Chevantia, in our Old Law Writers, is used for a loan or advance of money upon credit.

Chevaux de Frite. See Cheval de Frite.

Chevaux bien dressés, in Military Language, horses well broken. See Cavaliere and Cavalry.

Chevaux de troupe léger, the horses of light troops. They ought to be as well condition to the horses of the heavy cavalry, though they may not be so tall and powerful. They should however be neat, active, and light, as the duty and employment of those, whom mount them, are to harass the enemy incessantly, and to drive him before them when they have an advantage over him; and also to render a retreat long and troublesome when the enemy is superior. Chevaux léger. This was a corps of cavalry consisting of 202 men called d maîtres (masters), who formed part of the guard of the kings of France. It is remarked, to the honour of this corps, that they never loll either their kettle-drums or standards. It owed its formation to Henry IV., and was originally composed of men of arms of Navarre.

Chevec, in Ornithology, Grande Cheveche of Buffon, one of the synonymous names of the Short-eared Owl, Strix brachyota. The great Brown Owl, Strix Ulula, is also called Grande Cheveche by some French authors.

Chevelle, a term used by the French Herald to express a head where the hair is of a different colour from the rest of the head.

Cheverny, in Geography, a town of France, in the department of the Loire and Cher; 7 miles S. of Blois.

Chevet du canou, in Gunney, a billet, block, or quoin, sufficient for supporting the breach of a cannon.

Chevet du mortier, a wedge placed between a mortar and its bed or carriage for elevating it with.

Chevetaile, a Military Term. The French cavalry as well as infantry were anciently conducted by chevetaillers, that is to say, captains or commissaries, who held not their commands for life, but by commutation during the continuance of a war or of a particular expedition.

Cheville d'effet, in Gunney, an iron bolt or pin, which serves to bind together the whole of a gun-carriage by traversing or running across through it. Those that have iron buckles, hinges, or staples, are called chevilles à oreilles.

Cheviot Fourvier, a large nail or bolt, by means of which the timber is placed endwise the carriage of a piece of artillery.

Chevilles de travaux militaires, artillery nails of different sizes, to suit the purpuses for which they are used.

Chevillon, in Geography, a town of France, in the department of the Upper Marne, and chief place of a canton in the district of Wally. The place contains 850 and the canton 1568 inhabitants; the territory includes 1373½ kilometres and 15 communes.

Chevilly, a town of France.

Chevis, or Kevels, in Skip-building. See Kevels.

Chevin, a name used in some parts of England for the chub. See Capito, and Fishing.

Cheviot Hills, in Geography, hills of England in the county of Northumberland, near which was a tree chaf, called Chevot, curiously "Chevy Chafe," the scene of the encounter between the Frieries and the Dogges, celebrated in the ancient popular song: 6 miles from the borders of Scotland, and 18 S. of Berwick. These hills form a regular ridge running from the S.W. where they join those of Gal- low; on the N.E., and stretching from near Berwick to the Solway firth, constitute a kind of natural rampart between the two kingdoms.

Chevire, a town of France, in the department of the Mayne and Loire; 5 miles N.W. of Bauge.

Chevisance, in the Law of England, is said to be an agreement, or composition, or bargain between a creditor and debtor; but it seems chiefly to denote an indirect gain, in point of usury, &c. In our statutes it is often mentioned, and most commonly used for an unlawful bargain or contract. See the statutes against usury, anno 12 Annae. In the flat. i. Eliz. c. 7, it is used simply in the sense explained by Dutschne, for making contracts.

The word is said to be derived from the law French chev- vier, to come to the end, or finish any thing; in the same sense as the modern French il chevester.

Chevitie and Chevisse, denote in Mem. Angl. heads of ploughed land.

Chevre, a crab or gin. A machine for razing stones, large pieces of timber, and pieces of artillery. See Crab and Gin.

Chevre, in Zoology, the goat among French writers; Chevre sauvage of Tanner is the Caucaen Ixen. See Capra Asiag. in.

Chevregny, in Geography, a town of France, in the department of the Aisne, and district of Laon; 5 miles S. of it.

Chevres, a town of France, in the department of the Charentes; 18 miles E. of Angoulême.

Chevrolet, in Artillery, an engine to raise guns or mortars into their carriages; it is made of two pieces of wood of about four feet long, standing upright upon a third, which is square: they are about a foot slender, and parallel, and are pierced with holes exactly opposite to one another, having a bolt of iron, which being put through these holes, higher or lower at pleasure, serves with a hand-spike, which takes its poise over this bolt, to raise any thing by force.

Chevetty, and Chevrum, in Zoology, the name given by French writers to the Roe. See Cervus Capreolus.

Chlvreuil, the name under which Du Prat des-
CHE

ferbes the Cervus virginianus. Chevreuil is likewise the
French name of the Roe, Cervus capreolus.
CHEVREUSE, in Geography, a town of France, in the
department of the Seine and Oise, and chief place of a can-
ton, in the district of Verfailles; 8 miles S.W. of it. The
place contains 1753 and the canton 10,326 inhabitants; the
territory includes 110 kilometres and 21 communes.
CHEVRON, or CHEVRONY in Heraldry, one of the
honourable ordinaries of a shield, formed of two-fold lines
placed pyramidalvms, and representing two rollers of a
horse joined together, without any division.

It depends from the chief towards the extremities of the
coat, in form of a pair of compasses half opened. Thus, lie
bears a chevron, a chevron argent. See plates, Heraldry.
The chevron is the symbol of protection, fay some; or of con-
quiesence, according to others: some fay, it represents the
knight's spurs; others, the head-attire of priestesses; others,
a piece of the lift, or the barrier or fence of a park.

When it is alone, it should take up the fifth part of the
field, according to Leigh; and according to others, a third
part: when it is accompanied with any other bearings, its
breadth must be adjusted thereby.

It is borne divers ways; sometimes in chief, sometimes in
base, sometimes enarched, sometimes reversed, &c.
The chevron is sometimes charged with another chevron,
one third of its own height.

Two chevrons are allowed in the same field, but no more:
when they exceed that number, they are called chevronnes,
or chevronnés. There are chevrons of several pieces. The
dimensions of the chevron are the chevronel, which is half
the chevron, and a couple clofe, which is in space half
the chevron. See CHEVRONEL and COUPE-CLF.

A chevron is said to be abaféd, when its point does not ap-
proach the head of the chief, nor reach farther than the mid-
tle of the coat; mutilated, when it does not touch the ex-
tremes of the coat; eleven, when the upper point is taken
off, so that the pieces only touch at one of the angles;
broken, when one branch is separated into two pieces; couched,
when the point is turned towards one side of the efec-
cheon; divided, when the branches are of several metals, or
when metal is opposed to colour; and inverted, when the
point is towards the point of the coat, and its branches to-
towards the chief.

A coat is said to be chevroned, when it is filled with an
equal number of chevrons, of colour and metal.

Counter-chevroned, is when it is divided, as that colour is
opposed to metal, and vice versa.
Per Chevron, or Party per Chevron, is when the field
is divided by only two tinge lines, riling from the two base
points, and meeting in a point above, as the chevron does.

CHEVRONEL, a diminutive of chevron; and, as such,
only containing half a chevron. Morgan and Guillim tell
us, that when there are more than five chevrons in a coat,
they should be called couple-clofe; but Edmundson says,
that if there are 6, 7, 8, 9, or 10 in a coat, and they are
placed at equal distances from each other, they ought to re-
tain their name of chevronels; but in case they are placed
in pairs, then, and then only, they are to be called couple-
clofe.
The name writers also affit, that a chevron between two
chevronels should be termed " A chevron between two
couple-clofe;" but Edmundson is of opinion, that a che-
vron cotified, or a chevron between two chevronels, would be
a truer blazon, and much better understood.

CHEVRONNY, or CHEVRONY signifies the parting of
the shield, several times chevronwise: Gibbon says, che-
vronne of fix.

CHÉVROTAIN, in Zoology, Buffon calls the Musk
of Guinea, Moschus pygmeus of Erxleben, Chevrotain des
Indes Orientales. See Moschus pygmeus.

CHEVROTINE, in Military Language, a leaden ball
of a small diameter, of which there are sometimes from 66 to
166 to a pound.

CHEVROTTER, in French Music, is a term given, in
derision, by musicians to a bad shake: when a finger, in-
stead of a rapid vibration on two distinct sounds at the dif-
nent notes, of a whole tone or a semi-tone, flutters only on one
and the same note. The Italians call this pretended kind of
flakes, rfffe di capo, " a goat's cough." Early in the 17th
century, before finging had been much cultivated, while a
true shake was little known, it was common to write it
down, and even to print, an iteration of the same note at a
cloe, as a grace, when a real shake was afterwards required,
as at a clofe in G:

This appears in the Solf Musiche of Claudio Seracini of
Sienna, printed and published in 1624. We should have
supposed this to have been the caprice of an individual, had
we not found it elsewhere; but the same monotonous trill
occurs, expressed in notes, not only in songs of this period,
but is recommended to the practice of students in finging,
by the celebrated Caccini, in his Nuove Musiche, printed at
Venice, 1615.

CHEUX, in Geography, a town of France, in the de-
partment of Calvados, and dioclet of Caen; two leagues W. of
it.
CHEWASE, a town of America in the Tennesse go-
vernment; 24 miles S.W. of Tellico.

CHEWING-balls, in Farriery, a sort of balls contrived
for horses to chew, not swallowed at once; not intended as
food, but as incentives to appetite; and on other medicinal
occasions very useful to the creature. The receipt now most
extemned for these balls is this: take liver of antimony, and
of asa festuca, of each one pound; wood of the bay-tree,
and juniper wood, of each half a pound; pellitory of Spain,
two ounces: let all these be powdered together; then add
as much fine grape-juice as is necessary to make the whole
into a paste. This is to be formed into balls of about an
ounce and a half weight, which are to be dried in the sun.
These are the chewing-balls, and are to be used one at a time
in the following manner. The ball is to be wrapped up in a
linen rag, and a thread is to be fastened to this, in such a man-
er that it may be tied to the bit of the bridle, and kept in
the mouth: when the bridle is taken off, the horse will im-
mediately eat; and when one ball is consumed, another is
to be tied up, and put in its place, till the intent is an-
swered.

CHEYAM-HOI-EHOTUN, in Geography, a town of
Africa in the kingdom of Corea; 457 miles E.N.E. of Peking.
CHEYNE, George, in Biography, a native of Scot-
lund, where he was born in the year 1670, was at first intend-
ed for the church, but attending the lectures of Dr. Archi-
bald Fitzaine, he became a profeyle to his doctrines, and
determined on practicing medicine. Having taken his de-
gree of doctor, about the year 1700, he came to London,
and soon after published his opinion of acute fevers, in which
he attempts to explain the doctrine of secretion, on me-
chanical principles. His next work, on empyems, was pub-
lished in 1705, and procured his election into the Royal Soci-
ety. Arrived at a mature age, he calls this a juvenile produc-
tion, and acknowledges it was justly cenfur'd by De Moivre,
whom, and to Dr. Oliphant, he makes an apology in the
preface
che Gout," us. The newol; and the treated after contains to ihort-br which of been together nature luxuries, being which candid by year confined to the chart of Roxburgh, for whose use it appears to have been written.

As Chieve was a voluntary, the disposition to corpulence, which he inherited from nature, had so increased, by the time he attained a middle age, that he became unwieldy, short-breathed, and lethargic; alarmed at these appearances of a broken constitution, he determined on altering his mode of living, to which he justly attributed the evil; accordingly he confined himself to a milk and vegetable diet, and submitted to a total abstinence from fermented liquors. The experiment succeeded, and he was soon relieved from the most distressing symptoms of his complaint. Struck with the benefit he had received, he published in 1722, an "Effay on the true Nature and due Method of treating the Gout," together with the nature and quantity of Bath waters, and the nature and cure of most chronic diseases. As he had resided for some years, during the summers, at Bath, and drank the waters, he attributed much of the benefit he had received to them. His next publication, which appeared in 1734, was his famed "Effay on Health and Long Life," 8vo. In this he enunciates the necessity of a strict regimen, particularly in the article of diet, both in preventing and in curing diseases. It was dedicated to Sir Joseph Jekyll, master of the rolls, who had been under the author's care. In the preface the author gives an account of his former works, which he confines, where faulty, with great freedom. He is particularly severe on his own conduct, wherever he has treated other writers with levity or disrespect.

Although so much benefited by an abstemious course of living, he had not been able, it seems, to continue it, after his complaints were subdued; he once more therefore became a free lover, and indulged himself in wine, and other luxuries, but finding his complaints returning, he had again recourse to a milk and vegetable diet, and with much manifest advantage, that he continued it for the remainder of his life, which was extended to the year 1742, when he died at Bath, being 77 years of age. He had several years before, viz. in 1733, published his "English Manners," or treatise on nervous diseases of every kind, as spleen, vapours, lowness of spirits, hysteric and hypochondriac dis-eases, which he thought were more frequent, if not confined, to this country. This work became very popular. In it is contained a candid and judicious narrative of the author's case, which may be read with advantage, particularly by persons who, by inheritance, have impaired their health. For the titles and account of a few other productions, see Tilker's Bib. Med. and the Gen. Bibl. from which much of the above is taken.

CHEZE, la in Geography, a town of France, in the department of the North Coasts, and district of Loudes; 15 league S.E. of it. CHEZERY, a town of Savoy, cited to France in the year 1750.

CHEZY l'ABBEY, or CHEZI-sur-MARNE, a town of France, in the department of the Arthe, and chief place of a canton in the district of Chatou Thierry; 15 league S.S.W. of it. The place contains 1,820 and the carton 11,938 inhabitants; the territory includes 253 1/2 kilometres and 20 communes.

CHIA TERRA See Terra Cina.

CHIABERA, Gabriel, in Biography, a celebrated Italian poet, was born at Savona in 1732. He passed his elementary studies at Rome, and was received into the Roman college. He was a youth of unbounded passions, and was concerned in many disputes, one of which forced him to become an exile for many months. He at length found means to appease all animosities, and dedicated himself to literat pursuits. He was first noticed on account of some Latin verses, but he afterwards turned his talents to Italian poetry, of which he became a voluminous and highly admired author. His reputation as a poet caused him to be invited to the courts of several princes. By Ferdinand I. grand duke of Tuscany, he was munificently rewarded on account of verses composed for a dramatic exhibition given to the prince of Spain, and for others written in honour of the marriage of the princess Mary, who became queen of France. Charles Emanuel, duke of Savoy, professed him to reside at Turin; and on his refusal, made him magnificent presents, and liberally paid his expenses whenever he visited that capital. Vincent Gonzaga, duke of Mantua, was another of his patrons, and assigned him an annual pension. But nothing conducd to much to his reputation as the notice taken of him by the cardinal Barberini, himself a poet, who not only addressed to him an ode, but when pope, under the title of Urban VIII. honoured him with a brief filled with praises and high compliments. The republic of Genoa, of which he was a subject, conferred on him many honours and privileges, one of which was that of being covered when he addressed the serene college. Chabrier lived universally respected to the age of 80; he married a wife at 70, but left no children. As a poet he filled up the interval between the most flourishing and declining ages of Italian poetry. He aimed at originality, and uled to declare, that, like his countryman Columbus, "he was resolved to find a new world, or perish in the pursuit." This is perhaps to be chiefly understood of his lyrical productions, in which, it is said, that he naturalized the graces of Anacreon and the sublime flights of Pindar. He enriched the Italian verse by the introduction of various new measures. He was likewise an elegant prose writer; his "Familiar Letters" paves the graceful cale fitted to that species of composition. A collection of his most esteemed poems was published at Rome, in 3 vols. in 1718.

CHIACA, or CIACA, in Ancient Geography, a place of Asia in Armenia, between Dacula and Mentone. It had a Roman garrison, according to the Notitia Imperii.

CHIAGORAS, a river of Africa, considered by the ancients as one of those which contributed to form the Nile.

CHIAJA BECH, or KIAYA-BEJ, among the Turks, an officer whole duty or business is to serve the Aga of the Janizaries in quality of first maître d'hôtel in the name of all the corps. See KIAYA-BEJ.

CHIJA-BECH, or second lieutenant general, is the third general officer of the Janizaries. He yields in nothing to the second general officer or first lieutenant general, who is called Seyer Bayty, in point of privilege, authority, and command. Some judgment may be formed of the great power of the Aga, or chief of the Janizaries, from the rights and authority of this second lieutenant general, who is captain of the richest company, namely that of Bahr-Doury's, and governs it despotically. He is heir to his father's soldiers as die without children and parents, and he beholds at his pleasure in his subaltern or subordinate officers the governments of the cities of war or the offices called Khariz.

CHIAILS, a folk of Mongols or Moors, inhabiting Surat in the Eak Indies, w.o, as well as the modern Persia.
Persians belonging to the same class, do not consider Abubaker, Omar, and Omeyma as the lawful successors of Mahomet, but as usurpers; whereas Ali, the son-in-law of Mahomet, as the perfon who ought to have immediately succeeded to the place of the prophet; whereas the Turks, who are called 'Sunnites,' or 'Sunnites,' believe the contrary. This difference of belief is the caufe of an irreconcilable hatred between these people, which is encouraged and cherished by the princes on both sides. See SHIITES.

CHIALISH, in Geography, called also Yuldzuz, and by the Turks Karshah, or the black city, a town of Little Buccharia.

CHIAMETLAN, a province of North America in Mexico, bounded on the north by Culican, on the east by the Zacatecas, on the south by Xalafco, and on the west by the Pacific ocean. It is faid to be 37 leagues from north to south, and as wide from east to west. The soil is fertile; many mines of filver are found in the country; and it produces a great quantity of honey and wax. The native Indians are well made and warlike. The river St. Jago difcharges itself into the fea here; N.W. from the point of St. Jago. The chief town is St. Sebaffian.-Alfo, a town of Mexico, in the province of the fame name; 225 miles N.W. of Mexico. N. lat. 23° 40'. W. long. 101° 1'.

CHIAMETLAN-Island, a cluffcr of small islands in the Pacific Ocean, near the coast of Mexico. N. lat. 22° 20'. W. long. 102° 26'.

CHIAPA, a small maritime county of Afa, bounded on the north by the defert of Cochinchina, on the eait and south by the Indian fea, and on the west by Cambodia, from which it is separated by a ridge of mountains. Mr. Pennant, aftcr M. d'Anville, calls this tract Chiampa; and Sir George Staunton (Emb. vol. i. p. 364.) fubstitutes Tliampa, and fays that it appears from the fea, as a fandy tract interfeéted with rocks. Mr. Pennant informs us from an old French narrative, that the people of this country are called Loyes: and are large, muscular and well made, and have a reddifh complexion, rather flat nose, and long black hair; their dreff is very flight. The king refides at Feneri, the capital: and was tributary to Cochin-china. The productions of the country are cotton, indigo, and bad fik. Their junks are well built, and much employed in fhipping. CHIAN Marble. See Marble.

CHIANA, in Geography, a river of Italy, which joins the Ticiber, about 10 miles S. of Orvieto.

CHIANNI, a town of Italy, in the duchy of Tufcany; 16 miles S.E. of Siena.

CHIANTIL, a town of Mexico, in the province of Chiapa; 100 miles S.E. of Chiapa dos Efpanoles.

CHIAOUS, among the Turks, are officers in the corps of Janizaries. They are of three kinds or descriptions, and are distinguished by different names. The firft of these is the bar-chiaous, who as captain of the fecond Ola, or company, has the charge of regiftring thofe who enter into the corps of Janizaries. He receives them by taking them by the ear and giving them a cuff. He inflicts punishments on the guilty, and ranges the foldiers in a line, when the Aga is going to pafs, in order that each of them may have it in his power to blefs him, by repeating fome words of the Alcoran. This bar-chiaous commands two others, who are subordinate to him, each of whom is called Porta-chiaous. Neither of these is a captain, but rather a fott of lieutenant or captain-lieutenant. But their duty is to caufe the sentences of the captains againft delinquent foldiers to be carried into execution. For the foldiers of that corps the fingular privilege of being judged by their own proper officers, or thofe of their own companies. It is alfo the duty of the lorta-chiaous to direct the order of march for the infantry, and more especially to faltate the ftrt with hands joined when it paffes before the general. Every bar-chiaous then, or captain of a company of Janizaries, has two captain-lieutenants, or lieutenants under his orders.

CHIAOUS, an officer in the grand signior's court, doing the bufinefs of an uffier.

The word, in the original Turkifh, signifies envoy.

He bears arms offensive and defensive, and has the care of prisoners of dilfincion. His badge is a flaff covered with filver; and he is armed with a flcimiter, bow, and arrows. The emperor ufually choofes one of this rank to fend as embaffador to other princes. The chiaous are under the direfion of the chiaous-bijebi, an officer who affifts at the divan, and introduces thofe who have bufinefs there.

CHIAPA, in Geography, a province of Mexico or New Spain in North America; bounded on the north by the province of Tabafco, on the south-eaft by Vera-paz, on the south by Guatimala, on the south-west by Soconusco, and on the west by Guaxaca. It is about 85 leagues from eaft to weft, and its breadth, where it is narrowing, is about 30, and in parts nearly 100 miles. The country abounds with fords of pine, cyprifes, cedar, oak, walnuts, and wood vines; with aromatic gums, balflam, liquid amber, tabacuha, copal, and other articles, that yield excellent balflams; and alfo with corn, cocoa, cotton, and wild cochineal; together with fruits of various kinds, as pears, apples, quinces, c.; and achicote with which the natives colour their chocolate. Chiapa has alfo a great variety of cattle; and it is particularly famous for a fine breed of hofes, in fuch elimination, that they fend their colts to Mexico, at the dilfance of 500 miles. This province teems with beafls of prey, and alfo with foxes, rabbits, and wild hogs. In the hilly parts, more efpecially, are fnares of different forts, fome of which are faid to be 30 feet long, others of a red colour, and ftaeked with white and black; which the Indians tame and even coil round their necks. The inhabitants of this province are of a fair complextion, courteous in their difpofition and manners, well fkill'd in music, painting and mechanics, and refpeftful to their fuperiors. The country is well watered; its principal river is Chiapa, which running from the north through the country of the Quelenes, falls into the fea at Tabafco.

This river enables the Chiapa to carry on a confiderable trade with the neighbouring provinces, which confifts chiefly in cochineal and flk; and of the latt commodity the wives of the Indians manufacture handkerchiefs of all colours; which are purchased by the Spaniards and fent to Europe. Chiapa is reckoned by the Spaniards as one of their poorfe provinces, becaufe it has no mines or fand of gold, nor any harbour on the South fea, yet in fize it is inferior to none except Guatimala. To the Spaniards it is of great impoftance, becaufe the strength of their empire in America very much depends upon it; and it may be eafily entered by the river Tabafco, Puerto Real, and its vicinity to Yucatan.

CHIAPA, the name of two towns in the above province: the one is sometimes called "Cividad Real," or the royal city, and the other "Chiapa de los Indos," inhabited by Spaniards. The former is a bishop's fee, and the fott of the judicial courts. It is delightfully fittuated in a plain, surrounded with mountains, and almost equally dilfiant from the North and South seas, and 100 leagues N. from Guatimala. The bishop's revenue is 8000 duetvs a year. The town is neither populous nor rich; and the Spanifh gentry who reside in it are provocably proud, and ignorant. It has feveral monaftries, a cathedral of elegant ftricture, about 400 Spanifh families, and a faubsbour, containing about 100 Indian families. The city is governed by magiftrates.
brates chosen among the burghers of the town, in con- 
sequence of a peculiar privilege granted to them by the king of Spain. The principal commerce of this place is cocoas, cotton, and sailcloth. N. lat. 17°. W. long. 66° 40'.

The other town, called "Chiapa de los Indios," belonging to the Indians, is the largest they have in this country, and lies in a valley near the river Tehuaca, about 4 leagues N.W. of "Cienfald Real." The celebrated Bartholomew de Las Casas was the first bishop of Chiapa. See the biographical article Casas. The town is large and rich, with many cloisters and churches: and no town has a greater number of Indians valuing themselves on their rank than Chiapa. On the river they have several boats, with which they often exhibit fea-fights and sieges. In the environs are several farms well stocked with cattle, and some sugar plantations. Wheat is brought thither from the Spanish Chiapa; and of this they make hard biscuit, which the poorer Spaniards and Indians carry about and exchange for cotton, wool, and such trailing things as they want. In this town there are about 20,000 Indians. The heat of the day is extreme, but the nights are cool.

CHIAPPEN, in Mythology, an idol of the savages in the valley of Tunis, near Parnassus; being their Mars, or god of war. Before they set out for battle, they sacrifice slaves and prisoners in honour of him, and smear the body of the idol with the blood of the victims. In most of their enterprises they consult Chiappen; and they previously undergo a penance for two months, abstaining from the use of salt and all commerce with women.

CHIARENZA, or CLARENCE, in Geography, a town of European Turkey, on the west coast of the Morea, not far from the Mediterranean, near the river Silius; once a considerable place, but now almost ruined; 81 miles S.W. of Livadia, and 20 W. of Corinith.

CHIARELLA, et al. clearer in a Musical Term, one of the most essential requisites in a musical composition. The definition of good music, by that spirited and inventive vocal composer, Galuppi, more frequently called Buralitto, though short, is very comprehensive: it confines (he told the author of the Present State of Music in France and Italy) to "benevolenza, chiarezza, e buona modularazione."

Clearness in music is a very different quality from clearness in literature. In prose, verse, or reasoning, vivâ voce, when a thought has been presented in the most appropriate terms, exempt from all extraneous matter, but accompanied with the accouterments necessary to its development, and intelligibility, it is clear; interesting to be too concise occasions obscurity, and in trying to be clear, we become diffused:

--- Brevis ut laboris.

obscurus fo.

In literature, the greatest secret of the art, is not the saying all that may be said, but to let that be clearly conceived which is not said. It is totally different in music: the moment we become diffused, we cease to be clear; for that as the opposite to clearness in literature, is obscurity; the opposite to clearness in music, is confusion.

A musical idea, apart from all expression, is not an operation of the mind. It arises from a kind of instinct, or, if you please, from a sentiment which takes only directa; and just as it springs from the head of the musician, it is received by the audience, without the least obscurity. We speak here of simple melody. But if harmony is added to it, each part increases complication, obscures the principal idea, and it is then that clearness is wanted.

Each phrase in music should have a character, and this character arises from the melody. If the accompaniment to this melody forms another melody of a different character from the principal part, and is interposing, to which should we attend? there will then be a confusion.

To make use of a term in painting, upon these occasions, when there are many melodies in motion at once, we should aim at transparency; the several parts should be heard through each other.

M. Fraymery, in the Encycl. Meth., has extended this article, and pointed out the several causes of confusion and obscurity: one of which he says, and perhaps with truth, is the present rage for modulation, which destroys the unity of melody, and calls off the attention from the melody to the harmony; breaks the chain of thought, and drives us from the mind the original motive, and like fumes that is too acid, or too sweet, totally destroys the flavour of the principal voice. See Transparency, Melody, Modulation, Charge, and Laboured Accompaniment.

Though clearness is a common epithet, and well understood in common things, it is peculiarly necessary to be explained as applied to music. In compositions of many parts, when the principal melody is not disturbed by the two great complication or activity of the subordinate parts; when not only the principal melody is heard through the cell, but that every part carrying on a particular design, can be distinguished without confusion; here it is that the word transparency might be usefully admitted into the musical technique. However numerous the parts, the principal, the best or most intercalating melody should be respected, to whatever part it may be allayed. When many designs are carried on at the same time, as in double fugues with counter subjects, in writing which, as the composer's talk is difficult, is that of the hearer; as the science of the one is on the stretch, to is the attention of the other.

The composer should never forget the place and the audience for which he is at work. In productions for the church, where tranquility and profound attention are supposed to reign, learning and complication are more likely to be understood than in a theatre, where the interest of the drama, the beauty of the poetry, the gestures of the actors, the pomp of representation, all combine to attract the attention of the audience from the labours of the musical composer. These considerations not only furnish an apology for a thin score in opera fongs, but render it an object of praise. Clearness in dramatic music is so much more necessary than in that of the church or even chamber, as the objects that distract the attention of the audience are so numerous.

CHIARI, FRABRIZIO, in Biography, a painter and engraver of considerable reputation in his profession, was born at Rome in 1621, and died in 1655. He made several etchings from Poulsen, which, though slightly executed and incorrectly drawn, manifest the hand of a master; among others are the following, viz. "Mars and Venus in a Landscape," "Venus and Adonis," and "Venus with Mercury and several children." Strutt.

CHIARI, GIUSEPPE DE JOSPH, an eminent historical painter, was born at Rome, in 1641, and having studied the arts of design under Galliani, placed himself under the celebrated Carlo Maratta, whose style he copied and with whom he so ingratiated himself, that he was entrusted to finish several of his pictures and designs, and recommended to other employment. As he advanced in reputation, he was engaged in many great historical works for churches and palaces, while he exercised himself in fancy compositions. His pictures, in which he exhibited delicacy of touch, an agreeable tone of colouring, and elegance and correctness of drawing, have been held in high
high estimation. What he wanted in genius, says Mr. Fustel, he strove to supply byindustry, moderation, and judgment. He died at Rome in 1727.

CHIARI, in Geography, a town of Italy, in the Breffian, between Brescia and Crema; 12 miles W. of Brescia.

CHIARO SCURO, & OBSUCRO, among Painters. See CLAIR obscur.

CHIARMONTE, in Geography, a town of Sicily, in the valley of Noto; 25 miles W. of Syracuse.

CHIASCIO, a river of Italy, which runs into the Tiber, near Terni.

CHIALESSI, a town of Italy, in the country of Frilà, belonging to the state of Venice; 7 miles W. of Palma-la-Nueva.

CHIASMOS, in Ancient Greek Medical Writers, is the concourse or meeting of any two things under the same figure of a cross, or the letter χει, whence it is named. The adverbs χειρι, and χειρικος, signify the same thing; thus the optic nerves are said to meet χειρικος, so as to cross each other.

CHISTOS, the name of a bandage in Oribabius, so called from its resembling a cross, or the letter X.

CHISTOS, in Rhetoric, the name with what is otherwise called diadetes.

CHIVAY, in Geography, a town of Peru, in the province of Chicón; 120 miles N.W. of Potosí.

CHIAYARI, a town of Guinea; 15 miles W.N.W. of Brugateau.

CHIAVEMA, County of, a country of Switserland, in alliance with the Grisons, situated at the foot of the Rhätis Alp, N. of the lake of Como; about 8 leagues long and 6 wide. This country is fertile in wine and pastures; the inhabitants raise a considerable quantity of flax, but not corn sufficient for their wants, which they procure from their neighbours for cattle, wine, and flax. The inhabitants are Catholics, and dependent in spiritual matters on the bishop of Como. The country of Chiavenna came under the sovereignty of the Grisons at the same time and in the same manner with the Valdés. During the war of the Valdés, it frequently changed its masters; but at the peace of Milan, was finally restored to the Grisons. It is ruled, like the other provinces, by a Grison governor, under the name of commissary, whose whole power in some instances is less limited than that of the judges of the Valdés. The criminal court of justice is formed by the commissary and the affessor, who is appointed by the commissary, from three candidates nominated by the country. He must attend all examinations, concur in ordering torture for the conviction of a criminal, be present when it is inflicted, and ratify the final sentence; but as the affessor owes his place to the commissary, and shares in his exactions, he is a mere eyer, and seldom ventures to exert his right of interfering to a negative. This circumstance renders the courts of justice in Chiavenna more uniformly inequitable than even those of the Valdés; for the close union between the commissary and affessor almost precludes a chance of redress, and gives unbounded scope to oppression. The mode of proceeding established in this court of justice is similar to that of the Valdés, which fee. In civil causes the commissary receives 5 per cent. of the contended property, and an appeal from his decision may be submitted to the syndicate.

CHIAYENNA, the capital of the above county, is situated at the foot and upon the side of a mountain, and contains about 3000 persons. The inhabitants carry on but little commerce. The principal article of exportation, excepting the stone-pots called "Lawezzi," is raw silk, of which the whole country produces about 7500 pounds. A manufacture of flax flockings, the only one in the town, has been lately established. The neighbouring country is covered with vineyards; but the wine is of a meagre sort, and only a small quantity of it is exported. The great support of Chiavenna is the transport of merchandise;—this town being the principal communication between the Milanece and Germany, and from hence the goods are sent either by Coire into Germany, through Fregaz and the Engadine into the Tyrol. A duty is laid by the Grisons upon all the merchandise which passes through Chiavenna; but it is so small, that the whole customs, including those in the Valdés, are farmed for 17,000 florins, or about 1260l. per annum.

The principal object of curiosity in the environs is the fortress in ruins, seated upon the summit of a rock, which overlooks the town, once celebrated for its almost impregnable strength. The strongest part of the fortress was constructed upon an insular rock, rent, as some suppose, from the contiguous mountain, by a violent convulsion of nature. Others suppose that the separation of this rock was the work of art, and aefume to its order of Galeazzo Vicentini, in 1343. The length is above 250 feet, the height about 200, and the greatest distance from the adjoining rock about 20. Close to Chiavenna is a rock of asterlost. Coxer's Travels, &c. vol. iii.

CHIAULSA, a town of Mexico, in the province of Tlascalen; 20 miles S.W. of Puebla de los Angeles.

CHIAYORIO, a town of Germany, in the duchy of Carinthia; 8 miles S.of Traves.

CHIAYUSI, among the Turks, officers employed in executing the visitations, bailiffs, and other great men; the orders for which the grand signior sends them wrapped up in a black cloth, on the reception of which they immediately perform their office. See CHIADUS.

CHIBARAOI TAI KIAIEN, in Geography, a post of Chinela Tartary; 6 leagues N of Geho.

CHIBI, in Zoology, the name of the domestic cat in Paraguay, according to Mr. d'Aza, in his history of the quadrupeds of that country. It is also called by others mbaracaya.

CHIBICOUAZON, or Mbaracaya-Goupazou, the great cat, the name by which the people of Paraguay distinguish the ocelot, according to M. d'Aza.

CHICA, or CHICHA, liquor used by the Indians of South America, in the provinces of Quito, Peru, &c. in the times of the Incas, and still very common. The method of making it is this: they steep the maize in water till it begins to sprout, and then spread it in the sun, where it is thoroughly dried; after which they roll and grind it, and of the flour they make a decoction of any strength at pleasure. It is then put into jars or casks, with a proportional quantity of water. On the second or third day it begins to ferment, and when that fermentation is completed, about two or three days more, they deem it fit for drinking. It is reckoned very cooling; and it is also exhilarating. Among other medical properties that are ascribed to it, they say it is diuretic; and to the use of this liquor the Indians are supposed to be indebted for their being strangers to the ñrangur or gravel.

CHICADEE, in Geography, a mountain of N. America, in the state of New England.

CHICAL, in Zoology. According to Hasselquist this is the name of the common jackal in Turkey.

CHICALY, or CHICALY-CHICALY, in Ornithology, a bird very common in the woods of the illusmus of Panama. It is described by Wafer. (Dampier's Voyage) as a bird of great beauty. Bachelier also speaks of it (Voy. aux Indes Occidentales). The note of this bird, according to these writers, approaches that of the cuckow; but the per's...
and more rapid. The plumage is elegantly diversified with a variety of lively colours, as red, blue, &c.; the tail is long, and the bird carries it in a straight direction like the cock. It lives on wild fruits, inhabits trees, and is rarely seen on the ground. Some ornithologists have imagined this to be a species of Ara, but the true genus does not appear to be correctly ascertained.

CHICAMA, in Geography, a river of South America in the kingdom of Peru, and jurisdiction or intendancy of Truxillo; the water of which is distributed to the adjacent country by canals, and serves to render them productive, in great plenty of sugar-canes, grapes, and fruits of different kinds, both European and Creole, and particularly maize. From the banks of the river Lambayeque to Choco, sugar-canes flourish near all the other rivers; but none of them equal in goodnes or quantity those near the river Chica-

CHICANE, or Chicaneiy, in Law, an abuse of ju-
diciary proceeding, tending to delay the cause, and deceive or impose on the judge, or the parties. Some derive the word from exciun, the skin of a pomegra-
\ntate; whence the Spaniards formed their chico, little, slender; chicané being convenient about trifles.

The French call folletes, attorneys, &c. gens de chi-
cane.

Chicané is also applied to the foolish, to vain sophisms, distinctions, and substities, which immortalize disputes, and obscure the truth: as, the chicané of courts does jus-
tice.

CHICANES de juffer, chicaneiy of the duch or joffee, in Military Language, very serious and sometimes very bloody contrivances, intrigues, and attempts between the besiegers and the besieged, when the former endeavour to make themselves masters of the covert-way and the ditches. Be-
fides intrepidity and resolution on the part of both, a good deal of coolness, intelligence, and invention is required in those who conduct, on such occasions, either the attack or defence. The night is generally chosen for such enter-
prises.

CHICANGA, or Chicangn, in Geography, a kingdom of Africa, which was formerly a part of the country of Monomotapa, rich in gold mines. It is called "Manica" from the principal town, which is situated on the river Sofala, in S. lat. 20° 15', E. long. 28'.

CHICAPEE, or Chickapee, a small river of North America, in the state of Massachusetts, which rises from fe-
veral ponds in Worcester county, and running S.W. unites with Ware river, and 6 miles farther it discharges itself into the Connecticut at Springfield.

CHICAS, Chicas, or Tarija, a jurisdiction of South America, in the audience of Charcas, and belonging to the archbishopric of Plata, about 30 leagues S. of Plata; the greatest extent of which is about 35 leagues. This is now a province of the new vicereigny of Buenos Ayres. The temperature of this district is various, some parts of it being hot and others cold; and hence it has the advantage of pro-
ducing corn, fruits, and cattle. This country, every where where abundant in mines of gold and silver; and especially that part called Chocayas. Between this province and the country inhabited by wild Indians, runs the large river Tipuany, the sands of which, being mixed with gold, are washed like those of the river Caravaca. The gold mines in Chicas and Tarija, by the statement of Helms, are 41; the silver mines 55; and it has 1 lead mine.

CHICCAMOGA, a large creek of North America, which runs north-westerly into Tennessee river. Its mouth is 6 miles above the Whirl, and about 27 S.W. from the mouth of the Hillafee. N. lat. 35° 18'. The Chiccamog-
a Indian towns lie on this creek and on the bank of the Tennesse. See Chicagoes.

CHICHA. See Jollas.

CHICHACOTTA, a post on the frontier of Bootan, in the track from Bengal to Tibet; which was rendered famous by being an object of contile between the British troops, and the people of Bootan, in the war carried on upon their fron-
tier in the year 1772. As a fortification, it was then: as it is at this day, a large oblong figure encompassed by a high, bank, and thick flockade. The Bootans defended it with obstinacy, and a battle was fought in its vicinity, in which they displayed much personal courage; though it was impossi-
ble they could long contend against the superior advantage of firelocks and cannon over matchlocks, the fabre, and the bow. But though they were compelled to give way, they made Chicachotta, for a considerable time after, a post of danger and alarm, which the British troops were obliged alter-
atively to polishes and relinquish, till they were finally driven back, and purfued beyond Buxadawer or Pallaka. It was reftored at the clofe of the war, and now constitutes the Bootan frontier. The boule in the fort, to which capitulation Turner was conducted in his embassy to Tibet, was of a totally different construction from any in Bengal. The first apartment, to which the acent was by a wooden ladder, was elevated about 8 feet from the ground, and supported on forklifts: bamboo, reling on the forks, lerved as beams: the floor of one room was formed by mats of split bamboo, that of the other by pieces of plank from 3 to 6 feet long, and 1, or 1½ broad, hewn by the axe, and laid on beams of fir. A prop rode from the center of the ground-
floor to the roof, which was of thatch; and the sides of the room were encompassed by split bamboo, interwoven lattice-
wife, fo as to leave interfaces for the admission of light and air. The apartments were divided by reeds placed upright, confined at top between two flat pieces of bamboo, and rei-
ning at bottom in a groove. In the whole fabric there was no iron; the thatch was very low, projecting considerably be-
yond the walls; fo that the rooms were equally defended from the rain and wind. N. lat. 26° 35'; E. long. 85° 35'. Turner's Embafly, &c. p. 19.

CHICHE, a town of France, in the department of the Two Sevres, and the district of Thouars; 6 miles S.E. of Breuffire.

CHICHEROBE, a town of America in the state of Georgia; 20 miles N. of T'gloeo.

CHICHESTER, a city of Suffex in England, is raised on the site of a Roman fitation, on ground a little elevated in the midst of a very level tract of country. The four prin-
cipal streets, which are tolerably wide, and paved, branch off at right angles from the center of the city, in lines bearing direct towards the four cardinal points of the com-
pafs. At the end of each of these streets was formerly a fortified gateway: but these have been destroyed, and of the ancient embattled wall which formerly surrounded the city, only some portions remain. The principal of them is on the north side, where a spacious terrace was raised about the year 1755. This being covered with fine gravel and shaded by a row of lofty elm trees, affords an ornament to the city, and a pleasant promenade to the inhabitants. The whole circumference of this place within the walls is about 422 perches, or 696 feet, embracing an area of between 100 and 101 acres of land.

That Chichester was a Roman station appears evident from the termination of its present name, and from several relics peculiar to the Romans that have been found here at different times. In the year 1727 a telfellated pavement was...
was discovered near the episcopal palace: and Mr. Hay, in his recent History of Chichester, says it was the residence of the Roman, propurator, and that a heathen temple was erected here. On a place called the Revile, near the city, are the vestiges of a large encampment, the earth-works of which, according to Mr. Hay, extend about three miles in length, by one in breadth; but the Chichester guide states with more probability that it is an oblong square, of about half a mile in length, and half as much in breadth. The Roman name of this station was Regina or Regina.

