine and extensive tract of hilly country, intersected with large and fertile plains, between the Alabama and Mississippi rivers, and in the western part of the state of Georgia, in America. To this nation belonged, not many years ago, 43 towns and villages, in three divisions, containing 12,123 inhabitants, of which 9,041, or, as some say, 6,000, were warriors. They are called by the traders Flat-heads; all the males having the hair and band part of their faces flattened when young. These men, unlike the Mixquique, are lowly and negligent in every part of their dress; but they are said to be ingenious, ferile, and virtuous men: bold and intrepid, and yet quiet and peaceable. Some late travellers, however, have observed, that they pay little attention to the most necessary rules of moral conduct; or at least, that unnatural crimes are too frequent among them. Different from most of the Indians bordering on the United States, they have large plantations, or country farms, in which they employ most of their time in agricultural improvements, after the manner of the white people. Although their territories are not one-fourth so large as those of the Micmac Confederacy, the number of inhabitants is greater. The Chactaws and Creeks are invertebrate enemies to each other.
CHADACA, in Ancient Geography, a town of Albania, placed by Ptolemy, between the Albanus and the Callius.

CHADEI, a people who inhabited the eastern part of Arabia Felix, according to Pliny.

CHADAGH, in Geography, a town of Persia, in the province of Parthian, five miles W. of Schiras.

CHIADARA, in Botany. Forst. See Geewia populifolia.

CHADBOURNE'S River, in Geography, a river of America, in the district of Maine, called by some Great Water's river, about 33 miles from the mouth of the Bornebeag pond, from which flows. It is said to have derived its latter name from a mill with 18 saws moved by one wheel, erected by one Lodgers; but the project was soon laid aside. The former name is derived from Mr. Chadbourne, one of the first settlers, who purchased the land at the mouth of it, of the natives, and whole polterney possets it at this day.

CHADCHOD, in Jewish Antiquities, Ezekiel mentions chambers among the several merchandizes which were brought to Tyre. The old interpreters, not very well knowing the meaning of this term, continued it in their translation. St.Jerome acknowledges that he could not discover the signification of it. The Chaldee interprets it pearls; others think that the oys, ruby, carbuncle, crystal, or diamond, is meant by it. Ezek. chap. xxvii. ver. 16. Cabnet. Dict. Bibl. in v.c.

CHADDER, in Ornithology, a name given by the French to the Merops Ceylouis.

CHADER, in Geography, an island of Asia, formed by a river which runs from the Ephratus to the Perian gulf, and extends from Balfora nearly to El Catt, 240 miles long, and 39 wide.

CHADISIA, in Ancient Geography, a river of Cappadocia, which runs between the town of Amida and the river Lyseile.

CHADURANOTITE, or Catharanota. (Ptol.) a people of Arabia Felix, who inhabited the southern coast opposite to the Indian ocean, near the strait in which the river Parn discharges itself.

CHEOANOTITE, a people mentioned by Strabo, and placed in Attic Sarmatia.

CHEDENI, a people placed by Ptolemy in Scandianavia.

CHELLE Canabarium. See Crab's claw.

CHEMEL, in Ancient Geography, a people of Germany, who inhabited the districts near the river Amassus, according to Ptolemy.

CHENIDES, a people of Attic Sarmatia, according to Ptolemy; supposed to be the same with the Chanoanote of Strabo.

CHERCELA, a town of Africa, in Cyrenaica.

CHERETAPA, a town of Asia Minor, in Phrygia.

Chich. Char. Col. Umbel universal spreading; partial nearly equal in the number of its rays. Also, universal generally none; partial five-leaved or more; leaflets lanceolate, concave, reflexed, about the length of the partial umbel. Perianth proper scarcely discernable. Cor. universal nearly uniform; florets of the disk often abortive. Petalos five, inrolled, heart-shaped, with an inrolled point, flat-tish; outer ones a little larger. Stem. Filaments five, simple, the length of the little umbel; anthers roundish, Pijth. Germ inferior; styles two, reflexed; stigma obtuse. Peric. none. Fruit oblong, acuminate, even, divisible into two. Seeds two, oblong, attenuated upwards, convex on one side, flat on the other. Eff. Ch. Involucr reflexed, concave. Petals inrolled, heart-shaped. Fruit oblong, even.

Obf. In this, as in all other very natural families, authors differ very much from each other in the formation of genera. L. Mackit unites the charophyllum and scandium of Linnaeus, and affords that they make a well-defined genus, which ought by no means to be broken; and which has for its essential character: fruit slender, elongated like the beak of a bird, either even or frayed, smooth or hairy. Ventenat, on the other hand, has distributed the species into three genera. 7. Charophyllum, including charophyllum sylvestris; with scandium cereolium, nodosa and adventus of Linnaeus, with the following generic character. Col. entire. Cor. petals heart-shaped or emarginate, unequal. Fruit: cylindrical, awl-shaped, smooth, either soft or rough with hairs. 2. Myrthis, a name revived from the old botanical, including scandium odorata, with charophyllum hieracinum, aurum, bulbocodium, tetrameresum, and alouo; under the following character: fruit elongated, attenuated at the summit into a short point, either even or furrowed, smooth or hairy. 3. Scandium, including scandium peten, auriculata and grandiflora, with the following character: fruit terminated by a long point, finely frilled, either smooth or rough with hairs. Dr. Mill had before made the same division, and had founded this generic character on the comparative length of the nucleus and the whole fruit. According to him the nucleus of scandix is scarcely a quarter of the length of the seed, charophyllum three quarters, and myrthis the whole length. Under the first he figured the fruit of scandium peten; under the second, of scandium cereolium; and under the third, of scandium odorata, charophyllum auriculum, C. tetrameresum, and six canadensis. See Scandix.

CHÆRUS, in Ichthyology, a name given by Strabo and other old writers to the Capricus or goatfish of later writers. See Balistes monodon.

Gen. Chæs. Cat common, many-leaved; outer leaflets lanceolate, ciliated; intermediate ones linear, ciliated at the summit; inner ones linear, fearious, faphacellated, terminated by a bristle. Receptacle naked. Seeds oval; down capillary. There are two species, natives of Peru.

CHÆTHIA, in Zoology. This is the name under which Dr. Hill describes that kind of intellinial vermes, which the English call Ear-worm. Vide Hill, Holl. Anim. p. 14. It is a species of Gardens, the fist of Muller, and aquaticus of Linnaeus. See CHÆTHIS aquaticus.

CHÆTOCRATER, in Botany, (from κρατήρ, the name of a pot, and κύτταρος, a cap.) Boc. Nouv. Dict. Flor. Peruv. pl. 35. Chæs and order, acetabria manogynia.

CHÆTODON, in Ichthyology, a genus of Thoracir fishes. The head is small, mouth curved; lips retractile; teeth numerous, close set, equal, fimbriate, flexible, and movable; eyes round, small, vertical, and furnished with a ciliated membrane; gill membranes with from three to six rays. Body broad, compressed, heavy, and generally fimbriate.
Chetodon.

The fishes of this numerous genus are, with very few exceptions, extremely beautiful, their colours remarkably vivid, and their varieties conflicting generally of stripes, lines, bands, or spots; their body covered with strong scales, which are freely denticulated at the margin; and the dorsal and anal fin remarkably broad.

Chetodon aureus, La Bandonnière dorée, of French writers, and Golden Chetodon of the English, is one of the most brilliant species of this genus. The colour is golden yellow, with a spine near the check bone. Bloch. Gmel.

This beautiful fish was figured by Bloch from one of Plummer's drawings, as an inhabitant of the Antilles. The body is oval, and except the pectoral and ventral fin, the whole is covered with scales. The colour of the body is fine golden yellow; the fins are yellow at the base, and green at the extremity; the pectoral and caudal fins are both rounded, the reti calcated. The pectoral fin contains twelve rays; ventral fin; anal nineteen, caudal fifteen, and dorsal thirty-five. Length of this fish about twelve or fourteen inches.

Chetodon imperator. Yellow, with numerous longitudinal streaks, and about fourteen dorsal spines. C. imperator, longitudinalis quatuor, is described by Bloch. L'empereur du Japon; &c. The head of this fish is large, the eyes golden, and partly surrounded by a blue arch; mouth small, with the lips large, and the jaws equal; gill membrane of two parts marked with a blue streak; lateral line near the back, and bending down at the end of the dorsal fin. This is a most splendid fin, about the same length, or rather larger than C. aureus, and has the body also of an oval form. It is a native of Japan, where, according to Ruyfch and Renard, it is in high esteem as an article of food, and is said to be richer and superior in flavour to the salmon, called, by the lard writers, der Käifer von Japan.

First described by Valentin, who informs us the Dutch in India call it Malmefje Hertog. The body is whittish with a silvery hue, rather dusky on the back; and is barred across with nine broad bands of deep blue, each of which is marked on both sides with a narrow streak of brown; the dorsal fin is edged with a blue stripe, and the anal fin marked posteriorly with four nearly equidistant lines of the same colour. The iris is white; mouth narrow; jaws equal; gill-cover of one piece; lateral line near the back, and bending at the end of the dorsal fin; pectoral fin short, elliptic and rounded. The dorsal fin contains about thirty-five rays, the fourth of which are spinous. This inhabits the Indian seas.

Chetodon guttatus. Body spotted; ventral spines two. Bloch. Gmel. &c. The body is long, narrow, covered with minute scales, above cinereous, beneath white, and spotted with tawny. The eyes are large and round, with dusky yellow iris; mouth large; jaws equal; gill-cover of one thin long piece; fins dilute of scales, with the rays branched; pectoral fin yellow-brown; dorsal and anal cinereous; tail yellow, with cinereous spots. The dorsal fin contains thirty-four rays; pectoral fifteen; ventral seven; anal twenty-three; and the tail fifteen. This species inhabits Japan, and was first described by Bloch.

This fish inhabits South America, where it inhabits on smaller fishes, insects, and other aquatic animals; it is found throughout Brazil, and in Jamaica. The body is black, but at the sides grey, and the edge of each scale is large and edged with yellow. The eyes are small, with golden irides; lower jaw longest; gill cover of two pieces terminating downwards in a spine, and covering the membrane; vent in the middle of the body; pectoral and tail fins short, rounded; the reti long, and calciated; before the pectoral fin a yellow spot. Described by Maregrave as being from nine to ten inches long, but according to the manuscripts and drawings of Prince Maurice preferred in the royal library at Berlin, the length is more than fifteen inches.

The head large, and with the bract yellow-brown, spotted with blue and marked near the gills with blue lines; iris greenish-white; mouth small; gill cover of one piece, the membrane loose; lateral line parallel with the back, and interrupted at the end of the dorval fin; vent in the middle of the body; rays of the fin branched. This species is described by Bloch as a native of the East Indies, probably by a drawing, as he observes he is unable to determine its size; he adds that it is of the number of carnivorous fishes, and that the display of beautiful colours which pervade it induced him to name it paon de l'Inde. Indian Peacock Chetodon.

Chetodon versutus. Dorval and anal fin broad; band on the tail black. Gmel. &c.

This species inhabits India. The body is cinereous, beneath paler, very thin, and covered with minute scales. The head is diftinct of scales; Iris silvery and yellowish; mouth small; lips thick; gill-covers of two pieces; lateral line arches; fins cinereous, with branched rays; very prominent of the dorsal and anal fins yellowish. This species is in particular distinguished by the extreme length and breadth of the dorval and anal fin, both of which is of a somewhat triangular shape, and nearly equal the body in point of size; the depth from the opposite tips of the dorsal and anal fins is about six inches and a half, but that of the body from the front of the head to the extremity of the tail four inches. Supposed to be the sea-bat of Willughby. The French call it, la Bandonnière à larges nageoires.

Chetodon unimaculatus. On each side, near the back, an oval black spot; dorval spines about thirteen. Chetodon unimaculatus, Gmel. Bloch, &c. A native of India; the body is of a roundish ovate form; the colour greyish-white, with transverse brown lines; back cinereous; scales large; over the eye a black band; jaws equal; lateral line parallel with the back, and nearly approaching it; fins yellowish; tail brown at the base. The dorsal fin contains about forty-eight rays; pectoral four, ventral fin, anal thirty-six, and caudal sixteen. La Bandonnière à tache. Bloch.

Inhabits the gravelly shores of the Caribbean islands near the mouths of the rivers. The body is yellow; head and lower parts whitish; with eight pale brown bands; scales large. The eyes are oblong, with silvery irides; vent near the tail; fins without scales, and with bands the rays branched, yellow on the anterior, and cinereous on the posterior.
The body is of a roundish ovate form, with the snout so greatly lengthened into a tubular form as to afford an excellent criterion of the species; the irides are yellow; jaws equal; lateral line near the back and arched. The body is whitish, with a dusky tinge on the back, and marked with five transverse, and nearly equidistant brown bands, the edges of which are milky-white. The dorsal and anal fin are very broad at the hinder part, and the former is marked with a large black spot, encircled with white; the gill-covers are scaly, and without spines; the tail with a black hand edged with white. This fish lives in all the fens of India. According to M. Hommel, inspector of the hospital at Batavia, it resides principally in the deeper parts of the sea, or the mouths of rivers, the last of which it may be supposed to visit like many other fishes during the spawning season. The manner in which this species takes its prey, though not entirely peculiar to this fish, is rather extraordinary. It lives principally on the smaller kinds of molluscs that fly near the surface of the water, and when it observes any one of these hovering or giving near it, darts from its tubular snout a drop of water with an aim to steady and certain, as to bring the insect down with it into the jaws. If the fly, or other insect which it misses out for its object, beat tell on some aquatic plant, the fish cautiously approaches within the distance of four, five, or six feet before it ejects the water, which, even at this distance, is almost certain of bringing the insect down to the surface of the water. When kept in a flate of confinement in a large vessel, it is said to afford considerable entertainment by its dexterity in taking the insects placed at a convenient distance within its reach. M. Hommel informs us, that they are preferred in the gardens and houses of the great men in India, in very large vases, for the amusement of their ladies. The fish is edible, and the fish is usually taken with the hook and line.

A native of India. The head large and flopping; irides golden; gill-cover long, narrow, covering the membrane; lateral line composed of many straight, interrupted lines running together into a single; angle towards the back; vent in the middle of the body; upper part of the body bluish-green; belly white; ventral fins long, narrow, and falcated. The dorsal fin contains about 37 rays; pectoral 14; ventral 7; and 5; and caudal 14.

Inhabits the Indian Ocean and Red Sea. The length is two feet; body blackish, at the sides brown, and beneath white. The eyes are large; teefs in the upper jaw 16; in the lower 15; gill-cover long and narrow; lateral line near the back and continued parallel with it; pectoral and caudal fin cincereus, ventral black, dorsal and anal white at the base, the red brownish. Maneavre found this species in Brail, Hafelquey in the Red Sea, and Valentyn in the East Indies. It grows to the length of eighteen inches and rarely to two feet.

The
The Argus chetodon inhabits the fresh waters of India, living principally on fishy places, where it finds an abundant supply of insects, upon which it feeds. Valentin speaks of it as a fish of excellent flavour. The body is nearly square, of a silvery grey colour, and violet on the upper parts; fins yellow; the whole body and also of the fins are marked with numerous round spots, of a dark brown colour. The irises are golden; jaws equal; gill-cover large; membrane loose; lateral line arched; vent nearly in the middle of the body; tail even at the end.

This species is mentioned as a native of all the Indian seas, and is esteemed an excellent fish for the table. The body is yellow, braced with brown; above the eyes runs a black band, which Bloch considers as one of the leading particulars of its specific definition. There is also another black band at the edge of the body, near the base of the tail, which runs from the pectoral to the dorsal and anal fins; and a third black band across the middle of the tail. The head is covered with small scales, but those on the body are large. The gill-covers are of two pieces, the membrane loose; vent near the tail; fins yellow, with branched rays, the dorsal, anal, and caudal fins edged with black.

The body is white, with six black bands. The eyes are large; aperture of the gills very large, the membrane loose; lateral line interrupted at the dorsal fin: fins large and black; tail forked. Length eight inches. Inhabits the coral reefs on the shores of Baffin, India, and Arabia.

The body is yellow, fuscated with brown, one band passing in a semicircular direction transversely through the eyes, a second nearly parallel from the back to the belly, across the pectoral fin, a third intermediate between these and the tail, a fourth at the base of the tail, and the fifth across the tail; extremitu of the caudal fin, and posterior end of the anal and dorsal fins bound. Found in Japan, and other parts of India. The French call this \textit{L'ongeur}, or \textit{Le zibre}.

The body is silver, cinnereous on the back, with thick brown bands, one on the head, another on the breast, and a third passing from the dorsal to the anal fin. The head is large, the mouth narrow, jaws equal, gill-cover of one piece and mucronated in the middle; ventral fins long, and with the anal black; tail and dorsal fin cinnereous.

The body is covered with rather large scales; colour white, with brown lines. The eyes are very large; band through the eyes black, and edged with white; gill-cover fuscated, and consisting of two pieces; fins yellowish; the rays branched; dorsal and anal fin brown at the edge; spines feen-green; near the tail a black band. Length three inches. Inhabits Jamaica.

Chetodon rotundus. Dorsal spines twenty-three; body with five pale bands. Limn. Inhabits South America and India. The body is cinnereous and rounded.

Chetodon lanceolatus. Tail entire; body with three bands, one across the eye, another across the brachial, and a third extending from the anterior dorsal fin to the tail. Gmel. \textit{Caecius}, Edward. A native of India. Form of the body lanceolate. The bands are black, edged with grey.

This species inhabits the seas surrounding the Caribbean islands, and is described by Bloch from one of Plunier's drawings and manuscripts. The colour of the body is yellow, with five narrow violet bands, and beneath brown. The head is large, and of a violet colour, with a black spot on the mouth and checks. Its upper jaw is longer than the lower; vent nearer the mouth than the tail; fins without scales; pectoral, ventral, and anal fin violet, the tail barred with yellow; dorsal fin, varied with yellow and violet; tail yellow at the base, and violet towards the edge. In Plunier's drawing, above-mentioned, the dorsal fin contained 14 spines and 20 soft and branched rays; pectoral fin 15 rays; ventral 1 spine and 6 soft rays, 3 spines and 20 soft rays, and the tail 16.

A beautiful species, described like the preceding, on the authority of a drawing by father Plunier, and which is supposed to attain to a considerable size. It is a native of the American seas. The body is of a rhombic form, deep green on the upper parts; the sides greenish, below which, near the belly, are three green lines, and three intermediate lines of white; belly yellow. The head is silverly, truncated anteriorly, with the eyes large, and mouth full larger in proportion; teeth small; gill-covers confluent of two semilunar pieces, with the membrane loose; lateral line slightly curved, vent in the middle of the body; dorsal fin green; pectoral and ventral yellow at the base, and edged with violet; margin of the anal and caudal fin green.

Chetodon Plunier. Dorsal fins two; head without scales. Bloch.

This also is an elegant species, described by Bloch from the designs of father Plunier, and named in compliment to that collector. The fish inhabits the Saronic gulf on the American seas, and is of the number of edible fishes held in most esteem for the table. The body is of an oblong form, coated with small scales. The colour brownish above, cinnereous at the sides, beneath white, and marked with six greenish-black bands. The head is brown above, at the sides white; lateral line arched; fins much fuscated, green, at the base yellow, and without scales; all the spines of the first dorsal fin yellowish. In Plunier's figure are delineated 5 spines in the first dorsal fin, and 27 soft rays in the second; pectoral 14; ventral 1 spine and 5 soft rays; anal 2 spines and 27 soft rays; and tail 12 rays.

A native of South America. The head is large, the jaws of equal length, and the lips thick; the gill-covers are broad, yellow, and covered with large scales. The body is thick, brownish, with the sides silverly, and the scales edged with violet. The lateral line is composed of oblong white scales, and is broken, or interrupted at the dorsal fin; vent in the middle of the body; first yellow, with branched rays; tail forked.

3C Chetodon
**Chetodon** Mauriti. Doralf spines eleven; anal three.

The Brazilian name of this fish, according to the above author, is *Fajacuarana*. It describes it from one of Pommer's drawings, and informs us, on the authority of Prince Maurice, that it inhabits Brazil, grows to the length of two feet, and that the fish is white, and of a good flavour. The body is long, and covered with small scales; blue on the back, and the sides paler blue, and belly white. From the back extends a very narrow black transverse band, which terminates about the middle of the body. The sides are yellowish-filvery; the mouth and operculum of the gills large; the back rather arched, with the lateral line continuous, vent near the tail; rays of the fins rufous; ventral fin yellow; pectoral dusky; and the red pale blue. This is named in compliment to the memory of the celebrated Prince John Maurice of Nassau-Singen, under whose conduct the Dutch, in 1617 and 1618, became possessed of the richest part of Brazil, and who afterwards, while governor of that country, amused his leisure hours in taking drawings and descriptions of its zoological productions.

**Chetodon Bengalesis.** Body falcated; doralf spines thirteen; anal two. Bloch. *La bandoulieere bengalesis*, ib.

This fish inhabits Bengal. The body is large, white, with a bluish back, and marked across with five bay-coloured bands. The sides are yellowish-white; aperture of the gills large; lateral line slightly arched near the back, and interrupted at the extremity; vent near the tail; fins brown at the base and edged with blue.

**Chetodon olivaceus.** Body with eight brown bands; doralf spines eleven; anal three. Bloch. *La bandouliere*, ib.

This fish inhabits Bengal. The body is large, white, with a bluish back, and marked across with five bay-coloured bands. The sides are yellowish-white; aperture of the gills large; lateral line slightly arched near the back, and interrupted at the extremity; vent near the tail; fins brown at the base and edged with blue.

**Chetodon annularis.** Brownish, with obliquely curved longitudinal breaks, and a blue ring on the lateral line behind the gills. *Chetodon annularis*, Bloch. *La bandoulieere*, ib. *Ikan batte*, Java, and *Ikan pampus* Cambodiana.

A native of India. The body is ovate, and brownish, with about five blue lines. The sides are silvery; gill-covers of two pieces; the anterior one toothed and spinous; lateral line parallel with the back; vent in the middle of the body; doralf fin pointed; anal rounded, both dark brown, banded with blue, the rest of the fins white. The doralf fin contains fourteen spinous rays, and forty-one soft; pectoral sixteen; ventral one spine and six soft rays; anal three spines and twenty-eight rays, and caudal sixteen rays.

**Chetodon collaris.** Head with two white and three black bands; doralf spines twelve; anal seven. Bloch. *Le collier*, ib.

This kind is a native of Japan. The body is of a round ovate form; colour bluish on the upper parts, and yellow beneath. The scales are very large. The head is bloping, of a brown colour, marked with two white, perpendicular stripes, and three black ones; the mouth is white; eyes large, with the iris blue; lateral line bending in an obtuse angle at the doralf fin, and interrupted at the end; pectoral fins yellow; ventral cingular; the rest yellowish, edged with brown; the doralf fin is marked with a yellow band, and the tail across the middle by a brown one. Figured by Seba, who describes it to be about five inches long.

Shape of this fish roundish-ovate; the anterior part bluish-white, the hind part black; and the whole body covered with very small scales; gill-covers confined to two pieces, and are armed with one large and several small spines; the opening of the gills large; the lateral line runs near the back; vent situated in the middle of the body; all the fins are white, except the doralf and anal fins, which are black.

**Chetodon faber.** Body falcated; the third doralf spine very long. Bloch. *Le forgeron*, Brunnnet.

This species was first described by Bloch, under the name of *Forgeron*. It inhabits the Indian and American seas; and is figured in a drawing of Plancius's, referred to by Bloch, is said to grow to the length of eleven inches. The body is silvery, ornamented with six bands of deep blue. The iris of the eye is yellow; the lateral line is arched to the form of the back, running parallel and continuous; the vent is in the middle of the body. The ventral and pectoral fins are black, and the red deep blue. This is an edible fish, and in much request for the table in South America.

**Chetodon Surinam.** Doralf and anal fin armed with many spiny rays; body banded with fuscesc; a black semilunar mark at the base of the pectoral fin. *Chetodon Surinami*, *La bandoulieere de Surinam*, Bloch.

Form of this fish ovate; colour silvery-frey, dark from the back and fins; head and body marked with seven brown bands; doralf and anal fin rather broader behind, and with the tail yellow, with a broad violet border. Received from one of the Danish missionaries in Surinam by Cremers at Copenhagen.

**Chetodon canescens.** Tail bifid; doralf spines two, third ray very long; mouth bilobed. *Chetodon*, ib. *Cetodon canescens*. Described and figured in the work of Seba as *Chetodon canescens*.

The colour of the body is greyish, and covered with very small scales. Inhabits the American and Indian seas.

**Chetodon alpinus.** Tail bifid; doralf spines three; no ventral fins. Gmel. *Linn.*, &c.

Communicated to Linnaeus by Dr. Garlen. This inhabits the Carolinas. The body is of a roundish form, without scales; upper parts bluish; jaws with a simple row of teeth; lateral line parallel to the back, and dotted; doralf and anal fins falcated.

**Chetodon acuminatus.** Tail entire; doralf spines three; third ray very long. Gmel. *Linn.* Inhabits South America and India. The body is marked with three brown bands; doralf fin seporate. *Linn.*, *Mf. Ad. Fr.*

**Chetodon argenteus.** Tail bifid; eight spinous rays in the doralf fin, and two ventral spines instead of fork. *Linn.* *Acad.* Found in the Indian seas. *Obf.* The ventral spines are short, and the third doralf fin so small as to be scarcely visible.

**Chetodon**
CHETODON. Spines in the dorsal fin eight; pectoral fin falcated. Gmel. A species of a whitish or silvery colour, dotted with fuscos; eyes large, red; lateral line curved; three first rays of the anal fin distant.

CHETODON arcuatus. Tail entire; dorsal spines eight; body with four white arched bands. Gmel. Length four inches. This species inhabits Brazil.

CHETODON leucurus. Tail entire; dorsal spines nine. the first recurved; body black; tail white. Gmel. This is of a small size, and inhabits America. Obs. The ventral fins are pointed.

CHETODON lineatus. Tail bifid; dorsal spines nine, and one on each side of the tail. Gmel. Figured by Scb, and is an inhabitant of the South American and Indian seas.

This inhabits South America and India. Its form is oblong; the head is thick; eyes large, with silvery iris; gill-cover large, spinous, serrated, and of one piece; fins rigid, with branched rays; dorsal and anal fins entirely covered with scales; ventral fins small; pectoral pellucid; dorsal spines fifteen, anal three.

CHETODON glaucus. Lateral line straight; dorsal spines five. Block. Glaucus des anciens, Gauther, &c.

Described from the drawings and Ms. of Plunier. It is a native of the American seas, and grows to the length of a foot and a half. The body is of an oblong form, and covered with moderately fixed scales, above blue, and beneath silvery, with five short narrow brown streaks; flesh good, Plunier. Obs. The eyes are small with yellow iris; mouth large; lips thick, with many bones; aperture of the gills narrower, the gill-membrane loofe; fins with branched rays; ventral very small, and terminating in a long narrow point, and with the pectoral fin whitish, the red blackish; anal fin without spines.

Length twelve inches; the snout is lengthened; the body oval, coated with minute scales, and marked with five distinct bands; the first black, two next cincere, and the two last black and cincere. Nostrils two, and placed near the eyes; aperture of the gills arched, the cover of three pieces; lateral line arched and finely visible; vent near the middle of the body; pectoral fins small, and, like the ventral, pointed; dorsal fin large and yellow; tail falcated, edged with yellow, and a black oval spot near the tail.

CHETODON longirostris. Snout cylindrical; tail unarmed; dorsal spines eleven. Broussonet.

Inhabits the Pacific Ocean. The body is compriised, and citron-coloured; beneath inflated and coated with unequal obliquely imbricated scales; the head is fleshy and brownish; beneath silvery flesh-colour; pupil brownish; iris pale glaucescent; mouth large and oblong; jaws nearly equal, with a few small unequal teeth; tongue and palate smooth; lateral line falcated; vent nearly in the middle of the body; dorsal and anal fins citron-coloured, with a black line on the posterior part, and another edged with whitish, the latt with a black spot near the tip; ventral fins citron, edged exteriorly with brownish; tail and pectoral fin pale blue, the latter yellowish at the base.

CHETODON orbiculatis. Body somewhat roundish; cinereous brown; no dorsal spines. Forlk. Fr. Arab.

Inhabits the rocky shores of Arabia. Length about twelve inches; body refringible a flat fish, spotted with black; beneath whitish; belly yellowish; scales round and entire.

CHETODON auriga. Whitish, with about sixteen oblique brown bands; fifth ray of the dorsal fin long and siliform, Forlk. Fr. Arab.

Inhabits the shores of Arabia. Length five inches; shape nearly rhomboidal, and coated with rhombic scales; the head is flat above, scaly, of a reddish-white colour, and marked with four transverse tawny bands; iris of the eye black; mouth compressed and conic; lips rounded and equal; dorsal fin black at the postellar edge; anal varied with black and yellowish white.

CHETODON nefasteus. Anterior part of the body white; posterior brown, with twelve black bands. Careto- don parte anterioire albous, poiliorre fulcens, fuscis nigris. Forlk. Fr. Arab.

Found by Forskal on the shores of Arabia. The length is three inches; the body ovate, with large rhombic ciliated scales; head conic and narrow, with a black band through the eye; lateral line curved; pectoral fins glaucescent; ventral white; dorsal and anal brown; tail black, with a broad hyaline stripe at the tip.

Observed by Forskal on the shores of Arabia. The body is oval, and covered with rhombic scales, disposed in a quincunx order, and finely toothed; the teeth are numerous, siliform, and flexible; anterior gill-cover furnished with a strong spine, nearly half an inch in length. The general colour is black, with a transverse and somewhat lunar yellow band in the middle of the body, having the horns pointing backward; the lateral line is curved and near the back; dorsal and anal fins horizontal and falcated; tail rounded, tawny, and edged with black. Forskal describes another fish, which Gmelin and others consider as a variety of the last mentioned species. "Chetodon careuleus nitidus et fasciis obliquis, lincolis violaciis." Blush Chetodon, with oblique bands, blotches, and fine violet lines. This is a native of the Arabian shores, where it is chiefly found among corals; the flesh is bitter.

Inhabits the Arabian shores. The body is an ovate oblong, covered with ferrated scales; behind the middle of the head a large transverse golden spot; the front between the eyes is elevated, flat, and falcated; gill-cover leacy on the fore part, and ferrated behind; lateral line near and parallel with the back; pectoral fins oval; ventral lanceolate; dorsal falcated behind; anal triangular; tail fin entire, rather rounded, cinereous, and dotted with yellow.

CHETODON fordidus. Oval; osh coloured brown, with four obfolete transverse bands. Forlk. Fr. Arab.

This species, which is found among the coral beds on the coasts of Arabia, is about a span in length; the body is covered with broad scales, which are membraneous at the edge; the gill-cover is bidentate at the anterior edge; lateral line near the back; fins osh-coloured brown; pectoral so.
CHETODON.

fin oval, ventral pointed; anal and dorsal fin rounded behind; tail short, ye bowish, divided into two lobes, and marked with a black spot.

**CHETODON unicorns**. Front horned; tail with two elevated ridges on each side. For. F. N. Arab.

Very abundant on the Arabian coast, where it is seen swimming in schools of two or three hundred each, and feeding on small fish. 1 grows to the length of three feet or more; the body is oblong oval form, rough, and of a shining purplish blue; the front is all blue, with an horizontal straight horn before the eyes; the teeth are rigid and disposed in one row; lips equal; pectoral fin with lateral line parallel, and near the back; aperture of the gills short; pectoral fin pointed, oval; tail truncate in the middle. Abundantly distributed, Wiliamh. Le Njeron Licenn. Cape. 

**Lett.** Uthman fish. Grew.

**CHETODON fahari.** Tail with a bony carina, situated in a red cavity on each side. For. F. N. Arab.

Inhabits the deep waters of the Arabian shores; the body is of an oval form, about three spans long, or a brown colour, with longitudinal violet lines; beneath whitish; the head is scaly; the teeth contiguous, crested, and disposed in one row; lips equal; pectoral fin with lateral line oblique; fins coriaceus, violet; pectoral fin with a yellow foot; tail truncate in the middle. This is nearly allied to *Chetodon lineatus*.

**CHETODON lineatus.** Black fuscus; tail two lobed, with a recurved spine each side. For. F. N. Arab.

This species was observed by Forskal in the Arabian seas, where they live in deep waters. A variety of this species is described under the title of *gahm*, as being of a black colour, with the base of the tail violet. The length of this fish is five inches; first spine of the dorsal and anal fin covered by the skin; posterior edges of the tail whitish, two lobed, and the lobes falcated; lateral spine somewhat subulate and movable.

**CHETODON bifasciatus.** Tail bifid, yellow, with two black bands on the head. For. F. N. Arab.

Body of an oblong oval form, and silvery; the crown is wrinkled; iris silvery; jaws full of hemispherical callosities; upper lip long; anterior gill-cover falcated behind; posterior with a bony point or process on the back part; ventral fins black; dorsal fin and tail yellow; pectoral ones tawny yellow, the other white; lateral line curved and nearer the back. Gmel. Inhabit the Arabian coasts.

**CHETODON picus.** Whitish with oblique violet lines; occular band and tail black. For. F. N. Arab.

Nearer of a rectangular form; the body covered with broad, falcated, ubiquitously imbricated scales, and marked with about eighteen violet lines, disposed in an oblique direction; on the crown of the head are five transverse tawny lines; the snout is prominent; lips equal; lateral line curved; dorsal fin black, and rounded behind; tail truncate, marked with a golden crescent in the middle, and edged with brown.

**CHETODON trifasciatus.** Head with three black bands; body with fourteen longitudinal dark lines. Trans. Lin. Soc.

Discovered by Mr. Mungo Park on the coast of Sumatra, and described in the third volume of the Transactions of the Linnaean Society. The length is three inches; colour pale brown, or brownish, and covered with rather large ciliated scales; on the dorsal fin is a black band edged with yellow; another at the base of the anal fin, and a third through the middle of the tail; the iris brown; mouth very small; gill cover of two plates; lateral line bent, and notched near the back; the back is yellowish, inclining to olive-brown; the belly silvery; fins yellow. Figured by Bloch, from a large specimen in the collection of Link, at Leipzig.

**CHETODON caniculatus.** All the spines of the fins grooved. Lin. Trans.

The body is greenish yellow above; beneath whitish with paler spots; scales small, oblong; the iris fuscous; gill-cover of two pieces; lateral line parallel with the back; vent nearer the head; its greenish and with fin spots; tail blunt. Observed at the same place as the preceding species.

**CHETODON allii.** A black band across the eyes; dorsal fin with two spines, and an occipital spot; anal spines three. *C. allii*, Bloch.

Found in India. The body is yellow above; beneath white, and covered with large scales; the jaws are equal and prominent; lips thick; gill-cover consisting of one short golden lamina; lateral line straight, interrupted at the dorsal fin; fins emerald with branched rays.

**CHETODON joffier.** A very long falciform ray, and black annular spot in the dorsal fin. *Chetodon joffier*; Le Seton, Bloch.

The body of this fish is of a roundish ovate form, with the head rather taper and produced; the colour is purplish on the back, and a ting of red and intermixture of yellow pervades the rest of the body, which is transversely falcated with about nine oblique crimson spines; through the eye passes a broad black transverse band, margined on both sides with white; the fins are yellow, with a brown marginal line on the anal and dorsal fin, and three stripes of the same colour across the tail. A native of the Indian seas.

**CHETODON falcula.** Back with two black falciform spots, edged with white. *Chetodon falcula*, La Fauville, Bloch, &c.

This inhabits the coast of Coromandel. Its general properties this resembles the last; it is a similar occular band of black, but the colours are paler, more inclining to yellow; the transverse bands, violaceous, paler and less angulated, and the dorsal fin has neither the black spot encircled by a white ring, nor the remarkable falciform ray, like the last species.

**CHETODON tricolor.** Anterior part of the body yellow; posterior black; tail and border of the dorsal and anal fins yellow, edged with red.

Dumazedie was the first author who published a figure of this species. He speaks of it as a native of Gaudouch, and describes it as a Brazilian species, on the territory of Prince Maurice. It is of a more elongated figure than the generality of Chetodons, and seems to agree better in this respect with the Labrus genus. The head and part of the body are of a fine golden yellow, the posterior part dark black, and the two colours separate abruptly in an obliquely incurvated direction, leaving the lower half of the pectoral, and the body down to the vent, fine yellow. The border of black passes without interruption into the anal fin, and posterior end of the dorsal fin, in both of which it forms a subtransversal line with the yellow border of the said fins. The tail is much incurvated.

**CHETODON kleinii.** Head marked with an occular band; dorsal in fourteen-pressed.

First described by Klein, and named after that author by Bloch. This fish is of an orbicular form. The opening of the mouth very small; the nostrils simple; iris white; gill-cover consisting of two plates; lateral line bent, and notched near the back; the back is yellowish, inclining to olive-brown; the belly silvery; fins yellowish. Figured by Bloch, from a large specimen in the collection of Link, at Leipzig.
Leipzig: its general size in the East Indies, the seas of which it inhabits, is not exactly known.

Chetodon bimaculatus. It had marked with an oval band; an annular spot and half spot on the dorsal fin. Chetodon bimaculatus, La Boudouliere a deux taches, Blasch.

This fish is of a roundish form; the back very gibbous, and the abdomen flattened; the head is sloping, lengthened, and tapering; the back is brown; sides whitish, tinged with grey; pectoral and ventral fins are red; the reft yellow at the base, and greyfift at the extremities; band across the eyes edged with white; and the black spot on the dorsal fin is encircled with a white ring; the half spot bounded on one side with a semicircular white line. inhabits the Indian seas.

Chetodon bifasciatus. Two spined below the eyes. Chetodon bicinctus, La Bandoulière a deux yeux, Bicher.

The body of this fish is of an elongated form; the head is yellow; the back blue; and the belly white. Across the head, behind the eyes, is a tranverse brown stripe; another pafs across the middle of the body, and a third between the extremity of the dorsal and anal fins, near the tail. The posterior one of the two spines below the eyes is much larger than the other; all the fins are grey. This is a native of the East Indies.

Chetodon frygoides. Golden yellow; head and six transverse bands violet. La Chetodon Frygoides, Cepede.

Described by La Cepede from the drawings and manuscripts of Plummer. The dorsal fin contains thirteen fin rays; pectoral fin one: there is a deep-pression before the eyes; the opening of the mouth is small, and the upper lip thick; gill-covers rounded. This is a native of the American seas.

Chetodon lamarkii. Golden yellow, with three longitudinal dusky stripes. Chetodon La Mark, Cepede.

The description of this species is taken by Cepede from a specimen in the museum of the Prince of Orange, the native country of which is unknown. The lower jaw is longer than the upper; the scales rounded, acute, and dentate; fifteen fin rays, and fifteen soft ones in the dorsal fin; three fin rays, and twenty soft ones in the anal fin; gill-covers armed with a very long spine.

Chetodon conguptus. Yellowish grey, with numerous black bands, and body constricted in the middle. Shaw, N. Holland, Zool.

The length of this species is about eight inches; the shape of the body inclining to an oblong square, andremarkably contracting in diameter about the middle, so as to appear constricted in that part; scales of moderate size; colour yellowish-grey, tinged on the back and part of the fins with blue; across the body eight black bands, that in the middle narrowest, on the back two very distinct fins, the rays of the first being all spiny; tail incising, though very slightly, to a lunated form. Native of the Indian seas, and22 observed about the coast of New Holland.

The length of the species described in White's Journ. New South Wales, was about four inches; the colour silver-white, darker, and with a bluish tinge on the back; head of a somewhat lengthened form; across the body seven black bars; on the back two distinct dorsal fins, of which the first consists of very long spiny rays, the third exceeding the reft in length; tail very slightly inclining to a lunated form at the extremity. Observed about the coast of New Holland.

Chetouori, in Ancient Geography, a people placed by Ptolemy in the Higher Germany, among the Curiones.

Chafalia, in Geography, the first large body of water which leaves the Mississippi, and falls, by a regular and separate channel, into the gulf of Mexico. It leaves the Mississippi in the westernmost part of the remarkable band just below the boundary, and has every appearance of having been formerly a continuation of the Red River, when the Mississippi washed the high land from Clarksville to the Bayou Tunica, or Willim's creek, the traces of which are yet visible by the lake, through which a large current still passes, when the river is high. The distance on a straight line from Clarksville to the Bayou Tunica is not more than eight miles; but by the present course of the river, it is supposd to be not less than 50 miles. If the Mississippi should break its way by a shorter course, which is not improbable, the Chafalia will again become a part of the Red River. When the Mississippi is high, the draught into the Chafalia is very strong, and has frequently carried rafts, and likewise some few flaps or Kentucky boats down it, which are generally lost. This branch, notwithstanding its size, is not navigable to the gulf of Mexico, on account of an immense floating bridge, or raft, across it, of many leagues in length, and in some places so firm and compact that cattle and horses are driven over it. This astonishing bridge, or raft, is constantly augmented by the trees or rubbish, which the Chafalia draws out of the Mississippi.

Chafe, or Chaping of a rope, or Sea-Language, is paid of a rope that is galled or fretted, or when the rope runs against any thing. The cable is chafèd in the hawse, signifies that it is fretted or begun to be worn out there.

Chafe-Wax, or Chaffee-Wax, an officer in chancy, whose business it is to fit the wax for the sealing of writs, patents, and other instruments issued thence.

Chafier, in Geography, a town of Persia, in the province of Farsil; 50 miles S. of Shiraz.

Chaff, in Agriculture, the husky substance of corn, which is separated by threshing and winnowing. It also sometimes signifies the rind of corn; thus, barley that has a thick rind is said to be thick-chaffed; and it likewise implies straw, &c. cut small for the purpose of being given to horses and other cattle, mixed with corn. This substance, which is obtained by the dressing of grain or made from straw and other matters by cutting, is highly useful in the feeding of horses and many other animals, as having much other more valuable food. Besides its advantage in the common feeding of animals, it is of vast utility in the fattening of different sorts of animals, where much luxuriant green food is given, as a dry meat; as without some sort of material of this nature they never go on well.

It has been remarked by Mr. Young, that the practice of cutting both hay and straw for all sorts of stock is one that has been found very important by many practical and intelligent cultivators of great experience; and though he admits that general observations are not equally satisfactory with that of comparative experience, there can probably be little doubt of the advantage of this mode of applying it. Besides, there are but few persons who have opportunity, time, and power, to make comparisons between the food and labour of different teams fed in the common way with hay, and with cut chaff, half or one-third straw. The opinions of the best informed and most practical persons are, however, decidedly in support of the latter method. It is, therefore, conceived that the dressing of dry hay, but the formation of giving hay cut with a mixture of straw, instead of feeding in the common way with hay, is at all events to be advised to as great an extent as can be effected.
as the saving is unquestionable; and he thinks that it should not only be practiced for the teams, but likewise for all the other fences that confine hay. He adds, that Mr. Page of Cobham, in feeding his flock, gives no hay or straw but what is cut into chaff before it is fed. The same author thinks that if racks are permitted in a stable, it is not an easy matter to prevent hogs-keepers from cramming them full of hay, especially at night. The belt contrivance he has heard of to supply the place of racks was that of Mr. Vancouver, who made, he says, a fort of hoppers the whole length of the manger, which delivered chaff from a loft above it gradually, as the hogs moved the lower lip of the hopper with their noses; in this manner supplying themselves. But a very intelligent nobleman, he observs, on trying it, found that it would not deliver regularly. This might arise, he thinks, from the dimensions not having been sufficiently attended to; for if the hopper be not of a due breadth, the chaff might arch above the moveable board, and not come down: the aperture in the manger through which it passes must necessarily, he imagines, be of a certain size, neither too wide nor too narrow. It certainly seems, in his opinion, to be a practical idea, and very capable, after some trials and regulations, of being fully applicable to common practice. It well deserves attention, especially as the expense of an experiment for one stall could not be considerable. He has often determined to try it himself, but has always been prevented by some journey or excursion taking him from home, at the moment when he could otherwise have given the requisite attention. He conceives that it would demand a manger from four to six inches wider than common ones, to render it perfect for this purpose.

In the use of this subsistence for sheep, considerable attention is necessary to the troughs in which it is given, to see that they be so secured by boards that it is not blown out of them. This is effected, according to Mr. Young, in lord Clarendon's sheep-yard in Hertfordshire, by a semicircular boarding of thin material, which covers the heads of the animals while they are feeding in the troughs.

It has been suggested by the same writer, in the third volume of the Ack of Agriculture, that when chaff is made to undergo the process of fermentation in the houes where it is deposited, by slightly water it, it is rendered "much more nutritious than when used in the common way."

Chaff, in Botany, a name given to the scales or dry membranous substances, interposed between the florets of some aggregate and compound plants, as in Dipfacus, Hopcherasi, &c. In that case the receptacle is said to be chaffy.

Chaff-Cutter, in Rural Economy, an implement constructed for the purpose of cutting hay, straw, and other substanse into chaff. Instruments of this sort confit formed simply of a box and a cutting blade; but they are at present much improved, being made of different forms and constructions, so as to perform the work with greater economy and dispatch. Mr. Cook has invented one, which, by means of a man and boy, will cut one hundred quarters a week; and when fixed to a large wheel, and turned by an animal, such as a poney or ass, will cut half the above quantity per day. Another contrivd by Mr. Neat is capable of cutting three quarters an hour, by the assiduity of two men, and costs about two guineas. An instrument for this purpose, made by Mr. James Plce, is likewise both cheap and of the most simple construction. It is fixed on a wooden frame, which is supported by four legs; and on this frame is a box for containing the straw, four feet six inches long, and about ten inches broad: at one end are fixed across the box two rollers, inlaid with iron, in a diagonal line, about an eighth of an inch above the surface; on the ends of these rollers are fixed two strong brass wheels, which take one into the other. On one of these wheels is a contract wheel, whose teeth take in a worm one large inch; on the end of the arbour is fixed a wooden wheel, two feet five inches diameter, and three inches thick. On the inner part of this wheel is fixed a knife, and at every revolution of the wheel the knife passes before the end of the box, and cuts the chaff, which is brought forward between the rollers, which are about two inches and a half sudden. The straw is brought on by the worm taking one tooth of the wheel every round of the knife: the straw being thus pressed between the rollers, the knife cuts off the chaff with as great ease, that twenty-two bushels can be cut within the hour, and makes no more noise than is caused by the knife passing through the chaff. It consists of the box into which the straw is put, and an upper roller, with diagonal projecting ribs of iron; the whole moving by the revolution of the brafs wheel, on the axis of which it is fixed. Another brafs wheel has upon it a face wheel, whose teeth take into the endless screw on the arbour, while the teeth on the edge of this wheel enter between those on the edge of the other wheel. On the axis of the latter brafs wheel is a roller with iron ribs, similar to the above, but hid within the box. The arbour has one of the ends of which it is compoted made square, and passing through a mortise in the center of the wooden wheel, which is fastened by a strong screw and nut; the other end of this arbour moves round in a hole within the wooden block; and the knife is made fast by screws to the wooden wheel, and kept at the distance of nearly three quarters of an inch from it, by means of a lip of wood of that thickness, of the form of the blade, and reaching to within an inch of the edge. The handle is mortised into the outside of the wooden wheel.

An improved machine of this sort has been invented by Mr. Robert Solomon, of Woburn, Bedfordshire, and described in the Transactions of the Society for the Encouragement of Arts, &c. With it the chaff is cut by two knives, fixed on the inside of the folies to two wheels, which are strongly connected together; the edge of the knives being at an angle of about forty-five degrees from the plane of the wheel's motion. These knives are fixed as to be forced forward by springs on the wheel, which springs are formed to adjust, and act more or less, as occasion may require, so as to give the knives as much pressure against the box as may be requisite to cut the straw. The knives are prevented from coming too forward, and occasioning unnecessary friction, by wedges being put in under the flapels; which wedges, as the knives wear, must be drawn out for to admit the knives to come more forward. With the before-mentioned provisions, it will be found very easy at any time to put on new knives, as the springs, &c. will always adjust them to their work.

On one side of the wheel is fixed a round block of wood, in which there are four holes and a movable ferce; to this block is screwed one end of the feeding-arm, running nearly horizontally to the crofs bar at the end of the box; to which crofs bar there is a pin, moveable to five different holes, by means of which, and the four holes in the block before described, twenty changes in the length of the chaff may be obtained. The straw is brought forward by the rollers in the box, the form of which has been just described, which rollers are turned from the outside by the triggers or ratchet-wheels on each side of the box, which move more or less, according to the stroke given to the crofs bar by the feeding-arm and wheel. By this mode of feeding, the straw is perfectly
and the frame of the machine is to be made very firm and strong.

In order to apply this implement to the best advantage, the inventor proposes a second box, to be placed at the end of the first; which box may be of any length, and suspended by a line and counter-weight, whereby the end of it is brought down level with aad ing the frame, and then drawn up, to do the box a declivity, to make the frame more easily come forward.

It is supposed that much advantage may be derived in this instrument from its cutting various lengths, retting during the cut, the knives being adapted to their work by regulating springs, the feeding being readily thrown off, and the pressure movable to either side. It is also well calculated to be applied to any power which may be occasionally fixed to the opposite side to that on which it is turned by hand; and, by the additional box, when used by hand, the workman will be enabled to cut for some continuance, without stopping to feed.

Where threshing machines are in use, these implements may frequently be attached to them with great advantage. There are many other instruments of this sort constructed in different ways; but those which are the least complex, and can be afforded at the cheapest rate, are the most adapted to the purpose of the farmer. See Cutting-Box

The above machine, as considerably altered and improved by Mr. Rawlins, is seen in Plate VII. on Agriculture, in which fig. 1. is a side, and fig. 2. an end view of it. The advantages of this implement are, 1st, its great simplicity; 2d. its cutting the chaff of various lengths; 3d. the frame being at rest while the knives are making the cut; 4th. The friction being less, more work of course may be done with equal labour.

A. is the handle.
B. B, the fly-wheels on which the knives are fixed.
C. the ratchet-wheels, and rollers for drawing the straw forwards.
D. the rods to work the ratchet-wheels, connected with the lever and crank.
E. the box for containing the straw.
F. the lever and weight for pressing the straw.
G. the knives.
H. the crank for regulating the cut.
I. the frame.

At fig. 3. is represented Mr. M'Dougall's patent chaff-cutter, which is a very useful instrument of this kind. In this machine the inventor has been particularly careful to construct it, that, in case it should be accidentally broken, it might be easily repaired by any common mechanic. The substance to be cut into chaff may be pressed as hard as the workman chooses, by simply placing the weight near to the end of the lever. But the chief excellence of the instrument consists in the inventor having judiciously applied a spiral groove in the room of the endless screw, commonly used by other agricultural instrument-makers, by means of which it has in a great degree got rid of friction; and the lever may rise to any height, without putting the machine out of work.

It has been remarked by Mr. Young, that the number of machines which have been invented of late years for this purpose, most of which perform their work with sufficient accuracy, leaves no farmer in the kingdom under the necessity of employing the common chaff-box, which is worked by those only who have acquired the art of making use of it, and who commonly make much greater wages per day than the ordinary pay. He observes that there is a very good machine of this sort made at Thetford, which only costs eight guineas. It has been observed by a late practical writer, that as the principal objects aimed at in the construction of these machines are, those of expedition and the levelling of manual labour, it is evident that many of those of the improved kind must answer such purposes much more effectually than such as were formerly in use, especially where they are attached to any great power, such as that of horses, water, etc., as in the case of threshing machines, or other mills, to which they are in general well suited, as has been noticed above.

Mr. Page of Cobham has, according to Mr. Young, at the trifling expense of only five pounds, added a mill-wheel to his chaff-cutter, by which means a boy and a little poney cut twenty bushels of chaff per hour.

CHAFF-MADE, a place constructed for the purpose of containing chaff. It should be situated as near to the barn, threshing machine, and flax, as possible, in order that it may receive it with the least possible labour and trouble. And in order to prevent danger, where the chaff is fluffed to undergo the process of fermentation, it should be constructed of brick work. The dimensions must be suitable to the extent of the farm, or the quantity of live flock that are kept and fed with it.

CHAFFER, or Cockchaffer, in Entomology, the common English name of the beetle, called Linnaeus, Scarabaeus melolontha, and by Fabricius Melolontha vulgaris. See Scarabaeus.

CHAFFER-COLOURERS, in Commerce, printed linens manufactured in the Great Mogul's dominions. They are imported by the way of Surat; and are of the number of those linens prohibited in France.

CHAFFERS, in our Statutes, seem to signify wares or merchandise. 3 Edw. IV. c. 4.

The original French of the statute is Chaffriers.

CHAFFERY, or Chaffery, in the Iron-Works, the name of one of the two principal forges. The other is called the tranary. When the iron has been wrought at the finery, into what is called an ane can or square mass, hammered into a bar in its middle, but with its two ends rough, the bafins to be done at the chaffery is the reducing of the whole to the same shape, by hammering down these rough ends to the shape of the middle part.

CHAFFINE, in Ornithology. See Fringilla Cuculz.

CHIAGAING, in Geography, a city of the Birman empire seated on the north side of the Irrawaddy, and opposite to the ancient capital Anga-hung, or Ava, in N. lat. 21° 56'. E. long. 96°. This city, which was once the seat of imperial residence, is situated partly at the foot and partly on the side of a rugged hill that is broken into separate eminences, and on the summit of each stands a spiral temple. These
These temples, rising irregularly above one another, form a beautiful assemblage of objects, the effect of which is increased by their being carefully white-washed and kept in repair. Chiving is the principal emporium to which cotton is brought from all parts of the country, and where, after being cleaned, it is marked for the China market. The operation of cleaning it from the buds is performed by females, by means of double cylinders turned by a lathe, which a woman works with her foot, while she applies the cotton with her hands. This city has become a place of religious resort, from the number of prays or temples erected in its neighbourhood; as well as on account of its being the principal manufactory of images or statues of the divinity, Gaudia, which are sculptured of fine marble obtained in a quarry at Makeng about 12 miles distant. Birmans are forbidden to purchase the marble of which these images are made, but they are allowed and even encouraged to buy figures of the deity actually manufactured, and to carry them to the remotest corners of the empire. Exportation of these marble divinities out of the kingdom is strictly forbidden.

CHAGNON, a town of France in the department of the Rhone and Loire, 6 leagues S. of Lyons.

CHAGNY, a town of France, in the department of the Sienne and Loire, and chief place of a canton in the district of Châlons-sur-Lyon; 10 miles N.N.W. of it. The place contains 2,143, and the canton 15,204 inhabitants; the territory includes 13,725 kilometres, and 13 communes.

CHAGRE, a river of North America, in Terra Firma, which opens into the North Sea, in 9° 18' 40" N. lat. and W. long. 81° 41' 30 miles W.S.W. of Porto Bello, and has its source in the mountains near Cruces. It was formerly called Lagarto from the number of alligators in it, and was discovered by Lopez de Gozo. Diego de Alvites discovered that part of it where Cruces is situated; but the first Spaniard who sailed down it, so as to reconnoitre it to its mouth, was Captain Hernando de la Serna, in the year 1527. Its entrance is defended by a fort, seated on a steep rock on the east side near the sea-shore. This fort is called San Lorenzo de Chagres, and has a commandant and a lieutenant; and the garrison is drafted from Panama. The fort was taken by admiral Vernon in 1740. About eight toises from the fort is a town of the same name. The housetops are principally of reeds, and the inhabitants Negroes, Mulattoes, and Mestizos. They are a brave and active people, and occasionally take up arms to the number of triple the usual garrison of the fort. Opposite, on a low and level ground, stands the royal custom-house, where an account is taken of all goods conveyed up the Chagre. Here the breadth of the river is about 120 toises, but it becomes gradually narrower as you approach its source. At Cruces, the place where it begins to be navigable, it is only 20 toises broad; and the nearest distance between this town and the mouth is 21 miles, and the bearing N.W. 7° 24' westerly; but the distance measured along the several windings of the river is no less than 43 miles. It breeds a great number of Caymanes or alligators, creatures often seen on its banks, which are impalpable, both on account of the cloveness of the trees, and the bushes, which cover the ground, as it were with thorns. Some of these trees, especially the cedar, are used in making the logs of the barks, employed on the river. The passage of the river is obstructed by the trunks of the trees that fall into it; and also by the swift currents over the shallows. The banks employed on this river are the chatas and bongos, called in Peru, bonques. The first are composed of several pieces of timber, like barks, and of a great breadth, that they may draw but little water; they carry six or seven hundred quintals. The bongos are formed out of one piece of wood, some of them being 11 Paris feet broad, and conveniently carrying four or five hundred quintals. Both forts have a cabin at the stern for the convenience of passengers, and a kind of a covered house in the middle continued through the whole length of the vessel; and over the whole, when the vessel is loaded, are laid hides, that the goods may not be damaged by the rains, which are frequently violent. Each of these requires, besides a pilot, at least 18 or 20 re-built negroes, for without such a number, they would not be able, in going up, to make any way against the current. All the forests and woods near this river are full of wild beasts, and especially different kinds of monkeys, the flesh of which is highly valued by the negroes. They are also eaten by the Creoles and the Europeans.

CHALEIGNE, or CHABRIN, in Commerce. See ST. ALBRECHT.

CHAILAINS, in Geography, a town of France in the department of the Sarthe, and district of St. Clairs; 5 miles N.E. of Chateau du Loir.

CHAILIEN, a town of China in the province of Pechelbi; 7 miles S. of Chun-te.

CHAILO-TEI-KAN, a town of Chinese Tartary; 32 miles S.W. of Ning-yuen.

CHAILA, a river of Siberia, which runs into the Oby; 20 miles N.E. of Oboorokoi.

CHAILBAR, or KABIR, a large town of Araba, taken from the Jews by Mahomet, in the 7th year of the Hegira, A.H. 686; 152 miles N.E. of Medina.

CHAILLAIRE, Ie, a town of France, in the department of the Ardche, and chief place of a canton, in the district of Tournon; 4 leagues N.W. of Privas. The place contains 1,713, and the canton 9,053 inhabitants; the territory includes 16,252 kilometres, and 12 communes.

CHAILLANC, a town of France, in the department of the Indre, and district of Chatcauroux; 4 leagues S.W. of Argenton.

CHAILLAN, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Laval; 10 miles N. of it. The place contains 2,559, and the canton 15,106 inhabitants; the territory comprehends 2,773 kilometres and 9 communes.

CHAILLE-LES-MARais, a town of France in the department of the Vendee, and chief place of a canton in the district of Fontenay-le Comte; 3 leagues W.S.W. of it. The place contains 1,749, and the canton 7,547 inhabitants; the territory comprehends 235 kilometres and 7 communes.

CHAILLE-Sous-LES-OEMEAUX, a town of France, in the department of the Sarthe; 10 miles E. of Sable.

CHAILLEYVETTE, a town of France, in the department of the Lower Loire; 5 miles S. of Marennes.

CHAILLONE, a town of France in the department of the Orne, and district of Alencon, containing about 1,100 inhabitants; one league N. of Sées.

CHAIN, in French chaîne, an instrument composed, or consisting of links, and commonly made of iron, though it may be made of other metals. There are different chains for different purposes; as draft chains, bending chains, canting chains, mill-chains, measuring chains, neck chains, &c. &c.

A port-chain, or chaine de port, is a strong iron chain, reaching across the entrance of the port to prevent vessels from falling or getting into it. Of these there are sometimes several at the entrance of one and the same port; and when
when it is wide they are supported on piles from distance to
distance.

A foraging chain, or chaine du forrage, is the plowing, by
means of a chain of folders, or a military communication and
arrangement of troops, those who are charged with forag-
ing in a flat of security against any attack or incursion of the
enemy; those forming the chain being commanded to
keep a constant and careful look out on all sides.

The Romans, when they went to war, carried with them a
great number of chains, defined for those that might be-
come their prisoners. They had them made of different me-
tals; a great many of iron, others of silver, and some even of
gold. And they were distributed or made use of according to
the rank and quality of the prisoners. Before the battle at
the Granian lakes, between Hannibal and Flaminius
the latter, who, though altogether unfit for the manage-
ment of military affairs, was vain, arrogant, and presumptu-
ous; was singularly formed by nature for the gaining of pop-
ularity; was a plausible prater or deceiver, and to perpe-
tuate a public fracas, that he filled his people with such
confidence of victory and successes, that the multitude of
those, who followed his army for the sake of booty, as Poly-
lybüs informs us, exceeded even the number of his troop,
and carried with them chains, fetters, and other implements
of the same kind in great quantities and abundance.

The arms of the kingdom of Navarre are, chains, or, in a
field, gates. The occasion hereof is referred to the kings of
Spain leagued against the Moors; who having gained a ce-
lebrated victory against them in 1212, in the distribution of
the spoils, the magnificent tent of Miralammin fell to the
king of Navarre; as being the first that broke and forced the
chains thereof.

Chain, a gold, is one of the ornaments or badges of the
dignity of a lord mayor of London; and remains to the
person, after his being divested of that magistrature, as a
mark that he has held the chair.

Something like this, Chorier observes, obtained among
the ancient Gauls: the principal ornament of their people
in power and authority was a gold chain, which they wore
on all occasions; and even in battle, to distinguish them
from the common soldiery. Hist. de Dauph. lib. III. p. 130.

Chain also denotes a kind of string, or twisted wire;
serving to hang watches, twezer cases, and other valuable
toys upon. The invention of this piece of curious work
was owing to the English: whence, in foreign countries, it
is denominated the English chain. It was some time before
foreigners undertook to imitate them, and at last with no
extraordinary successes: those of Paris have come nearest.
These chains were at first usually either of silver or gold,
some of gilt copper; the thread or wire of each kind must
be very fine.

For the fabric, or making of these Chains: a part of the
wire is folded into little links of an oval form; the longest
diameter about three lines; the shornet, one. These, after
they have been exactly folded, are again folded into two;
and then bound together, or interwoven, by means of seve-
reral other little threads of the same thicknesses; some whereof,
which pass from one end to the other, resemble the warp of a
ruft; and the others which pass transversely, the woof. There
are at last 4000 little links in a chain of four pendants;
which are, by this means, bound so equably, and withal so
firmly together, that the eye is deceived, and takes the whole
to consist of one entire piece.

Plate Mechanics, fig. 1, represents the chain used for com-
mon purposes with oval links; the ends of which are welded
or foldered together.

Fig. 2, is the chain used for flight purposes, as scales, &c.
Vol. VII.
For small parcels, as gardens, &c. is sometimes used a small chain of one pole, or sixteen feet and a half in length; each link one inch long. In measuring towns, a chain of 50 feet in length, consisting of 50 links, is the most commodious, and with an off-set of 10 feet in length.

Some in lieu of chains use ropes; but these are liable to several irregularities; both from the different degrees of moisture, and of the force which stretches them. Schwenterus, in his Practical Geometry, tells us, he has observed a rope 16 feet long, reduced to 15 in an hour's time, by the mere falling of a heavy froth. To obviate these inconveniences, Wohlls directs, that the little hands whereof the rope consists be twilled contrary ways, and the rope damped in hot oil; and when dry, drawn through melted wax. A rope, therefore prepared, will not get or lose any thing in length, even though kept under water a day.

Sir George Bruelobatos observes (Phil. Trans. vol. xvii. p. 508), that the common Gunter's chain of the stap is always subject to spring and stretch confidually. That which he used in his measurement for ascertaining the height of mountains was made of hard red oak, on purpose to avoid this defect. It, however, still preserved some degree of elasticity, so, when pulled with a force of about 10 pounds, it shrank 0.12 inch longer than when laid gently on the floor without being stretched at all. He corrected its length by allowing for its expansion by heat at 13, 0.05 inch.

Use of the Chain in Surveying.—The manner of applying the chain in measuring lengths, is very obvious, Having provided a chain, with 10 small arrows (see Arrow), two persons take hold of the chain, one at each end of it, and, and all the 10 arrows are taken by one of them, who is to go foremost, and is called the leader; the other, for direction's sake, being called the follower. A picket, or flat-flain, being set up in the direction of the line to be measured, if there appear no natural marks in that direction; the follower stands at the beginning of the line, holding the ring at the end of the chain in his hand, while the leader drags forward the chain by the other end of it, till it is stretched, straight, and laid or held level, and the leader directed, by the follower's waving his hand, to the right or left, the follower fe off him exactly in a line with the mark or object of direction to which the measure is to be extended; the both of them stretching the chain straight, and so going as to hold it level, the leader having the hand of one of his arrows in the same hand by which he holds the end of the chain, let him then flick one of them down with it, while he holds the chain stretched. This being done, he leaves the arrow in the ground, as a mark for the follower to come to, and advances another chain forward, being directed in his position by the follower moving at the arrow, as before, as also by himself now, and at every measuring chain's length, by moving himself from side to side, till he brings the follower and the end of a mark into a line. Having then stretched the chain, and hung down an arrow, as before, the follower then takes hold of the arrows, and advances again in the same manner another chain's length. And thus the process is repeated till all the 10 arrows are employed, and are in the hands of the follower, and the leader, without as an arrow is arrived at the end of the 11th chain's length. The follower then sends one, or brings the 10 arrows to the leader, who puts one of them down at the end of the chain, and advances with the chain, as before. And thus the arrows are changed from the one to the other at every 10 chains' length, till the whole line is finished; when the number of the arrows shows the number of tens, to which the follower adds the arrows he holds in his hand, and the number of links of another chain over to the mark or end of the line. So that if there have been three changes of the arrows, and the follower holds six arrows, and the end of the line cut off 45 links more, the whole length of the line is 150 links, thus, 5045. In entering down the dimensions taken by the chain, the chains and links are separated by a dot; the former being integers, and the latter decimals; thus a line of 6 chains, 75 links long, is written 6, 75. If the links be short of 10, 5 cypher is prefixed; thus 10 chains, 8 links, are written 10.08. It is plain, however, to set down the length of lines, measured with a chain: it links as integers, every chain or length being 100 links; and not in chains and decimals.

To find the area of a field, &c. in square poles, or acres, given in Chains and links. An acre of land is equal to 40 square chains, i.e. 160 chains in length and one chain in breadth: or 40 x 40, or 4.032 square yards; or 40 x 40 = 160 square poles; or 160,000 = 100,000 square links. A parcel is divided into four parts, called roods, and a rood into 40 parts called perches, which are square poles, or the square of a pole, or 40 square links, or the square of 1/4 of a chain, or of 25 links, which is 6.25 square links. So that the divisions of land measure will be thus:

- 6.25 square links = 1 pole or perch.
- 40 perches = 1 rood.
- 4 roods = 1 acre.

Consequently, 1st. Multiply the links by one another, according to the rules for the area, and thus the content will be found in square links; and from the product cut off the figures towards the right, which is nothing more than dividing by 10,000 the number of square links in an acre; the fraction remaining on the left will be acres. 2dly, Multiply the five figures cut off, which are decimals, by four, the number of roods in an acre; and cutting off five figures from the product on the right, those remaining on the left will be roods. 3dly, Multiply the five thus cut off by 40, the fourth part of the square perches in an acre; and cutting off five figures, as before, on the right, those remaining on the left are square perches. E. G. Suppose the length of a rectangular piece of ground to be 792 links, and its breadth 55; to find the area in acres, roods, and perches:

<table>
<thead>
<tr>
<th>Links</th>
<th>Acres</th>
<th>Roods</th>
<th>Perches</th>
</tr>
</thead>
<tbody>
<tr>
<td>792</td>
<td>0.07</td>
<td>0.00</td>
<td>0.00</td>
</tr>
<tr>
<td>55</td>
<td>0.00</td>
<td>0.00</td>
<td>0.00</td>
</tr>
</tbody>
</table>

Add the 3 acres, 0 rood, 7 perches.

To the area of: D A E (Plate 1. Surveying, fig. 1) in a: CHAIN. Measure a small distance from the vertex A along each leg, v. y, to, and e, then measure the distance de; to lay it down, draw A E at pleasure, and from your scale set off the distance measured on it. See Scale.

Then, taking in y or any compass the length measured on the other side, on the vertex A, as a center, describe an arc de; and on the point as a center, with the measured distance of cd, describe another at. Through the
the point where this intersects the former arc, draw a line \( A \) \( D \). So is the angle plotted; and its quantity, if required, may be measured on a line of chords. See CHORD.

To survey a triangular field, \( A \) \( B \) \( C \), (fig. 4.) Having set up marks at the corners, if no natural marks occur; measure with the chain from \( A \) to \( P \), where a perpendicular would fall from the angle \( C \), and set up a mark at \( P \), noting down the distance \( A \) \( P \). Then complete the distance \( A \) \( B \) by measuring from \( P \) to \( B \). Having set down this measure, return to \( P \), and measure the perpendicular \( P \) \( C \).

And thus, having the base and perpendicular, the area is easily found. Or, having the place \( P \) of the perpendicular, the triangle is easily constructed. Or, measure all the three sides with the chain, and note them down; hence the content is easily found, and the figure constructed. Or, again, if two sides \( A \) \( B \), \( A \) \( C \) may be measured, as well as the included angle \( A \); or, one side \( A \) \( B \), and the adjacent angles. \( A \) and \( B \), may be measured; and then the figures may be easily plotted. Then by measuring the perpendicular \( C \) \( P \) on the plan, and multiplying it by half \( A \) \( B \), we shall have the content.

For an example of the application of this problem, let \( A P \) be 791, \( A \) \( B \) 1321, and \( P \) \( C \) 826: Then,

\[
\begin{align*}
1321 \\
826 \\
7916 \\
21642 \\
10568 \\
21091146 \\
543573 \\
+ \\
182292 \\
40 \\
3291685
\end{align*}
\]

Answer. 5 acres, 1 rood, 33 perches nearly.

To measure a four-sided field, \( A \) \( B \) \( C \) \( D \) (fig. 5.) Measure along a diagonal, as \( A \) \( C \), and either of the two perpendiculars \( D \) \( E \), \( B \) \( F \), as in the last problem; or else the sides \( A \) \( B \), \( B \) \( C \), \( C \) \( D \), \( D \) \( A \). From either of which the figure may be plotted, and its contents computed. Otherwise, measure on the longest side the distances \( A \) \( P \), \( A \) \( Q \), \( A \) \( B \), and the perpendiculars \( P \) \( Q \), \( D \). (fig. 6.) Or, measure the diagonal in fig. 5; and the angles \( C \) \( A \) \( B \), \( C \) \( A \) \( D \), \( A \) \( B \), \( A \) \( C \), \( A \) \( D \). Or, measure the four sides, and any one of the angles, as \( B \) \( D \).

Ex. 1. Let \( A \) \( E \) be 214, \( A \) \( F \) 362, \( A \) \( C \) 592, \( D \) \( E \) 216, and \( B \) \( F \) 326. Then,

\[
\begin{align*}
\text{Sum of perpendiculars} & = 592 \\
\text{AC} & = 102.2 \\
\text{EF} & = 46.14 \\
\text{DF} & = 22.86 \\
\text{DE} & = 325472 \\
\text{AC} & = 4 \\
\text{EF} & = 21888 \\
\text{DF} & = 40 \\
\text{DE} & = 875523
\end{align*}
\]

Answer. 3 acres, 0 rood, 81 perches.

Or, in fig. 6. Let \( A \) \( P \) be 110, \( A \) \( Q \) 745, \( A \) \( B \) 1110, \( P \) \( C \) 352, and \( Q \) \( D \) 595. Then,

\[
\begin{align*}
PQ & = 47.45 \\
QP & = 94.7 \\
DQ & = 35.79 \\
\text{Sum of perpendiculars} & = 230.62 \\
\text{AP} & = 110 \\
\text{PQ} & = 69.5 \\
\text{DQ} & = 52.65 \\
\text{Area} & = 178.5
\end{align*}
\]

Answer. 4 acres, 1 rood, 55 perches.

To survey any field by the chain only. Having set up marks at the corners, where necessary, of the proposed field \( A \) \( B \) \( C \) \( D \) \( E \) \( F \) \( G \), (fig. 7.) Form a judgment, by walking over the ground, how it may be divided into triangles and trapeziums; and measure them separately as in the two last problems. In this way it will be proper to divide it into as few separate triangles, and as many trapeziums as may be, by drawing diagonals from corner to corner; and so that all the perpendiculars may fall within the figure. Thus, the figure is divided into the two trapeziums \( A \) \( B \) \( C \) \( G \), \( G \) \( D \) \( E \), and the triangle \( G \) \( C \) \( D \). Then, beginning with the first at \( A \), measure the diagonal \( A \) \( C \), and the two perpendiculars \( G \) \( M \), \( A \) \( N \); then the bafe \( G \) \( C \), and the perpendicular \( D \) \( P \); lastly, the diagonal \( D \) \( F \), and the two perpendiculars \( P \) \( Q \), \( D \) \( G \). All which measures write against the corresponding parts of a rough figure drawn to refer measure the figure to be surveyed, or let them down in any other form at pleasure.

\[
\begin{align*}
\text{Am} & = 135 \\
\text{An} & = 410 \\
\text{AC} & = 550 \\
\text{CG} & = 152 \\
\text{CG} & = 440 \\
\text{FP} & = 206 \\
\text{FP} & = 588 \\
\text{PD} & = 520
\end{align*}
\]

Or thus; measure all the sides \( A \) \( B \), \( B \) \( C \), \( C \) \( D \), \( D \) \( E \), \( E \) \( F \), \( F \) \( G \), and \( G \) \( A \); and the diagonals \( A \) \( C \), \( C \) \( G \), \( G \) \( D \), \( D \) \( F \).

Otherwise; many pieces of land may be very well surveyed, by measuring any base line, either within or without them, together with the perpendicular let fall upon it from every corner of them. For they are then divided into several triangles and trapezoids, all whose parallel sides are perpendicular to the base line; and the sum of these triangles and trapezoids will be equal to the figure proposed, if the base-line fall within it; if not, the sum of the parts which are without being taken from the sum of the whole which are both within and without, will leave the area of the figure proposed. In pieces that are not very large, it will be sufficiently exact to find the points, in the base-line, where the several perpendiculars will fall, by means of the cross.
By the Chain to find the distance between two objects inaccessible in respect of each other. From some place, as C (Fig. 1), whence the common distance to each object, A and B, is accessible in a right line; measure the distance CA, which suppose fifty chains; and continue the line to D, viz. fifty more; measure also BE, which suppose thirty chains; and produce the line to E, viz. thirty more. Thus will be formed the triangle CDE, equal and similar to the triangle ABE; consequently the distance DE, being measured, will give the inaccessible distance required.

By the Chain to find the breadth of a river. On one side, place a pole, tour or five feet high, perpendicularly, having a hit at top, with a bright piece of wire, or the like, two or three inches long, put through the same. This is to be flipped up or down, till, looking along it, you find it point full on the other side of the river; then turning the pole with the wire in the same direction, observe the point on the dry land to which it points when placed along as before; measure the distance from the pole to this last point; it is the breadth of that of the first required.

**Chains, Catenae, in Ecclesiastical History**

In a kind of punishment inflicted on murderers. By Act 25 Geo. II. c. 37, the judge shall direct such to be executed on the next day but one, unless the Sunday intervene; and their bodies to be delivered to the surgeons to be dissected and anatomized; and he may direct them afterwards to be hung in chairs. During the interval between sentence and execution, the prisoner shall be kept alone, and sustained only with bread and water. The judge, however, has power to reverse the execution, and relax the other restraints of the act. Blackft. Com. vol. iv. p. 232.

**Chains, in Ship building**, are those iron by which the shores of the masts are made fast to the chain-wales.

**Chair, Cathedra**, was anciently used for the pulpit, or lectern, whence the prebend spoke to the people. It is still applied to the place whence preachers and regents in universities deliver their lectures, and teach the licences to their pupils: thus, we say, the professor's chair, the doctor's chair, &c.

**Chair, Canoes**, was an ivory seat placed on a car, when in were lected the prime magnificats of Rome, and those to whom the honour of a triumph had been granted.

**Chair, Sedia**, a covered vehicle for carrying a single person supported by two poles, and borne by two men, hence denominated chairmen. They were first introduced in London in 1624, when Sir Sanders Duncombe obtained the sole privilege to use, let, and hire a number of the said covered chairs for 14 years. The first sedan chair, says Hume (Hist. vol. i. p. 163), was seen in England, in the reign of James I., and was used by the duke of Buckingham; to the great indignation of the people, who exclaimed, that he was employing his fellow-creatures to do the service of beasts. In 1694, they were first taxed by act of parliament (5 and 6 W. and M. c. 22): and by 9 Ann. c. 23, § 8. 220 hackney-chairs were licensed, at 10s. per annum; and no person was obliged to pay for a hackney-chair more than the rate allowed by the act for a hackney-coach driven two-thirds of the said distance. By the said act every chair shall have a distinct mark on each side, and altering such mark incurs forfeiture of 5l. half to the former and half to the king. Nor shall any person carry for hire in a hackney chair, without licence, on pain of 40s.

In the following year, by 10 Ann. c. 19. chairs were increased to 300; and by 12 Geo. I. c. 12 to 400, on account of the great increses of buildings to the westward. By 7 Geo. III. c. 44, § 13, a chairman may take for any distance not exceeding one mile, 12d.; for any distance above one mile and not exceeding four furlongs, 16d.; or for every further distance not exceeding four furlongs, 6d.; and by the hour 18d. for the first hour, and 6d. for every half hour after. By 9 Ann. c. 23, a chairman, guilty of obseverence, by demanding more than his fee, or giving abusive language, or otherwise behaving rudely, shall, on conviction on oath forfeit not exceeding 20s. to the poor, or be committed for 7 days to Bridewell or some other house of correction; and by 7 Geo. III. c. 44, the commissioners may revoke his licence, or inflict on him a penalty not exceeding 5l. to the poor; and on non-payment, he shall be committed to hard labour in some house of correction for 30 days. See Hackney-coaches.

**Chair is also applied by the Romanists to certain feasts, held anciently in commemoration of the translation of the see, or feast of the vicarage of Christ, by St. Peter**.
The perforated chair, wherein the new-elected pope is placed, F. Mabillon observes, is to be seen at Rome; but the origin thereof he does not attribute, as is commonly done, to the adventure of pope Joan; but says there is a mystery in it; and it is intended, forsooth, to explain the pious sense of the Scripture, that God draws the poor from out of the dust and mine. 

CHAIRMAN, the president, or speaker of an assembly, company, &c. We say, the chairman of a committee, &c.

CHAISE, a sort of light open chariot, or calesca. See Coaches.

Aurelius Victor relates, that Trajan first introduced the use of post-chaises; but the invention is generally ascribed to Augilius; and was probably only improved by Trajan, and succeeding emperors. Goth. in Cod. Theod. tom. ii. p.506, &c.

CHAISE, Francais de La, in Biography, a distinguished ecclesiastic of France, in the reign of Lewis XIV. was born in the chateau of Aix in 1624, and entered the society of Jefuits at their college of Roanne, where he had been educated. He was employed for several years in teaching the belles-lettres, philosophy, and theology in different colleges of his order, and at length became provincial of the province of Lyons. From hence he was drawn to court, in 1675, by Lewis XIV. to fill the important post of his confessor, for which he possessed many necessary qualifications. As his figure was commanding, his manners polite, and his disposition to luxury and splendour such as suited the taste of Lewis, he acquired a powerful and permanent influence. To him was committed the distribution of benefices; and he maintained an absolute independence of mad. de Maintenon. His jealousy and diffidence with which he regarded him were expressed in her letters; but her unfavourable representations of his temper and character were counteracted by those of the duke of St. Simon, who describes him as mild and moderate, humane and modest, possessed of honour and probity, and though much attached to his family, perfectly disinterested. This panegyrist adds, that he valued himself on his birth, and loved to favour nobility; and this circumstance served to induce a partiality on the part of this nobleman in his favour. Attached to his own order, he promoted its triumph over Jansenism; nevertheless, his treatment of the Jansenists may be reckoned very moderate compared with that of his successor Le Tellier. In his 80th year, sensible of the decline of his faculties, he wished to retire, and with these wishes the Jefuits concurred; but the king would not allow it. Even when he was broken down by infirmities, and had lost his memory, the king, as M. de St. Simon emphatically expresses it, had the care of his confessor brought to him for the purpose of transacting the usual business. He retained this office till his death, at the age of 85, in 1709. He was one of the first members of the Academy of Inscriptions, to which rank he was entitled by his knowledge of medals and of ancient history. Nouv. Dict. Hist. Gen. Diog.

CHAISE, La, or LACHEZ, in Geography, a town of France, in the departement of the North coast, and chief place of a canton in the district of Loudes; 5 miles S.E. of Loudes. The place contains 426 houses, and the canton 1,184 inhabitants; the territory comprehends 212½ kilometres and 7 communes.

CHAISE-DIEU, La, a town of France, in the department of the Upper Loire, and chief place of a canton in the district of Brioude, 13 miles from Brioude, and 18 N.N.W. of Le Puy. The place contains 1,322, and the canton 5,042 inhabitants; the territory comprehends 250 kilometres and 14 communes.

CHAIZE-LE-VICOMTE, La, a town of France, in the department of the Vendée, and district of Montaigu; 5 miles E. of La-Roche-sur-Yon.

CHAUK, a town of Asia, in the country of Chara'm, on the frontiers of the Greater Bucclna.

CHAKEN KAN, a town of Asiatic Turkey, in the province of Caramania; 20 miles N.N.E. of Tarfus.

CHAKENI KOUZLY, a town of Asia, in the kingdom of Candahar; 120 miles E.N.E. of Candahar.

CHALA, a small foot-port of South America, in the Pacific Ocean, near the river Arequipa.

CHALAL, in Ancient Geography, a town of Asia, in Assyria; placed by Isidore de Charus in the Chalonsis.

CHALAMA, a river of Asia, in Syria.

CHALABRE, in Geography, a town of France, in the department of the Aude, and chief place of a canton, in the district of Limoux; 10 miles S.W. of Limoux. The place contains 1,820, and the canton 8,913 inhabitants: the territory includes 205 kilometres, 16 and 16 communes.

CHALACH, in Ancient Geography, the capital of Chalce, near the springs of the river Lyceu. Strabo places the Chalcean in the vicinity of Abydene.

CHALADRA, CHADRA, or GALADRA, a town and marth of Macedonia.

CHALEON, a port of Greece, in the Locris; 7 miles from Delphi, according to Pliny, who ascribes it to the Lacreni-Ozouk.

CHALAIN, or LA FOTHERIE, in Geography, a town of France, in the department of the Mayna and Loire, and district of Segre; 7 leagues N.W. of Angers.

CHALANS, a town of France, in the department of the Charonte, and chief place of a canton, in the district of Bordeaux; 15 miles W. of Anglet. The place contains 38, and the canton 7,728 inhabitants: the territory comprehends 130 kilometres and 16 communes.

CHALAMONT, a town of France, in the department of the Ain, and chief place of a canton, in the district of Trevoux; 4 leagues N.N.E. of Montluçon.

CHALAK, a town of Pefia, in the province of Ge-droia.

CHALAN, a town of Pefia, in the province of Farsilten; 40 miles N.W. of Schiras.

CHALANCO, a town of France, in the department of the Ardèche; 3 leagues N. of Privas.

CHALAPA, in Botany, and the Materia Medica, is a name given to jalap.

CHALAPU, in Geography, a mountain of the Cordillers, in South America; which has, in its neighbourhood, the town of Hambato, and its skirts diversified with beds and farms; but its declivity is very steep. On this mountain the French mathematicians erected one of their signals, in measuring the length of an arc of the meridian.

CHALARONNE, a river of France, which runs into the Sàng, near Tollevy.

CHALASTIC Medicines, are such as have the faculty of relating the parts; when, on account of their extraordinary tenion, or swelling, they occasion pain.

The word comes from gpaun, ή ραυς, relax.

Of this kind are butter, and many oils, &c.

CHALASTICUM, a name of a Materia Medica, given by four writers to the gal phem.

CHALASTRA, in Ancient Geography, a town of Macedon, placed by Blyn, in the Therman Gulf. Herodotus and Strabo call it Chalystra.

CHALAU, or KALAU, in Geography, a town of Luflia; 40 miles S.W. of Frankfort on the Oder.

CHALAUTRE, a town of France, in the department of the Seine and Marne; 2½ leagues E. of Provins.

CHALAZA,
CHALAZA, among Naturalists, a white knotty kind of
flour at each end of an egg, formed of the placenta of the
fibres of the membranes, whereby the yolk and white are
connected together.

Its use, according to Harvey, is to be as it were the poles
of this microcosm, and the connection of all the membranes
twisted and knotted together; whereby the liquors are not only
conferved, each in its place, but also in its due position to
the soul.

Mr. Durham adds, that they also serve to keep one and
the same part of the yolk uppermost, let the egg be turned
which way it will; which is done by the following me-
chanism: the chalaza are specifically heavier than the whites
wherein they swim; and being braced to the membrane of
the yolk, a little out of the axis, they cause one side of the
yolk to be heavier than the other. The yolk being thus
by the chalaza made buoyant, and kept swimming in
the middle of the two whites, is, by its own heavy side,
kept with the same side always uppermost: which uppermost side he
imagines to be that whereon the chalaza lies.

CHALAZA, in Botan. a name given by Gartner to a par-
ticular part of the internal membrane which belongs to
moll seeds. It has the form either of a small deep-coloured spot,
or of a small, pungent, callous tubercle, proceeding from the
extratines of the internal umbilical vessels, or from the dry
remains of the chorion, and appearing on the outer surface of
the membrane. It is found in many, but not in all seeds; and
is situated either near the external umbilicus, or directly
opposite to it. The first situation is not very common, but
exhibits a variety of forms. The chalaza is a black phaeno-
lated spot in cucumis, a thick fleshy excrescence in cyren-
thus, and a small pungent scale in the seeds of bibulous,
lavatera, and other malicious plants. When it is situated,
as most frequently is, opposite to the umbilicus, its form is
always round, with a moderate convexity; as in cistus, me-
robalanus, bixa, protea, flaphilia, alecimilla, and many
other seeds; in all which the deep colour of the chalaza, and
the close connection with the internal membrane, are clearly
discriminable. See Gartner de Fructibus, vol. i. introd.
p. 135.

CHALAZIAS, or CHALAZITES, in Natural History,
the name of a small fly, described by Pliny and other an-
tic writers, and said to have been of the size and colour of
a common hair-fly, and of the hardness of the diamond. It
was probably no other than the small phallic crystallall of the
Indus, which are at this time frequent on the shores of rivers
there, from the bigness of a large pin's head to that of a p.s.
as they lie in great clusters together, without any other
flies among them, they make a sort of coarse food, which
much resembles a cluster of hair-flies.

CHALCA, in Ancient Geography, a town of Africa,
according to Strabo.

CHALCANTHUM, in Natural History. This term,
together with chalcis, chalybe, and fury, was applied by the
ancients, without much scientific determination, to signify
iron and copper pyrites in a date of greater or less decom-
position, and therefore approaching more or less to
native vitrification. See Iron sulphate.

CHALCA, in Friesbus, the name with vitrification.

Some have and old tradition, contrary to colonists,
or virile red-faces.

CHALCANTHUM, in the Native Metals, a name
given by some of the old Greeks to the selenite, a
yellowish vitrified earth, which turned black on being
wrought with common iron.

CHALCA, in Automatic Geography, an ancient town of
Africa, in Libya, according to Steph. Byz.—Also, a town
placed by this geographer in Phocis.—Also, a town
situate in the territory of Larissa.—Also, an island of the
Mediterranean, on the coast of Asia Minor, near Rhodes,
according to Pliny; called also Chalca.

CHALCEA, a town of Asia, in Caria.

CHALCEDON, or CHALCEDON, in Ancient Geography,
a famous city of Bithynia, situated on the Bosphorus,
and built, as it is laid, by the inhabitants of Megara, some
years before Byzantium. It was anciently known by the
names of Procerallis and Calciana. It was taken by the
Athens in 405 B.C.; and 74 years before the same
year, it was besieged by the Romans, king of Pontus, but
surrendered by the general Lucullus. The emperor
Julian repaired it, and gave it its own name. It afterwards
came to be very powerful. Pliny, Strabo, and Tacitus call it
the „City of the Blind„; alluding to the answer which
the Pythian Apollo gave to the founders of Byzantium,
who, consulting the oracle in relation to a place where
to build a city, were directed to choose that spot which lay
opposite to „the habitation of the blind,“ that is, as it
was then understood, to Chalcedon: the Chalcedonians
discovered that spirit for having built their city on a barren
and sandy soil, without perceiving that advantageous and
pleasant spot on the opposite shore, which the Byzantines
afterwards chose. The emperor Julian erected a tribunal in
this city, for trying and punishing the evil counsellors of his
second successor Constantine. In the suburb of this city, was
named the „Oak,“ of Rufus, the infamous minister of the
emperor Theodosius, built a magnificent villa to which he
added a fluted column, consecrated to the goddess St. Peter
and St. Paul, and continually sanctified by the prayers
and penance of a regular society of monks. A numerous
d and almost general sympathy of the bishops of the Eastern
empire was fomented to celebrate, at the same time, the
dedication of the church and the baptism of the founder; and
this double ceremony was performed with extraordinary pomp.
Chalcedon became famous in Christian times for the council
held there in 451 against Eutyches, which is reckoned the
fourth general or ecumenical council. At this council
Eutyches, who had been already banished, and d proved
by the emperor of his factotum duality, was convicted, though
absent; and the following doctrine was anathematized
among Christians as the object of faith, viz. „that in Christ
two distinct natures were united in one person, and that
without any change, mixture, or confusion. („The emperor
Valens carried the walls of this city to be levelled with the
ground, for hiding with Preospus, and the materials to be conveyed
to Constantinople, where they were employed in constructing
the famous Valentinian aqueduct. This city was taken
after a long siege, A.D. 615, by Chosroes II. king of
Peria. Chalcedon is at present a poor place, known to the
Greeks by its ancient name, and to the Turks by that of
Chalke, and Kadi-keri, or the Judges-town.

CHALCEDONIUS, the name of a medicine described
by Galen; and esteemed by him to be injected into the ears,
in intermittent disorders of that part.

CHALCE, in the Gipsy Trade. See Glass-
cracker.

CHALCE, in Natural History. Of this mineral there
are the two following sub-species:—
1. Chalcis a Chalce, its colour is blue-black, passing
into milky-white and faint blue; also green-grey, passing
into apple and olive-green; or yellowish grey, passing into
wax and umber-yellow, yellowish and black-brown, and
brownish-black. Two or more of these colours are often
found in the same specimen, of which one generally forms
the
the ground, while the others are distributed over its surface in dots, clouds, or stripes. When white and yellowish-brown stripes alternate with each other, the stone is called an *onyx*, and is highly esteemed by the lapidaries. The grey varieties, with thick prismatic distinct concretions, when tranverse cut, present iridescent colours when held to the light, and have hence been named *rainbow chalcedony*. The translucent milk-white variety is called *cacholong*. The green and small-blue varieties are the rarest: the dark coloured ones, when cut thin and held to a strong light, appear blood-red.

It is found massive, or forming veins, or in round balls of various sizes called *geodes*; also kidney-shaped, botryoidal, stalactitic, mamillated, and imbricated by various organized bodies, such as tuerntanits, &c. Certain crystal-line forms, especially those of quartz, have all been attributed to chalcedony; but those appear to be nothing more than crystals of quartz coated over with chalcedony. It puffs little or no lustre; its fracture is perfectly even, passing into fine-spintery and flat-conchoidal; it breaks into indeterminate sharp-edged fragments; it frequently exhibits concentric, lamellar, or angular distinct concretions; it is commonly semi-transparent, but the darker-coloured varieties are only translucent; it is somewhat harder than flint, and much less brittle. Sp. gr. 2.58 to 2.65. It is insubfible per os before the blow-pipe, but becomes milk-white and opaque. According to Bergman, the chalcedony from Ferroe consists of

84 Silex.
16 Alumine and a little iron.

105

It occurs in veins and geodes in amygadaloid; also in veins, accompanied by quartz, pyrites, &c. in porphyry.

It was anciently procured from Chalcedon, in Lesser Asia (where its name); but at present it is found principally in Saxony, Hungary, Iceland, Scotland, and the adjacent islands, Cornwall, and various parts of Asiatic Rhufl.

2. Cornelian. The usual colour of this mineral is blood-red, whence it puffs into flesh-red, reddish white, milk-white, orange and honey-yellow. Two or more colours often occur in the same specimen, disposed in zones, stripes, and arborizations. It occurs in veins and rounded pieces, has a conchoidal fracture, and a flight degree of lustre: in other respects it agrees with the common chalcedony. The variety with alternate red and white stripes is called *fai-donys*.

Cornelian is found in various parts of Europe; but the most beautiful and valuable pieces are brought from Arabia, and Swat, and Cambay in India. Cornelion, from its beauty and hardness, has always been much sought after by lapidaries. Some of the finest antique cameos are made of it.

The coloured chalcedonies pass into *agate*, which see.

CHALCEPolON, in Antiquity, a ship, the rostrum of which was of bras.

The word is compounded of *xalos*, *breis*, and *rothtron*.

CHALCEPOS, in Botany, Dalech. See ECHINOPS &ca.

CHALCEOII!ES, in Ancient Geography, a name given by Strabo to a place of Asia Minor, in Caria.

CHALCECTORIUM, a town of the island of Crete. Steph. Byz.

CHALCIDENE, an inland province of Syria, bounded by Antiochene or Sclerens, on the west; Cyrhlicia, on the north; Chalybontis, on the east; and by Apamene and Cilcica, on the south. It took its name from its metropolis *Chalei*.

This was reckoned one of the most fruitful provinces of Syria, and was taxed by Ptolemy, the son of Menareus, during the troubles of Syria, and by him made a separate kingdom. Ptolemy *Hypaethros* is flyed by Josephus and Hcgelippus only prince of Chaleis; but his son Lyosias is honoured both by Josephus and Dio with the title of king.

CHALCIDENSES, a people of Asia Minor, placed by Strabo in Ionia.—Alfo, a people situate, according to *Diadochos* Secules, about the river *Pialins*.—Alfo, a people of Threes, in the country where were situated the towns of Tinda and Milcorous. They are mentioned by Ammochus and Thucydides.

CHALCIDIC, CHALCIDICUM, or CHALCIDONIUM, in the Ancient Architecture, a large magnificent hall belonging to a tribunal or court of justice.

Celtus says, it took its name from the city Chaleis; but he does not give the reason. Philander will have it to be the court, or tribunal, where affairs of money and coinage were regulated; so called from *xalos*, *breis*, and *reis*, justice. Others say, the money was struck in it; and derive the word from *xalos*, *breis*, and *reis*, justice.

In Vitruvius, it is used for the auditorium of a basilica; in other of the ancient writers, for a hall, or apartment, where the heathens imagined their gods to eat.

CHALCIDICA LACERTA, in Zooloay, a reptile described as a sort of serpent, and so called from its resemblance in colour to the chalcedony. Its bite is succeeded, they tell us, by a pellucid tumour, which has a shining blackness at the margin; and drank in wine, it cures its own bite, according to Paulus *Egineta*. This animal is no other than the *Lacerta Chalicides* of Linnaeus, which see.

CHALCIDIC, or CHALCITIS, in Ancient Geography, a country of Macedonia, according to Ptolemy, who comprehended the mountains S. E. of Apollonia, and the two peninsulas which lay between the Toronic, Singite, and Byrnomne gulfs. In this country was the famous mount *Axios*, which see. Ptolemy reckoned in this country only five cities; but Scalts fays, that Philip took here 32 towns. Among these we may mention *Aguss*, *Singus*, *Chaleis*, and *Ecanthus*, now Ethio.

CHALCIDICUM, in Antiquity, sometimes denoted a chamber, see CHALCIDIC.

CHALCIDICUS MANI, in Ancient Geography, a mountain of S. Lily, according to P Plius and Steph. Byz.

CHALCIDIUS, in Biography, a Platonic philosopher, concerning whose whole life and character writers have entertained different opinions. Some have supposed that he was deacon or arch-deacon in the church of Cartings; others thought he was an heathen. According to Hoby he was a Gentle, well acquainted with Carolian writings. BRondsbai calls him a Christian philosopher, and says, that he joined Christianity with Platonism. Cave is doubtful whether he was a Gentle or a Christian. Fabricius represents him as a Christian writer of the fourth century; but Molcheses supposes. Dr. Lardens urges some difficulties; such as his veneration to approve of the divinations of *Cau- tidium*, and allowing them to be of use for discovering future events. He quotes Moses as a wise man, but seems to express a doubt whether he professed divine inspiration, as well as human knowledge. Upon the whole, his manner of
writing does not clearly show whether his religion was Christianity or Gentilism. Lardner, with his usual modesty, inclines to the opinion that he was a polite Platonic philosopher, who wished to be upon good terms with Christians, whose religion prevailed at that time; and he supposes with Cave, that he flourished about the year 332. Chalcedon translated into Latin the former part of the Timaeus of Plato, and added a prolix commentary, in which he shows much learning and good skill in the sentiments of the ancient philo-sophers. This work is ascribed to Oribas, or Hlorus, supposed to be the bishop of Corduba in Spain, and a principal member of the council of Nice in 325. He refers to the history of St.Matthew (chap. n. 1) and whether he was a Christian or a heathen, this passage is a valuable testimony to St. Matthew's gospel, and to the history which he wrote. If the comments by he considered as the work of a Gentile philosopher, the several quotations of the Old Testaments and of the New that occur in it afford proof that the Scriptures were then well known in the world. Lardner thinks with Cave, that the style of the paragraph which he has cited, is that of a Gentile, not of a Christian writer. Lardner's Works, vol. viii. c. 45. Cave, Hist, vol. i. p. 192.

CHALCIS. Ancient Geography, a town of Greece, and reckoned the capital of Euboea, was built in the western part on a small peninsula, which seemed to join the mainland. The name of Chalcis, which was common to the island of Euboea, and its capital, Stephanus derives from the daughter of Aephus, king of Boreas; called Combe, and turns named Chalcis, from her having first invented brazen armour; whence Pliny deduces it from a Greek word Xacterial, signifying brazen or copper, which he supposes to have been first used here. The Chalcedians, in their better days, were renowned for their skill in navigation; but they were very generally reproached, on account of the ill-treatment of their masters; and their avarice was a topic of ridicule among the ancient Armenians. They sent colonies into Thrace, Macedonia, Sicily, the island of Coreia, Lemnos, Italy, &c. See EUBOE. Chalcis was one of the three cities which Philip, son of Demetrius, called the three cities of Greece. Strabo says, that it was joined to the continent of Boeotia, and Pliny thought that Euboea was united with the continent by this place, which is not improbable. The small strait which separates the island from the continent is called Euripus, and by the modern Greeks Euripos, whence by corruption is derived Eryipos, the name given to the island.

CHALCIS, a town of Macedonia in Chalcidice. It was situated between Olynthus, the Singitic gulf, and Apollonia. Thucydides and Steph. Byz. refer it to Thrace, because the boundaries of this country were sometimes changed.

CHALCIS, a mountain of Greece, in Aetolia, according to Strabo, who says, that it extended along the eastern bank of the Evus, from the mouth of this river to the northern extremity of Aetolia.

CHALCIS, a town of Greece, in Aetolia, situated on the fore-mentioned mountain. — Alfo, a town of Greece, in Boeotia, according to Hesychius. — Alfo, a river of Greece, in the Peloponnesus, which, according to Strabo, ran to the confines of Triphylia and the Epirite territory, near Samcus. — Alfo, a river of Acha Minor in Bithynia, which watered the city of Chaledon, and discharged itself into the Thracian Bosphorus. — Alfo, a mart the bough, with a port, in Acha Minor, upon the southern coast of Ionia, N. of the isle of Samos, and near Teos. — Alfo, one of the islands called Echinades, which were Grecian islands on the coast of Aetolia. — Alfo, a town of Acha, in Syria; seated on the northern bank of a lake, whence springs the river Chalees, and which gave its name Chalcedon to the country. The Notitia of Herodotus distinguishes it as an episcopal city of Syria Prima, and the Itinerary of Antwine places it W. of Bebus. — Alfo, a town of Arabia Felix, which Pliny says was founded by the Greeks, but destroyed by the war. — Alfo, a town of Scythia, mentioned by Steph. Byz.

CHALCIS, in Entomology, a genus of Hydrometopid insects established by Fabricius, and included by Gmelin in the Linnean arrangement between the Tiphia and Cheiris. The genus Chalcis contains, with the exception of one, or, at most, two species, of insects discovered since the time of Linnaeus, and which cannot, with propriety, be reduced to any of the Linnaean genera. It approaches both the Sphex and Velutus tribe; it is to the Velus Linnaeus refers Chalcis minutus of Fabr., and if the insect described in his Fauna Suecia, n. 1557, be the Chalcis Sipser, it is commonly believed, the latter being in his genus Sphex. The Fabrician character of the genus Chalcis is Palpif quatus quatuor: Antennae breves, cylindricae, fere solitariae; articulis primo subturbinatis. Fabr. Ent. Syrl. This following generic character after the Lacertian method is proposed for Chalcis, in the eleventh volume of the Natural History of British Insects. Mouth with a horny, compressed, and sometimes elongated jaw; feelers four, equal; antennae cylin- drical, uniform, frst joint rather thickened; thorax gibbous, lengthened behind, and obtuse; abdomen small, rounded, and subfusiform; posterior thighs thickish. Donov. v. 14. p. 57: t. 379.

Species.

Obf. The posterior thighs are elevated, and toothed, of a yellow colour, and marked with a large spot of black on both the female simple.

Size of the boll; colour black and glossy, except the posterior thighs. According to Hybner this insect inhabits Saxony; it has been taken rarely in England. Latreille, who describes it under the name of Chalcis elavipede, mentions it as a scarce insect in France.

Chalcis minuta. Black; posterior thighs thick, and yellow at the tip. Fabr. Vespa minuta, astra geniculata pedum lutea, femoribus posticis ovatis furibus multicristis,inct.

This species is small, and has the posterior thighs serrated, and thicks incurved, yellow, and tipped with black. Fabricius describes this as a German insect. Latreille informs us it is not uncommon in France, in the vicinity of Paris, and it may be considered, we believe, as a native of this country.

This kind inhabits the South American islands. The thorax is yellow, with black spots; the abdomen somewhat petiolate, yellow, tipped with black; posterior thighs with a black dot at the base and tip; wings white, and without spots.

Chalcis opiformis. Cineereous; abdomen black; posteri
tor's legs thick, telfacous, with a tooth at the base of the foot. Fabr.

Native country unknown. Derived from the collection of Land. The antennae are black, with ferruginous base; head villous and cinereous; lip rounded, yellow, with a black streak; thorax cinereous; abdomen black; wings white.

Chalcis pedegrica. Black; posterior thighs thick, ferrated, and ferruginous, with a white spot at the tip. Fabr.

Inhabits Tranquebar. Small; antennae short and thick; head and thorax black, with a callous dot before the wings; abdomen short, rather compressed, black and without spots; legs white; thighs black; posterior pair, with a large white spot above; the flanks incurred, white, and in the middle black.

This is a native of Italy. The size is small, and the colour entirely black, except the white wings; posterior thighs very thick.

Chalcis psylla. Glossy black; posterior thighs thick, with a white spot at the tip. Fabr. Refurns the habit, but is only half the size. Inhabits Saxony. Hylac natur.

Chalcis annulata. Black; posterior thighs thick and dowered, with a white spot at the tip; thanks white, fringed with black. Fabr.

Inhabits South America, and appears, from the account of Dr. Plag, to be of the parasitic kind like the Ichneumon, being found in the pupa of moths. It may be added, that as we are unacquainted with the Chalcis tribe in general, except in the winged state, the whole of them may be of the parasitic kind, depositing their eggs, and being nourished in the larve state in the bodies of other insects. The size of Chalcis annulata is the same as the preceding; the head and antennae are black; thorax somewhat villous, black, with a brownish white dot before the wings; abdomen conic, smooth, and without spots; wings white; thighs of the posterior legs thick; flank incurved.

Chalcis flavipes. Black; posterior thighs thick, ferrated, with a yellow spot at the tip; legs yellow. Fabr.

Described from the cabinet of Dr. Plag as a native of the South American islands. Refurns the habit in size and appearance. The head is black; thorax dotted, with a yellow callous dot before the wings; abdomen conic, black, and glossy; wings hyaline; legs yellow; thighs black at the base.

Chalcis maculata. Yellow, spotted with black; segments of the abdomen ferruginous at the base; posterior thighs elevated and immaculate. Fabr. Rohr.

Inhabits Ceylon. The body is small; antennae short, black, the fric joint telfacous; head yellow, with a central black line, and four vertical black dots; thorax yellow, anterior spot, dorsal line, and dot on each side black; legs yellow; thighs black at the base; posterior thighs ferrated.

Chalcis, in Ichthyology, a name by which some have called the pikehead; called by others celebiris, and Apa membros. See Ctenophorus piccas.

Chalcis was also the name given by Aristotle, Aelian, Appian, and other Greek authors, to the common herring. See Ctenophorus barbus.

Chalcitaceum, in the Materia Medica of the Ancients, a name given by the Greeks of the middle ages to the Calestuar, or Caleathum. Some have applied it to the Chalcites alone, but others make it express the vitrius in general. It is derived from the Arabian word caleathur.
CHALCOPITHONGUS, in Natural History, a word used by Pliny, and other writers, as the name of a peculiar species of marble, which was very hard, and of a deep black colour, and when broken, formed like braze.

CHALCORYCHIAN MOUNTAINS of Ptolemy, are mountains of Africa, in that part of Mauritania Cæsariensis, which belonged to the Tingitanians or Western Moors, between the rivers Dardus and the river Malva or Mollos. They were inhabited by the ancient Herpitiadani, and now by a tribe of Kabyles, called Beni-zenei Tel.

CHALCOS, in Coinage, a coin of braze, eight of which were contained in the silver obolus, and supposed to have been the first kind of Greek coin. At first it was regarded as of so little moment that it afforded occasion for a proverb; so that to lay a thing was not worth a chalcos, was the same with saying that it was worth nothing. As the Greeks became poorer, however, even this diminutive coin was subdivided into 2, 4, or even 8 lepta or small coins. Pollux, and Suidas after him, tell us, that there were seven lepta to one chalcos; but this kind of division, from the insufficiency of seven for proportional subdivision, is not likely to have occurred. But both these writers are too late as authorities: Pliny says that there were to chalces to the obolus, Diodorus that there were six, and Isidorus that there were four; and as these writers differ about the larger denomination, it may well be imagined that the smaller equally varied in different states. Most of the Greek copper coins which are now existing confound of chalcos; the lepta being small, and more liable to be lost. All the braze coins of Athens published by Dr. Coombe are reducible to four fives, which may be the lepton, dilepton, tetradrachm, or demichalcos, and chalcos. The first is not above the size of one of king James I.'s farthing tokens; the last about that of our common farthing. See Money.

CHALCOSMARAGDUS. Almost evergreen mineral of a saphire colour was called by the ancient Naturalists Chalcosmaragdus. The chalcosmaragdus or copper emerald was found in the copper mines of Cyprus, and therefore was probably some spar tinged green by carbonat of copper.

CHALCITOS, Los, in Geography, a town of New America, in the country of Mexico, and province of Zacatane.

CHALCUS, in Idulbyege; a name given by the ancient Greeks to the fish we call Doris, John Doriæ, or Doræ. It seems to have obtained both these names from its colour; the one from the word chalcos, braze; and the other from doræ, guided. See ZEUS fulcrum.

Chalces, among the Ancient Greek Physicians, a weight of about two grains, the same as scruta or arcalem.

CHALDAE, in Ancient Geography, an appellation at first and generally used as synonymous with Babylon, which feé. But in process of time, it was restricted to the country, that was situated to the S.W. of Babylonia towards the Persian gulf, and towards the S. of the Euphrates. In Chaldea, properly so called, Ptolemy places the cities Spunda, Batrahanta, Shatalia, Altha, and Teridona, all on the Tigris; in the inland country he enumerates Chudua, Chumana, Bethana, Orcbic, Biramba, and several others, equally unknown.

CHALDÆANS, a name never given by Xenophon in his Retreat of the Ten Thousand, nor in his Cyropædia, to the people of Babylonia; but it properly belonged to a family or tribe of people who from their infancy devoted themselves to the study of nature, to the observation of the stars, and to the worship of the gods, much after the same manner with the Magi of Persia and the Brahmins of India. The Chaldæans or Chaldaeans, properly so called, were the priests and learned men of Babylonia, whose whole science seems to have been subservient to the purposes of superstition. These Chaldæans were, perhaps, more distinguished from the people than the clergy are from the laity with us; and were as much revered in their country, as the Egyptian priests were in theirs; and they are said to have enjoyed the same privileges. See CHALDAEAN PHILOSOPHY.

Xenophon (ubi supra) gives also the same name of Chaldæans to the people who inhabited that branch of mount Caucasus, where the Tigris, the Euphrates, the Araxes, and the Cyrus had their source. These people are denominated Chalybes in the geography of Herodotus, and he places the Chaldæans in Babylon. Strabo says (ib. x. and xi.) that the people anciently called Chalybes were, in his time, named Chaldæans; and the emperor Constantine Porphyrogenitus, who calls the provinces by the name of the people who inhabited them, gives that of Chalda to the country, of which Trebizond was the capital, and which extended very far to the south and to the east of this city, comprehending a great part of the two Armenias. He adds that this name was derived from the Persians. Strabo describes the Chaldæans as a people almost savage, who dwelt in the mountains of Colchis.

The Chaldæans, says the learned Bayart, (Observ. and Inq. p. 253.) were the most ancient inhabitants of the country called by their name; nor are there any other principals, to whom we may refer their original. They seem to have been the most early constituted, and settled, of any people upon earth; and from their situation, and from every other circumstance, it appears, that Chus was the head of their family, and Nimrod their first king. They seem, he says, to have been the only people, that did not migrate at the general dispersion; and the centre of their province was at Ur, not far from the confluence of the Tigris and Euphrates. From hence they extended themselves under the names of Cufcans and Arabians, as far as Egypt, and as far as Ethiopia. Upon the Gambia is the king of Bushali, of African extraction, as are all the Phoebus natives; who retain their original language, and are of the religion of Mahomet.

CHALDAEAN PHILOSOPHY claims attention on account of its very high antiquity. The most ancient people, next to the Hebrews, among the Eastern nations, who appear to have been acquainted with philosophy, in its more general sense, were the Chaldæans; for though the Egyptians have pretended that the Chaldæans were an Egyptian colony, and that they derived their learning from Egypt, there is reason to believe, that the kingdom of Babylon, of which Chaldæa was a part, flourished before the Egyptian monarchy; and that the Egyptians were rather indebted to the Chaldæans than the Chaldæans to the Egyptians. Nevertheless, the accounts that have been transmitted to us,
CHALDÆAN PHILOSOPHY.

by the Chaldæans themselves, of the antiquity of their learning, are blended with fable and involved in considerable uncertainty. At the time when Callisthenes was requested by Ariosto to give information concerning the origin of science in Chaldaea, he was informed that the ancients of the Chaldæans had continued their astronomical observations through a period of 470,000 years; but upon examining the grounds of this report, he found that the Chaldæan observations reached no farther backward than 1603 years, or that of course (adding this number to 331 B.C., the year in which Babylon was taken by Alexander) they had commenced in the year 2234 B.C. Besides, Polonomy mentions no Chaldæan observations prior to the era of Nabonassar, which commenced 747 years B.C. Ariosto, however, on the credit of the most ancient records, speaks of the Chaldæan Magi as prior to the Egyptian philosophers, who, it is well known, cultivated learning before the time of Moses. There are other circumstances, independently of the antiquity of the Chaldæan philosophy, which render our knowledge of it imperfect and uncertain. We derive our acquaintance with it from other nations, and principally from the Greeks, whose vanity led them to fable and misrepresent the pretended learning of barbarous nations. The Chaldæans also adopted a symbolical mode of instruction, and transmitted their doctrines to posterity under a veil of obscurity, which it is easy to remove. To all which we may add, that about the commencement of the Christian era, a race of philosophers sprang up, who, with a view of gaining credit to their own wild and extravagant doctrines, passed them upon the world as the ancient wisdom of the Chaldæans and Periæans, in fabulous books, which they ascribed to Zoroaster, or some other eastern philosopher. Thus, the fictions of these impious authors were confounded with the genuine dogmas of the ancient oriental nations. Notwithstanding these causes of uncertainty, which perplex the researches of modern investigators into the distinguishing doctrines and character of the Chaldæan philosophy; it appears probable, that the philosophers of Chaldaea were the priests of the Babylonian nation, who instructed the people in the principles of religion, interpreted its laws, and conducted its ceremonies. Their character was similar to that of the Persian Magi, and they are often confounded with them by the Greek historians. Like the priests in most other nations, they employed religion in subservience to the ruling powers, and made use of imposture to serve the purposes of civil policy. Accordingly Diodorus Siculus relates, (ib. ii. p. 31, compared with Dan. ii. 1, &c. Eccles. xiv. 5.), that they pretended to predict future events by divination, to explain prodigies, and interpret dreams, and to avert evils, or confer benefits, by means of angury and incantations. For many ages, they retained a principal place among diviners. In the reign of Marcus Antoninus, when the emperor and his army, who were perishing with thirst, were suddenly relieved by a shower, the prodigy was ascribed to the power and skill of the Chaldæan footsowers. Thus accredited for their miraculous powers, they maintained their confluence in the courts of princes. The principal instrument, which they employed in support of their superstition, was astrology. The Chaldæans were probably the first people who made regular observations upon the heavenly bodies (Cic. de Divin. l. i. Strabo l. xvi.), and hence the appellation of Chaldæan became afterwards synonymous with that of Astronomer. Nevertheless all their observations were applied to the sole purpose of establishing the credit of judicial astrology; and they employed their pretended skill in this art, in calculating nativities, foretelling the weather, predicting good and bad fortune, and other practices usual with impostors of this class. (Sext. Emp. adv. Math. l. v. § 2. Aul. Gell. l. xiv. S. 1. Strabo, l. 5.) While they taught the vulgar that all human affairs are influenced by the stars, and professed to be acquainted with the nature and laws of their influence, and consequently to possess a power of prying into futurity, they encouraged such idle supposition, and many fraudulent practices. Hence other professors of these misleading arts were afterwards called Chaldæans, and the sects themselves were called Babylonian arts. Among the Romans these impostors were to troublesome, that, during the time of the republic, it became necessary to inflict an edict, requiring the Chaldæans, or mathematicians (by which latter appellation they were commonly known) to depart from Rome and Italy within 10 days, and, afterwards, under the emperors, these footsowers were put under the most severe interdiction. (Valer. Max. l. i. c. 3. Diod. Sic. l. xvii. p. 622. Sexton in Tiber.)

We may further add, that the Chaldæan philosophy confided, not in a free and diligent examination of the nature of things, but merely in the transmission of certain settled opinions from father to son. To this purpose Diodorus Siculus, (l. i. p. 31) deviating widely from the character of a true philosopher, commends the Chaldæans for having taken up their opinions upon the authority of their ancestors, and says, "that in this respect, they acted much more wisely than the Greeks, who, adding themselves to disputations, were ever ready to embrace new opinions; and thus obliged their disciples to wander through their whole lives in perpetual uncertainty." Accordingly, the mysteries of Chaldæan philosophy were revealed only to a select few, and judiciously concealed from the multitude; and thus a veil of sanctity was cast over their doctrine, so that it might more easily be employed in the support of civil and religious tyranny. Another circumstance which contributed to produce the same effect, was the care taken by the Chaldæan priests to prevent the spreading of religious and philosophical knowledge among the people; and with this view they confined the diffusion of it to a certain tribe and district. They also issued their dogmas under the disguise of symbols; thus referring to themselves the prerogative of varying the popular system according to the exigencies of the times, or the pleasure of the ruling powers, without danger of detection. The implicit credit which the Chaldæan priests obtained among the people by these devices is particularly noticed by Juvenal: (Sat. vi. 552.)

"Chaldæis ped major erit fiducia, &c.

"More credit, yet, is to Chaldæans given;
What they foretell, is deemed the voice of heaven.
Their answers as from Hammon’s altar come;
Since now the Delphian oracles are dumb.
And mankind ignorant of future fate,
Believe what fond astrologers relate.”

DREYDEN.

From the above account of the Chaldæans, it must appear, that they had but a very slight title to the appellation of wise men; and that, instead of ranking with philosophers, they belonged to the class of impostors. The knowledge they professed was applied to them by the purposes of superition; and little regard is due to the encomium passed upon this race of sages by some ancient writers, particularly Philo (De Nomin. Mutat. oper. p. 104/6.); and still less to the general admiration, which, at a very early period, they obtained in the east. Among the Chaldæans, however, there was some variety of opinions. We learn from the authority of Strabo (l. vi. p. 509.) and Pliny (Hist. Nat. l. vi. c. 16.) which is confirmed by the testimony of the Jewish prophets, that there were in Assyria and Chaldaea, different schools or sects, which probably differed from each other chiefly in the mode of
of practising the arts of divination and astrology; and whose knowledge of nature extended further than to the discovery of the supposed magical use of certain natural bodies, particularly minerals and herbs. (Plin. Hist. Nat. i. xxxvii. c. 10.) Moreover, the tenets or institutions of each sect, whatever they might be, were transmitted implicitly from father to son; and the followers of one sect very rarely revolted to another.

Among the ancients it is universally acknowledged, that Zoroaster was the founder of the Chaldaian philosophy. But much confusion and contradiction have occurred in the accounts that are given of this celebrated person. See Zoroaster. It is probable, that besides Zoroaster, who was a Peripato-Median, and who flourished in the time of Darius Hyblaphes, there was another of the same name who lived in a much more remote period among the Babylonians, probably towards the beginning of the Babylonian empire; who taught them astronomy, and who was the father of Chaldaian astrology and magic. (Plin. H. N. i. vi. c. 16; xi. 43.; xxx. i. Julii, l. i. c. 2. Recognitions Clementis, l. iv. c. 27.) The Chaldaian magic was, indeed, a very different thing from a knowledge of the real properties of bodies; and, though some acquaintance with the motions of the heavenly bodies was necessary for astrological calculations, it cannot be inferred, either from their magical or astrological arts, that the Chaldeans were eminent masters in any branch of natural science. All the writings, which have been ascribed to the Chaldaian Zoroaster, are unquestionably spurious.

Among the Chaldaian philosophers we may mention Belus, who professed the study of astronomy among the Assyrians, probably with a design of applying their faith in astrological predictions to political purposes, to whose memory Semiramis is said to have erected a lofty tower used afterwards by the Chaldeans as an astronomical observatory, and elevated after his death to the rank of divinities. (See Belus). See also Berossus.

The Chaldaian philosophy, notwithstanding the obscurity that has rendered it difficult of research, has been highly extolled, not only by the Orientalists and Greeks, but by Jewish and Christian writers: but upon recurring to authorities that are unquestionable, there seems to be little or nothing in this branch of the Barabian philosophy which deserves notice. The following brief detail will include the most interesting particulars: From the testimony of Dionysius, and also from other ancient authorities, collected by Eusebius (Prep. Evang. l. iv. c. 5.) it appears, that the Chaldeans believed in God, the lord and parent of all, by whose Providence the world is governed. From this principle sprung their religious rites, the immediate object of which was a supposed race of spiritual beings or demons, whose existence could not have been imagined, without first conceiving the idea of a Supreme Being, the source of all intelligence. The belief of a Supreme Deity, the fountain of all the divinities which were supposed to preclude over the several parts of the material world, was the true origin of all religious worship, however idolatrous, not excepting even that which consisted in paying divine honours to the memory of dead men. Besides the Supreme Being, the Chaldeans supposed spiritual beings to exist, of several orders: gods, demons, heroes: these they probably distributed into subordinae classes, agreeably to their practice of theology or magic. The Chaldeans, in common with the eastern nations in general, admitted the existence of certain evil spirits, clothed in a vehicle of greater matter; and in fulminating or counteracting these, they placed a great part of the efficacy of their religious incantations. (Plut. de Defectu Orac.)

These doctrines were the mysteries of the Chaldaian religion, imparted only to the initiated. Their popular religion consisted in the worship of the sun, moon, planets, and stars, as divinities, after the general practice of the calf. (Job, xxxii. 27.; Dio. Sic. v. 24.) Herod. i. c. 185.; Synes. de Dio. Syr. Pref. c. 3.) From the religious system of the Chaldeans were derived two arts, for which they have long been celebrated, viz. magic and astronomy. Their magic, which should not be confounded with witchcraft, or a supposed intercourse with evil spirits, consisted in the performance of certain religious ceremonies or incantations, which were supposed, by the interposition of good demons, to produce supernatural effects. This astrology was founded upon the chimerical principle, that the stars have an influence, either beneficial or malignant, upon the affairs of men, which may be discovered, and made the certain ground of prediction, in particular cases: and the whole art consisted in applying astronomical observations to this fanciful purpose, and thus imposing upon the credulity of the vulgar. (See Sext. Emp. adv. Math. i. v. p. 159. Dio. Sic. ii. p. 8.) Manilius, l. iv. v. 435. Janulb. de Myer. v. 8. c. 4. Fabr. Bib. Græc. v. v. p. 494. Velleius de Theolog. Gent. l. ii. c. 47.) Upon this supposition, Horace (lib. ii. od. xi. 1.) makes the following favorable reflection:

"Tu ne quaeris (faire nefas) quem mibi, quem tibi
Finem Dom deederint, Lenormand, ne Babylomnos
Tentaris numeros. At melius, quediquid ess, pati."

"All not—'tis impious to inquire—what date
The limit of your life is fixed by fate;
Nor vastly Babylonian numbers try;
But yield the true, to live or die."

The Chaldeans, whilst they were occupied in these and other arts of divination, contributed very little to the promotion of true science. We have scarcely any remains of their astronomical observations and opinions. The lore, related to the latter, is not much to be regretted, as far as we may judge by the following speciments.

According to Plutarch and Vitruvius, who quote Berossus, it was their opinion, that an eclipse of the moon happened, when that part of its body which is delusive of fire returned towards the earth. (Plut. de Pil. Phil. l. i. c. 28. Comp. Eueph. Prep. l. 35. c. 51. Vitruv. l. ix. c. 4.) From the same authority Seneque (Quadr. Nat. l. iii. c. 59.) gives it as a doctrine of the Chaldeans, that when all the planets shall meet in Cancer, the world will be consumed by fire; and that when they shall meet in Capricorn, it will be destroyed by an inundation. They thought the form of the earth to be that of a boat. (Dio. Sic. loc. cit.)

CHALDAISM, in Biblical History, denote certain expressions and modes of expression, derived from the Chaldean language, that occur in the scriptures of the Old Testament. Besides those parts of the Old Testament which are written in Chaldee, viz. the book of Daniel, from the 4th verse of the 2d chapter to the end of the 7th chapter; the book of Ezra, from the 5th verse of the 4th chapter to the 27th verse of
of the 7th chapter; and the 11th verse of the 10th chapter of the book of Jeremiah, there occur in the Hebrew text from single words that are merely Chaldee. Such is the Chaldee word פָּרָשֶׁת, for which is used instead of the Hebrew מָרֵשֶׁת. 12 as in Prov. xxxi. 2. Phil. ii. 12. Such are also בָּשָׂדֵנָם, for the Hebrew בָּשָׂדֵב, from בָּשָׂדֵב, gold, in Isaiah, xiv. 4, and בָּשָׂדֵנָם, in Ps. cxxxix. 17, translated by the vulgar "thy friends," in the Hebrew fruit of the term, but in Chaldee מַנִּית, signifies thought, and therefore most persons render it "thy thoughts." I dependently of these whole words, there are some Hebrew terms, which nevertheless are formed after the Chaldee manner, and on that account are found in the Hebrew. Thus, the plural maSSin nouns in Hebrew terminated in כ, but in Chaldee, and also in Syriac, in כ; as בָּשָׂדֵנָם (Job, xi. 11), for בָּשָׂדֵנָם (Job, xxiv. 22), in Ps. xxxix. 6, life, &c. &c.: nouns also which in Hebrew end in כ, cloe with כ in the Chaldee and Syriac; thus, מַנִּית (Exod. xxvii. 32, and xxxix. 22, for מַנִּית (Ruth, i. 2), for מַנִּית (Ps. cxvii. 7). &c. &c.: the Chaldee מַנִּית occurs (Ezek. xxxix. 30), for the Hebrew מַנִּית, &c. Chaldee affixes are also joined to Hebrew nouns, as בָּשָׂדֵנָם (Ps. cxvii. 8, for בָּשָׂדֵנָם, where the affix ר is used for ר: the characteristic of the conjugations בָּשָׂדֵנָם, and בָּשָׂדֵנָם, which in the Hebrew is כ, is in the Chaldee and Syriac כ: hence מַנִּית (Is. xlviii. 3), for מַנִּית, &c. and the characteristic of the future in Hebrew destroys the characteristic of the conjugation מַנִּית, which is not the case in Chaldee and in Syriac; thus we read מַנִּית (Hos. lii. 11), for מַנִּית, &c. the middle radical of the verbs מַנִּית and מַנִּית is very often changed into כ: thus מַנִּית (Hof. xix. 14), for מַנִּית, &c.; among the Hebrews the preteritic participle, or "Paul," has כ for כ: the penultimate; but among the Chaldeans and Syrians, it has כ, and is therefore called "Pehil," hence מַנִּית (Num. xvi. 5); for מַנִּית, the Chaldee and Syriac join כ to the כ of the gentilicium, thus מַנִּית (Amos, vi. 14), for מַנִּית: for מַנִּית, the Chaldeans and Syrians insert the letter כ in small words borrowed from the Hebrews, e.g. מַנִּית, thou, they make כ: and read כ (Job, xxvii. 2) for כ, &c. See Malelly's Gram. Heb. vol. i. cap. xxiii.

CHALDEE, or CHALDÆIC language, that spraekken by the Chaldeans or people of Chaldeea which was anciently used throughout all Assyria, Babylonia, Mesopotamia, Syria, and Palestine, and is still the language of the churches of the Nestorian and Maronite Christians in those eastern parts. In the same manner as the Latin is the language of the popish churches in the west, the Chaldee is a dialect of the Hebrew, and is nearly allied to it, that is, the forms, names, pronunciation, and divions of the letters are the same; and therefore, this language is easily acquired by those who are acquainted with the Hebrew. See Hebrew.

CHALDEE PARAPHRASE, in the Rabbinitic style is called Targum. There are three Chaldee paraphrases in Walton's Polyglot; viz. that of Onkelos, that of Jonathan son of Uzziah, and that of Jerusalem. See PARAPHRASE.

CHALDEASYGUES, in Geography, a town of France, in the department of the Cantal; 4 leagues S. of St. Flour.

CHALDONE, in Ancient Geography, a promontory of Arabia Felix, near the place where was the ancient mouth of the Euphrates, according to Pliny.

CHALDRON, CHALDOR, or CHALDOUN of coals, a dry English measure, consisting of thirty-six bushels heaped up, according to the sealed bushel kept at Guildhall, London. The chaldron should weigh about 28 cwt. or 3156 pounds. On ship-board, twenty-one chaldrens of coals are allowed to the crew. By act of parliament a Newe chaldren is to weigh 524 cwt. or 3 waggon's of 174 cwt. or 6 carts of 83 cwt. each, making 524 cwt. to the chaldren. The statute London chaldren is to consist of 36 bushels heaped up; each bushel to contain a Winchester bushel and one quart, and to be 15½ inches diameter externally. And as it has been found by repeated trials, that 15 London pool chaldrens are equal to 8 Newe chaldrens, if we reck in 524 cwt. to the latter, we shall have 38 cwt. to the former, or 3136 pounds to the London chaldren. Dr. Hutton found this estimation nearly confirmed by experiment.

For weighing one peck of coals, he found that it amounted to 21¾ lbs. and 4 × 2½ gives 87 lbs. for the weight of the bushel; and 36 × 87 gives 3122 for the weight of the chaldren; to which if the weight of the odd quart be added, or 3 lb. nearly, we shall have 3135 lbs. for the weight of the chaldren, or only one pound less than that which is given by statute. But the chaldren, or chaldren, ultimately delivered to the consumer, is still less than the chaldren in the pool, and hence it appears that the word chaldren conveys very different ideas, and that this confusion in the use of the term must open a door to deception and fraud. The monthly supply of coals for the metropolis is estimated at 300 cargoes, of 220 chaldrens each, or 66,330 chaldrens; and it has been alleged as no improbable supposition, that with some exceptions 50,000 chaldrens, on an average, remain exposed to depredations in open craft on the river all the year round. See Macnab's Letter to John Whitmore, Esq. on the Coal-Trade.

CHALETS, in the Botanical writings of the ancient Arabs, the name of a tree often occurring, and seldom explained. The best account we have of the chalés or chalés, is in the writings of Prosper Alpinus on the Egyptian plants, who tells us, that it is a kind of willow, growing in Egypt and in Mesopotamia. It is probably a species of Eucalyptus.

CHALENECY, in Geography, a town of France, in the department of the Upper Marne, and district of Langres; 13 miles S.S.W. of Langres.

CHALEOS, in Antiqu Geography, a town of Greece, situated in the Gulf of Corinth, in the country of the Locrian Ozoles, according to Ptolemy.

CHALES, CLAUDIUS FRANCIS MILLIET, de, in Biography, was born of an ancient and illustrious family at Chambury, in Savoy, in the year 1621, and belonged to the society of Jesuits.

In early life he applied to the study of the belles lettres, and acquired a considerable knowledge of the Latin and Greek languages; but his favourite studies, and those in which he eminently excelled, were mathematics, mechanics, and alchemy. He was appointed by Lewis XIV. royal professor of hydrography at Marieilles, and he gained great reputation as a teacher of mathematics at Trinity College in Lyons. It was probably on account of his distinguished reputation that the superior of his order appointed him teacher of theology in the same college, for which office he was first qualified than for any other. Charles Emanuel II., duke of Savoy, remarked on this appointment, that it was unwisely made, and that the attention of such a person as Chales should never have been divest d from the cause of study and employment to which he was attached. Accordingly, he was called off from this situation to Paris, where he was engaged for several years in teaching the mathematics. He died at Turin in 167, and the following eulogium was incribed on his monument: "Hic jacet Claudius Franciscus Milliet de Chales, genere, sapientia, virtute notus omnibus; ignotus fidei." His works are "Cursus Mun- dus Mathematicus," first printed in 1674, at Lyons, in 3 vols.
wals. fol. and afterwards in 4 vols. in 1683, by Amati Var- 
cin, who augmented and improved this edition by several 
valuable treatises found among his MSS. To this edition is 
 prefixed an historical account of the progress of mathema-
tical science from the age of Thales the Milesian to the 
author’s own time. De Chalès’s ‘Treatise of Navigation,’ 
and “Refereces on the Center of Gravity,” are much 
effected. See the funeral oration of father Hyacinth Fer-
rierus prefixed to Varinc’s edition.

CHALESTRA. See Chalastra.

CHALETTE, in Geography, a town of France, in the 
department of the Aube, and district of Arcis; 22 miles 
S.E. of Arcis.

CHALEURS, a deep and broad bay on the W. side of 
the gulf of St. Lawrence. From this bay to that of Verte, 
on the S. in the S.E. corner of the gulf is the N.E. fu-
line of the British province of New Brunswick; which 
see.

CHALI, in Ancient Geography, a people of Germany, 
placed by Ptolemy on the eastern coast of the Cimbic 
Cenfenssus.

CHALI, a town of Albania, Phocinia, placed, in the book 
of Joshua, in the tribe of Asher.

CHALIA, a town of Greece, in Boeotia, near Hyria.

CHALIAT, a town of Albania, in the Corduene, situated 
on the bank of the lake Arvissa, at the extremity of the N. 
and W. parts.

CHALICE, the cup or vessel used to administer the 
wine in, in the eucharist; and by the Romanists, in 
the mafs.

CHALIDRIS, Chalidris Nicola, in Ornithology, the 
name given by Aldrovandus and others to Tringa hirundo; 
which see.

CHALIGE, Canal of, in Geography. See Cairo.

CHALIGNY, a town of France in the department of 
the Meuse; 5 miles S.W. of Nancy.

CHALIM, a town of Portugal, in the province of Tras-
los-Montes; 20 miles S. of Braganza.

CHALIM-POU, a town of Chinefe Tarty. N. lat. 
41° 12’. E. long. 121° 54’.

CHALIN, a river of Russia, which runs into the Karfokin 
sea. N. lat. 73° 5’. E. long. 71° 14’.

CHALINAQUES, a town of France, in the department 
of the Cantal; 12 miles N. of St. Flour.

CHALINDREY, a town of France, in the department 
of the Upper Marne, and district of Langres; 5 miles S.E. 
of Langres.

CHALINOS, in Antiquity, the bit, or that part of a 
bride which is put into the mouth of a horse. But it was, 
among the ancient physicians, also used to express that part 
of the checks, which, on each side, is contiguous to the an-
gles of the mouth.

CHALISCUTELI HILLS, in Geography, hills of Hin-
dooflan, which lie between the western desert and the Set-
lege.

CHALISIA, in Ancient Geography, a maritime town of 
Africa, in Libya.

CHALIZA, in the Jewish Customs, the ceremony where-
by a woman who is left a widow, pulls off her brother-in-
law’s fovey, who should epousée her, and by this means is 
allowed to be at liberty to marry whom she please. The 
word signifies extraéel vel exerxe.

CHALK. The colour of this mineral is yellowish white, 
more rarely snow-white, or greyish white; when contami-
nated with iron it has more or less of an ochery tinge. It 
occludes generally in mafs, sometimes disintegrated, or inveting 
other minerals. It is without lustr, is opaque, has a fine 
earthly fracture, and breaks into blunt-edged angular frag-
ments. It stains the fingers, gives a white fileak, and, when 
pure, is very soft, and almost friable. It has a meagre feel, 
and adheres to the tongue. Sp. gr. 2.1. It effervescs vio-
lently with acids. When mixed with iron it is both harder 
and heavier.

In a state of purity, chalk appears to be composed only of 
water, lime, and carbonic acid; but Mr. Kirwan obtained 
from the analysis of a specimen,

Chalk, considered geologically, is among the most recent 
in formation of the several varieties of carbonat of lime. It 
occur in thick beds nearly horizontal, alternating with thin 
layers of frit nodules, and with the same irregularly dispersed 
through its sublunce. It contains in abundance the relics of 
marine organized bodies, such as echinates, glonopitar, pec-
tinites, &c.; and also, not unfruitfully, the hard parts of 
ampelobious and land animals, such as the heads and vertebrce 
of crocodiles, and teeth of elephants.

In beds of chalk are of frequent occurrence in the east and 
the south parts of England, also in the north east of France. 
Chalk is also met with in some of the Damih islands in the 
Baltic, and in Poland.

The uses of chalk are very great. The more compact 
varieties are employed as building-lime, and are burnt to 
quicklime: it is also largely used in polishing metals and 
glass; in converting moulds to cast metal in; by carpenters 
and others as a material to work with, and by harch-
makers and chemists to dry precipitates on.

Chalk, in Agriculture, is a calcareous sub stance, which, 
when pure, is of a white colour, moderate confluence, and 
duly surface; stains the fingers; adheres slightly to the 
tongue; does not harden when heated, but, on the con-
trary, in a strong heat burns to lime, and loses about four-
tenths of its weight. It effervescs with acids, and diffolves 
almo in entely in them. It may also be added, that this 
solution is not disturbed by caullc volatile alkals, as this is 
a circumstnace that distinguishes it from magnesia. It has 
the property of promoting putrefaction. In its native state 
it is useul as a manure, upon the fame principle as lime-
stone; but it is more easily pulverized, and lighter, or more 
porous in its nature. Nearly the whole of this material is 
calcareous earth, whereas none of the marks contain more 
than a fourth part of that subliance. It is in high esteem 
in the more southern counties of England, where it abounds 
very much. Its belt effects are produced upon deep soils 
which contain no calcareous earth. It is observed to have 
but very little effect upon lands where the sublustrum is 
chalk; and if the soil be thin, it does mischief in such cases. 
When used upon light thin soils, it is mostly made into 
composts with earth and dung, or some other similar material. 
When these are well mixed together, and duly proportioned, 
they produce valuable crops; and their influence is said to continue many years, in such in-

The common method of using this sort of compost is 
either by laying it upon fallows for wheat, and mixing it 
intimately with the fall by ploughing and harrowing, or 
upon grafts as a top-dressing: in both cases it has been found 
to answer well; and in the latter it is found capable of de-
stroying mois, rubes, and all coarse aquatic plants that grow
in heavy, four, or wet lands; while, in the former, it opens and pulverizes the soil, and never fails to produce good crops of that grain, or other kinds.

In making use of it, it has been recommended that it should be broken as small as possible. It should be dug from the pit near the end of autumn, and be laid on the land immediately; as at that season the air is generally moist, the moisture will of course be absorbed by the chalk. This will occasion it to swell, and break down into pieces; and if from should come on, it will much accelerate the benefits: but when it is dug in summer, it loses its moisture, and acquires a harder nave, which in a great measure prevents it from being of any use. It should in no cafe be ploughed in till its parts are properly broken down and separated, and then it should be completely harrowed in and mixed well with the foil, or mould of the land.

If the foil be thin and light, a certain proportion of dung will, if it is laid, be useful; but if it be heavy, the dung is affected to lessen the operation of the chalk. It is generally thought that lands which have been completely chalked will not bear a repetition of it for some time. A compost of it, however, may be used to great advantage. In the southern counties a field has been, it is observed, chalked, and divided with chalk and dung mixed, in portions alternately; and the former has been found to produce very bad crops, but the latter very good ones. It is affected, that laid on beyond a certain quantity, it will not only cease to operate as a manure, but even prove hurtful to the land. It ought, therefore, to be used with caution, and due pains be taken not only to ascertain the strength of the chalk, but the quality of the soil on which it is to be laid, before the application is made.

But there can be no doubt that chalk is a lasting manure, when applied on suitable soils; which are those of a cold, four nature, such asdiff untractable clays. Pufyie has remarked, that it was the custom of the ancient Britons to chalk their lands, by which they received a great and lasting improvement in the fertility of them.

In regard to the different kinds of chalk which should be distinguished by the farmer, the hard, dry, and firm foot is much the fittest for burning into lime; but that of the fat and uncouth kind by far the boil to be used in the crude state.

It has been flated that in some parts of Essex they lay from five to eight waggon loads of chalk on an acre, either upon a clover lay while feeding, or on a summer sallow; and that the effect of a very thin dressing of it is seen immediately to an inch, like that of rotten dung, and lasts twenty years, fifteen in good heart. The foil is a loam; they have also a little clay, and no sand, on gravel the effect is but slight. They bring the chalk from Malden, whither it is brought by sea from Kent, and a wagon load costs mostly ten shillings at the quay. It is rather hard, the sharpf root leaves many lumps unbroken; they break with pick-axes. The effervescence with vinegar is pretty consider- able, but in water it scarcely falls at all. It is also a general opinion in that county, that land which has been once chalked will not take it again; they acknowledge, however, that when mixed with earth and dung, it is then excellent. They observe, that laying a slight dressing of chalk and earth, or dung, on a field never chalked, will take so much effect, that the same field will not answer to chalk completely. They observe also, that the chalk pre- sently gives the land a red colour. And they are of opinion, that chalk is a great enemy to good grasses; and affirm, that a field which, before chalkling, will run of itself to a fine head of white clover, no longer does it after chalkling.

There is no saying anything against experience: we should not, however, draw general conclusions from partial experiments. Much of the effect of manures depends upon the soil on which they are laid. About Enfield, as observed in a paper in the Annals of Agriculture, the same chalk does wonders, which at North Mans has very little effect: the one is a rich brown, the other a poor gravel. And near Sandwich in Kent, chalk has been found in a very high degree to improve a sandy soil, giving it tenacity, and totally exterminating that pernicious weed the corn marigold, which is provincially called yellow bottle, tuddle, or golds, and so abundant in sandy soils. They lay on forty loads of forty bullocks each to an acre. Upon pasture land they think it does nothing. In Hertfordshire it is thought that chalk makes the land plough much better, and renders all manures much more effectual.

If a field be divided into parts, one chalked, a second chalked and manured with dung or foot, ashes, &c. and a third dragged or affed without chalk; although chalk alone has no effect, yet the other manure on the chalked part will have a much greater effect than on the part where no chalk is laid. Facts of this sort are highly interesting, but want to be more correctly made.

It has been remarked by the author of the Synopsis of Husbandry, who has had much experience in a district where it abounds, that this manure, though it falls infinitely short of marl in its fertilizing quality, is nevertheless prof- fessed of virtues which defrively entitle it to the ecleem of the farmer. By a proper application of this sublunance, the most tenacious clays are, he says, rendered friable and mellow; and thus their native rubbourness and adhesion being overcome, the several particles of the soil are enabled to im- bile the full benefit of the different changes of the atmosphere; and hence they are brought to work kindly under the several operations of the plough, harrow, &c. and to produce ample crops of grass or corn, which, before the application of this manure, they were incapable of bringing to perfection. So great are the benefits accruing from this manure, when laid on a stiff clayey soil, that the Esfex farmers find their account in freighting barges from the chalk cliffs in Kent, and afterwards carrying it with their teams several miles up the country; all which, though attended with a heavy expense, is found to answer the pur- pose extremely well. As it would, he think, be impossible to reduce these stubborn clays to a proper till without the previous application of this manure. Nor is it on clays only where chalk may be laid to advantage: gravels, especially those which lie near the springs, and all wet soils, may, he supposes, be dressed with this manure, which will never fail to improve the ground, and enable it to re- tain longer the virtues of the dung that may be applied, which, on these hungry soils, is liable to disappear in a short time: nor is so far are some farmers to the use of this manure, that he has known it carried on soils where the chalk lay within a few inches of the surface.

It has been flated, that the action of chalk on the soil is either chemical or mechanical. It acts chemically as an absorbent, contributing to preserve dry thin soils which are poachy and wet; and by its attraction for acids it may halen the putrefaction of vegetables. It acts mechanically, by entering into the composition, and totally altering the nature of clay, converting it by proper pulverization into a species of marl. By insinuating itself between the particles of clay, it destroys their adhesion; thus preventing it from becoming too hard in summer, and too wet in the winter season.

It is observed by Mr. Bamfier that there are two methods of obtaining chalk. The first is by uncalowing a piece of ground,
ground, and making it convenient for a pit, where the carts may be drawn into it, and filled: this is on a presumption that the chalk lies near the surface, and that the pit is within a small distance of the field on which the manure is to be laid. The other method is to sink pits in the field where the chalk is intended to be laid as a manure, and which, in his opinion, is far preferable to that of drawing it in carts as before mentioned. In this case, a number of pits are to be sunk according to the extent of the field. These pits are to be made in the form and circumstance of a well, with an apparatus at the top, and a bucket to draw up the chalk. The people who undertake this business, having been brought up to it from infancy, perform it, he says, with great facility, and without any trouble, though attended with much danger. A person is employed at the top to draw up the contents of the pit, shoot the chalk into the cart, and wheel the same on the land. When the labourer has arrived at the chalk, which takes up a longer or lesser time of interval according to the depth at which it lies, and has dug some little time therein in the perpendicualr form wherein he began the pit, he proceeds to form apertures in different horizontal directions; so that where the chalk is good, and the pit stands firm, large tracts of ground are undermined for this purpose. The price for digging chalk is, he says, 1s. per foot till the chalk be found, after which for the chalk is, per load, which is twelve bushels; and a penny per load for wheeling the chalk on the land, the farmer providing a horse and cart for that purpose. The quantity usually laid on an acre is from eighty to a hundred loads.

From this description of chalk-drawing, he says, "it is evident that much care and circumstancce are required to prevent any deceit being imposed on the farmer by the workmen, to whom their eagers for acquiring large wages, will be a powerful inducement."

He adds, that "the best chalk is that which is white and hard; and the deeper it lies beneath the surface, the more efficacious is the dressing supposed to be, as partaking of the nature of the soil wherein it is to be applied as a manure; indeed, on a clayey soil it is seldom to be met with, but at a considerable distance beneath the surface of the field. The most eligible season, he says, for the performance of this work is in the early part of the winter, as the chalk, which is laid out at that season will, by aid of the succeeding frosts, be, in great measure, meliorated and reduced to crumbs at the time of falling in April; whereas, should the bufnifs be deferred till the spring, no considerable portion of the chalk will remain in lumps till the next winter. From this neglect, a twelvemonth will be lost in point of time, as this manure will lie on the ground without affuring any good purpose till the lumps shall have been flaked by moisture and frosts; and that chalk is always most highly esteemed which yields foundling to the effect of the weather in falling into crumbs. This manure may be laid on the ground in the summer, without any other inconvenience than what has been before mentioned; contrary to the opinion of some people, who think that such chalk, having remained on the surface during the summer months without raining, will, on that account, be less susceptible of the frosts in the succeeding winter: but this idea is erroneous; and as it may often fuft the economy of the farmer to lay this chalk out in the summer, either from a neighbouring draw-pit, having at that time little other employment for two men and horses, or if he may be inclined to sink a pit in the field at that time; in either of these contingencies, the buftains may, he thinks, be safely ventured upon in that season; and it would be far better to furnish the ground, which is thus summer chalked, to be unploughed till the succeeding spring, than to crop it with wheat at the autumn after the manure is applied; for, having enjoyed the benefit of the frosts in the following winter, the ground will come in properly for a wheat sowing in the next year: and this may be generally effected, he says, where a person is inclined to lay on his chalk in the summer. For instance, suppose a lay ground be intended for a fallow the next year, this may be chalked in the summer time, with very little inconvenience or injury to the farmer, as the grofs which would have been produced from it between midsummer and the following spring could have turned to little account."

It is concluded by the same writer, "that when land is dressed with chalk, the surface ought to be pretty thickly covered over, otherwise it will fail to answer the end of pulverization, in which consists the chief virtue of this manure: and though the expense of chalking may appear considerable to those who are unacquainted with its effects, the good consequences according to the future crops will be found in the end amply to compensate the primary charges, and from whatever cause this improvement arises, whether an immediate fertility be conveyed to the soil by the chalk, or whether this dressing acts on the soil by destroying its adhesion, and thus impales it to work more kindly, and to part with its vegetative particles, which were before to clodily united as not to be drawn forth by any other means; in whichever of these ways the chalk acts upon the land it matters, he thinks, very little to the farmer, so that the intention be accomplished, namely, the acquisition of a more abundant crop. For his own part, he is inclined to think that the chief virtue of the chalk resides in its power of correcting the adhesion of stiff soils, and in its meliorating quality, and that it is much better to dung, in point of accelerating the growth of the crop; so that where a field has been well dressed with this manure, which is laid to be of foiling a nature as to fly its good effects at the distance of twenty years, it is by no means to be understood, that this field is not to be dunged, or to have any further addition of manure during this interval; on the contrary, such ground ought never to lose its turn of the dung-cart; and, indeed, on farms of a clayey soil, those fields only can be dunged to advantage which have been previously chalked; for experience hath demonstrated, that, without the application of this manure, dung will be of but small avail on these stiff soils."

It is remarked further by the same practical writer, "that on gravelly soils, where the springs lie within a small distance of the surface, it often happens that the water flows in before the chalk is found, and thus all further endeavours at that spot are rendered abortive, and another pit must be sunk in a different part of the field. Obstacles to this work sometimes, he says, fall out from the light contexture of the foil, which does not unfrequently give way to the deflection of the chalk-drawer. To the farmer, it may be of some consequence to consider the nature of his land, ere he embarks in this scheme of husbandry; as, if from circumstances above-mentioned, he may have reason to think that his pit will not stand firm, it would be a matter of prudence to delist from any further thoughts of sinking a perpendicular pit, and change the mode of operation, by bringing his chalk from an uncalled pit; but where it can be obtained at a moderate expense, and with a tolerable certainty of success, the preceding method is, he thinks, certainly the most eligible. See Calcareous Earth, and Manure."

In the chalking of land, the method pursued in Herefordshire, where the persons employed in it follow it as a trade, is the following: according to Mr. Walker: "a spot is fixed upon, nearly central to about 50 acres of land, to
CHALK.

To be chalked. Here a pit, about four feet in diameter, is sunk to the chalk, if found within twenty feet from the surface; if not, the chalkers consider that they are on an earth pillar, fill in the pit, and in fresh places, till their labour is attended with better success. The work from the surface of the chalk is kept from falling in by a fort of basket-work, made with hazel or willow rods and broomthrush, cut green and manufactured with the small boughs and leaves remaining thereon, to make the basket-work the clover. The earth and chalk are raised from the pit by a jack-rowl on a frame, generally of very simple and rude construction. To one end of the rowl is fixed a cart wheel, which answers the double purpose of a fly and a flop. An inch rope of sufficient length is wound round the rowl, to one end of which is fixed a weight, which nearly counterbalances the empty basket fastened to the other end. This apology for a *asis in perforation*, two wheelbarrows, a fpade, a shovel, and a pick-axe are all the necessary implements in the trade of a company of chalkers, generally three in number.

The pit-man digs the chalk and fills the basket, and his companions alternately wind it up and wheel its contents upon the land; when the basket is wound up to the top of the pit, to flop its deficient till emptied, the point of a wooden peg, of sufficient length and strength, is thrice by the perpendicular spoke in the wheel into a hole made in the adjoining upright standard of the frame to receive it. The pit is sunk from 20 to 30 feet deep, and then chambered at the bottom; that is, the pit-man digs or ruts out the chalk horizontally, in three separate directions; the horizontal apertures being of sufficient height and width to admit of the pit-man's working in them with ease and safety. One pit will chalk six acres, laying 60 loads on a acre. If more be laid on, and to the full extent of chalking, viz. 100 loads, then a proportionable lefs extent of land than six acres is chalked from one pit. Eighteen barrow-fulls make a load, and the usual price for chalking is 7d. per load, all expenses included; therefore the expense of chalking at 60 loads per acre is 1/2. 6d.; and at 100 ditto, 21. 18s. 4d. As the chalk is considered to be better the deeper it lies, and the top chalk, particularly if it be within three or four feet from the surface, very indifferent, and only fit for lime, or to be laid on roads, gateways, &c. the chalkers must be directed to lay by the chalk for the first three or four feet in depth, to be applied to the above purposes; or, if not wanted, to be again thrown into the pit when filled up; and also to pick out the flints from the chalk before it is carried on the land, for, if they are not narrowly watched, they will chalk with both.

It is added, that "Mr. John Hill of Coddicott farms upwards of 1200 acres in the adjoining parishes of Coddicott and Kimpton, a con siderable part of which is his own estate. He has chalked many acres of land, and approves much of the practice. He chalked a field of strong clay land in the autumn of 1792, laid on sixty loads to an acre, and the chalk where the pits were sunk lay about ten feet from the surface. Mr. Walker viewed the field the 7th of August 1794; it had borne a crop of peas since it was chalked, and was then under the plough, preparatory for a crop of wheat. The chalk was good, and the land appeared to work well, though the chalk was not then thoroughly incorporated with the soil. Mr. Hill never lays more than 60 loads of chalk on an acre; this he finds will not only make the land work much better, with lefs strength of cattle, but also, with a light coat of dung, or spring dressings occasionally laid on to quicken the vegetation, produce abundant crops for ten years; he then chalks again with equal success."

"This fort of work should proceed with dispatch during the summer months in all cafes, and in the autumnal ones in many situations where there is no danger of poaching the ground. Mr. Young suggests, that much advantage may be derived, in performing this fort of labours, from the use of small three-wheeled carts, as the third wheel affords a support for the cart and load while filling, without the full horse, and of course one horse may be sufficient for two carts, one being discharged upon the land while the other is loading. See MANURE."

"Chalk stone, in Medicine," a white chalky substance which is secreted in the inflamed joints and fragments in inveterate pain. It is one of the peculiarities of gouty inflammation to terminate by the production of this substance (where it does not end in resolution), and not in suppuration, or the production of pur, like the common species of inflammation.

The chalk-flone (as its name imports) was formerly considered as compos'd of some calcareous matter, and in particular of phosphat of lime; but accurate chemical analysis has now proved that it does not contain lime in any form, but is a neutral insoluble galt, consisting of the lithic or uric acid satured with soda. Dr. Wollaston has proved this point by the following experiments. If a small quantity of dilute fulphric acid be added to gouty chalk-flone, part of the alkali is separated from its combination, and crysyls of fulphat of soda are produced. Muratic acid in a similar way produces common salt. A greater quantity of either acid totally separates the alkali, and leaves an insoluble matter, which is found to be lithic acid by the following characters; viz. when distilled for & it yields a little ammonia, some prufic acid, and an acid insuble similar to the sublimed lithic acid; when distilled in dilute nitric acid, it tinges the skin of a fofe colour, and leaves, on evaporation, a fofe coloured refiduum; when thrown into caufic pot-af it difcolves therein, but is separable thence by an acid. The chalk-flone, when calcined, gives the usual products of animal matter, and leaves a white falt, which is carbonat of soda. Caufic pot-af dissolves the chalk-flone entirely. Boiling water dissolves a small portion of the flone, and the folution is lithat of soda. When a little muratic acid is added to this folution, as it cools it deposits lithic acid in minute crysyls.

The analysis of this concretion by Fourcroy, agrees very closely with that of Dr. Wollaston. M. F. remarks, that a hundred parts of water difcolve nine-tenths of the chalk-flone by boiling, forming a faponaneous liquor, of a faint animal fmall, from which fulphuric acid precipitates brilliant needled crysyls of lithic or uric acid.

To the solubility of these arthritic concretions in the alkalies, chemifts have attributed the great relief often experienced by gouty persons from a course of alkaline remedies long continued; and it certainly remains an interesting question to determine whether this disease is attended with any defect or excess in the natural quantity of uric acid in the urinary secretions. (For a fuller account of the properties of the lithic or Urac acid, see this article) See Phil. Transf. for 1797, pt. 2. Fourcroy Syteme des Connofi. Chim. &c.

CHALKI, in Geography, an island of the Grecian Archipalago, visited by Spallanzani, where he made known the F Turks
Chalking, in the Arts. See Drawing.

Chalking, in our Old Law, seems to be some duty laid on merchandise; what it was particularly we do not find: but in the rolls of parliament it is said the merchants of the staple require to be eaid of divers new impositions, as chalk, carageen, wharfage, &c.

CHALKY LAND, in Agriculture, denotes such sorts of land as are much impregnated with the chalky material, and which from their white appearance are sometimes denominated white lands.

It has been remarked, by the author of the Synopsia of Husbandry, that "chalky lands or soils differ from each other very essentially in point of fertility; for as there are some of them which, by good husbandry, may be brought to produce large crops, and do with great reason take the lead in point of fertility of every other light soil; to there are others which, from the superficial depth of mould over the chalk, are of the most barren species, and scarcely worth the expense of tillage. A chalky soil (says he) with a due covering of mould, so as to admit the plough to enter a reasonable depth, is perhaps the most kindly one to work upon, except a loam, and capable of the greatest improvement from the feudal operations of husbandry; having neither the tenaciousness of the clay, the burning quality of the gravel, nor the extreme porous texture of the sand; as it possesses a much greater share of humidity than the latter soil, free from the inconvenience of springs, so will it be less injured by a dry summer, whilst a moist and dripping season will be most favourable to the crops growing on it, when those on a clayey soil are in that case too frequently destitute or rendered of little worth." And Lord Dundonald, in his Treatise on the connection of Agriculture with Chemistry, remarks, that a pure unmixed chalky soil, like a pure or lean clayey one, is unfertile; and that the fertility of this sort of land, like all others, depends on its containing a due admixture of other earths, with the requisite quantity of vegetable or animal matter. A chalky loam, or mixture of chalk with clay, is frequently a very fertile soil, and well adapted to the culture of beans and wheat.

So, says the writer we have just quoted, "are the advantages attending these soils, where the chalk is not mixed in an undue proportion with the mould: but it rarely happens that a farmer is possessed of any great quantity of land of this description; for, in countries where chalky land abounds, there is on every farm a large proportion of poor land than of that which he has described; and the management of these chalky soils will demand the highest exertion of industry and skill in the husbandman; for although the crops raised on these soils are less subject to be injured by the scourching heat of the sun than those on gravels, yet where there is but a small proportion of mould, so that the chalk forms the greatest part of the cultivated soil, with a bed of the same hard substance for its under stratum, intermixed with large flints and chalk stones, scarce less solid, on such grounds, the crops (he says) will grow greatly in a dry summer, and for this reason, an early Lent leaft or leaf is always to be preferred on these soils, in order that the surface of the ground may be covered before the dry weather sets in." And he adds that "these chalky soils possess another very material advantage over gravels, namely, the power of retaining longer the heat of the summer; and therefore the crops on this soil often recover after a kindly rain, when those on the gravels, unable to withstand the preceding drought, are burnt up; indeed, on a chalky soil, the crops, when injured by the parching heat of the weather, cannot so properly be laid to burn, as to die away. To the evil propensities incident to chalks of every kind, may (he says) be joined their disposition to blight, a misfortune not easily to be guarded against; and in this respect they differ materially from gravels, where the corn generally yields well, if not injured by the dry weather during its growth. To this may be added (he says) another defect attached to chalky soils, which in their billy situation, since a tract of land of 200 acres, it is odds but many of the fields are mountainous and uneven." The ingenuous nobleman just mentioned further remarks, that chalky lands produce a short sweet herbage, and for the most part are more proper for a sheep pasture than for tillage. There are no fields that receive more benefit from artificial watering, as they are apt at certain seasons to be parched by drought. Chalky soils that produce short sweet herbage, should not (he thinks) in general be broken up, or converted into arable lands; a practice which will be attended with injury to the soil, and loss to the farmer, unless they are cropped with moderation, well-manured, and afterwards properly laid down with pasture-grass.

And Mr. Dammler further well observes that "there is one species of grass which may be raised to great advantage on a chalk, and this is fescue, cinquefoil, or holy-grass." The same writer observed that the effect of this grass in the culture of this grass is not natural relation to a chalky soil, the constant demand for the hay at market, and the small charges required in making it, (fays he) all combine to enforce its cultivation on the most barren chalks: which, by any other course of husbandry, could not have been brought to pay the expense of tillage: by these means the farmer will (he thinks) have it in his power to bestow a greater attention on the more fertile part of his land, will require a less number of horses and servants, and will generally infuse to himself plentiful crops of grain from that part of the farm which is kept in constant tillage; whilst the most barren spots will produce a yearly increase from the fescue at a trifling expense in the culture." Chalks are (he thinks) of all other land's least subject to be molested with couch-grass; and hence a person who hath not been accustomed to this kind of land is often deceived on a cursory view of the surface, which being totally free from couch-grass, and not greatly infested with weeds of any denomination, he is led to conceive that the ground is in good heart, and disposed for the reception of any kind of grain; whereas the contrary is often the fact; for a soil of this description, especially the more barren species, which, with a very flight proportion of earth, is made up of a crumby kind of chalk, and when wet wears the appearance of morass, will not naturally produce couch; and perhaps on this sort of ground it would be no easy task to make this grass thrive in it though the experiment were attempted; and even on the best and most kindly chalks, couch-grass is an enemy not to be dreaded. The weeds which form indigenous to this sort of land are poppy, bare-bend, crow-foot, charlock, caddock, or kik, cammock, and thistles. Where the late-mentioned weed prevails it is a manifest indication that the ground is not of itself unfriendly to the growth of corn; and that when the crops turn defective, this proceeds less from any defect in the land, than an imprudent management in the cultivation of it.