During the Saxon dynasty the name was changed to Ciffa-ceifer, from Cilla, a king of the South Saxons, who, after a long reign of 74 years, died A.D. 577. From this period Ciffa-ceifer continued the seat of the monarchs of this district for above 300 years, and was attacked at different times, by the kings of Wessex, and by the piratical Danes. At the Roman conquest, there were, according to the domed-day book, one church and above 100 dwelling houses within the walls; and soon after that event, Hugh de Montgomerie was erected by the conqueror, earl of Chichester and Arundel. To secure himself in the populous town he raised a castle, and augmented the fortifications of the former place. Camden states that Chichester was taxed at this time with 13s. per annum for the king, and 10d. for the earl. The latter having obtained leave of his monarch to establish a fee in his newly acquired town, granted the whole fourth part of it to Stigandus, who was the twenty-second abbot or bishop of Selcfa, and the heir of Chichester. It appears that two or three churches were erected here, and successively destroyed, before the present cathedral was founded. This is flated by Mr. Hay to have taken place during the prelacy of Bishop Seffrid, who, "affiliated by six other prelates, consecrated the church on the second of the ides (i.e. the 12th day) of September A.D. 1189." (History of Chichester, 8vo, p. 417). Judging from the styles of architecture which prevail in this building, and from some auxiliary circumstances, we should rather coincide with Dean Litticoton in attributing to bishop Ralph the "greatest part of the inside walls of the nave, choir, and transept." This bishop was installed in 1191; he began the church in 1195, and died in 1213. He signalized himself not so much for his buildings, as for his energy and spirit in refuting the papal encroachments which were then attempted to be made under the pretense of the Cardinal de Creina, whose blameless exit from this kingdom is noted, and justly reproached by Hume, Henry, &c. in their histories of England. Bishop Ralph appears to have been liberally afflicted in the progress of his cathedral by Henry I. In the year 1187, a devastating fire destroyed nearly the whole city of Chichester; and the wood work with some other parts of the cathedral was consumed, or considerably injured. This damage was, however, repaired by Bishop Seffrid and his immediate successors; one of whom was the famous bishop Poore, who was translated from this see to that of Sarum in 1217, where he exerted and displayed his knowledge of, and taste for, architectural science in designing the present magnificent fabric at the latter city. It is extremely probable that the principal additions of Chichester cathedral, which are easily distinguishable by pointed arches and their corresponding decorations, were completed about this time. The spires of this, and that at Salisbury are traditionally said to have been built by the same person, and their general resemblance seems to justify the conclusion. Both of these are, however, of a date much later than any other parts of the fabric, but are both striking varieties of the style which prevailed during the long and pious reign of Henry III., when the architects and ecclesiastics were animated by the same enthusiastic ardour of emulation. The ornaments of the interior of this cathedral, the halls of the choir, and the tallcets paintings on the ceilings, appear to have been executed in the time of bishop Sherburn, who was translated to this see in 1505. This prelate was employed many years by Henry VII., in a diplomatic capacity, and he is said to have brought into England an Italian artist of the name of Bernardo, who was commissioned to produce an historical painting on large panels of oak, and which were to occupy both sides of the south transept of Chichester cathedral. It was intended to represent the founders and benefactors of the church. This picture, or these pictures, though extremely bad as works of art, are very curious specimens of early portrait painting, and may perhaps be considered among the earliest examples of the kind in this country. The east end of this cathedral has totally lost its original character: as the chapel of the virgin is converted into a library beneath which are large vaults for the Richmond family, and for that of Waddington; also a cemetery for that of Millar. A large number of monuments is affixed to different parts of the cathedral, many of which are not only ugly in themselves, but are highly injurious to the stability and beauty of the building. One monument among these deserves particular notice, as a memorial to genius, and a specimen of English talent. This was erected by a subscription raised among the citizens, to commemorate the name and character of Collins the poet, who was a native of this place. The monument is by Mr. Flaxman, who has displayed his usual taste and talent in its design and execution. Here are some other marble monuments by the same artist. The site, &c. of Chichester cathedral may be estimated by the following measurements:

From east to west, 410 feet; crofs ailefs, or transept from north to south, 131 feet; breadth of body and aisles at the west end 92 feet; height of the central tower and flteeple 270 feet, which is 134 feet less than that of Salisbury; height of towers at west end 95 feet, and of another tower, which stands on the N.W. side of the church, 107 feet; height of the roof, or vaulting 61 feet. The four sides of the cloisters are respectively 120, 109, and 103 feet.

The walls of the city inclose six parishes; and without the walls are two other parishes. Besides the churches here is a fine ancient market crofs, a guildhall, a market-house, and council chamber, a workhouse, a theatre, a custom-house, a prison, a work-house, and some chapels. The crofs, an elegant octagonal structure, highly ornamented, was built by bishop Story, who was advanced to this see in 1435. "There is a degree of grandeur in the design, and elegance of execution in this crofs, superior to any other structure of the same class in England." A plan with details, &c. of it is given in the Architectural Antiquities of Great Britain, vol. 1. 410. The guildhall is a spacious ancient building, situated in a retired part of the city: here was a nunnery, founded by William dean of Chichester, in the reign of Henry II. It is now converted into an hospital under the patronage of the dean and chapter, and is supported by revenues from several valuable elates. Within its walls is a neat chapel. The bishop's palace is a large pile of building, and the gardens are spacious. The river Havant nearly encircles the city, and is navigable for small vessels: but the quay or harbour is about two miles from the city walls. In the reign of king James I. an act was obtained to widen and deepen the river up to the city; but this has not yet been effected. Chichester sent members to parliament in the twenty-third year of Edward I.; and by charter granted, in the reign of James II. A.D. 1685, it is governed by a mayor, recorder,
It sends two members to parliament, who are elected by the inhabitants paying fees and lot, and certain freemen, in all amounting to about 620 voters. Besides the mayor, who is elected from the aldermen, here are four justices of the peace, before whom and the mayor most of the petty causes and litigations are tried.

Here are two weekly markets, on Wednesday and Saturday; and every Wednesday fortnight the market is very large. Here are also five annual fairs. This city is 65 miles S.W. from London, and contains 8,511 houses, and 4,744 inhabitants. Hay's History of Chichester, 8vo. 1864.

About two miles and half N. of Chichester is the village of Lavant, near which is a seat belonging to the duke of Richmond, who has another at Rawmere, and another at Goodwood, about 4 miles from the city. Four miles N.E. of Chichester is West Stoke, the cheerful residence of Lord George Lenox. A short distance hence is WestDean the seat of Lord Selsby.

Chichester, Upper and Lower, two townships of America, in the state of Pennsylvania, and county of Delaware.

Chichester, a small township of Rockingham county in New Hampshire, about 35 miles N.W. of Exeter, and 45 miles N.E. from Portsmouth. It lies on Suncook river; was incorporated in 1737, and contains 403 inhabitants.

CHICHICOCO, a mountain of South America, in the province of Quito, being a branch of the snowy mountain of Carguarito, and one of the flattens in the Cordilleras of the Andes, where the Spanish aluminers fixed a signal in measuring the degree of a meridian. While they were in this station, an earthquake occurred, which reached 4 leagues round the country.

CHICHTILI, in Ornithology. See Strix cichicthi. Lam.

CHICHTOTOTLI, the Mexican name of the silver-beaked tanager, tangara lec d'argent of Soumain.

CHI-CHOW, in Geography, an island of the China sea, not far from Formosa, which in reality consists of two islands close to each other. The southern coast of this island, on Dallymple's chart, is in N. lat. 22° 13', but by the observators of captain Marchand, who anchored in the Sound under this island, it's coast is in N. lat. 23° 4' or 5'.

CHICHELY, Henry, in Biography, an English bishop, born of obscure parents at Higham Ferrers, in Northamptonshire. He was educated at Winchelsea school, from whence he was admitted at New college, Oxford, where he took the degree of doctor in civil and canon law. He was afterwards chaplain to Robert Medford, bishop of Salisbury, by whom, in the year 1402, he was promoted fint to the archdeaconry of Salisbury, and in two years afterwards to the chancellorship of that diocese. His various talents brought him into notice, and he was employed by Henry IV., and V. in various important negotiations. He was sent embassador to pope Gregory XII. to congratulate him on his advancement to the papacy; the bishopric of St. David's becoming vacant during his absence, he was promoted to that see by the pope, who consecr him with his own hands. In 1414, he was translated to the see of Canterbury. The commons having addressed the king to seize upon the revenues of the church, archbishop Chicheley employed his talents to divert the storm. He advised the clergy to grant the king a large subsidy, and then enflamed the ambition of the monarch to lay claim to the provinces of France which had belonged to his predecessor. He went over to France with the king, and on his return before his sovereign, he caused abundance of processions to be made for obtaining the favour of heaven upon his arms, and, at the many synods which he held, exhorted his brethren to open their purses freely in support of fo just and necessary a war. He was frequently with the king in his camp, and was present with him at Paris after the surrender of that capital. In 1421, he crowned queen Catherine in London, and during that year he baptized prince Henry, who, when he came to the crown, ever treated him with a fort of filial respect. During the minority of that prince he was nominated first privy-counselor, but never exhibited any inclination to engage in matters of state, confining himself to his ecclesiastical functions. He founded a noble college and large hospital at his birth-place, and endowed them with ample revenues, which were considerably augmented by his two brothers, who were aldermen of London. In 1426, pope Martin V. exhibited some tokens of displeasure against the archbishop for having vigorously opposed certain encroachments made by the see of Rome. The prelate was obliged to make his concessions before he could be restored to favour. He was a liberal benefactor to the university of Oxford, and was the founder of the college of All Souls, one of the noblest foundations in the university. He likewise displayed much munificence by contributing large sums in awning and improving the cathedral at Canterbury, and for building Croydon church, and the bridge at Rochester. This prelate, who was greatly respected, died in 1443, and was buried in a monument which he had himself erected in Canterbury cathedral.

CHICINE, in Geography, a town of Lithuania; 3 miles N. of Rohazow.

CHICK Pet. in Botany. See Cicer.

CHICKAHOMINY, in Geography, a small navigable river of America, in Virginia. At its mouth in James river, 37 miles from Point Comfort, in Chesapeak bay, is a bar, which has only 12 feet water at common flood-time. Vessels of his tons burden may go 32 miles up the river.

CHICKAMACOMICO, a creek of America, in the state of Maryland, and county of Dorchester, which runs southward between the towns of Middle-town and Vienna, and discharges itself into Fisbing bay.

CHICKAMAGUES, a denomination given to part of the Cherokee nation of Indians in America, which occupies five villages on the Tennesse river. See Chichamogga.

CHICKASAW, an American creek, which falls from the Eull into the Wabash, a little below Fort St. Vincent. -Alleo, a river which discharges itself into the Missipp, on the east side, 104 miles N. from the mouth of Mark's and 57 S.W. of Mine-au-fer. The lakes here are excellent, and covered with a variety of useful timber, canes, &c. This river may be ascended, during high floods, upwards of 30 miles, with boats of several tons burden.

CHICKASAW Bluff lies on the eastern bank of the Missipp, within the territories of the United States, N. lat. 35°. In 1795, the Spaniards suddenly built a strong fort in this place; but it was given up by a treaty of 1796.

CHICKASAWS, a famous nation of Indians, who inhabit the country on the east side of the Missipp, on the head branches of the Tombigbee, Mobile, and Yazoo rivers, in the N.W. corner of the state of Georgia, and N. of the country of the Cheatts. This territory is an extensive plain, tolerably well watered from springs, and of a pretty good soil. They have seven towns, the central one of which is in N. lat. 34° 23', W. long. 89° 30'. The number of persons, formerly occupying this district, was reckoned to be 17,253; and of these 575 are said to have been warriors.
CHI

CHICKEN, in Ornithology, the young of the gallinaceous order of birds, and especially of the common hen. Chickens require no meat for two days after they are hatched: and they are first fed with small oat meal, dry or steeped in milk, and the crumbs of white bread: and as they acquire strength, with curds, cheese-paste, or some kind of bread, the young are fed with their food will prepare them from the rye, and other differences of the head: and care should be taken to furnish them with a proper supply of clear water. In order to have fat crowded chickens, they should be cooped up when the hen forsakes them, and fed with wheat-meal mixed with milk, and made into a paste: this diet will fatten them in about a fortnight. See Cock, Fowl, and Hatching.

CHICKEN-POX, in Medicine. See Varicella.

CHICKWEED, in Botany. See Alisleine and Arenaria.

CHICKWEED, Bajfard. See Befonia.

CHICKWEED, Water. See Callirichie.

CHICLANA, in Geography, a town of Spain, in the province of La Mancha; 22 miles N. of Ubeda.

CHICOCA, in Mythology, an idol of the African negroes, supposed to be the guardian of the dead. His nativity, composed of wood, is erected near their burial-places.

CHICOMUJZLO, in Geography, a town of Mexico, in the province of Chicapa, remarkable for a cave which has a narrow entrance, but is spacious within, having a stagnant lake, of clear water, two fathoms deep towards the banks.

CHICOMYXEN, a town of America, in the slate of Maryland; 38 miles S.S.W. of Annapolis.

CHICORACEOUS, in Botany. M. Vaillant divides plants with composite flowers into three classes or families: the cynaropholopous, the eorymbifrons, and the chicoraceous.

CHICOREE, in Conchology, the name given by the French collectors to a variety of shells which are furnished with foliated processes, as in the Murex ramphus of Linnaeus. The collectors in this country distinguish the same kind of shells by the general appellation of endives, which literally have the same meaning as the French chicorée. With scientific collectors such indiscriminate terms are not however adopted, as shells of very different genera are comprehended under this title, although the greater number of them are mucres.

CHICOVA, in Geography, a kingdom or district of Africa, having on the north, Butan; on the west, Boronos, and on the south Mocaranga, called Monomotapa. This kingdom is reported by travellers to abound with silver mines, in several parts of the country, near Zambesi, which inundates the country like the Nile, except in the month of April. S. lat. 15° 46'. E. long. 29° 30'.

CHICOYNEAU, Michel, in Biography, a native of Blois, ruffed medicine at Montpellier, and was admitted doctor in that faculty on the 6th of October, 1652. In 1659, on the death of James Durant, he succeeded to the professorship of medicine; to this post was soon afterwards added, those of anatomy and botany, with the superintendence of the royal botanical garden, much to the regret of his brethren, who were sufficiently mortified, Allrue relates, to find a young man occupying such important posts, which had hitherto been belied as rewards for age and merit. Their opposition however did not prevent his being soon after made chancellor and counsellor of state. Knowing the enmity of his opponents he was careful, by diligence in the discharge of his duties, to render their efforts to get him dismissed of his offices, ineffectual. Cheveyne became blind towards the latter part of his life, which was extended to the year 1672. He had three sons, one of whom only, his second son, survived him.

CHICOUXNEAU, Francis, was born at Montpellier, in 1672. In March, 1693, he was made doctor in medicine, and his father had interred sufficient to purchase his the reversion of the feval offices he held on his death, and get him appointed his subtiture, to perform the duties of them. When from losses of sight he was rendered incapable of reading the簿. The diligence he used in performing the duties imposed on him, and the fidelity of his transactions, gained him the esteem of both his colleagues and pupils. As he had distinguished himself equally as a practictioner and teacher in medicine, he was appointed one of the physicians who were sent to Marseilles, in the year 1720, to assist in putting a stop to the dreadful ravages of the plague, which in the end almost depopulated that city; M. Chirac, his father-in-law, who was first physician to the regent, having recommended him as qualified for that office. The attention and zeal he showed in this situation, gave complete satisfaction to the inhabitants, and was rewarded on his return to Montpellier, by a pension; and in 1731, on the death of M. Chirac, he was chosen to succeed him as first physician to the king; he was also made counsellor of state, and honorary member of the Academy of Sciences. He died in 1752, being 80 years of age. In 1751 he published "Observations et Réflexions touchant la Nature, les Événements, et le Traitement de la Peste de Marseilles," 12mo. It was the 2nd part of his life, and Meffs. Verny and Dedler, who had been joined with him in the commission. Its principal trait is the opinion contained in it, that the plague was contagious. Influenced by that opinion they had boldly entered the apartments of the diseased, and fortunately escaped infection; but the confidence hence inspired, probably contributed in spreading the disease, and making it more general, by inducing the inhabitants to neglect separating the sick from the healthy. Having received orders from the king to collect the opinions of different physicians on the plague, and particularly all the facts and observations that had been published on the subject of the plague at Marseilles, he published his collection under the title of "Traite des Causes, des Accidents, et la Cure de la Peste," with a recueil d'observations, et un détail circonstanciation des précautions qu'on a prises pour le souffrir aux bords des peuplées alliées de cette maladie, ou pour le prévenir dans les lieux qui en sont menacés." Paris, 1744, 4to. This work is drawn up with candour, and is valuable from the number of useful facts contained. His son,

CHICOUXNEAU, Aimé François, born in 1699, was made grand pensioner of Montpellier in 1732. After receiving the rudiments of his education under his father, he went to Paris, and was farther instructed by his grandfather, Chirac, Du Verny, Winlow, and Vallant. Returning to Montpellier, he was first made demonstrator in botany, an office he filled with such credit, that he obtained the reversion of the places occupied by his father, and supplied his place when he was at Marseilles, and afterwards, on his being appointed physician to the king. As he was particularly attached to botany, which he cultivated with zeal, he fet himself with diligence to repair and almost renew the botanical garden, which had been founded by Henry IV. His father having procured him the office of counsellor in the court of aids, he applied himself to the study of the law, and with such success that he was soon enabled to discourse on the subjects which came before him in that department as readily as on theof in medicine. He was an elegant Latin scholar, and his orations were admired for the purity of the language, as well as for their neatness and perspicuity. But all these good qualities were soon lost to the world, as he died in 1745, aged only 38 years. Haller's Bib. Lloy. Diet. Hall. Gen. Bing.
CHICOQUERA. in Ornithology. See Falco Chigrara.

CHICALTI, the name of a kind of finpe found in the mountains parts of India; the exact species is not distinctly known: perhaps the same with the Notius corona of Nicergren, the Indian name of which according to that author is Chinchati. Its beak, he says, is long, black, and slender; its head is marked with undulated streaks of yellow near the eyes; the breast and belly of a whitish colour, and the throat with some black feathers intermixed with white ones; the back variegated with black, yellow, and green. This bird is found principally among the mountains, where it generally runs on the ground. It is easily bred in cages, and feeds indiscriminately on various kinds of food.

CHIDNEI, in Ancient Geography, the name of an ancient people who inhabited the vicinity of the Euxine sea.

CHIDRIA, a place in the Thracian Chersonesus, which some of the Athenians, after the defeat at Aegos Potaamos, made their escape.

CHIEF, a term denoting head, or a principal thing or person. The word is formed of the French, chef, head.

We say the chief of a party; the chief of a family, &c.

Agamemnon was the chief of the Greeks who besieged Troy. The Romans sometimes refused triumphs to their victorious general, because the conduct of the chief was not as answerable to his success. The abbots that are chiefs of their order are all regular; and it is there the general chapters are held.

Chief baron. See Barons and Court of Exchequer.

Chief, in Heraldry, is the upper part of the escutcheon, reaching quite across, from side to side.

The arms of France are three golden fleurs de lys, in a field azure; two in chief and one in point.

Chief is more particularly used for one of the honourable ordinaries, drawn horizontally across the face of the shield, and containing the uppermost third part of the escutcheon.

Plate, Heraldry. When the escutcheon is cut in feme, or in relievo, the chief stands out prominent beyond the rest; and is supposed to represent the diadem of the ancient kings and princes; or the caque of the knights.

It is frequently without any ornament; sometimes it is charged with other bearings; sometimes it is of a colour of metal different from that of the coat.

The line that bounds it at the bottom is sometimes straight, sometimes indented, engraved, embattled, lozenged, &c. Thus, ray they, the field is gules, a chief argent, &c. Again, he bears, gules, a chief sable, or embattled, argent.

Sometimes one chief is borne on another; expressed by a line drawn along the upper part of the chief; when the line is along the under part, it is called a fillet. The first is an addition of honour, the second a diminution.

The chief is said to be abated, when it is detached from the upper edge of the coat, by the colour of the field which is over it; and which retrocedes from it on-third of its height. We also say a chief is chevroned, paled, or bended, when it has a chevron, pale, or bend, contiguous to it, and of the same colour with itself. A chief is said to be supported, when the two thirds at top are of the colour of the field, and that at bottom of a different colour.

Chief, in. By this is understood any thing borne in the chief part, or top of the escutcheon.

Chief jousting, in Law. See Justice.

Chief jousting of England. See Justiciary.

Chief lord, denotes the feudal lord, or lord of an honour, on whom others depend.

Chief, holding in, or tenants in. See Capital and Tenure.

Chief, pleady, is the same as heir apparent, which fee.

Chief point. See Point.

Chief rents. Reduit capitate, in Law, denote the rents of freetholders of manors; called also quit-rents, quietus reditus, because by them the tenant gets quit and free of all other services. See Quit-rents and Rents.

CHIETAIN, the chief leader, or general of an army; or the like.

CHIELLEA, in Geography, a town of European Turkey, in the Morea, near the gulf of Corom. It was taken by the Venetians in the year 1685.

CHIELESEVICH, in Ichthyology, one of the names under which Remond describes the chimoton dus, which fee.

CHIEN-SEE, in Geography, a lake of Germany, in upper Bavaria, about 14 miles long and 5 broad; sometimes filled the sea of Bavaria. It contains several islands, particularly Herrenward and Frawnend; the former being the site of a bishop, suffragan of Saltzburg, founded in the 17th century.

CHIEN DE Mousseet. See the article Serpentus.

CHIEN-VOLANT, in Zoology, the name under which Daubenton describes the great ternate bat, vespefira vampyrus, which fee.

CHIEHTUENDEN, the Persian name of the rhinoceros, according to Pietro della Valle.

CHIENTO, in Geography, a river of Italy, in the Ecclesiastical State, which runs into the Adriatic, between Fermo and Recanati.

CHIERS, a town of Piedmont, seated on the declivity of a hill, in a pleasant country, where the air is soft and salubrious: the hills on the north and east are covered with vines, and those on the west and south present to view fruit-trees of various kinds: the land is fertile, and the inhabitants are industrious, and employed in manufactures of cloth and silk. The ancient name of this town was "Chermon," or "Carium;" and by the French it is called "Quiers." Frederic Barbarossa destroyed it by fire in 1154, but it was soon after rebuilt. It is encompassed by an ancient wall, defended by towers, with a fosse; and formerly had a fortress, called "Rochetta," which was demolished in the 16th century. It has fix gates, and other grand squares or palaces, many churches, and religious houses, though it has only two parishes within the walls, and one without: 6 miles E. of Turin. N. lat. 44° 45′. E. long. 7° 36′.

CHIERS, La. a river of France, which runs into the Meuse, between Monzon and Sedan.

CHIESA, La. a river of Italy, which runs into the Oglio at Caneto, in the Mantuan territory.

CHIETI, a city of Naples, and capital of the province of AbruzziCitrea, the site of an archbishop, erected by pope Clement VII.; 75 miles E.N.E. of Rome. N. lat. 40° 29′. E. long. 14°.

CHIETTA, La. a town of France, in the department of the Jura and district of Orgelat; 11 miles N.E. of it.

CHIEVRES, a town of France, in the department of Jemappes, and chief place of a canton, in the district of Mons. The place contains 2053, and the canton 12,720 inhabitants: the territory includes 130 kilometres and 21 communes.

CHIETTI, a town of Naples, in the province of Capitanata; 13 miles S.S.E. of Termoli.

CHIFFIR, or Chifir, according to Libianus, in the preparation of the philosopher's fire, is called lapis animale as the mineral is called chrus minerals. Johnstone says, that the chrus minerals is by some interpreted gold, but that he rather takes it to be any sulphur of the metallic kind.

CHIFFLET,
CHIFFLET, John James, in Biography, equally celebrated for his political and for his medical labours, was born at Béланц, the 12th of January, 1758. Having received such education as his native city could afford him, and been introduced to the study of medicine by his father, who was in high reputation there, he went to Paris, and, in succession, to Montpellier, Padua, and other of the principal schools, diligently attending the lectures of the professors in the different branches of medicine. In 1614 he returned to Béланц, and was appointed physician and counsellor to the city, in the place of his father, now far advanced in years. His reputation increasing, he was sent on an important mission to the arch-deans Isabella-Clara-Eugenia, governor of the Low Countries, and performed his commission with so much skill, as to attach that prince to him, who retained him as her physician in ordinary. Some time after, he was sent by his mistress to Philip IV. of Spain, who made him his physician, and engaged him to write the History of the Order of the Golden Fleece. He also wrote the History and Antiquities of Béланц, which was published at Lyons in 1618, 4to.; but the work which has been most noticed, was his Vindicia Hispanica; in which he attempts to prove that the race of Hugh Capet does not descend in the male line from Charlemagne, and that the female branch of the house of Austria precedes it. This work gave great offence; the rather, that Chifflet, being a Frenchman, should set up the house of Austria before that of his native sovereign. He was answered by Blondel, Le Tanneur, and other writers, who treated him with great asperity, which he was not backward in returning. Quitting Spain, he was appointed physician to Cardinal Ferdinand, who had succeeded Isabella as governor of the Low Countries in 1633. He enjoyed the same post under the arch-duke Leopold, and his succesor, and died there in 1662, aged 72 years. He wrote also de Ampulla Remedi, laughing at the fable of the holy vase of oil, used in the coronation of the kings of France, and published a collection of treaties of peace between France and Spain. His writings, in this way, were collected and published at Antwerp, in folio, in 1639. His principal works in medicine were, "Singulares ex curatiunibus et cadaverum findicionibus observaciones. Paris, 8vo. 1614." He supposes many diseases to be produced by the influence of the stars. There are nevertheless some useful and valuable observations in this volume. "Polvis ferribusis orbis Americani ventilatus. Lo- rain, 1652, 4to." Intermittents that had been lopped by taking the Peruvian bark, frequently, he says, return, and with increased violence: he therefore diffused from using it. He had three sons, an uncle, and three brothers, who were all writers, and distinguished for learning and abilities.

CHIFFRE, French, in Music, to figure a base, to indicate the chords in thorough base, and point out the harmony of a composition to an accompaniment on a harp, lute, or keyed instrument.

CHIFUNG, among the Chinefe, the name of an herb found about Canton, by which the sailors pretend to know how many storms will happen every year. They compute from the number of knots or joints; and from the distances of the knots from the root, they determine what month the storms will fall in.

CHIGGARON, in Geography, a river of Afa, which rises in Peru, and runs into the Caspian sea, a little to the north of Amol.

CHIGGRE, a small narrow valley of Africa, in the desert of Nubia, closely covered up and surrounded with barren and pointed rocks. The wells in this valley are ten in Vol. vi.
CHILBLAIN.

Immediate manner upon its surface, where it first excites a kind of cryp القطPlate inflammation of the skin, which becomes red and painful. When the operation of the cold is violent and long continued, the skin becomes pale and insensible, an uncommon degree of anxiety and languor is produced, and at last an irremovable inclination to fall asleep; which, if the patient does not retire with all his powers, brings on a complete apathy and insensibility, that finally terminates in death. Persons, who are obliged to expose themselves to extreme cold, ought, therefore, in order to avoid the impending danger, particularly to flun the inimicable use of spirituous liquors, to keep themselves constantly in motion, never stand or sit still, or rest themselves in any manner whatever; and as soon as they perceive languor and inclination to sleep come on, they should exert their strength to the utmost, in order to accelerate their motions, and preserve the circulation of blood in the extremities.

As a frozen limb may be recovered and revived by warming it, the same may also be done with the whole body, when it has been apparently deprived of life by the operation of cold. In the latter case, however, it is not sufficient to warm the body, but the vital motions must also be restored. When, therefore, any of these actions insufficient to detect in the heart and larger vessels of a body that has been frozen, they communicate themselves, as soon as the body is warmed, to the other parts of the system, and the patient is restored to life. But when all the vital actions have entirely ceased, and the blood in the heart itself is congealed, the body may indeed be thawed, but fearfully restored to life. And as this circumstance can never be foreseen, by the surgeon, he ought never to omit trying every possible means for restoring the patient's life; nor should he be induced to relinquish the attempt by the long duration of the apathy (or state of insensibility) as frozen bodies, that have remained for four and even six days apparently lifeless, have in some instances been restored to life. See article ASPHYXIA.

It is necessary, however, that the warming of a frozen body or limb should be performed in a very gradual manner. For when a limb that has only been exposed to a violent degree of cold, (without being actually frozen,) is suddenly warmed, it becomes affected with the most violent inflammation, swells to a great degree, becomes red and blue; and intolerable pungent and throbbing pains are produced in it. The consequences, when in a slighter degree, are chilblains; in a more violent degree, real inflammation, effusion of the fluids into the cellular sublimation, and suppuration: suppose it be in the lungs, for example, a cough and catarh will ensue; in the fingers, paronychia or whitlow, &c. But when a limb that is actually frozen is suddenly warmed, the same symptoms appear in a more violent degree, and mortification speedily and inevitably ensues. Of a similar kind and origin are the changes that take place in the whole body of a person who suddenly goes into a very warm place after having been previously exposed to extreme cold. The skin swells and becomes red; a burning and prickling sensation is felt; red spots appear, which proceed from small extravasations of blood; languor, vertigo, syncope, hemoptysis, anxiety, inflammation of the lungs, &c. are produced, all in consequence of the sudden relaxation of the surface of the body and lungs, and the violent influx of the fluids into the vessels of those parts. When a person frozen to death is suddenly warmed, all hopes of restoring him to life are annihilated, and putrefaction speedily ensues.

The best method of warming a frozen limb gradually is to rub it with snow, till it recovers its powers of sensatio and motion; but this must be done with caution, for fear of destroying its continuity, which may easily happen when the part is not supported by a bone, for example, the tip of the nose and ears. Or it may be sufficient to plunge the frozen part into ice-cold water; and in order to keep the water sufficiently cold, lumps of ice should now and then be thrown into it. When the powers of sensatio and motion have been completely restored, we may wash the part with cold brandy, or oil of turpentine, camphorated spirits, hirse and fuch like stimulating fluids; or we may apply electrical sparks, upon which it generally soon recovers its natural warmth. When this has been done, it is very serviceable to administer some gentle diaphoretic remedy, such as warm tea or wine-whey; to lay the patient in bed in a chamber without a fire, and to let him remain there for two or three hours, till a gentle perspiration takes place.

When a frozen limb has been too suddenly warmed, and is very much swollen, painful, red, blue, may even black, and to all appearance already gangrenous in several places; it may nevertheless sometimes still be completely restored, and all the above mentioned symptoms removed, by plunging it immediately into ice-cold water. But it must be suffered to remain in the water, till all the symptoms have disappeared from which we may rub it, and above mentioned, with brandy, &c. and gradually warm it. This treatment now and then succeeds in cases where it could fearfully have been hoped for. No benefit, however, can be expected from it, when it has been too long deferred, that mortification has already actually taken place, which must then be treated in the usual manner. See GANGRENE.

The body of a person who has been frozen must be treated in the same manner as a single member. He must be brought into a cold chamber, laid in snow, or in a vessel filled with ice-cold water, with his nose and mouth above the surface: the necessary caution should be also used, lest any frozen part might break; and in this situation he is suffered to remain till he begins to exhibit signs of life. As soon as these are observed, strong fomentations and fomentations are to be applied to his nose; air must be blown into his mouth; tobacco-smoke should be injected into the rectum; the fauces are to be irritated with a feather, a cloth dipped in cold vinegar and camphorated spirits is to be laid over the pit of the stomach, &c. If the jaws are firmly closed, they must be rubbed with the above mentioned spirituous and stimulating remedies. When the body has thawed, and more signs of life appear, the patient must be taken out of the water, rubbed with water or brandy, left cold than the former, and brought gradually into a warmer atmosphere; gentle fomentations are also to be administered, for example, an infusion of lemon and orange-peel with a little vinegar; and after he has been carefully wiped dry, he must be laid in bed, where he should remain till a gentle perspiration comes on. If, after he has been revived, a violent inflammatory fever comes on, it is necessary to draw blood from the arm. When the patient still remains insensible; when his face and the vena of the neck are filled, so that an apple-pie is to be apprehended; the jugular vein must be opened. If after he has been revived, any part of the body exhibits appearances of being still frozen, continuing rigid, hard, inflexible and without sensation; we must cover or rush such part with snow, or with cloths dipped in cold water, till its powers of sensatio and motion are restored; but on no account, use hot applications to it. Chilblains are typical inflammations, which produce symptoms more or less troublesome in proportion to the violence of the inflammation. In its slighter degree, a chilblain is a swelling attended with a moderate redness of the skin, which produces a sensatio of heat and itching; and after some
CHILBLAIN.

Some time spontaneously disappears. In a more violent degree, the swelling is larger, redder, and sometimes of a dark blue colour; and the heat, itching, and pain are so violent, that the patient cannot use the part. In the third degree, small vesicles arise upon the tumour, which burst and produce an excoriating fluid; soon becoming an ill-conditioned ulcer that sometimes penetrates so deep as the bone, discharges a thin acrid fluid, and generally proves very obilivate. In the most violent degree, the inflammation goes on to mortification, which is frequently distinguished by vesicles filled with blood that appear upon the tumour.

Chilblains from most frequently arise from the sudden application of heat to a part that has been exposed to cold; and, once west, from the sudden exposure of a part, that has previously been heated, to the cold. Hence they frequently appear upon those parts which are most exposed to sudden transitions from one degree of temperature to another; for example, the nose, ears, lips, hands, and feet. They are more certainly produced, when the part which is suddenly exposed to cold is not only warm, but at the same time moist and sweating. Sometimes appearances much resembling chilblains, are left behind in limbs that, after having been frozen, have been restored to sensation and motion; especially if they have not been treated with proper caution. Chilblains are more apt to be produced, the more venial and tender the skin is, and the less it is used to the cold: hence the people most frequently affected with them are children, young persons, women, those who have been bred up in a delicate manner, and are used to keep themselves unnaturally warm; or those who avoid exposure to the free air, and sweat much on the feet. But even when none of these causes are present, some weakly persons are extremely subject to chilblains, and in them their production seems to be favoured by some peculiar morbid predisposition.

Chilblains almost always make their appearance in the winter. During the summer they disappear, but return the succeeding winter. Some persons are attacked with them in the autumn, and some not till the spring. With some they continue only a few weeks, with others during the whole winter. When they are violent, they frequently deprive the patient of the use of the affected limb; and even excite a fever, by which the patient is confined to his bed. Suppurating chilblains frequently penetrate to the bone, and produce caries, and sometimes death. Suppurating chilblains are (from long habit) converted into a kind of fistulas; nature thus succours herself to the discharge and irritation, which at length are supposed to be necessary to health.

The most certain means of guarding against chilblains, consists in using the skin to a moderate degree of friction, and hardening it; in not exposing oneself to heated rooms, or keeping the body too warm; in adapting the quantity and kind of clothing to the climate of ventilation, so as to avoid extremes, either in summer or winter; in washing the body frequently with cold water; in using oneself to regular exercise in the open air, even in all weathers; and in taking especial care not to go suddenly into a warm chamber, or very near the fire, out of the cold atmosphere.

A chilblain, in the first and second degrees, is a pure topical inflammation; which, however, cannot be removed by the general antiphlogistic remedies, but requires means adapted to its peculiar nature. Amongst the various remedies of this kind, there is none which always proves successful: one remedy cures one patient, another remedy succeeds with another. In relaxed and feeble habits, spirited applications are generally serviceable; and in rigid constitutions oily and emollient substances. All these remedies, indeed, only remove the chilblains for the time, and do not prevent their return the ensuing winter. When the inflammation is so violent as to excite feverish symptoms, the application of leeches and internal antiphlogistic medicines are necessary; but leeches applied to the affected part are particularly serviceable in such cases.

One of the most effectual remedies against chilblains in the milder degrees, is water reduced to the freezing point of temperature. The affected part should be dipped in it several times in the day, and kept there till the heat and itching hand which the chilblain entirely disappears. After the part has been bathed in this manner, it should be well dried by rubbing it with a coarse cloth; then covered with leather or flannel, or a diasyphon plaster, and carefully guarded against the external air. Instead of water, we may also use snow, with which the affected limb should likewise be rubbed for some minutes several times in the day, till the chilblain disappears. With some persons, who are not used to expose to the cold, who have very irritable skins, or who are much inclined to cough and colic pains, the application of cold water and snow does not agree, and with some it even increases the inflammation; so that we must be guided in a certain measure by its effects. Exposing the part affected to an extreme heat and actually scourging it, has now and then proved efficacious; but it is too painful to be prudently adopted, as a general practice.

In one case, in which the pains were not relieved by the application of cold water, (see Richter's Chirurg. Biblioth.) Mr. Schneider used a bath of quick-lime, in which the patient was directed to hold his hands for the space of half an hour every morning and evening; after which the ulcerated hands and fingers were drenched with a quart of brine, of fiev. cervin. ol. laur. & ol. terebinth. spread upon linen. As soon as the mortified part had separated, and the remaining ulcer was clean and sensible, he drenched it with Guillard's cerate, till the cure was completely accomplished. The bath was prepared by plunging a piece of quick-lime, about the size of a man's fist, into four quarts of boiling water, and flinging it till the water was reduced to a lukewarm temperature.

In some cases, ol. petre. ol. terebinth. butter of cacao, cervin. balf. Peruvian. balf. capavia, either alone or mixed with the yolk of eggs; cataplasm of rotten apples, or bruised houfe-kec, or frch turnips bruised with eggs and myrrh; or an ointment of hog's lard, olive oil, yellow wax, and pitch melted together; or frozen turnips, scraped and fried with linseed oil; or queills applied with hot oil or hot turpentine, &c. have been found very serviceable. These remedies are partly applied fresh twice a day, and partly rubbed into the affected limb, if it be not ulcerated.

In other cases, strengthening and astringent remedies prove more serviceable; and in Germany with an ointment, employ Thiden's vulnerary wash, which is particularly serviceable when the chilblains swell as the frost sets in. This remedy is applied cold to the part, which is kept for some days constantly moistened with it. Persons who are subject to annual attacks of chilblains, may guard themselves against them by washing their feet and hands every morning and evening, during the autumn, with this mixture; only it is said to be inadmissible with those who have arthritic tumours upon their limbs, as these might thereby be repelled. It has also been recommended to wash the chilblains with water boiled with flour and millard-feed; also with marine acid, diluted in water; with hot salt water; spirits of wine, or soap liniment; the fumes of hot vinegar, a decoction of turnip peel in water with a fifth part vinegar: the lower orders of people employ hot urine, either alone or with lime-water. &c.
These remedies are to be applied to the affected part several times in the day: after they have been used, the part must always be well dried, and guarded against the external air, by means of gloves, or sacks of thin leather, wrought, or flannel. Sometimes all these remedies are of no service, unless the patient abjures from using the affected limb.

For the cure of suppuring chilblains, an appropriate strengthening regimen, and a course of medicines, will be generally required. See Ulcer and Gangrene.

CHILDBY, in Embryology, sometimes febrility, the Arabian name of a fish found in the Nile, which is figured and described by Somon in his Travels in Upper Egypt. This is a fish of the Gine genus, Silura myta of Pouchail; Silura myta, pinnus dorbillun, radius fex, in circulo ovo, Arclid and Linn. Haffeiquil also describes it. Somniss observes, that it is not such bad eating as some other fishes of the Nile. This writer has nothing to add to the Linnæan description above quoted, and for which Linnaeus was indebted to Haffequil, except that the upper jaw of the chilby has two rows of little sharp-hooked teeth; that the lower jaw has but one row of those recurved teeth; and that it is all over of a pretty uniform blackish; red colour, deeper above the lateral line than below, with a few tinges of red on the nose, and at the base of the pectoral, anal, and caudal fins; and lastly, that the iris of the eye is of a golden colour. See Silurus mytaus.

CHILCA, in Geography, a town of South America, in the vice-royalty of Peru, archbishopric of Lima, and jurisdiction of Canete, is situated about 10 leagues from Lima, and celebrated for its saltpetre, of which gunpowder is made in that city. It has also a good fishery, together with plenty of fruits, pulse, and poultry, which supply a large trade between the jurisdiction of Canete and the capital, S. lat. 12° 31', W. long. 76° 5'.

CHILCAUTHL, in Ornithology, the Mexican name of the St. Domingo teal, anas dominica; called also coelcanauli.

CHILD, a word of Saxon origin, meaning the young offspring of the human species, and expressing relation to parent.

We say Natural child, Legitimate child, Putative child, Bastard child, Adoptive child, Posthumous child, &c.

Dr. Derham computes, that marriages, one with another, produce four children, not only in England, but in other parts also. See Marriage.

It is well known that children, for some time after they are born, are too fat, and too imperfectly provided; and M. Petit, (Ac. Paris, 1727. H. p. 143.) after taking a great deal of pains to investigate the cause of it, found it to be owing in part to the thickness of their cornea, and the small quantity of their aqueous humour. Not that the mere thickness of the cornea could have this effect; but because the thickness is owing to it not being well stretched, and consequently, having wrinkles and inequalities on its surface, which occasion an irregular refraction of the light. On the same account also the cornea has not a sufficient degree of convexity to bring the pencils of rays to a focus soon enough. All these defects, he says, are remedied by the increase of the aqueous humour. M. Petit ascribes this imperfection of light in infants to their eyes being composed by the fluid in which they are immersed in the womb. He also gratified his curiosity by inquiring into this circumstance reflecting various new-born animals, as dogs, cats, rabbits, calves, hogs; and he found in all of them that the cornea was thick and flaccid, and the aqueous humour not sufficiently copious. It is possible, that, besides the small quantity,
After children have attained to manhood, and have left
their father's family, their duty to parents is simply that of
gratitude; in kindred the weakest of that which we owe to
any other benefactor, but in degree so much exceeding other
obligations, as a parent has been a greater benefactor than
any other friend. The services and attentions, by which filial
gratitude may be testified, cannot be distinctly enumerated.
It will shew itself in compliances with the will of parents,
however contrary to the child's own taste or judgment, pro-
vided it be neither criminal nor totally inconsistent with his
happiness: in a constant endeavour to promote their enjoy-
ments, prevent their wishes, and soften their anxieties, in
small matters, as well as in great; in afflicting them in their
businesses; in contributing to their support, care, or better
accommodation, when their circumstances require it; in a-
fording them our company, in preference to more amusing
engagements; in waiting upon their sickness or decrepitude;
in bearing with the infirmities of their health or temper, with
the peevishnes and complaints, the unfashionable, negligent,
andrue manner, and offensive habits, which often attend
upon advanced years: for where must old age find indul-
gence, if it do not meet with it in the piety and purity of
children? In all contests between parents and children, and
more especially those that occur in relation to marriage, or
the choice of a profession or business, it is the parent's duty
to represent to the child the consequences of his choice and
conduct; and this should be done with fidelity, moderation,
and candour. Parents, however, are forbidden to interfere,
where a truth is repeated personally in the son; and where,
consequently, the son was expected, and by virtue of that ex-
pectation is obliged, to pursue his own judgment, and not that
of any other; as is the case with judicial magistrates in the
execution of their office; with members of the legislature in
their votes; and with electors, where preference is to be
given to certain preferred qualifications. In these and similar
cases the son may shew his own judgment by the opinion
and advice of his father; but his own judgment ought finally
to determine his conduct.

The duties of children to their parents arise from a prin-
ciple of natural justice and retribution. For to those, who
gave us existence, we naturally owe subjection and obedience
during our minority, and honour and reverence ever after:
they having placed us under that care to which we were enti-
ted to our protection in the infancy of our age; they
who by suffrence and education have enabled their off-
spring to prosper, ought in return to be suppli-ted by that
offspring, in case they need assistance. The Athenian laws
carried this principle into practice with a scrupulous kind of
nicety; obliging all children to provide for their father,
when fallen into poverty: with an exception to fursious
children, to whose whole chastity had been prostituted by
confent of the father, and to those whom he had not put in
any way of gaining a livelihood. Our laws agree with those
of Athens with regard to the first only of these particulars,
the care of ftursious issue. In other cases the law does not
hold the tie of nature to be diffused by any misbehaviour of
the parent; and, therefore, the child is equally justifiable in
defending the person, or maintaining the cause of a bad
parent as a good one; and is equally compellable, (Rat. 43
Eliz. c. 2.) if of sufficient ability, to maintain and pro-
vide for a wicked and unnatural progenitor, as for one who
has flown the greatest tenderness and parental piety.

The duty of children to their parents was thought wor-
thy to be made the subject of one of the ten commandments;
and, as such, is recognized by Christ, together with the rei-
of the moral precepts of the de-calogue, in various places of
the gospel. The same divine teacher's sentiments concern-
ing the relief of indigent parents appear sufficiently from
that manly and deferred indignation, with which he repre-
sented the wretched efficacy of the Jewish exploitors, who,
under the name of a tradition, had contrived a method of
evading this duty, by converting, or pretending to convert,
to the treasury of the temple, so much of their property,
as their disreputed parent might be entitled by their law to demand.

Obedience to parents is enjoined by St. Paul to the
ephemians (ch. vi. 1.) and also to the Colossians (ch. iii. 20)
upon two principles: the distinct statement of which flows
that moral rectitude and conformity to the divine will were,
in his apprehension, the fame. By the Jewish law, disobedie-
cence to parents was, in some extreme cases, capital. Deut.
See also Education.

CHILD, Dr. William, in Biography, according to Ant.
Wood, was a native of Bristol, and disciple of Elway
Bevin. In 1631, being then of Christ-church College, Ox-
ford, he took his degree of bachelor in music; and, in 1636,
was appointed one of the organs of St. George's Chapel
Windor, in the room of Dr. John Monday, and soon after
one of the organs of the Royal Chapel at White-
hall. After the restoration he was appointed chanter of the
King's Chapel, and one of the chamber musicians to Charles
II. In 1663, the university of Oxford conferred on him
the degree of doctor in music, at an act celebrated in St.
Mary's church. Dr. Child, after having been organist of
Winford chapel 65 years, died in that town, 1697, at 90
years of age. In the inscription on his grave-stone, in the
fame chapel, it is recorded that he paved the body of that
choir at his own expense; he likewise gave 20l. towards
building the town-hall at Windfor, and 50l. to the corpora-
tion to be dispofed of in charitable uses, at their discretion.

The following epitaph is also on his grave-stone in St.
George's chapel:

Go happy foul, and in thy feat above
Sing endless hymns of thy great Maker's love.
How fit in heavenly fongs to bear a part!
Before well practis'd in the sacred art;
Whiff hearing us, sometimes the choir divine,
Will sure defend, and in our comfort join;
So much the music should not want a hall,
Has made our earth to reprefent their heaven.

His works are " Psalms for Three Voices," &c. with a con-
tinued base either for the organ or theorbo; composed after
the Italian way. London, 1639. "Catches. Rounds, and
Canons," published in Hilton's "Catch that Catch can,"
1652. "Divine Anthems and Compositions to several
Pieces of Poetry," some of which were written by Dr.
Thomas Pierce of Oxford. Some of his peculiar compositions
likewise appeared in a book entitled "Court Ayres,"
printed 1655, which will be mentioned hereafter. But his
principal productions are his services and full anthems,
printed in Dr. Boyce's collection. His serice in E minor
has something more varied and interesting, in the modula-
tion, than there is in most of his other works; and in his cele-
brrated service in D major, there is a glow of rich harmony,
which, without any great compass of genius or science, is ex-
tremely pleasing, the more so, perhaps, from being compose-
d in a key which is more perfectly in tune than most others
on the organ. His full anthems are not without imagination
and free, p. 67. (Boyce, vol. ii.) "And upon our solemn fast
day, &c.," the modulation and contrivance are admirable
to the end of the anthem. His style was so remarkably easy
and natural, compared with that to which choirmen has been
accustomed, that it was frequently treated by them with de-
ription.
The Child, the act of bearing a child. See Birth and Labour.

Child-wit, a power to take a fine of a bountiful woman unlawfully gotten with child; that is, without consent of her lord. Every reputed father of a bafe child, got within the manor of Writtle in Essex, pays to the lord, for a fine, 3D. 4d. where it seems, child-wit extends to free, as well as bond-women. Quotumque fecerit child-wit, archiepiscopus aut totam, aut dimidiam emendationis partem habebit, quidcumque de child-wit. Du-Cange.

Chidermass Day, called also Innocents' Day, an anniversary fault of the church, held on the 28th of December, in memory of the children of Bethlehem, mal feared by the order of Herod.

Children, Charity. See Charity school and Hospital.

Children, Expofing of. See Exposing.

Children, naming of. See Name.

Children, Overlaying of. This is a misfortune which frequently happens; to prevent which, the Florentines have contrived an instrument called arcuato.

CHILHOWEE, in Geography, a town of America, in the Tennessee government; 25 miles S. of Knoxville.

CHILL, an extensive, rich, and fertile country of South America, reaching from the frontiers of Peru to the irrigations of Magellan, terminating towards the coast partly on the frontiers of Paraguay, from which it is separated by uninhabited deserts, and partly on the government of Buenos Ayres with the intervening pampas, or extensive and level plains, and bounded on the west by the Pacific ocean. On the north its boundary is the defart of Atacama, or Atacama (which for), extending 80 leagues between the province of the same name, being the laft of Peru, and the valley of Copoypo, or Copiapo, the first in Chili: on the east it is separated by the eastern branch of the Andes from Cuyo, in the vice-royalty of La Plata, and the savage tribes; on the south, by barren mountains and regions covered with sand and snow; and on the west, as we have already faid, by the South Sea, extending from 27° nearly, the latitude of Copiapo, to 52° 30'. Its length is computed at 1260 geographical miles, and its breadth, which depends on the distance of the Andes from the ocean, is from 24° to 32° about 210 miles, from 32° to 37° 120 miles, and thence to the islands of Chile, about 300 miles. If we comprehend within its extent the Andes, Chili may be supposed to contain about 378,000 square miles. Of this extensive and interesting country little or nothing was known till about the middle of the 15th century. At that period the native Chilian were divided into 15 tribes, each of which was governed by its own chief. About the year 1450, the Inca Yuponqui, the 10th emperor, allured by the enchanting account given of this country, undertook the conquest of it, and persecuted the enterprise with such success, that he subdued the several nations inhabiting the valleys of Copiapo, Coquimbo, and Chili; but having established his dominion in some of the northern districts, his progress farther southward was vigorously opposed by a confederacy on the part of the gallant and high-spirited inhabitants, who were determined to maintain their independence; and the Peruvian army was defeated. The Chilotes, however, who were subdued, and those who remained free and independent, pursued the same mode of life. They cultivated their lands with maize, potatoes, yuccas, and other native plants; they encouraged the breed of the camel and sheep, which supplied them with flesh for food, and with wool for clothing; and they are said to have had at this time hogs and hens, besides other beasts and birds, which belonged to their country. But though they seemed to have advanced from a pastoral to an agricultural state, their instruments of husbandry were mean and unwieldy. Their villages consisted of scattered huts; and their chiefs, who were probably raised to this dignity on account of their wealth, possessed merely a power of direction, and not of coercion. The right of property was acknowledged; the field that was cultivated belonged to him who tilled labor on it, and defended to his children. Their looms resembled those of the Europeans, though of rude fabric, and they were acquainted with the processes of manufacturing earthenware. From their mountains they extracted gold, silver, copper, tin, and lead; and of a mixture, like bell-metal, they formed axes and other instruments; although those in more general use were made of baff. It has been supposed that they were acquainted with the use of iron; and this fact seems to be doubtful. They were not strangers to业主, both solid and that produced from water by evaporation: they fixed their dyes by means of an aluminous stone, called "polaua." They prepared thread for cords and nets from one of their plants; and they possessed canoes of different ports. In numbers, it is said, they could express one thousand, and they had pros or the Peruvian gipos, a bundle of threads of various colours, with different knots to express contracts or events. The native Chilotes, being generally of a mild character, as Molina cited by Mr. Pinkerton fugitives, may probably have proceeded from the illes of Polynesia; though their colour is brown, tinged with red or copper, whereas that of the Polynesians is generally olive. The language of the Chilote, which is said radically to differ from the Quechua, or Peruvian, is remarkably rich and harmonious, and from the vocabulary, formed by Molina, it is capable of expressing most natural objects, and even abstract terms. It essentially differs, however, from the other American languages, not less in its words than in its structure. The Araucans, the present possessors of nearly one half of Chili, and celebrated for their valor in fulfilling the progres of the Spaniards, may be considered as the genuine representatives of the ancient Chilote. The beautiful tract of country which they inhabit extends from the river Biobio north to that of Valdivia south, and is bounded on the eft by the Andes, and on the west by the sea. Their people derive their name from the province Arauco, which is the smallest of their states; and they are also distinguished by the appellation of "Aucas," or freemen. Without sacrificing the useful, they are generally robust, well-formed, and of a warlike aspect. The face is nearly round; the eyes small, but lively and expressive; the nose somewhat flat; the mouth well made, with white and uniform teeth; the legs muscular and elegant, and the feet small and flat. They have naturally little beard, and take pains to extract it: and they also eradicate the hair from other parts of the body. The hair of the head, which they prefer, is black and abundant, and they bind it up in a knot. Many of their women are handsome: particularly those of Boror. They live to the advanced age of 70, 80, and even 100 years, without any perceptible decay of mind or body. Their mental qualities correspond to their bodily vigour; and they are characterized as intrepid, patient of the labors of war, prodigal of their lives in defence of their country, ardent lovers of liberty, in defence of which they are ready to make any sacrifice, jealous of honour, courteous,
curteous, hospitable, Faithful to their engagements, grateful for benefits, generous, and humane towards the vanquished. These excellent qualities, however, are tarnished with the vices incident to savage life; such as drunkenness, sloth, self-confidence, and a pride which leads them to treat other nations with contempt. The drefs of the Araucans, who are a military people, is short, wholly made of wool, and generally of a blue colour. The coathing of the women is modelled and simple; though sometimes fested off with artificial ornaments. Their hair is parted into flowing tresses, and the head adorned with false emeralds, or with the green stone called "glauca," which they highly value. They also use necklaces and bracelets of glass beads, ear-rings of silver in a square form, and numerous silver rings on the fingers. Polygamy is almost universal; and their houses are constructed so as to admit the number of wives which the owner can entertain: but their furniture is plain, and such as is merely adapted for use. Their habitations are generally dispersed over the country, and situated near the rivers; but cities are regarded by them as prisons.

Their political arrangements are suited to their discriminating character. The whole territory of Araucana, from north to south, is divided into four parallel tetrarchies; almost equal in size, and demarcated the maritime, the plain, the upland, and the mountainous. Each of these is subdivided into five provinces, and each province contains nine districts. The mountainous tetrarchy is poissled by the Puelches, formerly allies to the Araucans, but now united with them. The government is aristocratical; and they have three orders of chiefs, viz. "Toquis," from toqui, a judge, who presides over each tetrarchy, and are independent of each other, except that they confederate for the general good; "Apo-ulmens," or grand chiefs, who govern the provinces; and "Ulnems," who preside over the districts, and acknowledge no superior, except on occasions of war. The distinction of a toqui is an axe of porphyry or basalt. Thrice of the other two orders have flatts headed with silver; the apo-ulmens being distinguished by a ring of the same metal round the middle of the staff. All these dignities are hereditary, in the male line, and sole order of primogeniture. The able-bodied power is vested with the Puelches, who decide all causes of a general character, called the "Araucayag," or assembly of freemen. This congress is commonly held in a spacious meadow. Their laws, degrading to them by tradition, are called "Admapu," or customs of the country. No two dignities are allowed to concentrate in the same head; and if a family fail, the vaflals exercise the right of election another; nor are they attached to the gleebe, as in the feudal system, or confined to any personal service, except in time of war. Tributes and taxes are unknown, as each chief lives on his own estate; nor are they resented as superiors, but merely as the first among equals. Although many crimes are punished with death, yet a composition may be entered into with the relations. The ulmens are the legitimate judges of their vaflals. Whenever war is resolved on by the great council, the commander in chief is selected from the toquis; who instantly affumes the axe of stone, as the symbol of his authority; all the other chiefs take oaths of obedience; and the people, though at other times unruly, become submissive to their military sovereign. Herals are sent to the confederate tribes, and to the Indians in the adjacent districts of the Spaniards; and the badges of these heralds are bundles of small arrows bound with a red thread, and their feecery is equal to their dispatch. The general signifies to the tetrarch the number of troops that are requisite, and it is divided among the apo-ulmens, who demand the contingent from each ulmen. As every Araucan is a soldier, the levy is easily raised: and the army generally amounts to 5,000, exclusive of a body of reserve. It consists both of cavalry and infantry: the former are armed with lances and sabres, the latter with pikes, or clubs having iron spikes. Each regiment of infantry is composed of 1000, and each company consists of 100: and they have all their particular banners, besides the common badge of the nation, which is a star. Under their usual dres they wear a cloak of leather; and of this leather, which they have a peculiar mode of hardening, they make helmets and shields. They have not discovered the art of making gun-powder. On the march the infantry is mounted, but they dismount before a battle. Each folder carries his provision of parched maize, which is steeped in water. Their camp is well formed and guarded. In battle, the cavalry forms two wings, and the infantry occupy the centre, in distinct battalions or divisions; a clubman and a pikeman placed alternately composing the files. The toqui addresses a pathetic discourse to the army, exhorting them not to permit the sacred flame of freedom, bequeathed by their ancestors to expire. They then advance with loud hoots, generally attacking the Spanish centre, and, with their clubs, notwithstanding the enemy's artillery, they often make terrible havoc. The booty is equally divided among the captors, without any preterence of the officers, or even of the general. The prisoners remain slaves, till exchanged or ransomed; and sometimes, though very seldom, one is sacrificed, to pacify the manes of the slain. Treaties are formed in a kind of council, held in a meadow near the river Biobio. The symbol of peace is a branch of the cinnamon tree; and an Araucan orator difficulties, in the Chilafo language, the motives of the war, and the means of future harmony. As soon as this speech is interpreted, the Spanish governor or president replies; and the articles being reviled, are ratified with a sacrifice of Chilafo camels. The president then dines in company with the toqui and chief ulmens, to whom he makes the usual preents, in the name of his sovereign; and these are presented on the arrival of every new president.

The Araucans acknowledge a supreme being, the author of all things, who is called "Pillan," or the Spirit; and they express, by hieroglyphics, his existence in heaven; his being the soul of all creation; dreadful from his univer- sity: the architect of the universe; omnipotent, eternal, and infinite. They also hold, that the affairs of worlds are administered by inferior spirits, of various rank and power. The Mars of the Araucans is Epumame; and Meulen is a beneficent god, and lover of the human race. They admit an evil principle, Guccuba, the author of calamity and death; and subordinate to Meulen are many genii, who attempt to counteract the machinations of Guccuba. These genii are male and female; and the latter are supposed to ferre the men. Conceiving that the spiritual lords resemble the ulmens, and would despise any attempts of mortals to praise and honour them, they have neither temples, idols, nor priests; and they offer no sacrifices, except during endemic maladies, or on a treaty of peace. However, they often address prayers to Pillan and Meulen. Chriftianity is tolerated in the country of the Araucans, and the milli onaries are well received; but the number of profelytes is small. These people are very attentive to omens and dreams; and the brave Araucan warrior will tremble at the sight of an owl. They consult their magicians in all affairs of moment; and are firm believers in apparaitions. They admit the immortality of the soul, and suppose that, after death, the soul passes to the well, to a place or country called "Galecman," where, according to some, delights abound
for the good, and the bad are punished by privation: but, according to others, all souls will enjoy pleasures, punishments, like or men, being short and transitory. The watch the dead all night, and, on the third day, carry the body to the cemetery of the family, which is commonly situated in a wood or upon a hill. The bar is surrounded by women, who affect to weep; and another spreads itself behind, in order to prevent the return of the soul to the Loupe. When the body is set down, we-she weapons are placed round it; and if it be that of a female, her ornaments; together with plenty of food, and vales of liquor, often cider or wine, that there may be no want on the journey into the other world. After a long leave of the dead, with many lamentations, and willing a happy journey, the body is covered with earth, or with flowers, in the form of a pyramid, over which they pour copious streams of cider. They farther believe, that an old woman soon arrives, in the form of a whale, to carry the soul across the ocean, where another old woman guards the Elysian fields, and sometimes exacts an eye, when the passenger cannot satisfy her demands. The occupation and pleasures of the future life remain the same; and the husband, if he chooses, may have his wife again; but there are no children, because it is the abode of the dead. There are also wars and battles; and armies, meeting in the air, cause thunder and lightning. The Araucans have an idea of a great deluge; during which many were saved on the mountain 'Thygthe,' which can float in water. This idea, Molina fuggetis, has arisen from the earthquakes and volcanoes, so common in their country; for, during the terrors excited by a severe earthquake, they flit run to the mountains, with provisions, in hope of escaping, if the sea should overwhelm their country.

The year of the Araucans is solar, and commences on the 22d of December, immediately after their summer solstice; and it is divided by the solstices in June into two parts. They have 12 months of 20 days, and 5 intercalary days. They have 4 feasons, each of 3 months; and they divide the day into 12 parts, 6 of light and 6 of darkness. The hours of the day are distinguished by the height of the sun; and those of the night by the position of the stars. Constella-tions are also marked; the Pleiades being styled that of fire from the most apparent stars, and the Arcanteric that of star. The milky way is called the thread of the table, because the astronomers of the country reject certain popular tales concerning it. They dilate on the planets, and believe them to be inhabited. The Araucans, though they have little or no idea of the speculative sciences, cultivate rhetoric, poetry, and medicine; to the purity of their language and to the elegance of their public speeches they pay great attention. They acquire themselves much to a figurative and all-egorical style, and their discourses abound with epistles and parables. Strong and lively images, bold figures, frequent allusions and similes, novelty and force of expression, and pathetic sentiments concur to form their poetry, which is chiefly employed in celebrating the actions of their heroes. Their lines consist of 8 or 11 syllables; and their poems are all in blank verse, with an occasional, though very rare, admission of rhyme. Of physicians there are 3 classes; the empirical, who are belh, have some knowledge of the pols, and use of herbs; those who believe that all diseases proceed from insects; and others who ascribe them to witchcraft, and thus occasion the death of innocent persons; they have also prisons who can fet broken bones and cure wounds. With regard to their mode of carrying on trade, we shall observe, that as the use of money is not known, exchange is the only mode of commerce. Their foreign trade consists chiefly in cloaks and cattle, which are exchanged with the Spaniards for wine and European articles. In their intercourse with Europeans they are troublesome; and they thither expect to be treated with great ceremony and respect; whilst they are devilish of benefits, they are eager for vengeance on their enemies. In their discrimination of different families, they use names and surnames. Polygamy, as we have already said, is universal, and a man may buy as many wives as he can maintain; but an old bachelor is regarded with contempt as an enemy of the state. Marriage is a very solemn rite; being of amusing rape, as the husband feizes the bride unexpectedly, while she is to cry out for assistance. Her friends then pass to his home, and after a festival, receive the nuptial present; to the first wife, however, particular honour is rendered, while the rest are regarded as mere concubines. The husband indicates his preference by ordering one, during dinner, to prepare the bed; the others sleep in the same chamber, which no stranger is permitted to enter; strangers being lodged in tents at a distance. All the wives pay great respect to their husbands. The Araucans are distinguished by neatness and cleanliness in their houses and in their own persons. The bath is universally used both by men and women; but the latter resort to separate places protected by shade and solitude. On the day of parturition, they take the new born infant to the river, wash it both in and them-seles, and return to their habitations without inconvenience; no bandages are used for their infant; they are placed in hanging cradles upon thin slates, and covered with a cloth, and they are rocked by means of a cord which hangs from the cradle, so that the mothers are not interrupted in their business; the infant is soon able to take care of itself. The education of children is repressed to horsemanship, the use of arms, and the practice of speaking their language with elegance. Faults are seldom noticed; nor do the Araucans ever chafe, because, in their opinion, punishments can only produce falsehood and cowardice. The food of the Araucans consists mostly of grain or pot-herbs variously dressed; but maize and potatoes are the most esteemed; they use little meat or fish, and instead of bread they have a kind of light cake or potatoes. Their drink consists of various kinds of beer and cider; and they are fond of wine, which they procure from the Spaniards. The mother and his family eat at the same table, which is covered with earthen-ware and goblets of horn or wood. They light their fire by turning one stick rapidly on another. Although in private they are frugal, yet on solemn occasions they spare no expense in their repasts; and then fermented liquors are freely taken. Music, dancing, and gaming, contribute their principal amusements. Their music is bad, and their songs harsh and hideous; but their dances are more cheerful and harmonious. The women, however, dance apart from the men. Their games are both sedentary and gymnastic. From time immemorial, it is said, they have known the game of chess, which they call 'comanc,' the young are fond of wrestling, the race, and a kind of tennis. But their favourite games of the gymnastic kind are the 'puenoo,' and the 'jalicam,' the first representing the siege of a fortress, when 12 or 20 persons form a circle and place a boy in the middle of it whom the assailants endeavour to seize; but seldom succeeds, the latter resembles a battle, 30 or more players attempting to drive the ball within their bounds, and this game will sometimes last half a day.

Having enlarged on the disposition and manners of the Araucans, because their country is little known, although Dr. Robertson in his 'America,' and Perou in his voyages, and some others have very trenchantly mentioned
Chili.

mentioned them, we shall close this part of the article Chili with observing, that the Puelches of the mountains, now united with the State of Araucania, are more rude and savage than the other inhabitants. Their name signifies eastern men; their stature is tall, and they are fond of the chase, so that they often change their habitations, and detach colonies to the eastern sides of the Andes, as far as the lake Naguelgapi, and the shores of the Atlantic, in the plains of Patagonia. By the Araucans the mountaineers are highly esteemed on account of their bold services in war, and their invincible fidelity in adhering to the confederacy.

The value of the Araucans, and their love of liberty and independence, have been signally manifested on a variety of occasions; not only in their early contests with the Peruvian Inca, but in their resistance to the hostile attacks of the Spanish invaders of their territory. Soon after their subjugation by Peru, the Spaniards, alarmed by the fame of the populace of Chili, commissioned Diego de Almagro to attempt the conquest of it. Accordingly, in 1535, he marched from Cuzco, and, after having many Indians and a considerable number of Spaniards, who perished with cold impounded over the Cordillera Nevada, as well as with fatigue and famine, he arrived at Copiapo, where the Indians immediately submitted. Thus encouraged, he proceeded to the conquest of other nations, which had never acknowledged the Peruvian Inca. In his progress he met with a vigorous opposition; as the Chiloe soon recovered from their first surprise, and not only defended themselves with obstinacy, but attacked their new enemies with more determined valor and ferocity than any American nation had hitherto discovered. The Spaniards however continued, amidst increasing difficulties and conflicts, to penetrate into the country, and collected considerable quantities of gold; but they were so far from thinking to make any settlement amidst such formidable neighbors, that, in spite of all the experience and valor of their leader, the final issue of the expedition still remained extremely dubious, when they were recalled from it by an unexpected revolution in Peru. (See the biographical article ALMAGRO.) In the year 1541 the scheme of invading Chili was again reformed, and the command of the expedition for this purpose was conferred by Pizarro on Pedro de Valdivia; and, notwithstanding the fortune of the natives in defending their possessions, he made such progress in the conquest of the country, that he founded the city of St. Jago or Santiago, which still remains the capital of the country, and thus commenced the establishment of the Spanish dominion in that province. In 1548 he was promoted to the government of it by the president of Peru. Valdivia, after having exhibited many displays both of courage and military skill, was cut off in 1553, together with a considerable body of troops under his command. Francisco de Villagra, Valdivia's lieutenant, by his spirited conduct, checked the natives in their career, and favored the remainder of the Spaniards from destruction. By degrees, all the champaign country along the coast was subjected to the Spanish dominion. Several colonial towns were established by the Spaniards, which the Araucans have repeatedly taken and destroyed. The frontier banks of the river Biobio are lined with fortresses. At the peace of 1773, after a war which had cost the Spanish treasury 1,706,000 dollars, the Totten of the Araucans milited on having a relitigious minister at the city of Santiago, and the Spaniards reluctantly complied. The mountainous country, however, is still polluted by the Puelches, Araucans, and other tribes of its original inhabitants, who are formidable neighbours to the Spaniards, and with whom, during the course of about three centuries, they have been obliged to maintain almost perpetual hostility, suspended only by a few intervals of indolent peace.

That part of Chili, to which the Spaniards are restricted, and which may properly be deemed a Spanish province, is a narrow district, extending along the coast from the desert of Atacama and the river Biobio, and divided into 13 provinces, viz. Copiapo, Coquimbo, Quillota, Aconcagua, Melipilla, Santiago, Rancagua, Colchagua, Maulli, Itata, Chillan, Pucuncavir, and Huiquilema. The Spaniards also possess port Valdivia, in the country of the Conchis; the archipelago of Chiloé; and the island of Juan Fernandez. Don George Juan and don Antonio de Ulloa, in their voyage to South America, inform us, that the captain-generalship of Chili comprehends four particular governments, viz. the major-generalship of the kingdom of Chili, to which belongs the military government of the frontier towns and fortresses, along the banks of Biobio, which are Araucana, the flatte residence of the general, Santajuan, Puren, Los Angelos, Tucapel, and Yumbel; Valparaiso; Valdivia; and Chiloé, which are respectively: and the following 11 jurisdictions, viz. Santiago, Rancagua, Colchagua, Chilao, Aconcagua, Melipilla, Quillota, Coquimbo, Copiapo and Guasco, Mano- doza, and La Concepcion; which fees. The president, governor, or captain-general of Chili, to whose government Spanish Chili is subject, resides in the city of Santiago, exercising, except in time of war, independent authority, and directing all military affairs; the three great officers of the kingdom, viz. the camp-marshals, sergeant-major, and commissary, and also the four governors of Chiloé, Valdivia, Valparaiso, and Juan Fernandez, being subject to his orders; as president and governor-general, he administers justice, or preaches in the court of audience in Santiago, which is divided into two halls, the civil and the criminal, with a regent, judges, fiscal or royal procurator, and a protector of the Indians. In cases where the property exceeds 10,000 dollars, an appeal lies to the supreme council of the Indies. There are also tribunals of finances, of the papal bull, and of vacant lands; and the confidante, or tribunal of commissary, which is a new institution in the Spanish colonies, is independent of all others. The provinces are governed by prefects or correedors, commonly named by the captain general. The inhabitants are formed into regiments of militia, besides which there is also a body of regular troops. In the town of Concepcion, there is a regiment of cavalry, and another of infantry, to watch the Araucans; and the city of Santiago maintains some troops of dragoons for its police and defence.

Spanish Chili is divided into two extensive archbishoprics, those of Santiago and Concepcion, both suffragans of the archbishop of Lima. The cathedrals are fixed by canon, and at Santiago the holy, or rather infamous, office of the inquisition, has a commissary and various subalterns. There are no convents, except at Santiago and Concepcion.

This province has derived considerable advantage from the liberty of commerce obtained in 1778; and its population has since that event been augmented. Before that period, the cultivation of the country, though singularly fertile and productive, had been shamefully neglected by the Spaniards. A great part of it remained uncultivated; and in its whole extent, there were not above 83,000 white inhabitants, and about three times that number of negroes and people of a mixed race. The Spanish inhabitants have, for the most part, migrated from the northern provinces; and they are intermixed with a few English, French, and Italians. They are described by Molina, cited by Pinkerton, as "well made, interped, incapable of treason or meannesses, vain, liber-
The rivers of this country, though sometimes considerable, have but a short course from the Andes to the sea. There are several lakes, both fresh and salt; the two largest being in Amauca, viz. the Lauanquen or Villarica, about 72 miles in circuit, with a beautiful conic hill in the centre; and the Nahnelgapi, about 80 miles in circumference, having an island in the centre, crowned with beautiful trees, and giving rise to a river of the same name, which runs towards the Atlantic, while from the first springs the river Tolten, which joins the Pacific. The country abounds with mineral waters and salt rivers, described by the Araucans to the beneficence of their god Meulon.

The climate of Chili is the most delicious in the New World, and is hardly equalled by that of any region on the face of the earth. Though bordering on the torrid zone, it never feels extreme heat, being tempered on the coast by the Andes, and refreshed on the well by cooling sea-breezes. The temperature of the air is so mild and equable, that the Spaniards give it the preference to that of the southern provinces in their native country. Influences occur in this country of surprizing longevity. A Spanish knight attained the age of 165 years, without knowing sickness; and he had by two wives 28 sons. Some of the crooks have arrived at the age of 104, 107, and 115. It is also said that the women are fruitful in an extraordinary degree, and that twins are common. A Frenchman who died in 1764, left by one wife 163 descendants. The fertility of the soil corresponds with the benignity of the climate, and is wonderfully accommodated to European productions. The most valuable of these, corn, wine, and oil, abound in Chili, as if they had been native to the country. The Fall, even that part of it which has been long in tillage, is little degeneratated by producing fruits almost as necessary. The grain, as some say, yields from 100 to 150; but by a more moderate and just estimate, it is rated both by Molina and in Perou's voyage, from 50 to 70 in the midland country, and in the maritime 40 or 50. Many of the plants of Chili are the same with those of Europe, and almost all the pot-herbs and fruits of that continent flourish there. The northern provinces produce the sugar-cane, the sweet-potato, and other tropical plants. Maize is common and abundant; the mango is a kind of rice, and the sweet-spike of barley, both of which were cultivated before the arrival of the Spaniards. Peas and potatoes were also well known to the Chilian. Of the latter they have 30 different kinds; and it is even conjectured that this valuable root was first brought into Europe from this country. The large white strawberry of Chili is now known in English garden. Many of its plants are valuable as dyes, and others as medicinal. The gentleman is peculiar to Chili. The vira-vira expels the ague; the papo is excellent for indigellin. Wild tobacco abounds in Chili. The beautiful flowers and shrubs are infinite. Lucerne, not inferior to that of Arabia, is produced by a shrub, diluting tears of a whitish yellow, and of a bitter aromatic taste. The trunk of the p€wi supplies excellent cork; the fusco kali is plentiful on the shores; and Chili produces seven kinds of beautiful myrtles, one of which yields an excellent aromatic wine preferred by

Strangers
strangers to any mucafeal. The cale furnishes a tea, which is known as a verminge. An acacia of the province of Quilota yields a ballam, that is used in the cure of wounds; and the palqui is esteemed, as a febrifug, superior to the Peruvian bark. The coffee feme grows on the banks of the rivers Maypo and Salvia. Of 97 kinds of trees, that diversify the beautiful forests of Chili, only 13 lose their leaves in winter. Cypress, pines, and red and white cedars grow in the valleys of the Andres; the red cedars, particularly in the Cordiller, are of an enormous size, to that from 700 to 500 pangs, 20 feet long, may be... from one tree. The cin- namon tree, that yields what is called winter's bark, is regarded as the trade by the Araucans, who present it as a token of peace. Beautiful woods of various colors are supplied by the Chillie fore's. Vines, though none appear to be native, flourish admirably well: they are found in the forests, arising from seeds deposited by the birds: on the confines of the river Maulli, they are three or four feet high, and supported by flaxes; but further to the south, they are left loose on the sides of the hills. The bell wine is that which is obtained from the banks of the river Itata, and is commonly called wine of Conception; it is red, generous, of an excellent flavor, and equal to the best in Europe. Mufcetal wines are also excellent. The vintage is April and May. All the other European fruits attain the greatest perfection.

Of the zoology of Chili, Molina has given an ample account. Oylters of an excellent kind are found near Coquimbo; and the rocks of Chile furnish the phools. There are also many kinds of lobsters and crabs. Among the insects is the locust of Africa. Bees abound in the southern provinces. Reptiles are rare; but the fest supplies 50 kinds of fish, all excellent and fatigable. The seals, called sea-cows, appear in the shores of Araucania. Opossums and aquatic birds of different species amount to 137; and the fowl are innumerable. Of these, several retire in spring to the forests of the Andres for propagation, and on return of winter, they revisit the plains. The American orchids appear in great numbers in the valleys of the Andres, and especially near the grand lake Nahueltpí. The egges, of which the female lays from 12 to 60 in the sand, yield, each of them, about two pounds of good food; and the feathers are used for plumes, parfafs, fans, &c. The condor is also found in this country. Molina reckons 50 species of quadrupeds in Chili; and it is observed that, most of the European animals have improved in this delicious climate and fertile country. The celebrated Spanish sheep have not lost any of their distinguishing qualities: the horned cattle are larger than those of Spain; and the breed of horses far surpass both in beauty and spirit the famous Andalusian race, from which they sprung.

Nor has nature exhausted her bounty on the surface of the earth: she has stored its bowels with riches. A) the argilaceous earths mentioned by Wallerius are found here, exclusive of the bole of Lemnos; and Molina adds live forts to those already described. Of metallic earths, according to his arrangement, there are mountain-blue and green, native cufre, ore of zinc, with brown, yellow, and red ochres. Among the rocks are slate, bone, green slate, fleatite, athes, amethyst, gold and silver mica; and the tale called Macnow ships is found in large plates, and used for windows. Limedon, marble, and gypsum, are plentiful. Besides the latt; marble, Chili affords the black, green, and yellow; and two mountains of Copiapo and Maulli are altogether compos'd of marble of different colors, and dispos'd in regular strata from the bottom to the top. Molina also mentions a great variety of flowers, yellow, green, and blue, called false topazes, emeralds, and sapphire. The Andres also afford fine alabaster, and large plates of folinite, used by the inhabitants of San Juan in the windows of their churches. Of silicious stones, there are quartz, flint, and rock crystal. Here are also freestone and grindstone, some common agates, and Jasper red, green, grey, white, and variegated. Rock crystal occurs of different colors, called falso ruby, topaz, jacinth, emerald, &c. One of the most celebrated, says this author, was found in Coquimbo, and a topaz in the province of Santander. A little hill, N. E. of Talca, is almost wholly composed of beautiful amethysts, in a kind of grey quartz. Turquoises are found in Copiapo and beautiful brecce, peridotes, and granites occur in the Andres. Rock-salt is abundant; and is often crystallized in cubes of various colors. Sul ammoniac is common near the volcanoes; and nine abundance in Coquimbo. The country is supplied with different kinds of alum or bitumen, and all the vitriles. Araucana furnishes jet; and coal is supplied by various parts of the kingdom. The province of Copiapo comprehends two mountains of crystalized feldspar; and the same substance abounds in all the Andres. Pyrites of several kinds and under various forms are found in several places. Of the semi-metals, this country yields arsenic, cobalt, bismuth, zinc, antimony, and mercury, both virgin and cinnabar. Chili contains mines, many of them very rich and productive, of lead, tin, iron, silver, and gold. The chief silver-mines are those of the provinces of Santiago, Aconcagua, Coquimbo, and Copiapo; but the most celebrated is that of Ulpahua, situated on the eastern mountains of the Andres, in the province of Aconcagua, supposed to extend to Poto, through a space of 840 geographical miles; discovered in 1636, neglected till 1762, but since wrought to great advantage. However, of all the metals, gold is the most abundant in Chili; so that there is not a mountain or a hill, which does not more or less produce it, and accordingly, it is found in the soil of the plains and the sand of the rivers. The gold is reckoned the purest in the world, being generally found of 22 carats, and often of 23½ carats. The most considerable mines of gold which have been disovered, have ever since the conquest of the country, yielded a confluent and considerable produce. The gold of the mines of Chili, paying the royal fifth, amounts to about four millions of dollars annually; of which a million and a half are coined at the mint of Santiago.

The commerce of Chili employs 23 or 24 ships from 5 to 1000 tons each, and in return for the grain, wine, fruits, provisions, tallow, leather, wood, copper, &c. sent to Peru, it receives iron, cloth, and linen made at Quito, hats, shoes, of which there are manufacturers in Chili, sugar, cacao, sweetmeats, tobacco, oil, earthen ware, and all kinds of European goods. A small commerce is also carried on between Chili, Paraguay, and Buenos Ayres, of which the latter is the staple. The products of Paraguay, which consist only in its herb and wax, are carried thither, then forwarded to Chili, whence the herb is exported to Peru. Large quantities of tallow are also sent to Mendoza for the manufacture of soaps. In exchange for these commodities Chili sends to Buenos Ayres linen goods, woolen and worsted stuffs, furs, of which are imported from Peru, and others manufactured in the country; also sugar, snuff, wine, and brandy, which two last the traders chiefly buy at San Juan, as most convenient for transportation. Ships from Spain, in return for European goods, receive gold, silver, copper, Vicuna wool,
and tanned leather. The domestic commerce of Chili chiefly consists in the provisions sent to Valdivia, which supplies other places with cedar. Chinese refreshments from the other parts brandy, wine, honey, sugar, the Paraguay herb, salt, and Guinea pepper; and return to Valparaiso and Concepcion several kinds of fine wood, with which the island abounds; also woollen stuffs of the country, made into shawls, quilts, &c.; together with hams and dried peaches. Copacabana sends copper to Valparaiso, which in exchange returns Cordova's leather, and soap, made at Mendoza, from whence it is carried to Santiago, and thence sold to different parts of the country. The trade with the wild Indians carried on by barter, consists in hardware, as bits, spurs, and edge tools; also toys, and some wine. They return horned cattle, horses of their own breeding, &c.

Before we close this article, we shall mention as a matter of annual observation, that the sea gradually retreats from the coast of Chili; and therefore, the shore consists mostly of a plain, 5 or 6 miles broad, between the sea and the maritime mountains; their sides bearing evident marks of the sinking of the ocean, which has sometimes formed curious grottos, with different chambers, hung with shells or stalactites, where bears take refuge in the winter. Voyage to South America, by Juan de Ulloa, vol. ii. Robertson's America, vol. iii. Pickerton's Geography, Ed. 5th.

Cordovan, formed of yemas, mtila, a thousand, an aflemage of several things ranged by thousands. The term was particularly applied to tables of logarithms, which were at first divided into thousands. Thus it was used by Mr. Briggs. See the article Briggs.

CHILIANO, in Geometry, a regular plane figure of 1000 sides and angles. We can safely demonstrate, that the sum of all its angles is equal to 1695 right ones; for the internal angles of every plane figure are equal to twice as many right angles as the figure hath sides, except those four which are about the centre of the figure, from whence it may be resolved into as many triangles as it has sides. The author of L'Art de Penfer, p. 44, 45, brings this inference to dwell the confusion between imagination and conceiving. See Notion.

CHILARCHA, or CHILARCIUS, from χίλαις, a thousand, and χιλιας, command, an officer in the armies of the ancients, who had the command of a thousand men.

CHILIARTE, in Church-History, the same with MIL- LARTE.

CHILIANTS. See MILLENAIRE.

CHILICOMITUS, in Ancient Geography, a canton of Avis, in Media; placed by Ammianus Marcellinus in the vicinity of Cordova.

CHILISQUAQ, in Geography, a township of Susquehannah river in Pennsylvania.

CHILKA, a lake of Hindostan, on the sea-coast of the province of Caractac on the N.W. side of the bay of Bengal. This lake bounds the Northern Circars on the north. It seems to be produced by a breach of the sea over a flat, sandy shore, whose elevation was somewhat above the interior country. Both this, and the Pusat lake of similar origin, communicate with the sea by a very narrow, but deep, opening; and are shallow within. The Chilka lake is about 40 miles in length from N.E. to S.W.; and in most places 12 or 15 wide; with a narrow slip of sandy ground between it and the sea. On this lake are many inhabited islands. On the N.W. it is bounded by a ridge of mountains: being a continuation of that which extends from the Mahaumdhy to the Godavery river; and shuts up the Circars towards the continent. It forms a pass on each side of it towards the Caractac province, and affords an agreeable diversity of objects; mountains, islands, and forests; and an extended surface of water, with boats and small vessels, resting on it. To those who navigate at some distance from the coast, it has the appearance of a deep bay; the slip of land not being visible.

CHILAKOTHE. An Indian town on the Great Miami, which was discovered in 1782, by a body of militia from Kentucky. This name is applied to many different places in honour of an eminent chief who formerly headed the Shawanoes. See TAMWAX.

CHILAKOTE, old, an Indian town, lying about three miles S. of Little Miami river, but destroyed by the forces of the United States in 1782. The part of the adjacent country, which is beautifully chequered with meadows, is rich. See MIAMI.

CHILLAN, or CHILAN, a town of South America and capital of a district of the same name, being one of the jurisdictions of the kingdom of Chili. The place is small, but has the title of city; the number of families not exceeding 2000, and having among them but few Spaniards. It is 75 miles N.E. of Concepcion.

CHILEIRON, a town of Portugal, in the province of Eltramadura; 44 leagues N.W. of Lisbon.

CHILLES, a town of France, in the department of the Lozere and district of Orléans; 14 miles N.E. from it.