In what regards the tillage on this sort of land, (though chalk may, he says, be numbered among the lighter kinds of soil, a much greater strength of horses, he says, is required in the tilling of them, than either on gravels or lands; not only on account of their hilly situation, the superior depth of mould, and of the large hills which are generally to be met with beneath the surface, but from the impenetrable quality of the under stratum, which deadens the depth of the plough, and causes it to work much heavier; to which may be added, the resistance from the roots of the cammock, which
which is so powerful as frequently to obstruct the course of the plough. For these reasons, a six-horse team, on a chalky soil, is of great utility, nor, indeed, can the buffets be advantageously prosecuted with four horses to a plough. Another reason why a more powerful strength of cattle is requisite on this than on any other light foil, is its disposition to hang to the gears; so that in wet weather the plough is increased to nearly double its own weight, by the additional load of mould adhering to it. These are circumstances which do not immediately strike the attention of a farmer, whose knowledge in husbandry has been acquired by working on a kindly loam. On the first view of a chalky foil, he concludes that little strength of cattle is required; for, having been accustomed to land where the surface is much deeper, he rather imagines, that more work may be done, in a given distance of time, with a less number of horses on a chalk than on a loam; of this truth, he is, in his own mind, so thoroughly convinced, that nothing less than ocular demonstration can drive him from his opinion.

Having enforced the necessity of maintaining a sufficient strength of cattle for the tillage of this sort of land, he advises the ploughing it to a good depth, where the surface of the land will admit of the practice; "for on the very light chalky grounds which abound in many places, and of which some parts of every chalky farm consist, this caution is unnecessary;" such land being ploughed with little strength, the plough must necessarily be let to go shallow. But on his other grounds, where there is a thick covering of mould, the farmer, he thinks, will always find his account in ploughing it to its utmost depth, so that the ploughman may feel the point of the share grate on the chalk beneath, without bringing up any part of it to mix with the mould. On this foil the blacksmith is, he observes, a perpetual retainer to the farm. The vicinity of the chalk, together with the number of large flints usually met with on this kind of ground, operating very forcibly in his favour, the eye of the farmer is, therefore, on no occasion more necessary, he thinks, than in a strict and daily examination of the plough-irons, since he may be materially injured either by a too frequent application to the smith, or too great a neglect of him. The point of the share for ploughing chalks to advantage, especially when infested with thistles or cammocks, ought to be hammered to the breadth of four inches, which will tear the roots up at a considerable depth. As these grounds are seldom injured by wet, there is scarcely any part of the year but the plough may be kept at work, save only when the land is locked up by frost, or the surface covered with snow. The breaking up of clover lays in the summer, in order to sow with wheat in the autumn, is often attended with great inconveniences on chalky soils, as the drought of the seafon frequently causes the ground to be extremely hard, so as to render the operation of the plough a matter of great difficulty, and, in some instances, the foil is totally impervious at this season, and must remain to be softened by the autumnal rains. But, in this case, the farmer, he observes, has generally other work to attend, and, therefore, need not suffer his hirsners and horses to be unemployed. But although, for these reasons, there is generally more perseverance required in breaking up a clover lay at Midsummer than at Michaelmas with wheat, than usually falls to the share of a common ploughman; yet the matter ought not to be discouraged, since he will most assuredly reap the good effects of corn sown on a stately furrow, where the land is chalky, and, indeed, on any other land of a light texture."

Where folding is practiced, it is added, that "a very judicious method at the breaking up of a clover lay, is to plough one day's work, which will employ a fold of 300 sheep eight nights; and when that is finished, to plough another day's work, and fold on the same, which course is to be pursued till towards autumn: by this mode the farmer reserves great part of the feed on the lay, which, though not very considerable, is, nevertheless, of some consequence, where a large flock is maintained; and, in truth, without a flock of sheep, little profit can be expected to accrue from the cultivation of these foils: besides which, he avoids the ill effects of ploughing up the whole field at autumn, and fowing it immediately with wheat; as he fupposes, in this case, the greatest part of the field will have been folded on before feed-time, and the remainder may be finished after the corn is sown, or trodden with sheep, both of them influences of a most excellent husbandry. But though there be no folding kept on the farm, this method of ploughing up the clover-lays at Midsummer ought to be pursued for the reason above mentioned: and at this time the farmer is generally at leisure to prosecute this work, having completed his fain-foin harrell and turnip seafon, and not meeting with any hindrance from the flirring of summer fallows, a piece of husbandry which is rarely practiced on these sorts of land."

And "the like method of ploughing should, (he says,) be pursued, in order to obtain a crop of turnips, on a chalky foil, as is recommended on a gravel; and though the land be of a very light texture, and not much infested with weeds, the several operations of the plough, harrow, and roll, ought by no means to be dispensed with, for the reason which is offered in treating of the tilage required on a gravelly foil. On a chalky foil, properly managed for turnips, and where a good crop of this root has been fed off, there need be no fear of a plentiful return of barley or oats, provided such corn be sown at an early period, which is particularly to be attended to at the spring seafon, as the crop of Lent corn on these foils generally fails, if the feed-time be pro-\vthered to late as is usual on loams." And "on this kind of land, (as on gravels, (fays he) the farmer poftfises the advantage of varying his manure as often as he chooses; having, besides yard dung, which may be layered a general dressing for every foil, the whole tribe of manures, except chalk, to select from. For wheat, there is no application so efficacious as the foil, which, when properly conducted, rarely fails of increasing the crop. For turnip ground, dung, mould, rabbit dung, woollen rags, &c. may be laid on to advantage; and to further the growth of clover, laintoifin, and meadow grafts, coal ashes, foot, and malt duit, are very proper applications: of these the two last, if sown over the green wheat in the spring, or harrowed in with the barley at the time of sowing that grain, are excellent substitutes for the more laiting kind of manures, where these cannot be procured in a sufficient abundance."

It has been remarked by lord Dundonald, that clay is the fittest sub stance to be applied with a view to alter the arrangement of the parts of a chalky foil. Peat is a good application to lands of this nature, which are frequently termed hungry foils, and very deficient in vegetable matter. And as a sufficiency of dung is not to be procured to manure fully every part of a farm, peat may be applied in one or other of the ways of preparation mentioned under that head. See Peat. Unfortunately for the improvement on chalky foils, fays he, neither clay nor peat is to be found but at the extremities or outskirts of the extensive tracts of chalky countries; but wherever they are to be had, the application of them should not be neglected. Calcareous chalky lands, which have long been under the plough, contain a large proportion of phosphat or oxalate of lime. These insoluble saline matters may, he fays, be rendered serviceable to vegetation by alkalies, vitriolic acid, vitriolic neutral.
chals, (especially if supercatted), and by pyritos and aluminous suffusions. Even green vitriol, which has hitherto been considered as unfriendly to vegetation, will, when applied in a proper manner to lands like this, considerably improve and promote the growth of paturage-gras. More experiments are, however, wanting fully to ascertain the utility of these chemical suffusions on grounds of this as well as other kinds. The principal disadvantage, says he, attending chalky lands, is, that of their being too dry and parched at certain feasons: but possibly this defect, when they are under paturage, may be counter-balanced by the more early gras they produce in the spring, as well as the luxuriant herbage that succeeds the autumnal rains.

It has been remarked, that the bell produce of the grain kind, in chalky lands, is harby and wheat; but oats will likewise do well on them. Their natural produce in weeds is poppies, May-weed, &c. For gras-feeds, fain-tom, trefoil, and, if rich, clover. The bell manure for these lands is rags, dung, folding of sheep, &c. as has been seen above. In these lands, if rain happen to fall on them just after flowing, before the corn gets up, it will frequently cause the earth to bind so hard, that it cannot get through it; but may be much helped by a light harrow, or other means of a similar nature. In breaking uplands of this nature from gras, too great a depth of furrow should, in moist cafes, be avoided.

Under the clas of chalky lands, a very large proportion of the grounds of this country may, it is observed, be comprehended.

The Hertfordshire farmers manage these lands for grain in the same manner as they do their clay-lands; but in Oxfordshire they commonly manure them with half-rotten dung, which, they say, prevents the binding of it; and some mix it with land which causes it to work short, especially if in any degree dry. They commonly further them with wheats, millet, and harby; and, after wheat, peas, or vetches: in doing of which they are obliged particularly to take care to have fine weather, because of the lands binding so greatly. See Soil.

Chalky Soil, that sort of land which is principally constituted of chalky materials. Soils of this nature abound very much in different parts of the kingdom. See Soil.

Challans, in Geography, a town of France, in the department of the Vendee, and chief place of a canton, in the district of Los Sables-d'Olonne; 7 leagues N. of it. The place contains 33,000, and the canton 10,902 inhabitants; the territory includes 2025 kilometres and 9 communes.

Challant, a town of Piedmont, in the duchy of Astia; 11 miles E.S.E. of Astia.

Challenge, a cartel, or invitation to a duel, or other combat. The word challenge was anciently translated commanx. It may very properly be called a provocation or summons to fight, when an affront in derogation of honour has been offered.

Challenges to fight either by word or letter, or bearing such challenges, are punishable by fine and imprisonment, according to the circumstances of the offence: and barely endeavouring to provoke another to send a challenge, or to fight, as by differiting letters full of reficktions, and inflaming a desire to fight, &c. is a high offence. (1 Hawk. P. C. 125. 138.) and if challenges arise from gaming, the offender shall forfeit all his goods to the crown, and be imprisoned two years. 9 Ann. cap. 14.

It is now the customary and frequent practice of the court of King's Bench to grant informations against perons leading challenges to justices of the peace, and in other leinous cafes.

Challenge, in Law, is an exception taken either against perons or things: in the former milance, against jurors, any one or more of them; and in the latter, as in the case of felony, by the prisoner against things, as a declaration, &c. Terms de la ley, 169. The former is the most frequent signification of the term.

Challenge to the jurors, is either made to the array, or to the poll to the array, as when the whole number is excepted against, as partially impanelled, or arrayed in the panel, or little square pane of parchment, on which the jurors' names are written. If the tithiff be of affinity to either of the parties; or if any one or more of the jurors are returned at the nomination, or under the direction of either party, or for any other partiality, the array shall be quashed. To the polls, or in capite, as when particulars are excepted against, as not indifferent. These may be challenged. 1. Proper honora reoletum, as when a lord of parliament is impanelled. 2. Proper delictum, as in the case of an alien born, which is defect of birth; or of a slave or bondman, which is defect of liberty; or in case of insufficient eleft. This latter exception has undergone several alterations by different statutes: but by 4 and 5 W. and M. cap. 24. the qualification is 10l. per annum, in England, and 6l. in Wales, either of freehold or copyhold lands: and by 3 Geo. II. cap. 25. the holder of a lease on life or lives, or for the term of five hundred years absolute, of the clear yearly value of 2ch. per annum, over and above the rent reserved, is qualified to serve on juries. 3. Proper affiction, or on infiction of partiality: and this kind of challenge is principal or to the favour; in the former case the cause of infiction is obvious, as, that a juror is of kin to either party within the ninth degree (Finch, 1. 401.) that he has been arbitrator on either side; that he has an interest in the cause; that an action is depending between him and the party; that he has taken money for his verdict; that he has formerly been a juror in the cause court; that he is the party's master, servant, counsellor, steward, or attorney, or of the same society or corporation with him: and in the latter case, when only some probable circumstances of infiction are pleaded, which are to be determined by triors. 4. Proper delictum, or on account of some crime, which disqualifies the juror, by affecting his credit, as conviction of treason, felony, perjury, or conspiracy; judgment of the pillory; branding or whipping, outlawry or excommunication; attaint of false verdict, or forgery, &c.

Challenger to the jurors, is also divided into challenge principal, and challenge per caufe: i. e. upon cause or reason alleged.

Challenge principal, otherwise called challenge peremptory, is what the law allows without cause alleged; or farther examination: thus, a prisoner at the bar, arraigned on felony, may peremptorily challenge twenty, one after another, alleging no cause but his own dislike; and they will be set aside, and new ones chosen in their room. 22 Hen. VIII. cap. 14. and 1 and 2 Ph. and Mar. cap. 10. This privilege of peremptory challenges, distinguishing the tenderness and humanity of the English laws, though granted to the prisoner, is denied to the king by Stat. 33 Edw. I. fl. 4. which enacts, that the king shall challenge no jurors without alleging a cause certain, to be tried and approved by the court. However it is held that the king need not aflign his cause of challenge, till all the panel is gone through, and unless there cannot be a full jury, without the persons so challenged. And then, and not sooner, the king's counsellor shall move the cause: otherwise the juror shall be sworn.
2 Hawk. P. C. 413. 2 Hal. P. C. 271. In case of high-
treason, no challenge peremptory was formerly allowed; but
by flat. 7 W. III. liberty is given peremptorily to challenge
thirty-five.

Yet there seems to be a difference between challenge prin-
cipal and challenge peremptory; the latter being only in mat-
ters criminal, and without any cause alleged; the former
mootly in civil cases, and with affixing some such cause, as
being found true, the law allows: v.g. if either party al-
lege, that one of the jurors is the son, brother, confin, or ten-
ant of the other, the exception is good. Also in the plea
of the death of a man, or in any action real or personal,
where the debt or damages amount to forty shillings, it is
a good challenge to a juror, that he cannot dispense forty shil-
lings per annum of freethold.

Challenge is also a term given or applied to an objection
made to a member of a court martial on the score of either
real or presumed partiality. The prisoner, however, must
in this case aijign his reason for or cause of challenge, of the
relevancy, propriety, and validity of which the members are
themselves the judges. Peremptory challenges, then, though
pracfished and admitted in civil cases, are not acknowledged
by military law, or allowed at courts martial. The privi-
lege of challenging is enjoyed equally by the prisoner and
the prosecutor.

Challenge upon reason or cause, is when the party does
allege some such exception as is insufficient upon acknowled-
gement of the truth of it; v.g. if the son of the juror have
married the daughter of the other party, or the like.

Challenges to the polls, or exceptions to particular jurors,
seem to answer the "recusatio judicis," in the civil and ca-
non laws; by the constitution of which a judge might be
refused upon any suspicion of partiality. By the laws of
England, also, in the times of Eacot and Flet, a judge
might be refused for good cause; but now the law is other-
wise, and it is held that judges and justices cannot be chal-
lenged. (Co. Litt. 204.) For the law will not suspend a
possibility of bias or favour in a judge, who is already sworn
to administer impartial justice, and whose authority greatly
depends upon that presumption and idea. And though the
fact at any time prove flagrantly such as the delicacy of the law
will not procure before-hand, there is no doubt but that
such misbehaviour would draw down a heavy censure from
those to whom the judge is accountable for his conduct.

CHALLENGE, in Hunting. When hounds, at first finding
the scent of their game, presently open and cry, the hunt-
men say, "they challenge."

CHALLIN, in Geography, a town of France, in the de-
partment of the Maye and Loire; 5 leagues W. of Ang-
ers.

CHALONNOIS, the name of a small country of
France before the revolution, in the environs of Chalon-sur-
Saone.

CHAL'O, a river of Asia, which rises near Lasa or Bara-
tols, in Tartary, passes through the province of Yunnan in
China, the country of Laos and Touquin, and discharges
itself into the gulf of Cochlin-China, in the Eastern sea, op-
posing the island of Hainan.

CHALONER, Sir Thomas, in Biography, a learned
writer and foreign minister in the reign of queen Elizabeth,
was born in London about the year 1545, and educated at
Cambridge, where he distinguished himself by his talent for
Latin poetry. Having been sent by Henry VIII. in the train
of the ambassador to Charles V. emperor of Germany, he
accompanied that prince in his unfortunate expedition
against Algiers, where he was shipwrecked and narrowly ef-
caped drowning, by keeping hold of a cable with his teeth,
many of which he lost on the occasion. On his return, he
became a favourite of the regent, duke of Suffolk, and
in consequence of his distinguished valour at the battle of
Muirburgh, he received the honour of knighthood. When
his patron was disfaced, and during the reign of queen
Mary, he lived in retirement; but on the accession of Eliza-
beth, he was appointed by the interest of Cecil, ambassador
to Flanders, emperor of Germany; and having acquired
great reputation in this office, he was sent in 1561 in a simi-
lar capacity to Philip, king of Spain. In this mission he
encountered several difficulties, which, notwithstanding the
relief derived from literary occupations, occasioned a lot of
ficknss that obliged him to request his recall; and this he
is said to have obtained by addressing the susceptible heart
of Elizabeth with an elegy written in the fyle of Ovid. Upon
his return towards the close of the year 1564, he publisht
the first part of his principal work "On the right ordering
of the English commonwealth." But his constitution was so
much impaired, that he died in October, 1565, at his house
in Clerkenwell Clofe; and as he was equally great in arms,
science, and arts, he was much lamented, and his funeral
was honoured by an interesting and affectionate attendance
at St. Paul's cathedral; Sir William Cecil officiating as chief
mournier. He was no less distinguished for his talents and
soundness of judgement, than for his literary endowments.
Of his writings the principal are, that already mentioned,
which, in its complete form, was printed at London in 1579,
40, under the title of "De Republica Anglorum inflau-
randa, lib. x.;" and a collection of his poletical pieces en-
titled "De Illiusqne quodam Encomium Miscellanea

CHALONER, Sir Thomas, a philosopher and technical
chemist, was the son of the preceding by his wife Ethel-
reda, born in 1559, and educated under the care of lord
treasurer Burleigh, first at St. Paul's school, and afterwards
at Magdalen college, in the university of Oxford. At college,
though he took no degree, he established his character for
abilities and learning. About the year 1580 he visited sev-
eral parts of Europe, and particularly Italy, where he pro-
longed his stay, and professed many curious inquirys in
natural philosophy and chemistry, together with a variety of
experiments. On his return home some time before the year
1584, he was much noticed at court for his polite behaviour
and accomplishments; and about this time married the
daughter of Sir William Fleetwood, recorder of London, by
whom he had severall children. In 1591 he was knighted;
and some years afterwards discovered the first alum mines
•which were ever known to be in this kingdom, on his estate
near Gilborough in Yorkshire. As during his foreign travel-
•es he had paid particular attention to the alum works at
Putchol or Pozzol, he found means to introduce that pro-
ductive manufacture into England, much to the advantage of
his country. The discovery of a mine in England was made
about the year 1600, and for rendering it practically useful,
workmen were brought from foreign parts; and at this period
it was adjudged to be a mine-royal, and was taken possi-
fion of by the crown. It was then granted to Sir Paul Findar,
at a rent of no less than 1,740 pounds sterling; nevertheless
the undertaking proved extremely lucrative. By the long
parliament it was voted to be a monopoly, and the alum
works were restored to their original proprietors. In the
latter end of queen Elizabeth's reign, sir Thomas Chaloner
visited Scotland, and was favourably received by king James;
so that in 1603, he was entrusted with the education of
prince Henry. He was likewise confidentially employed by
queen Anne. By a second wife he had children, to whom
he is said to have left a considerable estate in Buckingham-
shire. He died on the 17th of November, 1615, and was bu-

CHALONITIS, in Ancient Geography, a country of Asia; the most southerly province of Assyria. It extended along the left bank of the Tigris, S.W. of mount Tagros, which separated it from Media. It is said to have derived its name from the town of Chala; and the inhabitants were called Chalonites. This province, from its situation, was at all times the seat of war between potent empires and nations; and it is now become a desert, excepting some few small spots that may be cultivated about the inconsiderable towns which stand within its borders.

CHALONNE, in Geography, a town of France, in the department of the Mayne and Loire, and chief place of a canton in the district of Angers, situated near coal-mines; 4 leagues S.W. of Angers. The place contains 4922, and the canton 15,885 inhabitants; the territory includes 115 kilometres and 13 communes.

CHALONNE, an island in the Loire, a little below the town of the same name, about 3 miles in length, with a village.

CHALONS-sur-Marne, or CHALONS, a city of France, and capital of the department of the Marne; before the revolution, the see of a bishop, suffragan of Rheims, and chief place of the marsh of Champagne; situated between two fine meadows on the river Marne, containing 13 parishes, and partlysubject to its manufactures of flannels and coarse woollen cloth. The place contains 11,120, and the canton 15,503, inhabitants; the territory comprehends 260 kilometres and 16 communes. Chalons, or Duro-Catalaunum, afterwards Catalauni, formerly made a part of the territory of Rheims, from which it is distant only 27 miles. It is famous for a battle between the Romans and Attila, king of the Huns, in which the former, after an obstinate and furious combat, in which the number of the slain amounted, as some say, to 162,000, or, according to other accounts, to 300,000 persons, proved victorious, and Attila was obliged to retreat. At Chalons there is an academy of sciences, arts, and belles-lettres. It is 40 miles S.W. of Verdun, and 95 E. of Paris. N. lat. 48° 57', E. long. 4° 52'.

CHALONS-sur-Saone, a city of France, in the department of the Saone and Loire, and principal place of a district, seated on the river Saone, and, before the revolution, the see of a bishop, suffragan of Lyons. It is surrounded by walls, and defended by a citadel. It is the staple of iron for Lyons and St. Etienne, and of wines for exportation, which, as well as corn and wood, form its principal commerce. The city contains the Old Town, the New Town, and the suburbs of St. Lawrence. In the first is the court of justice, a modern structure, the cathedral, and the hotel-de-ville. The great Roman way from Lyons to Boulogne passed by Chalons; and it exhibits various traces of Roman magnificence, particularly the ruins of an amphitheatre. N. lat. 46° 47', E. long. 4° 57'.

CHALOSSE, a small country of France before the revolution, in the environs of St. Sever.

CHALTAPITES, or CHALPETES, in Ancient Geography, a division of Sufiana, according to Ptolemy.

CHALTARON, in Geography, a town of Aisa, in the country of Thibet; 10 miles W.N.W. of Coucha.

CHALVANCA, or CHUMBIQUELAS, a town of South America, and principal place of the jurisdiction of Chumbi-Vilecas, in Peru.

CHALUS, a town of France, in the department of the Upper Vienne, and chief place of a canton in the district of

St. Yrieux; 15 miles S.S.W. of Limoges. The place contains 1204, and the canton 274 inhabitants; the territory includes 227 3/4 kilometres and 7 communes. At this place Richard I. of England received a mortal wound, which he was reconnoitring there, previously to an assault for the purpose of recovering a treasure withheld from him by the vicount of Limoges.

CHALUS, in Ancient Geography, Kous, a river of Aisa, in Syria. Xenophon reports, that this river was full of large fishes, which the Syrians regarded as gods, and carefully preserved. It had its springs in the mountains W. of the town of Zefzina, ran S.W. to Chalybon, and from thence S. till it discharged itself into a lake, on the banks of which was built the town of Chalae. Xenophon places it at the distance of 25 leagues from the defile which lay between Syria and Cilicia.

CHALYBEATES, in Medicine. A chalybeate medicine is one in which iron or steel (chalybs) is a principal ingredient. See Iron (in Medicine).

Chalybeate waters form a very large and important class of mineral waters, which will be more fully described under the article Waters, mineral. It will be sufficient here to observe, that there are two principal classes of chalybeate waters; the first, those in which the iron is held dissolved by the carbonic acid; and, the second, those in which the sulphuric acid is the solvent. The former class is by far the most frequent. Of these, some waters contain little other foreign, and no other medicinal ingredient than the carbonic of iron, of which kind is the Tunbridge water; but others contain several neutral purging salts, of which the Cheltenham spring is an example. In all, the iron is totally precipitated in the form of a yellow light ochre, by boiling for a few minutes. The chalybeate waters holding the fufphat of iron generally can be traced to some pyritic source, and very often also contain fufphat of alumine. They are more alluring to the taste than the former, and the oxyl of iron is only partially separable by boiling, which therefore forms a ready test to distinguish the two species.

The chalybeate waters are found to be highly valuable medicines, though the actual quantity of iron taken in the usual doses is much smaller than in any other form in which this metal is given.

CHALYBIANS, in Ancient Geography, a people of Scythia, who are said to have derived their name from Chalybs, the son of Mars. Others say, that they were so called from their iron manufactures. Strabo is of opinion, that they were the same with the Alyzonians, mentioned by Homer, and that the poet either wrote Chalybes, or that the inhabitants were originally called Alybians. If so, Homer leads us to imagine, that they were as famous for their silvers, as they were, at that time, for their iron mines. They occupied that part which lay between the Taucitans and Scythimans. Diodorus Siculus calls them Chalybes; and they were the most valiant people the 16,000 Greeks in Xenophon's retreat had to encounter with. They were fierce and warlike; equally able to engage on the plains as on the mountains; they followed the Greeks all the way through their country, and terrified annoyed them on their march. This powerful nation extended itself to other parts, and occupied part of Fontus, which lay between Armenia Minor, the Macedons, the Mosynaeans and Tiberians. Their country was mountainous and barren; but furnished abundance of iron, which the inhabitants manufactured, and which, besides supplying their own wants, afforded a considerable article of commerce. In the time of Xenophon, this country was much reduced, and the Chalybiians were subject to the Mosynaeans. But in more ancient times it extended...
extended beyond the boundaries above-mentioned, between Amillus and Sinope, and comprehended a considerable territory on this side of the Halys. The Chalybes were the last people subject to Cretus. See Herodotus, l. i. c. 28.

CHALYBIANS, an ancient people placed by Pliny in Africa, in the Trogodite territory.

CHALYBYON, a considerable town of Afia, in Syria, situated in the midst of a large plain, on the bank of the river Chalbus, N. of Chalicia. See Aleppo.

CHALYBYONITIS, a country of Afia, in Syria, which extended from Cælesteria to the Euphrates, and which was so called from Chalbyon, the only city contained in it worthy of notice. Some supposing Chalep to be an abbreviation of Chalybyon, conclude Aleppo, Chalpe, and Chalbyon to be the same city; but Chalbyon is placed by Ptolemy at the 3d degree of latitude and 715 of longitude, and consequently far south of the present Aleppo.

CHALYS, now Cabe, a river of Spain, the banks of which were occupied by a people called Chalches, according to Justin. The waters of this river were reputed to give an excellent temper to cattle.

CHAM, or KHAN, the title given to the sovereign princes of Tartary.

The word, in the Persian, signifies mighty lord; in the Scholastic, emperor. Sperlingius, in his Dissertation on the Danish term of majesty, koning, king, thinks the Tartar term cham may be well derived from it; adding, that in the north they say kom, kommen, konge, konning, &c.

The term cham is also applied, among the Persians, to the great lords of the court, and the governors of provinces.

M. de Peyflellet, in his Strictures on Baron de Tott's Memoirs (i.e. vol. ii. p. 187.) observes, that no such word as cham exists; the true orthography being Khan. It is not, he says, a title exclusively assumed by the sovereign of the Tartars, since the Turkish emperors take it likewise. Of this the Ottoman money is a sufficient proof, the legend of which is "Soultan ibn el Soultaan Abdulhamid, Khan damel mukhows," i.e. Sultan, son of Sultan Abdulhamid, Khan, whose reign be everlasting. The title of Khan is certainly equivalent in figurisation to that of Shah, which means king; and yet the most absolute Persian monarchs, who have never assumed any other title than that of Shah, have permitted the governors of provinces in their empire to take that of Khan. Even in our time the governors of the provinces of Guendja, Guilan, Mazanderan, &c. who have no more authority in Persia than the Pachas in Turkey, take the title of Khan.

CHAM, in Geography, one of the provinces of Cochinchina.

CHAM, a town or parochial village of Swifferland, in the Canton of Zug, on the S. side of the Lake of Zug.

CHAM, or Chamb, a town of Germany, in the circle of Bavaria, seated on the Regen, at its confluence with a river called Ampl or Kamp; 84 miles N. of Saltzburg.

CHAM de Couca, a town of Portugal, in the province of Estremadura; 6 leagues N. of Thomar.

CHAMA, in Conchology, a genus of shells. The Chama are of the bivalve order, and are distinguished by having the shells rather rude or coarse; the hinge with a callous gibbosity, obliquely inflected in an oblique hollow: anterior slope of the shell clefted.

Vulva clavia abhyne nymphis. Linn.

The animal inhabitant of these shells is of the Tethys genus, having the body furnished with two small apertures on the left side of the neck: the body rather oblong, flabby, without peduncles; and the mouth with a terminal cylindrical proboscis under an expanded membrane or lip.

CHAMA cory. Shell roundish and smooth; beaks recurved; anterior slope with a gaping fissure.—Tegula sulcatus, latiusculus; rima bians, Linn.

This shell when full grown is about the size of a large orange. It inhabits most of the seas in the S. of Europe, and is rarely discovered as far northwards as the British isles, one or two instances only of its having been found in our seas are on record. Donovan. Brit. Shells. The French call it Coeur de beuf, in allusion to its general figure, which bears some resemblance to that of a bullock's heart. The English collectors distinguished it by the name of heart Cockle.

When in high perfection, this shell is of a delicate cream-coloured white, tinged and varied with pale reddish, and tawny; and is covered with an epidermis of a dusky brown colour.

CHAMA gigas. Shell plaited, with arched scales; posterior slope gaping.—Tegula plicata fornicata; fymonosia; ano bians, Linn. Chama fymonosia, Rumpl., Indrīciata, Argyn.

There is much propriety in the specific name gigas assigned by Linæus and other naturalists to this shell, for it is very much larger than the rest of the Chame, and indeed of a size very far superior to any other of the tawny-coloured productions heretofore discovered. Shells of this species weighing from one hundred to one hundred and thirty or forty pounds the pair are not very unusual; such occur in most public museums of Natural History in Europe. One individual of the Chama gigas is recorded by Conchological writers that weighed five hundred and thirty two pounds, including both the shells and the animal; and the latter was so large as to furnish one hundred and twenty men with food for a meal, and strong enough by the sudden collapsing or snapping its valves close, to cut asunder a cable rope, and lop men's hands off. This enormous species inhabits the Indian seas. Those of the largest size we are acquainted with, are whence they are occasionally brought as objects of curiosity into Europe, and kept as ornaments in gardens. During the early part of the last century they were in much request for the decorations of fountains, grottoes, and reservoirs of water, especially in Italy, the more modern Italians emulating in some manner the classic style of the ancients. This gigantic shell was perfectly familiar to the poets, and sculptors of antiquity; Venus is said to have ridden in one of them from the bottom of the sea, an allegory in itself extremely beautiful, and which has afforded matter for several of the most exquisite compositions of ancient, as well as modern artists; the former is obvious in a variety of remains of ancient sculpture, and of the latter we need only instance one, Barry's insuperable picture of "Venus rising from the sea," the impromptu and sublime effect of which is recent in the mind of every admirer of the modern arts. On gems and cameos of antiquity, Venus under various characters, Amphitrite, Doris, and other goddesses and nymphs in the train of Oceanus, frequently appear upborne upon the waves, or driving through the foaming billows in a chariot formed of the chama shell.

CHAMA antiquata. Shell somewhat heart-shaped, grooved longitudinally and ribbed transversely. Linn. &c.

A native of the American, Atlantic, and Indian seas. This shell is inequilateral, and is marked with brown or ferruginous spots; the ribs are from nineteen to twenty-two in number; the margin of the shell toothed; beaks inflected; back; anterior margin with a deep closed fissure.

CHAMA hippus. Shell plaited, muriuated; posterior slope
flopa rectue, closed, and toothed.— *Chama hippopus*, Linn. *Chama japonica* obliqua, Rumph. *Folium japonica*, Argent. This is a broad, and towards the beak gibbus hend, of a white or whitish colour variegated with spots of red, or sometimes purple, and very rarely yellow, and at the hinge are yellow calibrishes. The size is varies, but seldom exceed six inches from the beak to the margin, and nine inches in breadth; commonly one fourth less in size inhabits the Indian Ocean.

*Chama trapezia*. Shell trapeziform, gibbus, with longitudinal crenated grooves. Müll. *Zool. Dan*. A native of the Norway seas. This is of a gibbus form, about the size of a pea, of a white colour mixed with brown towards the margins, which last are crenated; the hinge nearly twenty in number ragged with unequal obtuse knots; beaks rather recurved; posterior slope ovate, heart-shaped, the anterior slope oblong, flat, and crenated on the outside. Schroth. Gmel. &c.

*Chama seminoricula*. Shell somewhat orbicular, compressed, coarse, with slight crenation each other. Linn. &c. This shell is longitudinally crenated and imbricated with scales; posterior slope with a whitish lobe; hinge margin crenated. Country unknown.

*Chama calicava*. Shell oblong, with imbricated grooves; anterior part recte. Gmel. &c. *Fefon*, Adamson. Found in the Atlantic, American and Indian seas. The colour is white, or when young, inclining to brownish; hinge with two teeth; exterior margin serrated, interior smooth.

*Chama graphiensis*. Shell orbicular, imbricated; one valve rather flattened, the other with a somewhat spiral produced beak. Linn. &c. *Concha rugata*, Rondel. *Jataon*, Adamson. Inhabits the Mediterranean, American, and Indian seas, where it occurs affixed to rocks. Authors enumerate six or more varieties of this shell, the colours of which are variable, as yellow varied with reddish or white, red varied with yellow and white, or white varied with red and yellow. The scales also in some specimens are more foliaceous, and sometimes are arched and imbricated.

*Chama couda*. Shell heart-shaped, and tranversely fricated; one side elongated and compressed. Linn. Inhabits the Red and Indian seas. Colour ferruginous, or chestnut. Ohé, Chama reineformis of Kowr is considered as a variety of this shell.

*Chama folia*. Shell subround, with toothed grooves intermixed with dots; posterior slope recte. Gmel. Native place unknown. Shell white, reddish on the outside; grooves elevated, longitudinally toothed, and alternately shorter; margin crenulated; posterior slope heart-shaped.

*Chama oblonga*. Shell oblong, the anterior part angular, with acute teeth in front. Linn. Inhabits the shores of Guinea, where it is scarce; it resembles mytilus modius; the shell is somewhat daphnous, white, with very fine irice crenating each other; the colour within citron; margin very entire; hinge with three middle teeth and an oblong acute lateral one bucking into a hollow between two teeth on the opposite valve. Figures by Chemnitz, T. 7: 50.

*Chama latavus*. Shell imbricated, with jagged lamellae; beak a little spiral obliquely. Linn. — *Placenta foliacea*, Argenville. Adheres to rocks. This shell is yellow, or white, with red beaks, and glabrous within; the upper valve is rather less and flatter than the lower, and in the hinge of the latter is an obtuse, thick, broad callosity crenated on each side, with an oblique contiguous hollow. A native of India.

*Chama bicornis*. Shell with conic valves, and horn-shaped oblique tubular beaks longer than the valve. Gmel. This bears a great affinity to *Chama gr. japonica*; colour in general yellow, and red or white on each side, with imbricated lamellae. Inhabits the Indian and American Oceans, and also the Mediterranean sea.

*Chama arcuata*. Shell grooved, muricated, with excava-

d dotted; hinge with a feble callosity. Gmel. Breadth two inches and nearly the same in length; colour white with some yellow, almost yellowish; margin crenated; posterior excava large, heart-shaped. Watery, wrinkled, with an appendage commonly on one side. A native of the American Ocean, but is rare.

*Chama mollissima*. Shell obtusely triangular, equilateral, plaited; anterior slope elevated, with oblique plains and friz. Chemnitz, &c.

This species, which is about the size of a hazel nut, resembles *Chama Cor*. It is milk-white and opaque; the beaks rather dilatant; hinge with a rounded narrow tooth under the beaks, and an adjoining hollow for the insertion of the tooth in the opposite valve; anterior to this is another long deep hollow between two teeth, and a little further back another round dilated tooth. Country unknown.

*Chama concamerata*. Shell with transverse wrinkles crossing the broad longitudinal sike: in the middle of each valve within an additional chamber. Walch. Gmel. &c.

This is a shell of small size, whitish, and very rare. Inhabits the American Ocean.

*Chama foliacea*. Shell white, with foliaceous ferrated transverse friz, the interfaces crenated; beak recurved. Gmel. Inhabits the Mediterranean, American and Indian seas; it is said to be found in fulli flate in Campania & France, but the latter is probably distinct although nearly allied to Chama foliacea.

*Chama arenicula*. Shell rounded, white undulated with brown; ribs triangular, perpendicular, and wrinkled; margin unequal. Bonn. Found on the shores of Syria.

Chemnitz supposes it may be of the Cordium instead of *Chama genu*.

*Chama circa*. Shell roundish, ventricose, inequivalve, and muricated with scattered unequal feble spines. Regenf. Conch. This is of a citron colour, and inhabits America.

*Chama thaca*. Shell roundish, longitudinally fricated; posterior slope recte. Gmel. &c.

Described in Molina’s Natural History of Chili as a native of the Chillee shores, where it buries itself in the sands. The shell is white violet and yellow on the outside, within elegant purple; diameter about four inches. The animal rich and agreeable food.

*Chama rugosa*. Shell somewhat orbicular, and very deeply sulcate; the wrinkles slightly imbricated; margin doubly folded. Linn. Mant.

This is about the size of a man’s finger, gibbos, and thick, with thirty grooves; the outer margin with concave prominent projections from the wrinkles, the inner margin obtuse plaited; hinge with two or three oblique grooves declining towards the anterior side. Native country unknown.

*Chama graphica*. Shell oblong, with a lateral oblique depression or hollow: callosity of the hinge dentated. Linn. Mant.

Reminisces Anomia gryphi. This species inhabits Barbary; the shell is ponderous and thick, about the size of a frit; beaks obliquely curved backwards; anterior slope longitudi-

**Chama alpitopha.** Shell cylindrical, white, diaphanous, with decurrent frize, the transverse frize arched and imbricated. Chama. Country unknown.

**Chamaedeas, in Military Language, a conference or parade.** Bittert la chamaede, is to beat a parade, or to make a signal by beat of drum, for a conference when any thing is to be proposed. This signal is sometimes made by found of trumpet, as well as by beat of drum. When the besieged are hard pressed or reduced to extremity, they beat the chamaede; and when either the besieged or besiegers will for a truce or short cessation of arms, for the purpose of withdrawing their wounded, or burying their dead, or of any reconciliation, whatsoever, they beat the chamaede: the besieged on the part of the rampart retire to the attack, and the besiegers at the most advanced part of their approaches.

**Chamaeleon, or Cameleon, in Zoology, a small and curious animal of the lizard tribe, celebrated from the remote days of classical antiquity, for the facility it was imagined to possess of changing its colours at pleasure, and affording to that of any situation, or object near it. In the Linnean system of animals it stands in that particular tribe of the Lacerta (see article Lacerta), which have the feet furnished with five toes, some only of which are connected, and the tail short, rounded, and incurved; the Chamaeleontes of Gimlin. The French naturalists, as Bronnart and Lapecepe, separate the chamaeleontes from the lacertae, and constitute a new genus of this natural tribe of animals, under the name of camele, cameleon, in which they include fix different varieties or species, as will appear in the sequel. The only kind of Chameleon with which the ancients seem to have been acquainted, is the common sort found in India, 3 G Africa,
Africa, and the hotter parts of Europe; as for instance, Portugal and Spain. This is specifically distinguished by the cinereous colour of the body, and the head being flat. Of this species there are two, or more, tuppotted varieties, or, as the French writers believe them, distinct, though very analogous species. One of these varieties has the body white, which is the Chameleon candidus of Laurenti; and another, Chameleon capitée preprens, has the head of a remarkably large size: this last is described by Dr. Parsons in the Philosophical Transactions for 1765. Besides these, the Chameleon mexicanus of Laurenti is considered only as a variety. Linnaeus was induced to admit all the different races of the chameleon tribe as varieties of this individual species; in the Gimelian edition of the Systema Naturae, the two kinds, Africans and Pumida, are very properly removed from the former, and described as distinct.

The general length of the common chameleon is about ten or twelve inches, measuring from the tip of the nose to the beginning of the tail; and the tail is nearly of a similar length. Its figure and proportions are uncouthlyingular. The head is large, flat above, and of a subtrigonal form: the posterior part of its body seems crumpled, and the legs ill-flapen and long. Its motions are flow, except when in the act of climbing trees in search of its prey, which consists of insects, when it ascends and descends with some facility, by means of its legs, which are well adapted for climbing, while at the same time it never fails to secure its hold more firmly by coiling its tail round the smaller branches. When it walks on the ground, it moves with a ludicrous air of gravity and circumvolution, in a regular and even pace, which it will not haleen, even at the approach of danger. The fecundity of this animal is supposed to be very great, being, from the flow of its motions and mode of life, incessantly exposed to the attacks of voracious birds, serpents, and various other animals, without any means of defence, and being yet found in vast numbers in the countries they naturally inhabit. The term of this animal's life is unknown; it breeds well in hot countries. Even in Lower Egypt, and on the coast of Barbary, when the weather is not very hot, the chameleon seems to lose its ordinary share of activity, and oftentimes, in the winter season, they are found in those parts concealed under heaps of stones, where they are overpowered by the cold in a perfectly motionless state, without being asleep. The Africans and Indians regard the chameleon as a most useful animal; they see them enter their habitation with pleasure, and endeavour as much as possible to domesticate them, the chameleon devouring mosquitoes, ants, and a host of other winged insects, with which they are tormented.

The chameleon by the power of poiffles, like mistress of the amphibia, of inflating its lungs, and retaining the air for a considerable time, can alter the appearance of its body at pleasure; sometimes appearing of a plump or fleshy aspect, while at other times, upon expelling the air from the lungs, and keeping them in a collapsed state, the whole animal assumes the mottlark and incredible aspect imaginable. At such times the skeleton seems scarcely more than covered with a thin skin, the back bone and ribs becoming distinctly visible on each side under the contracted skin. This inflation affects not only the body, but also the legs and tail, the tendons of which may be clearly traced in its extended flaithe through the skin. When thus put out, the animal can remain to for the space of an hour or two, or even so long as six hours, the parts being vividly inflamed, but the compression being exerted gradually, and thus by an almost insensible feeling of the parts, the dilated animal assumes the meagre condition before related. The skin in every part of the animal is of a granulated structure, the granules differing in size on various parts, from that of a small pin's head to the diameter of the tenth of an inch, or more, especially about the projecting parts of the head and jaws, and on each side of the belly. Down the back is a series of obsolete dentations, forming a furcate ridge from the head to the base of the tail, and decreasing in size towards the latter. The foot consists of five toes each, the anterior pair have the two outward toes united together by a common skin, and the three inner ones connected in a similar manner; the reverse of which is observed in the foot of the posterior legs, those having the three outer toes, and the two inner ones, connected.

The mouth is wide, and the bones of the jaws denticulated, so as to represent small teeth. Elliott mentions these effuse dentations, and lumping they could be of no service to the creature in eating, since it inhbits on flies, which it swallows whole, flies which must be interred by nature for its defence, and gravi already, that by means of these the chameleon holds a flock of flies in its month to prevent its being swalloved by serpents! The tongue is of a very extraordinary form, being composed of a white fold, flecked about ten inches long and three broad, round little flattened towards the end, hollow, and open, somewhat like the end of an elephant's probosces. This tongue is fastened to the os hyoideum by means of a sort of trunk, shaped like an intine, six inches long, and a line broad, having a membrane without, and a nervous sublimane within, which is solid and compact, though folt, and not easily divisible into fibres. This trunk serves to call out the tongue, which is fastened to it, by extending it, and to draw it back by contracting it, which motion it is enabled to perform by a kind of cartilaginous flucus, to which its innervating membrane is attached, and over which it is plated like a flat flack floting on the leg: this flaplus is an inch long, and takes its origin from the middle of the base of the os hyoideum, as in the tongues of several birds, and a number of blood vessels are distributed over it. This tongue is finel adapted for the purpose of seizing its prey, which consists of insects, forming a middle body with a diated and somewhat tubular tip, by means of which the animal seize them with the greatest effect, and partly covers the mouth in eating, as the tongue, neck, or the woodpecker, and retracting it inflammation with the prey secured at the tip. The structure, form, and motion of this creature's eyes are very peculiar: they are remarkably large, being nearly half an inch in diameter, of a spheric form, and projecting in the living animal half of their diameter: there are covered with only a single eye-lid or skin, pierced in the middle with a small hole, through which the bright and vivid pupil appears, surrounded by a golden yellow iris. The eyelid is granulated like the rest of the animal, and the fore part of the eye is attached to it in such a manner that the eyelid follows all the motions of the eye. The motions of the eye are not less singular than its structure, since it can turn them so as to see whatever passes either far backwards, on either side, or directly behind it, without at all moving the head. Sometimes one of these eyes will move while the other is at rest, or turn forwards while the other is directed backwards; or upwards, while the other is turned downwards. By extending the skin of the orbit crofs-ways, the chameleon can close its eyes, the holes then becoming a longitudinal sifure. The brain is extremely small; the heart is also small, truncated at the tip, and furnished with large ariucks, especially the left. The lungs are very large when inflated, and divided into several facetual subdivisions.

The Promethean-like faculty of the chameleon, to charge
its colour, has excited curiosity in all ages. That it depended in a very considerable degree on the will of the animal to exert this power was too apparent to be denied; but in what manner this effect was produced and operated on the frame of the chameleon was reserved for the investigations of later naturalists to determine with competent accuracy. Senecio stated it was effected by irritation; Salmons, by reflection; and others, as the Cartilagines, by the different disposition of the parts that compose the skin, which gave a different modification to the rays of light. Kircher ascribes the change of colour in the chameleon to the power of imagination in the animal, because it loses it when dead. Dr. Goddard attributes it to the grains in the skin, which, in the several postures, he thinks, may show several colours, and when the creature is in full vigour, may have, as he terms it, rationem speculati, or effect of mirrors, and reflect the colours of the bodies adjacent. That the colours are not by any means determined by surrounding objects, has been the aim of late observers to demonstrate; that they change with frequency and rapidity is admitted, but it is not true that they are influenced by the colour of any object in contact with it. The changes of colour which this animal exhibits vary according to the state of its health, the temperature of the weather, to age or sex, and a variety of other subordinate circumstances, all which tend to operate a change in the variable aspect of this singular creature. These transitions consist chiefly in the alternation of the chameleon's natural green, or bluish-grey of the skin into pale yellowish with irregular spots and variegations of dull red; or dusky inclining to black in. The epidermis of this animal is transparent, the skin beneath yellow, and the blood of a lively violet blue. The transitory combination of these colours therefore becomes apparent externally when the blood of the heart is impelled to the surface of the skin and the extremities, changing to violet, yellow, blue, and green, in a variety of hues as the blood circulates near the superficials. When the animal is sick it turns to a greyish dirty yellow, or brownish, like a decayed leaf, this being the true colour of the skin when the blood is withdrawn; but expose him to the rays of the sun, the genial heat revives and invigorates his whole system, and setting the blood, before torpid, in motion towards the skin, the violet and bluish prevail again, and by their intermixture with the yellowness of the skin the green will also re-appear. Return him again into the cold, the blood is withdrawn from the surface of the skin inwardly, and these colours, which depend on the immediate presence of the blood, will naturally fade away. Thus it happens also, that the colours of the chameleon are pale in the night time, or in the dark, as Opfonsville and Golbery have drawn. The same effect, and depending on the same causes as in the chameleon, is also observable in the lizard called Lacerta bullata by Gmelin and Linnaeus, with this difference only, that the transitions of colour are not so decidedly evinced as in the chameleon; but this latter animal which, exposed to the sun's shine is of a clear green, changes to a dusky blackish green, or yellowish, and in the cold to grey blending into brown; this animal, like the chameleon, possessesthe faculty of impelling its blood to the surface of the skin, or withdrawing it, and by that means of varying its tints at pleasure. The same circumstances are to be remarked in a still less degree in several other animals of the lizard tribe.

Chameleons have been sometimes brought alive into this country. In the year 1780 a specimen of this animal was kept in a living flate for some time in the company of apothecaries' physic garden at Chelsea, which, though, in a comparatively sickly state, exhibited those transitions of colour from bluish-ah to green, or yellowish spotted with brown before mentioned. Several chameleons have been preserved alive at different times in Paris. One of these afforded the French Academicians a favourable opportunity of investigating the manners and structure of this curious animal. The refits of their inquiries are interesting, and serve to throw considerable light upon the history of the chameleon. The following passages in particular seem to merit particular attention. "The colour of all the eminences (say those writers) of our chameleon, when it was at rest in the shade, and had continued a long time undisturbed, was a bluish grey, except under the feet, where it was white inclining to yellow, and the intervals of the granules of the skin were of a pale and yellowish red. This grey, which coloured all the parts exposed to the light, changed when in the sun; and all the places of its body which were illuminated, instead of their bluish colour, became of a brownish grey. The rest of the skin, which was not illuminated by the sun, changed its grey into several bluish and yellowish colours, forming spots about half a finger's breadth, reaching from the crest of the spine to the middle of the back; others appeared on the ribs, fore legs, and tail. All these spots were of an isabella colour, through the mixture of a pale yellow, with which the granules were tinged, and of a bright red, which is the colour of the bottom of the skin, visible between the granules: the rest of the skin not enlightened by the sun, and which was of a paler grey than ordinary, resembled a cloth made of mixed wool; some of the granules being greenish, others of a minute grey, and others of the usual bluish grey, the ground remaining as before. When the sun did not shine the first grey appeared again by little and little, and spread itself all over the body, except under the feet, which continued of the same colour, but a little browner; and when in this state the company handled it, there immediately appeared on its shoulders and fore legs several very blackish spots about the size of a finger nail, and which did not take place when it was handled by those who usually took care of it. Sometimes it was marked with brown spots, which inclined towards grey. We afterwards wrapped it up in a linen cloth, where having been two or three minutes, we took it out whitish; but not so white as that of which Aldrovandus speaks, which was not to be distinguished from the linen on which it lay. Our which had only changed its ordinary grey into a very pale one, after having kept this colour some time, lost it intenably. This experiment made us question the truth of the chameleon's taking all colours but white, as Theophrastus and Plutarch report; for ours seemed to have fuch a disposition to retain this colour, that it grew pale every night; and when dead it had more white than any other colour; nor did we find that it changed colour all over the body, as Aristotle reports; for when it takes other colours than grey, and dignifies itself to appear in disguise, as Ælian pleasantly says, it covers only certain parts of the body with them. Lastly, to conclude the experiments relative to the colours which the chameleon can take, it was laid on sublimes of various colours, and wrapped up therein; but did not take them as it had done the white, and it took that only the first time the experiment was made, though it was repeated several times on different days. In making these experiments, we observed, that there were a great many places of its skin which grew brown, but very little at a time; to be certain of which, we marked, with small specks of ink, those granules which to us appeared the whitest in its pale flate; and we always found that when it grew browned, and the skin spotted, those grains which we had marked were always less brown than the rest."

The popular error, of the chameleon living on air alone,
is thought to have arisen from the long abstinence which this animal can occasionally support; influences having, it is said, occurred in its palling several months without any apparent nourishment. This, though affected by respectable writers, is contradicted by the observations of the ingenious Somni, who, during his travels in Egypt, had an opportunity of ascertaining this circumstance, and actually did humble some pains, as appears from his writings, to determine this point to his satisfaction. It is now well known (says Sommi) that the changing of the colours in the chameleon is not to be attributed to the objects presented to them; that their different affections increase or diminish the intensity of the tints with which the very delicate skin which covers them, is, as it were, marbled; that they are not satisfied with nourishment to substantiate as; and that they require more light, aliments, and swallows like and other objects, and that, finally, the marvellous stories which have been told respecting this species of lizard, are merely a tissue of fictions which have disgraced the science of nature down to this day. I have preferred some chameleons, not that I was tempted to repeat the experiment of Cornebius le Brunn, who, after having gravely affurred us, that the chameleons which he kept in his apartment at Smyrna, lived on air, adds that they died one after another in a very short space of time, but I wished to satisfy myself to what a point they would sublimate without food. I had employed every precaution to prevent entirely their having any without ceasing to be exposed to the open air. They lived thus for 20 days; but what kind of life? From being plump as they were when I caught them, they soon became extremely thin. With this good plight they gradually lost their agility and their colures; the skin became livid and wrinkled; it adhered close to the bone, so that they had the appearance of being dried before they ceased to exist.

We shall now enumerate those species of the Linnean lacerta, which approach to near the common chameleon as to have been confounded with its varieties.

**African Chameleon. Lacerta africana.** Gmel. *Le caméléon d'Afrique,* of the French writers, is specifically distinguished by being of a blackish color, and having the crown of the head carinated. *Chamaeleo ex Africe coloris nigricantia, at pedine allo fayera dorson constans*, Sch. This, according to Sch., is from the coast of Barbary, and is the largest chameleon known; along the back to the end of the tail, runs a pure white stripe bounded by a blackish border or band; the rest of the animal is variegated with pale eumiceous undulations. In manners this resembles the last, and all the prominent parts are white.

**Little Chameleon. Lacerta panida.** Gmel. With the body bluish on the sides, and marked with two yellowish lines. *Le Caméléon panida* of Bosc and others. *Chamaeleo Promotorii Bone Spei, caralco alboucolo carumoris inflar cruciatus* of Sch. This kind inhabits the Cape of Good Hope, and has the head more flat than the former, though still elevated towards the middle part, and has the margin on each side denticulated. The body is of a bluish color, marbled or variegated with white.

Besides the common chameleon, *Le Caméléon commun,* and the two last-mentioned species, the French admit three others as species of their genus cameleon; *Le Caméléon du Sénégal*, *Le Caméléon du Cap de Bone-eferance,* and *Le Caméléon Fourchu.* The first, or Senegal chameleon, is smaller than the common chameleon; the helmet or head-piece is elliptical, and flat above; and the denticulations on the back and carina are less prominent. That from the Cape, the second species, has the head-piece almost flat above, with a line of large tubercles behind each eye; and the denticulations of the back and ridge of the collar are more dispersed and are not continued so far under the belly and the tail. *Le caméléon fourchu* is certainly a very distinct species from the rest. This has the muzzle advanced or projecting and terminated in two lengthened compressed processes. The top of the head is flat, and is denticulated in its outline. In size and general aspect it resembles the common chameleon. *T.* is was brought from Java, and was figured by Bronnian in the French *Bulletin des Sciences,* and is repeated in Latreille's recent *Hist. Nat. des Reptiles.*

In the year 1669, Claude Perrier published a work entitled "Descriptum Anatomiae du Caméléon." "Précéd., Differtatio de V. c. incre., seu martapus imed Chamaeleonis," &c. by Hopke appeared in 1681; and in 1707, "Differtatio de Chamaeleonis," by Brongniard. Besides the, and the works before mentioned, there are none of material interest on the chameleon. The paper by Dr. Paron in the 38th volume of the Philosophical Transactions entitled "An Account of a particular Species of Chameleon," appeared again in French as the "Relation d'une Espèce particulière de Chamaeleonis," (Journ. de Physique) but contained nothing new. "Nachricht von einer beolander gattung des Chamaeleons," and "Beschreibung eines Chameleons," are tracts upon the same subject.

**Chameleon, Mineral, in Chemistry,** a sublimate produced by subjecting one part of black oxyd of manganese to ignition in a crucible with three parts of pure nitrat of potash, until the mafa eakes fusing, and affumes a dry earthly appearance. If a portion of this powder be put in a glass containing clear pump-water, the fluid becomes fitt green, then violet, afterwards reddish, and at last again totally discoloured: the metallic oxyd falling then to the bottom with a black colour. But if it be preserved in a bottle quite filled with boiled, dibiled water, and well stopped, the green colour lasts longer, changes gradually to blue, and a yellow ochreous oxyd of iron precipitates. To explain these changes of colours, it may be observed, that the nitre is decomposed by the calcining heat, and alkaliized by the loss of its acid; that the black manganese oxyd is brought by ignition to the state of a mere imperfect oxyd, and that, therefore, its alkalic solution may appear blue. But as the black oxyd of manganese contains some admixed oxyd of iron, the blue colour of the solution is changed into a green by the yellow tint of the oxidised iron. The oxyd of iron sulfides by repole, and then the blue colour re-appears. The manganese oxyd absorbs again, by degrees, more oxygen from the atmospheric air; it affumes, therefore, a brown red tinge, becomes at last back, and precipitates at this period. *Gren's Principles of Modern Chemistry,* vol. ii. p. 420.

**CHAMELEONTES,** one of the families into which late writers separate the lizard or lacerta tribe. The Chameleonae are *Lacerta chameleon, Africana* & panida. See Lacerta.

**Chameleonum in Botany,** Barr. See Linum catharicum.

**Chameleum canariense,** Morif. in Botany. See Cheysanthemum fruticosum.

**Chameleum alpinum,** Bauh. Pin. — *paludum* & montanum, Barr. See C. alpinum.

**Chameleum alpinum abrotani folio,** Vail. See Anthemis montana.

**Chameleum inodorum**, Morif. Rai. See C. inodoreum.

**Chameleum inodorum**, Eauh. Pin. See Anthemis aurofia.

CHA-MA-HI, in Geography, a town of Asia, in the island of Formosa. N. lat. 22° 10'. E. long. 12° 8'.

CHAMAILLER is to light against an enemy armed cap-a-pe.

CHAMAILLERE, in Geography, a town of France, in the department of the Puy-de-Dôme, and district of Clermont; 1 mile S.W. of Clermont.

CHAMANA, in Ancient Geography, a country of Asia, in Cappadocia, according to Ptolemy.

CHAMANIM, in the Jeviyh Antiquities, is the Hebrew name for that which the Greeks call pyreia, or pyrætis t & St. Jerom in Levit. (ch. xxv. 70.) has translated somalthebra, in Isaiah (ch. xxvii. 9.) delabra.

These chamanim were, according to rabbi Solomon, idols exposed to the sun upon the tops of houses. Aben Ezra says, they were portable chapels or temples, made in the form of chariots in honour of the sun.

What the Greeks call pyreia, were temples consecrated to the sun and fire, wherein a perpetual fire was kept up. They were built upon eminences, and were large enclosures, without covering, where the sun was worshipped. Herodotus (lib. i. p. 87.) and Strabo (lib. xvi.) speak of them; and the greeks, or worshippers of fire, in Persia and the Indies, have still these pyreia. Strabo says, that in his time there were many of these temples to be seen in Cappadocia, consecrated to the goddess Astart, and the god Hamman. Astart is, in all probability, the moon, and Homanus the sun.

The word chamanim is derived from chaman, which signifies to warm. Calmet.

CHAMARANDE, in Geography, a town of France, in the department of the Seme and Osie, and district of Étampes; 5 miles N.N.E. of it.

CHAMARIM, a word mentioned in several places of the Hebrew Bible, and generally translated the princes of the idoles, or prigs dressed in black, because chamar signifies black or blackfu.

Camar, in Arabic, signifies the moon; Isis is the same deity. Grotius thinks the Roman prigs called camilli, came.
CHAMA, in *Ancient Geography*, a people of Lower Germany, placed by Ptolemy to the south of the *Bruttii*. M. d'Anville places them N.E. of the *Tenterrii*. They occupied the parts adjacent to the Rhine.

CHAMAZI, in *Geography*, a town of France, in the department of the Mayenne, and district of Château-Gontier; 4 miles S.W. of it.

CHAMBE, a town of Armenia; 120 miles S.E. of Erivan.

CHAMBER, in *Architecture*, a member of a lodging, or piece of an apartment, ordinarily intended for sleeping in; and called by the Latin *cubiculum*.

The word comes from the Latin *camera*; and that, according to Nicoll, from the Greek *kampos*, vault or curse; the term *chamber* being originally confined to places arched over.

A complete apartment is to consist of a hall, antechamber, chamber, and cabinet.

As to the proportions of chambers, their length should be to the breadth as 15 to 1, or some small matter less; but ought never to exceed that proportion; and, as for the height, it should be three-fourths of the breadth. The height of the chambers of the second story, should be a twelfth part less than the height of those below: thus, if the height of the first story be fifteen feet, that of the second will be fourteen feet eight inches. As to the height of the third story, it should be only three-fourths of the second.

In building bed-chambers, regard should be had as well to the situation of the bed, as to that of the chimney. For which reason, the chimney ought to be placed just in the middle, but distant from it about two feet, or two and an half, in order to make room for the bed, which prevents this inequality from being discerned. See Bed-Chamber.

CHAMBER MUSIC, compositions for a small concert-room, a small band, and a small audience; opposed to music for the church, the theatre, or a public concert-room. See Music of Camera.

CHAMBER, privy.—Gentlemen of the Privy-Chamber are servants of the king, who are to wait and attend on him and the queen at court, and in their directions, groffes, &c.

Six of these are appointed by the lord-chamberlain, together with a peer, and the master of the ceremonies, to attend all ambassadors from crowned heads in their public entries. Their number is fifty.

Their institution is owing to king Henry VII. As a singular mark of favour, they are empowered to execute the king's verbal command, and without producing any written order; their person and character being deemed sufficient authority.

Mr. Pegge (in his *Curialia*, 4to. 1783) has a dissertation on the original nature, duty, &c. of the king's most honourable privy chamber. From this we learn, that the most ancient mention of "gentlemen" of the privy-chamber, is said to be in the *Liber Niger dominus Regis Anglie*, in the time of Edward IV. They are called "esquires of household," in number 40; of 20 of them to be continually at court, in riding and going, at all times, and to help to serve his table, &c. A salary was appointed of 7d. daily, while in waiting, and clothing winter and summer, or else 40s. The salary, afterwards enlarged, was taken off, early in the reign of James I., from which time the office appears to have been merely a post of honour. It is conjectured their title was changed from "esquires of the household" to that of gentlemen of the privy-chamber, in the reign of Henry VI., or early in that of Henry VIII. "From being anciently near, and almost," says Mr. Pegge, "companionable officers to the royal person, they are now become the most remote, and seldom visible in their proper sphere, and scarcely distinguishable as such, above thrice in a reign." As no salary or emolument whatsoever attends the post at present, it may be asked, why it is so much sought after? The answer, as Mr. Pegge, observes, is very easy, and almost in omnium aere. "It is an exemption from serving the office of sheriff, and also from an arrest, without leave first obtained, together with other like immunities belonging to the royal servants."

CHAMBER, in *policy*, is used for the place where certain assemblies are held; also for the assemblies themselves.

Of these there are various kinds; some established for the administration of justice; others for matters of commerce, &c. Of the first kind among us was the

**Star-Chamber.** See Court of Star-Chamber.

**Chamber, Imperial,** is a court or jurisdiction held anciently at Spires, but since transferred to Wetzlar; in which are determined the differences arising among the princes and cities of the empire.

It was at first amulatory: in 1473, it was fixed to Augsburg, then removed to Frankfort on the Maine, and thence to Worms, in 1495; where a diet was held by Maximilian I., in which period some have referred the institution of the Imperial Chamber; poffeiling supreme jurisdiction to judge without appeal in every question brought before it, and established with these powers, in order to terminate the right of private war: afterwards it was removed to Nuremberg, and Ratisbon; again to Worms and Nuremberg; and from this last to Ellingen; thence, in 1527, to Spires; where Charles V. rendered it dentary, in 1530; and here it continued above a century and a half. It is now fixed at Wetzlar.

At its first institution by Maximilian, it consisted of a president, who was always a nobleman of the first order, one of 16 afflors, or judges. The president was appointed by the emperor, and the judges partly by him, and partly by the states, according to forms which it is here unnecessary to describe. A sum was imposed, with their own content, on the states of the empire, for paying the salaries of the judges and officers in this court. In consequence of the reformation, the number of afflors was increased. By the treaties of Weilphalia, particularly that of Olmaburg, in 1648, it was decreed, that the Imperial Chamber should be composed of a Catholic judge, and four presidents, named by the emperor, two of each religion, and 50 counsellors, 26 of whom are Catholics, and the red Protestant. But this chamber has been since reduced to a much smaller number of officers, being composed of the Elector of Trier, who is judge as bishop of Spires, of one Catholic and one Protestant president, and eight Catholic and seven Protestant counsellors. This court takes cognisance of all questions concerning civil right between the states of the empire, and passes judgment in the last resort, and without appeal. To it belongs likewise the privilege of judging in criminal causes, which may be considered as connected with the preservation of the public peace. Although the sentences of this, and also of the Aulic council, are final, there are, nevertheless, some cases in which the parties may appeal to the emperor, and
and demand a revision of the process, particularly in those cases which regard to doctrines, principalities, counties, and other immediate rights of the empire. In both those tribunals the emperor presides as sovereign judge, and when he is present, pronounces sentence; and in his absence, he, who represents his person as judge, has a right to wear an imperial regalia as a badge of his dignity. Processe in the Imperial Chamber are almost endless, on account of the infinite number of ceremonials and formalities with which they are embarrased. This court is frequently absent from its person, for fear of exposing its awards to some disfigure: the princes sometime not permitting such to be executed as clipeate them.

Chamber of accounts, a sovereign court in France before the revolution, where accounts were rendered of all the king's revenues; inventories and accounts thereof registered; oaths of fidelity taken, and other things relating to the finances transacted. The French had also Chambres, es officiels, which judged, by appeal, of differences arising on the taking of tithes: of these ecclesiastical chambers there were nine: viz. at Paris, Bourdeaux, Rouen, Lyons, Toulouse, Bourges, Pan, and Aix: they mutually consified the archbishop of the place, as president; other archbishops and bishops, a deputy of each of the dioceses, and three counsellors of parliament. The chamber chose as many counsellors out of the clergy as it thought proper; as also a promoter.

Chamber, apostolic, at Rome, is that wherein affairs relating to the revenues and domains of the church and the pope are transacted.

Chamber of audience, or grand Chamber, a jurisdiction that subsisted in every parliament of France. At the first institution of their parliaments, there were two chambers, and two kinds of counsellors; the one the grand chamber for audiences, the counsellors whereof were called jugurs, who only judged; the other the chamber of inquiry, the counsellors whereof were called rapponteurs, who only reported the processe by writing.

Chamber, direction, is a court instituted in Old Spain, for the regulation of divers affairs relating to their commerce to the Spanish West Indies.

Chamber of the edict, or My-port, was a court established by virtue of the edicts of pacification, in favour of those of the reformed religion wherein the number of judges of either religion was the same; and to which recourse was had in all affairs wherein any of the protestants were concerned. This chamber is now suppressed.

Chamber of London. See Chamberlain.

Chamber of alliances, in France, denoted a society of merchants and others, established by a decree of the council of state in 1658, for conducting the business of fermenting; but in Holland, it regulates a court of justice, where causes relating to insurances are tried.

Chamber of bookellers, in Paris, denoted a society consisting of a syndic and assistants, elected by four delegates from the printers, and twelve from the bookellers, whose business it was to suppress and regulate the trade of printing and selling books, prints, &c. In the Visitation of books, performed by at least three persons of the society, all letters against the honour of God, and the welfare of the state, and all books printed in violation of their regulations and privileges, were suppressed.

Chambers of commerce, are assemblies of merchants and dealers, where they treat about matters relating to commerce. Of these there were several, established in most of the chief cities of France, by virtue of an act of the 30th of August, 1701. Indeed there were some before this general establishment, particularly one at Marseille, and another at Dunkirk.

Chambres of the king, regie camera, in our old records, are used for the havens or ports of the kingdom.

Chamber, in French, chamber, of a battery, in fortification, is a dry place sunk under ground, and secured against rain or mole, for holding and preserving powder, loaded shells, and fuses.

Chamber of a mine, is, strictly speaking, the place where the powder is lodged for springing it with. There one end of the fascines, by means of which the powder in the mine is fired, terminates. There are mines, that have only one chamber; and there are others that have several. The chamber of a mine has a platform (ceiling or top) of strong planks, supported on four upright timbers or poles, behind which planks are also fixed, for fmitting up the sides and preventing the earth from tumbling down. A mine is sometimes excavated into the form of a parallelepiped, but generally into a re sembling that of a cube; and it is not, perhaps, improper to observe, that there should not be any vacant or open space left in it, or any vent communicating with it, for would occasion a great diminution of the effect of the powder employed for springing the mine.

Chamber of a port, is that part of the basin of a port, which is the most retired, and of the least depth, and to which disarmed or dismantled vessels are carried in order to be repaired.

Chamber of a cannon, in Military Language. See Cannon.

Chamber of a mortar, is the place which contains the charge of powder. The chambers of mortars are of various and very different forms as well as dimensions, for an account of which see the article Cannon.

Chambers, iron, in a Fire-flop, are ten inches long, and 3½ in diameter. They are breeched against a piece of wood fixed across the ports, and 1st into another a little higher. When loaded, they are almost filled with horn powder, and have a wooden tompon well driven into their muzzles. They are primed with a quick match thrust through their vents into the powder, with a part of it hanging out. When the ship is fired, they blow open the ports; and the port-huds either fall downward, or are carried away, and thus give vent to the fire out of the sides of the ship.

Chamber of a lock, in Inland Navigation, is the space within the gates, through which a boat rises or sinks, from one level to another of a canal or river. See Plate of Canals, V. fig. 30 and 37.

Chambers of the eye, in Anatomy, are those spaces in front of the eyeball, which contain the aqueous humour.

The anterior chamber is the interval between the posterior surface of the cornea, and the iris.

The postfere chamber is the interval between the uvea and the front of the crystalline lens. For a further description of these, see Eye, anatomy of.

Chamberdekins, in our Old Statutes, a denomination for certain Irish beggars, which by statute 1 Hen. V. cap. 7 and 8. were to leave England within a certain time. They were called in the statute chamberdekyne, and said to be clerics mendicants. Blount says they are called chamberdekins in the parliament-roll.

Chamberet, in Geography, a town of France, in the department of the Corrèze, 15 miles N. of Tulle.

Chamberlain, an officer who has the management or direction of a chamber.

The word chamberlain, according to Ragueau, originally signified a gentleman who was to sleep in the king's bed-chamber, at his bed's feet, in the absence of the queen. There
There are almost as many kinds of chamberlains as chambers: the principal are as follow:

CHAMBERLAIN of England, Lord Great, an officer of great antiquity and honour; being ranked the sixth great officer of the crown: a considerable part of his function is at the coronation of a king; when he dries him, carries the coff, sword, and gloves, to be used on that occasion; the gold sword and feather to be offered by the king; and the robe royal and crown; he also underwashes, and waits on him at dinner; having for his &c the king's b.d., and all the furniture of his chamber, the night-apparel, and the silver banes wherein the king washes, with the towels.

To him likewise belongs the provision of every thing in the house of lords, in the time of parliament; to which end he has an apartment near the lords house. He has the government of the palace of Westminster, and issues out warrants for preparing, fitting out, and furnishing Westminster-hall, against corruptions, trials of peers, &c.

He dispenses of the sword of flate, to be carried by whom he places; and when he goes to parliament, is on the right hand of the sword, the lord marshal being on the left. On all solemn occasions, the keys of Westminster-hall, of the Court of Wardens, and Court of Requels, are delivered to him.

To him belong livery and lodging in the king's court; and he has certain fees from every bishop at his doing homage to the king, and from every peer at his creation. Under his command are, the gentleman-usher of the black rod, the yeoman-usher, and door-keepers.

The office of lord great chamberlain of England is hereditary; and where a perfon dies feised in fee of this office, leaving two falfe, the office belongs to both falles, and they may execute it by deputy; but such deputy must be approved by of the king, and must not be of a degree inferior to a knight. 4 Bro. P. C. 146, 8vo.

This honour was long held by the earls of Oxford;viz, from the time of Henry I. by an efsate-tail, or inheritance; but in later coronations by the marquis Linsey, afterward duke of Ancaster, by an eflate or inheritance from a daughter and her general: and settled in that family.

CHAMBERLAIN of the househol, Lord, an officer who has the oversight and direction of all officers belonging to the king's chamber, except the pretendent of the red-chamber, which is absolutely under the groom of the robe.

He has the oversight and direction of the officers of the wardrobe, of the removing wardrobes, beds, tents, levells, muffes, comedians, hunting, musicians, trumpeters, drummers, handi-crafts, and other tradifion retained in the king's service: as also of all bequests at arms, physicians, apothecaries, furgeons, barbers; the king's chaplains, &c. and administrators the oath to all officers above fairs. Under him is a vice-chamberlain; and both are alway privy-counsellers. There is also a Lord Chamberlain of her majesty's househol.

There were formerly CHAMBERLAINS of the king's courts, 7 Edw. vi. c. 11: and there are chamberlains of the exchequer, who keep a controll of the pells, of receipts and exitus: they also have in their custody the leagues and treaties with foreign princes, many ancient records, and the two famous books of antiquity, called Domeday Book, and the Black Book of the exchequer: and also the standards of money, and weights and measures are kept by them. There are also Under-chamberlains of the Exchequer, who make searches for all records in the treasury; and are concerned in making out the tallies, &c. The office of chamberlain of the Exchequer is mentioned in the flat. 32 and 37 Hen. VIII. c. 14. Besides thefe, we read of a chamberlain Vol. VII.

of North Wales, Stowe, p. 541. There is also a chamberlain of Chelfter, to whom it belongs to receive the rents and revenues of that city; and when there is no prince of Wales, and earl of Chelfter, he hath the receiving and returning of all writs coming thither out of any of the king's courts. See COUNTY-palatine.

CHAMBERLAIN of London. This officer keeps the city-money, which is laid up in the chamber of London, an apartment in Guildhall; he also manages over the affairs of malfers and apprentices; and makes free of the city, &c.

His office lasts but for a year, being chosen annually on Midsummer-day; but the custom usually obtains to re-chooe the fame perfon; unless he has been chargeable with any misdemeanor in his office.

CHAMBERLAIN, vic. See Vice-Chamberlain.

CHAMBERLAIN, Laude, in Biography, the descendant of a good family at Odington, in Gloucefhire, was born in 1610, and educated in St. Edmund's Hall, Oxford, where he was graduated M. A. in 1641. During the civil wars, he travelled through nof of the countries of Europe; and after the restoratiun was made one of the fellows of the Royal Society, then founded. In 1669 he was secretary to the earl of Carlile, and went to Stockholm with the order of the garter to the king of Sweden: in the following year he was graduated L. L. D. at Cambridges; and in 1679 he was appointed to instruct George prince of Denmark in the English language. He died at Chelsea in 1705. Dr. Chamberlaine was the author of several pieces, political and historical, relating to the circumstances and events of his time; but he has been principally known by his "Anglica Notitia, or the Present State of England, with divers reflections upon the ancient State thereof;" Lond. 1668, 8vo; of which a second part was published in 1671, 8vo. This was a popular work, and often reprinted during the author's life. It was enlarged by his son, and has been occasionally reprinted, so as to have arrived several years ago, at the 36th edition. A harnifls inftance of the author's vanity was recorded on his monument, viz. "That he caufed some of his own books wrapped in cerecloth to be buried with him, as they might fiibly be of use to a remote age." The son of the former, John Chamberlaine, was educated at Trinity-college, Oxford, and became an industrious translatror of works from foreign languages, of which he is said to have understood fifteen. His principal translations were "Officelaud's Argumentes of the Books and Chapters of the Old and New Testaments;" "Fontenelle's Lives of the French Philosophers;" "Nicewentty's Religious Philosopher;" "Brand't History of the Reformation;" "The Lord's Prayer in 100 Languages;" "Difputations, historical, critical, theological, and moral, on the most memorable events of the Old and New Testament." To the Royal Society, of which he was a member, he communicated those pieces, which are inserted in the Philosophical Transactions. After an useful and wellspent life he died in 1724.

CHAMBERLEN, Hugh, a celebrated accoucheer, was a native of London, and born about the middle of the 17th century. His father, Paul Chamberlen, and two of his brothers, were also practitioners in midwifery. They invented among them an instrument, the obstetric forceps, with which they were enabled to deliver women with safety, in cases where, before this discovery the life of the child was usually lost. Of this Hugh Chamberlen gives the following account; his father, brothers, and myself, (though none else in Europe that I know) have, by God's blessings, and our industry, attained to, and long practiced a way to deliver women,
the head, on account of some difficulty, or disprop-portion, cannot pass, without any prejudice to them or their infants; though all others (being obliged, for want of such an expedient, to use the common way) do and must endanger, if not destroy, one or both with books.

By this annual operation, a labour may be dispatched, on the least difficulty, with fewer pains, and sooner, to the great advantage, and without danger, both of woman and child.' Prof. to Chamberlen's Transl. of Mauritceau.

But though he attributes the merit of the discovery to his father and brothers conjointly with himself, yet as the father did not appear to have been acquainted with the instrument in the year 1665, when he published his "Midwives' Guide," a very indifferent performance; and the brothers have left no memorials of themselves; their names are little noticed. After establishing the reputation of the instrument here, Dr. Hugh went, in the year 1727, to Paris, expecting to gain equal credit there, and intending, it is supposed, to sell the invention; but undertaking to deliver a woman whose pelvis was too narrow to admit the head of the child, passed, without mauling it, and the woman dying, as Mauriceau, who had seen her before, had predicted, he found himself so degraded, that he thought it advisable to quit Paris, and go to Holland. Mauritceau was not a little pleased at his discomfiture, of which he gives an account in the 1st vol. of his "Obf. fur la Grolfelle," Obf. 26. Addressing himself to Dr. Chamberlen, he tells him, "he must not think the Parifan women to be delivered with the fame ease as the English." "Lui faut entende qu'il estoit bien trompe, en croyant trouver autant de facilite a accoucher les femmes a Paris, comme il avoit pu trouver a Londres." In Holland he is supposed to have been more successful, and to have imparted the secret to Rayth and Roochuyfen, then in high reputation at Amsterdam, and to have received for his invention a considerable reward. He now returned to London, where he soon acquired a considerable fortune. "Not so much, Mauritceau says, from the sale of his forcepts, as from the information he had obtained by reading, and translating his "Observations fur la Grolfelle."

We have no doubt, but Chamberlen obtained much information from Mauritceau's book, which was the best treatise then extant on the subject of midwifery; but his forcepts had its share in raising him to the high rank he attained in his profession, and which he continued to enjoy to the end of his days. In 1683, he published his translation of Mauritceau's observations, which was received with great avidity, and has since been frequently reprinted. We have not been able to learn at what time Dr. Chamberlen died. His forcepts, simplified, and improved by Smellic, and further varied and altered by other teachers, continues to be esteemed as one of the most valuable instruments used in the practice of midwifery, and defervingly gives the inventor a distinguished rank among the improvers of the art. Haller Bib. Chr. Sur Effais fur l'art des accouchements. CHAMBERRY, or CHAMbery, in Geography, formerly the chief city of Savoy, now the capital of the department of Mont Blanc, and principal place of a district, is situated in a pleasant valley on the river Laffé. It has a castle, seated on an eminence, and is surrounded with mountains, but not fortified. Under most of the houses are piazzas, where people may walk without being incommoded in the worst weather. Its suburbs are large and handsome, and in the center of the town is the ducal palace. It contains two parochial churches, and 10,000 inhabitants; the north canton contains 14,655; and the south 14,690; the former contains 146½ square miles and 12 communes, and the latter 195 square miles and 17 communes. This town was taken by the French in 1752. The height of the first floor at St. Jean Baptiste is 35 feet below the lake of Geneva, or 83 feet above the Mediterranean. It is 27 miles N.E. of Grenoble, and 85 N.W. of Turin. N. lat. 45° 55'. E. long. 7° 50'.

CHAMBERS, Ephraim, in Biography, a perfone whose name desvers to be particularly recorded in a work of this kind, as he was the first, who, in this country, formed the plan, and undertook the execution of a scientific dictionary, that might be said to comprehend the whole circle of the arts and sciences; and in this respect it differed from Harris's Lexicon Technicum which preceded it, and which furnished many of the mathematical articles. The few particulars that are known concern the form him are collected and arranged by Dr. Kippis, in the last edition of the Biographia Britannica. The place of his nativity was Kendal, in the county of Westmoreland, but the time of his birth and the duration of his life, cannot, from any documents that remain, be precisely ascertained. His parents were Quakers; but when he came into the world, he does not seem to have manifested any attachment to their profession. In his education he probably enjoyed no advantages besides those that were necessary to qualify him for trade. At a proper age he was bound apprentice to Mr. Senex, the globemaker; and during his residence with this skilful mechanic he acquired that taste for literature and science, which marked the progress and directed the occupation of his future years. At this early period he formed the design of his grand work, the "Cyclopædia;" and it is said, that some of the first articles of it were written behind the counter of Mr. Senex. Apprized that the execu- tion of the plan which he had conceived was incompatible with the avocations of trade, he quitted business; and having made such arrangements as were necessary to procure for him a subsistence in the prosecution of it, he took chambers at Gray's-inn, where he chiefly resided during the remainder of his life. The first edition of the Cyclopædia, which must have been the result of many years' intense application, appeared in 1728, in two volumes, folio. It was published by subscription, at the price of four guineas, and the list of subscribers was very respectable. The dedication to the king is dated Oct. 15th, 1727. The reputation which Mr. Chambers acquired by the execution of this undertaking, procured him the honour of being elected into the Royal Society, Nov. 6, 1729.

In less than 10 years, a second edition became necessary, which was accordingly printed, with corrections and additions, in 1738. Instead of a new edition, the proprietors had proposed to give a new work. Mr. Chambers had actually prepared a considerable part of the copy with that view; and more than 20 sheets were printed off. In pursuance of this plan, it was their intention to have published a volume in 1737, and to have proceeded annually in supplying an additional volume, till the whole was completed. But they were diverted from executing their purpose, by a bill which passed in the House of Commons, though it was rejected in the House of Lords, and which obliged the pub-lishers of all improved editions of books, to print the improvements separately. Whilfst this edition was in agitation, Mr. Bowyer, the learned printer, had formed some extensive ideas of improving the dictionary; but the plan, whatever it was, did not appear to have been reduced to practice. About this time Mr. Bowyer had a dispute with Mr. Chambers concerning the title of the work, propoing to substitute "Encyclopædia" for "Cyclopædia." Mr. Chambers vindicated the title he had adopted, and persevered in retaining it. See the article Cyclopædia. The second edition of Mr. Chambers's dictionary was so favourably received by the pub
lie, that a third was called for in the very next year, 1730; a fourth, in 1741; and a fifth, in 1746. This rapid sale of a work, so large and expensive, must be considered, not only as a striking testimony of the general estimation in which it was held, but likewise, as a strong proof of its real utility and merit.

Although the Cyclopaedia, denounced by Mr. Bowyer, "the pride of bookfellers, and the honour of the English nation," was the grand business of Mr. Chambers's life, and may be regarded as almost the sole foundation of his fame, his attention was not wholly confined to this undertaking.

He was concerned in a periodical publication, entitled "The Literary Magazine," which was begun in 1735; and he also engaged, in conjunction with Mr. John Martyn, F.R.S. and professor of botany at Cambridge, in preparing a translation and abridgment of the "Philosophical Repository and Memoirs of the Royal Academy of Sciences at Paris." This work, which was comprised in 5 volumes, 8vo., did not appear till the year 1742, some time after our author's decease.

Mr. Martyn, in a subsequent publication, has severely censured Mr. Chambers's part in this abridgment. The only other work ascribed to Mr. Chambers, is a translation of the "Jefuit's Perspective," from the French, in 40., which has been several times reprinted. The indefatigable industry which Mr. Chambers employed in his literary and scientific collections, may be inferred from the account given by Mr. Airey, his amanuensis, who asserts that, between the years 1728 and 1753, he copied nearly 20 folio volumes, so large as to comprehend materials, which, if they had been printed, would have formed 30 volumes of the same size. Mr. Chambers, however, acknowledged, that, if they had been printed, they would neither have been fold nor read. Mr. Chambers, by his incessant application, so far impaired his health, that he was obliged to retire, occasionally, to a lodging at Canonbury-house, near Islington; and to make an excursion to the south of France. At his return to England, he died at Canonbury-house, and was buried in Wellminder Abbey, where the following inscription, written by himself, is placed on the north side of the cloisters of the abbey:

"Multis pervigatus,
Pensa notus;
Quis quam, inter lucem & umbram,
Nec eruditus, nec idota.
Litteris deditus, tranferti; sed ut homo
Qui humani nihil a fe alculum putat.
Vita fimul, & laboribus functus,
Hinc requiescite voluits.
Ephraim Chambers, R.S.S.
Obit XV. Maii, M.DCC.XL."

"Heard of by many,
Known to few;
Who being neither very celebrated nor yet obscure,
Neither very learned nor yet ignorant,
Paffed a life devoted to study;
And paffed it as a man
Who was not inattentive
To any of the offices of humanity;
Having ended his days and his labours together,
Here wished to repose.
Ephraim Chambers, F.R.S.
He died on the XVth of May,
M.DCC.XL.

The above narrative supplies us with no facts by which we may fix the age of Mr. Chambers. Supposing him to have been apprenticed at the age of 14, and to have quitted his service at 21; and conjecturing that he might be 60 years old when he died, there will remain a chasm of 26 years, from the termination of his apprenticeship to the year 1728, of which we have no account; but we may infer, from the extent of his work, which occupied his attention during this period, that he was fully employed. The intellectual characters of Mr. Chambers seems to have been fertility and attention. Indefatigable as a man of business, he had no leisure to pursue discoveries with the ardour of a philosopher. The whole occupation of his life seems to have confided in collecting and communicating knowledge; and, he undoubtedly possessed distinguished talents for the arrangement and illustration of the materials which he collected. His temper was cheerful, but impetuous; his mode of life referred, solitary, economical, and regular. His literary labours unquestionably entitled him to more than he received; but the compensations which authors received from booksellers, were, at that period, far inferior to what, in certain instances, they have lately rifen.

It may not be improper, for gratifying the curiosity of the readers of this article, to terminate it with a brief account of the "Cyclopaedia," or the effects which it has produced in the literary world. Whilst a sixth edition was preparing, the proprietors thought that the work might admit of a supplement in two additional folio volumes. This business was committed to the late George Lewis Scott, e. g.; but he was prevented from proceeding far in it, by being appointed sub-preceptor to his present majesty, when Prince of Wales. The chief management was then committed to Dr. John Hill, so well known by his voluminous and daily publications. In his name, together with that of Mr. Scott, the supplement was published; and though it contained a number of valuable articles, it was far from being uniformly conducive for judgment and due selection. The proprietors afterwards determined to combine the whole into one work; and after several ineffectual efforts for accomplishing their plan, the business devolved on the editor of this Cyclopaedia, who derived from the favour of the public, and the singularly rapid and extensive sale of the work, a recompense, which, independently of every other consideration, he reckoned amply adequate to his labour. This edition began to be published in weekly numbers, in 1778, and the publication was continued without a single interruption, till it was completed in the year 1785. The work was dedicated and presented to his majesty. The popularity of the "Cyclopaedia," gave rise to a variety of similar publications; of many of which it may be truly said, that most of the articles which compose them, are extracted verbatim, or at least with very few alterations and additions, from this dictionary; and that they manifest very little labour of refence, or of compilation. One defect seems to have been common to them all, with hardly any exception; and that is, that they do not furnish the reader with references to the sources from which their materials are derived, and the authorities upon which they depend. This charge was alleged by the editors of the French Encyclopaedia, with some justice, but at the same time with unwarrantable acrimony against Mr. Chambers. The editors of that work (see Encyclopaedia) while they pass high encomiums on Mr. Chambers's Cyclopaedia, blend with them censures that are unfounded. They say, e. g. that the "merited honours it hath received would, perhaps, never have been produced at all, if, before it appeared in English, we had not had in our own tongue those works, from which Chambers has drawn without measure, and without selection, the greatest part of the articles of which his dictionary is composed. This being the case, what must Frenchmen think of a more trauable part of that work? It must excite the indignation of the learned, and give..."
gave just offence to the public, to whom, under a new and pompous title, nothing is presented but riches of which they have a long time been in possession?" They add, however, after appropriate and justly deferred commendation: "We agree with him, that the plan and the design of his dictionary are excellent, and that, if it were executed to a certain degree of perfection, it would alone contribute more to the progress of true science, than one half of the books that are known." However, what their vanity has led them to assert, viz. that the greatest part of Chambers's Cyclopædia is compiled from French authors, is not true. When Mr. Chambers engaged in his great undertaking, he extended his researches for materials to a variety of publications, foreign and domestic, and in the mathematical articles he was peculiarly indebted to Wolins: and it cannot be questioned, that he availed himself no less of the excellent writers of his native land than those of France. As to the imperfections of which they complain, they were, in a great measure removed, as science advanced, by subsequent improvements; nor could the work, in its half state, be considered as the production of a single person. Nevertheless it cannot be conceived, that any scientific dictionary, compiled in four volumes, should attain to the full standard of human wishes, and human imagination. The proprietors, duly wise of this circumstancel and branch of the rapid progress of literature and science in the period that has elapsed since the publication of Chambers's Cyclopædia, have undertaken a work on a much larger scale, which, with the encouragement already received and further reasonably expected, will, it is hoped, preclude most of the objections urged against the former dictionary. We shall here only add, that the compilers and editors of the French Encyclopædia, in their relative capacity, have produced a work, which, though entitled to the highest praise, is very far from being exempt from the imperfections of every human production. Of this the French themselves have not been unapprised: for notwithstanding the improvements successively made in the Paris Encyclopædia since its first appearance, it has been thought necessary to adopt a new plan, and to form upon it a work of immense bulk, which is gradually proceeding, and is not likely to be soon completed. See Encyclopædia and Cyclopædia. Diog. Brit.

CHAMBERSBURG, in Geography, a port-town of America, and the capital of Franklin county, in Pennsylvania. It is on the canal from Conococheague creek, through which might be opened an easy communication with the Potomac river; and principally consists of two large streets, intersecting each other at right angles, and leaving a public square in the center. It contains about 2,500 houses, handsomely constructed of brick or stone, two Presbyterian churches, a brick court-house, and a flume gurdl. There is a printing-office in the town, and a paper-mill in its vicinity. The situation is favourable to trade and manufactures, and it has a lively and thriving appearance. The adjacent land is rich and fertile, and is highly cultivated. It is 157 miles W. of Philadelphia. N. lat. 39° 57'. W. long. 77° 30'.

CHAMBLES, or Sorelle River, a river of Canada, issuing from lake Champlain, and running to the river St. Lawrence near the island of St. Peter; 300 yards wide when lowest, full of dry seashores, and yet of sufficient breadth for rafting timber, &c. at the spring and fall.

CHAMBLIS, or CHAMBLEY, a town of France, in the department of the Oise, and district of Senlis; 13 miles W.S.W. of Senlis.

CHAMBOIS, a town of France, in the department of the Orne, and district of Argentan; 2 leagues N.E. of Argentan.

CHAMBON, a town of France, in the department of the Creuse, chief place of a canton in the district of Bonfloc; 8 miles E. of Gueret. The place contains 1,823, and the canton 7,143 inhabitants; the territory includes 255 kilometres and 16 communes.

CHAMNON, Le, a town of France, in the department of the Loire, and chief place of a canton, in the district of St. Etienne; 1 league S.W. of St. Etienne. The place contains 1,875, and the canton 9,825 inhabitants; the territory comprehends 1375 kilometres, and 12 communes.

CHAMBONLIVE, a town of France, in the department of the Corrèze, and district of Tulles; 5 miles E. of Uzerche.

CHAMPOISE, a town of France, in the department of the Rhone and Loire; 7 miles W. of Villefranche-en-Ban-joins.

CHAMBRANLE, in Architecture and Joinery, the border, frame, or ornament of stone, or wood, surrounding the three sides of doors, windows, and chimneys. The chambranle is different in the different orders; when it is plain, and without moldings, it is called, simply and properly, band, cadre, or frame. The chambranle consists of three parts; the two sides, called ascendants; and the top, called the traverse, or supercilium. The chambranle of an ordinary door is frequently called door-case; of a window, window-frame.

CHAMBRE, La, in Geography, a town of Savoy, or of the department of Mont Blanc, and chief place of a canton, in the district of St. Jean-de-Maurienne, situated on the Ire; 23 miles N.E. of Chambery. The place contains 429, and the canton 4,098 inhabitants, who are very subject to the gout, or swelling of the neck; the territory includes 1,569 kilometres, and 46 communes.

CHAMBRE, in Military Language, a defective concavity sometimes found in the thickens of the metal in pieces of ordnance. Un canon chambré is a cannon badly bad, and liable to burst when fired.

CHAMBRES, ou faire chambrés, is to put or collect together several soldiers or military people in one and the same chamber, in the same tent, or in one and the same barrack, for the purpose of eating, sleeping, and reposing themselves there.

CHAMBROSIS, in Geography, a town of France, in the department of the Eure, and chief place of a canton, in the district of Bernay; 5 miles W. of Bernay. The place contains 1,000, and the canton 11,262 inhabitants; the territory includes 255 kilometres, and 46 communes.

CHAMBROIS, a town of France, in the department of the Netherland, in the county of Hamaut, on the Dendre; 8 miles S.E. of Ath.

CHAMCHOU-POU, a town of Chinese Tartary; 8 miles N.N.E. of Ning-yuen.

CHAMCHOZ, a town of Armenia; 145 miles E. of Erivan.

CHAMEAU, in Zoology. The Bactrian camel is described
ferbed under this name by Buffon. See Camelus Bar-
trinus.

CHAMEAU-Léopard, the French name of the camel-
leopard, Camelopardalis Giraffe, which feed; called also
by some late French writers Chameau moucheté.

CHAMEAU-Marin, in Ichthyology, the French name of
Ostacran Turritus, Linn. which feed.

CHAMEISME, in Botany, Pluck. See Houstonia curnela.

CHAMEIRAT, in Geography, a town of France, in
the department of the Corrèze, and district of Tulle; 3
miles S.W. of Tulle.

CHAMELET, a town of France, in the department of
the Rhône, and district of Villefranche; 3 leagues W. of
Villefranche.

CHAMELOT, in Commerce. See Cambelet.

CHAMFER, or Chamferet, in Architecture, an orna-
ment confining half of a scotia; being a kind of small
futto, or putton, on a column; called also frix, and fritia.

CHAMFERING, or Chamfering, is used for cut-
ing the edge, or end of any thing aloof, or bevel.

CHAMFRAN, in Military Language, a sort of ar-
mour, that served as a defence for a horse in combats. It
was made of metal or boiled leather. It covered the fore
part of the head, in the form of an adjusted mask. The
chamfrain had on the middle of it an adjusted piece of iron,
round, and sufficiently large, terminating in a point, for
piercing every thing opposed to it. The chamfrain of the
count de St. Pol, at the siege of Harfuir in 1449, under
Charles VII. was valued at fifty thousand crowns of the
money of that time; and that of the count de Foix, at the
taking of Bayonne, was valued at fifteen thousand crowns
of gold.

CHAMIER, Daniel, in Biography, a French pro-
testant divine, was a native of Dauphine, and, after having
been long minister of Montemart, went, in 1612, to oc-
cupy the post of professor of theology at Montauban. He
was much employed by his party in political negotiation with
the court, and on all occasions manifested inflexible resolu-
tion. He is said to have drawn up the famous edict of
Nantes, and he presided in several synods, having an ex-
cellent talent for the conduct of public business. Nor was he
left distinguished for learning. Among his works may
enumerate a treatise, "De Occursu Monte Piceti," com-
manded by Scaliger; and his "Jeuifs' Letters," or epistles
addressed to him by fathers Cotton and Armand, with his
observations. But his greatest work was entitled, "Catho-
lica Pamphlet, or the Wars of the Lord," in 4 vols. 4to,
left incomplete, and containing a detailed view of the con-
traversies between the Papists and Protestants, and a re-
putation of cardinal Bellarmine. It was printed at Geneva, with
a preface by Turretin; and an abridgment of it was pub-
lished by Spanheim in 1643, in 1 vol. fol. He also
wrote a "Corpus Theologicum," printed at Geneva in
1653. He united the functions of the divine and of the
folder, and was killed by a cannon ball at the siege of Mon-

CHAMIL, in Geography. See HAMI.

CHAMILLARD, Stephen, in Biography, an emi-
nent antiquarian, was born at Bourges in 1656, entered
among the Jesuits at Paris in 1679, and took the vows in
1690. He was for some years a teacher of the helles letters and
philosophy in the schools of the society, and a distin-
guished preacher for 20 years. His erudition in the science of
medals is certified by two judges of unquestionable author-
ity, viz. Vaillant and Ezechiel Spanheim. He wrote se-
veral dissertations on particular medals preferred in his own
and other cabinets, some of which were infected in the Me-
moires de Trévoux, and some collected in a volume, en-
titled "Dissertations für plusieurs Medailles, Pierres gravées,
& autres Monuments d'Antiquités," Paris, 140, 1711. He
is said, however, to have been imposed upon with respect to
two medals, a Pacatianus and an Anna Paulina, which,
after exercising his erudition and talent and conjecture in two
elaborate dissertations, were proved to be fictitious. Father
Chamillard published a learned edition of "Prudentius, in

CHAMIR, in Geography, a fortified town of Arabia,
in the country of Yemen; 50 miles N.E. of Lohtha. It is
situated in the middle of the territories of the confederates
of Hashish-u-Bakil, and it has coilt the Imam no small trouble
in retaining possession of it. N. lat. 15° 15'. E. long. 43° 5'.

CHAMIRA, in Botany, Thunb. See Heliospila
circinata.

CHAMITIS, Gœrt. from the MSS. of Solander, in the
possession of Sir Joseph Banks. Cçlfs and order, pen-
tandria digyna. Nat. ord. Umbellata, Linn. Umbelliferae,
Juff.

Gen. Char. Umbel none, or simple. Invol. none, or
about eight-leaved. Cal. superior, five-toothed, permanent.
Cor. petals five, ovate-oblong, obtuse, quite entire. Stam.
filaments five. Pist. alykes two, filiform; stigmata thickish;
Peric. none. Fruit inferior, crowned with the calyx, divi-
bile into two. Seeds two, egg-shaped, with three elevated lines
on one side, flat on the other.

Sp. 1. C. integrifolia, Gœrt. tab. 22. fig. 4. Herb. of
Sir Joseph Banks. "Leaves entire." Stems very short,
branched, forming dense tufts. Leaves crowded, sheathing,
linear-lanceolate; upper ones ovate-acuminate; sheaths egg-
shaped, open, two-awned. Flowers white, solitary, terminat-
ing the little branches; peduncles capillary. Fruit small.
Gaertner observes that this genuine umbelliferous plant is sin-
gular, not only on account of its solitary flowers, but also of
its fruit, which is frequently divisible into three, as if the
author of nature had compensated the defect of its umbel
by the unusual number of its seeds. 2. C. irsirfucata, Gœrt.
tab. 22. fig. 4. Bank's Herb. "Leaves three-forked." Leaves
crowded about the root, broad-linear, three-forked at the
summit; segments diversivac, mucronate; fiesbts
bread, embracing the base of the item. Stigmas quite simple,
about two inches high, naked, or furnished with one sensible
tricuspidate leaflet. Invol. shorter than the umbel; leaflets
five or eight, linear, acuminate, permanent. Umb. simple,
equal; rays from eight to ten. Fruit four times larger than
its preceding species, narrowed above, somewhat
comprised. Both species are natives of Terra del Fuego.

CHAMITIS, in Geography, a town of Russia, in the
government of Mogilev, on the borders of Poland; 42
miles S.S.W. of Mogilev.

CHAMKA, or Chomka, a town of Asia, in the coun-
try of Tibet; 229 miles S.E. of Laffa.

CHAMMANENA, or Chamarana, in Ancient Geo-
graphy, a district of Cappadocia Minor, which lay towards
the west, and was watered by the river Halys.

CHAMEISKOI, in Geography, a fortress of Russia,
on the confines of China; 168 miles S.W. of Verich-
Ninski.

CHAMOIS, in Zoology, a species of antelope, Antil. pru-
sipriscapra Pallas, Schrebers, Erxleben, and Gmelin; Capraipr-
iscapra of Linnaeus; Rupicapra of Pllny; Le Chamois of Buf-
fon; Gems of Gefner; Gemus Allegani et Humberti Bocart;
and Chamois Antelope, Pennant. This animal is specifically
known by having the horns erect, round, smooth, with the
hooks backwards.

The
The chamois is about the size of the common goat. The head is of a whitish fawn colour, with a black or brownish band, on each side. The hair of the body is short, like that of the flag, except in winter, when it becomes longer and thicker. It varies in colour according to the seasons of the year; in spring it is of a greyish ash-colour, in summer of a reddish fawn colour, in autumn of a fawn-brown mixed with black, and in winter of a blackish brown. The cheeks, chin, throat, outer parts of the ears, and the belly, whiten in general; and along the back is a narrow line of a blackish colour. The horns are about six inches long, or rather more, of a slender form, and placed nearly upright, with the tips uncinated, or bent backwards; these horns are slightly wrinkled towards the base, but have no appearance of annulations as in the rest of the antelope tribe. At the base of each horn, at the back part, is a longitudinal orifice in the skin, or lachrymal pit similar to that observed under the eyes of the common antelope. The tail is short, like that of the goat, and of a blackish colour.

Buffon’s opinion of the chamois is well known. He believed the chamois, the wild, and the domestic goat to be only constant varieties of a single species, but all the later writers concur in separating the chamois from the goat; they have not only separated them as species, but divided them into two distinct genera, and not without sufficient reason. The chamois differs from the goat in having the horns from March to month, the goat, and being that of the antelope in being dillinct of the longitudinal ridge, so conspicuous in the horns of the goat tribe. The horns of the female goat are sometimes smaller than those of the chamois, but still possess the same longitudinal ridge or angle as those of the male. The lachrymal openings in the skin behind the horns dilates it also from the goat. The goat, in a state of nature, inhabits the very summits of the highest mountains; the chamois is an inhabitant of alpine regions, but only those of the second stage, and is rarely found in the lower elevations. The chamois is also rather smaller, and less active than the goat; it is dillinct of the beard, which in the goat is very long; and the hair of the goat is always long and thick, or bushy, while the chamois is very bare of hair, like the antelope during the summer season.

The chamois is the only species of antelope, except the saiga, that is found in Europe. It inhabits the mountains of Dauphiny, Padmont, and Germany, the Alps of Savoy and Italy, and the Pyrenean mountains. Several parts of Greece, and the mountains of Caratia and Albania. It is an animal of a social nature, as four, five, or six are usually found in company together. Sometimes it appears in troops of fifteen or twenty together. There are certain times when they assemble in still greater numbers, and then again disperse in small parties over the mountains. The full-grown males have a strong and unpleasant odour, which is yet more powerful than that of the male goat during the coupling season, which is in September and October: the female brings forth her young in April and May. A young female chamois is in maturity at the age of eighteen months: they bring forth two or rarely three at a birth. The small ones follow the mother till September, or sometimes longer, if the hunters or the wolves do not disperse them. They are supposed to live 20 or 30 years.

During the summer the chamois prefers the sides of the more inaccessible mountains that are thickly clothed with forests, and that, by which means, are protected from the heat of the sun; it goes to pasture early in the morning, or in the evening only. It is as well to be an extremely timid animal, for when several of the chamois are at

MIS. with - I for virtues they

in chamois
The chamois is very penetrating, and its heat remarkably acute. When it feels a man, it fixes its eyes upon him for an instant, and then flies off immediately. If the situation will admit, the animal retreats to the rocks, or some elevated point from which it can observe the objects of its apprehension, and again pursues its course, pausing at intervals, again to look back and notice the route of its pursuers, till it effects its escape, or is either overthrown or slain. In the chase it evinces every mark of extreme agitation and timidity. It feeds on herbs, making choice of the most delicate and tender parts, such as the flowers and young buds, especially those of an aromatic nature.

The flesh of the chamois is tolerable as an article of food, when in season; but is bad, by its great heat, to engender fevers. The blood is extremely hot; they pretend that it possesses the same medicinal virtues as the blood of the ibex; the hunters sometimes mix the blood of the two animals together, and feed it for that of the ibex, which is in much request; or often all of that of the chamois alone for the blood of the latter. The skin of the chamois, when dressed, forms a kind of strong and supple leather of considerable utility for wearing apparel, as it takes a good die either of yellow, brown, or black, and is remarkably durable.

The chase of the chamois is yet more dangerous than that of the ibex: even the mountaineers, who are accustomed from their infancy to climb the Alps, pursue them over the most precipitous precipices at the peril of their lives, and accidents often happen to them, either in falling from the crags, or slipping on the ice in the pursuit. The hunters sometimes follow them with dogs; but the chamois often retreats to the rocky eminences sheltered with woods, where it would be impossible for the dogs, and difficult for the men, to approach them. The hunters occasionally assemble together, and dividing themselves into small parties, betake themselves to different stations; one party ascending the rocks by means of scaling ladders in the most convenient places near the steeper eminences, while another party is waiting in the route it is supposed the chamois will take, when they shoot at it from a distance, and the other parties are again stationed in different avenues to intercept the animals, should they attempt to deviate from their usual track. In this manner many of the chamois are taken. They likewise kill them in the night time, or early in the morning when they quit the shelter of the woods to go out to graze. Most commonly, however, in the Alps, when the hunters discover a troop of the chamois, they fall out armed with their carbines, which they handle with much more facility than the full of the common huntmen, and pursuing the most secret ways over the rocks in different directions towards one rallying point, they come upon the herd by surprise, and kill them with little difficulty.

CHAMONILLE, in Botany. See Matricaria and Anthemis.

CHAMONIL, in Germany. See Anthemis.

CHAMOND, St., in Geography, a town of France, in the department of the Loire, and chief place of a canton, in the district of St. Etienne. The place contains 496, and the canton 14,652 inhabitants. The territory includes 87,516 square kilometers, and 8 communes.
CHAMONIX, a town of the department of Levan, and chief place of a canton, in the district of Bonneville. The place contains 1511, and the canton 3416 inhabitants; the territory includes 3559 square miles, and 4 communes.

CHAMOS, or CHEMOS, the idol or god of the Moabites.

The name of Chemos comes from a root, which, in Arabic, signifies to make calf; for which reason many believe Chemos to be the sun, whose precipitate course might well procure it the name of swift or speedy.

Further particulars may be seen in Calmet's Differtation on Baal Peor and Chemos, prefixed to his comment on the Book of Numbers.

CHAMO-TAO, in Geography, a small island, near the coast of China, in the Eastern Sea. N. lat. 37° 59'. E. long. 120° 50'.

CHAMOUNY, or CHAMOINT, a valley, and also a town or village, that lie at the foot of Mont Blanc, which flee. The inhabitants of this valley still retain a considerable share of that peculiar nature in their manners, for which they have long been noted. The men are solely employed in hunting the wild-goat, in searching for churls, and in acting as guides to strangers, whose curiosity leads them to ascend and explore the eminences of Mont Blanc and its adjacent summits; while all other work, domestic and agricultural, is left to the women. Since this valley has attracted so many travellers, the inhabitants of "Champs," affect genteel expressions in conversation, which form a glaring contrast with their natural rudeness. They load the stranger with civilities; and it is surprising to hear these rough mountaineers make use of the polite language. Almost a century has elapsed since the famous Pocock first visited the valley of Chamouny. The inhabitants were then wild and rough as the mountains surrounding them; but purity of manners and innocence graced their unfrequented huts; now, it is said, gold and vice have found their way to them. The ground-floor of the inn at Chamouny, near the foot of Mont Blanc, is elevated 3357 feet above the Mediterranean. For an account of the glaciers of Chamouny, see Mont Blanc and Glaciers.

CHAMOUX, a town of Savoy, or department of Mont Blanc, in the county of Maurienne; 4½ miles N.W. of Argentina.

CHAMP DE BATAILLE, Field of Battle, in Military Language, is the ground on which an action is fought. The enemy, who obliges his adversary to quit this ground and abandon it to him, obtains the victory.

A good general must be fensible that the victory depends, in a great measure, on the nature of the field of battle; he is, therefore, always laborious to derive primary advantages from the ground. The army that enjoys a superiority of position can act with so much the greater impunity against the enemy, who has to contend both with it and the advantages of ground.

A general who reckons chiefly on his infantry, against troops superior in cavalry, should choose positions that are broken, uneven, mountainous, deep, above all, enclosed; but if, on the other hand, he wishes to oppose his cavalry with advantage to infantry, he should endeavour to find ground a little elevated, but smooth, open, and not embraaced or interrupted with woods, morasses, ditches, or enclosures.

CHAMP Close. This was, from the commencement of modern history, and long afterwards, a place authorised by the laws made by sovereigns for the purpose, and consecrated to particular combats between those who wished to determine, in that manner, either a law-suit or dispute of honour. This name was also given to the place defined or set apart for tournaments.

CHAMP de Mars, the Field of Mars, an open place or field, in the neighbourhood of Paris, where the kings of France used frequently to review their troops, and where the French held their festivals after the revolution.

CHAMPS de Mars et de Mai, Let. in Antiquity, denoted those annual assemblies, which were held in the early period of the French monarchy, and in which whatever related to the general welfare of the nation was submitted to public deliberation, and determined by the suffrage of the people. These assemblies were called "Champs," because, according to the custom of all the barbarous nations, they were held in the open air, in some plain capable of containing the vast number of persons who had a right to be present: and they were denominated "Champs de Mars and de Mai" from the months in which they were held. Every freeman seems to have had a right to be present in these assemblies. In them every thing that concerned the happiness of their country, every thing that could be of benefit to the Franks, was considered and enjoined. Clotharius II. describes the buffets and acknowledges the authority of these assemblies; "they are called," says he, "that whatever relates to the common safety may be considered and resolved by common deliberation; and whatever they determine, to that I will conform." The judicial clauses, or words of legislative authority in the decrees issued in these assemblies, run not in the name of the king alone, "We have treated," says Godbert, in a decree A.D. 513, "in the assembly of March, together with our nobles, concerning some affairs, and we now publish the conclusion, that it may come to the knowledge of all." "We have agreed," says he elsewhere, "together with our valets." Again, "it is agreed in the assembly in which we were all united." The Salic laws, the most venerable monument of French jurisprudence, were enacted in the same manner. In their charters, the kings of the first race are careful to specify that they were granted with the consent of their valets. The historians likewise describe the functions of the king in these national assemblies in such terms, as imply that his authority there was extremely small, and that every thing depended on the court itself. These general assemblies also exercised supreme jurisdiction over all persons, and with respect to all causes. Moreover when any extraordinary aid was granted by free men to their sovereign, it was purely voluntary. In the annual assembly of March or May, it was the custom to make the king a present of money, of horses or arms, or of some other thing of value. This custom was ancient, and derived from their ancestors the Germans. These gifts were considerable, and seem to have made no small part of the royal revenue. See on this subject the authorities cited by Dr. Robertson in his Hist. of Ch. V. vol. i. p. 431. &c.

CHAMPA, in Geography. See CIAMPA.

CHAMPACAM, in Botany, Rumph. See MICHELIA.

CHAMPADADA, in Natural History, the name of a tree common in the woods of Malaca, and bearing a fruit much valued by the natives. It is a large tree, very full of branches, and those are very knotty, and, when cut, throw forth a thick and acid juice like that of the tallow. The fruit grows on the trunk and thick branches of the tree: the first appearance toward this is a large button, or bud; this by degrees opens into a flower consisting of a great number of leaves, among which, when open, are seen the rudiments of the fruit; this appears very small at first, but it soon grows to a very considerable bigness, being, when ripe, twelve or fourteen inches long, and as much in circumference; it is shaped much like a melon. The rind is green, and is all over
over divided into small pentagons, in the center of each of which is a small black spot. The pedicle is thick and woody, and entering into the substance of the fruit, it divides itself into several branching fibres, which run through the whole substance of it, and meet in a point at the end. Within this large fruit there are contained a large number of kernels of the size of our common chestnuts, all hanging together in bunches, so as to resemble a cluster of grapes; these are confined in a narrow compass, being prefixed firmly upon one another while the fruit is whole, but as soon as this is cut or burst open, they fly farther asunder, and hang to the stalks like grapes that are placed at a distance on the bunch, as some of our oobling kinds are. The people of Malacca are very fond of this fruit; they suck the pulpy matter which surrounds the kernels, and which is like a milk and lucious taffy, but of a disagreeable raw smell. The Indians are very fond of this fruit, as well for its qualities as its taste, for it is very heating, and when taken in large quantities, will inebriate people in the same manner as strong liquors. The kernels are much of the nature of our chestnuts, but of a less agreeable taste; they are eaten by way of food rather than as a delicacy, and the common way of eating them is boiled in water. Mem. Acad. Sci. Par. 1699, p. 640.

CHAMPAGNAC-DE-BELAIR, in Geography, a town of France in the department of the Dordogne, and chief place of a canton in the district of Nontron; 12 miles N. of Perigueux. The place contains 784 and the canton 6117 inhabitants; the territory includes 107 1/2 square miles, and 12 communes.

CHAMPAGNE, Philippe de, in Biography, an eminent painter of history, portrait, and landscape, was born at Bruxelles in 1602, and received his earliest instructions from Bouillon and Michael Bourdeaux, two ordinary painters, and afterwards became a disciple of Poussin, under whose tuition he formed a taste for landscape painting. At the age of nineteen he visited Paris in his proposed journey to Rome, and by the practice of portrait painting with one L'Allemane, he made great progress in that branch of his art, as well as in history and landscape. During his residence at Paris, he formed an acquaintance and friendship with Nicolo Poullin, which were of great importance to him; and these artifices were conjointly employed in painting the ornaments of the Luxembourg palace. On the death of Duchenez, whose daughter he married, he was appointed director of the queen's paintings, with a pension of 1200 livres a year, and apartments in the palace. At and near Paris he painted several historical pieces for churches and palaces, and several times took the portraits of the royal family, and of cardinal Richelieu. At the establishment of the Academy of Painting in Paris in 1648, he was one of the original members, and afterwards became professor and president. His affability in the exercise of his profession was such, that he arose at 4 in the morning, and in the course of the day allowed himself very little time for recreation. He painted with great facility, and paid particular attention to the false textures and figures, and to the execution of his pieces. Upon the arrival of Le Brun from Italy, though he had previously entertained the expectation of being their painter to the king, he manifested no dissatisfaction; but retiring from public business, indulged himself in the practice of his favourite art for his own amusement. He died in 1674. Champagne was correct in his designs, agreeable in his colouring, though it wants brilliancy, and well acquainted with the principles of perspective and architecture; nevertheless he partook of the coldness of his country, which had not been animated with the fire of Italy. De Piles observes, that all his knowledge consisted in a fervid imitation, in the performance of which he neither followed his genius, nor obtained the rules of art. His morose and tender character prevented his painting naked figures, indulging freely in fable, and painting even the portraits of the first nobility in France on a Sunday, though at other times he was very fond of getting money. His works, several of which have been engraved by the best masters, are very numerous in France; but a most capital picture of Champagne is Lewis XIII. kneeling before the Virgin and offering his crown. Pilkington. D'Argenville.

The nephew of the former, John Baptist Champagne, was born at Bruxelles in 1645, or, as some say, in 1643, and died in 1688. Having received instruction from his uncle, he visited Italy for the advantage of studying the works of the great artists. He adopted the dyle and manner of his uncle without deviating from them; but was inferior to him in design and execution. While he possessed many of his excellencies, he had also many of his defects. Pilkington.

CHAMPAGNE, in Geography, a town of France, in the department of the Ain, and chief place of a canton, in the district of Belfort, 10 miles N. of Belfort. The place contains 375, and the canton 6629 inhabitants; the territory includes 155 kilometres and 19 communes.

CHAMPAGNE, a town of France in the department of the Dordogne, and district of Riberac; 10 miles N. of Riberac.

CHAMPAGNE, in Heraldry, a name given by Ferne, and some other writers, to the line differing from the common lines, and called also urde, and by Upton ware, from its resemblance to the ends of the figures of that sort of fur which is called war by heralds.

CHAMPAGNE-MOUTON, in Geography, a town of France, in the department of the Charente, and chief place of a canton, in the district of Confolens; 10 miles W. of Confolens. The place contains 1155, and the canton 654 inhabitants; the territory includes 150 kilometres and 8 communes.

CHAMPAGNEY, a town of France, in the department of the Upper Saone, and chief place of a canton, in the district of Loue. The place contains 7651 inhabitants; the territory comprehends 180 kilometres and 9 communes.

CHAMPAGNOLE, a town of France, in the department of the Jura, and chief place of a canton, in the district of Poligny; 3 leagues S. E. of Poligny. The place contains 1474, and the canton 1606 inhabitants; the territory includes 100 kilometres and 31 communes.

CHAMPS. See CAMPAIGN, and CHAMPION. A Post CHAMPAIN, in Heraldry, is a mark of distinction in the coat of arms of him who kills a prisoner at war after he has cried quarter.

CHAMPS, in Navigation, are small flat-bottom vessels, used by the Chinese and Japanese. They have one mast rigged in the same manner as the main-mast of a junk, with a single sail made of cane; they seldom exceed 80 tons burthen; are constructed without iron or nail, and are
unt for rough weather. See Sampans under the article Boat.

CHAMPART, in our Old Customs, a duty, or tenure by which the tenant was to pay part of the fruits of the ground to the lord. It is also written champart, and in the middle Latin is called camparis, camparicum.

CHAMPARTORS, or CHAMPERTORS, are those who move pleas, or suits, or cause them to be moved, either by their own procurement or others; and sue them at their proper costs, to have part of the land, or other matter in variance against whom he has a writ of champerty.

CHAMPARTY, or CHAMPERTY, camparitarium, in Law, a maintenance of any man in his suit, upon condition of having part of the thing in question, be it lands or goods; in case it be recovered.

The word comes from the French, champ, field, and parti, divided; the field, or thing contended for, being supposed to be divided between the champartor or maintainer, who carries on the party's suit at his own expense, and the person in whom right he fees. 1 Hawk. P. C. 25.

Thus, champart, in the French law, signifies a similar division of profits, being a part of the crop annually due to the landlord by bargain or custom. In our fene of the word, it signifies the purchasing of a suit, or right of suing; a practice so much abhorred by our law, that it is one main reason why a close in action, or thing of which one has the right but not the possession, is not assignable at common law; because no man should purchase any pretence to sue in another's right. These pleas of civil society, says judge Blackstone, that are perpetually endeavouring to disturb the repose of their neighbours, and officiously interfering in other men's quarrels, even at the hazard of their own fortunes, were severely animadverted on by the Roman law: "qui improbè coeunt in abatern litem, ut quiquequid ex condemnatione in rem iphius redactam fuerit interesse communicaret, lege Juliae de vi privata tenuatur?" (Pl. 48. 7. 6.) and they were punished by the forfeiture of a third part of their goods and perpetual infamy.

This seems to have been an ancient grievance; for notwithstanding several statutes against it, and a form of writ accommodated to them in the time of Edward I. yet in that of Edward III. and also of Hen. VIII. it was enacted, that when the redress on the former statute was only to be had in the King's Bench, which then followed the court; for the future it should likewise be cognizable by the justices of the Common Pleas, justices of assize, and justices of peace in their quarter-sessions; and this offence is punishable by common law and statute: the 33 Edw. 1. st. 3. makes the offenders liable to three years imprisonment, and a fine at the king's pleasure. By 34 Edw. 1. c. 11. it is ordained, that no officer, nor any other, shall take upon him any business in fee, to have part of the thing in plea; nor shall any upon covenant give up his right to another; and if any do, and be convicted thereof, the taker shall forfeit to the king so much of his lands and goods as amounts to the value of the part purchased. The giving part of the lands in suit, after the end of it, to a counsellor for his reward, is not champart, if there be no preceding bargain relating to such gift; but if it had been agreed between the counsellor and his client before the action brought, that he should have part for his reward, then it would be champart. Bro. Champert. 2. And it is dangerous to meddle with any such gift, since it carries with it a strong presumption of champerty. 2 Inl. 564.

To this head may be referred the provision of the statute 32 Hen. VIII. c. 9, that no one shall sell or purchase any pretended right or title to land, unless the vendor hath re-

ceived the profits thereof for one whole year before such grant, or hath been in actual possession of the land, or of the revenue or remainder; on pain that both purchaser and vendor shall each forfeit the value of such land to the king and the protector. 2 Bl. Com. vol. iv. See Maintenance.

CHAMPON, in Geography, a town of France, in the department of the Mayenne; 2 leagues N. of Mayenne.

CHAMPDENIERS, a town of France, in the department of the Two Sèvres, and chief place of a canton, in the district of Niort; 10 miles N. of Niort. The place contains 1393, and the canton 6241 habitants; and the territory includes 100 kilometres and 13 communes.

CHAMPIS, a town of France, in the department of the Rhone and Loire; one league N. of Montbeffon.

CHAMPEAUX, William de, Lat. Compelius, in Biography, a famous scholastick philosopher and divine, was born in the 17th century, at Champeaux, a village of Bril near Melun, and studied under Anselm of Lyon at Paris, in the church of which metropolis he was made archdeacon and scholastic. His reputation in teaching philosophy attracted many scholars, and particularly the celebrated Abeilard. For an account of the jealously excited by the merit of Abelard, see the article Abelard. When the contents occasioned by this jealousy terminated. De Champeaux retired, in 1113, to his bishopric of Châlons-sur-Marne. Soon after his removal to this see, he was called upon to give his benediction as abbot to St. Bernard, with whom he contracted an intimate friendship. He was present at many councils, and distinguished himself by his religion, zeal, and knowledge of the scriptures. He died in 1211. He wrote several treatises on logical and theological subjects, and left a book of sentences; but the only work which has been printed was a small tract on the "Origin of the Soul," published in the 5th volume of D. Martin's Treatise of Archeologists. Moret.

CHAMPEAUX, in Geography, a town of France, in the department of the Seine and Marne; 7 miles N.E. of Melun.

CHAMPIEU, a town of France, in the department of the Aune-Château, and chief place of a canton, in the district of Ijou; 24 leagues N.W. of Ijoue. The place contains 1924, and the canton 10,766 habitants; the territory comprehends 155 kilometres, and 17 communes.

CHAMPPIER, SYMPHORIES, called also Campeius, and Campegius, in Biography, was born, as he informs us in one of his numerous productions, at St. Saphorine, a castle in the Lyonnois, in the year 1472. Of the course of his studies we have no information, but that he early attached himself to books, and that he was versed in the works of Plato, Aristotle, and the most abstruse of the writers then in vogue, the titles of many of his works shew. Such as "Symphonia Platonis cum Aristotele, Galenicum cum Hippocratic," &c. "Cribriati, Lima, et Annotinenta in Galeni, Avicennae et conciliatoris Opera," and many similar tracts, which serve to give the bad taste of the writer, and that he fell in with the humour of the times in which he lived. Champier took his degree of doctor in medicine at Pavia in the year 1515, and in 1522, he was made confid at Lyons, an honour he again enjoyed in the year 1535, on returning from Italy, where he had been attending on Anthony duke of Lorraine. That he was in great credit at this time, is shewn by his having for his correspondents the principal physicians and philosophers of the age, and by his having sufficient interest to found a college of physicians at Lyons, which was existing at the time of the revolution.
France. He died in 1555. For the titles of his works, and little more than the titles are now known, see Haller Bib., and Eloy, Dict. Hist. His Son Claude was author of a work "Sur les Singularités des Gauls."

CHAMPIGNE, in Geography, a town of France, in the department of the Yonne, and district of Joigny; 9 miles N. of St. Fargeau.

CHAMPION, in Gardening. See Acalicus.

CHAMPION, properly signifies a person who undertakes a combat, in the place or quarrel of another: though the word is also sometimes used for him who fights in his own cause.

Hottoman defines champion, curtidor, pro allo dato in duello a campo dictus, qui circius certarum nullius est: hence the word camp-fight.

Du-Cange observes, that champions, in the strict and proper sense of the word, were persons who fought in lieu of those who, being obliged by custom to accept the duel, had yet a just excuse for declining with it, as being too old, or infirm, being ecclesiastics, or the like. He adds, that the champions were usually retained or hired for sums of money, and were held infamous. There were also some valets, who, by the faith and homage sworn to their lord, were obliged to fight for them in case of necessity.

Some authors maintain, that any person was allowed the benefit of a champion, excepting parricides, and those accused of very heinous offences.

This custom of deciding differences by combat, was derived from the northern parts of Europe; whence it passed into Germany, and, with the Saxons, into England, and infamously through the rest of Europe. See Duel.

When two champions were chosen, the one on the part of the accuser, and another on that of the accused, it was always required there should be a decree of the judge to authorize the combat. When the judge had pronounced sentence, the accused threw a gage, or pledge, ordinarily a glove, or gauntlet; which being taken up by the accuser, they were both taken into safe custody till the day of battle appointed by the judge. If either of them died after this, he was declared infamous, and deemed to have committed the crime in question. Nor were the accuser and accused now allowed to make up the matter; at least, not without the consent of the judge; which was never granted, without making the lord satisfaction for the right of inheritance to the effects of the vanquished.

Before the champions took the field, their heads were shaved, and they made oath, that they believed the person who retained them was in the right; and that they would defend his cause to the utmost of their power. Each of them also swore with his hand on the crucifix to his faith in baptism, on his life, on his soul, and on his honour, that he verily believed he had good and just cause of quarrel, and that he had not besides either on himself, or on his horse, or in his arms, any herbs, charms, paroles, supplications, conjurations, psalm, or incantations, of which he wished to avail himself. The weapons they generally used in a combat were a sword and buckler; some say, in England, only a club and buckler: when on horseback, they were armed at all points. In a civil combat, on a writ of right, the only weapons allowed them were lances, or raves, of an ell long, and a four-cornered leather target. Their weapons were bluffed in the field by the priests, with great ceremony.

On the morning of the day appointed for the combat, the two combatants set out on horseback with the visor taken off, and made their arms, both offensive and defensive, be carried before them. They proceeded softly and slowly, having each of them in his hand the image of the saint, to whom he addressed his devotion, and in whom he placed confidence. Philippe-le-Bel, in authorizing combats, ordered the hills to be eighty paces long and forty broad.

But in civil combats it was customary to make them only about sixty feet square. On one side of the hill, a court was erected for the judges of the court of common pleas, who attended in their scarlet robes. That court was to sit by fun-ruling; and proclamation being made, the champions were introduced by two knights, and were dressed in a suit of armour, with red bandals, bare-legged from the knee downwards, bare-headed, and with bare arms to the elbows.

The action then began; at the sound of a trumpet they were to go to blows; after the number of blows or encounters expressed in the cartel, the judges of the combat threw a red into the air, to advertise the champions that the combat was ended. If it lasted till night, or ended with equal advantage on either side, the accused was reputed victor.

The punishment of the vanquished was that which the crime merited, whereof he was accused: if it were a capital crime, the vanquished was disarmed, led out of the city, and immediately executed, together with the party whose cause he maintained. If the conquered champion fought in the cause of a woman, she was burnt.

In civil combat, the combatants were bound to fight till the flars appeared in the evening; and if the champion of the tenant was able to defend himself till the flars appeared, the tenant prevailed in his cause; or if victory declared itself for either party, by the death of the other, which seldom happened, or by his proving recroent, and pronouncing the word craves, judgment was finally given in his favour. Black. Com. book iii. p. 359. &c.

Combats, from the very commencement of the French monarchy, and for a number of centuries afterwards, were lawful acts, ordered by their kings, demanded and solicited by bishops, or preferred by the same bishops, who had courts ad locum within the interior of their clouches, ornamented and prepared for each combat at the expense of the champions, whilst the fame prelates excommunicated kings and whole families for marriages contracted in even the fourth degree of consanguinity. Pope Eugenius III. when consulted respecting these combats, answered by a bull, that ancient usage must be complied with and submitted to. It can therefore hardly be supposed, that such pontiffs, though the successors of St. Peter, were much guided or directed by the Holy Spirit.

Champion of the king, is an officer, whose business is, at the coronation of the king of England, to ride into Westminster-hall, armed cap-a-pié, when the king is at dinner, and throw down his gauntlet by way of challenge; pronouncing by a herald, "That if any man shall deny, or "gainlay the king's title to the crown, he is there ready "to defend it in single combat, &c." Which done, the king drinks to him, fending him a gift cup with a cover, full of wine; which the champion drinks, and has the cup for his fee.

This office, ever since the coronation of Richard II. has been continued in the family of Dymoke, who held the manor of Serreby in Lincolnshire, hereditary from the family of the Marmions, who had it before, by grand serjeancy; on condition that the lord thereof should be the king's champion. Accordingly, Sir Edward Dymoke performed
performed this office at the coronation of king Charles II. 
and a person of the name of Dymocke performed it at the
consecration of his present majesty George III.

CHAMPION de Fujis, a military order called Angeleques D'orés de Saint Georges. This order owed its institution to
Contantine the Great, converted to the Catholic faith after a
great victory, which he gained over the enemies of the
Christian religion near Misensce. Wishing to confide the
care of the labarum, which he had adopted for a banner, in
place of the eagle of the former Romans, to intrepid
defenders, he chose from amongst those of his officers, who
had distinguished themselves most in that celebrated battle,
50 gentlemen, who were to constitute the number of knights or chevaliers, that were by his regulation to be
charged with the care of the labarum, when he took the
field. The mark of the order was a golden cross with eight
points hemmed and enamelled with gules, marked with
flower-de-luces, and carrying on one side of it thefe four
letters, I. H. S. V. in hoc signo vinces, and on the reverse the
image of Saint George piercing the dragon. The knights
were subject to the fame rules and restrictions as those of the
Orden of Maltese, except in the article of celibacy. This
order rendered itself so celebrated by its exploits, and particu-
larly at the battle of Lepanto in 1571, that it had thirty
great matters of the imperial house of Commen. A
number of kings and sovereign princes requested to become
knight, among whom were John Sobiesky, king of Poland;
Ferdinand Marie, elector of Bavaria, the Emperor Leopold
Firth, and the Emperor Charles the Fifth, who declared
himself chief of that body, and chose that his son should
carry the banner at the battle of Lepanto, in which the
Mahometans loft thirty thousand men, and had 400 galleyes
sink.

CHAMPION, or rather CHAMPAIN-lands, are lands not
inclosed; or large fields, downs, or places without woods
or hedges.

CHAMPLIN, in Geography, a river of Germany, in the
circle of Bavaria, which runs into the Regen at Cham.

CHAMPLAIN, Samuel De, in Biography, the prin-
cipal founder of the province of Canada, was a native of
Saintonge, and made his first voyages in the reign of Henry
IV., as lieutenant to the Sieur de Monte. He visited all
the harbours of Acadia, ran up the river St. Lawrence,
gave a beginning to Quebec and Montreal, advanced to the
lake ill called by his name, and afflicted the neighbouring
coustic tribes against the Iroquois. In another voyage he
proceeded further up the rivers, and defeated the Iroquois
in their own country. After his return to France in 1611
for the purpose of obtaining succours, he was sent back with
the commission of king's lieutenant in 1613, and with pro-
per requisites for fortifying Quebec. Here he remained,
and was continued in his office under the associated company
of Canada formed in 1628. But, in 1631, he was expelled
with his other countrymen by the English; but, upon its
being restored at the peace, he returned thither as govern-
general in 1634, in which year he died. He maintained the
character of an upright, courageous, active, and zealous
officer in promoting the interest of his country, and of the
settlement. He wrote, "Voyages and Travels in New
France, called Canada," 4to. 1613, in which are many
curious observations intermixed with inferences of credulity.
Nov. Dict. Hist.

CHAMPLAIN, in Geography, a lake of North America, so
called from the name of the subject of the preceding article,
who first discovered it in 1628, whereas it was before his time
called Corser's lake. This lake is next in size to lake On-
tario, and lies nearly east from it, forming part of the line that
divides the states of New York and Vermont. The length
from N. to S., says Morfe, is 80 miles; its breadth, where it
is widest, 14; but according to Mr. Weld, (Travels
through North America, vol. i. p. 209.) it is about 120
miles long, and of various breadths: for the first 30 miles,
that is from South River to Crown Point, it is nowhere
more than two miles wide; beyond this, for the distance of 12
miles, it is five or six miles across; then again it narrows,
and at the termination of a few miles, again expands.
That part called the "Brook Lake," because it is broader than
any other, commences about 25 miles N. of Crown Point,
and is 18 miles across in the widest part. Here the lake,
which is said to occupy about 500,000 acres, is interper-
ded with a great number of islands, the largest of which,
formerly called "Grand Isle, now "South Hero," says
Weld, "North Hero," according to Morfe, is 15 miles
long, and at a mean about four in breadth. The soil of
this island is fertile, and it is said that 500 people are settled
upon it. The other principal islands are North Hero, and
Morte island. They reckon in the whole not less than 60.
The broad lake is nearly 50 miles in length, and gradually
contracts till it ends in a large river called Chamblay, Riche-
beau, or South Sea Chambley. The foundations of lake
Champlain, except at the narrow parts, which terminate its
extremities, are generally very deep; in many places 62,
and in some 100 fathoms. In proportion to its breadth
and depth, the water is more or less clear; in the broad
part it is as pure and transparent as possible. On the west
side as far as Cumberland Bay, the lake is, for the greatest
part, bounded by steep mountains, close to the edge of the
water; at Cumberland Bay the ridge of mountains runs
off to the N. W., and the shore becomes low and swampy.
The east, or Vermont shore, is not, in general, much elev-
ated: at the distance, however, of 12 miles from the lake,
is a considerable mountain; the shores on both sides are
very rocky; the islands are almost encompassed with rocks,
so that it is dangerous to approach them within one or two
miles in particular parts. In falling along the shore when a
breeze is blowing, a hollow murmuring noise is heard from
the waters splashing into the clefts of the rocks. There
are many streams which fall into the lake; the mouths of
these on the western side are obstructed by falls, so that
none of them are navigable; some of these on the eastern
or Vermont side, are navigable by small boats to a short
distance. The scenery along various parts of this lake is
extremely grand and picturesque, particularly
beyond Crown Point; the shores are there beautifully
ornamented with hanging woods and rocks; and the
mountains on the western side rise up in ranges one behind
the other in a very magnificent manner. This lake is well
flored with firs, particularly salmon, salmon-trout, durgon,
and pickerel; and the lake's its banks, and on the banks
of its rivers, is fertile and productive. At Ticonderago,
which lies near the southern part of the lake, it receives
the waters of lake George from the S.S.W., which is said to
be 100 feet higher than this lake. The waters in lake
Champlain generally rise from about the 20th of April
to the 20th of June, from four to six feet, the greatest
variation being not more than eight feet. It is seldom shut
up with ice, until the middle of January, and the ice
generally goes off very rapidly between the 6th and 15th
of April.

CHAMPLAIN, the most northerly township of Clinton-
county, in the state of New York, takes its name from the
lake to which it is adjacent. It was granted to some Can-
dian and Nova Scotia refugees, who were either in the
service of the United States during the war, or fled to them
for
for protection. The indigence or ill habits of these people occasioned the breaking up of the settlement; and it is now occupied by a better class of inhabitants. The lands are fertile; and through it run two rivers, well formed with fish. It has 577 inhabitants, and three slaves. By the rate census of 1796, 76 of the inhabitants are electors.

CHAMPLAYN, a town of France, in the department of Nièvre, and district of Charnay; four leagues S.S.W. of Charnay.

CHAMPLATTE, a town of France, in the department of the Upper Saône, and chief place of a canton in the district of Gray; 12 miles N. of Gray. The place contains 2,634, and the canton 9,776 inhabitants; the territory comprehends 137 kilometres, and five communes.

CHAMPIGNY, a town of France, in the department of the Oise and Loire, and district of Nogent-le-Rotrou; 15 miles W. of Chaumont.

CHAMPOMONT, a town of Savoy; nine miles N. of Chambery.

CHAMIS, a town of France, in the department of the Cantal, and chief place of a canton, in the district of Mauriac; the canton contains 5219 inhabitants; the territory comprehends 535 kilometres, and eight communes.

CHAMPEUTERCIER, a town of France, in the department of the Lower Alps, and district of Digne; three miles W. of it.

CHAMPOCQ, a town of France, in the department of the Mayne and Loire, and chief place of a canton in the district of Angers; four leagues W.S.W. of Angers.

CHAMPOLAC, a town of France, in the department of the Mayne and Loire, and chief place of a canton in the district of Beaupreau; the place contains 1113, and the canton 8975 inhabitants; the territory includes 220 kilometres and 8 communes.

CHAMPSAUVS, a town of France, in the department of the Jura, and chief place of a canton in the district of Dole; one league S.W. of it.

CHAMPSAV, a town of France, in the department of the Upper Saône, and chief place of a canton in the district of Gray; one league south of it.

CHAMTA, or CHANTA, a town of Aia, in the country of Fribourg; 107 miles E. of Laiff.

CHAMTOA, a town of Aia, in the country of Thibet; 75 miles N.N.W. of Chantilly.

CHAMUNY, a town, mountain, and valley of Savoy, in the lordship of Faucigny. See CHAMOUNY.

CHAMUSCA, a town of Portugal, in the province of Elvas; three leagues N.E. of Santarem.

CHAMUT, a river of Naples, which runs into the sea, six miles S.S.E. of Girace.—Aia, a town of Naples, in the province of Calabria Ultra; five miles S.S.W. of Girace.

CHANA, or CHANE, in Ancient Geography, a navigable river of Aia, which discharges itself into the Cyrtus, according to Strabo.

CHANAC, in Geography, a town of France, in the department of the Lozère, and chief place of a canton in the district of Mende; 24 leagues S.W. of Mende. The place contains 1902, and the canton 5224 inhabitants; the territory includes 1471 kilometres and five communes.

CHANAY, a small island of Scotland, near the S.W. extremity of the island of I.4.

CHANAS, a town of France, in the department of the Loire, and chief place of a canton in the district of Vieleneuve; four miles S.S.W. of Vieleneuve.

CHANCAHILLO, a sea-port of South America, in the Pacific Ocean, on the coast of Peru; N.W. of Lima. S. Lat. 12° 5'.

CHANCAY, a town of South America in Peru, and principal place of a jurisdiction belonging to that of Guayaquil, in the archbishopric of Lima; situated about 15 leagues S. of Lima, in S. lat. 11° 57' 47". The town contains of about 300 houses and Indian huts: is very populous, and among other inhabitants, can boast of many Spanish families, and some of distinguished rank. Besides a parish church, it has a convent of the order of St. Francis, and an hospital chiefly supported by the benevolence of the inhabitants. The cor-

regular usually resides at Chancay, and appoints a deputy for Guayaquil. The adjacent country is naturally very fertile, and every where well watered by canals, cut from the river Pilcomayo, which runs about a league and a half to the southward of the town. These parts are everywhere town with maize, for the pur-pose of fattening, in hogs, in which article is carried on a very considerable trade; the city of Lima being furnished from hence.

CHAN-Chan, a town of Aia, in the kingdom of Coera; 12 miles S.W. of Long-Chu.ang.

CHANCE, a term we apply to events, to denote that they happen without any necessary for known or intending cause; or it is used to denote the bare possibility of an event, when nothing is known either to prevent or hinder it.

Our aim is, to describe those things to chance, which are not necessarily produced as the natural effects of any proper cause, which we can discover; but our ignorance and preci-

sity lead us to attribute effects to chance, which have neces-

sary and determinate causes.

When we lay a thing happens by chance, we really mean no more, than that its cause is unknown to us: not, as some vainly imagine, that chance itself can be the cause of any thing. Although Aristotle in his Ethics (I. iii. c. 3.), enumerating the active, efficient causes of events, mentions chance as one of them; these several causes, he says, are nature, necessity, and chance; and besides these, mind or intellect, and whatever operates by or through man. However, from the consideration that chance itself cannot be the cause of any thing. Dr. Bentley takes occasion to expost the folly of that old tenet, "the world was made by chance."

The cafe of the painter, mentioned by Plutarch, (τετερο) who, unable to express the foam at the mouth of a horse he had painted, threw his sponge in despair at the piece, and, by chance, did that which he could not before do by design, is an eminent instance of the force of chance: yet, it is obvious, all we here mean by chance is, that the thing never was before, or at least was not aware of the by cause, that did not throw the sponge with such a view; so that with respect to him it was fortuitous, because he did not design or foresee such an effect; not but that he actually did every thing ne-

cessary to produce it; infomuch that, considering the direc-

tion wherein he threw his sponge, together with its form, spe-

cific gravity, the colours wherewith it was smeared, and the

distance of the hand from the piece, it was impossible, on

the present system of things, that the effect should not

follow.

Chance, says Dr. Bentley (see Boyle's Lecture Sermons, vol. i. p. 44.), is but a mere name, and really nothing in

itself; a conception of our own minds, and only a compend-

iuous of speaking, by which we would express, that such

effects as are commonly attributed to chance, were really

produced by their true and proper causes, but without their

designing to produce them. And in any event called casual, if you take away the real and physical causes, there remains nothing but a simple negation of the agent's intending such an event, which negative being no real entity, but a con-

ception only of man's intellect wholly extrinsical to the ac-

tion, can have no title to a share in the production. The

adequate
DOCTRINE OF CHANCES.

Adequate meaning of chance, as this ingenious writer observes, is a bare negation, signifying no more than this, that any effect among inanimate bodies, ascribed to chance, is really produced by physical agents, according to the established laws of motion. But without their concurrence or concurrence to the production, and without their intention of such an effect. So that chance, in its true sense, is the same with nature, and both words are used promiscuously by some ancient writers (see Plato, X. De Legibus) to express the same thing.

Chance is frequently perverted, and erected into a chimical being, whom we conceive as acting arbitrarily, and producing all the effects, whose real causes do not appear to us; in which sense the word coincides with the Tægns, and Fortuna, of the ancients. See Fortune.

Chance is confounded with Fate and Destiny; and the word is also used for the manner of deciding things, the conduct or direction of which is left to chance, and not reducible to any determinate rules or measures; or where there is no ground for preference; as at cards, dice, lotteries, &c.

The ancient fars, or chance, M. Placette observed, was instituted by God himself; and in the Old Testament, we find several standing laws, and express commands, which preferred its use on certain occasions: hence the Scripture says, the lot, or chance, fell on St. Matthias, when it was in question who should fill Judas's place in the apostolate.

Hence also arose the fortes multitum, or method of determining things among the ancient Christians, by opening some of the sacred books, and pitching on the first verse they call their eye on, as a sure prognostic of what was to befall them. The fortes Hieromnes, Virgilianæ, PraxæÆneæ, &c. used by the heathens, were with the same view, and in the same manner. See Sortes.

St. Augustine seems to approve of this method of determining things future, and owns that he had praefidum itself; grounded upon this supposition, that God predisposes chance, and on Proverbs xvi. ver. 33.

Many among the modern divines hold chance to be conducted in a particular manner by Providence, and else it is an extraordinary way which God uses to declare his will, and a kind of immediate revelation.

CHANCES, doctrine of. This subject, no less useful than it is curious, does not appear to have engaged the attention of mathematicians in former times so much as its importance required. Until the beginning of the last, or at least, the middle of the preceding century, little is to be found in any of their writings concerning it. Of the few problems which they had been accustomcd to investigate, they withheld the solutions both from the public and from each other, and they seem to have considered the doctrine of chances rather as an exercise for their ingenuity, than as capable of being applied to any useful purpose. Before Mr. Huygens published his book “De Ratiocinis in Ludo Aæace,” no person had treated the subject methodically, and, with the exception of Mellers, Pafcall and Fermat, who had solved a few problems of no great importance or difficulty, he appears to have been the first who attempted either to give rules for the solution of any question, or to lay down the principles from which those solutions might be deduced. To him, therefore, we are indebted for the first regular treatise on this subject; although even his work, from the comparatively few problems which it contains, and the want of demonstrations to some of them, can hardly be regarded as an elementary treatise. To this work succeeded a small anonymous tract “on the Laws of Chance,” which was published in London in 1692, and a French publication of not much larger size, entitled “L’Analyse des Jeux de Hazard,” which was written by M. M. Mort, and published in the year 1788. In this latter work, the author having chiefly indulged in the same mode of reasoning with Mr. Huygens, in the solution of his problems, Mr. de Moivre, (who considered him reasoning as neither genuine nor natural,) was induced, in his celebrated work on the Doctrine of Chances, (which was first published in 1717,) to adopt a plan and less exceptionable mode, in which he has proceeded from the most simple to the most complicated cases; so that, by the variety of his problems and set as well as by the improvements and additions which he has made in two subsequent editions, he has rendered his work one of the most and most copious that has ever been written on the subject. In the year 1740, Mr. Thomas Simpson, in consequence, as he observes, of the high price of the preceding, and the imperfections of other books on the subject, was led to publish a small treatise on “the Nature and Laws of Chance,” which, like his other publications, is not only clear and concise, but contains some problems, whose solutions had either never been attempted, or, at least, never before communicated to the public. Prior, however, to the two last-mentioned publications, a paltrious work of Mr. James Bernardi was published in the year 1715, entitled “De Arte Conjeptandi,” containing an explanation of Mr. Huygens’s tract, and the solution of a great variety of other problems deduced from the general principles of combination. The second part of this valuable work has lately been translated into English by Mr. Baron Mifcre, with copious notes and commentaries, and it is to be regretted that the other parts had not been given to the public in the same manner.

In the first volume of his Mathematical Repository, published in the year 1748, Mr. Dodson has introduced the solution of several questions in the doctrine of chances; but chiefly with the view of applying them to the doctrine of annuities and insurance, which constitutes the principal part of his work. In the year 1765, and at other times, M. D’Alembert in his Opuscules, &c. wrote different essays; and about 15 years ago M. Cordewect published a small treatise on the same subject. But as these works are almost wholly confined to the investigation of events, whose probability or improbability can be ascertained by no computation, they serve more to shew the ingenuity of the authors than to answer any useful purpose. In addition to these, which are the principal publications on this subject, may be noticed a small tract, “De Menfura Sortis,” given by Mr. de Moivre, in his “Miscellanea Analeticæ,” and some papers written by him, by Mellers, Bernoulli, Euler, and others, in the Acts of Leiphe, the Journal des Sevans, the Philosophical Transactians, &c. among which may be particularly mentioned an “Essay on the Method of calculating the exact probability of all Conclusions founded on Induction, and a “Supplement” to that essay—the one preferred from the papers of the late Rev. Mr. Bayes, and communicated, with an appendix, by Dr. Price to the Royal Society in the year 1762; the other chiefly written by Dr. Price, and communicated in the following year. These tracts contain the investigation of a problem, the converse of which had formerly exercised the ingenuity of Mr. Bernoulli, de Moivre, and Simpson. Indeed, both the problem and its converse may justly be considered not only as the most difficult, but as the most important that can be proposed on the subject; having (as Dr. Price well observes) "no less an object in view than to shew what reason we have for believing that there are in the constitution of things fixed laws, according to which events happen; and that, therefore,
DOCTRINE OF CHANCES.

fore, the frame of the world must be the effect of the wis-

DOM and power of an intelligent cause; and thus to con-

firm the argument taken from final causes for the existence of the Deity. While the solution of these problems re-

quire and display the highest mathematical skill, their ap-

plication proves how much those are mistaken who have in-

sulted that the "doctrine of chances is of trivial con-

sequence and unworthy of any serious inquiry." In truth, there is no part of the mathematics of more consequence, at

least in this country, where the valuation of an immense pro-

perty, and the future provision of many thousands entirely depend on a right knowledge of the subject. In addition to the treatises and papers already mentioned, it may be ob-

served, that the last communication of Dr. Waring to the Royal Society, in the year 1791, contains the solutions of

two theorems on this subject; but as the chief design of the pre-

sent article is to explain the general principles on which all solutions in the doctrines of chances are founded, rather than to give a minute history of what has already been done, or an analysis of every particular case, it will be im-

proper to proceed further with this account.

In order the more rightly to understand the subject it will be necessary to begin with the following defini-

tions:

DEFINITION I. The probability of an event is the ratio of the chance for its happening to all the chances for its happen-

ings or failings: thus, if out of six chances for its happen-

ing or failing, there were only two chances for its happen-

ing, the probability in favour of such an event would be in the ratio of 2:6; that is, it would be a fourth proportional to

6, 2, and 1, or 1/3. For the same reason, as there are four chances for its failing, the probability that the event will not happen, will be in the ratio of 4 to 6, or, in other words, it will be a fourth proportional to 6, 4, and 1, or 1/3. Hence, if the fractions expressing the probabilities of an event's both happenings or failing be added together, they will always be found equal to unity. For let a be the number of chances for the event's happening, and b the number of chances for its failing, the probability in the first case being \( \frac{a}{a+b} \), and in the second case \( \frac{b}{a+b} \), their sum will be \( \frac{a}{a+b} + \frac{b}{a+b} = 1 \).

Having therefore determined the probability of any event's either happening or failing, the probability of the contrary will always be obtained by subtracting the fraction expressing such probability from unity.

DEFINITION II. The expectation of an event is the present value of any sum or thing which depends either on the happen-

ning or on the failing of such event. Thus, if the receipt of one guinea were to depend on the throwing of any particu-

lar face on a die, the expectation of the person entitled to receive it would be worth \( \frac{1}{6} \) of a guinea; for since there are six faces on a die, and only one of them can be thrown to entitle the person to receive his money, the probability that such a face will be thrown being \( \frac{1}{6} \) (according to Definition I.), it follows that the value of his interest before the trial is made, or which is the same thing, that his expectation is equal to one-sixth of a guinea, or \( \frac{1}{6} \) of a guinea. Were his receiving the money to depend on his throwing either of two faces, his expectation would be equal to two-sixths of a guinea, or \( \frac{2}{6} \). And, in general, supposing the present value of the money or thing to be received to be \( A \), the probability of the event's happening to be denoted by \( a \), and of its failing by \( b \), the expectation will be either expressed by \( \frac{Aa}{a+b} \) or by \( \frac{Ab}{a+b} \) according as it depends either on the event's happen-

ning, or on its failing.

DEFINITION III. Several events are inconsistent, when, if one of them happens, none of the rest can; thus, if the sum \( S \) were to be received on throwing either an ace or a deuce with a single die, it is evident that the expectation in this case would depend on either of two events which are incon-

sistent with each other; for if one particular face is thrown it is impossible that the other should be turned up at the same time. And since the value on the ace's being thrown is \( \frac{S}{6} \), and its value on the deuce's being thrown is also \( \frac{S}{6} \), it fol-

ows that the whole expectation will be equal to \( S \) multiplied into the sum of the probabilities of the two events, or \( \frac{S}{6} + \frac{S}{6} = \frac{S}{3} \); and this is universally true, whatever be the number of such events.

DEFINITION IV. Two events are contrary, when one or other of them must, and both together cannot happen.

DEFINITION V. An event is said to be determined, when it has either happened or failed.

DEFINITION VI. Events are independent, when the happen-

ping of any one of them does neither increase nor lessen the probability of the rest. Thus, if a person undertook with a single die to throw an ace at two successive trials, it is ob-

vious (however his expectation may be affected) that the probability of his throwing an ace in the one is neither increased nor lessened by the result of the other trial.

THEOREM.

"The probability that two subsequeint events will both happen, is equal to the product of the probabilities of the happen-

nings of those events considered separately."

Suppose the chances for the happening and failing of the first event to be denoted by \( b \), and those for its happening only to be denoted by \( a \). Suppose, in like manner, the chances for the second event's happening and failing to be denoted by \( d \), and those for its happening only by \( c \); then will the probability of the happening of each of these events, separately considered, be, according to Definition I. \( \frac{a}{b} \) and \( \frac{c}{d} \) respectively. Since it is necessary that the first event should happen before any thing can be determined in regard to the second, it is evident that the expectation on the latter must be lessened in proportion to the improbability of the former. Were it certain that the first event would happen, in other words, were \( a = b \) or \( a \frac{c}{d} = 1 \), the expectation on the second event would be \( \frac{c}{d} \). But if \( a \) is lefs than \( b \), and the expectation on the second event is restrained to the con-

tingency of its having happened the first time, that expectation will be so much lefs than it was on the former fappa-

sition as \( \frac{a}{b} \) is less than unity. Hence we have \( 1 : \frac{a}{b} = \frac{a}{b} : \frac{c}{d} \) for the true expectation in this case.

Corollary. By the same method of reasoning it will ap-

pear, that the probability of the happening of any number of subsequeint events is equal to the "product of the proba-

bilities of those events separately considered," and therefore if \( a \) always denote the probability of its happening, and \( b \) the probability of its happening and failing, the fraction A b

a + b
DOCTRINE OF CHANCES.

$\frac{a^b}{b^c}$ will express the probability of its happening $n$ times successively, and (by Definition 1.) the fraction \( \frac{b-a}{b} \) will express the probability of its failing $n$ times successively.

Remark. It should be observed that, in some instances, the probability of each subsequent event necessarily differs from that which preceded it, while in others it continues invariably the same through any number of trials. In the one case the probabilities are expressed, as in the theorem, by fractions, whose numerators and denominators continually vary; in the other they are expressed, as in the corollary, by one and the same invariable fraction. But this perhaps will be better understood by the following examples.

1. Suppose, that out of a heap of counters, of which one part of them are white and the other red, a person were twice successively to take out one of them, and that it were required to determine the probability that these should be red counters. If the number of the white be $6$, and the number of the red be $4$, it is evident, from what has already been shown, that the probability of taking out a red one the first time will be $\frac{4}{10}$; but the probability of taking it out the second time will be different; for since one counter has been taken out, there are now only nine remaining; and hence, in order to get a second trial, it is necessary that the counter taken out should have been a red one, the number of these red ones must have been reduced to 3. Consequently, the chance of drawing out a red counter the second time will be $\frac{3}{9}$, and the probability of drawing it out the first and second time will (by this theorem) be $\frac{4 \times 3}{10 \times 9} = \frac{2}{15}$.

2. Suppose next, that with a single die, a person undertook to throw an ace twice successively: in this case the probability of throwing it the first, does not in the least alter his chance of throwing it the second time, as the number of faces on the die is the same in both trials. The probability, therefore, in each will be expressed by the same fraction, so that the probability, before any trial is made, will, by the preceding corollary, be $\frac{1}{6} \times \frac{1}{6} = \frac{1}{36}$. On these conclusions depend all the computations, however complicated and laborious, in the doctrine of chances. But this perhaps will be more clearly exemplified in the following problems, which, containing the solution of some of the most difficult and important cases, will serve to explain the principles on which every other investigation is founded in this intricate and exhausitive subject.

PROBLEM I.

To determine the probability that an event happens a given number of times and no more, in a given number of trials.

Solution. 1. Let the probability be required of its happening only once in two trials, and let the ratio of its happening to that of its failing be as $a$ to $b$. Then since the event can take place only by its happening the first, and failing the second time, the probability of which is $\frac{a}{a+b}$, or by its failing the first and happening the second time, the probability of which is $\frac{b}{a+b} \times \frac{b}{a+b}$, the sum of these two fractions, or $\frac{2ab}{a+b}$, will be the probability required.

2. Let the probability be required of its happening only twice in three trials. In this case the event, if it happens,

must take place in either of three different ways. 1st. By its happening the first two, and failing the third time, the probability of which is $\frac{a^2b}{a+b}$; 2dly. By its failing the first and happening the other two times, the probability of which is $\frac{b^2a}{a+b}$; or, 3dly. By its happening the first and third, and failing the second time, the probability of which is $\frac{a^2b}{a+b}$.

The sum of these fractions, therefore, or $\frac{2ab}{a+b}$, will be the required probability. By the same method of reasoning, the probability of its happening only once in three trials; or, which is the same thing, of its failing twice in three trials, may be found equal to $\frac{ab}{a+b}$.

3. Let the probability of the event's happening only once in four trials be required. In this case it must either happen the first and fail in the three succeeding trials—or happen the 2d and fail in the 1st, 3d, and 4th trials—or happen the 3d and fail in the 1st, 2d, and 4th trials—or happen the 4th and fail in the 1st, 2d, and 3d trials. The probability of each of these being $\frac{ab}{a+b}$, the required probability will be $\frac{4ab}{a+b}$, and for the same reason the probability of its happening three times and failing only once in four trials will be $\frac{4ab^3}{a+b}$.

4. Let the probability be required of its happening twice and failing twice in four trials: here the event may be determined in either of five different ways. 1st. By its happening the 1st and 2d, and failing in the 3d and 4th trials—2dly, by its happening the 1st and 3d, and failing the 2d and 4th trials—3dly, by its happening the 1st and 4th, and failing the 2d and 3d trials—4thly, by its happening the 2d and 3d and failing the 1st and 4th trials—5thly, by its happening the 2d and 4th, and failing the 1st and 3d trials—or, 6thly, by its happening the 3d and 4th and failing the 1st and 2d trials. Each of these probabilities being expressed by $\frac{a^p}{a+b}$, it follows that the sum of them, or $\frac{6a^p}{a+b}$, will express the probability required.

By proceeding in the same manner, the probability in any other case may be determined. But if the number of trials be very great, these operations will become exceedingly complicated, and therefore recourse must be had to a more general method of solution.

Supposing $n$ to be the whole number of trials, and $d$ the number of times in which the event is to take place, the probability of the event’s happening $d$ times successively, and failing the remaining $n-d$ times, will be $\frac{a^d}{a+b} \times \frac{a^{n-d}}{a+b} = \frac{a^d \times a^{n-d}}{a+b^{n-d}}$. But as there is the same probability of its happening any other $d$ assigned trials and failing in the rest, it is evident that this probability ought to be repeated as often as $d$ things can be combined in $n$ things, which, by the known rules of combination, are $\frac{n!}{d!(n-d)!}$.
DOCTRINE OF CHANCES.

continued to $d$ terms; the general rule therefore will be

$$\frac{a^1 \times b^{n-2}}{a + b^2}$$

multiplied into $n \times \frac{n-1}{2} \times \frac{n-2}{3} \times \frac{n-3}{4}$ conti-

tued to $d$ terms.

Example. Supposing a person with fix dice undertakes to throw two aces and no more; or, which is the same thing, that he undertakes with one die to throw an ace twice, and no more, in six trials, it is required to determine the probability of his succeeding, $a$ being in this case $1$, $b$ $= 5$, $n = 6$, and $d = 2$; the above expression will become

$$\frac{a^1 \times b^{n-2}}{a + b^2}$$

multiplied into $6 \times \frac{5}{2} \times \frac{4}{3} \times \frac{3}{2} \times \frac{2}{1} = \frac{15 \times 10 \times 2}{10}$ nearly.

Hence, since there are only two chances for his succeeding, while there are eight for his failing, the odds against him will be as four to one.

Problem II.

To determine the probability of an event that happens a given number of times in a given number of trials; supposing, as in the former problem, the probability of its happening each time to that of its failing to be in the ratio of $a$ to $b$.

Solution. It will be observed that this problem materially differs from the preceding, in as much as the event in that problem was refrained so that it should happen either more nor less often than a given number of times, while in this problem the event is determined equally favourable by its happening either as often or oftener than a given number of times, so that in the present case there is no further restriction than that it should not fail short of that number.