CHILLIKOTHE, a town of America, in the state of Ohio and county of Roffs; situated on the Scioto river, about 65 miles from the Ohio. Such has been the increase of this settlement, that though it began in 1796, and became an incorporated town in 1792, it is now the seat of government and capital of the state. The adjacent country is fertile, and the town is rapidly increasing. At present it is said to contain 150 houses. Its public buildings are a goal, built with wood, and a court or house of hewn stone.

CHILLINGWORTH, William, in Biography, distinguished as a theologian, was born at Oxford in October 1602. He was an admiral of Trinity college in the year 1618, and after taking the usual degrees, was elected fellow of his college in 1620. He was, in very early life, charactised by a fondness for disputations; for this temper Lord Clarendon refers to his own life. "He was," says the Noble Lord, "a man of so great a subtlety of understanding, and so rare a temper in debate, that as it was impossible to provoke him to any passion, so it was very difficult to keep a man's self from being a little discomposed by his sharpness and quickness of argument; and instances in which he had a rare felicity, and a great advantage over all the men I ever knew." This turn of mind was attended with its disadvantages, for we are told he had contracted such an irreligion and habit of doubting, that by degrees he felt confident of nothing. It was probably the cause also of his conversion to popery, through the subtlety of John Fisher, a Jesuit, at what instance he went to the college of Douay. Here he made but a short stay, having, by means of a correspondence with his godfather, Laud, bishop of London, afterwards archbishop of Canterbury, seen reason to change his sentiments again. Upon his return to England he retired to Oxford, where he pursued his studies with great care and diligence. In 1634 he wrote a paper in confirmation of the arguments by which he had been deceived; each, however, was the ingenuousness of his mind, and his regard for truth, that after his return to Protestantism, he made it a practice to re-examine the grounds of it, which occasioned a report that he had gone back again to the church of Rome, and he continued through life to be reviled by one party and suspected by the other; yet he felt
flame on account of the candour and impartial inquiry which caused these fluctuations in his creed. Speaking of himself he says, "I know a man, that of a moderate Protestant turned a Papist, and the day he did so, was convicted in conscience, that his yesterday's opinion was an error. The same man afterwards, upon better consideration, became a doubting Papist and of a doubting Papist a confirmed Protestant. And yet this man thinks himself no more to blame for all these changes, than a traveller, who using all diligence to find the right way to some remote city, did yet mistake it, and afterwards find his error and amend it." Few persons, it is presumed, will, upon reading this, dispute Chillingworth's title to full approbation. In the year 1637, he published a work entitled, "The Religion of Protestants a safe way to Salvation," which is one of the ablest defences of the Protestant cause. Its fundamental principle is, that the scriptures are the only rule by which we can judge of controversies, and that no church of any one denomination, is, or ought to be, accounted infallible. "It is sufficient," says he, "for any man's salvation, to believe that the scripture is true, and contains all things necessary to salvation, and to do his best endeavours to find and believe the true sense of it."

Chillingworth's orthodoxy was now sufficient, and he was immediately branded with the epithets of Arius and Socinian; he had previously to the publication of this work refused prebend, which was offered him by Sir Thomas Coventry, keeper of the great seal, because he could not, at that time, subscribe to the thirty-nine articles: he declares that he is ready to endure any extremity of indulgence and the displeasure of his friends, rather than to make a declaration which his conscience could not thoroughly approve. These seruples were not of long continuance; for in 1638 he complied with the usual forms of subscription, on being promoted to the chancellorship of Salisbury, with the prebend of Brixworth in Northamptonshire, annexed to it. From a passage in the preface to his Religion of Protestants, it appears, that he now considered subscription as an offering to peace and union, not a declaration of faith, to which opinion he was probably led, by the arguments of his friend, Dr. Sheldon, afterwards archbishop of Canterbury. In addition to his other prebendary he obtained the mastership of Wigan's hospital in Lanchester, and in 1640, he was deputed as proctor by the chapter of Salisbury to the convocation. At the breaking out of the civil war he adopted loyally the royal cause, and was present in the king's army at the siege of Chichester, where he acted as engineer, and contrived some machines for assaulting the city. Very soon after this, on account of ill health, he retired to Arundel castle in Suffolk, where he was taken prisoner by Sir William Waller. His illness increasing, and not being able to go to London, he obtained leave to be conveyed to Chichester, where he was lodged in the bishop's palace, and after a short illness died in the month of January 1643-4, and was buried, according to his own desire, in the cathedral church of Chichester. Chillingworth was the author of several works besides his "Religion of Protestants a safe way to Salvation." He wrote nine sermons on special occasions, and a defence of episcopacy. His writings have always been highly esteemed by some of the most eminent persons of the nation, among whom were the great Locke, and archbishop Tillotson. His private character was marked by sincerity, candour, and benevolence: and according to Lord Clarendon he was a man of excellent parts and of a cheerful disposition, void of all kind of vice, and ended with many notable virtues; of a public heart, and an indefatigable desire to do good; his only unhappiness proceeded from his sleeping too little, and thinking too much, which sometimes threw him into violent fevers."

"This last circumstance," says Dr. Alken, "denotes that warmth of brain which may account for the mutability and the disputations turn that seem to have superseded in his nature." Biog. Brit. Gen. Biog. Blackburne's Works.

CHILOAS, or CHILAOAS, a jurisdiction of South America in the diocese of Truxillo, belonging to the vice-royalty of Peru, and the audience of Lima. See LLAMA.

CHILORN, a castle or caftellated house, in the kanon of Berin, 5 miles E.S.E. of Vevey. This is a large pile with round and square towers, standing on a rock in the lake of Geneva, and connected with the land by a draw-bridge. The vaults are very fine; the arched roofs, and the supporting pillars, are in a neat Gothic style. This castle in 1536 was wrested from Charles III. of Savoy by the canton of Berin assisted by the Genevans, who furnished a frigate to hefeive it by water. In a deep dungeon, below the level of the lake, the conqueror found Bonivard, prior of St. Victor, the intrepid antagonist of the dukes of Savoy, and the great allier of Geneva in peradventure. He had been imprisoned by the Savoyards for 5 years, and by confidant walking within his short limits, had worn a hollow in the rock. This castle was for a short time the residence of a bailiff from Bern, until a more convenient house was purchased in Vevey. It was feized by the insurgents in January 1558: and this act of rebellion, not being punished, was followed by the irruption of the Pays de Vaud from the canton of Bern.

CHILLY, a town of France, in the department of the Jura, and district of Loui-le-Saultier; one league S. W. of it.

CHILMA, or CHILMENSE oppidum, now called Gilma, an ancient town in the interior of Africa. Ptolemy and Pliny place it under the dominion of Carthage, and say that it was situated between the rivers Bagradas and Tri on. It is now in ruins, with fearcly any remaining veldige.

CHILMARK, a township of America on Martin's Vineyard island, in Duke's county and state of Massachusetts, containing 771 inhabitants. It lies 99 miles S.E. of Bolton.

CHILMARY, a town of Hindoostan, in the country of Bengal; 110 miles N.E. of Moorshatbad.

CHILMIRAR, CHILMINAR, or TCHELMINAR, the noblest and most beautiful piece of architecture remaining of all antiquity: being the ruins of the famous palace of Persepolis, to which Alexander the Great, being drunk, set fire, at the perfusion of the courtian Thais.

Authors and travellers are exceedingly minute in their descriptions of the Chilminar; particularly Gracia de Silva Figueroa, Pietro de la Valic, Chardon, and Le Brun. A general idea thereof may be conceived as follows: There appear the remains of near four columns; the fragments whereof are at least six feet high: but there are only nineteen that can be called entire; with a twentieth all alone, 153 paces from the rest. A rock of black hard marble serves for the foundation of the edifice. The ascent to the full plan of the building is by fourscore and fifteen steps, cut in the rock. The gate of the palace is twenty feet wide; on one side is the figure of an elephant, and on the other a rhinoceros, each thirty feet high, and of a shining marble; near these animals are two columns; and not far off the figure of a Pegasus. After this gate is passed, there are found a great number of columns of white marble; the remains whereof shew the magnificence of the work: the smallest of these columns is fifteen cubits high, the largest eighteen; each has forty fluting.
flattings, three inches broad; whence the height of the whole may be guessed at, with other proportions. Near the gate is an inscription on a square piece of marble, smooth as glass, containing about twelve lines: the characters are of a very extraordinary figure, resembling triangles and pyramids.

These noble ruins are now the shelter of beasts, and birds of prey. Besides the inscription above mentioned, there are others in Arabic, Persian, and Greek. Dr. Hyde chafers, that the inscriptions are very rude and unartful; and that fome, if not all of them, are in praise of Alexander the Great; and therefore are later than that conqueror.

M. Le Brun took his voyages to the East Indies, merely for the sake of viewing the Chilianizar. See Perspolis.

CHILLO, in Biography, one of the wife men of Greece, who flourished about the first year of the 56th Olympiad or 556 B.C. But Diogenes Laerterius fays, that he was an old man in the 52d Olympiad. He was one of the Lacedemonian Ephors, and celebrated for both his fagacity and probity. In the exercise of his office as a magistrate he acted with so much integrity that in his old age, he faid, that he recollected nothing in his public conduct which gave him regret, except that, in one instance, he had endeavored to feren a friend from punishment. The fighest attainment of wisdom, in his opinion, was, that fagacity which enables a perfon from the view of present circumstances and events to predict future occurrences. If a fop is faid to have once asked him, how Jupiter employed himself? He replied, "in humbling thofe that exalt themselves, and exalting thofe that abide themselves."

He is faid to have lived to a very advanced age, and to have expired through excess of joy, in the arms of his son, when he returned victorious from the Olympic games. Some fay, that the greatness of his value are the following:

—Three things are difficult: to keep a fecret, to bear an injury patiently, and to spend leisure well. —Visit your friend in misfortune rather than in prosperity. —Never ridicule the unfortunate. —Think before you fpeak. —Do not defire impossibilities. —Gold is tried by the touchstone, and men are tried by gold. —Honest lofs is preteritable to fameful gain; for by the one, a man is a fufferer but once; by the other, always. —In conversation use no violent motion of the hands; in walking, do not appear to be always upon hufines of life or death; for rapid movements indicate a kind of phrenzy. —If you are great, be condescending; for it is better to be loved than feared. —Speak no evil of the dead. —Reverence the aged. —Know thyfelf. Diogenes Laerterius, T. i. l. § 63-74. Pin. H. N. T. i. vi. § 32. Brucker's Hist. of Philof. by Eimfeld, vol. i. p. 133. Rollin's Ancient Phil. vol. ii. p. 334.

CHILLO, in Geography, a considerable island, or rather group of islands, being one of the governments of Chili, fited on its coast in the southern Pacific ocean, in the gulf of Chonos, or the archipelago of Guaytecas, and feparated in its southern part from the continent by a narrow fex, which forms a bay. It is about 130 miles in length by 30 in breadth; but almost divided, in the middle, by bays or creeks. It lies between 41° 40' and 43° 50' S. lat. The principal harbour of the island on the north coast is Chacao, which is faid to be well fortified and capable of a good defence, and at Culhuco, which is larger, reide a corregidor, nominated by the president of Chili, and also regidors and alcaldes annually. Besides the parish church, this place has two convents, and a college of Jiftins. The island is well peopled with Spaniards, Mulattoes, and Indian profefles. We learn from Lequanda, cited by Pinkerton, that from the middle of the 18th century many ships from Peru have visited the ife of Chiloe. The port of St. Carlos. (S. lat. 40° 50'; and long. 30° 57' from the meridian of Tenerife,) is capable of receiving considerable vessels, and the articles of commerce supplied by the island have given life to a trade somewhat beneficial. The natives are robust and well disposed; but are deficient in industry. Chiloe has forests of excellent timber, particularly cedar. It abounds in wine, and its pita, feeding on shell-fish, supplies excellent hams. It has an ample fisheries; its wheat is fteady, though the fift is good; but the deficiency is fupplied with a kind of potatoes, called papas, and with barley and beef, of which they make flour. Cattle and sheep, introduced from Spain, are abundant, and afford good meat; the tame and wild birds are numerous; and the kind of fheep, called cauf-wolf, is plentiful. The fhep of the fheep is felled by the Indians of the small adjacent islands called Chonos, and used as common food. The fheep, which is common from Chiloe to Valdivia, furnishes fur not inferior to that of the Canadian beaver, which might become a lucrative article of commerce; and the fkins of a bird, called the American fwan, is covered with an exquisite snowy down, and used as a delicate fur. The females of the island manufacture pouschos or Indian mantles, and other coarse woolen articles. Some few linen articles are also woven; but both these ma-ufactures are insufficient for clothing the inhabitants, who are estimated at 25,000, exclusively of the Chonos. They begin to import woolens and cottons from Peru; but the consumption is small. During five years, it is faid, the imports from Chiloe at Lima in boards, pouschos, hams, and felt-fish, amounted to more than 280,000 dollars. The exports from Lima to Chiloe exceeded 334,000.

CHILLO, a river of Siberia, which runs into the Sea of Okdeguck.

CHILONGO, or Ceylonogo, of Cylongo, in Geography, a maritime province of Africa, and the largest in the kingdom of Loango. It is situated between the rivers of Quila on the S. and Combi on the N., which last separates it from Majumba, once a small kingdom of itself, but now a province of this. Its plains are spacious and fertile, and fotted at a distance by ridges of high mountains. Its inhabitants carry on a very considerable commerce, especially of elephants' teeth, though in other respects they are extremely rude and unpolifhed. On the coast stands the "Cabro Negro," or black cape, fo called by the Portuguese on account of its dark appearance; the whole promontory being covered with trees.

CHILLOU, a village of Ceylon, S. of Patalaham, where the Dutch have erected houses for the entertainment of strangers. It is situated on the banks of a broad river, and the adjacent country is wild, and dangerous for passengers, on account of the multitude of wild beasts with which it is infalted. To the southward of Chilou elephants are numerous, and are hunted with considerable fecu.

CHILQUES, a jurifdiction of South America, in the kingdom of Peru and diocese of Cuzco; commencing at the distance of about 7 or 8 leagues S.E. of Cuzco, and extend-ing about 30 leagues in length. The temperature of the air corresponds to the situation of its several parts; some of which are very fertile in producing grain, and others fed a great number of cows and sheep. Besides these, its commerce is much augmented by the woollen manufactures of the Indians.

CHILTERN, a ridge of hills, traversing the county of Bucks
Bucks a little to the south of its centre, and reaching from Tring in Hertfordshire, to Henly, in the county of Oxford. To these hills, called the Chiltern Hundreds, is annexed the nominal office of steward under the crown, the acceptance of which enables a member of the British parliament to vacant his seat.

CHILTOTOL OF Hernandez and Ray, in Ornithology, the celsinalis of Broum, the Vibrignan Langer of Latham, and the tangara Breglia of Linnaeus; which see.

CHIMARA, in Ichthyology, a genus of fishes in the chaetodontiæ order, the head of which is pointed on the upper part. It is a small, quadriradial, and under the neck; smooth placed beneath, upper lip five-toed, cutting each two in front both above and below; body elongated; dorsal spine single. Gmulin adds, the tail ending in a slender thread, and longer than the body; but we rather agree with Bloch, who considers the finfold tail of the chimera monofisa as a specific a generic distinction.

Two species only of this singular tribe of fishes have been hitherto discovered; the first, monofisa, or sea monster, was sufficiently well known to the older writers as an inhabitant of the Iberian seas, under the names of centina prima, Simia marina, geles acanthias, &c.; the other callorhynchus, the elephant fish of Cook's voyages, is a native of the southern hemisphere, and ranks among the more recent discoveries in ichthyology.

Chimera monofisa has the lower part of the snout piano and plaited, and the tail terminating in a long and slender filament. Chimera monofisa regia, Subtilis pleiæ puncta, Linn. Fæ. Suec. Chimera caudata foiformis, Bloch.

A fish of more remarkable appearance can scarcely be conceived. The body is of a lengthened form, compressed, and gradually tapering towards the tail, which terminates in a long and slender filament; the head is large, thick, and ascending in front into a comical or pyramidal form; the mouth is placed beneath, and is of moderate size; each jaw is furnished with a pair of broad bony lamines, which are crenulated at the tip; the upper lip is divided into five parts, and the front, from the mouth to the eyes, is marked by transverse undulations and pores; a line of this kind runs across the forehead beneath the point of the tip, and is continued in a serpentine course into the lateral line, and another line passes from this beyond the eyes, which returns again towards the nostrils. The whole body is of a black brown above, varied with yellowish brown, and silvery, and the lower parts of a bright silver colour. The eyes are large, of a greenish colour with silvery irides, and very brilliant, and shining with phosphoric splendour. The pectoral fins are of considerable magnitude. The male is distinguished by having a single fringed crest on the top of the head, and by the rough, lengthened processes at the anal fin, which correspond with those observed in the males of the ray and shark tribe. This fish inhabits the northern seas of Europe, and is very rarely seen so far southward as the British isles. (Vide Donov. Brit. Fishes.) It grows to the length of three or four feet, and feeds on marine worms and fish of the smaller kinds. The Norwegian fishermen call it the king of herrings, from the circumstance of its being often lurking among the schools of that fish, the flesh of which appears to be its principal food. The flesh of the Chimera is hard, coarse, and unmarketable; the inhabitants of Norway employ however the roes of this fish in their patry, and in making cakes, and extract an oil from the liver, which they consider of singular efficacy in disorders of the eyes, and as an emollient for wounds and bruises.

Some call it the sea ape, and others the fradion; it is the Chimere arctica of modern French writers.

This nearly corresponds in size with Chimera monofisa, but has the front rather sloping downwards, and the upper lip extending into a lengthened cuticular flip, or appendage, bending down in a reversed direction beneath, from which peculiarity it has acquired the name of the elephant fish. The eyes are large; the front marked by multilobate lines, and pores, the bill of which appears numerous than in C. monofisa. The frill dorsal fin, as in that fish, large, somewhat triangular, and armed anteriorly with a strong spine; second dorsal fin resembling the first, but without a spine; the third very shallow, and continued into a thread at the termination of the tail, but which is very short. The pectoral fins are large; ventral moderate; anal small; lateral line commencing from the upper sides of the head, and thence continued in a straight direction, to the beginning of the caudal fin, at which place it terminates. General colour of the whole fish silvery, with a yellowish brown call on the upper parts; fins pale brown. Inhabits the South Seas.

Chimera in Fabianus History. See Chimera.

Chimarrhus, in Botany, (so named by Jacquin, 1769, because it usually grows by torrents), Schr. 309. Wild. 352. Jacq. Amer. 61. Ciais and order, pontandra monogyna.

Gen. Ch. Col pachan entire, crowning the germ, permanent. Cor. on- petalised, funnel-shaped; tube very short; border five-cleft; segments lanceolate, concave, blunted, hairy below, with a longitudinal line running along the middle, forading. Stam. filaments five, aw-shaped; the length of the corolla hairy at the base, below the divisions of the border; anthers oval. Erect. Fil. germ roundish, inferior; file diliform, the length of the stamens; stigma blunt, obtuse. Pet. capitate somewhat egg-shaped, obtuse, crowned, two-celled, two-valved; valves biaid at the tip. Stylus solitary.

Ell. Ch. Corolla funnel-shaped, with a very short tube. Capitate inferior, obtuse, two-celled, two-valved; valves biaid at the tip. Seeds one in each cell.

Sp. C. femos. A lofty tree, with branches spreading out horizontally, wood white, used for beams, rafters, &c. Leaves egg-shaped, acuminate at both ends, quite entire, shining, petioiled, opposite; a foot long, commonly eight or ten at the end of each twig. Flowers white, numerous, small, sessile, in cyme-like racemes half a foot in diameter; those in the axis opposite and solitary, those at the end usually four together. Capsules small. A native of Martinique, where it is called Baie de Riviere.

Chimarrus, in Ancient Geography, a river of Polonnesus; placed by Pausanias between the Eridanus and the maritime burch of Lerna.

Chimay, in Geography, a town of France, in the department of Jemmappe, and chief place of a canton, in the district of Charleroy. The place contains 1,892, and the canton 8,335 inhabitants; the territory includes 3,800 hectares and 17 communes. In the vicinity of Chimay, are mines, with founderies and forges, of iron. It is 105.203 E.N.E. of Cambes, and 154.8 S.E. of Lillo.

Chimbadores. See Santa.

Chimbo, a jurisdiction of South America, in the province of Quito, situate on the west side of the jurisdiction of
of Riobamba, and consisting of an affluent and seven villages: the former, being the capital, is called Chimbó, and was the residence of the corregidor; till it was thought proper, for the convenience of commerce, to remove it to Guayaquil, the principal of the above villages. Guayaquil is inhabited generally by Muñozos, with some Indians, and very few Spaniards. The jurisdiction of Chimbó being the seat of the Serrania, or ridge of mountains bordering on that of Guayaquil, carries on, by means of innumerable drays of mules, the whole trade of Quito and the other provinces, by the way of Guayaquil, carrying the whole of cloth and fleeces, together with the meal, corn, and other products of the country, from the former to the latter; and returning with wine, brandy, salt, cotton, fish, oil, and other goods, for the supply of the provinces of the mountains. This traffic is very advantageous to the inhabitants; but, as the roads, in winter, are impassable to beasts of any kind, it can only be carried on during the summer. This inter- mission of trade they call 4 carruse la montana, i.e. the shutting up of the mountains. The temperature of the air at Guayaquil, and of the greatest part of the jurisdiction of Chimbó, from the proximity of Chimborazo, is very cold. The country is extensive and fertile; but the leguminous, or legumes, are generally appropriated to the breeding of mules; a few oats being cultivated for different species of grain.

CHIMBORAZO, a mountain of South America, situ- ate in the province of Quito, about 100 miles to the south of the city of that name, and about 10 miles to the north of Riobamba, and reckoned the highest point of the Andes. The French mathematicians, who were employed from 1735 to 1742 in measuring a degree of the meridian, computed the height of this mountain to be 3217 French toises above the level of the sea, or 14,322 French feet, which, reduced to English feet, are 20,571. Others flate the height of this mountain above the ocean to be 19,596 feet. Con- sequently, if we admit the height of Mont Blanc to be 15,662 feet, Chimborazo, according to the French mea- sure, is nearly 5000 feet, or a quarter higher. That part of Chimborazo which is covered with perpetual snow, is about 2400 feet from the summit. It should be re-collected, however, that this mountain is elevated above the highest plain of Quito, which constitutes nearly one-half of the computed height, allowing it to be 9377 feet above the ocean; and, therefore, considered as mere excrescences from the land, they still yield to Mont Blanc. This mountain, though it lies in S. lat. 3° 41' 40", and consequently near the equator in the middle of the torrid zone, is covered on its sides with ice and snow; and the country adjacent to it is often pierced with intolerable cold, on account of the winds which blow from the mountain. See MOUNTAIN.

CHIMIPANESTICK, a river of Canada, which runs into the river St. Lawrence. N. lat. 50° 3'. W. long. 61° 25'.

CHIMIER, in Ornithology, the Chiming-Thrush and Tur- dus Campanella of Latham, La Carilloncelle of Buffon, and Turdus tumulbattus of Gmelin; which see. See also Chimera.

CHIMERA, or Hirma, in Ancient Geography, a town of Sicily, Steph. Byz. Chimaera, a mountain of Asia Minor, in a district of Lycaonia, according to Pliny, who says that it had many volcanoes, and resembled Etna. The Lyceans built near this mountain the town of Hephelise, which they consecrated to Vulcan. Virgil mentions this mountain in his Æneid. See Chimera infra.

CHIMERA, in Geography, a town and fortress of European Turkey, capital of a district in the province of Albanea, feated on a rock near the sea-coast, opposite to the island of Corfu. N. lat. 40° 47' E. long. 19° 2'.

CHIMERA, or Chimera, in Fabius History, a monster, the daughter of Typhon and Echidna, that breathed a fierce and incinquantuable fire, and which the poets feign to have the head a herd of a lion, the body of a goat, and the tail of a dragon; and to have been killed by Bellerophon, mounted on the horse Pegasus. This female monster was born in Lycaonia, and Bellerophon received his orders from Japhet, king of Lycaonia, to destroy her, and to extirpate a people called the Solyuni. Minerva, as S. Ray. Del., according to others, N. Paus. commending his first action, exposed to such dangers, sent him the flying horse Pegasus, by whose assistance he overcame the Solyuni and slew the Chimera.

The foundation of the table is this: that anciently, in Jules, there was a volcano, or burning mountain, of this name; the top whereof, which was deferti, only inhabited by men; the middle, having good pastures, was frequented by goats; and the foot, being marshy, by serpents: Thus Ovid:

"--- medinis in partibus hic um
\[\pi\]cUnos et ora lac, caudam serpentis habebit."

Bellerophon being the first who caused this mountain to be inhabited it was hence supposed that he flew Chimera. Pliny says, the fire that issued would burn in water, and could be extinguished with nothing but earth or dung. Among other explanations that have been given of this table, some have supposed that the Chimera was a pirate ship, whose prow bore the figure of a lion, the middle of that of a goat, and her stern a serpent. Among the Bronzes in the collection of the Grand Duke at Florence, is a curious representation of the Chimera, composed of a lion and goat, in their respective proportions, with an inscription in Etruscan characters. Among philosophers, and in common language, Chimera denotes a mere creature of the imagination.

CHIMERA is used, in Writers of the Middle Age, for a kind of vault or ship. It seems to have been less than the chironium.

CHIMERIUM promontorium, in Ancient Geography, a promontory of Asia Minor, on the coast of Lycaonia, according to Strabo. It was formed by the mountain called Chimera or Chimera.

CHIMES, in Horology, is a species of music mechanically produced by the strokes of hammers against a series of bells, tuned agreeably to a given scale in music; the hammers are lifted by levers actuated by metallic pins or wooden pegs stuck into a large barrel which is made to revolve by clock-work, and is so connected with the striking part of the clock mechanism, that it is set in motion by it at certain intervals of time, most usually either at every hour, or at every quarter of an hour. The music thus produced may consist of a direct succession of the notes constituting an octave frequently repeated, or otherwise may be a psalm tune, or short popular air in the key to which the bells are tuned. This species of mechanical music is by no means calculated to improve the taste, and had its origin most probably, like clockwork itself, in some of the musical institutions of Germany, where, according to Dr. Burney, it prevails greatly, and where the ringing of changes on bells, as in England, is but little, if at all practised. The chime mechanism may be adapted either to act with the large bells of a church clock, by means of wheel-work proportionally strong to raise heavy hammers, or a set of bells of different diameters may be arranged concentrically, within one an-
other on one common axis, sufficiently small to be introduced into the frame of a clock, or even of a watch, which we have seen performed by Margetts, who lately died in a state of infirmity. The manner in which the hammers are moved by the pins of the chime-barrel must necessarily vary according to circumstances, as the wires of different rooms are differently placed to produce the sound of a house bell, but an ingenious workman will vary the length and shape of his levers of communication agreeably to the situation and distance of his bells from the clockwork, so that if we give a description of the chime mechanism of a church clock, and also of a portable piece, he will not be at a loss to know how to devise and adapt the necessary parts for any other construction. But before we proceed to our descriptions, it will be proper to give an account of the chime-barrel, and the method of infecting the lifting pegs, or of what is called prick ing it.

Chime-barrel is that cylinder of brass in small clocks, or of wood in church-clocks, which gives motion to the hammers, that strike on the bells, and produce a change or tune thereon, by means of pegs inserted into certain points of its circumference at measured intervals, the pegs serving to lift the hammers in regulated succession both of order and time.

In making a chime barrel for any given tune there are certain necessary conditions to be attended to: First, the barrel must be well turned in a lathe upon its own arbor, so as to have the whole surface of its circumference concentric, when revolving on its pivots. Secondly, the train of wheel-work, belonging to the chime-work, must make the barrel revolve in a space of time exactly equal to what is required for playing the requisite tune on any other instrument, which time may be exactly limited by proportioning the fly on the half wheel to the power of the weight or spring that urges the half wheel of the train. Thirdly, there must be as many bells as the compass of the proposed tune contains musical notes, and also as many rows of pegs inserted into parallel circular lines on the circumference of the barrel as there are hammers to be lifted by them; and, lastly, the whole circumference of the barrel must be divided into as many longitudinal parallelograms of equal breadth, as there are musical bars in the proposed tune, each of which must be again subdivided into as many parts as there are notes of the lowest denomination, whether crotchets, quavers, or semi-quavers, in each bar; then the parallel dividing lines will correspond to the bars, and the sub-divisions within will be the guides for placing the pegs in those bars respectively; for instance, suppose that Pleyel's German hymn be required to be played by a chime clock of any description, and that the points on the barrel where the pegs or pins are to be inserted had required to be ascertained?

In fig. 1. of Plate VII. (Horology), it will be seen that the popular hymn is marked 

\[ \frac{a}{4} \]

which implies, that the bar is measured by four, or crotchets, of which there are two in each bar; it is also observable that the quickest note in the tune is a semi-quaver, of which denomination eight constituent two crotchets, or one bar; consequently the bar must be subdivided into eight. Now suppose the length of the barrel to be represented by the line, D D, or d d, because the compass of the hymn is just one octave beginning and ending with D inclusively, the line, D D, or d d, must be divided into seven equal parts, which will require eight points in each to include them, viz. D, E, F, G, A, B, C, D, and d, e, f, g, a, b, c, d; then, because the whole hymn contains 16 bars, the whole line, D d, which we assume as equal to the circumference of the barrel, must be divided into 16 equal parts, which we have made to fall opposite their respective bars, the better to elucidate our example; then each of these parts may easily be conceived to be subdivided into eight smaller divisions, as from 1 to 2 in the lower line, D d. From the dividing points let straight lines be drawn to complete the squares, or parallelograms which can be divided into, and there will be a figure, D D d d, with 8 \times 16 = 128 small squares or parallelograms, which we will suppose to be on paper that will exactly cover the barrel when placed round it, in order to convey a more distinct idea of the method of ascertaining the true places of the pins on the barrel, which may be thus done:

The first note, B, is a crotchet, and therefore the pin represented by a dot, that moves its hammer must be in the beginning of the line B b, and the next following pin must be at the space of half a bar forwards to limit its continuance; accordingly the next note, D, is placed on the line, D d, at half a bar forwards; again this second note, D, being also a crotchet, requires the next succeeding note of A to be removed another half bar, namely to the interjection of the lines, A a, with 2 2; but the third note, A, which we have just mentioned, is equal in length to three quavers, or fix semi-quavers; the succeeding pin to represent B must consequently be removed \( \frac{2}{3} \) or \( \frac{2}{2} \) of the bar, leaving \( \frac{1}{3} \) or \( \frac{1}{2} \) for the remaining quaver from B to C, the latter of which, being the first note of the third bar, falls on the interjection of the bar line, C c; with the hammer-tail line, C c e, by the same rule the crotchet, C, once struck continues half a bar, and requires the following A to be half of a bar advanced, but A is here \( \frac{2}{2} \) of a crotchet, and the following B only \( \frac{1}{2} \) of the same or \( \frac{2}{2} \) of the bar; the pin of B must therefore be at \( \frac{3}{2} \) of the bar, and the succeeding one on the bar line to limit its duration to \( \frac{3}{2} \). In the fourth bar there is a crotchet reb, which is the reason why there is no dot or pin between its bar lines, as though the B of this bar had been a minim. We might thus have analyzed the whole surface of the barrel, so far as relates to this hymn, but it is presumed the preceding detail, clearly understood, will render the rest perfectly intelligible without further explication.

When the hammers are very heavy, as in church clocks, these bells which have quavers or semi-quavers to be struck immediately in succession require to have each two hammers and each a pair of parallel circles pricked to perform within the limit of time; and when either the barrel is made adjustable, or the pins moveable, a number of times may be put on the same barrel, and where the bells are sufficiently numerous, the tune may be played in two or even three parts.

This method of pricking a chime barrel for playing on bells differs from that of an organ-barrel in this respect, that in the former the length of the note is measured by the space between the contiguous pins, whereas in the latter the limit of the note is produced by crank pieces, instead of pins, which pieces keep the pipes open, and therefore must cover the very spaces which lie between the pins of the other, the projecting parts of one barrel mutually corresponding to the vacant parts of the other.

Chimes of a church clock. Plates V. and VI. of Horology explain the chime mechanism in the clock-room of St. Margaret's church, Westminster: A (figs. 1 and 3) is a barrel on which the rope B is wound: this rope, after passing over a fixed friction roley, has a heavy leaden weight attached to it, by the weight of which the mechanism is actuated; D is a large wheel at the end, and on the arbor of this barrel, which is worked by a pinion E, not seen, the arbor of which is square at the projecting end for the key of the
the handle by which the weight is wound up; the barrel A is so contrived, by means of the click b and ratchet wheel e, (fig. 1) that, when the rope is in the act of being wound, the barrel flips round its stationary arbor, but when the weight is going down, it turns the large cylinder or chime barrel C, attached to the arbor along with it; the chime barrel is made of wood, and has a number of pegs struck into it, which, as it turns round at proper intervals, take hold of the inner ends d of the horizontal and parallel levers E; raise them to a certain height, and then let them go suddenly; this motion at the same time depresses the outer ends of the said levers, and by means of the upright rods G, and other intermediate rods, raises the hammer which strikes upon the large bells in the belfry or belfry above. On the end of the chime barrel next to barrel A, is a large wheel H (figs. 1 and 3) which takes into a small pinion on the arbor of the wheel I; this wheel works a pinion on one end of the long arbor K, (fig. 1) on the other end of which arbor is a pair of fanners, or a fly L, the vanes of which catch the air, as they turn, and regulate the velocity of the machine. This fly is shown separate in fig. 2. A is a portion of the arbor, on which is loosely fitted an iron bar B, having a vane D at each end to prevent the bar from slipping round the arbor in a retrograde direction; a ratchet wheel T is attached to the outer end of the arbor, and a click e is fastened on the fly, which is fast to the teeth of the wheel by a spring, so that when the arbor turns the click flips against the teeth of the wheel, and turns the fly with it, but when the arbor is suddenly stopped (as hereafter described), the fly continues its forward motion for some time by means of its momentum, the click e in the mean time flipping round the ratchet T; by this contrivance all strain upon the mechanism, by a sudden check of the momentum of the fly, is avoided. On one of the diagonal or cross bars of the wheel I (figs. 1 and 3), is a projecting piece of metal f, which piece, when the machine is to be flayed, is caught by a detent g, which detent may be moved towards the centre of the wheel (f0 as to clear the piece f) when the machine is to be put in motion; the upper end of the detent g is fastened to an arbor M, so as to have a circular motion with it; to which arbor is also fixed another detent h (fig. 3) bent to avoid the bar of the frame. On the middle of this detent h, a piece of upright iron i is riveted, on the end of which a hammer N (figs. 1 and 3) strikes; this hammer is raised at the proper hour by the church clock, and by its fall strikes the piece i, (fig. 3) depresses the bent detent h, and consequently moves the detent g from the flap of the piece f. O is a circular plate, having a notch in one part of its circumference, at the back of it are fastened four arms l, l, m, (fig. 3) and another not seen. On the face of the wheel H there is a projecting tooth n (fig. 1) which takes hold of one of the arms on O, and at every turn of the wheel H, moves the wheel O round the space of one quarter. Behind the arms l, l, m, are four knobs p, q, r, s, in a detached state (shewn in fig. 4) against which a lever R (figs. 3 and 4) is pressed by a spring S; the use of this additional mechanism is to make the wheel O always deliver a complete quarter of a revolution whenever it moves at all, for suppose the arms m, l, k, (fig. 4) to have the position of the dotted lines m', l', k', the pin n on the wheel H (figs. 1 and 3) takes the arm m and pulls it downwards, during which course the knob p (fig. 4) raises the lever R into the position of the figure; the spring and lever then act upon the knob p, and quickly bring the arms to the dotted position, in which situation the letters of reference are advanced each to the next arm. This clock has moreover the striking work, in which there is, as usual, a wheel called the count wheel, which turns round once in 12 hours; in this wheel there are three pins, that, at the hours 4, 8, and 12, move the end of a lever that communicates, by means of an intermediate r d Q, (figs. 1 and 3) with the tail P of the hammer N, so as to elevate it; as the count wheel turns round, one of its pins lets go the lever, and the hammer N falls upon the detent b, (the end of which is supposed to be in the notch of the plate O); pushes it down, and at the same time moves the detent g on the same arm O upward; as soon as the hammer has made a stroke, it is partly lifted up again by the tail spring t (fig. 3) acting against the bar of the frame, but the end of the bent detent b is prevented from again entering the notch in the plate O, when the hammer rises, by the lever R, which at the instant the lever b (fig. 4) is pulled down, moves the wheel O a little round, by means of the spring S, into the position of the figure. When the hammer has thus struck and removed the detent g, (fig. 3) the leading weight pulls the barrel A, and sets the machine in motion, during which motion the pegs in the chime barrel E strike the lever, F, and move the bell hammers in the due succession of time, the fly (fig. 2) in the mean time regulating the velocity of the barrel. At each revolution of the chime barrel E, the peg n in wheel H turns the wheel O round one quarter of a revolution, and by the time the barrel has turned four times, the notch in the plate O is brought again opposite to the end of the bent detent b, which therefore falls in by the weight of the detent g, the lever of which also falls at the same time, so as to catch the flap f which lays the machine. The said notch in the plate O is so placed, that when the bent detent b is broken into it, the knobs p, q, r, s, on the back of this plate, are in the position shown in fig. 4, so that this plate O moves, the instant it is permitted to do so, by the bent b being removed by means of the spring S, independently of the great wheel H. This machiniry plays four different tunes, which are changed by turning the index W (fig. 1) by the handle to the corresponding tune marked on the dial plate T; this handle has a pinion on its arbor, behind the dial plate, which works in a rack upon the crooked iron bar y, so as to move it up or down when the handle is turned; the bar y is made to move readily, by having a crooked x with parallel sides at each end, sliding against both sides of corresponding steady pins fixed in the frame; and the friction of a spring 7, pressing against it, prevents its being moved by accident: in the middle of the bar y is a bend y, which acts as an inclined plane between the rollers A, 4, fixed in a small frame at the end of the bar W, so as to move the bent detent b, while the crooked bar y is moved vertically; to the horizontal bar W are fixed the centres of the keys, or levers, F, and a long iron plate, 5, with 16 notches to confine each lever to its own plate of action. The sliding pins g, g, moving in a cock with two perforations attached to the frame, confine the bar W to a horizontal motion. In setting out the pegs on the barrel, 64 parallel circles, four to each lever, are drawn round it, at equal distances; every four of these coincide successively, by the rack-work adjustment, with one of the levers, so that the respective pegs upon the barrel in the first of four circles may work on its own lever, and play one tune; then by moving the levers, along with the bar W, the distance that two contiguous circles are apart, a second set of pegs is presented to the said levers, which now play a second tune; and in the same manner at a third and fourth, successively. The 16 rods G have each a screw adjustment at their lower ends, and their upper ends are connected with revolving rods fixed to the clock, by which the motion is conveyed, under each bell, to the
the hammers, which are placed each in a line perpendicularly under the axis of its bell, so as to strike near its lower extremity; (Plate vii. fig. 4;) the weight of each hammer is supported by a spring S, in such a manner that it rises from the bell the instant it has struck. There is moreover a long horizontal iron bar that goes across the levers E (Plate V. fig. 1) not seen, the ends of which are connected with another lever also not seen, which, when it is pulled down, takes up all the hammers at once, so as to clear the bells in the act of ringing. There are several in this chime, six of which have each two hammers, and the other four but one piece; the double hammers are used where the same bell is required to be struck twice in succession so quickly, that the same hammer could not be lifted up and be made to return twice in the requisite time.

In the mechanism we have here described, the chime barrel is so contrived as to be capable of playing only four tunes; but in some figured wheels which we have visited, the barrels have parallel longitudinal apertures, which admit the lifting pegs to slide into any situation, and which consequently render them disposable for any tune within the compass of the two extreme notes, the sliding pieces being fixed by thumb screws within the barrel.

Chimes of a common clock. After the ample account which we have given of the chime mechanism of a large church clock, we will satisfy ourselves with giving so much only of the chime work of a common clock, as may suffice to give the reader an idea how a communication is made from the barrel to the bells, which portion could not easily be represented where the bells are at a distance from the barrel, as is the case in a church steeple. We beg leave, however, to refer our readers to our article Clock with chimes, for a more particular description of the mechanism which connects the chime part with the going part of the clock, and which alternately locks and unlocks the train of wheel-work that regulates the chime-barrel, it being impossible to describe in a complete manner the contrivance for making the chimes go, and repeat at every quarter of an hour, without describing at the same time the striking mechanism, which does not properly belong to this article. Figures 2 and 3 of Plate VIII. (Horology) represent as much of the chime mechanism of an ordinary clock as will serve our present purpose: A B C D constitute a portion of the clock frame, of which one connecting pillar only is shown; E is the chime barrel of brasses, nearly equal in length to the pillar, and of a diameter sufficient to admit of diagonal rows of brasses or india pins to lift the hammer tails F, in the successive order of a descending octave, while the barrel is revolving, there being eight hammers G, usually striking successively again as many bells H, which are mounted concentrically within one another, on a common axis held fast by the bearing piece of wheel I, screwed to the face of one of the plates at its lower extremity. The mechanism connected with the striking part of the clock is so ingeniously contrived and arranged, as may be seen under the article to which we have already referred, that at and after the first quarter from any hour, it will repeat the octave once; at and after the second quarter, it will repeat the same twice; and at and after the third, four times; and at and after the hour itself, four times; also whenever the octave is repeated four times, the chime part unlocks the striking part, and allows the clock to strike the last hour as soon as the chimes have ceased, but not before. K is a brasses frame forced at the lower end across the side of the superior part of the clock frame, which holds the works, and has a brass plate N, of hammered metal attached to it by screws; this plate, N, is divided nearly to the top by eight parallel vertical flits, made by a saw, which form so many springs; the hammers all turn upon a common fixed arbor near P (figs. 2 and 3;) by means of a perforation made in each fold part P above the tails, which fold part has a straight edge in each, against the central point of which the respective spring bears a little above its inferior extremity (fig. 2); this mode of applying a spring gives the advantage of performing two offices, for it will not only keep the hammer tail in its proper situation, to be taken by a pin of the barrel, but will give a firmness to its bow, and then relieve it to its original position, by acting alternately, partly above and partly below the central hole; which kind of action will readily be understood, by examining the opening joint of a pen-knife, and attending to the manner in which its spring is applied. L is a cock screwed to the face of one of the plates of the frame, and holds the projecting pivot of the fly wheel, to which the fly M is attached with a spring O pressing against it, in such a manner as to hold it to the arbor of the wheel when the latter revolves, and yet to allow it to turn in a detached plate, when the motion of the wheel is suddenly arrested at the conclusion of the chiming, which is a necessary precaution for preventing the destructive effect which might be produced by an instantaneous check of the momentum of the fly, and answers the same purpose as the ratchet wheel and click, together with a spring, on the large fly of the church chime work before described.

The chime barrel which we have here described, is pricked for the performance of a repetition of the eight notes of the octave by a descending gradation, but it might as easily have been made to chime the same scale by an ascending gradation, or to play any hymn or other tune within the compass of the eight notes, or even with more notes, by the addition of a few more bells; and that without more than one hammer to each bell; for when the mechanism is light, the hammers may be made to act with as much rapidity, as the hammers of a grand piano forte.

CHIMIN, or CHEMIN, in Lat., a road, or way. See HIGHWAY and ROAD.

CHIMINAGE. A toll for wayfarage or passage through a forest. The feudista called it pedagogium.

CHIMITAS, the name of a tribe of American Indians, in the province of New Granada, who are seated on one side of the river Magdalbeca, whilst the Guagros occupy the other; and both concur in intercepting the trade of Cartagena and the coast.

CHIMNEY, in Architecture, a part of a house or chamber, in which the fire is made.

The word chimney comes from the French chemin, which is derived from the Latin communis, and that from the Greek κοινόν, a chimney, of κοινός, common. The parts of a chimney are, the hearth or fire-place, the jambs or sides, the back, the mantle resting on the jambs, and the tube or flue which conveys away the smoke.

It has been frequently made a question whether or not the ancients were acquainted with the use of chimneys in the common acceptance of the word. On this subject we shall proceed to state those circumstances and arguments that occur.

In favour of the antiquity of chimneys it has been alleged, that Homer (Odys. i. v. 58.) represents Ulysses, in the grotto of Calypso, as wishing that he might see the smoke ascending from Ithaca: whence Montfacon (L'Antiquitè expliquée) infers, that the houses of Ithaca had chimneys, without which the wish is unintelligible. But in reply, it may be said, that smoke might have been seen in its first, though it proceeded from doors or windows. Herodotus also relates (i. viii. c. 57,) that a king of Libya, when one of his servants asked for his wages, offered him in cold the sun, which
Chimney.

which at that time flone into the house, through the chimney as some have translated the origina but what is her called chimney was merely an opening in the roof, under which, probably, the fire was made in the middle of the edifice. Aristotle, in his comedy of the Vespex (v. 139), introduces old Philocleon that up in a chamber whence he endeavours to make his escape by the chimney; which, however, was a mere hole in the roof, as Reitil has determined; and this appears probable, because mention is made of a top or covering, with which the hole was closed. Several passages have been cited from Atheneus (Deipnosophists), which seem to refer to chimneys; but these are evidently inconclusive; and some of them intimate that there was no such passage for the smoke as a chimney.

Such are the testimonies of Greek authors, refecting the antiquity of chimneys; but they are rather evidences to the contrary, or that the houses of the ancients were constructed without chimneys; more especially when we consider, that there were no chimneys at Rome at the time when the authors wrote, which would not have been the case if the Romans had ever seen them among the Greeks. Vitruvius makes no mention of them, and it is well known that the Romans were accustomed to use other means for warming their houses, such as flues and braziers.

The two words *camina* and *focus* employed by the Latin authors to denote the fire-place are used indiscriminately, so that it is not possible to observe any difference in their signification. Thus, *focus*, which might be taken for a brazier in which charcoal was burnt, is also used to denote a place proper for the consumption of wood, as the words of Horace prove,

"Diluvva frigus, ligna super foco Large repone." Lib. i. Od. 9, 9.

And when Vitruvius directs in what manner the stoves of farm-houses should be placed with respect to the kitchen fire, (Lib. vi. cap. 9) he also uses the word *focus*, which certainly cannot be supposed in this place to mean a portable brazier.

Cicero, in writing to Atticus, says in the same sense as Horace: "Camino incutendo utendum cenico." When Vitellius was chosen emperor, the eating-room or *triclinium* was set on fire by the *camina*. Sueton, cap. 8. This passage, however, seems to allude to a chaffing-dish filled with coals.

Thus these two words are used in a manner which gives completely (fay the advocates for the antiquity of chimneys) the idea of a common chimney, for it cannot be supposed that in any dwelling where the conveniences of life were tolerably understood, a fire of wood should be made without a passage for the smoke. The line of Virgil,

"Et jam fumma procul villarum culmina fumant,"

in some measure supports this opinion, which is further confirmed by Appian, who says "that those persons preferred by the triumvirs fome hid themselves in wells and caves, some in the tops of houses and chimneys;" so for those who maintain this opinion understand *camina hominis sub teco pohtae*. It is alleged, however, that the true translation is *fumosa canacula*; and it is further said that the principal persons of Rome endeavored to conceal themselves in the smoky apartments of the upper story under the roof, which, in general, were inhabited only by poor people; and this seems to be confirmed by what Juvenal expressly says (Sat. x. v. 17) "Rarus venit in canacula miles." The use of chimneys, it is allowed, if it ever obtained among the Romans, was superseded by that of flues and flues; this practice was probably introduced about the reign of Nero. Senea relates that in his time there were invented certain tubes which were placed in the walls, by which the heat of the fire was made to circulate and warm equally the upper and lower apartments.

Against the antiquity of chimneys it has been urged, that if there had been any in the Roman houses, Vitruvius could not have failed to describe the construction of them. But he does not say a word on this subject; neither does Julius Pollus, who has collected with great care the Greek names of every part of a dwelling-house; and Grapaldis (De partibus aedificiorum), who in latter times made a like collection of the Latin terms, has not given a Latin word expressive of a modern chimney. It has been said, indeed, that the word *canina* means a chimney; but this term, though it was used for a chemical or metallic furnace, for a smith's forge, and for a hearth, does not seem, among the Romans, to have denoted a chimney.

In the houses discovered at Herculanum and Pompeii, there are no chimneys, but they appear all to have been warmed by the means of flues and a subterraneous furnace or *hypocaustium*. See that article, and also Browne.

The complaints often made by the ancients respecting smoke, serve also to confirm the opinion that they had no chimneys. Upon the whole it may be observed, that, though one or more expressions of ancient authors may appear to allude to a chimney, and though we should infer from such expressions, as Montfaucon has done, that the ancients were acquainted with the art of constructing in masonry elevated flues for conveying away the smoke, it must be allowed, when we consider the many proofs that occur to the contrary, that they were, at any rate, extremely rare. As they are so convenient and useful, and can be easily constructed upon most occasions, it is impossible, if they had been well known, that they should ever have been forgotten.

It is not easy to determine the period when chimneys first came into use. If it be true, as Du Cange, Voilus, and others affirm, that apartments called "*caminatae*" were apartments with chimneys, they must have been introduced at an early period; for that word occurs in the year 1569, or before that time; but it is always found connected in such a manner as entirely to contradict the above signification. The writers of the 14th century seem either to have been unacquainted with chimneys, or to have considered them as the newest invention of luxury. That there were no chimneys in the 10th, 11th, and 12th centuries has been premised from the terms "ignitenum," or "pyritium," the censer-bell of the English, and the repeater of the French; to intimate, that the people made fires in their houses in a hole or pit in the centre of the floor, under an opening formed in the roof; and when the fire was burnt out, or the family went to bed at night, the hole was flung by a cover of wood. See Curieu.

The oldest certain account of chimneys that has occurred to Beckmann in his researches (see Hist. of Inventions, vol. ii. p. 105.), is in the year 1347; for an inscription at Venice records that at the above period a great many chimneys (*molts camini*) were thrown down by an earthquake. He adds, that the first chimney-sweepers in Germany came from Savoy, Piedmont, and the neighbouring territories, and these for a long time were the only countries where the cleaning of chimneys was followed as a trade. Hence, he conjectures, that chimneys were invented in Italy.

In considering the countries of modern Europe we may observe the use of flues prevalent throughout the North, while in France and Great Britain open chimneys are general. On the other hand, in the warm countries of Italy and Spain there are very few chimneys, and the only method usually
A chimney, as it has been before observed, consists of a fire-place in which the fuel is consumed, and a flue to carry off the smoke and vapour arising from the combustion; thus affording the benefit of the heat of a fire without the inconvenience of its smoke. But these objects were, and still are very imperfectly attained, a very large portion of the fuel being wantonly consumed without increasing the warmth of the apartment, and, in fact, causing those blasts of cold air to commonly complained of by the sides of large open chimneys, while the smoke is frequently driven out to the intolerable inconvenience of the inhabitants. The plague of a smoking chimney is proverbial, and has engaged considerable attention from observers of various descriptions.

Dr. Franklin is the first who has treated this subject in a philosophical manner, and in his "Observations on the Causes and Cure of Smoky Chimneys," published in 1787; he has very satisfactorily explained all the usual causes of this defect, and shown their remedies. To this pamphlet, succeeded the Essay of Count Rumford, in 1796, whose improvements have been very generally followed in the construction of fire-places. From these two works, which together form a very valuable body of information, we shall draw the materials for the following treatise on the cause and cure of smoky chimneys, together with the methods of increasing the heat and diminishing the quantity of fuel consumed.

The mode and cause of the ascent of smoke in a chimney may be thus explained: the air contained in the flue being heated by the fire immediately below it, becomes rarefied, and therefore lighter than the external air through which it accordingly rises, and as the heated air escapes from the top of the chimney, its place is supplied by the influx of fresh quantities of air, which, passing over the fire, becomes likewise heated, and thus continues to rise; so that the smoke and vapour from the burning materials. It may be observed here that smoke is not, as some are apt to imagine, in its own nature specifically lighter than air, but the contrary, as may be shown by a simple experiment. Having lit a pipe of tobacco, plunge the stem to the bottom of a decanter half filled with cold water, then put a cloth over the bowl and blow through it, and make the smoke descend in the stem of the pipe, from the end of which it will rise in bubbles through the water, and being thus cooled, will not afterwards rise to go out through the neck of the decanter, but remain spreading itself and retreating on the surface of the water. In this case, therefore, the smoke is heavier than air, and it is only when rared by heat that it becomes lighter. As, however, the vapour rising from a fire must always be highly rared, it is easy to perceive that it would be as much a miracle if smoke should not rise in a chimney, (all hindrances to its ascent being removed,) as that water should refuse to run in a syphon, or to descend aSyphon. What is it then, which makes a smoky chimney? That is, a chimney, which, instead of conveying off all the smoke, discharges a part of it into the room? The causes of this effect may be reduced to the following general causes.

Smoky chimneys in a new house, are such, frequently, for want of air. The workmanship of the rooms being all good and just out of the workman's hands, the joints of the flooring and of the panelling of the wainscoting are all true and tight; the more so as the walls, perhaps not yet thoroughly dry, preserve a dampness in the air of the room which keeps the wood-work swelled and close: the doors and

the fashes too being worked with truth, shut with exactness, so that the room is perfectly tight, no passage being left open for the air to enter except the key-hole, and even that is frequently closed by a little dropping shudder. In this case it is evident that there can be no regular current through the flue of the chimney, as any air escaping from its aperture would cause an exhaustion in the air of the room similar to that in the receiver of an air-pump, and, therefore an equal quantity of air would rush down the flue to restore the equilibrium; accordingly the smoke, if it ever ascend'd to the top, would be best down again into the room. These, therefore, who stop every crevice in a room to prevent the admission of fresh air, and yet would have their chimney carry up the smoke, require inconsistencies and expect impossibilities. The obvious remedy in this case is, to admit more air, and the question will be how not exactly, will naturally supply the air without is to be admitted, so as to produce a great difference of climate at the door or window be left so much open, it causes a cold draft of air to the fire-place, to the great discomfort of those who sit there. Various have been the contrivances to avoid this, such as bringing in fresh air through pipes in the jams of the chimney, which, pointing upwards, should blow the smoke up the funnel; opening passages in the funnel above to let in air for the same purpose; but these produce an effect contrary to that intended, for as it is the constant current of air passing from the room through the opening of the chimney into the flue, which prevents the smoke coming out into the room, if the funnel is supplied by other means with the air it wants, and especially if that air be cold, the force of that current is diminished, and the smoke in its efforts to enter the room finds less resistance.

The wanted air must then indifferently be admitted into the room to supply what goes off through the opening of the chimney, and it is advisable to make the aperture for this purpose as near the ceiling as possible, because the heated air will naturally ascend and occupy the highest part of the room, thus confirming a great difference of climate at different heights, a defect which will be in some measure obviated by the admission of cold air near the ceiling, which descending, will beat down and mingle the air more effectually.

Another cause of smoky chimneys is too short a funnel, as, in this cafe, the ascending current will not always have sufficient power to direct the smoke up the flue. This defect is frequently found in low buildings, or the upper stories of high ones, and is unavoidable, for if the flue be raised high above the roof to strengthen its draft, it is then in danger of being blown down and crumbling the roof in its fall. The remedy in this case is to contract the opening of the chimney so as to oblige all the entering air to pass through or very near the fire, by which means it will be considerably heated, and by its great rarefaction, cause a powerful draft, and compensate for the shortness of its column. The cafe of too short a funnel is more general than would be imagined, and often found where one would least expect it; for in not uncommon in ill-contrived buildings instead of having a separate funnel for each fire-place to bend and turn the funnel of an upper room so as to make it enter the side of another flue that comes from below. By this means the funnel of the upper room is made short, of course, since its length can only be reckoned from the place where it enters the lower funnel, and that flue is also shortened by the difference between the entrance of the second funnel and the top of the flack; for all that part being readily supplied with air through the second flue, adds no strength to the draft, especially as that air is cold when there is no fire in the second chimney. The only easy remedy
Another very common cause of the smoking of chimneys is, their overpowering one another. For instance, if there be two chimneys in one large room, and you make fires in both of them, you will find that the greater and stronger fire shall overpower the weaker, and draw air down its funnel to supply its own demands, which air descending in the weaker funnel will drive down its smoke, and force it into the room. If, instead of being in one room, the two chimneys are in two different rooms communicating by a door, the same thing will happen, and the reason is, to take care that every room have the means of suppling itself from without, with the air its chimney may require, so that no one of them may be obliged to borrow from another, nor under the necessity of lending.

Another cause of smoking is, when the tops of chimneys are commanded by higher buildings, or by a hill, so that the wind blowing over such eminences falls like water over a dam, sometimes almost perpendicularly on the tops of the chimneys that lie in its way, and beats down the smoke contained in them. The remedy commonly applied in this case is, a turn-cap, made of tin or plate-iron, covering the chimney above, and on three sides open on one side, turning on a spider, and which being guided or governed by a vane, always presents itself back to the wind. This method will generally be found effectual, but if not, raising the flues, where practicable, so that their tops may be on a level with or higher than the commanding eminence, is more to be depended on.

There is another cause of command, the reverse of that last mentioned; it is where the commanding eminence is farther from the wind than the chimney commanded. For instance, suppose the chimney of a building to be so situated as that its top is below the level of the ridge of the roof, which, when the wind blows against it, forms a kind of dam against its progress. In this case, the wind being obstructed by this dam, will, like water, press and search for passages through it, and finding the top of the chimney below the top of the dam, it will force itself down that funnel in order to get through by some door or window open on the other side of the building, and if there be a fire in such chimney, its smoke is of course beat down and fills the room. The only remedy for this inconvenience is, to raise the funnel higher than the roof, supporting it, if necessary, by iron bars; for a turn-cap in this case has no effect, the dammed up air prevailing down through it in whatever position the wind may have placed its opening.

Chimneys otherwise drawing well are sometimes made to smoke by the improper and inconvenient situation of a door. When the door and chimney are placed on the same side of a room, if the door is made to open from the chimney, it follows, that when only partly opened a current of air is admitted and directed across the opening of the chimney, which is apt to draw out some of the smoke.

A room that has no fire in its chimney may sometimes be filled with smoke, which is received at the top of its funnel and descends into the room. To understand this effect, it will be necessary to observe, that currents of air are frequently produced in flues, though not exposed to the influence of fire. The air contained in a funnel, being confined on every side by brick-work, which is a bad conductor of heat, will not be immediately affected by any sudden variation in the temperature of the atmosphere; and thus, while it differs in weight from the external air, an ascending or descending current will be formed in the flue. If, after a warm season, the outward air suddenly grows cold, the empty warm funnels begin to draw strongly upwards, that is, the rarified air contained in them begins to rise, cooler air enters to supply its place, is rarified in its turn, and rises; and this operation continues till the funnel grows cooler, or the outer air warmer, or both, when the motion ceases. On the other hand, if, after a cold season, the outward air suddenly becomes warm, this operation is reversed. When the temperature of the atmosphere and of the flues is nearly equal, the difference of warmth in the air between day and night is sufficient to produce these currents; the air will begin to ascend the funnels as the end of the evening comes on, and this current will continue till, perhaps, nine or ten o'clock the next morning, when it begins to decline, and as the heat of the day approaches, it sets downwards, and continues so till towards evening, when it again hesitates for some time, and then goes upwards constantly during the night, as before mentioned. Now, when smoke, issuing from the tops of the neighbouring chimneys, palls over the tops of funnels which are at the time drawing downwards, as they often are in the middle part of the day, such smoke is of necessity drawn into those funnels, and descends with the air into the chamber.

Chimneys which generally draw well do, nevertheless, sometimes give smoke into the room, it being driven down by strong winds palling over the tops of their flues, though not descending from any commanding eminence. To understand this, it may be considered that the rising light air, to obtain a free passage from the funnel, must push out of its way, or oblige the air that is over it to rise. In a time of calm, or of little wind, this is done visibly for we see the smoke that is brought up by that air rise in a column above the chimney. But when a violent current of wind palls over the top of a chimney, its particles have received so much force, which keeps them in a horizontal direction, and follow each other so rapidly, that the rising light air has not strength sufficiently to oblige them to quit that direction, and move upwards to permit its issue. Add to this, that some of the air may impinge on that part of the inside of the funnel which is opposed to its progress, and be thence reflected downwards from side to side, driving the smoke before it into the room. The simplest and best remedy in this case is the application of a chimney-pan, which is a hollow truncated cone of earthenware placed upon the top of the flue. The intention of this contrivance is, that the wind and eddies which strike against the oblique surface of the cover may be reflected upwards instead of blowing down the chimney. The remarkable chimneys observed at Venice, in which the top of the flue is enlarged and rounded in the shape of a funnel, seem also intended as a remedy to this inconvenience, that the wind blowing over one of the edges into the funnel may be fanned out again on the other side by its form.

The bad construction of fire-places is another cause of smoking chimneys; and this will lead us to the consideration of the second part of our subject, namely, the methods of raising the heat and diminishing the consumption of fuel; for it will be found that the improvements necessary to produce the last-mentioned end will also have a general tendency to cure smoky chimneys. On this subject the most labourious works of Count Rumford are conspicuous, and we shall proceed to give an abridged account of his method.

In investigating the best form of a fire-place, it will be necessary to consider, first, what are the objects which ought principally to be had in view in the construction of a fire-place; and, secondly, to consider how these objects can best be attained. Now the design of a chimney-fire being simply to warm a room, it is essential to contrive so that this end shall...
be actually attained, and with the least possible expenditure of fuel, and also that the air of the room be perfectly pure and fit for respiration, and free from smoke and all other offensive smells.

In order to take measures with certainty for warming a room by means of an open chimney fire, it will be necessary to consider how and in what manner such a fire communicates heat to a room. This question may, perhaps, at the first view of it, appear to be superfluous and trifling; but a more careful examination of the matter will shew it to be highly deserving of the most attentive examination.

To determine in what manner a room is heated by an open chimney-fire, it will be necessary, first of all, to find out under what form the heat generated in the combustion of the fuel exists, and then to see how it is communicated to those bodies which are heated by it.

In regard to the first of these subjects of inquiry, it is certain that the heat which is generated in the combustion of the fuel exists under two perfectly distinct and different forms. One part of it is combined with the smoke, vapour, and heated air which rise from the burning fuel, and goes off with them into the upper regions of the atmosphere; while the other part, which appears to be uncombined, or combined only with light, is sent off from the fire in rays, to be afterwards reflected or refracted. With respect to the second subject of inquiry, it is highly probable that the combined heat can only be communicated to other bodies by actual contact with the body with which it is combined; and with regard to the rays which are sent off by the burning fuel, it is certain that they communicate or generate heat only when and where they are stopped or absorbed. In passing through air which is transparent they certainly do not communicate any heat to it; and it seems highly probable that they do not communicate heat to solid bodies by which they are reflected.

A question which naturally presents itself is, what proportion does the radiant heat bear to the combined heat? Though that point has not been determined with any considerable precision, it is, however, certain, that the quantity of heat which goes combined with the smoke, vapour, and heated air is much more considerable, perhaps three or four times greater, than that which is sent off from the fire in rays: and yet small as the quantity is of this radiant heat, it is the only part of the heat generated by the combustion of fuel in an open fire-place which ever is, or, indeed, ever can be employed in heating a room. The whole of the combined heat escapes by the chimney, and is totally lost: and no part of it could ever be brought into a room from an open fire-place, without bringing along with it the smoke, which is also combined.

It is, therefore, of the highest importance to determine how the greatest quantity of radiant heat may be generated in the combustion of the fuel, and how the largest proportion of that quantity may be brought into the room. Now the quantity of radiant heat depends very much upon the management of the fire, or upon the manner in which the fuel is consumed. When the fire burns bright much radiant heat will be sent off from it; but when it is smothered up very little will be generated, and, indeed, very little combined heat that can be employed to any useful purpose; most of the heat produced being immediately expended in giving elasticity to a thick dense vapour or smoke, which will be seen rising from the fire; and the combustion being very incomplete, a great part of the inflammable matter of the fuel being merely raised and driven up the chimney, without being inflamed, the fuel will be wasted to no purpose. During this time no heat is communicated to the room; and what is still worse, the throat of the chimney being occupied merely by a dense vapour, not polluted of any considerable degree of heat, and consequently not having much elasticity, the warm air of the room finds itself forced in forcing its way up the chimney and clearing, than when the fire burns bright: and it happens not infrequently, especially in fire-places ill constructed, that this current of warm air from the room which profeses into the chimney, crossing upon the current of heavy smoke which rises slowly from the fire, obstructs it in its ascent, and beats it back into the room: hence it is, that chimneys for-often smoke when too large a quantity of fresh coals is put upon the fire.

To cause as many as possible of the rays, as they are sent off from the fire in straight lines, to come directly into the room, it will be necessary, in the first place, to bring the air as far forward, and to leave the opening of the fire-place as wide and high as can be done without inconvenience; and secondly, to make the sides and back of the fire-place of such form, and of such materials, as to cause the direct rays from the fire which strike against them, to be sent into the room by reflection in the greatest abundance.

Now, it will be found, upon examination, that the best form for the vertical sides of a fire-place, or the enclosures, as they are called, is that of an upright plane, making an angle with the plane of the chimney of about 95 degrees. According to the old fashion of chimneys, this angle is 90 degrees, or forms a right angle; but, as in this case the two enclosures are parallel to each other, it is evident that they are very ill contrived for throwing into the room, by reflection, the rays from the fire which fall on them.

The next improvement will be to reduce the throat of the chimney, the immaterial space of which is a most essential fault in their construction; for, however good the formation of a fire-place may be in other respects, if the opening left for the passage of the smoke is larger than is necessary for that purpose, nothing can prevent the warm air of the room from escaping through it; and whenever this happens, there is not only an unnecessary loss of heat, but the warm air, which leaves the room to go up the chimney, being replaced by cold air from without, produces those drafts of air so often complained of. But though these evils may be remedied, by reducing the throat of the chimney to a proper size, yet, in doing this, several considerations will be necessary to determine its proper situation.

As the smoke and hot vapour which rise from a fire naturally tend upwards, it is evident that it will be proper to place the throat of the chimney perpendicularly over the fire; but to ascertain its most advantageous distance, or how far above the burning fuel it ought to be placed, is not so easy, and requires several advantages and disadvantages to be balanced.

As the smoke and vapour rise in consequence of their being raked by heat, and made lighter than the air of the surrounding atmosphere, and as the degree of their rarefaction is in proportion to the intensity of their heat, and as this heat is greater near the fire than at a distance from it, it is clear, that the nearer the throat of a chimney is to the fire, the stronger will be what is commonly called its draught, and the less danger there will be of its smoking, or of dust coming into the room when the fire is litred. But, on the other hand, when a very strong draught is occasioned by the throat of the chimney being very near the fire, it may happen that the influx of air into the fire may become too strong as to cause the fuel to be consumed too rapidly. This however will very seldom be found to be the case, for the throats of chimneys are in general too high.

In regard to the materials which it will be most advantageous to employ in the construction of fire-places, little difficulty
difficulty will attend the determination of that point. As
the object in view is to bring radiant heat into the room, it
is clear that that material is best for the construction of a
fire-place which reflects the mott, or which absorbs the heat
of it, for that heat which is absorbed cannot be reflected.
Now, as bodies which absorb radiant heat are necessarily
heated in consequence of that absorption; to discover which
of the various materials that can be employed for construct-
ing fire-places are best adapted for that purpose, we have
to find, by an experiment very easy to be made, what
bodies acquire heat least, when exposed to the direct rays of a
clear fire; for those which are least heated evidently
absorb the least, and consequently reflect the most radiant
heat. And hence it appears that iron, and in general metals
of all kinds, which are well known to grow very hot when
exposed to the rays projected by burning fuel, are to be
reckoned among the very worst materials that it is possible
to employ in the construction of fire-places. Perhaps the
best materials are fire-brick and common bricks and mortar.
These substances are fortunately very cheap, and it is not
easy to say which of the two the preference ought to be
given. When bricks are used, they should be covered with a
thin coating of plaster, which, when perfectly dry, should
be white-washed, when that is used; and every part of the fire-place
which does not come into actual contact with the burning
fuel should be kept as white and clean as possible.

We shall now proceed to describe particularly, with the
aid of figures, the improvements of Count Rumford.

**Fig. 1. Plate XLI. of Architecture, is a plan of a fire-place on the old construction; fig. 2, an elevation, and fig. 3, a section of the same. Fig. 4, a plan; fig. 5, an elevation, and fig. 6, a section of an improved fire-place.**

The bringing forward of the fire into the room, or rather
bringing it nearer to the front of the opening of the fire-
place, and the diminishing of the throat of the chimney, be-
ning two objects principally had in view in the alterations of
fire-places recommended, it is evident that both these may
be attained merely by bringing forward the back of the
chimney. It will then remain to be determined how far
the back should be brought forward. This point will be
limited by the necessity of leaving a proper passage for the
smoke. Now, as this passage, which in its narrowest part is
called the throat of the chimney, ought, for reasons before
flated, to be immediately or perpendicularly over the fire,
it is evident that the back of the chimney should be built
perfectly upright. To determine therefore the place of the
new back, nothing more is necessary than to ascertain how
wide the throat of the chimney ought to be left. This
width is determined by Count Rumford from numerous ex-
periments, and comparing all circumstances, to be four inch-
es. Therefore, supposing the breadth of the chimney, or the
wall above the mantle, to be 9 inches thick, allowing 4
inches for the width of the throat, this will give 13 inches
for the depth of the fire-place. The next consideration will
be the width which it will be proper to give to the back.
This, in fire-places of the old construction, is the same with
the width of the opening in front; but this construction is
faulty, on two accounts; first, because the openings being
parallel to each other, are ill contrived to throw out into the
room the heat they receive from the fire in the form of rays;
and, secondly, the large open corners occasion eddies of
wind which frequently disturb the fire and embarrass the
smoke in its ascent, in such a manner as to bring it into the
room. Both these defects may be entirely remedied, by
diminishing the width of the back of the fire-place. The
width which in most cases it will be best to give it, is one-
third of the width of the opening of the fire-place in front.
But it is not absolutely necessary to conform rigorously to
this decision, nor will it always be possible. Where a chimi-
ney is designed for warming a room of moderate size, the
depth of the fire-place being determined by the thickness of
the breast to 13 inches, the same dimensions would be a
good size for the width of the back, and three times 13
inches, or 3 feet 3 inches, for the width of the opening in
front, and the angles made by the back of the fire-place,
and the sides of it, or covings, would be but 135 degrees,
which is the best position they can have for throwing heat
into the room. In determining the width of this opening in
front, the chimney is supposed to be perfectly good, and
well fitted. If there is any reason to apprehend its ever
flickering, it will be necessary to reduce the opening in front,
placing the covings at a less angle than 135 degrees, and
especially to diminish the height of the opening by lowering
the mantle.

If from any consideration, such as the width to accommodate
the fire-place to a g ate or stove already on hand, it should
be wished to make the back wider than the dimension recom-
manded, as for instance, 16 inches; it will be advisable not
to exceed the width of 5 feet 3 inches for the opening in front,
as in a very wide and shallow fire-place, any sudden motion
of the air in front would be apt to bring out puffs of smoke
into the room.

The throat of the chimney being reduced to four inches,
it will be necessary to make a provision for the passage of a
chimney sweeper. This is to be done in the following manner.
In building up the new back of the fire-place, when this wall is brought up so high that there remains no
more than about 10 or 11 inches between what is then the
top of it and the underside of the mantle, an opening or
door-way, 11 or 12 inches wide, must be begun in the mid-
dle of the back, and continued quite to the top of it, which
according to the height that it will commonly be necessary
to carry up the back, will make the opening 12 or 14 inches
high, which will be quite sufficient for the purpose. When
the fire-place is finished, this door-way is to be closed by a few
bricks laid without mortar, or a tile or piece of stone con-
finned in its place by means of a rebate made for that purpose
in the brickwork. As often as the chimney is swept, the
chimney sweeper removes this temporary wall or stone, which
is very easily done, and when he has finished his work, he
again puts it in its place.

The new back and covings may be built either of brick-
work, or of stone, and the fire-place between them and the old
back and covings, ought to be filled up to give greater solidity
to the structure. This may be done with loose rubbish or
pieces of broken bricks or stones, provided the work be
strengthened by a few layers or courses of bricks laid in
mortar; but it will be indispensably necessary to finish the
work where these new walls end, that is, to fill, at the top of
the throat of the chimney, where it ends abruptly in the open
canal or flue, by a horizontal course of bricks well
secured with mortar. It is of much importance that they
should terminate in this manner; for were they to be flopped
outward and nailed in such a manner as to swell out the upper
extremity of the throat of the chimney in the form of a
trumpet, and increase it by degrees to the size of the flue
of the chimney, this contraction would tend to afflux the
winds which may attempt to blow down the chimney, in
forcing their way through the throat, and throwing the
smoke backward into the room.

The internal form of the breast of the chimney is also a
matter of great importance, and which ought to be particu-
larly
C H I M N E Y.

larily attended to. The worst form it can have is that of a vertical plane or upright flat, and next to this the worst form is an inclined plane. Both these forms cause the current of warm air from the room which will, in spite of every precaution, sometimes find its way into the chimney, to follow upon the current of air which rises from the fire in such a manner as to embarrass it in its ascent and drive it back. The current of air which, passing under the mantle, gets into the chimney, should be made gradually to bend its course upwards, by which means it will unite quietly with the ascending current of smoke, and will be less likely to check and impede its progress. This is to be effected by rounding off the inside of the breast of the chimney, which may be done by a thick coating of plaster.

Plate XLI. of Architectura, Fig. 1. The plan of a fire-place on the old construction: A, B, the opening of the fire-place in front; C, D, the back of the fire-place; A and B, the covings.

Fig. 2, shews the elevation or front view of the same fire-place.

Plate XLI. of Architectura, Fig. 3. This figure shews how the fire-place, represented in Fig. 1, is to be altered, in order to its being improved. A B is the opening in front, C D the back, and A C and B D the covings of the fire-place in its original state. A B its opening in front, B C its back, and A D its covings after it has been altered; e is a point upon the hearth upon which a plumb suspended from the middle of the upper part of the breast of the chimney falls. The situation for the new back is ascertained by taking the line e f equal to 4 inches. The new back and covings are represented as being built of bricks, and the space between the new and the old back and covings as being filled up with rubbish.

Fig. 4. This figure represents the elevation or front view of the fire-place, Fig. 2, after it has been altered. The lower part of the doorway left for the chimney sweeper, is shown in this figure by dotted lines.

Fig. 5. This figure shews the section of a chimney fire-place and of a part of the line of the chimney on the old construction. a b is the opening in front, b c the depth of the fire-place at the hearth, d the breast of the chimney, d e the throat of the chimney, and d f g e a part of the flue.

Fig. 6. This figure shews the section of the same chimney after it has been altered: b l is the new back of the fire-place, l m the tile or stone which closes the doorway for the chimney sweeper, d i the height of the chimney narrowed to 4 inches, a the old mantle, and b the new mantle formed under it to diminish the height of the opening of the fire-place in front, the new mantle being backed with plaster to make the inside of a proper form.

When the breast or wall of the chimney in front is very thin, it may happen, that the depth of the fire-place determined according to the preceding rules may be too small. Thus supposing the breast to be only 4 inches thick, which is sometimes the case, particularly in rooms fitted near the top of a house, taking 4 inches for the width of the throat, will give only 6 inches for the depth of the fire-place. In this case, it would be proper to increase the depth of the fire-place at the hearth to 12 or 13 inches, and to build up the back perpendicularly to the height of the top of the grate, and then sloping the back by a gentle inclination forward, bring it to its proper place directly under the back part of the throat of the chimney. This slope, though it ought not to be too abrupt, yet should be quite finished at the height of 8 or 10 inches above the fire, otherwise it may perhaps cause the chimney to smoke; but when it is very near the fire, its heat will enable the current of rising smoke to overcome the obstacle which this slope will oppose to its ascent, which it could not so easily do, were the slope situated at a greater distance from the burning fuel.

There is one important circumstance requiring chimney fire-places designed for burning coals which remains to be examined, and that is the grate. Although there are few grates that may not be used in chimneys, altered or constructed on the principles recommended by Count Rumford, yet they are not by any means all equally well adapted for that purpose. Those whose construction is most simple, and of which all the cheapest, are beyond comparison the best on all accounts. If thing being wanted but merely a grate to contain the coals, and all additional apparatus being not only useless but pernicious; all complicated and expensive grates should be laid aside, and such as are more simple substituted in their room. The proper width for grates in rooms of a middling size, will be from 6 to 8 inches, and their length may be diminished more or less according to the difficulty of heating; the room, or the severity of the weather. But where the width of a grate is not more than 5 inches, it will be very difficult to prevent the fire from going out. It has been before observed that the use of metals is as much as possible to be avoided in the construction of fire-places, it will therefore be proper always to line the back and sides of a grate with fire-brick, which will cause the fire to burn better and give more heat into the room.

Smoke in its passage through a chimney departs a great part of the foot, with which it is loaded, upon the sides of the flue, which caurs danger from fire, and is besides apt to fall back to the room. It is therefore frequently necessary to have the flues cleaned. To effect this, various expedients have been resorted to, but that most commonly adopted is the use of chimney boys, who ascend within the chimney and sweep down the foot. The evils of this disagreeable and unwholesome occupation to those engaged in it, are generally acknowledged, and at least twelve years the public attention has been directed to this subject, and premiums offered for the discovery of methods which might be substituted to a practice so offensive to humanity.

In the year 1802 a number of practical and wealthy persons affiated for this purpose, and offered considerable premiums to those who might invent and bring into practice, a method of cleaning chimneys by means of water which should supercede the necessity of chimney boys. Inventing themselves, perhaps, inaudaciously, they applied to the "Society for the encouragement of Arts, Manufactures, &c." in the Adelphi, requesting them to engage it, and to offer premiums on the subject. In consequence of this application the society offered their gold medal to the person who should invent the most effectual mechanical or other means for cleaning chimneys from foot, and obviating the necessity of children being employed within the flues. In a few months there were five candidates for this premium, whose several inventions were put to the test of experiment upon chimneys not less than 50 feet high. One of the inventions consisted of a lot of brushes with polished watts, which were to be let down from the top of the chimney, but as the object was to find an apparatus to effect the purpose from the inside of the house, the was deemed unfit to accomplish the views of the society. Another gentleman proposed the plan of throwing gravel up the chimney by means of conduited air; the machine was tried, and deemed wholly inadequate to the purpose. A third apparatus consisted of elastic rods of whalebone and cane, with a brush at the end of the upper one, which was found to answer only in short and straight chimneys. The next consisted of lattice several feet long, which locked into the other,
other, and on the upper one was fixed an elastic expanding flue, which, in its ascending and contracted state, occupied a space of only six or eight inches, but which was to be opened, when forced to the top of the chimney, by means of a spring attached to it, the whole length of the rods. After many experiments before divers persons appointed to examine its merits, this was given up as ineffective to the purpose required. The only remaining apparatus was invented by Mr. George Smart, the patentee of a method of making hollow rods for flues; to him, after a long series of practice, in which he has been almost uniformly successful, the gold medal was adjudged; he has received also, we believe, a premium for the invention. His method is now practised by several persons in and near the metropolis, we shall give a particular account of it, with references to an engraved plate. The principal parts of the machine are a brush, some rods or hollow tubes, that fit into each other, by means of brass sockets, and a cord for connecting the whole together.

The brush consists of four fan-shaped portions, see Plate C, fig. 1 and 2, which are to come upon the stage, in ascending the chimney, the brush may be kept up a small space as possible, and in descending, it may be turned out and keep the sides of the flue; by a contrivance exactly like that which is adopted in the common umbilical, the brush is prevented from falling down into its contracted form; fig. 1 represents it expanded, and in fig. 2 it is shown in its contracted state. The substance made use of in general for the brush is what is called white. The rods represented by a, b, c, d, e, f, &c. f, s, 1, 2, and 3, are hollow tubes with a metal socket, at the lower end; some of the sockets have a ferrule in them for the purpose of confining the cord after it has been duly stretched, and preventing the rods from separation (see fig. 2); the upper end of the rods are either with or without ferrules, and taper to admit of a small motion within the sockets. The rods are about thirty inches long, and the cord runs from the top of the brush through all the rods, and when drawn tight keeps the whole machine together. Fig. 3, represents the cloth to be placed before the chimney opening, and a bar of deal or other wood, with a flue on it, fixing it to different fixed openings; fig. 4, is a bar or bars made to slide out, like a telescope, with a ferrule to fix it at different lengths, for closing the sides of the cloth to the jamb of the chimney piece; fig. 5, exhibits the machine raised up the chimney with the man working, he being on the outside of the cloth, through which there is a small slit or opening to admit the tubes passing. Fig. 6, a part of the apparatus, consisting of a small pole and pulley, fixed in a board for the purpose of more easily drawing the cord tight before it is made fast with the ferrule. The method of using the machine is this: Having ascertained, by leaving up the chimney, that is the direction of the flue, the cloth is then to be fixed before the fireplace, with the horizontal lines for the flue, fig. 5, and the sides to be closed with two upright bars like fig. 4. The brush is introduced through the opening of the cloth, which opening is then to be buttoned, and one of the rods is to be slipped up the cord into the socket on the lower end of the rod which supports the brush; the other rods are in like manner to be brought up one by one in succession, till the brush is raised somewhat above the top of the chimney, observing to keep the cord constantly tigget, and when those rods which have a ferrule in the socket brought up, they are to be placed on the purchase; the cord is to be put round the pulley and drawn very tight, and screwed down, by which all their ends above will be firmly connected together, and the whole may be regarded as one long flexible rod. In pulling the machine down, the edges of the brush striking against the top of the chimney, will cause it to expand, and there being a spring to prevent its contracting again, it will bring down the foot with it. In drawing down the machine, the person should grasp with his left hand, the rod immediately above that which he is separating with his right hand, to prevent the upper ones from sliding down too soon. The rods as they are brought down, are to be laid carefully one by one in a small compact package, and arranged like a bundle of flints.

This machine has been found useful in extinguishing fires in chimneys; for that purpose a coarse cloth is to be tied over the brush, dipped in water, and then passed up in the manner directed. After three years experience, Mr. Smart's machine has been found a great support, to answer the purposes for which it was intended; in the course of several thousand trials it is ascertained that not more than one or two chimneys at most, in a hundred, has required the passage of the brush. It is, however, of importance to observe that the invention cannot be deemed in a state of perfection; foot from some causes adheres so strongly to the sides of the chimney and chimney pot, that no brush will of itself bring it down, so that after a considerable time it may be expected that means must be found to separate off the foot as the chimney ball is generally do. We have therefore that such an addition to the apparatus could be devised, as should remedy the defect: it is well known that one coat of the smoking of chimneys is from the circumference of the top of the chimney pot being clogged with foot that adheres to the upper edge, which it is certain Mr. Smart's brush has in many instances failed to remove. He has done much to obviate an evil long complained of; an evil that has deprived of health, and eventually of life, a multitude of persons in their youth, that might for a long course of years have been useful to the community, and we wish to see in his hands, the invention, to honourable to his talents, rendered still more useful by being more perfect. He has attained, with regard to making his brush ascend the chimney, all that can be expected, and instead of bringing up infants to climb the fifty or hundred chimneys which on account of the direction of the flue no apparatus can be made to ascend, other means may be adopted, such as, &c. By having a fixed apparatus at the top, with a chain descending down the flue, and a brush annexed to it, for which purposes two patents were taken out in the year 1827, one by Mr. Bill of Hampstead, and one by Mr. Davy, of London. Or 2nd, by the method practised at Edinburgh, and other places in the northern parts of the United Kingdom, of letting down a weight attached to one end of a cord, with a brush of lolly tied at the other end, which by means of a person at the top and another at the bottom of the chimney is worked up and down till the foot is thoroughly cleaned away.

Chimney-Sweeps, regulation concerning. By Statute 28 Geo. III. c. 48, the churchwardens and overseers of the poor of any parish, with the consent of two Justices, may bid any boy of the age of 8 years and upwards, who is chargeable to the parish, to any person following the trade of a chimney sweeper, till he shall attain the age of sixteen years. No master shall have more than five apprentices at one time; nor let out his apprentices to hire to any other person for the purpose of sweeping chimneys; nor cause them to call the streets before seven in the morning, or after twelve at noon, between Michaelmas day and Lady day; nor before five in the morning, or after twelve at noon the rest of the year. Every master shall cause his name and place of abode to be engraved on a brass plate, to be fixed upon the front of a heathen cap, which he shall provide for each apprentice.
prentice, who shall wear the same when he is out upon his duty. These regulations are enforced by penalties of not more than 10l. and not less than 5l. The law is so tender with regard to these generally foundless children, that it has appointed a particular form of indenture, by which the master converts to find his apprentices clothes for his daily occupation, and other clothes for his life when he is not employed at his work and on Sundays; he converts all to be that he is properly cleared from all foot and fifth week, and be required to attend public worship in the dress adopted for the purpose.