1. Let the probability be required of an event happening once at least in two trials. If it happens the first, and fails the second, or fails the first and happens the second time, or happens both times, the event will have equally suc-
ceeded. The probability in the first case is $\frac{a \times b}{a + b^2}$; the probability in the second is $\frac{b \times a}{a + b^2}$; hence the probability required will be

$$\frac{2a \times b + a \times a}{a + b^2}$$

2. Let the probability be required of its happening once in three trials. Provided it has happened once at least in the first two trials, the event will have equally succeeded, whether it happens or fails in the third trial, and therefore $\frac{a^2 + 2a \times b}{a + b^2}$ will represent the probability in this case. But it may have failed in the first two and happened in the third trial, the probability of which is $\frac{b \times b}{a + b^2}$; adding this to the preceding fraction, we have

$$\frac{a^3 + 3a \times b^2 + 3a \times b}{a + b^2}$$

for the probability required. In like manner the probability of its happening once at least in four trials will be

$$\frac{a^4 + 7a \times b^3 + 3a \times b^2}{a + b^2}$$

and the probability of its happening once at least in $n$ times will be

$$\frac{a^n + n \times a \times b \times n}{a + b^2}.$$ In other words, since the event must happen once at least, unless it fails every time, the probability re-
quired (by Def. I.) will always be expressed by the difference
between unity and $\frac{b^n}{a + b^n}$.

3. Let the probability be required of an event's happen-
ing twice at least in three trials. In this case it will succeed
if it happens the 1st and 2d, and fails the 3d time, if it
happens the 1d and 3d, and fails the 2d time, if it happens the 2d and 3d, and fails the 1st time, or if it happens each
time successively. The 1st three probabilities are $\frac{a^2 \times b}{a + b^2}$ and

the 4th is $\frac{a^4}{a + b^2}$; therefore the probability required will be

$$\frac{a^2 \times b + a \times b^2}{a + b^2}.$$ If the event is to happen twice at least in four times, the probability of its happening during the first three times has already been found. Let it be supposed to have happened only once in these times, the probability of which, by the preceding problem, is $\frac{a \times b}{a + b^2}$; then will the probability of its happening the 4th, after having happened once in the three preceding, be $\frac{a^2 \times b^2}{a + b^2}$, and therefore the whole probability will be

$$\frac{a^2 + 3a \times b + 3a \times b^2}{a + b^2}.$$ By proceeding in the same manner, it may be found that the probability of an event's happening twice at least in five trials, will be

$$\frac{a^4 + 4a \times b \times 6a^2}{a + b^2}.$$ And if the probability of the event's happening three in 4, 5, 6, &c. trials be required, they may, by pursuing the same

teps, be found

$$\frac{a^5 + 6a \times b^2 + 15a \times b^3 + 20a \times b^4}{a + b^2}$$

that is, the series in the numerator must be continued till the index of $a$ becomes equal to $d$.

Corollary. From this solution it appears that the series

$$\frac{\sum a^1 + n \times b^{n-1} a + n \times 2 \times b^{n-2} a + \cdots}{a + b^n}$$

will express the probability of the event's not happening so often as $d$ times in $n$ trials.

Example. Supposing a person with six dice undertakes to throw two aces or more in the 1st trial, what is the probability of his succeeding? In this case $a = 5$, $b = 1$, and $d = 2$ being respectively equal to 1, 5, 6, and 2, the above expression will become

$$\frac{1 + 5 \times 1 \times 2 + 20 \times 1 \times 3 + 125 \times 1 \times 4}{a + b^n}$$

$= \frac{122,814}{46,056}$. Hence the odds against his succeeding will be as

34,375 to 122,814, or very nearly as 2. 5 to one.

Problem
PROBLEM III.

To determine the number of trials in which it shall become an equal chance, that an event happens $d$ times; supposing still the ratio of the event's happening to that of its failing in any single trial to be as $a$ to $b$.

Solution. Let $n$ be the number sought: then since it appears, from the preceding corollary, that the probability of the event's not happening $d$ times in $n$ trials is equal to

$$\frac{a^n}{a+b}$$

and since this expression, from the nature of the problem, must be $\frac{1}{2}$, it follows that the series

$$1 + \frac{n a}{b} + \frac{n(n-1) a^2}{2 b^2} + \ldots (d)$$

will converge to $rac{1}{2}$, and therefore in order to obtain a solution of this problem, it will be necessary to find the unknown quantity $n$.

If $a = b$ or, in other words, if the chances of the event's happening or failing are equal, the series will become simply

$$1 + n + \frac{n(n-1) a^2}{2 b^2} + \ldots (d)$$

But the first half of the terms of the binomial $(1 + x)$ are equal to the root of the terms, or half the whole power, and the whole number of terms, in any binomial, raised to the nth power, is $n + 1$. Hence it follows that the exponent, $n$, in this case will always be $2d - 1$; so that supposing a counter to have a black and a white side, and that it was required to determine the number of throws which would be necessary to make it an equal chance, that either face should be turned up, 3, 4, 5, &c. times, the number thus required will be 5, 7, 9, &c.

If, on the contrary, instead of being equal, the ratio of $b$ to $a$ is indefinitely great, or, which is the same thing, if the fraction $\frac{a}{b}$ is indefinitely small; let this fraction be made $\frac{1}{d^2}$. Then we have

$$1 + \frac{n p}{1} + \frac{n^2 p^2}{2} + \ldots (d)$$

and the hyp. log. of this equation will become

$$1 + \frac{1 + p}{d^2}$$

Let $d = 1$, then will the above equation become

$$n + \log_{a} \left( \frac{1 + p}{d^2} \right) = \log_{a} 2$$

and $c.$ is equal the hyp. log. of $\frac{1 + p}{d^2}$ and, consequently, in as much as $p$ is indefinitely small, $n p = \log_{a} 2$. \&c. or $\frac{1}{d^2}$ very nearly.

2dly. Let $d = 2$, and $x$ is the logarithm of $2 + \log_{a} \left( \frac{1 + p}{d^2} \right)$. But the hyp. log. of $2 + \log_{a} \left( \frac{1 + p}{d^2} \right)$ is

$$\frac{x^2}{a} - \frac{a}{d^2} + \frac{a^2}{d^4} - \&c.$$

whence the result of the hyp. log. of $a + x$ is

$$\frac{x^2}{a} - \frac{a}{d^2} + \frac{a^2}{d^4} - \&c.$$

Vol. VII.
DOCTRINE OF CHANCES.

Example 2. In how many throws with four dice may it be undertaken to turn up 15 points twice?

Ans. The number of chances for throwing 15 points with 4 dice being 130 (see Prob. VII.), and the number of chances for missing being 67 - 140 = 1156, \( \frac{b}{a} \) will be equal to \( \frac{1156}{140} \), and therefore the number required will be

\[
\frac{1156 \times 2 - 3 + 2 - 3 = 15 \text{ nearly.}}{140}
\]

Example 3. Supposing a lottery, like that for the present year (1805), consisting of 2,500 tickets, of which 20 are to be prizes of 1000, and upwards; how many tickets will be bought in order to make it an equal chance that the purchaser has one of those prizes?

Ans. In this case \( \frac{b}{a} = \frac{24900}{20} \), and, therefore, the number required will be \( 1249 \times 1 - .3 + 1 - .7 = 375 \) nearly.

It may be observed, that in this lottery the whole number of prizes of every description being 5210, it may be found by the preceding rule that it will be necessary to buy about 3 tickets, in order to make it an equal chance that the purchaser has a prize.

PROBLEM IV.

Suppose a given number \( n \) of counters of the same shape and size, but marked with different letters, (of which \( a \) are white, \( b \) are red, \( c \) are blue, &c.) to be mixed promiscuously, and that a given number \( m \) of them were to be taken out at random; it is required to determine the probability that there shall be precisely \( p \) white, \( q \) red, \( r \) blue, &c.

Solution. By the well-known rules of combination, the number of ways in which \( a \) things may be combined, so that there shall be \( p \) things in each parcel, is

\[
a, a - 1, a - 2, a - 3, \ldots (p) = \frac{a!}{a - p!}
\]

and the number of ways in which \( b \) things may be combined, so that there shall be \( q \) things in each parcel, is

\[
b, b - 1, b - 2, \ldots (q) = \frac{b!}{b - q!}
\]

The number of ways, therefore, in which, \( a, b, c, \ldots \) things may be combined, so that there shall be \( r \) things in each parcel is

\[
c, c - 1, c - 2, \ldots (r) = \frac{c!}{c - r!}
\]

and so on. The number of ways, therefore, in which, \( a, b, c, \ldots \) things may be combined, so that there shall be \( p \) of the 1st, \( q \) of the 2d, \( r \) of the 3d, \( \ldots \), will be

\[
a, a - 1, a - 2, \ldots (p) \times c, c - 1, c - 2, \ldots (q) \times 1, 2, 3, \ldots (r) = \frac{a!}{a - p!} \times \frac{c!}{c - q!} \times \frac{r!}{r - p!}
\]

But the number of ways in which \( n \) things may be combined, so that there shall be \( m \) things in each parcel, without any restriction as to their being composited of any particular fort, is

\[
\frac{n!}{m! (m - n)!}
\]

It follows, therefore, that in taking out \( m \) (or \( p + q + r + \ldots \)) counters, the probability that there shall be precisely \( p \) of white, \( q \) of red, \( r \) of blue, &c. will be expressed by the fraction

\[
\frac{a, a - 1, a - 2, \ldots (p) \times b, b - 1, b - 2, \ldots (q) \times c, c - 1, c - 2, \ldots (r) \times 1, 2, 3, \ldots (m)}{n! (n - m)!}
\]

Hence, the odds are as 155 to 48, or rather more than three to one against the contingency above-mentioned. If nine were taken out, of which four were to be diamonds, three spades, and two clubs, the odds against their being taken in that order would be very nearly 22,250 to one.

Corollary. If only counters of one colour are to be taken out, the fraction will be simply

\[
a, a - 1, a - 2, \ldots (p) \times 1, 2, 3, \ldots (m) = \frac{n!}{m! (m - n)!}
\]

If counters of two colours, \( m \) will become \( \frac{p + q}{p + q - m} \), and the fraction expressing the probability will be

\[
a, a - 1, a - 2, \ldots (p) \times b, b - 1, b - 2, \ldots (q) \times 1, 2, 3, \ldots (m)
\]

Since the denominator \( n, n - 1, n - 2, \ldots (m) \) is

\[
\frac{(m + 1) m (m - 1) \ldots 1}{(m - n)!}
\]

and the fraction \( \frac{a, a - 1, a - 2, \ldots (p) \times b, b - 1, b - 2, \ldots (q) \times 1, 2, 3, \ldots (m)}{(m + 1) m (m - 1) \ldots 1} \) will be

\[
\frac{n!}{m! (m - n)!}
\]

And the last factor

\[
\frac{a, a - 1, a - 2, \ldots (p) \times 1, 2, 3, \ldots (m)}{n! (n - m)!}
\]
DOCTRINE OF CHANCES.

If counters of three colours are taken out, the fraction expressing the probability that there shall be $p$ of a fort, $q$ of $b$ fort, and $r$ of $c$ fort, will, by pursuing the same steps, and making $d = a + b + c - m$ be reduced to

$$\frac{d}{n - 1, n - 2, \&c. (p)} \times \frac{d - 1, d - 2, \&c. (a + q - m)}{n - 3, n - 4, \&c. (a + b)}$$

where $a, b, p$, and $q$ are not very large, and that $r$ be always put to denote the highest number. In short, if only one set of counters or things be very numerous, and the others inconsiderable, an expression will always be obtained by proceeding in this manner which shall give the probability required with very little trouble.

Example. Suppose a lottery like that of the present year (1866) to consist of 25,000 tickets, of which three are to be prizes of 20,000l. each, and three of 10,000l. each; and that a person has purchased 3000 of those tickets. What is the probability of his having among them one prize of 20,000l. and one prize of 10,000l.? In this case $n$ is equal to 25,000l., $a = 3$, $b = 3$, $d = 1$, $r = 2998$, and $d = 22,000$; hence the above expression becomes

$$\frac{25,000 \times 24,999 \times 24,998 \times 24,997 \times 24,996 \times 3000 \times 2999 \times 2998 \times 2997 \times 2996}{24,995} = 0.0777.$$
DOCTRINE OF CHANCES.

When \( \frac{3}{n-3} \) must be equal to \( \frac{1}{n} \), we shall have \( 1 - \frac{4}{n} \). 

\[
\frac{n}{n-1} \cdot \frac{n}{n-2} \cdot \frac{1}{n-n-2} = \frac{1}{n-1} \cdot \frac{1}{n-2} \cdot \frac{1}{n-n-2}
\]

for the probability that neither of the four counters marked \( a, b, c, d \), shall be taken out in their right order. Hence it is manifest, if the number of counters to be taken out be \( m \), and \( A, B, C, D \), \&c. be the several coefficients of the binomial whose exponent is \( m \), that the probability that neither of the counters come out in their right order will be expressed by \( 1 - \frac{A}{n} + \frac{B}{n-k} \), \&c. that the required probability in this case will be \( \frac{1}{n} \) multiplied into \( \frac{n}{n-k} \) in \( n \) to \( n-1 \) and \( n-2 \), \&c. 

\[
\frac{n}{n-1} \cdot \frac{n}{n-2} \cdot \frac{1}{n-n-2} \cdot \frac{1}{n-n-1} \cdot \frac{1}{n-n-2} + \&c. \quad (m+1).
\]

Corollary 1. If out of a given number of counters taken out, it were required to determine the probability that the first \( k \) of them should be in their right order, and the remaining \( m \) ones in the contrary, it will follow, since the fraction expressing the first of these contingencies is \( \frac{1}{n} \), and the fraction expressing the second or the contingency that none of the \( m \) counters shall come out in their proper order, that \( I - \frac{A}{n} + \frac{B}{n-k} + \&c. \quad (m+1) \).

Corollary 2. If it be proposed to take out the whole of the \( n \) counters, or, in other words, if \( n-k \) be \( m \), then will the probability that the first \( k \) counters come out in their proper order, and all the remaining ones in the contrary be expressed by \( \frac{1}{n} \) multiplied into \( \frac{n}{n-k} \), \&c. 

\[
1 - \frac{1}{n} - \frac{1}{n-1} - \frac{1}{n-2} \cdots \frac{1}{k} \quad (n+1).
\]

If \( m+1 \) be a large number, this fall series may be considered as infinite; and hence, thus continued, it is known to be the number whole hyp. log. is \( -1 \), the reciprocal of which is the number whole hyp. log. is \( +1 \). Deducting 1 therefore from \( 2.3025851 \) (the hyp. log. of \( 10 \) the remainder \( 1.3025851 \) will be the hyp. log. of the number \( 3.678738 \). Hence the above probability in this case will be nearly \( \frac{3.678738}{n} \). 

Corollary 3. Supposing \( n-k \) to be still \( m \), and it were required to determine the probability of taking \( k \) things in their proper order, without any restriction as to the rest, it is evident that the above expression ought to be repeated as many times as \( k \) things can be taken in \( n \) things, or \( \frac{n}{n-1} \cdot \frac{n}{n-2} \cdots \frac{1}{k} \) times, and consequently that the probability required will be very nearly \( \frac{3.678738}{n} \). 

Hence, if \( 3.678738 \&c. \quad \text{be put} = \frac{1}{n} \cdot \frac{2}{n} \cdot \frac{3}{n} \cdots \frac{4}{n} \quad (k) \quad \text{we shall have} \quad \pi, \pi, \pi, \pi, \&c. \quad \text{for the several probabilities of taking out \( 1, 2, 3 \&c. \) counters in their proper order; and} \quad 1 - \pi, 1 - 2\pi, 1 - 2\pi + \pi, \&c. \quad \text{for the several probabilities of} \quad 1, 2, 3 \&c. \text{ or a greater number, will not be taken out in their proper order.}

Corollary 4. If instead of \( n \) there be \( n \) counters marked with each of the letters \( a, b, c, d \), \&c. and it were required to determine the probability that \( k \) forts shall be taken out in the order of the alphabet, and \( m \) forts in the contrary order, the solution in this case will be easily obtained from that of the preceding problem. For since the permutations are \( \frac{n!}{n-1!} \cdot \frac{n!}{n-2!} \); and by pursuing the same steps as in the solution of the preceding problem, the probability that the \( a \)'s do not come out first nor the \( b \)'s next will be \( 1 - \frac{A}{n} - \frac{B}{n-k} + \&c. \quad (m+1) \), \( \frac{n}{n-1} \cdot \frac{n}{n-2} \cdot \frac{1}{n-n-2} \cdot \frac{1}{n-n-3} \cdots \frac{1}{n-k} \). 

Hence the probability that all the counters of any particular class shall not be taken in succession will be \( \frac{1}{b} + \frac{b}{n-n-1} \cdot \frac{n}{n-2} \cdots \frac{1}{n-k} \); and the probability of the \( a \), \( b \), \( c \), \( d \), \&c. of the \( a \) or \( c \) will be \( \frac{1}{b} + \frac{b}{n-n-1} \cdot \frac{n}{n-2} \cdot \frac{1}{n-n-2} \cdot \frac{1}{n-n-3} \cdots \frac{1}{n-k} \). 

As in Corollary 1, we shall have \( \frac{n}{n-1} \cdot \frac{n}{n-2} \cdot \frac{1}{n-k} \cdot \frac{1}{n-k-p} \cdot \frac{1}{n-k-p+1} \cdots \frac{1}{k} \cdot \frac{1}{k-p+1} \cdot \frac{1}{k-p+2} \cdots \frac{1}{k} \). 

Problem VI.

Supposing a fold with \( n \) regular faces to be thrown in continued succession by \( A, B, C \), and it be paid to the person who shall first throw any assigned face, to determine the value of the several expectations, or the probability of their obtaining this sum.

Solution. By the condition of the problem, \( A \) is to have the \( 1 \), \( 4 \), \( 5 \), \&c. throws; \( B \) the \( 2 \), \( 5 \), \&c. and \( C \) the \( 3 \), \( 6 \), \&c. The probability of \( A \)'s throwing it the \( 1 \)st time is \( \frac{1}{n} \); the probability of his throwing it the \( 4 \)th time depending on the contingency of his having missed it the first, and of \( B \)'s and \( C \)'s having missed it the
DOCTRINE OF CHANCES.

2d and 3d times, may be found by reasoning as in the solution of the preceding problem, \( \frac{n}{n-1} \times \frac{1}{n} \); the probability of throwing it the 7th time, depending on the contingency of his having missed it the 1st and 4th, or B's having missed it the 2d and 5th, and of C's having missed it the 3d and 6th times, may be found as \( \frac{n-1}{n} \times \frac{1}{n} \), and so on. In like manner the probability of B's throwing it the 2d, 5th, &c. times, will be \( \frac{n-1}{n} \), &c. and the probability of C's throwing it the 3d, 6th, &c. times will be \( \frac{n-1}{n} \), &c. Hence the whole expectation of A will be \( \frac{n}{n-1} \times \frac{1}{n} + \frac{n-1}{n} + \frac{n-1}{n} + \cdots \), &c., the whole expectation of B is \( \frac{n}{n-1} \times \frac{1}{n} + \frac{n-1}{n} + \frac{n-1}{n} + \cdots \), &c., the whole expectation of C is \( \frac{n}{n-1} \times \frac{1}{n} + \frac{n-1}{n} + \frac{n-1}{n} + \cdots \), &c., &c., or \( \frac{n}{n-1} \).

Corollary 1. If the solid be a cube, the odds in favour of A against B will be as 56 to 36, and the odds in his favour against C will be as 36 to 25. And supposing the sum S to be 101, the values of their respective expectations will be 56.138, 26.684, and 21.158.

Corollary 2. If, instead of a cube, the solid be a counter with two faces, \( n \) in this case will be 2, and the odds in favour of A against B will be as 2 to 1, and the odds in his favour against C will be as 4 to 1; that is, their respective expectations in the sum S (supposing it to be 101) will be 51.149, 21.758, and 21.543. Nearly. If, on the contrary, the solid have a great number of faces, the chances will be nearly equal. Hence the advantage of having the priority in the throws will be greater or less, in proportion as the faces are few or many in number.

Corollary 3. If instead of three there be \( d \) persons to throw the solid successively, the expectation of the 1st will be \( S \), the \( d \)th \( \frac{n}{n-1} \times \frac{1}{n} \); of the 2d \( \frac{n}{n-1} \times \frac{n-1}{n} \); of the 3d \( \frac{n}{n-1} \times \frac{n-1}{n} \); of the 4th \( \frac{n}{n-1} \times \frac{n-1}{n} \); of the \( d \)th \( \frac{n}{n-1} \times \frac{n}{n-1} \). Hence the chance of throwing any given number \( (p) \) of points with any number \( (m) \) of solids, having a given number \( (n) \) of regular faces.

Problem VII.

To determine the chances of throwing any given number \( (p) \) of points with any number \( (m) \) of solids, having a given number \( (n) \) of regular faces.

Solution 1. Let the chances be required of throwing on two common dice any given number from 12 to 2. In order to throw 12, the two fives must turn up together, and therefore there can only be one chance for this number. In order to throw 11, the fixes and fives may be changed alternately, and therefore there will be two chances for this number. The next number may be thrown by the two fives, or by a fix and four, and as these last may be alternately turned up, it follows that there are three chances for succeeding in this case. In the same manner nine points may be thrown by the turning up of the four and five, or of the fix and three; and since each of these admit of being alternately changed, the chances for throwing this number will be four. Again, eight points may be thrown by the two fours, the three and five, or the two and fix coming up; and since the two last pairs admit of being changed alternately, the number of chances in this case will be five. For throwing seven points, the chances will be fix; for either the three and four, the two and five, or the ace and fix may be turned up, each pair of which admit of being alternately changed. The chances for fix points are only five; consisting of the two alternate throws of an ace and five, or a four and four, or of the single throw of two fives. The chances for throwing five points consist of the two alternate throws of an ace and four, or of a four and a fix, and therefore are full four. The chances for throwing four points consist of the alternate throws of an ace and two, and of the single throw of two fives, and are therefore only 3. The chances for throwing three points consisting of the alternate throw of an ace and fix, and of the single throw of two fours, are therefore only 2. Hence the chance for throwing 12, 11, 10, 9, 8, 7, 6, 5, 4, 3, 2, 1, if either of these be divided by 36, or the number of all the changes upon two dice, the quotient will give the probability for any number of points required.

By proceeding in the same manner, the chances may be determined when there are any greater number of dice, or when the solid has a greater number of faces than the common die. But the following computations, when three and four dice are thrown, will explain the process better than a more minute detail of it.

</tbody>
</table>

The chance for turning up 13, 12, 11, &c. points being the same as those for turning up 15, 16, 17, &c. points respectively, it will be unnecessary to proceed with the operation. The whole number of changes on 3 dice being $6 \times 6 \times 6 = 216$, and on 4 dice $6 \times 6 \times 6 \times 6 = 1,296$, the probability of throwing any given number of points will be the fraction, whose numerator is given above, and whose denominator is either 216 or 1296, according as 3 or 4 dice are used; thus the probability of throwing 9 points with three dice is $\frac{25}{216}$, and the probability of throwing 15 points with 4 dice is $\frac{110}{1296}$; that is, the odds in the 1st case against throwing them are as $7\frac{3}{2}$ to 1, and in the second case as 8 to 1.

If the fodies have more faces than a cube, or if their number be much greater than is rated above, these operations will be rendered too complicated and laborious, and therefore it becomes necessary to have a more general solution of the problem. Suppose a single folid to have $n$ faces of faces, of which one is marked $A$, $r$ marked $B$, $r^2$ marked $C$, $r^3$ marked $D$, and so on to $n$ terms, then will $1 + r + r^2 + r^3 + \ldots + r^{n-1}$, represent the whole number of chances on such a folid, and each term of the series, divided by the whole, will represent the chance that any particular face will be turned up. If there be $m$ such fodies, (since the sum of the series is $\frac{1 - r^n}{1 - r}$) the whole number of chances on all those fodies will be $\frac{1 - r^n}{1 - r} m = 1 + m r + \frac{m + 1}{2} r^2 + \frac{m + 1 + m + 1}{2} r^3 + \ldots + \frac{m + 1 + m + 1 + \ldots + m + 1}{2} r^n + \cdots$, multiplied into $1 - m r^n + \frac{m + m + 1}{2} r^{n-1} - \frac{m - 1 + m - 2}{2} r^n + \cdots + \frac{m - 1 + m - 2 + \ldots + m - 1}{2} r^n + \cdots$.
DOCTRINE OF CHANCES.

Now since the smallest number of points that can be thrown with those solids is m, the next \( m + 1 \), the third \( m + 2 \), and so on, it follows that the first term of the product of these two series, or unity, will represent the number of chances for throwing \( m \) points. The second term the number of chances for throwing \( m + 1 \) points, the third term the number of chances for throwing \( m + 2 \) points, &c. and that the term of the series, in which the exponent of \( r \) is \( p - m \), will represent the number of chances for throwing \( p \) points.

But since this term arises from such terms of the first series, in which the exponents of \( r \) being \( p - m \), \( p - m - n \), \( p - m - 2n \), &c. are respectively multiplied into the first, second, third, &c. terms of the second series, and since the last factor of the co-efficient of the term, whose exponent is \( p - m \), is both in the numerator and denominator, \( = p - m \); it is evident that the whole co-efficient may be divided into \[ \frac{1}{1 \cdot 2 \cdot 3 \cdot \ldots \cdot (m - 1)} \cdot \frac{p - 1 \cdot p - 2 \cdot \ldots \cdot (p - m)}{p - 3 \cdot \ldots \cdot (p - m - 1)} \cdot \frac{p - m - 1 \cdot p - m - 2 \cdot \ldots \cdot p - m - 3}{3 \cdot (m - 1)} \cdot \ldots \cdot \frac{1}{1 \cdot 2 \cdot 3 \cdot (m - 1)} \cdot \frac{0}{0} \] and therefore that the term itself will be \[ \frac{1}{1 \cdot 2 \cdot 3 \cdot (m - 1)} \cdot \frac{p - 1 \cdot p - 2 \cdot \ldots \cdot (p - m)}{p - 3 \cdot \ldots \cdot (p - m - 1)} \cdot \frac{p - m - 1 \cdot p - m - 2 \cdot \ldots \cdot p - m - 3}{3 \cdot (m - 1)} \cdot \ldots \cdot \frac{1}{1 \cdot 2 \cdot 3 \cdot (m - 1)} \cdot \frac{0}{0} \] in the same manner the co-efficient of the term in which the exponent of \( r \) is \( p - m - n \) will be \[ \frac{1}{1 \cdot 2 \cdot 3 \cdot (m - 1)} \cdot \frac{p - 1 \cdot p - 2 \cdot \ldots \cdot (p - m)}{p - 3 \cdot \ldots \cdot (p - m - 1)} \cdot \frac{p - m - 1 \cdot p - m - 2 \cdot \ldots \cdot p - m - 3}{3 \cdot (m - 1)} \cdot \ldots \cdot \frac{1}{1 \cdot 2 \cdot 3 \cdot (m - 1)} \cdot \frac{0}{0} \] \&c. Hence, if the first of the terms just mentioned be multiplied into the second into \(- m \times r^m \); the third into \( \frac{m \cdot m - 1 \cdot m - 2 \cdot \ldots \cdot m - r^m}{r \cdot r^m} \) and \( n \) be made \( d \); \( p - 2 \cdot n \) is \( e \); \( p - 3 \cdot n \) is \( f \); &c. the number of chances for throwing exactly \( p \) points will be equal to \[ \frac{1}{1 \cdot 2 \cdot 3 \cdot (m - 1)} \cdot \frac{p - 1 \cdot p - 2 \cdot \ldots \cdot (p - m)}{p - 3 \cdot \ldots \cdot (p - m - 1)} \cdot \frac{p - m - 1 \cdot p - m - 2 \cdot \ldots \cdot p - m - 3}{3 \cdot (m - 1)} \cdot \ldots \cdot \frac{1}{1 \cdot 2 \cdot 3 \cdot (m - 1)} \cdot \frac{0}{0} \] or \[ \frac{(m - 1) \cdot (m - 2) \cdot \ldots \cdot (m - r)}{m - r^m} \] + \&c. which series are to be continued till they either vanish or become negative. But if \( r \) be \( 1 \), or, which is the same thing, if there be only one face of a fort on each die, the chances will be expressed simply by \[ \frac{1}{1 \cdot 2 \cdot 3 \cdot (m - 1)} \cdot \frac{p - 1 \cdot p - 2 \cdot \ldots \cdot (p - m)}{p - 3 \cdot \ldots \cdot (p - m - 1)} \cdot \frac{p - m - 1 \cdot p - m - 2 \cdot \ldots \cdot p - m - 3}{3 \cdot (m - 1)} \cdot \ldots \cdot \frac{1}{1 \cdot 2 \cdot 3 \cdot (m - 1)} \cdot \frac{0}{0} \] \[ \frac{1}{1 \cdot 2 \cdot 3 \cdot (m - 1)} \cdot \frac{p - 1 \cdot p - 2 \cdot \ldots \cdot (p - m)}{p - 3 \cdot \ldots \cdot (p - m - 1)} \cdot \frac{p - m - 1 \cdot p - m - 2 \cdot \ldots \cdot p - m - 3}{3 \cdot (m - 1)} \cdot \ldots \cdot \frac{1}{1 \cdot 2 \cdot 3 \cdot (m - 1)} \cdot \frac{0}{0} \] \&c.

Remark. Since it appears from the preceding computations, that the chances continually increase till the number of points required becomes a mean between the greatest and least possible number that can be thrown on the solids, and that they then as regularly decrease till the number of points required be the least than can be thrown on those solids; it will be best, if the number required be nearer the greater than the greater extreme, to use, instead of the former, a number equally distant from that greater extreme. Thus, the greatest number that can be thrown on three common dice is 18, and the least is 3. If therefore the required number be 6, it will lessen the labour to find the number of chances for throwing 15; the latter being as much less than 6 as the former is greater than 3; if the chances for throwing 11 points on 4 dice be required, it will be most convenient to find the chances for throwing 17 points, the latter being as far distant from 24, the greatest, as the former is from 4, the least number that can be thrown on 4 dice.

Example. Let it be required to determine the chances for throwing precisely 24 points on 6 dice. In this case \( n \) is \( = 6 \), \( p = 24 \), \( r = 1 \), \( m = 6 \), \( d (\equiv p - n) = 18 \), \( e (\equiv p - 2n) = 12 \), \( f (\equiv p - 3n) = 6 \), \( g = o \). The above expression therefore becomes \[ \frac{17 \times 16 \times 15 \times 14 \times 13 \times 6 + 11 \times 10 \times 9 \times 8 \times 7 \times 6 \times 5 \times 4}{2 \times 3 \times 4 \times 5 \times 6 \times 7 \times 8} = 343 \] and hence \( G \) (or the number of all the chances on 6 dice) is \( 46,675; \) the odds against throwing exactly 24 points will be as \( 12:1 \) to one; which also are the odds against throwing 18 points; these two numbers being equally distant, the one from the greater, the other from the lefer extreme.

Problem VIII.

To determine the probability that an event shall happen \( p \) times successively in \( n \) trials, when the ratio of its happening to that of its failing is as \( a \\ b \\ b \\ a \).

Solution. The probability that it happens the first \( p \) times after having failed the first time is \( \frac{b}{a + b} \times \frac{b}{a + b} \times \frac{b}{a + b} \times \frac{b}{a + b} \times \frac{b}{a + b} \) \&c. and since the probability of its failing any assigned time, without any re-}

DOCTRINE OF CHANCES.

the odds when each of them wants a given number to win
the game.

Solution. If only one can be reckoned at each party, the probability that either of them is the winner at the end of
it will be \( \frac{1}{2} \). Hence if A wants 2, and B only one
of being up; the former, in order to be the winner, must
gain twice successively, and therefore his chance will be
\[ \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}, \]
and the chance of the latter = \( 1 - \frac{1}{4} = \frac{3}{4} \).

Consequently the odds against A, or in favour of
B are as 3 to 1.

If A wants 3, 4, 5 6, or any other number of being
up, while B wants only one, his chance of winning in those
cases must always depend on his succeeding in every party
without intermission, and therefore the probability when he
wants 3 will be \( \frac{1}{2^3} = \frac{1}{8} \), when he wants 4 it will be \( \frac{1}{2^4} = \frac{1}{16} \)
when he wants 5 it will be \( \frac{1}{2^5} = \frac{1}{32} \), and so on; so that
the odds against him in those cases respectively will be 7 to
1, 15 to 1, 31 to 1, 63 to 1, &c.

If A wants 3, and B wants 2 of being up; the former
may win in either of 4 different ways. - 1st. By gaining the
1st, 2d, and 3d games. 2ndly. By gaining the 1st, 2d, and 4th,
and losing the 3d game. 3dly. By gaining the 1st, 3d, and
4th games, and losing the 2d; and 4thly. By losing the
1st, and gaining the 2d, 3d, and 4th games. The proba-

ability of the 1st is \( \frac{1}{8} \), and the probability of each of the
rest is \( \frac{1}{2} \times \frac{1}{8} = \frac{1}{16} \). Hence the sum of the 4 probabilities
will be \( \frac{1}{8} + \frac{3}{16} = \frac{5}{16} \). Consequently the odds against
him will be as 11 to 5, or rather more than 2 to one.

When A wants 4, B still wants 2 of being up, if he gains
the first game (the probability of which is \( \frac{1}{2} \)) he will be in
the same situation as in the preceding case, and his expecta-
tion in such an event will be \( \frac{1}{2} \times \frac{1}{2} = \frac{1}{4} \). - If he loses
the first game (the probability of which is also \( \frac{1}{2} \) he will
then want 4 while B wants only one of being up, and his expec-
tation in this case will be \( \frac{1}{2} \times \frac{1}{2} = \frac{1}{4} \); therefore
the sum of these probabilities being \( \frac{6}{32} \), it follows that the
odds against him are as 25 to 6. In the same manner the
odds may be found when he wants 5 of being up, to be as 57
to 7; when he wants 6 of being up, to be as 120 to 8, and so
on when he wants any other number, B being always sup-
posed to want only 2 of being up.

When A wants 4 and B wants 3 of being up, the former
may win in either of the 15 following different ways:

1st. By gaining the 1st, 2nd, 3rd, 4th game, the probability
of which is \( \frac{1}{16} \). } 2. The probability of each of which is \( \frac{1}{16} \times \frac{1}{2} = \frac{1}{32} \).
3. The probability of each of which is \( \frac{1}{16} \times \frac{1}{4} = \frac{1}{64} \).

Adding all these probabilities together, we have \( \frac{1}{16} + \frac{4}{32} \):
for the probability required, and hence the odds
against A's winning will be as 42 to 22.

By proceeding in the same manner when A wants 5 of being
up, the odds against him will be found to be as 219 to 37.
But these operations become more and more laborious in
proportion as the number wanted by each party becomes
more considerable, and therefore it will be better to have recourse to the rules of combination, which will greatly
reduce the labour in those cases. Thus; let B want 4 and A
want 5 of being up. The probability here of A's winning
will be expressed by \( \frac{1}{2^5} + \frac{1}{2^5} \), multiplied into the number of
ways in which 6 things may be combined by 5 of a fort
+ \( \frac{1}{2^5} \), multiplied into the number of ways in which 7 things
may be combined by 5 of a fort + \( \frac{1}{2^5} \), multiplied into the number of ways in which 8 things
may be combined by 5 of a fort + \( \frac{1}{2^5} \), multiplied into the number of ways in which 9 things
Vol. VII.
DOCTRINE OF CHANCES.

gaining two, in two trials, may be considered as the same with that of taking two out of four things of two sorts, so that both may be of the same fort. The chance of taking the proper fort the first time is $\frac{2}{4}$; the chance of missing it the second time is $1 - \frac{1}{4} = \frac{3}{4}$; the probability therefore of the event first mentioned is $\frac{2}{4} \times \frac{3}{4} = \frac{6}{16} = \frac{3}{8}$. The chance of taking out the same fort twice in succession is $\left(\frac{2}{4}\right)^2 = \frac{4}{16} \times \frac{2}{4} = \frac{1}{8}$. Hence, if A wants 2 and B only 1 of being up, the latter may win at the end of the first party, either by reckoning one or two (the probability of which is $\frac{1}{6} + \frac{1}{3} = \frac{1}{2}$), or he may also win by having lost only one at the end of the first party, and gaining one at the end of the second. Now if A has gained one at the end of the first party, the expectation of each at the beginning of the second will be equal, and therefore B's chance of winning in the second, after having lost in the first party will be $\frac{1}{3} \times \frac{1}{2} = \frac{1}{6}$. Hence the whole probability of his winning will be $\frac{1}{2} + \frac{1}{6} = \frac{2}{3}$, and A's chance will be the remaining $\frac{1}{3}$; that is, the odds against A will be as 2 to 1.

Let A want 3, B still wanting only 1 of being up. If A gains one in the first set, he will be in the same situation as in the preceding case. If he gains 2 he will be on an equality with B. His expectation on the first event is $\frac{1}{3} \times \frac{1}{3} = \frac{1}{9}$, and his expectation on the second $= \frac{1}{3} \times \frac{2}{3} = \frac{2}{9}$. His whole expectation, therefore, is $\frac{1}{9} + \frac{1}{9} = \frac{2}{9}$. That is, the odds against him are as 2 to 7.

In like manner, when A wants 4, B still wanting only 1 of being up. If he gains one he will be in the same situation as in the foregoing case; if he gains two he will be in the same situation as in the first case; hence, his expectation will be $\frac{1}{4} \times \frac{2}{5} + \frac{1}{4} \times \frac{1}{5} = \frac{13}{108}$, and the odds against him will be as 95 to 13. By proceeding in this manner, the odds may be found when A wants any greater number, B being always supposed to want only one of being up; nor will the reasoning, indeed, be different when B wants more than one; or when the game is of such a nature as that either A or B may reckon 3, 4, or any greater number at each party.

It would be as tedious as it is unnecessary to proceed further with these operations, and, therefore, it will be sufficient to observe, that the following table has been deduced from a similar method of reasoning with that which has been used in the preceding cases, and that it is inferred principally with the view of shewing the manner in which the odds are constantly leavened in proportion as the number to be reckoned at each party is increased.

</table>

Were the game of such a nature as to admit of an indefinite number to be reckoned at each party, the expectations would be nearly equal, or, in other words, the odds would be indefinitely small, whatever number were wanted on either side of being up. This, indeed, appears from the preceding table, where the odds are continually lessening as the number to be gained at each party increases. It is also to be observed, that, except in one instance, the odds in those tables are never inverely as the numbers wanted of being up; and that particularly in the last column, where 11 may be gained at each party, those odds vary from that ratio more than in any other.

Hence it follows, that in the game of whist, which admits of 11 being gained in a single deal, it would be very wrong to proceed on such principles in determining the odds; for, although whist may not be strictly of the same nature in every respect with the game supposed in the table, yet it is to be remarked, that the circumstances in which it differs, especially when less than three are wanted of being up, only serve to increase the errors of such a mode of computation.

This
DOCTRINE OF CHANCES.

This, however, if any doubt can remain on the subject, will be more clearly explained in the following problems.

**Problem X.**

To determine in the game of whist, the chance of any particular player (A) having one or more honours.

Solution. Let A be the dealer, and let the chance be required of his having 4 honours. Supposing it certain that an honour is turned up, it then becomes necessary to find the chance of his taking 3 particular cards in 12 out of a pack containing 51. By the corollary to the 4th problem this probability is expressed by

$$P = \frac{(a + q - m)\cdot m - 1 \cdot m - 2 (\rho)\cdot v \cdot v - 2}\{(a + q - m)\cdot m - 1\cdot v - 2\}$$

where \(\rho\) represents the number of cards, \(a\) the number of honours, \(\rho\) the number to be taken, \(m\) the whole number to be taken out of \(n\); \(v = a + b - m = n - m\), and \(\rho\) is the number of honours, and the fraction expressing the required probability is

$$\frac{51\times 50\times 49}{12\times 11\times 10\times 9}$$

which, being multiplied into \(\frac{1}{13}\), or the probability that the honour turns up, will become

$$\frac{44\times 14}{13\times 4165}$$

Supposing it certain, on the contrary, that the honour is not turned up, the chance of having four (making \(a = \rho = 4\)) will be

$$\frac{12\times 11\times 10\times 9}{51\times 50\times 49\times 48} \times \frac{9}{13}$$

which, being multiplied into \(\frac{9}{13}\), (or the probability that an honour is not turned up) will become

$$\frac{9 \times 33}{52 \times 4165}$$

Hence the whole chance of A's having the four honours will be

$$\frac{16 \times 44 \times 9 \times 33}{52 \times 4165} = \frac{11}{2380} = .00462.$$

If A is not the dealer, the chance of his having the four honours will be found by proceeding in the same manner,

$$\frac{13\times 12\times 11\times 10 \times 9}{51\times 50\times 49\times 48} \times \frac{9}{13} = \frac{33}{1660} = .00198.$$

The chance of his having three honours and no more may also be found either:

$$\frac{792 + 492}{20813} = .0618, \frac{443}{4165} = .03433$$

according as he is or is not the dealer.

The chance of his having two honours and no more may in like manner be found:

$$\frac{(11\times 11\times 14)}{4165} = .26684,$$

or

$$\frac{(151)}{4165} = .1957,$$

and the chance of his having one honour and no more:

$$\frac{913}{20825} = .43884$$

whether he is or is not the dealer. The chance also that he has no honour may in the first case be found:

$$\frac{37\times 62}{10660} = .22785; \text{and in the second case:} \frac{712842}{52\times 4165} = .3291.$$

Nor is the method of proceeding different when it is required to determine the chance of any two partners at whist having either four or three or two honours between them; the computation in this case being made on 25 or 26 instead of 12 or 13 cards, according as the honour is or is not supposed to be turned up. The chance of the dealer and his partner having four honours between them appears to be

$$\frac{115}{1660} = .06323; \text{the chance of their having three honours, or reckoning two, } \frac{468}{1660} = .28092; \text{and the chance of their having two, or not reckoning any thing by honours } = \frac{650}{1660}. \text{ The chance of the eldest hand and his partner's having four honours between them appears also to be } = \frac{60}{1660} = .03442; \text{the chance of their having three honours, or reckoning two, } = \frac{364}{1660} = .21849, \text{and the chance of their having two, or not reckoning any thing by honours } = \frac{652}{1660}, \text{or the same as in the case of the dealer and his partner.}$$

**Corollary.** Since the chance of the dealer's having three honours or more is .0618 + .0046 = .0664, and the chance of his having two honours or more is .064 + .2668 = .3332, if it follows that the odds against his having three or more honours are as 14 to 1, and that the odds against his having two or more honours are as 2 to 1. On the other hand, the chance of his having one honour or more being .3293 + .3332 = .672, the odds for his having one or more honours will be 3.5 to 1. Thee chances in the case of the eldest or any other single hand being .3293 + .21849 = .5478 respectively, the odds against each hand's having three or more honours will be as 26.8 to 1; the odds against his having two or more honours will be as 3.8 to 1; and the odds for his having one or more honours will be as 2 to 1. The chance of the dealer and his partner having three or more honours between them being .0664 + .28092 = .35 nearly, and the chance of the eldest hand and his partner having the like number between them being .03442 + .21849 = .26 nearly; the odds against the former partners reckoning any thing by honours will be nearly as 2 to 1, and the odds against the latter will be nearly as 3 to 1.

**Problem XI.**

To determine, in the game of whist, the chance of getting the odd or any number of tricks.

Solution. Let the chances of getting and losing a single trick be to each other in the ratio of \(a\) to \(b\), then will the probability of getting \(n\) tricks be represented by \(\frac{a^n}{a + b^n}\), the probability of getting \(n - 1\) tricks by \(\frac{n \cdot a^{n-1} \cdot b}{a + b^n}\), the probability of getting \(n - 2\) tricks by \(\frac{2 \cdot a^{n-2} \cdot b^2}{a + b^n}\), and so on. In the present case the chances of losing or winning a trick being equal, \(a\) will be equal to \(b\), and the chance of winning 13 tricks, or reckoning 5, will be \(\frac{1}{2} = \frac{1}{2^{192}}, \text{the chance of winning 12 or reckoning 6 tricks will be } = \frac{13}{8192}, \text{and the chance of reckoning 5, 4, 3, 2, and 1 trick will be } \frac{78}{8192} \frac{286}{8192} \frac{715}{8192} \frac{187}{8192} \frac{1716}{8192}, \text{respectively.}$$

**Corollary.** Hence the chance of reckoning 6 or more tricks.

L 2
DOCTRINE OF CHANCES.

819a. The chances

or more tricks is

or more tricks is

or more tricks is

or more tricks is

Problem XII.

To determine the respective chances at whist, when two of the partners have eight and the other two have nine of the game.

Solution. The party who reckon eight may win the game in the first deal either by having three or more honours between them, or by getting two or more tricks without reckoning any honours. Or, if they do not win the game in that deal, they may, however, reckon one by getting the odd trick, in which case they will be on an equality with their opponents. Supposing them therefore to be the dealers, the probability of their having three or more honours, by Cor. Prob. X. is .34; the probability of their getting two or more tricks, by Prob. XI. is .2953, and the probability of not having three or more honours is 1 - .35 = .65. Hence the chance of their getting the game in the first deal is

Again, the probability of their getting one trick and no more by Prob. XI. is

.3517 for their chance of reckoning only one in the first deal; and as their expectation in this case will be equal to that of their adversaries, it will of course be expressed by

.3517 x .65 = .22885, and their whole chance of winning will be

.3517 + .22885 = .58062. If they be not the dealers, their chance of winning may be found, by reckoning in the same manner:

.13517 + .2953 x .10 = .25 + .2953 x 1 = .26 + .20947 x 1 = .5428. Hence the chance of their winning in the first case is as 3 to 2, and in the second case as 6 to 5 nearly. But if it be not considered whether they are, or are not the dealers, their chances of winning will be one with another, very nearly as 7 to 5.

Corollary. Were these two partners only seven, their chance of winning the game might be found by the help of the two preceding problems and their corollaries, equal either to .3869 or .3869 according as they were, or were not the dealers, and their chance of winning if they were only fix might in like manner be found equal either to .3583 or .3583. That is, the odds against the two partners who reckon only seven, while the other partners reckon nine, are as 8 to 5, and the odds again 8 them when their reckoning only fix are as 21 to 10 or a little more than two to one.

By purifying the same steps the odds may be determined in every circumstance of the game; but the labour of such a computation would be very great, as the operations become more and more complicated in proportion as the game is further from being terminated.

Problem XIII.

A undertakes to play a match with B of three or five games, in winning the greater number of which he becomes of course the winner of the match. A has an advantage in all the games but one equivalent to the odds of b to a—in that one game B has the same advantage against A. It is required to determine the respective chances of A and B; and whether it is material that the games should be played in any particular order.

Solution 1. Let the number of games be three, and let A be supposed to play the two games, on which he has the advantage of b to a, first, and the game on which he has the chance only of a to b, last. Either A or B may become the winner by obtaining the superiority over his adversary in the following order: 1, 2, 3. 3, 1, 2, 3. A’s chance in winning this order is expressed by the fractions

and consequently B’s chance will be

If A be supposed to play the game first, on which he has only the advantage of a to b, and the other two games last, the fractions expressing the probability of his winning will be

Hence it follows that in this case it makes no difference in what order the games are played.

2. Let the number of games be five, and let A be supposed to play the five games on which he has the advantage of b to a, first, and the game on which the odds are against him, as b to a, last. Either party may become the winner, by succeeding in the following order: 1, 2, 3, 4, 5, 1, 2, 4, 3, 5, 1, 3, 4, 2, 3, 5, 1, 3, 5, 2, 4, 5, or 3, 1, 4, 5. A’s chance for winning in this order is expressed by the fractions

in consequence, b = a + 5.a b + 4 4 a b + 6 a b.

If A be supposed to play the game first, in which the odds are against him, the several fractions expressing his chance of winning may be found as follows:

It is evident therefore that in this, as well as in the former case, it is not in the least material in what order the games are played.

Example. Supposing A and B to play a match at piquet of five games, on the particular condition that B is to be the dealer in all the games except one, which gives an advantage to A in four of the games equivalent to the odds of 5 to 2. It is required to determine their respective chances of winning the match.—In this case a is .4, and b = .5; and hence the above expression denoting A’s chance becomes

and the expression denoting B’s chance becomes

.35824 and .59852. The odds therefore in favour of A are as 14 to 11 nearly. If they had played a match of only three games, and B was to have been the dealer in two of them, the odds against him would have been as 455 to 344. or nearly as 19 to 17.

Problem XIV.

To determine the chances in the game of Meaco.

Solution. In this game two packs of cards are shuffled together, from which three cards are dealt to each of the players,
players, who are generally five in number. The tens being always deducted from the aggregate number on the faces of the three cards, the remaining numbers will of course be either 9, 8, 7, 6, 5, 4, 3, 2, 1, or 0. If the first of these numbers is turned up, the person having it is entitled to 3 flake; if the second, he is entitled to 2 flake; if either a 7, or any of the lower numbers, he is entitled to 1 flake; but if a 0 is turned up, he is entitled to no flake. The question, therefore, to be solved is, the chance of having either 9, 8, 7, 6, 5, 4, 3, 2, 1, or 0.

The number of chances on n things when taken 3 and 3, being \( n \), it follows that all the chances of this kind on two packs, or 104 cards, will be \( \frac{104 \times 103 \times 102}{1 \times 2 \times 3} = 182,104 \), and, consequently, that the sum of all the chances for having either 9, 8, 7, 6, 5, 4, 3, 2, 1, or 0, is 182,104.

The number of chances on n things when taken 3 and 3, being \( n \), it follows that all the chances of this kind on two packs, or 104 cards, will be \( \frac{104 \times 103 \times 102}{1 \times 2 \times 3} = 182,104 \), and, consequently, that the sum of all the chances for having either 9, 8, 7, 6, 5, 4, 3, 2, 1, or 0, is 182,104.

DOCTRINE OF CHANCES.

with those for having 8: but the chances for having 0 will be found to be = 19,036. In other words, the sum of all the chances for having each of the odd numbers is 18,104; the sum of all the chances for having each of the even numbers is 17,922; and the sum of all the chances for having a blank is 19,036; which, being added together, make up the number 18,104 and, therefore, prove the truth of the solution.

**Corollary.** It appears from this problem that the odds against the number 9 being turned up are nearly as 9 to 1; against the number 8, as 9 to 1; against a blank, as 8 to 1; and for either of the other numbers, as 28 to 1. If, therefore, each flake (as is generally the practice in this game), be five guineas, the expectation of the player on the number 9 will be worth 11,105.2d; his expectation on the number 8 will be worth 10,922.5d, and his expectation on all the remaining numbers together will be worth 31,228.5d, making in the whole the sum of 44,657.

Innumerable other problems might be added for determining the laws of chance, as well in the preceding games, as in those of Hazard, Pharamon, Pigst, &c. &c.; but the solution of them (were the subject of much more importance than it appears to be), would dwell beyond all due limits, and for the whole chief design has been to give a clear idea of the principles on which the doctrine of chances is founded, together with the solution of such general problems as may admit of the most extensive application. Tho' however, who wish for further information respecting the games of chance, may have recourse to the writings of De Moivre, James Bernoulli, Thomas Simpson, &c., but particularly to those of the former, which are not surpassed, and perhaps, not equalled by any other work on this subject.

In addition to the problems given in this article, two others should be noticed, which are not only the most abstruse, but the most important in the whole doctrine of chances; the first of them solved by James Bernoulli, and afterwards, to greater exactness, by Dr. Moivre, the second, communicated by Dr. Price to the Royal Society, from the papers of the late Mr. Bayes, as hath been already observed in the beginning of this article. In regard to the former of these problems, Mr. James Bernoulli introduces his solution of it with observing, "Hoc est illud problema, quod evagudandum hoc loco propofui, potius quam per vicinum premio, & cujus tum nominis, tum fama utilitas, cum pari adjuncta difficilatatem omnium reliquis huic doctrinæ capitibus pondus & pretium superabundere possit." Such, therefore, being the opinion of that eminent mathematician concerning this problem, perhaps the present article ought not to be concluded without giving the solution of it, more particularly as Dr. Moivre, though he pursued the investigation to a greater degree of accuracy, has contented himself with stating the rules, without giving any demonstration of them.

**Proposition I.**

Supposing a very great number of trials to be made concerning any event, it is required to determine the probability there is that the proportion of the number of times it will happen to the number of times it will fail in these trials will differ less than by very small assigned limits from the probability of its happening to the probability of its failing in a single trial.

**Solution.** Let the probabilities of happening and failing be equal, and the number of trials be n. Let L and L also be the terms equally diffuse by the interval h, from the middle term of the binomial 1 + 1 &c, and the sum of the terms included between L and L, together with the extremes; then if n be a very great number, the probability that the event happens neither more frequently than \( \frac{1}{2} \) or less than \( \frac{1}{2} + h \),

following,


DOCTRINE OF CHANCES.

following, \( \frac{s \cdot r - 1 \cdot s - 2 \cdot \beta \cdot y}{l + l + 2 + 3 + \cdots + l + 1} \) the third term, and so on, it follows that the term whose distance from the greatest is \( p \), will be \( \frac{s \cdot r - 1 \cdot s - 2 \cdot \beta \cdot y}{l + l + 2 + 3 \cdots + l + 1} \times a^l \), and

\[
\frac{1}{l + 1} \cdot \frac{1}{l + 2} \cdot \frac{1}{l + 3} \cdots \frac{1}{l + p} \times a^l \text{, and}
\]

and

\[
\left\{ \frac{1}{l + 1} \right\} + \frac{1}{l + 2} + \frac{1}{l + 3} (l + p) = \log y + p \cdot \log b - p \cdot \log a + \text{the fluct of } \frac{1}{s} + \frac{1}{s - 1} + \frac{1}{s - 2} (t - p + 1)
\]

\[
- \text{the fluct of } \frac{1}{s - 1} + \frac{1}{s - 2} (l + p) = \log y + p \cdot \log b - p \cdot \log a \cdot l + \text{ &c.}
\]

and

\[
\frac{1}{l + 1} \cdot \frac{1}{l + 2} \cdot \frac{1}{l + 3} \cdots \frac{1}{l + p} \times a^l \text{, and}
\]

\[
\left\{ \frac{1}{l + 1} \right\} + \frac{1}{l + 2} + \frac{1}{l + 3} (l + p) = \log y + p \cdot \log b - p \cdot \log a \cdot l + \text{ &c.}
\]

But since \( a \) is \( b \), \( \log b - \log a \cdot l \) will vanish out of the equation; and since the numerators of the remaining terms are series of powers whose roots are in arithmetical progression, the sum may be easily obtained by the 1st Proposition in Stirling, De Summationi Stirriem; and hence the foregoing expression will be found = \( \log y = \frac{1}{l + 1} \cdot \frac{1}{l + 2} \cdot \frac{1}{l + 3} \cdots \frac{1}{l + p} \times a^l \), and

\[
\left\{ \frac{1}{l + 1} \right\} + \frac{1}{l + 2} + \frac{1}{l + 3} (l + p) = \log y + p \cdot \log b - p \cdot \log a \cdot l + \text{ &c.}
\]

furn bears to all the terms, will be \( \frac{y}{a + b} \) into \( 3 \cdot \sqrt{n} - \frac{d^1 \cdot \sqrt{n} + d^2 \cdot \sqrt{n} + \cdots n}{2 \cdot 5} \). But \( \frac{y}{a + b} \) (being the ratio which the greatest term has to all the terms) has been proved in the corollary to the preceding lemma to be \( \frac{a + b}{a + b} \); the above ratio therefore will be \( \frac{a + b}{a + b} \) \( \text{ &c.}
\]

Corollary 2. If the probabilities of happening and failing are equal, \( a + b \) will be \( 2 \), and \( d \left( \frac{a + b}{a + b} \right) \) will also be \( 2 \), hence the series in the preceding corollary will become = \( \frac{2}{\sqrt{n}} \) into \( 3 \cdot \sqrt{n} - \frac{d^1 \cdot \sqrt{n} + d^2 \cdot \sqrt{n} + \cdots n}{2 \cdot 5} \)

\[
\frac{1}{2} \cdot \frac{2}{5} \cdot 2 \cdot 3 \cdot 7 + 2 \cdot 3 \cdot 4 \cdot 9 - 2 \cdot 3 \cdot 4 \cdot 5 \cdot 11 + 
\]

\[
\text{ &c., which is given by M. De Moivre for determining the ratio between the sum of as many terms immediately preceding the greatest as there are units in } \sqrt{n}, \text{ to the whole power of the binomial } 1 + \sqrt{n}.
\]

Corollary 3. Since the log of the \( p \)th term from the greatest, or log. \( T \), is \( \log. y = \frac{dp \beta}{n} + \frac{dp \beta}{n} \), this equation, when \( a \) and \( b \) are equal, will be \( T = \log. y = \frac{2}{n} \). But the greatest term of the binomial \( 1 + \sqrt{n} \) is the middle term, the log. of \( y \), therefore, in this case, will be the log. of the middle term; hence will be the log. of the ratio which \( T \) has to the middle term be expressed, as M. De Moivre has observed, by \( \frac{2}{n} \).

Corollary 4. In this lemma it is to be observed, that the ratio only of the \( p \) terms next succeeding the greatest term is given. But the ratio of the \( p \) terms preceding the greatest term may be determined in the same manner. For since the \( p \)th term which precedes \( y \) is \( \frac{1}{l + 1} \cdot \frac{1}{l + 2} \cdot \frac{1}{l + 3} \cdots \frac{1}{l + p} \), it may be found by pursuing the same steps as have been taken in this lemma, that the expression denoting the ratio, in this case, is \( \log. y = \frac{1}{l + 1} \cdot \frac{1}{l + 2} \cdot \frac{1}{l + 3} \cdot \frac{1}{l + 4} \cdot \frac{1}{l + 5} \cdot \cdots \frac{1}{l + p - 1} \), &c.

If \( \sqrt{n} \) times, will be to the probability that the contrary happens very nearly as \( \frac{1}{2} + \frac{1}{2} \) to 1. If \( l \) were interpreted by a higher number, or, in other words, if the limits were extended, the probability might be increased, till it amounted almost to a certainty, yet the extension of those limits would bear but an inconsiderable proportion to the whole when \( n \) is very great, and none at all when it is infinite. Whence it follows, as M. De Moivre properly observes, that, "although chance produces irregularities, still the odds will be infinitely great, that in process of time those irregularities will bear no proportion to the recurrence of that order, which naturally results from original design." The truth of this observation, though undeniable, will, perhaps, be more fully confirmed by the following proposition, which is the converse of the preceding one, but rather more difficult in its solution, and more direct in its application to the arguments above-mentioned.

**Proposition II.**

The number of times an unknown event has happened or failed being given, to find the chance that the probability of its happening should lie somewhere between any two named degrees of probability.

**Solution.** The solution of this proposition being not only very long and laborious, but given at full length in the Philos. Transactions (vols. 53 and 54), it will be unnecessary to enter further into it at present, than to give a general idea of the manner in which it has been investigated, and of the principles on which the demonstration is founded.

If the probability of an event's happening in each single trial be \( a \), and that of its failing be \( b \), the probability of its happening \( p \) times, and failing \( q \) times in \( p + q \) (\( = n \)) trials, will be \( a^p b^q \) multiplied into the co-efficient of the term in which \( a^p b^q \) occurs when the binomial \( a + b \) is expanded. Or, denoting this co-efficient by \( E \), the probability will be \( E a^p b^q \).

If the ball \( O \) be then thrown \( p + q \left(= n \right) \) times, and if its rolling between \( A D \) and \( O \), after a single throw, be called the happening of the event \( M \) in a single trial, then the probability that the point \( e \) falls between any two points in the line \( BA \) will be the ratio of the distance between these two points to the whole line \( BA \); and if the ball \( W \) has been thrown, and the line \( OS \) be drawn, the probability of the event \( M \) in a single trial will be the ratio of \( A E \) to \( BA \). Hence, if on the base \( BA \), a figure \( B g e n a \) be described, whose property is this; that the base being divided into two parts, as \( A b \) and \( B b \), and at the point of division \( b \), a perpendicular being erected and terminated by the figure in \( n, y, x, r \), respectively represent the ratio of \( b m, A b, \) and \( B b \), to \( B A \) and \( y = E a^p b^q \) (being the co-efficient of the term in which \( a^p b^q \) occurs); then, before the ball \( W \) is thrown, the probability that the point \( e \) shall fall between \( f \) and \( b \), and also that the event \( M \) shall happen \( p \) times, and fail \( q \) times in \( p + q \) trials, will be the ratio of \( g + b \) to \( C A \), or the square upon \( B A \). Supposing now, before any thing is discovered concerning the place of the point \( e \), that it should appear that the event \( M \) had happened \( p \) times, and failed \( q \) times in \( p + q \) trials, and from hence, that it was guessed that the point \( e \), to any two points \( f \) and \( B \), in the line \( B A \), and consequently that the probability of the event \( M \), in a single trial, was somewhere between the ratio of \( A \) to \( B \), and that of \( A f \) to \( B A \), then would the probability that this guess was right be the ratio of \( g + b \) to \( B A \).

Having demonstrated the truth of these propositions, nothing further remained to complete the solution than to determine the area of the figure described above, and of the several parts of it separated by the ordinates perpendicular to \( B A \). For this purpose \( B A \) being made \( = 1 \), the equation of the curve \( y = x^r \), the area of the figure \( A b m \), and consequently its ratio to \( C A = 1 \), is found to be

\[
\text{figure } B d m, \text{ and its ratio to } C A = \frac{x^{r+1}}{r+1} - \frac{p \cdot r^{p+1}}{q + q^2} + \frac{p \cdot \frac{r-1}{r} \cdot r^{p+1}}{2 \times q + 3} + \ldots \text{&c. and the area of the whole figure } A m B \text{, and its ratio to } C A = \frac{1}{n+1} \times \frac{1}{E}. \text{ Hence the ratio of } A b m \text{ to the whole figure is } = n + 1 \cdot E \times \frac{x^{r+1}}{r+1} - \frac{q \cdot x^{r+1}}{p + q} + \frac{q \cdot q - 1 \cdot x^{r+1}}{2 \cdot p + 3} - \ldots \text{&c., and consequently the ratio of } g + b \text{ to } A m B \text{ will be } = n + 1 \cdot E \times \frac{x^{r+1}}{r+1} - \frac{q \cdot x^{r+1}}{p + q} + \frac{q \cdot q - 1 \cdot x^{r+1}}{2 \cdot p + 3} - \ldots \text{&c.}
\]

Suppose \( B C D A \) to be a plane perfectly level; the line \( A B \) to be divided into equal parts \( A b, b c, c d, \&c. \) and the perpendiculars \( b E, c F, d G, \&c. \) to be erected. If a ball \( W \) be thrown upon this plane, the probability that it rolls between, any two of the parallel lines will be equal. Supposing it, therefore, to be thrown for the first time, and a line \( O S \) to be drawn through the point on which it has settled.

**Vol. VII.**
DOCTRINE OF CHANCES.

Sec and the series
\[
\frac{a_{x+1}}{\rho + 1} - \frac{q}{\rho + 2} + \frac{q - 1}{2 \cdot \rho + 3} - \ldots
\]

When \( \rho \) and \( q \) are very large numbers, it will be possible to apply this rule to practice on account of the multitude of terms contained in the two series. Mr. Bayes, in his admirable attempt with great labour and ingenuity, to remedy the defect; but although he considerably improved the rule, he did not succeed in so far as to give the required result within limits sufficiently narrow. His friend and editor, Dr. Price, has therefore pursued the inquiry with equal labour, and the result of an investigation, which occupies too many pages to admit of its being inferred here, has been the following rule.

If nothing is known concerning an event, but that it has happened \( \rho \) times and failed \( q \) times in \( \rho + q \) or \( n \) trials, and from hence be guessed, that the probability of its happening in a single trial lies between \( \frac{\rho}{n} + z \), and \( \frac{\rho - 1}{n} - z \), the chance to be in the right, if either \( \rho \) or \( q \) exceed 1, is left
\[
I - 2 E \cdot a^{q} - \frac{2 E \cdot a^{q}}{n} + E \cdot a^{q} - \frac{E \cdot a^{q}}{n} + \frac{a^{q}}{n}
\]

than \( 2z \), and greater than \( \Sigma + \frac{\Sigma}{n} \), or \( \frac{\Sigma}{n} \), and
\[
\frac{1}{1 + 2 E \cdot a^{q} - \frac{E \cdot a^{q}}{n} + \frac{a^{q}}{n} + \frac{a^{q}}{n}}
\]

If either \( \rho \) or \( q \) exceed 10, this chance is less than \( 2 \Sigma \), and
\[
\frac{1}{1 + \frac{1}{2} E \cdot a^{q} - \frac{E \cdot a^{q}}{n} + \frac{a^{q}}{n} + \frac{a^{q}}{n}}
\]

all cases, where \( z \) is small, and also where the disparity between \( \rho \) and \( q \) is not great, the chance is very nearly \( 2 \Sigma \). In this rule, it is to be observed, that the ratio of the quadrantal arc of a circle to its radius, and \( H = \frac{E}{n} \), whose hyp. log. is \( \frac{2}{n^2} \), is
\[
\frac{1}{1 - 2 E \cdot a^{q} - \frac{E \cdot a^{q}}{n} + \frac{a^{q}}{n} + \frac{a^{q}}{n}}
\]

\( K \) = the ratio of the quadrant to the whole quadrant.

The hyp. log. is
\[
\frac{1}{12} \times \frac{1}{n} - \frac{1}{q} - \frac{1}{q} = \frac{1}{3} \times \frac{1}{n} - \frac{1}{q} = \frac{1}{9} \times \frac{1}{n} = \frac{1}{q} - \frac{1}{q}
\]

\( 1 \). Supposing an event to have happened about the probability of which nothing further is known than that it has happened once, and that it be inquired what conclusion should be drawn from hence with respect to the probability of its happening on a second trial. In this case \( q \) in the first rule becomes \( 1 + q \), and \( q = 1 \), and if the limits \( z \) and \( x \) be put respetively \( 1 \), and \( \frac{1}{2} \), the expression for the rule, or
\[
\frac{1}{12} \times \frac{1}{n} - \frac{1}{q} - \frac{1}{q} \left[ \frac{1}{1 - \frac{1}{2}} \right] \text{ will give } \frac{3}{8}
\]

for the answer; which shows that it is \( 3 \) to \( 1 \) that the chance lies somewhere between \( 1 \) and \( \frac{3}{2} \), or that the odds are \( 3 \) to \( 1 \), that it is somewhat more than an even chance that it would happen on a second trial. In the same manner, if the event has happened twice, the expression will be
\[
1 - \frac{1}{2} \left[ \frac{1}{2} \right] \text{, if}
\]

\( \frac{3}{8} \) if thrice, \( \frac{1}{2} \text{, if it has happened twice, and } \frac{1}{16} \text{ if it has happened thrice, for more than } \frac{1}{2} \text{ equal chance that it will happen on further trials. Again, if the event has happened ten times without failing, and inquiry be made what reason we have to think we are right if we guess that the probability lies somewhere between } \frac{3}{2} \text{ and } \frac{1}{2} \text{, or between } 3 \text{ to } 1 \text{ and } 2 \text{ to } 1 \text{, the answer in this case will be } \frac{2}{3} \text{, or } \frac{5}{6} \text{, which is } 360 \frac{1}{4} \text{, that is, the odds are greater than } 2 \text{ to } 1 \text{ against our being right. If we had guessed that the probability lay between } \frac{1}{16} \text{ and } \frac{1}{2} \text{, or between } 16 \text{ to } 1 \text{ and } 2 \text{ to } 1 \text{, the chance would have been nearly equal that we had guessed right.}
\]

2. Supposing nothing further to have been known of an event than that it happened ten times and failed once, and that a peron guessed from thence that the ratio of the probability of the event's happening in a single trial to that of its failing, lay somewhere between the ratio of \( q \) to \( 1 \) and
11 to 1; then would the chance of his being right in his
gues be expressed by \(\frac{n + 1}{n + 1} \cdot E\) multiplied into the dif-
cence between \(\frac{x_1 + 1}{\phi + 1} = \frac{q + 1}{\phi + 1}
and \(\frac{x_2 + 1}{\phi + 2} = \frac{q + 1}{\phi + 2}\). Now
\[\frac{x_1}{\phi + 1} = \frac{q}{\phi + 1} = \frac{10}{10}, \frac{q}{\phi + 1} = \frac{10}{10}, \frac{n}{\phi + 1} = \frac{11}{10}, \text{and } E\]
\[\frac{11}{10} \times \frac{10}{10} = \frac{110}{110} \text{ &c. \; so that there would be the odds of 923 to 77, or 12
1 to nearly again against his being right. If the event had hap-
pened 20 times and failed twice, the required chance would be
\[\frac{23}{10} \times \frac{23}{10} \times \frac{11}{12} \times \frac{11}{12} - 2 \times \frac{11}{12} \times \frac{11}{12} - \frac{23}{10} \times \frac{23}{10} \text{ &c. \; The odds, therefore, against his being right are less than in the former case, being here only 89.2 to 108.9 to 1 nearly.}
3. Lastly, supposing an event to have failed 1000 times, and
to have happened 100 times in 1100 trials; or, in other
words, supposing a person to have known nothing more
of a lottery than that he had just seen 1100 tickets drawn
of which 1000 were blanks, and 100 were prizes; and that in
consequence he guessed that the proportion of the blanks
to the prizes in the lottery lay somewhere between
\[\frac{11}{10}, \frac{10}{11} + \frac{1}{10}\]
\[\frac{23}{23} \times \frac{23}{10} \times \frac{11}{12} = \frac{110}{110} \text{ &c. \; In this case the first rule would re-
quire so many terms as to render it impracticable, and there-
fore recourse must be had to the second rule, by which the
question may be determined in the following manner:}
\[\text{Since } \phi = 1000, q = 100, n = 1100, \frac{x}{n} = \frac{1}{110}, \text{ and } m
\left(\frac{\sqrt{q}}{\phi \sqrt{q}}\right) = \frac{81.578, E a^b b^c}{\phi \sqrt{q}} \text{ may be found } = \frac{0.418145}{0.418145}
\text{and } \frac{n}{m} = \frac{3.1311}{1}; \text{ hence } e \times \frac{2}{1} = \frac{7.062}{1} \times \frac{1}{1} - 2 E a^b b^c - 2 E a^b b^c
\frac{1}{n} \times \frac{n}{m} = \frac{675.3}{675.3}, \text{ so that the chance of
his being right in his conjecture lies somewhere between}
\frac{7.062}{1} \times \frac{675.3}{675.3}, \text{ or between the odds of 220 to 105, and 205 to 103, or nearly between 120 to 5 and 10 to 5.}
\text{CHANCE, in Law. \; Where a man commits an unlawful act,
by mistake or chance, and not by design, it is an in-
consil of deficiency of will. In this case the will ob-
verses a total neutrality, and does not co-operate with the
act; and it therefore wants one main ingredient of a crime. It
may here be observed, that if any accidental mischief happens to
follow from the performance of a lawful act, the party
stands excused from all guilt: but if a man doing any
thing unlawful, and a consequence ensues which he did not
foresee or intend, as the death of a man or the like, his want
of foresight shall be no excuse; for, being guilty of one
offence, in doing antecedently what is in itself unlawful, he
is criminally guilty of whatever consequence may follow
the first misbehaviour. 1 Hal. P. C. 39. See the next
article.}
\text{CHANCE-Medley, formed of Fr. chance, and milier, misfor-
care, the accidental killing of a man in self-defence. This self-
defence is that by which a man may protect himself from an
affault, or the like, in the course of a sudden brawl or quarrel,
by killing him who affaulfs him.}
\text{This kind of killing (ms. defendore) is that which the law
expresses by the word chance-medley, or (as some write it) chau-
bledy; the former of which, according to its etymology,
signifies a casual affinity, the latter, an affinity in the heat
of blood or passion; both of these being much of the same
import: but the former is in common speech too often erro-
neously applied to any manner of homicide by inadvert-
tence; whereas it appears by the statute 24 Hen. VII.
c. 5. and our ancient books (Staunf. P. C. 16.), that it is
properly applied to such killing as happens in self-defence,
upon a sudden encounter. (3 Iust. 55. 57. Pott. 275, 276.)
This right of natural defence does not imply a right of
attacking; for, instead of attacking another one another for inju-
ries past or impending, men need only have recourse to the
ordinary tribunals of justice. They cannot, therefore, legally
exercise this right of preventive defence, but in sudden or
violent cases; when certain and immediate suffering would
be the consequence of waiting for the assislance of law.
Therefore, to excuse homicide by the plea of self-defence,
it must appear, that the slayer had no other possible (or,
at least, probable) means of escaping from his affiant. It is
frequently difficult to distinguish this species of homicide
(upon chance-medley in self-defence) from that of manslaugh-
ter, in the proper legal sense of the word. (3 Iust. 55.) But
the true criterion between them seems to be this: when both
parties are actually combating at the time when the
mortal stroke is given, the slayer is then guilty of manslaughter;
and if the slayer hath not begun to fight, or (having begun)
does not in good faith, to defend himself against his
offender, he discovers this, homicide excuseable by self-
defence. (Pott. 277.) See Homicide. In chance medley
the offender forfeits his goods, but hath a pardon of court.
See ibid. 6 Edw. I. c. 9.}
\text{CHANCEFORD, in Geography, a township of Amer-
ica, in York county, Pennsylvania.}
\text{CHANCEL, is properly that part of the choir of a
church, between the altar or communion-table, and the ba-
lustrade, or rail that encloses it; where the minister is placed
at the celebration of the communion.}
\text{The word comes from the Latin cancellus, which in the
lower Latin is used in the same sense, from cancelli, latties, or
croft-bars; whereas the chancels were anciently encom-
passed, as they now are with rails.}
\text{The right of a feat and a seipulchre in the chancel, is one of
the privileges of the founders of a church. The repairs
of the chancel belong by usage, in most parishes, to the
rector or vicar, or both.}
\text{CHANCELADE, in Geography, a town of France, is
the department of the Dordogne; one league N.W. of Per-
igueux.}
\text{CHANCELLOR, an officer, supplied originally to
have been a notary, or scribe, under the emperors, and
named cancellarius, because he sat behind a lattice, called
in Latin cancellus, to avoid being crowded by the people.
Naude says, it was the emperor himself who fat and ren-
dered justice within the lattice; the chancellor attending at
the door thereof, whence he took his title.}
\text{Others say, he had it from this, that all letters, addresses,
petitions, &c. to the king, being first examined by him, were
cancelled, where amifs: others, as Sir Edward Coke (4 Iust.
83.) because all patents, confirmations, and warrants, coming
from the king, were examined and cancelled by him, when
granted contrary to law, which is the highest point of
3 M 2}
his jurisdiction. Others, because he cancelled and annulled the sentences of other courts.

Du-Cange, from Joannes de Janus, fetched the original of the word chancellor from Palestina, where the honours were flat, and made in form of a terrace, with parapets or pall-fodors, called cancelli; those who mounted these honours to rehearse any harangue, were called cancellarii; whence the name passed to those who pleaded at the bar, which he calls cancelli forenses, and at length to the judge who presided; and lastly to the king’s secretaries.

The office, and also the name of chancellor (however derived), was undoubtedly known to the courts of the Roman emperors; where it originally seems to have signified a chief scribe or secretary, who was afterwards invested with several judicial powers, and a general superintendency over the rest of the officers of the prince. Under the emperor Carinus, one of his door-keepers, with whom he entrusted the government of the city, was denominated cancellarius and from this humble original, says Mr. Gibbon, (Hist. Rom. Emp. vol. ii. p. 91) the appellation has, by a singular fortune, rifen into the title of the first great office of state in the monarchies of Europe. From the Roman empire it passed to the Roman church ever emulous of imperial state; and hence every bishop has, to this day, his chancellor, the principal judge of his court.

And King Henry the Second, of the house, of the sainted Romans of the first age, did, according to the contemporary historians, of the monarchies of Europe, establish upon the ruins of the empire, almost every state preferred its chancellor, with different jurisdictions and dignities, according to their different constitutions. But in all of them he seems to have had the superintendence of all charters, letters, and other public instruments of the crown, as were authenticated in the most solemn manner; and therefore, when seals came into use, he had always the custody of the king’s great seal.

This officer is now in great authority in all countries: the person who bears it with us, or the

Lord High Chancellor of England, is the first lay person of the realm, next after the king and princes of the blood, in all civil affairs. He is the chief administrator of justice next the sovereign, being the judge of the court of chancery; and to him belongs the appointment of all the justices of peace in the kingdom.

All other justices are tied to the strict rules of the law; but the chancellor has the king’s absolute power to moderate the rigour of the written law, to govern his judgment by the law of nature and common sense, and to order things jejunum aquam & horam. Accordingly, Stamford says, the chancellor has two powers, the one absolute, the other ordinary; meaning, that though by his ordinary power he must observe the same form of procedure as other justices, yet in his absolute power he is not limited by any written law, but by conscience and equity.

Although Polydore Virgil, in his History of England, makes William I. called the Conqueror, the founder of our chancellors; yet Dugdale has shown, that there were many chancellors of England long before that time, who are mentioned in his “Origines Juridicarum,” and catalogues of chancellors; and Sir Edward Coke (4 Inst. 4) says, it is certain, that both the British and Saxon kings had their chancellors, whose great authority under their kings was probably derived from the reasonable customs of neighbouring nations, and the civil law. The offices of lord-chancellor and lord keeper, by the statute 5 Eliz. cap. 18, were invested with the same power; till that time they were different, and frequently JV filled at the same time in different persons; sometimes the lord-chancellor had a vic-chancellor, who was keeper of the seal.

Since that statute, there cannot be a lord-chancellor and a lord-keeper at the same time; but before, there might, and had been. King Henry V. had a great deal of gold, which he delivered to the bishop of Durham, and made him lord-chancellor; and also another of silver, which he committed to the bishop of London to keep. Lord Bridgman was lord keeper, and lord chief justice of the common pleas, at the same time; which offices were held not to be inconsistent. (4 Inst. 78.) By Stat. 1 W. and M. cap. 21, commissiorners appointed to execute the office of lord-chancellor, may exercise all the authority, jurisdiction, and execution of laws which the lord-chancellor, or lord-keeper, of right might do and execute, &c.; since which statute this high office hath been several times in commissiorn. The keeper was created per traditionem magni jussi, but the lord-chancellor by patent, though now that he has the keeper’s office, he is created in like manner by the mere delivery of the king’s great seal into his custody; whereby he becomes, without writ or patent, an officer of the greatest might and power of any now subsisting in the kingdom, and in point of precedence superior to every temporal lord. And the act of taking away this seal by the king, or of its being assigned or given up by the chancellor, determines his office. (1 Sid. 38.) The chancellor is a privy-counsellor by his office, and according to lord-chancellor Ellesmere, procures the great lordship of lords by praemunire. See Parliament.

Though he be sole judge of the court of chancery, yet in matters of much difficulty, he sometimes consults the other judges, though they have no share whatever of the judicial authority; so that this office may be discharged by one who is no professed lawyer, as anciently it commonly was by an ecclesiastic, who professed over the royal chapel, and became keeper of the king’s confiquence; visitor, in the king’s right, of all hospitals and colleges of royal foundation; patron of all the king’s livings, under the value of 20 marks per annum, in the king’s books, (38 Ed. III. 3. F. N. B. 35) though Hobart (214) extends this value to 20 pounds; guardian of all infants, idiots, and lunatics; and general superintendent of all charitable institutions; and all this, over and above the vall and extensive jurisdiction which he exercises in his judicial capacity in the court of chancery, wherein, as in the exchequer, there are two distinct tribunals; the one ordinary, being a court of common law; the other extraordinary, being a court of equity. See Court of Chancery.

The lord chancellor, as there is now no lord high steward, is accounted the first officer of the kingdom; and he not only keeps the great seal, but all patents, commissions, warrants, &c. from the king, are perused and examined by him, before they are signed; and he annuls the king’s letters patent when contrary to law. See this article Seals. By his oath he sweareth well and truly to serve the king, and to do right to all manner of people, &c. The Stat. 25 Ed. III. c. 2 declares it to be treason to slay the chancellor (and certain other judges), being in their places doing their offices; and it seems, that the lord-keeper and commissiorners of the great seal are within this statute, by virtue of Stat. 5 Eliz. c. 18. and 1 W. and M. c. 21. See Treason.

The lord-chancellor, in his judicial capacity, has twelve assistants or coadjuitors, anciently called clerks, as then being in holy orders, now Masters in Chancery, and the Master of the Rolls. See Master of the Rolls, Masters in Chancery, &c.

Defends these superior officers, he has other assistants. The six clerks in chancery transact and file all proceedings by bill and answer; and also refuse some patents that pass the great seal; which business is done by their under clerks, each
CHAM

each of whom has a seat there; of whom every one of the six clerks has a certain number in his office, usually about ten; the whole body being called the sixty clerks.

The curators of the court, 24 in number, make out all original writs in chancery, which are returnable in C. B., &c., and among thee the business of the several counties is severally distributed. The regifter is an office of great importance in this court, under whom are several deputies, who take cognizance of all orders and decrees, and enter and draw them up, &c. The master of the full-pen office signs all writs of fullpena. The examiners are officers who take the depositions of witnesses and examine them, and make out copies of the depositions. The clerk of the affidavits files all affidavits used in court, without which they will not be admitted. The clerk of the rolls sits constantly in the Rolls, to make searches for deeds, offices, &c., and to make out copies of the depositions. The clerks of the petty bag office, three in number, have a great variety of business belonging to their respective departments, in making out writs of summons to parliament, siege d'ecleris for bishops, patents for collets, liberates upon extent of statute-duple, and recovery of recognizances forfeited, &c.; and also relating to suits for and against privileged persons, &c. These clerks have several subordinate clerks. The officer of the chancery had formerly the receiving and custody of all money entered to be deposited in court, and paid it back again by order; but this business was afterwards assumed by the bailiffs in chancery, till by Stat. 18 Geo. I. c. 32. a new officer was appointed, called the accountant general, &c. There is also a serjeant at arms, to whom pernies standing in contempt are brought up by his subordinates as prisoners. A quareld of the fleet receives such prisoners as are committed by the court, &c. Besides these officers there are several others; such as a clerk of the crown in chancery; clerk and controller of the hanaper; clerk for inrolling letters patent, &c., not employed in proceedings of equity, but concerned in making out commissions, patents, powers, &c., under the great seal, and collecting the fees thereof; a clerk of the faculties, for dispensations, licences, &c.; clerk of the presentations for benefices of the crown in the chancellor's gift; clerk of appeals, in appeals from the courts of the archbishop to the court of chancery; and various other officers, who are constituted by the chancellor's commission.

Chancellor of a cathedral. His office is thus described in the Monasticon; viz. to hear the lefions and lectures read in the church, either by himself, or his vicar; to correct and set right the reader when he read amiss; to inspect schools, to hear causes, apply the seal, write and dispatch the letters of the chapter, keep the books, take care there be frequent preachings, both in the church, and out of it, and align the office of preaching to whom he lists.

Chancellor of a diocese, or of a bishop, is a person appointed to hold the bishop's courts, held in the respective cathedral of each diocese, and to affit the bishop in matters of ecclesiastical law. This officer, as well as all other ecclesiastical ones, if lay or married, must be a doctor of the civil law so created in some university. Stat. 37 Hen. VIII. c. 17. He was anciently called ecclesiasticus, and ecclesiasticus aulicis, the church-lawyer. See Bishop's Court.

Chancellor of the duchy of Lancaster, is an officer before whom, or his deputy, the court of the duchy chamber of Lancaster is held. It is his business to judge and determine all controversies between the king and his tenants of the duchy-land; and otherwise to direct all the king's affairs relating to that court. See Duchy Court.

Chancellor of the exchequer, is an officer, supposed by some to have been created for moderating extremities in the exchequer. He sometimes sits in that court and the exchequer-chamber, and, with the rest of the court, orders things to the king's betterment. He is always in communion with the lord-treasurer for letting lands accruing to the crown by dissolution of abbeys, and otherwise, has power (by Stat. 33 Hen. VIII. c. 39), with others, to compound for forfeitures on penal statutes, bonds, and recognizances entered into to the king. He has a great authority in managing the royal revenue, &c. and this seems of late to be his chief business; accordingly he is commonly the first lord commissioner of the treasury. The court of equity in the exchequer-chamber, which was intended to be held before the lord-treasurer, chancellor, and barons, is usually held before the barons only. When there is a lord-treasurer, the chancellor of the exchequer is under-treasurer. See Court of Exchequer.

Chancellor of the order of the garter, and other military orders, is an officer who sees the commissions and mandates of the chapter, and assembly of the knights, keeps the register of their deliberations, and delivers acts thereof under the seal of the order. This office is annexed to the see of Salisbury. See Garter.

Chancellor of an university, is he who sees the diplomas or letters of degrees, provision, &c., given in the university. See St. 15 Hen. VIII. c. 26.

The chancellor of Oxford is their chief magistrate, elected by the students themselves; his office is during vita, to govern the university, preserve and defend its rights and privileges, convolve assemblies, and do justice among the members under his jurisdiction.

Under the chancellor is the vice-chancellor, who is chosen annually, being nominated by the chancellor, and elected by the university in convocation. His business is to supply the chancellor's absence.

At his entrance upon his office, he chooses four pro vice-chancellors out of the heads of colleges, to one of whom he deputes his power in his absence. See Oxford.

The chancellor of Cambridge is, in most respects, the same with that of Oxford; only he does not hold his office during vita, but may be elected every two years.

He has under him a commissary, who holds a court of record of civil causes, for all persons of the university under the degree of master of arts.

The vice-chancellor of Cambridge is chosen annually by the Senate, out of two persons nominated by the heads of the several colleges and halls. See Cambridge. See also University Courts.

CHANCERY. See Court of Chancery.

CHANCHA, in Geography, a town of Egypt; 2 leagues E. of Cairo, at the entrance of a defile which leads to Mount Sinai.

CHANCHE, in Surgery, is a term originally derived from the Greek word κανέτα, Cancer, Cancer, or (agreeably to the French orthography) Chancre. This word, among the Romans, signified an eroding ulcer of any kind, ulcus cancreum seu fungus, for example, as may be often seen in the inside of the cheeks or lips, where the cuticle is extremely thin, as it is upon the gums and lips, and inferior part of the prepuce. "Si quando autem ulceris ursis cancer invadit, primo considerandum est, num malus corporis habitus fit, circu occurringum;" Celsus, de Med. lib. vi. cap. 15. The translators of Celsus, in this passage, and in lib. vi. cap. 26. § 31. 35. have not improperly rendered the term cancer by the word gangrene; and so, conversely, the Greek term γαγγραγία has been translated cancer in the Latin vulgate bible, and cancer in the authorized English version, 2 Tim.
Tim it. 17— because a gangrene is of an eroding off
scabbed nature. In this sense, the word may be used
metaphorically:

"Yet writers say, as in the sweetest bud
The eating canker dwells; so eating love
Inhabits the finest wits of all." Shakespeare.

French writers do not confine the term chancre, as most
of the modern English authors have done, to forest arising
from a venereal cause; although they, too, are getting more
into that habit: but the French use this word to denote
the little eating ulcer of the mouth, before noticed; and
they even apply the same term to vegetables, e. g. "Cet
abre la une chancre."

The older medical authors, especially those of the middle
age, employed the words caerola and carolus, likewise, to
signify that kind of eroding malignant fore which arises from
impure sexual intercourse; and it is this local disorder, al-
most exclusively, to which modern surgeons are accustomed
to apply the epithet chancre. Indeed, we seldom hear the
word without, &c., and in this connexion the idea of its originating in a
venereal cause; and from this association, we are very apt
to forget the true etymology of the term, and that it was in
use even before the existence of lues venerea.

The old Italian words carolo, a canker-worm, and caro-
lofo, worm-eaten, were, perhaps, derived from caries, which
signifies rottenness.

Hence, the Italians write, in their an-
p. 38. Hence again, Fracallorius and others say, "caries
pens," where we should say, "chancre pens."

Marcellus Cumanus, who wrote in the year 1195, during
the invasion of Italy by Charles VIII. tells us, he cured
many persons afflicted with venereal chancre: "Vidi quen-
dam paucitatem carolis in virgo, in parte praeputii interna;" and
in another place, he says, "Ego infinutos carolos caufatos ex puflulis vircis, & ex nana ratigationes & labore
curavi." That he means the same disease in both cafes is
evident, from the following observations: "Ut refolubitur bubo in principi et augmenti amaritatem, vel a
carie evanuit, &c."

And again, "Aliquando incipiebat purulenta una in modum veseulcis parese line dolore, &c; cum
pruritus, fricabant, et inde ulcerabatur tambanque forma
coarida; et poel aliiqunt dies incurrarent in angulatis
propriet doloribus in brachis, eruibus, pedibus, cum puflulis
magnum." This is the very first description on record of
what we now denominate venereal chancre: (See Luvs Veneria and Syphilis.) The next authors who
noticed this symptom of lues, were Torella, Alimenus, and
John De Vigo.

The most common characters of a chancre, in its incipi-
ent state, are a red, painful, and itching pimple, containing
a small quantity of subfuscent serum, which readily
burts into a little ulcer, having hard, thickeared, and slightly
elevated edgs. But this very kind of sore may arise in
other parts of the body, thinly covered with cuticle; and
it appears to be, in a great measure, owing to the structure
of the affected part, what characters the ulcer shall assume,
rather than to the peculiar nature of the efficient cause.
We do not, at present, enter into the subject of the cure of the
chance. Where this belongs to the article Syphilis or Luvs
Veneria: but we may here observe, that medical men
have variously figured this subject in their writings, and
too generally have imposed all chances to be venereal;
from which erroneous aet, they have further concluded,
that all chances require recourse for their cure! See Mr.
Blair's "Essays on the Venereal Disease," Part II, sub
numm; where this question is considered, in reference to the
medical use of nitric acid. Mr. Abernethy has also, of
late, thrown out some useful hints on the same subject, in

CHANDA, in Geography, a considerable city of Hind-
dorin, in the country of Berar, belonging to Nagpur,
and about 50 geographical miles to the south of it. N. lat.
19° 48'. E. long. 80° 2'.

CHANDACE, in Ancient Geography, a fortified town
of the island of Crete.

CHANDAIL, a circur or district of Hindooistan in
the territory of Allahabad, S.W. of the country of
Benares.

CHANDANA, in Ancient Geography, an ancient town
placed by Steph. Byz. in Japania.

CHANDANACI, a town of Asia, in Persia. Steph.
Byz.

CHANDELEUR islands, a cluster of islands in the
gulf of Mexico, near the coast of West Florida. N. lat.
29° 30'. to 29° 41'. W. long. 88° 45'. to 88° 58'.

CHANDELIER signifies a candlestick, lamp, &c., which
is illuminated. Chandelleurs fore: an important addition
to a collection of works in pyrotechny, and are much admired
by the Italians. They have the advantages of being easily
made; and in a grand exhibition illuminated pieces of this
kind should be fired after every two or three wheels, or
fixed pieces of common and brilliant fires. For the confection
of an illuminated chandelier, let it be made of thin wood,
confiding of a stem and arched branches, and surmounted
with a crown. In the front of the branches, in the body,
and in the crown at the top, bore as many holes for illumina-
tions as they will contain, at the distance of three inches
from one another: and in these holes illuminations formed
with white, blue, or brilliant charges. Having fixed the
port fires, clothe them with gheers, so that the chandeler
and crown may be illuminated together. See Pyro-
techny.

Chandelleurs, or Chandeleers, in Fortification, are
upright flakes railed on one or more pieces of wood to
support planks, bushes, fascines, and, in general, all that
can help to cover the besiegers, and prevent the enemy from
seeing what is doing behind them. When the besiegers are
under the necessity of opening any trenches that are en-
filaded, they must take such precautions and raise a parapet
every now and then to cover part of such a trench.
Chandelleurs sometimes serve as a moveable parapet.

CHANDEGHERE. See Kandegheri.

CHANDEREE, in Geography, a very ancient city of
Hindooistan, capital of a circur or district in the province
of Malwa, near the river Bcewah. It once contained,
according to the Ayin Abarace, 14,000 stone houses; and, al-
though, like most of the ancient cities of Hindooistan, it
is fallen into decay, it is still the residence of a principal raja:
244 miles N.E. of Ougtin, and 302 N.W. from Nagpore.
N. lat. 24° 38'. E. long. 78° 45'.

CHANDERNAGORE, a town of Hindooistan, in the
country of Bengal, formerly a French settlement, but now
possessed by the English, situated on the western bank of the
Ganges, about an hour's walk below Chinspur, and
s når more than 10 miles from Calcutta. It is built,
about a mile in length, along the Ganges, in a drayght line,
with two parallel and several crofs streets behind it, which
have some good buildings. The ruins of the fort, demoli-
hed by the English, are at the north end of the place, and
sailantly flew its former strength. The French governor
built a handsome house, and laid out an elegant garden
about four miles below the town, affording a charming
prospect along the Ganges. This place was taken by the
English,
English, under the conduct of colonel Clive and admirals Watson, in March 1757; returned to the French at the peace of 1763; taken again during the American war, and restored in 1783; and once taken in 1793, and retained. N. lat. 23° 51' 26". E. long. 89° 29' 15".

CHANDIEU, a town of France, in the department of the Rhône and Loire; 1 league N. of Montbrillon.

CHANDIGA, a river of Siberia, which runs into the Adlan. N. lat. 62° 10'. E. long. 135° 14'.

CHANDLER, Samuel, in Biography, an eminently learned and confirmed divine, was born in 1693 at Hungerford, in Berkshire, where his father was pastor of a congregation of protestant dissenters. His academical education was commenced under Mr. Moore of Bridgewater, and completed under the learned Mr. Samuel Jones of Twicklbury, where his fellow students were Butler and Secker, afterwards distinguished prelates in the church of England. Having acquired in this excellent seminary a very considerable share of critical, biblical, and oriental learning, he first began to preach in 1714; and in 1716 he settled with a dissenting congregation at Pekham, near London. But being married, and having an increasing family, and losing his whole fortune in the South Sea Scheme in 1720, the income derived from his office was inadequate to his support; so that he was under the necessity of opening a bookbinder's shop in the Poultry, which he kept two or three years, whilst he continued to discharge his duty as a minister. At this time he was appointed to preach weekly evening-lectures at the meeting-house in the Old Jewry, where he delivered a course of sermons on the miracles of Christ and the truth of the Christian religion. These sermons, which were published in 1725, in the form of a treatise, in 8vo, and entitled “A Vindication of the Christian Religion, in Two Parts,” the first containing a discourse on miracles and the second an answer to Collin's "Grounds and Reasons of the Christian Religion," were very favourably received by the public, and occasioned his being chosen, about the year 176, minister of the congregation in the Old Jewry, to which he officiated with a high degree of reputation, first as assistant and afterwards as pastor, for 40 years. As a preacher, he was eminently instructive and animated; and he was solicitous in the exercise of his pastoral office. In 1727, he published "Reflections on the Conduct of the modern Deists, in their late Writings against Christianity," with a preface in favour of the rights of private judgment, in answer to some remarks of Dr. Rogers; and, in the following year, he published "A Vindication of the Antiquity and Authority of Daniel's Prophecies, and their Application to Jesus Christ." Whilist he thus ably and strenuously defended the truth of revealed religion, he displayed his abhorrence of the perpetuating spirit which has been too often manifested by its erroneous advocates, in a translation of "The History of the Inquisition, by Philip à Litt. born," in 2 vols. 4to. 1733; and to this translation he prefixed "A Large Introduction, concerning the Rise and Progress of Persecution," which involved him in a controversy with Dr. Berriman, and occasioned the publication of two or three pamphlets on each side. In the prosecution of the subject of religious liberty, he published, in 1732, a letter to Dr. Gibson, bishop of London, concerning the repeal of the test act, entitled "The Dispute better adjusted about the proper Time of applying for a Repeal of the Corporation and Test Acts, by shewing that some Time is proper." Having formed a design of writing a commentary on the Hebrew prophets, he began by publishing, in 1735, "A Paraphrase and critical Commentary on Joel," 4to.; but whilst he was proceeding with the book of Isaiah, he was convinced, by the M.S. lexicon and lectures of Schultens, which fell into his hands, that he did not possess a sufficient acquaintance with the Oriental tongues for the execution of his plan; and he, therefore, abandoned his design. In 1736 he republished his introduction to the history of the Inquisition, in an enlarged form, under the title of "The History of Persecution, in 4 parts: 1. Amongst the Heathens; 2. Under the Christian Emperors; 3. Under the Papacy and Inquisition; 4. Amongst Protestants;" with a Preface, containing Remarks on Dr. Rogers's Vindication of the civil Establishment of Religion," 8vo. In the course of this publication he endeavoured to prove, that the things for which Christians have persecuted one another generally been of small importance; that pride, ambition, and covetousness, have been the grand forces of persecution; that the decrees of councils and synods are of no authority in matters of faith; that the imposition of subductions to human creeds is unreasonable and pernicious; and that the Christian religion absolutely condemns persecution for conscience sake. In 1734, he renewed his controversial warfare with deflin, by a "Vindication of the History of the Old Testament," which was followed, in 1742, by his "Defence of the Prime Ministry and Character of Joseph," both written in answer to Dr. Thomas Morgan, whom, according to Dr. Land, he clearly convicted of falsehood and misrepresentation. In 1744, he published "The Witnesses of the Resurrection of Jesus Christ re-examined, and their Testimony proved entirely convincing;" which, in the judgment of Dr. Leland, was "a valuable treatise," containing, particularly in the last chapter, a very clear and judicious summary of the evidence for the resurrection of Jesus. His next publication, in 1748, was "The Case of Subscription to explanatory Articles of Faith, as a Qualification for Admission into the Christian Ministry, calmly and impartially reviewed; in answer to, 1. A late Pamphlet, entitled, the Church of England vindicated in requiring Subscription from the Clergy to the 39 Articles; 2. The Rev. Mr. John White's Appendix to his third Letter to a dissenting Gentleman; to which is added, the Speech of the Rev. John Alphonso Turretine, previous to the Abolition of all Subscription, at Geneva, translated from a MS. in the French," 8vo. About this time he accompanied his friend, the earl of Fincastle, into Scotland, and accepted, what he had before declined, the honour of a doctor's degree in divinity, which was conferred upon him without solicitation, and with every token of respect, by the two universities of Edinburgh and Glasgow. He had likewise the honour of being afterwards elected a fellow of the Royal Society and of the Society of Antiquaries. Upon the death of king George II in 1760, Dr. Chandler published a funeral sermon, containing an eulogy of that prince, and comparing him to king David. This occasioned a pamphlet, entitled "The History of the Man after God's own Heart," in which the author eulogized the character of David, and censured the parallel which the preacher had delineated between him and the British monarch, as an insult to the latter. This wanton and illiberal attack was repelled, on the part of Dr. Chandler, by a publication, entitled "A Review of the History of the Man after God's own Heart, in which the Falsehoods and Misrepresentations of the Historian are exposed and corrected," Without attempting to vindicate the Jewish prince from all the accusations of his adversary, the author, by means of his skill in the Hebrew language, and his extensive acquaintance with biblical learning, detected and exposed the misrepresentations of his pious antagonist, who had chiefly availed himself
himself of Bayle's article of "David" in his dictionary, by thieving that he had paid no regard to scripture criticisms, to the various readings of particular passages, and the opinions of expositors and commentators. This gave occasion to a very learned and elaborate publication, in 2 vols. 8vo. entitled "A Critical History of the Life of David; in which the principal Events are ranged in order of time, the chief Objections of Mr. Bayle and others against the Character of this Prince, and the Scripture Account of him, and the Occurrences of His Reign are examined and refuted; and the Psalms which refer to him explained." This work, trivial as was the occasion which gave rise to it, did great honour to the judgment and sagacity, as well as the erudition, of Dr. Chandler; and contained explications of several psalms, and commentaries upon them, particularly that on the 86th psalm, which have been much admired. This was the last of Dr. Chandler's productions; and the greatest part of it was printed off at the time of his death, which happened on the 8th of May 1766, in his 73d year. In early life he had been subject to frequent and dangerous fevers, which induced him to restrict himself for 12 years to a vegetable diet; and this had so good an effect on his constitution, that although he afterwards returned to the natural mode of living, he enjoyed an unbroken share of spirits and vigour till the age of 70 years. During the last year of his life he was afflicted with frequent returns of a very painful disorder, which he endured with a great degree of Christian fortitude and resignation. Under repeated paroxysms of his complaint he often declared, "that to secure the divine felicity promised by Christ was the principal, and almost the only thing that made life defirable: that to attain this he would gladly die, submitting himself entirely to God, as to the time and manner of his death, whose will was most righteous and good; and being persuaded that all was well which ended well for eternity." He had several children, two sons and a daughter who died before him, and three daughters who survived him; one of whom was married to the Rev. Dr. Harwood. The eminent abilities and extensive learning of Dr. Chandler commanded respect and esteem not only from the dissenters, with whom he was immediately connected, and among whom he had a very considerable degree of influence, but from several dignitaries and other persons of rank belonging to the established church. He is said to have had liberal offers of preferment in the church; nor is this at all unlikely, considering his early acquaintance with the prelates Butler and Secker, and his connection with several persons of high rank in the state; but he declined every proposal of this kind, because he did not choose to conform: preferring a steady adherence to the dictates of conscience to any secular advantage which he might thus have obtained. Amongst the dissenters his talents and character gave him that influence, which must have been gratifying to his mind; and he exerted himself on a variety of occasions, by his acquaintance with persons in power, and by the respect with which he was held among persons of his own profession, in affecting individuals, and in promoting the general interest of his brethren. Accordingly he was principally instrumental in establishing the fund for the relief of the widows and orphans of poor dissenting ministers, which has been eminently useful, and has been long honoured with distinguished liberality. Besides the works which we have already noticed, Dr. Chandler printed a number of short sermons and pamphlets, on occasional subjects. After his death, 4 volumes of his sermons were published by Dr. Amory, in 1768, according to the directions of his will; and, in 1773, Mr. White, his immediate successor as pastor of the congregation in the Old Jewry, published in 4to. "A Paraphrase and Notes on the Epistles of St. Paul to the Galatians and Ephesians, with devotional and practical Observations; together with a critical and practical Commentary on the two Epistles of St. Paul to the Thessalonians." He also left an interlaced body, containing a large number of critical notes, which formed a publication; but by some accident or other, though they were intended for the press by gentlemen who purchased them, the design was never executed.

Mrs. Mary Chandler, the sister of Dr. Chandler, was celebrated for her literary acquirements and poetical productions. As she was somewhat deformed in her person, in consequence of an accident in her childhood, she used to say, "that as her person would not recommend her, she must endeavour to cultivate her mind, in order to render herself agreeable." She was born at Malmesbury in Wiltshire, in 1677; and, after an excellent education, settled in bufinefs at Bath, where he was highly esteemed by all who knew her, among whom were several persons of rank and eminence in the literary world. She published several poems; but that which she wrote on Bath was the most popular, and passed through several editions. Having long flirted with the beauties of a vulgusmary constitution, she died in 1743. Dr. Chandler drew up an account of her, which is inserted in "The Lives of the Poets," published under the name of Theophilus Cibber. Our author had also a brother, Mr. John Chandler, who was for many years eminent in his profession as an apothecary in the city of London, and much respected among his acquaintance. He published a pamphlet on colds and catarrhs, which was well received. Amory's Preface to Dr. Chandler's Sermons, Biog. Brit.

CHANDOR, in Geography, a town of Hindoosfan, in the country of Baglana; 52 miles N.E. of Nassiuk, and 80 N.W. of Aurungabad.

CHANDOL, a town of Persia, in the province of Ardirbeitzan; 130 miles N.E. of Tauns.

CHANE, in Ichthyology, a name given by Aristotle, Athenaeus, and the other Greek writers, to the fish called by other authors haiaula, chaunc, and chaumas. This fish appears to be the labrus herpes of modern writers, a species common in the Mediterranean, and which has the lower jaw long, and the sides transversely marked with black. See Labrus Hepatus.

CHANFRO, in the Manges, is the fore part of a horse's head, extending from under the ears, along the interval between the eye-brows, down to the nose.

CHANG, in Geography, a town of China, of the second rank, in the province of Chen-zi; 495 miles S.W. of Peking. N. lat. 31° 50'. E. long. 109° 31'.

CHANGA, or XANGA, a small island, in the Indian Sea, near the coast of Africa, at the mouth of the river of the same name. S. lat. 10° 45'. E. long. 29° 50'.

CHANGAMALI, a fortified place of Hindoosfan, in the country of Myloer, situated in the valley of Vaniun Laddy or Birna-maul, directly distant from Trinomaly about 123 miles.

CHANGAPRANG, a town of Aisa, in the country of Thitib, 242 miles W. of Laffa, and 195 N.N.E. of Catmand. N. lat. 8° 6'. E. long. 86° 22'.

CHANGASARI, a town of Ruffa, in the government of Vborg; 80 miles W.N.W. of Vborg.

CHANGAY, a moutain of Aisa; being a branch of the Aisan chain. See Alai.

CHANG-CHA, a city of China, of the first rank, in the southern part of the province of Ho-qiang.

CHANG-CHE, a city of China, of the second rank, in the
the province of Quang-fu; 403 leagues S.S.W. of Peking.
N. lat. 23° 6'. E. long. 106° 17'.

CHANG-CHEW, a city of China, of the third rank,
in the southern part of the province of Pei-kuen; situated on
a river which ebbs and flows; over which is a flatly bridge,
confining of 30 very high arches, broad enough to admit
ships on both sides, which are adorned with all sorts of rich
merchandise, both of China and the Indies. Its vicinity to
Ambon (which see), a place of vall commerce, occasions a con-
stant traffic to be continually carried on between them. The
neighbouring mountains yield the finest crystal, of which they
make bottling, fials, bottles of animals, &c. Also, a district
of the province of Kiang-nan or Nanking.

CHANG-CHOU, a town of China, of the third rank,
in the province of Honan; 15 leagues S.E. of Hsii.

CHANG, in Commerce. See Exchange.

CHANG, in Geography, a town of France, in the depart-
ment of the Mayenne; one league N. of Laval.—Also, a
town of France, in the department of the Sarthe; one league
S. of Le Mans.

CHANG, in the Hsomeone. To change a horse, or change
hand, is to turn or bent the horse's head from one hand to
the other, from the right to the left, or from the left to
the right. You should never change your horse without putting
him forward upon the turn; and after the turn, pull him on
straight, in order to a fleet.

Change of crops, in Agriculture, is that part of husbandry
which relates to the mode of changing, distributing, and
cultivating different sorts of crops, on any kind of soil, in
order to prevent its being exhausted in the least possible
degree. This is an improvement of considerable importance;
and which modern cultivators have attended to in a par-
ticular manner. It has been observed that experience
from taught men, that even the most fruitful soil cannot con-
stantly yield the same grain; and that of course laid them
under a necessity of seeking some means to remedy the
defect. They found that the plough was then the most
ready, and perhaps the most effectual: and hence all the
ancient writers so highly recommend a thorough ploughing.
At the same time the apparent loss of the produce of the
ground, during the year of fallow, put them upon inquiring
how this inconvenience might be prevented, conveniently with
keeping the land in good heart. Repeated observations con-
vinced the Romans, the most attentive of all nations to every
thing relative to husbandry, that, besides the alternate resting
of the land, what might, as is observed by Piny, be found
after lupins, vetches, beans, or any other plant which has
the quality of fertilizing and enriching the soil.

A judicious change of crops must therefore, without doubt,
be of great importance in the common tillage husbandry, as
it enables the farmer to save the expense and loss of a crop in
the fallow year; and to get quit of weeds, by attacking them
at different seasons of the year, and in different periods of their
growth; both from the nature of the crops cultivated, and
where the intermediate crops are hoed, as those of beans,
pulse, and many other similar seeds. It has been well re-
marked by cultivators, that in the change of crops that are
cultivated for the purpose of preventing the exhaustion of
land, by the repeated sowing of the same kind of grain,
attention should always be had, both to the nature of the
fallow, and the intentions of the farmer; as it is only in this
way that the most advantageous changes can be adopted and
introduced in the different situations and conditions of land.

But this method of operating, though a practice of infinite
consequence in agriculture, and which was much examined
and attended to at an early period of the art, seems to have
been much overlooked and neglected, until lately, when the
culture of turnips probably furnished the useful hint, and led
the farmer to perceive that his land, instead of being im-
poverished by that valuable root, was greatly enriched, and
prepared to yield a better crop of barley in the spring, than
would otherwise have been the case. This might, likewise
fugget to him, that other succulent plants, which frate and
cover the earth much with their leaves, might have the same
effect; and the fucellas which has followed has answered his
utmost expectation, as it is now found that a fallow does not
become necessary in several years; the ground being kept
clean from weeds and in heart by a variety of green and other
crops, when rightly timed and properly managed in respect
to their introduction and culture afterwards.

It has been discovered by modern cultivators that some
sorts of crops, such as peas, beans, clover, and all plants of
the pulse kind, are enrichers and cleaners of the earth; while
wheat, oats, barley, and the whole tribe of vegetables, whose
roots are fibrous and spread far, impoverish and rob the
ground. The latter also let it become foul, by giving way
to weeds and grass, which, being the natural products of
every soil, are more readily nourished by it than such plants
as it does not spontaneously produce. It is therefore evident,
that by judiciously interposing such green or other enriching
crops as are adapted to the soil between the grain-crops, the
farmer may not only, in a great measure, avoid the necessity
and expense of fallowing, but frequently be enabled to reap
better crops. Besides, under this system of management, he
may be enabled to keep a much larger flock of cattle, and
consequently produce a much larger quantity of manure, the
advantages of which are very great. See Green Crops and
Course of Crops.

Change of feed, denotes the practice of sowing feed taken
from a different soil, in order to prevent the land from becom-
ing tired with the same kind of grain.

This is a custom pretty common among farmers, though
experience has not yet shown how far it is well founded.
Great importance has been attached to this practice by some
cultivators, probably from adopting imperfect notions of the
nature of vegetation itself, or from pursuing false analogies
in respect to the breeding of animals; but it is evident, a
cultivator of much experience observes, from the trials that
have been made in the cultivation of grain, and from what
happens in particular cases of gardening, that it will be of
no utility to have recourse to the change of feed, provided
it is properly adapted to the soil, except it be for an impro-
ved kind. The only thing necessary, is that of collecting
and preferring the best of the different kinds, and by that means
preventing a degeneracy. "It is hardly, he observes, to be sup-
posed that the soil can become tired of, or be improper for,
producing a sort of grain for which it is adapted, since it
may be observed that the same sorts of plants are frequently
propagated on the same spots of ground, for a vast length of
time, without any manifest injury in respect to their qual-
ity."

A great objection to the practice is also found by some
on the ground of the expense.

It is observed by Mr. Middleton, in the Agricultural
Report of Middlesex, that the changing of the feed of a
flock every two or three years, though extremely general, is done
at an extreme expense of from 5s. to 1s. a bushel on wheat,
and half these sums on other kinds of grain. This practice
it, he thinks, as little founded on propriety, as a change of
flock once in every two years would be, and never will be
the means of advancing even to a high pitch of excellence.
On the contrary, when corn farmers become wise enough to
apply Blackwell's method of improving cattle to the raising
of feed grain, the advance will be rapid indeed, and its in-
crease
I. J. A.

The method he wishes to recommend to those cultivators who desire to excel in the article of grain, is, he says, the following: namely, a few days before harvest, to walk through their fields of corn, to select and gather the prime samples of every species of feed, and ever afterwards to continue the same practice, by repeating the operation of collecting the most perfect grain from the crops produced from such selected feed. The same observations, he affirms, apply to every variety of cultivated crops.

However this may be, we are inclined to believe, from offering what takes place in respect to the curl, a disease in potatoe crops, that a change of feed may sometimes be useful, though, perhaps, much less frequently than is the practice of farmers in general.

But it is added by the first of these writers, on the authority of Mr. Downland, that "as some of the varieties of the same sort of grain or feed, when grown under similar circumstances of soil and climate, are, however, often found by the cultivators to bear only in such manner early growth than others, as well as of a more or less hardy and vigorous nature; it may be of utility to change them in these respects, the early kinds being always cultivated on the colder and more backward descriptions of land, while those of the later are sown upon the dry and more warm soils. In this way the crops may often be considerably improved, as, in so far as regards themselves, they will enjoy the advantages of more genial soils and climates. Another advantage may be gained in this method, as by employing such early kinds of feed, the farmer may, in some cases, delay the putting in of his seed for several days, without the danger of the crop being injured thereby, or of its not being reaped at the usual time. He may likewise, in the late soils, thus obviate the difficulties and inconveniences attending bad seed times, as by such a change the feed, though put in later, may be equally early at the harvest." And it has also, he says, been remarked, that "there is an advantage resulting from changing feed from soils of opposite natures, which cannot be depended upon when the change is made from similar soils, which variety is дальнest continued through many generations, even when the plants are removed to other soils and climates, it must be advantageous for the agriculturist to inspect other crops as well as his own; and thus, wherever he can find a new vegetation, to collect feeds from it; which, he thinks, more certain to improve his crops than an indiscriminate change of feed. And that where feed-corn is purchased without a previous observation of its superior excellence, perhaps it would be more advantageous to take it from better kinds of soil, and from somewhat better climates; as the good habits acquired by such feeds may be continued long after their removal to inferior situations. But on the contrary, care should be taken not to collect a change of worse feeds from worse climates or inferior soils, unless the agriculturist is previously certain that they are of a superior kind or quality." See Seed and Sowing.

CHANGEABLE. See HIBISCUS.

CHANGER, or CHANGER, an officer belonging to the king's service who changes money for gold or silver bullion. See Banker.

CHANGER, M.N.E.R., is a banker who deals in the exchange, receipt, and payment of monies.

CHANGES, in Arithmetic, &c. the permutations, variations, or alternations of any number of quantities; with regard to their position, order, &c.

To find all the possible changes of any number of quantities, or how oft their order may be varied.

Suppose two quantities $a$ and $b$. Since they may be either wrote $ab$ or $ba$, it is evident, their changes are $2 \times 1$.

Suppose three quantities $a$, $b$, $c$: their changes $c a b$ will be as in the margin; as is evident by combining $a c b$ first with $a b$, then with $b a$; and hence the number $a b c$ of changes is $3 \times 2 \times 1 = 6$. If the quantities be $4$, each may be combined four ways with $c b a$ each order of the other three; whence the number $b c a$ of changes is $4 \times 4 \times 4 = 12 = 23 = 24$. Wherefore, if the number of quantities be supposed $n$, the number of changes will be $n \times n - 1 \times n - 2 \times n - 3 \times n = n(n - 1)(n - 2)(n - 3)$.

If the same quantity occur twice, the changes will be found $b d$ of three $a b a$, $a b b$, $b b a$; of four $c a b$, $c b a$, $b a c$, $b c a$. And thus the number of changes in the first case will be $1 = (2 \times 1) + 2 \times 1$; in the second, $3 = (3 \times 2 \times 1) + 2 \times 1$; in the third, $12 = (4 \times 3 \times 2 \times 1) + 2 \times 1$.

If a fifth letter be added, in case of four quantities, it will beget five changes, whence the number of all the changes will be $60 = (5 \times 4 \times 3 \times 2 \times 1) + 2 \times 1$. Hence
if the number of quantities be \( n \), the number of changes will be \((n \times n - 1 \times n - 2 \times n - 3 \times n - 4, \ldots) = \frac{n(n+1)}{2} \times 1 \times n\).

From these formulae may be collected a general one, viz. if \( n \) be the number of quantities, and \( m \) the number which flows from the same quantity occurs, we shall have \((n \times n - 1 \times n - 2 \times n - 3 \times n - 4 \times n - 5 \times n - 6 \times n - 7, \ldots) = \frac{n(n+1)}{2} \times 1 \times 2 \times 3 \times \ldots \times 2 \times 1 \times n - m \times n - m - 2 \times m - 3, \ldots)\).

If the number that flows from any of them is repeated, we obtain an universal form \((n \times n - 1 \times n - 2 \times n - 3 \times n - 4 \times n - 5 \times n - 6 \times n - 7, \ldots) = \frac{n(n+1)}{2} \times 1 \times 2 \times 3 \times \ldots \times 2 \times 1 \times n - m \times n - m - 2 \times m - 3, \ldots)\).

Suppose, for instance, \( n = 6, \) \( r = 3. \) The number of changes will be \((6 \times 5 \times 4 \times 3 \times 2 \times 1) = 3 \times 3 \times 2 \times 3 \times 2 \times 1 = 62,702,800.

Hence, if it be proposed to assign how many different ways 6 persons might be placed at table, the answer would be \( 6 \times 5 \times 4 \times 3 \times 2 \times 1 = 720. \) For 13 persons we shall find the number \(13 \times 12 \times 11 \times 10 \times 9 \times 8 \times 17 \times 3 \times 2 \times 1 = 12,270,208,000. \)

If it were required to find how many changes may be ranged on four bells, the answer would be \( 1 \times 2 \times 3 \times 4 \times 5 \times 6 (720 \times 7 = 5040. \) On 12 bells, it would be \(12 \times 11 \times 10 \times 9 \times 8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1 = 47,900,160,000. \)

Supporting 10 changes to be rung in one minute, that is, \(10 \times 12 \) or 120 strokes in a minute, or two strokes in each second of time, then, according to this mode of computation, it would take upwards of 91 years to ring all these changes on the 12 bells. If two more bells were added, so as to make the whole number 14 bells, it would require, at the same rate of ringing, about 16775 years to ring all the changes on 14 bells but once over. And if the number of bells were 24, it would require more than 117,000,000,000,000 years to ring all the different changes upon them. See Alternation.

In this manner may all the possible anagrams of any word be found in all languages, and that without any difficulty. Suppose, for instance, it were required to find the anagrams of the word Roma, the number of changes will be \( 4 \times 3 \times 2 \times 1 = 24. \) Thus,

\[
\text{Roma, arma, mara, aroma, mare, armo, \\
rama, mara, armo, arma, \\
rmoa, maro, armo, armo, \\
rama, maro, armo.}
\]

The anagrams therefore of the word Roma, furnishing any word of known significance in the Latin tongue, are seven; viz. Roma, ranro, maro, mero, moro, armoe, amero. Wallis's Algebra, p. 117. See Anagram and Combination.

Whether this new method of anagrammatizing be likely to prove of much service to that art, is left to the poets. Changes of inflex. See Aurelia, and transformation, &c. of inflex in article Entomology.

CHANGWATER, in Geography, a town of America, in the state of New Jersey; 25 miles W.S.W. of Morristown.

CHANG JHAI, a town of China, of the third rank, in the province of Kiang-nan, or Nan-king; 6 leagues S.E. of Son-kiang.

CHANG-CHANG, a town of China, of the third rank, in the province of Fo-kien; 50 miles S. of Tung-tcheou.

CHANG-HIA-TONG, a town of China, of the second rank, in the province of Quang-fu; 400 leagues S.S.W. of Peking. N. lat. 22° 27'. E. long. 160° 4'.

CHANG-HIO, a town of China, of the third rank, in the province of Chang-tung; 6 leagues S.W. of You-tung.

CHANGI, a gulf in the northern part of the Chinese sea, which is in the most advanced and narrow part of a great bay, which begins at the island of Pungme, and terminates at the frontiers of the province of Peking, about 30 leagues from the capital of the Chinese empire.

CHANG-IIN, a town of China, of the third rank, in the province of Quang-fu; 58 leagues S.W. of Peking. N. lat. 25° 3'. E. long. 160° 24'.

CHANG-KAO, a town of China, of the third rank, in the province of Kiang-fu; 10 leagues W.S.W. of Choutcheou.

CHANGLASSE, a town of Aiga, in the county of Thibet, near the river Sampo; 204 miles W. of Lassa, and 190 N.E. of Catmandu.

CHANG-LIN, a town of China, of the third rank, in the province of Quang-fu; 6 leagues N.W. of Ping.

CHANG-LING, a town of Aiga, in the kingdom of Corea; 5 miles S.S.W. of Hoang.

CHANG-NAN, a town of China, of the third rank, in the province of Chen-fu; 14 leagues S.E. of Chang.

CHANG-SE, a town of China, of the second rank, in the province of Quang-fu; 1180 miles S.S.W. of Peking. N. lat. 21° 18'. E. long. 107° 14'.

CHANG-TCHEOU, a town of Aiga, in the kingdom of Corea; 20 miles W. of Long-Konang.

CHANG-TCHING, a town of China, of the third rank, in the province of Honan; 8 leagues S.S.E. of Konang.

CHANG-THE, a city of China, of the first rank, in the southern part of the province of Hu-quant.

CHANG-TE, a city of China, of the first rank, in the province of Ho-nan.

CHANG-TI, or Tien, in Ancient Mythology, a deity of the ancient Chinese, whom, according to Du Halde, they worshipped as the supreme being: the name is said by some to denote the spirit which presides over the heavens; but, in the opinion of others it is only the visible emblem.

CHANG-TSAI, in Geography, a town of China, of the third rank; 6 leagues N. of Yun-hing.

CHANG-YEON, a town of China, of the third rank, in the province of Kiang-fu; 10 leagues N.N.E. of Nan-ghang.

CHANG-YU, a town of China, of the third rank, in the province of Tschu-kiang; 6 leagues E.S.E. of Chao-king.

CHANGY, a town of France, in the department of the Rhone and Loire; 31 leagues N.W. of Roanne.

CHANIERES, a town of France, in the department of the Gironde; 12 miles E. of Blaye.

CHANIEWIEZE, a town of Lithuaria, in the palatinate of Novogrodke; 56 miles S.W. of Novogrodke.

CHAN-LIN, a town of China, of the third rank, in the province of Quang-fu; 8 miles N.N.W. of Ko-hon.

CHANMANNING, a town of Aiga, in Thibet, where the grand Lama occasionally resides; 115 miles W. of Lassa, and 205 N. of Catmandu; about 167 geographical miles of horizontal distance from Paridrong, in the Lama's map.

CHANNA, in Ichthyology, the name of a fish, said to be caught in great plenty in the Mediterranean, and brought to market in Italy and elsewhere, among the sea perch, which it nearly resembles. It is not sufficiently clear that
the above species is the same with the Gmelinian *laurus chabanii*. as some imagine.

**CHANNADELLA.** A name given by Delionius and others to a species of *laurus*, apparently the *chama* of the elder writers. See *Laurus heptanis*.

**CHANNEL.** In Anatomy, Surgery, &c. See *Canal*.

**Channel,** in Architecture. See *Gutter*.

**Channel, or bed of a river.** See *River*.

**Channel of the rivers,** is the hollow both of a cornice, which makes the *pendant cornicula*. See *Lakyer*.

**Channel of the voice,** in the voice capital, is the face of its circumvolution, inclosed by a lip. See *Volute*.

**Channel, in Geography,** the English name of one of the French departments, called *La Manche*. This is one of the five departments formed of Normandy, and the north part of Perche. It is bounded on the north by the Channel; on the south by the Channel and the department of Calvados; on the east by those of Maine, and of Ille and Vilaine; and on the west by the ocean. Its superficies is about 1,123,92 square acres, or 67,513 hectares, and comprehends 68,668 kilometres; its population consists of about 538,113 persons. It is divided into five communal districts, 48 cantons, and 696 communes. The general total of its contributions amounts to 53,154,741 francs, and the expenses charged upon it are 57,575,410 francs. Its chief town is *Coutances*.

**Channel** is also applied to divers arms of the sea, where the waters run within the land; or to certain narrow seas confined between two adjacent continents, or between an island and a continent.

In this latter, sap. *George's* Channel, the British Channel, the Channel of the Black Sea, or Constantinople, &c.

**Channel, in the Mounge,** is used for that concavity in the middle of the lower-jaw of a horse, where the tongue lies. It is often being bounded on each side by the bars, terminates in the grinders or maxillary teeth. The barbels grow in this channel.

**CHANELLINGS.** See *Fluting*.

**CHANNEt Oudou, in Geography, a town of Chinefe Tartary, in the country of the Moguls. N. lat. 41° 51'. E. long. 14° 14'**.

**CHANON, in Conchology.** Adamon calls the Linean Metrus *Hyma* by this name.

**CHANONAT, in Geography, a town of France, in the department of the Plu de Dôme, celebrated for its mineral waters.**

**CHAN-san-shen,** a town of China, seated on the river *Chen-tang-chuang*, which at this place ceases to be navigable. See *Chen-tang-chuang*.

**CHANDEN-pou, in Beating, Rhised. See *Bauh-**

**CHAN-si, XAN-si, SHAN-si, or SHAN-sce, a province of China, bound on the north by Pecheli; on the west by Shen-6; on the south by Hima; and on the north by the Chinefe wall, which separates it from Tartary. It extends from 9° to 6° 2', W. long. from Pecking, or 115° 27' 50' E. long. to 110° 24' 30' E. long.; but from north to south, from 34° 37' to 40° 50' of latitude. It is a tradition among the Chinefe, that this was the firft inhabited province of the whole empire. The climate, though the country is mountains, is mild and favourous; of the mountains, some are lofty and rugged, and others are well cultivated, by means of terraces, cut from the top to the bottom, which produce plenty of corn and other grain. The plains are fertile, though not so well watered as the other provinces. The vines yield excellent grapes, which, instead of being applied to the purpose of making wine, are dried, and in this state sold in the other provinces. This province furnishes great quantities of musk, porphyry, marble, and Jasper; it has also mines of iron-ore, which affords iron that is fabricated into a variety of utensils. The mountains supply an abundance of coal, which is pounded and mixed with water, and formed into small cakes; these, though not very inflammable, afford a strong and lasting fire. The people are out of their ovens with their bread, and engaged in its circulation; but creditors are much admired for their slender shape and beauty. The number of inhabitants is estimated at 27,763,200; occupying an extent of territory of 55,256 square miles, or 35,711,130 acres. The revenue received into the royal treasury at Pecking from this province, and derived from the land, salt, and other taxes, amounts to 3,724,000 talers, or ounces of silver. Shan-fu contains five cities of the first rank, viz. T'ai-yuen; the metropolis of the province; Ping-yang; Lu-nghung; Peen chew, and T'ai-fung; and 85 of the second and third rank.

**CHANSON, French,** a long; a short lyric poem on familiar subjects, of love, wine, joy, sorrow, &c. put to an easy melody for local occasions: at table, to a milrefs, to friends, and even to yourself when alone, in order to drive away care, anxiety, low spirits in the rich, and to alleviate fatigue and indulgence in the poor.

A *jong* of this kind is totally diffent from what is called an *av*, or a lyrical drama, which, as a poem when taken out of its music, has neither beginning, middle, nor end. See *Sonnets*. See *Song*.

The French fongs, not dramatic, or chanrns à table, turn chiefly on love and wine, addressed by their votaries to *Venus et Bacchus*.

There are in France, likewise, numerous *fartitical fongs*, under the denomination of *Vaudrillards*, which see.

The ancient historians and poets of France mention their *military fongs* of very remote antiquity, in which were celebrated the heroic deeds of their favourite chiefs and most gallant commanders. These used to be sung in chorus by the whole army in advancing to attack an enemy; a custom probably derived from their German ancestors, as the privilege of leading off this kind of *var songes* usually appertained to the bard who had composed it. Charlemagne had a great passion for these heroic songs, and, like our Alfred, not only had them collected, but knew them by heart. However, the achievements of this victorious prince and his captains obliterated those of their predecessors, and gave birth to new fongs. One of these, in praise of Roland, the *Orlando innamorato* and *fanta*, of Boncourt, Berri, and Armel, was longer preferred than any other of the rest. Their French historians tell us, was begun at the battle of Hastings, where William became the conqueror of the English nation, by a knight called *Tallifer*, on whom this honour was conferred for his strong and powerful voice. Here he performed the office of *herold mylger* (*magnificus luctus*) at the head of the Norman army, and was among the first that was slain in the onset.

The song upon Roland continued in favour among the French soldiery as late as the battle of Poitiers, in the time of the king *John*; who, upon reproaching one of them with firing it at a time when there were 20 Rolands left, was answered, that Rolands would still be found if they had a Charlemagne at their head. But however popular this fong may have been in the fourteenth century, it is not come down entire to the present times.

Concerning the heroic song called *P'Homme armé*, on the melody of which all the first great contrapunctists composed masses of the most elaborate kind; nothing is more probable than
than that the tune of this song was the famous Cantilena Rolandi, or melody to the song which the French armed champion used to sing at the head of the army, in honor of their hero Roland, in advancing to attack an enemy.

CHANSONS de Geste. Songs on heroic, historical, and chevaleresque subjects. This kind of song was called in England during the Norman dynasty, chant royal; and Chaucer, in speaking of the musical talents of the poor scholar Nicholas, in the Miller's Tale, says:

And after that he song the Kinge's note;
Full often blessed was his merry throat.

The Chanson de Geste was distinguished from common fongs, according to Alberic, by the title of Hercia Cantilena. Their historical fongs or hybrid must have been sung to very short and simple tunes, such as our Chansons Chateaux, or such as is used by the Improvisatori of Italy in accompanying their inspirations, which frequently amount, in length, to many hundred stanzas.

Though the rest of Europe is not partial to the music of France, the words of their fongs, from the time of the Troubadours to the present, must be allowed to abound in wit, irony, badinage, and elegant, warm, and ingenious praises of love and wine, more than those of any other country.

CHANSONETTE, French. The diminutive of chanton, a little song.

CHANT, in our cathedral service, bears very little resemblance to the canto fermo, or plain chant of the Roman Catholics, which is chiefly pronounced, rather than sung by the priest alone, without base; whereas our chants are short phrases of melody, sung antiphonally from side to side, in four parts, accompanied by the choir, except in the first verse and Gloria Patri. Some of our chants are as ancient as the reformation; and perhaps still more ancient, as they resemble, in length, facility, and counterpoint, those used in Italy during the middle of the XVth century. Several composed by Palestrina and his contemporaries have been preferred in an ancient MS. procured in Italy, called Studi di Palestrina, and believed to be the autograph of that father of ecclesiastical harmony.

CHANT, Ambrosian. See Ambrosian Chant.

CHANT, Gregorian. See Gregorian Chant.

CHANT, French, is equivalent to melody, or the principal or treble part in a musical composition. See Canto, Cantilena, Ital.

CHANT, Cantus, is used for the vocal music of churches. In church history, we meet with divers kinds of chant or fongs: the first is the Ambrosian chant, established by St. Ambrose.

The second, the Gregorian chant, introduced by pope Gregory the Great, who established schools of chanters, and corrected the church fongs.

This is still retained in the church under the name of plain fong: at first it was called Roman fong.

The plain, or Gregorian chant, is where the choir and people sing in unison, or altogether in the same manner. See Choral Service.

CHANT sur le livre, French, is diatonic, or singing extem- pole in the plain fong in the cathedral service of the Romish Church; which is done by three or four fongs on the Gregorian notes, in the mass book on the desks in the middle of the choir, so that, except the canto fermo in the missal, which is generally sung by the tenors, the singers have nothing to guide them. However, there are choral fongs, io vered in counterpoint, that they even lead off and pursue subjects of fugue and canon on this foundation, without confusion, or violating the rules of harmony. See Discant, Contrapunto alla mente, or All'improviso.

CHANTABOUN, in Geography, a sea-port town of the kingdom of Savoy, on the frontiers of Camboja.

CHANTADA, a town of Spain, in the province of Galicia; 20 miles N. of Oranfe.

CHANTAGIR, a river of Siberia, which runs into the Enisei; N. lat. 51° 50'; E. long. 91° 34'.

CHANTELLE-le-chateau, a town of France, in the department of the Alber, and chief place of a canton in the district of Cannat, three leagues N. of Cannat; the place contains 1334, and the canton 11,910 inhabitants: the territory includes 222 square leagues and 20 communes.

CHANTAUDAY, a town of France, in the department of the Lower Loire, and chief place of a canton, in the district of Nantes; two miles west of it.—Also, a town of France, in the department of the Barthe, and chief place of a canton, in the district of Le Mans; 15 miles W.S.W. of it.

CHANTER, French, to sing. We shall not go to France for instructions in this art; though Messrs. Fra- mery and Ginguené have adopted and given in the Exocyl Meth. some very useful precepts from the Italian school, which we apprehend will not be generally received or put in practice by their countrymen for some time. We acknowledge, however, that Mr. Framery has discussed this subject with delicacy, discrimination, and good taste.

Rouet's definition of the verb chanter, is clear and precise: it is, in its general application, the forming with the voice such sounds as are appreciable. See MELODY. But it is more commonly understood to imply the producing, by vocal inflexions, a variety of such tuneful sounds as are agreeable to the ear, and by intervals admitted in harmony, and consonant to the rules of modulation. A finger placed in proportion as the voice is clear and well toned, the ear perfectly accurate, the organs flexible, the table well formed, and when instruction and practice have polished and improved the gifts of nature. To which, in imitative and theatrical music, should be added that degree of facility which impel us others with the sentiments which we affect to feel. From observations in hearing great vocal performers, many rules have been formed for facilitating and perfecting a vocal fluent; but many discoveries still remain to be made on the most lofty, short, and certain path to perfection in this difficult art.

CHANTEREAU-LE-FEVRÉ, Louis, in Biography, a learned antiquary of France, was born at Paris in 1538; and became eminent for his knowledge of his heart than for those of his understanding. He distinguished himself by his knowledge of jurisprudence, history, politics, and belles-lettres, and was advanced by Lewis XII. through successive polls to that of intendant of the finances of the duchies of Bar and Lorraine. He compiled from original records, "Historical Memoirs of the Houses of Lorraine and Bar," the first part of which only was published at Paris, 1642, fol. He also published other works on detached parts of French history; and after his death, his son published his "Treatise on Feuds," in 1652, fol. in which he maintains an opinion, which has been thought to be erroneous, viz. that hereditary feuds commenced only after the time of Hugh Capet. He died at Paris in 1658. Nouv. Dict. Hist.

CHANTERELLE, French, the first string of a violin, tenor, or violoncello.

CHANTIER, in Military Language, a square piece of wood, which is used for raising any thing upon, as, for instance, for ranging barrels of gun powder on, or for proving cannon without the assistance of gun carriages.

CHANTILLY, in Geography, a town of France, in the depart-
department of the Oise, and chief place of a canton, in the district of Soissons. The prince of Condé had, before the revolution, a magnificent palace in this place, with beautiful gardens, a manegery, extensive park, and curious waterworks. The flabe was reckoned superior to any in France, and the foreflew for the preservation of game extended many miles in circumference: 1½ league W. from Soissons, and 4 S.S.E. from Clermont.

CHANTILIE, in Buildings, a piece of wood fastened near the ends of the rafters, and projecting beyond the wall, to support two or three rows of tiles so placed to prevent the rain-water from trickling down the sides of the wall.

CH'ANT'ONG, CH'ANT'TONG. SHAH-TONG, or XANT'-TUN, in Geography, a province of China, bounded on the west by part of Pe-che-ni, Shan-chi, and T'orang; on the south, by Kiang-nan; on the east, by the Yellow Sea, and on the north, by the same sea and part of Pe-che-ni. It extends from 34° 35' to 33° N. lat. and from 116° to 117° E. long. It is reckoned one of the most fertile provinces and finest climates in China. One crop is laid to afford the inhabitants, who are not so numerous as those of some other provinces, several years' sufficiency. Besides the grand imperial canal, which traverses some part of this province, it has several large, rivers, and streams, which contribute to fertilize and enrich it; though it frequently suffers from drought, as it seldom rains here. It is much infested by locusts, wolves, and gangs of robbers, who beset travellers in the highways over the mountains, and often descend to the plains, plundering and ravaging the villages and open towns. The inhabitants are strong and healthy, and are employed in manufacturing great quantities of silk; besides the common food produced by the silk-worms, they find another food upon trees and bushes in great plenty, which is spun by a kind of worm not unlike our caterpillars. This last kind, though coarse, is stronger than the other; and with this they carry on a great trade, by means of their rivers and canals. The banks that come from the southern provinces pass along the northern canals; and the tribute of the merchandise thus conveyed has been computed to amount to a very large sum. Among other fruits produced in this province, they have one which is called Se-te, a kind of figs, which ripen about the beginning of autumn, and being dried, contract a crust of candied sugar, that gives them a delicious flavour. This province is rendered particularly venerable among the Chinese by a tradition, that their great philosopher Konfûtsse, commonly called by us Confucius, drew his first breath in it. Chantong is divided into six districts, which contain five cities of the first rank, that are very populous and flourishing. These again include no less than 114 towns of the second and third rank, besides a great number of towns and villages, fifteen forresses, some of them very large, and all of them built to guard the entrances of their ports and the mouths of their rivers. There are likewise several islands flatterted along the gulf, extremely well peopled, affording convenient harbours for Chinese transport, and a quick and easy passage to and from Corea and Loo-pong. The cities of the first rank are T'ih-pan or Ciennan, the metropolis of the province, Yung-chew, Tong-chang, Ting-chew, Ten-chew, and Loo-chew. The population of Chantong consists of twenty-four millions, occupying a territory in extent 65,414 square miles, or 41,604,750 acres. The revenue of this province, transmitted to the treasury at Peking from the land, salt, and taxes, amounts to 3,000,000 taels or ounces of silver, besides 360,000 measures of rice and other grain.

CHANTONICE, in Ancient Geography, a country of Asia, which made part of Carmania, according to Proclus.

CHANTONAY, in Geography, a town of France, in the department of the Vendée, and chief place of a canton, in the district of Fontenay-le-Comte; 43 leagues W. from La-Châtaiignoraye. The place contains 1,421, and the canton 8,283 inhabitants; the territory includes 26,794 square miles, and 15 communes.

CHANTOR, in the fourth Antiquities. In the temple of Jerusalem there was a great number of Levites, who were employed in singing in the temple of God, and in playing upon instruments before his altar. In the reign of David there were four thousand singing men, with their heads and president.

The chantors and Levites who were employed in singing, playing upon instruments, and other functions of the Temple, had no habits distinct from the rest of the people. Nevertheless, in the ceremony of removing the ark to the Temple of Jerusalem built by Solomon, the chantors appeared clothed in tunics of byssus, or fine linen. Josephus remarks, that in king Agrippa's time they obtained the favour from that prince of wearing a linen robe in the Temple, thus the priests. Agrippa believed it would be for the honour of his reign, to signalize it by so confiding a change as this. The other Levites, employed in different exercitings under the command of the priests in the Temple, preferred likewise commissiion to learn to sing, to the end that they might enjoy the same privileges with other brethren.

CHANTOR, or CHANTOR, a person who sings in the choir of a cathedral.

All great chapters have chantors and chaplains to sing and assist the canons, and officiate in their absence.

St. Gregory first instituted the office of chantors, erecting them into a body, called fihola cantorum: though Anaxibius seems to attribute their rise to Procopii Euphrasii, who lived an hundred years before Gregory. But the word grows accountable in this sense, and instead of it the word choir-man or singing-man is now used.

CHANTOR is used, by way of excellence, for the precentor or master of the choir; which is one of the dignities of the chapter.

The chantor bears the cope and the staff at solemn festivals; and gives tune to the rest at the beginning of plains and anthems. At St. David's in Wales, they have no dean, he is next in dignity to the bishop.

The ancients called the chantor, primicerius cantorum.

To him formerly belonged the direction of the deacons, and other inferior ministers.

CHANTRIGNE, in Geography, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Mayenne; 2½ leagues N. of it.

CHANTRY, or CHANTER. See CHANTER.

CHAN-YN, a town of China, of the third rank, in the province of Chah-fu; 25 miles E.N.E. of Shao.

CHAOU, one of the clifffs into which the late Mr. Muller arranged the islands between Karthikara and America, comprehending eight islands; viz. Immak, Kika, Thib-ghina, Ava, Chavia, Thengulak, Ungibea, and Anthigida, or the more distant Aleutans.

CHAUKAYSE, an order of horse in the service of the grand signor. These and the muskrellers were originally the guards of the sultans in Egypt, and their leaders were his two vizirs, that always accompanied him. They now constantly go out with the bafkaw.

The
The body of the chaosae seems originally to have been the guard out of which the Sultans used to send perons to execute his orders.

CHAO-HING, a city of China, of the first rank, in the province of Tche-kang; 6° 33' S. E. of Peking. N. lat. 30° 10'. E. long. 120° 14'.

CHAO-IM, a town of Chinee Tartary; 8 miles S. of Geo.

CHAO-KEOUING, a town of China, in the province of Chang-tung; 35 miles S. E. of Tai-nghin.

CHAOLOGY, the history or description of the chaos.

Orpheus, in his Chalology, sets forth the different alterations, evolutions, and divers forms, which matter went through till it became inhabitable; this amounts to the same with what we otherwise call cosmogony, or the creation of the world. See Cos mogony.

Dr. Burnet likewise gives us a chaology in his Theory of the Earth. He represents the chaos, as it was at first, a chaos, and uniformly rude and deformed; or the taba taba: then flew how it came divided into its respective regions; how the homogeneous matter gathered itself apart from all of a contrary principle; and lastly, how it hardened, and became a solid, habitable globe.

CHAO-MA-ING, in Geography, a town of Asia, in Thibet; 10 miles N. of CHAO-MA-ING HOTUN, is a town of Thibet, 285 miles E. of Hami.

CHAO-MANTIA, among the Ethosogtical Cehinfis, is the art of making prelages from observations on the air.

CHAO, in Ancient Geography, a mountain of the Peloponnecus, situated to the left of the route from Argos to Tegea, the lower part of which was planted with fruit trees. Hence proceeded the river Erinus, which supplied that of Styphalus in Arcadia. Baccus and Pan were honoured with sacrifices at the fall of the water which formed the Erinus, and a festival was celebrated in honour of Bacchus, which was denominated tyrs. Paufan. Corinth. i. ii. c. 24.

CHAONE, or CHAONIT, the name of a people who had the sovereignty of the whole of Epirus before the Molossi, according to Strabo. Virgil (Aen. i. 113) supposes that they were more ancient than the war of Troy; and in another place he says that Ceres and Baccus introduced the use of wheat instead of the acorn of Chaonia. It is more natural however to trace the descent of the Chaonians from the ancient Pelasgians than from the Trojans, as the greatest number of the people of Greece and its environs had originated from the Pelasgi; and Steph. Byz. reports that Chaonia in particular had been formerly called Pelasgide. Plutarch seems to have assigned the time of their establishment, and the chiefs of their colony, when he says, that the Histrians related, that after the deluge of Deucalion, Phoebus, one of those who accompanied Pelasgus into Epirus, was the first king of the Thebriots and Molossi, that is, of the Chaonians, the predecessors of these people. If the establishment of the Pelasgus in Chaonia soon followed the deluge of Deucalion, this last event serves to fix the origin of the Chaonians; for although we cannot precisely ascertain the period of this deluge, it is known that Deucalion lived 200 years before the siege of Troy, and that some of his descendants affixed at that siege. The deluge happened about the cloes of his reign, and therefore could not have preceded the Trojan war, more than about five generations, or 150 years; or, according to Sir Isaac Newton, four generations, or about 133 years, reckoning with the ancients three generations to 100 years. The establishment of the Chaonians, which immediately followed the deluge, must therefore have taken place about three or four generations, or from 100 to 133 years, before the Trojan war. Upon this supposition, we may determine who was the Pelasgus that conducted the Chaonians into Epirus. He could not have been the ancient Pelasgus, who lived before the flood of Deucalion, according to the history of his polity, traced out by Paufanias; but he had a grandson of the same name, who, according to the relation of Plutarch, conducted a colony to Epirus after the deluge of Deucalion. Steph. Byz. mentions a Pelasgus, the son of Lycaon, and father of Theophrus, and he also mentions his descendants, who inhabited Epirus. We have reason, therefore, to believe, that this is the Pelasgus to whom Plutarch refers, since a period near the deluge of Deucalion corresponded to the time of a son of Lycaon; and we learn from Apollodorus (iii. 8. 2.) that Deucalion's flood occurred in the reign of Nyctimus, the successor of Lycaon. Moreover, Paufanias (l. viii. c. 3.) informs us, that the sons of Lycaon, amounting in number to not less than 24, dispersed themselves in Greece. The oracle of Dodona in Epirus was of Pelasgian origin; and since the Pelasgi were not settled in Epirus till after the deluge of Deucalion, this oracle could not have been established at an earlier period, or till after the settlement of the Chaonians, and hence we may infer that it was probably of Chaonian origin. Herodotus (l. i.) affirms us, that the ancient Pelasgi invoked the divinity in general, without referring to him those appellations which afterwards disting- guished the gods and goddesses, whose worship was not yet introduced into Greece. This author adds, that the Pelasgi conflated the oracle of Dodona. The Pelasgus, according to Herodotus, were more ancient than the gods of Greece, and more ancient than the other Greeks, who, according to Strabo, cannot be traced to a higher antiquity than the Trojan war, since Pelasgus, their chief, was a descendant in the 8th degree of those who affixed in this war, according to Paufanias. The ichnolith of Ailurophanes says, that the Chaonians were descended from the Thracians; but Aristoftes traces them to the Orontes, one of the most ancient nations of Italy.

CHAO-NIA, a country of Greece, the most northern part of Epirus, so called from its ancient inhabitants the Chaonians. It was bounded on the north by the Odribe territory and part of the country of the Paeans; on the south-west, by the Mediterranean sea; on the south, by the Thetrapia; and on the call, by the country of the Antaeus. The Acro-erucian mountains bounded it to the north. The most noted cities in this part of Epirus were, according to Ptolemy, Oricum or Oricus, Cassiopea or Cassiope, Antigonia, founded by Antigonus. Phanes, Hecatompholium, Ophthalmion, Elueus, and the strong town, or, as Phoys calls it, castle of Chalcara, much frequented on account of its hot baths. See Epirus.

CHAO-NIA, a town of Asia, in Syria, situated at the confluence of two small rivers, S.W. of Zeugma. Ptolemy places it in Camagene, a country of Syria.

CHAO-NITES, a small country of A'ma, in Assyria. E. of the Tigis; more properly Chalaites, which fee.

CHA-OU-FOU, in Geography, a town of China, of the first rank, in the province of Toflan; 775 miles S. of Peking. N. lat. 22°. E. long. 117° 19'.

CHAO PAI, a town of Chinee Tartary. N. lat. 22°. E. long. 124° 42'.

CHAO-PING, a town of China, of the third rank, in the
The province of Quang-si; 5 leagues S.E. of Yang-nghoi.

CHAOA, one of the smaller Cape Verd islands.

CHAOOS, among the Ancient Philosophers, was described a dark, turbulent kind of atmosphere; or a disorderly system, or mixture, of all sorts of particles together, without any form or regularity; out of which the world was formed.

Of Chaos is everywhere represented as the first principle, even or seed of nature, and the world. All the ancient sages, fables, naturalists, philosophers, theocritus, and poets, hold that chaos was the eldest and first principle, 17

The Barbarians, Persians, Egyptians, Parthians, &c., all refer the origin of the world to a rude, mixed, confounded mass of matter. The Greeks, Orpheus, Hesiod, Mosander, Aristophanes, Euripides, and the writers of the Greek Poems, all speak of the first chaos: the Ionic and Pythagorean philosophers build the world out of it. The Stoics hold, that as the world was first made of a chaos, it shall at last be reduced to a chaos; and that its periods and revolutions in the mean time are only transitions from one chaos to another. Lastly, the Latins, as Ennius, Varro, Ovid, Lucius, Statius, &c., are all of the same opinion. Nor is there any fact or notion whatever, that does not derive their Cosmogony, the structure of the world, from a chaos.

The opinion first arose among the Barbarians, whence it spread to the Greeks, and thence to the Romans, and other nations.

Dr. Burnet observes, that besides Aristophanes, and a few other pseudo-Pythagoreans, nobody ever affected, that our world was always, from eternity, of the same nature, form, and structure, as at present: but that he had been the floundering opinion of the wise men of all ages, that what we now call the terrestrial globe, was originally an undifferentiated mass of heterogeneous matter, called chaos; and no more than the rudiments and materials of the present world.

It does not appear who first broached the notion of a chaos. Moses, the eldest of all writers, derives the origin of this world from a confusion of matter, dark, void, deep, without form, which he calls tohu bauh; which is precisely the chaos of the Greek and Barbarian philosophers. Moses goes no further than the chaos; nor tells us whence it took its origin, or whence its confused state; and where Moses stops, there precisely do all the rest.

Dr. Burnet endeavours to shew, that as the ancient philosophers, &c., who wrote of the cosmogony, acknowledged a chaos for the principle of their world; so the divines or writers of the theology, derive the origin or generation of their faired gods from the same principle.

Mr. Whiston supposes the ancient chaos, the origin of our earth, to have been the atmosphere of a comet: which though new, yet all things considered, is not the most improbable affection. He endeavours to make it out by many arguments, drawn from the agreement which appears to be between them.

So that, according to him, every planet is a comet, formed into a regular and lasting constitution, and placed at a proper distance from the sun, revolving in a nearly circular orbit; and a comet is a planet either beginning to be dissolved, or re-made: that is, a chaos, or planet, unformed, or in its primeval state, and placed as yet in an orbit very eccentric. See Cosmogony.

Chaos, in the phrase of Paracelsus, imports the air. It has also some other significations among the alchemists.

Chaos (cholos) &c., of Linn. in the 12th edit. of Syll. Nat. is the Vibia glutinata of Goeze and Gmelin.

CHAI SOURCE, in Geography, a town of France in the department of the Aube, and chief place of a canton in the district of Bar-sur-Seine; 5 leagues S. of Troyes. The place contains 1,650, and the canton 12,339 inhabitants: the territory comprehends 415 kilometres and 26 communes.

CHAI, in Ornithology, denotes either of the mandibles of a bird’s bill, which are distinguished by the epithets upper and lower. The term mandible is more commonly that adopted by modern zoologists.

CHAP., or CHAL., or AL., or CHAL., or CHAL.

CHAPALLA, in Geography, a lake of North America, in Mexico, and the province of Guadalaxara; 18 leagues long and 11 broad; 15 miles S. of Guadalaxara.

CHAPARANG, or DIAPGRAM, a town of Afn., in the country of the Hid. estate near the head of the Ganges; 140 miles N.N.W. of Sirinagar. N. lat. 35° 10′. E. long. 75° 20′.

CHAPARRAL, a town of Spain in the province of Guadalajara; 5 leagues from Antequera.

CHAP, the mettles part put on the end of a fashbard to prevent the point of the fward or bayonet from piercing through it.

CHAPEAU, in a general sense. See Hat.

CHAPEL is sometimes also used to denote the cap, or coronet, worn by some noble and distinguished persons. See Cap of Maintenance. The crest is borne on the chapel; and by the chapal the crest and coat are separated; it being a rule, that no crest must touch the field immediately.

CHAPeAU, Fr. literally means a hat; but in use it implies the.fm. circns over two or more notes which we call a flour, or ; and by which a figure underlines that ad the notes under or over this drum-circles, or flour are to be sung to one syllable; and in violin music to be played with one bow.

Chapleau de Minerve. See the article CHAsses de galerie.

CHAPEL, or CHAPEL, a kind of little church, served by an incumbent properly under the denomination of a chaplain. The word chapel, according to some, comes from part, little tents, or lodges, set up by traders in fairs, to shelter them from the weather. Paxia derives it both from the Greek and Latin, quasi capitis or populorum vel ludorum; others derive it from the chapal, or cope, which served to cover the body: others, a pelibus caparamus; because these places were anciently covered with great haims. Rebuff derives it from capa, St. Martin’s cope, which the kings of France carried to war with them as their standard, and preferred very carefully in particular tents, thence called chapels. There are two kinds of chapels, the one confrated, and bell as benefice; the other secular, being of the nature of ostentation. The first are built apart, and at a distance from the parish church; being neither parishes, cathedrals, nor priories, but labelling of themselves. These are called by the canons fab cha or fab. and by us chapels of. or, as being erected a distance from the mother-church, where the parish is large and wide, for the convenience of some of the parishioners who reside far off. They are served by some inferior parson, provided either by the rector or the parish, or by the vicar for whole. pace, and benefit they are intended, by prayers or preaching merely. Some of these are also parochial, having the parochial rights of chrismating and burying, and differing from a church only in the want of a rectory and endowment.

The second kind are frequently built in, or adjoining to a church, as a part of the same; living only a cell, &c., to read
read prayers in; and in the Roman churches, an altar, &c. to celebrate mass on; but without any hantidry or, font. Thee the canonists call fah. In the twenty-sixth canon of the council of Aquin, held in 582, allows private persons the use of a chapel; but wishes prohibition to all clerks to officiate in them without leave from the bishop.

Chapels, free, are those chapels of ease which have a settled revenue for perpetnal maintenance of a pastor. &c. by charitable donations of lands, or rents bestowed on them; so as not to be any charge either to the rector, or the parsonage; and they are thus called because they are free from all ordinary jurisdiction.

There are several collegiate churches in France, which they call sancta chaapler, holy chapel; as those of Paris, Dinjon, Bourges, Bourbon, &c. These are so designated, from being repositories of certain relics.

Hence, all those places where relics were preferred came to be called chapels; and the persons who had the care of them, chaplains.

Chapel is also a name given to a printer's workhouse; because, say some authors, printing was first actually performed in chapels, or churches; or, according to others, because Caxton, an early printer, exercised the art in one of the chapels in Westminster Abbey. In this sense they say, the orders, or laws of the chapel, the secrets of the chapel, &c.

Chapel, Knights of the, an order of knights instituted by King Henry VIII. in his testament, to the number of thirteen: though these have been increased to the number of twenty-fix: they are called poor knights.

These are not knights of the order of the Garter; but as it were, their attendants or deputies, serving to discharge all their offices in the funeral services of the kings of England.

They are subject to the office of the canons of Windfor, and live on pensions which the order affigns them.

They bear the blue or red cloak, with the arms of St. George on the left shouder; but the cloak is only cloth, and they wear no goat of garter: which distinguishes them sufficiently from the knights of the Garter.

Chapel Royal Establishment. We have an account of this establishment in the "Liber niger dominus Regis," in the time of King Edward IV. in which there is likewise a list of the several musicians retained in that monarch's service, as well for his private amusement as for the antics of his chapel.

As this seems the origin of those establishments, of the chapel royal and king's band, which still subsists, we shall give the account of them, and their several employments, at full length from this ancient book, as well as from N° 243 of the Harl. MSS. in the British Museum, and N° 11472, 3, 11. of the Ashm. Collec, Oxford, for Ordinances touching the King's household, made in the time of Edward II. as well as in that of Edward IV.

"Ministers thirteene, thereof one is Virgir, which dircet them all fettayd dayes in their stayones of bowinges and ryppynge to such offices as the officees might be warned to prepare for the King's meats and leuberis; to be more redere in all services and due tyymes; and all thse futting in the halles together, whereof some be trompotes, some with the shalmes and smale pypes, and some are strange men coming to this Court at lywe feastes of the year, and then take their wages of Houshol, after ij. ob. by daye, after as they have byte presentation in Courte, and then to avoyd altere the

next morrow after the feast, besides their other rewards yearly in the King's exchequer, and clothing with the Houfbol, winter and summer for eache of them xxx. And they take nightelye among themselves all ij. galones ale; and for winter taketh three candles waxe, ij. candles pitch, ij. tale fluides [fire-wood coal and cut into billets]; lodging xyfervante by the Harbengers for them and their horses houlday to the Courte. Anfso hauing into Courte if fervants to bear their trompotes, yeres, and other instruments, and torches for winter nights, whilst they blow to imprese of the chandulary; and at least two of thes perfones to continu newe fylle in Courte at wyne by the cheake rolle which they be pree-ente of every dayl. to warn the King's ridingh houfhold when he goeth to loudfucke as oft as it shal require, and that his houfhold men may follow the more redder aftere by the blowinge of their trompotes. Yf any of the two Minstrelles be late bloode in Courte, he taketh two loves, if mee of greater meetes, one galone ale. They part not at no time with the rewards given to the Houfhol. Alfo when the do the King to have if Minstrelles continuing at Courte, they will not in no wife that thes Minstrelles be fo familiarize to thee refraining from theire duties.

"Children of the Chappelle viij, founden by the King's proue Coifere for all that longeth to their apparell by the hands and overights of the Deane, or by the Malter of Songes assignerd to teache them, which Malter is appointed by the Deane, chosen one of the number of the fellowshipe of chappelle after rehearsed, and to drawe them to other Schooles after the form of Sacotte, as well in Songes in Orgaines and other. Thes Children eate in the Hall dayly at the Chappell bord, nexte the Yeomane of Ulfey; taking amongt Alle for lyverye daylye for brekefafte and all reight, two loves, one melle of greatte mete, ij. galones ale; and for winter fea- lone ij. candles piche, ij. tallheids, and lyttore for their pallees of the Sracante Ulfer, and carriage of the King's coste for the compelete beddeynge by the overights of the Controller. And amongt Alle to have one fervante into the court to truelle and bear their harnesse and lyverye in Court. And that day the King's Chappelle remoueth ever of theses Children then present receauyth mjd. at the Grene Clothe of the Comptinger-house for horfes dayly, as long as they be jurneyng. And when any of these Children come to xxij. years of age, and their wyseys change, ne canne not be preferred in this Chappelle, the nombre being full, then yt they will affente the King affyneth them to a College of Ox ford or Cambridge, or the foundations, there to be at lyvynge and studyng bothe inly and tyle the King may other- wise advance them."

In the Liber niger, there is likewise not only an account of the gentlemen and children of the chapel, but of the "Deane's peron and establishment, with that of the xxij Chappelen and Clerkes of the Chappelle by the Deane's electione or denominations," &c.

The establishment of cardinal Wolsey's chapel, and of Henry Ageron Percy, fifth earle of Northumberland, was full more numerous and fpended.

Chapel in the-Frith, in Geography, is a small town of Derbyshire, England. It stands on the side of a high conex hill, which rifes from a contracted vale, formed by some high mountains. The church was erected at the commencement of the fourteenth century. There are some small cotton manufacturies which furnish employment to part of the lower classes of inhabitants. This town is 160 miles N.W. from London, and has a small weekly market on Thursdays.

CHAPELAIN, JOHN, in Biographia, a poet and man of letters was born at Paris in 1525, and dying con...
his education under the boil masters, became tutor to the children of the marquis de la Tréfée, grand marshal of France, and afterwards reward to this nobleman. During an abode of 17 years in this family he translated "Guzman d'Alfarache," from the Spanish, and directed his particular attention to poetry. In this art he acquired reputation by a critique on the Adonis of the cavalier Marino, prefixed to a Paris edition of that poem, in 1652. By an ode addressed to cardinal Richelieu, a critique on the Cut, and other performances, he obtained the credit of an oracle in matters of taste. Concerning himself capable of producing an original work, he undertook the composition of an epic poem on the subject of John d'Arc, but when the first 12. books of his "Pucelles, ou la France délivrée," appeared in 1656, ushered into the world with all the advantages of typography and engraving, and pushed by court influence through its editions, in eight months, the expectations of the public were disappointed, and the author's fame sustained a deadly blow, so that the name of Chapeland as a poet was regarded in France much in the same manner with that of Blackmore in England. The hardships of the Hyle and verification of this poem became a subject of contemptuous satire; and Boujen, Racine, and la Fontaine are humorously said to have imitated upon themselves the penance, for committing any fault in language, of reading a certain number of pages of this poem. The learned Huet, in vain endeavored to vindicate and extol the Pucelles against the more effectual criticisms of Boujen and others; and thus the 12 additional books have ever since remained in MS. in the king's library. His interest at court, however, remained undiminished; and as his positions were more ample than those of any other literary man, Delcassé calls him "le mieux renté de tous les beaux-écrivins." The list of personages, recommended by Colbert to Lewis in 1662, was formed by Chapeland; and this distinction incited him to a degree of homage which counterbalanced the failure of respect which he had incurred as a poet. His private character was held in high estimation; and though he was not wholly exempt from the charge of arrogance, he was not ambitious of public eminence, and widely declined the office of preceptor to the first daughers, to which he had been nominated by Montausier. Delcaux himself is constrained to bear an honourable testimony to his moral qualities. He died in 1674, leaving property which few poets of a superior merit have acquired. His works, besides those already noticed, are the "Dissertation on the Reading of Old Romances," 18 books; miscellaneous pieces on literature; etc., Nov. Dict. Hist.