CHINEY, in Geography. - town of the island of Ceylon, 34 miles S.E. of Candi.

CHINAMAN, are the sides of a chimney, usually flandering out perpendicularly, sometimes circularly from the back; on the extremities whereof the mastic-tree tells.

CHINAMAN-piece, or burnt-many, a tax imposed by statute 13 and 14 Car. II. c. 10, expressing, that every fire-break, and lobe of every dwelling, or other house, within England and Wales, except such as pay not to church and poor, shall be chargeable with two shillings per annum, payable at Michaelmas and Lady day, to the king and his heirs. But this tax was declared to be an oppression and badge of slavery, and accordingly abolished by Act 1 W. and M. c. 10, and the window-tax established in its room. See PEACE AND WINDOW-TAX.

CHINAMAN-piece, in Building, a composition of certain moldings, of wood or stone, flanding on the outer side of the jambs, and coming over the mantic lecturer.

CHINAMOS, in Antiqu Geog., a maritime village of T. fret, on the borders of the Marcide name. Pliny.

CHIMANZEE, in Zoology, the Anglu-ape, fami tropelines of B Lamarck, f_camera index of Tolpian, &c.

This animal very nearly approaches the orang-outang, but in the opinion of most good zoologists is specifically distinct. It is, according to Blumenbach and Gmelin, distinguished among other particulars by having the body smooth, except the back and shoulders, which are hairy; the head is also of a form what comon ice, and the body brawny, or remarkably muscular. The true orang-outang has the body entirely covered with hair, the hamsches especially, and the hair on the fore arms is placed in a reversed direction. In the year 1758, one of those chimpanzees was brought over into England by the captain of a ship in the Guinea trade; it was of the female sex, and was two feet four inches high; it naturally walked erect. It would eat very coarse food, and was fond of tea, which it drank out of a cup with milk and sugar, as we do: it played in the manner of the human species, and in its voice made form-suggestion of the human speech, when people speak very haltingly, but without any articulate sound. The males of this species are represented as very bold; they will fight a man though they see him armed. Their disposition is extremely lascivious, insomuch as to render it unsafe for women to venture into the woods alone; it is affirmed that the female negroes are often surprized and overpowered by these dastardly animals. The chimpanzees thrown in London in 1758 was only about twenty months old, and was of a docile disposition: the parent had it in her arms when she was attacked by the Moors in Angola, and would not part with it till she was killed by one of their spears. This full-grown female was five feet high.

CHINA, in Botany, Ambulacina, Rumph. See SMILAX zebrina.

China radix, Bauh. Pin. See SMILAX China.

China pura radice, Bauh. Pin. See SMILAX ficula China.

CHINA, in History and Geography. The word China is well known to the people whom we call Chinese; but the mod learnt among them never apply it to themselves or their country. They wish to be described as the people of Han, or of some other illustrious family, by the memory of whose actions they flatter their national pride; and their country they call Chum-cut, or the central kingdom, representing it in their symbolical characters by a parallelogram exactly bfecked; at other times they distinguish it by words that mean all that is valuable upon earth. It is difficult to give any account that shall be satisfactory as to the origin of the Chinese. Four opinions have been advanced, all of which have been preternaturally asserted rather than supported by argument and evidence. By a few writers it has been urged that they are an original race who have dwelt for ages, if not from the first creation of things, in the land which they now possess; by others, chiefly the missionaries, it is alleged that they sprang from the same flock with the Hebrews and Arabs; a third assertion is that of the Arabs themselves, and of M. Panow, who contend that they were originally Tartars, descending in wild clans from the despees of Ilius; and a fourth is that of the Brahamins, that the Chinese, so they call them in Sanscrit, were Hindus of the military class, who, abandoning the privileges of their tribe, rambled in different bodies to the north-east of Bengal; and forgetting, by degrees, the rites and religion of their ancestors, established particular principalities, which were afterwards united in the plains and valleys which are now poissified by them. Sir William Jones has examined each of these claims with great care and attention, and he observes, that, "in support of an opinion, (viz. that Chinfe and Hindus were the same people), which I offer as the result of long and anxious inquiries, I should regularly proceed to examine the language and letters, religion and philosophy of the present Chinese, and I shall join some remarks on their ancient monuments, on their sciences and their arts, both liberal and mechanical; but their spoken language not having been preferred in the usual symbols of articulate sounds, must have been for many ages in a continual flux; their letters are merely the symbols of ideas; their popular religion was imported from India in an age comparatively modern; and their philosophy seems yet in a rude state, as hardly to serve the appellation; they have no ancient monuments from which their origin can be traced; their sciences are wholly exotic; and their mechanical arts have nothing in them characteristic of a particular family; nothing which any set of men in a country to highly favoured by nature might not have discovered and improved. They have, indeed, both national music and national poetry, and both of them beautifully pathetic; but of painting, sculpture, or architecture, as arts of imagination, they seem to have no idea. Instead, therefore, of altering separately on each of these heads, I shall briefly inquire how far the literature and religious practices of China confirm or oppose the proposition which I have advanced."

In the course of this inquiry, he finds that the Buddha of the Hindus is unquestionably the Po of China; but the great progenitor of the Chinefe is also named Po-hi, where the sound syllable signifies a victim. Now the ancestor of that military tribe whom the Hindus call the Chandra-rana, or "children of the moon," was, according to their legends, Buddha, or the genius of the planet Mercury, from whom, in the fifth degree, descended a prince, named Drauya; whom his father, Yatay, sent in exile to the east of Hindoostan, with this imprecation, "may thy progeny be ignorant of the Vedas." The name of the banished prince cannot be pronounced by the modern Chinese; and though Sir William Jones does not assert that the last syllable of it has been changed
changed into Yao, he observes, that Yao was the fifth in descent from Fo-hi, or at least the fifth mortal in the first imperial dynasty; that all Chinese history before him is considered by the Chinese themselves as fabulous; that his father, Yao, like the Indian king, Yavati, was the first prince who married several women; and that Fo-hi, the head of their race, appeared, say the Chinese, in a province of the west, and held his court in the territory of Chin, where the rivers mentioned by the Indian legislators are supposed to have settled. Another circumstance in defence of this opinion is, that the mother of Fo-hi was the "daughter of heaven," named "Flower-loving"; and, according to the Chinese mythology, as the nymph was walking alone on the bank of a river, with a familiar name, she found herself suddenly encircled by a rainbow; soon became pregnant, and was delivered of a son, called "Sin," or the "Star of the Year." According to the fyttem of the Hindus, the nymph Rukhini, who prelides over the fourth lunar mansion, was the favourite mistress of Soma, or the Moon, among whose numerous epithets we find one answering to "Delighting in a species of water-flowers that blossoms at night," and their daughter, for which they were the eda, was highly estimated also from her parent Raudrapea, or Swarna. Sir William Jones shows also, that the opinions of the Chinese and Hindus are in many respects similar: they both believe this earth to have been wholly covered with water, which they describe as "flowing abundantly, then subsiding, and separating the higher from the lower age of mankind," and that the division of time, from which their poetical or fabulous history begins, just preceded the appearance of Fo-hi on the mountains of Chint. Though the religion of Confucius was pure, and worthy of a great mind, containing for the existence of a Supreme God, and giving a demonstration of his being and providence from the exquisite beauty and perfection of the celestial bodies, and the wonderful order of nature, in the whole fabric of the world; yet the people of China, in general, had an ancient system of ceremonies and superstitions, which the government and philosophers appear to have encouraged, and which has an apparent affinity with many parts of the oldest Indian worship. They believed in the agency of genii, preliding over all things, of which, like the Hindus, regions of a pleasant type. To these they offered victims on high places with ceremonies, and in a language very like those used by the Brahmans. M. L. Gentil observed, he says, a strong resemblance between the temple rites of the Chinese, and the fraddha of the Hindus: and M. Baily, the celebrated French astronomer, after a very learned investigation, concludes, that "even the purer and abstruder stories of the Chinese fabulists contain a remnant of ancient Indian history, with a faint sketch of the first Hindu ages." After a very elaborate discussion, in all the particulars of which we cannot follow him, Sir William Jones says, that the several circumstances of literature and religion, seen collectively to prove, as far as the question admits of proof, that the Chinese and Hindus were originally the same people, but having been separated nearly four thousand years, have retained few strong features of their ancient conformation, especially as the Hindus have preferred their old language and ritual, while the Chinese very soon lost both; and the Hindus have constantly intermarried among themselves, while the Chinese, by mixture of Tartars, have from the time of their first establishment, have at length formed a race distinct in appearance from Indians and Tartars.

Mr. Barrow, who has visited China, and seen much of the inhabitants, and to whose excellent account of his travels in this country we shall have occasion frequently to refer, does not agree with Sir William Jones with regard to the origin of the Chinese. He admits several of the facts adduced by M. Baily and others: he allows that the Hindus, like the Chinese, have always shown a remarkable predilection for the number nine; that the two nations resemble one another in the observance of the folliated and equinoctial festivals; in making offerings to the maus of their ancestors; in the dread of leaving no offspring behind them, to pay the accustomed obsequies to their memory; in observing eight cardinal or principal points of the world; in the division of the zodiac, and in a variety of other coincidences; which the late Mr. Bryant accounts for, by supposing the Egyptians, Greeks, Romans, and Indians, to be derived from one stock, and that some of these people carried their religion, and their learning into China; but he says their physical character is a sufficient proof that the Chinese do not owe their origin to the same stock as the Hindus. The fancied resemblance of the Chinese in the size of their eyes, and general turn of countenance peculiar, on the continent of Asia, from the tropic of Cancer to the Frozen Ocean. The peninsula of Malacca, and the vast multitude of islands spread over the eastern seas, and inhabited by Malays, as well as those of Japan and Iermukon, have clearly been peopled from the same common stock. Having given this account of the different conjectures respecting the origin of the Chinese, we proceed to consider the

Situation and extent of China. In the last century, the Chinese emperors extended this wide empire over many western countries, so that it may be now considered as reaching from those parts of the Pacific Ocean called the Chinese and Japan Synto and Satoou to the eastern limits of India, in a distance of 8°, which, reckoning the median latitude of 30°, will amount to nearly 4,200 geographical, or 4,900 British miles. From N. to S. this vast empire may be computed from the Uralian mountains, lat. 50°, to the southern part of China, about lat. 21°, being 29° of latitude, that is, 1740 geographical, or nearly 2020 British miles. This empire consists of three principal divisions; that of Chi a proper; the territory of the Mandales and Mengus, on the north and west; and lastly, the singular and interesting region of Tibet; with the flirf of these we are at present concerned, referring the others to their proper places in the alphabet.

China proper extends from the great wall in the north to the Chinese sea in the south, about 1140 geographical, or 1350 British miles. The breadth from the shores of the Pacific ocean to the frontiers of Tibet may be computed at 1750 British miles. In square miles the contents have been estimated at 1,979,669, and in acres at 3,850,795,392. On the wall and south the boundaries are maritime, and to the north there are marked by the great wall and the desert of Sihama. The confines with Tibet on the west seem to be chiefly indicated by an ideal line, though occasionally more strongly marked by mountains and rivers; particularly according to M. D'Aulville by the river Yatan, which falls into the Kian-kil, the country of Sifan lying between Tibet and China, on the south of the Eluths of Kotonor.

As China extends from the second to the fifth climate,
its temperature must vary accordingly. The difference of the length of its days is little more than four hours; the longest in the most northern parts, being about fourteen hours and three quarters; and the shortest, in the most southern, about ten hours and three quarters; and the proportion considerable. It is, however, generally reckoned very moderate, except only towards the north, where the cold is extremely piercing, not so much from its northern situation, as from ridges of mountains that intersect those parts, and are vastly high, and covered deep snows. Even in those parts which lie under the tropics, the winds that blow thither from the large and mountainous parts of Tartary render the weather exceedingly cold and piercing, during the three, and sometimes four, winter months. The southern parts, on the other hand, must be supposed to be very hot and dry; but these heats are more easily borne, by the help of their groves, groves, and cooling shades; to these they retire during the heat of the day; at which time there is the same universal silence, and cessation from business, as if it were midnight. In these southern parts there is neither snow nor ice, but they are much troubled with storms, and violent rains, about the time of the equinoxes; all the rest of the year is crowned with a clear sky, and a most delightful verdure. Upon the whole it must be admitted, that where nature has been most unequal in the distribution of her gifts, Chinese industry has supplied the defects. It has in some instances levelled whole ridges of mountains in particular provinces, and raised the land in others. By providing proper fences against excessive colds in some, and heats and droughts in others; and by varying their agriculture, according to the different soils and climates, every spot almost of that vast territory produces enough to maintain its inhabitants, rendering the whole country delightful, populous, healthy, and opulent.

Progressive Geography. The progressive geography of China, as known to the western nations, is not of ancient date, whether with M. de l'Anville we suppose the Sinzato have been in Cochin-China, or with Gozcinpl place them in the western part of Siam. The most ancient external relation which we possess, is that of the two Mahometan travellers in the ninth century, who suppose us with accounts of barbarism and cannibalism little to be expected: but the Arabs are so fond of fables, that implicit credit may be safely withheld from several passages. Yet these travellers impart high ideas concerning the Chinesse empire, and mention Cafoo, supposed to be Canton, as a city of great trade, while the emperors resided at Cambay, which seems to be the city also called Nanking, or the southern court, in contradistinction from Peking, or the northern court. This wide empire, continued, however, obscure to the inhabitants of Europe, till the travels of Marco Polo appeared, in the end of the fourteenth century. Yet the work of this traveller remained so unknown, that pope Pius II. In his description of Asia, is contented with the more imperfect account by Nicola Conti, a Venetian traveller of his own time, who visited Cathay. Haihò the Armenian, who wrote his book on the Tartars about the year 1306, begins with an account of China; and Odeicer of Portmaur defers his voyage to China in 1318. Sir John Mandeville visited China about 1340; and Pegezelli gave directions for the route in 1385. But in the following century there seem to have been a strange and unaccountable intermission of intercourse and research, if we except the travels of Nicola Conti above mentioned; and so perishable was the knowledge acquired, as to have escaped even a learned pointil. After this relapse of darkness, the rays of more genuine and authentic knowledge gradually emerged by the discovery of the Cape of Good Hope, and the subsequent enterprises of the Portuguese.

History. The Chinese as a nation pretend to an antiquity beyond all credulity; they carry their history back many millions of years before the period assigned by the Scriptures to the creation of the world. According to the Chinese histories, the first monarch of the whole universe, that is, of China, was called Puon-lu, which is a word denoting the highest antiquity. Puon-lu was succeeded by Tomehlaung, which signifies the emperor of heaven; to this monarch they ascribe the invention of letters. He was succeeded by Ti-hoang, the emperor of the earth, who is said to have been skilled in astronomy; to have divided the day and night; appointing thirty days to make the period of one moon; and he fixed the winter solstice to the eleventh moon. Thoahng was succeeded by Gine-hoang, sovereign of men, who shared the government with nine brothers. These are said to have taught their subjects to build houses, cities, &c. The reigns of these four emperors make up but one of what the Chinese called L, "ages" or "periods," of which there were nine before Fo-ahi, who is acknowledged, by the most fertile writers, to be the founder of their empire, but the regular history begins with Yan.

The Chinese historians of this country have reckoned twenty three dynasties, of which the first included Fo-ahi and his eight successors down to Shen. The others, together with the number of emperors belonging to each family, and the years they reigned, are as follow:

The most interesting particulars of the Chinese history relate to the incursions of the Tartars, who at last conquered the whole empire, and who still continue to hold the sovereignty; though by transferring the seat of empire to Peking, and by adopting the Chinese language, manners, and customs, Tartary seems rather to be incorporated with China, than the conqueror of it. These incursions began very early, even in the time of Shun, the immediate successor of Yao above mentioned, when the Tartars were repelled and driven back into their own territories. From time to time, however, they continued their invasions, and the northern provinces of China were often ravaged by the Tartars in their neighbourhood. About the year before Christ 213, Chi hoang-ti having subdued all the princes of
the different provinces, became the emperor of China, with the possession of unlimited powers. He divided the whole empire into thirty fix provinces, and finding the northern parts of his dominions greatly harassed by the invasions of the neighboring barbarians, he sent a formidable army against them, which drove them far beyond the frontiers of China, and to prevent their return he built the famous flower-wall which separates China from Tartary. After this, being elated with his own exploits, he formed a design of taking further policies, believing that he himself had been the first Chinese emperor that ever sat on the throne. For this purpose, he ordered all the historical books and records, containing the fundamental laws and principles of the ancient government, to be burned, that they might not be employed by the learned to repel his authority, and the changes which he proposed to introduce into the monarchy. He is even said, on this occasion, to have caused four hundred of the literati to be burnt, together with their books. In the tenth century of the Christian era, the Kitan, a people of Eastern Tartary, made incursions into the country, subdued a part of the empire, and established a government of their own in 916. Thirty years after this, Mu'tiz-tung, the emperor of China, was attacked by his brother-in-law, She-kong-tang, and was by him deprived of his crown and life. She-kong-tang assumed the title of emperor under the name of Kau-tu. But the Kitan general refused to acknowledge him, except on the condition of his yielding up to the Tartars sixteen cities in the province of Pe-cheli, which is the most northern province of China. This submission served only to inflame the avarice of the Kitan, and in the year 927 they invaded the empire again. Thang-van, the emperor, opposed them with a formidable army; but through treachery he was taken prisoner, and was obliged to resign his empire to one of his own generals, who assumed the name of Kau-tu. The succours of this man opposed the barbarians insufficiently till the year 978, when they became so strong as to lay siege to a formidable city. The emperor sent against them in the night 300,000 soldiers, each carrying a light in his hand, with orders to approach the camp as near as possible. The enemy, in a moment, set fire to the whole Chinese army, and immediately fled, and, falling into the ambuscade laid for them, were almost all cut to pieces. In the year 967, and again in 995, the Kitan attacked the empire, and laid it under heavy contributions; after which we hear little more of them till the year 1117, when their ravages became so intolerable, that Wey-yong-tung, the emperor, in order to put a stop to them, called in the assistance of the Eastern Tartars to destroy the kingdom of Kitan, which they effectually accomplished. Thus, however, proved of no advantage to the Chinese; for the Tartar general, elated with his conquest, gave the name of Kiu to his new dominion, assumed the imperial title, and began to think of aggrandizing his empire. For this purpose he invaded and made himself master of the greater part of the provinces of Pe-cheli and Shan-fu, when, after several conferences between the Tartar general and Wey-yong-tung, the latter was thrown into prison, where he ended his days in 1126, having nominated his eldest son, Kiu-tung, to succeed him. Kiu-tung began his reign with putting to death six ministers of state, who had betrayed his father into the hands of the Kiu-Tartars. The Barbarians in the mean time purified their conquests, and, marching directly towards the imperial city, took and plundered it, at the same time fixing the Emperor and his court, they carried them away captive. The crown devolved on Kiu-tung, the ninth son of Wey-yong-tung, who fixed his court at Nanking. He made several fruitless efforts to recover some of his provinces from the Kiu. Kiu-tung, the Kiu monarch, in the mean time, endeavored to gain the esteem of his Chinese subjects, by paying a great regard to their learning and learned men. He advanced to Nanking a man whom Kiu-tung had retired, and took it, but receiving advice that Yo-shi, general of the Song, or Southern Chinese, was approaching to the relief of the city, he left the palace, and retired northward. However, Yo-shi arrived time enough to fall upon their rear-guard, which suffered so much, that, from this time, the Kiu never dared to cross the river Kyang. But in 1127, the king approached the mouth of that river, and commanded his troops, on the pain of death, to cross it, which they refused, rebelled against their sovereign, and killed him in the beginning of the tumult, and then retired. After this, nothing remarkable occurs in the Chinese history till the year 1210, when the chief of the Western Tartars, Moguls, or Monguls, quarreled with Yong-thi, emperor of the Kiu. In 1212, the Monguls forced the great wall to the north of Shan-fu, made inroads as far as Peking, the capital of the Kiu empire, and defeated an army of 30,000 Kiu. The war was continued, and several battles fought in the next year; in one of which, the ground was burned with dead bodies for upwards of four leagues. In 1220, Oktay marched into Honan, besieged the capital of the Kiu empire, took several cities, cut to pieces an army of 40,000 men, but was, notwithstanding, obliged to retire into Shan-fu. The war was carried on with various successes by Oktay and his brother-Toyly, who took more than fifty important places in the province of Shan-fu. Toyly demanded of the Song a passage for his army through the country of Han-chung-fu, which being refused, he forced the passage, and put to the sword the inhabitants of two cities. Having cut down rocks to fill up deep abysses, and made roads through places almost inaccessible, he besieged the city itself, the inconsiderable inhabitants of which fled to the mountains on his approach, where more than a hundred thousand of them perished. In January 1227, Oktay, seizing the Whang-lo, encamped in the district of Kay-long-fu, the capital of the Kiu empire, and sent his general, Suputay, to besiege the city. At that time the place was 50 miles in circumference; but having only 40,000 soldiers to defend it, as many more, besides 20,000 packhorses, were ordered into the city, while the emperor published an affecting declaration, animating the people to defend it to the last extremity. Although the Monguls took some considerable towns, yet, in other instances, they were opposed with such intrepidity and valor, that they were obliged to retire. Oktay resolved to return to Tartary, but Suputay, his general, pushed on the siege of the capital with renewed vigor. For sixteen days and nights he continued his attacks without intermission, which seemed only to inspire the besieged with fresh courage, an incredible number of men perishing on both sides; at length Suputay, finding that he could not take the city, withdrew his army. Soon after, the plague broke out in Kay-long-fu, and raging with such violence, that, in fifty days, more than a million of persons perished by it, and took the city in a short time the war was again renewed. The capital of the Kiu empire was delivered up by treachery to Suputay, who put all the males of the imperial race to the sword, while he spared, by command of Oktay, the inhabitants, who are said to have amounted to near a million and a half of families. The monarch, after this disaster, retired to Juning-fu, a city in the southern part of Honan, attended only
only by four hundred persons. Here they were again beleaguered by the Moguls, and reduced to the extremity of living three months on human flesh, killing the old and feeble, as well as many prisoners, for food. This being known to the Moguls, they attacked them, but were repulsed, though at the expense of all the five Khan officers; upon which the emperor resigned his crown to Cheng-shih, a prince of the blood. While the ceremony of installing the new emperor was performing, the Moguls broke into the city, slew the late emperor and his successor; and, thus, in the year 1271, an end was put to the dominion of the Kin Tartars in China.

The empire of China was now to be shared between the Song, or southern Chinese, and the Moguls. It had been agreed upon, that the province of Honan should be delivered up to the Song as soon as the war was finished. But they, without waiting for the expiration of the term, or giving Ok-tay notice of their proceedings, introduced their troops into some of the considerable Mogul cities. On this the Mogul general resolved to attack them, and repulsing the Whang-ho, cut to pieces part of the garrison of Loyang, while they were out in search of provisions. The Song emperor now declared a continued peace, which, however, did not accord with the views of Ok-tay, who, at the head of the Moguls, made great progress in the province of Hu-ping, where he took several cities, and put vast numbers to the sword. From 1239 to 1246, the Moguls were unable to make any progress; but upon the death of the Chinese general, Hong-kue, they renewed the war with more vigour and success than ever, for several years. In 1259 they laid siege to Ho-chue, a strong city, to the well of Peking, defended by a numerous garrison. The siege continued from February till August, when the Moguls made a general assault in the night. They mounted the walls before the governor had intelligence of it, but were soon attacked with the utmost fury; a terrible slaughter ensued, and among the rest fell the emperor himself, upon which they raised the siege, and retired to Shen-hi. Hupilay succeeded to Mong-ko, and laid siege to Yu-chiang-fu, a city near the capital of the Song empire. The relief of this city was committed to a man desitute of courage and talents, and who, to obtain a peace, entered into a treaty, by which he engaged the Song empire to pay an annual tribute of 12,000,000, and likewise to acknowledge the sovereignty of the Moguls. This treaty proved the ruin of the empire; for when the Mogul emperor found the terms not fulfilled, he determined to revenge himself on the Song for their treachery, published a manifello against them, and, in 1268, the war was renewed. They made many conquests, took Nanking, and marched towards Hang-chew-fu, the capital of the Song empire. Notwithstanding, however, the progress made by the Moguls, vast territories still remained to be subdued, before they could be confidered as masters of the Chinese empire. On the death of Iwon-tong, therefore, the mandarins raised his brother, Te-ping, to the throne. His army, consisting of nearly 200,000 men, ignorant of the art of war, was defeated by 20,000 Mogul troops. Nor was the fleet more successful; for being thrown into confusion by that of the Moguls, and the emperor in danger of falling into their hands, one of the officers, taking him upon his shoulders, jumped with him into the sea, where they were both drowned. Molt of the mandarins followed this example, as did also the empress and minister, all the ladies and retainers of honour, and multitudes of others, infusion that 100,000 people are supposed to have perished on that day. Thus ended the Chinese race of emperors; and the Mogul dynasty, known by the name of Ywen, commenced.

Though no race of men ever existed more remarkable for cruelty than the Moguls, yet the emperors of the Ywen dynasty were not, in any respect, worse than their predecessors. On the contrary, Hupilay, aided by the Chinese Shih-tin, who was the first emperor of that race, entered himself so much to the people, that the reign of his family is flaid by the Chinese, the wife government. The Moguls were made acquainted with the value of science by paying hands regard to their ancient laws and customs, by the methods of his government, and by his attention and encouragement to learned men. In 1280 he employed some mathematicians to search for the source of the river Whang-ho, which, at that time, was unknown to the Chinese themselves. In four months they made the discovery, and drew a map of it, which they presented to his majesty. A treatise on astronomy was, by his order, published in the same year. And, in 1282, he brought together all the learned men of the empire, to examine into the state of literature, and to take measures for its advancement. Soon after his accession he fixed his residence at Peking, where being informed that the harks, which brought to court the tribute of the southern provinces, were obliged to come by sea, and often suffered shipwreck, he caused that celebrated canal to be cut, which is at present one of the wonders of the Chinese empire. It reaches from Canton to Peking, and thus forms a communication between the southern and northern provinces. During the reign of Shih-tin he formed the design of reducing the islands of Japan, and the kingdoms of Tumpin and Cochin-China; but these enterprises failed, with the loss of 300,000 men. The throne continued in this family till the year 1297, when Shinh-ti, the last of that dynasty, was driven out by a Chinese, named Chu, who assumed the imperial title under the name of Hong-yu, and thus put an end to the Ywen government. Hong-yu and his successor drove the Moguls beyond the great desert, which separates China from Tartary. They continued, notwithstanding, to make incursions upon the empire till 1289, when vast numbers of them were cut to pieces by the Chinese troops. The twenty-fourth dynasty of Chinese emperors, founded in the year 1280, continued till 1644, when they were again expelled by the Tartars. The last Chinese emperor was Hwey-tiong, who ascended the throne in 1268. He found himself at once engaged in a war with the Tartars, and attacked by a number of rebels in the different provinces of his empire. The former were both vanquished; but the emperor finding himself overpowered by the rebels, deserted by his subjects, betrayed by those in whom he placed the greatest confidence, and preferring death to the disgrace of falling into the hands of his enemies, retired with his empress, whom he tenderly loved, and the princes, their daughter, into the garden. His grief was so great that he was unable to utter a single word. After a few silent embraces the empress hanged herself on a tree. Her husband laid only to write these words on the border of his veil: "I have been falsely deserted by my subjects; do what you will with me, but spare my people." He then cut off the young prince's head with one stroke of his scimitar, and hanged himself on another tree, in the seventeenth year of his reign. His prime minister, queens, and counsels followed his example. And thus ended the Chinese monarchy, to give place to that of the Tartars, which has continued ever since. The whole empire submitted to the usherer Li, except prince U-fang-ghey, who commanded the imperial forces in the province of Lyau-tong. This brave prince, finding himself unable to cope with the usherer, invited the Tartars to his assistance; and Hong-te, their king, immediately joined him with an army of 30,000 men. Upon this Li marched directly to Peking, plundered and
and burn the palace, and then fled with immense treasures. The young T'arter monarch was immediately declared emperor of China, his father, T'o-nè, having died almost as soon as he set foot in that empire. The new emperor, Shun-chi, conferred upon U-fan-ghey the title of king, and offered to him the capital of Shên-hi for his residence. In 1642 the whole empire was so entirely subdued, that the emperor, Kang-hi, successor to Shun-chi, determined to visit T'arter, his native dominions, in order to take the diversion of hunting. This practice he continued for several years. He was a great encourager of learning and the Buddhist religion, in favour of which he published a decree in 1667. In 1676, however, he revised some of his laws against the Christians; and in the next reign Christians of all denominations, not excepting even those of the Iberian race, were persecuted; the J suits were banished into Tartary, a little island inhabited by the Portuguese, but subject to China.

In the year 1720, the emperor received the congratulations of the whole empire, on the signal victory which his forces had gained over the Khubs, who polluted the country of the Lamas, and had committed dreadful ravages for four years successively; which victory gave him now the title of command of the kingdom of Tibet. In the month of June an earthquake was felt at Peking, which lasted about two minutes, and killed about 10,000 persons by the fall of houses. In November, the czar of Muscovy made his public entry into Peking, with a numerous and splendid retinue, dressed after the European manner. He met with a gracious reception at the court, though the emperor would not accost the object of this visit, which was to take measures for establishing free commerce between the dominions of the two sovereigns.

The emperor, while taking the diversion of hunting in one of his parks, was suddenly seized with a swerving fit, which obliged him to return to his palace immediately. His illness increased, and medical assistance was applied to, but was found to be in vain. Being conscious of his approaching end, he assembled all his grandees, and having in their presence declared his faith for his successor, he expired on the 29th of December, 1722, in the 60th year of his age. Yong-ch'ing was 43 years old when he ascended the throne. He had several brothers, but placed his confidence only in one; the rest he dispossessed or banished. He imprisoned many of the princes and grandees for protecting the mulattiques, to whole design he had himself formerly been so favourable; and disdained all these fathers from his service except one, who was an excellent painter. In other respects he showed himself a wise prince, industrious and indefatigable in the discharge of the duties of government, steady and resolute in his disposition, and endowed with a degree of eloquence and address, and attentive in anwering the memorials which were presented to him. He governed wholly by himself; and no monarch was ever more absolute, or more dreaded by his subjects. This unlimited authority enabled him to enforce a great many wholesome laws and regulations, in framing which he spent whole days and nights with the most persevering industry. The purest way of gaining his favour, was by presenting him with some scheme tending to the public good, or to the relief of his subjects in times of calamities, in the execution of which, if it appeared practicable, he spared no pains. On the 12th of November, 1731, the city of Peking was nearly overturned by a dreadful earthquake, such as had never before been felt in China. The first flocks, which happened about eleven in the forenoon, were so sudden and violent, that in less than an minute above 100,000 inhabitants were buried in the ruins of houses, and a full greater number in the surrounding country, where whole villages and towns were destroyed. The emperor was then at his pleasure-house about two leagues from the capital. While taking an airing in his barge, feeling the eddies and tumultuous currents of the river, he fell on the knees, with his hands and eyes lifted up to heaven. He published an edict, ascribing himself as the chief cause of the calamity, and attributing the judgment to the wrath of God for his offences and want of care in governing the people. He then ordered an appearance to be taken of the remains which had suffered by it, and an enumeration of the damage which had occurred; advancing considerable sums for their relief; part of which was bestowed to the ministers, towards repairing their churches. But in the following year as he reviewed his perfecution against the Christians, and could the misfortunes, and all that belonged to them, to be loaded with iron, and thrown into prison; such he ever condemned to the punishment of carrying the war-dollor. This prince was succeeded by K'ing-Ling, who, after a happy, peaceable, and long reign of 61 years, died on the 11th of February, 1796, and was succeeded by K'ing-Hing, the present emperor, and the fifth of the T'arter dynasty. These emperors have wisely prevented the European nations, who have overflowed in this thievish and gaudy country, from obtaining a footing in China. They permit them, the English in particular, to carry on a refined intercourse at the single port at Canton; but they treat with coolness every attempt to obtain exclusive privileges, to build forts, or to establish permanent factories.

Topographic Description, Population &c.—After the above historical sketch, we proceed to the topography of China. It is divided into fifteen provinces, six of which are flyed northern and nine southern. The names of these will be green below, when we come to speak of the population; and the description of each province will be found in the alphabetical order of the dictionary. Sufficient as the Chinese seem to be of the advantages derived from an easy communication between the different parts of the empire, by means of canals, it is the more surprizing what the motives could have been that, till this moment, have restrained them from facilitating an intercourse by means of good roads, in such parts of the country as have no inland navigation. In this respect they fall short of most civilized nations. Except near the capital, and in some few places where the junction of the grand canal with navigable rivers is interrupted by mountains of ground, there is scarcely a road in the whole country that can be ranked beyond a foot path. Hence it happens that in the northern provinces, during winter, it is impossible to travel with any degree of safety, with convenance, or facility; all the canals to the northward of the Yellow river, which runs from 36° to 35° latitude, being frozen up. It is equally surprizing that their ingenuity has not extended itself to the invention of bridges, or some sort of carriages, suitable for travelling on ice, which other nations have converted into the belt of roads. The cities and large towns are for the most part built in a regular form; their walls are high and strong, the gates are spacious, the main streets are broad and straight, intersected with others, which cross them at right angles. The squares are adorned with noble structures, such as triumphal arches and stately towers several stories high, embellished with galleries, carving, gilding, and a variety of other ornaments. Their public buildings are more remarkable for their extent than for their magnificence; their private houses are large but low, seldom exceeding one story in height, without any windows towards the street; their are often painted, varnished, and gilt, in a most splendid manner. The shops are set out with all their rich mer-
CHINA.

Chandize, some of which is brought out and dispayed in
front of the houses. Before these are erected large wooden
pillars, the tops of which are higher than the eaves of the
houses, bearing inscriptions in gilt characters, setting forth
the nature of the wares to be sold, and the hon (£)l reputation
of the seller, and, to attract the more notice, they are
generally hung with various colored flags and streamers
from top to bottom, exhibiting the appearance of a line of
flying dreel, as may be sometimes seen, on the river
Thames, in the colours of all the different nations of Eu-
rope. The streets, being generally unpaved and covered
with land, prove so dusty in dry weather, as to be not only
offensive to the great crowds that continually throng them,
but very injurious likewise to the fine merchandise that is
exposed. These clouds are still increased by multitudes of
horses and carriages of all descriptions that are in continual
motion. In rainy weather they are still more inconvenient
from the mud and dirt, so that in winter and summer they
are very troublesome and even unhealthy to walk in. The
towns, villages, and military polls, are regularly placed at
intervals of about three miles. No just idea can be formed
of the population and magnitude of a Chinese city by the
extent of its enclosing walls. Few are without large patches
of unoccupied grounds within them, which, in many in-
fances, far exceed the quantity of land that is built upon.
Even in that part of the capital called the Chinese city, se-
veral hundred acres are under cultivation. The imperial
city, containing the palace and buildings for the officers of
flute, the eunuchs, and artificers, occupies nearly a
square mile, more than two-thirds of which is a kind of
park and pleasure grounds; and under the north wall of
the Tartar city there is a pond or swamp, which appears to
be fully twice the dimensions of Lincoln’s-Inn-Fields. Such
spaces of unoccupied ground might perhaps have been re-
erved for the use of the inhabitants in cafe of siege, as the
means of supplying a few vegetables of the pungent kind,
as onions and garlic, for the beleaguered, which are the more
necessary for a people who use no small portion of animal
food, and little or no milk. Thus the cities of Babylon
and Nineveh, which were so frequently exposed to the cala-
mities of war and siege, had gardens and corn-lands within
their walls. Independently of towns and villages, the bodies
of the peasants are, in many parts, scattered about.
The face of the country is often level and entirely open; not a
hedge-row, and very few trees to be seen through an exten-
sive district. The cottages appear clean and comfortable;
they are without fences, gates, or other apparent precaution,
against the intrusion of wild beasts or thieves. Robbery is
said to happen seldom, though not punished by death, un-
less aggravated by the commission of violence. The wives
of the peasantry are of material assistance to their families,
in addition to the rearing of their children, and the care of
domestic concerns; for they carry on most of the trades
which can be exercised within doors. Not only do they rear
silkworms and spin the cotton, but the women are almost
the sole weavers throughout the empire.

Many parts of the country are so covered with swamps
and morasses, as not to admit of the usual cultivation. In
such situations the Chinese exhibit new instances of industry
and ingenuity. They form rafts or hurdles of bamboo
which they float upon the water, or reit upon morails; on
these rafts they spread a layer of soil, from whence they
raise various kinds of vegetables, in like manner successful
attempts are also made, in miniature, to produce smaller
vegetables on flat-land, by laying seeds on moistened soil,
or even on pieces of flannel placed in frames and wetted. By
these means the radical leaves of mulgard, for example,
sprout up quickly and are particularly grateful to persons
long absent from land. Besides this method of raising a
crop upon the water, the lakes, rivers, and canals of China
are converted affably to such other useful purposes, as in
cultivating vegetables growing from their bottom, or
in catching the birds that swim upon its surface, or the fish
that exist under it, or the other animals which creep upon
the bottom, or by fertilizing the lands, by irrigation from
them, and by the cheap and easy communication which they
afford between the different districts of the empire;
thus saving so much land, otherwise necessary for roads, and
so much labour to make and keep them in repair, which is
now employed in agriculture. In a country so populous as
China every precaution is necessary to prevent the smallest
spot of ground from being unoccupied that can be applied
to any use; hence grape-vines, small quantities of which are
produced in this country for food, are generally planted on
the sides of the canals; and, as they spread, small upright
poles are driven in the water five feet from the bank,
by which means that space is converted into a perfect arbour,
without any expense of earth but what is immediately about
the roots. Ample provision is likewise made for the con-
stant cultivation of the land, by the forfeiture of such as
are neglected, to the sovereign, who immediately grants
them to other farmers willing to undertake their culture.

We must next proceed to the rivers of China, of which the
Hoan-ho and the Kian-ku, deserve particular attention.
The sources of the first, which is also denominated the Yel-
low river, from the quantity of mud which it devolves,
are two lakes, situated among the mountains of that part of
Tartary known by the name of Kowonor. These lakes
lie about 35° N. lat. and 9° of longitude, to the westward
of Peking, or about 97° E. of Greenwich. This prodigious
river is extremely winding and devious in its course, pur-
furling a N. E. direction to about 45° N. latitude, and
after running due east it suddenly bends south to a lat-
titude nearly parallel to its source, and pursues an easterly
direction till it is lost in the Yellow sea. Its comparative
course may be estimated at about 100 British miles; or ac-
cording to the late embassy 2150. At about 70 miles from
the sea, where it is crooked by the imperial canal, the breadth
is little more than a rod, and the depth only about nine or
ten feet, but the velocity equals about four or eight miles
an hour. The Kian-ku rises in the vicinity of the sources
of the Hoan-ho; but, according to the received accounts
and maps, about 200 miles further to the west, and winds
easily to the south as the Hoan-ho does to the north.

After washing the walls of Nanking, it enters the sea at
about 200 miles to the south of the Hoan-ho. The Kian-ku
is known by various names during its long progress; and near
its source is called by the English, Portuchu or Petchou; its
course is about equal to that of the former; these two rivers
being considered as the longell on the face of the earth, for
they are supposed to exceed the famous river of the Amazons
in South America, and the majestic course of the Ganges
does not extend half the length. In the late embassy
the length of the Kian-ku is estimated at 2700 miles; and it is
observed that these two great Chinese rivers taking their source
from the same mountain, and falling almost close to each other,
in a particular spot, afterwards separate from each other,
to the distance of 1° of latitude, or about 105° British
miles; and finally discharge themselves into the same sea,
comprehending a tract of land of about 1600 miles in
length, which they greatly contribute to fertilize. To
these great rivers many important streams are tributary;
but it would not be consistent with our plan to enter into
details here respecting them, the principal of these meriting
notice.
China.

In China there are many noble and extensive lakes. According to Du Halde, there is one in the province of Hou-quang, that is at least 85 leagues in circumference. In the province of Kiang-nan there is another about thirty leagues in circumference, formed by the confluence of four large rivers, and is itself very dangerous to navigators. There is a considerable lake, not far to the south of Nanking, besides a number of smaller ones chiefly in the eastern and central parts of China. Sir George Staunton mentions, that upon a lake near the imperial canal, were observed thousands of small boats and rafts, constructed for a singular species of fishery. On each boat, or raft, are ten or twelve birds, which, at a signal from the owner, plunge into the water: and it is astonishing to see the enormous size of fish with which they return grasped within their bills. They are so well trained, that it does not require either ring or cord about their throats, to prevent them from swallowing any portion of their prey, except what the master is pleased to return them, for encouragement and food. The boat made use of by these fishermen is of a remarkably light make, and is often carried, together with the fishing birds, by the men who are there to be supported by the employment.

Du Halde describes some of the Chinese mountains as abounding with silver: others produce marble and crystal. In the province of Kiang-nan there is a district, wholly mountainous. Two grand ranges, running E. and W. intersect the centre of the empire, apparently continuations of the enormous chains of Tibet. In the southern part of China the principal ridges run from N. to S.