CHAPELIER, in the Maine, a couple of flannel-makers, mounted each of them with a flannel, and joining in a sort of flannel buckel, called the head of the chapeliets, by which they are made full at the puffed end of the buckle, after being adjusted to the right length and bore. They are used both to avoid the trouble of taking up and letting down the flannels every time that a gentleman mounts on a different horse and saddle, and to supply what is wanting in the academy saddles, which have no flannel to them.

CHAPELLET, armour of iron furring a circle with three branches of the same metal, by means of which the noyau of the mould of a piece of ordnance is fastened to the shape. They also give this name to a pump or chimney. It is likewise given to an hydraulic engine for drawing water out of a wet or inundated foundation, where people are going to carry on masonry or other work.

CHAPELLE, Claude Emmanuel L'Huillier, in Biography, a French wit and poet, was the natural son of Francis l'Huillier, master of the accounts, and received his name from the village of La Chapelle, between Paris and St. Denys, the piece of his nativity. His education was liberal, and he learned philosophy under the famous Gaffendi. His genius, however, inclined to poetry of the light and easy kind, and he excelled in double rhymes. His disposition was convivial, and his manners those of a man of pleasure. His "Journeys to Montenlier," written jointly with Dauchament, and consisting of a mixture of prose and verse, is a "model of that pleasurable literature which is more rare than correct tastes and elevation." Without availing himself of his connection and interest in order to obtain any sorts of honour or profit, he was content with a moderate annuity, and prolonged a life of ease and indigence to the age of 70 years. He died at Paris in 1676. A new edition of his "Journeys" was published by Le Perve de St. Marc in 1711, 2 vols. 1,100. To this edition are annexed some "Fugitive Pieces," in verse and Prose. Nov. Dict. Hist.

CHAPELLE. JOHN De LA, a member of the French academy, was born at Bruges in 1655, and obtained by his father's purchase the post of receiver-general of the finances at Rochelle. Abandoning the career of business, he became a dramatic writer, after the manner of Racine, whom he studied to imitate, but could not rival; and his performances owed their success in a great degree to the acting of Baron, and a due attention to stage effects. The subject of the most popular of his dramas, "Les Confidences," maintained its place at the theatre. In 1687 La Chapelle became secretary to the prince of Conti, and he was dispatched by his patron to Switzerland in business of importance to his house. He was also employed by the king on public affairs; and he gave evidence of his patriotic and political knowledge in a series of "Letters from a Swiss to a Frenchman, on the True Interest of the Powers at War," the object of which was to diffuse Europe from its league against the French monarchy. As a member of the French academy, into which he was admitted in 1683, and in the chair at its public settings, which he often occupied, he conducted himself so as to gain applause. Although he incurred the displeasure of Despreaux, who was a formidable adversary, he was not supported as to escape injury; and his private conduct was such as to conciliate general esteem. He died at Paris in 1752, at the age of 68 years. He wrote, besides the works above enumerated, "Memorial Memoirs of the Life and Bust of Bourbon, Prince de Conti," printed in 1689; and the "Lives of Cavile and ThoUills," forming 2 separate works, in which are the facts and features depicted by those poets, D'Alembert, Hul. des M. de l'Ane, 

CHAPELLE, A. Marin, La, in Guersacq, a town of France, in the department of Puy-de-Dôme; 5 miles N. of Ambert.

CHAPELLE, d'Abrécéon, La, a town of France, in the department of the Cier, and chief place of a canton in the district of Sancerre; 16 miles N. of Bourges. The place contains 531, and the canton 4,898 inhabitants; the territory includes 315 kilometres and 5 communes.

CHAPELLE, Aube, La, a town of France in the department of the Meuse and Loire, 8 miles S. of St. Fleric.

CHAPELLE, Buffe, La, a town of France in the department of Lower Lot; 9 miles N. E. of Nantes.

CHAPELLE, Eglise, La, a town of France, in the department of the Sois and Marne, and chief place of a canton in the district of Fontainebleau. The place contains 83, and the canton 6,920 inhabitants. The territory comprehends 255 kilometres and 25 communes.

CHAPELLE
CHAPELLE de Ernée, a town of France, in the department of the Ille and Vilaine, and district of Vitre; 1\(\frac{1}{2}\) league E. of Vitre.

CHAPELLE de Ernée, La, a town of France, in the department of the Lower Loire, and chief place of a canton in the district of Nantes; 5 miles N. of Nantes. The place contains 1,979 and the canton 8,176 inhabitants; the territory includes 92\(\frac{1}{2}\) square miles and 6 communies.

CHAPELLE de Guichenay, La, a town of France, in the department of the Sarthe and Loire, and chief place of a canton in the district of Mâcon; 2 leagues S. of Mâcon. The place contains 1,376 and the canton 8,176 inhabitants; the territory comprehends 77\(\frac{1}{2}\) square miles, and twelve communies.

CHAPELLE de la Mothe, La, a town of France, in the department of the Mayenne; 4\(\frac{1}{2}\) leagues N.W. of Vitré.

CHAPELLE d'Euvre, La, a town of France, in the department of the Yonne; 2 leagues S. of Sâmiz.

CHAPELLE St. Laurent, La, a town of France, in the department of the Two Sèvres; 11 miles N.W. of Parthenay.

CHAPELLE St. Mysmaï, La, a town of France, in the department of Loiret, and chief place of a canton, in the district of Orleans; 3 miles W. of Orleans.

CHAPELLE Taillfert, a town of France, in the department of the Creuse; 4\(\frac{1}{2}\) leagues S. of Guéret.

CHAPELLE La Trélon, a town of France, in the department of the Two Sèvres, and chief place of a canton, in the district of Parthenay; 4\(\frac{1}{2}\) leagues W.S.W. of Parthenay.

CHAPELLE en Tercerors, La, a town of France, in the department of the Drôme, and chief place of a canton in the district of Die; 13 miles N. of Die. The place contains 1,320 and the canton 8,176 inhabitants; the territory includes 149 square miles and five communies.

CHAPELLING, in Scanning, is bringing a ship to the fame tack she was previously on, when in a light breeze of wind, and close-hauled; she has been taken back, either through a sudden shift of wind, or want of attention or skill in the helm. This is usually done by instantly bracing sharp round the head, and keeping all the jib and lary fall férots.

CHAPELNESS, in Geography, a cape of Scotland, on the coast of the county of Fife, in the Firth of Forth; 1\(\frac{1}{4}\) mile W. of Elskev.

CHAPELRY, Capellanis, is used for a certain precinct belonging to a chapel, having the fame relation to it that a parish has to a church.

CHAPERON, Chaperonne, or Chaperon, properly signifies a bonnet garnished with a fort of hood, or covering of the head, having a tail hanging down in a point behind, incidently worn by both men and women, the nobles, and the populace, and afterwards appropriated to the doctors; and licentiates in colleges, &c. It was worn of different kinds, divided into two colours. During the time of the famous league, which terminated with the accession of Henry of Navarre to the crown of France, the different parties made themselves known and distinguished by the colours of their Chapersons. And the fame fort of diminution took place during the great disputes between the Dukes of Orleans, Bourgogne, and Armagnac.

Hence the name passed to certain little shields, and other funereal devices, placed on the foreheads of the horses that drew the hearse in pompous funerals, and which are still called Chapersons, or Chaperonne; because such devices were originally affixed on the Chapersons, or hoods, worn by those horses with their other coverings of state.

CHAPRON of a bit mouth, in the Monsi, is only used for search-months, and all others that are not cannon-months, signifying the end of the bit that pises to the branch just by the banquet. In search-months the chapron is round, but in others it is oval; and the same part that in featal and other months is called chapron, is in cannon-months called franceron. See Bitt.

CHAPETE, or Chapote, in Ancient Geography, a strong place of Aisa, in Meopotamia.

CHAPETONES, a denomination distinguishing the Spaniards who come from Europe to America, and who are the first performer in the country with respect to rank and power. As the Chapetones are named to SUCH POMMICE in America by the conquerors in the period of the court, they stood down with oldness on every other order of men. The interior traffic or every colony, as well as any trade which is permitted with the neighboring provinces, and with Spain itself, are carried on chiefly by the Chapetones who, as the recompense of their industry, wind immense wealth; while the Creoles look in them, and are satisfied with the revenues of their national chiefs.

CHAPITEAU d'anciennes tours de créchieris, is composed of two small pieces of boards or planks, joined together with such manner, as to form the base or top of a roof with a pitch, and serves to cover the vent or touch-hole of a piece of Ordonance.

CHAPITERS, in Architecture, the crowned or upper parts of a pillar. See Capital.

CHAPITERS with mouldings, are those which have no ornament, as the Tuscan and Doric.

CHAPITERS with sculptures, are those which are adorned with leaves and carved work, the skull of which is of the Corinthian order.

CHAPITERS, in Luca, were anciently a summary of such matters as were to be inquired of, or presented before justices in their courts of office, or of the peace, in their feillons.

Chapters are now taken for articles delivered by the mouth of the justices, in his charge to the inquest; though it appears from Bracton and Britton, they were formerly written exhortations given by the justices for the good observance of the laws, and the king's peace; first read in open court, then delivered in writing to the grand inquest: which the grand jury, or inquest, were likewise to answer upon their oaths, either affirmatively or negatively.

CHAPLAIN properly signifies a person provided with a chaplainy, or who discharges the duty thereof.

CHAPLAIN is also used for an ecclesiastical person, in the house of a prince, or a person of quality, who officiates in their chapels, &c.

With us there are forty-eight chaplains to the king, who wait four each month, preach in the chapel, read the service to the family, and to the king in his private oratory, and say grace in the absence of the clerk of the cloister. While in waiting they have a table, and attendance, but no salary.

An archbishop may retain eight chaplains; a duke or a bishop, six; a marquis or earl, five; a viscount, four; a baron, knight of the Garter, or lord chancellor, three; a duke, marchioness, countesses, baronets, the treasurer and comptroller of the king's house, the king's secretary, dean of the chapel, almoner, and master of the rolls, two each; the chief justice of the king's bench, one; all of whom may purchase a licence or dispensation, and take two benefices with cure of souls. Stat. 22 Hen. VIII. c. 13.

Every judge of the king's bench and common pleas, the

chancellor
chancellor and chief baron of the exchequer, the king's attorney and solicitor-general, may each of them have one, entitled to one benefice with cure, and non-residence. Stat. 27 Hen. VIII. c. 16.

And also the groom of the bedchamber, treasurer of the king's chamber, and chancellor of the duchy of Lancaster, may retain each one chaplain. Stat. 27 Hen. VIII. c. 27. A chaplain must be retained by letters testimonial under hand and seal, or he is not a chaplain who is retained, and a chaplain thus qualified may hold his livings, though disowned from attendance, once the name of a chapel has been fixed; though he may retain other chaplaines in his family, quality one of them to hold pluralities whilst the first is living. - Rep. 92.

The first chaplains are said to have been instituted by the ancient kings of France, for preserving the chapel, or capes, with the other relics of St. Martin, which the kings kept in their palace, and carried out with them to the war. The first chaplain is said to have been Guile de Melun, chaplain to St. Louis. Preachers to and at the last regent had its chaplain. Regent's chaplains were afterwards reduced and put on half pay during the war. There remained however of the chaplains, a chaplain general, who directed the performance of church service, throughout the year.

CHAPLAIN in the order of Maltes, is used for the second rank, or class, in that order; otherwise called deacon. The knights make the first class, and the chaplains the second.

Chaplains of the pope, are the auditors or judges of causes in the sacred palaces to be held, because the pope anciently gave an office in his chapel, for the decision of causes sent from the several parts of Christendom.

He likewise summoned as. indefatigably the most learned lawyers of his time, and they hence acquired the appellation of capellani capellani.

It is from the decrees formerly given by the deacon, that the body of decreta is composed: their number pope Sixtus IV. reduced to twelve.

Some day, the manner of relics were covered with a kind of tent, cape, or capella, i.e., the cape; and that hence the priests, who led the cars of them, were called capellani. In time, their relics were regulated in little churches, either contiguous to a chapel, or separate from it; and the same name, capella, which was given to the car, was also given to the place where it was lodged; and hence the priest who superintended it came to be called capellani.

CHAPLET, or Crown, a string of beads, used in the Roman church. A chaplet comprises the number of Patriarch and Apostles, to be recited in honour of God and the Holy Virgin.

Chaplets are sometimes called Prioles. A ROSEMARY is a chaplet of fifteen of Ave Maria's.

Menage derives the world from a word but, because of the resemblance the thing bears to the beads or rosary, chapelet de rosic. The modern Latins call it espaliers; the Italians more frequently rosiere.

Larrey and P. Viré alone fix the first invention of the chaplet by Peter the Hermit, well known in the history of the crusades.

There is a chaplet of our Saviour, consisting of 33 beads, in honour of his 33 years living on earth, instituted by Father Michael, the Camaldulian.

The Orientals have a kind of chaplets which they call chains, and which they use in their prayers, rehearsing one of the perfections of God on each link or bead. The
great monks is said to have 1/3 of these beads, all of precious stones, fine diamonds, others rubies, pearls, &c.

The Turks have like chaplets, which they bear in the hand, or hang at the girdle: but father Dusini observes that they differ from those used by the Romans, in that they are all of the same bigness, and have not that direction of beads; though they confess of fix degrees or colors. Besides, that the monofenes have presently run out the chaplet, the prayers being extremely short, as compared with those words, Pray for us, of the chaplet God, God, God, for each bead.

Besides the common chaplet, they have likewise a larger one, of 1200 beads, woven from fineinition, as being divided by little threads into three parts, or one of which we put our chaplet in, &c. It is called the 7th chaplet, or chaplet of the third, or 3rd order. The thing in having a thin silver wire to make, the number of beads, may add other parts on, the beginning of the chaplet.

He adds, that the Mediterrean chaplet appears to have had its rise from the East, and is said to be the best of all, which the Arabs are said to have acquired, and which we find them using in their prayers. He says that 17th century, having this in common, they took it, and so did others, without any knowledge of how it was made, or by what means.

CHAPLET, or CHAPELLE. In Arthut, a little moulding, cut or carved into round beads, pearls, diamonds, or the like.

A chaplet, in reality, is little else but a baseless enriched with sculpture. See BEAUTY.

CHAPMAN, George, in 24 folios, an early English dramatic writer, the first translator of all the works of Homer, was born in 1505, and partly educated at Trinity College, Oxford, where he was distinguished for classical education. From Oxford he returned to an early age to the Monastery, and cultivated an acquaintance with the wits of that period, Shakespeare, Benet, Marlowe, David, &c. In 1557, he published the first four parts of his works, called Homers Works, &c. In 1567, he published the seventh and eighth, in 1561. Those works were not printed in 1564, and the whole poem, though perhaps not quite as it appears, published by the dedication to queen Mary, and in 1563. Before this period, he was a writer of concordances for several years, he translated the public with dramatic poems, both tragic and comic, many of which were popular. He was a joint writer with Jorden, and rivalled him in fame. In 1614, he published his version of the Gileles, and in a year after completed his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his version of the Gileles, and in 1568, the translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens. He also translated the 4th book of the Odyssey, and from after completing his translation of all Homer's works by the Tintaciamazam and Hyens.
the Homeric compounded epithets, which have been happily employed by his successors. Waller, as Dryden says, could never read Chapman’s Homer without transport; and Pope has derived advantage from the attentive study of it. His critical additions furnish no favourable specimen of an accurate acquaintance with the Greek language. Diod. Brit.

CHAPMAN, EDMUND, an eminent surgeon, and accoucheur, had the merit of giving the first delineation and account of the obstetric forces, invented by the Chamberlens, more than 60 years after their being first used by that family. Of this intelligent and ingenious practitioner, we have only been able to learn, that he was born about the end of the seventeenth, or the beginning of the last century, and after being well instructed in his profession, in some neighbouring county, where he is said to have practised a few years, he came to London, and soon distinguished himself by his superior skill and adroitness, in conducting difficult labours.

The management he adopted consisted in turning the child and delivering the feet, when it presented any other part than the head to the uterine orifice, and in some cases, when the head was the presenting part; and in using the forces in many difficult births, in which it had been usual before to deliver with the crochet.

The Chamberlens, to whom, by general consent, the invention of the forces is attributed, guarded the secret with so much caution, that they avoided calling it infantum, lest it should lead to a discovery. “My father, brothers, and myself,” Dr. Hugh Chamberlen says, (preface to his translation of Mauriceau’s Midwifery) “we have attained to, and long practised a way of delivering women.” Since from Mauriceau we learn, that those fortunate deliverances were achieved by means of an instrument, but of what kind he was not able to inform us, and it remained concealed, or at least no account of it was given to the public, until Chapman published his “Treatise on the Improvement of Midwifery, chiefly with regard to the Operation, with Cashes,” Svo. 1732, that is, nearly twenty years from the time they were first used by the Chamberlens. Chapman’s Treatise is a work of considerable merit. It contains a delineation and description of the forces, in which he had made considerable improvements, with an ample account of the cases, in which they might be advantageously employed. Sometimes, he tells us, he made use of a fillet, but on the whole, he prefers the forces. He condemns the practice of pushing back the coccygis, in difficult births, which was recommended by Deveiler, as well as the opinion, so strongly insisted on by that writer, that labour is frequently rendered tedious and difficult, by the uterus being placed obliquely in the pelvis. Chapman was also author of a small work, “A Reply to Douglas’s first Account of the State of Midwifery in London,” Svo. 1717, in which he ably defends the cause of the men-midwives (or mid-men, as Douglas calls them) against the severe attacks of their adversary. Haldr Bib. Chir.

CHAPOTENSIS, in Writers of the Middle Age, a kind of coin. We do not find any certain account of its value. Du-Cange inclines to think it the same as the CHATUS.

CHAPPAR, a courier of the king of Peria, who carries dispatches from court to the provinces, and from the provinces to the count. The word, in the original Persian, signifies courier.

The poets, M. Tavernier tells us, are not established and regulated in Peria as among us: when the court sends out a chappar, the sultan’s master of the horse furnishes him with a single horse; how long his journey be, and a man to run after him, when his horse is weary, he takes that of the first horseman he meets with, who does not make the least refusal, and funds his own home by the man who follows him.

As for the matter of the new horse he has taken, he must run, or at least, send after the chappar, to retake him, when the chappar dismounts some other horsemans to change him.

CHAPPE, in Heraldry, the partition of an escutcheon, by two lines drawn from the middle point in chief to the two base angles of the field.

The figures or the fides are to be of a different colour from the rest. Mackenzie calls it, A chief part per bend devers, or sineris, or both.

CHAPPE D’AUVERGNE, JOHN, in Biography, a French astronomer, was born at Mauriac, in Upper Auvergne, in 1728. His parents, who were persons of rank and opulence, afforded him every advantage of education, and placed him first in the Jesuits’ College at Mauriac, and afterwards removed him to the College of Louis le Grand at Paris. In his earliest years he manifested a taste for mathematics and design; and employed his leisure hours in drawing plans and making calculations. In acquiring the elements of mathematics and astronomy, he was assisted by a Cartesian, named don Germain; and to the latter of these studies he was so ardently devoted, that he spent a considerable part of such nights as were favourable for his purpose in observing the heavenly bodies. Father de la Tour, who was then president of the college, conceived a high opinion of his talents and performances, and recommended him to M. Caffini, as a young person who deserved peculiar encouragement. Accordingly, this celebrated astronomer employed him in drawing a general map of France, and in the French translation of Halley’s tables, which were published, with considerable additions, in 1752. In the following year, he was engaged by the French government in surveying the county of Biche in Lorraine, and in afterwards marking the true position of that town, in order to complete the local geography of the district to which it belonged. Having accomplished this undertaking to the satisfaction of his employers, he was elected a member of the Royal Academy at Paris, and in 1756, he was appointed assistant astronomer in the room of M. Lalande, who had been promoted to the rank of associate. In 1760, he was occupied in making observations on the two comets, which then appeared, and in forming, by means of his observations, a theory of their orbits. He communicated to the academy at the same time, an account of the zodiacal light, and of the aurora borealis, which he had a favourable opportunity for observing. At this period he prepared for an expedition to Tobolik in Siberia, in order to observe the transit of Venus over the sun, which was to happen on the 6th of June, 1761; and after encountering many difficulties, and pursuing a route of about 600 leagues from Peterburgh, arrived at the destined place of observation on the 10th of April.

M Himacoff, the governor of the town, to whom he presented the order of the emperors, received him with respect, and afforded him every necessary assistance in accomplishing the object of his expedition. He lost no time in constructing an observatory, and in fixing and adjusting his instruments; and by means of a solar and lunar eclipse, he was enabled accurately to settle the longitude of the place. His observations of the transit, which were made with great precision, in the presence of M. Himacoff, count Pouchkine, and the archbishop of Tobolik, were speedily transmitted both to Peterburgh and Paris. The severity of the climate, which injured the abbé Chappe’s health, and other circumstances, induced him to halt his return; and having visi-
fited the mines at Cathhunburgh, of which he has given an interesting account, he proceeded to Cahan, and at length, after a journey of much fatigue and danger, arrived at Petersburg.

Declaring the offer which the empress made him of the place that had been occupied by Mr. de Laff, he returned to France in 1762, after an absence of two years. In the course of his perspective to and from Tobolke, he availed himself of such opportunities as occurred for investigating the nature of the soil and its productions; the rivers, mountains, coal, canes, animals, and minerals; the manners and customs of its inhabitants; and for collecting such particulars of information as might serve to improve an acquaintance with the extensive empire of Ruffia.

Upon his return he applied with diligence to the arrangement of the various materials which he had collected; and from these he formed a narrative of his travels, illustrated with charts and several engravings of different kinds, and comprehended in a work, which appeared in 1763, in 3 vol. 4to. It was nothing indubious in the discharge of his official duties, as assistant after the death of the prelate of the infaubrity of Quadrant, the 1st in June 1769, it was re-foredoom imposed, that it might be advantagesously employed in the north west part of Europe; but it was necessary to obtain a series of observations to the south-west, at the extremity point of California, viz. at Cape St. Lucan. The Abbé Chappel left for Mexico and, proceeding to Calix, he filled in a field which he had driven through, and expected as a visitation, and received California 19 days before the computed day of observation. At this time an alarming disorder prevailed in the district of California, where he proposed to make his observations, and he was advised to remove out of the reach of danger. But his zeal for the promotion of science was such, that before his departure from France, he replied to those who opposed him of the infalubrity of the climate, "That if he were here of dying the day after making the proposed obervation, that abundance should not deter him." Accordingly, he determined to remain at the village of St. Joseph, where he completed 15 observations in the most satisfactory manner. Three days after the death of the prelate, he was attacked with the disorder, which had before feized his companions; but his resolution was invincible. On the 18th of June, when he was thought to be in a flat of convulsion, he inquired on looking up to observe a lunar eclipse, and this occasioned a relapse. During the progress of his disorder, and as it approached to the fatal crisis, while he declared his convict on that he should not survive, he also expressed his satisfaction, that the object of his mission had been accomplished before his death, which happened Augst 11, 1769, in his 42d year. His papers were transmitted by M. Paul, a French engineer, the only survivor of this expedition, to the French Academy, and afterwards published under the direction of the youngest Callin. The Abbé Chappel was a lively, cheerful, social disposition, upright in his views, and candid in his conduct: devoted to the pursuit of science, and in a great degree remiss of all considerations of private interest. The brief history above given enunciates his incomparable firmness and intrepidity.

CHAPPEL, SUR CHAPEL.

CHAPPEL, William, in Biography, a pious and learned prelate, was born in 1782 at Lexington in Nottinghamshire, and educated at Chittis college, in the University of Cambridge, of which he became fellow in 1707. Having no prospect of advancement, he continued at college and devoted himself to the business of tuition, for which his talents, disposition, and general character peculiarly qualified him. As a difputant he was skilful and formidable; and it is said that on occasion of an act performed when king James visited the university in 1624, he pulld his respondent, Dr. Roberts of Trinity college, so hard, that, unable to maintain the contest, he fainted away. The king attempted to support him, but without success; upon which he declared himself happy that no recumbent a champion was at the same time so good a subject. By the interest of Laud, bishop of London, he was promoted, in 1633, to the deanship of Caph in Ireland; and to the provostship of Trinity college, Dublin, in 1634.

Subservient to the view of government in opposing that puritanical spirit, which very much prevailed in both kingdoms, he conducted himself with that temper and steadiness of discipline which awakened the spirit of his appointment; and in recompence of the services which he performed, he was promoted, in 1638, to the bishoprics of Cork, Clon Gui, and Ros, and was allowed to hold his provostship till the year 1642. Apparently, however, of the gathering forces, he withdrew his high prelates for the time being; and, in England, in 1644, his studies and imprisonment were exhibited against him before the lords, to which he was unable to give a satisfactory reply; and that his conduct, whatever might be the general tenor of it, was in some degree certain, he may reasonably presume from the circumstances of his having for his two sons all advanced private usher and Dr. Mellor, bishop of Meath, and also from his acquittal to the great patronage of Lord and Wentworth. At length he obtained leave to embark for England; but at Tynby, soon after his arrival, he was committed to gaol, on account of his having left Ireland without licence, and deposed in custody for seven weeks. His misfortunes were further gravated by the loss of the ship in which most of his property and his books were embarked. This reduced almost to a state of indigence, he returned to his native county; and having afterwards fixed his residence at Derby, he died there in 1659. Although he was a man of acknowledged learning, his publications were few. His "Mathematical Compendium," was printed at London in 1643, 8vo, as an English translation, entitled, "The True Mathematicks, in England," and published in 1644. His other works were "The Use of Holy Scripture," Lond. 1657, 8vo, and his own life "Vita Gallici Chappel," two years printed. Bosc. Hist.

CHAPPEL HILL, in Geography, a small-town of America, in Orange county, N. Carolina, seated on a branch of Newhope creek, which discharges itself into the N.W. branch of Cape Fear river. This spot has been selected for the seat of the University of North Carolina, which was opened for students in 1795. This town is placed on a beautiful eminence, and commands an extensive prospect of the surrounding country; 12 miles S. of E. of Hiliborough, and 472 S.W. of Philadelphia. N. lat. 35° 40'. W. long. 79° 0'.

CHAPPELLES, in Geography, a town of France, in the department of the Aube, and district of Barse-Sur-Seine; 10 miles S. E. of Tires.

CHAPPELES, or CHAPELLES, in Military Language, are barrels that are made use of for covering other filled with powder, the better to prevent it, and to prevent any of it from being lost by falling or finding its way through between the flaves of the barrels containing it when they are moved, broken or jolted. The name of chappe or chapelle, is also given to a plastering of cement, which is spread over all the raults of founderies, bombs, proofs, and magazines, to prevent any moisture or humidity from penetrating. This appellation is likewise given to a composition of earth, hork-dung, and hair, that is employed for covering the mould of a cannon or mortar.
CHAPPOY, in Geography, a town of France in the department of Sura; 25 leagues S. E. of Salins.

CHAPPIRE, a town of South America, in the country of Chil, and jurisdiction of Coquimbo.

CHAPTAKE, in Botany, Venetaus. See PERESDIUM.

CHAPTER, Capitulum, a community of ecclesiastics belonging to a cathedral, or collegiate church.

The chief or head of the chapter, is the dean; the body consists of canons, or predantas, &c. See Dean.

The chapter has now no longer any share in the administration of the diocese, during the life of the bishop; but succeeds to the whole episcopal jurisdiction during the vacancy of the see.

The origin of the chapters is derived from hence, that anciently the bishops had their clergy residing with them in their cathedrals, to assist them in the performance of sacred offices, and the government of the church; and even after parochial settlements were made, there was still a body of clerks who continued with the bishop, and were indeed his family, maintained out of his income. After the monastic life grew into request, many bishops chose monks rather than seculars for their attendants.

These bodies, either of monasteries or seculars, then had the same privilege of chusing the bishop, and being his council, which the whole clergy of the diocese had before; but, by degrees, their dependence on the bishop grew less and less; and then they had distinct parishes of the bishop's diocese assigned them for their maintenance; till at last, the bishop had little more left than the power of visiting them. On the other hand, these capitular bodies by degrees also lost their privileges; particularly that of chusing the bishop, for which the kings of England had a long struggle with the pope; but at last Henry VIII. got this power vested in the crown; and now the deans and chapters have only the shadow of it.

The same prince likewise expelled the monks from the cathedrals, and placed secular canons in their room; tho' he thus requited, are called deans and chapters of the new foundation such as Canterbury, Winchester, Worcester, Ely, Carlisle, Durham, Rochester, and Norwich: such also are the chapters of the four new sees, of Peterborough, Oxford, Gloucester, and Bristol.

Chapter is also applied to the assemblies held by religious and military orders, for deliberating on their affairs, and regulating their discipline.

Papists say they are so called, quod capitula ibi legentur.

The establishment of general chapters of religious orders is owing to the Cillergians, who held the first in 1116, and were soon followed by the other orders.

Chapter is also used for a division of a book; contrived for keeping the matters treated therin more separate, clear, and distinct.

The reformaters were uneaunticised with the division of books into chapters and fections. Papists say, the name chapter, capit, arose hence, quod fit altius fictiion capit, or quod capitatio toin summation. St. Augilius compares chapters to inns, as much as these refresh the reader, as those the traveller.

The division of the Bible into chapters is attributed by some to Stephen Langton, archbishop of Canterbury, in the reigns of king John and Henry III. But it was really done by Cardinal Hugo, who flourished about the year 1240, the author of the first Scripture Concordance, with a view of rendering this work an useful index to the Scripture. See BIBLE and CONCORDANCE. The chapters were again subdivided, not into verses, but by the letters A, B, C, D, E, F, G, placed in the margin at an equal distance from each other, according to the length of the chapters. In some, all the seven letters were used; in others, fewer, as the length of the chapters required. In 1445, Rabbi Nathan, a famous Rabbi among the Western Jews, finished a Concordance to the Hebrew Bible, in the manner of Hugo's above mentioned; and introduced the division of the Hebrew Bible into chapters: he also improved on his plan, by using the actual division into verses, and by numbering them, fixing the numerical letters in the margin at every fifth verse. Athens, in his edition of the Bible, 1661 and 1677, introduced the Indian figures, and placed them at every verse. Vatulius published a Latin Bible, in which the same kind of division was adopted; though some say this division and division by numbers were first used in R. Stephen's Latin Bible, published at Paris, 1553. R. Ste- phens made the same division of the chapters of the New Testament into verses, for the sake of a concordance to the Greek Testament, which was printed by his son H. Stephens.

Chapters, the three, is a phrase famous in Ecclesiographical History, signifying a volume published by Theodoret, an adherent of Nestorius, against St. Cyril, confining a letter of Ibas priest of Nisibis, to Mars a bishop of Persepolis; from extracts from the works of Diodorus and Taurus, and Theodore of Moppehtis, wherein the fame doctrines were taught, that were contended for by Nestorius; and of two pieces of Theodoret, the one against the council of Ephesus, the other against the anathemas of St. Cyril.

They make the famous three chapters; which were first condemned by an edict of Julianus, A. D. 344. and since by various councils, and many popes.

CHAPRE. See IMP:RS.

CHAPUZEAU, Samuel, in Biography, a native of Geneva, who became preceptor to William III. king of England, and afterwards governor of the pages of George, duke of Brunswick-Luneburg, in which situation he died "old, blind, and poor," at Zell, in 1701. Of his various works in history, politics, and belles lettres, we shall mention his "Description of Lyons," 1675; "An Account of Savoy;" "L'Europe vivant," or political state of Europe, in 1696; "Prefet State of the electoral House of Bavaria," 1673; "Le Theatre Francois," 1674; several comedies under the title of "La Mule enjouer, ou le Theatre comique." His arrangement and publication of Tavernier's voyages and travels, first printed in French, 1675, 4to, may be reckoned among his most useful labours. In 1693, he published the plan of an "Historical, Geographic, and Philosophical Dictionary," to which he had devoted 15 years; but it never appeared. He complained that Moret had made great use of his MSS. in compiling his own dictionary. Gen. Bing.

CHAIQUILLON, in Geography, a town of Persia, in the province of Segelan, now in ruins; 90 miles N. E. of Zan- reng.

CHAR, a town of Arabia; 140 miles N.W. of Mecca.

Allo, a river of France, which runs into the Boutonne, near St. Jean d'Angely.

Char, in Ichthyology. See SALMO ALPINUS, and CHARR, OR CHARRE.

Char de Neptune, in Natural History, one of the nume-
rous synonymous names of MADREFA LUCIANA, which see.

Char of lead, denotes the quantity of thirty pigs.

Chaka, in Africology, the name of one of the CANE,
vegetables.

Chara, in Botany, (supposed to be fancifully derived from χαμωθ, because, says Professer Marty, it is the joy or de-
light of the water; or rather, if it be worth while to add one uncertain conjecture to another, because it delights in wa-

Obf. Authors are much at variance with respect to the structure of this flower. Haller and Gertner are of opinion, that the yellowish or red globules which are found near the germ, cannot answer the purpose of the anther. "Or what use, inquires the latter author, can a cellular anther which never opens? What effect can be produced by pollen which is not dispersed, and which, if it were dispersed, is to light and vagabond, that it cannot remain on the germ, but must ultimately fall to the surface of the water? It is therefore sufficiently evident, that these globules are not real anthers; but are either mere aerial vessels designed to enable the plant to float on the water, or aborative germ filled with unimpregnated seeds." See Grott. de fruct., vol. 1. intro. p. 14. Dr. Smith acknowledges that as the plant flowers under water, there can be no wonder if the nature of its anther and pollen be obscure; but he has not a doubt with respect to the part in question being a proper anther, and recommends to further inquiry the opinion of the very able Mr. Correa, who thinks that the impregnation may be performed within the stem, by a undefined communication between the anther and germs, and that the five leaves which crown the germ, are not (as has been supposed) the stigma, but the tips of a five-leaved calyx, closely enclosing that part in a spiral manner. The analogy of Hippurus, to which this genus is nearly allied, induces him, also, to conclude that the flower is really a naked one, and that the four leaves which have been thought to constitute the calyx of the female flower, and which are sometimes wanting, are not other than proper leaflets of the plant. Under this supposition he has removed the genus to Monandria Memogynia, with the following essential character: Cal. none. Corn. none. Anther foetid, Stylo none. Berry with many seeds. See L. Bot. 374; and Flor. Brit. vol. i. p. 4. Gertner calls the fruit a one-celled, many seeded nut; and accordingly thus describes that of the most common species: "Trizehropy, a nutclouded with a membraneous integument, which never splits or separates spontaneously from the nut; shell oval-globular, crinkled, brittle, rather thick considering the size of the nut. Seeds bedded in a pale, friable, herbaceous inflan, which fills the cavity of the nut." But from this description the fruit is properly a berry.

Ch. 1. C. ypgiris. Linn. Sp. Pl. 2. Lam. 1. Mart. 2. Hedwig Tab. 32, 33. Eng. Bot. tab. 376. Lam. Ill. 3. Mart. 742. fig. 1. (Equiatorium suffruticans aqua repens: Bann. Prodr. 5. Ger. exim. 1115.) "Stem without prickles, flared; leaves awl-shaped, jointed." Whole herb foetid, brittle. Stems a foot long, thread-shaped, twisted. Leaves about eight in a whorl, erect-spreading, acute, compound, channelled above, bearing the flowers. Anther naked, foetid, depressed, stilly, in its decaying cracking into chinks. Germ surrounded by four leaflets adhering to the anther, egg-shaped, five to eight at the tip. Berry with a thick bark. This, in common with the other species, is often clothed with a greyish pritty matter, which has been supposed to constitute part of the plant, but is really more than an adherent incrustation of calyx and a lining of the water, which is never found on plants growing in ponds or low green grounds.

The plant on natural ground is found in a bright green colour, and in the C. Vulgaris of Dr. Smith, and the C. minor Linnaeus. 1. the fruit of Rass Symphon. The leaves of C. ypgiris, drawn from a species cut with the leaves as in our figure. C. Hippurus. Linn. Sp. Pl. Lam. 1. Mart. 3. Mart. Bot. 407. Lam. 1H. Pr. 2. 32. 33. (Equiatorium suffruticans aqua repens: Pehr. Tab. 175. 175.) "Needs on the stem capillary, crowded." Lam. "Stems and leaves frappulate." Lam. "Stem arrow-shaped, jointed; leaflets with a few often two times a stalk, rather short and broad, prickly thickly on the under part. Flowers in a leafy sole of C. Vulgaris. 3. C. Hippurus. Linn. Sp. Pl. (Equiatorium frappulate: Mart. 1. Lin. tab. 29. fig. 4. E. S. Hippurus Linnaeus. Mart. Bot. tab. 178. 178. fig. 6. (Equiatorium egg-shaped.)" The English names which have been referred to this species by Hudson, Wethering, and Sibthorp, are disputed by Dr. Smith; for he is only a variety of the preceding.

We have specimens now before us, taken many years since in the outlet of Mahim farm, in the Caven district of Yorkshire, which appear to us to be the C. tisdiorn of Linnaeus, but the plant is too marked by its calceolous-corr, that we will not venture to pronounce it specifically distinct from C. Hippurus. 4. C. flexillis, Linn. Sp. Pl. 4. Lam. 4. Mart. 4. Eng. Bot. tab. 170. minor. Lam. 11. Bot. 742. fig. 2. major. "Fruits of the plant without prickles, so rare, broader upwards." Linn. "Without prickles, so transparent; leaves cylindrical, obtuse, somewhat muchoate." Dr. Smith. Whole plant smooth, not frilled. There are two varieties figured by Vaillant (Act. Phils. 1791. tab. 3. fig. 8, 9,) one larger and the other smaller. Specimens of both are before us, both gathered, we believe, in some part of Yorkshire, and it appears to us that Linnaeus has formed his specific character from the former; Dr. Smith his, from the latter. All the species are annual, and grow in ponds and slow ditches, flowering in July and August.

CHARABASA, in Ancient Geography, a town in Africa Propria, according to Ptolemy.

CHARABAI, or TISERIDON, in Geography, a seaport town on the north coast of the island of Java, situated in a country which produces abundance of rice, sugar, coffee, pepper, cotton, &c. which is purchased by the Dutch at a low price: about 130 miles south of Batavia. N. lat. 60'. E. long. 109'.

CHARADE, or CARADE, is sometimes used for amber, (which fee); as also for the juice of the poplar-tree.

CHARABY, in Geography, a town of Persea, in the province of Mozzanderia; 59 miles W. of Asterabat.

CHARACENE, in Ancient Geography, a country of Afia, being the southern district of Sitakai. According to Ptolemy, it was the territory of the town of Charac, which fee.

CHARACENI, a denomination given by Ptolemy to the inhabitants of Charax, on the southern coast of the Tauric Cherbonitis.

CHARACINA, a small country of Afia in Cilicia, in which Ptolemy places the town of Fluvipolus.
CHARACITANI, in Ancient Geography, a people of Spain, placed by Ptolemy in the Tarragonene district. He adds, that they inhabited deep caverns, near the Tagus, into which they retired when they were pillaged by their neighbours.

CHARACOMA, a town of Laconia, situated on the road that passes from Arcadia to Sparta, and to the north of that city.

CHARACOMA, a name given by Ptolemy to a town of Arabia Petraea. Some have denominated it Characomba.

CHARACTER, in a general sense, signifies a mark or figure, drawn on paper, metal, stone, or other matter, with a pen, graver, chisel, or other instrument, to signify, or denote any thing. The word is χαρακτέρι; formed from the verb χαρακτάω, to engrave, impress, &c.

The various kinds of characters may be reduced to three heads, viz. literal characters, numeral characters, and abbreviations.

Character, literal, is a letter of the alphabet, serving to indicate some articulate sound, expressive of some idea, or conception of the mind. See Alphabet.

These may be divided, with regard to their nature and use, into nominis, real, and emblematical. Nominal characters are those we properly call letters; which serve to express the names of things. See Letter.

Real characters are those that, instead of names, express things and ideas. Emblematical, or symbolical characters, have this in common with real ones, that they express the things themselves; but they also have this further, that they in some measure perfect them, and exhibit their form: such are the hieroglyphics of the ancient Egyptians. See Hieroglyphic.

Characters, literal, may be again divided, with regard to their invention and use, into particular and general, or universal.

Particular characters, are those peculiar to this or that nation; or that been said: such are the Roman, Italian, Greek, Hebrew, Arabic, Gothic, Chinese, &c. characters. See each of these articles.

Universal characters are also real characters, and make what some authors call a philosophical language.

The diversity of characters used by the several nations to express the same idea, is found the chief obstacle to the advancement of learning: to remove this, several authors have taken occasion to propose plans of characters that should be universal, and which each people should read in their own language. The character here is to be real, not nominal; to express things and notions; not, as the common ones do, letters, or sounds: yet, to be mute, like letters, and arbitrary; not emblematical, like hieroglyphics.

Thus, the people of every nation should retain their own language, yet every one understand that of each other, without learning it; only by seeing a real or universal character, which should signify the same thing to all people; by what sounds forever each expressed it in their particular idiom.

For instance, by seeing the character δεικτός to signify to drink, an Englishman should read to drink; a Frenchman, boire; Latin, bibere; a Greek, πίνω; a Jew, מַעַרְבָּה; a German, trinken; and so of the rest in the same manner as facing a horse, each people express it after their own manner; but all mean the same animal. This real character is no chimera; the Chinese and Japanese have already something like it. They have a common character which each of those nations understand alike in their several languages; though they pronounce it with such different sounds, that they do not understand a title of the speech of one another.

The first, and most considerable attempts for a real character, or philosophical language, in Europe, are those of bishop Wilkins, and Dalgarne: but these, with how much art ever so contrived, have yet proved ineffectual.

M. Leibnitz had some thoughts the same way: he thinks the great men did not adopt the right method; and adds, it would be probable, indeed, that, by this means, people, who do not understand one another, might easily have a commerce together; but that they have not fixed on true real characters.

According to him, the characters should resemble those used in algebra: which, in effect, are very simple, yet very expressive; without any thing superfluous or equivocal; and contain all the varieties required.

The real character of bishop Wilkins has its just applause: Dr. Hook recommends it, on his own knowledge and experience, as a most excellent scheme; and, to engage the world to the study of it, published some fine inventions of his own relating to it. See Language.

M. Leibnitz tells us, he had under consideration an alphabet of human thoughts; in order to a new philosophical language, on his own scheme; but his death prevented this from being brought to maturity.

M. Lodwick, in the Philosophical Transactions, gives us a plan of an universal alphabet, or character of another kind: this was to contain an enumeration of all such finge founds, or letters, as are used in any language; by means whereof people should be enabled to pronounce truly and readily any language; to describe the pronunciation of any language that should be pronounced in their hearing; so that others accustomed to this language, though they had never heard the language pronounced, should at first be able truly to pronounce it: and, lastly, this character is intended to serve as a standard to perpetuate the sounds of any language. Abrodgm. vol. iii. p. 373.

In the Journal Litteraire, an. 1720, we have a very ingenious project for an universal character: the author, after obviating the objections that might be made against the babel of such schemes in the general, proposes his own: his characters are to be the common Arabic, or numeral figures. The combinations of these nine are sufficient to express distinctly an incredible quantity of numbers, much more than we shall need terms to signify our actions, goods, evils, duties, passions, &c. Thus is all the trouble of framing and learning any new characters at once prevented; the Arabic figures having already all the universality required.

The advantages are immense: for 1. We have here a stable, faithful interpreter; never to be corrupted or changed, as the popular languages continually are. 2. Whereas the difficulty of pronouncing a foreign language is such as usually gives the learner the greatest trouble, and there are even some founds which foreigners never attain to; in the character here proposed, this difficulty has no place: every nation is to pronounce them according to the particular pronunciation that already obtains among them. All the difficulty is, the accustoming of the pen and the eye to affix certain notions to characters that do not, at first sight, exhibit them. But this trouble is no more than we find in the study of any language whatever.

The inflections of words are here to be expressed by the common letters: for instance, the name character shall express a fally or a cell, a horse or a mare, an old hoff or an old mare, as accompanied with this or that distinctive letter, which shall shew the sex, youth, maturity, or age: a letter is
also to express the bigness or size of things: thus, v. g. a man with this or that letter, to signify a great man, or a little man, &c.

The use of those letters belongs to the grammar, which, when once well understood, would abridge the vocabulary exceedingly. An advantage of this grammar is, that it would only have one declension, and one conjugation: those numerous anomalies of grammarians are exceeding troublesome, and arise hence, that the common languages are governed by the populace, who never reason on what is best: but in the character here proposed, men of sense introducing it, would have a new ground whereon to build regularly.

The difficulty, however, is not in inventing the solemn simple, easy, and commodious character, but in engaging the several nations to use it; there being nothing they agree left in than the understanding, and purposing of their common interest. The consideration of a universal language, with respect to the mode of its formation, as well as its advantages and practicability, will be reserved under the article Language.

Characters, literal, may be again divided, with respect to the nations among whom they have been invented, and used, into Greek characters, Roman characters, Hebrew characters, &c.

The character now ordinarily used throughout Europe, is the Latin character of the ancients, which was formed from the Greek, and that from the Phenician, which Cadmus brought into Greece.

The Phenician character was the same with that of the ancient Hebrew, which subsisted to the time of the Babylonish captivity; after which they used that of the Amorians, which is the square Hebrew, now in use; the ancient being only found on some Hebrew medals, commonly called "Mosaic Medals."

Polycrates and others shewed that, beside the Phenician, the Chaldean, Syriac, and Arabic characters were likewise formed from the ancient Hebrew.

The French were the first, who, with the Latin of St. Gregory, admitted the Latin characters. And in a provincial synod, held in 1091, at Leon in Spain, the use of the Gothic characters invented by Ulflas was abolished, and the Latin ones established.

Medallists observe, that the Greek character, consisting only of majuscule letters, has preferred its uniformity on all medals as low as the times of Gallienus; there being no alteration found in the turn of the character, notwithstanding the many considerable ones both in the use and pronunciation. From the time of Gallienus, it appears somewhat weaker and rounder: from the time of Constantine to Michael, the space of 500 years, we find only Latin characters; and after Michael, the Greek characters recommence, but from that time they began to alter with the language, which was then a mixture of Greek and Latin.

The Latin medals preserve both their character and language as low as the translation of the feast of the empire to Constantinople. Towards the time of Decius, the character began to alter, and to lose of its roundness and beauty: some time after it retired itself, and subsisted tolerably till the time of Julian; when it fell into the flat barbarity mentioned under Michael; though it afterwards grew worse, and degenerated into the Gothic; so that the rounder and better formed the character is on a medal, the greater pretence it has to antiquity.

Characters, numeral, are those used to express numbers.

Numerical Characters are either letters, or figures, otherwise called digits. The kinds now chiefly in use, are the Common and the Roman: to which may be added the Greek, and another called the French character; as also the letters of other alphabets which have been made use of to express numbers. The common character is that ordinarily called the Arabic, as supposed to have been invented by the Arab astronomers; though the Arabs themselves call it the Indian character; as if they had borrowed it from the people of India.

The Arabic characters are ten, viz. 1, 2, 3, 4, 5, 6, 7, 8, 9. In the East, all the letters are called abjad.

The Arabic character is used almost throughout Europe, and that on almost all occasions; in commerce, in measuring, in astronomical calculations, &c.

The Roman character, consists of the majuscule letters of the Roman alphabet: whence probably its name: or, perhaps, from its being used by the ancient Romans on their coins, and in the inscriptions of their public monuments, erected in honour of their gods and great men; on their sepulchres, &c.

The numeral letters that compose the Roman character are in number seven, viz. I, V, X, L, C, D, M. The I denotes one, V five, X ten, L fifty, C a hundred, D five hundred, and M a thousand. The 1, repeated twice, makes two, 11; threes, three, 111; four is expressed thus, IV, I before V or X: taking an unit from the number expressed by each of those letters. To express six, an I is added to a V, VI; for seven, two, VII; and for eight, three, VIII: time is expressed by an I before X, IX, agreeably to the preceding remark.

The like remark may be made of the X before L or C, except that the diminution is by tens, not units: thus, XL signifies forty, and XC, ninety; an L followed with an X, sixty. LX, &c. The C before D or M, diminishes each by a hundred.

Besides the letter D, which expresses five hundred, that number may also be expressed by an X before a C inverted, thus, IX; and thus, in lieu of the M, which signifies a thousand, is sometimes used an I between two C's, the one direct, the other inverted: agreeable to this, six hundred may be expressed IDC; and seven hundred, IDC, &c.

The addition of C and D before, or after, raises CID by tens, thus, CCCI00, 10000; CCCI000, 100,000, &c.

This is the common way of notation, formerly used by the Romans; who also expressed any number of thousands by a line drawn over any numeral less than a thousand; e. g. V, 5000; LX, 60,000: so likewise M is 1000,000; MM is 2,000,000, &c.

Besides which, (I) certain liberties or variations have been admitted, at least by some modern writers; e. g. IIX, 8; ICIX, 89. (II) And certain characters have been used, which seem to have been derived from the letters; e. g. M, by which they express (Mille) 1000, was formed from CX, or CI; half of which, viz. IX, being reduced to 9. (III) And for the easier writing of these characters, 1, 10, 100, 1000, &c. have been altered into D; 100 into A; or V; 3, CI into oo or 4; whence X, 1000; or, 200, 200, V, X.

In Roman inscriptions, we meet with the characters Q and E, used to express a thousand. The usual note of a thousand, is either I between two CC's (direct and reversed) thus, CI0; or else X, thus, CX0. The former figure, when closed at top, exactly resembles an ancient M, thus, Q; and the latter, when that top, the figure of 8, inclined thus oo.

We also find in some inscriptions, the character E, which is X between two CC's, but closed on all sides. But the learned Dr. Taylor seems to suspect the accuracy of the copy
copy of the inscription from whence this character is taken. See Phil. Trans. N. 482, § 2.

As to the origin and use of the character X, so often met with on the coins, utensils, and manuscripts of the ancients, see X.

Greek numerals. The Greeks had three ways of expressing numbers. (1.) The most simple was, for every single letter, according to its place in the alphabet, to denote a number from a to ω 24; in which manner the books of Homer’s Iliad are distinguished. (II.) Another way was by dividing the alphabet into, (1) 8 Units: α ω, β 2, &c. (2) 8 Tens: α0, α 20, &c. (3) 8 Hundreds: α 100, a 200, &c. N. B. Thousands they expressed by a point, or accent under the letter, e. g. α 1000, β 2000, &c. (III.) A third way was by fix capital letters, thus, Π [a for μ], ΠΙ [πιν] 10, ΠΙI [πιλ] 20, ΠΙII [πιλλ] 30, ΠΙΠ [πιπ] 40, ΠΙΠΙ [πιπι] 50, ΠΙΠΠ [πιππ] 60, ΠΠΠ [πππ] 700, ΠΠΠΠ [ππππ] 800. Of these letters, they expressed unities, e. g. Ν or Ν Ν Ν 1000, Ν Ν Ν 1000, Ν Ν 1000, Ν 1000, Ν 1000, Ν 1000. From these complete or round numbers, if they may be so called, they formed compound numbers, as in the following table:

<table>
<thead>
<tr>
<th>Ν 1</th>
<th>11</th>
<th>110</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>134</td>
<td></td>
</tr>
<tr>
<td>13</td>
<td>348</td>
<td></td>
</tr>
<tr>
<td>14</td>
<td>653</td>
<td></td>
</tr>
<tr>
<td>25</td>
<td>863</td>
<td></td>
</tr>
<tr>
<td>47</td>
<td>1001</td>
<td></td>
</tr>
<tr>
<td>58</td>
<td>1071</td>
<td></td>
</tr>
<tr>
<td>69</td>
<td>1071</td>
<td></td>
</tr>
<tr>
<td>72</td>
<td>4074</td>
<td></td>
</tr>
<tr>
<td>84</td>
<td>6008</td>
<td></td>
</tr>
<tr>
<td>96</td>
<td>1727</td>
<td></td>
</tr>
</tbody>
</table>

It is to be observed, that the number 15 was never expressed by Π, according to the above mode of notation, but it is denoted by ΠΙ, being 6 and Π, the sum of which is 15. For the same reason, ΠΙ and 7 is used instead of Π 10 and 6, to express 16.

The 22 Hebrew letters express numbers as far as 4000: and the 5 remaining hundreds, under one thousand, are expressed by different forms of 5 of the letters, which seems to have been invented on purpose to express them.

It has been above observed, that five letters of different forms, called the final letters, were invented in order to affix or particularize the Hebrew numeration. This scarcely admits of a doubt, when it is considered, that as 5, and only 5; of the several hundreds wanted each a single letter, and as 5, and only 5; of these different forms were invented; therefore those forms were invented to express those remaining hundreds. The different forms of these 5 letters have been used at the end of words, perhaps, ever since their first invention. It is therefore probable, that if we could fix the age of these final letters, we might then fix the time, when the Bible numbers were expressed by single letters. These final numbers are not known to the Samaritans, and as they are not at all wanted to express words, and yet are used in the Bible, we may hence conclude, that they were first introduced into the Bible for the purpose of numbers. This is the use made of them by the Jews in their own writings; and indeed they are admitted, even now, into the Jewish Commentaries, as printed with the Hebrew text. See H. S. Jarchi on Gen. xxx, 8. As the age of these final numbers tends to fix the age of these numeral letters; it may be observed, that the final Mem is mentioned in the Talmud of Babylon; and that the authors of both Talmuds speak of the five final letters as of great antiquity, even in their time. St. Jerome also, in his preface to the book of Kings, mentions the final letters as equally in use with the 22 letters; and as his Hebrew MSS. might be 200 years old, if the final numbers were in his MSS. it follows, that they must have been used soon after the time of Christ. If, therefore, we may infer from Jerome, that the final letters were used in the Hebrew MSS. at the latest, about 200 years after Christ, we may infer from the Greek version, that they were not used in the Hebrew MSS. till about 100 years before Christ. Dr. H. Bodio tells us, that the book of Jeremiah was translated into Greek about 130 or 140 years before Christ, and from this version of Jeremiah, (ch. xxxviii, 8) it seems clear that the final letters were not then in the Hebrew text. For in that verse the 7 letters קינעכ (which are here 2 words, and properly signify to avus; τυπας) are rendered in all the copies of the Greek version τυπας. But such a rendering, being the proper Greek of קינעכ, which is one word only, shews that the ק was not then (κ) mem finally since the final Κ would have divided the letters into two words, and prevented such a wrong translation. Dr. Kennicott has applied these observations to the purpose of accounting for the corruption of the Hebrew text in its numeral letters. See his second dissertation on the state of the printed Hebrew text, &c. p. 212.

Character, French. It is called, because invented, and chiefly used by the French, is more usually denoted, character of account, or finance.

It consists of fixed figures; partly taken from the letters of the usual current hand, and partly invented by the contriver; the fixed characters are j, b, s, L, C, g, c. The j confounded standing for one, the b for five, the s for ten, the L for fifty, the C for a hundred, and the last character g for a thousand.

This character is only an imitation of the Roman character; and in its use in most respects the same, particularly in what relates to the combination of certain letters, which cancel before or after others, diminish or increase their value. Indeed it has these things peculiar in it, that when several things occur successively, only the last is expressed. 2dly, That sinity, and the following numbers to one hundred, 3 P 2 are
are expressed, thus, \( jijj \times j ij \), ninety; \( jijj \times j ij \), ninety one; \( jijj \times j ij \), &c.

It is principally used in the chambers of accounts, in the accounts given in by treasurers, receivers, farmers, and other persons concerned in the management of the revenue.

Characters in Printing, denote the letters or types, by the various arrangement whereof are composed forms; whence impressions are taken, by means of a press, on paper. For the method of calling these Characters, see Letter Foundery. For other characters in Printing, see Correction.

Character, is also used in several of the arts, for a symbol, contrived for a more concise, immediate, and artful conveyance of the knowledge of things.

In this sense of the word, Paulus Diaconus refers the invention of characters to Eumius; who, he says, contrived the first eleven hundred. To these were many more added by Tyro, Cicero's freedman, and by Philagryus, Faunus, and Aquila, freedmen of Macenas.

Laity, L. Ananus Senece made a collection of them, reduced them into order, and increased their number to five thousand. Tyro's notes may be seen at the end of Gruter's inscriptions.

Valerius Probus, a grammarian, in the time of Nero, laboured to good purpose in explaining the notes of the ancients. P. Diaconus wrote an ample treatise of the explication of the characters in law, under the reign of the emperor Conrad I.; and Goltzius another for those of medals.

Characters, or symbols, are now chiefly affected in the several parts of mathematics; particularly in algebra, geometry, trigonometry, and astronomy: as also in medicine, chemistry, music, &c. The principal of each kind we shall here subjoin.

Characters used in Arithmetic and Algebra.

\( a, b, c, \) and \( d \), the first letters of the alphabet, are the signs or characters that denote given quantities; and \( x, y, z, \) &c. the last letters, are the characters of quantities fought. Some for the former, use consonants, or large letters; and vowels, or small ones, for the latter.

Stifelius first used the capitals \( A, B, C, \) &c. for the quantities, unknown or required. Afterwards, Vieta used the capital vowels \( a, e, i, o, u, y, \) for quantities, unknown or required, and the consonants \( B, C, D, \) &c. for known or given numbers. Harriot changed Vieta's capitals into the small letters \( a, b, c, d, \) for unknown, and \( e, f, g \), &c. for known quantities. And Des Cartes changed Harriot’s vowels for the latter letters \( z, y, x, \) &c. and the consonants for the first letters, \( a, b, c, d, \) &c.

Note. Equal quantities are denoted by the same character.

For the method of expressing the powers of quantities. See Algebra.

\( m, n, r, s, t, \) &c. are characters of indeterminate exponents, both of ratios and powers: thus \( x^2, y^3, z^4, \) &c. denote indeterminate powers of different kinds; \( m, n, r, s, \) different multiples, or submultiples of the quantities \( x, y, z, \) according as \( m, n, r, \) &c. are either whole numbers or fractions.

\( a, b, c, \) the basis of addition, is called the affirmative, or positive sign, and is read plus, or more; thus \( 9 + 3, \) is read \( 9 \) plus \( 3 \); or \( 9 \) more \( 3 \); that is, the sum of \( 9 \) and \( 3, \) equal to \( 12 \).

When this character is set before any single quantity, it denotes that it is an affirmative or positive quantity; when it is set between two or more quantities, it denotes their sum, showing that the latter are to be added to the former. It is not easy to ascertain when, or by whom, this sign was first introduced; but we owe it probably to the Germans, and it seems to have been first used by Stifelius in his arithmetic printed in 1544. The early writers on algebra used the word plus in Latin, or pis in Italian, for addition; as they used minus, or mene. or merely the initial \( m, \) for subtraction; and thus these operations were denoted in Italy by Lucas de Bergo, Tartalea, and Cardan, while the signs + and − were employed much about the time in Germany by Stifelius, Scheubelius, and others, for the same operations.

— Before a single quantity, shows the quantity to which it is prefixed to be a negative quantity.

Between quantities, it is also the sign of subtraction, and is read minus, or lef; thus \( 14 - 2, \) is read 14 minus, or abating 2; that is, the remainder of 14, after 2 has been subtracted, viz. 12. This sign first occurs in Stifelius.

Is the sign of equality: thus, \( 9 + 3 = 12 \); signifies 9 plus 3, to be equal to 14, minus 2.

This character was used by Robert Recorde, and after him by Harriot: Des Cartes in lieu of it uses 22.

Wolfius, and some other authors, use the same character, =, for the identity of ratios; or to denote the terms to be in a geometrical proportion; which most authors express thus::

\[ x \] is the sign of multiplication, denoting the quantities on either side to be multiplied into one another, and was introduced by Oughtred; thus, \( 4 \times 6 \), is read 4 multiplied by 6; or the factum, or product of 4 and 6 = 24; or the rectangle between 4 and 6.

Ordinarily, however, in algebra, the sign is omitted, and the two quantities put together: thus \( bd \) expresses the product of the two numbers denoted by \( b \) and \( d \), which suppose 2 and 4, the product whereof is 8, signified by \( 8 \).

Wolfius, and others, make the sign of multiplication a dot (.) between the two factors: thus \( 6.2 \) signifies the product of 6 and 2 = 12.

Where one or both the factors are compounded of several letters, they are distinguished by a line drawn over them: thus, the factum of \( a + b - c \) into \( d \), is written \( d \times a + b - c \).

Guido Grandio, and after him Leibnitz, Wolfius, and others, to avoid the perplexity of lines, in lieu thereof distinguished the compound factors, by including them in a parenthesis, thus \( (a + b - c) \).

The parenthesis \( ( \), as a vinculum, was invented by Albert Girard, and used in such expressions as these \( \frac{1}{2} \times 5 \), and \( B \) \( (B + C) \), both for universal roots, and multiplication, &c. The straight-lined vinculum \( — \) was used by Vieta for the same purpose: thus \( A - B \) in \( B + C \).

\( \div \) is the character of division, and was introduced by Dr. Pell: thus, \( a \div b \) denotes the quantity \( a \) to be divided by \( b \).

Indeed, ordinarily, in algebra, the quotient is expressed fraction-wise; thus, \( \frac{a}{b} \) denotes the quotient of \( a \) divided by \( b \).

Wolfius, &c. make the sign of division (:) thus, \( 3 : 4 \) denotes the quotient of 3 divided by 4 = 2.

If either the divisor or dividend, or both, be composed of several letters, e.g. \( a + b \), divided by \( c \); instead of writing the quotient fraction-wise, thus, \( \frac{a + b}{c} \), Wolfius, &c. include the compound quantities in a parenthesis; thus, \( (a + b) : c \), or \( (a + b) : c \).

\( \otimes \) is the character of multiplication, or of producing the square of any quantity, by multiplying it by itself.
The character of evolution, or of extracting the roots out of the several powers, the reverse of √. Both these characters were used by Dr. Pell.

7. The sign of majority, or of the excess of one quantity beyond another: some use this \( \sqrt{\), or this \( \).}

8. The sign of minority. These two characters were first introduced by Harriot, and have been since used by Wallis and Lamy. Other authors use others; some use this \( 2 \).

9. The sign of fluence, commended in the Miscellanea Beroliniania, and used by Leibnitz, Wolius, and others; though the generality of authors use none.

The same character is used by other authors for the difference between two quantities, while it is yet unknown which is the greater. It was introduced for this purpose of denoting a general difference by Dr. Wallis.

\[ \sqrt{\] is the character of radicality, and shows that the root of the quantity, to which it is prefixed, is extracted, or to be extracted: thus \( \sqrt[3]{25} \) or \( \sqrt[4]{25} \) denotes the square root of 25, viz. 5; and \( \sqrt[3]{25} \) the cube root of 25. This sign is derived from the initial R or r of radix or root, which was used at first by Paciolius, Cardan, &c. The character \( \sqrt{\) seems to have been first used by Stifelius in 1544, and by Robert Record in 1557. At first they used the initial of the name after it, to denote the several roots: as \( \sqrt[3]{\) the quadratic or square root, and \( \sqrt[4]{\) the cubic root. But the numerical indices of the roots were prefixed by Albert Girard, just as they are now used, viz. \( \sqrt[3]{\), \( \sqrt[4]{\), \( \sqrt[5]{\), the 2d, 3d, or 4th root. See Root.

This character sometimes affects several quantities distinguished by a line drawn over them, thus, \( \sqrt[3]{b + c} \) denotes the square root of the sum of \( b \) and \( c \).

Wolius, &c. in lieu hereof, includes the roots composed of several quantities in a parenthesis, adding its index: thus, \( (a + b - c)^{3} \) denotes the square of \( a + b - c \), ordinarily written \( a + b - c^{2} \).

\( \therefore \) Is the character of arithmetical proportion disjunct; thus, \( 7:3:13:9 \), intimates \( 3 \) to be exceeded by \( 7 \), as much as \( 9 \) by \( 13 \); viz. by \( 4 \).

\( \therefore \) This is the character of identity of ratio, and geometrical proportion disjunct; thus, \( 8:4::30:15 \), expresses the ratio of 30 to 15, to be the same with that of 8 to 4; or that the four terms are in geometrical proportion, viz. \( 8 \) and 4, as \( 30 \) and \( 15 \). This character was introduced by Oughtred.

Wolius, in lieu hereof, uses the character of equality \( \equiv \); which he prefers to the former, as being more fictitious and expressive.

\( \therefore \) The character of geometrical proportion continued, implying the ratio to be carried on without interruption: thus, \( 2, 4, 8, 16, 32, \) \( \equiv \) are in the same uninterrupted proportion. This mark was introduced by Oughtred.

When one or more terms in an equation are wanting, their places are usually marked with one or more afterfifths; \( \frac{a}{y} + \frac{p}{y} + \frac{q}{y} \) \( \equiv \) \( o \).

The characters for the Sun, Moon, Mars, Mercury, Jupiter, Venus, and Saturn, are used to denote the days of the week, viz. Sunday, Monday, &c.

With regard to the mythological signification of these characters, we may observe, that antiquaries and astrologers, according to whose opinion the planets were first distinguished by them, considered them as the attributes of the deities of the same name. The circle, in the earliest periods, among the Egyptians, was the symbol of divinity and perfection, and seems with great propriety to have been chosen by them as the character of the sun; especially as, when surrounded by small strokes projecting from its circumference, it may form some representation of the emission of rays. Some have thought, however, that the character of the sun, \( \bigcirc \), is the picture of a buckler; the middle point of which represents theumbo or boss; and it is observed, that the bucklers of the ancients used to be bright, in order to dazzle the eyes of their enemies, (vid. Plautius, art. i. fe. 1, 6.) Hyde, (de Rel. Vet. Perf. p. 106.) informs us, that the Persians often call the sun by a word which signifies a buckler; and in MSS. the character is often a buckler, seen in a side view; often a cone, which was sacred to the sun, (Porphyri. ap. Enfeb. Præp. Evang. p. 98.) A circle is mentioned as an Egyptian character of the sun, by Clemens of Alexandria, (Strom. l. v. p. 657. ed. Potter.) The femicircle \( \bigoplus \) is, in like manner, the image of the moon, the only one of the heavenly bodies that appears under that form to the naked eye; and accordingly it is thus mentioned by Clemens, (vid. supra.) As to the characters of the planets, the common opinion is, that they were taken from the symbols of those deities whose names they bear: thus, the character of Mercury \( \bigotimes \) is his caduceus or wand, with serpents twining round it; that of Venus \( \bigotimes \), a looking-glass, with a handle; that of Mars \( \bigodot \), a lance and buckler; that of Jupiter \( \bigcirc \), his thunderbolt; or, as others more generally agree, the first letter \( Z \) of his name in Greek, with a stroke through it, as a mark of abbreviation; and that of Saturn \( \bigotimes \), aickle or sythe. (Riccioi, Almag. vii. 1. vol. x. p. 482.) Salmasius, (Plin. Excit. p. 1237.) supposes, that all the characters are the initial letters of the Greek names of the planets. Kircher, somewhat fancifully, (Eddnp. Egypt. t. ii. pars 2. p. 402.) compounds the characters of the planets out of \( \bigodot \) and \( \bigodot \), a crofs + , the mark used for the four elements, and \( \bigodot \), the character of Arics, which he says, denotes fruitfulness.

\[ \text{Characters, Chemical.} \]

The reasons that have chiefly led
led to the invention of life of chemical characters, are the two following; namely, their conciseness, and the facility which they afford of concealing from the uninitiated the knowledge of valuable or curious facts. The latter reason is that by which the ancient chemists were for the most part influenced; the former is that which has induced some modern chemists to their adoption.

The extensive destruction of chemical books in Egypt, by order of Diocletian, and the combination of the Alexandrian library with the Arabians, in all probability occasioned the loss of many curious facts and processes, and the characters in which they were recorded: the utter incomprehensibility also of many of the early manuscripts on these subjects that are yet extant, (especially those written in Greek or Arabic,) has considerably diminished the number of characters which it is at all worth while to be at the trouble of reproducing.

In the table of ancient chemical characters, Plato Chymista, are comprehended all that are to be found in the printed works of chemists, from the time of Roger Bacon to Bergman. It is obvious, even on a cursory inspection, that some of these are borrowed from the science of astronomy; that others are mere arbitrary signs; and that others are rude types or hieroglyphics; the whole being defective in any uniform system, and very applicable to the use of chemistry, after it had assumed a scientific form.

Bergman, being aware of the unfitness of the old signs, has rejected all except those employed to denote chemical substances: to these he has added others to represent those bodies which were unknown to the older chemists; and has from this whole into a system, capable of expressing in a tabular form, with brevity and clearness, the results of figure and compound affinity, which was the only purpose to which they were applied by this eminent chemist.

When Lavosier had invented the system of chemistry which is at present received, and had reformulated the nomenclature in conformity with it, two of his countrymen, Mellis, Hassenfratz and Aétet, chose to employ themselves in the formation of a species of ctenography to correspond with the terms of the new system, but the good sense of the age being convinced that it was a difficult to add to the necessary difficulties of the most comprehensive of all sciences was wholly needless, has so unaniomously rejected the letters which these gentle- men have taken the trouble to forge, that any criticism upon the subject would be entirely fruitless.

Characters used in the Arithmetic of Infinites.

The character of an infinitesimal, or fluxion, thus, \( \varepsilon \), expresses the fluxions, or differentials of the variable quantities \( x \) and \( y \); two, three, or more dots, denote second, third, or higher fluxions. See Fluxion.

This method of denoting the fluxions, we owe to Sir Isaac Newton, the inventor of fluxions: it is adhered to by the English; but foreigners generally follow M. Leibnitz, and in lieu of a dot prefix the letter \( d \) to the variable quantity; on pretence of avoiding the confusion arising from the multiplication of dots, in the differentiations of differentials.

The character of a differential of a variable quantity, thus, \( dx \) is the differential of \( x \); \( dy \) the differential of \( y \). The character was first introduced by M. Leibnitz, and is followed by all but the English. See Calculus Differentialis.

Character of a sharp note. This character at the beginning of a line or space, denotes all the notes in that line or space to be taken a semitone higher than in the natural series. And the same affects all their octaves, above and below, though not marked.

When the character is prefixed to any particular note, it shews that note alone to be a semitone higher than it would be without such character.

Characters, in Swift Writing, or short-hand. See Stenography.

Character is also used for a certain manner, air, or assemblage of qualities, resulting from several particular marks, which disinguish a thing from any other, so as it may be known thereby.

Thus, we say, the character of Achilles; generosity and greatness of mind formed the character of the Romans; Ciceron had a character of politenesse, which is wanting in Democritus; every passion has its peculiar character.

The writers of characters are, Theophrastus, whose fragments are still extant; Du Moulin, in his Exemplar Morum; Paeschal, in his Characters Virtutum & Vitiarum; M. de la Chambre, in his Characters of the Passion: and De la Bruyere, in his Characters and Manners of the Age.

The drawing of characters is one of the most splendid, and, at the same time, one of the most difficult ornaments of historical composition. For characters are generally considered as professed exhibitions of fine writing; and an historian, who seeks to shine in them, is frequently in danger of
CHARACTERS.

of carrying refinements to excess, from a desire of appearing very profound and penetrating. He brings together so many contrats, and subtle oppositions of qualities, that we are rather dazzled with sparkling expressions, than entertained with any clear conception of a human character. A writer, who would characterise in an instructive and masterly manner, should be simple in his style, and should avoid all quaintness and affectation; at the same time not contenting himself with giving us general outlines only, but descending into those peculiarities which mark a character, in its most striking and distinctive features. The Greek historians sometimes give eulogiums, but rarely draw full and professed characters. The two ancient authors who have most laboured this part of historical composition, are Salutii and Tacitus. In describing characters, as well as in relating transactions, the historian should always have himself to be on the side of virtue. To appear neutral and indifferent with respect to good and bad characters, and to affect a crafty and political, rather than moral turn of thought, will, besides other bad effects, derogate greatly from the weight of historical composition, and will render the strain of it much more cold and unintelligible. See History.

Character, is a term in common with all the arts, implying something peculiar and original. In *Moses, perhaps more than in any other art, this term is wanted; as a movement or composition, said to be of a distinct call or character, implies invention. Without some specific stamp or impression, to awaken in the reader the idea of some passion, affection, or sentiment, it is of no character, but resembles Shakespeare's "Fellow without mark or likeness."

It is but in modern times that this kind of stamp has been aimed at or expected. Neither Corelli nor Gemistiani flamed the melodies of their movements with any thing but a kind of wafer feel, regularly barred indeed. Pure and sweet harmony, merrily figures, and pleasing effects are produced in mass of their productions just that innate and striking character, which is in many, felt, which distinguishes a movement from all others, and which, without learned modulation, studied combinations, or ingenious arrangement of the parts, fetizes the attention, impresses itself on the hearer's memory, never to be effaced, is wanting.

Handel has choruses of every species of character, and more fongs than any composer of his time. "Return, O God of Holts," is a sublime supplication. "He was despised and rejected," is impressed with a deep and dignified sorrow. "He shall feed his flock like a shepherd," has a true pastoral call.

Pergolesi, Jomelli, Piccini, and Sacchini, have produced airs of character so frequently, that it is now formed into a principle by men of original genius, such as Pacciuolo, Cunio, and Sarti in Italy, and Emanuel Bach, Haydn, and Mozart in Germany, who have seldom let a movement go out of their hands ere they have affected their feel to it.

Gluck produced great effects by harmony, energy, and bold modulation; but his melodies have seldom any peculiar mark of pathos, grace, or novelty.

Character, in Poetry, especially the epopea and drama, is the result of the manners, or that which each person has peculiar and singular in his manners, whereby he is distinguished from others. In the drama characters are chiefly displayed by means of sentiments and passions; but in the epopea, or epic poetry, which comprehends a greater compass of time and action, and which therefore allows a more full display of characters, they are displayed chiefly by means of actions.

As it is the business of an epic poet to copy after nature, and to form a probable interesting tale, he must study to give all his personages proper and well supported characters; such as display the features of human nature. This is called by Aristotle giving manners to the poem. It is by no means necessary that all his actors be morally good; imperfect, nay, vicious characters may find a proper place; though the nature of epic poetry seems to require, that the principal figures exhibited should be such as tend to raise admiration and love, rather than hatred and contempt. But whatever the character be which a poet gives to any of his actors, he must take care to preserve it uniform, and consistent with itself. Everything which that person says or does, must be suited to it, and must serve to distinguish him from any other. Poetic characters may be divided into two kinds, general and particular: the former are such as are wise, brave, and virtuous, without any further distinction; the latter express the species of bravery, of wisdom, of virtue, for which any one is eminent; they exhibit the peculiar features which distinguish one individual from another, which mark the difference of the fame moral quality in different men, according as it is combined with other dispositions in their temper. In drawing such peculiar characters, genius is chiefly exerted. In this part Homer has particularly excelled; Tasso approaches the nearest to Homer; and Virgil has been the most deficient.

It has been the practice of all epic poets to select some one personage, whom they distinguish above all the rest, and make the hero of the tale. This is considered as essential to epic composition, and is attended with several advantages. It renders the unity of the subject more sensible, when there is one principal figure, to which, as to a centre, all the rest refer. It tends to interest us more in the enterprise which is carried on; and it gives the poet an opportunity of exerting his talents for adorning and displaying one character with peculiar splendour. It has been asked, who then is the hero of "Paradise Lost?" The Devil, it has been answered by some critics; and in consequence of this idea, much ridicule and censure have been thrown upon Milton. But these critics have misunderstood that author's intention, by proceeding upon a supposition that, in the conclusion of the poem, the hero must needs be triumphant. Whereas Milton followed a different plan, and has given a tragic conclusion to a poem, otherwise epic in its form. For Adam is undoubtedly his hero; that is, the capital and most interesting figure in his poem. Blair's Lectures on Rhetoric, &c. vol. iii.

The poetical character, Bolfus observes, is not properly any virtue or quality in particular; but it is a composition of several, mixed and combined in various degrees, according to the occasions of the tale, and the unity of the action. All the single qualities that enter this compound, must not have the same rank, nor be equal to each other: hence, in that cafe, one prevailing on one occasion, and another on another, the character will appear changeable; and the poem, as well as the hero, will seem animated with several fads.

There must, therefore, be one to reign over all the rest; and this must be found in some degree in every part: just as the same hero, in several paintings, should have the same lines and features, how different soever his passions and passions may be.

This first quality in Homer's Achilles, is wrath; in Ulysses, dissimulation; and in Virgil's Aeneas, mildness; each of which may, by way of eminence, be called the character of those heroes.

These are never to go alone, but always are to be accompanied
panied with others, to give them the greater luster; either by hiding their defects, as in Achilles, whose anger is palliated by great courage; or by making them eke out in some solid virtue, as in Ulysses, whose diffudemake makes a part of his prudence; and in Eneas, whose mildness is chiefly employed in a subliminon to the will of the gods.

These secondary qualities of courage, prudence, and sublimination, make the goodness of the characters of those heroes, and even of the poems.

Boffu adds, that the quality of courage must always have a share in the character of a hero, to serve as a support to the reft: the heroic character, therefore, he makes a compound of three kinds of qualities. Those of the first kind are necessary and essential to the fable; those of the second are the supplements, or embellishments of the first; and courage, which fulfills the other two, makes the third.

The first, which is the chief, is to be some universal quality, to have place on all occasions, and to distinguish the hero wherever he is found.

For the unity of character, we have Horace's express command: *Sic quidvis jambibus dantur & una*.

The unity of character is somewhat different from that of the manners: in the latter, the unity or equality consists in not giving contrary sentiments to the same person; which is not sufficient to the unity of character: but to this must be added, that the same spirit must always appear on all occasions, whether contrary or otherwise: thus, Eneas shewing great goodness in the first part of the poem, and much valor in the second, but without discovering any of his former piety, and gentleness; there had been no offence against the eunoms of the manners, but much against the unity of the character.

So that besides the qualities which have their particular place on different occasions, there must be one to have place throughout, and to reign over all the others. Without this there is no character: as would be the cafe, though a poet give his hero the piety of Eneas, and the courage of Achilles, without considering the feverity of the one, and the mildness of the other.

A hero, it is true, may be made as brave as Achilles, as mild, or pious, as Eneas, and, if the writer thinks proper, as prudent as Ulysses; but it would be a mere chimera to imagine a hero, with the particular courage of Achilles, the piety of Eneas, and the prudence of Ulysses, at the same time.

The unity of character is not only to be kept in the hero, and the several other persons of the piece; but also in that of the poem itself: that is, all the characters, how opposite forever, must centre and re-unite in that of the hero; and be so fwayed by it, that this alone may seem to govern throughout the whole. Thus Homer makes wrath prevail throughout the whole Iliad; and artifice and diffudemake throughout the Odyssey; the hero's character is perceived everywhere, and has its full sway, and is favoured by the similitude of the characters of some of the other persons. Virgil had a great difficulty to grapple with to preserve his unity; because of the direct opposition between the humours of his hero, and those of some other of his persons, as in Turnus, Mezentius, Didon, &c. He therefore takes care not to carry those opposite characters to their full length, but moderates and restrains them: and as this moderation could not flow naturally from the persons themselves, it is produced either by some passion, as in Didon; or some dependences, as in Turnus and Mezentius. To this artifice he adds epistles, accommodated to the general character, by which he interrupts the particular actions, which require an opposite character.

Claudian's conduct, in this respect, is unpardonable; from the horrible characters of Pluto and the Furies, with all the terrors of hell, he passes to the gaiety and pleasures of the Graces, gilded palaces, flowery fields, &c. He has as many different prevailing characters in his three books, as Homer and Virgil in their sixty. See Drama and Epicene. For the characters in Comedy and Tragedy; see those articles.

Character is also used for certain visible qualities, which claim respect or reverence to those who are vellted with them.

The majesty of kings gives them a character which procures respect from the people. A bishop should fulfill his character by learning and solid piety rather than by worldly luire, &c.

Character is also used among Divines, especially those of the Romish church, for an indelible mark, or impression, which certain sacraments are supposed to leave behind in those who receive them. The sacraments that leave this character are incapable of being repeated. The character is generally supposed to be something physical. The sacraments of baptism, confirmation, and ordination, in particular, leave such indelible character.

Character, in Natural History, is synonymous with the definition of the genera of animals, plants, &c.

CHARACTERISTIC, in the general, is that which characterizes a thing or person, i.e. constitutes its character, whereby it is distinguished from all others.

Charactertelastic is peculiarly used in Grammar, for the principal letter of a word; which is preferred in most of its tenses and moods, its derivatives and compounds.

The characteristic frequently shews its etymology; and ought confantly to be retained in its orthography; such is the letter r in course, fort, &c.

The characteristics are of great use in the Greek grammar, especially in the formation of the tenes; as being the same in the same tenes of all verbs of the same conjugation, excepting in the present tense, which has several characteristics; and the futur, the aoritus primus, the preteterperfect, and the pluquam perfect tense of the fourth conjugation, which have two characteristics. The characteristics of the conjugations in the Hebrew grammar are the letters prefixed to, or inferred between, the radical letters: e.g. י in Niphal, ו and י of Hiphil, ו of Hophal, and י ו of Hihpahel.

These technical terms have obtained such long polish in the Hebrew grammar, that it would be difficult, and perhaps improper to expel them, or to substitute others in their room. The chief inconvenience attending them is, that they represent only the position or situation of the letters in the different modes or voices, but give no intimation of the meaning conveyed by these modes.

Characteristic of a Logarithm, is its index or exponent. This term was first used by Briggs in his Arithmetical Logarithmus, to denote the integral or first part of a logarithm towards the left hand; and this expresses, see less than the number of integer places or figures in the number corresponding to that logarithm, or how far the first figure of this number is removed from the place of units: thus, o is the characteristic of all numbers from 1 to 10; 1 the characteristic of all from 10 to 100; 2 of all from 100 to 1000, &c. See Logarithm.

Characteristic triangle of a curve. See Curve.

CHARADE, is the name of a new species of composition, or literary amusement. It owes its name to the Idler who
who invented it. Its subject must be a word of two syllables, each forming a distinct word; and these two syllables are to be conceived in an enigmatical description, first separately, and then together. The exercise of charades, although it may not be very instructive, is innocent and amusing; and may force to try the inventive talents of children, and to occupy their intervals of leisure.

CHARADRA, in Ancient Geography, a town of Greece, in the Pheceide, according to Herodotus. It was feated on an eminence, below which flowed the river Charadraus, about 20 stadia from Liza, according to Paufanias. Notwithstanding the vicinity of this torrent, the inhabitants were in frequent want of water.—Allo, a place of Greece, in Epirus, itinate, according to Polybius, near the gulf of Ambraeia.—Allo, the name of one of the towns founded by Pelops, according to Strabo, itinate in Messenia.

CHARADRIUS, in Ornithology, a genus of the grall order, in which the bill is roundish and obtuse; noltrils linear; feet three-toed, and furnished for running.

Species.

The length of this bird is from six to seven inches; the bill is of an orange colour; at the base, and at the tip, or anterior half, black; the upper mandible is also black at the base, and a black space extends from thence through the eyes to the ears; the forehead is white, and behind this is another mark of black. The chin, throat, and broad collar extending backwards from thence are white, and beneath this is another collar of black, encircling the neck behind. Its breast and under parts are white; back and wing-coverts pale brown; quills dusky; the middle feathers of the tail are greyish brown, becoming almost black towards the ends, the three next on each side the same, but having the tips white, the tail but one white, with a brown band, the outer one white, marked with a single spot. The plumage of the male inclines more to ash colour, and the white on the forehead occupies a greater space than in the female.

These birds inhabit Europe and America: they migrate into England in the spring, and leave us in autumn. They lay four eggs an inch and a half in length, and of a pale yellowish, spotted, and blended with black, upon the ground under some fitcher, for they make no nest. They run very fast, sometimes taking short flights, and twittering loud at the same time, then alight and run again, and, if still disturbed, will either fly away, or secrete themselves in some holes till the danger is over.

A variety of this bird, &c, is described as an inhabitant of Spain; the plumage is greyish, with the collar and abdomen white. Another, &c, is mentioned as a native of America; the colour of this is greyish-ash, the front and collar white; lower half of the tail black, tipped with ferruginous. This last kind was brought from Owyhee.

This species inhabits almost every part of the world. On the European continent they are met with chiefly in hilly or mountainous situations, in Sweden, Denmark, Lapland, Iceland, and as far south as Aleppo. It breeds on several of the unfrumented mountains of Britain, and especially in the heathy hills of the Scotch islands. In America, it appears on the coast of Labrador and Hudson’s bay, and from thence to New York, as low as Carolina. It has been observed in China, and in some of the islands of the South Seas; and a supposed variety of it, Pluvialis dominicus aurea of Briffon, is mentioned as a native of St. Domingo. The length of this bird is ten inches and a half; the bill is about one inch, and of a dusky colour; the irides dull red. The upper part of the plumage is dusky, spotted with greenish yellow; round the eyes and the chin almost white; sides of the head and body, together with the neck, with the upper parts, but paler; middle of the belly dusky yellow; the greater quills are dusky; tail barred, dusky, and dull yellow; legs black. In some individuals the belly is black, in others black and white. The male and female differ very little. In young birds the spots are not of a full yellow colour, as in the adults, but incline more to grey. The supposed variety before noticed as a native of St. Domingo, has the body blackish, varied with yellowish, and beneath white; and the lower part of the neck and breast pale grey; tail brown, having the margins of the feathers spotted with yellowish white.

RUDIBUS. Red, varied with black spots, and sprinkled with white; two middle tail-feathers fuscous, with ferruginous margins, the red whithit, Lath. Gmel. Rudy plover, Lath. Donov. &c.

Inhabits Hudson’s bay. The bill of this bird is straight and black; the head, neck, breast, and scapulars, with the wing and tail-coverts, of a ruddy colour, spotted with black, and powdered with white; the outer webs of the first four quills are brown; the inner white, tipped with brown; the red white above and brown beneath; legs black; toes divided at their origin. At Hudson’s bay it is known by the name of Mikk. Burns has Pasim.
A variety of this species is found in Newfoundland, which has the upper parts of a brownish ash-colour, mixed with brown, and streaked with black; forehead and under parts cinereous white; lesser and middle wing-coverts black, fringed with ash-colour; the greater cinereous with whitish edges; quills and tail dufty; legs black.

Size of the golden plover. The plumage above black, spotted with orange; at the base of the upper mandible the feathers are black; front, eye-brows, lower eye-lid, flanks, and vent white; wings and tail brown and black bands; legs black. This inhabits the northern parts of Europe, as Sweden, Denmark, Iceland, and Greenland.

RUBICOLELLUS. Cinereous; body beneath white; head and neck black, with a large, square, rufous-chestnut foot on each side. Lath. Charadrius rubricollis, Gmel. Red-necked Plover, Lath.

This species inhabits the South Seas. The bill is fuscous, at the tip black; the upper part of the plumage is ash-colour; with a slight mixture of white, the breast and under parts are white; quills and tail dufty; legs fuscous-colour. Length about seven inches and a half.

Inhabitats Egypt near the Nile. This is the size of a lark; the bill is black; forehead white, passing backwards in a streak over the eye; from the base of the bill a streak of black runs through the eye and reaches behind to the ears; top of the head, back, and wings brown; round the neck a collar of white; belly white; quills blackish grey; four middle tail feathers dusky brown; tail much rounded; legs black.

The Limnean Charadrius egypius is considered as a variety of this species. This is distinguished by having a black band on the breast; eye-brows white; tail-feathers with a black band, and white tip; and legs blue. This bird inhabits the funny plains of Egypt, and feeds on insects. Another variety, called the red-eyed plover, has the crown of the head black, and the legs red.

PHILIPPINUS. Fuscous; region of the eyes, collar, and tail black; front, body beneath, and tip of the tail-feathers white. Petit Pluvial de Collier du Leon, Gmel. &c. Size of the lat, and is a native of the Philippines.

NOVE-SELANDE. Greenish, face and collar black; annular stripe on the head, band on the wings, and body beneath white. Charadrius maritimus, Gmel. New Zealand Plover, Lath. Inhabitats New Zealand. It is known in Queen Charlotte's Sound by the name of Donohoea aites. This is rather larger than the ringed plover; the bill is of a red colour tipped with black; legs red.

GREGARIUS. Cinereous, beneath white; breast with a black femicircle, on the hind part rufous; tail-feathers white, with a black band. Charadrius gregarius, Pallas. Gregarious Plover, Lath.

Described by Pallas as being common in the fields about the Volga, Jack, and Samaara, where it appears in flocks; it is not seen farther north than 54° degrees; and is by some called the "Hen of Steppes." This is the size of a lapwing. The bill in shape and size the same as in that bird; crown of the head brown, mottled with white; forehead white, passing in a streak over each eye; the hind head; through the eyes a black streak. The body is of an ash-colour, somewhat approaching to that of the turtle; tail even at the extremity; legs furnished with an imperfect back toe.

Inhabitats the salt lakes in the deferts of Tartary; and is a rare and solitary bird. In size it rather exceeds the ringed plover. The crown of the head, back, and wings are greyish ash-coloured brown; tail brown, with the feathers whitish at the edges, and tipped with black; legs red.

TAR TARICUS. Collar cinereous; breast ferrugineous; band on the chin and breast black; abdomen white; wings and tail fuscous. Pallas &c. Observed near the salt lakes of southern Tartary. Supposed by some to be a variety of the dotterel.

MONGOLUS. Cinereous fuscous; front beneath white; throat and breast ferrugineous; chin with a black fuscous. Pallas &c. Mongolian Plover, Lath. This inhabits the salt lakes about the Mongolian country in tolerable plenty. It is the size of the common dotterel.

The length of this bird is nine inches and three quarters. Bill an inch long and black; eye-lids red; the forehead is white: between the eyes, across the head, a bar of black palling on each side to the hind head: the chin and fore part of the neck white: at the lower part of the neck, the white encircles it like a ring, and is accompanied by a bar of black all round; on the breast is another black bar, and, except those, all the under parts are white. The hind part of the head, neck, and upper part of the body and wings, are dusky brown; rump and tail rufous; the latter much rounded in shape, tipped with white, and barred near the end with black; legs pale yellow. This species inhabits America; it is a clamorous and restless bird. In Virginia it is called the kill-deer, from its note resembling the pronunciation of that word. There is a variety of this species which has the breast varied with black; front white; crown and collar black; bill and legs bluish; three outer tail feathers tipped with white. This is the Charadrius torquatus of Limneus, and Pluvialis à collier de St. Domingue, Buff. Pl. Eul.

JAMAICENSIS. Dusky fuscous, beneath white; breast spotted black and white; tail varied with whitish, rufous, and black; bill black; collar and legs white. Gmel. Pluvialis jamaicensis torquata, Briff. Large grey fink, Brown Collared Plover, Lath.

Size rather less than that of the noisy plover; length eight inches; bill an inch long, and black; upper part of the head, neck, body and wings, dull brown; throat, fore part of the neck, belly, thighs and vent, white; at the lower part of the neck the white passes round as a collar; quills dull brown; tail whitish, varied with rufous and blackish. Inhabitats Jamaica, where it frequents the banks of rivers.

The Dotterel is from nine to ten inches in length. The bill an inch long, and of a black colour: the forehead an intermixture of dusky and grey; over the eyes is a white hand which bends downwards, and palls to the hind head; the sides of the head and throat are white: the hind part of the neck, the back and wings, greyish brown; the feathers margined with pale ferrugineous, but those of the lower part
of the back and rump inclined to grey; fore part of the neck cinnereous olive mixed with a little white next the throat; the lower part of the neck is bounded with a line of black, beneath which is another of white; the breast and sides are of a pale dull orange; middle of the belly black; lower parts and thighs rufous white; tail olive brown, with a black band, and white tip; the two outer feathers edged with white; legs black. The female differs in being rather larger, in having the black on the belly mixed with white, and the general colour of the plumage more obscure.

These birds are common in the northern parts of Europe, where they may be supposed to breed. Linnæus says they are very frequent in Dalmatia and the Lapland Alps, and that they visit Sweden in May. They are known to breed in the north of Russia and Siberia. In England, they occur in great plenty in the counties of Cambridgeshire, Lincolnshire, and Derbyshire. With us they are migratory, appearing in flocks of eight or ten in number the latter end of April, and stay till the end of May or June, when they are very fat, and are much esteemed for the table. It is supposed they breed in the mountains of Cumberland and Westmorland, as they appear there in May, and are not observed there after the breeding season. We are informed in the Flora Scotia, that they breed on several of the Highland hills. The manners of the Dotterel prove it a likely bird. There is a variety of this bird which has the crown varied with white, grey brown and yellowish mixed with white, with the two middle tail feathers brown, and the lateral ones white.

FALKLANDICUS. Brown-clouded; front, neck beneath, and abdomen white; annual stripe on the head ferrugineous; breast and band on the crown black. Lath. *Rufus coroned Plover,* Portlock Voy.

This species, which is about seven inches and a half in length, inhabits the Falkland islands. The bill and legs are blackish; body beneath white; stripe encircling the head of the male resembling a crown.

SIBIRICUS. Front varied with black and white; crown barred with blackish; breast brown, terminated by a white band; belly ferrugineus. Lepch. It. *Charadrius Sibiricus,* Gmel. A native of Siberia.

OBSCURUS. Black, beneath ochraceous; front and chin whitish; collar dusky with pale friz. Gmel. &c. *Dusky Plover,* Lath.

This was found by the English circumnavigators in Dusky Bay, New Zealand, where the natives call it *Happo-bire*; in point of friz, it rather exceeds the common frizpe. The bill is black; forehead redish white; plumage on the upper part dusky, edges of the feathers paler; chin and fore part of the neck dusky white; lower part of the neck, breast, and under parts, dusky yellow ochre colour, with a tinge of red; neck marked with pale and dusky streaks, and transversely mottled with the sides with narrow lines; legs bluish; claws black.

FULVUS. Above blackish, the feathers edged with tawny; beneath whitish; breast fulvous spotted with black; wings with a white band. *Charadrius Fulvus,* Gmel. *Fulvous Plover,* Lath.

This bird inhabits the shores and marshy places of Otago-heite. The size is rather less than that of the lapwing; the bill is dusky; irides bluish black; its forehead and throat are dusky white; belly dusky white spotted with black; wing coverts black, spotted with fulvous, the lower order of black brown, tipped with white; quills brownish black, with white shafts; tail brown, with white bands; legs blue; claws black and blunted. A variety of this bird, in the late Leverian Museum, had the bill brown, legs yellowish, and the wing defluite of the white band. This was probably a young bird, the length being only eight inches; while that before described measured twelve inches and a half; the plumage on the upper part was brown, and had the feathers margined with golden yellow; the under part of the body was white, except the breast, which was of a dusky pale brown. The quills were brown, having the end half of the shafts white; the secondaries as long as the quills, and both of them reaching to the end of the tail and concealing it; the tail was two inches long, brown, and marked with obscure pale brown spots on each side of the web: legs about two inches long, and of a pale yellow colour. The native place of this variety could not be ascertained.

LUCOGASTER. Fulvous; body beneath, front, white line above and beneath the eyes white; legs pale blue. Gmel. &c. *White belied Plover,* Lath.

Described from a specimen in the late Leverian Museum. The length six inches; bill one inch; the plumage on the upper part dirty brown; secondaries and prime quill feathers of equal length; some of the first white for half their length from the base, with white shafts; of the middle tail feathers brown, the next white at the tip and base, the three exterior ones white, the last but one with a brown spot on the inner web near the tip, and the third black at the extremity. Native place unknown. Lath. &c.

This corresponds in size with the golden plover; the bill is an inch long, and black; irides red; crown of the head and throat are black, passing a little way down the neck before. The back part of the neck, and upper part of the body and scapulars are grey; sides of the head, and all the under part from the throat to the vent yellowish white, except a crecent of black on the breast, the convex part uppermorn. The outer wing-coverts are black, the middle ones grey, the greater yellowish white. On the fore part of the wing just within the bend, is a slightly incurvate black spur, about half an inch in length. The tail is yellowish white, tipped with black, and legs are black. This singular bird inhabits the marshy places of Lower Egypt. Sonnini, speaking of the natural productions of Rosetta, tells us the most numerous and generally diffused of all the aquatic birds in this part were the spur-winged plovers; "fowl animals (adds this writer) which might likewise be called manfully, for they have a haughty and almost continual movement of the head and neck, drawing them up brilliantly, and then quickly stretching them forward almost as if they were making haly and eager bows." Halléquilt acquaints us it inhabits the marshy places of Lower Egypt in the month of September, and that it is also found in other parts of the neighbourhood, and is called *Dominican,* the neck being black, with white sides, and not inaptingly resembling the collar part of the habit of that order of religious.

A variety of the spur-winged plover found in Russia, and which is frequent near Aleppo, about the river Ore, is of a ochreous-colour above, with the neck and lower part of the belly white; and the breast, wings, and tip of the tail black. This is the black-breasted Indian plover or Edwards, p. 47. The spur-winged plover of Edwards, pl. 280, is supposed to be the female. Another kind of spur-winged plover, *Le plover arm de Cayenne,* is inferred by Dr. Latham in his General Synopsis as a variety of this bird; and also appears as such in the German edition of the *Systema Naturae.* In Latham's Ind. Ord. this is, however, described as a distinct species, under the title of *Charadrius Cayanus.*

*Cayanus.* Head, back part of the neck, and pectoral band.
band black; annular band on the hind-head, fore part of the neck, belly, and base of the tail white; spurious wing armed with a spur. Lath. Ind. Orn.

This is a native of Caräne. Its length is nine inches; the bill an inch long, of a dusky colour; back part of the head and nape of the neck white mixed with grey; the fore parts and sides black, passing back to the nape, and occupying all the hind part of the neck, and thence extending forward on the fore part above the breast; space between this and the chin white; the middle of the back and wings are rufous grey; fasciules and quills black; under parts from the breast white; legs yellowish.

The length of this bird is ten inches and a half; the bill is yellow, red towards the end, and black at the tip. The forehead is covered with a carunculated yellow membrane passing round the eyes; the head and jet the contiguous part of the neck is black. The hind-head is furnished with a few short pointed feathers, pendant like a small crest, beneath which the hind-head is white. Above the plumage is rufous grey, all the under parts are white, with a few dusky dashes down the fore part of the neck; the quills and end of the tail black; legs red. This inhabits Senegal.

Coronatus. Piqueous, head above black, circle on the crown, belly, greater wing-coverts and tail white; the lat with a broad black band near the tip. Charadrius coronatus, Gmel. Pileaer couronné du cap de Bonne Esperance, Buff. Wreathed plover, Lath.

This bird inhabits the Cape of Good Hope. Its length is twelve inches. The bill is reddish, and dusky towards the point; the hind part of the neck, and upper part of the body are brown, glossed with greenish purple; as far as the neck the breast is grey; belly white; quills black; legs rufous-colour.

Bilorus. Rufous grey; eye-brows, abdomen, and band across the wing white; crown of the head, and bar on the wings and tail black; front with a pendent wattle. Charadrius bilorus, Gmel. Le plovier a lambeaux, Buff. Le plouvier de la côte de Malabar, Pl. Enl. Wattled plover, Lath.

This bird, which inhabits the coast of Malabar, is the size of the golden plover. The bill is yellow; on the forehead is a bare skin hanging down in a pointed flap on each side of the jaw; and the legs are pale yellow.

A native of Senegal. The length is seven inches. The bill black, and an inch in length; upper part of the head black; all the tail-feathers, except the two middle ones, marked with black near the ends, with the extreme tips white. The under parts from the chin pale rufous, deepset on the breast, where it is mottled with transverse dusky markings, and towards the vent nearly white; legs cinereous grey; claws black.

Inhabits India; and is about the size of the common lark.

Gmelin describes two other birds as species of the charadrius genus, namely, gallicus, and coromandus, both which are referred by Dr. Latham in his Ind. Orn. to the new genus curficus, those having the bill rounded, incurved at the tip, and terminating acutely, besides differing in other general particulars from the charadrius. See Curorius.

Charadrius, in Ancient Geography, a river of Greece, which passed near the town of Charadra, andsoon after discharged itself in the Cephisus, according to Paufanias.—Also, a river of the Peloponnesus in Messenia.—Also, a torrent of the Peloponnesus in the Argolid, in the route from Argos to Mantinea. It ran south of Hyilia, and flowed into the Argolic gulf. Another torrent of the name passed N. W. of Hyilia, and discharged itself into the river Inachus.—Also, a torrent of Achaia, the course of which was from north to south. Its mouth was near the promontory of Rhium. The waters of this stream were said to aid the females of animals that drank them in the act of conception, and therefore they were brought from a great distance for this purpose.—Also, a torrent of Arcadia, which ran at a small distance to the north of Orchomene, and discharged itself into a lake not far distant towards the east.—Also, a strong and ancient place of Asia in Cilicia; situate on the seacoast, in the vicinity of mount Cragus, according to Strabo.

Charag, the tribute which Christians and Jews pay to the grand signior.

It consists of ten, twelve, or fifteen francs per annum, according to the ciate of the party. Men begin to pay it at nine, or at sixteen years old; women are dispensed with, as also priests, rabbins, and religious.

Charagio, in Geography, a town of the island of Corfla, or department of Golo, two miles S. of Cervione.

Charaïns, a fek of the Jews in Egypt. They live by themselves, and have a separate synagogue; and the other Jews are remarkable for their eyes. To these are for their large noses, which run through all the families of this sect. These are the ancient Sifines. They strictly observe the five books of Moses, according to the letter, and receive no written traditions. It is said that the other Jews would join the Chraim, but those not having observed the exact rules, of the law with regard to divorces, think they think they live in adulteries.

Cheramokotan, in Geography, one of the small Kurile islands in the Northern Pacific Ocean. N. lat. 45° 52'. E. long. 154° 54'.

Charancy, a town of France, in the department of the Moleffe, and district of Longwy; 33 leagues W.S.W. of Longwy.

Charandass, in Ancient Geography, a place of Asia, situate on the Euphrasus of Thrace, and called also Delphius.

Charandra, a golf of the Red Sea, in which Ptolemy Philadelphus built a town, called Arsinoe, which see.

Charantía, in Botany, Dod. Sce Momordica Balsamina.

Charas, Moses, in Biography, early distinguished by his skill in chemistry and pharmacy, was born at Uzer, a town in Upper Languedoc, about the year 1618. He first settled at Orange, but at the end of a few years, in the hope of being able to exhibit his talents to a more advantage, he removed to Paris. In this expectation he was not disappointed, as he was soon fixed on to read the lectures on chemistry.
milily, at the Royal Garden there. This office he filled for nine years, until October 1685, when having embraced the doctrine of Luther, he was obliged, by the revocation of the edict of Nantes, which took place at that time, to quit France. He came thence to London, and was received by our king Charles II, with great kindness. After refiding five years in England, he went to Holland, took his degree of doctor in medicine at Leyden, and at length, on the prevailing solicitations of the Spanish envoy, he went to Madrid, invited thither to undertake the care of the health of the king of Spain. What success he had with his patient, we are not told; it was probably not considerable, as he suffered him to be imprisoned in the Inquisition, where he was detained four months, and did not escape, until he had made a full recantation of his errors. He was now upwards of forty-two years of age. He then returned to Paris, and was admitted a member of the Royal Academy. At Paris he continued until January 17th, 1698, when he died, aged eighty years.

In 1668, he published, in 8vo. “A Chemical Analysis,” of the famous elixary; the “Theriac Adromach,” with an account of each of the ingredients entering the composition of that heterogeneous compound. He had the good sense to attribute its salutary powers to the opium and ipecac contained in it, and therefore, contrary to the then received opinion, determines that age impairs, and not improves its efficacy. “Nouvelles Experiences sur la Vipere, les effets de fon venin,” &c. 1669, 8vo. Paris. A drop of the oil of tobacco inclosed into a wound infected with the viper, kills it immediately. He gives a neat anatomical description of the viper, and even describes the bag, the repository of the poison, but inflicts the liquor only becomes poisonous when the animal is irritated; contrary to the experiments of Sig. Redi, who had shown that the liquor taken from a dead viper, and inclosed into a wound through a gull, is as malignant, as when infected by the bite of the enraged animal. Redi defended his experiments, and was anwered by Charas in 1672, who still retained his opinion. The same year he published, “Pharmacopeia royalis galenicus, et chemique,” which, as well as his other works, have passed through several editions. Haller Bib. Med. Elov Dict. Hist.

CHARASM, in Geography. See CHARAS.

CHARATZAIKA, a fastness of Siberia, on the confines of China; 34 miles S.S.W. of Silengisk.

CHARAVARI. This appellation is given by the Poles to a fort of very large breaches, which take in the tails and greatest part of all their clothes, when they let out on horseback on a long journey or march, or when it rains, or the roads are bad and dirty. These are buttoned over the frock, and reach quite down to their heels. This fort of cuvette forms an essential part of the attire or dress of a Hulan.

CHARAVEND, a town of Perlia, in the province of Irap-Agemi; 123 miles S.E. of Iphahan.

CHARAUNI, or CHARRANCE, in Ancient Geography, a people of Scythia, on the other side of the Issus. Ptolemy alligns to them a town called Carvania. They correspond to the Karia or Karia of the present times.

CHARAX. CHARA-CLA, a promontory of the Tauric Cheironotus, N.E. of Cnossinoton, and W. of the promontory Corax, mentioned by Ptolemy and Pliny. — Alfo, a commercial port, placed by Strabo in Africa Propria, and called by Ptolemy Pharaon. — Alfo, a town of Asia Minor in Caria, falf by Steph. Byz. to have been called, in his time, Trallis. — Alfo, a town of Asia, situation in the interior, and between the mountains of the Leper Armenia, according to Ptolemy. — Alfo, a town orburgh of Asia in Parthis, according to Ptolemy. — Alfo, a commercial place of Asia Minor in Bitjyna, placed by Steph. Byz. in the gulf of Nicolea.

Alfo, a promontory of the isle of Crete.—Alfo, a place of Asia Minor in Phrygia, placed by Niceetas, cited by Ortelius, between Lampis and Grafogala.—Alfo, a town of the island of Corica, mentioned by Strabo.—Alfo, a town of Susania, situated between the Tigris and the Eulcus, upon the banks of a canal which connected these rivers.

CHARAX, in Ichthyology, a name given by Hellian, Appian, and many other Greek writers to the fish called by later writers Carassius. Cynicus Carassius of Linnaeus, who distinguishes it by having ten rays in the anal fin, and the lateral line straight. See Cynicus Carassius.

CHARAX, the lower town of China, fina eund radiis 51, is the name and character given by Gellius to the Dimulated Salmon, Sulina micraculus, which see.

CHARBANUS, in Ancient Geography, a mountain of Asia, in Media, which, according to Pliney, lay in the road from Babylon to Chactana. It is supposed to have been a part of mount Zagrus.

CHARON, in the Mangue, signifies that little black spot or mark that remains after a large spot, in the cavity of the corner teeth of a horse. About the seventh or eighth year, when the cavity fills, the tooth being smooth and equal, it is said to be raised.

CHARBONNIER, in Zoology, the name under which Buffon describes the Brant-fox, Canis Lupus of Gmelin. It is distinguished by having the tail straight, and tipped with black. The species inhabits Europe, Asia, and Chili in South America.

CHARBONNIER, in Ornithology. The Great Titmouse or Ox-eye of English writers is described by Buffon under the name of Charbonniere and Groffe Merlange. See Parki major. Buffon also describes the Colemous, under the name of Petite Charbonniere. See Parki atex.

CHARVISOOKA, in Geography, a river of Kamtschatka, which runs into the Penzinkoi gulf; 50 miles S.S.W. of Tiguilko.

CHARCAS, Audience of, a province of South America, regarded before the grand alteration in 1778, as a dependency of Peru, is equal in the extent of its jurisdiction to that of Lima, but with this disadvantage, that many parts of it are not so well inhabited; some abounding with immense deserts and impenetrable forests, while others are full of extensive plains, which are intercepted by the stupendous heights of the Cordilleras. The denomination of Charcas formerly included many populous provinces of Indians, whom the Inca Capai Yapanque subjected to his empire; but he carried his arms no farther than the provinces of Tuytras and Chaqui, where he terminated his conquests towards Callafuyno. On the death of this monarch, his son Inca Roca, the sixth in the succession of those emperors, pushed his conquests farther in the same path, till he became sovereign of all the intermediate nations to the present peninsula of Charcas. See Planta.

The jurisdiction begins on the north side at Valcamanta, belonging to the province of Lampa, in the diocese of Cufco, and reaches southward to Buenos Ayres. Eastward it extends to Brazil, being terminated by the meridian of demarcation; and westward, part of it reaches to the South Sea, particularly at Atacama, the most northern part of it; on this side the remainder of Charcas borders on the kingdom of Chili. Their vast tracts of land give ore bishopric, and five bishops his suffragans, viz. the archbishop of Plata, and the bishops of La Paz, Santa Cruz de la Sierra, Tucuman, Paraguay, and Buenos Ayres. See these articles.

CHARCA, or BETH SOLDO, KARR, or BETH-BARN, in Ancient Geography, a town of Asia, seated on the left bank of the Tigris; S.E. of Bithra.

CHARCANT.
CHARCOAL, in Chemistry. Under the article Carbon are mentioned the chemical properties of charcoal; nothing further therefore remains to be described except the method of preparing the sub stance and a few other particulars intimately dependent upon it.

Charcoal is prepared either by burning or distillation; of these the first is the simplest, most ancient, and usual method, on which account we shall begin with it.

The buhines of charcoal burning takes place during the whole of the summer months, and is for the most part carried on in the woods to save the expense of cartage. Two or three families commonly unite for this purpose, dwelling in tents or temporary huts during the time in which they are thus employed for the convenience of being near their buhines. After they have killed the timber, and it is become sufficiently dry, the process of converting it into charcoal is begun by raising a plot of ground a little higher than the surrounding surface, and bringing it to a slightly convex form by beating it, and thus forming a hard, dry, and solid floor. In the center of this area is placed a circle of stakes adjoining each other and composing a vertical hollow cylinder from three to four inches in diameter, and about six feet high. Round this interior cylinder are ranged suc- cessive concentric circles formed by truncheons from one to ten inches in diameter, care being taken that the truncheons in any one circle are of the same diameter, and that one built of the largest wood be always succeeded by one of the smallest wood, in order that there may be as few interstices as possible. The outermost circle is composed of brush-wood. When the pile measures from twenty to thirty feet in diameter, it is sufficiently large; a coating is now laid on of turf, the gruffy side next to the wood, and dry earth is heaped up round the bottom of the pile, and well rammed in order to prevent the admission of air. Three or four screens formed of large hurdles well stuffed with brushwood, are also prepared in order to protect the pile from the violence of the wind. All the preparations being now completed, the pile is kindled by dropping lighted chips down the hollow cylin- der in the center, which, in proportion as they are consumed, are supplied by others during the first three or four days, at the end of which period, the kindling of the pile is com- pleted. The top of the cylinder is now closed, and a row of holes, each about two inches in diameter, is pierced at the

The author of the Rural Economy of the midland coun- tries observes, that in making charcoal, men accustomed to the buhines cut and cord in wood in the winter, and burn during the summer season. The minute of the process of which are there, he says, these. The fite, or hearth, being determined upon, the fward is pared off, and the fuds laid on one side. The wood usually about the cord is then laid in a ring, somewhat wider than the intended hearth; beginning on the outer circumference of the ring with the smallest of the round-wood, laying the larger pieces of top- wood, and the cloven roots, or but-ends, towards the center. With these last, some of them nearly as large as bathel-
blocks, they begin to make their pile, leaving a kind of chimney in the middle, (a vertical aperture, from a foot to eighteen inches wide), and round this core of roots set up the top-wood, (which has previously been cut at the time of wording, in such a manner, that no forkedfeet or other awkward crookedfeet are left; or, if not cut in this manner, or cut improperly, it is prepared by the coilliers themselves, previous to laying it ready for setting), joining the blocks, or rather fitting them in, as close to each other as possible; placing the crown fire of the logs outward, forming the pile in the shape of an inverted bowl, nearly semiglobular. The pile being formed, it is covered over with fods, which are pointed, to keep in the heat the better, and the seams are filled up with fine pulverized mould. The chimney is now filled with short pieces of dry wood; near the top a live coal is put; over these layer more of dry pieces: and upon these a close cap of fods is placed; nevertheless, this one coal, not larger than the fist, and excluded from the open air, is sufficient to set the whole pile on fire. As the pieces in the chimney burn away, they are replaced by fresh ones: thus feeding the fire with fresh fuel. Paled hurdles are placed on the windward side of the heap, to prevent the fire from arling partially.

When the fire begins to work itself out, at the outward sides of the bottom of the pile, it is known that the coal is fully burnt, (or rather the wood sufficiently charred), which it will be, in a pile of ten cords, in fine dry weather, in seven or eight days. The fire, during the whole time, is carefully kept from breaking out, by throwing mould or ashes upon the weak parts; so that, though the fire paffes through every part of the wood, little or none of the matter of heat escapes. It is observble, he says, that notwithfanding the intense heat, no part seems to be consumed; not the bark only, but even the moss upon it, comes out as entire as when it went in: the only apparent change is, in its being rendered friable and of a black colour. Wood that is charred, feems, he says, to be only very highly dried. It shrinks considerably during the process of charring; but there is no visible derangement of parts. One of the smaller pieces, which is not broken in the drawing, appears as entire when it comes out as when it went into the pile. The brittleness after charring, however, shows that the texture of the wood is altered by the action of the fire. As soon as the fire is out of the coal, on the outside of the heap, the workmen begin to draw; which is done by running a peel over the coal and the hearth, raising up the coal in such a manner as to let the mould and ashes of the fods fall through between the pieces, upon the inward parts, still full of fire. If this makes its appearance in any particular spot, a peel full of ashes is immediately thrown against it. Having got sufficiently near to the fire, the coals raised by the peel are raked oft with long, wide-toothed, iron rakes; the teeth about a foot long, and flanging about six inches a-part; the handle and head of wood, except a plate of iron on the back, with which the small coal is gathered together. No sieve, nor any rake with finer teeth than the above, is used. The coal being light, it is readily brought to the surface of the ashes and dirt; and, when there, is easily collected with the back of the rake. The hide, thus drawn, being rounded up and secured with ashes, another, the cooleft part, is drawn in the fame manner. The drawing is an infernal businefs: the men working among fire and heat enough to suffocate Satan himself. Such pieces as ftil retain fire, after they are drawn, are quenched with water; which the workmen have in plenty flanging by them, in pails. If a large piece contain much fire, (which hides itself chiefly in the chinks of the large pieces), it is plunged bodily into the water. If the heap itself prove too refractory to be kept under by the ashes alone, a sufficient quantity of water is thrown upon it, to keep the fire under. Such large pieces as are fopificous are laid on one fide, in order that those which take fire may be the more readily discovered. A waggon attends to take away the coal as fast as it is drawn: for, if it take fire, or get wet in the hands of the burners, it is at their risk; and, while in the waggon, it is at the risk of the waggoner. Every particle burnt is so much entire fuel.

The quantity of ashes arising from a charcoal hearth, he says, is considerable. There were four cart loads taken up from two small hearths, and a load or two more full remained. The dust of charcoal has been found, by repeated experience, to be of great benefit to land, especially to fuch foids as are till and four. It is to be used in the fame manner as foot and wood-ffhes. See and .

And the author quoted above observes, that charcoal ashes are in good esteem in the midland districts as a manure, particularly for turpins, and for mung grafs land. They arife principally from the fods used in covering, but in part from the bits of coal which break off in taking it out of the ashes. There cannot be any doubt but that all the refe of charred materials that become reduced into a powdery flate during the process of drawing the coal, is highly beneficial, when applied on the more flill and heavy fort of land as a manure, as much advantage has been derived from it in the experience of different cultivators.

The microscope discovers a furprifing number of pores in charcoal: they are disposed in order, and traverse it lengthwise; so that there is no piece of charcoal, how long ever, but may be boxes glazed through. If a piece be broken pretty short, it may be seen through with a microscope. In a range the eighteenth part of an inch long, Dr. Hook reckoned one hundred and fifty pores; whence he concludes, that in a charcoal of an inch diameter, there are no less than five millions seven hundred and twenty-four thousand pores.

It is to this prodigious number of pores that the blackness of charcoal is owing: for the rays of light, striking on the charcoal, are received and absorbed in its pores, instead of being reflected; whence the body null of reflectivity appear black, blackness in a body being no more than a want of reflectivity.

Mathematical instrument makers, engravers, &c. find charcoal of great use to polifh their bradl and copper plates, after they have been rubbed clean with powdered pumice-stone. Mr. Boyle says, that the more curious burn it a second time, and quench it in a convenient fluid. Plates of horn are polifhable the fame way, and a glof may be afterwards given with triply.

Charcoal and foot-black are the two most durable and useful blacks of the painter, and the varnish-maker. Those of the former kind are used both as pigments and pencils; and charcoal crayons prepared from the willow are preferred on account of their finepuf. See concerning them Lewis’s Comemium Phil. Techn. p. 536. Charcoal tinges glasses in fusion yellow, reddish, &c. and by baking it assimilates yellow. See ibid. p. 628. See also his observations on the differences of different carbons, &c. and of the manner of distinguishing between the vegetable and animal. Ibid. p. 356. and fig.

Charcoal was anciently used to distinguish the bounds of estates and inheritances; as being suppod incorruptible, when let very deep within the ground. In effect, it preserves
serves itself so long, that there are many pieces found entire in the ancient tombs of the northern nations.

Mr. Dodart says, there is sometimes found charcoal made of corn, probably as old as the days of Cæsar: he adds, that it has kept so well, that the wheat may be still distinguished from the rye; which he looks on as a proof of its incorruptibility.

CHACON, in Geography, a town of Persia, in the province of Farsistan; 70 miles S.E. of Shiraz.

CHARD, an ancient town of Somersetshire, England; is situated in the southern part of the county, and consists of 246 houses, which are disposed in two streets interecting each other. This place was anciently denominated Cerde, which name, according to Mr. Collinson, it obtained from Cerde, a Saxon chief, who was repeatedly engaged against the Britons in this part of the island. Two or three springs rise in the immediate vicinity of the town, and this part of the country is so high, that the streams of water may be turned either north into the Bristol channel, or south into the British channel. Chard, in the reign of Edward I., was made a free borough, and sent members to parliament nine times: but it afterwards lost this privilege. A market was formerly kept here on Sundays, but the market-day is now Monday, and is well supplied with corn, and vast quantities of potatoes. Collinson's History of Somersetshire, 4to. vol. ii.

CHARDIN, Jean, in Biography, the son of a jeweller at Paris, of the Protestant persuasion, who distinguished himself as a traveller. He was born at Paris in 1643, and followed the profession of his father. At the age of 21, he set out on his travels, and remained for a considerable time in Persia. After his return in 1670, he printed at Paris an account of the coronation of Soliman III. King of Persia, together with the principal events that introduced his reign. In the year 1671 he again departed for the east, and having spent several years in Persia and the East Indies, he collected various particulars of curious information concerning the state of those countries, which he published after his return to Europe. In 1681 we find him in London, where he was knighted by Charles II. and appointed his majesty's jeweller. He married the daughter of a French refugee in London, and died in this city in the year 1733. A collection of his travels was published in 10 vols. 12mo. in 1711, and in 4 vols. 4to. in 1723, at Amsterdam. They were translated into English, German, and Flemish: and as they contain authentic and valuable information, with regard to the religion, manners, products, and commerce, &c. of the countries he visited, they obtained an extensive circulation. Among other curious particulars, he records several medical facts; and particularly an account of his own case, when he was attacked with a dangerous fever at Cambrai, and cured by the country physicians, who employed the repeated suction of cold water. This fact has suggested an useful hint to modern practitioners.

CHARDIN. See JARDIN.

CHARDONNE, in Geography, a town of France in the department of the Meuse, and district of Bar-le-Duc; 4 miles N. of it.

CHARDON, in Conchology. The French distinguish a species of ray by this name, the Raja fulvatica of Linnaeus, which see.

Charon pour monter a l'assaut, in Military Language. When the use of crampons (creepers or cram-irons) was not at all known, the sapper, to avoid slipping down in mounting the breach, or to the assault, took off one shoe. At present he makes use of a crampon, or shardon d'iron, which is fastened with a strap and buckle, or by means of a screw to the heel of the foot. But this last method does not seem to be sufficiently firm or solid, particularly for assaults of much danger.

CHARDONNET, points of iron, like those of darts, placed on the top of a grate, or the coping of a wall, to prevent any peril's getting over them.

CHARDONNERET, Chardonnet jaune, &c. in Ornithology, the name under which Buffon and other French authors describe Fringilla thalassina, which see. — Called by Pennant and Latham the American Goldfinch.

CHARDIS, in Gardening, is a term which is applied to different parts of different sorts of vegetables after they have undergone a sort of blanching, and are become tender by being tied up or covered in some way or other. Thus in the artichoke they are the leaves, which have been wrapped up during the autumn and winter with straw bands; the tops of the plants being only just left out. And in the white beet they are the dewy shoots of the tops of such plants, as have been covered with long dry dung during the winter season.

CHARE CULLOU, in Geography, a town of Asia, in the province of Cabul; 42 miles S.W. of Cabul.

CHARENTE, a river of France, which rises in the department of the Upper Vienne, passes by, or near to, Civray, Kuffee, Vertee, Maulle, Angoumois, Jarnac, Cognac, Saintes, Rochefort, &c. and discharges itself into the sea, about eight miles below Rochefort, opposite to the isle of Oleron.

CHARENTE, department of, a district or division of France; taking its name from the river Charente, which passes through it, and formed of Angoumois, and a part of Saintonge. It is bounded on the north by the departments of Upper Vienne, and the Two Sevres; on the east by those of Upper Vienne and Dordogne; on the south by those of Dordogne, and Lower Charente, which bounds it also on the west. Its length from N. E. to S. W. is about 56 miles, its average breadth 30 miles, its territorial extent about 6310000 hectares, or about 1,153,684 square acres, and its population about 321,577 persons. It is divided into five communal districts, which comprehend 28 cantons, and 455 communes. Its capital is Angoumois. This department, in the 11th year of the French era, contributed 2,978,926 francs, and was charged with an expense towards the support of administration, justice, and public instruction, of 279,019 francs, 66 cents.

CHARENTE, Lower, department of, is situated on the seacoast, north of the river Gironde, and takes its name from the river Charente, which crosses it near its center: it is composed of Annis and a part of Saintonge. It is bounded on the north by the departments of La Vendee, and the Two Sevres; on the east, by a part of that of the Two Sevres, and by that of Charente; on the south, by the departments of Dordogne and Gironde; and on the west by the ocean. Its length is somewhat more than 80 miles, and breadth unequal, being towards the south about 10 miles, towards the north about 20, and in some parts nearly 40. Its territorial extent is 7247½, or about 1,494,450 square acres, or 716,814 hectares: its population consists of about 402,105 persons: it is divided into ten communal districts, comprising 37 cantons, and 506 communes; its contributions amount to 4,105,94 francs, and it is charged with expenses to the administration, judiciary, and public instruction, amounting to 331,035 francs, 66 cents. The capital is Saintes.

CHARENTENAY, a town of France, in the department of the Yonne, 7 miles S. of Auxerre.

CHARENTON, Joseph Nicholas, in Biography, a French Jesuit, was born at Blois in 1663; and having spent 15 years as a missionary in Persia, settled at Paris, and pursued his studies till his death in 1755. Besides a translation of two devotional pieces of Thomas Kempis, he also published "The General History of Spain, by Father-Marmara, 3

translated
translated into French, with historical, geographical, and critical notes, medals, and maps," 7 vols. 4to. Paris 1725; to which he has added a valuable preface. This work is held in confiderable estimation.

Charenton, in Geography, a town of France, in the department of the Cher, and chief place of a canton, in the district of St. Amand; 5 miles E. of it. The place contains 8,148, and the canton 5,507 inhabitants: the territorial extent comprehends 255 kilometeres, and 11 communes.—Allo, a town of France in the department of the Seine, and chief place of a canton, in the district of Senois. The place contains 8,16, and the canton 7,773 inhabitants: the territorial extent includes 68 7/8, kilometeres, and 11 communes.

Châora, or Châerai, a town of the island of Cuba; 5 miles W. of Habana.

Châerai, or Châerai, a town of the kingdom of Naples, in the province of Calabria Ultra; 9 miles S. of Girace.—Allo, a river of Naples, which runs into the sea 10 miles S.S.E. of Girace.

Chares, in Biography, a famous Boturary, was a native of Lindus, and a disciple of Lyfippus; and his name is transferred to as the fabricator of the Rhodian Colossus of the Sun, which was a metal statue of an immense bulk. See Colossus.

Chares, in Ancient Geography, a river of Peloponnesus, in the Argolid, near which, according to Plutarch, was fought a severe battle between Aratus and the tyrant of Argos.

Charge, in Electricity, in a strict sense, denotes the accumulation of the electric matter on one surface of an electric, as a pane of glass, Lephyd phal. &c. whilst an equal quantity passes off from the opposite surface: or, more generally, electricity are said to be charged, when the equilibrium of the electric matter on the opposite surfaces is destroyed, by communicating one kind of electricity to one side, and the contrary kind to the opposite side; nor can the equilibrium be restored till a communication be made by means of conducting substances between the two opposite surfaces. And when this is done, the electric is said to be discharged.

The charge properly refers to one side, in contradistinction from the other; since the whole quantity in the electric is the fame before and after the operation of charging; and the operation of charging, unless what is gained on one side is lost by the other, by means of conducting rays applied to it, and communicating either with the earth, or with a sufficient number of non-electrics. In order to facilitate the communication of electricity to an electric plate, &c. the opposite surfaces are coated with some conducting substance, usually with tin-foil, within some distance from the edge; in consequence of which the electricity communicated to one part of the coating is readily diffused through all parts of the surface of the electric in contact with it; and a discharge is easily made by forming a communication with any conductor from one coating to the other. If the opposite coatings approach too near each other, the electric matter forces a passage from one surface to the other, before the charge is complete. And some kinds of glafs have the property of conducting the electricity over the surface, or of being permeable to it, so that they are altogether unfit for the operation of charging and discharging. Mr. Canton supposes that this quality of glafs is owing to its unvitriled parts. If, indeed, the charge is too high, and the glafs plate obtain too little attraction between them, the two opposite electricities forces a passage through the glass, and makes spontaneous dis charge, and the glafs becomes unfit for further use. See Conductors, Electrics, Lephyd Phal, &c.

Charge, in Military Affairs, has chiefly the three meanings, viz. an attack, an accuation, and a load or quantity of powder. The French make use of it technically in the first of these general meanings, in two different senses, using the terms charge precipitate, and charge a volante. The charge precipitate is given when the four times are precisely marked, as charges vos armes, un, deux, trois, quatre; and is chiefly applicable to the drill. The charge a volante is executed in the same manner as the charge precipitate with this difference only, that the soldiers do not wait for the specific words.

It was a custom with most of the ancients to charge with volafls, mixed with their martial music. The Galls, the Germans, the Parthians, and all the barbarians in general, observed this custom. The Turks have preferred it, and march towards the enemy with the most terrible howlings; they believe, and not without reason, that these howlings animate the soldier, divert his thoughts from the dangers which surround him, and strike a terror into the enemy. The Romans, and some of the Greeks, such as the Argians, the Mantinians, and the Macedonians, did the same; but they did it by rule; so that what was among the Barbarians, no better than a confused noise, excited by an impetuous motion, was among the others a matter of discipline. As soon as they came in sight of the enemy, they gave a general shout before they advanced nearer to him; and this shout continued, and it was from the manner in which it was given, the general formed his judgment of the disposition of his troops. The Samnites and the Etrurians had the same custom as the Romans. In an engagement between the latter and the Samnites, which terminated in the retreat of both, they kept looking at each other a long time, before either gave the shout; neither being willing to give it first. Craffus, as we are informed by Plutarch, after being harassed by the Parthians during a whole day, resolved to charge them with all his forces. He ordered the shout to be given by a signal from the trumpets, which soon after founded to charge; the troops then put themselves in motion; and ran up to the enemy, exciting each other from time to time with repeated shouts. The Romans at the same time drummed their jaulins, and drove against their lances, which still augmented the noise, and carried with it a very terrible effect. If the shout had been to be repulsed, they set up a new shout every time they returned to the charge, but it was never given by the party which attacked. The second line, when it did not charge with the first, kept its shout till its turn for setting off came; as did likewise the revete. Those troops gave louder and louder shouts, in proportion as they redoubled their efforts. Some of the Greeks did not shout in charging, but only sung a kind of air, which they called the hymn of battle." We still find traces of this custom among the Ar- nauts, inhabitants of Macedonia, at present subject to the Turks. These people, shout and bold like their ancestors, engage with a rapid pace: the chief sing, and their troops answer, while they press forward with an accelerated velocity. These hymns should be short, and composed of short verses, set to a lively air. Horace speaks in one of his odes of a poet called Tyrteus, who, in the wars of Mphina, anim- ated by his verses the Lacedemons to such a degree, that they thereby gained a complete victory. The Lacedem- onians, however, did not always follow this custom. In the time of Theucides, they marched in silence, to the sound of flutes, and by its cadence regulated their steps, the better to preserve their ranks. This, without doubt, suggested to the Romans the first idea of marching to time, which much contributed to the perfection of the military art. Although the step of the Romans was not only regulated, but animated by the sound of warlike instruments, they thought the shout necessary.
necessary at the time of their charging the enemy. As they charged running, the rapidity of their motion, joined to the noise of their own shouts, and of the trumpets and horns, inflamed them, and filled them with a sort of fury, which their leaders nevertheless knew how to moderate by the exactness of their discipline. Plut. in Crassum. Livy, 1. e. c. 21.

_Cha de mine, or Charge of a mine_, is the quantity of powder that is put into its chamber for the purpose of springing it, or making it explode.

_Chafe of powder, in Artillery Matters_, is the quantity of powder put into a piece of ordnance for faltling, saluting, proving, or rejoicing; or for propelling, projecting, or throwing from it shots, bullets, shells, grenades, &c.

Various charges of powder are best adapted to the different uses to which artillery is applied, as field service, battering in breach, garrison-service, firing en richefeet, &c. &c.

The charge of powder for proving guns is equal to the weight of the ball; but for service the charge is one-half, or one-third of the weight of the ball, or even less; and, indeed, in most cases of service, the quantity of powder is too great for the proposed execution.

In the British navy, the allowance for thirty-two pounders is but seven-sixteenths of the weight of the bullet. But a late author is of opinion, that if the powder in all ship cannon whatever was reduced to one-third weight of the ball, or even less, it would be a considerable advantage, not only by saving ammunition, but by keeping the guns cooler and quieter, and at the same time more effectually injuring the vessels of the enemy. With the present allowance of powder, the guns are heated, and their tackle and furniture strained, and this only to render the bullet less efficacious. For a bullet which can but just pass through a piece of timber, and loses almost all its motion thereby, has a much better chance of rending and fracturing it, than if it paffed through with a much greater velocity. See Robins’s Tracts, vol. i. p. 290, 291.

Professor Euler concludes, from certain calculations, by means of which he has formed a table, representing the charges for the greatest velocity, that those assigned by Mr. Robins are much too great. See True Principles of Gunery investigatd and explained, &c. 1777. p. 120. 260.

Mr. Robins observes, that the charge is not to be determined by the greatest velocity that may be produced, but that it should be such a quantity of powder as will produce the least velocity necessary for the purpose in view; and if the waffe be moderate, no field-piece should ever be loadd with more than \( \frac{3}{4} \), or at the utmost \( \frac{4}{5} \) of the weight of its bullet in powder; nor should the charge of any battering piece exceed \( \frac{1}{2} \) of the weight of its bullet. Tracts, &c. vol. i. p. 266, &c.

Different charges of powder, with the same weight of ball, produce different velocities in the ball, which are in the subduplicate ratio of the weights of powder: and when the weight of powder is the same, and the ball varied, the velocity produced is in the reciprocal subduplicate ratio of the weight of the ball: and this corresponds both to theory and practice. See Dr. Hutton’s paper on Gun-powder, in the Phil. Trans. for 1778, p. 50. and his Tracts, vol. i. p. 266. This, however, is on a supposition that the gun is of an indeterminate length; whereas, on account of the limited length of guns, some variation from this law occurs in practice, as well as in theory; in consequence of which it appears, that the velocity of the ball increases with the charge only to a certain point, which is peculiar to each gun, where the velocity is the greatest: and that, by farther increasing the charge, the velocity is gradually diminished, till the bore is quite full of powder. By an easy fluxionary process, it appears, that, calling the length of the bore of the gun, \( l \), the length of the charge, producing the greatest velocity, \( b \), ought to be \( \frac{2.718281828}{4.718281828} \) or about \( \frac{1}{2} \) of the length of the bore; where \( 2.718281828 \) is the number whose hyperbolic logarithm is 1. But for several reasons, says Dr. Hutton, in practice, the length of the charge, producing the greatest velocity, falls short of that above mentioned, and the more so as the gun is larger. From many experiments, he has found the length of the charge, producing the greatest velocity, in guns of various lengths of bore, from 15 to 40 calibres, as follows:

<table>
<thead>
<tr>
<th>Length of bore in calibres</th>
<th>Charge for greatest velocity</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
<td>( \frac{1}{5} )</td>
</tr>
<tr>
<td>20</td>
<td>( \frac{2}{5} )</td>
</tr>
<tr>
<td>30</td>
<td>( \frac{3}{5} )</td>
</tr>
<tr>
<td>40</td>
<td>( \frac{4}{5} )</td>
</tr>
</tbody>
</table>

See Cannon.

_Charge, in Gunrey_, implies not only the quantity of powder put into a piece of ordnance for firing it with, but also the shot, shells, grenades, &c. with which it is loaded. The success of a campaign, of a siege, or defence, often depends on the skilful and judicious application of artillery. But in a most every application of it, there is more powder than is either proper or necessary made use of; and our pieces of ordnance have in general by far too much windage.

_Charge, in Military Language_, denotes an attack either of infantry or of cavalry.

_Charge bayonet_, is a word of command given to infantry to rush on the enemy and attack them at the point of the bayonet.

_Charge, to found a_, is a signal given by found of trumpet for cavalry to commence the attack.

_Charge, in Military or Martial Law_, is the specific faction of any crime or offence, for which a commissioned officer, non-commissioned officer, or funder, is tried by a court-martial. In all charges of this nature, the time and place, or when and where the crime or offence was committed, must be set forth with accuracy and precision.

_Charge, in Heraldry_, is applied to any figures or things which occupy the field of a shield of arms, and are placed either throughout the whole superficies of the escutcheon, or elfe in some special part of the same, whether it be animal, vegetable, or any other matter. Anciently, arms were simple and plain, consisting of few figures, distinctly placed in the field: the heralds of those times, as we find by their writings, being of opinion, that the less that appeared in a coat, the more honourable it was. As coats of arms increased in number, a deviation from their original principles soon became unavoidable; and a conspicuous variation from each other was absolutely requisite, in order to their making a due armorial distinction between families. This was at first effected, either by a repetition, on the same escutcheon, of some one or other of those particular figures, which had before been used as charges, or by placing in the field two or more distinct bearings. This mode, however, was soon found to be inadequate to the purpose; for the continual multiplication of arms had exhausted all the variations that could be made with respect to the figures then used in heraldry, and required additional marks of distinction. Hence was introduced, from time to time, such a multitude of new charges, that there is scarcely anything, either natural or artificial, that either is not, or hath not been, represented in the coat-armour.

Charges peculiar to the art and usage of armory, as the cross, chief, pale, fesse, &c. are called _proper charges_; and frequently ordinaries.

Bloom restrains the term charges to those additions, or re-
wards of honours, frequently placed on escutcheons, as cantons, quarterings, gules, &c.

**Charge.** in Law, denotes the instructions given to the grand jury with respect to the articles of the inquiry, by the judge who presides on the bench.

**Charge,** also signifies a thing done that bindeth him who doth it; or that which is his to the performance of it; and **Discharge** is the removal of that charge. Lands may be charged in various ways; as, by grant of rent out of it, by statutes, judgments, conditions, warrantees, &c.

Lands in fee-simple may be charged in fee; and where a man freely disposes of the land itself, he may charge it by a rent, or statute. Lit. ecc. 648. Moar. Ca. 179. Dyer 10. If one charge land in tail, and land in fee-simple, and die, the land in fee only shall be chargeable. Bro. Ch. 9. Land intailed may be charged in fee, if the eiate-tail be cut off by recovery: if tenant in tail charge the land, and afterwards levy a fine or suffer a recovery of the lands, to his own use; this confirms the charge, and it shall continue. 1 Rep. 61. If one joint-tenant charge land, and afterwards release to his companions, and die, the survivor shall hold it charged; but if it had come to him by survivorship, it would be otherwise. 6 Rep. 76. 1 Shep. Abr. 325. He that hath a remainder, or reversion of land, may charge it; because of the possibility that the land will come into possession, and then the possession shall be charged. But where one leaves land for life, and grants the reversion or remainder over to A. B. who charges the land, and dies, and the tenant for life is heir to the fee; in this case he shall hold it discharged, for he had the possession by purchase, though he had the fee by demise. Bro. 11. 1 Rep. 62.

If a rent be falling out of a house, &c. and it falls down, the charge shall remain upon the foil. 9 E. IV. 20. But when the eiate is gone upon which the charge was grounded, then, generally, the charge is determined. Co. Litt. 340. And in all cases where any executory thing is created by deed, then, by consent of all the parties, it may be, by deed, defeated and discharged. 10 Rep. 29.

**Charge,** in the **Manage,** a fort of unguent, made of oil, honey, gels, turpentine, and sometimes of lees of wine, and other matters, applied externally to a horse, &c. for the cure of strains, bruises, and swellings.

**Charge,** a military term for a few detached paffages for trumpets, side-drums, and kettle-drums, performed when on the point of charging or attacking the enemy. "Sound the charge!" is the command given to the trumpets; "Beat the charge!" to the drums.

**Charge,** Fr. loaded, crowded with parts. This is said of *Mafia,* when the subordinate parts are to load and duty that the principal melody cannot be heard through them. See Caricata, which has the same meaning in Italian. Rameau and Gluck have been accosted of this redundancy of notes in their operas; the former from a systematic determination to give to every base its full harmony; the latter, perhaps, from a desire to place the French in their own way, by pursuing the method of Lulli and Rameau, but he likewise gratified his own taste in manifesting his ingenuity by giving to each part a different subject in the accompaniment, and also in giving way to the force and fire of his own genius. Piccini, in his early productions, put the instrumental performers in his operas to hard labour by giving them so many notes to execute, that he has been said at Naples, "to put the orchestra in flames." But this was in his comic operas, full of quarrels and improprieties. The Buona figliola maritata required more rehearsals than any opera that was ever performed in this country. But he did not crowd his score from pedantry or futility, but to produce effects by the instruments which it would have been ridiculous for even comic fingers to attempt. When Piccini gave way to his native fire and invention, it was for something ingeniously planned, and which when well executed, interested and delighted the audience.

**Charge,** or rather Other **Overcharge,** in Painting, is an exaggerated representation of any person, wherein the likeness is preferred, but at the same time ridiculed.

Few painters have the genius necessary to succeed in these charges: the method is, to select and heighten something already amiss in the face, whether by way of defect or redundancy; thus, A. G. if nature have given a man a nose a little larger than ordinary, the painter falls in with her, and makes the nose extravagantly long; or if the nose be naturally too short, in the painting it will be a mere lump; and thus of the other parts.

De Piles observes, that there are charged outlines which plague, because they are above the lowliness of ordinary nature, and carry with them an air of freedom, with an idea of a great talent, which deceives most painters, who call such excelle the grand manner. And although, to such persons, who have a true idea of correctness, simplicity, and elegance of nature, their excelles may seem superficial, as they only adulterate the truth, yet one cannot forbear to commend some things that are overcharged in great works, when the distance whence they are to be viewed softens them to the eye; or when they are used with such discretion as makes the character of truth more apparent. It ought, however, to be remarked, that, in the antique flates, which are allowed to be the rule of beauty, nothing appears charged, anything affected; nor is there any thing of that kind in the works of those who have always imitated them; as Raphael, Domenichino, Nicolò Poussin, and some others.

**Charge of lead,** is thirty six pigs. See Lead, Pig, &c.

**Charge, in Sea-Language,** is sometimes used for burden; thus, a *flip of charge* is such as draws much water, or swims deep in the sea, though sometimes an unwieldy ship, that will not bare nor steer, is called a *hip of charge.*

**CHARGED, in Heraldry.** A shield, carrying on it some figure or impresa, is said to be charged therewith.

So, also, when one bearing, or charge, has another figure added upon it, it is properly said to be charged. This was the ancient method of blazon; but it is now laid aside.

**charged cylinder,** in Gnomery, is that part of the gun which contains the powder and ball.

**CHARGEOLR,** a charge for great guns.

**CHARGERS,** are also either bandleaders, or little flanks that contain powder for charging and priming.

**Charger, in Military Language,** is likewise a term made use of to denominate a horse which an officer is mounted on in action.

**Charger en Canne, en Mortier, en Fusil, &c.** is to put into it the powder, the ball, the shell, the cartridge, &c.

**Charger pennenti, to charge the enemy; is to march towards the enemy directly in front, receiving his first fire, but retarding your own. You are thus fire to fight to advantage, as you have gained ground, a circumstance that seldom fails to ensure success to the assailants, and to discourage those who are attacked. This phrase is also employed to denote the prefling upon, pursuing an enemy, and the obstructing and shutting up his communications, ways, and pâillage.

**Charger l'epée à la main,** to charge sword in hand. Before the use of the bayonet, the soldier took his musket by its rest in his left hand, and charged the enemy with his sword.
sword in his right; which method of charging must have been very incommodeous, fatiguing, and difficult. M. le maréchal de Puypérou, in his art of war, derives this phrase from the time when the mullet was used without the bawomct.

CHARGES MILITAIRES; all employments, offices, or appointments by brevet, from a field-marshals of France down to the lowest subaltern officer, were called chargés militaires. But the office or appointment of intendant general of stores and provisions, and all those of a similar nature, constituting the fute of an army, and part of its staff, do not come under the denomination of charges militaires.

CHARGEUR, an artilleryman, whose duty or bunif con is to charge or load the cannon.

CHARGEY, in Geography, a town of France, in the department of the Upper Sûone, and district of Gray; 1 league N. of Gray.

CHARIDEMUS, in Ancilus Geography, Gato del Gato, a promontory of Spain, at the extremity of the coast of Britons.

CHARIENISMUS, in Rhotor: a figure wherein a taunting expression is softened by a jeer.

CHARILLOS, Los, in Geography, a town of South America, in Peru, and in the jurisdiction of Lima.

CHARIN, or Carin, Lewis, in Biography, an eminent scholar and physician, was born at Lucens in Switzerland, in the beginning of the 15th century. In the early part of his life, he was preceptor to part of the family of the Fuggers. In Basle, where he died in 1760, he was in considerable repute for his skill in the practice of medicine; but his name is recorded principally for having left by his well provision for foundling, and supporting for ever, three scholarchips in the university of that city. Elly, Dict. Hitt.

CHARINA, in Ancient Geography, a place of Asia, in Chambadene, to the east of mount Zagus in Media.

CHARINDAS, a river of Asia, in Media, according to Ptoleomy.

CHARIOPOLIS, a place situated towards Thrace and Macedonia.

CHARIOT. See Coach. Chariots were used both for military purposes, and in the Olympic games. War- chariots were very generally used by the ancient inhabitants of various nations. We learn from Homer, and from the Sacred Writings, that they were used in many parts of the eastern world for military purposes. Among the Medes and Persians they had chariots with two wheels, which were generally drawn by four horses abreast, with two men in each; one of dislinguished birth and colour who fought, and the other only for driving the chariot. Cyrus, however, thought this method very expensive, and of little service; because the equipment of 500 chariots required 1300 horses and 600 men, of whom only 300 fought; the other 500 who were persons of distinction, and capable of performing signal service, being occupied merely as charioteers or drivers. To remedy this inconvenience, he altered the form of the chariots, and doubled the number of fighting men that rode in them, by putting the drivers into a condition to fight, as well as the others. He caufed the wheels of the chariots to he made stronger, so that they might not be so easily broken; and their axle-trees to be made longer, that they might thus become more firm and steady. At each end of the axle-tree he caufed fcythes to be fastened that were three feet long, and placed horizontally; and he caufed others to be fixed under the fame axle-tree with their edges turned to the ground, that they might cut in pieces men or horses, or whatever the impetuouf violence of the chariots should over turn. It appeared from several passages in ancient authors, that, in after times, they armed the beam or pole to which the horses were fastened with pikes, having iron points which projected forward; the yokes of the horses had also pointed iron three cubic inches in length: and the hinder part of the chariot was armed with several rows of sharp knives to hinder any force encoun tering behind. Between the spokes of the wheels were placed javelins, and even the fellies of the wheels were furnished with fcythes, which tore every thing they met with to pieces. The driver of one of these carenges was called the charioteer; and his feat was a kind of little tower, made of very f lids wood, and raised breadth high. Sometimes the tower was large enough to hold several armed men, who threw flowers of darts and arrows at the enemy. Chariots of this kind were in use for many ages in all the oriental countries. They were regarded as the principal strength of the armies, as the most certain instruments of victory, and as an apparatus the best adapted to strike the enemy with combination and terror. In proportion, however, as the military art improved, the people found the ineconveniences attending them, and at length laid them aside. For, in order to obtain any advantage from them, it was necceary to fight in immense plains, where the ground was very even, and where there were no rivulets, grottoes, woods, or vineyars. Several methods were also contrived, in process of time, to render them absolutely useless. A ditch was cut in their course which was sufficient to stop their progress. Sometimes an able and experienced general, as Eumenes in the battle which Scipio fought with Hannibal, attacked the chariots with a detachment of slingers, archers, and spearmen, who, spreading themselves on all sides, poured such a flower of stones, arrows, and lances upon them, the whole army shouting at the same time so loud, that they terrifed the horses of the chariots, and occasioned such disorder among them, as often made them turn round, and run foul upon their own forces. At other times they rendered the chariots inefficace and inactive, only by marching over the space which separated the two armies, with an extraordinery swiftnes, and advancing suddenly upon the enemy. The strength and execution of the chariots depended on the length of their course; and this gave impetuoufity and rapidity to their motion, without which they were feeble and insignificant. It was after this manner that the Romans under Silla, at the battle of Chersones, defeated and put to flight the enemy's chariots by raising loud peals of laughter, as if they had been at the games of the circus, and by crying out that they should fend more. Diod. Sic. i. xvi. Q. Curtius i. iv. Xenoph. Cyprou. lib. vi. Livy, i xxxvii.

In the western world war-chariots were much used in ancient times. Accordingly we find that those who fought from chariots of this kind, constituted the most remarkable corps in the armies of the ancient Britons. This formidable corps seems to have been chiefly composed of persons of distinction, and the very flower of their youth. As this singular art of war was, at the period to which we now refer, almost peculiar to the ancient Britons, and they greatly excelled and delighted in it, we shall give a brief description of the different kinds and conffuctions of their war-chariots, and of their way of fighting from them. Before Britain was invaded by the Romans, if we consider the imperfect state of some of the most necessary and useful arts in the country, we could hardly expect to find in it wheel-carriages of any kind, much less chariots for battle, for pleasure, and for war, of various forms, and of elegant and curious workmanship. It appears, however, from the concouning testimonies of many writers of the most unquesionable credit, that there were such chariots in prodigious numbers, even in the most remote and uncultivated parts of this island in the ancient

3
Chariots. (Tact. vit. Agric. c. 12, 15. Cæs. de Bell. Gall. I. liv. c. 24, 25. l. v. c. 16, 19. Xiphilin. ex Dioge. Sever. Dio Cassius l. xii. Mela. l. iii. c. 5. Strabo. l. iv. p. 203. Diod. Sicul. l. v. c. 35, 52.) The wheel-carriages and war-chariots of the ancient Britons are mentioned by Greek and Roman authors under several different names, particularly the following, viz. Cassius, Cæsarius, Carrus, Carus, Carrus, Charis, CHariotus, Erida, and Rueda. The Britons seem to have been a kind of carriage used rather for travelling than for war. It comprised two or more persons who were called Con- cœrones, from their sitting together in the same machine. It probably derived its name from the British word Bin, head or chief; and these carriages might have obtained this appellation from the high rank of the persons who used them. The Pærium teems to have been a larger kind of carriage than the former, and is thought to have derived its name from having four wheels, as a fara in the British tongue, and pæra in the Zélée dialect of the Greek tongue, (which was spoken by the people of Marseille in Gaul) signifies four. The Carrus, or Currus, was the common cart or wagon, used by the ancient Britons in time of peace, for the purposes of agriculture and merchandise, and in time of war, for carrying their baggage, and wives and children, who commonly followed the armies of all the Celts nations. The Carus was a war-chariot, and a very terrible instrument of destruction: being armed with sharp swords and hooks for entangling and tearing all who were too happy as to come within its reach. This kind of chariot was made very light, and had few or no men in it besides the charioteer; being designed to drive with great force and rapidity, and to do execution chiefly with its hooks and feythes. The Eridaun and Rheda were also war-chariots, probably of a larger size, and more strongly made than the carus, and designed for accommodating a charioteer for driving it, and one or two warriors for fighting. The greatest number of the war-chariots of the ancient Britons were of this kind.

Two circumstances respecting these war-chariots are very remarkable; viz. their number and the admirable dexterity with which they were managed and conducted. Cæsar acquaints us (De Bell. Gall. l. v. c. 19) that after Catiline had dispersed all his other forces, he still retained no fewer than 4000 of these war-chariots about his person. The fame illustrious warrior and writer, who was an attentive observer of every thing of this kind, gives us (De Bell. Gall. l. iv. c. 23) the following account of the dexterity with which the Britons managed their war-chariots: "Their way of fighting with their chariots is this: first, they drive their chariots on all sides, and throw their darts; insomuch that by the very turn of their horses, and noise of the wheels, they often break the ranks of the enemy. When they have forced them way into the midst of the cavalry, they quit their chariots and fight on foot. In the mean while the drivers retire a little from the combat, and place themselves in such a manner as to favour the retreat of their countrymen, in case they should be overpowered by the enemy. Thus in action they perform the part both of nimble horsemen and of able infantry, and by continual exercise and ofte have arrived at such expertise, that in the most steep and difficult places, they can flop their horses upon full lefletch, turn them which way they please, run along the pole, roll on the harness, and throw themselves back into their chariots, with incredible dexterity." War-chariots had also been used by the people of Gaul in former times; but they seem to have laid them aside, for they were engaged with the Romans under Julius Cæsar; (Diod. Sic. l. v. p. 52. Liv. Hist. l. x. c. 28.) for that general makes no mention of them in any of his battles with the Gauls. It is probable, therefore, that in Cæsar's time chariot-fighting was known and prac-
ticed only in this island, and continued to be so until it was subdued by the Romans, and longer in those parts of it that were not conquered. When we consider what a singular and formidable appearance it prodigies a number of these war-chariots, driven with such rapidity, and managed with such dexterity, must have made in advancing to the charge, we need not be surprized that the Roman soldiers, though the bravest and most intrepid of mankind, were so much disconcerted, as we are told they were, by this way of fighting. Cæs. de Bell. Gall. l. v. c. 15, 16.

Chariots were used in the celebration of the Olympic games; and they were introduced into those games in the 27th Olympiad. Indeed it appears, from the story of Ozonamus and Pelops, that the chariot-race was known in Elis, even before the institution of the Olympic games; and therefore it seems to have been discontinued on account of the great scarcity of horses throughout all Greece, not only at the time of the revival of these games, but for many olympiads after, and also on account of the great expenditure that attended the breeding and managing of horses, and perhaps from the little estimnation in which the Olympic games were held at their re-institution. In process of time they acquired extraordinary celebrity, and the introduction of the chariot-race, as well as the race of running-horses, admitted in the 33d Olympiad, served to encourage those who excelled in the breeding and managing of horses, and thus to excite a emulation which tended to supply Greece with a stock of these animals, which were so much wanted. Accordingly we find that the rich and noble became competitors in the chariot-race; and Alcibiades in particular outshone not only all his competitors, but all who either before or since contended for the honour, in the number and magnificence of his chariots, and in the victories obtained by them: for he brought at once seven chariots into the course, and carried off at the same time, the first, second, and fourth prize, according to Thucydidcs (l. vi.), or third, according to Hecatores and Euripides; the half of whom composed an ode upon the conqueror, part of which is quoted by Plutarch. In this ode the poet compliments Alcaibades upon his having gained at once three prizes; a thing, says he, which no Greek had ever done before him. The Emperor, when they introduced the chariot-race into the Olympic games, were particularly desirous of inducing the wealthy to aspire after the Olympic olive, as they alone were able to support the great expense that necessarily attended the breeding, keeping, and managing of horses; and, therefore, they wished the conditions of obtaining the prize as easy as possible, by exempting them from the trouble and danger of driving their own chariots. No one, however, was prohibited from driving his own chariot; and the office of charioteer was anciently far from being dishonourable; besides, the skill of managing the horses, which were then used only in chariots, was reckoned among the accomplishments of a hero; but when chariots came to be laid aside in war, which seems to have happened soon after the heroic ages, the ufefulnes of, and consequently the reputation, of that art began to decline by degrees, whereas it soon came to be lodged in inferior hands. Although the mastery of the horses was procured the conqueror, and reposed the crown, the horses had a share of the honour, and were crowned with the congratulations and applause of the whole assembled. A crown was also given to the charioteer, to whose feet and to whose victory was always in a great measure owing. Skill and courage were indispensably necessary to both happy a contest, which the many startings, round the pulleys, and the number of

1 chariots
CHARIOT.

chariots which sometimes ran together, rendered extremely difficult and dangerous. Alecbandes, we have already said, brought at one time for his own share seven chariots, and he must have had competitors who disputed the crown with him. Sophocles speaks of 10, and Pindar of no less than 40 chariots, which contained at the same time. The number, therefore, of carriages must have embarrassed the competitors on these occasions; more especially when attention is given to the course itself. See HIPPODROME.

When we consider the form of the chariots, the attitude of the drivers, the rapidity of the motion, and the accidents that were likely to occur, arising from the nature of the course, and the number of chariots that frequently ran together, we have less occasion for wonder at their being thrown out of their chariots and put in danger of their lives, than at their maintaining their posts amid so many difficulties, and coming off with safety and success. These chariots, by some figures of them upon ancient medals, &c. seem to have been very low, open behind, but closed up before and on the sides, with a kind of parapet, which was sometimes enriched with various ornaments. There does not appear to have been any seat for the driver, who is therefore always represented leaning, and leaning forward to the horses. They had but two wheels, and consequently the fore part of them must have been supported by the horses, which inevitably rendered their motion very unequal, and made it so difficult for the charioteer to keep upon his legs, that nothing but a long course of practice could induce a man from falling in such a situation. Nero, manifestly folly equal to his vanity, exposed himself to the danger of this exercise. He entered the Hippodrome in a chariot drawn by ten horses, which he undertook to drive himself, and was thrown out of his chariot, to the great hazard of his life; and though he was put into it again, he found himself unable to finish the race, and defiited. Nevertheless, he was proclaimed conqueror, and honoured with the Olympic crown. In return for the compliment, at his departure, he presented the Hellanodices, and judges of the games, with the sum of 250,000 drachmas, or about 8000l. and all Greece with her liberty.

Upon the day of the race, the chariots, at a certain signal, marched out of the lodges in which they stood, and entering the course according to the order before settled by lot, were drawn up in a line; but whether abreast, or one behind another, is a question among the learned.

At the sound of a trumpet they all started, some times to the number of 40, started from the barrier, and all prattled with ardour and emulation towards the fame point or pillar. "

Soil thou not how, when from the goal they started, the youthful charioters with beating heart
Rush to the race, and panting fearlessly bear
Th' extremes of year's hope and chilling fear;
Stoop to the reins, and with all their force;
The flying chariot kindles in the course,
And now a low, and now aloft they fly,
As horse thro' air, and firm to touch the fly.
No stop, no stay; but clouds of sand arise
Spare'd and cast backward on the follower's eye:
The bindroot blows the foam upon the first:
Such is the love of praise, an honourable thing!"

Sophocles, in his tragedy of Elektra (v. 700, &c.) has given a noble description of a chariot race in all its forms, of which we have a translation by Mr. Web (sub infra).

Of chariots for the race, there were different kinds, subject to the same laws and customs, executing that the length of the race was diminished for some of them. The chariot first introduced into the Olympic Hippodrome, was the τίλιος ἀμφώ, or complete chariot, so named either because it was drawn by full-aged horses, or because it was drawn by four horses, which number seems to have made a complete set among the ancients. These four horses were all ranged abreast; the two middle ones only were harnessed to the chariot by the yoke; the two side horses were fastened either to the yoke or some other part of the chariot by their traces. Erichthonius, according to Virgil (Georg. i. iii.) was the first that drove with four horses, and, according to Manilius (i. i. 22.) he was for that invention honoured with a place among the heavenly bodies. Pagondes of Thebes had the honour of first obtaining the prize of this fort of chariot race in the Olympic games, as Erichthonius had in the games called Panathenaic. In the 936 Olympiad was added the race of the chariot called "Sy- nornis," which was drawn by a yoke, or one pair only of full-aged horses. The "Apenis" was a chariot, drawn by two mules, and was introduced into the Olympic games by an Afandruflus; but, as mules were held in abomination by the Eleans, and not allowed to be bred in their country, this race was abolished within a very few Olympiads after its first admission. Paufanias (l. v. c. 9.) informs us, that it was introduced in the 70th Olympiad, and abolished by proclamation in the 84th. In the 994 Olympiad was introduced the τελικος ἀμφώ, which was a chariot drawn by four colts, and the ξερις ἀμφώ, or chariot drawn by two colts, which was introduced, according to Paufanias (l. v. c. 8.) in the 120th Olympiad, and he says that Bellicethe, a Macedonian lady, was the first that carried off the crown in that race. Mr. Web has, by paffages from Pindar, alligned to each species of the chariots above described, the different lengths of the race appropriated to it. The whole course or round, όμος, being equal to four stadia, it is inferred, that the two pillars, viz. that from which the horses started, and that round which they turned, which divided the course into two equal lengths, were two stadia distant from each other; consequently the whole length of the race of the τελικος ἀμφώ, or chariot drawn by full-aged horses, consisting of 12 rounds, amounted to 48 stadia, or six Grecian miles; and that of the τελικος ἀμφώ, or charriot drawn by colts, consisting of eight rounds, to 32 stadia, or four Grecian miles; and a Grecian mile, according to Arbutnott's computation, was somewhat more than 800 paces, an English mile being equal to 1056. For farther particulars, see Web's "Dissertation on the Olympic Games" in his translation of the Odes of Pindar, vol. iii. sect. 13. See also an elaborate dissertation on the ancient chariot, both for war and the race, by Mr. Pownall, in Berenger's "Art of Horsemanship," vol. i. p. 271, &c.