The population of China has been a topic of considerable debate. Pauw observes from Du Halde, that when the missionaries proceeded through the empire, to prepare their maps, they found in the greater part of its large governments, countries of more than twenty leagues, little peopled, almost uncultivated, and often so wild as to be quite unhabit-

able, and he infers that the population is even exaggerated when it is computed at 82,000,000. "In so wide an empire," says Mr. Pinkerton, "most of the features are on a large scale, nor can human industry totally overcome, though as we have seen, it diminishes certain impediments of nature, as ridges of rocks, and extensive swamps, in certain positions; and in the north of China large forests are indispensably preferred for the sake of fuel. On a smaller scale, such ob-
tacles to universal population are found even in the most fertile countries; they occur, as we all know, near the capital of our town." Civil wars, which, as we have seen in the foregoing history, have repeatedly raged in China, have laid desolate immense districts of the country for a long period of time. As it would be absurd to suppose that all China consists of land fit for cultivation, so it would be equally absurd to deny that the population has increased every traveller with astonishment, and with ideas totally differ-
tent from those of Pauw, who seems to have forgotten that the want of cultivation in some districts is balanced by that refiding on the waters, millions of families palling their whole existence in boats, on the numerous rivers, lakes, and canals. The recent English embassy, prepared as they were for something very extraordinary on the subject of population, were nevertheless greatly astonished when the following statement was delivered at the request of Lord Macartney by a mandarin of high rank, as the abstract of a census that had been taken the preceding year: "The amount," says Mr. Barrow in his Travels in China, "appeared so en-
ornous as to surpass credibility. But as we had always found this officer a plain, unaffected, and honest man, who on no occasion had attempted to deceive or impose on us, we could not confidently consider it in any other light than a document drawn up from authentic materials. To the table containing the account of the population are added the number of people on a square mile, and the value of the surplus taxes remitted to Peking in the year 1792.

The
The measurement annexed to each of the fifteen ancient provinces was taken from the maps constructed by a laborious, and, as is generally believed in China, very accurate survey, which employed the Jesuits ten years. Whether this great empire, the first in rank both in extent and population, does or does not actually contain three hundred and thirty-three millions, is a point that Europeans are not likely to ascertain. That it is capable of subsisting this and a greater population, Mr. Barrow, in his work already referred to, has taken considerable pains to prove. He mentions several canals that have contributed to the population of this country: since the Tartar conquest China has enjoyed a profound peace, and its army being parcelled out as guards for the towns, cities, and villages, and stationed at the numberless posts on the roads and canals, all marry, have families, and a certain portion of land, which they have time to cultivate, is allotted for their use. As the nation has little foreign commerce, there are but few feamen: such as belong to inland navigation are mostly married; public opinion indeed considers celibacy as disgraceful, and a sort of infamy is attached to a man who continues unmarried beyond a certain time of life. As an encouragement to the nuptial state, every male child may be provided for, and receive a stipend from the moment of his birth by having his name enrolled on the military list. By the equal division of the country into small farms, every peasant has the means of bringing up his family, if drought or inundations do not frustrate his labour; and the pursuits of agriculture, it is well known, are very favourable to health, and consequently to population. From the general poverty that prevails among the lower classes, drunkenness is little known, and temperance, from necessity, very much practiced. The climate in general is moderate and uniform, and, excepting the small pox, the Chinese are liable to few epidemic disorders; the women are very fertile, and from the innate kind of life which they lead, are subject to few accidents, and they all fiddle and nurse their own children. From these and other favourable circumstances, Mr. Barrow supposes that the population of China may not have been exaggerated even by those who have given the highest calculations.

Canals and Chinese Navigation. In China there is scarcely a town or even a village which has not the advantage either of an arm of the sea or a canal; by which means navigation is rendered so common, that almost as many people live on the water as on land. The great canal is one of the wonders of art; it runs from north to south, extending from the city of Canton to the extremity of the empire; and by it all kinds of foreign merchandise entered at that city are conveyed directly to Peking, a distance of 825 miles. This canal is about 50 feet wide; it passes through, or near 41 large cities; it has 75 large sluices to keep up the water, besides several thousand bridges. China owes the greatest part of her riches to these numerous canals, which are cut through any kind of private property, not even excepting the gardens of the emperor, who, when the work arrives at his ground, digs the first spade of earth, and pronounces with an audible voice, "This is to let all know that private pleasure should never obstruct the public good." The canals are bordered or faced with quays of freestone, and, in low places, long causeways are raised for the convenience of travellers. There are bridges over the canals of three, five, or more arches, of which the middle one is high enough for vessels to pass under with their masts lowering. When the water is liable to overflow the neighbouring meadows, they open the sluices to convey it away, and there are inspectors appointed to keep the canals in proper repair. One great canal generally runs through every province, and a vast number of smaller ones are cut from the large one; which again are divided into some still smaller, that end at a village or great town; sometimes they discharge themselves into a lake, or large pond, from which all the adjacent country is watered. Among all the canals in the southern provinces, one is called the great canal, which is the grandest inland navigation in the known world, being, according to Mr. Barrow, nearly 1000 feet in width, of which the sides are built with masonry blocks of grey marble mixed with others of granite; and this immense aqueduct, although forced several feet above the surface of the country, by embankments thrown up by the labour of mankind, with a current of about three miles an hour towards the Yellow river. The buftle and activity both on shore and on the numberless canals that branch out in every direction from the main trunk, exhibit, for several miles, on either side, one continued town, extended to the point of junction with this large river, celebrated in every period of Chinese history. That which most charms the eye is the immense number of large boats with imperial colours, and beautifully painted, that sail in fleets, and commanded by a single mandarin of the province, and laden with its belt productions, and chiefly on the emperor's account. There are several classes or rates of these boats: very neat and commodious; a middle sized one has a hall and four very convenient rooms, besides a good kitchen, and place for the attendants; the rooms are generally carved, painted, and gilt; even the ceiling is painted, and the whole varnished; some of these boats are of 200 tons burthen, and from 300 to 400 of them on the same canal at the same time, and sometimes in one fleet; and by the clearness and good management of the canals, it is rendered the most pleasant and fertile country in the world. The Chinese junks are strong roomy vessels, from 150 to 300, and some 300 tons burthen; the hold below deck is divided into several distinct apartments, partitioned off with two-inch planks, grooved or rabatted as close as possible, and the joints or seams are caulked with a cement of lime, pitch, &c. prepared in such a manner as to render it perfectly watertight. A junk may strike against a rock and not sink; a leak may be sprung, but will damage no further than the goods in that apartment. Before the barges are launched from the canal into the stream of the Yellow river, certain ceremonies are conceived to be indispensably necessary: an oblation is made in every vessel to the genius of the river: the animals sacrificed on such occasions consist of fowls or pigs. The blood, with the feathers and the hair, are daubed upon the principal parts of the vessel, and on the fore-castle are placed cups of wine, oil, and salt; the latter article being thought by the Chinese as necessary to every sacrifice. The cups, the slaughtered animals, and several made dishes remain on the fore-castle, while the captain flands over them on one side, and a man with his gong on the other. On approaching to the rapid part of the stream, at a signal given by the gong, the captain takes the cups one by one, the contents of which he throws over the bow of the vessel, into the river. The libation being performed, a quantity of crackers, figs, and gilt tin foil are burnt with up-lifted hands, while the deepounding gong is incessantly struck with increasing violence as the vessel Peggs along with the current. The victim and the other dishes are then removed for the use of the captain and the crew, and the ceremony ends by three genuflexions, and as many prostrations. The Chinese are unfitted in the art of navigation. They keep no reckoning at sea, nor possess the least idea of drawing imaginary lines upon the surface of the globe, by the help of which the position of any particular place may be ascertained; in other words, they have no means of ascertaining the latitude or longitude of any place.
place either by the distance failed, or by observation of the heavenly bodies. Yet they pretend that many of their early navigators made long voyages in which they were guided by charts of the route, sometimes drawn on paper, and sometimes on the wax surface of large gourds.

The present system of Chinese navigation is to keep as near the shore as possible, and never to lose sight of land, rules in voyages that absolutely require it, such as to Japan, Batavia, and Cochin-China. Knowing the bearing or direction of the port intended to be made, they endeavour to keep the head of the ship always pointing to it by means of the compass. Yet even with the assistance of the compass it is surprising how their ill-constructed vessels can perform a long and dangerous voyage as that of Batavia, and, indeed, very few numbers of Chinese vessels are annually lost by shipwreck in attempting it. When a ship leaves Canton on a foreign voyage, it is considered as an equal chance that she will never return; and when the event proves favourable, a general rejoicing takes place among the friends of those who had embarked in the hazardous undertaking. Some of these ships are not less than 1000 tons burden, and contain half that number of souls, besides passengers, who hope to make their fortunes at Batavia or Mollucca.

A ship belongs to several merchants, and is divided into as many compartments as there are partners, and each fits up his own as he pleases. He ships his goods and accompanies them in person, or sends his son, or a near relation, for it rarely happens that they will trust each other with property where no family connection exists. Each sleeping-place is just the length and breadth of a man, and contains only a small mat spread on the floor, and a pillow. Behind the compass is generally placed a small temple, with an altar, on which is continually kept burning a spiral taper composed of wax, tallow, and sandal-wood. This holy flame answers a double purpose: for while the burning of it fulfils an act of piety, its twelve equal divisions serve to measure the portions of time which make up a complete day. It should seem that the superstitious notions inculcated on the people, have led them to believe that some particular influence resides in the compass; for on every appearance of a change in the weather, they burn incense before the magnetic needle.

Government and political Relations. The government of China is patriarchal. The emperor is absolute, but the examples of tyranny are rare, as he is taught to regard the people as his children, and not as his slaves. Being considered as the common father of his subjects, he is accordingly invested with the exercise of the same authority over them, as the father of a family exerts on those of his particular household. In this sense he takes the title of the Great Father; and by his being thus placed out of the reach of any earthly control, he is subjected to be also above earthly defects, and therefore, as a natural consequence, he sometimes flites himself the sole ruler of the world and the son of heaven. Conformably to this system, founded entirely on parental authority, the governor of a province is considered as the father of that province; of a city, the father of that city; and the head of any office or department is supposed to preclude it over it with the same authority, interdict, and affection, as a father of a family superintends and manages the concerns of domestic life. The stability of the government, in all its sensible and evident motions, terms and customs, justly astonishes those who are most conversant in history. It arises from a circumstance unknown in any other government, the admission and practice of the principle, that "knowledge is power." For all the offices of government pass through a regular education, and a progress of rank, which are held indispensable. Of the officers called mandarins, there are nine classes, from the judge of the village to the prime minister. The profession requiring a long and severe course of study, the practice of government remains, like that of medicine, wherein by exterior events; and while the imperial throne is subject to accident and force, the remainder of the machine goes on without interruption. The governors of the provinces have great and absolute power, yet rebellions are not uncommon. Bribbery is also an universal vice, and the Chinese government, like many others, is held beautiful in practice than in theory. The Chinese laws are ancient, but numerous; and edicts of the reigning dynasty have restrained the mandarins within stricter limits of duty.

Though unbounded authority is given to the emperor by the laws, yet the same laws lay upon him a necessity to use his power with moderation and discretion, which are the two props that have to long supported the great fabric of the Chinese monarchy. The first principle induced into the people at large, is to respect their prince with so high a veneration as almost to adore him. His commands are indissoluble, and his words sacred. He seldom hews himself to the people, and is never spoken to but on the knees. When he is ill, the palace is full of mandarins, who spend their whole time in a large court, offering petitions to heaven in behalf of their prince's cure. No weather, no inconvenience, can excite them from this duty: so long as the emperor is in pain or in danger, the people seem to fear nothing but the loss of him. Self-interest is no small occasion of the great respect which is shown him by his subjects; for as soon as he is proclaimed emperor, the whole authority of the empire is in his hands, and the fortunes of his subjects are entirely at his disposal. 11. All places of honour and profit are in his gift. Honour, learning, experience, and gravity of behaviour, are said to be the only qualifications to induce succeces to the candidate for any post of trust or dignity. As the emperor has the sole choice of all his official of state, he diffuses, without ceremony, those who are deficient in their duty. 12. He has absolute power over the lives and properties of all his subjects. Offenders are arraigned and tried in the different provinces, but the sentence is always presented to the emperor, who either confirms or rejects it, as he pleases. He can lay what taxes he thinks fit upon his subjects to supply the pressing wants, and relieve the necessities of the state. 13. The right of making peace and war belongs to the emperor; he may make what treaties, and upon what terms, he pleases, provided they are not dishonourable to the kingdom. The judgments passed by him are irrepealable, and his foreign courts and vicegerents dare not use the least delay in regenerating them. 14. Another irregular circumstance belonging to the Chinese government, is the right that the emperor has of choosing his successor, whom he may select both only from the royal family but from among other subjects there and have been emperors, who, finding none of their own family able to support the dignity of a crown, have chosen for their successors persons of mean birth and fortune, but eminent for virtue and understanding. Examples of this nature are not, however, very common, but it frequently happens that the choice does not fall according to seniority, which, in China, never occasions any civil commotions or rebellions. 15. The grave itself does not put an end to his power over his subjects, which is exerced even upon the dead, whom he disgraces or honours, when he has a mind either to reward or punish them or their families. He confers upon them, after their decease, titles of honour; canonizes them as saints, or, according to their language, "makes them naked spirits." Sometimes he builds for them temples; and, if their administration of public
affairs has been very beneficial, or their virtues remarkably eminent, he commands the people to honour them as gods. The emperor has ever been looked upon as the chief priest and principal servant of religion; and there are ceremonies and public sacrifices which he alone is thought worthy to offer up to the great Creator of heaven. 6th. The emperor may change the figure and character of the letters, abolish characters already received, or form new ones. He may likewise change the names of provinces, of cities, and of families. He may forbid the use of any commonly received expression or modes of phrase, and introduce others which have hitherto been esteemed obsolete and uncomely.

To afflit the emperor in the weighty affairs of the state, and in the arduous task of governing an empire of so great an extent, and such an immense population, the constitution has allotted him two councils; the one, called the ordinary council, is composed of his principal ministers, of which there are five. The other, or extraordinary council, confids entirely of the princes of the blood. For the administration of the affairs of government, there are fix boards or departments, consisting of, 1. The court of appointments to vacancies in the offices of government, being composed of the ministers and learned men, qualified to judge of the merits of candidates. 2. The court of finance. 3. The court of ceremonies, presiding over the direction of ancient cutumens, and treating with foreign ambassadors. 4. The court for regulating military affairs. 5. The tribunal of justice. 6. The board of works.—These public functionaries resolve upon, recommend, and report to the emperor, all matters belonging to their separate jurisdictions, who, with the advice of his ordinary, and, if necessary, of his extraordinary council, confirms, amends, or rejects their decrees. Subordinate to these supreme courts held in the capital, are others of a similar constitution, established in different provinces, and great cities of the empire, each of which corresponds with its principal in Peking.

The political importance and relations of China may be said to be concentrated within itself, as no example is known of alliance with any other state. It has been supposed, that one European ship would destroy the Chinese navy, and that 10,000 European troops might over-run the empire. Yet it is very probable, that an obstacle to foreign conquest, and, perhaps, not less than 100,000 soldiers would be necessary to maintain the quiet subjugation of it; so that any foreign yoke must prove of very short continuance. The recent conquest by the Mandhurs happened in consequence of the general detachment excited against a fanatical usurper; and the invaders were in the immediate proximity, even while a Russian army would find almost insurmountable difficulties on the route, and the conquest, like that by the descendants of Zingsis, would infallibly prove of short duration. The Chinese have taken almost all their civil laws from their canonical books of morsy. Filial piety is their basis, as well as that of their government. Some decrees of the emperors, and especially those respecting the observance of certain ceremonies, which custom has established, form the rest of the code. In a word, the Chinese jurisprudence contains every thing that is to be found in the bill moral writers. Every mandarin who is a governor, either of a province or city, is obliged, twice a month, to instruct the people around him, and to recommend the observance of certain salutary rules, such as filial piety, a certain deference to others, frugality, temperance, and the other personal virtues. An experts law points out those points of morality which ought to be the subjects of these discourses. Jurisprudence is taught in China in the same manner as the principles of religion are taught in other countries.

The laws of China which concern marriage are very extensive. A man can have only one lawful wife; and her rank and age must be nearly equal to his own; but he may receive into his house, on certain conditions, several concubines or wives of the second rank, who are wholly subject to the lawful spouse. Their children are considered as hers, they address her as mother, and can give this title to her only. Divorces are granted in China as they were among all ancient nations, but with less facility and only in certain cases, such as adultery, incompatibility of temper, filial disobedience, and infectious diseases. The law protects every wife who is abandoned by her husband, and can, if she desires, repudiate for three years, take another husband, provided she first get the consent of the mandarin. The law forbids marriage in certain circumstances: and marriage is also suspended when a family experiences any severe misfortunes. Every father of a family is responsible for the conduct of his children; he is even accountable for that of his daughters. Every fault is imputed to him, whose duty it is to prevent it. The old persons of a family live generally with the young; the former force the piously of the latter, and the influence of age over youth is supported by the sentiments of nature, by habits of obedience, by the precepts of morality ingrained in the law of the land, and by the unremitted policy and honest endeavours of parents to that effect. They who are paid labour dispense the rules and the wisdom which experience taught them, to those who are advancing in life. Plain moral maxims are written up in the common hall where the male branches of the family assemble. In almost every house is hung up a tablet of the ancestors of the person then residing in it, to which references are perpetually made, and their example serves as an incitement to travel in the same path. The descendants from a common stock visit the tombs of their forefathers together, at stated times, which practice collects and unites the most remote relations. They cannot lose sight of each other, and seldom become indifferent to their respective concerns. The child is bound to labor and to provide for his parents' maintenance and comfort, and the brother for the brother and the sister, who are in extreme want; the failure of which duty would be followed by such detestation that it is not necessary to enforce it by positive laws. The most constant kindsmen, reduced to misery by accident or ill-health, has a claim on his kindness for relief. Manners, stronger than laws, produced and nurtured by intercourse and intimacy, secure efectual alliance for him. These habits and manners fully explain a fault that appears extraordinary to Europeans, that no spectacles of divers are seen to excite the compassion, and inspire the casual charity of individuals.

Civil and Military Establishments. From the produce of the taxes, the civil and military establishments, and all the incidental and extraordinary expenses, are first paid on the spot on which they are incurred, out of the provincial magazines, and the remainder is remitted to the treasury in Peking to meet the expenses of the court, the establishment of the emperor, his palaces, temples, gardens, women, and princes of the blood. The confiscations, presents, tributes, and other articles, may be reckoned as attaching to his privy purse. The furplus revenue remitted to Peking in the year 1792, was flated to be about twelve millions sterling. It is a general opinion among the Chinese part of his subjects that vast sums of the surplus revenue, and much as arise from confiscations, are annually sent to the capital of Tartary; this, however, is an erroneous opinion. Notwithstanding the great wealth of the imperial treasury, the present emperor found it necessary, in a single year, to accept of what
is called an offering, of five hundred ounces of silver, from the late merchants of Canton, and sums of money, and articles of merchandise from other quarters, to enable him to quell a rebellion that was raging in one of the Western provinces. He even sent down to Canton a quantity of pearls, azurite, pericarpus, and other stones of little value, in the hope of raising a temporary supply from the sale of them to foreign merchants. The emperor of China, therefore, has not so much wealth at his disposal as has usually been imagined. He even accepts of patriotic gifts from individuals, consisting of pieces of porcelain, filks, fans, tea, and such like trifling articles, which afterwards have to pay to foreign embassadors; and each gift is promptly proclaimed in the Peking gazette. The civil officers in the civil departments of government, independent of the ministrés and the different boards in Peking, according to the statement of Tschou-ta-gin, with their salaries and allowances, reduced into silver, will be seen from the following table:

Total ozs. 2,560,000

The inferior officers acting immediately under the orders of these, and amounting to many thousands, together with the salary and expenses of the different boards, all of which are paid out of the public treasury, must require a sum, at least equal to the above; so that, on a moderate calculation, the ordinary expenses of the civil government will amount to the sum of 5,920,000 ounces of silver, or 1,073,313 pounds sterling. Some idea may be formed of the numerous appointments and the frequent changes in administration, from the Chinese court calendar, which is published every three months, making four large volumes. The attention, precaution, and extreme jealousy of the government, have not been considered as sufficient for the protection of the empire, without the assistance of an immense standing army, which, in the midst of a profound peace, was flouted by Fan-ta-gin, to consist of one million of infantry and eight hundred thousand of cavalry. The expense of this military establishment, together with artillery, tents, war-equipage, vessels of force on the different rivers and canals, the building and keeping in repair the military posts, &c., &c., has been estimated at 34,982,973l. sterling. The revenue is estimated at fifty-six millions sterling, so that the whole will stand as follows:

Total amount of the revenue
Civil establishment £1,973,333
Military ditto 49,982,973 £51,956,266

Surplus, being for the emperor’s establishment £14,043,734

which accords pretty nearly with the sum paid to have been remitted to Peking in the year 1792. It may perhaps be asked, in what manner this large body of men is employed. Since the nation is so little engaged in foreign war, it may be replied, that the employments of the military differ materially from those among European nations. Except a great part of the Tartar cavalry, who are stationed on the northern frontier, and in the conquered provinces of Tartary, and the Tartar infantry, who are distributed as guards for the different cities of the empire, the rest of the army is parcelled out in the smaller towns, villages, and hamlets, where they act as constables, thief-takers, attendants to magistrates, subordinate collectors of the taxes, guards to the granaries, and are employed in a variety of different ways under the civil magistracy and police. Besides these, an immense multitude are stationed as guards of the military posts, along the public roads, canals, and rivers. These posts are small square buildings, like so many little castles, each having on its summit a watch-tower and a flag, placed at the distance of three or four miles a fortnight. At one of these posts there are never fewer than six men, who not only prevent robberies and disputes on the roads, but convey the public dispatches to and from the capital. An express sent from post to post travels in this way at the rate of a hundred miles per day, and there is no other mode of conveying letters for the convenience of the public.

A great part then of the Chinese army may be considered as a kind of militia, which never has been, and probably never will be, embodied; as a part of the community not living entirely on the labour of the soil, but contributing something to the common stock. Every folder stationed on the different guards has his portion of land assigned to him, which he cultivates for his family, and pays his quota of the produce to the state. The different kinds of troops compose the Chinese army consist of 1. Tartar cavalry, whose 

only weapon is a saber; and a few who carry bows. 2. Tartar infantry, bowmen having also large sabers. 3. Chinese infantry, carrying the same weapons. 4. Chinese matchlocks. 5. Chinese tigers of war, bearing large round shields of basketwork and long swords. On the shields are painted monstrous faces of some imaginary animal, intending to frighten the enemy, or to petrify their beholders. The military dress varies in almost every province; sometimes they wear blue jackets edged with red, or brown with yellow; some have long pantaloons, some breeches, and others petticoats and boots: the bowmen have long loose gowns of blue cotton, fluffed with wadding, stuffed with bras knobs, and bound round the middle with a girdle, from which the fabre is appended behind. On the head they wear a helmet, with flaps on each side, that cover the cheeks and fall on the shoulders. The upper part is like an inverted funnel, with a long pipe terminating in a kind of spear, on which is fastened a tuft of hair dyed black. They call the greatest number of soldiers' taws Mr. Burrow, that we saw at any one place might be from 2 to 3,000, which were drawn up in a single line along the bank of a river, and, as they stood with
with an interval between each other, equal to the width of a man, they formed a very considerable line in length. Every fifth man had a small triangular flag, and every tenth a large one; the flags that supported them were of different colours, and fixed to the jacket behind the shoulders." The Tartar cavalry appear to be remarkably swift, and to charge with great inactivity; but the horses are so small, and broken into so quick and short a frothe, that the eye is deceived, and their real speed is but moderate. Their saddles are soft, raised before and behind, so that the rider cannot be easily thrown out of his seat; and the stirrups are fo short that the knee is nearly level with the chin. They have little artillery, and that is very bad. They have a decided preference to clumsy matchlocks, over the fire-locks now in use among European troops, pretending that the former, by being fixed with iron forks into the ground are capable of doing more execution than the latter; but the true reason are probably their want of good metal to manufacture locks, or the bad quality of their gun-powder, or, above all, their deficiency in courage to make use of them with that flexibility which is required to produce their full effect.

Their favourite weapon is the bow, which, like all other muffle weapons, requires less courage to manage than those which bring a man to oppose himself in close contest with man. Although the Tartars have continued the Chinese arms on the old footing, they have used every exertione to recruit it with their own countrymen in preference to the Chinese. Every male Tartar child is accordingly enrolled, a precaution highly necessary, as their whole army at the time of the conquest is said not to have exceeded 80,000 men. It is, however, certain, that the Chinese government was at this time under a very weak administration, and every department both civil and military under the control of eunuchs, 6,000 of whom are said to have been turned adrift by the Tartars, on the taking possession of the palace at Peking.

The conduct of the Manchou Tartars, whose race is now on the throne, was a matter-piece of policy not to have been exposed in a half-civilized race of people. They entered the Chinese dominions as auxiliaries against two rebel chiefs, and in a short time placed their own leader on the throne; but instead of setting up for conquerors they melted into the mael of the conquered. They adopted the dress, the manners, the opinions of the people, and in all the civil departments of the state, they appointed the abett Chinese, and all vacancies were filled with Chinese in preference to Tartars. They learned the Chinese language, married into Chinese families, encouraged Chinese superstition, and, in short, omitted no step that could tend to incorporate them as one nation; their great object was to strengthen their army with their own countrymen; while the Chinese were so satisfied with the change, that they almost doubted whether a change had really taken place. In proportion as the Tartar power increased, they have become less solicitous to conciliate the Chinese; all the heads of departments are Tartars; the ministers are Tartars; and most of the offices of high trust and power are filled by Tartars. The best soldiers of this empire are collected from the three northern provinces; those supplied by the rest are seldom called forth; but remain with their families, enjoy their pay, and have seldom any occasion to remember that they are soldiers, except when ordered to appear at a review.

State of Society; Manners and Customs. It may be laid down as an invariable maxim that the condition of the female part of society in any nation will furnish a tolerably just criterion of the degree of civilization to which that nation has arrived. The manners, habits, and prevailing sentiments of women have great influence on those of the society to which they belong, and generally give a turn to the ideas and conceptions on the moral and intellectual powers of the mind in the female sex are held in most estimation, will be governed by such laws as are best calculated to promote the general happiness of the people; and, on the contrary, where the personal qualifications of the sex are the only objects of consideration, as is the case in all the despotic governments of Asiatic nations, tyranny, oppression, and flavery are sure to prevail; and these personal accomplishments, so far from being of use to the owner, serve only to deprive her of liberty and the society of her friends, to render her a degraded victim subservient to the sensual gratifications, the caprice, and the jealousy of man. Among savage tribes the labour and drudgery fall heavily on the weaker sex. The Chinese have imposed on their women a greater degree of humility and restraint than the Greeks of old, or the Europeans in the dark ages. Not satisfied with the physical deprivation of the use of their limbs, they have contrived, in order to keep them the more confined, to make it a moral crime for a woman to be seen abroad. If they should have occasion to visit a friend or relative, they must be carried in a close sedan-chair; to walk would be the height of vulgarity. Even the country ladies, who may not possess the luxury of a chair, rather than walk, suffer themselves to be rolled about in a sort of covered wheel-barrow. The wives and daughters, however, of the lower classes are neither confined to the house, nor exempt from hard and laborious labour, many being obliged to work with an infant upon the back, while the husband, in all probability, is gaming, or otherwise idling away his time. In the province of Kiang-fei nothing is more common than to see a woman drawing a kind of light plough, with a single handle, through ground that has previously been prepared; the easier talk of directing the machine is left to the husband, who, holding the plough with one hand, calls to the same time, with the other, the feed into the drills. The advantages which these women possess in a higher sphere of life, if any, are not much to be envied. Even at home, in their own family, a woman must either eat at the same table, nor sit in the same room with her husband. And the male children, at the age of nine or ten years, are entirely separated from their sisters. Thus the feelings of affection, not the instinctive products of nature, but the offspring of frequent intercourse, and of a mutual communication of their little wants and pleasures, are nipped in the very bud. A cool and ceremonious conduct must be observed on all occasions between the members of the same family. There is no common focus to attract and concentrate the love and respect of children for their parents. Each lives retired and apart from the other. The incidents and adventures of the day, which furnish the conversation among children of many a long winter's evening, by a comfortable fire-side, in our own country, are in China buried in silence. Boys, it is true, sometimes mix together in schools, but the stiff and ceremonious behaviour, which constitutes no inconsiderable part of their education, throws a restraint on the little playful actions incident to their time of life, and completely subdues all spirit of activity and enterprise. A Chinese youth of the higher classes is inanimate, formal, and insensible, constantly endeavouring to assume the gravity of years. To beguile the many tedious and heavy hours that must unavoidably recur to the secluded females, totally unqualified for mental pursuits, the tobacco-pipe is the mind expeditant. Every female from the age of eight or nine years wears, as an appendage to her dress, a small flaken purse or pocket,
to hold tobacco and a pipe, with the use of which many of them are not acquainted at this tender age. Some, indeed, are constantly employed in working embroidery on silk, or in painting birds, insects, and flowers on their gauze. But the women who employ their time in this manner are generally the wives and daughters of tradesmen and artificers; a lady of rank would not be supposed to confide the use of her needle. Daughters may be laid to be invariably fond. The bridgroom must always make his bargain with the parents of his intended bride. She has no choice, but is disposed of to the highest bidder. The man, indeed, in this respect, has no great advantage on his side, as he is not allowed to see his intended wife until the arts forms in formal procession at his gate. If, however, on opening the door of the chair in which the lady is shut up, and of which the key has been lost before, he should desire his bargain, he can return her to her parents; in this case the articles are forfeited that constituted the price; and a sum of money in addition may be demanded, not exceeding the value of these articles.

C To what a degraded condition," says Mr. Barrow, "is a female reduced by this absurd custom, and how little Intelligence can she have to render herself amiable or elegant, knowing that she will be configured into the hands of the first man who will give her the price that her parents have fixed up on her charms." The man takes a wife because the laws of the country direct him to do so, and custom has made it indispensable; and a woman after marriage continues to be the same piece of inanimate furniture she always was in her father's house. She suffers no indignity, nor does she feel any jealousy or disturbance when her husband brings into the same house a second or a third woman. Although polygamy be allowed by the government, yet few take the advantage of it. Nine-tenths of the community find it difficult to rear the offspring of one woman by the labour of their hands; nay, therefore, are neither in circumstances, nor probably feel much inclination to purchase a second. The unיבורious distance which the law prefers to be observed between the lexers, and the cool and indifferent manner of bargaining for a wife, are not calculated to produce numerous instances of criminal intercourse. These, however, sometimes happen, and the weight of punishment always lies heavier on the woman. The husband finds no difficulty in obtaining a fiction of divorce, after which he may sell her for a slave, and thus redeem a part at least of his purchase-money. The same thing happens in case a wife should elope; but if a young girl should chance to lose what is justly held to be the most valuable part of female reputation, she is sold to market by her parents, and publicly folded for a slave. In cases of mutual duilt, or incompleteness of temper, the woman is generally sent back to her parents. The prohibition against the frequent intercourse with modest females, for there are public women in every great city, is not attended here with the effect of rendering the pursuit more easy; it seems even to have the contrary effect, of promoting that sort of connection, which, being one of the greatest violations of the laws of nature, will ever be considered by an enlightened people as the first of moral crimes, a connexion that links the man infinitely below the brute. The commissio of this detestable and unnatural act is attended with so little sense of shame, that many of the first officers of state seem to make no hesitation in publicly avowing it. Each of these offenders is constantly attended by his pipe-bearer, who is generally a handsome boy, from 14 to 18 years of age, and is always well dressed, the reason of which is too obvious, to bye-bidders, to be misunderstood.

The state of domestic society in China is ill calculated to promote the affection and kindness which children feel for their parents in many countries. A tyrant to command, and a slave to obey, are found in every family; and if the acts of kindness and attention that create mutual engagements be wanting among the members of the same family living under the same roof, it will be in vain to expect to find them in the large sphere of public life; and in fact there are no friendly locales, nor meetings, to talk over the transactions and the news of the day. These can only take place in a free government. A Chinama, having fulfilled his daily employment, retires to his solitary apartment. There is, it is true, a fort of public houses where the lower orders of people resort for their cup of tea; but such places are not frequented for the sake of company. Whatever a few Chinese meet together, it is generally for the purpose of gaming, or to eat a kettle of boiled rice, or drink a pot of tea, or imake a pipe of tobacco. The upper ranks indulge at home in the use of opium, of which they are very fond, though it is strictly prohibited by law. It is, however, too expensive to be used by the common people. The young have to occasionally assemble for the purpose of dancing, and of executing themselves in acts of activity, which in Europe are attended with the happiest effects. The first day of the new year, and a few succeeding days, are the only holidays that are observed by the working part of the community. On these the poorer peasantry make a point of procuring new clothes for himself and his family; they pay visits to their friends and relations, intercalate civilities and compliments, make and receive presents; and the officers of government, and the higher ranks, give feasts and entertainments; but even in these there is nothing that bears the remembrance of conviviality. The guests never partake together of the same service of dishes, but each has a separate seat; the eyes of all must constantly be kept on the master of the feast, to watch his motions, and to observe every morcel he puts into his mouth, and every time he lifts the cup to his lips (for a Chinama of good breeding can neither eat nor drink without a particular ceremony), to which the guests must pay attention. If a person invited should be prevented from attending, the portion of dinner that was intended for him is sent in procession to his own house; it is even customary to send after the guests the remains of his dinner. Whatever may be the occasion of bringing together a few idlers, they seldom part without trying their luck at some game of chance, for which a Chinama is never unprepared. He rarely goes abroad without a pack of cards in his pocket, or a pair of dice; both of these are different from similar articles elsewhere; their cards are much more numerous than ours, and their games much more complicated. They sometimes play at chess, which appears to be essentially different from that game as played in other Oriental nations. The spirit of gaming is so universal, in most of the towns and cities, that, in almost every bye corner, groups are to be found playing at cards or throwing dice. They are accust of even taking their wives and children on the hazard of a one of their most favourite sports is cock-fighting, which is as eagerly pursued by the upper classes in China, as it continues to be by those in a similar situation in some parts of Europe. The training of gums for the same cruel purpose of butchering each other, further abundance of employment for the idle and dispossessed. They have even extended their inquiries after fighting animals into the insect tribe, in which they have discovered a species of gryllus, or locust, that will attack other with such ferocity, as seldom to quit their hold without breaking away, at the same time, a limb of their antagonist. These little creatures are kept apart in bamboo cages; and the custom of making them devour
devour each other is so common, that during the summer months fearlessly a boy is seen without his cage end grafters.

Another trait in the Chinese character, which must not be passed over, is the horrid practice of infanticide, tolerated by custom, and allowed by government; because where the legislature does not interfere to prevent crimes, it may be said to lend them countenance. The laws of China do not indeed suppose such an unnatural crime to exist, and have therefore provided no punishment for it. They have left the child entirely to the disposal of the father, concluding, that if his feelings will not prevent him from doing it an injury, no other consideration will. Thus, though the commission of infanticide be frequent in China, it is considered as more prudent to wink at it, as an inevitable evil, which natural affection will better correct than penal statutes. It is, however, tacitly considered as a part of the duty of the police of Peking, to employ certain persons to go their rounds at an early hour in the morning with carts, in order to pick up such bodies of infants as may have been thrown into the streets in the course of the night. No inquests are made, but the bodies are carried to a common pit without the city walls, into which all those that may be living, as well as those that are dead, are said to be thrown promiscuously. The number of children thus inhumanly slaughtered, in the course of a year, is differently stated by different authors. Some making it about 10 and others 50,000 in the whole empire. Mr. Barrow thinks the truth may probably lie in the mean of these extremes. He concludes that about 24 infants are on an average daily destroyed in Peking, where it is supposed about an equal number are exposed, to that of all the other parts of the empire. How weak then, says he, must be the boasted filial affection of the Chinese for their parents, when they scruple not to become the murderers of their own children, towards whom, according to the immutable laws of nature, the force of affection will ever be stronger, than for those, whom the laws of China, in preference, have commanded to be protected and supported when rendered incapable of affilling themselves. Hence, and from other facts, the result of his own observations, he infers that filial pitty, among the Chinese, may rather be considered in the light of an ancient precept, carrying with it the weight of a positive law than the effect of sentiment. These unfavourable features, in the character of a people whose whole natural disposition is neither ferocious nor morose, but on the contrary mild, obliging, and cheerful, can be attributed only to the habits in which they have been trained, and to the heavy hand of power, perpetually hanging over them. That this is the case may be inferred from the general conduct and character of those who have from time to time emigrated into other countries, where they are not less remarkable for their honesty than for their peaceable and industrious habits. In these places it appears also that their quickness at invention is not surpassed by accuracy of imitation. The exterior deportment of every class in China is uncommonly decent, and all their manners mild and engaging; but even these, among persons of any rank, are considered as objects worthy of the interference of the legislature; hence it follows that they are ceremonious without servility, insipidions of the most only of politeness, without either the eafe or elegance of good-breeding. An inferior makes a sham attempt to fall on his knees before his superior, and the latter affects a flight motion to raise him. A common satisfaction has its mode preferred by the court of ceremonies; and any neglect or default in a giberian towards his superior is punishable by corporal chastisement, and in men in office by degradation or suspension. In a govern-

ment where every man is liable to be made a slave, where every man is subject to be brigaded with the bamboo, where he is compelled to thank the tyrant on his knees for the trouble he has taken to correct his morals, high notions of honour, or even of common honesty, cannot be expected. Such a system is well calculated to exclude and obliterate every notion of the dignity of human nature. A flave in fact cannot be dishonoured, the vices of such a condition are innumerable, and they appear on all occasions: a Chinese merchant will cheat, whenever an opportunity offers him the means, because he is considered incapable of acting honestly; a Chinese peasant will steal whenever he can do it without danger of being detected; because the punishment is only the bamboo, to which he is daily liable; and a Chinese prince, or a prime minister, will extort the property of the subject, and apply it to his private ufe whenever he thinks he can do it with impunity. The only check upon the rapacity of men in power, is the influence of fear, arising from the possibility of detection. The love of honour, the dread of shame, and a sense of justice seem to be equally unfelt by the majority of men in office. Mr. Barrow produces a variety of instances to prove that the character of the Chinese is generally defective in these respects; and he says that the refined knave displayed by Chinese merchants in their dealings with Europeans, and the tricks that they play off on their tranfactions with one another, are well known to nations, and proverbial in their own. A merchant, with them, is considered as the lowest character in the country, as a man that will cheat if he can, and whose trade it is to create, and then supply artificial wants. To this general character, an exception is due to those merchants, who, acting under the immediate function of government, have always been remarked for their liberality and accuracy in their dealings with Europeans trading to Canton. The want of principle in the Chinese character seems to be more in the system of government, than in the nature and disposition of the people.

The Tartars, by assuming the drefs, the manners, and the habits of the Chinese, are scarcely distinguishable from them in their external appearance; and if any physical difference exists it seems to be in stature only. The Chinese are rather taller and of a more slender and delicate form than the Tartars, who are in general short, thick, and robust. The small eye, elliptical at the end next to the nose, is a predominating feature both in the Tartar and Chinese countenance; they have both the same high cheek-bones and pointed chins, which with the custom of shaving off the hair gives to the head the shape of an inverted cone. The natural colour both of the Chinese and Tartars seems to be that tint between a fair and a dark complexion, and the shades of this complexion are deeper, or lighter, according as they have been more or less exposed to the influence of the climate. The women of the lower classes, who labour in the fields or who dwell in welfels, are almost invariably coarse, ill featured, and of a deep complexion, very like that of a Hottentot. Among the men, those who are drest drest wear a front of velvet cap on their heads; a short jacket close buttoned round the neck and folded across the breast, the sleeves remarkably wide; the materials, cotton cloth; black, blue, or brown silk; or European camlet; they wear quilted petticoats and black satin boots. The common people are drest in large straw hats, blue or black cotton frocks, wide cotton trousers, and shoes made of straw; some have coarse fockings of cotton cloth; the legs of others are naked, and a single pair of drawers constitutes the whole clothing of a great portion of the crowd. On the banks of the Pei-ho, and indeed in most parts of the country, bunches of large artificial flowers,

of
of different colours, are stuck in the jet black hair of the women, which is screwed up close behind, and folded into a knot across the crown of the head. Two bodkins of silver, brass, or iron, are conspicuously placed behind the head in the form of an oblique crook. Their faces and necks are daubed with white paint, the eye-brows are blackened, and on the centre of the lower lip, and at the point of the chin, are two spots about the size of a small wafer, of a deep vermilion colour. A blue frock like that of the men, reaching to the middle of the thigh, in others to the knee, is almost universal. A pair of wide trousers of different colours are extended a little below the call of the leg, where they are drawn close, the better to display an ankle and a foot which, for singularity at least, may challenge the whole world. This distended member consists of a foot that has been cramped in its growth to the length of four or five inches, and an ankle that is generally swollen in the same proportion that the foot is diminished. The little shoe is as fine as tinfoil and tawdry can make it, and the ankle is bandaged round with party-coloured cloths ornamented with fringe and tassels; with such a leg and foot thus drest out they are considered in China fuperlatively beautiful. This monstrous fashion of cramping the growth of the feet has been attributed to the jealousy of the men. The fashion is, however, at present so universal, that any deviation from it is considered as disgraceful. Upon the principle of being thought superior to others, the men of learning, as they call themselves, fatter the nails of their little fingers to grow, sometimes to the length of three inches, for the sole purpose of demonstrating the impossibility of their being employed in any sort of manual labour; and upon the same principle, perhaps, the ladies of China may be induced to continue the custom of maiming their female infants in order that they may be distinguished from those of the peafantry, who in most of the provinces are condemned to submit to the drudgery of the field. The interior wrappers of the ladies' teet are said to be seldom changed, a custom that conveys no favourable idea of Chinefe cleanliness; this, indeed, forms no part of their character; the comfort of clean linen, or frequent change of under garments, is equally unknown to the sovereign and the peafant. A fort of thin coarse flits supplies the place of cotton or linen, next the skin, among the upper ranks; but the common people wear a coarse kind of cotton cloth. These velments are rarely removed for the purpose of washing; the consequence is an abundant increafe of those vermin, to the production of which filthinefs is found to be favourable. The highest officers of state make no hesitation of calling their attendants in public to feek in their teets for thofe troublesome animals, which when caught they put between their teeth. They carry no pocket handkerchiefs, but make use of small square pieces of paper, which their attendants have ready prepared for the purpose. They sleep at night in the fame cloaths they wear by day; their bodies are as seldom washed as their articles of dress. At their meals they make no use of table linen, and eat without knife, fork, or spoon; a pair of small sticks, or the quills of a porcupine, are the only substitutes for these convenients articles; and a Chinefe, if his rank enables him, lies down to feep as soon as he has finifhed his lonely meal. There are no infants in any part of this vall empire, that is, no inhabited and furnished houses where a traveller may purchase thofe refreshments of which he stands in need. What they call innis are mean holvs, confifting of bare walls, where, perhaps, a passenger may procure a cup of tea for a piece of copper money, and permission to pas the night, but this is the extent of the comfort which such places afford. The practice indeed of journeying by land is so rare, that no house of decent accommodation could be supported by the occasional visits of travellers. The officers of state invariably make use of the conveniences which the temples afford, as being the belt that can be obtained.