CHARIOT a c a m p o, in Military Language, a car or carriage solely made use of for carrying and transporting the body of a piece of ordnance. Such chariots receive the gun-carriages, require fewer horses, and get more easily along bad roads in the field and on a campaign.

CHARIOTS d'un armee, the chariots or carriages of an army. These may, in a variety of circumstances, be rendered of the greatest assistance and advantage by an able general, who sees himself followed or almost harassed by superior forces. He can employ them for covering his march; supporting his columns; and for preventing his being harassed by the enemy. He may make use of them to cover his camps whilst he is hurryng on his encroachments. By flitting up the avenues to a single village, that an enemy wishes to take possession of, he may, by means of a proper disposition of them for that purpose, give a great effusion of blood.

When Alexander Farman, was leading an army of Spaniards rum?
CHARISTICA, Commodity, or Donation, a person to whom is given the enjoyment of the revenues of a monastery, hospital, or benefice.

The charistematics, among the Greeks, were a kind of donatives, or commodities, who enjoyed all the revenues of hospitals and monasteries, without giving an account the soil to any person. — The original of this abbe, referred to the Ionoeolites, particularly Constanine Cepouronovas, the armed enemy of the monks, whose monasteries he gave away to strangers.

In after-times, the emperors and patriars gave many to people of quality, not by way of gift, to reap any temporal advantage from them; but to repair, beautify, and patronize them. At length avarice crept in, and those in good condition were given, especially such as were rich; and at last they were all given away, rich and poor, those of men and of women; and that to laymen, and married men.

Coustelier, in his Ecclesiical Greece Monuments, gives us the form of these donations: they were granted for life, and sometimes for two lives. See Annex.

CHARISTUS, in Ancient Geography, a river of the Colchide territory, according to Pliny. By Ptolemy it is called Charisias, and by Strabo Charis. Arrian denominates it Charisias, and places between the Phasis and the Chobus, about 99 Cud from the one and the other. It is now named Tamain.

CHARIS, a town of Asia, placed by Appian in Parthia.

CHARISASAR, in Geography, a town of Asia, in the country of Candaia; 15 miles N. E. of Candaia.

CHARISIA, in Ancient Geography, a town of Peloponnesus in Arcadia. The ruins, according to Paufanias, lay between Scia and Tricoli.
nance of houses of correction, or of the poor. 35 Eliz. c. 7. § 27. Money given to put out apprentices, either by parishes or public charities, pays no duty. 8 Ann. c. 9. § 40.

CHARITY, one of the three grand theological virtues; confounding in the love of God and our neighbour. Charity is the habit or disposition of loving God with all our heart, and our neighbour as ourselves. It has two material objets, therefore, as the school expresses it; viz. God and our neighbour.

CHARITY is also used for the effect of a moral virtue, which consists in supplying the necessities of others, whether with money, counsel, affnance, or the like.

CHARITY, brief. See Brief.

CHARITY, brothers of. See Brothers.

CHARITY, schools of. See Agape.

Charity-schools, are schools erected and maintained in various parishes, by the voluntary contribution of the inhabitants, for teaching poor children to read, write, and other necessary parts of education.

In most charity-schools the children are likewise clothed, and put out to trades, services, &c. on the same charitable foundation.

Charity-schools have spread throughout most of the con-

 siderable towns of Great Britain and Ireland; and do ho-

 nour to the benevolent and patriotic spirit of the country, whilst they contribute, in a variety of ways, to the relief and advancement of individuals, and to the general prosperity and welfare of the nation.

In Scotland the establishment of parish schools has taught almost all the common people to read, and many of them to write and account. In England and Wales the establishment of charity-schools has had a similar effect, though not so universal, because the establishment has not been so universal; though liberal provision has been made, by private bequests and donations, for extending this public benefit. If in those little schools the books by which the children are taught to read were a little more instructive than they commonly are; and if, instead of a smattering of Latin, which the children of the common people are sometimes taught there, and which can scarcely ever be of use to them; they were instructed in the elementary parts of geometry and mechanics, the liter-

ary education of this class of people would perhaps be as complete as it can be. There is hardly a common trade which does not afford some opportunities of applying to it the principles of geometry and mechanics, which would not therefore gradually exercise and improve the common people in those principles, the necessary introduction to the most sublime as well as to the most useful sciences. The people might easily be led to encourage these most essential parts of education, by giving small premiums and little badges of distinction to the children of persons in the inferior ranks of life who excelled in them. And the public might impose upon almost the whole body of the people the necessity of acquiring these most essential parts of education, by obliging every man to undergo an examination, or probation in them before he could obtain the freedom in any corporation, or be allowed to set up any trade either in a village or town corporate.

It was in this manner, by facilitating the acquisition of their military and gymnasical exercises, by encouraging it, and even by imposing upon the whole body of the people the necessity of learning those exercises, the Greek and Roman republics maintained the martial spirit of their respective citizens. They facilitated the acquisition of those exercises, by appointing a certain place for learning and practising them, and by granting to certain masters the privilege of teaching in that place. Those masters do not app.

peal to have had either salaries or exclusive privileges of any kind. Their rewards consist in what they got from their scholars; and a citizen who had learnt his exercises in the public gymnasium, had no legal advantage over one who had learnt them privately, provided the latter had learnt them equally well. These republics encouraged the acquisition of such exercises, by bellowing little premiums and badges of distinction upon those who excelled in them. See more on this subject, on the importance and utility of the instruction of the poor, in Smith's Wealth of Nations, vol. iii. See also School and Chart. School.

In London we had formerly a charitable corporation for the relief of the industrious poor, erected under queen Anne; for enabling indigent manufacturers and traders to take up money at common and liberal interest; there being a fund of 30,000l. raised for that end.

The money was lent to the industrious poor at 6l. per cent. interest, on pawns and pledges, to prevent their falling into the hands of pawn-brokers: and hence the society derived its appellation: but they likewise took 6l. per cent. for the charge of officers, warehousemen, &c. In the 7th year of king Geo. II. the chief officers of this corporation, by conveyance of the principal directors, abandoned and broke, and defrauded the public proprietors of great sums; and for relief of the sufferers, as to part of their losses, several statutes were enacted. See flats. 5 Geo II. c. 31, c. 32. 7 Geo II. c. 11.

Charity, order of. There are several religious orders which bear this title: one instituted by St. John de Dieu, for the affilliation of the sick: this institute was approved of in 1350, by Leo X. and confirmed by Paul V. in 1617. The religious of this order apply themselves wholly to the service of the diseased. See Brothers of Charity.

Charity of the Holy Virgin, is a religious order established in the diocese of Challons, by Guy lord Joinville, &c. towards the close of the 13th century, approved under the rule of St. Augustine, by the popes Boniface VIII. and Clement VI.

In each parish of Paris, there was a society of women, who applied themselves to find out and relieve the wants of the poor of the parish; and on this account called, Dames de la Charité, and Seurs de la Charité.

CHARKE, Richard, in Biography, was a dancing-master, an actor, a man of humour, and a performer on the violin, with a strong hand. He was leader of the band at Drury-lane theatre. As a composer, he only distinguished himself by being supposed the first who produced that species of musical buffoonery called a Medley Overture, wildly made up of threads and patches of well-known vulgar tunes. But we believe that this very easy species of pleasantrays was first suggested by Dr. Pepusch, in the overture to the Beggar's Opera, brought on the stage in 1728, and Charke's medley overture bears date 1735. There is a flang hornpipe under Charke's name, which used to be a favourite among the tars. We believe him to have been a facetious fellow, gifted with a turn for b. g. humour, of which, and of his tricks and stories, Dr. Arne, in moments of jocularity, used to give specimens.

He was married to Charlotte, the youngest daughter of Colley Cibber, a female not without talents as an actress; but of such an eccentric and indecorous character, that the memory of her life, though written and softened by bringing her own biographer, could never be read by persons of her own sex, not wholly abandoned. For many years of her life she never appeared on or off the stage in a female dress. Mademoiselle d'Eon's habiliments during many years, were a real disguise and concealment; but Mrs. Charke's.
favored person being well known, her dress was no disguise, but a publication of her impudence.

As long as Charles was the leader of Drury-lane band, his concerto on the violin was the lure in the second nuftle, two or three times a week; which many lovers of music had to go into the theatre to hear, who never laid it to the curtain was drawn up, before which time their money was returned, if demanded. His debts obliged him to leave his car spofa; and, returning to Jamaica, he there, in a short time, and in the prime of life, ended his days. Though this couple was allowed to possess talents of various kinds, there was nothing in which they manifested more ingenuity than in plaguing each other.

CHARKINA, in Geography, a fortress of Russian Tartary, on the Don, in the government of Caucasus; 25 miles N.E. of Astrachan.

CHARKING, or CHARKING, the burning of wood to make charcoal.

CHARKLIIQUEU, in Geography, a town of Atlas Turkey, chiefly inhabited by tanners, who manufacture the beautiful morocco leather. The caravans stop here two or three days. The town is situated between Erzerum and Tous.

CHARKOV, or KHARKOV, a government of Russia, formerly comprised in the government of Ukraine Slavonia, and containing 15 districts. It is bounded on the north by Kurisk, on the east by Voronetz, on the south by Catherinofnaff, or Ekatherinofnaff, and on the west by Tcheremishof and Kief; about 185 miles in length, and from 40 to 80 in breadth.

CHARKOV, or KHARKOV, the capital of the above government, seated on the Uda, which falls into the Donetz, and forming one of the 15 districts of the government of the same name. It contains 10 churches, 2 convents, and several public seminaries; 352 miles S. of Moscow, and 640 S.S.E. of Petersburg. N. lat. 57° 21'. E. long. 37° 34'.

CHARKS, pit-coal charred, or charred. See Coal.

CHARLATAN, or CHARLETAN, an empiric or quack, who retails his medicines on a public stage, and draws the people about him with his bawleries, feats of activity, &c.

The word, according to Calpurne, comes from the Italian Ce
tato, or Ce
ta, a town near Spoleto, in Italy, where these impostors are said to have first rilen. Menage derives it from circulato, and that from circulatorius, of circulator, a quack.

CHARLEMAGNE, or CHARLES I., in Biography, king of France, and emperor of the Holy Roman Empire, born in the year 742. By the death of his father Pepin the Short, in 768, and at the express desire of the dying monarch, Charles, in conjunction with his younger brother Carloman, succeeded to the throne of France. At first they appeared to rule the empire with equal and undivided authority; the partition of power, however, soon threatened michtiefs similar to those that had been experienced under the earlier sovereigns of France; but the death of Carloman, in 771, at the moment when he was meditating an open rupture with his brother, ensured the public tranquillity. Charles, thus rendered sole monarch of the Franks, was endowed by nature with all those qualities which could conciliate the affections of his subjects, by whom, it is said, he was equally beloved and revered. Unlike his father, he was tall in stature; his air was courteous and dignified; his body robust, and finely formed; his eye keen and penetrating, and his countenance open and prepossessing.

Having become, by the death of his brother, sovereign of a mighty empire, and freed from every thing that might shackle his genius, or fet bounds to his ambition, his first object was to infuse a military spirit into the nation; he re-stablished the ancient assemblies of the field of Mars, and, beflowing on them the title of parliaments, delegated to them a portion of his authority, by constituting them members of the legislation. In retorting to this measure of State policy, he felt no apprehension for his own security: the force of his genius and the greatness of his talents placed him beyond the dread of any rival he endeavoured, therefore, to infuse into all ranks of his subjects a thirst for military glory. By these means Charles was enabled to double the extent of his empire. The whole of Gaul, Italy, the vast territory which extends from the Rhone to the Vit
us, and to the Baltic, together with a great part of Spain, fell under his powerful dominion.

Previously to the death of Carloman, Charles had divorced his wife and married Bertha, daughter to Didier, king of the Lombards; this prince, however, granting an open protection to the widow and children of Carloman, with a view, no doubt, of possessing a part of his dominions, excited the jealousy of Charles, who obtained a second divorce. Didier, enraged at the humiliation, fought an alliance with pope Adrian, but having failed in the attempt, he attacked the papal territory, and endeavoured to freeze on the person of the pope. Adrian solicited the succour of Charles, who instantly crossed the mountains, entered Italy, defeated his adversary, and thus put an end to the kingdom of the Lombards in Italy, which had lasted 2(?) years. Charles immediately took possession of the vacant throne, and was declared by the pope king of Italy, and patron of Rome. In his first visit to the capital, the newly acknowledged sovereign was received with all the honours which had formerly been paid to the representative of the emperor; and these honours obtained new decorations from the gratitude of pope Adrian. No sooner was he informed of the approach of the monarch, than he dispatched the principal people of Rome to meet him, with the banner, about thirty miles from the city. At the distance of one mile, the Flaminian way was lined with the schools, or national communities of Greeks, Lombards, Saxons, &c.: the Roman youth under arms, and the children of a more tender age, with palms and olive branches in their hands, chanting the praises of their great deliverer. At the sight of the cortege and other holy emblems, he dismounted his horse, led the procession of his emissaries to the Vatican, and, as he ascended the stairs, devoutly kissed each step of the threshold of the apostle's. The pope was waiting for him at the head of his clergy in the portico: they embraced as friends and equals, but in their march to the altar, the king assumed the right hand of the pope; nor was he content with a van fllew of respect. In the twenty-six years that elapsed between the conquest of Lombardy and his imperial coronation, Rome, which had been delivered by his sword, was subject, as his own, to the sceptre of Charles.

Previously to these successes in Italy, Charles had been called on to exhibit his military talents in a contest with the Saxons, who were inimical to the government and religion of the Franks. They rejected with contempt the servile obligations of tribute, and in succedaneous engagements displayed a ferociousness of courage which could only be repelled by the superior skill and intrepidity of the troops of Charles. A decisive victory, after various less important defeats, obtained over them at Onsaburgh, by which they lost their capital, their temple and their god Irmenulf, obliged their leaders to sue for peace, and to accept of such terms as were imposed on them by the conqueror.

Sarcely had Charles returned, from receiving the oaths of allegiance and other marks of homage from his new subjects in Lombardy, where he had caused himself to be crowned, when another revolt of the Saxons recalled him to their country. They had already assumed a formidable app
The fate of Tassilion did not crush the designs of his con-
d federates, the Huns and the emperor of the East; but their
enterprises served only to augment the glory of Charles, and
his commanding genius triumphed over the Greeks in the
plains of Italy. The latter renounced for ever the fortunes of
Adalgive, the son of Didier; and with the young prince,
the hope also of restoring the kingdom of the Lombards:
but the former still continued their dilatory incursions, and
provoked the victorious king of the Franks to retaliate
the calamities which they had inflicted on Bavaria. At the head
of a formidable army, he invaded the country of the Huns,
forced their intercessions in an obstinate engagement, and
penetrated as far as Raal on the Danube.

The defections of the Moorish chiefs invited Charles to
the conquest of the islands of Majorca and Minorca; but
the satisfaction which he felt from this expedition was more
than balanced by the tumults which prevailed at Rome, on
account of the election of Leo III. as successor to Adrian.
The cause of Leo against his rival was zealously espoused by
Charles, who sympathized in all the sufferings of the pontiff,
and, what was of more importance to his situation, rendered
him every assistance that his case required.

Charles had been accustomed to pass annually from the
Pyrenees into Germany, and thence to Italy. At the latter
end of the year 799, as he was approaching Rome in one of
these journeys, pope Leo dispatched a messenger to meet him,
with the keys of St. Peter, and the standard of the city; thus
rendering him every respect, religious and civil, of which he
was capable. On the festival of Christmas, which was then
the first day of the new year, Charles appeared in the church
of St. Peter; and to gratify the vanity of Rome, he had ex-
changed the simple drefs of his country for the habitat of
a pontiff. After the celebration of mass, at which the king
had devoutly assisted, the pope suddenly placed a precious
crown on his head, and the dome of the church resounded
with the acclamations of the people. "Long life and
victory to Charles, the most pious Augustus, crowned by
God the great and pacific emperor of the Romans." The
pope immediately consecrated the monarch, and conducting
him to a throne, paid him those marks of respect which had
then been claimed by the ancient Cæsars. Charles from this
time undoubtedly, in the name of Charlemagne, the appel-
ation of Magnus, the Great. In a familiar conversation with
his secretary and son-in-law, Erkuban, he protected his igno-
rance of the intentions of the pontiff: if, however, he did
not seek or even expect the honours devoted upon him,
he nevertheless was ambitious in maintaining them, and
insisted on being recognized as emperor of the West, by all
those princes with whom he had any correspondence.

Among the ambassadors who came to congratulate the
good fortune of the emperor, were those of the caliph
Harun-Al-Raschid, who ceded to him the sepulchre and the
sacred places of the city of Jerusalem. But a still more
interesting negotiation was intrusted to the munificence of Irene,
the empress of the East, who, having rendered her relud-
tious to her subjects, by the murder of her own son, endeavoured
to secure the protection of Charlemagne, by a proposal of
marriage. The emperor entertained the idea, and dispatched
ambassadors to the Byzantine court to arrange the necessary
preliminaries to so important a treaty. In the mean time she
was dethroned by Nicephorus, who ascended the throne, and
exiled the late empress. The new sovereign, anxious to
preserve to himself the title of emperor of the East, contented
to acknowledge in Charlemagne the dignity of Augustus,
and to settle with him the mutual boundaries of their empires
in Italy.

From this period the talents of Charlemagne were em-
ployed
ployed in repelling the encroachments of the Danes and the Normans under their leader Godfrey, who menaced with their fleets and armies the tranquillity of the west. Peace was at length established from motives of mutual convenience, and it was agreed that the subjects of Charlemagne were on no account to violate the Norman territory, and Godfrey promised to respect the dominions of the emperor of the West.

The empire of Charlemagne in Europe began to rival that of ancient Rome, and a new era is dated from his reformation of the western empire. This prince was at the same time sovereign in France, Spain, Italy, Germany, and Hungary. The Roman province of Gaul had been transformed into the name and monarchy of France, but its limits were contracted by the independence of the Bretons, and the revolt of Aquitaine. Charlemagne purified and confined the Bretons on the shores of the ocean: after a long contest, the rebellion of the dukes of Aquitain was punished by the forfeiture of their province, their liberty, and lives. The Saracens had been expelled from France by the grandfather and father of Charlemagne, but they ill polishecl the greatest part of Spain, from the rock of Gibraltar to the Pyrenees: these he dispossessed of their powers, and made himself master of the infant kingdoms of Navarre and Arragon. As king of the Lombards, and patron of Rome, he reigned over the greatest part of Italy. Charlemagne was the first who united Germany under the same sceptre; and by his conquest of the Avars, he obtained possession of Hungary, Transylvania, Ubria, Croatia, and Dalmatia, with the exception of the maritime towns, which his moderation left under the real or nominal sovereignty of the Greeks.

In the year 806 Charlemagne assembled the princes and nobles of his empire at Thionville, in whose presence he made the final distribution of his kingdoms. In 810 his son Pepin died, whole natural son, Bernard, then only an infant, Charlemagne caused to be proclaimed king of Italy; and in the course of only a very few months the unhappy monarch witnessed the death of his eldest son, Charles. The increasing weight of public cares suggested to him the necessity of associating his surviving son, Louis, to the imperial purple; the ceremony was performed at Aix-la-Chapelle, and the aged sovereign inculcated on the mind of his son, by every motive which long experience could suggest, the maxim by which he had advanced the grandeur and happiness of his subjects. Early in the following year his increased and rapidly increasing fortunes warned him of his approaching dissolution. He was attacked in the middle of January by a fever, which was followed by a pleurisy: the prelude of affliction he bore with firmness and resignation. On the 27th a fainting fit announced a speedy termination to his life, and on the following day this great prince expired, in the 47th year of his reign, and the 72d of his age; carrying with him the sincere regret of all his subjects. He died at Aix-la-Chapelle, and was buried in the church of Notre Dame in that city, which he had himself built.

From this sketch of the career of Charlemagne, it is not difficult to appreciate the various merits of his character. As a warrior and politician, he has been rarely excelled. He was indefatigable in his attention to public business, and in the performance of all the duties attaching to his high station. Considering the times in which he flourished, he did much to improve the condition of his subjects: he suppressed mendicity; he composed a series of exceptional edicts for the correction of abuses, and the reformation of manners, among the people at large; and he attended to the economy of his own immediate household. He established a fixed and invaluable price of corn, in the hope of enabling the meanest of his subjects to supply their wants. These, and various other regulations, though not characteristic of the true principles of legislation, did honour to his attempts to mollerate the state of society. It is true, that among other improvements which he contemplated for the good of his country, he formed the vast project of a canal which should unite the Danube and the Rhine, and thus establish a free communication between the ocean and the Euxine; he bestowed himfelf the friend of learning and learned men, and made such efforts to promote the interest of literature, as entitle him to great praise. He invited to his court learned men from all nations, with a view, no doubt, of inspiring his people with a thirst for knowledge; among these was our country-man, Alcuin, a clergyman celebrated for his literary attainments, who received the highest tokens of respect and honour from the emperor, and who even became his companion and preceptor in the sciences. He founded schools in various parts of his dominions, and instituted within the boundaries of the count a kind of learned society, every member of which was called by some celebrated name of antiquity. He collected all the ancient songs relative to the history of his country, and to all things connected with the advancement of his mind, that he might possess on all the knowledge which he afforded to learning, and the marked respect and reverence which he shewed to men of literary talents, reflect the highest lustre on the character of the emperor of the West. He was highly esteemed for his regard to religion, and to the clergy; but the authority with which he invested his aspirers body laid the foundation of their tyrannical claims over his left enlightened and less able prelates. As a man, Charlemagne was simple in his dress, easy in his manners, and temperate in his mode of living. His morals are stained with the charge of inconstancy, to which the number of his wives and concubines bear infallible evidence. As a statesman, his conduct has been arraigned by the measures of dividing his kingdom, during his own life, among his sons. His many wars prove that he little valued the lives of his subjects, in a cause in which his ambition was concerned. His humanity flanks impeached by the extirpation of his nephews, the sons of Carolman, and by the cruelties frequently exercised upon the valiant Saxons, whose attachment to freedom and their country merited a very different kind of treatment. These are blemishes in the character of Charlemagne which time cannot obliterate; but, after every allowance for his frailties, it must be admitted, that the title of Great, which has been blessed with his name for more than ten centuries, has seldom been awarded upon fairer claims: and it is to be regretted that in the lapse of a thousand years so few have been ambitious of attaining to that degree of celebrity which attaches to the virtues of Charles the Great. Gibbon, Hume, Du Frebnoy, Modern Univ. Hist.

Charlemagne has merited a place in medical history, by his good taste in preferring the secta fomna of the Romans to the Gallic plan-chant. We have from contemporary writers, the relation of a serious quarrel between Gallic and Roman physicians, so early as the time of Pope Adrian and Charlemagne, concerning superiority of taste and knowledge; a quarrel which has been since often renewed, but which, had it been left to the reference of unprejudiced and intelligent judges of other nations, would have been soon determined without ever coming to a second trial or combat.
The French, however, after every defeat, revive with still greater clamour, their pretensions to a titular sovereignty, without having the least claim to it, either from inheritance, conquest, or former possession.

The story of this ancient musical quarrel is somewhat long, but the necessity of inferring it here at full length seems the greater, as it not only shews the antiquity of the ridiculous rivalry and hatred still subsisting between French and Italian musicians, but is a convincing proof that the English were not the only people obliged to the Romans for the method of chanting the Psalms, and singing their hymns in their cathedral service. See biographical article Bene, veraneable. Multuple millionaries were sent, at this time, from Rome to other parts of Europe, to instruct the converts to the gospel in the church service; which accounts for that similarity and almost identity of melody, observable in the sacred music of all the countries of Europe at the time of the reformation, till which period, little other music was known or practiced than of that of the church.

'The most pious king Charles having returned to celebrate Easter at Rome, with the apostolic lord, a great quarrel ensued, during the festival, between the Roman and Gallic fingers. The French pretended to sing better, and more agreeably, than the Italians: and the Italians, on the contrary, regarding themselves as more learned in ecclesiastical music, which they had been taught by St. Gregory, accused their competitors of corrupting, disfiguring, and spoiling the true chant. The dispute being brought before our sovereign lord the king, the French, thinking themselves sure of his countenance and support, insulted the Roman fingers; who, on their part, emboldened by superior knowledge, and comparing the musical abilities of their great master, St. Gregory, with the ignorance and vulgarity of their rivals, treated them as fools and barbarians. As their altercation was not likely to come to a speedy issue, the most pious king Charles asked his chantors, which they thought to be the purest and best water, which that was drawn from the fountain, at the fountain-head, or that which, after being mixed with turbid and muddy rivulets, was found at a great distance from the original spring? They cried out, unanimously, that all water must be pure at its source; upon which, our lord the king said, Mount ye then up to the pure fountain of St. Gregory, whose chant ye have manifestly corrupted. After this, our lord the king applied to pope Adrian for finger-masters, to correct the Gallican chant; and the pope appointed for that purpose Theodore and Benedict, two chantors of great learning and abilities, who had been instructed by the disciples of St. Gregory himself: he likewise granted to him Antiphonaria, or choral books of that faint, which he had written himself in Roman notes. Our lord, the king, at his return to France, sent one of the fingers, granted to him by the pope, to Metz, and the other to Soissons; commanding all the finger-masters of his kingdom to correct their Antiphonaria, and to conform in all respects to the Roman manner of performing the church service. Thus were the French Antiphonaria corrected, which had before been vitiated, interpolated, and abridged, at the pleasure of every choir-man; and all the chantors of France learned from the Romans that chant which they now call the French chant. But as for the beats, trills, shakes, and accents of the Italians, the French were never able to execute or express them; nor, for want of sufficient flexibility in the organ of voice, were they capable of imitating in these graces, any thing but the tremendous and guttural noise of goats. [Chevaillier, et sur une table de caprice, are explications applied in France and Italy to such fingers as have a bad shake. John Diaconus, in his Life of St. Gregory, gives in

queer and barbarous Latin, scarcely to be translated, a curious account of the vocal abilities of the ancient Germans and French, who, in attempting to sing the Gregorian chant, were wholly unable to express its sweetness; "injuring it by barbarous changes," suggested, says he, either by their natural ferocity or inconstancy of disposition. Their figures were gigantic, and when they sung, it was rather thunder than musical tones. Their rude throats, instead of the inflections of pleasing melody, formed such rough sounds, as resembled the noise of a cart jolting down a pair of flairs." Quae牙齿 per gradus confusae fanamia, rigidus vocis jactant. Vide S. Greg. cap. 2.] The principal school of singing was established at Metz, and in the same proportion as the Roman chant exceeded that of this city, the fingers of Metz surpassed all those of other French schools. The Roman chantors likewise instructed those of France in the art of organizing and our sovereign lord Charles having, besides, brought with him into France matters in grammar and arithmetic, ordered these arts to be cultivated throughout his dominions; for, before the reign of the said lord the king, the liberal arts were neglected in France." [Et reverius est Res plenissim Carolus, &c. Vide Annal. & Hill. Francor. ab an. 706, ad an. 950. Scriptores Coctanenses. Impr. Francoforti 1594. Sub vita Caroli magne.]

The abbé Velley, who, in his Hist. de France, tom. i. p. 53, gives the same account of the establishment of the Roman chant in France, adds, that "the monach was likewise desirous of introducing into his churches the liturgy, or mass, as used at Rome; but here he met with greater difficulties. The French clergy, jealous of their ancient usages, opposed, in a body, this measure, as an innovation; the royal authority, however, at length prevailed." After such an account of Charlemagne, it is hardly possible to read the following passage without amazement. "Charles confirmed the Infrumens with his hand, that is to say, by making his mark; for it is to be observed, that this prince, of the most learned men of his age, at that time could not write!" According to Mezeray, the addition to the signature of this prince, at the bottom of each treaty, must have been erred; for he there says, "I have signed it with the pommet of my sword, and promise to maintain it with the point."

In Charlemagne's time, liions, mimes, and actors of farces, were very numerous in France: and, according to the abbé Vertot (Mem. de Litt.), this prince made a collection of ancient Gallic songs; and Eginhard, his historian, obhiges that these songs, which were chiefly military, like those of the Germans, constituted the principal part of the History of France, and comprised the most heroic actions of her kings.

In the history of France there have been eight other monarchs of the name of Charles, besides Charlemagne; they, however, are not sufficiently renowned to induce us to give separate articles of each. The reign of the second Charles, whom we shall call Charles II, was diabolous to the country as well as unfortunate to the sovereign. France, under this sovereign, was perpetually subject to hostile invasions and internal commotions. He was the grandson of Charlemagne, and was poisoned by his physician after a long reign of 38 years.—The character of Charles III, who wholly surrendered himself to his minister Hagonon, a man of talents, but of infamous principles, is sufficiently expressed by his surname the Singe. He died in 926, after a reign of more than 30 years. In the reign of Charles IV, who was son to Philip the Fair, a fierce war raged between France and England, which ended in the cession of the province of Guienne to England: he died in 1328, after a short reign of six years.—Charles V. is celebrated
brated for his love of learning; he made a large collection of books, and died in 1580—Charles VI. began his adminis-
tration with such effectual reforms for the alleviation of the public burdens, that he became extremely popular, and ob-
tained the appellation of Well-beloved. His reign was very
unfortunate, owing to the bad management of his ministers, and the contentions of the dukes of Orleans and Burgundy. Henry V. of England taking advantage of the internal com-
motions of France invaded and conquered a great part of it.
This prince was subject to fits of insanity; but his intentions
were always good; he was beloved by his people for his
many excellent qualities; on account of his misfortunes he
was the object of commiseration, and the regret of many
accompanied him to the grave, in 1422, after a reign of 42
years.—Charles VII. called the Victorious, regained his king-
dom which had been lost in the former reign. By his ac-
tivity the English were driven from all their possessions, ex-
cept Calais. Under this prince the militia was disestablished, and
a standing army was first instituted, for the maintenance of
which the perpetual taille was granted. From this reign
France dates several of those institutions which always tend
to make a nation great. This sovereign died in 1461.—
Charles VIII. ascended the throne in 1483, at the age of
13. In 1494, contrary to the representations of his coun-
fellors, he set out with a determination to conquer Naples,
though he was scantily supplied with troops and money.
His progress was unsuccessful. In six weeks he traversed Italy,
and entered Naples in triumph, and in a fortnight after he
was master nearly of the whole kingdom. He died in 1498;
—Charles IX. ascended the throne in the year 1563, when
he was only ten years old. To his mother Catherine de Medici was
given the regency, a trust that the abdication in a
most shamefaced manner. To her is to be imputed that in-
dible disgrace to the reign of Charles IX. the infamous massacre
of Paris on St. Bartholomew's day, 1572. It has been said,
that at the approach of the fatal hour, the king showed signs
of compunction for the orders that he had been induced to
give, but upon being reproached by the savage Catherine for
his want of decision, he exclaimed, "Well then, let not one
be left to be upheld me with breach of faith." He betrayed
no symptoms of pity during the execrable deed; but even fired
with his own hand on the miserable wretches endeavouring
to escape across the river. His dilatation before, and his
cruelty during this horrible transection, fix his character, and
rank him among the Nero's and Domitians of the world.
He died in May 1574, a prey to all the horrors of remorse,
having probably never enjoyed an hour's peace after the massacre
he had functioned.
CHARLEMONT, in Geography, a town of the Nether-
lands, in the county of Namur, ceded to France by the treaty of
Nimeguen. It was built by Charles V. in 1555, not far
from Givet, on a mountain near the Meuse. It is small but well
fortified; 8 leagues S.W. of Namur, and 7 N.E. of Rocroy.
CHARLEMONT, a village of the county of Armagh, Ire-
land, on the banks of the Blackwater, where there is a fort,
which, though now neglected, has a governor regularly ap-
pointed. It was built by Lord Montjoy, lord deputy at the
latter end of queen Elizabeth's reign, to guard the passage
over the Blackwater, and was called from his christian
name. It was purrised by the Irish under Sir Phelim
O'Neih, in 1641, and the governor and garrison put to death,
after which it remained for some years in the possession of the
Irish. Previous to the Union it was a borrough, but has now
lost its privilege. Of late years it has been remarkable only for
having given title to that reprehensible and popular nobleman,
who was general of the volunteers of Ireland in 1689, and
who was first president of the Royal Irish Academy, which
was in great measure established by his exertions. Charle-
ment is 65 miles N. by W. from Dublin. Ware's Antiqui-
ites.
CHARLEMONT, a township of America, in Hampshire
county, Massachusetts; 16 miles W. of Deerfield, containing
665 inhabitants.
CHARLEMAINE, a town of France, in the department
of the Jemeppe, and principal place of a district, is situa-
ted on the confines of Hanaut, on the north side of the river
Sambre, in a place formerly called Charroy. It was for-
tified and betrayed in 1678, assuming the name of Char-
les-les-Fontaines; in honour of Charles II. king of Spain. In 1793, it
changed its name to Charles-sur-Sambre. At the peace of
Aix-la-Chapelle, in 1648, it was given to France; by the
treaty of Nimeguen it was ceded to Spain; and in 1693
taken by the French. In 1697 it was returned to Spain;
by the peace of Utrecht it was surrendered to the States-Gen-
eral; in 1716 it was granted to the emperor by the bar-
rier treaty; and in 1746 again surrendered to France. It
Carries on a considerable trade in iron-works and foundery.
The place contains 1744, and the two cantons 24,27 inhabit-
ants. The territorial extent comprehends 850 kilometres
and 66 communes. N. lat. 50° 20'. E. long. 4° 10'.
CHARLES I. third son to James the Sixth of
Scotland, and First of Great Britain, by Anne of Den-
mark, was born in Scotland, in the year 1600, and suc-
ceded his brother Prince Henry as Prince of Wales, in
1616. In 1617 the king of England, anxious to con-
clude the dignity of his son in marriage, warmly pressed
an alliance with the court of Madrid. Philip, equally zeale-
ous for the establishment of his filler, listened to his over-
tures with pleasure. Besides the portion of fifty hundred
thousand pounds, he offered with the infant the restitution
of the palatinate to Frederic. When all measures were
agreed to between both parties, and nothing was wanting
but the dispensation from Rome, this connexion, so honour-
able and advantageous to England, was broken by a roman-
tic enterprize, originally conceived with a design of hasten-
ing the proposed alliance. The sole recommendation of
personal accomplishments had raised George Villiers, from
an obscure lot in life to the rank and title of duke of Buck-
ham. His influence over James was unbounded. To in-
gratiate himself equally with the son, he proposed to the
prince of Wales to break through the forms of royalty,
and, travelling to Madrid in disguise, to introduce himself
the infant as an ardent and devoted lover. This proposal
was in unison with the spirit of gallantry natural to Charles's
time of life. The son was obliged to interest, and the fa-
vourite to reproach, before a reluctant consent could be ex-
torted from James; when the prince of Wales, accompanied
by Buckingham, quitted London privately, and crossed
over to Calais. They even ventured on their journey to visit
the French court in disguise, where the princess Henrietta,
father to Lewis, made a serious and permanent impression
on the heart of the young prince. Though Charles and the
duke were received at Madrid with every mark of respect
and attention, yet the volatile manners and diffusive pleasures
of the latter but ill accorded with the gravity and dignity of the
Spanish court. His pride was peculiarly offensive to
Olivarez; and their rising hatred had already shewn itself in
mutual expressions of contempt. when Buckingham, influ-
enced by caprice or difficulty, determined to return without
accomplishing the object of his journey. He hastily obtained
the acquiescence of Charles. A plausible pretence was fur-
nished by the delay of the dispensation from Rome; but his
real motive was more openly proclaimed in his last conver-
sation with Olivarez. He declared it was his intention to
promote every measure which could cement the friendship of England and Spain; but he added with his usual haughtiness, "with regard to you, Sir, in particular, you must expect from me all possible enmity and opposition." The count replied, with becoming dignity, that he accepted of what was proffered. The first part of the duke's speech, however, was not dictated by the same frankness as the last; and immediately on his arrival in England he prevailed on the king and prince, first to suspend, and afterwards to break off the negotiation with Spain.

As it would be impossible to enter in detail on so extended a field of narration, on which whole libraries have been written, as to late a period of our history would open to our view, and as a mere table of contents of this and the succeeding reign would swell our pages without adding to the information of our readers, who must all be supposed to have heard of ship-money, long parliaments, civil wars, commonwealths, and martyrs, we have resorted on the course of giving a character, rather than an history of our own Charles's. We have given at some length the account of the circumstances attending the rupture of the Spanish, and consequent accomplishment of the French marriage, because it was on this occasion that the first Charles, ill-fated and misguided, appeared upon the public scene; and by observing his conduct and character on this occasion, we can be at no loss to account for the progress of his career through life, and the consequences in which he was involved at the close. Among all the varying representations, to which party and prejudice have given occasion, what is generally considered as a bad natural character has rarely, if ever, been attributed to him. But a habit of confidence in the advice of persons, whose judgment was no better, and their defiles infinitely worse than his own, began in the instance which we have just produced, and continued to the end, gaining strength from time, from increasing difficulties, from obstinacy inflamed by opposition, from the necessity of the approaching crisis and the mad excess to which some principles were carried by the contrary party. Charles acceded to the throne with the impetuous Buckingham for his minister; and this very circumstance impressed on the palate of the nation a foretaste of fulpicion and distrust. Felton's knife removed the minister, but the natural inclination of doing as he liked had been impressed on Charles, and he was at no loss to find seeming friends, who were willing to exchange the hazardous office of telling him the truth, for the few less dangerous task of carrying his views into execution, in spite of popular opinion and the rising force of parliamentary power. Strafford was a minister of great abilities, whose vanity might have curbed the spirit of resistance, but had been left deeply rooted. Even he, in his tum, might have been borne in civil affairs, had not Land's supercilious and intolerance been fo extremely offensive in the management of the ecclesiastical jurisdiction. Yet, had Charles been faithful to his colleagues, he might have saved himself. But the fate of his victims appeared to be the watch-word for an attack upon his own person, through the medium of a civil war, in which it was difficult for an innocent individual to avoid ranging himself under the equally detectable banners of the conspirators or the round-heads. The events of the war had little connection with the personal character of the king. But his conduct whether in prison, on trial, or at the scaffold, was firm, unaffected, and decent; so that those, whose views of his political and religious case are the farthest from granting him the palm of martyrdom, may creditably feel a sentiment of commiseration, not unaliend to the sympathy excited by those who have really been martyrs. His private virtues were unquestionable, and even the repulsive feature of his character as a man rather added dignity to his deportment as a monarch. He was respectable both in literature, polities, and the arts. He was deficient neither of abilities for the functions of government, of regularity in the conduct of life, nor of amicable temper in his personal and domestic relations. Had he relied more on himself and less on others, he might possibly have prospered better; though it is much to be questioned whether personal character could at all have interfered with the trial of the great question, agitated between the contending parties. If we regard him as an author, the "Eikon Bathe" would secure to its author a very considerable reputation among the writers of the age: but it must still be strongly doubted whether king Charles had any claim to the credit of the performance. But we cannot perhaps illustrate the character of Charles more fully and fairly, than by transcribing the summary of his virtues and vices, poured into the opposite delineations of Hume and Mr. Macaulay.

The character of this prince (observes Mr. Hume), as that of most men, if not of all men, was mixed; but his virtues predominated extraordinarily above his vices, or, more properly speaking, his imperfections: for scarce any of his faults rose to that pitch as to merit the appellation of vices. To consider him in the most favourable light, it may be affirmed that his dignity was free from pride, his humanity from weakness, his bravery from rashness, his temperance from avarice, all these virtues in him maintained their proper bounds, and merited unfettered praise. To speak the most hardly of him, we may affirm that many of his good qualities were attended with some latent frailty, which, though seemingly incomparable, was able, when seconded by the extreme malevolence of his fortune, to disappoint them of all their influence: his beneficent disposition was clouted by a manner not very gracious; his virtue was tinctured with superciliousness; his good fense was disfigured by a deference to persons of a capacity inferior to his own; and his moderate temper exempted him not from hasty and precipitate resolutions. He defers the epithet of a good, rather than of a great man; and was more fitted to rule in a regular established government, than either to give way to the encroachments of a popular assembly, or, finally to subdue his pretenisons. He wanted supplencns and dexterity sufficient for the first measure: he was not endowed with the vigour requisite for the second. Had he been born an absolute prince, his humanity and good sense had rendered his reign happy and his memory precious: had the limitations on prerogative been in his time quite fixed and certain, his integrity had made him regard, as sacred, the boundaries of the constitution. Unhappily, his fate threw him into a period when the precedents of many former reigns favoured strongly of arbitrary power, and the genius of the people ran violently towards liberty. And if his political prudence was not sufficient to extricate him from fo perilous a situation, he may be excused: since, even after the event, when it is commonly easy to correct all errors, one is at a loss to determine what conduct, in his circumstances, could have maintained the authority of the crown, and preserved the peace of the nation. Exposed without revenue, without arms, to the assault of furious, implacable, and bigotted factions, it was never permitted him, but with the most fatal consequences, to commit the smallest mistake; a condition too rigorous to be imposed on the greatest human capacity.

Some historians have rashly questioned the good faith of this prince: but for this reproach, the most malignant scrutiny of his conduct, which, in every circumstance, is now thoroughly
Radical, a moderate and pliant will, and the magnificence of his profligacy and declarations; we shall allow, that probability and honour ought justly to be numbered among his most shining qualities. In every treaty, those concessions which he thought he could not in conscience maintain, he never could, by any motive or persuasion, be induced to make. And though some violations of the petition of right may perhaps be imputed to him; there are more to be ascribed to the necessity of his situation, and to the lofty ideas of royal prerogatives, which, from established precedents, he had imbued, than to any failure in the integrity of his principles.

This prince was of a comely presence; of a sweet, but melancholy aspect. His face was regular, handsome, and well proportioned; his body strong, healthy, and justly proportioned; and being of a middle stature, he was capable of enduring the greatest fatigue. He excelled in horsemanship and other exercises; and he polished all the exterior, as well as many of the essential qualities, which form an accomplished prince.

Historians (fairs M. s. Macaulay) are called upon to scrutinize with exactness his principles, conduct, and character; since, from the false colourings which by designing men have been thrown on these, and the rancour with which his opponents have been falsely aspersed, have been deduced consequences destructive to the security and welfare of man, and highly injurious to the reputation of patriot citizens.

In the character of Charles, as represented by his panegyrists, we find the qualities of temperance, chastity, regularity, piety, equity, humanity, dignity, condescension, and equanimity; none have gone so far as to allow him integrity; and many writers, who condemn his political principles, give him the title of a moral man. In the comparison of this representation with Charles's conduct, accurately and fully described, it is discernible that vices of the worst tendency, when shaded by a formal and pliable carriage, when concordant to the interests of a faction and the prejudices of the vulgar, assume the appearance of, and are imposed on the credulous world as virtues of the first rank. Passion for power was Charles's predominant vice; idolatry to his regal prerogatives his governing principle. The interests of his crown legitimated every measure, and sanctified in his eye the widest deviation from moral rule. His religion was to this a secondary and subordinate affection; the prelates of the church of England paid him an impious flattery: they inculcated a slavish dependence on the regal authority; the corruptions in their ecclesiastical discipline fostered superstition; superstition secured their influence over the people; and on these grounds, and to these ends, they kept an interest in the king's heart, which continued to the last period of his life. If Charles had an higher estimation of the faith in which he had been educated than of popery, it was because the principles of popery acknowledged a superior allegiance to their spiritual than their temporal prince; but regarding that superstition to be most favourable to the interests of monarchy, he preferred it to the religion of any differing sect, and publicly avowed his will, that there never had been a schism in the church. Neither gratitude, clemency, humanity, equity, nor gentleness, have place in the fair part of Charles's character. Of the virtues of temperance, fortitude, and personal bravery, he was undeniably possessed. His manners partook of the diffipation, and his conversation of the indiscretion, of a court. His chastity has been called in question by an author of the highest repute; and were it allowed, it was tainted by an excess of uxoriousness, which gave it the properties and the consequences of vice. The want of integrity is manifest in every part of his conduct; which, whether the corruption of his judgment or heart, left him no fair opportunities of reinstatement in the throne, and was the vice for which, above all others, he paid the tribute of his life. His intellectual powers were naturally good, and so improved by a continued exercise, that, though in the beginning of his reign he spoke with difficulty and hesitation, towards the close of his life he discovered in his writings a purity of language and dignity of style; in his debates, eloquence, and quickness of conception. The high opinion in which he entertained of regal dignity occasioned him to observe a flatness and impertinencies of manner, which, to the rational and intelligent, was unamiable and offensive; by the weak and the formal, it was mistaken for dignity. In the exercise of horsemanship he excelled; had a good taste, and even skill in several of the polite arts; but, though a proficient in some branches of literature, was no encourager of useful learning, and only patronized adepts in the largest, the divine right and utility of kings and bishops. His understanding in this point was so depraved by the prejudices of his education, the flattery of praises, and the affections of his heart, that he would never endure conversation which tended to inculcate the principles of equal rights in men; and, notwithstanding the particularity of his situation, enforced his attention to doctrines of this kind, he went out of the world with the same fond prejudices with which he had been fostered in his nursery, and enjouled in the zenith of his power.

Charles was of a middle stature; his body strong, healthy, and justly proportioned; his face was regular, handsome, and well proportioned; and his aspect melancholy, yet not unpleasing. His surviving issue were three sons and three daughters. He was executed in the 45th year of his age, and buried, by the appointment of the Parliament, at Windsor, decently, yet without pomp. The duke of Richmond, the marquis of Hertford, the earls of Southampton and Lindsay, at their express desire, were permitted to pay the last duty to their master, but were denied (by colonel Whitchurch) the honor of the burial service, according to the book of Common-Prayer.

Lord Lyttelton, speaking of Charles I., makes the following observations. He had many better qualifications than his father, but as wrong a judgment, and greater obliquity. He carried his affection for the clergy, and abhorrence of the puritans to an excess of bigotry and rage. He agreed so ill with his parliaments, that he soon grew weary of them, and refused to be troubled with no more; none were called for twelve years together, and all that time he governed as de facto as the bishop of Peruia. The laws were either openly infringed or explained in the manner he directed: he levied money on his subjects against privileges expressly confirmed by himself. In short, his passion for power might have been fully gratified, if his more prevailing one to bigotry had not engaged him in a few evils undertaking, of forcing the same form of worship upon his subjects in Scotland, as he had declared himself to warmly for in England. It is safer to attack men in their civil rights, than their religious opinions: the Scots, who had acquiesced under tyranny, took up arms against perfection. Their insurrection made it necessary to call a parliament; it met, but was instantly dissolved by the intemperate folly of the court. All hopes of better measures were put an end to by this last provocation. The Scots marched into England, and were received by the English, not as enemies, but as brothers and allies. The king, unable to oppose them,
them, was compelled to ask the aid of another parliament. A parliament met, exasperated with the oppressions of fifteen years: the principal members were men of the greatest capacity, courage, and virtue, firmly united among themselves, and whom the court could neither corrupt nor intimidate. They resolved to make use of the opportunity, to redress their grievances, and secure their liberty; the king granted every thing that was necessary to either of those ends, except such securities as might have been turned against himself; but what, perhaps, was really concession, had the appearance of constraint, and therefore gained neither gratitude nor confidence: the nation could no longer trust the king; or, if it might, particular men could not; and the support of those particular men was become a national concern: they had exposed themselves by serving the public; the public therefore judged that it was bound in justice to defend them. Nor indeed was it possible, when the work of reformation was begun, after so long a denial of justice, to keep a people fore with the remembrance of injuries received and satisfaction refused, within the bounds of a proper moderation. Such a liberty is much easier in speculation than it ever was in practice. Thus, partly for the safety of their leaders, and partly from a jealousy of his intentions too justly conceived, the parliament drew the sword against the king: but the sword, when drawn, was no longer theirs; it was quickly turned against them by those to whose hands they trusted it: the loneleft and woful of both parties were outwitted and overpowered by villains; the king perished, and the constitution perished with him.

This prince, during the life of his father, had received instructions in music from Coperario, an Englishman whose name was Cooper; but who having been in Italy, wished to pass for a native of that country. According to Playford, Charles, while prince of Wales, had made a considerable progress under this master on the violin da Gamba; and when he ascended the throne, he not only discovered a great affection for music in general, but manifested a particular attention and partiality to compositions for the church. [Playford (Pref. to his Introd.) speaking of the musical skill of our princes of the house of Tudor, says, "Nor was his late majesty Charles I. behind any of his predecessors in the love and promotion of this science, especially in the service of Almighty God, and with much zeal he would hear reverently performed, and often appointed, the service and anthems himself, especially that charming service composed by Dr. William Child being of (from) his knowledge in music, a competent judge therein; and would play his part exactly well on the bato-viol, especially of those incomparable fancies of Mr. Coperario to the organ." ] At his private concerts he is said to have condescended to honour with his notice several of his musical servants, who had the good fortune to be frequently in his presence; and to gratify them in a way the most flattering and agreeable to every artist of great talents, with smiles and approbation, when either their productions or performance afforded him pleasure. And, indeed, whatever political crimes may be laid to the charge of this prince, he was certainly a most liberal and gracious master to his domestics, and possessed a singular power of attaching them to his person by kindnees and consideration, still more than by royal bounty and munificence.

In the beginning of his reign, Nicolò Laniere, (a real Italian) was appointed master of the king's band; (see Lis- zier) and in Rymer's Fædera, (tom. xviii. p. 228.) is recorded a grant to him and the rest of the royal band for their several amusements and yearly pensions. The name, however, of such musicians as were in a more peculiar manner honoured with this prince's notice, afterwards, do not appear in the grant; as it was observed, that his majesty was particularly delighted with the choral compositions of Dr. Child; the performance on the lute of Dr. Wilton; and the music of William and Henry Lawes, which was introduced in the masques that were exhibited at court.

The productions for the church during this reign, though superior in excellence to those of any other species, yet if we except those of Dr. Giles and Elwes Bevin, who more properly belong to the reign of king James, are too few in number, that the augmentation they make to our former stock lies in a very small compass.

This prince, however, his judgment or that of his councillors may have erred, appears to have been poissified of an invariable good taste in all the fine arts; a quality which in less morose and turbulent times would have induced him to the most enlightened part of the nation: but now his patronage of poetry, painting, architecture, and music, was ranked among the deadly sins, and his passion for the works of the bel arts in the kingdom, profane, pagan, popish, idolatrous, dark, and damnable. But however gloomy flate-reformers may extirpate this prince, it would be ungrateful in the lovers and professors of any of the fine arts, to lose all reverence for the patron of Ben Jonson, Rubens, Vandyke, Inigo Jones, and Dr. Child.

William and Henry Lawes were early established in the favour of this monarch, and indeed in that of the whole nation, to a degree for which their musical productions do not clearly enable us to account. William, taking up arms early in the grand rebellion in defence of his royal patron, was killed by an accidental shot at the siege of Chester in 1645. Henry was always a loyalist, though he long enjoyed the favour and friendship of Milton; but this was previous to the political life of our great poet. Henry Lawes set Comus to music in 1634, and Survived not only the rebellion, but the interregnum and restoration, extending his life to the year 1662.

Though the early part of Charles the First's reign was favourable to the fine arts, particularly to music of the dramatic kind in the frequent and splendid masques that were performed at court and in the mansions of the principal nobility; yet from the breaking out of the civil war in 1642, nothing but hope and confusion reigned. In 1643 the cathedral service was totally suppressed, which gave a grievous wound to sacred music, not only checking its cultivation, but annihilating as much as possible the means of restoring it, by destroying all the church books, as entirely a whole of the Romish communion had been at the time of the reformation.

During such a period, what leisure or disposition could there be for the culture of art which had no connexion with the reigning interests and passions of men? The fine arts have been truly and emphatically called the arts of peace, and the celebrated periods in which they made the most considerable strides towards perfection, were calm and tranquil. Musicians, who previous to those unhappy times had employment either in the chapels royal, cathedrals, or public exhibitions in the capital, were forced to seek about the country, and fledge an asylum in the lodges of private patrons, whose mansions, and abilities to protect them, did not have been very precarious. And, indeed, if they could have been rendered permanent, they would not so much have contributed to the advancement of the art, as the pride, effort, and emulation of working for a severe and fastidious public would have done. Many a man of creative genius and gigantic abilities, has been managed by idle fa-
vanity, and self-applause in a private station, where safe from rivals, and certain of the approbation of a small, and perhaps ignorant and partial circle of friends, he has degenerated into billefines, conceit, and affectation.

Charles II., king of Great Britain, was the son of Charles I. and Henrietta-Maria of France, born in 1630. At the time of his father's execution, he was a refugee at the Hague. During the time of the commonwealth, he was a wanderer and a dependant, and was one of the various characters which presented themselves at the memorable treaty of the Pyrenees. His importunate necessities reduced him to implore the assiduity of Mazarine and Don Lewis de Haro. The former refused so much as to see him. The latter received him with a generosity and ancient hospitality, which was ever the characteristic of his nation, and relieved his personal wants by the present of a considerable sum of money. But the powers of the continent were wisely cautious of interfering in the internal constitution of England, and paused before they enlivened themselves for the support of royalty and its hazardous claims. Even after the death of Cromwell, the commonwealth, thoughickly, yet survived, and there was at least a possibility that it might recover under an able regimen and superintendent. Indeed, the constitution of parliament appears to have been much better a speculation than that of royalty; and Charles, whose condition, like that of a patient in the crisis of a fever, never seemed so desperate as at the precise period of a change to convalescence, that the court of Madrid ordered the royal exiles to quit the territories of Spain. This was undoubtedly a servile attempt to conciliate the friendship of a party, which must have been hitherto in a country the principles of whose government were so diametrically opposite to those of republicanism. But practical statesmen, who are not infected with a spirit of political quixotism, will applaud and justify the prudence which dictated an unpalatable acquiescence, however unfortunate it might have been in point of time and preface. It happened, in point of fact, that a very short time intervened between the order in question and the restoration of the exiled monarch. England, wearied out with contending factions, impatiently waited for the re-establishment of her ancient constitution, and looked to that event as to the consummation of her happiness. The wishes of the people were seconded by the loyal declarations of general Monk, who marched from Scotland at the head of an attached, brave, and well-disciplined army. Charles was invited once more to grace the palace of his ancestors with his presence. So strong was the torrent of returning allegiance, that he took possession of his kingdom without the smallest effusion of blood. It was to be wished that he had been duly impressed with the circumstances, far more favourable than he could reasonably expect, under which he retrieved the situation to which he was defined by birth, but from which fortune had displaced him. Conciliation and prudence might have carried both the king and the people to a height of external prosperity and domestic happiness, beyond what Great Britain had ever experienced. But he erred most grievously in remembering on the throne the difficulties he had experienced in adversity, whether at home or abroad. He forgot the generosity of Don Lewis de Haro, but he remembered his banishment from the dominions of Spain; and the subsequent alliance he concluded with Portugal, may, in a great measure, be ascribed to his resentment at the neglect of the court of Madrid. It was not indeed till a later period of his reign, that he avowed and exhibited the diftrust he had cherished against the Presbyterian and the friends of liberty; but when it did appear, it hurried him into excesses of tyranny, incongruent with the gay and social tendencies of his natural temperament. But even these virtues, little as they weigh in the estimate of a public character, were converted into bane and poison by the licentiousness into which they suffered a monarch of dissipate temper to fall, who nearly drew into his own vortex whatever remained of purity and propriety, from times which, though too precie and formal, wore on the side of safety in sacrificing the waywardness of will and pleasure to rigid, though sometimes mistaken duty. Dissipation was attended by expense, as its necessary and natural consequence; and exorbitant expense involved the king and government in pecuniary embarrassments, disgraceful negociations, and the venal barter of national honour and vital interests. The sale of Dunkirk was unpopular; and the exploit of the Dutch at Chatham disgraceful. A minister was able to far to enliven the heart of Charles, as to make him lose sight of his own honour and his people's welfare in a blind attachment to the politics and alliance of France. Arbitrary measures, and demonstrations of an inclination towards Poppery, began to be more unequivocally manifested; and though the firm renonciations of the English parliament occasionally compelled a fulmination of the intercourse with Lewis, and a more moderate and tempering policy at home, it seemed from the complexity of the times, that there was no alternative between an arbitrary government and a renewal of civil holilities. There was, however, notwithstanding all his obliquities, a better feeling about Charles II. which prevented him from driving things to extremity. It is even supposed, that, tired with combating the free spirit of his parliament, he became uneasy under the plan of goverment he had adopted, and meant to pursue a different system; and if so, the house of Stuart had the most serious reasons to lament that his life was not further prolonged. But Charles the second of England, so celebrated in the annals of politics, wit, gallantry, and profligacy, was cut off from the opportunity of reformation and repentance, if ever such a scheme had seriously taken possession of his thoughts. He died at variance with his parliament, and deified by his people. Had the misfortunes of his father served to restrain the arbitrary principles and dissolute conduct of Charles, or the rash zeal and blind obedience of James for the church of Rome, the revolution would never have taken place; but the laws of the country were violated, and the established religion was fought to be subverted, in a greater or less degree, more openly or more covertly, according to the circumstances of the times, but uniformly, from the period of the restoration to that of the revolution; and the issue was, that the subjects of Great Britain were ultimately compelled to seek their safety in revolt, and in the protection of the prince of Orange.

With respect to the general character of Charles, it seems most candid, as in the infancy of his father, to place in opposition the different, and often opposite, determinations of Hume and Mrs. Macaulay.

During the few days of the king's illness, says Hume, cleragmen of the Church of England attended him; but he discovered a total indifferency towards their devotions and exhortations. Catholic priests were brought, and he received the sacrament from them, accompanied with the other rites of the Romish church. Two papers were found in his cabinet, written with his own hand, and containing arguments in favour of that communion. The duke had the imprudence immediately to publish these papers, and thereby both confirmed all the reproaches of those who had been the greatest enemies to his brother's measures, and afforded to the world a specimen of his own bigotry.

If we survey the character of Charles II. in the different lights, it which it will admit of, it will appear various, and give
give rise to different and even opposite sentiments. When
considered as a companion, he appears the most amiable and
engaging of men; and indeed, in this view, his deportment
must be allowed altogether unexceptionable. His love of
railway was so tempered with good breeding that it was never
offensive. His propensity to satire was so checked with
difference, that his friends never dreaded their becoming the
object of it: he felt the expression of one who knew
him well, and who was himself a good judge, could not be
said so much to be very refined or elevated, qualities apt to
beget jealousy and apprehension in company, as to be a plain,
gaining, well-bred, recommending kind of wit. And though
perhaps he talked more than strict rules of behaviour might
permit, men were so pleased with the affable, communicative
departure of the monarch, that they always went away
contented both with him and themselves. This, in-
deed, is the most shining part of the king's character: and
he seems to have been infallible of it: for he was fond of
dropping the formality of state, and of relapping every
moment into the companion.

In the duties of private life, his conduct, though not free
from exception, was, in the main, laudable. He was an
cal, generous lover, a civil, obliging husband, a friendly
brother, an indulgent father, and a good-natured mæster.
The voluntary friendships, however, which this prince con-
trasted, nay, even his sense of gratitude were feeble; and
he never attached himself to any of his ministers or courts
with sincere affection. He believed them to have no motive
in serving him but self-interest; and he was fluid ready, in
his turn, to sacrifice them to present ease or convenience.

With a detail of his private character we must set bounds
to our panegyric on Charles. The other parts of his con-
duct may admit of some apology, but can deserve small ap-
plause. He was indeed so much fitted for private life, pre-
ferably to public, that he even overlooked order, frugality,
and economy, in the former: was profuse, thoughtless, and
negligent, in the latter. When we consider him as a sovereign,
his character, though not altogether destitute of virtue, was
in the main dangerous to his people, and dishonourable to
himself. Negligent of the interests of the nation, careless
of its glory, averse to its religion, jealous of its liberty, la-
eth of its treasure, sparing only of its blood; he expended
it by his measures, though he ever appeared but in sport,
the danger of a furious civil war, and even to the ruin
and ignominy of a foreign conquest. Yet may all these
enormous, if fairly and candidly examined, be imputed, in
a great measure, to the indifference of his temper: a fault
which, however unfortunate in a monarch, is impossible for
us to regard with great severity.

It has been remarked of Charles, that he never said a
foolish thing nor ever did a wise one: a confine which,
threw too far carried, seems to have some foundation in his
character and deportment. When the king was informed of
this saying, he observed, that the matter was easily accounted
for: for that his discourse was his own, his actions were
the ministry's.

If we reflect on the appetite for power inherent in human
nature, and add to it the king's education in foreign coun-
tries, and among the Cavaliers, a party which would nat-
urally exaggerate the late usurpations of popular assembies
upon the rights of monarchy; it is not surprising, that civil
liberty should not find in him a very zealous patron. Ha-
rassed with domestick faction, weary of clamours and com-
plaints, oppressed with debts, straitened in his revenue, he
fought, though with feeble efforts, for a form of govern-
ment, more simple in its structure, and more easy in its
management. But his attachment to France, after all the
pains which we have taken, by inquiry and conjecture, to
fathom it, contains still something, it must be confided, mys-
terious and inexplicable. The hopes of rendering himself
absolute by Lewis's assistance seem so chimerical, that they
could scarcely be retained with such obstinacy by a prince
of Charles's penetration; and as to pecuniary subsidies, he
fully spent much greater sums in one season, during the
second Dutch war, than were remitted him from France during
the course of his reign. I am apt therefore (says Home) to
imagine, that Charles was, in this particular, guided chiefly
by inclination, and by a prepossession in favour of the French
nation. He considered that people as gay, sprightly, polite,
elegant, courteous, devoted to their prince, and attached to
the Catholic faith; and for these reasons he cordially loved
them. The opposite character of the Dutch had rendered
them the objects of his aversion; and even the unceasing
humours of the English made him very indifferent towards
them. Our notions of interest are much warped by our af-
fections; and it is not altogether without example, that a
man may be guided by national prejudices, who has ever been
little biased by private and personal friendship.

The character of this prince has been elaborately drawn
by two great masters perfectly well acquainted with him,
the duke of Buckingham and the marquis of Halifax; not
to mention several elegant brochure given by Sir William
Temple. Dr. Welwood likewise, and bishop Burnet have em-
ployed their pencil on the same subject: but the former is
somewhat partial in his favour; as the latter is by far too
harsh and malignant. Instead of finding an exact parallel
between Charles II. and the emperor Tiberius, as affec-
ted by that pratele, it would be more just to remark a full con-
trast and opposition. The emperor seems as much to have
surpassed the king in abilities, as he falls short of him in vir-
tue. Provident, wise, active, jealous, malignant, dark, ful-
ken, unfeizable, referred, cruel, unrelenting, unmerciful;
these are the lights under which the Roman tyrant has been
transmitted to us. And the only circumstance in which it
can justly be pretended he was similar to Charles, is his love
of women, a passion which is too general to form any illus-
rious resemblance, and which that detestable and detested
monarch shared also with unnatural appetites.

Mrs. Macaulay observes, that nature had bestowed on
Charles II. powers, which if properly exerted, might have
constituted an heroic character; but which, by an adver-
fate, enabled him to exceed in wickedness and folly all the
princes who had ever sat on an English throne.

The unhappy fate of Charles I. and the adversity into
which it hurriedly threw his son, by depriving him of the
advantages of parental care, and exposing him, at a time of
life when the passions are the strongest and the judgment the
weakest, to the pernicious licentiousness which prevailed in
the court of France, gave such strength and power to the
natural bias of his disposition, as totally to efface every ver-
tige of that moral sense which helps to form the mixt chara-
ter of the generality of mankind, and which is so very
entirely lost, even by the most illustrious. If with the ju-
diced eye of prejudice we can excite, and even applaud
the mean hypocrisy used by Charles, during his absence
with the Scotch covenanters, the breach of his oaths, and the
barbarity with which he afterwards treated this people, when
exalted to a kind of despotic power over them, with the per-
fections with which he repaid the services of the English pre-
bytersians; what can even the voice of faction say to the in-
gratitude with which he treated the ancient and faithful
friends of the fortunes of his family; and the dishonouring all
those with ignominy who endeavoured to reconcile the pre-
rogative of the king with the safety of the nation, and the
II. father's or cable: but in, an tcr, and that I the highest degree of affection? If with the men of pleasure, and the thoughtless companions of the bottle, we view with complacency, and even with applause, the licentious manners of a prince infected with the vices of every country which had yielded an asylum to his wandering steps, it is possible not to reflect, that Charles was totally deficient in that kind of sympathy and indulgent good nature which often accompany the effeminacy of a luxurious life; and that the unjust severity and even cruelty with which he treated all those whom he regarded as his enemies, are blemishes not to be excused when united to the ferrelest manners and the highest degree of principle.

If with the Papists, we applaud the king for the piets desogns he had entertained of restoring the British empire to the church of Rome; what can we say to the calm manner in which he abandoned this design, and the whole party, to their inveterate enemies? What can we say to the breach of the promise he had made to this body, that he would declare his conversion, and avow his patronage after the receiving a sum of money for this purpose from the coast of France? And what can we say to the mean manner in which he concealed his predilection to Popery till the hour of his decease, in which he vainly hoped to secure a safe passage to the regions of eternal bliss, from the merits of a submission exerted by the terrors of an afflicted conscience? And if, with the zealous churchmen, we regard him as the patron of the reduced privileges of that holy body, what excuse can we make for the deep designs he had entered into, of sacrificing all those sacred rights to the ambition of Papists, and the interests of the papal chair?

In the duties of private life, we are told by the panegyrists of Charles, that his conduct, though not free from exception, was in the main laudable: but though a large measure of indulgence is to be given to the foibles, the firmest, and even the vices of every man or woman, who has not received the benefits which arise from a perfect form of education, yet we cannot possibly trespasa so highly on our sense of propriety, decency, and the inimitable virtues of sobriety, as to rank a facility in which the king became the constant dupce of his amorous inclinations and passion for variety, among the good qualities of a rational agent; nor can we agree to the observation, that Charles was a civil and obliging husband, merely on the merit of his not having sacrificed an innocent woman to the venom of party spirit. On the contrary, setting aside the advantages of affluence, and the splendor of rank, the queen's situation must be considered as equally mortifying to that in which every other female is involved, whom a severe fate unites in the indissoluble bonds of matrimony with a proud rake.

On the subject of the king's constancy to the duke of York's interest, it is observable, that a coldness and mutual jealousies prevailed between the two brothers till the period of the first French treaty; a circumstance which rendered all future dissension dangerous to the peace and happiness of both. Burnet affords, that Charles both hated and feared his brother; and Sir John Kerley, who has manifested the highest degree of partiality to the conduct of the king, allows that it was motives of policy alone which were the grounds of his inlexible patronage: as on this single instance, therefore, thus circumstanced and opposed by the whole tenor of Charles's public and private conduct, it is impossible to agree with the duke of Buckingham, that this prince was even inclined to justice; or with the rest of his panegyrists, who found on the merits of the act of indemnity, issued from the necessity of the times, a propensity in his disposition to clemency and forgiveness; we must conclude, that the half picture drawn of Charles II. by bishop Burnet, is a just likeness, viz. that he had enormous vices without the tincture of any virtue to correct them; that, under the appearance of gentleness, he concealed a cruel and unrelenting heart; and under the mask of sincerity, the highest degree of hypocrisy and dissimulation; that he was void, not only of every principle, but every manly sentiment; that he was as incapable of friendship as of integrity; that he considered power and the trunks which accompanied it, in no other light, than as the means to gratify his criminal and selfish passions; that he acted as too rather than the protector of his people; and that it was undutiful, indiscreet, and the love of ease, which were the single correctors to that rage for absolute power which invades all princes; and which, but for the predominance of his vapid passions, Charles would have pursued with a vigilance equal to the importance of the undertaking; and which, notwithstanding the unconquerable indolence of his temper, the depravity of the times had, in a great measure, enabled him to effect.

Lord Lyttelton speaks of this monarch in the following terms. The methods pursued by Charles the Second, in the conduct of his government, were in many respects different from his father's, though the purpoie of both was much the same. The father always bullied his parliaments; the son endeavoured to corrupt them; the father obstinately refused to change his ministers, because he really esteemed them as honest men; the son very easily changed bis, because he thought they were all alike dishonest, and that his designs might as well be carried on by one knave as by another: the father was a tool of the clergy, and a perverter, out of zeal for the religion; the son was almost indifferent to religion, but loved the passions of his clergy against the differents from motives of policy: the father desired to be absolute at home, but to make the nation respectable abroad; the son afflicted the king of France by his invasions on the liberties of Europe; that, by his help, he might maintain the title of legislator, nay, he was even a penitent to France, and, by so vile a production of his dignity, set an example to the nobility of his realm, to sell their honour likewise for a penion; an example, the ill effects of which have been felt too feebly ever since.

Yet, with all these vices and imperfections in the character of Charles the Second, there was something so bewitching in his behaviour, that the charms of it prevailed on many to connive at the faults of his government; and, indeed, nothing could be lo hurtful to a country, which has liberties to defend, as a prince who knows how at the same time to make him self despotic and agreeable: this was eminently the talent of Charles the Second; and, what is most surprising, he profited it without any great depth of understanding.

But the principal instrument of his bad intentions, was a general depravity of manners, with which he took pains to infect his court, and they the nation. All virtues, both public and private, were openly ridiculed; and none were allowed to have any talents for wit or business, who pretended to any sense of honour, or regard to decency.
The king made great use of these new notions; and they proved very pernicious to the freedom, as well as to all of his subjects; but an indolence, natural to his temper, was some check to his designs; and, fond as he was of arbitrary power, he did not pursue it any further than was consistent with his pleasure and rejoic.

All music, except Stile's puerile, seems to have been filtered from the year 1612 to 1662; but at the restoration of monarchy and ancient religious establishments, all the surviving musicians, who had been degraded and involved in the calamities of the civil war, quitted their retreats. Many however had died in, and during the conflict, in every order of the state. No more than nine of the six and twenty bishops were living; and death had probably made the like havoc among the rest of the inhabitants, in proportion to age and numbers. Of those that fell by the sword, we know not the exact calculation; but, except archbishop Laud, the prelates may be supposed to have died in their beds. Of the gentlemen of Charles the First's chapel, none seem to have claimed their former station, but Dr. Wotton, Christopher Gibbons, and Henry Lawes; the last, indeed, did not long survive the restoration.

Child, Christopher Gibbons, Rogers, and Wilton, were created doctors, and therie, with Law of Oxford, though advanced in years, were promoted; Child, Gibbons, and Law, were appointed organists of the Chapel Royal, and Captain Henry Cook master of the children. Cook had been bred up in the King's Chapel, but quitted it at the beginning of the rebellion; and in 1642, obtaining a captain's commission, he retained the title of captain ever after. Gibbons was likewise organist of Westminster Abbey; Rogers, who had termly been organist of Magdalen College, Oxford, was preferred to Eton; Wilton had a place both in the chapel and Westminster Abbey; and Albertus Byrne, a scholar of John Tomkins, was appointed organist of St. Paul's, where he had been brought up.

The establishment of Charles the Second's chapel, at the time of the coronation, appears by the following entry in the cheque-book.

April the 23d, being St. George's day, 1661.

Dr. Walter Jones, subdean.
Roger Nightingale
Ralph Amner
Philip Tinker
John Sayer
Durant Hunt
George Law
Henry Smith
William Tucker
Edward Lowe
William Child
Christopher Gibbons
Henry Cook, master of the children
Henry Lawes, clerk of the cheque
Thomas Piers
Thomas Hazzard
John Hardie

[Names of organists and musitians followed, including names like William Haynes, Thomas Blagrove, Gregory Thorneall, Edward Bradock, Henry Purcell, James Coe, Nathaniel Watkins, John Cave, Alphonso Marth, Raphael Courtville, Edward Colman, Thomas Purcell, Henry Frott, John Goodgroom, George Betchenhorn, Matthew Pencll, and others.]

At which time every gentleman of the chapel in orders, had allowed to him for a gown five yards of fine scarlet; and the rest of the gentlemen being laymen, had allowed unto each of them four yards of the like scarlet.

The salaries of the gentlemen of the chapel had been augmented both by James I. and Charles I. and in the year 1663; Charles II. by the privy seal, further augmented them to twenty pounds a year; and granted to Capt. Cook and his successors in office, thirty pounds a year, for the diet, lodging, washing, and teaching each of the children of the Chapel Royal. A copy of this grant is entered in the cheque-book, and said to have been obtained by the solicitation of Mr. Cook.

The small stock of choral music with which the chapel began, in becoming a few years somewhat delightful by frequent repetition, the king perceiving a genius for composition in some of the young people of the chapel, encouraged them to cultivate and exercise it; and many of the first set of choristers, even while they were children of the chapel, composed anthems and services that are still used in our cathedrals. These, by the king's special command, were accompanied by violins, cornets, and flutes, to which instruments introductory llyphonies and ritornelles were given, and the performers of them placed in the organ-loft.

Dr. Tindal, in the dedication to the second volume of his manuscript Collection of English Church-music to Lord Harley, affirms the following reasons for the change of style in the music of the Chapel Royal, by a mixture of what he terms theatrical and secular.

"The standard of church music begun by Mr. Tallis, Mr. Bird, and others, was continued for some years after the Restoration, and all composers confirmed themselves to the pattern which was set them.

"His majesty, who was a brisk and airy prince, coming to the crown in the flower and vigour of his age, was fond, if I may so say, tired with the grave and solemn way which had been established by Tallis, Bird, and others, ordered the composers of his chapel to add symphonies, &c. with instruments to their anthems; and thereupon established a select number of his private music to play the symphonies and ritornelles which he had appointed. The old masters of music, Dr. Child, Dr. Gibbons, Mr. Low, &c. organists to his majesty, hardly knew how to comport themselves with these new-fangled ways, but proceeded in their compositions, according to the old style, and therefore there are only some services and full anthems of theirs to be found.

"In about four or five years time, some of the forwardest and brightest of the children of the chapel, as Pelham Humphrey, John Blow, &c. began to be masters of a faculty in composing; this his majesty greatly encouraged, by imbibing their youthful fancies, so that every month, at least, they produced something new of this kind. In a few years more, several others, educated in the chapel, produced their compositions in this style; for otherwise it was vain to hope to please his majesty."

King Charles the Second, (says the Hon. Roger North, Mem. of Mus.) though a professed lover of music, had an utter aversion to Fancies, which was increased and confirmed by a successful entertainment given him by secretary Williams. After which the secretary had no peace; for the king, as was his custom, could not forbear whetting his wit upon fancy music, and his patron the secretary; nor would he allow the matter to be disputed upon the point of superiority, but ran it all down, by saying, have not I cares? He could bear no music to which he could not beat time, which he continually tried to do to all that was performed in his presence, which he generally heard wading. Of fancies he only approved the soft strain in triple time; which rendered that kind of movement fashionable among the masters and composers for the stage, as may be seen in the printed songs of the time.
CHARLES V.

His majesty had once a wife, in order to compare styles, to hear the singers of several nations, German, Spanish, Italian, French, and English, perform together on the court stages, at Whitehall. The Italians performed the celebrated trio of Carissimi, Che dite, che fiate; and the English brought up the rear under great disadvantage, with I pass all my hours in a foathy old grove; for though the king chose that song as the best, others were not of his majesty’s opinion.

The old way of comforts was laid aside by this prince immediately after his restoration, when he established his band of 24 violins, after the French model, and the style of music was changed accordingly. So that French music became in general use at court, and in the theatres; indeed, performers on the violin had a lift into credit before this period, when Baltyzar, a Swede, came over, and did wonders upon it by swiftness and double stops. But his hand was accounted hard and rough, though he made amends for that by often tuning in the lyra way, and playing idoms conformable to it, which were very harmonious, as is manifest by many of his pieces still extant.

During the first years of king Charles’s reign, all the music in favour with the beau-monde, was in the French style; which, at this time, was rendered famous throughout Europe, by the works of Baptift Lulli, a Frenchified Italian, and master of the court music at Paris, who enriched the French music by Italian harmony, which greatly improved their melody. His style was theatrical, and the pieces called branscì, or overtures, consisting of an entrée and a courante, will ever be admired as the most flatly and complete movements in music. All the composers in London strained hard to imitate Lulli’s vein. However, the whole tendency of the age, affected the foot more than the ear; and no one could listen to an entrée, with its sprints and leaps, without expecting a dance to follow.

The French instrumental music, however, did not make its way so fast as to bring about a revolution all at once; for, during a great part of this king’s reign, the old music was still used in the country, and in many private meetings in London; but the treble viol was discarded, and the violin took its place.

The taste of Charles I. seems to have been French in all things, but particularly in music; for he had French operas; a band of twenty-four violins, in imitation of the French band at Paris; French masters of his band, Cambert, and, afterwards, Grabu; he sent Pelham Humphry to study under Lulli, and young Banister to learn the violin at Paris. Indeed, though we have since had better models for our musical studies of all kinds, from Italy and Germany, music, as well as every other liberal art, was at this time in a higher state of cultivation in France than in England. But though Lulli carried Italian dramatic music into France, it was such as had been produced during the infant state of the art in Italy; yet, notwithstanding the subsequent improvements it received in its native country, from innumerable masters, particularly since they were furnished with lyric poetry by Metastasio, near a century elapsed before our neighbours the French perceived it possible to compose better music than that of Lulli.

Our merry monarch, (as he is called in the Spectator, No. 462) certainly loved music, and had an accurate ear, particularly for time; nor would he allow any composition to be music, to which he could not beat the measure; which is, in general, a very good criterion of clearness, accent, and rhythm; but these bring all wanting in the music of Lulli, excites a wonder at his majesty’s partiality for French music. But, He had heard little or no Italian music, and the German music of his time was rude and unpolished in melody, though in harmony and fugue very learned. But little our gay and voluptuous sovereign would not give himself the trouble to analyse, or even to hear. Purcell, the nation’s darling, born in 1658, was but two years old at the restoration; and at the death of Charles but 24, at which time his fame had scarcely taken wing’s

CHARLES V. This celebrated prince was born at Ghent, on the 24th February, 1500. He had not completed his sixteenth year, when the rich inheritance of Cathie, of Arragon, and Navarre, of Naples, Sicily, and Sardonia, devolved on him, by the death of his maternal grandfather, Ferdinando. His early youth had been formed by Margaret of Austria, his aunt, and Margaret of York, the widow of Charles the Bold. These two princesses were distinuiugished equally by their virtue and abilities. On the death of his father, Philip, William de Croy, Lord of Chievres, and Adrian of Utrecht, were the princes appointed by his grandfather Maximilian, for the purpose of carrying forward his education, and forming his sentiments and principles. It was the whim of Adrian, however improbable its success, to involve his young mind in all the vexatious mazes of metaphysical theology; but the more authoritative and more acceptable instructions of Chievres led him from monastic speculations to the robust exercises of military life. The arts of government were a no les acceptable studies, connected with the history of his own kingdom, and of those neighbours with whom he had most frequent intercourse. From his fifteenth year, when he assumed the government of Flanders, Charles was accustomed to business. It was a part of his discipline to peruse flate papers, to prelude at the deliberations of his council, and to propose in person those questions on which he wished for advice. From such an education, his habits and manners assumed a character disproportioned to his years. Yet his outlet was marked by no feats of superior genius. His figure and address, his graceful and manly accomplishments, were flattering to the vanity of his subjects; but there was a certain temporizing deference, which seemed to lay him open to the artifices of courtiers, and a tone of pallion which prepared him for a dupe, and his people for a prey.

Ferdinando, his grandfather, died in 1515; on which event Charles claimed the title of king, while his mother Joanna was yet alive. The times were difficult; but Ximenes was equal to the crisis. The Pope, as head of the church, and the Emperor, as head of the empire, concurred in confirming the dignity, as of their own right; and on these grounds was Ximenes instructed to press the claim on the Spanish nation. Yet, by the laws of Spain, the full right to the crowns of Cathie and Arragon belonged to Joanna; nor had any public act, declaring her incapacity, reconciled the pretentions of Charles, either to the delicacy of filial forbearance, or to the privileges of the two nations. Ximenes protested against the principle, but was prompt and vigorous in carrying his orders into execution. The title was recognized at Madrid, in spite of discontent; though the states of Arragon were obstinate, under the irreolate administration of the archbishop of Saragossa. The Arragonians waited for the king’s arrival in Spain, before they would acknowledge any other title than that of prince. The war which had arisen from the holy league had been transmitted by Ferdinando to his grandson, who, as king of Spain, was in actual hostility against France. But Chievres, conscious of the advantage which his countrymen, the Flemings, derived from their commerce with the French, warmly recommended an accommodation, and obtained the manage-
ment of the treaty. The king of France listened with joy to the first overtures. The principal articles of the treaty were, that Francis should give in marriage to Charles his eldest daughter, an infant of a year old, with all his claims and pretensions to the kingdom of Naples, for her dowry. In consideration of Charles's being already in possession of Naples, he was to pay 100,000 crowns a-year to the king of France until the accomplishment of the marriage, and the half of that sum annually as long as the princess had no children. When Charles should arrive in Spain, the heirs of the king of Navarre might repudiate him their right to that kingdom; and in default of due satisfaction, Francis was at liberty to afflict with his forces. Charles probably would never have signed such conditions, but for the purpose of securing a safe passage into his Spanish dominions. Yet such was the ascendancy of his Flemish favourites, and their jealousy of Ximenes, that after a year's delay, nothing but the repeated remonstrances of the cardinal, and the murmurs of the Spaniards, prevailed on him to embark. No sooner was Ximenes informed of his arrival, than he advanced to meet him. But his journey was stopped by ill-feats, which some attributed to poison, though it seems naturally accounted for, by extreme old age and unfeizable fatigue. The neglect of his counsels, and the cold formality with which the king, as a matter of form, allowed him to retire, produced an effect equal to any poison, in his almost immediate death. Charles received the news of it with indifference; but he had scarce entered Valladolid, before he was sensible of his loss. The cortes of Castile infiltrated on his mother's name appearing first in all public acts, and on the revocation of her authority, in cafe of her recovery. They were liberal in their grants; yet was the discontent loud; to which the king's hesitation in speaking Spanish, and attachment to Frenenish favourites, not a little contributed. These events took place in the years 1518 and 1519.

Before his departure from Aragon, Charles sent his brother Ferdinand into Germany, and thus obviated his intrigues. He found the cortes of Aragon highly refractory; the assembly of Catalonia full worfe; and the Castilians were taking those measures, in defence of their privileges against strangers, which laid the foundation of that memorable union among the confederates of Castile. With respect to the rejection of Navarre, neither the monarchs of Castile nor their barons were inclined to part with it, and the conference at Montpelier was abortive. The death of Maximilian vacated the imperial throne; and the European princes had learned, from the Italian wars, the advantages which might be derived from that dignity. The previous negotiations of Maximilian, and the situation of his hereditary dominions with respect to the Turks, had predisposed the former towards the elevation of Charles. But he was opposed by a formidable rival in Francis, who pressed it on the consideration of Europe, that the crown was elective, and ought not to be made, by preceptive custom, hereditary in the house of Austria. His emissaries contended besides, that the person who held the crown of Naples was excluded by a fundamental constitution. To their arguments were added horrid loads of treachery, and unlimited promises.

The electors directed their views to Frederick Duke of Saxony; but he rejected their proposal, and at the same time effectually turned the scale in favour of Charles, who received the news of his election at Barcelona. But his Spanish subjects were fuller and refractory, refusing to grant any subsidy to an absent sovereign. Charles, in his turn, countermanded the association of the "brotherhood," which proved the source of much calamity to the kingdom. The cortes of Castile were not less violent than the Valencian barons. Opposition and artifice united could with difficulty extort a donative, to enable him to appear with becoming splendor in Germany.

Conscious of the rivalship which still subsisted between himself and the king of France, Charles was desirous of courting the alliance of Henry VIII. of England, whose possession of Calais gave him a great degree of influence with both monarchs. Henry had agreed to an interview with the French king between Guines and Ardrès; but Charles studiously pre-occupied his favour, byItering directly from Corunna to Dover, and, by a visit of only four days, at once made a favourable impression on the king of England, and attached Wolsey to his interest, by a pension of 7,000 ducats, and the lure of his future succession to the apostolic chair. After the interview with Francis at Guines, Henry returned the visit of Charles at Gravelines, who, excused, by his seeming deference, the impreffions which the conduct of his rival had made.

From the Low Countries, Charles pursued his route to Aix-la-Chapelle, where he was invested with the crown of Charlemagne. Germany was now his by election; Castile, Aragon, Austria, and the Netherlands, by succession; Naples and Granada inherited by the right of conquest; Mexico added to his resources by Fernando Cortes. Yet his territories were dilant and disjointed; his authority was limited; his subjects were strangers to each other, and reluctant in their obedience to him.

Luther had now declared the pope to be Antichrift. The first act therefore of the emperor's administration was to appoint a diet at Worms, to check these new and dangerous doctrines. These events occupied the years 1520 and 1521.

In the mean time, the discontent in Spain had gathered to a head. The citizens of Toledo, Segovia, Burgos, Zamaora, were all influenced by the same spirit. Adrian trembled in Valladolid at the rapid progress of insurrection; but he forced his naturally lenient disposition, and ordered a body of troops to proceed against the delinquents. Charles, though he had received accounts of these transactions, could not return immediately to Spain, without endangering the imperial crown. He therefore promised, to those who continued faithful, not to exact the subsidy granted by the late cortes; and engaged, that no office should be conferred in future, but upon native Castilians. At the same time he wrote to the nobles, to excite them to the defence of their own rights, and those of the crown, against the commons. He appointed the high admiral and the high constable of Castile, whose abilities and influence would be highly useful in an appeal to arms, to act as regents in conjunction with Adrian. But the junta, relying on an unanimous support, now aimed at a more extensive reform of political abuses. They demanded that the king should return, and reside in his Spanish dominions: that he should not marry without the consent of the cortes; nor appoint a foreign regent in case of unavoidable absence. That no stranger should be naturalized; and that those who already held public offices should resign them. A reduction of the taxes, an extended and reformed representation in all future cortes, which were to assemble as matter of right once in three years, were the other objects to which their remonstrances were directed.

These internal factions encouraged Francis to take up arms. A body of troops, under Andrew de Foix, invaded Navarre, in behalf of Henry d'Albret. The Castilian nobles heard of the irruption with indifference; but when the enemy prefumed to invade Lagrogno, a small town of Castile, all parties were routed at once: they took the French general prisoner, and brought Navarre back to its obedience.

Charles,
Charles, having entered into an alliance with pope Leo, determined on open war. The progress of this treaty, to contrary to his inclinations, had been concealed from Chievres. The chagrin of the latter, on the discovery, shortened his days, and left the royal pupil to the uncontrolled exercise of his own powers. Robert de la Mark had ravaged the open country of Luxembourg, and laid siege to Vinton. Charles, at the head of 20,000 men, over-whelmed the territories of Robert, and reduced him to sue for mercy. The count of Nassau was commanded to invade Mezières; but the chevalier Bayard, the knight, without fear, and without reproach, managed his slender resources with such skill and gallantry, that the imperialists abandoned the siege with considerable loss. At this time, Francis, at the head of a superior army, from excels of caution, missed the opportunity of a personal engagement with his rival, suggested by the crafty Bourbon, which might have been fatal to the future grandeur of Charles, who soon faced the disgrace of his retreat by the reduction of Tournay, and secured an important advantage in the alliance of Henry, king of England.

In the mean time, Francis, defeated in Italy, had renewed the war on the side of Spain. Navarre was again invaded, and Fontarabia, a strong town of Basçay, was taken by Bonivert, admiral of France. This loss determined Charles to re-visit his Spanish dominions. On his way, he halted at London six weeks, received the garter, confirmed his alliance with Henry, and again caressed Wolsey with distant hopes of succeeding Adrian. The emperor's first attention was directed, on his arrival in his Spanish dominions, to heal the wounds of faction. He rejected the bloody suggestions of his council, and excepted only fourcore perons from the general pardon. When an officious courtier offered to inform him where one of the most considerable rebels was to be found, he replied, with a smile, "you had better let him know I am here, than tell me where he is." Thus, by his magnanimity and address, he established an ascendancy over the Spaniards, of which he availed himself to obtain pecuniary grants and military support, equal to the prosecution of all his enterprises. Among these, his mysterious correspondence with Charles, duke of Bourbon, was not the least important. That nobleman was equally entitled to favour by his birth and services. But Louisa, the king's mother, had contracted a violent attachment to the house of Bourbon, and had communicated her prejudices to her son. The death of the duke's wife revealed Louisa's passion; but her advances were rejected, and her affection again converted into hatred. She commenced a suit against him for the duchy of his deceased comfort, and he was stripped of his fortune by an openly notorious sentence. This political intrigue was brought to bear in the year 1523. But the conspiracy was discovered and disconcerted. The confed- rates were repelled in three separate attempts to invade France, and lost half the Milans. But the wealth of Mexico prompted Charcs to new enterprises, and purchased him new allies. He opened the campaign of 1524, with the siege of Fontarabia, which he thought while the magazines were yet full, and the walls entire. Charles received the intelligence of the victory of Pavia at Madrid, with an air of the most perfect complacency and moderation; but the pro- jeets which he entertained on this unexpected success, were most extensive and ambitious. Yet his own embarrassments were scarcely inferior to those of the prince his former, from the limited condition of his revenues, and the universal jealousy of his neighbours. In the mean time France was filled with contention by the defeat at Pavia: the king sent the first news of it to his mother, in these words: "Madam, all is lost, except our honour." Henry now began to tremble for the balance of power, and his minister Wolsey repeated the faithful promises of the papacy. The former therefore secretly advised Louisa of his support, but in his language to the emperor, offered to invade Guinene with a powerful army, on condition that Francis should be delivered to him, and the monarchy of France extingushed. These extravagant proposals were designed to diffcult the emperor, on whole rejection of them the king of England found a decent pretext for withdrawing from his alliance.

The low state of the emperor's finances preventing him from penetrating into France with the forces of Spain and the Low Countries, he proposed terms to Francis of a rigorous nature, that the latter, drawing a dagger, exclaimed, "It is better that a king should die thus."

The removal of Francis from Italy had equally enraged Bourbon and Pescara. The discontent of the latter had reached Jerome Morone, vice-chancellor of Milan, whose genius for intrigue was inflamed by the hope of delivering Italy from the yoke of foreigners. He tempted Pescara with the throne of Naples; and the latter acceded to the proposal: but, on reflection, he deemed it either most honourable, or most safe, to reveal the whole confi- dence to the emperor, who had been already apprized of it by his spies. He commanded Pescara to continue the negotiation. The latter invited Morone to a last interview; but Antonio de Leyva had been concealed in the apartment, and, appearing suddenly, arrested Morone, and committed him to the castle of Pavia. Sforza was declared to have forfeited all title to the duchy of Milan, which was seized in the emperor's name. But the emperor's recent acquisitions in Italy were more than counterbalanced by his increasing dangers. The health and even the life of Francis, whole captivity was ex- pected to prove so advantageous, had been endangered by six months of harsh treatment. Charles, therefore, hastened from Toledo to Madrid, and inspired his prisoner with the hopes of speedy deliverance; but he relapsed into his former dulness and indifference, as soon as he had produced the effect intended, which was soon counteracted by the arrival of Bourbon in Spain. Charles met the rebellions subject without the gates of Toledo, though he had with difficulty been prevailed on to visit the king. But the Spaniards detested Bourbon's crime, and shunned all intercourse with him.

In the year 1526, the two monarchs came to an agreement, by which the French king was to restore Burgundy to the emperor in full sovereignty, as soon as he was let at liberty, delivering at the same time the Dauphin and the duke of Orleans, or twelve of the principal nobility in lieu of the last, as hostages. In confirmation of this agreement, Francis was to marry the emperor's sister, the queen dowager of Portugal. The treaty was signed about the middle of January, and on the return of the ratification from Paris some weeks after, the marriage was consummated, and Francis took leave of his new brother-in-law with dissembled demonstrations of regard. In the course of the same year, Charles married Isabel, the sister of John III. king of Portugal, a choice equally acceptable to the Cortes of Càñilo and Arragon, and pleasing to the court of Lisboa.

On the death of Lewis II. king of Hungary and of Bohemia, on the field of Mohacz, those kingdoms were claimed by the archduke Ferdinand, as inheriting the ancient pretentions of the house of Austria, and in right of his wife, the sister of the deceased monarch. The Valyowde of Transylvania was a competitor; but the personal merit of Ferdinand, and the influence of the emperor now had the
foundation of that pre-eminence, which has rendered the House of Austria so formidable to the rest of Germany, since these acquisitions became hereditary in their family. Having experienced the danger of awakening the fears of mankind, Charles affected to disclaim the enterprise of Bourbon against the pope's liberty. But Europe was not to be cajoled by prayers and proceedings, and Francis rushed to action. The Milans were threatened by the imperial forces, by the expedition against Rome, and the Italians received Lauriere with open arms. The whole dutchy, as well as Alexandria and Pavia, must have been restored to France, had not Lauriere feared the jealousy of the confederates. He, therefore, marched towards Rome, where the pope was still a prisoner in the castle of St. Angelo. The Imperial army demanded their arrears; and Charles, who could depend neither on his fidelity for the liberty of the cortes, nor on the liberality of the church, himself clement his freedom for three hundred and fifty thousand crowns. Part of this sum was distributed among the Imperial troops, who then quitted Rome, and pointed their retreat towards Naples.

In the year 1559, while the contending parties were fluctuating in their counsels, a negotiation, undertaken between Margaret of Austria, the emperor's aunt, and Louise, the mother of Francis, terminated in the peace of Cambrai, by which Francis was to pay two millions of crowns for the ransom of the dauphin and the duke of Orleans; to relieve the towns he held in the Milanese; to renounce his claims to Naples, Milan, Genoa, and all beyond the Alps; to abandon the Venetians, the Florentines, and the duke of Ferrara; to pay a sum of money to the Emperor for losses he had sustained; to disclaim the indulgence of his paternal feelings at the expense of his character as a public man and a sovereign. Henry VIII. accorded to the peace of Cambrai; so that this interval of tranquillity gave Charles an opportunity of visiting his Italian and German dominions. Before his embarkation, a question having arisen whether the inhabitants of Barcelona should receive him on his entry, as emperor or as count of Barcelona, he instantly decided for the latter title, and was rewarded for his flattering dispositions by an oath of allegiance from the lords of the provinces to his infant son Philip. In Italy, he appeared in all the pomp of military and civil state; and took infinite pains to influence every unfavourable prepossession from the minds of the natives, by the equity and moderation with which he attended the concerns of the country. But in the year 1550, the affairs of Germany called for his immediate attention. Though Solyman had been obliged to abandon the siege of Vienna with disgrace, the empire disorders of the empire demanded the presence of its head. Several of the German princes, who had embraced the opinions of Luther, had not only established in their territories that form of worship, but had entirely suppreffed the rites of the Romish church. Many of the free cities had imitated their conduct. Nearly one-half of the Germanic body had revolted from the papal see, and its authority was considerably weakened in the other half. The Imperial influence began to be weakened by these divisions, to suppreff which, the diet of Augsburg was called, and attended by all the princes of the empire, especially those who had protected against the decrees of the late diet at Spire, for the celebration of mass. The princes of the free-Bavarians were the electors of Saxony, the marquis of Brandenburg, the Landgrave of Hesse, the dukes of Lauenburg, and the prince of Anhalt. They conducted themselves with decency, but defended their opinions with fortitude. Their tenets were, however, condemned by the majority of the diet, whose decree induced them to confede more closely, and produced the league of Smalkalde. In the year 1532, the emperor marched against Solyman; but the campaign was not without any memorable event. He afterwards fell against Tunis, and took the Goletta, garnished by six thousand Turkish soldiers, under the command of Sultan, a renegade Jew, which led to the defeat of Barbarossa. But before Charles could give the necessary orders for protection against military violence, the soldiers had precipitated themselves on the city of Tunis, where thirty thousand inhabitants perished in one day, and Charles's victory was blunted by the excesses of lust and avarice. Mulhe Hafcen took possession of the throne, and committed to his mercy the crown of Tunis; to set all Christian slaves at liberty without ransom; to allow the emperor's subjects the free exercise of their religion; to exclude the Turkish corsairs from his harbours; to deliver up the Goletta and all his fortified posts, and to pay twelve thousand crowns annually for the subsistence of the garrison. The issue of this expedition dazzled Europe, and 20,000 slaves, freed from bondage, and clothed at his expense, traced his return to Spain; after which, in the year 1570, he improved his leisure in providing funds and forces for a new war. He drew money from Naples and Sicily, troops from Germany, and then threw down the gauntlet to the king of France, in presence of the pope and cardinals. His confidence of success was so great, that, notwithstanding the remonstrances of his envoys and generals against the plan of his campaign, he defined the historian, Jovius, to make a large provision of paper to record his impending victories. But Francis had discovered his design of penetrating into the southern provinces of France, and left it to the Maréchal Montmorency to defeat the plan who executed the trust by making a descent from the Alps to Marsailles, and from the sea to the confines of Dauphine. Charles sailed two months in Provence, and then, having lost half his troops by disease or famine, gave the signal for a reluctant retreat; and nothing could have saved the Imperialists from destruction, but the adherence of Montmorency to his favourite maxim, that a bridge of gold should be made for a flying enemy.

In the year 1578, the two monarchs, listening to the exhortations of the Roman pontiff, extended their truce of ten months to ten years. A few days after signing the treaty, the emperor, on his passage to Barcelona, was driven by contrary winds on the coast of Provence, and invited by Francis to a personal interview, at which the two rivals seemed to have buried all animosity, and to contend only for superior cound and liberality. Charles had no sooner landed in Spain, in 1579, than he was acquainted with the edition of his troops, who had plundered the Milanese, and were only to be quieted by the address of the imperial generals, who borrowed and extorted money to discharge their arrears, and then disbanded the greater part of them. Before the success of his plan was ascertained, the emperor had endeavoured to influence the liberality of his Catholic subjects; but the nobles pleaded exemption from any tax, and prevailed to urge on Charles a confiding residence in Spain. They were dismissed with indignation, and were not afterwards called to the assembly of the Cortes. But they still affected their personal privilege. On the return of the emperor from a tournament, one of the freemen struck the duke of Infantado's horse, who drew his sword and wounded the officer. Charles ordered the judge of the court to arrest the duke; but the contable of Castile claimed the right of a jurisdiction over a grantee, and conducted Infantado to his apartment, attended by all the nobles present. The emperor perceived the hazard of irritation, and prudently sent to the duke of Infantado, offering to punish the person who had insulted him: but the duke forgave the officer, and gave him a compensation for his wound.
CHARLES V.

In the year 1540, Charles, having negotiated a safe conduct by deceitful assurances, passed through France with a small but splendid train of about an hundred persons, and meeting the king at Chatellerault, proceeded with him to Paris, where he laid only six days, and pleading the necessity of his presence in the Low Countries, was accompanied as far as St. Quentin by his generous and unsuspecting rival. The citizens of Ghent were incapable of resistance; and he received their ambassadors with a declaration that he would appear with them as their sovereign, with the sceptre in one hand, and the sword in the other. He entered the city on his birth-day, and put twenty-six of the principal citizens to death, and thus set an example of severity, which might bridle the fictitious spirits of his other subjects in the Netherlands. In the year 1541, he summoned a diet at Ratibon, in which while he confirmed the papal authority, he privately assailed the reformed of his protection, and thus induced them to grant him a liberal supply of men and money for the war against the Turks. The remembrance of the glory he had acquired in his late expedition to Africa inflamed him with the desire of conquering Algiers. After a tedious and tempestuous navigation, at an advanced season of the year, against the advice of Andrew Doria, he anchored off the coast of Africa, to experience a series of calamities, which neither prudence could counteract nor exertion overcome. On the second day after his landing, there arose a tempest which overawed the camp during the night, and the next morning at day break they were attacked by the enemy, who were with difficulty repulsed. His ships were most of them wrecked, and eight thousand men perished in an hour, either in the sea or by the hands of the Arabs. The next day Doria sent him word that he had borne away with the remnant of the fleet to Cape Metafuz, which was three days march from the present camp. Puffed by sickness and by wounds, by famine and the Arabs, they at length reached Metafuz, and Charles by prudent dissimulation gained a credit for fortitude and humanity, which prosperity had hitherto allowed him no opportunity of claiming. He flourished in the hardships of the meagre foldiers; he exposed his person, and animated his fellow-sufferers; and though a body of Arabs hovered about his rear, he was the last to quit the shore. On his return to Spain he was attacked on various sides. In the year 1542, five formidable armies invaded his dominions, but they only consumed their strength in fruitless enterprises. In 1543, he obtained a liberal supply from the Cortes, borrowed a considerable sum from John, king of Portugal, on the security of the Molucca islands, negotiated a marriage between his son Philip, and Mary the daughter of that monarch, obtained donations from the states of Aragon and Valencis, and a valuable consideration from Ofria de Medici for withdrawing his garrisons from the citadels of Florence and Leghorn, and prevailed with Henry of England to declare on his side. Under these circumstances, it might have been expected that Charles would have opened the campaign of 1544 with vigour; but after providing for the security of Spain, and detaching a body of Spanish troops into the Netherlands, he passed into Germany, and preferred the intrigues of the diet to engaging in the operations of the field. He at length signed his final treaty with Francis, in which, besides the public articles, there was a private agreement for the extermination of the protestant heresy. He now summoned the diet to Ratibon, whether the Protestant sect deplored, though the Roman catholic members appeared in person. The emperor, while the elector of Saxony and the landgrave of Hesse were hesitating whether to renounce their homage and restore war, had been reinforced by Paul's quota of troops, and some of his own Spanish forces. He determined, however, to wait until his lines till the protestant force should be dissipated by diffusion and necessity. As soon as Maurice of Saxony, with whom he was in secret league, had by an intercept withdrawn the elector to the relief of his subjects in Saxony, the emperor put his troops in motion in the winter of 1547, and reduced the duke of Wurttemburg, the cities of Ulm, Augsburg, and Straubourg, to submission. At this period he was the most formidable of the parties which have been called the star of the house of Austria. Francis died at Rambouillet, in the thirty-third year of his reign. From this source of duellistic, the emperor crossed the Elbe, leading his cavalry in person, together with the flower of his army, routed the Saxons, and took the elector prisoner. Having now dispersed his enemies in the field, Charles summoned a diet at Augsburg, and in the year 1548 proposed that ycleum of doctrine, known by the name of the Interim, which was confided by both parties as an unsatisfactory and infamous compromise. But the power of the author ensured its reception everywhere, but in Magdeburg, Bremen, Hamburg, and Lubeck. On the death of Paul, and the succession of Julius the Third to the apostolical chair in 1555, the emperor began to cherish the ambitious design of transmuting the German empire to his son, as well as the kingdom of Spain, and his dominions in Italy and the Low Countries. But he met with a powerful obstacle in the jealousy of his brother Ferdinand. The Germans were besides dissatisfied with the revenge and haughty manners of Philip, and alarmed at the concentration of so much power in the head of the empire; so that Charles was reluctantly compelled to drop the scheme. He therefore refrained the enforcement of the interem, and would probably have succeeded completely, had he not been deceived by Maurice, whose intricate plan of policy blinded the most quick-fisted prince in Europe. In 1551, the diet pointed Maurice out as the most proper general to enforce the reception of the interim, and Charles approved of the recommendation. His credulity could not fail of placing him at length in a most embarrassed situation, and he tried the effect of negotiation. The danger of the emperor at Innsbruck and his sudden retreat by torch-light are well known; and these two masters of finefeet came to a better understanding, which terminated in a peace, and the establishment of the protestant church in Germany, by the treaty of Passau in 1552.

But the German princes, engrossed by their own concerns, took little care of the French, who were expostulated to the refitment of Charles. Emerging from his retreat, he advanced to march towards Hungary, but turning suddenly to the right, and being joined by Albert of Brandenburg, invaded Metz at the head of eighty thousand men. His intentions having been anticipated, the city was ably defended by Francis duke of Guise; and notwithstanding the emperor's perseverance even to obstinacy, founding himself defeated by his soldiers, whose spirits had been exhausted by hardships, and whose numbers had been thinned by a pestilential disease, he yielded to the solicitations of his generals, and retreated. His disappointment exasperated him to a feverish caution against fortune, whom he likened to other females, in her preference to young men, and insouciance to her earlier favourites. In 1553, however, he effaced in some measure the disgrace of his repulse at Metz, by the capture of Terouanne and Hesdin.

In 1554, the French king determined to act vigorously both in the Low Countries and Italy, that he might compel Charles to an equitable peace. He ravaged Hainaut, Liege, and Artois; reduced Marienburg, took Bouveires, and Danzig by assault, and invaded Rends, to the relief of which
which the emperor marched notwithstanding his infirmities. He wished to avoid a decisive action, but a dispute about a post brought on a general engagement, in which the Imperialists were repulsed, and might have been completely routed, but for the tardiness or jealousy of the enemy. The emperor, on his retreat, entered Picardy, and took his revenge for the ravage of Hainault and Artois. In Italy, his general, the marquis of Merano, defeated the Florentine exile, Strozzi; Siena was besieged, and capitulated on honourable terms; and Charles was in hopes of recovering Metz by an intrigue with the father guardian of a convent of Franciscans in the city. But in this design he was disappointed by a delivery on the very day of execution. The death of pope Julius the Third, and the exaction of cardinal Caraffa, the invertebrate enemy of his house, augmented his chagrin, and he now, at the early age of fifty-six, determined to retire from public life. Both his constitutional and mental powers began to be seriously impaired by the increasing severity and duration of the gout; the complication of his political concerns, extending to every nation of Europe, was beyond his strength to manage, and he had a natural gift of mankind. He therefore thought that he should better consult his fame by a voluntary retreat than by continuing to struggle against the tide of more active and vigorous competition. On the twenty-fifth of October, 1555, when the States of the Low Countries were assembled at Bruxelles, Charles seated himself for the last time in the chair of state, and explained, by the president of the council, his intention in calling the meeting. He then rose from his seat, and leaning on the prince of Orange’s shoulder, took a solemn review of his own administration, and pathetically detailed his reasons for retiring. He addressed his son in a strain of serious and dignified exhortation, in which he enjoined him to prove his gratitude by confiding the welfare of his people. Exhusted by this long address, he sunk into his chair, more honoured and beloved by his subjects in his new character of a philosopher, than when dazzling their eyes by the pomp of state, and swelling their pride and his own by conquest and grandeur.

In the beginning of the next year, he resigned the crown of Spain, and all its dependencies, referring nothing to himself but an annual pension of an hundred thousand crowns, for domestic expenses and charity. His last public act was the negotiation of a long truce with France, by which he secured his son an interval of peace, and finding it hopeless to tamper with his brother for the transfer of the imperial dignity to Philip, he cloistered all by formally transferring his claims of allegiance from the Germanic body to the king of the Romans. On his way to the place of his retreat, he visited Ghent, the place of his nativity, and after a prosperous voyage, arrived at Laredo in Biscay. As soon as he landed, he prostrated himself on the earth, and said, “Naked I came out of my mother’s womb, and naked I now return to thee, thou common mother of mankind.” He felt mortified at the thin attendance of Spanish nobility at Burgos, and was still more affrighted at his son’s ingratitude and ditillary payment of his pension. His retirement was fixed at the monastery of St. Justín, a few miles from Pazzecina in Etremadura, with which spot he had been stricken in passing by it some years before. It was esteemed the most healthful and delicious situation in Spain; and an architect, whom he sent before him, had accommodated the arrangements to the simplicity of his future habits. His plan of life was that of a private gentleman, from which all ceremonious forms were discarded. He never inquired after the politics of Europe, but occupied himself with the cultivation of his garden, and the exercise of riding on a little horse, the only one he kept. He occasionally entertained a few neighbouring gentlemen at his table, and lectured mechanical principles with Turrano, an ingenious artist, who accompanied him in his retreat. A considerable portion of his time was devoted to religious exercises, and in this dig- nified leisure did he pass the first year of his seclusion. But the debility arising from a broken constitution, and the natural tendency of a superstitious faith and practice, at length degraded his sinking mind to the servility and infancy of monastic penances. Promoted by the monks, to whose direction he had resigned himself, he resolved to celebrate his own obsequies, which he did with all the solemnity of a real funeral. The awful impositions which the ceremony, however absurdly and improperly devised, had left upon his mind, hastened the event which he had so vaguely anticipated. On the following day he was fezd with a fever, and expired on the twenty-first of September, 155^, in his fifty-ninth year. The character of his mind was rather that of careful and deliberate attention than of brilliant talents or rapid conception. He preferred benevolence to pleasure, and made public concerns at once his study and amusement. But his promptitude in execution was equal to his patience in deliberating; he was at once fagacious in devising measures, and firm and resolute in carrying them forward. Though he devoted himself more to the cabinet than to the field, he never appeared at the head of his armies without entitling himself to rank with the greatest generals of the age. But his principal excellence consisted in the felicity with which he applied the important science of human nature to the choice of fit agents and the adaptation of abilities to situation and office. If his manners were less pleasing than those of his rival, his virtues were at least as solid, and his adherents as faithful and attached. His confidence in his generals was unbounded; he rewarded their services munificently; he neither envied their glory, nor mistrusted their intentions. But his ambition was infatiable, and his policy too often ungenerous; while his contemporaries, Francis the First and Henry the Eighth, with numberless vices from which he was exempt, were characterized by an openness and credulity, which made them more popular, principally because it rendered them less dangerous.

Charles seems to have lived more in the Netherlands, than either in Spain or Germany. And it was during his reign that so many great composers flourished in that country, as to incline musical historians to assign to them the invention of counterpoint. Rabaisius, in the prologue to the 3d book of his Pantagruel, written in 1552, names 60 et autres joyeux musiciens, whom he had heard perform, the chief of whom were Netherlanders. Sandowal, in his life of the emperor Charles V. tells us that he was a great friend to the science of music, and after his abdication, would have the church-offices only accompanied by the organ, and sung by fourteen or fifteen singers, who were good musicians, and had been selected from the most expert performers of the court. He was himself so faithful, that he knew if any other singer intoxicated, and if any one made a mistake, he would cry out, such an one is wrong, and immediately mark the man. He was earnest too, that no secular should come in; and one evening, when a contango from Phæseta’s flood near the death with the fingers, and sung one verse with them eminently well, before he could sing another verse of the barbarians ran and told the prior to turn him out of the choir, or at least bid him hold his tongue.

The emperor understood music, felt and talked its curiosities; the singers often discovered him behind the door, as he sat in
Charles XII.

Charles VI., fifth son of the emperor Leopold, was born 1683, declared king of Spain by his father in 1700, and crowned emperor in 1711. Though we never heard, from good authority, that this prince was a poet, a musical composer, or performer, his retaining Apollo Zino and Meta-flario so many years in his service, chiefly to furnish dramas for music, and employing the bell composers of the time, of whatever country, to let them, and every great vocal performer of good morals to sing in them, prove him to have been an intelligent, munificent, and dignified patron of the musical art, in all its higher departments, fancied and professed. See Operæ et Oratorio.

Charles XII., king of Sweden, was born in 1682, and succeeded to the crown on the death of his father Charles XI. in 1697. According to the laws of the state, he was not at first crowned till he had attained the age of 18, but he speedily emanciped himself from the restrictions by which the will of the late king intended him to be bound. In very early life he had been trained to violent and martial exercises; and had in a thousand trials shown an impracticability of disposition, which no force could conquer, but which was always alive to sugggestions of military glory. He was invited to the study of Latin, because his contemporaries, the kings of Poland and Denmark, were reputed to be well versed in that language. From reading the history of Alexander, by Quintus Curtius, his passions were inflamed with a desire of imitating that renowned conqueror, and of becoming himself another Alexander in feats of martial prowess. With this view, he, in a short time after his father's death, gained over a party in the council to deprive the dowager regent of her authority, and to surrender to him the reins of government without any limitations. An easy way was fixed for his coronation; but he, unwilling to wait for the formal forms that long custom had rendered necessary on such solemn occasions, corruptly snatched the crown from the hands of the archbishop of Upps, and placed it on his own head. At first the young king seemed little ambitious of entering into the details of government; he was fond of amusements, and attached to those who were subfervient to his pleasures; but to others, however high their rank, and respectable for talents and wisdom, he exhibited a proud and fullf him.

The inexperience of Charles encouraged the kings of Poland, Denmark, and the czar of Russia, to enter into a confederacy against him, for the purpose of wresting from him a part of his dominions, which had been ceded to his father and grandfather. The youthful monarch was not desconcerted at the news of this powerful league; he seemed rather to rejoice that an opportunity would be afforded him of displaying his hitherto latent courage and abilities. When their deigns were certainly known, a Swedish council was convened, at which the king attended, for some time, the silent spectator of their proceedings; in the midst, however, of their discussions, respecting the measures to be pursued, he rose, and with a dignified air declared that he had determined never to engage in an unprofitable war, but having been drawn into one by the ambitious views of an enemy, he would never desist till he had humbled and ruined him. "It is," says he, "my resolution to go and attack the first who shall dare to marrow his designs; and when I have conquered him, I trust the others will be intimidated." This declaration, so unexpected on the part of his council, was followed by a total change of counsels. He gave up all his former amusements, and renounced those habits and indulgences that might seem to withdraw his attention from the more important business of his country. In his domestic concerns he enjoined, by factions not to be flighted, the strictest economy; he had since all the exterior splendour of dress; and prepared to exhibit in his own person the flutean style and the hero.

The Danes, commanded by the duke of Wartenburg, attended by the king in person, commenced the attack, by invading the duchy of Holstein, which belonged to the brother-in-law of Charles. The Swedish sovereign at first sent a body of troops to his foe, and some attempts were made at negotiation between the parties; but the Danish kings, instead of yielding to the ill voice of peace, excited the sovereignty of Poland to invade Livonia with a Saxen army, to draw off the attention of the Swedes from attacking the duke. The king was no sooner informed of this circumstance, than he drew his sword, determined not to yield an inch to the设计s, but hurried the invaders into a state of complete humiliation. He quitted his capital in May 1700, to revisit it no more; and, embarking his troops at Copenhagen, sailed for Denmark, and proceeded at once to Copenhagen. As soon as the vessel in which he was touched the ground, he leaped into the sea, sword in hand, followed by his guards and great officers; and advancing in the midst of a shower of muskelt-shot, he asked of the general who fled near him, what the whiffing was which he heard: "It is the noise of the bullets fired at you," replied the general. "This then," said the king, "shall henceforth be the musk in which I will delight." At the fame moment the general was wounded, and a lieutenant fell dead by his side. The Danish entrenchments were speedily forced, and Charles approached Copenhagen without further opposition. The king of Denmark had taken refuge with his army in Holstein. Under these circumstances, Charles resolved to finish the war at once, and prepared to besiege Copenhagen by land, while the fleet blockaded it by sea. The citizens, defeterd by their sovereign, and terrified at the preparations making by Charles, besought him not to destroy the town; and the king on horseback, at the head of his regiment of guards, received the deputies, who fell on their knees, and whose request he granted, on the consideration of their paying a certain sum of money. The king of Denmark, finding his capital gone, and himself without the means of extricating his country from the power of the Swedes, was glad to listen to almost any terms that might be offered. The victorious monarch assured him that he required nothing but justice to be done to the duke of Holstein, which must include a complete indemnification for all his losses, as well as a restoration of all his possessions. Thus, in a few weeks, did a youth only 18 years of age conclude a war on terms the most honourable to himself, and to the total discomfiture of the aggressor. In the mean time Riga, the capital of Livonia, had been so bravely defended, that king Anglius of Poland, in despair of taking it, raised the siege. At this period, the Swedes, after the example of their king, were feted with an enthusiastic
for military glory, that allowed no time for reflection. Taxes, which are the fines of war, were considered and readily granted as an honorary tribute; and every family was ambitious of furnishing a folder. The troops soon became habituated to the toils and privations connected with a military life, and were contented with the coarsest fare, and that even in small quantities.

No sooner had Charles concluded a treaty with the king of Denmark, than he turned his arms against the Russians who had undertaken the siege of Narva, with 80,000 men. The Swedish monarch, though at the head of 20,000 troops, advanced to the relief of the place with less than half that number. When he was within sight of the Russian vanguard, he was urged to select upon the great disparity of numbers; to which he replied, "Do you doubt whether the king of Sweden, with 8000 men, can beat the czar of Russia, who is at the head of 80,000 men?" The Russians at first found the shock with advantage; but, after an engagement of three hours, their entrenchments were forced with great slaughter, and Charles entered Narva in triumph. The Swedes captured many times their own number of prisoners, butchered all the enemy's artillery; but the king only retained the principal officers, whom he treated with great kindness. On this occasion the czar, who was absent from this battle, failed, "I knew that the Swedes would beat us; but, in time, they will teach us to become in our turns the conquerors."

A close alliance was now formed between the czar and the king of Poland; and the latter engaged to furnish a large succour of German. Charles having passed the winter at Narva, entered Lithuania, and appeared in the neighbourhood of Riga. He passed the Dvina, on the banks of which were posted the Poles and Saxons, whom the Swedish monarch attacked with great bravery, and after an obstinate and bloody engagement, gained a complete victory. He then advanced to the capital of Courland, from whence he passed into Lithuanian, and entered in triumph the town of Bergen, where the czar and the Polish sovereign had a few months before planned his destruction. The king of Sweden now determined to dethrone the sovereign of Poland; the intrigue formed in that country facilitated the enterprise; and Augustus finding little resource in the attachment of his subjects, attempted to negotiate, and employed for the purpose the courtiers of Königsberg, one of the most captivating women of the age; but all her seductions were useless against him who had renounced pleasure, and who, as a farther security to his virtue, constantly refused an interview. Aware also of the discontent of the Poles, he entered into a secret correspondence with the miscontents, and marched into Warfaw, which opened its gates to him at the first summons. He was soon waited upon by the leaders of the discontented party, to whom the Swedish monarch gave the most positive assurances that he would never give the Poles peace till they had elected a new king. Augustus, being informed of these proceedings, assembled all his troops, which were at least double the number of those under his opponent. The contesting kings met in a plain between Crecow and Warfaw: the attack was begun by the Swedes, and though the battle was fought with the greatest valour on the part of Augustus, yet victory declared itself for Charles. It cost him, however, the life of his friend and relation, the duke of Holstein, over whom he shed tears of unsatisfied affection. The king of Sweden marched to Crecow, which immediately surrendered; and Augustus fled into Saxony; in the pursuit of whom Charles unfortunately fell from his horse, and broke his thigh, an accident which detained him some weeks in a state of inactivity. A second victory obliged the Polish sovereign to provide for his security by retiring into Saxony. At length the Poles resolved to depose their sovereign, which was effectuated in February 1704; and Stanislaus Leszkinski was chosen his successor on the 12th of the following July, and by the interell of Charles he was crowned at Warfaw the 16th of October.

The czar sent 60,000 Russians to attack the Swedes in their conquests; they entered Poland in separate armies, and were joined by a great number of Saxons and Cullacks. Charles attacked and defeated the Russian troops, and nothing could impede the progress or equal the celerity of the victorious Swedes. If a river interposed, they swam over it; and the Swedish monarch, at the head of his cavalry, marched 30 leagues in 24 hours. Struck with consternation and dismay at these rapid movements, the Russians retired beyond the Donibehren, and left Augustus to his fate; who, was, in a short time after, compelled to renounce his pretensions to the crown of Poland, and to acknowledge Stanislaus lawful sovereign of the kingdom. He renounced, at the same time, his alliance with the czar, his most powerful friend, and gave up all the subjects of Charles who had withdrawn their allegiance, and especially Patkul, who at the time bore the character of ambassador to the czar. While the treaty was pending, Charles and Augustus had an interview; during which the dethroned sovereign received marks of studied civility from the conqueror, but he was nevertheless obliged to submit to his will, even to the writing a letter of congratulation to his rival and successor for Stanislaus. Such conduct on the part of the Swedish monarch cannot be justified on any principle, and the savage treatment of the virtuous Patkul, whom he caused to be broken on the wheel, with every circumstance of ignominy and severity, will for ever impair the character of emperors, worthy of general indignation.

Charles, now in the zenith of power and reputation, compelled the emperor of Germany to make some very humiliating concessions in favour of his Protestant subjects in Saxia, of whose interests he declared himself the protector. But his heart was principally occupied in measures of revenge against the czar, whom he determined to dethrone, as he had done Augustus; for this purpose he marched at the head of 45,000 men from Saxony. The czar was at Grodnau in Lithuania, whither Charles followed him, in the depth of winter, and entered the city at one gate as the czar went out of the opposite one. Determined on his object he purified the Russians and drove them across the Dnieper. In his way, with the advanced guard alone he defeated a large body of them entrenched behind a morass. The czar Peter began now to be fearfully alarmed for his empire, and caused proposals of peace to be made; to which the haughty king answered, "I will treat with the czar at Moscov." To this the czar replied with diffidence, but in the tone of a prediction, "My brother Charles is determined always to act the Alexander, but I flatter myself he will not find me a Darius." In the month of October, 1708, he had arrived within 100 leagues of the Russian capital, when impassable roads and a scarcity of provisions induced him suddenly to turn aside into the Ukraine. A rigorous winter now commenced, which to the Swedes, who were unprovided with proper clothing and necessaries, was so far infupportable that in one march two thousand of them perished with cold. Charles, however, flared with his soldiers all the hardships incident to the situation, and thus inspired them with principles of patience and fortitude fearlessly to be expected. In April, 1709, the whole army under the Swedish monarch was reduced to about 35,000, and in a few weeks the king penetrated to the town of Poltowa on the eastern frontier of the Ukraine. Here the czar had laid up
his magazine; it was therefore of the utmost importance to Charles to gain possession of the place. He accordingly invested it, but his operations were interrupted by the approach of the enemy at the head of 70,000 men. Charles always unwilling to yield to another what he could himself perform, went to reconnoitre the enemy, and was wounded by a musket shot, which broke the bone of his heel. No change in his conduct betrayed the wound to his attendants, and he continued six hours longer on horseback giving his orders with the greatest tranquillity. He was, at length, carried to his tent in executive agencies, and such was the nature of the wound that the surgeons were of opinion that the king must lose his leg. Another mode was, however, adopted, and the king, during a painful operation, kept his leg steady with both hands, looking on like an indifferent spectator. The czar having collected all his forces, was advancing, and to the Swedes a retreat seemed impossible. Without calling a council of war, Charles refused to wait for the enemy in his entrenchments, but ordered a general attack for the next day, and then went to bed. On the 8th of July, 1700, was fought the celebrated battle of Pultowa which decided the fate of the Swedish king: he caused himself to be carried in a litter, at the head of his infantry, and after the combat of cavalry, which was disastrous to his cause, he advanced against the Russian line, defended by a formidable artillery. One of the first volleys killed two horses of his litter, by another, two fresh horses were killed, and the litter dashed to pieces. He was then carried by his life-guards, and of the twenty-one were destroyed out of twenty-four. The Swedes began to give way on all sides; their principal officers were killed or made prisoners, nine thousand were left dead on the field of battle, and their camp at Pultowa was forced. Even in this extremity the king refused to fly. By the orders, however, of Poniatowski, he was placed on horseback, notwithstanding the pain occasioned by his wound, and about five hundred horse rallied around him, by whose exertions he was conveyed safe through ten Russian regiments, and brought to his baggage. As long as he reached the Dnieper, whither Lewenhaupt had gone with what remained of the army, amounting to about sixteen thousand men of various countries. There were chiefly pursed by the Russians, to whom they eventually surrendered, with the exception of the king, who was conveyed across the river in a small boat, a few of his officers who accompanied him, and about three hundred Swedish horses, with a number of Poles and Cossacks, who ventured to swim across. With these Charles escaped to Bender, a Turkish town in Moldavia. Here he was received with every mark of respect, and remained in a state of inaction, employing himself partly in military exercises, partly in reading, and playing chess. The Turks and neighbouring Grecians, hearing of his exploits, flocked in crowds to see him. His indefatigable resolution to abate from wine, and his great regularity in conforming to their customs, and in attending at their religious services, made the Mahometans consider him as a true believer, and inspired them with an ardent desire of marching under him to the conquest of Russia.

While thus at a vast distance from his kingdom, his enemies were busy in pulling down all the fabric of power which he had reared by his conquests. Augustus returned into Poland, and repopulated himself of his throne. The czar took Wiborg, and all Carelia, poured his troops into Finland and laid siege to Riga. The king of Prussia invaded Swedish Pomerania; and the king of Denmark made a descent on Schonen, and took the town of Helsingburg. The Swedes however, remained firm; and the disaffection of their king rather enhanced their loyalty and patriotism than diphirited them. The idea of dethroning the czar of Russia was still uppermost in the mind of Charles: he solicited the affiance of the Ottoman Porte, and Archmet III. the reigning sultan, sent him a present of a thousand ducats, while the grand vizier paid to his envoy, "I will take your king in one hand, and a sword in the other, and conduct him to Moscow at the head of 200,000 men." The czar's money, however, changed the sentiments of the Turkish ministers, who laid aside all thoughts of war. The military chieft which Peter had taken at Pultowa furnished him with new resources against the vanquished Charles, whose treasures were turned against himself. The hopes which the fallen king had entertained against his enemy being thus frustrated, he accused the grand vizier with corruption, who in his turn procured an order for him to leave the Turkish dominions, but with this he refused to comply. By some unexpected changes in the Ottoman court, his interest again prevailed, and liberal offers were made of finding him home with a large treasure. He retired from the windows upon the Turks, and with this he was not contented, but persevered in demanding money for his convey; and at length he refused to go at all, though he had received 12,000 purces from the grand vizier to pay his debts and defray his expenses. An order was given to compel him to depart, but Charles determined to retake the whole Ottoman power with 500 Swedes, and actually began fortifying his camp in the face of an army of 20,000 Turks and Tartars. No enticement against this mad project had any avail, he conceived his honour concurred, and no considerations of prudence or humanity had weight with him. The Janizaries unwilling, from a respect for his character, to proceed to extremities, sent a deputation of their fencers to propose terms of accommodation; but instead of listening to them, he threatened to cut off their beards, if they did not depart. "Let the iron-head then perish, if he will perish," they indignantly replied, and the attack immediately commenced. The little camp was soon forced, and the 500 Swedes were made prisoners. Charles fought refuge in his house, together with a few general officers and domesties. After he had fled from the windows upon the Turks, 200 of whom he killed, and bravely maintained himself under the edifice was in flames. In this extremity a constant had the presence of mind to observe that the charcary-house, which was at the distance of fifty yards, had a stone roof, and was proof against fire, and in which they might defend themselves to the last. "There is a true Swede," exclaimed the monarch, rushing out, like a madman, at the head of a few desperadoes. "From respect to the person of the king, the Turks at first recoiled, but recollecting their orders, they made him prisoner, and carried him, by main force, to the tent of the bashaw. That officer sent the Swedish monarch in a chariot to Demotica, a small town at the distance of ten leagues from Adrianople where the emperor then resided with his court. Here he remained a considerabe time, and left the Turks should not pay him the respect due to his royal person, or should be tempted to exact from him any thing beneath his dignity, be feigned illness, and confine himself to his bed for the space of ten months. It was generally believed throughout Europe that he was dead, and the future of Sweden no longer expecting his return, requited his sultan to undertake the regency. She found him not at all willing to comply, but finding it was their intention to put an end to the wars which were ravaging their country, she refused to act, and sent her brother word of their proceedings. He indignantly wrote to the senate, that if they pretended to interfere with public affairs, he would send one of his hosts to govern them.

Weary of the state of inactivity in which he lived, he obtained
tained permission to return to his own dominions. He took a formal leave of the Turkish court by a very splendid embassage. He set out on his return in October 1714, and after crossing the land and sea to Stralsund, he arrived in the night at Stralsund: he was admitted with difficulty, but as soon as he made himself known, the whole city was in a blaze of illumination for joy at his arrival. Charles found his affairs in a very distressing state; but without giving himself time to reflect upon this, he dispatched orders to his generals to renew the war with fresh vigour. Intoxicated by the presence of glory, all the young men crowded to the standard of their king, and fearlessly they were left for the labours of agriculture but the aged and infirm, who were little qualified to save Sweden from a famine, with which she was threatened. On opening the campaign, Charles was surrounded by so many enemies, that value could be of little service, without a greater force. The combined army of Prussians, Danes, and Saxons, invested Stralsund, in hopes that the king would there perish, be taken prisoner, or be compelled to make peace. The idea of Rügen being possessed by the enemy, it was of importance to dislodge them; Charles made a desperate attempt for that purpose, but was repulsed. He returned to Stralsund, pursued the siege in person, and performed, as usual, prodigies of valour. The fall of the city was, however, inevitable, and fearing lest he should come into the hands of the enemy, he embarked in a small vessel, and by favour of the night, passed safely by through the Danish fleet, and was landed in Sweden. The next day the town capitulated. He wintered at Carlscroon, and was permitted to visit his capital till he could appear there under more prosperous circumstances. He raised new troops, and in the following spring made an invasion into Norway with twenty thousand men. He pushed on as far as Christiansia, but for want of provisions, was obliged to return to Sweden. He now, through his minister, the baron de Gueritz, effected a peace with Russia, and began to devise means for the de-thronement of George I. of England, and the restoration of the Stuart family. Another object of his ambition was to re-establish Stanislas in Poland. To effect these purposes, an alliance was formed between Sweden and Russia, by the intervention of cardinal Alberoni, an Italian, a man of considerable activity and enterprise. The impetuosity of Charles, the alliance which he had formed, and the ambition of his minister, seemed ready to overturn the system of Europe. In the interval, however, of preparing for this vast enterprise, the Swedish monarch, as if willing to lose no time, invaded Norway, in order to wrest it from the king of Denmark, and thus indemnify himself for the provinces which he had ceded to the czar. He formed the siege of Frederickshald, in the month of December, regardless of the cold of a Norwegian winter, which not unfrequently froze the channels to death on their polts. To animate his troops, the Swedish sovereign exposed himself to all the rigour of the climate, and to the dangers of the siege; and, covered only with his cloak, usually slept in the open air. Anxious to finish the siege, he, on the evening of the 11th of December, visited, with his principal engineer, the trenches that had been formed. He was rolling with his elbows upon the parapet, attending to the workmen who were opening the ground by hand-light. Almost half his body was exposed to the battery of the enemy, which was firing grape shot at the very spot in which he died. He had been in that dangerous situation some time, with no one near him except the chief engineer, and an aide-de-camp, when he was seen to fall upon the parapet, heaving a great sigh. He was taken up dead, with his forehead beat in by a cannon shot, and his right hand grasping the hilt of his sword. Such was the end of this extraordinary character, though there have been historians who maintain that he was assassinated by the French aide-de-camp, Sigeur; but after investigating all the circumstances that attended the event, there is no good reason for believing other than that he received his wound from one of the Danish battalions.

Charles died at the age of 56 years and 6 months, after a reign of 21 years. His military talents may command admiration, but there was little in his character to awaken in the feelings any emotions of attachment or esteem. He possessed many eminent, but few, if any, amiable qualities. He was a mere soldier; in person he was well formed: in conversation he was awkward and bashful: he was just, but rarely exhibited any traits of kindness. Charles seems never to have known what it was to fear, and the bluntness of his feelings rendered him incapable of hardships and dangers for himself and others. His wonderful intrepidity and perseverance in whatever he undertook; his fortitude under misfortune; his contempt of danger, and his passion for glory, will for ever rank him foremost among military heroes, but no king was ever more lavish of human blood, or ever less consulted the real interests and happiness of his people. Univer. Hist. Voltaire Hist. de Charles XII. Du Frenays. Coxes Travels, vol. 4.

Of the other eleven Charleses of Sweden, there is little to be said to entitle them to separate articles in this work. Charles Canuto, the eighth of that name, from grand marshal in the reign of Eric, made himself sovereign in the year 1454. In the exercise of his office he was twice compelled to renounce all pretensions to the crown. He retired to Finland, where his credit was so low, that the archbishop refused him a small loan. His retreat did not give peace to his distracted country, he was accordingly recalled, and put in possession of all the honours of sovereignty; and in 1470, he closed an eventful life, resigning his kingdom to his nephew Sture. The historians of his country have praised for his regard to justice, as well as for political talents: he is said also to have been versed in philosophical and mathematical knowledge.—Charles X. was born in 1622, and very early engaged in military service. His rank and high reputation as a military commander caused him, in 1648, to be appointed general in chief of the Swedish forces. In 1655, he succeeded to the crown. He immediately revived the martial spirit of the country, and during the six years of his reign was engaged continually in war. He died in 1660, of a fever, leaving behind him a considerable reputation for private virtues, which were wretched compensations for the disasters which he inflicted on his country, by an inordinate ambition, and a fondness for martial glory.—His son, Charles XI. though a minor, at the death of his father, concluded an advantageous peace with his neighbours. In a few years he made himself absolute, after which one of his first measures was to raise the nominal value of the coin, in order to liquidate the public debts. Such a step is always unjust, and in general, very injurious to the state that adopts it. He forbade the exercise of any religion except the Lutheran, and performed many other acts of despotic authority. His subjects remonstrated against his assumed arbitrary power by means of deputes; these he caused to be prosecuted and convicted of high treason, among them was Petkull, who pleaded the cause of his country with energy and manly eloquence, for which a sentence of capital punishment was passed against him, which he avoided by flight. The character of this monarch was stern, inflexible, and unfeeling; in reply to his queen, who was interfering in behalf of some of his subjects grievously oppressed, he said, "Madam, we have taken you to bring us children, not to give
Charles Emmanuel III. is, however, by much the most celebrated of the dukes of Savoy. He succeeded to the throne, by the voluntary resignation of his father, in 1730, with the titles of duke of Savoy and king of Sardinia, his predecessor having, at a general peace in 1713, been given Sicily, with the title of king; this, in four years after, he exchanged with the emperor for Sardinia, which it was agreed he should enjoy with the regal title. This prince, in 1731, united with France and Spain in a war against Austria; and in 1742 he allied himself with the queen of Hungary. During the several wars in which he was engaged, he experienced many reverses of fortune, but was for the most part successful. When he had obtained a peace, he devoted himself to the establishment of such regulations as might be beneficial to his subjects; he was particularly anxious to pay the debts which had been incurred by the war. When he had accomplished that favourite object of his heart, he exclaimed, "This day is the happiest of my life; I have just now suppressed the last of the extraordinary taxes." "How few," says a contemporary writer, "of the occupiers of thrones, have been capable of feeling such a pkasure?" His moderation and attachment to his country kept him free from the war of 1756, and in 1763 he enjoyed the felicity of acting as mediator between the contending powers. He zealously promoted every thing that could render his kingdom prosperous. He corrected the abuses of law by a new code, which was afterwards published at Paris, in 2 vols. 1760. By his example, as well as by edicts, he sanctioned the principles of economy and good morals. He died on the 22d of February, 1777, leaving behind him the character of a wise and good king. Du Frenay. 

Charles, Cape, in Geography, a cape on the east coast of Labrador, N. lat. 52° 27'; W. long. 55° 25'.—Also, a cape of America on the coast of Virginia, at the east side of the mouth of the Chesapeake. N. lat. 37° 12'. W. long. 75° 58'.

Charles River, a river of America, in the state of Massachusetts, anciently called Quinnibogen, the principal branch of which rises from a pond bordering on Hopkinton. It passes through Holliston and Bellingham, divides Medway from Medfield, Westham, and Franklin, and proceeding to Dedham, forms, by a curious bend, a peninsula of 950 acres of land. A stream, called "Mother Brook," runs out of this river in this town, and falls into Neponset river, forming a natural canal, uniting the two rivers, and affording a number of excellent mill-falls. From Dedham the course of the river is northerly, dividing Newton from Needham, Welton, and Waltham, passing over romantic falls; it then bends to the N.E. and E. through Watertown and Cambridge, and falling into Bolton harbour, unite with the waters of Mystic river at the point of the peninsula of Charlestown. It is navigable for boats 7 miles to Watertown. The most remarkable bridges on this river are seven which connect Bolton with Charlestown and Cambridge. On this river are seven paper mills, besides other mills.

Charles County lies on the western shore of Maryland, between Potomack and Patuxent rivers. Its chief town is Port Tobacco, on a river of that name. Its extreme length is 28 miles, and breadth 6 and 1/2, and it contains 20,016 inhabitants, including 10,385 slaves. The country has few hills, is generally low and sandy, and produces tobacco, Indian corn, sweet potatoes, &c.

Charles, a cape on the S.W. part of the coast entering into Hudson Bay. N. lat. 62° 42'. W. long. 74° 15'.

Charles
CHARLESTON, in Geography, a post town of Cecil county, in the state of Maryland, near the head of Chesapeake bay; 6 miles E.N.E. from the mouth of Susquehanna river; 19 W.S.W. from Elkton, and 59 S.W. by W. from Philadelphia. N. lat. 39° 34'. In this place there are about twenty houses, chiefly inhabited by people who are employed in the herring fishery. Beyond it the country is much diversified with hill and dale; and the soil being of an indifferent quality, the lands are so little cleared, that in many parts the road winds through uninterupted woods for four or five miles together. The scenery in the neighbourhood is highly interesting. Near Charleston there is a small foundery for cannon, which are bored by water, and of which two 24 pounders are manufactured every week. The iron is extremely tough, so that few of the guns built on being proved.

CHARLESTON, a district in the lower country of South Carolina, lying between Santee and Combahee rivers, and divided into 14 parishes. To the late legislature it lends 48 representatives and 13 senators, and to congre on one member. It contains 66,996 inhabitants, of whom 16,532 are free; and pays taxes amounting to $14,734. ed. Sterling.

CHARLESTON, the most considerable town, though not the present seat of government, in the state of South Carolina, situate in a district of the same name, on a tongue of land formed by the confluent streams of Ashley and Cooper, two large and navigable rivers, though not of great extent. By their union below the town they form a spacious and convenient harbour, which communicates with the ocean at a distance of about 7 miles below Sullivan's island. The tide in these rivers which commonly rives about 6½ feet, has the singular property of uniformly rising 10 or 12 inches more in the night.

The situation of the town is flat and low, and the water brackish; but the agitation occasioned by the tides, and the refreshing sea breezes contribute to render it more salubrious than any part of the low country in the southern states. The freets, though too narrow for a place so large, and so warm a climate, are regularly formed; running from E. to W. and from river to river, they open in beautiful prospects, and they are kept clean and healthy by means of subterraneous drains. The freets are interfetted at right angles by others, which divide the town into a number of squares. The modern houses are chiefly confructed with brick and have tiled roofs; and many of the buildings are neatly, elegant, and airy. The public edifices are an exchange, a flate-houfe, an armourey, a poor house, and an orphan's houfe. Besides several respectable academies, here is a college adapted to the accommodation of a number of students. The two banks of Charleston are a branch of the national bank, and the South Carolina bank, established in 1792. The places of public worship are, two episcopal churches, two for Independents, one for Scotch Presbyterians, one for Baptists, one for German Lutherans, two for Methodists, one for French Protestants, one for Quakers, a Roman Catholic chapel, and a Jewish synagoge. The adjacent country abounds with poultry and wild ducks; fish are rare in the market; and with regard to the beef, mutton, and veal, they are not generally celebrated of the bell kind. Charleston was incorporated in 1753, and divided into 13 wards, in which are as many wardens, chosen by the inhabitants, one of whom is elected intendent of the city, by whom and the wardens is formed the city council, which is empowered to make and enforce bye-laws for the regulation of the police. The number of inhabitants was estimated in 1787, at 15,000, including 3400 slaves, and occupying 1600 houses.
houfs; but in 1791, the inhabitants amounted to 16,750, of whom 7684 were fliues. This town has often suffered by fire, and particularly in June 1796. The value of exports from the port of Charleston in the year ending Nov. 1797, amounted to $5,527,341. 56, Sterling, and the number of vessels cleared in that year from the custom-house was 587, of which 753 were American, and the rest belonging to Great Britain, Ireland, Spain, France, and the United Netherlands. In 1794, the value of exports amounted to $3,846,392 dollars. The light-house of this town lies in N. lat. 32° 45', W. long. 79°, 496; 496 of the inhabitants, being by the late census of 1796, electors.—Alfo, a township of Mason county in Kentucky, fittuated on the Ohio at the mouth of Lauren's creek; 6 miles N. of Washington, and 60 N.E. of Lexington. N. lat. 38° 45'.—Alfo, a township in Chester county, Pennsylvania.—Alfo, a poft town in the county of Chehire, and flate of New Hampshire, on the E. side of Connecticut river, 30 miles S. of Dartmouth college, 116 N. of W. of Bolton, and 431 N.E. of Philadelphia; incorporated in 1753, and containing about 100 houfes, a congregational church, a court-house, and an academy. Through this town the road paffes from Bolton to Quebec. N. lat. 43° 10'; W. long. 72° 19'.—Alfo, the principal town in Middlesex county, Massachusetts, called by the aboriginal inhabitants "Mifkwaun," connected with Bolton by Charles river bridge. This town is built on a peninsula, formed by Mylne river on the E. and a bay from Charles river on the W. It is advantageously fittuated for health, navigation, trade, and almofl all kinds of manufactures. The adjoining hills, celebrated in the history of the American revolution, afford delightful prospects of Bolton and its variegated harbour of Cambridge and its colleges, and of an extensive tract of highly cultivated country. It contains within the Neck or parifh about 250 houfes, and 2000 inhabitants. The principal public buildings are a congregational church and an alms-house. Its chief manufactures are thofe of pot and pearl-ash, ship-building, rum, leather, fiver, tin, brafs, and pewter. Its houfes, population, trade, and navigation, have greatly augmented within a few years past. This town is a port of entry in conjunction with Bolton. At the head of the Neck is a bridge over Mylne river, connecting Charlestown with Malden.—Alfo, a village in Berkeley county, Virginia, fittuate on the great road leading from Philadelphia to Winchester; 20 miles from Winchester.—Alfo, a township in Washington county, Rhode ifland, having the Atlantic to the S. and feparated from Rich- mond towards the N. by Charles river, a water of Pawca-tuck, 19 miles W. of Newport; containing 2022 inha- bitants, including 12 slaves.—Alfo, a town on the ifland of Nevis, one of the Caribbees, belonging to Great Britain. It has large houfes and well-furnished fhips, and is defended by Charles-fort. Near the town is a high mountain, the altitude of which, taken from a quadrant in Charlestown bay, is falt to be 11 mile perpendicular, and from the bay to the top 4 miles. N. lat 16° 54'; W. long. 66° 14'.—Alfo, one of the principal towns in the ifland of Barbadoes called Olinon.

CHARLETON, in Geography. See CHARLETON.

CHARLETON, in Biography. See CHARLETON.

CHARLETON, in Geography, an ifland situated at the bottom of James's Bay, in New South Wales, on the coast of Labrador, and exhibiting a beautiful pro- fect of trees and branches, which are spread over the ifland.

The air at the bottom of the bay, though in N. lat. 51°, is excessively cold for nine months of the year, and very hot for the other three, except on the blowing of a N.W. wind. The foil, on both the eafit and west fides, bears all kinds of grain; and about Ropert's Bay are fome fruits, as goose-berries, frawberries, and dewberries. N. lat. 52° 30'. W. lon. 82°.—Alfo, a township in Saratoga county, New York. By the late census of 1795, 268 of its inhabitants were eelctors.—Alfo, a township in Worcester county, Massachusetts, incorporated in 1754, and till that time forming the wester part of Oxford; 60 miles S.W. of Bolton, 15 S. W. of Worcester; containing 1966 inhabitants.

CHARLEVALE, Charles Faucon de Vey, lord of, in Biography, a polite scholar and poet, was born in 1613, and, notwithstanding the feeble-ness of a peculiarly delicate constitution, lived to the advanced age of 80 years. Of his conversation and writings, it is faid, they were charac- terized by sweetness and refinement; and Scarron faid of him, "that the Mufes fed him only with blanc-mange and chick- en-water." He was not only personally attached to polite literature, but a liberal patron of literary merit. Upon be- ing informed that M. and Mef. Dacier were returning from Paris to the country, in order to avoid expence, he prefied them to accept of 10,000 livres in gold. His death was occasioned by a fever, which his phyficians thought that they had fubdued by frequent bleedings. On faying to one an- other, in the preffence of Thevenot, the king's librarian, "the fever is going at lait," he interpoled, and obferved, "O no, it is the patient that is going," and he died in three hours. A small collection of his poems, conflituting of flanzas, epigrams, fongs, and fonnets, which are easy and elegant, but feeble in thought and iyle, appeared in 1759. Nouv. Dict. Hiét.

CHARLEVALE, in Geography, a town of France, in the department of the Eure, and district of Les Andelys; 10 miles S.E. of Rouen.

CHARLEVILLE, a market and poft town of the county of Cork, Ireland, fittuated on the border of the county of Limerick. It is in many repects a flourishing town, and its trade is daily increasing. It was formerly called Rath- gogan; but the first Lord Orrery, better known by his former title of Broghill, being the politoff of it, changed its name to Charleville, in honour of the king; made it the seat of his government, as president of Munster, and had it erected into a borough, fo that it fent two members to par- liament, till the union deprived it of this privilege. Lord Orrery also established a free school there; and one of his successors gave ground for a charter-school, for the recep- tion of 53 children. The country round about is very fer- tile; the foil is a light brown earth lying deep on a lime- stone bottom. Mr. Young speaks of 30 looms for making ferge being in this town. It is 112 miles S.W. from Dub- lin, and 29 N. from Cork. Smith.

CHARLEVILLE, a town of France, in the department of the Ardennes, and chief place of a canton in the diufet of Mezieres, from which it is feparated by the Meul. Before the revolution, it belonged to the prince of Coët, being exempt from the general taxes of the kingdom. The place contains 7400, and the canton 12,567 inhabitants: the territory includes 1371/2 kilometers and 12 communes.

CHARLEVOIX, Peter Francis-Xavier de, in Biography, a writer of voyages and travels, was born at St. Quentin, in 1664; and having entered the faculat of Jefuits, taught the languages and philofophy with reputation. After returning from his foreign missions, he was engaged for 24 years in the conduct of the "Journal de Trevoux," and was much elcemed by his brethren of the society for the pu-
CHARLIER, Jean, an eminent ecclesiastic, born in 1303, at Gerion, in France, from whence he takes the name Gerion, by which he is more commonly known than by that of Charlier. He received his education at Paris; after which, he studied divinity ten years under Peter d'Alilly and Giles Dufchamps, and received the degree of doctor in 1392. Three years after, he was appointed to the chancellorship and canonry of the church at Paris. At this period, the violent disputes between the dukes of Orleans and Burgundy, and the schism in the papal see, rendered Charlier's office very difficult to be executed. He went as a deputy, with others, in 1446, to Gregory and Benedict, the competitors for the papal see, with a view of persuading them to restore union to the church; and was afterwards highly instrumental in the deposition of both, and in the election of Alexander V. On the abdication of the duke of Orleans, by the order of the duke of Burgundy, in 1408, he inveighed publicly and loudly against the foul crime, by which he incurred the greatest danger from the triumphant party. He attacked the propositions written by John Petit in defence of the action committed by the duke of Burgundy; procured the cenures of them by the faculty of theology at Paris, and supported their condemnation at the council of Constance, where he appeared in the capacity of ambassador from the king of France, and deputy from the university of Paris. At that council, he spoke on all matters of doctrine and discipline with so much eloquence, and conducted the cause in which he had embarked so ably, that he obtained the highly esteemed appellation from cardinal Zabarella, and the titles of evangelical and most erudite doctor were conferred upon him. At the instance of Gerion alone, the council of Constance decreed, that Petit's principles wereetical, feitious, authorising treason and perjury; and they farther decreed, that whoever maintained it should be considered as obdurate heretics. On every occasion he displayed the purest and most enlightened zeal for the reformation of manners, and his own example proved the sincerity of the motives by which his conduct was actuated. His noble indignation against the infamous principles avowed and defended by Petit, drew upon him the malice of the Burgundian faction, so that he dared not, upon the breaking up of the council, return immediately to France, but remained in Germany in the disguise of a pilgrim. At length he undertook the humble occupation of a schoolmaster at Lyons, in which he continued some years, and died in 1429, aged 66. Gerion was author of many works, which were collected in 1769, and published at Antwerp, in five volumes folio. To him has sometimes been ascribed the celebrated tractate "On the Initiation of Christ," but Du Fresnoy, and other French historians, have determined that this was not written by Gerion. To the Antwerp edition of his works is prefixed a piece entitled "Gerfonna," containing a multitude of curious biographical anecdotes of the author, Peter d'Alilly, and other contemporary divines. According to the testimony of Du Pin, the church never had an author of greater reputation, more profound knowledge, and more solid piety, than Gerion. His style, though harsh and sometimes careless, is methodical, and his arguments are generally conclusive. "He defends the truth," says the ecclesiastical historian, "upon all occasions, with an admirable and undaunted courage. He suffered a cruel persecution for a righteous cause, and died in exile for maintaining it with vigour." Du Fresnoy, Du Pin. - Priéville's Eccl. Hist.

CHARLIET, in Geography, a town in France, in the department of the Loire, and chief place of a canton, in the district of Roanne; 12 miles N.W. of Lyons, and 3 N. of Roanne. The place contains 2829, and the canton 10361 inhabitants: the territory includes 1475 square kilometres and 15 communes.

CHARLOCK, in Botany. See Sinapis arvensis, and Raphanus raphanistrum.

Charlock, in Gardening, (Sinapis nigra), is a weed too generally known to the farmer to require a minute description. It is frequently called charlock, catlock, corlock, and white rape. Almost the whole plant is covered with pellucid hairs.

There are, according to some, two sorts of charlock, one bearing white and the other yellow flowers; but they are said to be only a variety of the same plant.

And it is observed by the author of the Staffordshire agricultural report, that the "yellow-flowered weed termed charlock by the farmer, is not one individual, but three separate and distinct plants, each species more or less abounding in different places, and which are as follows: 1. The rough-leaved charlock, or wild mustard, (Sinapis nigra); 2. The smooth-leaved or wild rape, (brassica napus); and 3. The rough-leaved wild radish with white flowers, (Raphanus raphanistrum). These plants are all annuals, produced entirely from seeds, which they bear in great abundance, and which seeds will lie in a clod as safe as in a granary, and vegetate at the end of twenty years, when ploughed up and exposed to moisture. These intruders are only to be extirpated by ploughing them under when the field is fallow, or by weeding them out of the crop before their feed shall have been ripened; for if suffered to perfect and feed their seed, each single plant will produce an hundred; the farmer should therefore carefully prevent this by weeding or hoeing them out in time. The increase of the above and some of our field weeds, when they are permitted to feed their seed, is, he says, beyond all calculation."

The young plants of charlock, are said so nearly to resemble those of turnips that they are not easily distinguished but by the taste; the charlock being hot and bitter, and the turnip mild. Farmers should therefore be very careful in weeding their turnips left they mistake them for charlock. Mr. Lile has suggested that cold wet lands are always more subject to charlock than white or chalky lands; and that by an experiment which he made in sowing charlock seed and turnip-seed at the same time, he found that the turnips appeared in three days, but the charlock not in less than ten.

It has been remarked that sheep are fond of eating these weeds; and that of course advantage may be derived from feeding them down in the spring by sheeps. See WEEDS.

CHARLOTIA, in Geography, a town on the E. shore of St. John's river in East Florida, seated on a high bluff, 15 or 20 feet in perpendicular ascent from the river, and half a mile or more in length. The aborigines of America feem, from the remains of great tumuli and conical mounts of earth and shells, and other traces of a settlement, to have
had a large town in this place. The river for an interval of about 12 miles above the town, is divided into many channels by a number of islands.

CHARLOTTE, a considerable township on the east side of Lake Champlain, and the south-westernmost in the county of Chittenden and state of Vermont. It is separated on the north from Burlington by Shelburne, and contains 6,595 inhabitants.

CHARLOTTES, a county of Virginia, lying S.W. of Richmond on the head waters of Staunton river, and containing 10,978 inhabitants, of whom 4,916 are slaves. The court-house is distant 21 miles S.S.W. from Prince Edward court-house, and 379 in the same direction from Philadelphia.

CHARLOTTES Bay, a bay on the south-east of Nova Scotia. N. lat. 44° 35', W. long. 58° 50'.

CHARLOTTES Cape, a cape at the south extremity of New Georgia. S. lat 54° 32', W. long. 36° 11'.

CHARLOTTES Fort, a fort of America, in the late state of South Carolina, near the town of Petersburg in the late state of Georgia.

CHARLOTTES, Queen, isle, a group of islands on the N.W. coast of America, bounded towards the south by Cape St. James, and to the north by Cloak Bay, North Island, and Dixon's Straits; and situate between N. lat. 51° 49' and 54° 12', and W. long. 134° 50' and 135°. The inhabitants of these islands confide, according to Captain Dixon's account of several tribes of Indians, who are in their disposition and manners docile and savage, so that they see frequently in a state of hostility with one another, and fear on the bodies of their enemies that are slain in battle, whilst they prefer the heads as trophies of victory. However, they carry on by means of their canoes, a very considerable trade in furs of an excellent quality. They appeared to be much addicted to plunder, and with this view they not only permitted, but urged their females to go on board the English ships whenever invited, availing themselves of the opportunities which these visits afforded them of stealing, with singular dexterity, whatever fell in their way. Although every tribe in these islands is governed by its respective chief, they are nevertheless divided into families, each of which appears to have regulations, and a kind of subordinate government of its own.

The chief usually trades for the whole tribe, but sometimes each separate family, disapproving his method of barter, has claimed a right to dispose of its own furs, and the chief has always complied, though it is uncertain whether he receives in consideration of his compliance any emolument. The number of sea-otter skins collected by captain Dixon at these islands was no less than 18,511, many of which were very fine; other furs are found in less variety here than in many other parts of the sea-coast: racoons, pine-martins, and seals, being the main kinds that were seen. Portlock and Dixon's Voyage, &c. p. 328, &c. Svo. Vancouver's Voyage, vol. 1. p. 369, &c. It has been diffused to whom we are indebted for the first discovery of Queen Charlotte's Islands: captain Meares, (Voyages, p. 53,) says, that captains Lowrie and Guyle, who commanded two vessels that were fitted out at Bombay in 1780, and which arrived at Nootka Sound on the 29th of June, where they remained till the 27th of July, in which day discovered that land to which Mr. Dixon gave the name of Queen Charlotte's Islands; which is said to have done merely from a jocular opinion, as they were never proved to be such, till captain Douglas, in the Iphigenia, sailed through the channel which separates them from what was then supposed to be the American continent. M. Fleureuf, in his introduction to Marchand's voyage, does not presume to dispute with the English this last discovery; for he says that La Peroufe, who had rightly presumed that these lands must be an island, had not an opportunity of satisfying himself in this particular; but he contends with captain Meares the priority of the discovery attributed to captains Lowrie and Guyle. It is not known, he says, at what precise period captain Meares discovered Queen Charlotte's Islands, nor how the discovery was made, nor what portion of these lands they examined; but we certainly know, that La Peroufe discovered them on the 10th of August of the same year; that he followed and examined the coasts of them for 10 days, and ranged along them from north to south, over an extent of 50 leagues. After all, on whatever side the priority lies, the two discoveries must be nearly contemporary; and it is alleged, that on both sides the honour is equal.

Captain Dixon, continuing his route in 1787, from the space included between the parallels of 55° and 57° to the S.S.E. discovered on the 18th of July, land in 54° 24', which was the north part of those islands that are now laid down in the English charts under the name of Queen Charlotte's Islands, and of which La Peroufe had been the first discoverer the preceding year. Dixon ranged along the Archipelago, as La Peroufe had done, by the western shore, to its southern extremity, doubled it to the northward, and finally closed along the coast, as far as 51° 10'. He afterwards ran down the east coast of these islands, as he had ascended it, without pursuing his researches towards the continent. Captain Duncan in 1788 anchored and traded in several harbours of the east coast of Queen Charlotte's Islands, examined and visited them, from the latitude of 52° to 54°. Captain Douglas, who made a voyage to the N.W. coast of America in 1785, in company with captain Meares, running down the coast, visited some ports which had not been known, and one among others, towards the latitude of 55°, to which he gave the name of Port Mores. That harbour is situated on the northern side of the limits, which to the northward separates from the continent the lands discovered in 1786 by La Peroufe, and called Queen Charlotte's Islands. It appears that captain Douglas is the first known navigator who passed through this latitude, and thus penetrated by the north into the gulf or channel which lies situated between the islands to the west and the archipelago of San Lazaro. Douglas ranged along this coast throughout its whole length, without ever casting to sea land on both sides, the arm of the sea that separates the islands from the continent not being more than 20 leagues wide; and he ran down as far as Nootka Sound, where he rejoined captain Meares. The two ships of these commanders carried to Canton the furs which they had procured on the different parts of the coast that they had visited. See Marchand's voyage by Fleureuf, vol. 1. Intro.

CHARLOTTES, Queen, Sound, a sound of New Z. land, visited by captain Cook in 1774; the situation of which was minutely ascertained by the observations of M. Waré, to be in N. lat. 41° 5' 56° 5'. E. long. 174° 25' 25°. Alto, a land on the western coast of N. America, in N. lat. about 51°, and E. long. 128°.

CHARLOTTES, a town of the island of Dominica, on the west coast, formerly called Rosian. N. lat. 15° 37', W. long. 69° 47'.

CHARLOTTES Town, a town of the island of St. John, in the gulf of St. Lawrence, situate about the center of the island, towards the south coast. N. lat. 46° 15'. W. long. 62° 50'.
CHARLOTTEBURG, a town of America, in the county of Brunswick and state of North Carolina, seated on an island, and having an inlet and found of the same name, a little to the south of it. N. lat. 35° 18'. W. long. 81°.

CHARLOTTENBERG, a town of Germany, in the circle of Welphalia, and county of Holzapfel, built by the French refugees; 4 miles S.W. of Holzapfel.

CHARLOTTENBURG. See Berlin.

CHARLOTTESB KG, a town of America, in the state of Jersey, and county of Bergen; 12 miles N. of Morris town.

CHARLOTTENLUND, a town of Denmark, in the island of Zealand; 4 miles N. of Copenhagen.

CHARLOTTESVILLE, or CHARLTON, a poll town of America in Salisbury district and state of North Carolina, and the chief town of Mecklenburg county, seated on Steel creek, which joins the Sagaw, and falls into Catawba river, about 10 miles N. of the South Carolina boundary, and 44 S. of Salisbury, containing about 40 houses, a court-house, and gaol.

CHARLOTTESVILLE, a town of America, the capital of Albemarle county in the state of Virginia, lying on the poll road from Richmond to Danville in Kentucky; and containing about 45 houses, a court-house, and a gaol; 86 miles W.N.W. of Richmond, and 40 S.E. by E. of Staunton.

CHARLTON, WALTER, M. D. in Biography. Of this learned and ingenious physician, and of his numerous writings, Anthony Wood, who was cotemporary with him, has given a long account, from which the following is principally taken. He was born at Shepton Mallet, in Somersetshire, on the second of February 1619, and received the rudiments of his learning under his father, who was rector of the place. In 1645, he was admitted a commoner in Magdalen Hall, Oxford, and put under the tuition of Mr. John Wilkins, afterwards bishop of Cheltenham, under whom he made considerable progress in logic and in philosophy. His disposition leading him to the study of medicine, he soon became conspicuous for his proficiency in that art, and in 1642 he was created doctor in medicine by the favour of the king, Charls the first, and appointed his physician in ordinary. With this title he came to London, was admitted a fellow of the college of physicians, and continued to enjoy a considerable share of credit during the troublesome times that followed. On the restoration of king Charles the second, he was made one of his physicians in ordinary, and a member of the newly formed royal society, about which time his first publication appeared, "Spiritus Gorgonius exatus, feu de caufa, signis, et fanfaneum Litthaleset." Svo. Luz. Bat. 1650, in which he adopted the opinion of Van Helmont, as to the cause of the generation of urinary calculus, and recommends the feed of the wild carrot as a powerful lithotriptic. "Excercitationes pathologique, in quibus morborum pene omnium natura et caufa ex novis anatomicae inventis inquiruntur." London, 1661, 4to. In this, as well as in the rest of his medical labours, there is little new; but they tended to spread the knowledge of the many improvements in anatomy and phialy, which had been made by the Bartholomew, by Harvey, Giffon &c. "Natural History of Nutrition, Life, and voluntary Motion, containing all the new discoveries of Anatomists." 4to. London, 1658. But his writings were not confined to medical subjects. He wrote "The Darkness of Atheism discovered by the Light of Nature," "The Ephebian and Cimmerian Matrons; two remarkable examples of the power of love and wit." In 1660, to shew his loyalty, which had perhaps been suspected, from his living about the court of Oliver Cromwell, he circulated a flisc, containing a character of his most fancied majesty, Charles the Second; and in 1663 he published "Chorou Gigantum; or the most famous Antiquity of Great Britain, vulgarly called Stone Henge, standing on Salisbury Plain, referred to the Damis." 4to. Luige Jones had supposed it was a Roman temple. Charlton, instructed, Wood says, by Olaus Wormius, the Danish antiquary, inferred, that the flones were placed there by the Danes, but they were supposed, with more propriety, to be Druidical remains. We have also by him an Harveian oration, printed in 1682: Lectures on the structure of the heart, the course of its motion, &c. read before the college on the 10th, 20th, and 21st, days of March, 1682, with numerous other pieces, for titles of which see Wood's Athenae Oxoni., Haller's Bib. General Biography, &c. In 1689 he was made president of the College of Physicians, which office he held two years. It is probable, however, that he never had any very considerable share of practice, as we find him soon after this retired to the island of Jersey, "where he now is, Ant. Wood says, viz. 1695, a learned and unhappy man, aged, and grave, yet too much given to romance." Wood gives a list of more than twenty publications by Charlton, and he is known to have intended many more, the manuscripts being now in the British museum. The greater part of his publications and writings were alien to the practice of medicine, and most therefore have tended rather to obfure, than forward his acquisition of fortune. He died in the year 1707, in the 88th year of his age.

CHARLTON, in Geography, an island in the southern part of Hudson's bay. N. lat. 52° 8'. W. long. 83°.

CHARLY, a town of France, in the department of the Aisne, and district of Chateau-Thierry, 2 leagues S.W. of it.

CHARM, derived from the Latin carmen, verfe, a magick power, or spell, by which with the affiliation of the devil, forcers and witches are supposed to do wondrous things far surpassing the powers of nature. See Magic.

Phylactery, figures, &c. are, all, kinds of charms.

CHARMANDA, in Ancient Geography, a nation of Asia, placed by Xenophon on the other side the Euphrates.

CHARMES, in Geography, a town of France, in the department of the Valois, and chief place of a canton, in the district of Mirecourt, 23 leagues N.E. of it. The place contains 2686, and the canton 10774 inhabitants; the territory includes 217 ½ kilometres and 27 communes.

CHARMIDAS, in Biography, the companion of Philo of Larissa (see Philo), and celebrated for the compass and facility of his memory, and for his moral wisdom. Cie. Tus. Quod. l. i. Pint. H. N. i. c. 16. Stobux, form. 212.

CHARMIS, a native of Marcellae, but for his great skill in the practice of medicine invited to Rome, where he flourished in the time of the emperor Nero. Having succeeded in restoring some of the principal men there to health, by means of the cold bath, he soon found himself at the head of the profession, and was thence enabled to acquire a large property. He is said to have charged one of his patients 200,000 livres, or 6000 livers, for a single cure. He decried, many says, the practice of his brethren; though he might have recollected, that the cold bath, by the use of which he acquired his reputation, had been recommended by Ant. Musa. He invented
Charon, in *Ancient Geography*, a small town on the island of Sardinia, founded, according to Steph. Byz., by the Carthaginians.

CHARMOGOL, in *Geography*, a town of Perßa, in the province of Chorasan: 200 miles N. of Erat.

CHARMONY, a town of France, in the department of the Meuse: 14 miles N.E. of Vitry.

CHARMOSYNA, in *Mythology*, a festival at Athens; and, according to Pluarch, in Egypt.

CHARMOTAS, in *Ancient Geography*, a sea-port of the Arabian gulf, the entrance of which, according to Strabo, was fair and dangerous.

CHARMOUTH, in *Geography*, a village of England, on the coast of the county of Dorset, at the mouth of a small river called Char, where the Danes made a defiant, and ravaged the country, in the years 853 and 840; 3 miles E. of Lyme.

CHARMUT, in *Ichthyology*. The Linnaean Silurus anguillaris, which inhabits the Nile, and other rivers of Africa, is known among the Egyptians by the name of Charmut. See Silurus anguillarisl

CHARMUTH, *Silurus charmatl nubiticus* of Hasselquint is the Linnaean Silurus anguillaris, which is.

CHARMUTHA, in *Ancient Geography*, a peninsula of the Arabian gulf, on the coast of Arabia Felix, according to Diodorus Siculus.

CHARNEL, a portico, or gallery, anciently near the church-yard; over which were disposed the bones of the dead, when the flood was confumed.

The charnels, or charnel-houses, are now usually contiguous to the church.

CHARNAY, in *Geography*, a town of France, in the department of the Indre and Loire, and district of Loches; 10 miles S. of it.

CHARNE, in the *Materia Medica*, a name given by some of the ancient writers to the *Silica dulcis*, or carob-tree. The Arabian physicians mention two kinds of this; the Syrian, and Nabathean: the first they call *afgenbat*, and the other *ahabat*. Avicenna tells us, that the first of these was a purgative, and was given with succus in pains of the bowels; and the other an astringent, in profit in the maladies of the bowels.

CHARNY, in *Geography*, a town of France, in the department of the Meuse, and chief place of a canton in the district of Verdun; one league N. of Verdun. The place contains 615, and the canton 901; inhabitants: the territory comprehends 215 kilometres and 22 communes.

CHARNY, a town of France, in the department of the Yonne, and chief place of a canton in the district of Joigny; 19 miles N. of Auxerre. The place contains 513, and the canton 13,141; inhabitants: the territory includes 287½ kilometres and 22 communes.

CHAROLLES, a small country of France, before the revolution; so called from Charolles, the capital.

CHAROLLES, a town of France, in the department of the Saône and Loire, and chief place of a district. The place contains 240, and the canton 10,811 inhabitants: the territory includes 190 kilometres and 14 communes.

CHARON, a town of France, in the department of the Loire, in the canton of Rochefort.

CHARON, in *Mythology*, the ferryman of hell; son of Erebus and Nox, according to the theology of Hesiod. His province it was to carry in his boat, over the waters of Acheron, Styx, Cocytus, and Phlegethon, the souls of the dead; particularly of those who were buried; for persons who were not interred were supposed to wander about the shores for 100 years before they were carried over. Thus Virgil (Aen. vi) describes their state:

"Centum errant annos, volitant hae litora circum: Tum demum adfluit flaga exoptata revivit."

A hundred years they wander on the shores, At length, their penance done, are wafted o'er.

However, Charon was first paid his fare, which was never less than one obolus, nor more than three, which was put into the mouths of persons interred. Some mythologists have derived his name from *charon*, fine gravel, formed of a præv. and *gran*, granul, denoting the ungracefulness of his aspect. Others say, that Charon, the old Egyptian, fig. simply a ferry-man. The Arabian historians describe Charon as a person of great power; who could load several camels with the keys which opened the numerous apartments that contained his treasures. Perhaps in Egypt the name of Charon was a dignity bestowed on the boatmen who conveyed the bodies of the Pharaohs over the lake Moeris to deposit them in the cells of the labyrinth, of which he was the keeper. Without doubt, the person who performed the same office on the lake of Memphi, with respect to the inhabitants of that city, had the same title. If this conjecture be founded, we discover the reason why the Greeks, borrowing from the Egyptians, gave the name of Charon to the boatman of hell; and why the Arabs call the lake of Moeris, "biruk Caroom," and runs in its vicinity "balad Caroom," the burgh of Charon, and "caf Caroom," the palace of Charon. The present inhabitants of Egypt have a kind of traditional fable, that Charon was a person of mean extraction, who placed himself near this lake, and demanded a certain sum for every corpse that was ferried over to be interred; which impost he continued for several years without any authority; but as he insisted upon receiving the usual fare for the king's son, the fraud was discovered and discontinued. The king, however, as the fable reports, perceiving the advantage of this impost, confirmed it by royal authority, and appointed Charon to the post he had before occupied, which he rendered the most lucrative office in the kingdom. It is also said that he became rich and powerful, as to suffice his sovereign, and ascend the throne in his stead. To this fanciful narrative we may subjoin the account given by Tzetzes, who, representing the Fortunate islands as British, observes, that the souls of the dead are reported to be carried thither; and that on the shores of the ocean, which washes the island called Britain, men fish by fishing, who are subjected to the Franks, but pay them no tribute, because, as it is reported, they transport the souls of the dead to the coast of Britain, which is reckoned among the islands of the Blefled, and the habitation of deceased persons, conveyed thither by these fishermen. Charon is represented by the poets as a fat, squalid, old man, with a long grey beard, and rheumatic eyes, clad with tattered rags, that scarcely covered his nakedness. Virgil describes him as possessing the vigour and firmness of old age, mealy clad, with a long beard, grey matted hair, and fixed fiery eyes. Thus,

"Portitor has horrendus aquas et fluminis fervat Terribili quizalare Charon: cui plurima mento Canities inculta jacet; ibant lumina, flammas: Sordidus ex humerus nodo dependet amictus."
CHA

Ina ratem conto subigit, velitque missiatur,
Et ferrugineâ fulvecat corpora cymbâ,
Jam feniur; sed cruda Deo viridique fere-Euus."

Aen. vi. v. 258, &c.

There Charon stands, who rules the dreary coals:
A fordid god: down from his hoary chin
A length of beard descends, uncom'd, unclean;
His eyes like hollow furnaces on fire;
A girde, foul with grace, binds his obscene attire.
He spreads his canvas, with his pole he steers,
The freights of fitting ghosts in his thin bottom bears.
He look'd in years; yet in his years were seen
A youthful vigour, and autumnal green.

CHARONDAS, in Biography, a native of Catanea in Sicily, flourished about 446 years B. C. and is supposed to have been a disciple of Pythagoras. He was distinguished both as a philosoper and a legislator; and is said to have framed a code of laws for his own native place and several other cities of the Chalcidians, and also for the Megi; and they were afterwards adopted by the inhabitants of Thurium in Magna Graecia, rebuilt by the Sybarites, when they established their republic. Some of these laws were such as follow: Persons who married a second time, if any children by their first wives were living, were excluded from the Senate: and from all public employments, because bad fathers, as the legislator conceived such to be, would make bad magistrates. All false accusers were carried through every part of the city crowned with heath or brome, and thus exposed to public ignominy, as the vilen of men. All those were perfected and fined who composed a correspondence, or contracted a friendship with wicked men. Conceiving ignorance to be the greatest evil and the source of vice, Charondas enjoined, that the children of all the citizens should be instructed in literature and the sciences. Instead of putting detectors and those who fled in the day of battle to death, he sentenced them to appear for three days in the city, chained in the habit of women. To prevent the rash and hasty abrogation of his laws, he enjoined, that those who proposed to alter or amend them, should appear in the public assembly with a halter about their necks, and if the alteration proposed did not pass, they were to be immediately frangled. Charondas did not long survive his own laws. Returning one day from pursuing some thieves, and finding a tumult in the city, he came unarmed into the assembly; though he himself had prohibited any person doing so by an express law. When a person observed him and recriminated in fierce terms on account of the violation of his own laws, "I do not violate them, says he, but thus may they, with my blood;" and having thus spoken, he plunged his sword into his bosom, and expired. Diod. Sic. Diog. Laerc.

CHARONIUS, Charman, is used as an epithet for caves, some of which are found in Italy, and in other parts of the world, where the air is so loaded with a poisonous vapour, that animals cannot live in them even a few moments.

CHAROST, in Geography, a town of France, in the department of the Cher, and chief place of a canton in the district of Bourges, seated on the river Arnon; four leagues S.W. of Bourges. The place contains 1,550 and the canton 86,535 inhabitants: the territory includes 3,242 kilometres, and 13 communes.

CHARPE, in Military Language. This consists of two ropes or cables fastened together, somewhat crossways from one pontoon to another, as also to the banks or sides of a river, when you wish to make a bridge across it, in order to keep the pontoons steady in their places.

CHARPENTIER, Francis, in Biography, a native of Paris, where he was born in 1626. Although he was originally intended for the bar, his love of retirement, and attachment to literature, diverted him from this pursuit, and induced him to rank himself among the men of letters. His reputation and connections caused him, in 1657, to be elected a member of the French Academy; and after he had been employed by the minister Colbert, in recommending to the nation the proposed establishment of an East India company, he was chosen, under the function of the minister, a member of the new-instituted Academy of Inscriptions and Belles Lettres, for which distinction his knowledge of the ancient languages peculiarly qualified him. M. Charpentier, however, though conversant with ancient writers, and though he had commenced his career by the translation of Xenophon's Cyropedia and Memorabilia, was very far from indulging a bigotted attachment to antiquity; and in the dispute that agitated the literati concerning the comparative merit of the ancients and moderns, he took part in favour of the latter. In 1676, he wrote "A Defence of the Use of the French Language for the Inscriptid on the Triumphal Arch," and in 1683, he published two volumes "On the Excellence of the French Language." These publications excited the aroused enmity of Boileau, who satirized him with much unmerited severity; although it must be allowed that his task was unequal to his vivacity and learning. The inflated style of the inscriptions placed under the pictures of Le Brun in the gallery at Versailles, such as "The incredible passage of the Rhine," and "The miraculous capture of Valence;" incurred just censure, and the epistles were craved by the king's order. In his adulation of the king he exceeded his contemporaries, even at a period when they were vying with one another in this kind of panegyric. Charpentier was ambitious of displaying his rhetorical powers, which he polished in an eminent degree, on various occasions; and particularly in the meetings of the French Academy, at which he was affilious in his attendance. His last work, entitled "A Dissertation on the Excellence and Utility of Academic Exercises," was published in 1695. As to his private character, it was eminently mild and honourable. Whilst he retained the grateful remembrance of benefits which he received, he soon forgot injuries, and never cherished rancour against any of his adversaries. He died in 1704; and long after his death some literary fragments were published under the title of "Carpentariana," that are held in no great estimation. D'Alemb. Hist. des Mem. de l'Acad. Fr. Gen. Diog.

CHARPENTIER, in Military Language, a carpenter. Such workmen are absolutely necessary in the service of an army. Without their assistance the miners can do nothing. For all military operations in general their services are indeed more or less necessary. Care should be taken, that such of them, as follow an army, are strong and robust.

CHARPENTIER, Juvene, in Ornithology. See Picus exalbula.

CHARPEY, in Geography, a town of France, in the department of the Drôme; 3 leagues E. of Valence.

CHARPOT, in Ancient Geography, a town of Asia, situate between the mountains, in the valley through which passed the river Ararans in its Course to the Euphrates.

CHARR, Char, or as sometimes called Charrée, in Ithylhys, the common name of the Alpine salmon, Salmo Alpinus of Linnaeus. This fish is found in the lakes of Weitmorland, and the mountainous parts of northern Europe. It is esteemed an excellent fish for the table, and prized is considered an article of luxury. In England we distinguish more than one kind of charr, though they are generally believed to appertain to a single species only. Mr. Pennant, upon
upon the authority of the Rev. Mr. Farinh of Carlisle, cru-

necates the Cali chalk; the Cali chalk, or one which has not

spawl of the preceding clakan, and is on that account reck-

oned to be in the greatest perfection; and the Red chalk,

which last is distinguished in Weftmorland by the name of

Red chalk, because in duncing the field assumes a higher co-

lor than the others. The late circumstances is observable

in the town. With respect to the Targn of the Welsh, or

"Red kelly," a kind of chalk found in one of the Snowdo-

nors lakes, we are not satisfied that it is of the same species

as the chalk of Weftmorland, though uniformly described as

such by authors. We shall notice more particularly un-

under the article Salmo Alpinus, observor only in this place,

that the fish spawes at a different time of the year from the

former, that it is smaller, and brighter instead of paler in co-

lour when in seacon than the red chalk of the Weftmorland

lakes. Vide Donov. Brit. Fishes ; and article Salmo alpinus.

CHARRE, or CHARRE, in Ancient Geography, a town

t of Afn, in Mepopotamia, situate near the river Scythus, now

called " Harania," and thought to be the fame that bears

this appellation in the history of Abraham's peregrinations.

CHARARA, in Geography, a town of Persia, in the

province of Farisian ; 45 miles N.W. of Schiras.

CHARRÉ, a town of Arabia; 9 miles N.E. of San'a.

CHARRETTE, a cart. Every one knows the meaning

of this word. But it is proper to introduce it, as charrettes

are extremely useful in matters of artillery. They serve

the purpoce of carrying and transporting ammunition ;

and vary in their forms or figures in different departments thereof,

as the lieutenant generals and commanding officers of artill-

ery have them constructed according to his own method.

to suit the countries they serve in.

CHARRIERE, Joseph, de La, in Biography, a fur-

geon of eminence of Annecy, in Savoy. After refiding

several years in Paris, and receiving the instruction of the

belt matters there, he returned to Annecy, where he soon

distinguished himfelf by his superior attainments. In 1600,

he published, as the result of an extensive practice, "Traité

des Opérations de Chirurgie," 12mo. Paris. He gives the

descriptions of each of the diseases, with the reasons for,

and the manner of performing the operations, and though

this treatise was supered by the Institutiones Chirurgieae

of Heister, as Heister's has been by the works of later

writers, it enjoyed, in its time, no small share of reputation,

as appears by its having been reprinted fix or seven times in

the space of twenty years. "Anatomie nouvelle de la Fête

de Phomme," 12mo. 1703. Paris. The parts are minutely

and with sufficient accuracy described, but with no addition

to what was before known on the subject. Hall. Bib. Anat.

CHARRING of Pofts, in Rural Economy, the pracice

of reducing that part of the surface of pofts which is to be

put into the ground to somewhat of the flate of charcoal, so

to render it more durable and lasting. This method of prepa-

ring pofts is highly useful where they are to be placed in

wet situations, or to stand between wet and dry. The pracice is common in Norfolk; where, according to

Mr. Marshall, it is thus performed: "A trench is dug eighteen inches wide, eighteen inches deep, and fix feet

long, and aired by burning the flaw and a faggot or two in

it previously to laying down the pofts. This being done,

the pofts are laid across the trench; placing the part to be

burnt, namely, the part propend to stand between air and

soil, immediately over the fire; thrashing the fuel (dry

oven faggots) in at the windward end of the trench. As

one side becomes charred, another is turned downward;

and, to prevent the fire from spreading too wide (reaching too high up the poft), the part not intended to be burnt is

wetted by means of a wet straw band, tied round the poft, on

the part where the fire ought to be checked; pouring

water from time to time upon the twisted fraw. The pofts

having been repeatedly turned on all sides, until white ashes

begin to form on the surface of a black coat of coal, about

one inch of an inch thick, then they are removed, and their

places supplied by others. Chips, he fays, are preferable

to faggots, as fuel, in this operation; as they can be drift

in between the pofts wherever an increaf of fire is wanted."

From the great scarcity of hop-poles it has been sug-
ggled that this method may likewise be useful in preferving

the bottom parts of them from decaying. As 3000 of

these poles are required for an acre of land, this is conceived
to be an object of great moment to the hop planter.

CHARROW, Carriage, or Wagnoe, in Military Language.

This word ought to be regarded as extending in its meaning
to all carriages, horses, mules, and, in general, to every thing

defined for the transport of all kinds of provisions and ammuni-

tion for the use of armies.

CHARRON, Peter, in Biography, was the fon of a

bookfeller, at Paris, and born in 1541. He was educated

for the law at Orleans and Bourges, and in the university of

the latter place he took his doctor's degree. He practised

as an advocate in the parliament of Paris for five or six

years; but renouncing the profition in dífguif, he directed

his attention to theology, took priest's orders, and became

a celebrated preacher. His reputation was fuch, that he

was solicited to accept the office of canon to several churches,

and he served as fuch to several cathedrals; he was also nomi-

nated by queen Margaret her preacher in ordinary, and he

was in the retnue of Cardinal d'Armagnac, legate at Avi-

gon. After a long abfence from Paris, he returned

thereafter in 1588, and made an attempt to gain admission

of the Cathchans, and then among the Celeb-

tines, but he was refufed, on account of his being too

man to adopt their discipline; he therefore refolved to

retain the office of a parish priest. At Bourdeaux, he con-

tracted an intimate friendship with the famous Michael

Montagne, and imbibed his philosophical sentiments. Their

mutual affection was fuch, that Montagne gave by his will

to Charrown the privilege of bearing his arms, and Charrown

made the brother-in-law of Montagne his refuddary legate.

In 1394, Charrown published his treatise, entituled "Three

Treatises," propelling to maintain, 1. That there is a God and

a true religion; 2. That of all religions the Christian

is the only true one; and 3. That among Christian

communion the Roman-Catholic is the only true church.

This orthodox treatise procured for him the fupport of the

bishop of Cahors the dignity of grand-vicar, and a theological ca-

nonship; and in 1595 he was depoited to the general assembly

of the clergy, and made secretary to that body. In 1603,

he printed a volume of "Christian Diffcourts," and in 1601

appeared the firft edition of his "Treatie on Wilfom." In

1603; he went to Paris to print a second edition of this

work, and there died suddenly in the street. This book,

though his character was unblemifh, and his inocency in

his religious profefion unquestionable, occasioned his being

ranked among the molt dangerous free-thinkers. Attached

from his infancy to a fystem of faith inofensible to reason,

he seems to have thought it neceffary, in vindication of his

opinions, to depreciate the conclusions of mere reafon.

Hence he was led to fuggel, that strength of mind inclined

to Atheism; and also to affert, that the immortality of the

soul, though an univerfal dogma, is founded on very weak

natural arguments. He likewise gave offence by maintai-
ing that, although all religions derive their origin from
heaven by divine inspiration, yet all have been received by
human hands and means. In the second edition he excepted
the Christian religion. He was also charged with lay-
ning undue stress on the differences which have always sub-
stituted among Christians, together with the evils resulting
from them; and the strength and fairness with which he flated
the arguments against revelation were disapproved by some of
his adversaries. On these accounts the second edition of his
work excited great alarm and opposition among theologians,
and the impression was allowed, after some alteration in the
work itself, by particular favour. Although the author in this
treatise, which was evidently formed on the principles
of Montaigne’s essays, has introduced many original and
ingenious observations, he exhibits upon the whole a gloomy
picture of human nature and society. Charron himself,
however, was of a gay and cheerful disposition; ready in
conversation; and liberal, considering the age in which he
lived, as to his mode of philosophizing. Gen. Dict. Nou.
Dict. Hist. Breucker’s Phil. by Lindeh, vol. ii.3

CHARRONS, cartwrights, workmen very necessary in
the suite of an army, and particularly of the artillery.

CHARROUX, in Geography, a town of France, in the
department of the Allier, and district of Gannat; 5 miles
N. of Gannat.

CHARROUX, a town of France, in the department of the
Vienne, and chief place of a canton, in the district of Civar,
1 1/2 leagues E. of it. The place contains 1581, and the can-
ton 6828 inhabitants: the territory includes 237 1/2 kilome-
tres and 9 communes.

CHART, or Hydrographical Map, in Navigation,
is a representation, in plans, of a part, or of the whole of
the water on the surface of the globe, and the adjacent
coast. There are various kinds of charts, as Plane, Mercator,
&c.

Charts were first introduced into the marine by Prince
Henry, duke of Víchio, son of John I. king of Portugal, about
the year 1420. There were of the kind denominated plane
charts, and continued in use for many years, and for very
small portions of the coast, even to the present time. For
any considerable extent, charts of this construction were
soon found to be very erroneous; and their errors were suc-
cessively expost by Martin Cortes, a Spaniard, in his trea-
tise, intitled Breve Compendio de la Sphera, y de la Arte de
Navegar con nuevos Instrumentos y Reglas, printed at Seville
in the year 1556; by Petrus Nonius, a Portuguese, in his trea-
tise de Arte et Ratione Navigandi, printed at Basle in 1587;
by Mr. Edward Wright, in his Certain Errors in Navigation
detected and correctt, of which the first edition was print-
ed at London in 1599; and by others. These errors, as
enumerated by this last author, in his own words, are the
following: 1. Error in the proportion of the length and
breadth of places in the common sea charts. 2. Error in
finding out the difference of longitude by the common sea
charts. 3. Error in the lying and bearing of places one from
another, in the common sea charts. 4. Error in setting of
places out of the common sea charts into the globe. 5. Error
in showing the distances of places in the common sea
charts.

In order to correct these errors of the plane chart, Gerard
Mercator, in the year 1569, published a chart, in which the
meridians and parallels of latitude are upright lines, as in
the plane chart; but in order to compensate the errors arising
from the parallelism of the meridians, he increased each de-
gree or portion of the meridian with its distance from the
equator. It, however, appears, that his charts had no claim
to accuracy; for the intervals between the parallels of each
Vol. VII. ten degrees of latitude in the chart, as given by Blundeville
in his Exercices, page 356, do not agree with the differences
of the corresponding meridional parts of those parallels.
Thus, the difference, according to the chart, between the par-
allels of 50 and 60 degrees, is 1 1/2 less than the difference of
the meridional parts of those parallels; and that between
the parallels of 70 and 80 degrees is upwards of 4 degrees less
than the truth. It is hence evident Mercator had no certain
fixed rule for dividing the enlarged meridian. The disco-
very of a rule for this purpose was left to Wright, who
published the first table for that purpose in his book above
mentioned; in the preface to which he expresses himself as
follows: "But to come to those that may perhaps object,
I doe but altum agere, in doing no more then hath bin done
already by Gerardus Mercator in his univerall mappe of the
world many years since. I must anwser, that indeed by
occasion of that mappe of Mercator, I first thought of cor-
recting so many, and grolfe errors, and abfurdisties, as I have
already toucht, and are hereafter at large shewed in the
common sea-chart, by increasing the distances of the par-
allels from the equinoctial towards the poles, in fitch fort,
that at every point of latitude in the chart, a small part of
the meridian might have the fame proportion almoft to the
like part of the parallel, that it hath in the globe. But the
question then is: how this should be done, I learned neither of Mercator,
or any other man else. And in that point I wish had been
as wise as he, in keeping it more charily to myself. For to
so perhaps it might have been more beneficall to me."

In the above paragraph, we have Wright’s express declara-
tion, that no man taught him the true method of enlarging
the meridian line; and as all charts prior to his discovery
were erroneous in this increase of the degrees of latitude,
he, consequent y, was the first discoverer of the true method
of constructing this kind of a chart. We cannot omit men-
tioning, in this place, Wright’s very ingenious idea of tran-
fering the several circles, &c. on the globe to a plane sur-
facc. "Suppose, says he, a spherrical superficies, with meri-
dians, parallels, rumbes, and the whole hydrographical
description drawn thereupon, to be inscrib’d into a concave
cylinder, their axes agreeing in one.

Let the spherrical superficies swell like a bladder, (whiles
it is in blowing), equally always in every part thereof (that
is, as much in longitude as in latitude) till it apply, and
join itself (round about, and all along till towards either
pole) unto the concave superficies of the cylinder: each par-
allel upon this spherrical superficies increasing successively
from the equinocial towards either pole, until it come to be
of equal diameter with the cylinder, and consequently the
meridians till widening themselves, till they come to be so
far distant every where each from other as they are at the
equinocial. Thus it may most easily bee understood, how
a spherrical superficies may (by extension) be made a cindrical,
and consequently a plain parallelogram superficies; be-
cause the superficies of a cylinder is nothing else but a plain
parallelogram wound about two equal equidistant circles
that have one common astree perpendicular upon the centers
of them both, and the peripheries of each of them equal to
the length of the parallelogram as the distance between
two circles, or height of the cylinder is equal to the breadth
thereof. So as the nautical sphere may be hereafter to
be nothing else but a parallelogram made of the spherrical
superficies of an hydrographical globe inscrib’d into a con-
cave cylinder, both their axes concurring in one; and the
spherrical superficies dwelling in every part equally in lon-
gitude and latitude, till every one of the parallels theriupon
be inscrib’d into the cylinder, (each parallel growing as
great as the equinocial) or till the whole spherrical superfi-
cies,
the touch and apply itself every where to the concavity of the cylinder.

In this nautical planisphere thus conceived to be made, all places must needs be ficate in the same longitudes, latitudes, and directions or courses, and upon the same meridians, parallels, and rhumbs, that they were in the globe, because that at every point between the equinoctial and the pole, we undertand the sphatical superficies whereof this planisphere is conceived to be made, to twel equally as much in longitude as in latitude (til it join itself unto the concavity of the cylinder) fo as hereby no part thereof is any way distorted or displaced out of his true and natural situation upon his meridian, parallel, or rhumb, but only dilated and en- larged: the meridians also, parallels, and rhumbs, dilating and enlarging themselves likewise, at every point of latitude in the same proportion.

Now then let us diligently consider of the geometrical lineaments, that is, the meridians, rhumbs, and parallels of this imaginary nautical planisphere, that we may in like manner express the same in the mariners chart. For so undoubtedly we shall have therein a true hydrographical description of all places, in their longitudes, latitudes, and given proportional lineaments, or respective situations each from other, according to the points of the compass in all things correspondent to the globe, without either sensible or explicable error.

Since, in this projection, the parallels are all made equal to the equator, it is evident they are enlarged in the proportion of the radius to the co-line of their respective latitudes: wherefore, the meridian, in order to preserve every its proportion to the several parallels thus encased, must, at the latitude of each parallel, be enlarged in the proportion of the radius to the co-line of the latitude, or so that the length of a minute of the true or proper meridian, which upon the globe is the same in all latitudes, and equal to the length of a minute of the equator, may be to the length of a minute on the enlarged in any latitude, as the co-line of the latitude to radius; or, which is the same, as radius to the feant of the latitude: Therefore, the length of a minute on the proper meridian must be to the length of a minute on the enlarged meridian, at any latitude, as radius to the feant of that latitude. Hence, a table of natural feants, to every degree and minute of the quadrant, and whose radius is 1, will express the several lengths of the enlarged meridian at the latitudes belonging to those feants respectively. And, hence, the sum of the feants of all the minutes from the beginning of the quadrant, to the degree and minute of any parallel’s latitude, will be, in minutes of the equator, or nautical miles, the length of that part of the enlarged meridian which is contained between the equator and the given parallel. In this manner Mr. Wright constructed his “Table of Latitudes for graduating a Meridian in the general Sea-Chart,” to every degree and minute of the quadrant, which has since obtained the general name of “A Table of Meridional Parts;” and by the French, that of “La Table des Grécentes.”

The above method of dividing the meridian is not strictly geometrical; and, in order to shew that Wright knew this to be the case, we cannot avoid extracting the following paragraph from his Corrëction of Certain Errors, &c., p. 12. But in this table it was thought sufficient to use such exactness, as that thereby (in drawing the lineaments of the nautical planisphere) sensible error might be avoided. Else it lieth to be more precise, may make the like table to decades or tens of seconds, out of “Joachimus Rheticus his Canon Magnus Triangulorum.” Notwithstanding, the geometrical which direcrt exact truth, cannot be satisfied neither: for whole fake and further satisfaction, 1 thought good to adjoin also this geometrical conecit of dividing a meridian of the nautical planisphere."

“Let the equinoctial and meridian be drawn upon a globe: Let the meridian (divided into degrees, minutes, seconds, &c.) roul upon a bright line, beginning at the equinoctial, the globe swelling in the mean time in such fort, that the semidiameter thereof may be always equal to the feant of the angle, or arch contained between the equinoctial and semidiameter, infilling at right angles upon the forefaid straightforward line: the degrees, minutes, and seconds, &c. of the meridian, noted in the bright line, as they come to touch the face, are the divisions of the meridian in the nautical planisphere. And this conecit of dividing the meridian of the nautical planisphere may satsise the curious exactness of the geometrician; but for mechanical use, the table before mentioned may fullit.”

The above paragraph seems to have induced several eminent mathematicians to endeavour to discover a more accurate method of enlarging the meridian: and, in the year 1645, a method, strictly accurate, was pubhished, as an addition to Northrow’s Epitome of Navigation, by Mr Henry Bond. This method appears to have been discovered by chance; but neither the name of the discoverer, nor the time when it was discovered, are known. The demonstration of this method was still wanting: this, however, was given, for the first time, by the excellent Mr. James Gregory of Aberdeen, in his Exercitaciones Geometric, published in the year 1668, but not without a long train of reasoning: and in the year 1695, a more concise demonstration was given by Dr. Halley in the Philosophical Transactions of London, No. 219. vol. xix. Both these demonstrations are reprinted in the 2d volume of Baron Maleres’ Scriptores Logarithmi, printed in the year 1791.

In Dr. Halley’s demonstration, it is shewn, that if, “in the common tables of logarithmic tangents, the indices alone are taken as integers, and all the rest of the values as decimals: then the difference between the logarithm of the radius, and the logarithmic tangent of half the complement of any given latitude, divided by 0.001 120 331 14, &c. will be the meridional parts corresponding to that latitude.”

For the demonstration of this proposition, the reader is referred to the article MERIDIONAL Parts. Dr. Halley has shewn various other methods of constructing a table of meridional parts.

CHART, globular, is a projection so called from the conformity it bears to the globe itself. This projection was proposed by Meff. Senex, Wilfon, and Harris, in which the meridians are inclined, the parallels equidistant and curvilinear, and the rhumb-lines real spirals, as on the surface of the globe. From this last property, it is evident it can be of very little use in navigation; as a map, however, it has its advantages.

CHART, reduced, is that in which the meridians and parallels are represented by straight lines; these last are parallel to and equidistant from each other but the former being directed to the pole, are not parallel: and hence a rhumb-line on this chart is a curve, and, therefore, it is of little use in navigation. The degrees of latitude are equal, but those of the extreme and intermediate parallels are unequal; the length of each extreme parallel being equal to the length of a degree on the meridian, multiplied by the cosine of the corresponding parallels. A chart of this kind will answer tolerably well for the equatorial parts of the earth, but not for parts distant from the equator, unless for a small country, and then only as a map.

CHART, spheroidal, a chart adapted to the spheroidal figure of the earth. In Mercator’s chart, the figure of the earth
earth is supposed to be that of a perfect sphere: but theory confirmed by observation has shown it to be an oblate spheroid. Sir Isaac Newton, from theory, found the ratio of the equatorial to the polar axis to be as 230 to 229. By comparing menfurations made at different parts of the earth, this proportion has been found to vary considerably, some making it more, and others less, than what Sir Isaac Newton affixed. From a comparison of the measure of a degree in France with that at the polar circle, the diameter of the equator to the axis of the earth was found to be as 178 to 177. Vide Degree du Meridien, &c. Paris, 1741, p. livi. According to Don George Juan, this proportion is as 266 to 265; and agreeable thereto he calculated a table of meridional parts for the spheroid. Again, M. Du Sejour, from a comparison of the lengths of pendulums vibrating seconds in different latitudes, concludes the proportion to be as 321 to 320. Traite Analytique, tom. ii., p. 270. And, agreeable to this proportion, J. De Mendoza Rios, etq. calculated a table of meridional parts for the spheroid, which is inserted in the Connoisement des Temps pour l'annee 1793.

In the year 1758 Mr. Benjamin Martin published the first spheroidal chart, in his "New Principles of Geography and Navigation," adapted to Don George Juan's proportion of the equatorial diameter of the earth's axis. These charts have not, however, come into general use.

Chart, variation, a Mercator's chart, upon which are laid down curve lines, representing the variation of the compasses at those places through which they pass. This chart was first constructed by Dr. Halley, in the year 1700, with a view to find the longitude. Since the variation at the same place is liable to an annual change, the above chart, in a few years, became almost useless. In the years 1744 and 1756, it was republished in London by Melliss, MOUNTAIN, and Doddson, from nearly one hundred thousand observations. It was also published at Paris, in 1765, by M. Bellin, and again at London in the years 1768 and 1774. Variation charts, adapted to different years, have been published by Mr. Samuel Dunn. Vide Dr. Mackay's Longitudes, vol. i. p. 264. For the method of finding the longitude at sea by this method, the reader is referred to the article Longitude; see also Variation.

Chart of the Inclination, or Dip of the Magnetic Needle, contains curve lines expressing the quantity of the inclination or dip of the needle at those places through which they pass. A chart of this kind, for a small portion of England and France, was published by Mr. William Whiton, in his treatise entitled "The Longitude and Latitude founded by the Inclination or Dipping Needle," printed at London in 1721. In the year 1768, M. Wilck of Sweden published a general chart, exhibiting the lines of equal dip, in the most frequented parts of the globe. This chart was re-published by M. Le Monnier, in his treatise "Lois du Magnetisme," printed at Paris in 1776. It has been proposed to find the latitude by means of a chart of the inclination of the needle; and by both inclination and declination of the needle, the latitude and longitude might be found, provided the theory of the variation was known, and instruments could be constructed to shew the quantity of the variation and dip, with sufficient accuracy.

Charts, Constructions of.

I. Of the plane chart.

The number of degrees of latitude which the chart is intended to contain, and the extent from east to west being fixed upon; a line is to be drawn near the side or end of a sheet of paper, in length equal to the whole length of the chart, from north to south; and this line is to be divided into degrees, and numbered accordingly. From each end of this line perpendiculars are to be drawn, and made equal to the intended extent of the chart from east to west, and their extremities are to be joined by a straight line. If the chart is to commence at or near the equator, and to extend only a few degrees of latitude, the divisions of the parallels may be equal to those of the meridian: but if the chart begins at any considerable distance from the equator, it will conduct to accuracy to make the length of each degree of the parallel equal to the co-ine of the mean latitude, the radius being 60 minutes; or, the extreme parallels may be divided according to the above proportion, and in that case it will become a reduced chart. Meridians and parallels are there to be drawn at convenient distances.

A scale is now to be made of thin paper or pasteboard, equal in length to the extent of the chart from east to west, and divided and numbered accordingly. By this scale, the positions of those places contained within the limits of the chart are very easily laid down, by placing the divided edge of the scale over the latitude of the given place; and under the given longitude, a mark being made will represent the position of the place on the chart.

A compass is to be infected in any convenient place of the chart, an arrow showing the direction of the food tide or current. The times of high water set and change are to be marked in their proper places, expressed in Roman characters; foundings and quality of the ground at bottom, the leading marks to avoid dangers, &c.

II. Of a Mercator's Chart.

A Mercator's chart, for any given portion of the surface of the globe, is constructed as follows:

The limit of the proposed chart is first to be determined, that is, the number of degrees of latitude and longitude which it is to contain, and the degree of latitude and longitude of its commencement.

Find the meridional parts answering to each degree of latitude within the intercalated limits of the chart, and take the difference between each, and that corresponding to the least degree of latitude in the chart; and reduce these differences to degrees, by dividing by 60.

A parallel, representing that of the least latitude, is to be drawn; upon which the number of degrees in the proposed difference of longitude, from a scale of equal parts, is to be laid off, and divided into degrees, and smaller portions, if convenient, and numbered at each fifth or tenth degree. From each end of this parallel a perpendicular is to be drawn, and made equal to the difference of the meridional parts of the extreme latitudes taken from the divided parallel; and the ends of these meridians are to be joined by a straight line, which will represent the other extreme parallel, and which is to be divided and numbered in the same manner as the first drawn parallel; the meridians are then to be divided into degrees, and numbered at every fifth or tenth degree.

Take the meridional difference of latitude between the beginning of the chart, and the next fifth or tenth degree of latitude from the divided parallel, and lay it off from the first parallel on each of the scale meridians, and join these points by a straight line. In like manner, the meridional difference of latitude answering to each successive interval of five or ten degrees, is to be taken from the first drawn parallel and laid off, and the corresponding parallels are to be drawn and numbered accordingly, and the intermediate spaces are to be subdivided. If the chart is upon a large scale, the meridional difference of latitude answering to each degree, is to be laid off from the least parallel.
CHART.

If the chart is intended to be upon a larger scale, equimultiples of the intervals are to be taken, such as will answer to the proposed extent of the chart.

A ship of strong paper is to be divided and numbered in the same manner as the first drawn parallel. Now, each place within the limits of the chart is to be laid down, by placing the ship of paper so that its extreme points of division may be at the latitude of the given place on each meridian; then, under the longitude of the place a mark is to be made, which will represent the position of that place. In like manner, all the places on the coast are to be laid down and connected by observations made on the coast; or if no sketch had been drawn, the contour of the coast is to be drawn agreeable to the best charts. Meridians and parallels are to be drawn through every fifth or tenth degree of latitude and longitude and extended to the coast.

A compass is to be inserted in some convenient part of the chart, and the points extended to the land: an anchor is to be drawn where there is a good anchoring ground, and in places where it is safe only to float a tide, an anchor without a block is to be laid down. The soundings, the quality of the ground, the times of high and low water, &c. are to be marked in their proper places.

For the method of laying down a Mercator's chart by means of a scale of logarithmic tangents, the reader is referred to Dr. Mackay's Treatise on Navigation, from which the greater part of the preceding, and also the remaining part of this article are extracted.

III. Of the Variation Chart.

Having constructed a general chart according to Mercator's projection, mark down with dots all the places in which the declination of the magnetic needle has been ascertained; then draw lines through those points having the same declination. These lines, or arcs, are called lines of declination; and by proceeding in this manner as far as the variation is known the chart will be completed.

CHARTS, manner of using.

The principal use of a chart is, to find the course and distance between any two places within its limits, and to lay down the place of a ship on it, so that the position of the ship with respect to the intended port, the adjacent land, islands, &c. may be readily perceived.

As it is incompatible with the plan of the present work to infer large charts, therefore, in performing the following examples, it is supposed, the practitioner has the necessary charts before him.

I. USE OF THE PLANE CHART.

Problem I.

To find the Latitude of a Place, on the Chart.

Rule.—Take the nearest distance between the given place and the nearest parallel of latitude, which being applied in the same way on the divided meridian, from the point of intersection of the parallel and meridian, will give the latitude of the proposed place.

Example.—Required the latitude of Port Louis, in the Isle of France.

The least distance between Port Louis and the nearest parallel being laid in the same way on the meridian, from the extremity of that parallel, will reach to 20° 8' S. the latitude required.

Problem II.

To find the Course and Distance between two given Places on the Chart.

Rule.—Lay the edge of a scale over the given places, and take the nearest distance between the center of any of the compasses on the chart and the edge of the scale, move this extent along, so as one point of the compasses may touch the edge of the scale, and the straight line joining the points may be perpendicular thereto; then will the other point show the course, and the interval between the places being applied to the scale, will give the required distance.

Example.—Required the course and distance from Cape St. André to Cape St. Sebastian, both in the island of Madagascar?

The edge of a scale being laid over the two places, then, by moving the compass as directed, the course will be found to be N.E. 4/5 E. and the interval between them will measure 105 leagues.

Problem III.

The Course and Distance found from a known Place being given to find the Ship's Place on the Chart.

Rule.—Lay the edge of a scale over the place failed from, parallel to the given course; then take the given distance from the scale on the chart, and lay it off from the given place by the edge of the scale, and it will give the point on the chart representing the place of the ship.

Example.—The correct course of a ship from Cape St. Maria, on the N. side of the entrance of the river La Plata, was N.E. by E. and the distance 258 leagues. Required the place of the ship on the chart?

The edge of the scale being laid over Cape St. Maria, in a N.E. by E. direction, and the distance 258 leagues, laid off from Cape St. Maria by the edge of the scale, will give the place of the ship, which will be found to be in latitude 38° 15' S.

Problem IV.

Given the Latitude in, and Meridian Distance, to lay down the Place of the Ship on the Chart.

Rule.—Through that place from which the meridian distance is reckoned, let a meridian be drawn, then lay a scale over the given latitude, and the meridian distance being taken from the scale on the chart, and laid off by the edge of the scale from the point of its intersection with the meridian, will give the ship's place.

The manner of performing this problem is obvious; and the various other problems that may be resolved on the plane chart, require no further explanation, being only the consequent of the remaining problems in plane sailing.

II. USE OF MERCATOR'S CHART.

Problem I.

To find the Latitude of a Place with the Chart.

Rule.—This is performed in the same manner as Problem I. on the plane chart.

Problem II.

To find the Longitude of a Place on the Chart.

Rule.—Take the least distance between the given place and the nearest meridian, which being laid off on the equator, or divided parallel, from the point of intersection of the parallel and meridian, will give its longitude.

Example.—Required the longitude of Funchal in the island of Madeira?

The least distance being taken between Funchal and the nearest meridian, and laid off from the intersection of that meridian with the divided parallel, will give 17° 0' W. the longitude required.
Problem III.  
To find the Course between two given Places on Mercator's Chart.

Rule.—For the manner of performing this problem, the reader is referred to the use of the plane chart, Problem II.

Problem IV.  
To find the Distance between two given Places on the Chart.

1. When the given places are under the same meridian.  
Rule.—Find the latitude of each; then, the difference, or sum of their latitudes according as they are on the same, or on opposite sides of the equator, will be the distance required.

Example.—Required the distance between the nearest extremities of the islands of Grenada and Gaudaloupe?

Latitude of southernmost extremity of Gaudaloupe - - - - - 15° 52' N.
Latitude of northernmost extremity of Grenada - - - - - 12° 14' N.

Distance - - - - - 338 = 218 M.

2. When the given places are under the same parallel.  
Rule.—If that parallel is the equator, the difference, or sum of their longitudes, found by Problem II, is the distance between them. If not, take half the interval between the given places, lay it off on the meridian on each side of the given parallel, and the intercepted degrees will be the distance between the places.

If the given parallel is near the north or south extremity of the chart, the following method may be used. Take an extent of a few degrees from that part of the meridian where the given parallel is the middle of the extent; then the number of extents, and parts of an extent, contained between the given places, being multiplied by the length of an extent, will give the required distance.

Example.—Required the distance between Cape Cantin and Funchal, both lying nearly in the same parallel?

By proceeding as directed above, the distance will be found to be 6° 45' or 1343 leagues.

3. When the given places differ both in latitude and longitude.  
Rule.—Find the difference of latitude between the given places, and take it from the equator, or graduated parallel; then, lay the edge of a scale over the given places, and move or slide one point of the compass along the edge of the scale, until the other point just touches a parallel. Now, the distance between the place where the point of the compass rested, and the point of intersection of the edge of the scale and parallel being applied to the equator or divided parallel, will give the distance between the places in degrees and parts of a degree; which, multiplied by 60, will give the distance in miles.

Example.—Required the distance between Cape Finisterre and Porto Santo?

Take the difference of latitude between the given places, viz. 9° 54', from the graduated parallel, and move one point of the compass along the edge of the scale, laid previously over the places, until the other point just touches a parallel; now, the interval between the place where the point of the compass rested, and the point of intersection of the scale and parallel, being applied to the divided parallel, will measure 11° 24', or 228 leagues.

Remark.—To some charts a set of scales is adapted to each degree of latitude within the limits of the chart; by which the distance between any two places is easily measured, by applying that distance to the scale answering to the middle parallel of latitude of the two places.

Problem V.  
Given the Latitude and Longitude in, to find the Ship's Place on the Chart.

Rule.—Lay the edge of a scale over the given latitude, and lay off the given longitude from the first meridian, or the difference of longitude from the nearest meridian, by the edge of the scale, and the ship's place will be obtained.

Example.—The latitude is 47° 30' N. and longitude 12° 15' W.; it is required to lay down the ship's place on the chart?

Lay the edge of the scale over the latitude 47° 30' N.; then take, from the divided parallel, the interval between 10° and 12° 15', which laid off by the edge of the scale from the meridian of 10°, will give the ship's place.

Problem VI.  
Given the Course steered from a known Place, and the Latitude in, to find the Ship's Place on the Chart.

Rule.—Lay the edge of a scale over the place failed from, in the direction of the given course, and its intersection with the parallel of latitude arrived at will be the place of the ship.

Example.—A ship from the Lizard failed S.W. by S. and her observation is in latitude 45° 20' N. Required the place of the ship on the chart?

The edge of a scale being laid over the Lizard, parallel to the S.W. by S. rhumb, will intercept a parallel drawn through the given latitude, 45° 20' N. in the ship's place.

Problem VII.  
Given the Course steered, and Distance run from a known Place, to lay down the Ship's Place on the Chart.

Rule.—Lay the edge of a scale over the place failed from, in the direction of the given course; then, take the distance from the equator, put one point of the compass at the intersection of any parallel with the edge of the scale, and the other point of the compass will reach to a certain place by the edge of the scale; now, this point remaining fixed, draw in the other point of the compass, until it just touch the above parallel; apply this extent to the equator, or divided parallel, and it will give the distance of latitude. Hence, the latitude come to will be known; and the point of intersection of the corresponding parallel with the edge of the scale, will be the place of the ship.

Example.—A ship from Cape St. Vincent failed S.S.W. 300 miles. Required the ship's place on the chart?

Lay the edge of a scale over Cape St. Vincent, parallel to the S.S.W. rhumb. Take the distance five degrees from the divided parallel; place both points of the compass close to the edge of the scale, so that one of them may be at the intersection of a parallel with the edge of the scale, and the other on that side of the parallel on which is the acute angle formed by the scale and parallel. Now this last point of the compass remaining in the same position, diminish the extent of the compass, until the other point touches the parallel, and this extent applied to the divided parallel, will measure 4° 37'; hence, the latitude in, is 32° 25' N.; and a parallel drawn through 32° 25', will intercept the edge of the scale in the place of the ship.

Problem VIII.  
Given the Latitude and Longitude failed from, the Course steered, and Longitude come to; to find the Ship's Place on the Chart.

Rule.—Draw a meridian through the longitude come to; then,
then, lay the edge of a scale over the place failed from, in the direction of the course, and its intersection with the meridian will be the place of the ship.

Example,—The true course of a ship from Cape St. Bernard, in the island of Bourbon, was N.E. ¾ N. and the longitude come to 59° 40' E. Required the ship's place on the chart?

The edge of a scale laid over Cape St. Bernard, in a N.E. ¾ N. direction, will intercept a meridian drawn through the given longitude 59° 40' E. which will represent the ship's place; the latitude of which is 15° 18' S.

Chart, Biographical, See Biography. See also Hay-fair's Chronology, p. 247.

Chart, Chronographic, is a delineation of particular countries.

Chart, Heliographic, a description or delineation of the body of the sun and of the mausoleum or spots observed on it.

Chart, Historical. See History.

Chart, Seismographic, a representation of particular appearances of the spots of the moon, or of her appearance and mimic.

Chart, Telegraphic, a description or delineation of the telegraph on paper.

Chart, Topographic, is a specific delineation of military posts and positions in given tracts of country. This ought always to be as correct as possible in regard to their relative dispositions of the positions and more, especially with regard to their relative heights. It is in this respect particularly that military surveys and reconnaissances are defective. The French have formed companies of topographers for the purpose of correctly and expeditiously pointing out to generals and other commanding officers all the leading points and relative situations of ground and locality. A general, however, should not rely implicitly on their reports or delineations, but ought if practicable to examine the principal positions himself, particularly those that he fixes on for his encampments.

Chart, primarily signifies a sort of paper made of the plant papyrus or burlis.

Charta emporica, in Pharmacy, &c., a kind of paper made very soft and porous, and used as a filter.

Charta, also used in ancient customs for a charter or deed in writing. See Charter.

Charta de fregis. See Charter of the forest.

Charta magna, the great charter, is an ancient instrument, containing several privileges, and liberties, granted to the church and state, by Edward the Confessor, together with others relating to the feudal laws of William the Conqueror, granted by Henry I., all confirmed by the succeeding princes about thirty times. See Magna charta.

Charta mercatoria, a charter or declaration of protection and privileges granted to foreign merchants, first published by Edward I. in 1303; who also afoertained the customs or duties, which those foreign merchants, in return for the said charter, were to pay on merchandise exported and imported. Upon the grounds of this famous charter, historians agree that this king was the first who established the great customs on merchandise. This charter was confirmed by Edward III. in 1328.

Charta paxdonationis se defendenda, is the form of a pardon for a person's killing another man in his own defence.

Charta paxdonationis uti garata, is the form of a pardon of a man who is outlawed.

Charta simplex, is a single deed, or deed-poll. See Deed.

Charta, in Ancient Geography, a place of Asia in Mesopotamia, where the Romans had a garrison.—Also, a town of Palestine, mentioned in the book of Joshua as belonging to the tribe of Zebulon; it was granted to the Levites of the family of Merari.

Chartagune, in Military Language, a solid retrenchment almost always withdrawn from the enemy's view, that is thrown up in a wood or forest for the defence of an important place.

Charta, in Ancient Geography, a large and rich town of Asia, situated to the call of Hircania.

Chartan, a town of Palestine, in the tribe of Naphtali. It was granted to the Levites of this tribe, who were of the family of Gerham.

Chartani, a people of Africa, placed by Ptolemy in Libya near Egypt.

Chartarius, the name with chartophylax.

Chartel. See Cartel, Champion, Combat, Duel, &c.

Charte, Chart, in Law, an instrument or written evidence of a thing under the seal of a prince, lord, church, chapter, or community.

The word charter comes from the Latin charta, anciently used for a public or authentic act; from Xaper, thick paper or parchment, wherein public acts were used to be written.

Bracontays, donations are sometimes made in charters, in perpetuum rei memoriam; and Britton, in his 35th chapter, divides charters into those of the king and those of private persons.

Charters of community, were certain privileges first obtained by violence, or purchase, and afterwards freely be- lowed by emperors, kings, and barons; whereby the inhabitants of towns and cities were enfranchised, all marks of servitude abolished, and these cities, &c., were formed into corporations and bodies politic, to be governed by a council and magistrates of their own nomination. The first person who conferred these privileges, was Lewis the Gros in France, about the beginning of the twelfth century; and his example was followed very generally by others. These charters convey a very striking representation of the wretched condition of cities previous to the institution of communities, when they were subject to the judges appointed by the superior lords of whom they held, and had scarcely any other law but their will. Each concei- tion in these charters must be considered as a grant of some new privilege which the people did not formerly enjoy, and each regulation as a method of redressing some grievance under which they formerly laboured. The charters of communities contain likewise the first expedients employed for the introduction of equal laws and regular governments. For an account of the most important articles in these charters ranged under the two general heads, of such as respect personal safety, and such as respect the security of property; See Robertson's Ch. V. vol. i. p. 348. &c. See Cities.

Among royal charters granted to communities, it appears that in the reign of Edward IV. by his letters patent under the great seal of his realm of England, bearing date the 24th of April, 1469, in the nineth year of his reign, this patent, "of and for him and his heirs, give and grant licence into Walter Holiday, Marshall, John Cuff, and Robert Marshall, Thomas Granc, Thomas Calthorne, William Cliff, William Christian, and William Eyneyham, then minifrels of the said king, that they by themselves should be in deed and name one body and comonality, perpetual and capable in the law, and should have perpetual feceffion; and that as well the minifrels of the said king, which then were, as other minifrels of the said king and his heirs which should be after-
wards, might at their pleasure, name, chuse, and ordaine, and successively constitute from among themselves, one marshall, able and fit to remain in that office during his life, and also 2 wardens every year to govern the said fraternity and guild.

The original charter is preferred in Rymer's Polyglotta, tom. xii. Pro fraternitate imparabilis regis. James the First, upon what beneficial principle it is now difficult to discover, by letters-patent incorporated the musicians of the city of London into a company, and they still continue to enjoy privileges in consequence of their constituting a fraternity and corporation; bearing arms azure, a swan argent, within a treble counter-flour, or: in a chief, gules, a rose between two lions, or: and for their crest the celestial sign Lyra, called by astronomers the Orphian Lyre. Unluckily for the bona vivans of this tuneful tribe, they have no hall in the city for festive delights! However, on days of greatest gourmandize, the members of this body are generally too busily employed in exhilarating others, comfortably to enjoy the fruits of good living themselves. And here historical integrity obliges us to say, that this company has ever been held in derision by real professors, who have regarded it as an institution for foreign to the cultivation and prosperity of good music, as the train bands to the art of war. Indeed the only uses that have hitherto been made of this charter seem the offering to aliens an easy and cheap expedient of acquiring the freedom of the city, and enabling them to pursue some more profitable and respectable trade than that of building; as well as empowering the company to keep out of processions and city feasts every street and country dance player of superior abilities, to those who have the honour of being styled the worth of the corporation.

This charter granted by Charles I, to the musicians of the city of Westminster, had lain dormant from that time till the reformation; but immediately after that event, the persons named in it, who were still living, determined to refuse music from the disgrace into which it had fallen, and exert their authority for the improvement of the faculty, and interest of its professors. Fifty-two musicians, consisting of the king's band and other professors, natives and foreigners, the most eminent of the time, were enrolled in this charter as the king's musicians: "and all such as are, and shall be the musicians of his majesty, his heirs and successors, shall from henceforth for ever, by force and virtue of the said grant, be a body corporate and politic, in deed, fact, and name." The other powers granted by this charter, allowed the corporation to meet from time to time, in order to make bye-laws and impose fines on such as transgressed them, "which fines they shall have to their own use."

In pursuance of these powers, the corporation hired a room in Durham Yard, in the Strand, within the city and liberty of Westminster. Their first meeting was on the 22d day of October, 1661; Nicholas Laniere then being marshal; from which day they proceeded to make orders, summoning, fining, and prosecuting the first professors who dared "to make any benefit or advantage of musick in England or Wales," without first taking out a licence from their fraternity. Among the instances of the exercise of their power, Jan. 13th, 1665, it was "ordered that Matthew Lock, Christpher Gibbons, Dr. Charles Colman, and William Gregory, do come to the chamber at Durham Yard, on Thursday next, at 2 of the clock in the afternoon, and bring each of them ten pounds, or threew caufe to the contrary."

This seems to have been one of the most oppressive and unmeaning monopolies with which the Stuarts had long vexed the nation. Such a tyranny as this over the professors of a liberal art, there is reason to fear, would be abused in whatever hands it was lodged. The College of Physicians, which superintends the dispensations of life and death, may have its life by preventing or detecting Charlatanerie; but that the minister of our innocent amusements should be subject to any other control than that which the common law of the realm is empowered to exercise over men of all ranks and degrees in the state, seems at first but a wanton and useless, if not a noxious delegation of power, which was less likely to benefit the public, or accelerate the progress of the art, than to enable artificers to torment and harass each other.

It appears by the transcriptions of this corporation, the minutes of which are extant in the British Museum among the Harleian MSS. No. 1911, that the meetings of its members continued no longer than 1679; when finding themselves involved in law suits and incapable of enforcing the power they assumed, and penalties they threatened, it was thought most advisable to leave the art and arts to the neglect or patronage of the public.

The fund for the support of decayed musicians or their families, established in 1738, and formed into a regular society of musicians, after the commemoration of Handel, in 1784, having been honoured by his majesty's immediate countenance and protection, and graciously allowed to assume the title of Royal Society of Musicians, had a charter granted them. See Commemoration of Handel, and Fund for decayed Musicians and their families.

Charter of the forest, is that wherein the laws of the forest are comprised and established. In the time of king John, and that of his son, Henry III., the rigours of the feudal tenures and the forest laws were so warmly maintained, that they occasioned many infractions of the charters or principal foundations; which at last produced all this effect, that first king John, and afterwards his son, conferred on the two famous charters of English liberties, magna carta, and carta de foresta. The latter, in particular, was well calculated to redress many grievances and inroads of the crown in the exerion of forest law. This charter, as well as the other, was established, confirmed, and settled in the reign of Edward I. See Forest.

Charter, Great, Magna charta. See Magna charta.

Charters of immunity or franchises, were granted to some towns and villages by the lords on whom they depended, long before the institution of communities in France. But there are very different from such as became common in the 12th and 13th centuries. They did not erect these towns into corporations; they did not establish a municipal government; they did not grant them the privilege of bearing arms; they contained nothing more than a manumission of the inhabitants from the yoke of servitude; an exemption from certain services which were oppressive and ignominious; and the establishment of a fixed tax or rent which they were to pay to their lord in lieu of impositions which he could formerly lay upon them at pleasure. Two charters of this kind to two villages in the county of Rouillon, one A. D. 974, the other A. D. 1025, are still extant. Such concessions, it is probable, were not unknown in other parts of Europe, and may be considered as a prep towards the more extensive privileges conferred by Louis the Great on the townsfolk from his dominions. See Charters of community.

Charters of the king, are those whereby a king makes a grant to a person or community; v. gr. a charter of exemption, that a person should not be imprisoned on a jury, &c. See Letters patent.

Charter of pardon, is that whereby a person is forgiven a felony, or other offence against the king's crown and dignity, of which there are several forts. See Pardon.
CHARTERS OF PRIVATE PREFACE, are deeds and instruments for the conveyance of lands, etc. And the purchaser of lands shall have all the charters, deeds, and evidences as incident to the same, and for the maintenance of his title. Co. Litt. 6. Charters belong to a feoffee, although they be not sold to him, where the feoffees are not bound to a general warranty of the lands; for there they shall belong to the feoffor, if they be sealed deeds or with in writing, but other charters go to the tenant. Monr. Ca. 687. The charters belonging to the feoffor, in case of warranty, the heir shall have, though he hath no land by descent, for the possibility of descent after. 1 Rep. 1.

CHARTER GOVERNMENTS in the British colonies, are in the nature of civil corporations, with the power of making by-laws for their own interior regulation, not contrary to the laws of England; and with such rights and authorities as are specially given them in their several charters of incorporation. The form of government is borrowed from that of England. They have a governor named by the king (or in some proprietary colonies by the proprietor), who is his representative or deputy. They have courts of justice of their own, from whom decisions an appeal (as fome say, in the nature of a reference by way of arbitration) lies to the king in council here in England. Their general assemblies, which are their house of commons, together with their council of state, being their upper house, with the concurrence of the king, or his representative, the governor, make laws suited to their own emergencies. But it is particularly declared, by Stat. 7 and 8 W. III. c. 22, that all laws, by-laws, usages, and customs, which shall be in practice in any of the plantations, repugnant to any law, made or to be made in this kingdom, relative to the said plantations, shall be utterly void and of none effect. These are called charter governments, by way of distinction from the provincial establishments, the constitutions of which depend on the respective charters issued by the crown to the governors, and the instructions attending them; under the authority of which, provincial assemblies are constituted, with the power of making local ordinances, not repugnant to the laws of England; and also from proprietary governments, granted out by the crown to individuals, in the nature of feu-duty principalities, with all the inferior regalities, and subordinate powers of legislation, which formerly belonged to the owners of counties palatine. See farther Blackstone's Comm. vol. 1. p. 108.

CHARTERER is in some places, as Cheshire, used for a freeholder.

CHARTER-HOUSE. See CHARTERHOUSE.

CHARTER-LAND, in law, is such as a man holds by charter, that is, by evidence in writing; otherwise called freehold. This the Saxons called buck land; which Lambard renders, terra ex scripto. See BUCK-LAND.

It was held on more easy conditions than the folk-land, or terra fine scripto, held without writing: the former being hereditaria libera et immunis; whereas the latter confin perstatbam annum, atque officiorum quodam ferocitate erat obigatus. This kind of land was held by deed under certain rents and free services, and in effect was no respect different from free foage lands; and hence have arisen most of the freehold tenants who hold of particular manors, and owe suit and service to the same.

CHARTER PARTY, in commerce, denotes the instrument of freightage, or articles of agreement for the hire of a vessel. This, among merchants and sea-faring men, is commonly called "a pair of indentures," containing the covenants and agreements made between them, touching their merchandize and maritime affairs. 2 Inst. 673.

The charterparty is in writing, and it is to be signed both by the proprietor, or the master of the ship, and the merchant who freights it.

The charterparty is to contain the name and the burden of the vessel; those of the master and the freighter; the price, or rate of freight; the time of loading, and unloading; and the other conditions agreed on.

It is properly a deed, or policy, whereby the master, or proprietor of the vessel, engages to furnish immediately a sound found vessel, well equipped, caulked, and flopped, provided with anchors, sails, cordage, and all other furniture to make the voyage required, as equipage, hands, victuals, and other munitions; in consideration of a certain sum to be paid by the merchant for the freight. Lastly, the ship, with all its furniture, and the cargo, are respectively subjected to the conditions of the charterparty.

The charterparty differs from a bill of lading, in that the first is for the entire freight, or lading, and that both for going and returning; whereas the latter is only for a part of the freight, or at all only for the voyage one way.

The common law confirms charterparties, as near as may be, according to the intention of them, and not according to the literal sense of traders, or those that merchandise by sea: but they must be regularly pleaded. In a case of covenant by charterparty that the ship should return to the port whence she sailed, and not to another place, the Admiralty, by a certain time, "dangers of the sea excepted," and afterwards, in the voyage, and within the time of the return, the ship was taken upon the sea by pirates, so that the master could not return at the time mentioned in the agreement; it was adjudged that this impediment was within the exception of the charterparty, which extends as well to any dangers upon the sea by pirates and men of war, as dangers of the sea by shipwreck, or storm, etc. Stile 132. 2 Rol. Abr. 248. A ship, freighted at a certain premium per month of the time that the ship shall be out, and covenanted to be paid after her arrival in the port of London, is cast away coming up from the Downs, but the lading is all preserved; in this case the freight shall be paid, for the money becomes due monthly by the contract, and the place mentioned is only to ascertain where the money is to be paid; and the ship is entitled to wages, like a mariner that serves by the month, whose executors, if he dies in the voyage, are to be answered to prorata. Mill. de Jur. Marit. 260. If a part-owner of a ship refuse to join with the other owners in the fitting out of the ship, he shall not be entitled to any share of the freight; but by the course of the Admiralty, the other owners ought to give security if the ship perils in the voyage, to make good to the owner standing out, his share of the ship. Sir L. Jenkins, in a case of this nature, certified that by the law marine and course of the Admiralty, the plaintiff was to have no share of the freight; and that it was so in all places: for otherwise there would be no navigation. Lex Mercat. See Freight and Insurance.

The president Boyer says, the word comes from hence, that per medium charter inclusio, & sic ficta charter partia; because in the time when notaries were less common, there was only one instrument made for both parties: this they cut in two, and gave each his portion, and joined them together at their return, to know if each had done his part. This he observes to have been practiced in his time; agreeable to the method of the Romans, who, in their stipulations, used to break a staff, each party retaining a motley thereof as a mark.

CHARTER SCHOOLS are schools in Ireland, of which there are 58, designed for the instruction of the children of the Papists and other poor natives, in the English tongue and the
the principles of morality and true religion; besides two called the "Ranelagh Schools," which admit only the children of Protestants. The excellent Mr. Howard, in his journey to Ireland, examined the state of these schools, and made a report upon them to the committee of the House of Commons in 1738. He has given a particular account of them, with appropriate remarks in his "Account of the principal Lazaretto in Europe," &c. p. 101, &c. See School.

CHARTIER, Alain, in Biography, a native of Bayeux, one of the first French citizens who aspired to elegance, flourished about the year 1430. He was secretary to the kings Charles VI. and VII. and employed in several embassies. His compositions in prose excelled those that were poetical, and he spoke as well as he wrote, so that he was esteemed the father of French eloquence. The following curious anecdote relating to him is recorded. Margaret of Scotland, first wife to the dauphin, afterward Lewis XI., as she passed through the Louvre, observed Alain asleep, and went and kissed him. When her attendants expressed their surprise that the should thus deign to copy a man remarkable for his ugliness, she replied, "I do not kiss the man, but the mouth that has uttered so many charming things."

His works were published by the elder Du Chesne, in 1617, in 4to: the first part consisting of his works in prose, viz. the "Curial," a "Treatise on Hope," the "Laudatologia Inedita" against Edward III.; and others, partly spurious; and the second part containing his poems, which are, for the most part, obscure and tedious. Alain Chartier died at Avignon in 1449. Nouv. Dict. Hill.

CHARTIER, John, brother of the preceding, was a Benedictine monk, and charter of St. Denis. He was the author, at least, the compiler, of a dry work, displaying much credulity and inaccuracy, entitled the "Great Chronicles of France," commonly called "Chroniques de St. Denis," from Pharamond to the death of Charles VII., 3 vols. fol. Paris, 1543. His "History of Charles VII." was published at the Louvre, in 1651, fol. by the learned Godfriedon, who enriched it with his notes and several unedited pieces. Nouv. Dict. Hill.

CHARTIER, René, born at Vendome, where he received the rudiments of his education. He was sent thence to Paris, and having completed his studies, was made doctor in medicine on the 14th of August 1668. He was soon after appointed by the faculty of medicine professor in surgery and pharmacy. In 1612, he was made physician in ordinary to the king, and to the princes of France. With one or other of the princes, in their turn, he visited the courts of Spain, Savoy, and England. Returning at length, and settling at Paris, his whole time seems to have been employed in forming the splendid edition of the works of Hippocrates and Galen, which goes under his name, and in which he is said to have expended so large a sum of money, (five-quantes mille ecus, his biographer says) as to reduce himself nearly to a state of indigence. The work is printed in 13 volumes, though usually bound in 9, and the volumes came out at different times, but not in the order of their numbers. Of the ten volumes, which were published in the lifetime of the editor, the first six, the eighth, and the thirteenth, appeared in the year 1639, the seventh and the eleventh ten years after, viz. in 1649; the ninth, the tenth, and the twelfth volumes, which completed the work, were printed under the care and direction of doctors Blondel and Le Maine, and did not appear until the year 1672. Though the editor spared neither labour nor expense in his endeavours to give perfection to the work, and has arranged his materials so that any of the treatises, by either writer, may be turned to with facility; yet, in the opinion of Fried, and Mack, to which Haller also accedes, the works of Hippocrates, as here exhibited, are more imperfect than in some earlier editions.

Cherchant also edited "Ludovici Dureti Scholia ad Jacobi Hallerii Librum de Mibus internis," Paris, 1614, 4to. "Bartholomaii Perdelius, Universa Medicina," ibidem, 1630, 4to. His son John, who was created doctor in medicine in 1634, published, translated from the Greek, "Palladii de Februbus, concilia Synoposis," 1616, 4to., and in 1611, "La Science du Plomb sacra des Sages, ou de l'Antimonie, on font decrites les rares et particulieres virtus, puissances, et qualites," 4to. This work gave great offence; the faculty of medicine at Paris, with Guy Patin at their head, being particularly hostile to antimonial medicines. To ridicule their foolish prejudices, Chartier placed at the head of his book the figure of an owl, with the following lines:

"Le hibou fait la chante vivifique
Et bien qu'il ait lunettes et flambeaux,
Il ne peut voir les secrets les plus beaux
De l'antimonie, et du vin enemique."

John Chartier was also professor in surgery, and physician in ordinary to the king, in which honour he was succeeded by his younger brother Philip, who was created doctor in medicine in the year 1659. Haller Bib. Med. Eloy Dict. Hill.

CHARTIER, in Geography, a township of America, in the county of Washington and state of Pennsylvania.

CHARTIER, St. a town of France, in the department of the Indre, and district of La Châtre; 1/3 league N. of it.

CHARTIER'S Creek. See CANONSBAY and MORGANZA.

CHARTIS redhendis, a writ which lay against him that had charters of feoffment intrusted to his keeping, and refused to deliver them to the owner. Reg. Oeg. 159.

CHARTOPHYLACIUM, a place where records were kept.

CHARTOPHYLAX, an officer in the church of Constantinople, intrusted with the custody of the archives.

The word is formed from χαρταὶ, and χαρτου, χαστός; and signifies charter-keeper.

Codi calls the grand chartophylax the judge of all causes, and the right arm of the patriarch. He adds, that he was the depositary or keeper of all the charters relating to the ecclesiastical rights; and that he prefigured over matrimonial causes, and was judge of all the clergy. He drew up all the ceremonies and decrees of the patriarch, who signed and sealed them: he prefigured the grand council of the patriarch: he took cognizance of all matters and causes ecclesiastical and civil, whether among the clergy, the monks, or the people.

He took place of all the bishops, though himself only a deacon; and, on occasion, discharged the functions of the priests: he had twelve notaries under him.

The chartophylax was much the same at Constantinople with the chartular in Rome.

There were, in reality, two officers who bore this title; the one for the court, the other for the patriarch; the first was called also registrator, and the latter scriinarius: though the two are usually confounded together. Leunclavius, and others, confounded chartophylax with chartular.

CHARTRAIN, in Geography, a small county of France, so called before the revolution, in the environs of Charent, its capital.

CHARTRE, La, a town of France, in the department of the Sarthe, and chief place of a canton in the district of St. Calais; two leagues E.N.E. of Chateau-du-Loir. The place...
place contains 173, and the canton 10,153 inhabitants: the territory includes 1,5 kilometres and 9 communes.

CHARTRES, a city of France, and principal place of a district in the department of the Eure and Loir, one of the most ancient towns of the country, and before the revolution, the seat of a bishopric, finally the capital of the diocese of Chartres. Its cathedral is esteemed one of the most beautiful churches in the kingdom. It is situated on the Eure, over which is a bridge, constructed by the celebrated Vauban. Its principal trade is in corn. The place contains 14,400, the north canton 16,783, and the south canton 16,321 inhabitants: the territory includes 6764 kilometres and 35 communes. N. lat. 28° 46' 46". E. long. 1° 28' 55'.

Chartres, a fort built by the French on the easterly side of the Milliphi; three miles northerly of La Prairie du Rocher, or the Rock-Meadows, and 12 miles northerly of St. Genevieve, on the western side of that river. It became untenable on account of the constant washings of the high floods of the Milliphi, and was abandoned in 1772. South of the fort is a village which was very inaccessible in 1778; above this is another village, settled by 170 warriors of the Piorias and Mitchigamias tribes of Illinois Indians, who are idle and debauched.

CHARTREUSE, a celebrated monastery of Carthusians; so called from the name of a steep rocky place, in a frightful defart, five leagues from Grenoble in France; where St. Bruno retired from the world, and first instituted the order of Carthusians, which fee.

The name has since passed to all houses of Carthusians; and that near Grenoble is now distinguished by the name of the Great Chartreusse.

That of London, corruptly called Charter-houfe, was before the suppression of monasteries by Henry VIII. a priory belonging to that order, and from the powers by which it was first erected into a hospital, it was denominated *The Hospital of king James." On occasion of a dreadful plague which filled all the common burial grounds with the dead, Walter de Manny, a Fiennish nobleman, purchased in 1549, of the master and brethren of St. Bartholomew's Hospital in Smithfield, 13 acres and a rod of land, denominated *The Siptal Crott," and appropriated the same, after it had been inclosed and concreted, as a common cemetery for the accommodation of such deceased persons as could not have place in their respective parish grounds. A chapel was also erected in the said cemetery by the right honourable proprietors, in which many liberal oblations were made for several succeeding years. In 1571, Manny founded in this place a Carthusian monastery; and the revenues of this convent amounted, at the time of its suppression in 1588, to 642 l. 4s. 4d. per annum, which was conferred upon Sir Thomas Audley, speaker of the House of Commons, and from him descended to Thomas, earl of Suffolck, who disposed of it to Thomas Sutton, esq. by the name of "Howard-houfe," commonly called the "Charter-houfe," consisting of divers courts, a wilderufs, orchards, walks, and gardens, &c. for which he paid the sum of 13,000l. in 1611. By letters patent obtained in this year, the hospital was established, and confirmed by parliament, in 1628.

The charge of the establishment for the admission of pensioners and scholars, together with the original purchase-money, amounted to 20,000l. Besides this sum, Sutton endowed his hospital, called "Sutton's Hospital," with 15 manors, and other lands, to the amount of 4,912 l. 19s. 10d. per annum. After considerable losses, which this hospital sustained in 1633, 1624, and 1649, Sir Richard Sutton, one of the founder's executors, improved the estate belonging to the foundation to such a sum, that in the year 1673, it amounted to 539 l. 12s. 6d. yearly. It has since amounted to about 12,000l. This establishment is to consist of decayed gentlemen, soldiers, and merchants; eighty of whom have a partial maintenance of diet, lodging, and instead of apparel, a gown once in two years, and 4l. per annum, physic, &c. living together in a collegiate manner; and of scholars, or youths, forty of whom are taught, and furnished with necessaries, and each of them are fit for the university (it is thither, with an exhibition of 40l. per annum for the first four years, and 60l. for the four la<s, on condition of constant residence, viz. eight months in the year; the rest are put to trades, with a premium of 40l. each. As a further encouragement to the scholars brought up in this foundation, there are several ecclesiastical préférences in the patronage of the governors, who, according to the constitutions of the hospital, are to confer on them those that were educated in this school.

For the superintendency of this hospital there are sixteen governors, generally of the prime quality; vacancies being supplied by the election of the remaining governors. The ordinary officers are, a master, preacher, regifter, treasurer, school-mater, &c.

CHARTREUX, religious of the order of St. Bruno, called also Carthusians.

CHARTREUX, poudre de. See KERMS mineral.

CHARTULARY, Chartularius, a title given to an ancient officer in the Latin church, who had the care of charters and papers relating to public affairs.

The chartulary preferred in ecclesiastical judgments, in lieu of the pope.

In the Greek church, the chartulary was called chartophylax; but his office was there much more considerable; and none even equaling the chartulary from the CHARTOPHYLAX in the Greek church.

CHARUS, in Ancient Geography, a river of Asia, in that part of the Colchide which was to the right of the Phasis. Strabo says, that the town of Saphalopolis or Disofcuria, was situated near this river.

CHARWELL, in Geography, a river of England, which runs into the Thames, at Oxford.

CHARYBDIS, a tappowed whirlpool in the straits of Messina, between the coast of Calabria and that of Sicily, and thought in ancient times to be very dangerous to navigators. According to the tables of the poets, Scylla (which see) and Charybdis were two sea-monsters, whose dreadful jaws were continually directed to swallow unhappy mariners; the one situated on the right, and the other on the left extremity of the straits of Messina, where Sicily fronts Italy. Thus Virgil describes them:

"Dextrum Scylla latus, levum implicata Charybdis Obfidet, atque imo bernthi ter gurgite vadis Sorbet in abruptum fluctus, rursumque sub auris Linget alternos, et ferdes verbearum undis: At Scyllam cervus exhibet fpiunea laterbris Ora exercentia, et cymbales in fixa trahentem. Prima hominum factus et pulchro peccabo virgo Pute tenuis; podrema immami corpore pritis. Dulphishum caudas utero commissi luperum."

"Far on the right her dogs foul Scylla hides; Charybdis roaring on the left precedes, And in her greedy whirlpool fakes the tides. Then spouts them from below; with fury drive'n The waves mount up, and wash the face of heav'n. But Scylla from her den, with open jaws, The linking vessel in her eddy draws, Then..."
Then dashes on the rocks: a human face
And virgin bosom, hide her tail's disgrace:
Her parts obscure below the waves defend,
With dogs inclo'd, and in a dolphin end."  

Dryden.

Charybdis is situated within the strait, in that part of the sea which lies between a projection of land named "Punta Scossa," and another projection on which stands the tower called "La Panteria," or the light-house; a light being placed at its top to guide vessels which may enter the harbour by night. The ancient and modern authors who have written concerning Charybdis, have all (Spallanzani excepted) supposed it to be a whirlpool. Homer is the first writer who has represented Charybdis as a monster which three times in a day drinks up the water, and three times emits it forth.

"----- ex Χαρυβδίς απαίφθονι μεγὰ ναός,
Τεσί μεγά τ' αὐτὸν ν' ἐπὶ ἑαυτῷ, τεσί διαφῆβον
Δωμαν."  

Hom. Odyss. xii.

Beneath Charybdis holds her haiforous reign
'Midst roaring whirlpools, and absoirs the few:
Thrice in her gulfs the boiling sea subsides,
Thrice in dire thunders she returns to the tide.

Pope.

The description of Virgil, above cited, differs from that of Homer only in placing a deep gulph below. Strabo, Hid- dorus, Tzetzes, Hefychius, Didymus, Euthathius, &c. concur in the same opinion. The Count de Buffon adopts the idea of Homer in full confidence, and places Charybdis among the most celebrated whirlpools of the sea. "Charybdis," says he, "absoirs and rejects the three waters three times in 24 hours." Strabo tells us, (ib. vi.) that the fragments of ships swallowed up in this whirlpool are carried by the current to the shore of Tauromenium (the present Taormina) 30 miles distant from Charybdis. In confirmation of this tradition, an amusing though tragical anecdote is related of one Colas, a Melianus diver, who had acquired, from his being able to remain a long time under water, the surname of "Pêçe" the fish. It is reported, that Frederic, king of Sicily, who came to Messina on purpose to see him, tried his abilities by throwing a golden cup into Charybdis, which, if he brought up, was to be the reward of his re- solution and dexterity. The hardy diver, after having twice astonished the spectators by remaining for a long time under water, plunged into it a third time and appeared no more: but, some days after, his body was found on the coast near Taormina. Spallanzani determined to investigate, by his own observation, the truth of the opinion which had been entertained with respect to Charybdis.

It is distant from the shore of Messina about 750 feet, and is called by the people of the country "Calofaro," from "καλος" and "φαρος," i.e., "the beautiful tower," from the lighthouse erected near it for the guidance of vessels. The phenomenon of the Calofaro is observable when the current is descending: when the current is given from the north, the pilots call it the "descending rema" or current; and when it runs to the south, the "ascending rema." The current ascends or descends at the rising or setting of the moon, and continues for 6 hours. In the interval between each ascent or descent there is a calm which lasts at least a quarter of an hour, but not longer than an hour. After- wards at the rising or setting of the moon, the current enters from the north, making various angles of incidence with the shore, and at length reaches the Calofaro. This de- lay sometimes continues 2 hours. Sometimes it immediately falls into the Calofaro, and then experience has taught that it is a certain token of bad weather. Spallanzani, apprised by the pilots that there was no danger in visiting the Calofaro, approached it in a bark managed by some expert mariners, who assured him of his safety. When he observed Charybdis from the shore, it appeared like a group of tumultuous waters, which became more exccuse and more agitated in his nearer access to it: but upon being carried to the edge he was convinced that what he saw was by no means a vortex or whirlpool. Hydrocyclists teach us, that by a whirlpool in a running water we are to understand that circular course which it takes in certain circumstances; and that this course or revolution generates in the middle a hollow inverted cone, of a greater or less depth, the internal sides of which have a spiral motion. But nothing of this kind was perceived in the Calofaro. Its revolving motion was circumfered within a circle of about 500 feet in diameter, within which limas there was no incarceration of any kind, nor vertiginous motion, but an incessant undulation of agitated waters, which fell, burst, and dashed against each other. Yet these irregular motions were so far placid that nothing was to be feared in passing over the lipot; though his little bark rocked very much from the continual agitation; so that the mariners were obliged constantly to make use of their oars to prevent its being drawn out of the Calofaro. Substances thrown into the stream that were heavier than the water, sunk and were no more seen; those which were lighter remained on the surface, but were soon driven out of the revolving circle by the agitation of the water. Spallanzani, thus convinced that there was no gulph under the Calofaro, because in that case there would have been a whirlpool, which would have carried down into it the floating subfuscions, founded the bottom with a plummet, and found that its greatest depth did not exceed 600 feet. From these facts he concluded, that at the time of his observation, there was no whirlpool in Charybdis; though it might have been different when the sea was tempestuous. In order to satisfy himself concerning this circumstance, he questioned the pilots who had frequently seen Charybdis in its greatest fury, and obtained from them the following account: When the current and the wind are contrary to each other, and both in their greatest violence, especially when the south wind blows, the swelling and dashing of the waves within the Calofaro are much more impetuous and extensive. It then contains three or four small whirlpools, or even more, according to the degree of its extent and violence. If at this time small vessels are driven into the Calofaro by the current or the wind, they are seen to whirl around, rocks, and plunge; but are never drawn into the vortex. They merely sink when filled with water by the waves beating over them.

When vessels of a larger size are forced into it, whatever wind they have they cannot extricate themselves; their sails are useless; and after having been for some time tossed about by the waves, if they are not affailed by the pilots of the country, who know how to bring them out of the course of the current, they are seriously driven upon the neighbouring shore of the Lantern, where they are wrecked, and the greater part of their crew perish in the waves. Spallanzani having evinced the erroneousness of the opinion with respect to Charybdis, that has been transmitted from Homer to the present time, further observes, that Homer was not exact with regard to the situation of Charybdis. The ancient poet, probably mulied by the account which he had received from others, and not having had an opportunity of observing it himself, places Charybdis near Scylla: the distance from one of these rocks to the other being an arrow's flight, which does not at all accord with the present situation of

3 Z 2 of
of Scylla. Although within the present century the strait of Messina has become narrower, yet we know from various and unquestionable testimonies that, long before this event, Charybdis was situated where it is at present, on the side of Sicily, a little beyond Messina. Our ingenious writers proceed to inquire what foundation there is for the popular idea of the

"Incident in Scyllam, euphemis vitae Charybdis," i.e. he who endeavours to avoid Charybdis, dashes upon Scylla; which proverb was applied by the ancients to those who, while they sought to shun one evil, fell into a worse. The Messine pilots informed him, that this misfortune, though not always, yet frequently happens, unless proper measures are taken in time to prevent it. If a ship be extricated from the fury of Charybdis, and carried by a strong southerly wind along the strait, towards the northern entrance, it will pass out safely; but should it meet with a wind in a nearly opposite direction, it will become the sport of both these winds, and, unable to advance or recede, be driven in a middle course between their two directions, that is, full upon the rock of Scylla, if it be not immediately afflicted by the pilots. They added, that in these hurricanes a land wind frequently rises which descends from a narrow pass in Calabria, and increases the force with which the ship is impelled towards the rock. If it be slight, how it happens that Scylla and Charybdis are now less dangerous than they were in former times, as Scylla still remains, as it was in the time of Homer, and Charybdis must at present be more perilous because the strait of Messina is become narrower; the answer is, that the difference arises from the improvement of the art of navigation which, formerly in its infancy, dared not launch into the open sea, but only ventured to creep along the shore; but time, study, and experience, have rendered her more mature, better informed, and more courageous: so that she can now pass the widest seas, brave the most violent tempests, and laugh at the fears of her childhood. See Spallanzani's Travels in the Two Sicilies, vol. iv. Thucydides (lib. xi.), and some other approved historians, use the term Charybdis to signify the whole strait between Sicily and Calabria.

Charybdis, a place of Syria, between Antioch and Aphaena. Strabo says, that the river Orontes is lost in this place, and that it rises again to view about 40 itad. below it.

Charybdis is also a word used by Dr. Plot to express certain openings which he supposes in the bottom of the sea, by which its waters are received and conveyed by a subterranean circulation to the origin of fountains and springs. The fusa mofhenicus, or masthfrine on the coast of Norway, is supposed to be owing to some such subterranean indract; and it is advanced also, that the Mediterranean sea could not be emptied of the vast quantities of waters which it receives, but must overflow the land of Egypt, unless swallowed by some such charybdis, which is either in some part of the bason of that sea, or near the mouth of it; in which case, it may be the occasion of that strong under-current, described by all those who have treated of this sea. An immense charybdis, placed near the strait's mouth, may be hid under the immensity of waters there; but as it would absorb the deep waters continually, and in large quantities, it would necessarily cause such an under-current there. See VAPUX.

Charybdis, in Mythology, was a female robber, who, according to the fable, stole the oxen of Hercules, for which she was struck with a thunder-bolt by Jupiter, and turned into a whirlpool dangerous to navigators.

CHASE, in Agriculture, is a word sometimes employed to denote a row or rank of thorns, &c. Thus, in the planting of quicksets, a single chafe signifies a single row; and a double chafe a row planted below the first, not immediately underneath the upper plants, but under the middle of intermediate spaces or vacant parts.

CHASE, or Chase, in Law, is used for a driving of cattle from any place, to a distant part, &c.

CHASE, or Chase, in a general sense, denotes a great extent of woody ground lying open, and privileges for wild beasts and wild fowl; the beasts of the chase comprehending not only the buck, doe, fox, martin, and roe, but, in a common and legal sense, all the beasts of the forest. Co. Litt. 233. A chase differs from a park in not being inclosed, and also in this particular, that a man may have a chase in another person's ground, as well as in his own; it being indeed the liberty of keeping beasts of chase or royal game therein, protected even from the owner of the land, with a power of hunting them there. Bl. Comm. vol. ii. 38. But if a man have a chase within a forest, and he kill or hunt any flag, or red deer, or other beasts of the forest, he is liable to a prosecution.

Yet the same author adds, that a forest may be granted by the king to a subject, in so ample a manner, as that there may be courts equivalent to a court of attachment, swainmote, and justice-feat. Yet it is of a large extent, and flanked both with a greater diversity of wild beasts, or game, and more keepers, than a park. Crompton observes, that a forest cannot be in the hands of a subject, but it forswrith loses its name, and becomes a chase; in regard all these courts lose their nature when they come into the hands of a subject; and that none but the king can make a lord chief justice in the coire of the prey.

The common law, no person is at liberty to take or kill any beasts of chase, but such as hath an ancient chase or park; unless they be also beasts of prey.

But the same author adds, that a forest may be granted by the king to a subjeet, in so ample a manner, as that there may be courts equivalent to a court of attachment, swainmote, and justice-feat. It is not lawful to make a chase, park, or warren, without licence from the king under the broad seal. See Forest, Game, and Park.

CHASE, belief. See Beasts.

CHASE, or Chase, wild-goat, a term used to express a fort of racing on horse-back. Use formerly, which resembled the flying of wild geese, these birds generally going in a train one after another, not in confused flocks as other fowls do. In this contest, the horse which was nearest in matches, the two horses, after running twelve fere yards, had liberty, which horse sooner could get the leading, to ride what ground the jockey pleased, the hindmost horse being bound to follow him within a certain distance agreed on by articles, or else be whipped in by the trainers or judges who rode by; and whichever horse could distance the other, according to the interval settled when the match was made, won the race. If the horse which at the beginning was behind, could get before that which first led, then he was likewise bound to follow, till he can either get before, or else the match be lost or won. This fort of racing was not long in common use, for it was found inhuman and destrutive to good horses, when two such horses were matched together. For in this case neither was able to distance the other, until they were both ready to sink under their riders, and often two very good horses were both spoiled, and the wagers forced to be drawn at last. The match of this fort of racing first introduced the method now in use, of running only a certain quantity of ground, and determining the plate or wager, by the coming in first at the poll. It is well known that this
this chafe still preserves its name in a common proverb, and
"that many people follow" it, "without knowing" that
they do so.

"Chafe, in Sea-Language, signifies a vessel pursued by
another, apprehended or known to be an enemy. Hence,
to chafe is to pursue a ship; which is called also giving
chafe.

A vessel that chases another ought to have the advantage
of failing; because, if the ship that is chased were as good
a failer as the chaser, she could never come up with her, if
they maneuvered equally and at the same time. It is there-
fore unsafe to chase a ship, with respect to which you have
does not know how to take the benefit of her equality. In
order to ascertain whether or not your ship fails quicker than
your adversary, you must get in the same track, under
the same fails, and keep the same course with the vessel you
wish to chafe, and let her exactly with a compas. If you
fail right, the chafe will soon be drawn a point more at;
but if she has the advantage, you will in a short time bring
her a point farther forward: if you fail equally, the will
remain in the point you left her at first.

In chasing at sea, the following rules are to be observed,
as the ship that is chased is either to windward or leeward
of the chaser. When the chaser is to leeward of the vessel he
means to pursue, he ought to veer on the same tack as
the enemy, till he brings her to bear exactly perpendicular
to his course, if he has not already paffed that point: then
tack, and continue the second board till he brings the chase
again perpendicular to the direction on which he is standing
by the wind, and he must then heave about again; always
continuing the same manœuvre, by tacking every time he
brings the chafe perpendicular to his course on either board.
In this manner, the chaser will, by the superiority only of
his failing, join the other by the shortest method. You
continue on the same tack as the enemy, when first seen, in
order to lofe no time; because you will always bring the
ship you are in chase of right on your beam, when you have
a superiority of failing, whatever may be the tack she is on,
provided you are careful not to pass that point; but, if per-
chance you shou'd, you must get on the other tack with all
possible dispatch. The chafe heaves about as soon as the
vessel he is in pursuit of is on his beam; because he is,
at this time, at the shortest possible distance, if he chases on
the same tack, and heers the same course with the vessel
chased. If the chaser runs on a different tack from the
vessel chased, he is still to tack when the latter is on his
beam, because the distance is the least possible between
them on the different boards they hold. This mode is pref-
erable to all others; it not only being the shortest, but be-
cause you force the chafe to fly from you close upon a wind,
preailing her more and more from the leeward, by never pass-
ing the point at which the distance between the two vessels,
in plying to windward, is the shortest possible. The wea-
ther ship, which flies, will always be joined by the chaser,
for it is granted she does not fail so well as the purifying
vessel. It is therefore her advantage conflatly to keep one
course, without losing time to heave about, as tacking can-
not be so favourable to her as to her adversary, whose fail-
ing is superior. If the chaser should mistakenly stand on a
long way, and tack in the wake of the chafe, the bel't thing
she can do is to heave in flays, and pafs to windward of him
on the other tack, unless you suppose your vessel would have
a large superiority. If the chapey perfils in tacking in the wake
of the other ship, the chase will be very much prolonged.

When the ship you wish to chafe is to leeward, or
when you are to windward of her, keep the ship away, to
cut her off; and, steering continually on that course, you
come at last together at the point where the courses run by
the two vessels interfect each other. This will be exactly
executed by the chasins ship, if, in the course she has
chosen, she constantly keeps chase in the same degree of the
compsas as at the beginning of the pursuit. This prin-
ciple applies equally to all the courses which the retreating
ship fleers; for overtaking can only be obtained by keeping
in a straight line, which is the shortest possible that can be
drawn between any two points. If you take another course
than that which keeps you in the same point of bearing you
were in with respect to the vessel pursued, at the beginning
of the chase, you would fail, by being either too far a-head
or too far a-tack; that is to say, if the chaise keeps his
wind too close, he will be too much a-head, and consequen-
tly prolong the chase; and, if he keeps too much away, he
will be too far a-tack. These are the only two considera-
tions to be regarded for the performance of this manœuvre;
considerations which are cathy observed, and corrected with
an azimuth compas; for when you fee that, at the end of
a certain time, you bring the chase more a-baff than the first
point of bearing, it is evident you keep your wind too
much; if, on the contrary, you draw her forward, it is a
proof that you keep too much away. These errors are
caly corrected, by fleering, for the first fale, so as to
fee that the chafe is always kept exactly on the same degree of
the compas; and, for the second, you keep your wind a
little more, till you fee that you ret in the same point of
bearing with respect to one another. Then, it is evident
you chase by the shortest and most certain method, since
you reach the chase, in running on a straight line.

The vessel that is to leeward, and chased, ought to run in the
course that will carry her most immediately from the chafier.
Some veffels have greater advantage in going large than others:
some with the wind right aft; and others again are to be
found which go bett clote-hauled. Attention should there-
fore be paid to the known qualities of a ship, in order to
take the most advantageous and most convenient directions
able of effecting a retreat. It is however almost certain,
that if the chase does not fail at least at an equal rate with
the chafe, whatever manœuvre the may practive, the ve-
will at length be overtaken by a skillful chafe adhering to prin-
ciples. If the chase be found right a-head, and fo to the
chafier be put to a flem-chafe, then the bell failer shal1 carry
is, if there be sea-room and day-light. Being come up clote
with the chafe, endeavour to crofs her fore-foot; and by
that means you will both hinder her way, and avoid the
fury of her ordination (except thofe in her chase), and tile
your own, if required, to more advantage; and that as well
your chafe-pieces, at your first getting up within reach, as
your broad-side and quarter-pieces, as you pafs thwart her
hawse, and fcor her decks from flern to flern. If the
makes away from you, ply your guns, as many as possible,
at her fais, yards, masts, and general tackling; and, being
near, fpare not your cafe-shot, or crofs-bar-shot, to make
the greater damage.

Chafe, fern, is when the chafier follows the chased a-
ftern, directly upon the fame point of the compas.

To lie in a ship's fore-foot in a chase, is to fail, and meet
with her by the nearest distance, and fo to crofs her in her
way, or to come accru her fore-foot.

A ship is said to have a good chafe, when she is so built
forward on, or a-ffern, that she can carry many guns to
shoot forwards, or backwards; according to which, the she
is said to have a good forward, or good fern-chafe.

Chafe-guns, are such whole ports are either in the head
called bow-chafes (and then they are used in chasing of others);
or in the fern, called *fern-bafes*, which are only useful when they are purified or chafed by any other flip.

**Chase of a gun. See Cannon.**

**Chase of small, fillets, and girdle. See Cannon.**

**Chase of land.** In Agriculture, is such fort of waste land as was formerly in the state of chase. There are still large tracts of this fort of land in different parts of the kingdom, though much within these few years has been cleared and brought into a state of cultivation. It has been observed by the author of the Middlesex Agricultural Report, in speaking of a tract of this fort of land, in the vicinity of London, that lately been attempted to be brought into a state of improvement, that it abounded with trees and bushes, which rendered it necessary for the cultivators to dig up the soil and flood out the roots, before any of the ordinary operations of husbandry could take place. These were works which not only required, he says, much labour to effect, but also as usually a large expenditure of money, for which there was no immediate prospect of return. Oats was the only article which found a ready sale. The very unusual and extraordinary supply of flack-wood and bavins, to far exceed the demands for these articles, that the price fell far below the woodman's labour. Inexperienced farmers became alarmed at these circumstances, and in consequence set themselves about trying confined, partial, and penurious experiments, certainly very ill-calculated to succeed on a raw crust soil, which had from the earliest ages been shufet up by a thick foliage in an excess of damp, excluded from the benign influence of the solar rays, and every other power of evaporation. It is added, that the wood in the first instance, being only cleared away from small patches of land at a time, such cleared ground was necessarily still left surrounded on all sides by woods, which by the redundancy of damp they occasioned, continued the disorder under which the soil naturally laboured. Again, the flooding up the roots, and digging the soil, as before-mentioned, would unavoidably bury a great part of the surface mould, which was by much the best, and in its stead turn up a worthless clay, a perfect enemy to the whole vegetable world: or at least it would mix so much bad soil with the small portion of good, as to produce together a new surface, certainly much inferior to the one destroyed by this operation. It ought not therefore, he thinks, to excite surprise, that, "under all these disadvantages, the soil should, as it were full and reluctantly, yield back again even so much as the seed town. In fact, it could not otherwise happen till such time as the woods being more generally cleared, the superabundant water drained off, and the excessive damp evaporated, the soil should obtain a proper degree of dryness. Nor even then could great returns be expected, without the application of some stimulating ingredient, as turf-ashes, lime, marl, &c., to correct the natural acidity and crudeness of the soil. But in order to make it permanently productive, manure should have been dealt with a liberal hand.

At length, however, the fire-wood being grubbed, and marketed in less quantities, increased its price; and by the money it produced opened the way for a more extended clearing of the soil. The half-yard wood, which was originally given as a recompence to the labourer for clearing the ground, now yielded to the proprietor seven shillings a flack; the spikes twenty-four shillings; the bavins, when drawn to town, from sixteen to twenty-four shillings per hundred; and the spire, being made up into what they called pimps, several shillings profit.

The account between the proprietor and the labourer therefore now flood thus, viz.

On this it is well remarked that this rise in the value of the above articles plainly evinced, that, though under a parmi-
nous management the soil refused to repay the toils and expense of husbandry on the produce of grain, it would, at least for a short time, yield, in the value of fire-wood, sufficient to answer the demands of the crown. This circumstance no doubt was the means of its being cleared from wood. But unfortunately, the occupiers not knowing how to cultivate this kind of soil to advantage, and without being apprehensive of incurring a considerable loss by any mistake in the management of it, let it lie in a state of waste for several years; and it would probably have continued so till this time had not the more spirited and well-directed exertions of a few enterprising and intelligent individuals thrown the way to success." And it is stated as a matter of some doubt, "whether the best mode of improving such a soil as that of this chase, was then known in this part of England; but it is certain that it was not practised. It is also clear to demonstration, that unless a well-
digested system be pursued, the profit must be precarious, and the success of the undertaking uncertain.

It is added, that "if the parties concerned in the culti-
vation of it had set out upon a liberal and judicious plan, in the first instance, and began by tilling the timber in the proper season, and diving off it at the belt market; next pared the old fawd, and flowed out all the roots; and, as soon as they were dry burn the roots, bushes, and fawd, into ashes; then ploughed these ashes in with a very thin furrow (in order to avoid bringing up to the surface the wretched sub-
soil); after this, spreading lime, and barrowing it in; had, he says, this method been adopted by the first cultivators of the chase, he thinks he may venture to assert, that he should not now have heard complaints against the soil, or that it would be called fallen and unproductive. At least, it would have grown tares and perhaps cole, which should have been eaten by flock on the land which produced them. This should have been annually repeated, and the land plentifully supped with manure brought from town, (if nigh such) and the farm-yard, until the soil had acquired a sufficient degree of richness to be laid down to permanent grasses." The land of this chase is, he says, in its nature too flubborn to answer in a course of aration; particularly as it is so nigh the metropolis, and where the expense of horse-keep and men's labour are so high that they would consume all the produce of such land. It should therefore be only pared, burnt, ploughed, drained, limed, and manured, and then laid down clean and in good heart, to permanent grasses. Indeed, wherever there is a clean skin of good plants already, it will be sufficient that it be well drained and manured, in which case the grasses will be sure to improve, and in a few years become good meadow."
These remarks flew the vast importance of beginning upon a good plan in the cultivation and management of this fort of waste land, as it is only in this way that advantage can be gained, or encouragement hold out to the cultivation of such ground.

CHASIDENS, or ASIDEANS, in Ancient Geography, so called on account of their great zeal for the law, and their voluntary engagement to observe it more rigidly than other men, were a valiant people of Judea, who, after the settlement of the Jewish church on the return of the Jews from the Babylonian captivity, super-added to the law the constitutions and traditions of the elders, and other rigourous observances, to which, by way of supererogation, they voluntarily devoted themselves; and who, from the superior degree of holiness to which they aspired, were called CHASIDIM, i.e. the Pious. These perfons were distinguished for their valor, and joined Mattathias and his companions when they fled from Jerusalem to the mountains and desarts of Judea, in order to avoid the persecution of Antiochus. The Chassidees reckoned it one of the chief points of that piety which they professed, to fight zealously for their religion, and the defence of the temple and its worship, which had been profaned by the Heathens. They concerned with Mattathias in his efforts for purging the land of the idolatry which the persecutors had imposed upon it, and re-establishing the true worship of God.

CHASING, a method of working, or enriching, gold, silver, &c. properly called cleansing.

CHASIRA, in Ancient Geography, a town of Asia in Armenia Minor, according to Ptolemæus.

CHASLEU. See CIsLEU.

CHASLUHM, in Ancient Geography. See CASLUSH.

CHASM, XAXUX. See Grotto and Hiatus.

CHASME, or CHASMS, among Ancient Physicians, denotes oblation or gaping. Hippocrates informs us that long respiration is a cure for continual obturation.

CHASPHON, CHASPHORA, or CHASBONA, in Ancient Geography, a town of Palæstine, in the country of Gaulad, according to the book of Macchabees and Josephus. It was taken by Judas Maccabæus.

CHASSAIR, or CASAIR, in Geography, a town of Africa, in the kingdom of Morocco, about 6 leagues from mount Atlas, near which are mines of lead and anthumony, which the inhabitants dispose of at Fex.

CHASSE, in Military Language, a charge of powder roughly bruised, which is put at the bottom of a cartouche, the better to force and throw out the materials with which it is filled.

CHASSE-COQUINS. See BANDOLIER.

CHASSE-CRAPAUD, in Ornithology, the European goat-fucker, caprimulgus Europeanus, is determined under this name by Salomon de Boodt.

CHASSELAY, in Geography, a town of France, in the department of the Rhône and Loire, and district of Camp de Lyone; 2 leagues N. of Lyone.

CHASSENEUIL, a town of France, in the department of Angoulême; 11 miles N.W. of La Rochefoucault.

CHASSENEUX, Bartholomew de, in Biography, an eminent lawyer, was born at Ippe-Féveques, near Autun, in 1480; and after finishing his studies with a view to the law in Italy, was made master of requests to Charles d'Amboise, governor of the Milanese, who employed him at the court of Rome. In 1531, he was appointed counsellor of the parliament of Paris, and in the following year president of the parliament of Provence. He occupied this post in 1540, when this body inflicted its fanguous decree against the Vaudois of Merindol and Cabrieres. These people, whose general character appears under another article, incurred, for deviating in their sentiments, worship, and practice from the precepts of the church of Rome, the charge of being pelihtetous heretics, and it was determined to extirpate them by fire and sword. Chasseneux, it is thought, did not in his judgment approve these exertions, though he was officially obliged to figu the parliamentary decree. He contributed, however, by a variety of humane artifices to delay the execution of it, whilst he lived; and his death, in 1541, has been ascribed to those who wished to see the commencement of the bloody persecution. The works of Chasseneux are, "A Latin Commentary on the Cumborns of Burgundy, and of almost all France," fol. printed five times during his life, and more than fifteen times since; the last edition being that of president Behmer, at Paris, 1717, 4to.; "Catalogus Oloriae Mundi," Lyons, 1529, fol. "Conflilia," Lyons, 1531, fol. "De Epìstaphis des Rois de France, jufque à Francois I. en vers, avec leurs Efligies," and the name in Latin. Nov. Dict. Hist.

CHASSENSAL, in Geography, a river of France, which runs into the Ardche, not far from its source.

CHASSER L'ENEMI, in Military Language. This phrase is of the same import as the word déjouer, to drive an enemy before you, forcing him to quit a post that he occupies.

CHASSERADES, in Geography, a town of France, in the department of the Lozère, and district of Mende; 8 miles N. of Villefort.

CHASSEURS. See CAVALRY.

CHASSIFERS, in Geography, a town of France, in the department of the Ardche; 10 miles W. of Viviers.

CHASSIRON, Tower of, a light-house on the north point of the island of Oleron, near the coast of France, which has two fires by which it is distinguished from the tower of Cordovan.

CHASSIS DE GALLERIE, in Military Language. These are flat beams, or polls of different heights, which the miners make use of for supporting the earth, in proportion as they advance in the gallery. These support other pieces of timber laid transversely upon them, which hinder the tumbling down of the earth; and this is what is called chapeau du mineur, or the miner's hat.

CHASTE-TREE, in Botany and Gardening. See VITEX.

CHASTELAIN, Claude, in Biography, was born at Paris in 1639; and occupied the office of canov in the cathedral of his native city. With a view of studying the usages peculiar to each church, he travelled through France, Italy, and Germany, and acquired an extensive acquaintance with liturgies and religious rites and ceremonies. Accordingly Harsy, archbishop of Paris, placed him at the head of a commission for preparing a formulary for the use of his diocese, and he was also employed by other bishops in correcting and altering their breviers and church books. He likewise composed the offices for several religious orders. The "Hagiological Dictionary," which he published, was furgested by Menage in his etymologies of the French tongue; and he bears this testimony to his profound and various knowledge; viz. "Cæsareum faculm non intellexit;"—His own age did not comprehend his merit; and an intelligent person, who visited Rome 17 times, affirmed that Chastelain knew him more curiously, and taught him more facts than he had gained any knowledge of in all his other visits. In 1705, Chastelain published his "Roman Martyrology," translated into French, &c. 4to.; containing...
ing only the two first months of the year. In 1709, he published "An Universal Martyrology," upon the same plan. The Bollandists who wrote the lives of the saints, were thus led to seek his acquaintance, and they dedicated to him one volume of their work. He died in 1712, leaving among various other works in MS. a journal of his own life.

CHASTELLET, Gabrielle Emilie de Breteuil, marchioness of, was born in 1706; and became celebrated both for the beauty of her person, and the culture of her mind. In the course of her education, which was of a superior kind, she acquainted herself with the best ancient and modern authors; but her attention was more particularly directed to mathematics and natural philosophy. She began her literary career, with an institute of the philosophy of Leibniz, under the title of "Institutions de Physique," 1707; but the afterwards transferred her respect from the reveries of the German philosopher to the discoveries and realizations of Newton. Accordingly, she translated the Principia, and added a commentary; which were published after her death under the superintendence of the celebrated Clairaut. She died in 1749, at the palace of Luneville. Although she was a mathematician and philosopher, she was far from being a recluse; for she conversed with persons of her own rank with such a degree of freedom and ease, and partook to much of their pleasures. that even the ladies who had the honour of associating with her had no reason to suspect that she was the commentator of Newton. Her memory was singularly retentive, her eloquence ready and impressive, her taste for poetry correct and lively, and she manifested that indifference to popular applause, which is the usual characteristic of a great mind. But notwithstanding these various mental qualities and attainments, it is generally admitted, that she had no pretensions to the character of chaliness. "Nous. Dict. Hill."

CHASTELET, in Geography, a town of Germany, in the circle of Wolfsburg, and bishopric of Liege, situate on the south side of the Sambe, 30 miles S.W. of Brabant, and 30 W.S.W. of Liege.

CHASTELLAN, a town of Savoy; 3½ miles N.E. of Chambly.

CHASTELLUX, Le Chevalier de, in Biography, brigadier des armes du roi at the time of the revolution, was born 1774, and received in the French Academy in 1775. He had early in life a strong passion for poetry and music. His professional employment, as a military officer, has never impeded the successful cultivation of those talents. Many of his comedies, written for private theatres, and heard with transports, would have been sure of success if represented on a public stage, had he had courage sufficient to make the experiment. But his "Essay on the Union of Poetry and Music" is the chief production which entitles him to a place here as a musical writer. This little book, which first appeared in 1765, is but a pamphlet of about 90 or 100 pages 12mo. Yet next to Roufseau's "Lettre sur la Musique Francaise," it is the best piece of musical criticism in the French language. It called the attention of persons of taste to Italian poetry and music, which the abbé Armand and M. Saard had attempted before; but we think with less knowledge of the subject and more parts-spirit. M. de Chastellux luckily produced his treat before the Gluck and Piccini factions had birth, and seems to write from feeling and zeal for the musical drama, apart from all contention for victory over writers of opposite opinions. He has many ideas concerning ancient as well as modern music, which were new, at least in France, when his treat appeared, and which have been since adopted by subsequent musical writers, and rendered common such as symmetry of air, not only in the number of bars, but in the general cast of each bar, which is a rule of much the same tendency as Roufseau's "Unity of Melody." In speaking of ancient music, the author thinks, though inferior to the modern, that the great effects of its modes were produced by their being severely confined to particular keys and measures. If a whole nation were to hear a particular melody in a particular key only on occasions of religious ceremonies, and another was confined to military purposes, their effects would be greatly heightened. If, for instance, in the midst of a tumult, a band of good musicians was to play a religious air in its usual key, it would excite piety and respect in the most turbulent. And if, during a religious ceremony, a military air unexpectedly to be performed in its original key, there can be little doubt but that the people would immediately fly to arms. The effect of the ancient Greek music must greatly have depended on its appropriation; as in China, from time immemorial, particular musical airs have been confined to particular purposes. This is only applicable to instrumental music; but for vocal, the author wishes poets to become musicians, and musicians poets, otherwise they have different interests, and mutually injure and degrade each other. On this subject, he says, most truly, that the lyric poet should never forget that he is writing for music; that he should sacrifice wit and point to sentiment and effect. Though there is a confluent jealousy between poetry and music, he says it is impossible to deny that music is the principal object in an opera. Metastasio, whose dramas were justly admired and respected as poetry, never was jealous of the applause which composers and singers acquired, or thought it was at his own expense. The French perhaps do wisely in allowing few airs in their operas, and those, short, easy, and simple; having no fingers capable of performing bravura, and still less airs in a grand style of cantabile; but why Italy, and all Europe who have Italians, or singers of the Italian school, capable of performing in all styles, should conform to the present plan of French operas, and banish good singing from their lyric theatres, or be accused of ignorance of the true style of dramatic music, we know not. That a people just emerging from barbarism in music of all kinds, should arrogantly dictate to nations long polished, refined, and accustomed to perfection, gives but too just grounds for imagining, that presumption, though confined to individuals in some countries, is, in others, a national vice.

The chevalier Chastellux seems the first writer in the French language (after Roufseau) who truly comprehended the merit of Italian vocal music and performance, and felt the merit of Metastasio. He seems to have a correct idea of dramatic poetry, and words to be set to such music as will display the abilities of a composer as well as singer. He says very truly, that to obviate, or at least to soften, the radical evil of mixing long with declamation, the poet, in going from speech to song, can only render the contralto and more parts-spirit more bearable by increase of interest or passion, which seems to excite for a different expression. He should avoid the introduction of airs, in cold and uninteresting situations; or in the midst of a dialogue, before the characters are sufficiently animated; and by this means avoid the being too loud of those airs which should be retained for occasions of passion, and the termination of scenes.

CHASTISEMENTS, or Corrections, in the Romans, are the severe and rigorous effects of the aids; for when the aids are given with severity, they become punishments. See Correction.

CHASTITY, a virtue defined by the Romans. On the reverse of a medal of Paulina the younger, it is represented sitting,
CATAMARAN, or CATAMARAN, in Ancient Geography, a people of Germany, who formed part of the Catata. They are mentioned by Tacitus, Strabo, and Ptolemy.

CHASZAVENICA, a place which had a Roman garrison, under the orders of the commander of Armenia, mentioned in the Not. Imp.; but the situation is not ascertained.

CHAT, Cape, in Geography, a cape on the south coast of the river St. Lawrence. N. lat. 49° 10'. W. long. 66°.

Chat, Cut, in Gunnery, a piece of iron with one, two, or three very sharp prongs or claws, which, when it has three of them, are arranged in a triangular form or flake. This piece of iron is fixed to a flint or handle. It is used for searching and examining a piece of ordnance. By being introduced into the bore, it shews or discovers whether it is honey-combed, damaged, or otherwise defective. There is another sort of chat, that differs a little from this. It consists of two branches of iron fixed to one end of a piece of the same metal, which have each of them two fixed prongs. One of these branches has a hinge with a spring so fixed, that when the chat is put into the bore, the smallest cavity releases the spring, and the defect is immediately discovered. This invention does credit to the inventor. Founders who do not like it, call the common chat the diable, or the devil, and the one with two branches la malice du diable, the malice of the devil.

Chat, Allo a fort of tower, that anciently was made use of in France for carrying soldiers at the besieging of places.

Chat, in Zoology. See Cat and Felis canis.

Chat-bizam of Volmer, &c. See Viverra tigrina.

Chat cerver, the lynx. See Felis Lynx.

Chat/Pfajgern of Riddingor, and Chat de Conflantimpe. See Viverra geneta.

Chat-buont, in Ornithology, the brown owl, Strix sibirica, Linn. Chat-buont is also the common name of owls in general.

Chat manoul, in Zoology. See Felis manoul.

Chat-pard. See Pardus.

Chat rocher, in Ichthyology, the name given by Bruenfey et others to the greater cat-fish. See Squalus belaricus, Linn.

CHATA, in Geography, a town of America, in the Tennessee government; 22 miles S.S.W. of Knoxville. Vol. VII.

CHATABOUCHEE, or CHATABUTHS. See Chatauca.

CHATA-HATCHI, or HATCHI, a river of America, the largest which falls into St. Rois's bay in West Florida. It is also called Pea River, and runs from N.E. entering the bay by several mouths, but so shoal, that they can only be palled by a small boat or canoe. About 25 leagues up this river, Mr. Hutchins found a small settlement of Cussis Indians. The soil and timber on its banks very much resembles those of Elzamia.

CHATAIGNERAIE, l.A., a town of France, in the department of Vendee, and chief place of a canton in the district of Fontenay-le-Comte; 15 leagues S.E. of Nantes, and 3i N. of Fontenay-le-Comte. The place contains 1645 and the canton 15,066 inhabitants; the territory comprises 350 kilometres and 24 communes.

CHATAISK, a river of Siberia, which runs into the Enfici, near Turunkanch.-Also, a town of Siberia, on the east side of the Enfici, 156 miles N. of Turunkanch.

CHATANGA, a river of Russia, which runs into the Frozen sea; extending itself by the addition of many rivers into a large gulf at its mouth. N. lat. 74° 40'.

CHATAS, a name given to one fort of banks employed on the river Charlie in America, tho' of the other fort are called bongos. See Chagre.

CHATAUCHE, or CHATABOUCHE, in Geography, a river of America, which rives in the Apalachicola mountains, on the borders of the Tennessee government, traverses the state of Georgia, and uniting with the Flint in N. lat. 37°, forms the Apalachicola, which feeds. It is about 30 rods wide, very rapid, and full of shoals. The soil on its banks is light and sandy, and the clay of a bright red colour. The lower creeks are filled in dispersed claus and villages from the head to the mouth of this river. Their huts and cabins resemble, by the colour of the clay, cloisters of new-burn'd brick-kilns. The distance from this river to the Tappofo river is about 70 miles, by the war-path, which crooks at the falls, just above the town of the Turkabache.

CHAUTAGUHF, a lake of America, in the county of Ontario and state of New York, about 18 miles long and 3 broad. It is connected with Aleighgy river by the river Conewango, which runs a 5 S.E. course. This lake serves to form an easy communication between lake Eric and the Ohio; there being water sufficient for boats from fort Franklin in the Alleghamy, to the N.W. corner of this lake; and from thence there is a passage of nine miles to Chautagoune harbour in lake Eric. Over ground capable of being made a good waggon road. This communication was once used by the French.

CHAT-TCHEOU, or Qua-ctcheou, a town of Asia, in the country of Thibet; 160 miles S.E. of Hami. N. lat. 45° 22'. E. long. 95° 19'.

CHATE, in Botany, Alp. See Cucumis chat.

CHATEAU, in Military Language, a place fortified either by nature or art, in a town or city, or in a district or tract of country, the passage through which is wished to defend. A castle, unless it be naturally strong and peculiarly situated, cannot at present make much resistance. Castles, however, are still preferred in certain places, as being like citadels to furnish retreats for prolonging capitulations, or overrating towns in cafes of popular sedition.

CHATEAU Arnoux, in Geography, a town of France, in the department of the Lower Alps, and district of Silleron; 5 miles S. of Silleron.

CHATEAUBELAIR, a bay on the west coast of the island of St. Vincent in the West Indies. N. lat. 13° 14'. W. long. 61° 17'.

4 A CHATEAU.
CHATEAU-BOURG, a town of France, in the department of the Ille and Vilaine, and chief place of a canton in the district of Vitre; 2½ leagues W. of Vitre. The place contains 1243 and the canton 7555 inhabitants; the territory includes 1024¾ quarters of land and 10 communes.

CHATEAUBRIANT, a town of France, in the department of the Loire, and principal place of a district; 11 leagues N. of Nantes, and 9 S.S.E. of Rennes. N. lat. 47° 43'. E. long. 1° 29'. The place contains 3049 and the canton 7668 inhabitants; the territory comprehends 157¾ kilometres and 4 communes.

CHATEAUBRUN, John Baptist Vienne De, in Biography, was born at Angoulême in 1689, and became steward of the household to the Duke of Orleans, member of the French Academy, and a writer of tragedy. His first publication in 1714, was a piece entitled "Mahomet II." His best work, written soon after, was "Les Troadennes," which was not acted for 40 years, and the reason he alleged for delaying the exhibition of it, was the fear of giving offence to the devout prince, his master. He also wrote the tragedies of "Philoctetes" and "Alcyone," which, though feeble in poetry, abound with sentiment, and are conducted with skill. He was admitted into the Academy in 1753, and died in 1755. His taste was formed by the study of the Greek and Latin poets. His private character was that of a true philosopher, mild, virtuous, tolerant, and disinterested. Nouv. Dict. Hist.

CHATEAU-CAMBRESIS, in Geography. See CA-
TEAU CAMBRESIS.

CHATEAU-CHALONS, a town of France, in the department of Jura, and district of Poligny; 2 leagues N. of Lons-le-Saunier.

CHATEAU-CHINON, a town of France, in the department of the Nièvre, and principal place of a district, situate near the source of the Yonne. It has a considerable trade in cloth, leather, wood, and wool; 11 leagues E. of Nevers, and 5¾ W.N.W. of Autun. N. lat. 47° 3'. E. long. 3° 49'. The place contains 3156, and the canton 12837 inhabitants; the territory includes 395 kilometres and 14 communes.

CHATEAU-CORDONET, a forrest of the island of Guernsey.

CHATEAU-DAUPHIN, a strong forrest of Piedmont, in the marquiture of Saluzzo, ceded to the duke of Savoy by the treaty of Utrecht. It was taken by the combined armies of France and Spain in 1744; 15 miles W. of Saluzzo, and 30 S.S.W. of Turin. N. lat. 44° 33'. E. long. 6° 58'.

CHATEAU-DUN, a town of France, in the department of the Eure and Loire, and principal place of a district; 25 miles S. of Chartres. N. lat. 48° 40'. E. long. 1° 15'. The place contains 6146, and the canton 13467 inhabitants; the territory includes 3024 kilometres, and 19 communes.

CHATEAU-PORT, a town of France, in the department of the Seine and Oise; 1 league N.E. of Cinevreuve.

CHATEAU-GAY, a town of France, in the department of the Puy-de-Dôme; 1 league S.W. of Riom.

CHATEAU-GERARD, a town of France, in the department of the Yonne, and district of Tonnerre; 12 miles S.S.E. of Tonnerre.

CHATEAU-GIRONS, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the district of Rennes; 2½ leagues S.E. of it. The place contains 1413, and the canton 11561 inhabitants; the territory includes 1574 kilometres, and 10 communes.

CHATEAU-GOMBERT, a town of France, in the department of the mouths of the Rhone, and district of Marseilles; 4 miles N.E. of Marseilles.

CHATEAU-GONZI, a town of France, in the department of Mayenne, and principal place of a district, seated on the Mayenne. It has a manufacture of linen and woollen. The place contains 4656, and the canton 17776 inhabitants; the territory includes 250 kilometres, and 17 communes. It is distant 5 leagues S. from Laval, and 5 W. from Saile. N. lat. 47° 57'. W. long. 0° 49'.

CHATEAU-D'IF, a fortres and three small islands near the coast of France, in the Mediterranean; about 3 miles W.S.W. of Marseilles.

CHATEAU-JOUX, a fortres, in the department of the Doubs, near Pontarier.

CHATEAU-LANDON, a town of France, in the department of the Seine and Marne, and chief place of a canton in the district of Fontainebleau; 25 leagues S. of Nmours. The place contains 1303, and the canton 8935 inhabitants; the territory comprehends 2924 kilometres, and 16 communes.

CHATEAU-MAILDRE, a town of France, in the department of the North coast, and district of St. Brieuc; 25 leagues N.W. of St. Brieuc. The place contains 869, and the canton 13083 inhabitants; the territory includes 1321 kilometres, and 9 communes.

CHATEAU-LIN, a town of France, in the department of Finisterre, and principal place of a district. The place contains 3172, and the canton 13583 inhabitants; the territory includes 2074 kilometres, and 11 communes. This town has a considerable trade in flutes for tilling houes; and in its vicinity are a medicinal spring, and some mines of copper and iron. It is four leagues N. of Quimper. N. lat. 48° 11'. W. long. 4° 01'.

CHATEAU-DU-LOIR, a town of France, in the department of Sarthe, and chief place of a canton, in the district of St. Calais. The place contains 2652, and the canton 13082 inhabitants; the territory includes 1375 kilometres, and 14 communes. A considerable quantity of claret-wine is manufactured in the vicinity of this town. It is distant 7 leagues N.N.W. from Tours, and 7 S.S.E. from Le Mans. N. lat. 47° 32'. E. long. 6° 26'.

CHATEAU-LOMBARDY, a fortres of Alsatia Lombardy, in the province of Caramania.

CHATEAU-EN-MARCHE, a town of France, in the department of the Lower Seine; 2 leagues N. of Montvilliers.

CHATEAU-MEILLANT, a town of France, in the department of the Cher, and chief place of a canton, in the district of St. Amand, having an ancient castle, which is said to have been built by Julius Caesar. The place contains 2235, and the canton 9107 inhabitants; the territory comprehends 325 kilometres, and 13 communes. It is 104 leagues S. of Paris. N. lat. 46° 34'. E. long. 2° 0'.

CHATEAU-NUEF, L' Abbe De, in Biography, author of an agreeable little book on the music of the ancients, entitled "Dialogue de la Musique des Anciens," published anonymously in 1725, but feebly written about 1705; during the heat of the controversy between the exclusive admirers of the ancient and modern literature, and not long after "The Battle of the Bards." The interlocutors are composed of Erages on both sides, and the author seems to have affirmed the office of Mediator.

CHATEAU-NUEF, in Geography, a town of France, in the department of the Higher Alps; 10 miles S. of Serres.—Hilo, a town of France, in the department of the Charente, and chief place of a canton, in the district of Cognac; 10 miles W.S.W. of Angoulême. The place contains
contains 2184, and the canton 9931 inhabitants: the territory includes 165 kilometres, and 18 communes.—Also, a town of France, in the department of the Cher, and chief place of a canton, in the district of St. Amand. The place contains 1719, and the canton 6999 inhabitants: the territory includes 230 kilometres and 12 communes.—Also, a town of France, in the department of the Côte d'Or, 17 miles S.W. of Dijon.—Also, a town of France, in the department of the Évre and Loire, and chief place of a canton, in the district of Dreux: the place contains 1271, and the canton 10,744 inhabitants: the territory includes 272½ kilometres, and 29 communes.—Also, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the district of St. Malo: 7½ miles S. of it. The place contains 539, and the canton 6929 inhabitants: the territory includes 12½½ kilometres, and 7 communes.—Also, a town of France, in the department of Loiret, and chief place of a canton, in the district of Orleans: 12 miles E. of it. The place contains 3127, and the canton 7444 inhabitants: the territory comprehends 267½ kilometres, and 10 communes.—Also, a town of France, in the department of the Mayne and Loire: 13 miles N. of Angers. The place contains 916, and the canton 9085 inhabitants: the territory includes 265 kilometres, and 15 communes.—Also, a town of France, in the department of the Saone and Loire; 3 leagues E.S.E. of Mâcon.—Also, a town of France, in the department of the Upper Vienne, and chief place of a canton, in the district of Limoges: 17 miles S.E. of it. The place contains 1136, and the canton 9039 inhabitants: the territory includes 262½ kilometres, and 10 communes.—Also, a town of France, in the department of the Var, and district of Graffe; 3 miles N.E. of Graffe.

CHATEAUNEUF du Pig, a town of France, in the department of Finistère, and chief place of a canton, in the district of Châteaulin; 16 miles N.E. of Quimper. The place contains 2163, and the canton 13,596 inhabitants: the territory includes 330 kilometres, and 11 communes.

CHATEAUNEUF de Galaur, a town of France, in the department of the Drôme; 13 miles N. of Romans.

CHATEAUNEUF de Marsen, a town of France, in the department of the Drôme; nine miles N.N.E. of Montelimar.

CHATEAUNEUF du Pape, a town of France, in the department of the Mouches of the Rhône; 3 leagues N. of Avignon.

CHATEAUNEUF de Randon, a town of France, in the department of the Lozère, and chief place of a canton in the district of Mende; 4 leagues N.E. of it.

CHATEAUNEUF de Rhône, a town of France, on the E. side of the Rhône, opposite Viviers.

CHATEAUNEUF-au-Val de Bargis, a town of France in the department of the Nièvre; 10 miles N.E. of La Charité.

CHATEAU d'Oleron, a town of France in the department of the Lower Charente, and chief place of a canton in the district of Marans. The place contains 2116 and the canton 5151 inhabitants; the territory includes 1024 kilometres, and 3 communes.

CHATEAU-PONSAAC, a town of France in the department of the Upper Vienne, and chief place of a canton in the district of Bellac; 18 miles N. of Limoges. The place contains 3920 and the canton 10,207 inhabitants; the territory includes 185 kilometres and 7 communes.

CHATEAU-PORCIEN, a town of France, in the department of the Ardeche, and chief place of a canton, in the district of Relhèl: 2 leagues W. of it. The place contains 1972 and the canton 8695 inhabitants; the territory includes 230 kilometres and 17 communes.

CHATEAU-REGNAULT, a town of France, in the department of the Indre and Loire, and chief place of a canton in the district of Tours; 5 leagues N.E. of Tours. The place contains 2518 and the canton 2534 inhabitants; the territory comprehends 297½ kilometres, and 17 communes.

CHATEAU-RENARD, a town of France, in the department of the Loiret, and chief place of a canton in the district of Montargis; 4½ leagues E. of it. The place contains 2888 and the canton 9454 inhabitants; the territory includes 296 kilometres, and 10 communes.—Also, a town of France, in the department of the Mouches of the Rhône, and chief place of a canton in the district of Tarascon; 9 miles N.E. of Tarascon, and celebrated for its excellent white wine.—Also, a town of France, in the department of the Ardennes; 10 miles N.W. of Sedan.

CHATEAU-ROUX, a town of France, in the department of the Higher Alps; 5 miles N. of Embrun.—Also, a town of France, in the department of the Indre, and principal place of a district; seated on the Indre in a fruitful country, and having a large woollen manufacture. The place contains 8148 and the canton 14,666 inhabitants; the territory includes 302½ kilometres, and 11 communes. N. lat. 46° 49'. E. long. 1° 35'.

CHATEAU-SALINS, a town of France in the department of the Meurthe, and principal place of a district, deriving its name from its extensive salt-works; 5 leagues N.E. of Nancy. N. lat. 48° 49'. E. long. 6° 24'.

CHATEAU-THIERRY, a town of France, and principal place of a district, in the department of the Aisne; seated on the Marne, and having in its vicinity a medicinal spring. The place contains 4160 and the canton 12,018 inhabitants; the territory includes 187½ kilometres and 21 communes. N. lat. 49° 3'. E. long. 3° 18'.

CHATEAU-VAUZIERE, a town of France, in the department of the Indre and Loire, and chief place of a canton in the district of Chinon; 5 leagues N. of Langeais. The place contains 686 and the canton 10,692 inhabitants; the territory comprehends 240 kilometres, and 16 communes.

CHATEAU-VILLAIN, a town of France, in the department of the Upper Marne, and district of Chauxmont, 5½ leagues W.N.W. of Langres.—Also, a town of France, in the department of the Ile; 16 miles E. of V. Island. CHATEEEN, a town of Little Bouchardia. CHATEL, or CHATE, a town of France, in the department of the Ardennes; 5 miles S.E. of Grandpré.

CHATEL, a town of France, in the department of the Vosges, and chief place of a canton in the district of Épinal. The place contains 1165 and the canton 9178 inhabitants; the territory includes 257½ kilometres, and 28 communes.

CHATEL-CENSOY, a town of France, in the department of the Yonne, and chief place of a canton, in the district of Avalon; 4 leagues W. of it.

CHATEL-GUION, a village of France, in the department of Puy-de-Dôme, celebrated for its mineral water; one league N. of Riom.

CHATEL-DE-NEUVE, a town of France, in the department of the Allier, and district of Moulins; 10 miles S. of Moulins.

CHATELARD, a town of France, in the department of Mont Blanc, and chief place of a canton in the district of
Chambery. The place contains 1060 and the canton 10,412 inhabitants; the territory includes 237½ square miles, and 13 parishes.

CHATELDON, a town of France, in the department of Puy-de-Dôme, and chief place of a canton in the district of Thiers; 6 leagues E.N.E. of Riom. The place contains 1587 and the canton 6,728 inhabitants; the territory comprises 157½ square miles, and 6 parishes.

CHATELLET, was anciently a small chateau or fortress, and the officer who commanded it was called chatelain.

The word is a diminutive of chateau, formed from cafel, tum, a diminutive of cafrum; or from caffellatum, a diminutive of caffel, eagle. The term in later times has been used at certain courts of justice established in several cities of France; the grand chatelat in Paris, v. gr., was the place where the prud'hommes, or ordinary court of justice of the prevôt of Paris was kept; consisting of a presidial, a civil chamber, a criminal chamber, and a chamber of policy. The term signifies the same at Montpellier, Orleans, &c.

The little chateau at Paris was an ancient fort which served as a prison.

CHAT, chatel, 3. E. in Geography, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the district of Melun; 2 leagues E. of Melun.

The place contains 1004 and the canton 8970 inhabitants; the territory includes 237½ square miles, and 16 parishes.

CHATELLERAULT, a town of France, in the department of the Vienne, and chief place of a district, seated on the Vienne; and principally employed in the manufacture of clocks and cutlery. The place contains 8426, and the canton 12,725 inhabitants; the territory includes 157½ square miles and 8 parishes.

CHATELLET, a town of France, in the department of the Cher, and chief place of a canton, in the district of St. Amand; 2 leagues N.N.E. of Chateauroux-Millitant. The place contains 1107, and the canton 5202 inhabitants; the territory comprises 180 square miles and 8 parishes.

CHATELUX, a town of France, in the department of the Creuse, and chief place of a canton, in the district of Boufflaç; 4 leagues S.W. of Boufflaç. The place contains 776 and the canton 836 inhabitants; the territory includes 18½ square miles, and 12 parishes.

CHATELUX-LE-MARCHIEUX, a town of France, in the department of the Creuse, and district of Bourganeuf; 5 miles N.E. of it.

CHATENAY, a town of France, in the department of Paris; 2 leagues S. of Paris.

CHATENOIS, a town of France, in the department of the Vouge, and chief place of a canton in the district of Neufchatel; 2 leagues S. of it. The place contains 1379 and the canton 9839 inhabitants; the territory includes 175 square miles, and 20 parishes. Also, a town of France, in the department of the Lower Rhine; one league W. of Schelstadt.

CHATHAM, in Geography, a town of Kent, England, is celebrated for its naval arsenal; and is joined to the ancient city of Rochester. This town has been mostly built since the reign of queen Elizabeth. The houses united with those of Rochester, and the village of Stroud, make one long street, of more than two miles in length, through which the high road passes from London to Dover. Many of the houses extend along the banks of the river; and, like most sea-ports, the streets are narrow, disagreeable, and ill built.

The viscounting-office, some officers' houses in the dock-yard, two breweries, and a few private houses, are however commodious and handsome. At the east end of the town is the parish workhouse, which was built on a large and extensive plan in 1725; but the principal objects of this place, and from which it has obtained its present population and importance, are the docks, viscounting-places, and other naval establishments. Among the first is a foundation called the Chest of Chatham, which was instituted in 1758, when the seamen in the service of queen Elizabeth agreed to allow a portion of each man's pay for the relief of their fellow-sailors, who had been wounded in the battle with the Spanish armada. The same custom has been continued to the present time, and many wounded sailors have derived temporary relief and comfort from this fund. See Chest. Here are two docks respectively denominated the Old Dock, and the Royal Naval Dock. The former, with its connected wharf, forehouses, &c., are the places of deposit for royal stores and ordnance. The guns belonging to the royal shipping are collected and ranged on this wharf in long tiers, and large pyramids of cannon-balls, shells, &c., are accumulated here to be ready for service. In a continued range of forehouses are deposited the cartridges for the guns, and almost every other article of naval stores. In one apartment is a small armory furnished with muskets, pistols, cutlasses, pikes, pole-axes, and other warlike instruments, classed and arranged in regular order. The whole of this department is under the management of a forekeeper, who has a good house, a clerk of the survey, and clerk of the cheque, who have each handsome salaries, and separate offices. Befide these, here are two extra clerks and some inferior officers, laborers, &c. The Royal Naval Dock-Yard connects with the former, and ranges along the eastern bank of the river for nearly one mile in extent. The increase of the navy during the reign of Elizabeth occasioned these docks to be enlarged, and in the subsequent reigns of James and Charles I. they were considerably extended; within the last fifty years, they have been greatly enlarged and improved; and within the fortified walls are now concentrated almost every requisite for the fitting out, repairing, &c., of a fleet. The forehouses, shops, and most of the buildings are extremely spacious and commodious; whilst those belonging to the commissioner and other principal officers are provided with every comfortable and elegant accommodation. One of the forehouses is fix hundred and sixty feet long; and the sail-loft, where sails are made, is two hundred and nine feet in length. A new rope-house measures 1440 feet in length; in this the cables are manufactured, some of which are one hundred and twenty fathoms long, and twenty-two inches round. Some of the masts made here are one hundred and thirty-six feet in length, and thirty-six inches in diameter. Here are two spacious basins of water, where the timber for masts, &c., is kept continually floating till wanted for use. The smith's shop contains twenty-one forges, which are almost constantly in use, in making anchors, &c. Some of these weigh nearly five tons each. In this yard are four spacious docks for docking and repairing vessels belonging to the royal navy; in these there are fix slips or launches, on which ships are continually building. Among the large vessels that have issued from this yard are the Victory of 110 guns, the new Royal George of 100 guns, finished in 1788; this was the first ship of that rate ever launched from a slip; the Royal Charlotte of 100 guns was launched here in 1740, and the Ville de Paris of 110 guns, with some others of larger dimensions, have been fini-
ed here since that period. The whole of this yard, except on the side of the river, is guarded and enclosed by a high thick wall; it is entered through a large handsome gateway, which is flanked by two towers. In time of war every stranger is precluded access within the walls, unless he has a satisfactory passport.

The buildevs of this yard is transacted by a commissioner, who has three clerks under him; a clerk of the cheque, storekeeper, master-shipwright or builder, clerk of the survey, and two master-attendants, master shipwrights' affilrients, master caulker, clerk of the rope-yard, master ropemaker, a boatwain, purveyor, surgeon, and several other inferior officers. To provide greater security to this national arsenal, two acts of parliament were obtained in the reign of queen Anne for vesting certain lands and tenements in truists, for the purpose of fortifying and giving additional security to this dock; among others, a large quantity of contiguous land, with many houses, was accordingly purchased for the crown; but nothing further was done till 1758, anno 31 George II. when the French having threatened to invade this country, it was deemed necessary to put these acts in force relating to the dock-yards. Another act was however passed that year for purchasing more lands, &c. and extensive lines of fortifications were immediately formed round the land side of this dock, with ramparts, palliades, and a deep broad ditch. These extended from the river above the old dock, to the same again below the dock at Gillingham, about one mile in length. Large and commodious barracks were also erected within the lines sufficient to accommodate five regiments of soldiers, and a battalion of artillery, which have been constantly quartered here; these fortifications have been progressively augmented and repaired; a new redoubt has been made, and other collateral works have been added. Another act was passed in 1762, for vesting other lands on the south side of the town in the crown.

At the entrance of Chatham from Rochester, is the Vic-tualing Office, containing a cooperage, pickling, baking, cutting, slaughtering, and store, houses. A new wharf has been added to it, and additional buildings have been erected for the convenience and service of this department of the navy.

In digging for the fortifications round the dock, various Roman coins, paterae, &c. were found. The present church was erected in 1788, and is constructed mostly with brick. Chatham and the contiguous hamlets are extremely populous. Here is a large market on Saturdays; and two annual fairs of three days each. Chatham is 30 miles E. from London; it contains 1729 houses and 10959 inhabitants. Halded's History of Kent, 12 vols. 8vo. 1758, vol. iv.

Chatham, a maritime township of America, in the county of Barnstable and isle of Massachusetts, seated on the exterior extremity of the elbow of Cape Cod, conveniently for the fishery, in which the inhabitants have usually about 40 vessels employed. It has 1840 inhabitants, and lies 95 miles S.E. of Boston. See Cape Cod.—Also, a township in Grafton county, New Hampshire; incorporated in 1767 and 1795, containing 58 inhabitants.—Also, a flourishing township in Middlesex county, Connecticut, on the eastern bank of Connecticut river and opposite Middleton city; it was a part of the township of Middleton till the year 1767.—Also, a township in Essex county, New Jersey, seated on Passaic river; 13 miles W of Elizabeth town, and nearly at the same distance from Newark.—Also, a township of Columbia county, New York. By the late census in 1796, 280 of its inhabitants were electors.

Also, a county in Hillsborough district, North Carolina, about the center of the state. It contains 5221 inhabitants, of whom 1632 are slaves; the chief town is Pittsburg. The court house is a few miles W. of Raleigh, on a branch of Cape Fear river.—Also, a town of South Carolina in the Cheraws district, situated in Chesterfield county on the west side of Great Peeee river. Its situation, in a highly cultivated country and at the head of a navigable river, promises to render it a place of great importance.—Also, a county in the lower district of Georgia, lying in the north east corner of the state, having the Atlantic ocean on the east, and Savannah river in the north-west. It contains 10,769 inhabitants including 8201 slaves. The chief town is Savannah.

Also, a large bay called Penjiio bay, on the west side of the south end of the promontory of East Florida. It receives North and Delaware rivers.

Chatham Island, a small island in the Indian ocean, within the harbour of the island of Andaman on which is situated the settlement of Port Cornwallis; the utmost length of this small island does not exceed two miles, and its breadth is little more than half a mile; the southern extremity terminates in a narrow neck of land, fordable at low water to the main.

Chatigan, a town of Asia, in the kingdom of Bengal, on the most calmer branch of the river Ganges; which is now a mean place, although it was the first in which the Portuguese established a settlement. It has a few cotton manufactures, and furnishes excellent timber. The inhabitants are so falacious of each other, that they always go armed with a sword, pithol, and blunderbuss. It is subject to the Great Mogul. N. lat. 23°. E. long. 91° 10'.

Chatillon, a large town of France, in the department of the Côte-d'Or, and principal place of a district, built on both sides of the Seine, and having iron forges in its vicinity. The place contains 37,000, and the canton 14,577, inhabitants: the territory comprehends 450 kilometres and 20 communes; 38 miles N.W. of Dijon.—Also, a town of France, in the department of the Dôme, and chief place of a canton in the district of Die; 34 leagues N.W. of Lyons. The place contains 1380, and the canton 6533, inhabitants: the territory includes 255 kilometres and 10 communes.—Also, a town of France, in the department of the Indre, and chief place of a canton in the district of Châteauroux; 3 miles S.W. of it. The place contains 2699, and the canton 8139, inhabitants: the territory comprehends 247 kilometres and 10 communes.—Also, a town of France, in the department of the Marne, and chief place of a canton in the district of Reims; 9 miles W.N.W. of Epernay. The place contains 1002, and the canton 7702, inhabitants: the territory includes 165 kilometres and 21 communes.—Also, a town of France, in the department of the Seine; 15 leagues S.W. of Paris.—Also, a town of Savoy, in the department of Leman, and district of Geneva; 3 miles S.E. of St. Julian.—Also, a town of Piedmont, in the duchy of Aosta, seated on the Doria Baltis; 9 miles S.E. of Aosta.

Chatillon-en-Bazois, a town of France, in the department of the Nièvre, and chief place of a canton in the district of Château-Chinon; 8 miles N.W. of Moulins. The place contains 663, and the canton 9138, inhabitants: the territory includes 532 square kilometres and 16 communes.

Chatillon-sur-Chalaronne, a town of France, in the department of the Ain, and chief place of a canton in the district of Trevoux. The place contains 3169, and the canton 16,876, inhabitants: the territory includes 187 square kilometres and 15 communes.

Chatillon-sur-le-Côtes, a town of France, in the department
The inhabitants: The league which, people whereas the town, vantages.

But, district and canton of the district of Montargis; 4 leagues S. of it. The place contains 1996, and the canton 849, inhabitants: the territory comprehends 3724 kilometres and 15 communes.

Chatillon-sur-Loing, a town of France, in the department of Loiret and chief place of a canton in the district of Gien; 3 leagues S.E. of it. The place contains 1985, and the canton 6735, inhabitants: the territory includes 2275 kilometres and 6 communes.

Chatillon-sur-Saulx, a town of France, in the department of the Valois; 3 leagues S.S.E. of La Marche.

Chatillon-du-Bois, a town of France, in the department of the Two Sevres, and chief place of a canton in the district of Thouars; 7 leagues W. of it. The place contains 512, and the canton 6842, inhabitants: the territory includes 3173 kilometres and 13 communes.

Chatillon-en-Vendelais, a town of France, in the department of the Ille and Vilaine, and district of Vitre; 2 leagues N. of Vitre.

Chatimens Militaires, military punishments. These, generally speaking, consist in the execution of sentences pronounced by courts-martial on military delinquents. But, in our service, military punishment more particularly means the inflicting of a certain number of lashes upon a reduced non-commissioned officer or on a private man. Military punishments have been different in different ages, and in different countries, as they are at present. The Romans had some institutions respecting them; which, though they are truly admirable, have not been adopted by any of the moderns. The Turks never inflict them but in the night. A judge sometimes pronounced death is delivered up into the hands of civil justice, and the person is never tried, but taken from the registry of the corps, who pretend to be exempt from the ignominy of punishment. Those in our service are simple, and in general very summary, particularly with regard to officers. In some foreign services it is customary to fend officers, found guilty of certain offences, from their regiments to garrisoned towns for certain periods, during which they lose all the advantages of promotion. Hence the phrase être envoyé en garrison, to be sent into garrison, implies a species of military chastisement.

A judicious application of punishments contributes much to the preservation of discipline, a punctual obedience of orders, and the success of military operations, both in garrison and in the field.

Chatonnay, in Geography, a town of France, in the department of the Ile, and district of Vienne; 5 leagues E. of it.

Chatramis, a country of Arabia Felix, over against Persia.

Chatrammite, a people of Arabia Felix, on the borders of the Erythrean sea. Ptol.

Chatres, in Geography, a town of France, and principal place of a district in the department of the Loiret, which has a woollen manufacture, and carries on a large trade in cattle. The place contains 246, and the canton 1442, inhabitants: the territory includes 4625 kilometres and 24 communes; 6 leagues S.S.E. from Chateauroux. N lat. 46° 35', E long. 1° 53'.

Chats, in Agriculture, a term employed in some districts to signify the keys of the ash, sycamore, and some other trees.

Chats, Lake, in Geography, a lake of Lower Canada, on the north side of the river Ulusaw, between the Grand Calumet and the lake Des Chaudières. At the extremity of the latter is the "Portage des Chats," over which the canoes and lading are carried with great difficulty 274 paces. The river is here barred by a ridge of black rocks, rising in pinnacles, and covered with wood, which, from the small quantity of soil that nourishes it, is low and riddled. The river makes its way over these rocks, in numerous channels, falling 15 feet and upwards. From hence two trips are made through a serpentine channel, formed by the rocks, for several miles, when the current slackens, and is accordingly called the "Lake des Chats."

Chatsworth, a town of America, in the state of Virginia; 4 miles S.E. of Richmond.

Chattel, in Ancient Geography, a people of Germany. Ptol.

Chattentia, a country of Arabia Felix, near the Erythrean sea, attributed by Steph. Bz. to the Gerrans.

Chattelles, Catalis, Callata, in Law, a Norman term which primarily signified only baits of husbandry, or (as we still call them) cattle; but in its secondary sense comprehended all moveable goods. In the grand coutumier of Normandy, (c. 87.) a chattel is described as a mere movable, but at the same time it is set in opposition to a fief, or feud; so that not only goods, but whatever was not a feud, were accounted chattels.

Spelman defines chattels to be bona quaequeque mobilia & immobilia; propriis tantum et honorum pars, quae in animalibus conquit, est quorum capitibus res tiba, alias capita, alias capitalia dita sunt.

In the modern sense of the word, chattels are all sorts of goods moveable or immovable, except such as are in nature of freethold, or parcel thereof: and they are either personal or real.

Chattels personal, are such as do either belong immediately to the person of a man, as his horse, sword, &c. or such things as being injuriously withheld from him, a man has no way to recover but by personal action: or, strictly speaking, they are things moveable, which the owner may carry with him from one place to another; such as animals, household furniture, money, jewels, corn, garments, and every thing that is capable of being removed.

Chattels real are, immediately upon the death of the testator, in the actual possession of the executors; whereas chattels real are not in his possession till he hath made an entry, or recovered them. An owner of chattels is said to be possessed of them; but a person is said to be seiz'd of a freethold. See Property.

Chattels real, are either such as do not appertain immediately to the person, but to some other thing, by way of dependence; or such as necessarily issue out of some immovable thing to a person; as a lease, or rent for years.
Sir Edward Coke observes (1 Inf. 118.) that chattels real are such as concern, or favour of, the reality: as terms for years of land, Wardships in chivalry, (while the military tenures subsisted), the next presentation to a church, chattels by statute-merchant, statute-dapple, elegant, or the like: these are called real chattels, as being interests issuing out of, or annexed to, real estates; of which they have one quality, viz. immobility, which denominates them real; but want the other, viz. a sufficient, legal, indeterminate duration, and it is this want that constitutes them chattels. The utmost period for which they can be held is fixed and determinate, either for such a space of time certain, or till such a particular sum of money be raised out of such a particular income: so that, in the eye of the law, they are not equal to the lowest estate of freethread, a leaf for another's life. Their tenants were considered upon feodal principles, as merely bailiffs or farmers: and the tenant of the freethread might at any time have destroyed their interest, till the reign of Henry VIII. (See Estate for years.) A freethread, which alone is a real estate, and feems to answer to the fief in Normandy, is conveyed by corporeal investiture and livery of feitt; which gives the tenant the freedom of a hold of the land, that it never after can be wrested from him during his life, but by his own act of voluntary transfer or forfeiture; or else by the happening of some future contingency, as in chattels "per autre vie," and certain determinable free-holds. (See Estates for life, and Freethread.) And even there, being of an uncertain duration, may by possibility last for the owner's life; for the law will not presuppose the contingency to happen before it actually does, and till then the estate is to all intents and purposes a life-chattel, and therefore a freehold interest. On the other hand, a chattel interest in lands, which the Normans put in opposition to fiefs, and we to freehold, is conveyed by no feitt or corporeal investiture, but the possession is gained by the mere entry of the tenant himself; and it will certainly expire at a time prefixed and determined, if not sooner. Thus, a lease for years must necessarily fail at the end and completion of the term; the next presentation to a church is satisfied and gone the inftant it comes into possession, that is, by the first avoidance and presentation to the living; the conditional estates by statute and elegant, are determined as soon as the debt is paid; and so gatherings in chivalry expired of course the moment that the heir came of age. And if there be any other chattel real, it will be found to correspond with the rest in this essential quality, that its duration is limited to a time certain, beyond which it cannot subsist. Blackf. Com. Book III.

CHATTERER, in Ornithology: the Bohemian or Waxed chatterer, AMPHIS garrulus of LINNEUS. This bird is about eight inches in length. It is distinguished by having the hind part of the head crested, and the fide necky quill-feathers tipped with red and brown appendages. This is an inhabitant of Europe, America, and the north of Asia.

CHATTERPOUR, in Geography, a town of Hindooftan, in the country of Allahabad; 212 miles S.S.E. from Agra, 159 miles S.W. from Allahabad, 237 from Banares, 747 N.E. from Bombay, 603 N.W. from Calcutta by Moorhead's, 628 by El Bonn, 623 N.N.E. from Hy- drabad, 776 S.W. from Lucknow, 975 N. from Madras. Lat. 25 4 E. long. 80 2.

CHATTERTON, THOMAS, in Biography, a youth of very extraordinary genius, was born after the death of his father, at Bristol, on the 25th November, 1752. The life of this young man was short but eventful: it began and terminated in Indigence and misfortune. His mother, by the loss of a husband, was left in poverty, and the son, owing to the same unfortunate event, was deprived of that attention which might have conducted his early years through all the difficulties of circumstances, and an untoward disposition to the attainment of knowledge. He could not be induced to learn his letters, till he fell in love, as Mrs. Chatterton expressed herself, with the illuminated capitals of a musical manuscript in French; the afterwards taught him to read from an old black-lettered Bible. When he was about eight years old, he was admitted into a charity school, where he might learn the elements of reading, writing, and common arithmetic. The first years of his residence at this seminary passed without notice, and with scarcely any effort on his part. When he was about ten years of age, he acquired a taste for reading, which became from that period a kind of ruling passion, and out of the tribute allowed him by his mother for pocket-money, he began to hire books from a circulating library. His disposition as well as his taste differed much from what was observable in other children. He was grave, penive, and not unfrequently of a melancholy cast. At times he seemed lost in contemplation, and for days together fearfully spoke to any one. His intimates in the school were few, and those of the most serious cast. Before he was 12 years old, he drew up a catalogue of the books which he had read, and which amounted to more than 70; soon after this, it is certain that he had composed some verses, and he now began to exhibit that ardour of mind by which he was afterwards so strongly characterized. At fifteen he was bound apprentice to arewen of Bristol, in which situation his leisure allowed him ample time to follow his literary pursuits. He had not continued in this course of life for more than a year, before he began to attract public notice, by the publication of an article in the Bristol Journal.

In the church of St. Mary Redcliffe, Bristol, which was founded or re-built by W. Cannyge, an eminent merchant, during the reign of Edward IV, there is a room containing several large chests, in one of which, called Cannyge's chest, were deposited some title-deeds: these, about the year 1725, were wanted, and an order was given to break open the chest. The deeds were taken, but the other manuscripts were left exposed as of no value. Many of them were carried away, but Chatterton's father, who was nephew to the sexton, removed several bibles full of parchments, which he put to no better use than that of covering copy-books and bibles for the school over which he presided. Young Chatterton, soon after the commencement of his apprenticeship, was struck with one of these parchments converted into a thread paper; he soon got possession of all that were left of the board, and from this period, at last, he seems to have formed the design of converting them into a system of literary forgery. Upon the opening of the new bridge at Bristol, an article appeared in Farley's Bristol journal, in 1758, entitled, "A Description of the Poet's first passing over the Old Bridge, taken from an Ancient Manuscript." This was traced to Chatterton, who, after much equivocation, avowed that it came from the old chest. He next caused a rumour to be propagated, that certain ancient pieces of poetry had been obtained from the same place, the authors of which were Thomas Cannyge, and the friend of Sir Thomas Rowley, a poet. The report gained credit, and he was applied to by some respectable inhabitants of Bristol, whom he presented, without any kind of reward, with various poetical pieces, under the name of Rowley.
In 1770 he wrote to the Hon. Horace Walpole, offering to furnish him with accounts of several eminent painters, who had flourished in early times at Bristol, including in the same packet, two specimens of the old poems, with a relation of their discovery. By the poets Mason and Gray, to whom they were shewn, these were instantly pronounced to be forgeries, and, after a considerable lapse of time, returned.

Chatterton, prior to this, had commenced a correspondence with the Town and Country Magazine, and had inserted in that work various articles relative to antiquity, of extracts from the pretended Rowley, and of pieces entitled "Saxon Poems, written in the Style of Offian." He also became a writer of Satire, particularly of the poetical kind, in which he did not spare even those who had been his friends. His character began now to be developed, and it did not appear in the most favourable light. The confidence which he felt in his own powers rendered him proud and impatient of control. Whatever plan he adopted he entered upon with an almost unexampled eagerness. Poetical enthusiasm was never more strongly exhibited than in Chatterton. He fancied he could write with effect, only at particular seasons, and the full of the moon was the time when he imagined his genius was in perfection; at this period, as if the immediate presence of that luminous added to the inspiration, he frequently devoted a considerable portion of the night to composition.

London was become the first object of his views, the only proper place, as he thought, for the display of his talents: yet he knew not how to free himself from his indigence. At length, having avowed himself an unbeliever in the Christian religion, he threatened to put an end to his life, on Easter day, 1770; his master, on learning this fact, immediately diffified him from his service. Chatterton now set out for the metropolis, and in an answer to some inquiries from a friend, was given an exposition of his plans. "My first attempts," said he, "shall be in a literary way: the promises I have received are sufficient to dispel doubt; but should I, contrary to my expectation, and myself deceived, I will, in that case, turn Methodist preacher. Credulity is as potent a deity as ever, and a new feat may be easily devised. But if that should fail me, my last and final resource is a pillot." From a young man of 17, who could deliberately avow such sentiments, much moral worth was not rationally to be expected. A contempt for the truths of revealed religion is almost always succeeded by a laxity of principle very injurious to real and progressive improvement. Upon his arrival in London he engaged in many projects with the bookellers; a history of England, and another of the metropolis; essays in a magazine, and in the newspapers, and fongs for places of public entertainment were among his projected plans.

He was particularly attached to party politics, and connected himself with what was deemed the popular side of the question; he was introduced to the Lord Mayor Beckford, who received him kindly, but from whom, it appears, Chatterton was not able to get any remuneration for his exertions in the cause which his heart conformed. Stung with disappointment, he observed, that he must be a poor author who could not write on both sides. Upon this maxim he acted; but prosperity was not the attendant upon his dereliction of principle. For some time indeed he indulged the most fantastic hopes of attaining to distinction, and even influence, by the exertions of his pen; and to his honour he is spoken, with these pretensions in anticipation, gave him more pleasure than the hope of being able to afflIf his widowed mother and beloved sisters in their need. From his first earnings, scanty as they were in comparison of what he had fancied they would provide, he devoted a part for presents to his relations at Bristol. Within a very short time after he had boasted of his prospects with regard to the future, he experienced some change in his expectations. The reverse was suddenly, and the dream of hope was speedily converted into the anguish of despair. The particular cause of this depression of spirits has never been exactly ascertained. He perhaps perceived that he had nothing to hope from the patronage of the great; and he felt, that a subsistence depending on bookellers must be scanty, and hardly earned. He had anticipated celebrity and influence; he had a taste for dilapidation, and public amusements seemed necessary as food to his exactions: ill prepared, therefore, he was for regular and habitual industry. His pride was mortified, and he was disillusioned with the labours of a literary life. He determined to quit the scene of his disappointment, and made an indelible attempt to be sent out a forger's mate to the coast of Africa; his last hope was blasted; and from this time he fell into a state of extreme indigence, which cannot be accounted for but on the presumption that he preferred death to the moderate exercise of those talents with which he was endowed. He was reduced to the want of necessary food; yet his pride even at that period was too great to allow him to accept of a dinner from the person with whom he lodged, the day before his death. In these desperate circumstances, his mind reverted to what he had been accustomed to regard as his last resource: on the 24th of August 1770 he swallowed a quantity of arsenic in water, which proved fatal to him in a few hours. He was interred in the burying-ground belonging to the workhouse in Shoe Lane. Thus terminated the life of the unfortunate Chatterton, before he had completed eighteen years. What multiplied our regret for this rafli flip, is, the circumstance, that Dr. Fry of Oxford went to Bristol within two or three days of the unhappy catastrophe, in order to search into the history of Rowley and Chatterton, and to patronize the latter if he appeared to deserve and stand in need of assistance—when alas! all the intelligence he could procure was, that Chatterton had, within a few days, destroyed himself.

The authenticity of the poems ascribed to Rowley was at first defended by persons of considerable rank in the antiquarian literary world; but the advocates for this opinion have long since been silenced, and Chatterton is almost universally admitted to be the author; and the measure of his reputation, as an author and a poet, is taken from them. They consist of pieces of all the principal classes of poetical composition: tragedies, lyric and heroic poems, pastoral, epistles, ballads, &c. &c. Many of them abound in sublimity and beauty, and display wonderful powers of imagination and facility of composition. They are however very unequal in merit; yet, after all their defects, they must ever be regarded as very extraordinary productions for a mere lad of 15 or 16 years of age. The other writings of Chatterton display many excellencies, but they are inferior to these. The perfon of Chatterton, like his genius, was premature. He had a manliness and dignity beyond his years; and there was about him something remarkably prepossessing. He had an uncommon ardour in the pursuit of knowledge, and a great facility in the attainment of it. His ruling passion, that which governed his whole conduct, was the desire of literary distinction. This passion intruded itself in his letters, and in his conversation it seemed to absorb all his attention. It was his favourite maxim, that "man is equal
to anything, and that every thing might be achieved by diligence and abstinence.” His ambition was evident to all who knew him, from his earliest youth. His melancholy was extreme on some occasions, and then he was ever eager to argue in favour of suicide. The natural gloomines of his disposition was probably increased by the principles of scepticism which he had unfortunately imbibed; and to these may be attributed his death. He has been charged with licentious conduct, and with indulging strong refractions against those who had offended him. His faults have been probably exaggerated; at any rate, they are much exceeded by the good qualities that have been fairly attributed to him. His temperance was exemplary: he was a lover of truth from the earliest dawn of reason; but the most amiable feature in his character was his generous attachment to his mother and relations. Every favourite project for his advancement in life was accompanied with promises and encouragement to them. In this respect his whole conduct is deserving the imitation of those in more fortunate circumstances, and under the influence of better principles than this unfortunate young man cherished. Biog. Brit.

CHATUGA, in Geography, a town of America, in the Tennessee government; 3 miles S.W. of Tellico.

CHATUS, in Middle Age Writers, a kind of gold coin.

Chatus was also called, by some French writers, maillot sabchat.

Du Cange makes it a question, whether the chatus was the same coin as the cahotens, and supposes that the latter might be formed from chati Pititavenepes; in French, chat de Payot.

CHATZAN, in Geography, a town of Aifa, in the Moulten country, W. of the Indus; 90 miles W. of Moulten. N. lat. 31° 8', E. long. 69° 45'.

CHAVABEDA, a principality of Arabia Duferta, whose chief towns are Chavaheda, Tangia, Merah, and Megiarah. This principality, and also that of Arcia, are in all respects unknown to us, except in the Arabian tables.

CHAVALINES, a town of France, in the department of the Maine and Loir; 4 leagues S. of Angers.

CHAVANAY, a town of France, in the department of the Rhone; 7 leagues S. of Lyons.

CHAVANGES, a town of France, in the department of the Aube, and chief place of a canton, in the district of Arcis-sur-Aube; 6 leagues S. of Arcis. The place contains 974, and the canton 5871 inhabitants: the territory includes 1524 kilometres, and 14 communes.

CHAVANNE, a town of France, in the department of the Ain, and district of Bourg; 8 miles W. N.W. of it.

CHAVARIGHTS, a seat of Mahometans, who deny that God ever sent a prophet that was infallible; and who had a commission to give a law to mankind: they pretend likewise that if such an office should ever become necessary, it would not be confined to a single family, but that every man of probity and virtue would be capable of that honour.

CHAUBI, in Ancient Geography, a people of Lower Germany, placed by Strabo near the ocean, between the Brusteri and Sicambri.

CHAUCER, Geoffrey, in Biography, the earliest English classic poet, was born, it is generally supposed, in the year 1328. Of his parentage and early youth little is known, except that he was born and brought up in London. It should seem, from circumstances discovered by his biographers, that he was exposed to the inconvenience of a narrow fortune, but that he received all the instruction which the metropolis could then afford. It is admitted that he flourished in both the English universities, first at Cambridge, then at Oxford, and probably at Paris also. It is evident, from his various writings, that he acquired a large acquaintance with the scholastic learning of the age. To him the Greek classics were inaccessible; but he successfully studied the Latin, French, and Italian. Virgil was his favourite author. The adventures of romance and the songs of the minstrels Chaucer listened to with avidity. Tales of chivalry, of enterprise, and heroic adventure, had a double interest with him, because he knew that, when he went forth into the world, the men of whom he read, a race now extinct, would be the objects of his observation and intercourse. The whole word was then romantic, fanciful, and sublime. This was the age of reformers and troubadours. Pilgrimages and crusades invited the conquest of the pious. Chaucer had also a particular turn for subjects of humour. At college he contracted a friendship with Gower and Strype, two young Oxonians of great learning and talents, and upon his return from the continent, whilst he went for improvement, by travels through France and the Low Countries, he is supposed to have studied the law at the Temple. He was, for a short time, a soldier as well as a lawyer, but he quitted each of these professions after a short trial, and his final destination was the court, where he first obtained the post of valetutus, or yeoman to Edward III. He had already distinguished himself as a poet, a quality that was likely to recommend him to a prince who was the patron of letters. Chaucer was a courtier in the best sense of the word, not depending upon ministers, but associating with princes; he seems, however, to have placed the chief hopes of his fortune on the friendship of John of Gaunt, duke of Lancaster; with whose family he formed an intimate connection, though not of the most creditable kind. The duke entertained as governors to his children, Catherine, the widow of Sir Hugh Swynford. This lady was also the favourite mistress of John of Gaunt, by whom he had several children. She had a richer, to whom the duke and duchesses were also attached, who recommended her to Chaucer for a wife. He married her in 1366, and from that time he speedily advanced at court. He received the gift of a house almost contiguous to the royal palace at Woodstock; and he was garrisoned with an annuity from the Exchequer of 200 marks, which sum was doubled on his being appointed gentleman of the king’s privy-chamber. In 1373, he was sent, with other persons, as a commissioner to Genoa, on a matter of public concern; and it is affirmed by Froissart, that Chaucer was the principal in the unsuccessful attempt to negotiate a marriage for Richard, prince of Wales, with a daughter of the French king. He was made comptroller of the customs, and various other lucrative employments were conferred upon him, which enabled him to live in a dignified style. It was the custom of that age for the great public officers to keep their own accounts, and Chaucer was enjoined to perform the duties of his office with his own hand. He was rarely absent from his office, for one and only written leave of absence to him for a month is formally recorded upon the patent rolls. Of himself, he says, that he had no opportunity for the pleasures of study, "till he had made an end of all his reckonings," and the buxiness of the day was concluded. He did not, however, renounce the pursuits of literature, for several of his poems were written during the period of his prosperity and attendance upon the court. Still he regarded the duke of Lancaster as his peculiar patron, whose political schemes he felt himself bound to promote. The duke having espoused the cause of Wickhille, Chaucer employed his pen in exposing the vices and ignorance of the clergy. On the succession of Richard to the crown, the duke of Lancaster
for a time obtained a chief share in the administration of affairs; and a renewal of some of the grants to Chaucer was among the arrangements in this reign; but he seems to have been deprived of his most lucrative office as comptroller of the customs. His affairs soon fell into disorder, and he was obliged to have recourse to the sovereign's protection against his creditors.

In a few years the duke, his patron, became unpopular, both in and out of the court, by his adherence to the followers of Wickliffe, who were considered as the authors and abettors of the commotions that disturbed the kingdom. London itself was divided into two parties, one favouring the reformation, the other adhering to the established clergy. Chaucer sided with the former, and thereby rendered himself obnoxious to the officers sent to suppress the disturbances, and he would have been apprehended had he not escaped first to Hainault, and thence to Zealand, where he lived in concealment till his difficulties forced him back to London. He was, however, immediately seized and sent to prison, where he was treated with the greatest severity. As in exile he was nearly delirious of all the necessaries of life, so in prison he experienced the savage triumph of his enemies, and was probably the witnes of many barbarous executions. The terms upon which he was liberated from confinement, after five years of oppression and difficulty, were such as no honourable man ought to have complied with. For the sake of pardon he deposed all he knew of the design of the party whose cause he had formerly defended; thus did Chaucer obtain his liberty, accompanied with a heavy load of merited obloquy. Upon his restoration to liberty Chaucer was appointed clerk of the works, a situation which he occupied only a very short time: he was in truth reduced to such a state of penury, that he sold his penfions and retired to Woodstock. Here he calmly employed himself in revising and correcting his various writings, and of applying to practical purposes those fluos of philosophy which study and reflection had enabled him to accumulate.

In this retreat, after he was sixty years of age, he planned and composed his Canterbury Tales, which have been deemed one of the most extraordinary specimens of active genius and various talent that England has produced. The two last years of his life he spent at Donnington castle. The return of the duke of Lancaster to court, and his marriage with Catharine Swynford, his old mistress, were favourable circumstances to Chaucer, who obtained a renewal of his annuity, and a grant of a pipe of wine annually, from the customs of the port of London. Chaucer lived to see his sovereign deposed, and the son of his patron John of Gaunt usurp the government. In addition to his former grants, were conferred upon him 40 marks per annum during life: but it is to the praise of Chaucer, that as he was too old to oppose the pretensions of the usurper, or to contribute to redress the wrongs which he deplored, yet all the benefits of the new king, and all his connections with, and obligations to, the father of that monarch, could not extort from him a line of congratulation. Soon after the commencement of the new reign, his own affairs required him to visit the metropolis; but he was too old to bear the fatigues attendant upon the journey. He died in a house that he had hired at Weilminster, October the 25th, 1400, at the age of seventy-two. His remains were interred in Weilminster-abbey.

From this sketch Chaucer appears to have been a man of the world as well as a scholar, and to the variety of the scenes in which he engaged, is to be ascribed the varied character of his writings. As a courtier, a traveller, and a man of pleasure, he acquired an air of gallantry, and a talent for rich and elegant description, which distinguishes him from all other writers of that period: at the same time a kind of serious reading, joined to the impressions which the scenes of adversity had made upon his mind, rendered him well calculated to sustain the part of the moralist and philosopher. His works are numerous; his fame ranks high as an original poet, and his industry is no less conspicuous as a translator and imitator from the French and Italian writers. He enriched his native language by new forms of diction and verification; but there is nothing in which he excels his contemporaries more than in profifiting that true poetical character of which they were almost wholly void. In many of his tales are to be found fine figures and splendid imagery displayed in glowing and elegant language. The most considerable and celebrated work of this poet is his "Canterbury Tales", which are a set of stories connected by the fiction of their being told by a company met at an inn in Southward, for the purpose of a pilgrimage to the shrine of St. Thomas-a-Becket, at Canterbury. These tales are various in their subject; heroic, and romantic; satirical, humorous, and moral; and the prologue by which they are introduced, is one of the most curious memorials of the age. It contains a description of all the personages forming the company, among whom are individuals of the most remarkable characters both male and female, of which society is composed. These are delineated with a strength and precision that can scarcely be surpassed, and form a group highly interesting to the observer of human nature; in short, they exhibit a view of the private life of the fourteenth century. The Canterbury Tales have been handomely published by Mr. Tyrwhitt in five volumes 8vo., but the editions of Chaucer's other works do not equal the value of the former edition. They are highly indispensable to the lovers of ancient English poetry. B. E. B. Godwin's Life of Chaucer.

CHAU-CHEW, in Geography, one of the 10 jurisdicitions into which the province of Quang tong or Canton, in China, is divided, and also a city of that jurisdiction.

CHAU CHOO FOO, or CHAO-CHOW-FOO, the second city of the province of Canton, in China, situate at the confluence of the river Pe-kiang, with another considerable stream proceeding from the N.W. The environs of this city are pleasant and romantic. The plains are fringed with rice and tobacco, and the rising grounds are planted with cotton and the jute plant. The palaces are covered with numberless flocks, and the coasts teem with fish. The boats which ply from one part of the city to another, are chiefly managed by females, who are generally young and neatly dressed, with an evident intention of attracting the attention of passers. At this city the concurrence of two navigable rivers occasions a concourse of male strangers. The small females in the boats had not combined this double occupation, after having quitted their parents, or on being abandoned by them on account of their misconduct; but the parents themselves, taking no other interest in the chastity of their daughters than as it might contribute to an advantageous disposal of them to wealthy husbands, feel little reluctance, when no such prospect offers, to devote them to one employment with a view to the profits of another. The distinction which this city has acquired is owing to a celebrated monastery of the Bonzes which is in its vicinity. Its situation is singularly delightful: from the middle of a mountain called Nan-hoa, where it stands, there is a charming prospect of a defert, stretching out into an immense plain, which is bordered with hills, on the summits of which fruit trees are planted in regular order, interspersed here and there with groves, the foliage of which is always green. The country about the town belongs to the monastery, the
origin of which is traced back 3 or 500 years. The Donces pretend that its founder practised the most edifying austerity, an example, however, which they do not chuse to follow, as they abandon themselves to every kind of debauchery. The people who formerly visited this place as pilgrims, complained much of their theft and robberies; but these abuses have been corrected, and the devotees of the province may now visit the place in safety. The air of this city, however delightful its situation, is infalutibles; and contagions distempers, generally prevailing here from the middle of October to the beginning of December, sweep off every year a great number of inhabitants. This city has under its jurisdiction 6 cities of the third class; near one of which grows a kind of black reed, of which various instruments are made that cannot be distinguished from those that are made of real ebony. Emb. to China, vol. ii. Groffer's Descript. of China, vol. i.

CHAUCI, CAUCI, or CAUCI, in Ancient Geography, a people of Germany, whose territory commenced with the Friiri, occupied part of the sea-coast, and had behind it the Chaumavi, Angrivarii, Dulbigini, &c., according to Tacitus. This author, as well as Ptolemey and Pliny, distinguished them into great and small. Strabo says, that Drufus Germanicus was the first of the Romans who, crossing the sea, penetrated into their territory, after having gained a naval victory over the Anfibari, and subdued the Frithii. Tacitus says, that the Thibaravi and Batavi, who, according to Tacitus, were of the Roman empire under the empire of Claudius; but were defeated by Gabinus, who hence obtained the appellation of "Caucian," according to Suetonius. Tacitus says, that they routed their neighbours, the Anfibarians, under the empire of Nero, and during the troubles of Vitellius's reign, they united with the Batavi and Frithii, and spread themselves over the empire; but they were again restored to favour. They remained in tranquillity till the reign of Aurelius, when they invaded the territory of the Batavi, but Didius Julianus repelled their progress.

CHAUDER, in Law, according to its proper etymology, denotes an affair that happens in the beat of blood or passion. See CHANCE-MEDLEY.

CHAUNDEBREG, a village of France in the department of the Mofelle, near Thionville, celebrated for its medicinal waters.

CHAUD,DE-AIGUES, a town of France in the department of the Cantal, and chief place of a canton in the district of St. FLOUR, deriving its name from its medicinal springs, and trading chiefly in ikins and glue; 12 miles S. of St. FLOUR. The place contains 2049, and the canton 8150 inhabitants; the territory comprehend 340 kilometres and 14 communes.

CHAUDIERE, a river of Canada, which rises in Lincolm and Hancock counties in the district of Maine, and joins the river St. Lawrence, about 7 miles above Quebec. The fall in this river is not half that of Montmorenci, or about 120 feet high; but it is no less than 250 feet broad. However the scenery round this cataract is in every respect much superior to that in the neighbourhood of Montmorenci. The banks of La Chaudiere are covered with trees of the largest growth, and amidst the piles of broken rocks which he scattered about the place, you have some of the wilder and most romantic views imaginable. As to the fall itself, it grandeur varies with the season; when the river is full, a body of water rushes over the rocks in a manner that amazes the observer; but in dry weather, and, indeed, during the greater part of the summer, the quantity of water is inconsiderable. The carrying place from boatable waters in the Chaudiere to similar waters in the Kennecac, is not more than five miles.

There are several portages on the north side of the river Utawas, in Lower Canada, called Portages de Chaudiere; at the first portage of this name, the body of water falls 25 feet, over craggy excavated rocks, in a wild and romantic manner. At a small distance below, is the river Rideau on the left, falling over a perpendicular rock near 40 feet high, in one sheet, assuming the appearance of a curtain; from which circumstance it derives its name. To this extent the lands have been surveyed, and are very fit for culture. Many loyals are settled upon the river Rideau, and have thriving plantations. Some American families, preferring the British territory, have also established themselves along a river on the opposite side, where the soil is excellent; and it is apprehended, that at no very distant period, the lands will become settled from this vicinity as far as Montreal. Over this portage, which is 635 paces long, the canoe with its whole laden is carried. The rock is so steep and difficult of access that it requires 12 men to take the canoe out of the water; it is then carried by 6 men, two at each end on the same side, and two under the opposite gunwale in the middle. From hence to the next is but a short distance, in which they make two trips over the second Portage de Chaudiere, which is 700 paces, to carry the loading alone. From hence to the next and last Chaudiere, or Portage des Chenes, is about 6 miles, with a very strong current, where the goods are carried 740 paces, the canoe being towed up by the line, when the water is not very high. The next remove is to the Lac des Chaudiere, computed to be 30 miles in length; but though it is called a lake, it hasa strong draught downwards, and its breadth is from 2 to 4 miles. At the end of this is the Portage des Chats. See CHATS.

CHAUDIERES, of CHAUDIERES DE MAGASINS, are vessels made use of in military magazines, to boil pitch in for various purposes. They are necessary in all places and particularly during sieges.

CHAUDRON, in Geography, a town of France in the department of the Maine et Loire; 15 miles S.W. of Angers.

CHAVES, a town of Portugal, in the province of Tramondos, near the confines of Spain, defended by a castle, walls, and bastions, seated on the Tagus, and founded by the emperor Trajan; several traces of its ancient magnificence still remain; 12 leagues W. of Draganda. N. lat. 41° 47' W. long. 6° 31'.

CHAUFFAGE MILITAIRE, in Military Language, is an allowance of fire-wood regulated by particular orders or ordinances to officers and soldiers whether they are in barracks not, during the continuance of cold weather.

CHAUFFAILLES, in Geography, a town of France in the department of the Saone et Loire, and chief place of a canton in the district of Charolles, 4 leagues E. of Mardyj; the place contains 2155, and the canton 7292 inhabitants; the territory includes 142½ kilometres and 9 communes.

CHAUFE. A spot where the wood is collected and burnt in a foundery. The chasse is three feet below the furnace, over every part of the inside of which the flames spread, and by their intense heat dissolve the metal.

CHAUPE-WAX. See CHAUFE-WAX.

CHAU-CHOU. CHAO-CHING, or CHAO-KEWING, in Geography, one of the 10 capital jurisdictions into which the province of Quang-chow, or Canton in China is divided; and also the chief city of the jurisdiction, and the residence of the viceroy. See CHAO-KEWING.

CHAУ-
CHAUKUNDA, a town of Africa, near the river Gambia, in the kingdom of Jemarow.

CHAUL, a town of Hindooftan on the coast of Malabar, with a good port, and defended by a citadel, taken in 1550 by the Portuguese; 6 leagues S. of Bombay.

CHAULIEU, William Anove De, Abbé, in Biography, a favourite French poet, was born at his father's seat at Fontenay, in 1639, and became by means of his natural genius, excellent education, and lively disposition, the delight of elegant society, and the esteemed friend of the great Duke of Vendome, and of his brother the grand prior of Malta. Entrusted with the management of their concerns, he was recommended by several valuable penates; which, added to the lordship of Fontenay, enabled him to gratify his inclination by pursuing a life of pleasure. His apartments at the temple in Paris were the resort of learned friends, who were charmed by his amiable qualities and lively conversation. The poetry in which he excelled was a mixture of the voluptuous and sentimental, blending with the gaiety of Amoreon, the philosophical good-humour of Horace. Chapelle was his model, whom he imitated in the easy negligence of his verse and the occasional use of double rhymes; and as a poet he deferves to be ranked with the careless men of genius, rather than with the maisters of the art. Notwithstanding several fits of the gout, this lively Epicurean lived to his 81st year; dying at Paris in 1739. The most esteemed of the several editions of his works are that of Amsterdam in 1733, and that of Paris, in 1744, each comprised in 2 vols. 8vo. Nouv. Dict. Hist.

CHAULIDONTA, from χαλάς, I put forth, and θης, tooth, among Ancient Naturalists, is applied to those animals, the teeth of which grow to a great length out of their mouths, as the boar and the elephant.

CHALMES, in Geography, a town of France, in the department of the Seine and Marne, and district of Melun; 7¼ leagues S.S.E. of Paris.

CHALNES, the Duke de, in Biography, a peer of France, distinguished as an astronomer and mathematician, was born at Paris in 1714, and manifested, in early life, a strong propensity for the study of the sciences. In the tumult of armies and camps he cultivated mathematics, astronomy, mechanics, &c. In 1743 he was named honorary member of the academy; and, at the meetings of this illustrious body, which he regularly attended, he produced various conjectures and corrections of instruments in astronomy and dioptrics, and particularly of achromatic telescopes. The result of these researches was a new parallelic machine of an improved kind, and the mode of applying the micrometer to telescopes, and of accurately measuring the parts of that instrument. Whilst he was prosecuting similar speculations and experiments for the improvement of science, his career was terminated by death in 1769. The Memoirs of the Academy of Sciences contain a variety of his communications. In the volume for 1755, we have observations on some experiments in the 4th part of the 2d book of Newton's Optics: in that for 1765, observations on the platform for dividing mathematical instruments; also a determination of the distance of Arcturus from the sun's limb at the summer solstice; and observations on some means of perfecting astronomical instruments: in that of 1767, observations on some experiments relating to dioptrics; in 1768, the art of dividing mathematical instruments; in 1769, observations on the transit of Venus in that year; and a new method of dividing mathematical and astronomical instruments.

CHALNES, in Geography, a town of France, in the department of the Somme, and chief place of a canton in the district of Péronne; 7 miles S. of it. The place contains 1243, and the canton 10,022 inhabitants. The territory includes 160 kilometres and 23 communes.

CHAU, in Ancient Geography, a mountain of Peloponnese, in the Argolid, in which, according to Pausanias, was the source of the river Eraus.

CHAUHERGY, in Geography, a town of France, in the department of the Jura, and chief place of a canton in the district of Dôle; 5 leagues W. of Poligny. The place contains 306, and the canton 4851 inhabitants: the territory includes 874 kilometres and 17 communes.

CHAUROUETTE, Anthony, in Biography, a surgeon of eminence, was born at Puy, a town on the banks of the Loire, in France, in the early part of the 18th century. In his preface to his Enchrydium Chirurgicum, he informs us, he was first sent to Montpellier, where he studied medicine under Roudeletis, and that he went thence to Paris, and having completed his education in anatomy and surgery under Sylvius, he returned to his native country, where he appears to have been in great request. In 1560 he published an abridged practice of phycie, to which he added a treatise on the lues venera; in which he strongly recommends the use of mercurial frictions, which had succeeded, he tells us, when all other methods and medicines had failed. This gained to his work such popularity, that in the space of about thirty years from its first appearance at Paris, editions of it appeared in almost every country in Europe. The title of the work is, "Enchrydium Chirurgicum, externarum morborum remedia, tum universalia, tum particularia brevissima complectens." Quibus morbi venerea curandi methodus probabilissima accedit." Parisis, Eloy. Diet. Hist. Bib. Cl.

CHAMONT, in Geography, a town of France, in the department of the Ardeennes, and chief place of a canton, in the district of Rethel; 9 miles N.N.W. of it. The place contains 965, and the canton 1287 inhabitants: the territory includes 202.5 kilometres and 21 communes.

CHAMONT, a town of France, and principal place of a district in the department of the Upper Marne, seated on a mountain near the river Marne. It has a manufacture of coarse woollen cloth, and considerable trade in deer and goat's skins. N. lat. 48° 7'. E. long. 5° 2'.

CHAMONT, a town of France, in the department of the Oise, and chief place of a canton in the district of Beauvais; 13 miles S.S.W. of it. It derives its name from an artificial mountain, on which was erected a fortress, which served as a boundary of France when the English possessed Normandy. The place contains 1085, and the canton 1277 inhabitants: the territory comprehends 273.5 kilometres and 39 communes. N. lat. 49° 15'. E. long. 1° 47'.

CHAMONT, a town of Savoy, in the Genevois, near the frontiers of France; 6 miles N.E. of Stifell.

CHAMONT, a town of France, in the department of the Forêts and district of Neufchatel; 6 miles S. of Baillouge.

CHAMONT sur-Tharonne, a town of France, in the department of the Loire and Cher, and chief place of a canton, in the district of Romorantin; 17 miles N. of Blois. The place contains 1194, and the canton 7424 inhabitants: the territory includes 41.5 kilometres and 7 communes.

CHAUMERT, See CHAMPART.

CHAUSSAY, in Geography, a town of France, in the department of the Indre and Loire; 12 miles S. of Loches.

CHAUSSAY, a town of France, in the department of the Marne, and district of Neufchâteau; 6 miles S.W. of Reims.

CHAUSSAY, a town of France, in the department of the Somme, and chief place of a canton in the district of Péronne; 7 miles S. of it. The place contains 1243, and the canton 10,022 inhabitants. The territory includes 160 kilometres and 23 communes.
CHAUNAY, a town of France, in the department of the Vienne, and district of Civray; 2 leagues N.W. of it.

CHAUNCY, Sir Henry, in Biography, a topographical writer, was born of an ancient family of Hertfordshire, in that county, and educated at Caius College, Cambridge. In 1649 he entered the Middle Temple, pursued the study and practice of the law, was knighted by Charles II. in 1681, and in 1688 was appointed a Welsh judge. He died in 1700. His "Historical Antiquities of Hertfordshire," though burdened with pedantic diffusions, and depreciated by mealy-executed engravings, is a work in good estimation. Biog. Brit.

CHAUNITOR, chaunter. See Chantor.

CHAUNTRY, or Chantry, was anciently a church, or chapel, endowed with lands, or other yearly revenue, for the maintenance of one or more priests, daily faying or singing masses for the souls of the donors, and such others as they appointed. These chantries were dissolved by 1 Ed. VI. cap. 24.

Hence, channer-riots, are rents paid to the crown by the tenants, or purchasers of channer-lands.

CHAUNY, in Geography, a town of France, in the department of the Aisne, and chief place of a canton in the district of Lons-le-Saunier, placed by Ptolemy on the other side of the Imaus.

CHAURIAT, in Geography, a town of France, in the department of the Puy-de-Dôme; 4 miles N.W. of Bollon.

CHAURINA, in Ancient Geography, a town of Asia, in Aria. Ptol.

CHAURUS, or Chorus, among the Romans, the north-west-wind, or that which blew between the wind called Scythia and the north.

CHAUS, or Snaus, in Geography, the most easterly and extensive province of Fez; in general mountains, rocky, and unfruitful; but in some parts fertile, and capable of feeding numerous herds of cattle.

CHAUS, in Ancient Geography, a river of Asia, towards Pthidia, and near the town of Erissa, according to Livy.

CHAUSSE, Michael Angelo De La, in Biography, an able antiquary of Paris, went to Rome at an early age, and fixed in that capital. His "Museum Romanum," published at Rome in 1569, fol. and in 1575, 2 vols. fol. contains a large collection of engravings of inedited antiquities, and is indebted to Gravius's collection of Roman antiquities. He published also "A Collection of Antiquities," Rome, 1707, 4to, with Italian explanations; and "Picture Antiques, Cataraman et Sepulchri Nasanum," 1738, fol. All his works display erudition and fragacity, and are esteemed by those who are led to study the subjects which they comprehend. Nouv. Dict. Hist.

CHAUSSE, trape, in Conchology, the French name of the Linnaean Murus tribulus.

CHAUSSET, trape, or Culiropus, in Military Languages, are what we call crows-feet. They are iron instruments with four or more spikes, each of them made in such a manner, that whatsoever way any of them may fall, it will always lie with one of their spikes uppermost. They are well calculated for defending breaches and parapets. For when thrown up and driven them, they are very troublesome to the foot that mount the breaches, or to the enemy's horfe that would pass along some narrow places or ditches. There are three sorts of them, viz. small ones, with spikes about three inches long; middling ones, with spikes four inches long; and great ones, with spikes four inches in length.

CHAUSSE, or Res de chauffe, an old term for the level of the field, or of the plain ground.

CHAUSSET, in Geography, a town of France, in the department of the Jura, and chief place of a canton in the district of Dôle; 3 leagues S. of it. The place contains 1107; and the canton 7461, inhabitants: the territory includes 190 kilometres and 23 communes.

CHAUTLAN, a town of North America, in the country of Mexico, and province of Chiaapa; the inhabitants of which carry on a considerable trade in cocoa, pottery, felt, and dates.

CHAUVEAU, Francis, in Biography, was born at Paris in 1651; and, as his father left his fortune by gaming, he was constrained, after a liberal education, to apply the knowledge of the arts, which he had acquired as a polite accomplishment, to his own support and that of his illegitimate mother. He was instructed in the art of design by Laurent la Hire, and began with the use of the graver, but soon quitted it for the point, which was better suited to his taste, and the celebrity of his execution. He commenced the exercise of the profession which he had assumed at the early age of 15 or 16; and his first essays were copies of the performances of his master; but such was the fertility of his invention, that he soon abandoned this servile labour, and sketched out his own thoughts on paper, as fast as they occurred, and executed his designs in etching with aqua fortis, which he wrought with such rapidity as force and spirit; he seldom corrected or expunged any part of them afterwards, so that his works are often faulty, and unequal to each other. His house became the resort of some of the first wits of the time; and about the year 1630, they were accommodated to assemble there in order to converse on various subjects. These meetings gave occasion to the establishment of the French Academy. Chauveau was admitted into the Royal Academy of Painting and Sculpture in 1665; and in 1664, he was employed by the king to engrave the friezes of plates of the Caroussel; displaying in the attitudes of his men and horses an admirable variety and animation. By this work he obtained a pension for life. Many of his designs for the romances of the day were executed by way of amusement after supper; the stories were read to him by his children, and fixed upon some of the most striking subjects, he traced his designs upon the plate, and so far completed them as to make them fit for the aqua fortis next morning. The number of his works is almost incredible; sometimes they amounted to 3000; others say that he engraved 4000 with his own hand, and mostly from his own designs, and that more than 1400 were engraved by other artists after his designs. His small plates, lays Mr. Strutt, are executed in a style much resembling that of Le Clerc, founded upon that of Callot. In his large prints, he approaches near to tint coarse, dark style, which was adopted by his tutor, La Hire. He furnished drawings not only to painters and engravers, but to chased, embroiderers, and various other artists. He excelled in painting to such a degree, that Le Brun admired his pictures, and bought several of them. He engraved from Le Brun and many other masters. Among the sets of prints, executed from his own compositions,
compositions, are those for the “Bible History,” the
“History of Greece,” the “Metamorphoses of Ben-
erade,” the “Jerusalem of Tasso,” the “Fables of La
Fontaine,” a “Aria,” or “Rome conquered,” and
several romances. Among the prints, engraved from other
masters, are “Christ with the Disciples at Emmaus,” from Titian,
a “Concert,” from Domenichino, the “L. I. C. of St. Bruno,”
from Le Sueur, “Apollo and Daphne,” from N. Poussin,
“A Virgin and Child, with St. John and little Angels,”
finely etched and finished with much taste, and “Meleager
presenting the Head of the Boar to Atalanta.” This
artist died at Paris in 1676. Moreri. Strutt.

CHAUVEAU, René, the youngest son of the preceding, was
also an eminent artist, resembling his father in the vivacity
of his imagination and facility of his execution. He was born
at Paris in 1663, and being left an orphan, he was placed first
with a carver in wood, and afterwards with Caïfere, the
sculptor, by whom he was employed in modelling trophies
for the king. In this situation he attracted the notice and
engaged the patronage of Colbert, and several succeeding
comptrollers-general of the buildings; and at the age of 25
or 26 was reckoned the first of sculptors for models and
etchings. After his marriage, a lodging was assigned to him
at the Louvre, but on being deprived of it on some pretext,
he was so much offended that he accepted an offer of going
to Sweden in the service of Charles XII. under the protection
of the baron Toffin. Here he continued few years, and
in his way to France, in 1700, he executed some works
at Berlin. Several of the nobility of his country employed
him in sculptures and decorations about their seats, and
in various works for churches and chapels. Many of his
compositions, exhibiting great taste and elegance, were engraved.
From several of his employers he received munificent rewards;
and particularly from the bishop of Metz, who kept
him at work for eight years at his seat at Frecati. Being
questioned twice in one day by his late employer, the marquis
of Torci, what he expected for his day’s work, he was so
much piqued, that, without making any reply to a question
so degrading, he fuit out immediately on foot for Paris.
Fatigue and chagrin, together with vexation at a loss he sustained
by bank-notes, occasioned an illness, which terminated in his

CHAUVIN, in Geography, a town of France, in the
department of Vienne, and chief place of a canton in the
district of Montmorillon; seated on the Vienne, 4 leagues
E. of Poitiers. The place contains 1608, and the canton
7347 inhabitants: the territory includes 217 3/4 kilometres
and 11 communes.

CHAVIS, in Ancient Geography, a town in the interior of
the Tauric Chersonesus, according to Strabo.

CHAUD, in Geography, a town of France, in the
department of the Charente; 20 miles S.W. of Angou-
leme.

CHAUDON, a large and beautiful village of
Switzerland, in the principality of Neuchâtel, situated in a
broad valley which reaches to Franche Comté, and connected
with Léde, by a continued range of delightful cottages,
that skirt both sides of the road, and are likewise scattered
over the country. La Chaux de Fond and Lode, together
with the districts belonging to them, are supposed to contain
about 6000 inhabitants, distinguished for their genius,
industry, and skill in the mechanical arts. They carry on an
extensive trade in lace, stockings, cuttery, and other articles
of their own manufacture; and they particularly excel in
watch-making, and every branch of clock-work. All sorts of
workmen necessary for the completion of this business,
such as painters, enamellers, engravers, and gilders, are
found in these villages, where, upon an average, about
40,000 watches are yearly made. On these mountains every
individual is sure of obtaining a comfortable maintenance;
and as the people have a prospect of sink placing their
children in a way of procuring a decent subsistence, they marry
early. Not many years ago, the greater part of the valleys
was almost one continued forest; but the powers of industry
have changed the scene into flourishing villages and fertile
parks. Besides the natural effect of frequent and early
marriages in contributing to the increase of population, every
farmer, who brings a certificate of his good behavior, is
at liberty to fell, and follow any trade without the least
restraint. Here no apprenticeship is necessary, nothing
is court-hand, and industry exerts itself untaught. The origin
of watch-making in these parts is traced to the year 1679,
at which time one of the inhabitants brought a watch from
London, when an ingenious artist employed to repair it,
examined its mechanism, and after a whole year spent in invent-
ing and finishing the necessary instruments, and six months
more in the work itself, completed a watch after this model.
Several inhabitants of Chaux de Fond and Lode are well
skilled in other branches of mechanical science, besides those
already mentioned, and have invented useful mathematical
and astronomical instruments. Several automatical figures
of a very singular and surprising construction may be enumerated
among the inventions of this district, for which the curious
are indebted to Jacques Droz and his son: one of these played
upon the harp-chord, another drew landscapes, and a third
copied any word presented to it, and wrote down whatever
was dictated by any of the company. The inhabitants apply
their ingenuity to convert the flames and torrents, de-
fering from mount Jura, to useful purposes. Accordingly
in the midst of the subterraneous channels formed by these
waters, they have erected mills, which they serve to put in
motion; they have also contrived wheels, where I seemed
scarce practicable, invented new modes of scatting, and
various other contrivances for the accomplishment of their
object. The natives are very courteous to strangers, and,
in general, well informed in various branches of knowledge;
and as they spend their leisure hours in reading, many of the
villages contain circulating libraries. The houses are plaf-
ted and white-washed; though small, they are commodious
and well-built, and furnished with a degree of neatness, and
even elegance, peculiarly striking in these isolated
mountains. We shall only add, that these people are placed
through these mountains to such a degree, as to exclude poverty
and the distress attending it; and thus they afford a pleasing
view of the valuable effects of industry under a mild and equitable
government. Cox’s Switzerland, vol. ii.

CHAW-STICK, in Botany. See GOAUNIA.

CHAYANTAS, in Geography, one of the jurisdictions
belonging to the new viceroyalty of Buenos Ayres in South
America, lying about 50 leagues N.W. from the city De la
Plata, and extending in some parts about 45 leagues. This
country is famous for its gold and silver mines. The former
are not at present wrought, though the old subterraneous pa-
pages are still open; and the river Grande, which waters the
province, has in its land considerable quantities of gold dust,
and grains of this metal. The silver mines are still wrought
to great advantage. According to the statement of Halls, it
has 2 gold mines, 3 of silver, 1 of copper, 1 of tin, and 1 of
lead. The cattle of this province are barely sufficient for the
inhabitants.

CHAYOTA, in Botany. Jacq. See SECCINUM.

CHAZA, in Ancient Geography, a town of the interior of
Africa, belonging to Ethiopia, near the Nile.

CHAZAUNI, CHAUPANISH, or CHAUNAHI, a people
of Scythia, according to Ptolomy.

CHAZET, in Geography, a town of France, in the
department
CHE, the department of the Indre, and district of Chateauroux; 7 miles S.S.W. of Argenton.

CHAZELLES, John Matthew, in Biography, an eminent mathematician and engineer, was born at Lyons in 1657, and educated in the Jesuits' college of his native place, where he removed to Paris in 1675. M. Du Hamel, secretary to the Royal Academy, introduced him to Cassini, and he was placed in the observatory, where he learned the practical part of astronomy. He afterwards affiliated in forming the geographical planisphere, 27 feet in diameter, and in continuing the meridian line of France towards the south. After remaining five years with Cassini, he became tutor in mathematics to the duke of Montemart, for whom he obtained the post of geography-professor to the galleys at Marcellas, and in this situation he made many plans of the sea coast; and he performed various other services as hydrographer and engineer, as well as in the astronomical department. He also made a voyage to the Levant, measured the pyramids of Egypt, and ascertained that the position of the four sides of the largest pyramid exactly faced the four cardinal points of the compasses. Upon his return, he reported the particulars of his travels to the Academy of Sciences, and was admitted, in 1695, a member of their body. The memoirs of the academy previous to the year 1708, contain many of his communications. He died at Marcellas in 1716. Elage par Fontenelle. Gen. Bio.

CHAZELLES for Lyon, in Geography, a town of France, in the department of the Drôme, and chief place of a canton in the district of Montbrison; 7 leagues W.S.W. of Lyons. The place contains 2564 and the canton 13,441 inhabitants; the territory comprehends 2328½ square miles, and 21 communes.

CHAZEN, in Ancient Geography, a country of Asia in Mesopotamia, placed by Strabo in the vicinity of Adiabene.

CHAZINIZARIANS, or Chatzinizaris, a feat in Armenia in the seventh century.

The word is formed of the Armenian chazin, cros. In the Greek text of Nicephorus, they are called Chatzinizaris, Narcacesius.

They are also called Staurolutes, which, in Greek, signifies the same as Chazinizaris in Armenian, viz. adores of the cros; they being charged with paying adoration to the cros alone.

In other respects they were Neflorians; and admitted two persons in Jesus Christ. Nicephorus, lib. xvi. cap. 54, ascribes other singularities to them, particularly their holding an annual feast, in memory of the dog of their false prophet Sergius, which they called Arzicharres.

CHE, in Geography, a town of China, of the third rank, in the province of Ho-nan; 12 leagues W.N.W. of Shantung.

CHEADLE, a town of England, in the county of Stafford, situated in a country abounding with coal, and surrounded by copper and brafs works. It has a weekly market on Friday; 15 miles N.E. of Stafford, and 146 N.N.W. of London.

CHEAPA, a river of America, which runs into the bay of Panama; 30 miles E. of Panama.

CHEAT, a river of America, which rises in Randolph county, Virginia, and after pursuing a N.N.W. course joins Monongahela river 3 or 4 miles within the Pennsylvania line. It is 200 yards wide at its mouth, and 100 at the Dunkards settlement, 50 miles higher, and is navigable for boats, except in dry seasons. There is a portage of 57 miles from this river to the Potomack at the mouth of Savage river.

CHEATS, in Law, are deceitful practices in defrauding, or endeavouring to defraud, another of his known right by some artful and dishonest device; as by playing with false cards or dice, by fraudulently obtaining the execution of deeds and trusts, by suppressing wills, by raising money under false pretences, &c.

If any one cheats with false cards or dice, or by false weights and measures, or by selling one commodity for another, an action on the case lies against him for damages, upon the contract which the law always implies, that every transgression is fair and honest. 10 Rep. 56. In contracts likewise for false, it is constantly understood that the seller undertakes that the commodity is his own; and if it proves otherwise, an action on the case lies against him, to exact damages for this deceit. In contracts for provisions, it is always understood that they are wholesome; and if they be not, the name remedy may be had. Also if he that selleth any thing doth, upon the false, warrant it to be good, the law annexes a tacit contract to this warranty, that if it be not so, he shall make compensation to the buyer: also it is an injury to good faith, for which an action on the case will lie to recover damages.

Any deceitful practice, whether in trade or otherwise, is punishable with fine, imprisonment, and pillory. 1 Hawk. L. C. 108. And by the Statutes 52 Hen. VIII. cap. 1. and 52 Geo. II. cap. 24. if any man defraud another of any valuable chattels by any false token, counterfeit letter, or false pretences, or pawns or dispossee of another's goods without the consent of the owner, he shall suffer such punishment by imprisonment, fine, pillory, transportation, whipping, or other corporal pains, as the court shall direct. And by 9 Anne, cap. 14. if any person cheats at play, and at one time wins more than 10l. or any valuable thing, he may be indicted thereupon, and shall forfeit five times the value to any person who shall sue for it, and (in case of cheating) shall be deemed infamous, and suffer such corporal punishment, as in case of wilful perjury. Blackfi. Com. vol. iv. p. 158, and 173.

CHEBIB, or Tallitz, in Geography, a mountain in Africa. in the province of Fez, on which are many towns.

CHERRECHIN, a town of Poland, in the palatinate of Bellaw; seated on the declivity of a hill. The walls are watered by the river Werip, which afterwards falls into the river Bog. The Jews in this place are very rich. N. lat. 52° 25'. E. long. 23° 51'.

CHEBUCTO, a bay and harbour on the S.E. coast of Nova Scotia. Near the head of this bay on the western side, stands the city of Halifax, the capital of the province. N. lat. 44° 40'. W. long. 63° 31'.

CHECAYA, in Turkish Affairs, is the second officer of the janizaries; and synonymous with lieutenant, or the second in any office.

CHE-CHEOU, a town of China of the third rank, in the province of Hau-quang, seated on the river Yang-tse; 11 leagues E.N.E. of Pong.

CHECHMEBAND, a town of Persea, in the province of Begelcan; 70 miles N.E. of Zarko.

CHECHURMAT, a town of Persea, in the province of Adurbatan; 200 miles N.E. of Taurus.

CHECK, in Commerce, a draft or bill on a banking-house, paid at sight to the bearer.

CHECK, a term in the game of cheats, used when one party oblige the other either to move or guard his king.

CHECK-mate denotes a movement on the chess-board that kills the opposite men, or hinders them from moving.

CHECK-roll, a roll, or book, containing the names of such as are attendants, and in pay to the king, or other great persons; as their household servants. Stat. 19 Car. II. cap. 1. It is otherwise called the chequer-roll, and seems to take
its etymology from the exchequer. 14 Hen. VIII. c. 13. See Roll.

Check, clerk of the, in the king's household, has the check and controlment of the yeomen of the guard, and all the others belonging to the royal family; allowing their absence or defects in attendance, or diminishing their wages for the same, &c.—He, also, by himself, or deputy, takes the view of those that are to watch in the court, and has the setting of the watch. 33 Hen. VIII. c. 12.

Check, clerk of the, in the king's dock-yards, is also the name of an officer, who keeps a muster or register of all the men employed aboard his majesty's ships and vessels, and of the artificers and others in the service of the navy, in the port to which he belongs.

Check, in Falconry, is where a hawk forfakes her proper game, to follow rooks, pies, or other birds that crosses her in her flight.

CHECKER. See Exchequer.

CHECKER-course, in Brick-Making. See Brick.

CHECKY, in Heraldry, is where the shield, or a part thereof, as a bordure, &c. is chequered, or divided into chequers, or squares. Where there is but one row of squares, it is not properly called checky, but counter-compartment.

Checky, according to Colombiere, is one of the most noble and ancient figures in all armoury; and ought never to be given, but to persons who have distinguished themselves in war: for it represents a chess-board, which itself is a representation of a field of battle. The pawns and men, placed on both sides, represent the soldiers of the two armies; which move, attack, advance, or retire, according to the will of the two gamellers, who are the generals.

Checky is always composed of metal, and colour. Some authors, however, would have it ranked among the sorts of turs. When the whole effutcheon is chequered, it should ordinarily contain five ranges; there is no need of blazoning to express them; only it must be observed, to begin to blazon by the first square in chief on the dexter side. So that if that be or, and the next gules, the houf, or family, is said to bear checky, or, and gules.

When the whole shield is not chequered, but only the chief, a bend, crofs, or the like, the number of ranges should be expressed.

CHECO, KECIO, or TONG-TOW, in Geography, a town of Asia, and capital of the country of Tongtius, situate on the river Songkoi; 100 miles from its mouth.

CHEC-ONG, a town of China, of the third rank, in the province of Set-chuen; 10 miles S.E. of Tong-tchouen.

CHECY, a town of France, in the department of the Loire, and chief place of a canton, in the district of Orleans. The place contains 1,533, and the canton 10,087 inhabitants; the territory includes 305 kilometres, and 15 communes.

CHEDABUCTO, or MILFORD-HAVEN, a large and deep bay on the easterly extremity of Nova Scotia, at the mouth of the gut of Canoe. Opposite to its mouth is Ille Madame, Salmon river falls into this bay from the west, and is remarkable for its very great fisheries. N. lat. 42° 25', W. long. 61° 10'.

CHEDDER, a village of England, in the county of Somerset, about 5 miles N.W. of Wells; which though only a village deserves particular mention. This village is situated under the S.W. side of Mendip hill, and yet much elevated above the level of the moor, so that the contrast between the lofty brows of the hills on one side, and the fertile flats on the other, is singularly striking, and seems to render this village and its adjacent scenery peculiarly romantic. The chasm by which the cliffs of Cheddar are formed does not disclose itself until we approach a null turned by a rapid brook that gushes out near the entrance and soon afterwards loses itself in the Av. Proceeding along the side of this brook, we are filled by a grand view, in the side of the mountain, of the extent of which we at first form an erroneous idea, because the rocks project one behind another so that they seem to prevent further progress. After many deceptions, it is at length discovered that this stupendous chasm extends quite through the S.W. ridge of Mendip, from top to bottom; the length being at least 2 miles, at the end of which it divides into two branches, so as to allow an easy ascent, in a winding direction, nearly from S.W. to N.E. to the top of the hill. In several points the cliff rises perpendicularly to the height of 200 feet; some terminating in bold pinnacles, others in irregular fragments like shattered battlements of huge cakes, and others inclining with a dreadful aspect on the observer passing under them; protecting yews growing in several of the fissures, form shady canopies; and long mantles of ivy covering some of the rocks, and contrasted against the craggy nakedness of others, heighten the picturesque effect of the scene. On the right hand, the cliffs are much steeper than on the left, and for the most part inaccessible; but, in general, the slanting angles on one side correspond with the recipient ones on the other. Every circumstance indeed serves to impress a belief that the mountain must have been evidently rent asunder. The inclination of the cliffs, from one foot to three feet in thickness, is nearly to the S.W., their general direction being from N.W. to N.E.; this is the course of the hills, the height of which seems to increase northward, and particularly near the village of Loxton, where is a prodigious eminence called Crook's Peak.

The rocks of Cheddar are on a much grander and boldier scale than those of Dover's cliff, which resemble them; though they have not the advantage of a beautiful stream, like the Dour, dividing them. Stupendous as those are, there is a contiguous part of Mendip, which is some hundred feet higher, flowing from the top with a grandal descent, and commanding particularly to the W. and S. a most extensive prospect. The Cheddar cliffs produce several of the rarer plants, particularly the Dianthus caucalis, (Chedder pink.), D. arenarius, and Thalictrum minus. The first of these plants, the history of which is somewhat perplexed, is distinguished by the flowers being mostly single-flowered, the scales of the ovary round, and short; the petals notched and bearded; and the leaves rough on the margin; this elegant plant it is said, has never yet been found except on the cliffs of Cheddar, where it was first gathered by Mr. Brewer in the time of Kay. The flowers make their appearance in July, and very luxuriantly decorate the rocks. Mason's Observations relative to the Natural History of the Western Counties of England, made in 1749 and 1756.

Cheddar is famous for its adjacent paturages and a large kind of cheese. In this place it is common for 3 or 4 dairies to join their milk, in order to make one great cheese, which generally weighs from 150 to 200 pounds weight, and which is often sold at a very high price.

The goodness of Cheddar cheese is chiefly owing to the land in which the cows feed, as the method of making it is the same with that which is purveyed throughout Somersetshire, and the adjoining counties. Thus all the land in the north parts of Wilts have a surpising effect both on the butter and cheese.

CHEDUBA, or SANDIA, an island in the bay of Bengal, near the coast of Ava, said to be about 45 miles long and 9 wide. Cheduba and Ramaree, called by the Birmans, Ma
Although about this island, which belongs to the Birman government, yields abundance of rice, and is governed by a chekey, or lieutenant, who is subject to the maywoon of Arracan. The channel between this island and the main is annually navigated by large trading boats, but does not afford a safe passage for shipping.

Cheego Hills, hills of Hindoolan near the fourth coast of the country of Gutch.

Cheek, in Anatomy, that part of the face situated below the eyes on either side.

Cheeks, wounds of. See Suture and Wound.

Cheeks, a general name among Mechanics, for almost all the pieces of their machines and instruments that are double, opposite to, and perfectly alike to each other.

The cheeks of a printer's table, are two long pieces of wood, between which are placed the puppets, which are either pointed, or otherwise, serving to support the work, and the mandrils of the workman. These two pieces are placed parallel to the horizon, separated from another by the thickness of the tail of the puppets, and joined with terrors to two other pieces of wood, placed perpendicularly, called the legs of the table.

Cheeks of the glazier's voice, are two pieces of iron joined parallel at top and bottom; in which are the axis, or lipndites, little wheel, cullions, &c. whereof the machine is composed.

In the construction of gun-carriages, the term cheeks is used to denote the flrong planks which form their sides. See Carriage.

Cheeks of a mortar, or Brackets, in Artillery, are made of strong planks of wood, bound with thick plates of iron, and are fixed to the bed by four bolts; they ride on each side of the mortar, and serve to keep it at what elevation is given to it by the help of strong bolts of iron which go through both cheeks, both under and behind the mortar, by which they are traversed to the right or left.

Cheeks, in Ship-Building, are two pieces of timber, fitted on each side of the masts, at the top, serving to strengthen the masts there, and to fulfil the frame of the top and top-mast. The uppermost bail or piece of timber in the back of a ship, is called the cheek. The knees which fall on the back-head to the bow of the ship, are called cheeks; and the sides of any block, or the sides of a ship's carriage of a gun, are called cheeks.

Cheeks, upper and lower, are those pieces of timber on each side of the trail-board.

Cheen, in Geography, an ancient name of the kingdom of Pegu, as we learn from the Ayen Akbery, (vol. iii. p. 7.) As this country borders upon Ava, where M. Gofhein, in his Geography of the Greeks analyzed, places the Vol. VII.

Great promontory, the resemblance of names may seem, perhaps, to confirm his opinion, that since Metropolis was situated on this coast, or not so far east as the kingdom of Cochín-China, where M. D'Arville places it.

Cheesadam, a lake of North America, on the E. end of Slave lake, in the territory of the Hudson's bay company; about 35 miles long, and the same in breadth. N. lat. 63° 15'. W. long. 106°.

Cheese, in Rural Economy, a well known kind of food prepared from milk by means of coagulation with rennet, and separated from the serum or whey, by prelude in vats for the purpose, being then dried for use. See Dairying.

The use of cheese seems to have been adopted more generally, and at a much earlier period than that of butter. Hippocrates, who was almost contemporary with Herodotus, speaking of the method practised by the ancient Scythians of skaking the milk of their mares in wooden vessels, says, that the heavy and thick part, which subdues, when the fat part rises to the surface, and the whey or serum remains in the middle, being kneaded and properly prepared, is, after it has been dried, known by the name of "hippice," which evidently denotes cheese made of mares' milk. It is not improbable, that the Scythians hardened the separation of the caeseous part from the whey by warming the milk, or by the addition of some substance proper for that purpose. Hippocrates, in another place, expressly says, that the Scythians drink mares' milk and eat cheese made of it. Although the word butter does not occur in Aristotle, and his allusion to that substance has even been doubted, yet we find that he gives very proper information respecting milk and cheese which indicates careful observation; and in one place he ascribes to milk only two component parts, viz. the watery and the caseous; but elsewhere he mentions also a fat substance in milk, which, in certain circumstances, resembles oil. Lucullus, in his History of Ethiopia, acquaints us, that the Habennians or Ethiopians made both butter and very good cheese; and the Roman writers, who give an account of the ancient Germans, and say that they lived principally on milk, disagree in one circumstance; viz. whilst many of them inform us, that they used cheese, others affirm that they were not even acquainted with the method of preparing it. Cic. de Bell. Gall. iv. 1. vi. 22. Strabo, lib. iv. Fliny, however, says, (l. xi. c. 41.) that they did not make cheese, but butter, which they used as a most pleasant kind of food. But the oxygala of which he speaks was evidently a kind of cheese, the preparation of which has been defended by Cohnella, (l. xii. 8.) In order to make it, sweet milk was commonly rendered sour, and the ferrum was always separated from it. Fliny also mentions, under the above name, a kind of cheese formed from the caseous parts which remained behind in the butter-milk, and which were separated from it by acids and boiling, and were mixed and prepared in various ways. It is not possible from any data that remain to determine whether Tacitus (De Mor. German. c. 23.) by "lac concerum," which he says, was the most common food of the Germans, meant cheese, or butter. The term "biesus" or "besus," compounded of "bius," ex, or "bues," and "ciesus," seems to intimate, not only that cheese was known at a much earlier period than butter, but that the Grecian and Roman authors considered butter as a kind of cheese, because "bius" once signified any coagulated full substance. See Butter.

Cheeses are of different qualities and forms, in different districts, and according to the methods in which they are made. Thus, the Cheshire cheeses are mostly thick, and of a fine sharp or piquant flavour, while those of Gloucestershire are mostly small, thin, and of a pleasant mild taste.
The double Gloucester is a cheese that pleases almost every palate: the best of this kind (say Mr. Hazard of Stoney-Littleton,) is made from near, or, as it is called in that and the adjoining counties, "covered milk," an inferior sort is made from what is called "half-covered milk," though, when any of these cheeses turn out to be good, people are deceived, and often purchase them for the best "covered milk cheeses;" but farmers who are honest have them flapped with a piece of wood in the shape of a heart, by which they may be distinguished.

It will be every farmer's interest (if he has a sufficient number of cows) to make a large cheese from one meal's milk; this, when brought in warm, will be easily changed or turned with the rennet; but if the morning or night's milk be to be mixed with that which is fresh from the cow, it will be a longer time before it turns, nor will it change sometimes without being heated over the fire, by which it often gets dull, or foot; nor should I forget to place (says this writer) which is true to give the cheese a very disagreeableavour.

When the milk is turned, the whey should be carefully strained from the curd, which curd should be broken small with the hands; and when it is equally broken, it must be put at a little time into the vat, carefully breaking it as it is put in, which vat should be filled an inch or more above the brim, that when the whey is prefled out it may not shrink below the brim; if it does, the cheese will be worth very little. But first, before the curd is put in, a cheese-cloth, or filerain, should be laid at the bottom of the vat, and this should be so large, that when the vat is filled with the curd, the end of the cloth may turn again over the top of it; when this is done, it should be taken i to the pref, and there remain for the space of two hours, when it should be turned, and have a clean cloth put under it, and turned over as before; it must then be prefled again, and remain in the pref six or eight hours, when it should again be turned, and rubbed on each side with salt, after which it must be prefled again for the space of twelve or fourteen hours more; when, if any of the edges project, they should be pared off; it may then be put on a dry board, where it should be regularly turned every day.

It is a good way to have three or four holes bored round the lower part of the vat, that the whey may drain fo prefectly from the cheese as that not the least particle of it may remain.

The prevailing opinion of the people of Gloucestershire and the neighbouring counties is, that the cheeses will spoil if they are not scraped and washed when they are found to be muddy; but I know this (says Mr. Hazard) to be erroneous, and that suffering the mould to remain mellows them, provided they are turned every day; or if they have the mould off, it should be removed with a clean dry flannel, as the washing them is only a means of making the mould (which is a species of fungus rooted in the coat) grow again immediately.

Some people scald the curd, but this is a bad and mercenary practice; it tastes the cheese of its fats and, can only be done with a view to raise a greater quantity of whey butter, or to bring the cheeses forward for sale, by making them appear older than they really are.

As most people like to purchase high-coloured cheese, it may be right to mix a little rennet with the milk before it is turned; no cheese will look yellow without it; and though it does not in the least add to the goodnes, it is perfectly innocent in its nature and effects.

Cheshire cheese is much admired, and yet no people take less pains with the rennet than the Cheshire farmers; but their cheeses are so large as often to exceed teetles weight each; to this, and also to the age to which they are kept, the richness of the land, and their keeping such a number of cows, as to make such a cheese, without adding a record milk's milk, their excellence may be attributed; indeed, they kill the curd (which may make a difference), and keep the cheese in a damp place after they are made, and are very careful to turn them daily.

In other counties they likewise vary greatly in these different respects, as well as in form other.

Besides the cheeses already mentioned, there are different sorts of cream cheeses, as thick and thick, the former known under the name of Cotentin, and the latter more that of Stilton cheese.

The Stilton cheeses, called the Parmeian of England, are usuall: made in square vats, and weigh from six to twelve pounds each. Immediately after they are made, they should be put into square boxes made exactly to fit them, as they are so extremely rich, that, without this precaution, they would be apt to bulge out, and break atunder. In these boxes they should be duly turned, and kept two years before they are mellowed for sale. Some make them in a net, like a cabbage-net, so that they appear when made like an ample head, but when broken, the cheese acquires a thicker coat, and wearing the rich flavour and mellowres of the others. The manufacture of these cheeses is not confined to Stilton and its neighbourhood; as many other persons in Huntingdonshire, and also Rutland and Northampton shires, make a similar fort, sell them for the same price, and give them the name of Stilton cheeses.

It is observed by Mr. Hazard that, though the farmers about Stilton are remarkable for the cleanliness of their dairies, they take very little pains with the rennet; for if they did, they would not have so many faulty and unsound cheeses. The inhabitants of other counties might make as good cheese as that of Stilton, if they would adhere to the same plan, which is this. They make a cheese every morning, and to this meal of new milk they add the cream taken from that which was milked the night before. This, and the age of their cheeses, it is said, are the only reasons why they are preferred to others, their land not being in any respect superior to that of other counties.

Excellent cream cheeses are made in Lincolnshire, by adding the cream of one meal's milk which is already broken to another of a thicker coat, and wearing the rich flavour and mellowness of the others. The manufacture of these cheeses is not confined to Stilton and its neighbourhood; as many other persons in Huntingdonshire, and also Rutland and Northampton shires, make a similar fort, sell them for the same price, and give them the name of Stilton cheeses.

There is also a fort of green or sage cheese. And we have a cheese brought from abroad under the title of Parmesan. The Parmesan cheese is so called, because Parma and Piacenza were once the countries in which the belt was made, though now the district of Lodi is the highest repute for this kind of cheese. The method of making it is described, from their own observation, by Mr. Benjamin Pyece, in the 7th volume of the Bath Society's papers, (see also Letters on Agriculture, vol. vii., and Reptrory, vol. iv.,) and by Mr. Arthur Young, in the 2d volume of his Travels in France. These cheeses, how much sooner exalted, are made entirely of skimmed milk: that of the preceding evening, mixed with the morning's milk: the former having flood for 15 or 17 hours, and the latter about 6 hours. At 10 o'clock in the morning, 1 2/3 brecks of milk, each breck being about 20 quarts, were put into a large copper, which turned on a crane, over a slow wood-fire, made about two feet below the surface of the ground. The milk was ferred from time to time; and about 11 o'clock, when just like-warm, and considerably under a blood-heat, (about 81/2 of Fahrenheit, the atmosphere being at the same time 70 Fahrenheit, Young,) a ball of rennet, as big as a large walnut,
walnut, was squeezed through a cloth into the milk, which was kept stirring. This rennet was to have been purchased of a man at Loch, famous for the composition; but it seemed to have principally consisted of the same part of the calf as we use in England, for the same purpose, mixed up with salt and vinegar, (spices and oil, Young,) and alle, as Mr. Praye apprehends, with old cheese. The proportion of rennet, he conceives, was of much greater consequence than the rennet itself. By means of the crane, the copper was turned from over the fire, and let stand till a few minutes past 12; at which time the rennet had sufficiently operated. It was now stirred up, and left to stand a short time, for the whey to separate a little from the curd. At 1 o'clock, says Mr. Young, the cazarro, or dairyman, (for this is not women's work in Italy,) examined the coagulation, and finding it complete, he ordered his sata cazarro to work it, which he did with a stick armed with croas-wires; this operation served instead of cutting and breaking the curd, in the manner it is done in England, free from the whey. When he has reduced it to such a fineness of grain as satisfies the cazarro, it is left to subside, till the curd being quite firm, the whey is nearly clear on the surface. Part of the whey being taken out, the copper was again turned over a fire sufficiently hot to give it a triumphant heat, but below that of boiling; a quarter of an ounce of sal ammoniac put in to give it a little colour; but not so unnaturally high as some cheeses in England are coloured; and it was well stirred from time to time, with a wood machine to keep it from burning; the cazarro examining it from time to time, between his fingers and thumb, to mark the moment when the right degree of fineness and solidity of grain was attained. The heat was 124½ Fahrenheit; but it is often 151½ Fahrenheit. When the small, and, as it were, granulated parts, felt rather firm, which was in about 1½ hour, the copper was taken from the fire, and the curd left to fall to the bottom. As soon as a certain degree of subfinence had taken place, the cazarro emptied about 2½ lbs. of the whey, in order the better to command the curd. He then pours three or four gallons of cold water around the bottom of the cauldron, to cool it sufficiently for handling the curd; and then by a formal kind of operation, he flies a coarse cloth under the curd, and thus brings it up and places it in a tub to cool. When sufficiently drained, it was put into a box, and about half an hundred weight laid upon it for about an hour; after which the cloth was taken off, and the cheese placed on a shelf in the same hoop. At the end of two, or from that to three days, it is sprinkled all over with salt. The same process is repeated every second day, for about 40 to 45 days, (or 32 or 40 days, according to the seasons; 30 in summer and 40 in winter, Young,) after which no further attention is required. Whili saltmg, they generally place two cheeses one upon another; in which state they are laid to take the salt better than singly. When these operations are completed, the cheeses are scraped clean, and after that rubbed and turned in the magazine every day, and rubbed with a little infected oil on the coats, in order to preserve them from all sorts of infects. They are never sold till they attain the age of six months, and the price is 90 livres per 100 lb. of 28 oz.

The morning's butter-milk is then added to the whey, and heated; and a stronger acid used for a fresh coagulation, to make whey cheese, called here "Makhopino." Little ones are kept in wooden cafes, in the smoke of the chimney.

In Scotland there is likewise a sort of cheese made from the milk of cows, which is rich and of a sharp flavour. It is usually known under the title of caw cheese.

Dunlop Cheese, so called from the parish of Dunlop, in Ayrshire, where it was first made, has been long known and distinguished over Scotland, insomuch that all the cheese made in the country around is known by that name, and gives a higher price and finds a readier market than any other. The practice of making facec milk cheese, as it is called, was first introduced into the parish of Dunlop, by one Barbara Gilsour, whole great grandson is still living, and proprietor of the same farm. Having gone to France to avoid the persecutions which people were then exposed to on account of religion, she is said to have brought the art with her; when she returned about the time of the revolution. Since that period the sort of cheese has been the great and almost only business of Dunlop. So much that their situation was more favourable for this than any other purpose, the people believe this to be the great advantage. They have inclined all their ground, and have but a third or fourth of it in tillage, which is more owing to the custom of the country than the will of the farmer, (as throughout the whole of Ayrshire there can be no more land in each farm in that state than one third;) and the rest in pasture, which is always a plentiful crop and of the full quality. They are very attentive to the breed of their cows, which are rather small than otherwise, and generally of their own rearing. They are fed in incomeliness, and never brought under a roof, except for milking, from the beginning of May till the end of harvest; the quantity of milk they give is very great and of the full quality.

The process for making the cheese is extremely simple. The cows are milked twice a day, at six in the morning, and at the same hour in the afternoon. At each of these hours the whole milk, while warm, is collected in a large vessel and thickened or warmed; after it is congealed into a curd, it is then cut in different directions, and the whey gently pressed out; the curd, after it has acquired sufficient consistency by the pressure of the hand, and by the application of weights over it, is next cut very small by an instrument for the purpose, and salted. For the further compreheison of the cheese, various contrivances are used, the most common is a large hewn stone, probably a ton weight; this is fitted to a frame, and lifted up and let down by a screw. Others use levers of various contructions, and thus by the application of a few pounds weight they give any degree of pressure that may be deemed necessary.

Where farms have only a few cows and where it would not be worth while to make a cheese twice a day, two milkings or sometimes more are put together; this may be done two ways: 1st, the milk which has flood over is first creamed and then warmed to the temperature of the new milk, and the whole is congealed together; the cream is afterwards added, and thoroughly mixed with the two milks. Each mode has been tried, but this is thought to be the most effective in making good cheese; or 2d, the curd of the first milk is reduced to the consistency proper for salting, and thus set aside till a second milking be brought to the same state; when the two are mixed together, and salted and finished in the usual way. It may be proper to observe, however, that there is no cheese to good as that made directly from new milk: it was this kind which was first known by the name of Dunlop cheese. The subtlest practice of colouring is not known, except by a very few, who make it in imitation of English cheese. From a dozen of good cows a farmer will make from a hundred and fifty to a hundred and sixty stones (provincial weights of cheese, that is, something more than a ton,) and a half this, in the markets of Edinburgh, Glasgow, and Paisley, will bring from 10 to 12 shillings per stone, or from twenty to eighty pounds sterling, for the produce of the feast. From the whey after it is pressed out, the most delicious...
CHEESE.

butter in Scotland is produced. It is also the practice in other places, and particularly in Cheshire, to make butter of the cheese whey.

For the form of the instrument used for cutting the curd before salting, see Plate 8. 

In the preparation or making of cheese a variety of different circumstances are necessary to be considered by the dairy farmer, such as the season of the year and the mode of conducting the curd into milk, the properties of the milk, the manner of giving the necessary colour, the method of preparing the rennet, the mode of breaking and gathering the curd, the management of the cheese in the presses, the process of salting, and the treatment afterwards requisite in the cheese-room, as well as some other circumstances of less importance. All these, as well as many other parts of management that appear of consequence in the process of cheese-making, will be fully considered in speaking of the nature of Dairy ing. See Dairy ing.

It has been observed by Dr. Anderson, that "it is generally supposed that the goodness of cheese depends almost entirely upon its richness; by which is meant the proportion of oily matter, whether natural or adventitious, that it contains: nothing, however, is, he says, more certain, than that this is not the case. If, says he, the sapor, the pleasant relish to the taste, be adopted as the rule for ascertaining excellence, nothing can be more certain, than that this does not depend upon this circumstance. Parmesan cheese is, he observes, in general, deemed in respect to sapor, among the belt kinds of cheese that are made; but it contains no remarkable proportion of oily matter. To many palates, the small round Dutch cheeses are very pleasing to the taste; yet these are, he affirms, made entirely of skimmed milk. And if softness to the feel, and that kind of consistence which appears meadowed and butyrous, be the rule for ascertaining the riches of cheese, neither will this, says he, be found to depend necessarily upon the proportion of oily matter that they contain. He has seen cheeses made of skimmed milk, that are exactly like the finest kind of cream cheese, which approaches to the taste and consistency of butter; and he has seen cheeses made entirely of cream, which had much less of that buttery tallow and appearance than the other. In short, much more, he thinks, depends upon the skill and dexterity of the operator, than on the quality of the materials. Many cheeses are made in England of as rich milk as the Stilton cheeses, which seem not to contain nearly the same proportion of cream; and he had lately occasion to notice, that a great many cheeses are made of the same kind of milk with the Suffolk cheeses, which have nothing of that hoary hardness and indigible quality for which these are remarkable." It is further remarked, "that if the taste and consistence of the cheese acquires when set out by heat in the process of salting, be affirmed as a criterion for judging of its richness, neither will it be found that this depends upon the proportion of cream that enters into their composition. He has seen very indifferent cheese, that has been made of skimmed milk, which, when toasted, was richer to the taste, and more soft in consistence than Stilton cheese. And he has at this moment in his house a round Dutch skim-milk cheese, that, when toasted, appears richer and more pleasing to the palate of most persons who have tasted it, than very excellent North Wilts hire cheese, which is deemed among the best kinds that are made in this island. From these facts, and many other considerations, he is satisfied, that what we call the riches of cheese depends more upon the particular process adopted in the management, than upon the materials of which the cheese consists. The taste of Gloucester and that of Cheshire cheeses are very different from each other, though the quality of the milk of which they are made varies very little. The same may be said of Stilton and Parmesan cheeses, though the vanity of man, desirous to conceal his own weaknesses, is, he says, for ever disposed to attribute these peculiarities to folly, or perverseness, or other circumstances, that seem to throw the blame of want of success off from off his shoulders. And this he conceives to be the case in many other instances, as well as that of cheese.

It is observed, that any vegetable or mineral acid, put into milk, will produce a coagulation; with this difference, that the mineral acid affords its cheese or curd than the vegetable; and the various substances used to cause coagulate milk may perhaps act merely by virtue of the acid they contain. The coagulum which is added in all these cases contains a substance of the nature of gluten, which forms the cheese; and another of the nature of oil, which forms the butter. When cheese is prepared for the table, the butter is not separated, because it renders it milder, and more agreeable. The caustic alkalies diffuse cheese by the influence of heat; but it is not held in solution by an alkali in milk. If one part of cheese newly prepared, and not dried, be mixed with eight parts of water highly acidulated by a mineral acid, and the mixture be boiled, the cheese will be dissolv'd, though it would not have been sufficiently acted upon by a vegetable acid. This is the reason why the vegetable acids separate a much greater quantity of curd from the same quantity of milk than the mineral acids do. The caustic alkalis, galls, sugar, &c. coagulate milk may be deduced from the greater affinity of the water with these bodies than with the cheese. The earth of cheese is a phosphatic of lime, according to Scheele. No substance has a stronger resemblance to cheese than the white of egg boiled. Scheele thinks that the coagulation of white of egg, lymph, and cheese, is owing to the combination of carbonic acid. Ammoniac diffuses cheese more effectually than fixed alkalies. If a few drops be poured into coagulated milk, it quickly causes the coagulum to disappear. Concentrated acids likewise diffuse it. Nitric acid diffuses it. Nitrates and nitrites engage nitrogen. Chapter's Elem. of Chem. vol. iii.

Cheese of every kind is liable to putrefaction; and, by reason of this quality, it approaches to the nature of animal substances. This opinion is confirmed by the consideration that the matter of which it is formed, is, like animal substances, coagulated by acids, alcohol, and heat. It is also said to yield, in distillation, a volatile alkali; though this is a disputed fact. Upon the whole, we may conclude, that as milk contains a portion of animal matter, and as the milk of animals feeding wholly, or for a great part, on vegetables, partakes of their quality, cheese must be an aliment of an intermediate kind between vegetable and animal. However, cheese employed in diet is of very different kinds, partly owing to the state and quality of the milk that is employed, and also of the rennet, and partly to the various processes employed in preparing it, such as the different circumstances of the coagulation, the management of the coagulum or curd, the pressure given to it, the salting and drying of it, and the manner in which it is afterwards preferred. The cæ忪 or coagulable part of milk contains a great, if not the greatest part of the nourishment which milk affords; and, therefore, taken by itself, must be considered as a very nourishing matter. When the coagulum has the whey separated from it, it then becomes a more nutritious substance than the milk from which it was taken, but probably of more difficult digestion. Cheese, in its dried state, made from milk previously deprived of its cream, may still be very nutritious, but it is of very difficult digestion, and fit only for the most debilitated persons; and even the difficulty of digestion may diminish...
Cheese.

Cheese made of entire milk must be a still more nourishing substance, and, as Dr. Cullen conceives, of much easier digestion; and cheese made of entire milk, with a portion of cream taken from other milk added to it, will be still more nourishing, and hardly of less easy digestion, as the oily parts are the materials that are here opposed between the parts of the gluten milk, and the adhesion of this lye firm. As cheese is often made of cream alone, the qualities of this will be readily understood from what has been just now said. Cheese is often made of the milk of cows or goats, and often of a portion of the milk of ewes added to cows’ milk. In all these cases, as the milk of cows and goats contains a larger proportion of the oily and caesious parts, so in proportion as these are employed, the cheese becomes more nutritious, but at the same time more difficult digestion. As cheese is employed not only when recent and fresh, but also under various degrees of corruption, it becomes more acid and indigestible, partly from the acrimony it has acquired by corruption, and partly by the great number of infects that are very constantly generated in it in that state. In this corrupted condition, cheese can hardly be taken in such quantity as to be considered as alimentary; and with regard to the mode or degree in which, as is commonly supposed, it becomes a condiment influencing the digestion of other food in the stomach, Dr. Cullen professes himself unable clearly to explain. Cheese is often eaten, after having been toasted; or when a portion of its oil is evaporated, whilst the other parts are united more closely together. Many persons are able to digest this food pretty well; but it is certainly not easily digested by weak stomachs; and for those who can be hurt by indigestion, or heated by a heavy supper, it is a very improper diet. Cullen’s Mat. Med. vol. i. pt. i. c. 2.

Cheese, when new, is found to load the stomach, by reason of its moisture and viscidity; and when too old, it heats and inflames it by its fats. The physicians advise it to be eaten in small quantities: hence that Latin verfe,

Cafeus ille bonus, quem dat avara manus.

Dr. Quincy says, it cannot be too old: it is certain, the more it abounds with fats, the more will it contribute to digestion, and the clearing of the stomach of other food. Indeed some condemn all use of cheese: sheltering themselves under that ancient maxim, “Caeus est nequam, quia concoqit omnium fe quam.”

The Laplanders make a fort of cheese of the milk of their rein-deer, which is not only of great service to them as food, but on many other occasions. Scheffer’s Hist. of Lap.

Cheese-board, a circular piece of board, about an inch, or an inch and a half in thickness, upon which the newly made cheeses are placed in the cheese-room. Cheese-boards should be made of such parts of wood as are the least liable to warp, and be planed smooth on both sides, being of sufficient thickness to reflect the effects of heat as much as possible.

Cheese-cloth, the cloth in which the cheese is placed in the presses, in order to undergo the operation of squeezing out the whey.

Cheese-colouring, is the material employed to give colour to cheeses, in order to their being more faceable. It is a substance used to be obtained from the skin or pith of the kernel of the bixa of South America, or of the shrub when cultivated in our gardens. See Bixa. Of the proportion of this matter from the red pulp which covers the seeds, the following account is given by Mr. Miller. The contents of the fruit are taken out and thrown into a wooden vessel, where as much hot water is poured upon them as is necessary to suspend the red powder or pulp, and this is gradually washed off with the assistance of the hand, or of a spatula or spoon. When the seeds appear quite naked, they are taken out, and the wash is left to settle; after which the water is gently poured away, and the sediment put into shallow vessels to be dried by degrees in the shade. After acquiring a due coagulation, it is made into balls or cakes, and kept dry in an airy place until it be perfectly firm. Some persons first pound the contents of the fruit with wooden paddles; then covering them with water, leave them to steep six days. This liquor being passed through a coarse sieve, and afterwards through three finer ones, is again put into the vat or wooden vessel, and left to ferment a week; it is then boiled until it be pretty thick, and then cool spread out to dry, and then made up into balls, which are usually wrapped up in leaves. And when of a good quality, it is of the colour of fire, bright within, soft to the touch, and capable of being dissolved in water. But the substance mostly made use of, and which is purchased from the druggists, is a preparation made by them, in which madder is probably a principal ingredient; it is of a brick colour, and a hard compact texture.

In regard to the method of using the soft or genuine fort, it is simply by dissolving such a quantity as is necessary, in a small portion of milk, allowing such particles as will not dissolve to settle to the bottom. The milk thus coloured is then poured off, and mixed with that which is to be made into cheese. But when the hard preparation is used, pieces of it are frequently used under the necessity of being rubbed against a hard smooth even-faced pebble or other stone, being previously wetted with milk to forward the emulsion, and to collect the particles as they are loosened. For this purpose a dish of milk is generally placed upon the cheese-ladder; and as the stone becomes loaded with emulsified matter, the pieces are dipped in the milk from time to time, until the milk in the dish appears to be sufficiently coloured. The stone and the “colouring” being washed clean in the milk, it is flared boldly about in the dish, and having stood a few minutes for the suspended particles of colouring to settle, it is returned into the cheese-cowl; pouring it off gently, so as to leave any sediment which may have fallen down in the bottom of the dish. The grounds are then rubbed on the bottom of the dish, and fresh milk added; until all the finer particles be suspended: and in this the skill in colouring principally consists. If any fragments have been broken off in the operation, they may remain at the bottom of the dish: hence the superiority of a hard, closely textured material, which will not break off or crumble in rubbing. The price of this material is usually about ten-pence an ounce; which will colour about twenty thin cheeses of from ten to twelve pounds each. The colouring therefore costs about a halfpenny a cheese, or a little more.

Cheese-cowl, the name of the milk cooler or vessel in which the curd is formed.

Cheese-knife, a large fork of knife or spatula made use of in some dairies, for the purpose of cutting or breaking down the curd while in the cheese-tub, in order to its being placed in the vat to undergo pressure.

Cheese-press, an engine or press employed in cheese dairies, for the purpose of forcing the whey from the curd when in the cheese vat, by means of prejudice. It is observed by the author of the “Rural Economy of Norfolk,” that in making cheese much depends on the construction and power of
of the press, the excellence of which arises from its pressing level. If it have too much play to us to incline and become tottering or leaning one way or another, and do not keep perpendicular upon the cheese-board, one side of the cheese will frequently be much thicker than the other; and, what is still worse, one side will be thoroughly pressed, while the other is left lopsided and lop-sided. The power of this machine may be given in different ways, as by the screw, the lever, or by a beam weight; and it ought always to be proportioned to the size and thickness of the cheese. The author just mentioned, found one that was constructed on these principles, highly useful and convenient, the power of which was a dead weight of 150 pounds contained in a cubical box moving in grooves, to be kept at a horizontal plane; the medium weight, one hundred weight and two quarters, but regulated by the frame agreeably to the thickness of the cheese or cheeses to be pressed. In the vale of Gloucester, he says, the presses are mostly loaded with gravels in cubic boxes, rated by rollers, and made to fall horizontally on the cheeses. At Maberley where they use, he observes, a double press; each division of it holding six or eight of these cheeses. A press of the most general kind is represented in Plate VIII. $f. 1$ in which $a$ is the press, $e$ and $f$ levers moveable about the pivot $d$. $e f$ by applying the hand at $e$, the frame or weight, and $f$ the plate to the rack. And a press upon a somewhat elevated plan may be seen at $f g a$, by which the press is given with greater ease and expediency.

Cheese-rack, a sort of contrivance made for the purpose of receiving and containing such cheeses as have become sufficiently firm and coated. These racks may be constructed in different ways and forms, but Mr. Marshall thinks that the plate-rack form, with four or five tiers one above another, is the best for this purpose. If the cheeses intended to be placed in it be nearly of one size, the rack should be made of the same width at the top as the bottom; but if they be of different sizes, it ought to be made narrower at the top than at the bottom, and if they be of different thicknesses as well as of different diameters, the spaces for the respective cheeses should likewise be varied. A small rack may be flung with a rope and pulleys at each end of the cheese-room, so as to be drawn up and lowered down at pleasure; but a large one is difficult to fling in a common room, in that manner; it ought therefore to stand on legs about two feet high, with a broad base broad projecting over the legs, so as to prevent vertical or climatic shake to this rack; this kind faces much labour, he says, in tuning and collecting the cheese into a final compact, and putting it out of the way of vermin.

Cheese-running or Rennet, in Botany. See Galium verum.

Cheese-Run or Runnet, in Rural Economy. See Rennet.

Cheese-Room, a room appropriated for the reception of cheeses while they remain in the hands of the maker. Rooms of this kind are frequently fitted up with shelves; and in some an entire living is put round the walls, with a flag or two in the middle, gangways being left wide enough to pass conveniently between them. In one dairy in North Wiltsire, Mr. Marshall says, he remarked an admirable arrangement of cheese-rooms. The shelf-room was immediately over the dairy-room, and the laits over the shelf-room with trap-doors in each floor, to hand the cheeses through. This, he observes, is a plan which faces much awkward carriage, and which might be adapted with advantage in every way which will admit of it. These rooms should always be sufficiently aggregate and situated conveniently for the dairy.

Cheese-Tangy, a sort of wooden frame placed occasion-
life among the Cordeliers, and having completed his studies at Paris, commenced preacher in his own country. In the exercise of this office he acquired reputation, and in 1562 became provincial of his order in Brittany. At Rome, whether he afterwards removed, he was guardian of his province, and teacher of divinity in the convent of Ara Coeli. In 1571 he was chosen general of his order, and as such conducted himself during 8 years with great zeal and prudence. Pope Gregory XIII1, created him archbishop of Carthage in 1579; and having remained in that diocese for 7 years, he took a journey to Flanders; and at Antwerp converted many heretics by his preaching, and confirmed others that were wandering. Under a charge of deviating from found orthodoxy, he repaired to Rome in 1587, for the purpose of vindicating his character; and though his peculiar opinions were never formally examined, he was treated with respect by five successive popes. At length he died in a convent at Rome, in 1595, at the age of 63.

Cheifontaines, during a great part of his life was a hard student; he understood 5 languages besides his native Bas Breton, and was well acquainted with the theology and philosophy of his time. He reasoned strongly and wrote in a good style. One of his chief works was a letter in French, afterwards translated into Latin, in defence of free will; but his most curious treatise was entitled "De necessaria Theologiae scholasticae Correctione," in which he discusses the question whether the words "this is my body, this is my blood," were those by which our Saviour consecrated the bread and wine at his last supper. Having previously alleged in a sermon that the repetition of these words by the priest was insufficient for the consecration of the elements in the eucharist without benediction and prayer, he had incurred the charge of heterodoxy. His other works it is now needless to recite. Du Pin.

CHEGGIO, in Botany, a name given to a fort of liliaceous plant, common in Cambay. It is reported by authors and by the people of the country, that those knobs and beards of this plant which grow facing the north, are a very noble medicine in the cure of apoplexy and other acrimonious disorders, but that those knobs and beards of the same plant which look southward are poisonous. Redi proved some of this famous plant, and gave it several fair trials, but found the history of its nature and effects wholly false.

CHEGIASAR, in Geography, a town of Persia, in the Isak-Agemi; 130 miles W.S.W. of Amadan.

CHEGOMEGAN, a point of land about 60 miles in length, on the south side of Lake Superior; about 100 miles W. of this cape a considerable river falls into the lake; upon its banks virgin-copper is found in great abundance.

CHEHAW, a town of America, in the State of Georgia; 165 miles W.S.W. of Augusta.

CHEILOCACE, in Surgery, literally signifies the lip-civil. It is a swelling of the lips, to which the inhabitants of northern countries, especially children, are liable to be very subject; particularly those in England and Ireland, if we may credit Castellus.

Gen. Ch. Calys perianth four-leafed; leaflets ovate-oblung, concave, erect, parallel-converging, deciduous; two outer ones gibbous at the base. Cor. four pelted, cruciform; petals roundish, longer than the calyx; claws the length of the calyx. Stam. filaments five, awl shaped, parallel, the length of the calyx; two of them gibbous within, the leaflets of the calyx a little shorter; anthers erect, bident at the base, acute, and reflexed at the tip; a metatarsiferous gland surrounds the base of the shorter flaments on each side. Pet. germ prismatic, tetragonal, the length of the flaments, marked on each side with a tubercle; style compressed; stigma oblong, two, three, or four-cleft, thick, in, permanent. Flores filique long, compressed, the two opposite angles obliterated, and marked with a small tooth, two-seeded, two-valved, terminated by the style. Seeds several, pendulous, alternate, somewhat egg-shaped, flat.

Che. Germ furnished on each side with a small glan-dular tooth. Calyx closed; two of its leaflets gibbous at the base. Seeds flat.

Ob. The little tooth on each side of the germ, in some species, becomes nearly evanescent, in others increases in size.

wallflower. "Leaves lanceolate, acute, smooth; branches angular; stem fleshy.\ characters of the species. Stems foot and a half high, branched; branches rather upright. Leaves scattered, rather narrow, entire, smooth, greenish. Flowers yellow; calyx commonly tinged with a reddish brown or violet colour. Seeds with a membranous edge.

This species has long been cultivated, and is universally esteemed for the beauty, durability, and fragrance of its flowers. These, as they appear under the head of cultivation, are single or double, larger or smaller, pale or deep yellow, ferruginous, yellow, or bloody; varieties which are perpetuated chiefly by cuttings or slips. A native of Europe. 7. C. fistuliformis, Linn. Mant. 94. Smiths Prof. 587. Brit. (C. chiri, Linn. With. R. & Sib. Lecoumum lutanum, vulgo cheiri, Rai. Syn. 261. L. lutanum minus furcatus, Barcel. l. tab. 1228.) Wild wallflower. "Leaves lanceolate, acute, greyish underneath; pubescence quite simpler, pricked close down; stem fleshy; branches angular.\" Root perennial. Stem much branched; branches erect, leafy, greyish, bearing flowers near their summit. Leaves crowded, petioled, acute, generally quite entire, green above; lower ones somewhat serrated. Flowers yellow, sweet-scented; calyx purplish; petals emarginate. Silique erect, roundish, greyish; style short; stigma emarginate. Seeds without a membranous edge. It differs from the preceding in having acute leaves, greyish underneath; smaller petals; and recurved, rather rigid, not falcate, loosely dependent capsules. Dr. Smith. A native of old walls in England and other parts of Europe. 8. C. calyptrae, Mart. 5. Willd. 7. Linn. jan. Supp. 236. "Leaves lanceolate, entire, callous; stem angular, fleshy.\" A native of the Cape of Good Hope. Thunb. 59. C. fruticosus, Mart. 4. Willd. 8. Linn. jan. Supp. 296. "Leaves linear, acute, smooth; stem fleshy, erect.\" Thunb. A native of the Cape of Good Hope. 10. C. tenuifolius, Mart. 20. Willd. 9. Hort. Kew. ii. p. 395. L'Herit. Strip. i. p. 9. Narrow-leaved fleshy, fock-gilliflower. \"Leaves filiform, quite entire, somewhat fiky; stem fleshy; branches.\" Root perennial. Stem a foot and half high. Leaves very narrow, spreading, acute; younger ones greyish. Flowers yellow; petals obtuse. Silique linear, erect, terminated by the thick style; stigma obtuse, capitate. A native of Madeira, flowering in May and June. 10. C. mutabilis, Mart. 21. Willd. 15. Hort. Kew. ii. p. 395. L'Herit. Strip. i. 92. Bot. Mag. Pl. 193. Broad-leaved shrubby rock-gilliflower. \"Leaves lanceolate, acuminate, sharply serrated; stem fleshy; filices pedunculate. Root perennial. Flowers, at their frill opening, white; sometimes inclined to yellow; in a few days becoming purple. A native of Madeira, flowering in March and April. 12. C. arius, Willd. 11. \"Filipid, leaf-lanceolate, somewhat toothed at the base; filices erect.\" Root perennial. Whole plant fleshy, but the apericophilus. Stems several from one root, about seven inches high, quite simple, somewhat woody. Leaves rather obtuse, sometimes quite entire. Flowers purple, peduncles spreading. Siliques stiff, smooth, linear, terminated by the thick style and two lobed stigma. A native of Siberia. 13. C. Chius, Linn. Sp. Pl. 3. Mart. 3. Willd. 12. (Hesperis chia; Lam. 15. Tourn. Cor. 16. Dill. Elth. tab. 143. fig. 178. Lecoumum thapsocus falcet; Herm. Par. tab. 193.) \"Leaves inver by egg-shaped, veinless, emarginate; filices aw-shaped at the tip.\" Root annual. Stems slender, much-branched, diffuse, prostrate at the bottom, oblique above, zig-zag, hairy. Leaves generally entire, sometimes a little serrated, fimbrious about the edge. Flowers small, reddish, purple, or purple-violet, in terminal racemes; claws of the petals a little longer than the calyx; expansion short, emarginate. Siliques slender, cylindrical, beflret with short close-preflved hairs. A native of Greece, Barbary, and Spain. 14. C. maritima, Linn. Sp. Pl. 4. Mart. 4. Willd. 13. Bot. Mag. 166. (Hesperis maritima; Lam. Tourn. Infl. 223. Lecoumum; Pluk. phyt. 432. fig. 252.) Mediterranean rock, improperly called Virginia rock by the English gardeners. "Leaves elliptical, obtuse, naked, roughish; stem diffuse, rough.\" Root annual. Stems much branched, from five to seven inches high, divaricated, diffuse, rather rigid, rough with two close-preflved hairs. Leaves obtuse, somewhat re- flaxed at the tip, green, rather rigid and rough, on long petioles; upper ones nearly toothed. Flowers lively red, changing to blush purple, in a terminal raceme; calyx close, even; petals inversely heart-shaped; anthers in the throat of the flower. A native of the coast of the Mediterranean. This humble species continuing long in flower, is often used as an edging to borders, and is sometimes sown in patches with other annuals on the beds of the flower-garden, which it enlivens with the splendour of its blossoms. If sown in the autumn, it will come up early in the spring, and by varying the time of sowing it may be made to flower almost the whole summer. 15. C. parviflorus, Willd. 14. \"Leaves lanceolate, repand-toothed; filices fllife, horizontal, dilated, forked at the tip.\" Root annual. Stem about seven inches high, erect, branched. Leaves green, pubescent, with flattened hairs, narrowing into a short petiole. Flowers pale violet, small, in a very long raceme. Silique two inches long, round, terminated by two long awns with the short obtuse stigma between them. A native of Morocco; described by Willdenow from a living plant. 16. C. incanum, Linn. Sp. Pl. 6. Mart. 11. Willd. 17. (Hesperis volaria; Lam. Lecoumum incanum major; Eanth. pin. 202. Viola; Lob. le. 129. Stock-gilliflower. \"Leaves lanceolate, quite entire, obtuse, hoary; filices truncate at the tip, compressed; stem rather fleshy.\" Root perennial, sometimes biennial. Stem from fifteen to eighteen inches high, branched; branches cylindrical, straight, hoary. Leaves fleshy, long, soft, cloathed with a short down. Flowers pale or bright red, variegated or pure white, easily becoming double by culture. sweet-scented. A native of the seacoast in France and Spain, but cultivated from a very early period in the English gardens for the beauty and splendour of its flowers. Numerous varieties have in consequence been produced. The principal ones mentioned by Miller are the queen's rock-gilliflower, the Brompton rock, the white rock, and the white wall-flower. 17. C. fascinulis, Linn. Sp. Pl. 5. Mart. 12. Willd. 13. Jacc. Hort. 2. tab. 173. (Hesperis fascinulis; Lam.) \"Leaves crowded in heads, recurved, waved; stem undivided.\" Scarcely more than a variety of the preceding. Root biennial. Stem six inches high or more, fleshy, perfectly sene the first year, but afterwards divided at the top into two or three straight cylindrical branches. Leaves broader and shorter than those of the preceding. Flowers smaller and less sweet-scented. Native country unknown; first sown in the Uphal garden in 1753. It received its trivial name from its peculiar fleshy from the blades of grasses. 18. C. salinus, Linn. Mant. 93. Mart. 10. Willd. 15. (Hesperis salina; Lam.) \"Leaves lanceolate, obtuse, quite entire; stem erect; anthers included.\" Root perennial. Similar to C. incanum, but eight times smaller. Whole plant smoothly tomentous. Stem erect, enduring several years. Flowers purple with a yellowish throat; stigma obtuse, thickish, bid, by no means slender. The scent of C. incanum. A native of the salt marshes of Siberia and Tartary. 19. C. bifolius, Willd. 16. (Hesperis orientalis)

**Cheiranthus.** See *Hesperis hiera.*

**Cheiranthus turbinates, barbati-foliat et paniculatus, Lam.** See *Erysimum cheiranthoides, barbati-foliat et repentum.*

**Cheiranthus Gron. syl.** See *Arabis syriaca.*

**Cheiranthus Africana.** Comm. See *Manuela cheiranthus.*

Obf. The essential character of this genus, like that of most of the other genera in this natural order, is by no means well-defined. *Linnaeus* makes it chiefly consist in the glands on each side of the germ. *Lam.* considers this particular as too inconsiderable, and too uncertain to constitute a genus; and ascertains, that two distinct sects of plants are improperly united by *Linnaeus* under his *Cheiranthus.* He therefore pays no attention to the glands, and includes under his genus only those species which have yellow flowers and four-cornered siliques, removing to *Hesperis* those which do not possess these characters, and admitting some of *Linnaeus's* *Erysimum.* Ventenat and *Du Tour,* in *Nouv. Dict.* add to the character of *Cheiranthus,* "feeds with a membranous edge," which, according to them, is not to be found in the true *Hesperis.* *Du Tour,* in consequence of this decision, determines the colour of the flowers to be of no consequence; and replaces among the *Cheiranthi,* the *incanus,* *fendritical,* and *annuus,* which have such a feed; and suffers the *falcatus,* *maritimus,* and others, to remain under *Hesperis,* because their feed have no membranous edge. But in so doing, he falsely separates plants which nature has closely united. In the present state of the science, it appears to us most eligible to adhere to the arrangement of *Linnaeus.* The confusion cannot be removed till some master-hand shall undertake a thorough investigation of the whole family.

**Cheiranthus.** In *Gardening,* comprehends plants of the ornamental kind, as the wall-flower and Stock-gilliflower.

There is a great number of species; but those mostly cultivated for ornament are the common wall-flower (*C. eheiranthus*); the queen's buck gilliflower (*C. incanus*); the chuter-kaved dwarf gilliflower (*C. fendrical*); the annual dock gilliflower, or ten week dock (*C. annuus*); and the dwarf annual stock gilliflower, or Virgin dock (*C. maritimus*).

The first sort has tough fibrous roots and a woody upright, short stalk divided into many erect angular branches, forming a bulky head from one to three feet in height, furnished with green spear-shaped leaves, and terminating in numerous spikes of flowers, varying in colour in different varieties. It is a native of Switzerland.

The chief varieties are, the common dwarf yellow with a low bulby head; the large yellow with a branchy firm forming a bulby head; the large yellow, bulby with a branchy head; the true bloody, with a branchy firm; the flowered flax-coloured; the variegated-leaved yellow; the winter; and the white, having a very branchy greenish stem, and bulby-headed: the flowers in each variety single or double.

The second sort has a naked white root, an upright strong abiding woody stem from one to three feet in height, branchy at top, with spear-shaped oblong hoary leaves, and the stems and branches terminated by spikes of flowers. It is a native of Spain. The flowers vary in their colour; some being of a pale red, others of a bright red, and some curiously variegated, but those of the bright red are generally held in the highest esteem. And there are likewise other varieties, as the scarlet *Brompton* flower, with a strong upright single stem, from one to three feet high, crowned by a cluster of long thick leaves and erect spikes of large scarlet single and double flowers: the *solite* *Brompton* flower, with the same stem and long erect spikes of large elegant flowers: the *purple* or *Tr wettenham* *stock,* which has a thick stem a foot and a half or two feet high, very branchy upwards, and all yellow, erect spikes of purple single and double flowers, purple blue-spotted single and double flowers, variegated purple and white flowers: the *small flowered or shrubby* *stock,* which has a shrubby firm stem from a foot to a yard high, dividing into many short branches, forming a bulby head, all terminated by erect spikes of pure white single and double very fragrant flowers, which feed in double flowers, which feed with a membranous edge, with a white flower, or feebly red spotted flowers.

The third sort has a shrubby firm stem from six to eight inches in height, and nearly of the thickness of the little finger, straight, rigid, round, being covered with leaves, hairy with nap, dividing at the top into two or three very short alternate branches; the leaves are feebly petialous, linear-lanceolate, bending this way and that; the flowers alternate, nearly the size of those in the common *stock,* of a purple colour; they appear from May to July.

The fourth species rises with a round smooth stem about two feet in height, dividing into several branches at the top, the leaves lanceolate hoary, rounded at the end, nearly opposite or alternate, or three or four together of unequal sizes; the flowers produced in loose spikes at the ends of the branches, placed alternately. It is a native of the south of Europe. And of this sort there are varieties with red, purple, white, and striped single flowers, as well as with double flowers of the same colours.

The fifth species has the habit six or eight inches in height,
CHEIRANTHUS.

height, very much branched, divaricated, somewhat fluff, rugged, with twin appressed hairs; the leaves ovate lanceolate, somewhat reflected at the tip, green on rather long petioles, five-fifths, obscurely subnerved in the upper ones; the branches terminated by spikes of red flowers, turning purple. It is a native of the sea coast of the Mediterranean. It is sometimes improperly termed Virginia fcock.

Method of Culture. These plants are all capable of being raised without much trouble of difficulty.

Method of Culture in the Wall-flower Kind. These plants may be easily increased by leafs, slips, or layers; but, in order to have good flowers, very great care should be taken to have the seeds collected from the bell plants; as such as are purchased from the seeds-men can seldom be fully depended upon for the purpose. The seed in this fort is left liable to produce double flowers than in the succeeding kind.

The seed should be sown in the spring season, as in April or the following month, either in the situations where the plants are to remain, or on beds of earth that have not been enriched by manure, being covered lightly in; but the first is the better practice. When the plants appear, frequent waterings should be given to them in dry weather; and when they have attained sufficient growth, where the bed method is practised, they should be thinned out during a wet season in the latter end of summer or beginning of autumn, and be replanted in the situations where they are to flower, or be pricked out in nursery beds, nine inches distant, to remain till the following spring, to be removed with balls of earth about their roots to the places where they are to flower; but the first is the most advisable method, as they do not succeed so well by removing. The bed method is chiefly in use with the market-gardeners, who cultivate the flowers for sale in large quantities. The slab mode of raising the plants is chiefly practised in perpetuating the fine double flowers. The slips are made from the side-shoots that have no flowers, which, after being divested of their lower leaves, are planted in the situations where they are to remain, or in beds, to the depth of three or four inches, any time from April to May, flight waterings and shade being given. In the autumn these in the beds should be removed into separate pots, to have the occasional protection of a frame in the winter, where the weather is very severe.

The young, tender, and more pliable branches may be laid down into the ground in the usual manner any time from May till the end of June, a little water being occasionally given when the weather is dry. They should afterwards be taken off when they are well rooted, and be planted out either where they are to remain, or in pots; or, what is the bed practice, in both ways.

These two last methods, however, seldom afford plants that have good flowers as those raised from seed, being mostly weaker and furnished with shorter spikes of flowers. They should therefore be chiefly confined to those varieties that cannot be raised with certainty from seed.

When these plants are intended for the purpose of ornamenting and adorning variety on walls, ruins, and other places of this sort, the seed should constantly be sown upon them in the autumn or very early spring, covering it with in with a little earth to the depth of half an inch. They will afterwards propagate themselves by shedding their feed, and continue for a great length of time in such places.

Where they are cultivated in the vicinity of large towns, for the purpose of sale, it is the practice, especially with the market-gardeners around London, to prick the young plants out of the feed-beds into nursery rows at the distance of ten or twelve inches, and nine or ten from plant to plant; and where they grow too luxuriantly in these situations, they are again removed about August, in order to check their too full growth, and by that means render their heads more bushy. They are usually exposed for sale, with small balls of earth about their roots, when full beginning to put forth bloom, so that their colours and the properties of their flowers can be discerned in some degree.

And where a blow of the double feeding sort is desired, they should be placed in pots, with balls of earth to their roots at fo as their double flower-beds appear, giving them a little water and proper shade, till they become established again in the earth or mould.

These plants in general succeed well and continue long, where the soil is of the poor and rather calcareous kind. In rich soils they soon decline and go off.

Method of Culture in the Stock Gillyflower Kind.

In all these plants the work of raising them may be performed exactly in the same manner as in the wallflower sort; only the seed should always, as much as possible, be sown where the plants are to remain, or the plants be pricked out into them while they are very young, as in their more advanced growth they never succeed well when removed, or are of 15 long duration: as their roots are nice and but thinly provided with fibres. When the removal of the plants is practised at a late period, it should constantly be done with large balls of earth to their roots, or else they are very apt to be destroyed.

And in the slab or layer methods, as practised for the different varieties, the plants seldom grow so freely or become so fine as those raised from seed. The foils on which they are found to succeed bell, are such as are fresh, and which have not been enriched by manure. In rich soils they soon disappear.

But both these species and their varieties, in order to have a good show of flowers, and the bell and most perfect plants, should be raised annually in the different modes, as, in whatever way they are increased, they always afford the finest flowers the first season of their complete flowering, continuing to decline afterwards.

And such of the double sorts of the different kind as have been potted, should be protected during the winter season, either in frames for the purpose, or some other contrivance, a free supply of fresh air being always admitted when the weather is suitable.

In order to have good flowers of this sort, great care should be taken to remove all the small and imperfect flowers from the feed-beds at the time of setting the plants out.

Method of Culture in the Annual Stock Kind.

In these sorts of plants the work is accomplished by sowing the seeds at suitable times, as to produce succession of flowers during the summer and autumn, from the beginning of February till the latter end of May, covering the seed in lightly. The first and second sowings should be made on a very gentle hot-bed, or in pots placed in it, or in frames, to be protected in the night; but the others may in general be performed in the places where the plants are to flower, or in beds, to be afterwards pricked out or removed into pots, or where they are to remain and blow. The former is, however, the best practice where it can be employed, as removing always injures the growth of the plants. And in sowing and planting them out in the borders, or other parts of pleasure grounds, it is usual to put them in, in patches, of five or six in each patch, desposing them in a varied manner, in different parts of them.

The plants of the early sowings will mostly be in a state to be planted out in pots or on the borders in the beginning of May, a little water being given at the time, when the
weather is dry. They are always proper to be set out when they have attained three or four inches growth, and have several leaves, and should never be delayed much longer.

In cafes where these plants are raised by themselves for show, it is the practice to plant them in rows in beds four feet wide, ten or twelve inches apart each way; care being taken to keep them clear from weeds, and duly watered in dry weather afterwards.

In order to have these plants to flower in the autumn and winter, some of them should be potted about the latter end of July, and placed in a warm situation, occasional watering being given, and in the beginning of autumn be removed under the protection of the green-houfe, or good garden frames; due supplies of fresh air being admitted when the weather is suitable.

Much caution is also necessary in the culture of these flowers, not only to chufe good feed, but to remove all the bad and imperfect plants as soon as possible from the beds, or other places where they are grown, as without this the plants are seldom good.

And in the fourth species the plants may likewise be increased by fowing the seeds at different times, as in the above fort, chiefly in the place where they are to flower, and a few in pots to be set out with others of similar growth.

The fifth fort may be raised and managed in the fame methods as the two firft.

It is advised, in order to provide good feed of the three firft species, that great attention should be paid to have it collected from thole flingle plants which have the largest flowers, with the defteft and brightest colours. Some fuppofe it advantageous to take it from fuch plants as have rather a tendency to the double kinds. The branches should be feparated when dry, as the feeds become perfectly ripe, and be tied up in small bunches, and hung up in a dry airy situation, till the feed is fit to be rubbed out and put up for ufe, which should always be done as soon as it is in a fit state.

But in the two laft species nothing further is necessary but to take it, when perfectly ripe, from the best plants of the repective kinds.

All the species and varieties of these plants are highly ornamental, but particularly the double flowering forts, being introduced not only in the more open exposures of the clumps and borders of the pleafe-grounds and gardens, where variety is wanted; but in other places contiguous to the house, for the delightful smell they afford while they are in blow, which is a coniderable length of time.

And the laft species is sometimes made ufe of as an edging, and the third as an ornamental plant in the windows of bed-chambers, and other places where plants in pots are necessary.

CHEITO, in Geography, a town of Persia, in the province of Farfihan; 120 miles S. of Shiras.

CHEITORE, a town of Hindoostan, in the province of Oudipour, confidered by major Rennel as fynonymous with Cheitore, fubject to the Rana, or chief prince among the Raj-poors, and reckoned the firft among the Raj-poot fates. The whole of this province, and the adjacent tract of country in the foab of Agimere, confift of high mountains divided by narrow valleys; or of plains environed by mountains, accessible only by narrow paffes and defiles; and, in effect, one of the strongest countries. It has, however, an extent of arable land fufficient for the fupport of a numerous population, and is bleffed with a mild climate, being between the 24th and 28th degrees of latitude. It is repreffented as a country likely to remain for ever in the hands of its prefent poifieurs, and to prove the fylum of the Hindoo religion and fufpicions. Notwithstanding the attacks that have been made upon it by the Gznnavde, Patan, and Mogul emperors, it has never been more than nominally reduced; and fuch are the strength of its fortresses and the independent spirit of its inhabitants, that every war made on thole people, even by Aurungzebe, ended in a compromise, or defeat, on the part of the affailants. It firft fell into the hands of the Mahrattas in 1750, when Alla had pollifhon of the throne of the Mogul, and began his plan of conqifit by the reduction of Gujarat.

Cheitore was the capital of the Rana in the days of his greatest; it was then a fortex and city of great extent, situated on a mountain; but it has been in ruins ever fince the time of Aurungzebe in 1681; and had once before experienced a like fate from the hands of Achar, in 1567. Ren nel places it in N. lat. 25° 21'. E. long. 74° 56'. It is 300 miles S.W. of Agra; 76 S. of Agimere; 651 W. of Benares; 547 N. of Bombay; and 1768 by Moorehead, and 1663 by Bulbom, N.W. of Calcutta.

CHEIWAN, a town of Arabia; 49 miles S. of Saade.

CHE-KANG, a town of China, of the third rank, in the province of Kiang-nan; 11 leagues E.S.E. of Tchikchou.

CHEKAO, in Natural History, the name of an earth found in many parts of the East Indies, and sometimes ufed by the Chinefe in their porcelain manufactures. It is a hard and fmony earth, fomewhat like alum, and the manner of uifing it is this: they firft confine it in an open furnace, and then beat it to a fine powder. This powder they mix with large quantities of water, and fliring the whole together, they let the coarser part fliftide, and pouring off the ref, yet thick as cream, they leave it to fettle, andufe the matter at the bottom, which is found in form of f. f. paff, and will retain that humidity a long time. This supplies the place of the earth called boache, in the manufacture of that elegant fort of China-ware which is alU white, and has flowers which seem formed by a mere vapour within its furface. The manner of their uifing it is this: they firft make the vefiil of the common matter of the manufacture; when this is almoft dry, they paint upon it the flowers, or whatever other figures they pleafe, with a pefcil dipit in this preparation of the chekao; when this is thoroughly dry, they cover the whole vefiil with the varnish, in the common way, and bake it as usual. The confequence is, that the whole is white; but the body of the vefiil, the figures, and the varnish, being three different fubftances, each has its own particular white; and the flowers, being paint ed in the fecond white of all, are diftinctly feen through the varnish upon the vefiil, and feem as if traced by a fine vapour only. The boache does this as well as the chekao, and has beside this the quality of faving for the making of the porcelain ware, either alone, or in the place of the kaolin: the chekao has not this property, nor any other fubftance beside this boache, which appears to be the fame with our flateaft or faw-fap. See Porcelain.

CHEKE, John, in Biography, a very learned writer, and an eminent promoter of learning in England, was born at Cambridge, June 16, 1714; he received his grammar learning under Mr. John Morgan, and was admitted into St. John's college about the age of 17, where he was greatly distinguished for his application to study, and particularly to the Greek language, which was then almost universally neglected. At the recommendation of Dr. Butts to Henry VIII, he was made king's foiliar, and supplied with money for his education, and for his charges in travelling into foreign
foreign countries. At the age of 26, Mr. Cheke was appointed Greek professor at Cambridge, in which situation he endeavoured to render the study of that language more popular, and to reform the pronunciation of it, which was become almost barbarous. In both attempts he incurred the opposition of that party who set their faces against improvements of every kind. Gardiner, bishop of Wincheliter, was his chief and most violent opponent: he raised an edict, commanding a strict and rigid adherence to the old and received modes. Cheke justified his own conduct upon the authority of Erasmus, but the bishop adhered to his former resolution. In spite, however, of episcopal mandates, the improved pronunciation gradually made its way into the schools and universities of the kingdom. The reputation of Cheke was so high that, in 1544, he was sent for to court, to assist in the education of prince Edward, and he appears to have had some share in the literary infusions of the princes Elizabeth. When his royal pupil Edward VI. succeeded to the crown, he was rewarded with an annuity of 100 marks, and a grant was made to him of several parcels of land and mansions: he was also, by royal authority, made provost of King's college, Cambridge. His interest, at particular periods, seemed to decline at court; he, nevertheless, continued in his post as tutor to the king, who was greatly indebted to him for the knowledge and virtuous principles by which his short life was so honourably distinguished; he became also the patron of religious and learned men, both of his own countrymen and foreigners. In 1551, the king conferred on him the honour of knighthood, and gave him a considerable estate for the maintenance of his rank in life. In the same year he acted as one of the disputants on the Protestant side of the question, at two conferences on the subject of transubstantiation; he at other times displayed his controversial talents, and at the close of the young monarch's reign he had ever succeeded as to be clerk of the council, secretary of state, and privy counsellor. The death of Edward was a fatal blow to the confederation of Cheke: he was anxious to have the crown transferred to lady Jane Grey, to whom, and to her council, he acted as secretary. Upon the accession of Mary to the throne of these realms, he was committed to the Tower, and indicted for high treason; but being flipp'd of the greater part of his property, he was pardoned and set at liberty. Unable, however, to conform to popery now re-established, he obtained leave to travel in foreign countries for a limited time. He went to Switzerland, and from thence to Padua, where he affiliated some of his young countrymen in their studies, and read with them the orations of Democritus in the original. He afterwards settled at Strasburgh, where the Protestant forms of worship were openly maintained. His not returning home at the period appointed, afforded his enemies a pretext for condemning what remained of his estate, so that for maintenance he was obliged to read Greek lectures at Strasburgh. In the beginning of 1556, by the invitation of his former friends, lord Paget and sir John Maiton, who had become converts to the new order of things, he was induced to go to Brussels, where his wife was. Disturbing the infancy of his old friends, he had recourse to the arts of astrology, to the follies of which he was addicted: these assured him that the intended journey would be prosperous. He was, however, way-laid by orders from Philip II., and carried to the Tower of London, where he was detained a close prisoner till the terrors of a cruel death induced him to recant, and make submission to the pope's legate, cardinal Pole. This humiliation was not sufficient: he was compelled to make a formal renunciation of all his errors in the presence of the cruel queen, and more cruel and revengeful court. His lands were now restored; but with these no power could restore that peace which rarely attaches itself to those, who, from whatever motives, submit to a dereliction of principle. In many infinences he was forced to witness the conviction of Protestants who exhibited that constancy in a good cause which he knew ought to have been shewn by himself. He became a prey to remorse, when he probably, but too late, recid ed the feelings of those who expired at the stake, and died at the age of 43, leaving behind him three sons.

Sir John Cheke was an accurate and elegant scholar; his most celebrated work is entitled "De Superfluiti, ad Regem Henriicum," written to excite the king to a complete reformation in religion. He endeavoured to correct the orthography and diction of the English language, and would admit of no words but the genuine English of Saxon and Teutonic origin. Hence he objected to the received version of the Bible, and undertook a new one. He finished the gospel of St. Matthew as a specimen, which is deposited in the library of St. Benet's college, Cambridge. Sir John was an excellent statesman, a sincere Christian, and an ardent friend to the reformation, though he wanted courage to die in its defence. He was benevolent and charitable, and the country is greatly indebted to him for his successful endeavours in reforming the pronunciation of the Greek and Latin languages.

CHE-KIANG. See Cheh-Kiang.

CHEKOUTOMIES, in Geography, a nation or tribe of Indians, situat near the south bank of Sanguenai river in Upper Canada.

CHELA, has several significations. It imports a forked probe, mentioned by Hippocrates, lib. ii. De Morbis, used in extricating a polypus of the nose. But in Ruffius Ephesius, cap. iv. ebela denote the extremities of the cilia, which touch each other when the eyes are shut. But the most frequent significiation of ebela is clums, particularly those of the crab.

Cheke further signify filasses in the heels, fest, or pudenda.

CHELE, in Ancient Geography, a place seated on the mountain coast of the Exuine sea, at the distance of 20 stadia from the small island of Apollonia, or Daphnusa, and 124 from the mouth of the river Sangar, according to Arrian.—Also a part of the Thracian Bosphorus, on the coast of Aila Minor, was a temple of Diana Dictyne.—Also, two promontories, mentioned by SliusItellia, supposed by Orosius to be the two promontories of Apollo and Mercury, which comprehended the gulf of Carthage.

CHELADNIIUM, in Middle Age Writers, is used for a kind of velvett or stuff. It is also called elcodivus, elcodius, elchandra, falandra, and falandria, and by the Byzantine writers 25x7/4x. It is mentioned by Ditmar as a velvett of great length, carrying ears, and 150 ferman. It seems to have resembled an Italian galley.

CHELADURUS, a small kind of chelidium.

CHE-LAOU, in Geography, a town of China, of the third rank, in the province of Chou-fi: 14 leagues S.W. of Fuen-tchen.

CHELAIJUM, a name used by some authors for a moveable tubercle in the eye lid, commonly called in English a flitte or fbee.

CHELIDON, in Ichthyology, a name by which many of the old Greek writers, writing with the Latin word Triglo birende, or tub-fish of Ray. See Triglo birende.

CHELIDONIA, among the Romans, a name given to the wind more commonly called Fraxinus.

It was only called chelidonia for a fortnight in the middle...
of February, because at that time the swallow makes its first appearance.

*Celidonia*, in Antiquity, a festival celebrated at Rhodes, in the month Bear, during which the boys went from door to door begging and singing a long song called "Celidonium," because it began with an invocation of the chelidion, or swallow. It is said to have been composed by Chrobus the Lindian, as an artifice to get money in a time of public calamity.

*Celidonia*, in Botany, C. B. Smith. See Ranunculus foetina.

*Celidonia* Insulce, in Ancient Geography, rocks of the Mediterranean sea, upon the coast of Lyca, in Asia Minor, according to Ptolemy. Strabo places them at the commencement of the coast of Pamphyia, and he says there are three mountains on the island, about five itadia from one another, and six from the land. M. d'Anville has placed them to the south of "Sacram Promontorum."

*Celidonia*, a people of Libya.

Gen. Ch. Cal. two-leaved; leaves roundish, concave, caducous. Cor. Petals four, roundish, flat, spreading. Stem. Filaments numerous (from twenty to thirty), shorter than the corolla; authors oblong, compressed, crept, two-celled. Dph. Germ cylindrical, the length of the flammis, superior; style none; stigma bilabiate. *Peric. *Capsule reeling a filike, many-seeded, one or two celled, two or three-valved.

Fif. Ch. Stigna not more than bifid or trifid. Capsule flander, linear, reeling a filike. Sp. 1. C. major, Linn. Sp. Pl. 1. Mart. 1. Lam. 1. Wild. 1. Bauh. Pin. 143. Thurn. Ind. 231. Flor. Dan. tab. 542. Linn. Ill. tab. 430. Woodv. Med. Bot. Supp. tab. 263. Eng. Bot. pl. 1781. (Papaver chelidiona dictum. Rai. Syn. 509.) Common or great chelidion, so called in contradiction to Ranunculus ficaria, which was called by the old botanists the liver celandine. "Peduncles in umbles." C. C. Fluctuat. Dill. in R. Syn. 529. Millier. pl. 92. fig. 2. Flor. Dan. tab. 676. "Leaves resembling those of the common cow." The whole plant yields a yellow or sialon-coloured, acid juice. Root. Root pernnial, spindle-shaped. Stem near two feet high, branched, terete, sometimes a little hairy. Leaves green above, glaucous beneath, alternate, large, fott, unguiculately winged, lobed, and notched; petioles hairy. Flowers yellowish, in axillary and solitary umbelis; general and proper peduncles hairy. Capsules about two inches long, slender, somewhat tapering at each end, one-celled, two-valved. Seeds small, black, shining, oblongately crowned, with a white, compressed, glandular cret, which, when fallen off, leaves an oblong scar; receptacle Eliated, placed at the junction of the valves on each side, and furnished with a double row of teeth. A native of hedges and uncultivated grounds, among rubbish and under walls in the neighbourhood of villages in England, and other parts of Europe. The variety 8 is very hairy; its leaves are divided into long, narrow, segments, deeply jagged at their edges; and, what is most remarkable, its petals are lacinated or cut into several parts. La Maree thinks it a distinct species. It is mentioned by Cluibus, Bauh. and several other of the old botanists, was found plentifully in the former part of the last century, among the ruins of the Duke of Leab's fort at Wimblidcn, and, as we learn from La Maree, was cultivated in the royal garden at Paris, a little before the French revolution. Both kinds agree in their sensible qualities. The whole plant has a taint, unpleasant smell, and a durable, bitter, acid taste, which is considerably stronger in the root than in the leaves. Both water and rectified spirit extract nearly the whole of the poisonous matter. The juice of the leaves is yellow, and gives a green tincture to rectified spirit; that of the root is of a deep brown-colour, and tinges the same menstruum with a brownish-yellow. Its pungency is not of the volatile kind, little or nothing of it rising in distillation either with water or spirit; it is nevertheless greatly abused by drieding the plant itself, or by infusing with a gentle heat the spirituous or watery infusions. Its virtues have been highly extolled by some of the modern, as well as by the ancient physicians, in the removal of obstructions of the liver and the other visera, in promoting expectation and curing intermitents, but though they have gained it a place in the EdinburghPharmacop-eia, t. Sacrum have been greatly overrated; its use, in the jaundice, in particular, was probably suggested by the old absurd doctrine of signatures. The juice, however, certainly possesses active powers, and may be employed with advantage to destroy warts, cleanse foul ulcers, and remove obstructions of the cornea. See Woodville's Medical Botany. 2. C. japonicum, Mart. 3. Wild. 2. Thumb. Jap. 321. "Peduncles one-flowered; leaves petioled, winged, egg-shaped." Stem herbaaceous, upright, weak, fibrous, smooth. Leaves alternate, petioled, unequally winged, leaflets three or five, opposite, on short petioles, ovate, more or less oblong, acute, gashed, unequally serrated with coarse ciliated ferratures, smooth, pale underneath, an inch or an inch and a half long, the terminal lobe always longer. Flowers yellow, axillary; peduncles calcarious, nearly the length of the leaves; calyx smooth; corolla a little larger than the calyx: four times the length of the flammis. A native of Japan. 3. C. glaucinum, Linn. Sp. Pl. 2. Mart. 2. Lam. 2. Wild. 3. Flor. Dan. tab. 787. Engl. Bot. pl. 8. (Glacieium flore biso.) Tourn. Ind. 234. G. Hove. Fl. Crpt. 1. Sp. 1. Venture. 1:766. Vent. 3. 92. Smith. Flor. Brit. 2. 753. Papaver corculimentum; Bauh. Pin. 171. Loc. ib. 753. Scia Celadine, or yellow horned-poppy. "Peduncles one-flowered; leaves embracing the stem, foliated; stem smooth." Whole plant glaucous. Root perennial. Stem several, near two feet high, branched, weak, spreading, on an even furface. Leaves alternate. A little flabby, rough with short hairs; root ones lyrate-pinnatid. Flowers yellowish, large, axillary and terminal; calyx hispid. Capsules from ten to twelve inches long, slender, curved, often rough with tubercles, two-valved, two-celled; partition gomous, produced by an enlargement of the receptacle. Seeds numerous, seared in deep excavations within the substance of the partition or receptacle; pitted. A native of the seacoast in England and other parts of Europe. 4. C. pharecon, (C. communis; Linn. Sp. Pl. 5. Mart. 3. Lam. 3. Wild. 3. Glacium pharecon; Tourn. 2. 244. Grass. 2. 167. tab. 115. Smith. Flor. Brit. 2. 154. Eng. Bot. pl. 142. Curt. Lond. fade. 6. tab. 31. Papaver. Bauh. Pin. 151.) Scarlet horned-poppy. "Peduncles one flowered; leaves foliaceous, pinnatifid; stem hispid; capsule brilify." Root annual, spindle-shaped. Stem two feet high, branched, cloathed with horizontal hairs. Leaves glaucous, hairy; root ones lyrate-pinnatifid; stem ones deeply pinnatifid, jagged and toothed, half embracing the stem. Flowers teartal, half the size of those of the preceding species. Cap-
false rough with longish rigid close bristles, two-valved, two-celled with a partition or receptacle resembling that of the preceding species. Seeds pitted. A native of Germany and the south of France. It’s right to be received as a British plant rests entirely on the authority of Stillingfleet, who sent it from Norfolk to Hudon, but it has not been found there by any other person. In Chelsea garden it has come up as a weed from time immemorial. 5. C. fulvum. (Glaucescens fulvum; Smith. Exot. Bot. tab. 7.) “Peduncles one-flowered; stem-leaves rounded, valved, capitate rough; flowers nearly sessile.” Raised by Dr. Smith from seed originally obtained from the Cambridge garden by the name of C. conicum, and presumed to be a native of the north of Europe. Whole herb of a more blue cast. Root annual. Flowers orange, twice as large as those of C. thunbergianum. 6. C. violaceum. (C. hybridum; Linn. Sp. Pl. 4. Mart. 4. Lam. 2. Willd. 5. Eng. Bot. pl. 20.) Glaucescens violaceum; Juss. 236. Smith. Flor. Brit. vol. 2. p. 565. Papaver; Bauh. Pl. 172. "Peduncles one-flowered; leaves pinnatifid, with linear segments.” Root annual. Stem a foot high or more, slender, branched smooth, green. Leaves twice or thrice pinnatifid, deep green, smooth. Flowers rather large, violet, with a darker spot at the base of each petal; stigma triqued. Capsules two or three inches long, three-valved, one-celled; receptacles three; fixed to the valves, but not so far extended as to render the capsule three-celled. Seeds pitted. A native of Spain and the south of France. It has been found nowhere in Great Britain but in Cambridgeshire and Norfolk. Linnaeus supposed it to be a hybrid plant between Papaver Argemone and some species of Chelidonium; but there does not appear any sufficient reason for the opinion. Obf. The Chelidonium of Linnaeus comprehends the Chelidonium and Glaucescens of Tournefort, which were separated from each other by that great botanist, partly on account of the difference in the number of the cells of the capsule, but chiefly because the petals of Chelidonium majus, his only species, appeared to him to be properly cruciform, whereas those of the other species are rather roflacens, and therefore according to the principles of his system, belong to a different class. Gartner, Jussieu, Ventenat, and Dr. Smith, all agree in reordering Tournefort’s original genera, principally on account of the different number of cells; their Chelidonium being only one, and their Glaucescens two. But unfortunately their Glaucescens violaceum, which cannot be separated from their G. luteum and phacenum, has only one cell, in direct contradiction to the generic character. Ventenat, who seems to have felt this difficulty, has dropped all consideration of the number of cells in his essential character of Glaucescens, observing that the capsule of Phacenum and Luteum (Chelidonium corniculatum and Glaucescens of Linnaeus) appears two-celled, because the space between the two receptacles is filled with a thick fungous substance. It is indeed so different in its constitution from the usual disposition or partition, that Jussieu could scarcely prevail upon himself to call it by that name. Its form in C. violaceum sufficiently demonstrates its true nature, and affords a connecting link between C. majus and the other species. It is with much difficulty that we differ from such high authorities; but for the reason acknowledged, we cannot but think Linnaeus fully justified in uniting Tournefort’s two genera. The effect of this introduction by Gartner and Dr. Smith into their essential character of Chelidonium; and the capitule itama introduced by Ventenat into that of Glaucescens, are, we apprehend, separately considered, of too little consequence to constitute generic distinctions.

**Chelidonium majus canadensis;** Can. Moril. Ray. See **Sanguinaria canadensis.** **Chelidonium minus.** See **Ranunculus ficaria.** **Chelidonium Promontorium,** in *Ancient Geography,* a promontory of Asia, in Pamphylia; probably the same with the Sacrum Promontorium. **CHELIDONIUS.** In *Natural History,* a stone pretended to be found in thedomes of young swallows; much esteemed by some for the falling sickle. The word is formed from Xalx, a *swallow stone.* **Swallow stone.**

**CHELLIFER, in Entomology,** a generic name assigned by Guettard and De Geer to the *Acmeons Cramerosot of Linnaeus; Helium Cramerosot of Seopoli and Gamlin;* which latter see.

**CHELLES,** in *Geography,* a town of France, in the department of the Seine and Marne; 4 leagues W.S.W. of Meaux.

**CHELLUS,** in *Ancient Geography,* a town of Paleltine, mentioned in the Apocryphal book of Judith.

**CHELM,** in *Geography,* a town of Poland, in Red Russia, and capital of a patrimony of the same name; the seat of a Roman bishop, suffragan of Lemberg, and a Greek bishop, suffragan of Kiev. The patrimony is partly subject to Russia and part to Anhia. The town is in a state of decay; 108 miles S.E. of Warsaw and 396 E. of Brillan. N. lat. 51° 10’ E. long. 24°.

**CHELMER,** a river of England, in Essex, which runs into the sea a little below Malden.

**CHELMIEZ,** a town of Lithuania, in the patrimony of Minik; 50 miles E. of Mozyr.

**CHELMON,** in *Ancient Geography,* a town of Paleltine, over-agained Efraelon, according to the book of Judith. Holofermes encamped before this city when he went to besiege that of Bethulia.

**CHELMSFORD,** in *Geography,* the shire town of Essex, England, is pleasantly situated near the centre of the county, at the confluence of the rivers Chelmer and Can, from the ancient ford over the former of which it evidently derives its name. Camden, without any authority but its diligence from the supposed site of the Roman station of Camalodunum, which lies places at Malden, fixes Canumon here, though every circumstance, it is observed by Mr. Gough, "is against assigning such antiquity to this town; there was not even a road near it till Henry the First’s time, when Maurice, bishop of London, to whose see it always belonged till Bonner’s time, built a bridge over the Chelmer." Maurice posished the episcopal dignity about the year 1300, and to his bridge this town owes its importance, as it occasioned the great road which before passed through Writtle, a village two miles to the west, to be brought to Chelmsford; and from that time the latter increased in buildings and population. In the first year of king John, William de Sancta Maria, bishop of London, procured the grant of a weekly market, and other privileges; these were afterwards confirmed by Edward I. In the eleventh of Edward III, four members were sent from Chelmsford to a council held at Westminister. The town is chiefly formed by four respective streets. Near the centre is the shire-hall, an elegant, commodious, and well-defined structure, erected at the expense of the county, from designs and under the immediate direction of J. Johnson, architect, who having completed it to the satisfaction of his employers, and at a less expense than the original estimate, was presented, in purdiance of a vote paid at the quarter sessions in 1792, with an elegant silver cup. The front of the building.
building is of white stone with a reddish Inferior, and is connected with four tare square columns supporting an ap- plan. The corn exchange, apartments for the courts of 
C. Glabra, Linn. Sp. Pl. 1. Excluding part of the 
fons, an admiralty room, and other convenient 
lish, are within the walls of this building. Contiguous 
to it is a neatly furnished court, to which the water is 
brung from a spring about a quarter of a mile distant. 
When the original conduit was built is unknown; the pre- 
sent was erected a few years ago chiefly from subscrip- 
tions of the inhabitants, to which the Sun and Royal Ex- 
change offices contributed £52 each. The church is a spa- 
cious handsome building, dedicated to St. Mary; the body 
is modern, and was erected from designs by Mr. Johnson, in 
place of the more ancient part, which fell to the ground on the 
night of January 17th, 1800. At the well end is a 
square fiant tower with pinnacles. When the original church 
was founded is uncertain; but from an inscription which 
was placed on the south side of the centre aisle, it appears 
to have been repaired by subfcription, anno 1624. In this 
town is a free grammar-school, founded and liberally endow- 
ed £52 by Edward VI., on the petition of Sir William Pe- 
tre, knight; Sir Walter Mildmay, knight, then one of the 
general supervisors of the court of augmentations: Sir 
Henry Tyrrell, knight; and Thomas Mildmay, esq. The 
government was at the same time constituted a body corpo- 
rate. The church was at first a chapel, 1782: by R. Tenant 
itself, then acting governor, on the site of a more ancient one, 
which was erected by Sir John Tyrrell, bart. The educa- 
tion of youth is further provided for by two charity schools 
supported by voluntary subscription; one founded August 
17, 1713, for fifty boys: the other in April 1714, for twenty 
girls. The school-house stands at the north end corner of 
the church-yard; adjoining to it are three almshouses for 
decayed families. The bridge, erected by bishop Maurice, 
over the Chelmer, having greatly decayed, was rebuilt with 
one arch in 1787 from a design by Mr. Johnson. This 
bridge unites the hamlet of Moulham with Chelmsford. 
Near it, on the Moulhain side, stands the county-gaol, a 
spacious and well-arranged stone building, which was com- 
menced in 1772, by an architect named Hyland, but has 
since been much improved and completed by Mr. Johnson. 
The front is formed by a commodious house occupied by 
the gaoler; from which, westward, extends a large paved 
yard, terminated by the hospital or ward for female crimi- 
nals, and a very neat and convenient chapel. On the north 
side, next the north door of the church, 1782: by R. Tenant 
improvements, appropriated to the use of the convicts employed in picking 
Oakum and making ropes. On the south side, extends a 
range of separate cells for condemned criminals, behind 
which, on the opposite side of a paved yard, are apartments 
for debtors, conveniently d'f f. Every yard is provided 
with excellent spring water, which, with the general atten- 
tion to cleanliness, greatly contributes to the health of the 
prisoners. The population of Chelmsford as returned under 
the last act was 3755, the houses 653. The surrounding 
country is extremely pleasant and fertile: the soil consists 
 principally of a deep rich loam, interspersed with veins of 
gravel. Several flourishing plantations of hops are es- 
lahished in the neighbourhood. Within the last seven years, 
twelve extensive ranges of barracks, with accommodations for 
upwards of 4900 troops, have been erected in this parish; 
the largest at the west end of the town, the other on the 
southern side. At a small distance well of the latter begins 
a line of embankment for defending the approach to the 
metropolis, consisting of ear batteries and parapets. It has 
been carried a considerable way in a south-ea direction, 
but is not yet completed to the extent proposed. This line 
is one among the numerous works now carrying on in this 
county to protect the metropolis in case of invasion. 
Chelmsford is 19 miles from London; has a weekly market 
on Fridays and annual fairs. About one mile from 
this town, Mr. Allen's hall, the seat and manor of the 
Mildmays, which, prior to the Norman conquest, was parcell 
of the possessions of the abbey church of St. Peter's, Wiln- 
imster. Morant's History of Essex, 2 vols. fol. Salmon's 
History of Essex, 6 vols. 8vo. 

Chelmsford, a township of America, in the county of 
Middlesex and state of Massachusetts, situated on the south 
side of Merrimack river, 26 miles N.W. from Boston, and 
containing 11,114 inhabitants. This town is connected with 
Dracut by a bridge over the river at Pawtucket falls, of 
ingenuous construction. The course of the Middlesex canal, 
design'd to connect the waters of Merrimack with those of 
Boston harbour, will be afterwards the seal part of 
Chelmsford.

Chelone, in Botany, (from Chelone, a tortoise) Linn 
gen. 75,689 Spec. 100, Wild. 1719, 14:2 Jott. 17. Vent. 
Ephemer. Jott. 17.

Gen. Ch. &.L Periarch, permanent, one leaf'd, five leaf'd; 
fig. the same. Cor. monospermatous, ringshaped: 
tube-cylindrical, very short; throat inflated, oblong, 
with a few villous hairs. Stam. 4. Anther

4. Leaves petioled, egg-shaped, serrate; uppermost ones 
opposite, embracing the stem; peduncles long, calyxes 
clawed.)
Rudiment fragments upper people denfe differing cle chium, cles hyx nial. of ated. " Hand, genus neived. violet. 242. Ol'f. fig. Stem pmfer, nodding, in a terminal panicle; partial peduncles two, three, or four-flowered: segments of the calyx obtuse; lower lip of the corolla with three acute reflexed segments; inner part of the throat cloathed with a dense yellow pubesence. A native of Mexico. ** Barren filament, bearded near the top. 5. C. pubescens. C. PentSTEMon, Linn. Sp. pl. 2, Mart. 415. Lam. 2. Illus. pl. 228. PentSTEMon, Mitch. gen. 14. PentSTEMon pubescens, Wild. 2. Dra-ereo,calamus, Morif. Hill. 3. tab. 21. fig. 2, 3. Cyecromium, Pluk. Mant. 62.) " Stem pubescent; leaves embracing the fium; panicle dichotomous. " Root perennial. Stem a foot and half high, cylindrical, branched in its upper part. Leave opposite, lanceolate, entire, or very obscurely toothed; lower ones narrowing into a petiole. Flowe-er purple, whifht about the throat in a terminal panicle with opposite ramifications; tube the length of the calyx; upper lip fhort, obtusely bifid, reflexed; lower lip three-lobed, reflexed at the fides; barren filament broader toward the top, longitudinally bearded. Seeds without a membranous border. A native of Virginia. It varies in having broader or narrower leaves. 6. C. birrata. Linn. Sp. Pl. 2. Mart. 3. Lam. 3. (PentSTEMon hisnita, Wild. 1. Digitalis Virginianna, Pluk. Mant. 64.) " Stem and leaves hairy." According to Miller nearly allied to C. glabra, differingchiefly in the hairiness of the item and leaves, and superior whiteness of the flowers. Linnmus, on the other hand, infpects it to be a variety of the preceding. 7. C. lovgata. PentSTEMon lomigata, Wild. 3. Chelten-ham, Ar-doit. Spec. tab. 3. Digitalis perfoliata, Morif. Hill. 2. tab. 8. fig. 6.) " Stem smooth; lower leaves quite entire." Root perennial. Lower leaves ovate-acuminate, petiolated; upper ones embrancing the item, lanceolate, toothed. Flowers violet. A native of North America. 8. C. campanulata, Mart. 5. Cavan. ic. 1. tab. 20. (C. campanuloides, And. Repos. tab. 40. PentSTEMon campanulata, Wild. 4.) " Stem smooth; leaves lanceolate, acuminate; all sharply serrated. Root perennial. Leaves opposite, filiform, or embracing the item, green above, paler underneath. Flowers purple or violet, in a long loofe terminal spike; peduncles axillary, fingle; lower ones two-flowered. A native of Mexico. Olf. The PentSTEMon of WilIedenow differs from his Che- lone in nothing but the bearded barren filament, a charac-ter certainly too trifling to constitute a generic distinction. Every one must be glad to get fairly rid of 10 harsh and in-determinating a name. CHELONIA, in Ancient Geography, a promontory of the ifland of Cos, so named by Paufanias. CHELONIDES, a mouth of Africa in interior Libya, according to Ptolemey. This was a lake formed by the river Gir. CHELONISSCUS, in Zoology, the name given by Co-Vol. VII. lumin to the species of Armadillo, called Doyipus quadr- cinnus by Gmelin, which fee. CHELONITES, in Ancient Geography, a promontory of the Peloponnesus, in the territory of Elfe, according to Pto-lemey. Strabo calls it Chelomitas. It is suppos'd by some to be the present Cape Tornef. CHELONITES Sinus, a gulf placed by Ptolemey on the western coast of the Peloponnesus; commencing at the promontory Labrys, and terminating at Parthena. CHELONITES, a lone found to be in the Indian tortoises, and to have the faculty of refting poison. The word is formed from gelium, a tortoise. Some confound the chelomites with the bunionites, or tooth-foles. CHELONITIDES, of Captathia, in Ancient Geo-graphy, two small iflands of the Red Sea, according to Pto-lemey: who places them above the port called 'Theon So-teron.' CHELONOPHAGI, a people of Arabia, inhabiting the deferts that lie between Egypt and the Perian gulf, according to Mela. Strabo says that they call their dead into the fea. -Alfo, a people of Asia, who inhabited a corner of Caramania, according to Pliny and Ptolemey. -Alfo a people of Ethipia, who not only used the fkin of tortoises for food, but likewife covered their huts or cottages with the fells of these animals. As in size and figure these fkins resembled a small fishing velifl, the Cheloonophagi employed them as boats on some occasions. CHELSEA, in Geography, a large and populous village of England in the county of Middlifex, fituate in the vicinity of London on the north fide of the Thames, and famous for its college or hospital. See Hospital. CHELSEA, called by the ancient natives "Winnifmet," a town of America, in Suffolk county and the flate of Massachufetts, containing 472 inhabitants. Before its incorpo-ration in 1758 it was a ward of the town of Boflon. It is fituate north-eallly of the metropolis, and separated from it by the ferry across the harbour, called Winiifnet. -Alfo, a township of Orange county in the flate of Ver- mont, having 239 inhabitants. -Alfo, a district of the town of Norwich in Connecticut. See Norwich. CHELTENHAM, a town of Glouceffershire, England, more celebrated for the fublimity of its medicinal water than for any other circumstance, is fuppofed to have derived its name from the river Chilt or Chelt, which flows on the fourth fide in its paffage to the Severn at Wim- lode. By a peculiar circumftance of the manor confirmed by act of parliament, though lands defcend as by common law, yet the eldest female inherits freely. The fituation of Cheltenham is extremely pleafant: open to the vale on the fouth and west; but sheltered on the north-eall by the immense amphitheatre formed by the Cotwold hills, which terminate abruptly at the distance of two miles to the north-eall. The houses are principally ranged in one freet, which extends nearly a mile in length. Since the commencement of the last centfly, when the fanfitive qualities of the springs were firft noticed, the buildings have progreffivey improved, both in appearance and numbers, and especially within the falt twelve years. Many neft mantlees have also been erected in the vicinity, the principal of which is Baye-Hill Lodge, an elegant building, erected for the late Earl of Fauconberg, in the year 1781; and dillinguifhed as the residence of their præfent majeftries during their visit to Cheltenham in the fummer of 1788. The Spring or Spa, as it is called by way of distinction, was firft obferved to poiffes medicinal virtues in the year 1716: the discovery of its qualities appears to have arisen from accident, but the immediate caufe is uncer- 4 E thin.
taine. It rises about six feet below the surface of a meadow, which is about half a mile south of the town; and according to the experiments of Dr. Short, the water is "a neutral, purgative chalybate." It continued open for two years from its discovery, but was then nailed in; and in 1724, was let by the then owner, Mr. Mafon, for the sum of 614, per annum. In 1738 it became the property of Captain Hilliscornc, in right of his wife, the daughter of Mr. Mafon: this gentleman erected a brick pavilion or dome, on four arches, over the well; formed several contiguous walks, and built a commodious room for the reception of the company. About the same time a long avenue of lime trees was planted. Several similar improvements have been since made. The beneficial effects of this spring have proved an increasing source of wealth to the town; its visitors, however, have been so numerous, that it was feared the waters would not have been sufficient to supply the increasing demand. In 1788, at the depth of about 50 feet, a spring was discovered, and was found to possess all the specific medicinal qualities of the other, and to be much more copious: a circumstance which enabled the proprietor to afford a more abundant supply for every necessary occasion. A new spring was discovered, in 1803, by Dr. Thomas Jamefon, who has described the water as somewhat resembling that at Harrowgate, in Yorkshire, and containing rather a greater proportion of sulphureous gas than the other wells. The ameliorations of Cheltenham are similar to those of most places of public resort: the fever is from May to the end of November. The assembly-rooms are spacious and handsome; and a new theatre has been lately completed on an enlarged plan, under the direction of Mr. Watfon. The hotel and principal lodging-houses are handsomely and conveniently fitted up. The church, situated near the center of the town, on the south side, is a large and elegant fabric dedicated to St. Mary, and for the most part, of the architecture of the middle ages. An hospital for sick poor men and women, and a free school, were founded here, in the year 1574, by Richard Pate, Esq. Queen Elizabeth increased the endowments. By a subsequent benefaction, two scholars educated at the free school are sent to Pembroke college, Oxford. Some other schools are also established in this town; and a peculiar charity was instituted, about the year 1800, called the "Cheltenham repository, for the reception and sale of works of ingenuity and Industry, for the benefit of the sick and indigent poor." This establishment originated with the fair, and is principally managed by a committee of females. The population of this parish was stated in the late return to be 3574: the number of houses 710. Cheltenham is 94 miles N.W. from London, has a market on Thursdays, and three annual fairs.

About two miles from Cheltenham, in the parish of Bishop's Cleeve, is Southam House, a venerable and far-famed mansion, now the property of Thomas Bagliott de la Berc, Esq. whole father, William Bagliott, Esq. of Prebury, claimed the name la Berc, in pursuance of the will of his uncle, Kynard de la Berc, Esq. who, dying without issue in 1735, bequeathed to him this estate. Leland mentions this house as recently built by Sir John Huddlstone, at the time he made his survey by command of Henry VIII.; and it yet retains as much, or more, perhaps, of its original form, as any other domestic building in England of that era. Atkins's History of Gloucestershire, fol.

CHILVA, or XELLA, a town of Spain, in the province of Valencia; 6 leagues S.W. of Segorba.

CHELUM, a river of India. See Debh.
CHE

Chollet. The place contains 3122, and the canton 10,346 inhabitants; the territory includes 310 kilometres, and 10 communes.

CHEMIN, Couvert, Covert, or Covered Way, in Fortification, is a space five or six foiles broad, adjoining to the counterscarps of the ditches, and going quite round the works at a fortification. It is covered by the inner part of the glacis, which serves as a parapet to it, and is raised from 6 to 7½ feet high. The glacis terminates in an easy slope towards the field, at the distance of about 20 foiles from the crest of it. The covert way is generally pallidised throughout its whole extent; has traverses to prevent its being exploded from without, and has places of arms in its re-entering angles.

CHEMIN Creux, a hollow way. See Ravin.

CHEMIN des Ronds, a space left between the rampart and the upper part of the revetement of masonry in a fortified place, as a passage for the rondes or rounds. The old works at Portsmouth, to wit, those round the town, having a complete revetement, have also a chemin des rondes: whereas the new works round the Common and the Dock-yard, having only a demi-revetement, have no chemin des rondes.

CHEMIN, in Geography, a town of France, in the department of the Vara, and chief place of a canton, in the district of Dôle. The place contains 242, and the canton 69,573 inhabitants; the territory includes 130 kilometres, and 16 communes.

CHEMINAIS, Timoleon, in Biography, a celebrated French preacher, was born at Paris in 1592, and entered among the Jesuits in 1667. After having taught the languages and rhetoric for some time in their school at Orleans, he gained great applause by preaching at Paris and Versailles; and before the appearance of Malcham, was reckoned the most pathetic of the French preachers. But his health declined at an early period of his life; and when he was unable to preach, he went every Sunday, as long as he was able, into the country, for the purpose of inculcating the poor. His course of service, however, was terminated in his 58th year. After his death, three volumes of his sermons were published by Bretonneaux, and have been several times reprinted. He also wrote "Les Sentimens de Piété," 1691, 12mo.; and he is said to have had a talent for light and familiar poetry. Nouv. Dict. Hist.

CHEMINON, in Geography, a town of France, in the department of the Marne; 10 miles E. of Vitry-le-François.

CHEMISE, Shirt. This word is not much in use as a military term; but when it is employed as one, it most frequently denotes a thin wall or revetment against the inner slope of a work, to prevent the earth from tumbling down. The same word is also used sometimes for expressing the exterior revetment of the rampart of a work.

CHEMISE de coup de main de furprise, a number of flirts of linen, or cloth well whitened, which a general or commanding officer sometimes makes use of for his troops, when he attempts a coup de main, or surprize, in order to enable them, in a mixture or mêlée, to distinguish one another from the enemy.

CHEMISE de feu, a French fca-term, employed to denote several pieces of old fail of different fibres, which, after they have been well pitched and thoroughly laked in other combustible matter, as oil of petrol, camphor, &c. may be nailed to an enemy’s ship on boarding her, and when let on fire to consume her.

CHEMISE de mailles, or de mailles, a shirt of mail, or a sort of body-lining made of several scales or rings of iron, which was worn under the coat as a kind of defensive armour to protect the body of a man. To this chemise they also gave the name of gallotte.

CHEMISTRY. The science of chemistry may be defined, a knowledge of those attractions which take place at insensible distances between the heterogeneous particles of matter. The attraction of gravitation takes place not only between heterogeneous but homogeneous bodies, between malleus as well as particles, between bodies that are at a distance from each other as those that are in contact: hence magnitude, form, and distance, or, in other words, the elements of mathematical investigation must be the basis of all inquiry into the phenomena of gravitation. The case is very different with regard to chemical inquiries: the subjects of these are particles of matter, both the magnitude and form of which, and the distances within which they act on each other, are wholly incapable, on account of their extreme minuteness, of being appreciated. The elements, therefore, of mathematical calculation cannot be applied to this branch of knowledge.

The science of chemistry is comparatively of late origin, although many chemical arts, such as metallurgy, pharmacy, cookery, the preparation of vinous liquors, dyeing, tanning, glass-making, &c. can boast of a very high antiquity. Neither among the ancient Egyptians, Greeks, or Romans, till after the age of Constance, are there any traces of chemistry, unless some obscure and idle speculations about the four elements, as entering into the composition of natural bodies, may be dignified with this appellation. For this a double cause may be assigned: in the first place, it was not the habit of the age to make experiment precede theory; and in the second place, hardly any of the agents that are even the most indispensible in chemical inquiries were as yet discovered. None of the acids were known except the acetic; and of the alkalies, soda was the only one of which even a very imperfect knowledge had as yet been obtained. The conquests of the Saracens, in the seventh and eighth centuries, destructive as they were to the religion and civilization of those countries which they occupied, appear to have given the first ferous impulse to the study of chemistry in the west. Rhazes, Avicenna, Geber, and other Arabian physicians, introduced to the notice of Europe many pharmaceutical preparations, both vegetable and mineral, and made great improvements in the mode of conducting processes, particularly distillations. The three mineral acids were discovered, the vegetable and mineral alkalies were distinguished from each other, the preparation of alcohol was made known, the activity of the newly-discovered menhirs was directed upon the metals, and the golden age of alchemy commenced.

The conversion of the bafer metals into gold was now the object that for the most part occupied the attention of chemists for several centuries, and an immensity of time, labour, and ingenuity was wasted in this visionary pursuit: it was attended, however, with this incidental advantage, that a considerable dexterity of operating was thus acquired, and many new substances and valuable facts were discovered, which perhaps, without this strong incentive, would have remained much longer in obscurity. In the 15th century, when the ardour of alchemy began to decline, a fresh motive for chemical pursuits began to be developed, by the happy application of them to the improvement of medicine. This was chiefly owing to a German monk, of the name of Basilius Valentine, who, in his "Cursus Triumphalis Antimonii," communicated to the public a number of valuable antimonial medicines, and discovered the volatile alkali. The speculators attending these new preparations, the controversy which they occasioned, and the recent discovery of the art of printing,
printing, all contributed to give a vigour to chemistry which it had never felt before; and from this period its progress was rapidly accelerated. Isaac Hollandus, though deeply tincted with alchemical notions, eminently contributed to direct the attention of his contemporaries and successors to the improvement of metallurgical processes, and cleared the way for George Agricola, whose masterly work, "De Re Metallica," liberated metallurgy for ever from the trammels of alchemy, and may be considered as the basis of all the splendid discoveries by which this branch of chemical art has since been illustriated. Among the immediate successors of these three able men occur the memorable names of Lezzuros Ercker, Wolfair, Glaser, Caius, Potters, Van Helmont, Kunckel, Glauer, Kircher, and Conringius, to whom is owing the discovery of a multitude of new substances, principally among the classes of compound facts, as well as many improvements of apparatus, and of those arts, such as glass-making, which are more strictly chemical. A similar praise is due to Beccher, who is still further worthy of notice as the author of certain speculations on inflammable earth, which suggested to Stahl the first hint of that theory which has rendered his name immortal in the annals of chemistry.

A multitude of chemical facts had been by this time discovered, but, from the state of disorderly confusion in which they were, their real value was much misunderstood, and their mutual connexion, as parts of a system, had not even begun to be appreciated. The first traces of a philosophical arrangement of chemical facts occur in the "Exercitium Chemicum" and "Chemia Philoica" of Parner, the latter published in 1675, and the former in 1689, which long continued to be the text books of lecturers in chemistry, in the most celebrated schools of Europe. In 1675, Stahl, professor at Leipsic, wrote a valuable treatise, shewing that the prevalent opinion of acid and alkaline ferments was insufficient to account for a large number of chemical phenomena, and therefore could not be received as the foundation of a philosophical theory of this science; and in 1679, Wedel published a work, entitled "Non Entia Chemica," also with the view of explaining some of the most popular Platonic notions with which chemistry was at this time infected. The way being thus in some degree cleared, and the spirit of experimental investigation gaining ground rapidly, the illustrious Stahl propounded his theory of phlogiston or inflammable earth, in his "Specimen Becherianum," published in 1703, and still more fully in his "Fundamenta Chemiae," in 1723, and thus established himself for nearly 80 years as the acknowledged head of the chemical world. A few modifications of the Stahlian theory, of no great importance, were successively introduced by Boerhaave, Junker, and Machy, and with these chemists rilled content, till the discovery of the gasses and the foundation of pneumatic chemistry by Hales, Black, Scheele, Cavendish, Priestley, Bergman, and Berthollet. An immense crowd of new and highly interesting facts was now offered to the attention of chemists, many of which appeared wholly irreconcilable to the phlogistic theory; and the philosophic geniuses of Lavoisier, demonstrating the falsehood of the popular system, founded a new and more comprehensive one on the affinities and combinations of oxygen with the various substances in nature, which, after a reasonable discussion, has been generally acquiesced in, as explaining a great number of phenomena in a manner much more consonant to the general mass of chemical facts than any other, though by no means entirely free either from difficulty or error.

The system of Lavoisier has been represented by many of his zealous partizans as a general theory of the science; and oxygen, in one form or other, has been considered as the great agent of chemical composition and decomposition. It is manifest, however, that this substance has nothing to do with the mutual action of the metals, the earths, the alkalies, and the simple inflammables, into some of which oxygen enters as an ingredient; not to mention some of the acids and compound inflammables, in which the presence of this principle is rather inferred than demonstrated. It is, therefore, to the higher and more abstrait itquires concerning chemical affinity that we must have recourse for the philosophy of the science, the general principles applicable to the chemical action upon each other of all the substances in nature.

The above sketch is not intended as a history of chemical discoveries, for to give any satisfactory account of these would require more minute detail than would be proper in this place: we have accordingly distributed this part of the subject among the several chemical articles contained in this work, by which much repetition has been avoided, and the historical notices respecting each particular subject and substance have been brought together in one point of view.

The subjects of chemical science are so prodigiously extensive as to require some classification, in order that we may be duly aware of their very magnitude. They may be conveniently arranged under the following heads:

1. General Chemistry, both theoretical and practical. The theoretical includes the philosophy of chemistry, or chemical affinity, and those extensive, but not, properly speaking, general systems, by which ingenious men have at different times, and with various success, endeavoured to link together a large number of chemical phenomena. The practical part comprehends, in general, the action of all the simple substances on each other.

2. Pneumatic Chemistry, the investigation of which requires a peculiar set of apparatus, and includes all the particulars relative to those substances that exist in a state of elastic fluidity.

3. Metallurgical Chemistry, which treats of the alloy of metallic ores, and their reduction to the requisite state, both in the small and great way.

4. Mineralogical Chemistry, or the method of analysing minerals, including under this term both the stony minerals and mineral waters.

5. Animal Chemistry, including the analysis and properties of all the products of animalization, and the consideration of those vital functions which, like respiration, appear to be for the most part decidedly chemical.

6. Vegetable Chemistry, comprehending not only an acquaintance with the products of vegetation, but with such parts of the physiology of plants as can be explained or illustrated by the chemical action of their food, and those atmospheric influences to which they are exposed.

7. Meteorological Chemistry, including the chemical analysis of the atmosphere, and the whole subject of endimometry, as well as the connection of chemical agency, with all the meteoric phenomena.

8. Technical Chemistry, or the principles and processes of those arts and manufactures which are for the most part purely chemical, such as dyeing, bleaching, the manufacture of glases, porcelain, and pottery, tanning, and the preparation of spirituous fermented liquors.

Before a reference to each chemical substance, for the history of its discovery, and the particular theory connected with it, we beg leave to direct the notice of the reader, who wishes for further and more general information, to the articles Acids, Affinity, Chemical, Alchemy, Earths, Gas, Heat, Metals, and Metallization, Oxygen, and Philogiston.
CHEMMIS, in Ancient Geography, a town of Egypt, situated on the eait bank of the Nile, and at a full half league from it. The Greek name is Panopolis, and Chemmis, the Egyptian name, still subsists in that of Berkumin or Achnimin. The remains of the ancient city are yet to be seen to the eaiiflard, and near the walls that surround the modern town. An ancient mosque is still the object of the veneration of the Chriftians, who pretend that it was formerly one of their churches. The Copts fafely affert that it had been built upwards of 1500 years; but the edifice is falling, and its unfafe construction sufficiently proves, that it is not the workmanship of a period when buildings profefled greater solidity. The temple is fafpace, and has feveral entrances; its periphery is faftened by a line of contiguous windows. The interior, like that of all the mosques in this country, is a large, empty, and naaked clofure: but the fafnall granite pillars by which it is supported, and which were taken from among the ruins of Panopolis, excite admiration. This town in its preient state, like all those of Egypt, contains a crowd of pifflefees addicted to the moft diffiguifhing fenfuality, and who, like our street-walkers in Europe, make a trade of felling the famblance of pleasure. The Niles, fays Sommiini, in the vicinity of this town, furnishes fish in great abundance. That which is moft common is the faftetive, a fpecies of Silurus, which grows to a great size without acquiring any addifional flavour. See Achmim.

CHEMNITZ, Martin, in Biography, an eminent Lutheran minifter, was born in 1522, at Britzen in the Marche of Brandenburg, and educated under Melchthon at Wittemberg, after whose death he became the moft celebrated divine of the Auguftian confeflion. Besides his fkill in theology, he was also well acquainted with mathematics and astronomy. His counfel and services were much sought by the Protfeftants princes in all ecclefliallial affairs. His "Examination of the Decrees of the Council of Trent," publifhed at Frankfort in 1583, was held in elevantion as a histo-rical and theological work. He alfo composed a "Harmony of the Gofplets," and feveral other works. At Bruflinweick, where he died in 1586, he was 30 years a profeflor. Mohiheim, E. H. vol. iv.

CHEMNITZ, Bogelfaus-Philip, grandfon of the pre- ceding, was born at Stettin in 1605, followed the profeflion of arms, and having entered fielf into the service of Holland, and afterwards into that of Sweden, was raised by his merit to the post of counfeller of flate and hitlographer. Queen Chriftina emobded him, and prefented him with the eattle of Holinfeld in Sweden, where he died in 1678. His prin-cipal work was a "Hiftory of the Swedifh Wars in Germany," 2 vols. fols. 1648 and 1653, bringing down the his- tory to 1676, and much eelerted, particularly the second volume, which was compiled from materials furnifhed by count Oxentifiem. To Chemnitz is attributed another work entitled "De Ratione Status Imperii Romano-Germanici," printed at Stettin in 1649, under the feigned name of Hippolytus a Lapiide, and impugning the claims of the Houfe of Austria. Moreri.

CHEMNIKT, in Geography, a town of Germany, in the circle of Upper Saxony, and marquisate of Meifen, containing three churches and an hospital; 36 miles W.S.W. of Drefden, and 22 S.W. of Meifen.

CHEMNITZ. See KAMNITZ.

CHEMOSH, in Mofes, an idol of the Moabites, mentioned in Scripture. St. Jerom fuppofes that Chemosh and Baal-Peor, (which fce) were both names of one and the fame idol, not very different from Priapus, which is inferred from the indecent ceremonies used in their worship. Others, however, deny this charge. Dr. Hyde derives Chem-

moh from the Arabic hamaf, which signifies green, (though in the particular dialect of the tribe of Hodali,) oppofing it to have been an althegorical talisman in the figure of a goat, made to drive away thofe infects: and Le Clerc, who takes this idol for the Sun, deduces it fromČamofka, a root in the fame tongue figuring to be ferec.

CHEMOSIS, in Surgery, an inflammation of the eye, accompanied with an effusion of feinous fluid, &c. under the tinea conjunctiva, which confecns the white of the eye, as it were, to overtop the transparent cornes; and thus to produce a force of flux or gap, at their place of union. Galen calls this defect a red and fliely inflammation of the cornes, as it seems to be, when the blood-veffels are greatly dilated.

Lightly afftringent and fadetive applications fhould be employed in this cafe, and, if the veffels be very turrid, it may be proper to puncture them freely with a lancet, or even to remove a portion of the protruding membrane. Dr. Burghart, in a Chemufa where the cornes was burnt, dilated the opening, and extracted the cryftalline lens, which had come forward before the iris. The elevation of the tinea conjunctiva will sometimes be fo confiderable, as absolutely to prevent the flutting of the eyelids. See OPHTHALMIA.

CHEMPSWALLAN, in Geography, a beautirul city of Mexico, fittuated on the coaft of the gulf of Mexico, and remarkable for being that by which the Spaniards entered the Mexican empire.

CHEMUNG, a name sometimes given to the western branch of Susquehanna river. See TIOGA river.

CHEMUNG, a township of Tioga county in the State of New York. It has Newton W. and Oswego E., about 150 miles N.W. from New York city. By the late census in 1796, 51 of its inhabitants were felectors.

CHEN, in Ancient Geography, a town, which according to Steph. Byz., was the country of Myron, or Mifon, one of the seven wife men of Greece. He placed it in the Peloponnessus, in Latiunia.

CHENALOPEX, in Ornithology, the name given by Moching to the great Auk, Alca impennis of Linnaus, Alca major of Briflion, and Grand Pingouin of Buffon. — This bird has the bill fufetted and comprefled, and an oval fpat of white on each fide of the head before the eyes. It is about three feet long, and inhabits Europe and America.

CHENAY, in Geography, a town of France, in the department of the Two Sevres, and chief place of a canton, in the district of Melle; 8 miles S.E. of St. Maixent. The place contains 1036 and the canton 6475 inhabitants: the territory includes 205 kilometres and 14 communes.

CHENCE, in Old Customs, feems to be much the fame as AMBYR.

CHENCOUR, or CHEMCOU, in Geography, a town of Armenia, on the frontiers of Kurgifan, which has a beautirul cafe, grand caravansaries, and feveral mosques; 106 miles N.E. of Erivan.

CHENDI, or CHANDI, a large village of Abyflinia, the capital of its district, in the province of Atbara, the governor of which is called in difcoure Mck El Jaheleen, prince of the Arabs of Beni Korsh, who are all settled about the bottom of Atbara, on both fides of the Magri- ran. In this place there is a tradition, that a woman, whole name was Hendaqne, once governed all that country; whence one might imagine that this was part of the kingdom of Candace; for writing this name in Greek letters, it would be no other than Hendagque, the native, or metrefs, of Chendi or Chandi. This was once a town of great refori, being the place of rendezvous for all the caravans of Shennar, Egypt, Suakem, and Kordofan, especially since the Arabs have cut off the rood by Dong-

8.
gola, and the desert of Bahiouda. Here every thing is cheaper and better than at Sennar, the article fuel excepted, for wood is much dearer here than in any part of Athbara, so that the people burn camel’s dung; but fire, indeed, would be unnecessary, if it were not for dreeing victuals, for the heat is so great that in the month of October the thermometer was once so high as 115°; and in the months of August and September, the weather was so sultry that many pertons dropped down dead with heat, both in the town and the villages round it. Chendi has about 250 hones, two or three of which are tolerable, but the rest are miserable hovels built of clay and reeds. The men of Chendi are called the most beautiful in Athbara, and the men the most renowned. N. lat. 16° 30' 35'. E. long. 3° 24' 45'.
fiie, ovate-lanceolate, obtuse, with a fleshy point, flat above, convex underneath, fiddle-like; upper ones imbricated. *Flowers* axillary, solitary, or in pairs, fleshy in the axil of every leaf towards the top of the branches. A native of the Cape of Good Hope, on the low coast, flowering in August and September; cultivated by Miller in 1728.

CHENONCEAU, in Geography, a town of France, in the department of the Indre and Loire; 2 leagues S.E. of Amboise.

CHENOPODIE, in Botany, the name given by Ventenat to that natural order which Jussieu calls Atriplices. It consists of plants which are most commonly herbaceous, sometimes shrubby, with fleshy roots. *Stems* almost always upright. *Leaves* generally alternate. *Flowers* always hermaphrodite; calyx one-leafed, often deeply divided; flammes of a determine number, inserted into the base of the calyx; germ simple, superior; styles commonly more than one, of a determinate number; stigma one to each style, rarely two. *Seed* generally one, either naked, or covered by the calyx, or enclosed in a pericarp; peripetal fruit, carnosous, central, surrounded by the embryo, which is circular or rolled up in a spiral; radicle inferior. Ventenat places under it the following genera. 1. Funt a berry; *phytolacca*, Mart. 2. *teeth*; *raceme*. Linn. 3. *calyx*; *panicles*. Mart. 4. *stamens*; *rhamnus*. Linn. f. In this volume.

Gen. Ch. Cal. piscians five-leaved, concave, permanent. Cor. none. Stam. filaments five, awl-shaped, opposite to the leaves of the calyx, and of the same length; anthers roundish, didymous. Ptl. germ superior, obicular; style short, bifid, or trifid; stigma obtuse. Peric. the closed calyx, with five compressed angles, deciduous. Seed solitary, len- ticular.

Eff. Ch. Calyx five-leaved, finally shutting close, and becoming a five-angled pericarp. Corolla none. Seed one.

Species.

*With angular leaves.*

teeth above. A native of Chili. It is generally cultivated in Peru, where the leaves are eaten as spinach or forced, and the seeds, as millet. Mixed with the latter, it makes a pleasant kind of beer. Dombey, on his return from Peru, was lavish in its praise as a valuable elixir, and took great pains to naturalize it in France. The seeds which he brought into Europe failed; but the Spaniards are said to have imported some in a better state of preservation, which are likely to gratify the wishes of the public-spirited naturalist.

** Leaves entire.

branched, whitethin. *Leaves* alternate, petiolated, small, covered, especially underneath, with a whitish unctuous meal. *Flowers* small. A native of waife places in England and other parts of Europe, especially near the sea shore; common about London and Yarmouth; flowering in August. The whole plant in its recent state has a nauseous smell, and a strong offensive smell, resembling that of prunted felt fish, and the hands after touching the herb.

To this remarkable factor its medicinal qualities are ascribed by Dr. Cullen, who says that it has been employed with advantage in Scotland as a powerful antispasmodic, and particularly in hysterical affections. He adds that, as it loses all its sensible qualities when it becomes dry, it can be used only in its recent state, when the most convenient formula is that of a conserve. It can, therefore, be only occasionally procured, and in many situations is altogether unattainable.

Peace, Saskatchewan, and Athabasca rivers, and live altogether on venison, have a less healthy appearance than those whose fullness is obtained from the waters. At the same time the savages is wholly unknown among them. In the fall of the year the natives meet the traders at the forts where they barter the furs or provisions which they may have procured; they then obtain credit and proceed to hunt the beavers, and do not return till the beginning of the year, when they are again fitted out in the same manner, and come back the latter end of March or the beginning of April. They are now unwilling to repair to the beaver hunt until the waters are clear of ice, that they may kill them with fire-arms, which the Chepewyas are averse from employing. The greater number of the latter return to the barren grounds, and live during the summer with their relations and friends in the enjoyment of that plenty which is derived from numerous herds of deer. But those of that tribe who are most partial to these do-farms, cannot remain there in winter, and they are obliged, with the deer, to take shelter in the woods during that rigorous season, where they contrive to kill a few beavers, and feed them by young men, to exchange for iron utensils and ammunition.

Till the year 1782, the people of Athabasca sent or carried their furs regularly to Fort Churchill in Hudson's bay; and some of them have, since that time, repaired thither, although they could have provided themselves with all the necessaries which they required. The difference of price paid on goods here and at that factory, made it an object with the Chepewyas to undertake a journey of 5 or 6 months, in the course of which they were reduced to the most painful extremities, and often lost their lives from hunger and fatigue. At present, however, this traffic is in a great measure discontinued, as they were obliged to expend in the course of their journey that very ammunition which was its most alluring object. See the next article.

**Chepewyas, or Chipewan**, a numerous tribe of Indians, in North America, who consider the country between the parallels of N. latitude 60° and 65°, and W. longitude 105° to 110°, as their lands or home. They speak a copious language, of which Mr. Mackenzie (abs infra) has given a specimen, very difficult to be attained, and furnishing dialects to the various emigrant tribes which inhabit the immense tract of country, the boundary of which is as follows. It begins at Churchill and runs along the line of separation between them and the Klallamenas, up the Mississippi to the ile a la Crofe, passing on through the Buffalo-lake, River-lake, and Portage la Loche; from thence it proceeds by the Elk river to the lake of the Hills, and goes directly W. to the Peace river, and up that river to its sources and tributary waters; from thence it proceeds to the waters of the river Columbia, and follows that river to N. latitude 52° 24', and W. longitude 112° 54', where the Chepewyas have the Atnah or Chin nation for their neighbours. It then takes a line due W. to the sea-coast, within which the country is possessed by a people who speak their language, and are consequently defended from them, so that there is no doubt of their progress towards the east. A tribe of them is even known at the upper establishments on the Saskatchewan, and they also follow the Rocky mountains to the east. The number of those who trade with the English does not exceed 500 men, and they have a flattering of the Klallamenas tongued in which they carry on their dealings. Those who inhabit the coast of the Lake Superior and the islands in that lake furnished about 50 years ago 1000 warriors. Other tribes of their nation inhabit the country round Saginquam or Sagara bay and lake Huron, the Pau bay, and a part of lake Michigan.

Of the number of the Chepewyas it is not possible to form a just estimate; but it bears no proportion to the immense extent of their territories, which may, in some degree, be attributed to the ravages of the small-pox. These people entertain singular ideas of the creation. They conceive, that, at first, the globe was a vast ocean, inhabited merely by a bird of large size, whose eyes were fire, whose glances were lightning, and the clapping of whose wings was thunder. On his descent to the ocean, and touching it, the earth instantly rofe, and remained on the surface of the waters. This omnipotent bird called forth the whole variety of animals from the earth, except the Chepewyas, who were produced from a dog; and this circumstance occasioned their aversion to the flesh of that animal, as well as to the people who eat it. The great bird, having finished his work, made an arrow, which was to be preferred with great care, and untouched; but the Chepewyas carried it away, and thus enraged the bird to such a degree, that he has never since appeared. They have also a tradition among them, that they originally came from another country, inhabited by very wicked people, and that they had traversed an extensive lake, narrow and full of islands; and that in their voyage they had encountered many hardships from ice and deep snow, as it was always winter. Upon their first landing at the Copper-mine river, the ground was covered with copper, under a bed of earth, to the depth of a man's height. They further believe, that their ancestors lived till their feet were worn out with walking, and their throats with eating. They describe a deluge, where the waters spread over the whole earth, except the highest mountains, on the tops of which they preferred themselves. It is their opinion, that immediately after death, they pass into another world; and that, when they arrive at a large river, they embark in a canoe of flone, and are carried with a gentle current to an extensive lake, in the centre of which is a most beautiful island; in the view of which they receive that judgment for their conduct during life, which decides their final and unalterable fate. If their good actions predominate, they are landed in the island, and commence an eternal happiness, consisting in the enjoyment of sensual pleasures and carnal gratifications. But if their bad actions weigh down the balance, the flone canoe sinks at once, and leaves them up to their chins in water, to behold and regret the reward enjoyed by the good, and eternally struggling, with ineffectual efforts, to reach the blissful island, from which they are for ever excluded. They have also some faint notion of the transmigration of the soul.

The Chepewyas are sober, timorous, and vagrant, with a selfish disposition, which has occasioned fupicions of their integrity. With regard to their stature, they are seldom corpulent, but sometimes robust. Their complexion is swarth, their features coarse, and their hair lank, but not of a dingy black; nor have they universally the pleasing eye which generally animates the Indian countenance. The aspect of the women is more agreeable than that of the men; but they acquire an awkward gait, from their being accustomed, for nine months in the year, to travel in snows, and to drag fedges from 2 to 400 lbs. in weight. To their husbands, who are sometimes jealous, they are very submissive; and yet, for trivial caufes, the brutal men treat them with such cruelty as sometimes to occasion their death. They are frequently objects of traffic; and the father poififies the right of disposing of his daughter. However, they do not sell them as slaves, but as companions to
those who are supposed to live more comfortably than themselves. The men, in general, extract their beards; though some prefer a bushy black beard to a smooth chin. They cut their hair in various forms, or leave it to its natural long flow, as capriole or fancy juggles. The women wear their hair of great length, and well arranged; unless the jealousy of their husbands cause them to depil it of its tresses, which they consider as a worse punishment than manual correction. Perfoms of both sexes have blue or black bars, or straight lines, from one to four, on their cheeks or forehead, by which they distinguish the tribe to which they belong. These marks are either tattooed, or made by drawing a thread, dipped in the necessary colour, beneath the skin. Their dres in winter is composed of the skins of deer and their faws, and prepared with as much care as the chamois leather in the hair. In summer, their apparel to the same, except that it is prepared without the hair. When they are completely drenched, they will lie down on the ice in the middle of a lake, and repose in comfort; though the following morning they find some difficulty in disengaging themselves from the snow which has drifted on them in the night. When they are in want of provision, they cut a hole in the ice, and seldom fail of catching some trout or pike, the eyes of which they scoop out, and then eat as a great delicacy; but if their appetite is not satisfield, they finish their meal with the fish in its raw state; though they generally prefer the dressing of their victuals, when circumstances admit the necessary preparation: but the want of wood for fuel sometimes reduces them to this exigency, though they generally dry their meat in the sun. The provision called "pemican," on which the Chepewyans, as well as the other savages of this country, chiefly subsist in their journeys, is prepared by cutting the lean parts of the larger animals in thinlices, and placing them on a wooden grate over a flow fire, or exposing them to the sun or to the frost. When the flesh is dry, it is pounded between two flones; and it may then be kept with care for several years. The fat of the indike, and of the rump, is melted and mixed, in a boiling flate, with the pounded meat, and then put in barrels, for the convenience of carriage. This becomes a nutritious food, and is eaten without any further preparation. Another fort is made, with the addition of narrow and dried berries, which is of a superior quality.

The women, when they are travelling, carry their infants on their backs within the folds of their loose garments, in a position convenient for being suckled; nor do they difcontinue to give their milk to them till they have another child. They have a singular custom, when they are delivered, of cutting off a piece of the navel filling of the new born child, and hanging it about their necks, and they decorate it with porcupines' quills and beads. The women, though absolutely subject to the men, are always consulted, and posses a considerable influence in the traffic with Europeans, and other important concerns. Plurality of wives is very common among these people; and marriage is a very simple ceremony. The girls are betrothed at a very early period to those whom their parents think best able to support them; nor is the inclination of the female considered. When a separation takes place, it altogether depends on the pleasure of the husband. In common with the other Indians of the country, they have the custom of excluding women in their pericidal flate from society; they are not allowed in travelling to keep the same path as the men; and it is considered as highly indecorous for a woman in such circumstances to touch any utensils of manly occupation. The subsequent ufe of such defiled utensils would, in their apprehension, be followed by certain mischief or misfortune.

The Chepewyans are not remarkable for their activity as hunters, which is owing to the cafe with which they larme deer and spear fissh. They make war on the Elquiamaus, who cannot relive their superior numbers, and put them to death, as it is a principle with them never to make prisoners. Nevertheless, they hare a vast number of them, who are not fo numerous as themselves, when they treat them as enemies. As these people are not addicted to spirituous liquors, they always posfess a degree of understanding, which enables them to perceive and to pursue their own interest, and this disposition occasions their being sometimes charged with fraudulent habits. They submit with patience to the moat severe treatment when they are conscious of deserving it; but they will never forget or forgive any wanton or unnecessary rigour. Mr. Mackenzie represents them as the most peaceful tribe of Indians known in North America. They have among them conjurers and high privlgs, who operate by their ceremonies on the imaginations of the people in the cure of certain disorders. Their principal maladies are rheumatic pains, the flux, and consumptions. The universal complaint is also very common: and though its progress is slow, it gradually undermines the constitution, and brings on premature death. For the cure of these disorders they have recourse to superstition, and charms are their only remedies, except the bark of the willow, which, being burned and reduced to powder, is strewn upon green wounds and ulcers, and places contrived for promoting perspiration. Of the ufe of simples and plants they have no knowledge; as their country does not produce them.

Although they have no regular government, every man being absolute lord in his own family, they are influenced more or less by certain principles which conduce to their general benefit. In their mutual quarrels they rarely proceed to any greater degree of violence than is occasioned by blows, wrangling, and pulling of the hair; and their abive language conflicts in applying the name of the most offensive animal to the object of their displeasure, and adding the term ugly, and chivy, or ill born.

Their arms and domestic apparatus, besides those which they procure from the Europeans, are spears, bows and arrows, fishing nets, and lines made of green deer-skin thongs. They have also nets for taking the beaver as he endeavours to escape from his lodge when it is broken open.

Their snow-shoes are of superior workmanship; the inner part is straight, the outer one is curved, and it is pointed at both ends, with feet in front turned up. They are also very neatly lined with thongs made of deer-skin. Their fedges are formed of thin strips of board turned up in front, and are highly polished with crooked knives, in order to slide along with facility. The belt wood for this purpose is that which is close grained; but theirs are made of the red or swamp spruce fir-tree. The chief vegetable substance produced by the thin soil of their country is the mea, on which the deer feed; and a fort of rock-mofs, which, in times of scarcity, prefers the lives of the natives. When boiled in water, it diffuses into a clammy glutinous sub stance, that affords very sufficient nourishment. Notwithstanding the barrenness of their country, these people, with proper care and economy, might live with great comfort, as their lands abound with fish, and their hills are covered with deer. However, in the dead of winter, they are under the necessity of retiring to their feasty sheltered woods. To the westward they might find the mulk-ox, but they do not recur to it as an article of subsistence. They have also
also large hares, a few white wolves peculiar to their country, and several kinds of foxes, with white and grey stripes, &c. The beaver and moose-deer they do not find till they come within 60° of N. latitude; and the buffalo is known to frequent an higher latitude to the westward of their country. These people find on the surface of the earth a beautiful variegated marble, which is easily wrought, leaves a fine polish, and hardens with time; it also endures heat, and is manufactured into pipes or calumets, as they are very fond of smoking tobacco, a luxury which was communicated to them by the Europeans.

Their amusements are few. Their music is so inharmonious, and their dancing so awkward, that they seldom practice either. They shoot at marks, and play at the games that are common among them; but they prefer sleeping to any recreation, and their time is spent either in procuring food or in reeling from the toil that is necessary for obtaining it.

Their disposition is querulous; and they express their complaints by a constant repetition of the word "cudly," it is hard, in a whining and plaintive tone of voice. They are extremely superstitious; and almost every action they perform, however trivial, is influenced by some whimsical notion. Mr. Mackenzie never observed among them any particular form of religious worship; but as they believe in a good and evil spirit, and a state of future rewards and punishments, he thinks they cannot be altogether without religious impressions.

The Chepways have been accused of abandoning their aged and infirm people to perish, and of not burying their dead; but these, says Mr. M., are melancholy necessities which proceed from their wandering way of life; and they are by no means universal. In their own country they cannot bury their dead, because the ground never thaws; but when they are in the woods, they cover them with trees. Besides they manifest no common respect to the memory of their departed friends, by a long period of mourning, cutting off their hair, and never making use of the property of the deceased. Nay, many frequently destroy or sacrifice their own, as a token of regret or sorrow. The baronesses of their country might be supposed to lead them to the horrid practice of cannibals; but this is a supposition from which Mr. M. amply vindicates them. "In all my knowledge of them," says he, "I never was acquainted with one instance of that disposition; nor among all the natives which I met with in a route of 5000 miles, did I see or hear of an example of cannibalism, but such as arose from that irreducible necessity which has been known to impel even the most civilized people to eat each other." Mackenzie's Voyages, &c. Introduction.

CHE-PING, a town of China, of the third rank, in the province of Koei-tchenou; 5 leagues W. of Tchi-yaen.—Also, a city of China, of the second rank, in the province of Yoon-nan; 410 leagues S.S.W. of Peking. N. lat. 25° 49'. E. long. 105° 24'.

CHEPO, CHEPO, or ST. CHRISTOVAL DE CHEPO, a small Spanish town of South America, in the country of Terra Firma, and province of Darien, seated on a river of the same name; 1 league from the sea, and 9 E. of Panama; N. lat. 10° 42'. W. long. 77° 50'.

CHEPSTOW, a town of Monmouthshire, England, is seated partly in a deep hollow, and partly on the steep side of a hill, shelving to the river Wye. This river makes a considerable curve here, and at the distance of about two miles, south-west, unites with the Severn. The situation and scenery of Chepnot are extremely picturesque and romantic. From some eminences the marts and falls of

vehicles seem to rise in the midit of an immense quarry; which, with the town crouching in a deep dell, and rising a precipitous hill, form a singularly interflecting mixture of buildings, vehicles, cliffs, water, and woods. The natural features of this place are described by Mr. Coxe in the following terms: "The eminences which tower over the town are thickly overcast with wood; among which the rich groves of Pechfield strikeComparison. The romantic cliff of the Wye are here extremely picturesque, particularly the ridge which forms the left bank of the river below the bridge; it is lofty, perpendicular, of a concave shape, and tinted with various hues; white, grey, red, and yellow are beautifully blended, while green is superadded by the foliage of the oak that skirts the top and shades the sides, or by large clusters of ivy flattering from the crevices at all heights, and twining in all directions. The ponderous remains of the castle form a grand and permanent feature in this diversified scenery; they cover a large tract of ground, and stretch along the brow of the perpendicular cliff which impends over the Wye."

The Romans probably occupied the site of Chepnot as a position commanding for several miles the only passage of the Wye, and we may infer from its name that it was not overlooked by the Saxons. But this part of Monmouthshire, which was then included in the county of Gloucester, came, soon after the conquest, into the possession of the Normans, and the castle of Eltrigionel or Strigul, by which name Chepnot was then known, was erected by William Comes, who is supposed by Camden and Dugdale to be William Fitzalborn earl of Hereford. He was killed in 1070; and his third son, the heir to this castle, being doomed to perpetual imprisonment, it was probably transferred to the illustrious house of Clare, in whose possession we find it in the reign of Henry I. Isabella, the daughter and heiress of Richard Strongbow, earl of Pembroke, conveyed, on the death of her father in 1176, the castle and manor of Strigul, with all his other possessions, to her husband William, earl marshall of England, who, on the death of king John, became protector of the realm, and was created, in right of his wife, earl of Pembroke and Eltrigol or Strigul. By this illustrious nobleman, who, in a period of warfare, exhibited the most heroic prowess, and in an age of rebellion the most unbroken loyalty, the tottering crown of John was supported, the confedecacy of the barons who had sworn allegiance to the Dauphin was dissolved, young Henry was fixed on the throne of his ancestors, and his distracted country blessed with peace. The Earl's five sons dying without issue, his eldest daughter Maud transferred the castle and borough of Strigul to her husband Hugh Bigod earl of Norfolk. But their grandson Roger having surrendered to the crown all the honors and estates of his family, they were granted by Edward II. to his brother Thomas de Brotherton; after whose death the castle and manor of Chepnot defended to the Normans, and were sold by John, duke of Norfolk, to William Herbert, earl of Pembroke, with whose other estates they were conveyed by marriage to Sir Charles Somerset, and are now in the possession of his descendant the duke of Beaufort.

The town of Chepnot was formerly fortified; and the ruined walls, which were strengthened by round towers, reach from the bank of the river below the bridge to the castle, which, at one period, surpassed, in extent as well as importance, any fortress in this part of Great Britain. Its ruins stand on a precipice which overhangs the well bank of the Wye; the northern side, being built close to the edge, appears part of the cliff, and the ivy by which the walls are overgrown.
overlooked, twines and clusters about the unwieldy fragments, and down the perpendicular side of the rock: towards the land a moat defended it, and it was flanked with lofty towers. A very considerable space is occupied by the area, which is divided into four courts: the first contains the shells of the kitchens, grand hall, and other numerous apartments; from the second, which is now a garden, a passage leads into the third, and to a building called the chapel; there was formerly a communication from the third, which is also a garden, to the fourth, to which now the only access is by creeping through a folly-port in the wall. The characteristic style of the architecture appears, from a general survey, to be Norman; the shell seems to have been constructed on one plan and at the same period; but the other buildings have been altered and enlarged by later proprietors. Great importance attached to this fortress during the civil wars, when it was at first garrisoned for the king, till Colonel Morgan, aided by the mountaineers, took possession of the town, and forced the castle to surrender. It was recaptured by the loyalists under Sir Nicholas Kenneys, who, with only 160 men, made a courageous stand against the assaults of Cromwell; but after a laborious siege, it was stormed, and Sir Nicholas and forty of his brave adherents, perished in the attack. At the south-eastern extremity of the first court of the castle is a tower, remarkable as the prison of the celebrated regicide Harry Marten. An early adherent of republican principles, he zealously co-operated with Cromwell in the abolition of monarchy; and on the trial of the king he sat as one of the judges. From the dissolution of the long parliament until the restoration, he remained in obscure retirement, when he surrendered on the king’s proclamation: he was arraigned and condemned for high treason, but his sentence was commuted for perpetual imprisonment, and he was removed to Chepstow castle, where he was treated with great lenity, was allowed the possession of his whole property, and the privilege of visiting the neighbouring gentry. In the twentieth year of his abode here, an apoplexy terminated his confinement and life, at the age of seventy-eight. He was buried in the chancel of the church of Chepstow, where a stone with an inscription of his own writing, was placed over his remains; but the zeal of the vicar not suffering the monument of a regicide to pollute the vicinity of the altar, it has since been removed into the body of the church.

Chepstow is about three miles from the passage over the river Severn at Auft ferry; five from the new passage at Black Rock; fifteen from Monmouth; sixteen from Bristol, and 133 from London. The tide of the Wy flows with great rapidity up to the town. It frequently rives at the bridge to 56 feet, and in January, 176S, it rose about 70 feet; a phenomenon occasioned by the projection of the rocks at Beachley and Auft, which turns the tide with great violence into this river. The floor of the bridge, constructed similar to that of Caerleon, is level; and was formerly supported by wooden piers, about the height of 40 feet, which the counties of Gloucester and Monmouth jointly contributed to keep in repair. They remain in their original state on the Glocestershire side, but those piers have been substituted on the opposite shore. Part of it belongs to the county of Glocester, and part to Monmouthshire.

Chepstow contains no manufactories; but supplies Herefordshire and this part of Monmouthshire with the necessary imports by the Wy, and exports the native productions, which are principally timber, grain for the Bristol market, coal, grind and mill-stones, iron, oak-barks, and cider. A considerable foreign trade is carried on during peace, and some vessels are built here. An alien priory for Benedictine monks (of which scarcely any traces remain) was founded here soon after the conquest, by one of the proprietors of the castle. The parish church was part of the priory chapel, and displays a curious specimen of Norman architecture. Its western entrance is a magnificent portal, enriched with the mouldings peculiar to the Saxon and Norman styles. In the neighbourhood are the remains of several religious houses. A pleasant eminence to the west of the town was occupied by St. Kyemark’s priory; the walls of which, still visible, enclose the garden and yard of a farm-house, called St. Kyemark’s farm. The foundations of St. Lawrence’s chapel may also be traced. The traveller, in passing to this spot along the fliere Newton road, and along the fields, commands a singular and beautiful prospect of Chepstow and its environs. The remains of several other chapels still exist. In the garden belonging to a house in Bridge-street, is a well remarkable for good water, which at high tide becomes perfectly dry: a little before which it begins to subside, and soon after the ebb it returns; neither wet nor dry weather affects it, but its increase and decrease regularly correspond with the tide. The well, which is thirty-two feet deep, has frequently fourteen feet of water.

About two miles north of Chepstow is Llerefield, a seat of much celebrity, and a just theme of a descriptive encomium with the tourists and topographers of Monmouthshire. The grounds are extensive, and embrace much diversified scenery of wood, lawn, rock, and river. Stretching along the irriguous banks of the Wy, from the castle at Chepstow, to a lofty perpendicular rock called the Wynd-cliff, is a walk of about three miles in length: the prospects from which, and its accompanying scenery, are described in the following terms by Mr. C. X. “On entering the grounds at the extremity of the village of St. Arvans, and at the bottom of Wynd-cliff, the walk leads through plantations, commanding on the right a distant view of the Severn, and the surrounding country; it penetrates into a thick forest, and conducts to the Lover’s Leap, where the Wynd-cliff is seen towering above the river in all its height and beauty, and below yawns a deep and woody abyss. It waves almost imperceptibly in a grand outline, on the brow of the majestic amphitheatre of cliffs impending on the Wy opposite to the peninsula of Llanwit, then crosses the park, runs through groves and thickets, and again joins the Wy, at that reach of the river which stretches from Llanwit to the castle of Chepstow. From the Lover’s Leap the walk is carried through a thick mantle of forests, with occasional openings, which here not the result of art or design, but the effect of chance or nature. This bowery walk’s connection to the genius of Piozchel; the screen of wood prevents the uniformity of a bird’s eye-view, and the imperceptible bend of the amphitheatrical conveys the spectator from one part of this fairy region to another without discovering the gradations. Hence the Wy is sometimes concealed, or half obscured by overhanging foliage, at others wholly expanding to view is seen sweeping beneath in a broad and circuitous channel; hence at one place the Severn spreads in the midst of a boundless expanse of country, and on the opposite side to the Wy; at another, both rivers appear on the same side, and the Severn seems supported on the level summit of the cliffs which form the banks of the Wy. Hence the same objects present themselves in different aspects, and with varied accompaniments; hence the magic transition from the impervious gloom of the forest to open groves; from meadows and lawns to rocks and precipices,
pieces, and from the mild beauties of English landscape to the wildness of Alpine scenery."

The house erected on this estate is a magnificent pile of building, of freestone, and stands nearly in the centre of the park. Piercefield was long the property of the Waters family, till the year 1756, when it was sold to Colonel Morris, father of Valentine Morris, Esq. who afterwards possessed it, and to whose taste and liberality it is indebted for its chief artificial beauties, and its long established celebrity. In 1784, it was bought by George Smith, Esq. who again sold it in 1794 to Colonel Wood, formerly chief engineer at Bengal. This gentleman has recently disposed of Piercefield to -- Wells, Esq.

For the most recent account of this feat, of Chepeflow, and this county, see Coke's "Historical Tour in Montgomeryhire." 2 vols. 4to.

CHEQ., CHEF, or SHERRIFE, the prince, or high-priest of Mecca; sovereign pontiff of the Mussulmans; and owned by each as such by all the sects into which they are divided.

The grand signor, sophies, mogolas, khanas of Tartary, &c. fend him yearly presents; especially tapestry, to cover Mahomet's tomb, and treats for himself: for the cheq. has a tent near the mosque of Meccan, wherein he lives during the seventeen days of devotion in pilgrimage to Mecca. The tapestry and tent are changed every year, and pieces thereof sent to the princes who furnish new ones.

His dominions are extensive; and his revenue is very considerable, consisting of presents made by the Mahometan princes, and pilgrims, to the mosque of Mecca and Medina. See Sherrife.

The cheq. subsists all the pilgrims during the seventeen days of devotion; on which account he is every year furnished with a very considerable sum of money from the grand signor: the better to obtain this, he makes them believe, that there are constantly, during this time, seventy thousand pilgrims; and that, should the number fall short, the angels, in form of men, would make it up.

CHEQUETAN, or SEGUITANEO, in Geography, a town of North America, on the coast of Mexico, in the province of Mechochan, 7 miles W. of the rocks of Seguitaneno. Between this and Acapulco towards the east is a sandy beach, 18 leagues in extent, against which the beating of the sea is so violent as to prevent boats from landing; nevertheless there is a good anchorage for shipping at a mile or two from the shore, during the fair seasons. The harbour of Chequetan, though hard to be traced, is very important to vessels that cruise in these seas; as it is the most secure in a vast extent of coast, yields plenty of wood and water, and may be defended by a few men. When lord Anfon touched here, the place was uninhabited.

CHER, a river of France, which rises near Auzouze, in the department of the Cerefe, pannes by Mountluqon, Aimay-le-Vieux, St. Amand, Chatcaunef, St. Florent, Vierzou, Meneton, Villefranche, Chabris, Selles, St. Aignan, Montsche, Biere, &c. and joins the Loire a few miles below Tours.

CHER, a department of France, deriving its name from the river Cher, which traverses a part of it, and bounded on the north, by the departments of Loire and Cher. Loiret and Nievre; on the east, by that of Niort, from which it is separated by the Acher; on the south, by those of Creuse, Allier, and Indre; and on the west, by those of Indre, Indre et Loire, and Indre and Cher. This department is formed of part of the province of Berry, and its capital is Bourges. The territorial extent comprehends 7785 kilometres, or about 740,125 hectares, or 1,450,134 square acres; and is distributed into three districts, contain-

ing 29 cantons and 327 communes. The population was estimated in the 11th year of the French era at 2,193,957 persons; its contributions to various purposes amounted to 1,732,073 francs; and the expenses charged upon it for administration, justice, and public instruction, were 265,025 francs 79 cents.

CHEREA, a river of South America in the province of Quito, in Peru, passing near Colan, and supplying Paota with its fresh water.

CHERELUS, in Ancient Geography, a small town of Lower Egypt, situated upon the Nile, from which a canal passed to Alexandria, that served to discharge the water of the lake Moeris.

CHERAMIS, in Antiquity, a medical measure. According to Eroton on Hippocrates, it was the hollow of a shell-fish called myas, and took that name from myasos, which signifies a hollow plate. It frequently occurs in Hippocrates, and seems not much different from the chema, which in Galen's Exegeysis is expanded by it. Cornavus also explains cheramis by the measure of a chema; and Calvus on another passage expands it by a pugil.

CHERASCO, in Geography, a town of Italy, in the principality of Piedmont, and capital of a county of the same name, on the borders of that of Afti, seated on a mountain, at the confluence of the Stura with the Tanaro. It is said to have been built by some inhabitants of Alba, Maenza, Miana, &c. who were expelled their towns by the tyranny of their lords, and surrounded with walls. It was afterwards fortified in the modern manner with bastions, fosses, and out-works, by order of Crislina of France, duchess of Savoy. Since that time it has been considered as the key and bulwark of the estates of Savoy, being situated on the frontiers of Piedmont, Montserrat, and the duchy of Milan, and strong both by nature and art. It was at first a republic, governed by its own laws, but professing dependence on the emperors of Germany. Cherasco continued in this flourishing state till the year 1265, when its allegiance was transferred to Charles I. of Anjou, king of Naples and Sicily; and it remained subject to that crown till the reign of Jane I. queen of Naples, when, left destitute of her protection, it was voluntarily surrendered to Amadus VI. count of Savoy, and Jacques de Savoy, prince of Achala. In a few years it became successively subject to other powers, till at length it was possessed by Charles V., who gave it, in 1538, to Charles III. duke of Savoy, lamed the Good, in consideration of his marriage with Beatrice of Portugal. After having been taken in the same century by the Austrians and the French, it was restored by the peace of Cambray, in 1559, to Emanuell Philibert, son of Charles. Victor Amadeus gave it the title of city, and made it the capital of a province and residence of a governor. It has, together with the whole of Piedmont, at a late period, fallen into the hands of the French. See Piedmont. This town is in the diocese of Alii, and has 7 parish churches, 4 within the walls, and 3 without. The county, of which it is the capital, is about 9 miles in diameter; the land is fertile; the plains produce great plenty of corn, and the hills of various heights yield good wine for exportation. It is 20 miles S.E. from Turin, and 15 miles E. from Saluzzo. N. lat. 44° 33'. E. long. 7° 41'.

CHERAW HILL, a mountain of North America, in the state of South Carolina; 40 miles N.N.E. of Charleston.

CHERAWS, a district in the upper country of South Carolina, bounded on the north and north-east by North Carolina; on the south-east by Georg-town district; and on the south-west by Lynche's creek, which separates it from Camden district. Its length is about 87 miles, and its breadth 63; and it is subdivided into the counties of Darlington,
ten, Chafferly, and Marlborough. By the census of 1791, the number of inhabitants appeared to be 10,706; of whom 7,616 were whites, and the rest blacks. It tends to the flat
legibility, fix representatives and two senators, and in con-
junction with George town district one member to Congress.
This district is watered by Great Pedie river and other
smaller streams; on the banks of which the land is popu-
larly cultivated and well cultivated. The chief towns are
Gren-
ville and Chatham.

CHERBOURG, a sea-port town of France, in the de-
partment of the Channel, and chief place of a canton in
the district of Valognes; situated at the bottom of a large bay,
between Cape Barfleur and Cape Hogue. The place con-
tains 11,189 and the canton the same number of inhabitants.
The territory comprehends 175 square kilometres and one commune.
Before the revolution, Cherbourg was the seat of a governor
and an admiral. The chief employment of the inhab-
itors consists in building small vessels, and manufacturing
wooden flints. In 1758 this town was taken and plundered
by the English; the port destroyed, and the ships burned in
the harbour. The French have always considered this port
of great importance in the navigation of the English Chan-
nel; and they have expended immense forces on the erection
of piers, deepening and enlarging the harbour, and erecting
fortifications. The value of 900 tons can be admitted in high-
water mark, and in low-water thole of 270 tons. N. lat. 49° 38' 26". W. long. 1° 38' 11".

CHERCHESENE, a town of Arabic Turkey, in the
province of Cudilian; 62 miles S. of Kerkuk.

CHEREM, or SHARIF, a title assumed by the emperors
of Morocco.

CHEREM, among the Jews, is used to signify a species
of Annihilation.
The Hebrew word cherem signifies properly to destroy, ex-
terminate, devote, anathematize.

CHEREM is sometimes likewise taken for that which is con-
secrated, vowed, or offered to the Lord, so that it may no
longer be employed in common or profane u ses. There are
some who assert, that phenons thus devoted were put to
death; whereof, they say, Jephtha's daughter is a memor-
able example. Judg. xi. 29, &c.

CHEREM is also used for a kind of excommunication in use
among the Jews. See Ninou.

CHEREN, in Ornithology, the Arabian name of the
king-fisher, Alcedo Ipida.

CHEREN (Athanar., in Geography, a town of ChinefeTar-
tary. N. lat. 41° 32'. E. long. 116° 31'.

CHERIDON, one of the four empires or kingdoms into
which the island of Java is divided: the other three are
Bantam, Jacatra, and Socofhoenam. Cheridon is under
the dominion of three different princes, who are independent
of the Dutch, and fojourn in their respective districts.
Whilst the company possessed power in the island, the princes
of Cheridon were their allies, and bound, by treaty, to sell
the whole produce of their territory exclusively to the com-
pany, and not to permit any other nation besides the Dutch,
to enter their dominions. For the due maintenance of which
conditions, the company took care to guard and garrison
their sea-ports. The company, on former occasions, has ex-
ercised a kind of despotic power over these princes; de-
throne one, and establishing another in his room. An in-
stance of this kind occurred in the commencement of the
year 1760; when one prince was dethroned and banished to
the island of Amboyna, and the elevated prince constrained to furnish a certain sum of money an-
nually, for the support of his imprisoned predecessor.

CHERIC, in Ornithology: the Gmelinian Motacilla Ma-
dagascariensis is so called by Buffon; named by Latham the
white-eyed Warbler.

CHERI-KIAMEN, in Geography, a port of Chinefe Tar-
tary; 15 miles S.E. of Petour Hoton.

CHERI-OUJOU, a town of Chinefe Tartary; 8 miles
S. of Chou.

CHIAPPE, an inconsiderable village of S. America, in
Terra Firma, which furnishes the weekly market of Pa-
uma with provisions.

CHIERNAY, in Ornithology. See Falco.

CHLILLA, in Botany, (so called in honour of J.
Henry Cherler, Linian-in-law and ajistant to John Bauhin,
88. Juss. 301. Vent. vol. 3. 234. Clas and order, dec-
Gen. Ch. Cal. Perianth five-leaved; leaves lanceolate, con-
erved, keeled, flat, expanding. Cor. Petals none, Hall.
Linn. Lam. Smith. (five, strap-shaped, green, Segn.) Nect-
taries five, very small, exarinate scales. Stam. Filaments
five; attached to the scales of the nectary; five alter-
ating with the calyx-leaves, inserted into the receptacle be-
tween the scales. Pelt. Germ superior, 5yles three. Peric.
Capsule egg-shaped, twice as long as the calyx; three-
valved, three-celled, with three seeds. Linn. Lam. &c. (one-
celled, with many seeds, Smith.) Seeds angular.

Eff. Ch. Calyx five, in-flower; stamens 5; stigmas 5, emer-
ginate; capsule superior, three-valved.

tab. 12. fig. 8. Sedum montana; Morif. Hift. tab. 4.
fig. 14.) Root perennial, long, somewhat woody, much
divided. Stems forming a tuft, an inch long, thickly
bent with leaves. Leaves awl-shaped, obtuse, thre-
ethreaded underneath. Flowers yellowish, green, erect.
Petals equal, axillary, towards the top of the inflo-
remulous; inflorescence, flowering in July and August.
First observed in Great Britain by some of Dr. Hope's travelling pupils.

CHERMANSICK, in Geography, a town of Arabic
Turkey; in the province of Nataoa; 50 miles N.N.E. of
Miilts.

CHERMES, in Entomology, a genus of hemipnerous
insects. The snout is placed in the breast, and contains three
inflected bristles; antennae cylindrical, and longer than the
thorax; wings four, deflected; thorax gibbous; posterior
legs formed for leaping.

There are many species of the chermes genus, some of
which are peculiar to particular plants, while others inhabit
a variety of plants indiscriminately. The females are fur-
nified with a sharp tubular instrument at the extremity of
the abdomen, with which they pierce the leaves of the
willow, ash, oak, fir, and other trees, in order to deposit
their eggs beneath the surface, and by these punctures oc-
cur the swellings or excrescences of various fleshes, which
are commonly known by the name of tree-galls. These galls
contain the infant brood of chermes, both in the larva and
pupa, as well as egg flate: the larva has fix feet, and is ge-
nerally covered with a kind of hairy or woolly subfusce,
and the pupa is distinguished by two protuberances of the
thorax which contain the embryo wings. In the perfect or
winged state the chermes leap or spring with great agility.
Geoffroy, who names several of this tribe of insects Pfylia, ob-
erves, that both in the larva and pupa they eject from the
vent a fugar-like subfusce of a white colour, and much re-
sembling
fleeting manna: sometimes this matter occurs in the form of small white grains upon the leaves of plants, and is often seen attached to the posterior extremity of the insect's body. The galls occasioned by these insects are useful for various purposes. Some late French writers comprehend the two Limenian genera, cermes and coccus, under one, denominated Kerme.

[Species.]

GRANIVIS. Found on grasses, particularly the atra favo- 
ofis, Linn. Inhabits Europe.

ULM. On the atri flavofinis, Linn. In the emerald leaves of this tree.

CERASTH. On the leaves of the american, ferracum, Linn. 

PYR. On the leaves of the petrus communis, Linn. In- pects. Cermes pravi of Deguer. This is of a brownish-green colour, with inky spots and bands; it has the wings spotted with brown.

SORE. On the Sorbus aucuparia. Fabr. Above varied with black lines and characters; beneath greenish; thorax yellow; with two dots in front, and four black lines behind.

PERIC. On the amygdaes ferosa, Fabr. Cermes ferosa oblongus, Geoffr. Le cermes oblong du ynier. This is chiefly on the branches of the mygdales picus; the body is oblong and ferruginous.

CALYX. On the flowers of caltha palustris, Fabr. Antenna black at the tip; thorax rufous with three black curved wings white, with yellow veins and a brown dot.

BUX. On the box, and other ever-greens, Fabr. This is of a green colour, with facetous antenna, and the wings yellowish brown. The punctures of this insect make the leaves bend in towards each other at their extremity, forming a hollow knob in which the larvae are enclosed.

URTICA. On the urtica dioica, Linn. Inne. Suce. This is of a green or fuscous colour with the sides of the abdomen spotted with white.

BETUL. On the branches of the betula alba, Linn.

ALNI. On the Ithaca alni, Linn. Cermes alni lanata viridus, Deguer. Verris ffloridae alni, Frisch. The antennae are variegated with white and black; front white tipped with black; body whitish; wings white with brown veins.

'QUECUS. On the oak, Linn. Inne. Suce.

FAG. On the fagus sylvatica, Linn. Inne. Suce.

ACEIETIS. On the branches of Ipinacatis, Linn. et Cappon, &c. Iphisa pallida: ferrina ovula fufa, als agris, Geoffr. Iphisa tendue, ferrina ovula fufa, als agris, Geoffr. Iphisa tendue, ferrina ovula fufa, als agris, Geoffr. Pitcairp. Chin. This species occasions by its puncture enormous fleshy swellings or protuberances at the end of the branches of the pine.

SALICIS. On various species of Salix found in Europe, Fabr.

TRAUX. On the fraxinus excelsior, Linn. This is of a black colour varied with pale yellow.

AVCRIS. On the branches of acer platanoides, Linn. The body is yellowish, beneath green; tail andapplied and brownish.

FICUS. On the ficus carica. Fabr. The body is brown; antenna thick and hairy; wings brown, nerved.

LICHERIS. On various species of lichens, Gmel. &c. This is of a fuscous colour dotted with black, and has the antennae longer than the body; the wings are spotted with brown.

PISI. Linn. Inhabits pines. It is not perhaps distinct from C. abietis.

CASTANEA. Fuscous; antenna facetous and smooth; wings nervous, Geoffr. &c. Inhabits various plants.

PUBERS. Red; wings nervous, Geoffr. Inhabits various plants.

VOL. VII.
null
CHERSA, called also *fcula*, in some medical writers, signifies a root reduced to a farinaceous powder. This way of preparation is said to be of the highest antiquity, and is recommended by Galen, and other ancients.

CHERSATUM, in *Old Caftoria*, is used for *churnerettes*. See CHURCH-SCOT.

CHERSUS, in *Ancient Geography*, a river placed by Ptolemy in Phoenicia; the mouth of which, according to him, lay between Dora and Cefarea of Strabo, which were towns of Palæstina.

CHERSO, in *Geography*, an island of the Adriatic, on the coast of Croatia, about 150 miles in circumference. It is mountainous and rocky: nevertheless it yields much wood, cattle, wine, oil, and honey. It belongs to the Venetians, who send a nobleman as governor every two years, with the title of count or captain, who resides at the capital, situated in the centre of the island, which has the same name, and contains about 2500 inhabitants. N. lat. 43° 14'. E. long. 14° 26'.

CHERSON, or KHERSON, a town of Russia, in the province of Catherinefief, seated on the Dnieper, about 14 versts below the mouth of the Inglitza, and a little above the mouth of the Bog, in the neighbourhood of the Liman, a swampy lake, the entrance of which is guarded by the fords of Kinburn, and is about a mile over. This lake has depth sufficient for the reception of large vessels; but they very quickly decay in it, as the water is fresh. The ancient city of Cherfon was situated some miles to the south-west of the spot, where the Russians have built Swatopul. The present Cherfon was founded by Catherine II. in 1778: it is chiefly built of hewn stone, and the completion of it was much accelerated by the activity of Prince Potemkin. It was intended to be the principal mart for all the commodities of export and import; but if an extensive trade should take place in this quarter, the great depotary for the merchandise would be more conveniently fixed on some spot below the bar of the Dnieper, and 12 miles S. of Cherfon. In 1783 Cherfon contained 40,000 inhabitants within its walls: and from its dock were launched not only vessels for the purposes of commerce, but ships of war destined to strike terror into the Ottoman empire. A new town, however, called Nicolai, now the principal dock, was built by Potemkin, on the confluence of the Inglitza and the Bog. The port and city of Cherfon have not perhaps been equalled with regard to celebrity, prosperity, and importance, if we consider its recent building, by any colony of modern times. Artisans, manufacturers, and merchants, have poured into it from all quarters, and the trade seems not to be so great as when it shall rank as the second port in the extensive empire of Russia. Its commerce was, if we may be allowed the expression, guaranteed and secured to the emperors by the cession of Kinburn, which lies opposite to Czakow, at the mouth of the Dnieper. Cherfon is celebrated as the place where the empress Catherine principally resided during her memorable journey to the Crimea, when the Turkish faction of the provinces conquered from Turkey, and where she was visited by the emperor Joseph II. It is also on record as the place where the illustrious Mr. Howard closed his career of humanity and benevolence on the 20th day of January 1750. It is distant about 10 leagues from Oczikow and 2500 versts from Petersburgh. N. lat. 46° 40'. E. long. 33° 57'.

Chersonesus, *Nisusov*, of *Nisos*, land, and *mors*, island; which signifies the same, in Geography, as peninsula; or a continent almost encompassed round with the sea, only joining to the main land, by a narrow neck, or isthmus.

This term is used by the moderns, in compliment to the ancients, who called all their peninsulas by this name: accordingly such places as were hereby distinguished among them retain the name among us: as the Cherfonesus of Peioponnesus, of Thrace, Cherionesus Cimbrice, Aurea, &c. Chersonesus Aurea, the golden Cherfonese, in *Ancient Geography*, a peninsula delineated by Ptolemy as if it stretched directly from north to south, and having at its southern extremity Sabana Emporium, the latitude of which he fixes at three degrees beyond the line. To the east of this peninsula he places what he calls the Sinus Magnus, or great bay; and in the most remote part of it, the flaton of Catigara, the utmost boundary of navigation in ancient times, to which he affixes no less than 84° of southern latitude. Beyond this he describes the earth to be altogether unknown, and affirms that the land turns thence to the westward, and stretches in that direction till it joins the promontory of Prafilum in Ethiopia, which, according to his opinion, terminated the continent of Africa. M. D'Anville, who has attempted to bring order out of the confusion in which this part of the geography of Ptolemy is involved, assigns to the peninsula of Malaca the position of the golden Cherfonese of Ptolemy; but, instead of the direction which he has given it, we know that it bends some degree towards the east, and that cape Romania, its southern extremity, is more than a degree to the north of the line. This geographer considers the gulf of Siam as the great bay of Ptolemy; but the position on the east side of that bay, corresponding to Catigara, is actually as many degrees to the north of the equator as Ptolemy supposed it to be south of the line. Major Rennell has given the function of his approximation (Intro. p. 39,) to the geographical ideas of M. D'Anville, and they have been generally adopted. But M. Goellin has lately published "The Geography of the Greeks analyzed, &c." in which he differs from M. D'Anville, with respect to many of his determinations. According to M. Goellin, the Magnus Promontorium, which M. D'Anville concludes to be cape Romania, is the point of Brugia (which see), near to which he places Zab, supposed by M. D'Anville to be situated on the strait of Sincapura or Malaca. The Magnus Sinus of Ptolemy he maintains to be the same with the gulf of Marathan, and not the gulf of Siam; and the position of Catigara corresponds, as he attempts to prove, to that of Mergui, a considerable port on the west coast of Siam. Thins or Sima Metropolis, which M. D'Anville removes as far as Sin-hua in the kingdom of Cochlin-China, is situated, according to M. Goellin, on the same river with Mergui, and now bears the name of Tana-ferrum. The city of the infola of Ptolemy, which M. D'Anville determines to be Sumatra, is, by Goellin's arrangement, one of that cluster of small islands which lie off this
this part of the coast of Siam. M. Gueffelin conceives, that the ancients never sailed through the straits of Malacca, had no knowledge of Sum ter, and were altogether unacquainted with the eallem ocean. With regard to the golden Chersonese of Ptolemy in particular, he observes that what chiefly characterizes it is the mouth of a large river, which there divides itself into three branches before it joins the sea. Thudie chain is so considerable that each of them bore the name of a river, the Chryseos, the Panderan, and the Attabas. It does not appear that Ptolemy knew the source of this river, or that he had any knowledge of the interior of this country, as he does not determine the position of any place. Without detailing the other arguments of M. Gueffelin, we may observe, that upon comparing Ptolemy’s map with that of the country, there seems little reason to doubt that the golden Chersonese is the southern part of the kingdom of Pegu, which may be considered as inhabited. In the southern part of the Malayan peninsula, which has hitherto been regarded as the Golden Chersonese, the river John is so small a stream, that it is about the size of one of the streams noted by Ptolemy; and his delineation of the country of the Sinu, stretching along a western sea, palpably corresponds with Tana-ferim; while M. D’Anville’s map so much contradicts that of Ptolemy as to place the sea on the east of the Sinu, and proceeding towards the north instead of the south. Moreover, the rivers laid down by Ptolemy, between the mouths of the Ganges and the Delta of the golden Chersonese, amount to three; of which three appear in our maps, but we are ignorant of the southern part of Arraca, which probably contains the other two. The three chief mouths of the Jrawaddy, in the map of Mr. Dalrymple, feebly correspond, even in the form and manner of division, with those in the golden Chersonese of Ptolemy; and the bay to the south of Dalla Isims is the Perimulous Sinus of the Greek geographer, the small river to the east of which is that of Sirian or Pegu. If the Malayan peninsula had been the golden Chersonese of the ancients, the ancient geographer could not have been wholly ignorant, as he seems to have been, of the straits of Malacca, and of the northern part of the great land of the emperors. Many have thought, but without sufficient reason, that the Ophir of Solomon was situated in the golden Chersonese. See ORMIN.

CHERSONEUS Cimbria, a peninsula of Europe to the north of Germany, fappende to have derived its appellation from the Cimbri who came from thence, and now called Jutland; which see. From this peninsula, bounded by the river Elbe on the south, by the German ocean on the west, and by the Baltic sea on the north and east, those people came into Britain, from whom the great body of the English nation is descended. When the unhappy Britons formed the fatal resolution of calling in foreign auxiliaries to preserve them from that destruction with which they were threatened by the Scots and Picts, they could find none nearer than the inhabitants of this peninsula, who were likely to afford them necessary succour and protection; for they were their nearest neighbours and natural allies, the Gauls, who spoke the same language, and professed the same religion with themselves, were in no condition to give them any assistance; having been invaded, and almost conquered by the Franks, another German nation. The country above-mentioned, to which the Britons directed their views for relief in their distresses, was at that time inhabited by three nations, which were called Saxons, Angles, and Jutes; who sent armies into Britain, and here obtained settlements. From these three nations the English in general derive their origin; though several other nations, particularly Danes and Normans, have since mingled with them in very great numbers. See ANGELS, JUTES, and SAXONS.

CHERSONEUS Magna, a port of Africa, in Marmarica, near the port called Phuthus. Sclavas places it opposite to the island of Crete. The great Chersonesus of Ptolemy is supposed to be the present Cape Raccalldino in the kingdom of Barea; so called because it forms a peninsula. M. D’Anville places it on the coast N.W. of Marmarica, at some distance S.E. from the pr montary Drepanum.

CHERSONEUS Taurica, a port or castle of Egypt, mentioned by Ptolemy and Strabo; and placed by the latter at the distance of 75 stadia S.W. from Alexandria, on a part of the coast which formed a small promontory.

CHERSONEUS Taurica, Græca, a considerable peninsula of Europe, lying between the Euxine sea, the Palus Maccot, and the Bolphorus Cimmerus; extending, according to Sir John Chardin, 67 leagues from east to west, and about 35 from north to south; and joined to the continent by a narrow promontory called the Bolphorus or Bosphorus. In very remote times this peninsula was governed by its own sovereigns. Its most ancient inhabitants were the Tauri, or Tauroctythes, as Phus and Ptolemy call them, and from them it derives its appellation. The mythologists refer to these remote times the first voyage of the Greeks into Taurica. In process of time the Greeks traded here and founded cities. Mithridates, king of Pontus, possessed the peninsula, and it is said, drew from it annually a tribute of 2,263,300 measures of grain, and 200,000 talents in silver. It was conquered by the Romans, and given by them to the kings of Dolporus. Some of the easter tribes of Asia, known to us by the name of Huns, established themselves here, and many of them remained till the time of the emperor Julian. It afterwards passed to the princes of the family of Genghizian. The cities of note in former times were Taphor or Taphphas on the illiumis, where Przekop or Przecop now stands; Cherfonesus, or Chefon; Theodorus, afterwards called Cafs, but now known by its ancient name; Nymphza, Lagryza, and Cimlux, seated on the Euxine sea, and Pantopcaura on the Bolphorus or Bosphorus.
the opinion of the oracle, which they had consulted. Upon this, Miltiades engaged a number of the Athenians to accompany him to the Cheironion, and the Delphics immediately invited him with the foreign power. He began his reign with erecting the wall which separated the plain from the continent. At his death, he bequeathed the sovereignty to his nephew Stilacoras, who was infallitated; and when this disastrous event occurred, the Phitalatrices sent Miltiades, the son of Canon, and brother of Stilacoras, in take possession of the government of the Cheironion. At length the Athenians lost this peninsula; and under the kings of Macedon, after Alexander, it belonged to Thrace, and made part of their kingdom.

CHERBSDUS, Χέρσος, an amphibious serpent; so called, because it lives first in watery places, whence it is called hydros; after which it shifts its habitation, and lives on dry ground, and thence has its compound appellation cherbysdrus.

CHERT, in Mineralogy. See Horn floss.

CHERTBALUS, in Ancient Geography, a town of Upper Pannoni, situated near the Danube.

CHERTSEY, in Geography, a town of England, in the county of Surrey, situated near the banks of the Thames; 20 miles W.S.W. of London. This town was formerly the residence of some of the Saxon kings, and the first burial place of Henry VI, who was afterwards removed to Windsor. Here was formerly an abbey, founded in 1064; of which, only part of the walls now remains. It has a weekly market on Wednesday.

CHERUB, or Cherubim, a celestial spirit, which, in the Hierarchy, is placed next in order to the cherubim. The word is formed of the Hebrew דְּכָרְבָּא, cherub; the plural whereof is cherubim. In Hebrew, this term is sometimes taken for a calf or an ox. In Syraic and Chaldean, the word cherub signifies to till or plough, which is the work of oxen. It also denotes strong and powerful, implying the strength of an ox. According to Grocyn, the cherubim were figures resembling a calf. Doctart and Spencer think they were similar to the figure of an ox. Josephus mercy says, that they were extraordinary creatures, whose figure was unknown to mankind. Clemens of Alexandria is of opinion, that the Egyptians imitated the cherubism of the Hebrews in their sphinxes and hieroglyphical animals. The figure of the cherubism was not always uniform, since they are differently described in the shapes of men, eagles, oxen, lions, and in a composition of all these figures put together. Moses likewise calls these symbolical or hieroglyphical representations, which were reprented in embroideries upon the vails of the tabernacle, cherubim of costly work. Such were the symbolical figures which the Egyptians placed at the gates of their temples, and the images of the generality of their gods, which were commonly nothing but figures composed of men and animals.

There were two cherubim that covered the mercy-seat are represented by Moses as extending their wings on both sides, and looking upon one another with their faces turned towards the mercy-seat, which covered the ark. It would afford our readers little instruction or entertainment to introduce in this article the fanciful conjectures of the Hachtschiera, with regard to the form or import of the Hebrew cherubim; or to detail the result of the researches of Mr. Parkhurst, in his Hebrew lexicon, which this writer, who has minutely traced in the cherubim figures emblems or representations of the three persons in the Trinity. That the cherubim were hieroglyphical or emblematical figures, composed of the various parts of different animals, is unquestionable. Each cherub had four heads or faces; viz. those of a man, of a lion, of an ox, and of an eagle. Their bodies, at last in the upper part, resembled the human form. The prophet Ezekiel describes the cherub as having four wings: the seraph of Isaiah had six wings. They had four hands or arms; and their wing part from the rim of the helm downwards was composed either of human thighs, legs, and feet, to which were appended behind, the body and hinder legs of an ox; or, more probably, the body and four legs of an animal which the human part seemed to refer; so that the wings below the rim of the body was in the form of an ox, and that above this the body was human. As to the services which they were designed to perform, it has been suggested (see Fragments annexed to the last edition of Calmet's Dictionary) that, as the vision of Ezekiel and also of Isaiah was that of the likeness of a movable throne or chariot of immovable fize, in which the conductor was supposed to sit, the wheels annexed to it were such as were joined to the royal travelling or military thrones of the Persian kings, and the four cherubim occupied the places of four horses for drawing this capacious machine. As to the eyes in the wheels and the cherubim it has been conjectured, that they were spots or streaks embellished with brilliant colours. After all the figurations and conjectures of ingenious and learned persons, it still remains to be determined, what these emblematical figures were intended to represent. It is certain that they are very ancient, and that they have been adopted in other countries besides in which they were originally introduced. Symbolical figures resembling cherubim embellished part of the palace of Petepolls; and they are thus described by Sir John Chardin. In the front of each pillar is a figure of monstrous size, whole head and feet stand out in whole relief, and make the front of the pillar. The relief is two inches high. These figures, which look towards the plain, have their faces in mutilated, that it cannot be known, whether they represented horses, lions, rhinoceroses, or elephants. These figures which look towards the mountains are more entire; and represent monstrous creatures, whose body is, e.g. that of a winged horfe, with the head of a man covered with a high cap, having a crown upon it. The figures delineated by Chardin have at least three parts of the cherubic composition, the bird, the ox, and the man.

CHERUB, in Heraldry, a child's head between two wings, or between three pair of wings. We shall here observe, that the word דְּכָרְבָּא, formed of דְּכָרְבָּא, or רֶבְעָא, and נִנָּה, a child, denotes a child.

CHERUBIM, was also the name of an ancient military order in Sweden, otherwise called the order of Skarhima. It was institutted by Magnus II. in 1334. in memory of the siege laid to the metropolita city of Upfal, and abolished by Charles IX. upon the change of religion which happened in Sweden; but it was revived Feb. 11th, 1748; by Frederic I. king of Sweden. It took its denomination from the golden figures of cherubim, whereof the collar of the order was composed.

The habit of the order is a white satins jacket, trimmed with black lace, and lined with black; white breeches, flaps, and Hockings, trimmed with black, and black ribbons; a black flat short cloak lined with white, and a black cape, trimmed with black lace; a hat of black satin, bound with white, having on the left side four white ostrich feathers, the other set in the middle of a black feather. Upon the left breast of the cloak is a titer of white embroidered in silver; and upon the jacket on the same side is the like, far, somewhat less in fize. The collar of the order is composed of four golden heads of Skarpus, with wings expanded, and in blue patriarchal crosses, enamelled in gold, all joined with chains of
the last. To the collar is suspended the ensign of the order: viz. a fليف of 8 points, enamelled white, the centre blue, with the arms of Sweden, and the initial letters I. H. S., over the H. a cock; the arms enclosed with a border of Seraphs, as in the collar; in the arms, under the bottom crown, the passion-nails. The Seraphs heads are between the double points of the f岘, and over the upward point is the royal crown of Sweden, by which it is pendant to the collar. The ensign is also pendant to a brooch sky-blue watered ribbon, worn scarf-wise, and brought over the right shoulder, and under the left arm.

CHERUBIN, Father of Olears, in Biography, an astronomer and philosopher, concerning whom little is known. He flourished about the year 1592. Having acquired a competent knowledge of the languages, he was admitted a captain in the convent at Orleans. His large work, entitled, "De Septem Oriente," on the theory, nife, and mechanism of telescopes, is adorned with engravings of instruments designed by himself, and was printed at Paris 1675, fol. Another work, suppoted by some to be an enlargement of the former, and entitled, "La Vision Parfaite," was published in 2 vols. fol. in 1677 and 1678. Morea.

CHERVES, in Geography, a town of France, in the department of the Charente; one league N.W. of Cognac.

CHERVEUX, a town of France, in the department of the Two Sevres, and district of Niort; 24 leagues N.E. of it.

CHERVIL, in Botany. See Scandix cerefolium, Christophylum styphar, and Tamulentum.

CHERUSCI, in Ancient Geography, a powerful people of Germany, who were situated near the Hercynian forest. They had the Cauchi to the south, and were separated from the Catti by the fole Bacau. Tacitus and Cesar mention them.

CHESAPEAK, in Geography, one of the largest and fairest bays in the United States. Its entrance is nearly E.N.E. and S.S.W. between Cape Charles, N. lat. 37° 12', and Cape Henry, N. lat. 37°, in Virginia, 12 miles wide; and it extends 370 miles to the northward, separating Virginia from Maryland. Its breadth is from 7 to 13 miles, and general depth about 9 fathoms: it affords many convenient harbours, as well as a safe and easy navigation. It has many fertile islands, particularly along the eastern side, and some on the western shore. A number of navigable rivers, and other streams, discharge themselves into it: the chief of which are the Sufquannah, Patapoco, Patuxent, Potomack, Rappahanonck, and York, all which are large and navigable. This bay has also many excellent fisheries of herring and flad, as well as of very good crabs and oysters. It is the resort of swans, and of species of wild duck, called a Canvasback, much admired for its richfens and delicacy. In a commercial view, Chesapeake bay is of very considerable advantage to the neighbouring states, and particularly to Virginia.

CHESELDEN, William, in Biography. By the assistance of Mr. Bowyer's biographical anecdotes, we are enabled to give a pretty distinct account of the life of this celebrated surgeon and anatomist. He was of a respectable family in Rutlandshire, and born at Burrow-on-the-Hill, in Leicestershire, in the year 1688. After such acquisitions in Latin, as might be picked up at a neighbouring grammar school, he was put apprentice, in 1703, to Mr. Wilkes, a surgeon at Leicester, and at the end of his apprenticeship, he came to London, and was admitted a pupil in St. Thomas's hospital, under Mr. Fern, whom he afterwards succeeded. In anatomy he was instructed by Cowper, at whose house he resided. The progress he made under these preceptors was so considerable and rapid, that he commenced lecturer in surgery and anatomy as early as the year 1711, when he was only 22 years of age. The same year he was elected fellow of the Royal Society. In 1713, he published his "Anatomical Description of the Human Body," in 8vo, with plates, to which were added some select cases in surgery, and a syllabus of his lectures. Cheeselden had the pleasure of seeing this work pass through six editions, each more improved than the former one. To the fourth and subsequent editions the author added an appendix, in which he gave a short history of the operation of cutting for the stone in the bladder. He performed the operation in the manner recommended by Dr. James Douglas, on nine patients in St. Thomas's hospital, with success; but failing in some subsequent trials, he returned to the mode recommended by Ruq, which he so much improved, that the first 27 patients, whom he cut by that method, all recovered. Notwithstanding the conduct with which Cheeselden had acknowledged the improvements made by Dr. Douglas in the method of performing the high operation, yet he did not escape censure: an anonymous pamphlet, supposed to have been written by the Douglas, being addressed to him, under the title of "Lithotomus castratus." But his character, both as a lithotomist and as a surgeon in general, was too well established to be injured by so trifling an attack. To the same edition of his anatomy he added some curious observations, made by a patient, who had been blind from his infancy, and whom he restored to his fight. The case was first published in the Philosophical Transactions. In 1729, he was elected a corresponding member of the Royal Academy of Sciences at Paris; and in 1732, he was made foreign associate to the Royal Academy of Surgery, then newly instituted. He had before been appointed principal surgeon to queen Caroline, to whom he dedicated his splendid work on the stones, published in 1733, in folio. The bones are given on a large scale, and are beautifully, and the large ones correctly, delineated. Some errors in delineating the small bones of the head, drew upon him the censure, much too severe, of his opponent and rival, Dr. Douglas. In 1738, Mr. Samuel Sharp dedicated to him his treatise on the operations in surgery, acknowledging the great improvements he had made in the art. Cheeselden had the year before been appointed surgeon to Chelsea hospital, to which place he retired, to enjoy a comparative state of leisure, from the hurry and battle of public practice. Besides the works we have mentioned, some of his lucubrations on subjects of anatomy and surgery, were published in the Philosophical Transactions, and he furnished 21 valuable plates, and some useful observations, to Gataker's translation of Le Dran's treatise on the Operations in Surgery. Towards the end of the year 1751, he was seized with a stroke of palsy, which induced him to go to Bath, where he appeared for a time to have received some benefit, but this was of short duration, as he died in a fit of apoplexy, on the 11th of April, in 1752, aged 64 years.

Cheeselden was strongly attached to his profession, and was always ready with his advice, and assistance, to young practitioners. He was of a social and chearful disposition, and among other acquaintances was intimate with Mr. Pope, who appears to have had a great esteem for him. To his patients he was tender and humane, and he said he had to live a considerable duration of spirits, when about to perform an operation, but this never proceeded so far as to occasion any trembling, or indescripts of his hand, which the success of his practice, and the high character he enjoyed, abundantly testify. It was probably to cure himself of this weakness, that he became a frequent attendant at the places where
where prize-fighting and other athletic exercises were performed. With so much acknowledged ability, that there should be mingled some portion of vanity, and being allowed to decide on subjects or surgery, that he should sometimes expect the same attention to be paid to his opinions, on subjects with which he was not so well acquainted, should excite no surprise. Some stories of the kind, which we shall not contribute to propagate, have been handed down. He left only one child, a daughter, who had been married to Charles Coates, M. D. of Woodcore, in Shropshire, member of parliament for Tamworth, in Staffordshire. She became a widow in 1748, and removed to Greenhithe, in the parish of Swancombe, in Kent, where she died several years after her father, leaving no issue.

CHESELETH-THABOR, or ARTHARA, in Ancient Geography, a town of Judaea, in the tribe of Zabulon. Joshua gave it to the Levites of this tribe, who were of the family of Merari. It was situated on the side of Mount Tabor. Ezechias and Jerom call it Cafalus or Exalas, and place it 10 miles E. from the S.W. part of Decapolis.

CHESHAM, in Geography, a small but populous town of England in Buckinghamshire, situated in a pleasant and fertile valley, and consisting of three streets, which are principally occupied by lace-makers and shoe-makers, and the manufacturers of wooden articles, in the respective branches of round, hollow, and Tunbridge ware. The turnery goods produce a considerable sum annually; and the number of shoes made every week has been computed at a thousand pair. The inhabitants are for the most part dissenters; and the town has 4 places of worship, besides the parish church. There is also a free-school for the education of the children of the poor. Chesham has a weekly market on Wednesday. It is 29 miles W.N.W. from London.

CHESHIRE, one of the western counties of England, was included by the Romans in the division named Flavia Caesaris; but on the final departure of that people from the island, it reverted to the Britons, who continued in possession till about the year 607, when it was conquered by Ethelfrith, the Saxon king of Bernicia, who defeated the army of Broochmal Ychthore, king of Powys, near Chester. On this occasion, Ethelfrith is said to have slain 2000 defeated monks, whom Broochmal had called from the neighbouring monastery of Bangor, and stationed on a neighbouring hill, in order to defend himself with their assistance. It was afterwards wrested from Bernicia by the Mercians, and continued a part of their kingdom till the reign of Egbert, who united it with the other Saxon states under one government. Canute the Dane, who obtained this division of the kingdom by his famous partition treaty with Edmund Ironside, invited the administration of this county in the ears of Cheler; three of whom enjoyed that dignity prior to the conquest; Leofric the son of Leofwin; Algar, his son; and Edwin, his son of the latter; in whom ended the race of the Chelmsford earls of Saxon blood. On the conquest, the provinces of Britain which had hitherto been governed by a few great men, were divided into lesser portions, and distributed as rewards among the followers of the Norman king. Chelmsford was bestowed on Gherbod, a valet Fleming; and after him on Hugo de Aurange, better known by the name of Hugh Lupus. To him the monarch delegated a fullness of power; made this a county palatine, and gave it such a sovereign jurisdiction, that the ancient earls kept their own parliaments, and had their own courts of law, in which any offence against the dignity of the sword of Chelmers was as cognizable as the like offence would have been at Westminster against the dignity of the royal crown; for William allowed Lupus to hold this county "tam liber ad gladium, sicet ipse rex tenebat Angium ad coronam." The favor with which he was invested is still to be seen in the British Museum, inscribed Hugo Comes Celestii. As soon as Lupus was firmly established, he began to exert his regal prerogatives. He formed his parliament by the creation of eight barons, who were obliged to pay him attendance, and to repair to his court to give it the greater dignity. They were bound in all wars between this county and Wales, to find, for every knight's fee, a horse with caparison and furniture, or two without furniture, for the division of Chelmsford. Their knights and freeholders were to have corselets and lances, and were to defend their lands with their own bodies. This species of government continued from the conquest till the reign of Henry III., a period of 171 years, when in 1237, on the death of John Scott, the seventh earl of the Norman line, without male issue, Henry took the widow into his own hands, and gave the daughters of the late earl other lands in lieu; unwilling, as he said, that so great an inheritance should be parcelled out among dailiffs. The king bestowed the county on his own son Edward, who did not assume the title, but afterwards conferred it on his son Edward of Carnarvon. Since that time the eldest sons of the kings of England have always been earls of Chelmsford as well as princes of Wales. The palatinate was governed by the earls of Chelmsford as fully and independently for nearly three centuries after this period; as it had ever been by the Norman earls; but Henry VIII. by authority of parliament, made it subordinate to the crown of England. Yet notwithstanding this restraint, all pleas of lands and tenements, and all contracts within the county, are to be heard and determined in it; and all determinations out of it are deemed void, "et coram non judice," except in case of error, foreign plea, and foreign voucher; and for no crime but treason can an inhabitant of this county be compelled to try out of it. Thus being solely under the jurisdiction of its own earls, and confirmed in a certain degree as a separate kingdom, representatives to the national parliament were never sent, either for the shire or city, till the year 1549, the third of Edward VI., when upon the petition of the inhabitants, two members were summoned from each.

Cheshire is bounded on the north by the rivers Mersey and Tame, which separate it from Lancashire; on the east by the counties of Derby and Stafford, the division between which is chiefly marked by chains of hills and by the rivers Goyt and Dane. The southern side unites it with Shropshire and Flintshire; and the western border is skirted by Den- bighshire, Flintshire, and the estuary of the Dee. The dimensions of the county are estimated by Mr. Wedge, in the "General View of the Agriculture of Cheshire," at about twenty-two miles and a quarter, on a medium, in width, and nearly forty miles in length from W.S.W. to E.S.E. Its form is rather oval, with two projecting necks of land; one about twenty miles in length, and six in breadth, running out into the Irish sea, between the estuaries of the Dee and Mersey, and called the Wirral. The other forms part of Maclesfield field, and extends about fifteen miles in length from Stockport, between the counties of Derby and York; but rarely exceeds four miles in width. Alfred divided this county into seven hundreds, exclusive of Chelmsford which is a county in itself; it contains one city, twelve towns, 670 villages, about 35021 houses, and 191,751 inhabitants.

Cheshire is in general a flat country, though some considerable hills rise near its eastern borders, and connect with those of Derbyshire and Staffordshire. These ex-
terd about twenty-five miles in length from Congleton to the north-eastern corner of the county. An in-
terrupted ridge of high ground also crost it from north to south, on the western side, beginning near Frod-
ham, where a bold promontory overhangs the Mersey. After crossing the large tract of heath, called Delamere
Forest, it exalts itself in the towering rock of Becon, near the middle of the county. About Macclesfield are
a few other hills, and one on the Shropshire side. Another
chain runs north and south through the populous of Wirral.

The soil of the county is nearly level; and the principal
part of it consists of arable, meadow, and pasture land.
A variety of soil is found in this county; but clay, sand,
black moor, or peat, seem to predominate; and the under
soil is commonly clay, or marl. The red grit rock is the
most prevalent stone of the county, and of this most of
the towns and villages are built. There are few large woods
in the county; yet, as the generality of farms abound with
hedgerows, a considerable quantity of timber is produced,
and particularly a great number of oak trees, from which
the tanners derive a supply of that invaluable antiseptic, oak
bark. Cheshire was formerly distinguished for its numerous
yeomanry; and though they have decreased for the last
hundred years, they are still very considerable. In the
vicinity of manufacturing towns, and particularly on the
borders of Lancashire and Yorkshire, many parcels of land
have been pur chased by tradesmen and appropriated to small
farms; but the greater portion of the county is retained
and cultivated by gentlemen who reside on their own estates.

The evil of commingling agriculture and manufactures
extended into Cheshire; and the post-farms that furnished
supply and gave independence to several families, have been
thus confined to one. The tenure is almost universally
freehold; yet in the manors of Macclesfield, Halton, and
some others, there are a few copyholds, or what may be
denominated customary freeholds, paying fines and rents
certain. Leasing for lives, which was formerly a very con-
stant and general practice, is yet continued by a few land-
holders; but the most common term of leases is eleven years,
with a restriction on the tenant to a certain quantity of
rable (usually about one-fourth of his farm) and a particu-
lar rotation of crops. The extent of farms is, on the average,
from 150 to 500 acres; but some few contain upwards of
500.

The Dairy is the principal object of attention with the
Cheshire bullocks; yet it is rather a singular fact, that
though the county is well adapted for its climate, it was formerly a celebrated for its cheese. It is stated
that when both flourished, the milk was very abundant, and the whey skimmed off. This process is repeated till
when the whey is nearly dry, and the curd is placed in a vat, and occasionally sprinkled with salt. Some dairy women use about three
hundred to a cheese, and make it a rule to put the greatest quantity near the middle. The vat is filled very full, and
the whey repeatedly skimmed out before it is placed in the
vat; as it is very material to expel all the whey, and also
to keep the vat quite full of curd. The cheese is commonly
taken twice or thrice from the vat, to place fresh cloth, pare
off the edges, and turn it; and sometimes it is immersed in
hot whey, which is supposed to harden its coat. After re-
maining in the vats two or three days, it is next conveyed
to the lathing house, where it is placed in a lathing-tunnel
or tub, in which it continues about three days longer, and is next
placed on the benches for about eight days, being well lathed
over, and turned every day. After this process it is
turned twice daily for five or seven days, and then washed
in warm water, and wiped dry with a cloth; and when dry,
immerged over with whey butter, and placed in the warmest
part of the cheese-room, where it is left to assume its proper
age and confidence.

The principal general productions of Cheshire are silk and
coal. Of the latter, a considerable quantity is found on the
collieries, and some is obtained from the hound of Wirral.
The former is more abundant in this county than in any other
part of England. The immense trade carried on in this article,
and the vast revenue derived from it,render it an object of con-
siderable local and national importance. The principal colli-
eries are at Nantwich, Middlewich, Winsford, and North-
wich. See NANTWICH and SALT.

The cotton factories, next to the manufacture of silk, seems
to be the most considerable. This flourishing branch of trade
has lately been extended from Lancashire, and some of the
bordering counties, over many parts of Cheshire. Exclusive
of

summer seasons. The annual quantity of cheese made from
each cow varies from 50 to 500 lb. and upwards; the pro-
duce being governed by the nature of the herd, the quality
of the cattle, the weather, and the season of the year.

On the whole, the average produce may be rated at
about 200 lb. from each animal. The quantity of milk, ac-
cording to the estimation, yielded daily by each cow, during
the milking season, is about eight quarts, which is commonly
supposed to produce one pound of cheese. The Cheshire
cheese is generally made with two meals' milk; though
often, towards the latter end of the season, which commences
nearly twenty-two weeks, with four, five, or six: for as the
cheeses are usually made very large, it is necessary to have
a sufficient quantity of milk to make one at a time; though
in some of the dairies two are made in a day. The most
common size for a cheese is sixty pounds; a weight suf-
cceptible of every excellence to be found in the cheese of this
county. It is usual to preserve the evening's milk till the
next morning, when it is skimmed, heated, and incorporated
with the new milk; and after being mixed in a large tub,
together with the cream, the dairy woman puts in a proper
quantity of rennet and coloring, and leaves it for about
an hour and half to coagulate or curdle. The coloring
should be Spanish arnuto; but, from the high price of that
article, an adulterated coloring is often substituted. In
making cheese of the bell quality, the milk used is as pure
as it comes from the cow, not robbed of any cream; though
the practice of making a certain quantity of fresh butter
weekly, frequently occasions an appropriate benefit to the
cream. After the cheese is "come," or when the milk is properly
cogulated, the dairy-maid breaks the curd into very small
particles, which are then left to fimbre, and the whey
skimmed off. This process is repeated till the whey is nearly
dried, when the curd is placed in a vat, and occasionally
sprinkled with salt. Some dairy women use about three
hundred to a cheese, and make it a rule to put the greatest
quantity near the middle. The vat is filled very full, and
the whey repeatedly skimmed out before it is placed in the
vat; as it is very material to expel all the whey, and also
to keep the vat quite full of curd. The cheese is commonly
taken twice or thrice from the vat, to place fresh cloth, pare
off the edges, and turn it; and sometimes it is immersed in
hot whey, which is supposed to harden its coat. After re-
maining in the vats two or three days, it is next conveyed
to the lathing house, where it is placed in a lathing-tunnel
or tub, in which it continues about three days longer, and is next
placed on the benches for about eight days, being well lathed
over, and turned every day. After this process it is
turned twice daily for five or seven days, and then washed
in warm water, and wiped dry with a cloth; and when dry,
immerged over with whey butter, and placed in the warmest
part of the cheese-room, where it is left to assume its proper
age and confidence.

The principal general productions of Cheshire are silk and

The former is more abundant in this county than in any other
part of England. The immense trade carried on in this article,
and the vast revenue derived from it, render it an object of con-
siderable local and national importance. The principal colli-
eries are at Nantwich, Middlewich, Winsford, and North-
wich. See NANTWICH and SALT.

The cotton factories, next to the manufacture of silk, seems
to be the most considerable. This flourishing branch of trade
has lately been extended from Lancashire, and some of the
bordering counties, over many parts of Cheshire. Exclusive
of
of these, manufactures of leather, ribbon, thread, gloves, buttons, and throes, are carried on at Nantwich, Macclesfield, Congleton, Knutsford, and some other places.

Most of the rivers and streams which wind through this country direct their currents northward, and empty themselves into the Mersey or the Dee. The former divides Cheshire from Lancashire for a course of nearly 62 miles, about 35 of which, from Liverpool to the mouth of the river Irwell, are navigable for vessels of considerable burthen. The Mersey derives its course from a conflout of small streams at the junction of the county with Derbyshire, and flowing in a westerly direction, receives in its course the waters of the Goyt, the Dane, the Bolin, the Irwell, and the Weaver. After its junction with the latter, it swells into a broad estuary, and taking a north-westerly course, soon meets with the Irish channel. The Dee was held in great veneration by our British ancestors, and its waters regarded as sacred and purifying. It derives its origin in the mountainous districts of Merionethshire, and after forming the large lake of Pembridge, passes through a series of picturesque and grand scenes, and approaches the western border of this county, to which it forms a boundary from Worthenbury to Aldford. It then passes on to Chester, where it narrows and, afterwards flows to the west, through an artificial channel, which was formed, at an immense expense, by a body of gentlemen, called The River Dee Company. This river also forms a large sandy estuary between the county of Flint and the hundred of Wirral, and joins the Irish sea about 14 miles N.W. from Chester. The Weaver, deriving its source from Ridley Pool, close to Chaldoncleve Hill, passes the towns of Nantwich, Macclesfield, Weaver, Winsford, and Nethchive, where it is joined by the Dane, from the northern parts of Staffordshire, and two or three other streams from the central parts of the county. Hence it proceeds to Warrington, Acton-Bridge, and Frodsham, where it falls into the swelling bason of the Mersey. The Weaver receives several tributary streams in the course of its progress; and from Winsford to Frodsham it has been rendered navigable by means of various locks. See Canal.

Several other rivers meander through this county, the principal of which are the Goyt, the Bolin, the Dane, and the Whirlow. Cheshire also abounds with broad sheets of water, denominated mere, lakes, and pools. The principal are Oak-Mere, Ruthern-Mere, Mere-Mere, Tattow-Mere, Comber-Mere, Broad-Mere, and Bag-Mere; Petty-Pool, Roseberry-Pool, and Ridley-Pool. Most of these waters abound with fish.

The county is intersected by portions of four canals, which allow a very constant and cheap intercourse between the towns of Chelfter, Liverpool, Manchester, the north of England, Staffordshire, Shropshire, and adjacent counties. See Canal.

The diocese of Chester comprehends all Cheshire and Lancashire, and various parts of Westmoreland, Cumberland, Yorkshire, Denbighshire, and Flintshire, and is divided into two archdeaconries. Cheshire returns four members to parliament, viz. two for the shire, and two for the city of Chester: pays seven parts of the land-tax, and furnishes the militia with 500 men. Gower's Sketches towards a History of Cheshire. Leigh's Natural History of Lancashire and Cheshire.

Cheshire, a county of America, in New Hampshire, on the E. bank of Connecticut river, bounded on the S. by the state of Massachusetts, on the N. by Grafton county, and by Hillsborough county on the E. It contains 54 townships, the chief of which are Charlestown and Steins, and 28,772 inhabitants, including 16 towns.

Vol. VII.

Cheshire, a township in the county of Berkshire and the Count of Massachusetts, famous for its good cheese; 140 miles N. westerly from Boston.—Also a township of New-Haven county in the state of Connecticut; 13 miles N. of New-Haven city, and 26 S.W. of Hartford. It contains an episcopal church and academy, and three congregational churches.

Chefsen, a town of China, of the third rank, in the province of Shen; 15 leagues N.W. of Hsing-nan.

Chesin us, in Ancient Geography, a river of European Saxonia. Prolemy.

Chesley, in Geography, a town of France, in the department of the Aube; 9 miles S.E. of Eivy.

Cheslon, in Ancient Geography, a town of Palestine, in the tribe of Juda.

Chesne. See La Chene.

Chesne, Andrew Du, in Biography, called "the Father of French History," was born in 1584, at l'ile Bouchard, in Touraine. His historical and geographical researches were very various, and his productions, considering that his life was not very extended, were astonishingly numerous. In these he appears rather the diligent and labious compiler, than a judicious writer. His premature death in 1649, was occasioned by an accidental injury.

He wrote "A History of England," 2 vols. fol. 1614: "A History of the Papes," 2 vols. fol. 1631; "A History of French Cardinals;" "The Genealogies of several Great Families of France," 7 vols. fol. 1684; "History of the Duke of Burgundy," 2 vols. 4to.; "A Bibliotheca of Authors who have written on the History and Topography of France." He was also the editor of the works of several other authors, as Abclar, Palquin, &c.; and he issued proposals for printing a large collection of French historians, in 24 vols. fol. of which 12 volumes, containing the period from the origin of the nation to the time of Hugh Capet, were published in 1616; and other two volumes, in the press at the time of his death, together with a fifth, bringing the History down to Philip the Fair, were published by his son, Francis du Chesne, who was also a learned man. Moreri.

Chenes, or Queue, called also Quercetanius, an eminent practitioner and voluminous writer in medicine, which he practised successfully many years in Germany, was born in the county of Armagnac in Gascony, about the middle of the sixteenth century. Applying himself to the study of medicine, particularly of chemistry, in which he acquired a considerable proficiency, he was admitted to the degree of Doctor at Balle, about the year 1573. In the latter part of his life, he removed to Paris, and was made one of the physicians in ordinary to the king, Henry IV. As he affected great mystery, and was a professed admirer and follower of the doctrines of Paracelsus, he drew upon himself the cenfures of many of his contemporaries; among them, Riolan was one of the most formidable of his opponents. We also find Guy Patin, who flourished some years at Berlin, treating his doctrines with great severity, and in fact, whatever popularity his works might enjoy in the lifetime of the author, they are long since deftinitely forgotten. Haller has given the titles of them, and analyses of the principal of their contents. The most celebrated among them, which passed through the greatest number of editions, is his Pharmacopoea Dogmaticorum restituta, praxis, felectissime Hermeticorum Floribus illustrata. Gise Hefs. 1607. This is said to have been recommended by Beeckhaves his pupils. Schrueber, in 1645; published a volume, in quarto, 41
under the title of Quercetanus redevisus, containing an
abridgment of his dialogues. He died at Paris in 1672.
Haller, Bib. Elst. Diet.
CHESNEAU, Nicholas, a physician of Tournon, was
born at Maribières, where he took his degree of Doctor
in Medicine, in the early part of the eighteenth century.
He appears to have had a large share of practice in his
profession, and was author of several useful publications.
The greatest of them is his Observationum Medicinæum Libri
quatuor. Quibus accedit ordo Remediiorum alphabetices
ad omnes morbis conterminatus," &c. 8vo. Parisiis, 1732.
This work has passed through several editions, and in 1741,
was printed at Leyden in 4to. Haller has given an abridged
account of its contents. Amidst some insignificant and some
incredible accounts of cures, there are contained in it many
useful practical observations. Haller Bib.
CHESNUT, in Botany. See Fagus sylvatica.
CHESNUT, in Geography, a township of America, in
the county of Northampton and state of Pennsylvania.
CHESNUT creek, a branch of the Great Kanawah, in Vir-
ginia, where it crosses the Carolina line. Here, it is said, are
iron mines.
CHESTER, part of the Alleghany mountains, in Pennsyl-
vania, westward of Greenborough.
CHESS, an ingenuous game performed with little round
pieces of wood, on a board divided into sixty-four squares;
where full and alders are so indispensible requisite, that
chance has no place; and a person never loses but by his
own fault.
Saratins a precise treatise on the different opinions of
the origin of the Latin facet; whence the French echets,
and our chess, is formed. Menage is also very full on the
same head. Leandroes takes it to come from the uschets,
famous Turkish robbers. P. Rimond from the German
schach, theft; and that from calculus. He takes chess to
be the same with ludus latrunculorum of the Romans, but
imperfectly. This opinion is contentious by Voellis and
Salmasius, who derive the word from calculus, as used for
latrunculus. Some derive it from the Hebrew ס_epochs,
whence calculer, calculat; & נד, nut, mori, mortuus;
other; from הלת, sed, levis, and הית, mori; whence
chess and chess-mate. Fabricius says, a celebrated
Perisan astronomer, one Schatrenachs, invented the game of
chess; and gave it his own name, which is still in bears in
that country. Nicod derives it from שֶׁפֶּעַה, or שֶׁפֶּעַק, a Moorish
word for lord, king, and prince. Lochart adds, that schach
is originally Perisan, and that schachmat, whence our check-mate,
in that language, signifies the king is dead.
The learned Hyde has undertook to shew, from un-
doubted authorities, that this game was first invented in
India, and passed from thence to Persia before the year of
Christ 576, and from Persia to Arabia. He adds, that the
antiquity of this game is traced much higher, or to the
middle of the second century, in an irish chronicle, the
authenticity of which is doubtfull. And he shews, that פֶּשֶּק,
that is, was a term much in use among the orientals, which
engaged in this play, and that used it to caution the
king against any danger; and hence the Europeans and
others have denominated the game פֶּשֶּק חלד, and פֶּשֶּק
חלד, and in English chess, from this circumstance. He also
derives the word מַט from the Peric manus, לִשׁוֹן הָעַד; and
fays that it was used in play; when any of the men was fixed
in its place, or taken captive. See Historia Shahsudii apud
Syntagma Diferentiationem, &c. Hyde, editum a Doctore
Sir William Jones concurs in opinion with the learned
Hyde, and ascribes the invention of this game to the Hind-
ous. "If evidence were required to prove this fact," says
this excellent writer, "whole knowledge of the eastern lan-
guages, combined with indefatigable industry in his re-
searches, and a correct judgment and taste, gives a kind of
decisive authority to his opinion. (See Asiatic Researches,
vol. v.)" It is not necessary that the Persians should be
the originators of this game, or that the Persians have
alone been the inventors of any of the arts and sciences
which they have been peculiarly distinguished. The
Persian, however, must be regarded as the original
inventor of the game as it is now generally understood.
Periander, who, though as much inclined as other nations
to appropriate the ingenuous inventions of a foreign
people, unanimously agrees, that 'the game was imported from
the west of India in the 6th century of our era. It seems to
have been immemorially known in Hindoostan by the name
of Chaturanga," i.e. the four angles, or members of an
army; which are the, elephants, horse, chariots, and foot
soldiers; and in this sense the word is frequently used by
epic poets, in their descriptions of real armies. By a natural
corruption of the pure Sanscrit word, it was changed by
the old Persians into chaturang; but the Arabs, who soon
after took possession of their country, had neither the
initial nor final letter of that word in their alphabet, and con-
sequently altered it further into ṇataran, which found its way
presently into the modern Persian, and at length into the
dialects of India, where the true derivation of the word is
known only to the learned. This has a very significant
word in the sacred language of the Brahmins been trans-
formed by progressive changes into uñatran, riñuch, echets,
and, by a whimsical concurrence of circumstances, has
given birth to the English word clock, and even a name to
the Exchequer of Great Britain."
It is confidently affixed, that Sanskrit books on chesh exist
in Bengal; but Sir William had seen none of them when he
wrote the memoir which we have quoted. He exhibits, how-
ever, a description of a very ancient Indian game of the same
kind, but more complex, and in his opinion more modern,
than the simple chess of the Persians. This game is also
called Chaturanga, but more frequently CHATURANG, or
the four kings, since it is played by four persons representing
as many princes, two allied armies combating on each side.
The description is taken from a book called "Bhavishya Pu-
ran," in which the form and principal rules of this factional
warfare are thus laid down: "Eight squares being marked
on all sides, the red army is to be placed to the east, the
greens to the south, the yellow to the west, and the black to
the north. Let the elephant (fays the author of the Purana)
stand on the left of the king; next to him the horse; then
the boat; and before them all, four foot-soldiers; but the
boat must be placed in the angle of the board." From this
passage (fays the president,) it clearly ap-
ppears, that an army with its four angas must be placed on
each side of the board, since an elephant could not stand,
in any other position, on the left hand of each king; and Rad-
hacan (a Pandit) informed me, that the board consisted,
like ours, of 64 squares, half of them occupied by the
forces, and half vacant. He added, that this game is men-
tioned in the oldest law-books, and that it was invented by
the wife of a king, to amuse him with an image of war, while
his metropolis was besieged in the second age of the world.
A ship or boat is abridgely substituted, we see, in this complex
game for the "rath," or armed chariot, which the Bergal-
she pronounced "rath," and which the Persians changed
into "rakth," whence came the root of some European
nations; as the virg and sol of the French are supposed to be
corruptions of zere and sile, and the prime minister and elephat
of the Persians and Arabs." As fortune is supposed to have a great
share in deciding the fate of a battle, the use of dice is introduced into this
game to regulate its moves; for (fays the Puran) "if unique
be thrown, the king or a pawn must be moved; if quatre, the elephant; if trois, the horse; and if deux, the boat. The king pauses freely on all sides, but over one square only, and with the same limitation the pawn moves, but he advances straight forward, and kills his enemy through an angle. The elephant marches in all directions as far as his driver pleases; the horse runs obliquely, traversing the squares; and the ship goes over two squares diagonally. The elephant, we find, has the powers of our queen, as we are pleased to call the general or minister of the Perkins, and the ship has the motion of the piece to which we give the unaccountable appellation of Bishop, but with a restriction which must greatly lessen its value.

In the Puran are next exhibited a few general rules and supercilious directions for the conduct of the game. Thus, "the pawns and the ship both kill and may be voluntarily killed; while the king, the elephant, and the horse may fly the foe, but must not expose themselves to be slain. Let each player prefer his own forces with extreme care, securing his king above all, and not sacrificing a superior to keep an inferior piece." Here (says the proponent) the commentator on the Puran observes, that the horse, who has the choice of eight moves from any central position, must be preferred to the ship, which has only the choice of four. But this argument would not have equal weight in the common game, where the bishop and tower command a whole line, and where a knight is always of less value than a tower in action, or a bishop of that side on which the attack is begun. "It is by the overbearing power of the elephant (continues the Puran) that the king fights boldly; let the whole army, therefore, be abandoned in order to secure the elephant. The king must never place one elephant before another, unless be be compelled for want of room, for he would thus commit a dangerous fault; and, if he can play one of two hostile elephants, he must destroy that on his left hand."

All that remains of the passage which was copied for Sir William Jones relates to the several modes in which a partial success or complete victory may be obtained by any one of the four players; for, as in a dispute between two allies, one of the kings may sometimes assume the command of all the forces, and aim at a separate conquest. First, "When any one king has placed himself on the square of another king (which advantage is called "finhama") or the throne he wins a flake, which is doubled, if he kill the adverse monarch when he fixes his place; and, if he can feat himself on the throne of his ally, he takes the command of the whole army." Secondly, "If he can occupy successively the thrones of all the three kings, he obtains the victory, which is named "chatu-raji;" and the flake is doubled if he kill the last of the three, just before he takes possession of his throne; but if he kill him on his throne, the flake is quadrupled. Both in gaining the "finhama" and the "chatu-raji" the king must be supported by the elephants, or by all the forces united." Thirdly, "When one player has his own king on the board, but the king of his partner has been taken, he may replace his captive ally, if he can seize both the adverses kings; or if he cannot effect their capture, he may exchange his king for one of them, against the general rule, and thus redeem the allied prince, who will supply his place." This advantage has the name of "triprisrishta," or recovered by the king. Fourthly, "If a pawn can march to any square on the opposite extremity of the board, except that of the king or that of the flake, he attains whatever power belonged to that square." Here we find the rule, with a slight exception, concerning the advancement of the pawns, which often occasions a most interesting struggle at our common chess; but it appears that, in the opinion of one ancient writer on the Indian game, this privilege is not allowable when a player has three pawns on the board; but, when only one pawn and one ship remain, the pawn may advance even to the square of a king or a ship, and likewise the power of either. Fifthly, According to the people of Lucca, where the game was invented, "there could be neither victory nor defeat if a king were left on the plain without force; a situation which they named "caca-cahita;" Sixthly, "If three ships happen to meet, and the fourth ship can be brought up to them in the remaining angle, this has the name of "vishanauca;" and the player of the fourth seizes all the others."

The account of this game in the original Sanscrit is in verse, and there are two or three couplets still remaining, to very dark, either from an error in the manuscript, or from the antiquity of the language, that Sir William Jones could not understand the Pandit's explanation of them, and yet perhaps, that even to him they gave very indistinct ideas. It would be easy, however, he thinks, if it be judged worth while, to play at the game by the preceding rules; and a little practice would perhaps make the whole intelligible.

The Honourable Daines Barrington, in his elaborate "Historical Disquisition on the Game of Chefs," (See Archaeologia, vol. ix.) affords, and maintains the claim of the Chinese as inventors; though, he says, Hyde inclines against it, chiefly because they have some additional pieces, which differ from ours, both in their form and powers. This single circumstance, he thinks, is by no means conclusive; because, in all countries where any game hath been of long continuance, the players will make innovations, though in substance it remains the same. Du Halde cites a Chinese treatise, by which it appears that it is the favourite game of that country, and, as such, is sometimes depicted upon Chinese paper. Indeed, in China, it makes a considerable part of the education of their females, and seems to take the place of dancing among us. The origin of this game has been traced to China, in a last from Eyles Irwin, Esq., to the Earl of Charlemont, published in the 6th volume of the Transactions of the Royal Irish Academy. During a long residence in the East Indies, where the game of chess is generally supposed to have originated, Mr. Irwin has often heard of its existence in China, though on a different footing, as well in respect to the powers of the king, as to the aspect of the field of battle. A tradition of this nature obtained among the Brahmins, who excel in this game. When a young Mandarin was shown an English chess-board, he informed Mr. Irwin, that the Chinese had a game of the same nature; and he specified the difference that inhabited in the pieces and the board. Upon further investigation of the subject, the young Mandarin, named Tinqua, brought a Chinese MS, which contains an account of the origin of the game of chess in that country. From this MS it appears, that 370 years after the time of Confucius, or 1665 years ago, Hung Cocn, king of Kiangnan, sent an expedition into the Shensi country, under the command of a mandarin, called Fangting, to conquer it. After one successful campaign, the soldiers were put into winter quarters; where, finding the weather much colder than what they had been accustomed to, and being also deprived of their wives and families, the army, in general, became impatient of their situation, and clamorous to return home. Fangting, upon this, resolved in his mind the bad consequences of complying with their wishes. The necessity of footing his troops, and reconciling them to their position, appeared urgent, in order to finish his operations in the ensuing year. He was a man of genius, as well as a good soldier; and having contemplated some time on the subject, he invented the game of chess, as well for an amusement to his men, as in their va-
event hours, as to inflame their military ardor, the game being wholly founded on the principles of war. The Bra-
tagon succeeded to his wish. The soldiery were delighted
with the game, and forgot, in their daily contests for vic-
tory, the inconveniences of their post. In the spring the
general took the field again, and, in a few months, added
the rich country of Shênit to the kingdom of Kiugian,
by the defeat and capture of its king, Choupayuen, a fa-
mous warrior among the Chinese. On this conquest Hung
Cochu assumed the title of emperor, and Choupayuen put
an end to his own life in despair.

From the above extract from the Concum, or Chinese an-
imals, it appears, that the institution of this game forms a
principal era in the Chinese history; since, by the conquest
of Shênit, the kingdom was first connected in its present form,
and the monarch assumed the title of emperor. Mr. Irwin
observes, that the confined situation and powers of the king,
resembling those of a monarch in the earlier parts of the
world, countenance the supposition of the Chinese origin of
chefs; and that, as it travelled westward, and defended to
later times, the sovereign prerogative extended itself, until
it became unlimited, as in our state of the game. The
agency of the princes also, in lieu of the queen, points out
the nature of the Chinese customs, which exclude females
from every kind and degree of influence and power; and
these princes, in the passage of the game through Peria,
were changed into a single vizier, or minister of state, with
the enlarged portion of delegated authority that exists there;
instead of whom, the European nations, with their usual
gallantry, adopted a queen on their board. The river
between the parties is explicable of the general face of this
country, where a battle could hardly be fought, without
encountering an interruption of this kind, which the soldier
was here taught to overcome; but, on the introduction of
the game into Peria, the board changed with the dry na-
ture of the region, and the contest was decided on terra
firma. Moreover, with the Indians, this game was designed
by a Brahmin, to cure the melancholy of the daughter of
a rajah. But with the Chín, it was invented by an ex-
perienced soldier, on the principles of war; not to difpol
love-fick vapours, or instruct a female in a science that could
neither benefit nor inform her; but to quiet the murmurs of a
discontented soldiery, to employ their vacant hours in lefs-
jons on the military art, and to cherish the spirit of conquest
in the bosom of winter quarters. Its age is traced by the
Chinese actually on record near two centuries before the
Christian era; and among the numerous claims for this no-
bulous invention, that of the Chinese, who call it by way of
discrimination, Chung-Ke, or the royal game, teems to Mr.
Irwin to be indisputable.

In Thibet and the Birman empire, as well as throughout
Bengal and Hindooan, the game of chefs is held in high eli-
nation. The board used by the Birmans, as we learn from
Symes's Embassy to Ava, (vol. iii. p. 285) is exactly similar
to ours, containing 64 squares, and the number of their troops
the same, 16 on each side; but the names, the power, and
the disposal of them differ essentially, the king and his mi-
sider (a queen being never introduced by the orientals)
are mounted on elephants; these are defended by two castles,
two knights on horseback, two officers on foot, and eight
foot soldiers; the forces of each party are arranged in three
lines, by which eight squares remain unoccupied; none of
the pieces allows equal force with our queen; and this re-
stricted operation renders the Birman mode of playing more
complex and difficult than ours. The Birmans affirm that
it is a game of high antiquity, and that it is acknowledged
and worshipped by their sacred writings, although every play
of chance is prohibited. The name of this game, viz.
"Cheedere," bears some resemblance to the name which is
given to the game in most other parts of the world. Col.
Symes infers from this opinion of Sir William Jones, that
it is not of Perian origin. Others may probably con-
ccur with the honourable Mr. Barrington, Mr. Irwin, &c., in
deducing it from the long civilized empire of China, and
 tracing its progress westward through Thibet and Hindooan
to Peria. It indeed this most interesting game had been
known in Peria, whilst Alexander or his successors conti-
nued there, they would undoubtedly have introduced it into
Greece, and its name would certainly have been transmitted
unto us, together with its pieces and their moves.

Chefs is unquestionably a very ancient, as it has been a
very general, game. The opinion maintained by some
learned writers, and which has much prevailed, ascribes the
invention of it to Palamedes at the age of Troy. Most of
the passages relied upon in proof of this opinion may be
found in Stephens's Theaurus, Art. Παλαμεδ, or pebbles.
Mr. Barrington says, that he has examined all these pas-
fages, and that he can venture to affirm, that none of them
relate to chefs, because there is not the most distant allusion
to the putting of the enemy's king in such a situation that
he cannot be extricated, which is the great object of each
player. From a line in the first book of the Odyssey it has
been inferred that Penelope's suitors amused themselves with
this game before the gates of Ulysses's palace. The game
played by Penelope's suitors, and called πίττρα, is particu-
larly described by Athenæus in his tit book of the Diogn-
epholil, on the authority of a native of Ithaca, and it de-
fers most materially from chefs, as the pieces were in number
128 instead of 32. The principal authority for Palamedes's
having been the inventor of chefs is a line from Sophocles,

Εξήντα ; (cf. Palamedes) πίττρας, κοιτός τί πίττραν άπό παντα
κοιτάζει.

But nothing more can be inferred from this line than that he
invented some game which was played with pebbles, πίττρας.
The game called πίττρα in Greek, was by the Romans termed
calcini or latronchi; and Ovid (de Art. Am. i. iii. 357-
366) has described the mode of playing it, that no per-
son who is acquainted with the moves even at chefs, can
read it with attention, and conceive that it alludes to this
game. Mr. —— has also examined a passage cited from
Lucan, in order to prove that chefs was known to the
Romans, and shown that it is not justly applicable to this
game, supposing that the passage is genuine or ancient.
Donatus, on Terence's Emuch, observes, that Pyrrhus,
the most knowing and expert prince of his age, ranging a
battle, made use of the men at chefs to form his designs
and to shuffle the secrets thereof to others. Vopiscus, in
his life of Proculus, informs us, that one of the Roman em-
perors had the title Augvius given him, because of his gaine
ning ten games at chefs sucessively.

Tamarlae is also recorded as a very expert gambler at
chefs.

It appears from Mr. B——'s historical account, that the
game of chefs, called by the Perians Ξανας, and by the
Constantinopolitans Καπα, was a common game at Contan-
tinople in the 12th century, when Anna Comnena flourished;
and this will probably account for its introduction into Eu-
rope. The first crusaders, before the destruction of the
eastern empire, often remained for some time at Constantin-
ople, and thus probably became acquainted with this be-
witching game, which, on their return, they introduced into
their respective countries. Among the European na-
tions it was first known to the Italians, as we may conclude from
From their being nearer to Constantinople than others, and from their early trade with the eastern ports of the Mediterranean. Accordingly we find by Boccace, who lived in the 14th century, that it was a most common amusement at Florence, and that there was a celebrated player, who (like Philidor) could beat two antagonists without seeing either of the chess-boards. Of its first introduction into Italy we have further evidence in the term *gamblat* at chess, now known in most European languages, which is confidedly of Italian origin; _suo dure il gamblato Signore_ to throw down your adversary in wrestling, by placing your foot against his. Chefs thus introduced, became the favourite game throughout Europe till it was given up for cards; but before cards had banished chess, it was in such vogue that the kings both of Spain and Portugal personified the great players, whilst they also flaked confidant fums on the event of the game. We find that three Italians set out from Naples for the court of Philip II., in which was a famous player, and by concealing their skill won very large fums. Hence it happened that as it was impossible to form a just ell mate of the abilities of an antagonist, no one would play at chefs for money, which, therefore, like drafts, fell into disuse, Italy, however, continued to produce the greatest proficient at this game, till the middle of the 17th century. The Italians are said to have been so much devoted to chefs, that a father, who had died before the conclusion of a game, has bound his son to finnish it; and the same custom is also said to obtain among the Germans. See Hyde, ubi supra, p. 7, 8. As Italy was the country from which Europe in general derived its knowledge of chefs, Spain seems to have had the next claim for having produced at an early period players of eminence; and it has been said that in this country whole cities have challenged each other at this game. As at the time of its introduction into England, the learned Hyde supposed that it was known in our country about the time of the conquist, because the court of exchequer was then first established. See Exchequer. Mr. Barrington, however, is of a different opinion; and though he allows it possible that chefs might have been known in England in the next century after the first crusade had taken place, he rather supposes that it was introduced during the 13th century, upon the return of Edward I. from the Holy Land, where he continued so long and was attended by so many English. The Turks, who never change their habits, are full great players at this game, which well suits both their feudal disposition and their taciturnity. Many of them were often prisoners in the Christian camp, as were also the Christians to the Saracens, so that they had many favourable opportunities in all these ways of obtaining instruction. The first mention which Mr. Barrington has met with of chefs being known in England is in a MS. of Simon Aylward, paid by Hyde to be in the library of Magdalen college. The same learned writer cites another MS. of Lydgate, monk of St. Edmund's Bury, who calls it the "game royal," in which are the following lines:

"Was of a Fert fo fortunate,"

"Into a corner drive and mast,"

Which lines are very intelligible, if we suppose that the preceding line relates to the piece called the king; and they will then have the following meaning: "the king was by a fortunate queen (of the adversary) driven into a corner of the chess-board, and check mated;" which of course concludes the game.

We find in Gale's edition of Hist. Ramfieins. (c. 8.) that when bishop Aetheric obtained admission to Canute the Great about midnight, upon some urgent business, he found the king and his courtiers engaged at play, some at dice, and others at chefs. From Hist. Olai Magni (p. 572.) we learn, that when a young nobleman applied to a father for permission to pay his addresses to his daughter, the parent, as it is said, commonly made a trial of his temper, by playing with him at dice and chefs, before he gave him an answer.

It is certain that our ancestors played much at chefs before the general introduction of cards, as no fewer than 26 English families have emblazoned chefs-boards and chefs-rooks in their arms, and it must therefore have been considered as a valuable accomplishment. Hyde moreover gives, that chefs was much played both in Wales and in Ireland; and that in the latter country some of their belt elates depended upon it, and that it was a condition by which two noble families entertained their lands, that the one should engage the other every year at this game. Barrington, however, expresses his doubts as to these facts, because neither of these countries was so early civilized till the latter end of the reign of Henry VIII. With respect to both Ireland and Wales he apprehends, that they have no term for this game in their respective languages. From a treatise, entitled "the Game at Chefs," and published by Caxton in 1474, it appears, that this game was not uncommon during the reign of Edward IV.; and it is certain also that it was a fashionable amusemen in most houses of rank in the time of Richard III.

From the time of Edward IV. chefs continued to be played by our ancestors, till cards became the more general amusement. We have reason to believe that queen Elizabeth was a chefs player. Charles I. was also supposed to have been a player at this game; though in the *Exemp. Barishen*, ascribed to him, he advises his son against it, because it is over-wit. In the last century Stamma, who was a native of Aleppo, and resided some time in England as translator of Oriental dispatches, published some select games at chefs, together with a few instructions; and after him Blitc gave a method how to open the game at a crown per letter. In France this game seems to have been known at an earlier period than in England. The traces of its antiquity, however, are few and faint. The historian Carte gives us the following account of a chefs-match between Henry I. before his accession to the throne of England and Louis le Gros, son to Philip of France; which took place at Philip's court in 1087. Louis lost several games to Henry, and a considerable sum of money, by which he was so much irritated, that he threw the chefs-men at Henry's head. Henry retaliated the affront by striking Louis with the board, so that he was laid bleeding on the floor, and Henry would have killed his antagonist, if his elder brother Robert had not interposed. This is without doubt a very early instance of the game being known in France; but Barrington says, it is much to be wished that Carte had flated the term used in the Norman chronicle to which he refers, and which he has translated chefs, as the game of drafts was very ancient, bears a considerable affinity to chefs, and equally requires a chequered board.

John of Salisbury relates, that in a battle between the French and English in 1117, an English knight seizing the bridle of Louis le Gros, and crying out to his comrades, the king is taken, that prince struck him to the ground with his sword, saying, *Ne fait tu pas qu'aux echecs on ne prend pas le roy? Dijois tu ains seur, qu'at chefs le king is never taken?* The reason is, that when the king is reduced to such a pass, that there is no way for him to escape, the game ends, without exposing the royal piece to further affront. This fact is said to be related in John of Salisbury's book "De Nigis Curialium;" but Mr. Barrington has not been able to discover it. In the reign of Charles V. of France, the king, as Froissart relates, played at this game with the duke of Burgundy. Chefs is alluded
CHESS.

To in the Romance of the Rule, which ascribes the invention of it to one Attalus; and many of the French families bear in their arms a chess-rose. In the sixteenth century it was much played in this kingdom; and in the seventeenth century the traffic instilled "The Calabrian" was translated from the Italian into French, and might have contributed to revive the game after it had been supplansted, as it has been with us, by the more general amusement of cards. At a later period, and even in our own times, Philidor, who was born at Doux, was the most distinguished champion in this game, and considerable subscriptions were made towards bringing him over to England, that the amateurs of chess might have an opportunity of perceiving his decided superiority. It is well known, that he could play two games against able adversaries, and generally beat them, without being either of the boards. Great chefs-players must necessarily bear in their minds several moves which are probably to ensue, both on their own part and that of their adversary; and he, who, like Philidor, can do this throughout the whole game, even with a single antagonistic, must commonly be the victor.

With regard to Germany, Mr. Barrington has not been able to obtain much information; but he says, that Schauen, duke of Brunswick, wrote a treatise on that subject, and named one of his tovows from it. In Mufcovy it is said to be in great vogue among the shop-keepers and common people, who play before the doors of their shops or houses; and it is highly probable that they received it, together with their profession of faith, from the eastern empire, whilst the Greek sovereigns resided in Constantinople. The Russians are said to be great proficient in chess. With them the queen has, in addition to the other moves, that of the knight, which, according to Philidor, spoils the game, but which renders it more complicated; and of course more interesting. The Russians play also at chess with four persons at the same time, two against two: for which purpose the board is longer than usual, contains more men, and is provided with a greater number of squares. This mode, it is said, is more difficult, but more agreeable, than the common manner. Hyde informs us, that this game is not unknown even in Iceland; and it would undoubtedly be a very convenient game for occupying their very long nights during the winter. As the Mahometan religion forbids gaming for money, the Moors of Africa, particularly in the empire of Morocco, are only allowed by the government publicly to play at chess, which is in itself a game sufficiently interesting without the assistance of wages.

Cardinal Cajetan, and other cardinals, rank chefs in the number of prohibited games, as requiring too much application; and Montaigne blames it as too serious for a game.

Hyde (ubi supra) has given a copious account of the names of the several pieces used in this game, as they occur in different languages. The honourable Daines Barrington has also made some remarks on this subject. Conceiving that the game was originally Chinesc, and that it was transferred from their country to Tibet, Bengal, Hindoostan, and Persia, he thinks it highly probable that the pieces did not differ materially in these several countries, either in name or figure. But when the Turks had learned it from the more extrn inhabitants of Arabia, they of course made the pieces different of any particular form or figure, as they understood the feudal commandment in its most literal and rigid sense. The Greeks and Crusaders, becoming adepts in this game by their long continuance in Palestine, took the liberty of giving any name or form to the pieces at their own pleasure; and consequently they often differ in the several parts of Europe where chefs have been introduced. It was natural, therefore, that their principal piece should be a king, both in form and name, and this term to have obtained also in the more eastern parts of Asia. In most of these countries, however, the kings are rather indolent monarchs, and consequently this piece frequently moves at s, but is merely to be defended from attack.

The emperor himself, being thus indolent, necessarily requires a minister or general, who can protect his matter by vigorous and extensive motions, against distant invasion; in the most remote parts of the board. Accordingly the piece of the greatest powers was by the Persians styled "Pherez," or general. Chefs having been universally considered as an engagement between two armies, and the piece of the greatest importance being termed the general, the allusion is properly purfued. When the game, however, was introduced into Europe, the Christians did not trouble themselves about the Asiatic names for the pieces, and styled the "Pherez" or general, queen, probably because she is placed near to the king, as the general was among the Asiatics; but this does not keep up to properly the idea of a military conflict, as when the "Pherez," or general, is placed in the same situation. Another improvement of variety arises from the Pawn's becoming a queen, where the hath reached the last square of the adversary's camp; as it is a suitable reward to the Pawn (or foot-soldier) to make him a general, if he penetrates so far through the enemy's troops; but certainly no provost on his part can entitle him to be transformed into a queen. The French, and after them the English, in the middle ages, called the queen "femmes," from the eastern word "Pherez;" but the title Queen is of considerable antiquity. The next piece in power to the "Pherez," or Queen, is that which we sometimes call the "Rook," but more commonly the Castle. Mr. Douce (Archaeologia, vol. viii.) suggests, that the European form of the castle was copied in part from some ancient Indian piece of the elephant with a castle on his back. Mr. Barrington conceives this term to be derived from the Italians, the first Europeans who played at chess; as rocco in their language not only signifies a rock but a fortress, which was generally placed on such an eminence. Hence, he adds, our phrase at chefs, "the King castles," or puts himself in a state of security, by exchanging, in some measure, places with the castle, which then becomes more exposed to the enemy. The piece, which we call the Bishop has been termed by English writers alpin, aspin, &c. from an Arabic word, signifying an elephant; sometimes was named an archer; by the Germans the bannor or runner; by Russians and Swedes the elephant, by Foks the priedge; and by the French at a very early period the snaif or foot. The reason of this last appellation seems to be, that as this piece stands on the sides of the King and Queen, some of the times. Mr. Barrington suggests, from this circumstance, styled it the fool, because anciently royal personages were commonly thus attended, from want of other names of this amusing themselves. But it is not to easy to accustom for our term Bishop, as our kings and queens have never had any such companion attendants. When it was first introduced it cannot be exactly ascertained; as in Caxton's time this piece was styled the Epilins. Probably the change of name took place after the reform. The top of this piece was exhibited to the Antiquarian Society by Mr. Barrington, among those chefs-pieces that belonged to Charles I. something resembles a bishop's mitre. The Knight has always retained this distinction, says Mr. Douce, on the French and English chess-boards: the Germans, from the nature of their motion, give him the appellation of hopfer, and the Russians call them waffes. The Pawn is supposed to receive their name from pedes, a barbarous Latin term for foot-soldiers. The Germans, Danes, and Swedes have converted
converted them into pensants. The writers of the middle ages, in speaking of the chiefs men, universally style them familiz. In this game each player has eight dignified pieces, viz. a king, a queen, two bishops, two knights, and two rooks, and also eight pawns, which were anciently called fcia, q. d. militis, and made in different figures, and of various materials, mostly of wood or ivory. These pieces are distinguished by being painted in white and black colours.

According to their disposition on the board, the white king is to be placed on the fourth black house from the corner of the board, in the first and lower rank: and the black king is to be placed on the fourth white house on the opposite, or adversary's side of the board. The queens are placed next to the kings, on houses of their own colour. Next to the king and queen, on each hand, place the two bishops; next to them, the two knights; and last of all, on the corners of the board, the two rooks. As to the pawns, they are placed, without distinction, on the second rank of the house one before each of the dignified pieces.

Having thus disposed the men, the outlet is commonly begun by the pawns, which march straight forward in their own file, one house at a time, except the first move, when they may advance two houses, but they never move backwards: the manner of their taking the adversary's men is sideways, in the next house forwards; where, having captured the enemy, they move forward as before. The rook goes forward or cross-ways through the whole file, and back again. The knight skips backward and forward to the next house, face one, of a different colour, with a fiding march, or all ape, and thus: kills his enemies that fall in his way, or guards his friends that may be exposed on that side. The bishop walks always in the same colour of the field which he is placed in at first, forward or backward, slope or diagonally, as far as he pleases. The queen's walk is more universal, as she takes all the steps of the fore-mentioned pieces, excepting that of the knight; and as to the king's motion, it is one house at a time, and that in any direction. As to the value of the different pieces, next to the king is the queen, after her the rooks, then the bishops, and last of all the knights. The difference of the worth of pawns is not so great as that of noblemen; however, the king's bishop's pawn is the ball, and therefore particular care is taken of him. It ought also to be observed, that whereas any man may be taken, when he falls within the reach of any of the adversary's pieces, it is otherwise with the king, who, in such a case, is only to be taken with the word check (black), warning him of his danger, out of which he must move; and if he cannot move without exposing himself to a similar inconvenience, it is check-mate, and the game is lost.

Chess-trees, or Chess-trees, in Ship-Building, are two small pieces of timber with a hole in them, bolted on each side of the floor, and placed as far before the man-mast as the length of the main-beam; their use is to confine the cuie of the main-fall, and for this purpose a rope passes through, that usually extends the clue of the fall to windward.

CHEST, in Anatomy, that part of the body which contains the heart and lungs. See BREAST and THORAX.

CHEST, in Commerce, a kind of measure, containing an uncertain quantity of several commodities. A chell of sugar, v. g. contains from ten to fifteen hundred weight: a chell of glass, from 200 to 250 feet; of coarse silk, from two and a half to three hundred weight; of indigo, from one and a half to two hundred weight; five score to the hundred.

CHEST at Chatham was established in 1783, for the benefit of maimed and supernumerated English mariners, out of which pensions are paid to such for their lives. This fund was at first raised by a voluntary monthly contribution of the mariners out of their pay, and afterwards made perpetual by queen Elizabeth.

By 43 Geo. III. c. 119, this institution was removed from Chatham to Greenwich, denominated "The Chef at Greenwich," and committed to the management of a body corporate, forming the lord high admiral of Great Britain and Ireland, the comptroller of his majesty's navy, the governor of the Greenwich hospital, and the under-treasurer of the same hospital, and denominated "The Supervisors of the Chef at Greenwich." These supervisors are empowered to appoint five persons out of the lieutenant governor, captains and lieutenants belonging to the Greenwich hospital, to be directors of the said chef, together with subordinates officers and clerks, with suitable salaries. This act contains several provisions, for the management of the funds of the institution, and ameliorating the condition of the pensioners.

CHESTER, or WEST-CHESTER, in Geography, an ancient city of Chester in England. From its proximity to the Welsh principality, and its peculiar local character, its annals embrace much curious history: and hence we shall find it necessary to give a more copious account of this, than of the generality of topographical articles. This respectable city is situated near the southern boundary of the county, on a rocky eminence, above the river Dee, and is half encircled by a sweep of that river; a circumstance that occasioned the Roman geographers to name it Deva or Deusa; an appellation that has been relinquished by later historians for that of Celtia, or Ceferea; from celere, a camp or military station, which it seems to have been made previous to Agricola's expedition to Scotland. This commander made it the head-quarters of the twentieth Roman legion, whereas the Britons gave it the name Ceur Llwyd y Gwy, or the camp of the great legion on the Dee. The Saxons styled it Legescaster, and Legessebur; but its denomination West-Chester was obtained through its relative situation to other places which have the name of Chester with some addition. Its Roman occupation is illustrated by the frequent discoveries that have been made of remains of antiquity belonging to that nation, such as coins, fluates, altars, and hypocausts, and many of them with correlative inscriptions. The walls of the present city determine the limits of the ancient; and the form in which the buildings are disposed is evidently the same as that of the Roman camp. Chester principally consists of four streets, running from a centre towards the points of the compass, and each was formerly terminated by a gate. These streets were excavated from a stratum of rock, and are sunk several feet beneath the surface, a circumstance that has been the cause of a singular construction in the houses. On the level of the streets are low shops or warehouses, and above them a gallery on each for reaching from street to street, open in front, and isolated into. These galleries, called the rooks by the inhabitants, appear curiously crowded to strangers, who, when walking in them, can hardly divest themselves of the idea of their being up one pair of stairs. Along the rows are rows of shops, and above them the higher stories, which project to the streets, and form a line with the warehouses beneath. The whole appears as if the first stories of the fronts of all the houses were laid open and made to communicate with each other; pillars only being left for the support of the superstructure.

"These rows," says Mr. Pennant, "appear to me to have been the same with the ancient velabri, and to have been a form..."
a form of building preferred from the time that the city was
puffed by the Romans. They were built before the doors,
landward between the streets and the houses, and were the
plaz, where dependents waited for the coming out of their
patrons, and under which they might while away the tedious
months of expectation. Plutarch, in the third act of his
Henry VI., describes their situation and use:

"Videmus regum ante axées et ambulacrum ejusmodi."

The streets beneath the rows were the cortas and apthbces; rings
for the various necessaries of the owners of the
houses. The streets were once considerably deeper, as is appar-
ent from the clopse, whose floors lie far below the present
pavement; and in digging foundations for houses, the Ro-
nian pavement is often discovered at the depth of four feet
below the modern." The Roman modes of fortification are
still evident in the remains of military architecture which
surround the city. The walls are in many parts guarded by
tower, mostly of a round form, and so placed as not to be
beyond bow-shot of each other, that the arrows might reach
the enemy who should attempt to scale the walls. From
Domesday Book it appears, that in the reign of Edward the
Confessor, Chelte contained 433 houses that were taxable,
bethes 37 that belonged to the bishop. It had a guild mer-
cantile, analogous to a modern corporation; so that no per-
son that was not of that society, could exercise any trade, or
carry on any commerce, within its precincts. The privileges
of the guild were maintained by two overseers, who were
selected from the principal citizens, and who received,
for the use of the city, the customs paid by strangers. A supreme
officer, called the praefect regis, or provost, had the superin-
tendence both of the civil and commercial interests. Some
particular usages prevailed in this city at that period, among
which, whenever the king came there, he claimed from every
longhouse 2 s. 6d. or capons; one cota or vat of ale;
and one reuka of butter; and whoever made bad ale,
were either to pay four shillings, or fit in a tumbril or dung-
cart. The commerce of Chelfte, according to Lucan the
monk, who lived near the time of the Norman conquest,
was even then very considerable. "The beautiful river on the
from side," he remarks, "serves as a harbour for ships from
Gocoing, Spain, Ireland, and Germany, who, by the guide-
ance of Chelte, and the industry and prudence of the mer-
chants, supply and refresh the heart of the city with abun-
dance of goods; so that, through the various confections of
the divine favour, we have wine in profusion from the plenti-
ful vintages of those countries." The principal exports
were hores and flaves; to the latter innumerable traffic the
Saxons were much addicted; and the situation of Chelte,
and the frequent wars carried on with the Welsh, confi.png it
greatly to flourish in this city. The chief of the other com-
modities exported were lead, copper, hides, horns, and cheez,
which the people of Chelte had been celebrated for making
even from the time of the Romans. Chelte, for two or
three centuries from the conquest, was the place of rendez-
vous for troops employed in the Welsh expeditions, and
frequently suffered during the contest between the two nations.
Llewelyn ap Gryffydd, in revenge for the evil inflicts his
subjects had received from Geoffrey Haugrey, who acted as
lieutenant to prince Edward, (afterwards Edward I.), carried
fire and sword to the gates of the city, and destroyed every
thing round it. These ravages were committed in 1255; and
with in two years, king Henry harminned his nobility to at-
tend him at Chelte with their vassals, that he might invade
Wales, and repay the injuries sustained by his people. This
city also was appointed by Edward I. in 1275, to receive
the homage of Llewelyn; a degradation to which that high-
sprited prince refused to submit, and was in consequence in-
volved in the war which proved so fatal to him and to his
country: his subjects being obliged to acknowledge the
sovereignty of England, and make personal homage and fealty
of their lands to Edward of Caernarvon, prince of Wales,
who received their submission in this city in 1295. Richard
II. converted Chelte into a principality, and having annexed
it to the shifte of Holt, with several lordships in Wales,
and on the borders, made an act that it should only be held
by the king's eldest son, but this was rescinded by Henry
VI., who, in 1392, fixed the city and castle, when on his
visit to Flint, where Richard was then imprisoned, through
the treachery of those in whom he had confided. The
ruins of the plague and sweating-houses rendered the six-
teenth century memorable in this city. During the happy
civil war in the time of Charles I. Chelte was particularly
distinguished for its loyalty, and consequently sustained many
fights, bravely resisting the parliamentary forces for three
years, till the siege being converted into a regular blockade,
and the garrison reduced by famine to the utmost distress,
and compelled to feed on hores, dogs, cats, &c. they sur-
rendered on honourable terms February 3, 1645-6. Within
two years the city was visited by a dreadful pestilence, which
carried off more than 3000 persons, and reduced the place
almost to a defart. In the reign of William III., Chelte
was one of the six cities appointed for the reception of an
affay-master, and permitted to issue a coinage of silver.

In reviewing the ecclesiastical state of this ancient city,
it may be needful to premise, that the kingdom of Mercia
was divided into the five bishoprics of Litchfield, Worcester,
Lyeaaster, Dorchell, and Chatte. About the year 785
the latter became incorporated with Litchfield, though its
annual payments to the pope amounted to 3000 flavers,
while that fee only advanced 3000. This, and other
evidences of its prosperity, attracted the attention of Peter,
bishop of Litchfield, who removed his episcopal seat to
Chelte, in 1753; and during the remainder of his life made
use of the church of St. John for his cathedral. This
transfer was hot of short continuance; for his successor
established himself in the former diocese, and Chelte re-
mained without a bishop till after the suppreffion of the
monasteries, when it was restored to its priorine honour by
Henry VIII. who, in 1345, made it one of his new
fees that were then formed. At this period, the church of
the abbat of the abbey of St. Werburgh was converted into a
cathedral. A very important alteration in the concerns of
this diocese was effected by the field of the new bishops. John
Bird, whose vehement opposition to papal supremacy had rec-
commended him to the favour of the rapacious Henry, who
removed him from Danger, the fee he had before occupied.
His disposition harmonized with the spirit of the times; in
15, he granted the manors and demesnes of the bishopric
to the kng, and accepted improvements and rectories in ex-
change. The fee was thus deprived of all its possessions;
and, with the exception of the single acre on which the
palace stands, and the court before it; another house adja-
cent, a little orchard called the Wyndon, two fousbes near
St. John's church, a few small tenements in the city of York,
and some lands in Broughton and Chander Thornton,
bequeathed in 1705, is completely divested of its temporal-
ties, and though the greater in extent of any in England,
is of the smallest value. St. Werburgh's abbey, from whole
possessions this fee was formed, was of great and unquestion-
able antiquity, but its origin is enveloped in the obscurity of
tradition. It is generally supposed to have been a monu-
ment, founded in 660 by Wulfherus, king of Mercia, in accordance
with the wishes of his daughter St. Werburgh; and it forms
probable
Indeed that it was raised by the Danes, when they perfected themselves of Chester, in 895. In place of the muns, a society of canons regular was established in the reign of Athelstan, by Etheldreda, the heroic daughter of Alfred. There were suppressed by Hugh Lupus, on his accession to the earldom of Chester, and a colony of Benedictines introduced in their stead. Liberal grants were made to the abbey, which continued to flourish till the general dilution. Various remains of its buildings are yet standing.

The cathedral is a spacious irregular pile, become ragged through the decay of the mouldering frame with which it is built. The lower part of the hall has a row of arches now filled up, and appears to be the oldest part of the present building; though not any of it can boast of a remote date. All the labour of the Saxons, and almost all of its refounder, Hugh Lupus, are now lost. Simon Pley left, elected abbot in 1485, limited the middle aisle and the tower, and the initials of his name are interlaid in cyphers on the capitals of some of the pillars. The columns are thick, surrounded by pilasters, with small rounded arches. Above is a gallery, with a neat stone balustrade in the parts where it is entire, and a row of large and broad pointed windows, which is the general style. With the exception of these light fragments, most of the present structure seems to have been built in the reign of the three last Henrys. The beautiful west end was begun in 1508, and the first stone laid with much ceremony. The window over the door is filled with elegant tracery; and the door-case enriched with figures and other sculpture. The descent into the church is by several steps, whence it is reasonably inferred that the present was erected on the foundation of the ancient church, which was originally on a level with the old streets. Besides the cathedral and St. Olaf's which forms a part of it, Chester contains eight parishes churches; but St. John's is only entitled to particular notice.

Within the cathedral precincts is the new county gaol, which is scarcely exceeded by any other in the kingdom. It is built with white freestone, and contains five yards, with a working-room and two day-rooms in each. The apartments for the men and debtors are separate from the others. The number of solitary cells for condemned criminals is fourteen. The principal charge incurred in building this fabric was defrayed by the income arising from the river Weaver navigation. The carpenter is performed by two companies of invalids; and has a governor, lieutenant-governor, and constable. The latter holds his place for life, and is the keeper of the prison, but appoints a deputy. The punishment of preying on death, or the pene forte et dure, for standing mute when arraigned, is paid, by Mr. Pennant, to have originated within the walls of the old goal. The puppet for the purpose was made by Edward II. in whose fourth year, Adam, a man of John, of the Woodhouses, was charged with burning his own house; and carrying away the goods. He stood mute; and, a jury having decided that he could speak if he thought proper, he was imprisoned ad dition. This was an ironical term, except five of the influence allowed, which, on the first day, was three morsels of the world bread; on the second three draughts of water out of the next puddle; and after alternately till the sufferer died. This Adam's death being certified, the statute for preying was made, as being left horrible than flaming. The superior wisdom and humanity of modern times have again altered the law, and a refusal to plead is now considered the same as pleading guilty. The walls round Chester are, in circuit, one mile three quarters, and one hundred and one yards. They are the only entire specimen of ancient fortification, those of Carlisle excepted, in Great Britain, but are now only preserved for the purposes of recreations. The continued walk on the top affords a very great variety of prospects. The Welch mountains, the Cheshire hills of Broxton, and the inflated rock of Deloton, crowned with its castle, the rich flat interposed, and the perpetually changing views of the river, are the most prominent and striking objects in this favourite tour. The expense of the repairs is defrayed by certain imposts, called marge-duite, collected at the custom-house, on all merchandise brought from beyond sea into the port of Chester. The whole annual duty is about 250L., great part of which arises from Irish linen, though the sum levied is only two-pence for one hundred yards. The gates were anciently under the protection of the Earls of Shrewsbury, Oxford, and Derby, and the principal magistrate of the city: the guard was maintained by tolls, exacted from strangers at each entrance. The Norman early invested Chester with great privileges, which were confirmed by Henry III. in whose reign its government assumed the form of a regular corporation. The succeeding sovereigns granted various charters and immunities. The date of the last charter is 1676, temp. Charles II. The corporation of Chester consists of a mayor, recorder, two sheriffs, twenty-four aldermen, and forty common-councilmen, two of whom are leave-takers, whose office it is to inform of all persons exercising trades within the city without being Freeman. The two senior officers are mayors, or receivers of the marge-duite, for repairing the walls; and two are treasurers, who are generally next in succession to the mayor. There are likewise a sword-bearer, mace-bearer, and other inferior officers. The principal charitable institution is the Blue-coat School, which is situated near the north gate, and was founded, in 1706, by Bishop Stratford, and endowed for the complete maintenance of thirty-five boys for four years. A sufficient sum was allowed to bind them apprentices at the expiration of that time. Various alms-houses are dispersed through the city: the chief of these is for forty decayed freemen, aged sixty or upwards, who are allowed 4l. annually, and a gown every third year. The infirmary is a handsome structure, situated in an airy spot, on the west side of the city. Chester is distinguished as a port of provincial metropolis, being a place of occasional residence to many of the gentry of the neighbouring counties. The only manufacture of consequence is that of gloves, which are made in vast numbers, chiefly by women. Additional employment is supplied by a small manufacture of tobacco-pipes, an iron foundery, taff-mills, and some embellishments for ship-building. The latter busines is carried on to great advantage; many vessels, from 100 to 500 tons, being built yearly. These, in point of strength and beauty, are reckoned as complete and durable as those built in any port in the kingdom; the materials are entirely of British oak. A shot manufactry was likewise established in 1801. The maritime business of Chester chiefly consists of the Irish and coaling trade. Great quantities of linen cloth are imported from Ireland; and, for the better accommodation of the merchants, a new hall was erected in the year 1778: this is a handsome square brick building, including a spacious area, and containing 111 shops. Besides linen, the com-
modeties imported are, wood, hides, tallow, feathers, butter, provisios, and other articles, from Ireland; groceries, from London; timber, hemp, flax, iron, and tallow, from the Baltic; kid and lambkins, from Lago-horn; fruit, oil, barns, and cork, from Spain and Portugal; and from the latter, a large quantity of wine. The exports are, coal, lead, lead-ore, calamine, copper-plates, calt-iron, and salt quarters of cheese, with which vessels are laden at various times for London from the large cheese warehouse on the river. The limits of the port extend, on the Chefther side of the Dee, to the end of the Werrell; and on the pinntelmire side to the mouth of the Crayvoll; yet the number of ships is but small in proportion to the extent of the commerce. The port of Chelfer was much improved during the last century. The great breadth of the estuary of the Dee, and the comparative smallness of the body of water flowing through it, rendered it liable to be choked up with the sand brought in by the tide; and this gradually so increased, that in the year 1674, vessels of twenty tons could scarcely reach the town; and ships of burthen were obliged to lie under Netton, ten miles lower, which was the origin of that assemblage of house on the adjacent shore, called Park Gate. In that year a plan was formed by Mr. Andrew Yarrenton, to make a new channel for the river, and at the same time to recover, by embankment, a large tract of land from the sea. Between the years 1750 and 1752, a company was established to execute this project; and different powers were granted from time to time by parliament; but the first operations were so expensive, that many sub- 

The county round Manchester, 410. Pennant's Tours in Wales, and Tour from Chelfer to London.

CHESTER, a township of Nova Scotia, in Lunnabenough county, in Mahone bay, first settled by a few families from New England. The road from this place to Windsor is 25 miles.—All, a small plantation of Lincoln county, in the district of Maine; 9 miles from Titcomb.—All, a township of Hampshire county, in the state of Massachusetts, adjoining Westfield on the E. and about 20 miles N.W. of Springfield. It contains 177 houses, and 1119 inhabitants. —All, a large and pleasant township of Rockingham county, in New Hampshire; 21 miles in length, with a lake on the west side, the waters of which flow into Merrimack river. This township was incorporated in 1723, and contains 1392 inhabitants, chiefly farmers. It is situated on the E. side of Merrimack river, 14 miles N.W. of Haverhill; 35 W. by S. from Portsmouth, and 6 N. from Londonderry. This is a port town, and contains about 60 houses and a congregational church.—All, a township of Windor county, in the state of Vermont, 11 miles W. by S. from Charlestown, in New Hampshire, containing 984 inhabitants.—All, a borough and port-town in Pennsylvania, and the capital of Delaware county; pleasantly situated on the west side of Delaware river, near Marcus borch, and 13 miles N.E. of Wilminglon, and contains about 60 houses, a court-house, and a gaol. The first colonial assembly was convened here in December, 1682. This place is the resort of much company from Philadelphia, the metropolis, distant 20 miles by water, and 15 by land, in the summer season. It was incorporated in December, 1795, and is governed by two burgesses, a constable, a town-clerk, and three officials.—All, a county in Pennsylvania, W. of Delaware county, and S.W. of Philadelphia; about 45 miles long, and 30 broad; containing 33 townships, of which West-Chester is the thirc town, and 27,957 inhabitants, of whom 149 are slaves. In the northern parts of this county is found iron ore, which employs six forges, and producing about 1000 tons of bar-iron annually.—All, a court-house in South Carolina, 22 miles S. of Pinckney court-house, and 38 N.W. of Columbia. —All, a navigable river on the eastero shore of Maryland; rising two miles within the Delaware state from two sources, Cyprus and Andover creeks, which unite at Bridge-town; purifying its course nearly S.W. after falling Chester S. nearly three miles, when it receives S.E. creek, and 15 miles further in a S.W. direction; and discharging itself into Chesapeak bay, at Love point. At its mouth it forms an island, and by a channel on the E. side of Kent island communicates with Eastern bay. It is proposed to cut a canal, about 11 miles long, from Andover creek, 1/2 mile from Bridge-town, to Salisbury, on Upper Duck creek, which falls into the Delaware at Hook island.—All, a small town in the county of Shannandoa and state of Virginia, situate on the point of land that is formed by the junction of Allen's, or North river, and South river, which form the Shannandoa; 16 miles S. by W. from Winchester. N. lat 39° 3' W. long. 78° 22'.—All, a county of Pinckney district, in South Carolina, lying in the S.E. corner of the district on Wateree river, and containing 6866 inhabitants, of whom 5866 are whites, and 938 slaves. It lends two representatives, but no senator, to the state legislature.—All, a town in Cum- in Cumberland county, Virginia, situate on the S.W. bank of James river; 15 miles N. of Blandford, and 6 S. of Richmond.

CHESTERFIELD is a large but irregularly built town, situated on the west side of the river Rother, in Derbyshire, England. Its name decidedly implies that it originated.
originated from a Roman station; as all places whose ap-
propositions begin or terminate with "Chester" were occupied by the Romans during their residence in Britain. The Rev. Mr. Pegge, in the 12th vol. of the "Archaeologia," observes, that the Roman road from Derby to York passed this way; and that the fortress, or camp, was on the hill called Tapton or Tupton, but distinguished in several ancient writings by the name of Castle-hill. Chelferfield, at the time of the Norman Survey, appears to have been of so small importance as to be noticed in Domesday Book only as a bailiwick, belonging to Newbold, which is now a small hamlet at a short distance to the north. After this period, it rapidly increased, both in size and population: a church, erected here towards the end of the eleventh century, was given by William Rufus to the cathedral at Lincoln. In the reign of King John, the manor was granted to William de Briwere, or Bruere, his particular favourite, through whose influence with the king the town was incorporated, and an annual fair of eight days continuance and two weekly markets obtained. The Stanhope's derive the title of earl from this town. Chelferfield has been particularly distinguishd from a battle fought here in 1135, temp. Hen. II. between Henry, the king's nephew, and Robert de Ferrers, earl of Derby. After the discomfiture of the barons at Eyeworth, this earl bound himself by an oath to a forfeiture of his estate and honours, if he should join his party again; but after some proceedings in the parliament held at Northampton in 1266, which were obnoxious to the barons, he, in the spring of the ensuing year, again assembled his followers in his castle at Duffield, and, being strengthened by several disaffected nobles, advanced and took poit at Chelferfield; where he was surprized by the forces of Henry, and, after a severe conflict, defeated and taken prisoner. The church, which is said to have been dedicated in the year 1253, is a spacious handsome building, in the form of a cross, but more particularly remarkable for the appearance of its spire, which rises to the height of 250 feet; and is so singularly twisted and dilated, that it seems to lean in whatever direction it may be viewed. An hospital for lepers was founded in this town previous to the tenth of Richard I., and continued till the time of Henry VIII.

Here was also a guild, dedicated to St. Mary and the Holy Cross; several other guilds are mentioned in ancient writings belonging to the corporation: from the chapel of one of them, called St. Helen's, the grammar-school is supposed to have received the name Chapel-school, by which it is generally known. This school was founded in the reign of Queen Elizabeth, and was formerly the largest in the north of England: both the master and usher are clergymen. The present school-house was erected in 1770. In the market-place, a neat town-hall was built a few years ago, under the direction of Mr. Carr of York; on the ground-floor of which is a gallery for debtors, and a residence for a porter; and on the second floor a large room for holding the sessions, &c. Several almshouses have been endowed in different parts of the town. The charter, granted by King John, has been confirmed and enlarged by several succeeding sovereigns. The government of the town till the reign of Elizabeth appears to have been exercised by an alderman and twelve brethren; but the charter of incorporation granted by her, vefi it in a mayor, six aldermen, six brethren, and twelve capital burgesses; who are assisted by a town clerk. By an ennumeration made in 1788, it was found that Chelferfield contained 801 houses, and 5626 inhabitants. Since that time its size and population have increased, as appears from the returns under the late act, by which the number of houses was ascertained to amount to 929, and of residents to 4257. The support of the latter is principally derived from the iron-works of the town and vicinity, and the manufacture of stockings. Some additional employment arises from three potteries for earthenware; from a carpet manufactury; and from the making of shoes, of which a large quantity is annually sent to the metropolis. Chelferfield is 150 miles N.W. from London.

CHERESFIELD, a township of America, in the county of Hampshire, and state of Massachusetts, 14 miles N.W. of Northampton, containing 185 houses, and 1183 inhabitants. -Also, a township in Cheshire county, New Hampshire, on the east bank of Connecticut river, having Wellesmer's to the north, and Hinfield to the south. This township was incorporated in 1752, and contains 1905 inhabitants. It lies about 25 miles S. by W. from Charlestown, and about 90 or 100 W. from Portsmouth. Welf river mountain in this township has frequently alarmed the inhabitants with explosions and columns of fire and smoke; and in two places the rocks bear marks of having been heated and calcined. -Also, a county in South Carolina, in the district of Cheraw, in the N. Carolina line; 35 miles long, and 29 broad. -Also, a county in Virginia, situated between James and Appamatox rivers, about 30 miles long, and 25 broad; containing 14,214 inhabitants, of whom 7407 are slaves. -Also, an inlet on the western side of Hudson bay, in New South Wales, upwards of 220 miles in length, and from 10 to 150 in breadth; full 30 miles.

CHESTER-LE-STREET is pleasantly situated in a valley to the west of the river Wear, and on the Roman military way leading to Newcastle. It is supposed by Camden to be Condercum of the Romans; by the Saxons it was called Cuneagefer, and under that name became the parent of the fee of Durham; as it is only 5 miles north of Durham, and 10 south of Newcastle, lying immediately on the high road, and in the neighbourhood of numerous coal works, it has risen to importance, and promises to become still more important: its ancient and modern history will, therefore, be not uninteresting.

In 882 the body of St. Cuthbert was first removed from Holy Island, the ancient Lindsfarne, and, after a variety of misfortunes to his followers, was carried to a settlement appointed for them by the interposition of such miracles as a conjurer of the present date would refuse to own. Thee, however, bishop Eardulf pretended were sufficient to stop the wanderings of the religious party which attended the body, and whilst the place afforded a secure asylum to the sacred remains, there, in their turn, procured a respectability and reverence for the situation. Eardulf died in 902. Eighteen of the last years of his life were spent in Chester-le-Street. The saint becoming afterwards an object of more general devotion, Athelstan, in the 5th year of the pontificate of Wigerd, who succeeded Eardulf, visited the tomb in his expedition to Scotland, enriched the church by a multitude of gifts, and ordered, should he fall in the undertaking he was entering upon, that his body might be buried as near the relics as possible. In 947 Sexhelm surprised the bishoiie; but so addicted was he to the love of riches, that he oppressed not only the people, but the very persons who were officiating in the sacred duties. We are told by Symeon, that the bishop was admonished by dreams against practices so detaining, to his holy functions, and those visions were so deeply impressed upon his mind, and were attended with such affliction of body, that at length he retired from the see in the greatest distress, and was not relieved till he got without the limits of St. Cuthbert's "circle of power." In the year 995, the see, which had been enjoyed by Chelfer, was removed from it, perhaps for ever; the remains of St. Cuthbert, with every other
other sacred relics, as well as all other kinds of riches, were removed. The incidentable miracles which disturbed the province of Northumberland from the time the fee was settled at Chester, gave little opportunity for the progress of literature, arts, sciences, or manufactures. The bishops too, whilst they were abundant of miracles, appear to have left good works and real piety out of their view. Architecture had made few improvements, for the cathedral of Lindisfarne, from whence the relics of St. Cuthbert had been originally transported, was built of stone, though the monasteries of Jarrow and Monkwearmouth were also erected with the same materials. Yet with all its splendour of priory miracles, and princely homages, that of our present subject still remained of wood. All the hands between the Tyne and the Wear, comprehending the present county of Durham, were in the possession of these ecclesiastics, and obtained the title of "The Holy and Undivided City of the Most Holy Virgin," (after the example of St. Peter's Patrimony at Rome) and the inhabitants were reconciled to the church, by the idea that they were consequentially freed from every sort of military duty except that of fighting in defence of their patron saint. Nothing particular in the history of this place occurs, until the re-assertion of the bishopric by Egbert, at which time it is said by Symeon, that when the workmen were digging a deep foundation for the new church of Chester, a very great treason was discovered, hidden, it was presumed, by the officers of the avaricious Sexelme, who being obliged to abeond, left it there; but it is very probable it was a more ancient concealment; be that as it may, the bishop removed it to Peterborough, and withdrew himself from the fee to that place. Unlike, however, the generality of priests of that day, he employed the treasure upon objects, not of munificence only, but of general utility, as bridges, canals, and other public accommodations; it is therefore no wonder this good man should be perfecuted by the rest of the clergy. In 995, the fee being removed to Durham, this place lost its consideration and weight, and it is only lately that it has obtained a new importance. The present church is a hand-some stone edifice, with a nave, side aisles, and tower; the bate of the latter is of a square form, but above the roof of the church it assumes an octagonal shape apparently more modern, and is terminated by a very elegant stone spire, second only to that of Reyton, (a village up the Tyne) in the north of England. The entire height is 156 feet. The interior of the church is neat, and well preferred; it contains a singular arrangement of monuments, with effigies of the deceased ancestors of the noble family of the Lumleys. The deanery house, now the seat of the ancient family of Hedworth, commands a fine view of Lumley castle, and is surrounded by excellent meadow grounds. The manor of Chester deanery is copyhold, belonging to the bishop, and its jurisdiction is very extensive: it has a coroner, and gives name to the ward. The township, as returned under the late act, contains 1662 inhabitants, and 229 houses; most of the latter are of stone, and they are chiefly arranged in one street, nearly a mile in length.

Chesterton, a pott town of America, and the capital of the county of Kent, in Maryland. Situated on the west side of Chester river, 16 miles S.W. of George town, 38 E. by S. from Baltimore, and 81 S.W. of Philadelphia; and containing about 140 houses, a church, college, courthouse, and gaol. The college was incorporated in 1782, by the name of Washington; and in 1787, it had a permanent fund of 1250£, a year settled upon it by law. N. lat. 30° 12', W. long. 75° 57'.

CHESTNUT. See CHEST.

CHEST-ROPE, in a ship, is the same with the gurt or girt-ropes, and is added to the boat-ropes when the boat is towed at the stern of the ship, to keep her from heaving, i.e. from swaying to and from.

CHE-CHOU-QUEI, a town of China, in the province of Hon-quaung; 750 miles S.S.W. of PEKING. N. lat. 30° 16'. E. long. 108° 54'.

CHE-TCHING, a town of China, in the province of Quang-chor; 8 leagues W.S.W. of HAO.-ALO, a town of China, the third rank, in the province of Kiang-su; 30 leagues S.E. of KİNGAN.

CHETECAN-HEAD, a cape on the west coast of the island of Cape-Breton. N. lat. 45° 40'. W. long. 65° 45'.

CHETIB and KERI, in Biblical Literature, the one derived from כותיב, to write, and the other from כתי, to real, are terms usually used by Jewish authors to express the difference between the reading of the MSs. and that of the printed copies of the Old Testament. The Chetib is the word adopted in the text, and is marked with a small circle above it, which refers to a different reading in the margin, named the Keri, commonly distinguished by the letter koph פ, and sometimes written in Rubbanch characters. These different readings are supposed to have been conferred by Ezra and the other 119 men of the great synagogue. With regard to the introduction of the keri and Está, the celebrated R. Dov. Remeiious observes, that during the captivity, the sacred books were lost or dispersed, and wise men, who excelled in the knowledge of scripture, were dead. Hence it happened, that the men of the great synagogue, who restored the law to its former state, found varieties in different books, and employed the knowledge they possessed in adulterating them. But in those instances, with regard to which their knowledge failed, they wrote one word, without pointing it, or wrote it in the margin, without inverting it in the text: and they wrote one word in the margin, and another in the text. Kennicott's Diff. Gen. p. 10.

CHETIMACHAS FORD, in Geography, an outlet of the river Misissippi in Louisiana, about 30 leagues above New Orleans, which, after running in a southerly direction about 8 leagues from that river, divides into two branches, one of which runs south-westerly, and the other southerly, to the distance of 7 leagues, when they both discharge their waters into the Mississippi gulf. On the Chetimachas, six leagues from the Mississippi, there is a settlement of Indians of the same name; and thus far it is uniformly 135 yards broad and from two to four fathoms deep, when the water is lowed. At its mouth in the Mississippi, some drifted logs have formed a shoal which it would not be difficult to remove; and the Indians say that no impediment to navigation occurs between their village and the gulf. The banks are higher than those of the Mississippi, and so elevated in some places as never to be over flowed. The productions are the same as those of the Mississippi, but the soil, from the extraordinary size and compactness of the canes, is superior. By proper attention the most prosperous and important settlements in that colony might be formed upon its banks.

CHETIMACHAS, grand lake of, a lake of Louisiana, near the mouth of the Mississippi, 24 miles long, and 9 broad. Lake de Porriage, which is 13 miles long, and 4 broad, communications with this lake at the northern end, b. a front 1 of a mile wide. The country bordering on these lakes...
lakes is low and flat, producing evergreen trees and other kinds of
oak; and on the eastern side the land between it and the
Chalalay river is divided by a great number of navigable
streams, occasioning as many islands. Nearly opposite to an
island, at a small distance from the south-eastern shore of the lake
of Chetnichas, there is an opening which leads to the sea,
about 150 yards wide, and having 16 or 17 fathoms of water.

CHEFAN, a town of Arabia, 6 miles south of Kahtah.

CHE-TSEN, a city of China, of the first rank, in the
province of Koe-te-choen, 875 miles S.S.W. of Peking. N.
lat. 27° 39'. E. long. 107° 44'.

CHE-TSUEU, a town of China of the third rank in the
province of Shang-tu; 50 miles N.E. of Mao.

CHE-TSUNG, one of the towns of China, of the second rank, in the
province of Yunnan, 240 leagues S.S.W. of Peking. N.
lat. 24° 50'. E. long. 108° 38'.

CHETTÉA, in Ancient Geography, a maritime town of
Africa, in Marmorica; sittuate, according to Ptolemy, in
the name of Libya.

CHETTENHAM, in Geography, a township of America,
the county of Montgomery, and state of Pennsylvania.

CHEVAGE, or CHEVAGE. In ancient, formed of the French,
chef, head, according to Bracton, signifies a tribute by
a head, or a kind of pole money, anciently paid by
such as held lands in villanage, or otherwise, to their lords,
in acknowledgment.

The word seems also to have been used for a sum of money
yearly given to a man of power, for his patronage and
protection, as to a chief, head, or leader: but lord Coke says,
that it is a great misprision for a subject to take sums of
money, or other gifts, under the name of chevage, in this
sense of the term. Co. Litt. 140.

In the first sense, Cooke observes, there is still a kind of
chevage fullfilled in Wales, called awoly: paid to the
prince of Wales for the marriage of his daughters;
ancestly by all, now only by some. Lambard writes it chivage.

The Jews allowed to live in England, long paid at Easter
chevage, or pole-money: viz. threepence per head, as appears
by Pat. S. Ed. I. par. 1.

CHEVAGNES, in Geography, a town of France, in the
department of the Allier, and chief place of a canton, in the
district of Moulins, 9 miles east of it. The place contains
8360, and the canton 6873 inhabitants: the territory includes
370 kilometres, and 11 communes.

CHEVAL, in Zoology. See Equus Caballus, horse.

CHEVAL marin. See HIPPODONTUM amphibilis. Che-
val marin is also the name given to the Synonathus hippo-
campus, by Belon.

CHEVAL de Bois, in Military Language, a wooden horse.
It is commonly formed of two planks nailed to trefoils, on
which the French used to put their horsemen when they
wished to punish them for some flight offence, as well as
girls of a debauched and bad life, when they were found
with the folders.

CHEVAL de Frise, in Fortification, a large piece of wood,
or beams, generally from 15 to 18 feet long, thick full and
travers'd with wooden pins or laches from 5 to 6 feet long,
painted and armed each of them with iron at both ends.
Chevaux de frise are made of for stopping up breaches,
and securing the avenues or passages to a camp against the
inroads both of infantry and cavalry; for rendering the
passage along gullies, ravines, and narrow places impracticable.
They are sometimes mounted on wheels with artificial fires
to roll down in an affliot on the assailants, and at other times
they are used instead of reenforcements, as also in front of
ditches in lieu of abatis. On the medal of Luscinus, is found
a kind of cheval de frise, made with spikes interposed;
being to express a fortified camp.

CHEVALER, in the Menea. A horse is said to che-
valer, when, in paffage, upon a walk or a trot, his far
fore-leg crosses, or over-laps the other fore-leg, every second
time or motion.

CHEVALERIE. This word signifies formerly what
was afterwards and is now called robelle, and took its
origin from this circumstance, that the principal exercises of
the nobles were war, julls, and tournaments, which were
carried on or performed by them on horseback. Chevalerie has,
perhaps properly enough, been distinguished into four
kinds: namely, La militaire, La regulaire, L'honoraire, and
La societé.

La chevalerie militaire, was that which was acquired by
army, and was a mark of distinguation that was con-
ferred with the obstinance of several military ceremonies,
as the girding of a sword upon them who was honoured with
the title of chevalere, the putting of gilded foals on him,
the recommending to him the punctual and manly fulfillment
of the duties and functions of his profession, and to forth.

La chevalerie regulaire was that order of chivalry or
knighthood in which one engaged to wear a certain habit, and
to carry arms for the defence of religion, and the protection of
pilgrimages to holy places, &c.

La chevalerie honoraire was that order of chivalry or
knighthood which princes bestowed on each other, and on
the first and favorite seigneurs of their courts.

La chevalerie sociale was only a particular constitution
of people who associated themselves under that title for
different purposes.

CHEVALET, in Fortification, an assemblage of several
pieces of timber for supporting a bridge of fitches or planks,
to enable a body of troops to cross a small river. Chevalets
are also used for bridges of communication in the ditch of a
fortified place between detached works.

CHEVALET d'armes, in Military Language, a sort of bell-
tent, that was formerly used in the French Service. It was
conical and somewhat resembled the wigwam of an Indian.

CHEVALIER, ANTOINE-RUDOLPH, i.e. in Biogra-
phy, a learned French Protestant, was born in 1507, at Mont-
camps, near Vire in Normandy, and studied Hebrew first
at Paris under Vatable, and then at Oxford under Pagini.
He was tutor in the French language to princes; afterwards
queen Elizabeth, and remained in England till the death of
Edward VI. He then removed to Germany, and having
married the daughter-in-law of Tremiltius, he perfected
himself in the oriental language under his direction. From
Strasburg, whither he was invited in 1550, he went to Ge-
neva; where he taught Hebrew, and published an improved
edition of Pagninus's Theocarurius. He afterwards settled at
Caeo, but the civil wars obliged him to take refuge in Eng-
lau, and was kindly received by queen Elizabeth. However,
as soon as the termination of the religious differences at Caeo
allowed of it, he returned thither; but the fatal day of St.
Bartholomew again expelled him; and in his voyage to Eng-
lau he was feiz'd with a disorder, which terminated his
life at Guernsey, where he was landed, in 1574, at the age
of 65. He translated from Syrac into Latin the " Tar-ri
Hierofylumtanum," and St. Paul's epitome to the Galatians;
and his accurate Hebrew grammar, entitled " Rudimenta
Hebraica Linguar," 4to., was printed at Wittenberg in
1574. He had undertaken a bible in four languages, but
died before it was finished, More: Gen. Bzo.

CHEVALIER, formed of the French cheval, horse, and
that of the Latin cavallus, in a general acceptation, signifies
a knight or horsemann.

From the mott remote period of modern history the title of
chevalier has been very eminent and of high consideration.
The novicite necessary for arriving at it was long and trou-
blesome.
balsome. It was requisite, in order to obtain it, to pass through the full or principal degrees that conferred nobility, and to be inadmissible in point of morals and behaviour, as well as in point of bravery and courage. The admission or reception of a chevalier was very august and magnificent; it was accompanied by a degree of pomp altogether extraordinary.

It even attracted the presence of stranger kings and emperors, whose children were not born chevaliers, and could not be received as such, but subject to the formalities prescribed for esquires and gentlemen. When all these things began to decline and get into disuse, sovereigns established different orders of chivalry. See the articles Ecuve, and Ordres de chevalerie militaire.

It is used, in Heraldry, to signify any cavalier, or horsemanship armed at all points; by the Romans called catapultarius. See bows, dow, out of use, and only to be seen in coat armour.

Chevalier, in Ornithology, chevalier aux pieds rouges of Buffon. See Scopilus caudata, the red-backed.

Chevalier of Form. Serin, the ipur-winged waterhen. See Parker jacea.

Chevalier vert, of Buffon. See Rallus bengalensis, Bengal water-rail.

Chevaliers d'armes, or chevaliers servans, form the third rank in the order of Malta. See the article Servans d'armes.

Chevaliers errans, knights errant. These were worthless, who were constantly wandering along the roads and ways in search of fine adventures and giving challenges and defiance.

Chevan. See Chian.

Chevancy Le Chateau, in Geography, a town of the Netherlands, in the duchy of Luxemburg, about 13 miles from Montmedy.