Buildings and Furniture of the Chinefs. The Chinefe buildings, even public monuments, and the emperor's palaces, lioke more by their extent than their magnificence. The imperial palace at Peining may be compared to a large city; those of the princes, principal mandarins, and people of great fortune, contain four or five outer courts, in each of which is a separate building with three gates; that in the middle is larger than the other two, and is decorated with two marble lions, which are placed on either side of it. The halls set apart for receiving visits are neat, and provided with seats, and other plain furniture, but nothing can be perceived in them which marks either magnificence or grandeur. The apartment in which they entertain their friends is equally plain and simple. Thofe set apart for their women and children are inaccessible to every intruder, even the most intimate friend of the master of the house. The Chinese gardens are laid out in a peculiar style. In these are groves, ponds, artificial mountains and rocks, and winding alleys, which conduct to different points of view, each of which presents a new object. The Chinefe are fond of every thing that is gigantic: with them the beauty of a column consists in its size and height; and that of a hall in its extent. Two provinces, viz. Chian-tong and Kiang-nan, abound with excellent marble, and in quantities sufficient to supply the rest of the empire; but the Chinefe are neither acquainted with the art of cutting it properly, nor of applying it to the purposes of building. They generally employ it in constructing bridges, for thresholds to the doors, and to pave their streets, where any of them are paved. Some triumphal arches, temples, and pagodas, are, however, built of it, but without art or taste. The Chinefe exhibit but little attention in ornamenting and embellifying the interior part of their houses: they have neither mirrors, tapestry, nor gilding. They, besides, receive no visits but in a particular hall, which is situated in the front part of the house, and before every other apartment, for the purpose of preventing those who are admitted into it from having any communication with the inner apartment. Its ornaments consist of large lanterns made of painted silk, which are suspended from the ceiling, tables and other furniture, which are generally covered with a most beautiful varnish so transparent, that the veins of the wood may be seen through it, and to bright and shining, that it reflects different objects like silvered glass. The fort of tapestry manufactured in China is of white fatin, on which are wrought birds, flowers, landscapes, &c. Sometimes they contain, in large characters, a few moral sentences, which generally compose a kind of epitaph. Poor people are contented with whitening the walls of their apartments; others cover them with that fort of paper which is brought from China, and which people of fortune, in Europe, used formerly to employ in ornamenting some part of their's. The beds of the rich are furnished in winter with curtains of double fatin, and in summer of plain white taffety, interspersed with flowers, birds, and trees: sometimes they are composed only of very fine gauze, which keeps out gusts and mosquitos, and leaves a free passage for the air. The poils of these beds are gilt, painted and ornamented with what they denominate sculpture. The common people use curtains only of linen, and plain mat-teries, tufted with cotton; in the northern provinces they sleep upon beds constructed of brick. These fquare beds are larger or smaller in proportion to the number of the family.
nily. They are kept warm by means of a small fire. Those who are able place on the bricks a kind of mattress. In the morning this is removed, and its place is supplied by a carpet, or mat; the bed then becomes a fort of couch, upon which the whole family sit and work. At the flowers, the poor people dress their meat and warm their tea and other liquors, for, notwithstanding the heat of the climate, they never drink any thing cold. In the houses of the great the flowers are built in the wall, and the fire is lighted from the outside.

Language and Literature. The Chinese language is not only one of the most ancient in the universe, but is, perhaps, the only language of the early ages, which is still spoken and living: it is indeed extraordinary, as the people who speak it, and has no relation whatever to any known language. Its genius is such that no laws of analogy can comprehend it. It has no alphabet, and the words which compose it consist of one syllable only, and are very few in number. These words always remain the same; that is to say, monosyllables, even when two are united to signify one thing; whether they are written or pronounced, they remain always separate and distinct, and are never blended into one. These monosyllables never produce one sound. When they are written by the European alphabet, they generally begin by the letters ch, kgh, g, or j, b, l, w, n, ng, p, s, ts, vs; the final letters are a, o, 0, ou, u, i, n, ng. The middle of the Chinese words consists of vowels and consonants, which produce only one sound, and are always pronounced as monosyllables. The Chinese language contains only about three hundred and thirty primary and radical words; though some dictionaries make them amount to four hundred and eighty-four. The sense of these primitive words may be multiplied almost without end, by the abundance and variety of accents, inflections, and aspirates used, and by other changes of the voice which pronounces them. The nice distinctions between the tones and accents of words, nearly resembling each other in sound, but varying much in fene, require a great nicety of ear to distinguish, and of vocal powers to render them exact. To succeed in making these distinctions perfectly, a stranger should begin to learn them at an early age, while his organs are flexible and acute. Synonymous words are frequently introduced into Chinese dialogues to prevent any doubt about the sense. If, however, in an intricate disquisition any uncertainty should still remain as to the meaning of a particular expression, recourse is had to the criterion of tracing, with the finger in the air, the form of the character, and thus completely ascertaining at once what was meant by a word. In the Chinese language there are not many minute rules of grammar, conjugation or declension. There is no necessity of distinguishing inflections, adjectives, or verbs; nor any accordance of gender, number, and case, in a Chinese sentence. The beginning or end of words is not altered as it is in the Greek verb, by the times of performing the action meant to be expressed, or the cases in which the things mentioned are intended to be placed. A very few particles denote the pall, the present, and the future; nor are those auxiliaries employed, when the intended time may be otherwise inferred with certainty. The plural number is marked by the addition of a word, without which the singular is always implied. Neither the memory, nor the organs of speech, are burdened with the pronunciation of more sounds to express ideas, than are absolutely necessary to mark their difference. A single syllable always expresses a complete idea, and may be answered by an European confiant preceding a vowel, sometimes followed by a liquid. Such an order of words renders the language soft and harmonious as the Italian, from the rarity of confiants, and the frequency of its vowel

terminations. There is in the Chinese a certain order or setted syntax in the succession of words in the same sentence: a succession fixed by custom, differently in different languages. The formation of Chinese sentences is often the simplest and most artless possible, and such as may naturally have occurred at the origin of society. A simple character repeated, stands sometimes for more than one of the objects which, singly, it denotes; and sometimes for a collective quantity of the same thing. The character of wood, singly, is a tree; repeated, is a thicker; and tripled, is a forest. In Chinese there are fearfully fifteen hundred distinct sounds. In the written language there are, at least, eighty thousand characters, or different forms of letters.

The Chinese characters are divided into fixed sorts; the first exhibiting the shape or image of sensible things; the second indicating the object by some visible addition to the image or symbol; the third associating two characters to express one object, which neither will denote separately; the fourth expressing a sound, in order to supply the defect of the figure, as ya adjoined to the figure of a bird, to represent a duck, &c.; the fifth being a metaphorical application of their characters, by which their language acquires a force and vivacity of colouring peculiar to itself, but at the same time rendering it extremely obscure; the sixth extending the primitive sense of a character, so that the same character may denote a verb or adverb, an adjective or substantive. These characters have been represented by some learned writers for sensible things, and symbols for mental objects, which are tied to no sound, and may be read in every tongue; and this seems to have been the case in the most remote antiquity, when their characters, which are now abbreviated and disguised, might have been more simple and natural. See Phil. Transf. vol. lix. p. 489.

The characters of the Chinese language were originally traced, in most in Indian, with a view to express either real images, or the allegorical signs of ideas: a circle, for instance, for the sun, and a crescent for the moon. A man was represented by an erect figure, with lines to mark the extremities. The difficulty and tediousness of imitation, soon occasioned a change to traits more simple, and more quickly traced. A faint resemblance, however, still remains, in a few infinences, of the original forms in the present hieroglyphic characters; and a gradation of their changes is traced in several Chinese books. Not above half a dozen of the present characters consist of a single line; but most of them consist of many, and a few of seventy different strokes. A certain connexion is to be perceived in the arrangement of the written characters of the Chinese; as if it had been originally formed upon a system to take place at once, and not to grow up, as other languages, by flow and dilatant intervals. Upwards of two hundred characters, each consisting of a few lines, are made to mark the principal objects of nature. These may be considered as the genera or roots of language, in which every other word or species, in a syllabic tongue, is referred to its proper genus. The heart is a genus, of which the representation of a curve line approaches somewhat to the form of the object, and the species referable to it, include all the sentiments, passions, and affections, that animate the human breast. Each species is accompanied by some mark denoting the genus, or "heart." Under the genus "hand" are arranged most trades and manual exercises. Under the genus "word," every sort of speech, study, writing, understanding, and debate. A horizontal line marks a noun; crossed by another line it stands for ten. The five elements, of which the Chinese suppose all bodies in nature to be compounded, form so many genera, each of which comprehends under it a great

number
number of species. As in every compound character or
species, the abridged mark of the genus is discernible, a per-
son is soon enabled to consult the Chinefe dictionary, in
which these characters are arranged under their proper ge-
nera. The characters of the genera are placed at the be-
ninning of the dictionary, in an order, which, like that of
the alphabet, is invariable, and soon becomes familiar to the
learner. The species under each genus follow each other,
according to the number of strokes of which each consists,
indipendently of the one or few which serve to point out the
genus. The species wanted is thus found out, and its mean-
ing and pronunciation are given through other words in
common life, the first of which denotes its signification,
and the other its sound. When no one word is found to
render exactly the same sound, it is communicated by two
words, with marks to inform the inquirer, that the confonant
of the first word, and the vowel of the second, joined to-
gether, form the precise sound wanting. The composition of
many of the Chinefe characters often displays considerable
ingenuity, and serves to give an insight into the opinion and
manners of the people. The character expressive of happi-
ness, includes abridged marks of land, the source of their
physical, and of children, that of their moral, enjoyments.
This character, embellished in a variety of ways, is hung up
in almost every house.

Upon the formation, changes, and allusions of compound
characters, the Chinefe have published many thousand vo-
lumes of philological learning: No where does criticism
more abound, or is more strict. The introduction or altera-
tion of a character is a serious undertaking, and seldom fails
to meet with opposition. The most ancient writings of the
Chinefe are still classical among them. The language seems
in no influence to have been derived from or mixed with any
other. The written forms to have followed the oral lan-
guage, soon after the men who spoke it were formed into a
regular society. The Chinefe printed character is the same
as is used in most manuscripts, and is chiefly formed of straight
lines in angular positions, as most letters are in eastern
tongues. A running hand is used by the Chinefe only on
trivial occasions, or for private notes, for the cafe and expe-
dition of the writer; and differs from the other as much as
an European manuscript does from print. The principal
difficulty in the study of Chinefe writings, arises from the
general exclusion of the auxiliary particles of colloquial lan-
guage, that fix a relation between indeclinable words, such as
are all thofe of the Chinefe language. The judgment must
be confantly exercised by the student, to supply the absence
of such affilation. That judgment must be guided by atten-
tion to the manners, customs, laws, and opinions of the
Chinefe, and to the events and local circumstances of the
country, to which the allusions of language perpetually re-
fer. The Chinefe characters are sketches, or abridged figures;
and a sentence is often a string of metaphors. The
different relations of life are not marked by arbitrary sounds,
flningly conveying the idea of such a connexion, but the qua-
lities naturally expressed to arise out of such relation become
frequently the name by which they are respectively known.
Kindred, for example, of every degree is thus distinguished,
with a minuteness unknown in other languages. That of
China has distinct characters for every modification known
by them of objects in the physical and intellectual world.
Abstract terms are no otherwise expressed by the Chinefe
than by giving to each the name of the most prominent ob-
jects to which it might be applied, which is likewise indeed
generally the cafe of other languages. Among the Latins
the abstract idea of virtue was expressed under the name of
virtus, being the quality most esteemed among them, as filial
piety is considered to be in China. The words of an alpha-
abetical language being formed of different combinations of
letters, each with a different sound and name, whoever knows
and combines these together, may read the word without the
least knowledge of their meaning; this, however, is not the
case with hieroglyphic language, in which each character has
a found annexed to it, but which bears no certain relation to
the unnumbered lines or strokes, of which it is composed.
Such character is studied and belt learned by becoming ac-
quired with the idea attached to it; and a dictionary of
hieroglyphics is lefts a vocabulary of the terms of one lan-
guage with the correspondent terms in another, than a Cy-
clopedia containing explanations of the ideas themselves,
re-presented by such hieroglyphics. In such a case, only, can the
acquisition of Chinefe words be fully said to engross most of
the time of men learning among them. Enough, however,
of the language is imperceptibly acquired by every native,
and may, with diligence, be attained by foreigners, as far as
concerns the ordinary concerns of life.

We now proceed to the literature of the Chinefe. In
their language are a multitude of books, abounding in
useful knowledge; but the highest class consists of five
works: one of which, at least, every Chinefe who aspires to
literary fame must diligently peruse. The first is purely
historical, containing annals of the empire from 2337 years before Christ; it is entitled Shihking,
and a version of it has been published in France. The second
classical work of the Chinefe contains three hundred odes, or
short poems, in praise of ancient sovereigns and legislators,
or descriptive of ancient manners, and recommending an imi-
tation of them in the discharge of all public and domestic du-
ties. They abound in wise maxims, and excellent precepts,
their whole doctrine being reducible to this grand rule, "that
we should not even entertain a thought of any thing base or
culpable." So high an opinion do the Chinefe entertain for
this work, that one of their writers asks, "Why, my sons,
do you not study the book of Odes? If we creep on the
ground, if we be useless and inglorious, those poems will
tafe us to true glory: in them we fee, as in a mirror, what
may beft become us, and what will be unbecoming; by
their influence we fhall be made focial, affable, benevolent:
for, as mutic combines founds in juft melody, fo the ancient poetry
temper and compofes our fations. The Odes teach us our
duty to our parents at home, and abroad to our prince; they
instruct us also delightfully in the various productions of na-
ture." "Hail, thou fublime," said the philofopher to his
fon, "the firit of the three hundred odes? He who fhudies
them not, refembles a man with his face againft a wall, unable
to advance a step in virtue and wisdom." Moll of these
odes are three thousand years old. The work is printed in four
volumes. The third book is entitled Teeling, or the book of
changes, believed to have been written by Po, the Hermes of
the East, and confiting of line regularity variously difpofed;
it is, however, scarcely intelligible to the moft learned manda-
rins. Confucius, himfelf, being d iffatisfied with the com-
mentators upon it, intended to have elucidated it, but was
prevented by death. The fifth, or Liki, is compiled from old
monuments, and confifts chiefly of the Chinefe ritual, and of
tracts on moral duties; but the fourth, entitled Chung-Ciu,
or Spring and Autumn, by which the writer meant the flu-
rifying late of an empire under a virtuous monarch, and the
fall of kingdoms under bad governors, is an interrelling work
to every nation. The Chinefe have their fanzas, odes, eleg-
gies, elegues, epigrams, and fatives. The common people
also have ballads and fongs peculiar to themselves. Some of
the moft diftinguished of the literati have even thought it of
importance to turn into verse the celebrated maxims of mo-
rality,
CHINA.

ralty, the duties of the different conditions, and the rules of
civility for their use. Seldom is the Chinese poetry disdained
by obscurity, and if it ever happens, the author must pay dear
for it if his works fall into the hands of government. It is
in consequence of that rigid and severe attention which
watches over every thing in the least tending to corrupt pub-
lic manners, that all romances, without exception, are ex-
presly prohibited by the laws. The police, however, less
severe than the law, permits such novels and romances as have
an useful tendency, and in which nothing is found prejudicial
to morality. Every writer who writes against government is
punished with death, as well as all those who have had any
hand in the printing or circulation of his works. The rules
of dramatic composition established in Europe are not known
to the Chinefe. They neither observe our unities, nor any
thing that can give regularity and probability to the plot.
Their dramas do not represent a single action; they exhibit
the whole life of a hero, and this representation may be sup-
posed to continue forty or fifty years. The representation of
these is thus described by Sir George Staunton: "The com-
pany of actors successively exhibited, during a whole day,
several different pantomimes and historical dramas. The
performers were habited in the ancient dress of the Chinefe,
at the period when the personages represented were supposed
to have lived. The dialogue was spoken in a kind of recita-
tive, accompanied by a variety of musical instruments; and
each pause was filled up by a loud crash, in which the bo bo
bore no inconsiderable part. The band of music was placed in
full view, immediately behind the stage, which was broad,
but by no means deep. Each character announced, on his
first entrance, what part he was about to perform, and where
the scene of action lay. Unity of place was apparently
preferred, for there was no change of scene during the repre-
sentation of one piece. Female characters were performed
by boys or eunuchs."

Chiefs Education. According to the book of ceremonies,
the education of a child should commence at the moment
of its birth: it allows nurseries, but enjoins mothers to use
the greatest precaution in choosing them. As soon as a child
can put its hand to its mouth, it is weaned, and taught to
use its right hand. At the age of six, he is made acquaint-
ed with the numbers moral in ufe, and with the first prin-
ciples of geography. At seven, he is separated from his sis-
ters; after which he is no longer suffered to eat with them,
nor to fit down in their presence. At eight he is instruc-
ted in the rules of good-breeding and politeness. The calen-
dar becomes his study at the age of nine. At ten he is sent
to school, where he learns to read, write, and count accounts.
From thirteen to fifteen he is taught music; after which he
is instructed in the ufe of the bow and arrow, and how to
mount a horfe. When the Chinefe youth have attained to
the age of twenty, they receive the first cap, if they are
judged to deserve it: they are then permitted to wear silk
dresses, ornamented with fur, but before that period they
have no right to wear any thing but cotton. In their mode
of instruction, the Chinefe select some hundreds of charac-
ters that express the commonest objects, or those at least
which fall most frequently under the perception of the
sense, such as a man, some domestic animals, ordinary
plants, the most useful furniture of a house, the sun, the
moon, and even the heavens. These objects are engraved
or painted separately on certain substances, and under each
is put the name of the thing represented, which points out
to the children the meaning of the word. The first book
put into the hands of a child is a collection of short fen-
tences, consisting of three or four verbs each. They are
obliged to give an account in the evening of what they have
learned in the day. Youth in China have no relaxation from
the severity of their studies, but at the commencement of the
new year, and a few days at Midsummer. After this ele-
mentary treatise, they have to learn the books that contain the
doctrines of Confucius and Mencius; and while they are
learning by heart all the characters, they are taught to form
them with a pencil: for this purpose they have leaves of
paper given them, on which are written or imprinted with
red ink very large characters; these are required to
cover with black ink, and to follow exactly their shape and
figure, which infenfibly accumulates them to form the difer-
ent strokes. After this they are made to trace other char-
acters, placed under the paper on which they write; these
are black and smaller than the former. It is of great ad-
vantoge to the Chinefe literati to be able to paint charac-
ters well, because a deficiency in this respect will frequently
occasion a fudent to be rejected at his examinations when
he is candidate for his degrees. When a pupil has made
himself master of a sufficient number of characters, he is put
upon composition. To incite the youth to improvement
in this part of their education, there is a fort of competition
established in China. Twenty or thirty families, who are all
of the same name, and who consequently have only one hall
for the manes of their ancestors, agree among themselves to
send their children to this hall at stated times in order to
compete. Each head of a family in turn gives a subject
for literary contest, and adjudges the prize; but the exerci-
se of this privilege lays him under the necessity of being at
the expense of a dinner, which by his orders is carried to the
hall of competition. These contests are private, and have
no concern with the rules laid down for public education;
but every student is obliged to undergo an examination, at
least twice a year, under the inspection of an inferior ma-
azar of letters. This practice is general throughout all
the provinces in China. It happens frequently, that the
mandarins of letters order those students to be brought be-
fore them, to examine into the progress they have made in
their studies, and to excite a spirit of emulation among
them. Even the governors of cities do not think it below
their dignity to take this care upon themselves. They
order all the students, who are not far distant from their
residence, to appear at their tribunal once a month. The
author of the best composition is honoured with a prize,
and the governor treats the candidates on the day of com-
petition at his own expence. To encourage learning, there
are in every city, town, and hamlet in every village, mailers
who keep schools, for the purpose of teaching what they
call the Sciences. Besides this, parents, poffessed of the
means, provide preceptors for their children, to attend and
instruct them, to form their minds to the principles of virtue,
and to initiate them in the rules of good-breeding and the
acclimated ceremonies, and, if their age will admit of it, to
make them acquainted with the laws, and with the knowl-
dge of history. To give dignity to the examinations, the
building in which they are held has always something to
distinguish it, even in the smallest cities; but in those de-
nominated capitals of provinces, it is a real palace. When
the competition begins, the students are all flut up, each
in a small chamber, care being taken that no one con-
ceals any thing that might afford him advantage in his com-
position. They are forbidden, under the severest possible
penalties, to carry any thing with them into their closet
but pencils and ink; and from that moment they are allow-
ed to have no communication with any one.

In connection with this part of our subject we may notice,
that
who speaks to his father does it with the greatest reverence and modesty: he does not even call himself the son, but the grandson, though he may be the eldest of the family, and perhaps the father of many children himself. He will also often make use of his own name, that is, the name that he prefix'd at that period, for the Chinese have different names in bosom, according to their age and rank. The family name is that which is given them at their birth; a month after, the parents give a diminutive name to their son, which is generally that of a flower, animal, &c. This name is changed when the youth begins to make progress in his education at a public school, and the master bestows upon him some flattering appellation, which the pupil adds to his name. When he has attained to manhood, he requests a new name from his friends, and this he retains during life, unless he has the good fortune to rise to some dignity in the state, when he is honoured with one that corresponds with his talents and office. No other must be afterwards given him, not even that of his family.

Religion of the Chinese. The primitive religion of China, or at least those opinions, rites, and ceremonies, prevalent in the time of Confucius, and before that period all seems to be fable and uncertainty, may be pretty nearly ascertained from the writings ascribed to that philosopher. He maintains that out of nothing there cannot possibly be produced any thing; that material bodies must exist from all eternity; that the cause or principle of things must have had a co-existence with the things themselves: that therefore this cause is also eternal, infinite, indestructible, without limits, omnipotent, and omnipresent; that the central point of influence from which this cause acts, is the blue firmament, from whence its emanations spread over the whole universe; that it is, therefore, the supreme duty of the prince, in the name of his subjects, to present offerings to Tan, and particularly at the equinoxes, the one for obtaining a propitious field-time, and the other a plentiful harvest. These offerings to the deity were always placed on a large stone, or heap of stones, erected on the summit of a high mountain, on the supposition that their influence would be so much the greater, in proportion as they should approach the seat and fountain of creating power, like the ancient Persians, who confedered the circle of the heavens to be the ruling power of the universe, to which they also sacrificed on high mountains. To the same principle Tacitus refers, observing that the nearer mortals can approach the heavens the more distinctly will their prayers be heard. Noah also, after quitting the ark, built an altar on the mountain where it rested, and made a burnt offering, the smoke of which ascending into heaven, was pleasing to the Lord. Abraham was commanded to offer his only son Isaac on a mountain, and Balaam ascended to the top of Mount Piphah, to offer a sacrifice and to curse Israel. Thus all nations in their infancy seem to have adopted the natural idea of paying adoration to heaven from high places. The large stones or heaps of stones, that have been appropriated to religious rites in almost every part of the world, may have been introduced from the custom among savage nations, to mark with a great stone the place where their worship was intimated; such being at length deified in the opinions of their votaries, the stones that were dedicated to their memory were used in their religious worship. The peculiar homage, that, from time immemorial, has been paid to the memory of the dead by the Chinese, renders probable this explanation of the origin of their altars, or four stones, which are called Tan, and which in former times were erected on most of their high mountains. At the present day the Tan is represented, upon many of the altars erected in their temples, by four stone lions placed in the corners of the altar, as the horns were in the corners of the Jewish altars. As the people increased and spread over the empire, the inconvenience of adorning any particular mountain wastful, and the Tan was then transferred to places better adapted to general accommodation. In the city of Peking, which stands on a sandy plain, the tes-hun, or altar of heaven; the te-hun, or altar of earth; and the ten-hung-hun, or altar of ancient agriculturists, are erected on artificial mounts, within the walls of the palace; and here the emperor continues, to this day, to sacrifice at appointed times, exclusively, as the son of heaven, and the only being on earth worthy to intercede for his people. The same doctrine prevailed in the time of Confucius, who believes that the distance between the all creative power and the people is immeasurably great, that the king, as high priest, can alone offer such a sacrifice; and that this power is wholly satisfied when man performs the moral duties of life, which confect chiefly in filial piety, and unlimited obedience to the will of the prince. In the writings of Confucius appears a strong predilection for predicting events by the mythical lines of Fo-free. By the help of these lines, he pretended to foretell the events that would take place for a considerable length of time. This manner of expounding the lines of Fo-free by Confucius, the supposed system of binary arithmetic by Leibnitz, laid the foundation of consulting future delinings, at this day universally fought after by the Chinese. Government even grants bences to certain persons, who pretend to predict events and cast out evil spirits by a charm, consisting of some character written by them, according to the supposed prevailing planet. Predestination in all ages has formed one of the leading features of popular religion, but the Chinese confine the influence of lots to the events of this life. Other parts of the doctrine of Confucius were well calculated to keep alive the superstitious notions that still prevail among the Chinese multitude. He taught them to believe that the human body was composed of two principles, the one light, invisible, and ascending; the other gross, palpable, and descending; that the separation of these principles causes the death of man, when the light part ascends into the air, and the gross sinks to the earth. The word death never enters into the philosophy of Confucius, nor is it even now employed by the Chinese. When a person departs this life, the common expression is, he is returned to his family, and it was on this ground, that it became the indispensable duty of every good man to observe a strict obedience in the performance of the sacred rites in the temple consecrated to the memory of ancestors. He maintained that all who neglected this duty, would, after death, be deprived of the privilege of visiting the hall of ancestors, and of the pleasure arising from the homage bestowed by their descendants. Such a system could not fail to establish a belief in good and evil spirits profesting over families, towns, cities, houses, mountains, and other particular places.

Neither Confucius nor any of his disciples attached the idea of a personal being to the deity; nor does it form ever to have entered into their minds to represent their first cause under any image or personification. They considered the sun, moon, stars, and the elements, with the azure firmament, as the creative and productive powers, the immediate agents of the deity, and inseparably connected with him, and they offered adoration to these agents, united in one word, Tan (Heaven). The disciples of Confucius, like the Rhois, consider the whole universe as one animated system made up of one maternal substance and one spirit, of which every
every living thing was an emanation, and to which, when separated by death, from the material part it had animated, every living thing again returned. But what has been esteemed surprising is, that the followers of Confucius have never erected any image to his memory, nor paid him divine honours, as has been erroneously supposed. In every city in China, in which examinations for public offices are held, and this building is called the house of Confucius. Here on certain days the men of letters assemble to pay respect to the memory of their philosopher. In the great hall, appropriated for this ceremony, a plain tablet is erected with an inscription to this effect: “O Confucius-to-fy, our revered master, let thy spiritual part descend, and be thou pleased with this token of respect which we now offer unto thee.” Fruit and wine, flowers and perfumes, and other articles are then placed before the tablet and scented gums, frankincense, and tapers of fandal wood are at the same time burnt. This ceremony is in every respect the same as that which Confucius taught to be observed towards the mages of departed relations, who are thought to delight in hovering over the grateful odour of fruits, flowers, and the smoke of incense.

Another religion sprung up shortly after the death of Confucius. A man of the name of Lao-kung, having travelled into Tibet, became acquainted with the worship of the priests of Lama, which he thought suit his countrymen, and he accordingly established a sect under the name of Tao-tees, or fans of immortals. He maintained, like Epicurus, that to live at ease and make himself happy were the chief concerns of man. The doctrine of immortality, a branch of the Metempsychosis, was converted by Lao-Kung, into the art of producing a renovation of the faculties in the same body, by the means of certain preparations taken from the three kingdoms of nature. The infatuated people flew with avidity to the fountain of life. Princes fought after the draughts that should render them immortal, but which, in fact, in numerous instances, brought on premature death. Confident with the principle of “taking no thought for the morrow,” the priests of Lao-Kung devoted themselves to a state of celibacy, as being more free from cares and the incumbrances which necessarily attend a family connection; and, the better to accomplish this end, they associated in convents. Here they practised all manner of incantations, and their succeners perform their magic tricks as they march in procession round the altar, on which the sacred flame is supposed to be kept continually burning. They chant in unison a kind of recitative, and they bow their heads obsequiously every time they pass before the front of the altar. The great Gong is struck at intervals, accompanied by tinkling sounds, emitted by gently striking small metal plates, suspended in a frame. Their temples are crowded with large and monstrous figures, some made of wood, some of stone, and others of baked clay, daubed over with paint and varnish, and sometimes gilt. To these figures, however, they do not seem to pay any homage, but they are intended to represent good and evil genii under the various passions to which human nature is liable.

About the year 65 of the Christian era, the sect of Fo was introduced into China from Hindoostan. The name was derived from the idol Fo, supposed to be the Buddha of Hindoostan, and the chief tenets are those of the Hindus, among which is the metempsychosis, or transition of souls from one animal to another. The priests are denominated bonzes, and Fo is supposed to be gratified by the favour shown to his servants. Since the fifteenth century, many of the Chinefe literati have embraced a new fyltem, which acknowledges an universal principle, under the name of Taik, seeming to correspond with the foul of the world of some ancient philosophers. This opinion may indeed deserve the name of atheism, but it is confined to very few; and the Chinese are far from being atheists, that they go into the opposite extreme of polytheism, believing even in petty deities, who delight in displaying minute acts of magnificence. There is in China no definite religion, none is professed or encouraged by it; the emperor is of one faith, many of the mandarins of another; and the majority of the common people of a third, which is that of Fo. This last clafs, the least capable, from ignorance, of explaining the phenomena of nature, and the most ex acted to wishes which it cannot supply by ordinary means, is willing to recur to the supposition of extraordinary powers, which may operate the effects that it cannot explain, and grant the requests which it could not otherwise obtain. The Chinefe have no Sunday, nor even such a divition of time as that of a week. The temples are open every day for the visits of devotees, and perfons of that description have, from time to time, made grants, though to no great amount, for the maintenance of their clergy; but no lands are subject to ecclesiastical tythes. The common Chinese are remarkably superstitious: besides the habitual offices of devotion, the temples are particularly frequented by the disciples of Fo, previously to any undertaking of importance; whether to marry or to go a journey, or conclude a bargain or change situation, or for any other material event of life, it is necessary first to consult the superintendent deity. This is performed by various methods. Some place a parcel of consecrated flicks differently marked and numbered, which the consultant, kneeling before the altar, shakes in a hollow bamboo till one of them falls on the ground; its mark is examined, and referred to a correspondent mark in a book which the priest holds open, and sometimes even it is written upon a sheet of paper pafled upon the ifide of the temple. Polygonal pieces of wood are by others thrown into the air, each side of which has its particular mark; the side that is uppermost when fallen on the floor, is referred to its correspondent mark in the book of fate. If the first throw be favourable, the person who made it, prostrates himself in gratitude, and undertakes, in confidence, the business in agitation. But if the throw be adverse, he tries a second time, and the third throw determines, at any rate, the question. In other respects, the people of the present day seem to pay little attention to their priests. The temples are, as we have observed, always open to such as choose to consult the decrees of heaven. They return thanks when the oracle proves propitious to their wishes. Yet they more frequently call lots to know the issue of a projected enterprise, than to supplicate for its being favourable; and their worship converges more in thanksgiving than in prayer. Although the religion of Fo teaches the doctrine of the transmigration of souls, and promises future happiness to the people, on certain conditions, yet the Chinese seldom carry the objects, to be obtained by their devotion, beyond the benefits of the present life.

The temples of Fo abound with more images than are found in most Christian churches, and some that bear a greater analogy to the ancient than to the present worship of the Romans. One figure, representing a female, was thought to be something similar to Lucina, and is particularly addressed by unmarried women wanting husbands, and married women wanting children. The doctrine of Fo, admitting of a subordinate deity particularly propitious to every wish which can be formed in the human mind, would fearlessly fail to spread among those classes of the people, who are not satisfied with their prospects, as resulting from the natural causes of events. Its progress is not obstructed by the government.
The cemeteries of the dead exhibit a much greater variety of monuments than the dwellings of the living.

The funeral rites may be reckoned among the Chinese religious customs. Formerly it was usual to bury slaves alive with their dead emperors, but this cruel practice has given way to that of burning representations of their domiciles in tin foil, cut into the shapes of human beings, and of placing their statuettes, in wood or stone, upon their graves. The Chinese burying-places, planted with cypress trees, are at a distance from any church or temple, and are no otherwise consecrated than by the reverence of the people, the remains of whose ancestors are deposited in them. The people prefer those faced in pottery with all the care they can afford to follow upon them. They visit them annually, repair any breaches that accidents may have made, and remove any weeds that may have grown. No person is allowed to be buried within a city, and where there is ground that cannot be cultivated, it is always preferred for places of interment, as les habilable to be disturbed; yet the meanest peasant will respect the spot over which a heap of earth denotes a repository of the dead beneath. The last remains of a relation are interred with all the honours which the family can afford. The loss of a parent in China is esteemed the greatest that can happen to any one, and the sentiment of affection and respect towards such, while living, is not suddenly extinguished in the breach of the forebears. The heart is indulged and comforted by paying superluous duties to the mazes of the deceased. The dictates of nature in this instance are enforced by the moral laws which govern the empire. Every institution tending to maintain the habits of affectionate regard of offspring towards their progenitors, is sanctified into a precept, not to be neglected but at the peril of being accounted infamous.

The funeral processions of the great officers of state, sometimes extend for nearly half a mile in length. In the front marches a priest uncovered, next a group of musicians with flutes, trumpets, and symbols; after these the male relations of the deceased, in long white frocks, and behind them the chief mourner, supported by two or three of his relations to prevent him from tearing his cheeks and hair appear ridiculous; next follows the coffin, covered by a magnificent canopy, and borne generally on the shoulders of men; after the canopy, the female relations proceed in chairs, or in little covered carts, wearing white frocks like the men, their hair dishevelled, and broad white fillets bound round their foreheads. Over the mourners are carried umbrellas, with deep curtains hanging from the edges. Several persons are employed to burn circular pieces of paper, covered chiefly with tin foil, as they pass by burying-places and temples. These pieces, in the popular opinion, like the coin to Charon for being conveyed to the Elysian fields, are understood to be convertible, in the next stage of existence, into the means of providing the necessaries of that new life. Notwithstanding the philosophical doctrines of the learned Chinese, which exclude all notions so confounding with reason, as well as the reality of all beings not referable to the senses, they often yield, in practice, to the notions of the vulgar. The people, among other superstitions, are particularly scrupulous about the time and place of burying their dead. The delay occasioned before those difficult points are ascertained, has often detained the coffins of the rich from their last repository; many are seen in houses and gardens under temporary roofs to prevent them, in the mean time, from the weather; but necessity obliges the poor to overcome many of their scruples in this respect, and to deposit at once, and with very little ceremony, the remains of their relations in their last abode.
peror, who continues, as if it were an imitation of the deity, invisible the whole time.

The celebrated feast of lanterns, when the whole country is lighted up, from one extremity of the empire to the other, in every possible way that fancy can suggest, is an ancient religious usance, of which, at the present day, they can give no plausible account. It has been supposed that it may be derived from a common origin, with an annual illumination of the same kind mentioned by Herodotus; which was generally observed, in the catacombs of the Nile to the borders of the Mediterranean, by hanging lamps of different kinds to the sides of the houes. On this day the Chinese not only illuminate their houes, but they also exercise their ingenuity in making transparentities in the figure of different animals, in which they run through the different streets by night. The effect when perfectly dark, is whimsical enough. Birds, beasts, fishes, and other animals are seen darting through the air, and contending with each other; some with equus in their mouths breathing fire, some sending out fire-rockets, others rising into pyramids of party-coloured fire, and others bulking like a mine with violent explosions.

Throughout the whole empire of China a grand festival is celebrated on the same day, called the vesral festival. In the morning the governor of every city comes forth from his palace crowned with flowers, and enters a chair, in which he is carried amid the noise of different instruments which precede. The chair is surrounded by several litters covered with silk carpets, upon which are represented perfons illustrious for the support they have given to agriculture, or some historical painting on the subject. The litters are hung with carpets; triumphal arches are erected at certain distances; and the houes are every where illuminated. A large figure made of baked earth representing a cow comes next. A child with one foot nailed and the other iold, which represents "the spirit of labour and diligence," follows, beating the image to make it advance. Labourers furnished with implements of husbandry march behind, and a number of comedians and people in masks close the rear, whose appearance and attitudes afford entertainment to the populace. The governor advances to the eastern gate as if he intended to meet the spring, and then the procession returns to the palace in the fame order. After this the cow is stripped of its ornaments, and a number of carthens caves are taken out of its belly, which are distributed, as well as the figure itself, when broken to pieces, among the crowd. The governor then puts an end to the ceremony, by making a short oration in praise of agriculture, in which he endeavors to excite his hearers to promote so useful an art by all the means in their power. Another Chinese festival is that on the commencement of the new year, during which all affairs, whether private or public, are suspended; the tribunals are shut; the polls are dropped; presents are given and received; the inferior mandarins go and pay their respects to their superiors: children to their parents; and servants to their masters. This is called taking leave of the old year. In the evening all the family assemble to take a grand repast, when no stranger is admitted; but on the following day they become more Sociable, the whole of which is employed in diversions and feasting, and the evening concluded with illuminations. It may be worth observing in this place, that almost every intercuirse in China between superiors and inferiors, is accompanied or followed by reciprocal presents, but those made by the former are granted as donations, while those on the part of the latter are accepted as offerings. Chinese terms correspond to these are still applied to the presents passing between the emperor and foreign princes, according to the official style of the arrogated

Vol. VII.

superiority affected by the Chinese court. But when the emperor of China has occasion to make mention of himself, he uses the most modest and, indeed, humble expressions in every thing that relates to his own person, according to the fyllem of Chinese manners; which require, in the mention of one's self, that the most abject terms should be employed, and the most exalted towards those who are addressed.

State of Knowledge in China. It is a matter of doubt whether natural philosophy or chemistry can be said to be known as sciences in this country. There are several treatises indeed on particular subjects in each, and the Chineses possess a very voluminous Cyclopedia containing facts and observations relating to them; but no traces are to be perceived of any general system or doctrine by which separate facts or observations are connected and compared, or the common properties of bodies ascertained by experiment; or where kindred arts are conducted on similar views; or rules framed, or deductions drawn from analogy, or principles laid down to constitute a science; for some there is not even a name. Of pneumatics, hydrostatics, electricity, and magnetism, they may be said to have little or no knowledge; and their optics extend not beyond the making of convex and concave lenses of rock crystal, to affix the light in magnifying, or for the purpose of burning glasses. The single microscope is in common use, but the Chinese have never hit upon the effect of approximating objects by combining two or more lenses. Their books are full of particular proecesses and methods, by which a variety of effects may be produced in chemical and mechanic arts, and much might probably be gained by the perusal of them, by perfons versed in the language of the defcribers, and acquainted with the subject of the description. As soon as the product of any art or manufacture has appeared to answer the purpose for which it was intended, it seldom happens that the discoverer is either impelled by curiosity, or enabled by his opulence, to endeavour to make any further progress towards its encreased utility. The use of metals for the common purposes of life has made them search for them in the bowels of the earth, where they have found all those that are deemed perfect except platinum. If they have not discovered the best methods of separating the precious metals from the substances among which they are found, nor of reducing the ores of others into their respective metals, they have at least succeeded in obtaining them without alloy, whenever they wish to do so. The gold is chiefly collected in small grains among the sand in the beds of rivers and torrents, which carry it down with them as they descend from the mountains. It is pale, soft, and ductile, and is often formed into bracelets, which some mandarins and many women of rank wear round the wrist, not more for ornament, than from a notion that they prefer the wearer from a variety of deceases. The Chinese beat it into leaf used for gilding, and the weavers employ it in their tiflites and embroideries. Trinkets are also made of it at Canton, which are sent to Europe as earrin ornaments. Besides the use of silver as a medium of payment for other goods when it passes according to its weight, it is likewise drawn into threads used in the silk and cotton manufactures. Bell metal and white copper are made in great perfection in China; the latter is found to consist of copper, zinc, and a little silver. The iron ore of the Chinese is not well managed, and the metal is not so soft, malleable, or ductile, as the iron of this country; and their smiths work is exceedingly brittle, clumsy, and without polish. They excel in the art of casting iron, and form plates of it much thinner than is generally known to be done in Europe. Much of the tin imported by the Chineese is formed into as thin a foil as possible, to plate it

upon
upon square pieces of paper, which are burnt before the images of their idols. With the amalgam of tin and quick-silver, they make mirrors; and their speculae, which are much used in China, are formed of crystal, which the Canton artists cut into lamine with a kind of file saw. The powder of the crystal, like that of the diamond, helps to cut and polish itself. In almost every thing the Canton artists are uncommonly expert in imitating European works: they mend and even make watches, copy paintings, and colour drawings with very great success. They supply hangings with coarse silk flossings, manufactured at Canton, though none of the natives wear rich, unless one or some young Chinese, who are fond of following the fashions of Europeans. The toys made at Canton, known under the name of balancers or tumblers, are partly filled with quick-silver. That metal is sometimes used in the same complaints as that to which it is applied in Europe as a specific; but a prejudice prevails among the common people, that it is apt to destroy the powers of one sex, and to occasion barrenness in the other.

The state of phyic is extremely low in China: there are no public schools or teachers of it; and a young man who wishes to become a physician has no other way of acquiring medical knowledge than by engaging himself as an apprentice to some practitioner. He has thus the opportunity of seeing his master's practice, of visiting his patients with him, and of learning such parts of his knowledge and secrets as the other children to communicate. The encomiums of the profession rarely exceed the skill of the practitioner. As many copper coins as are equal to about sixpence are said to be the usual fee among the people, and perhaps quadruple among the mandarins. The latter of high rank have physicians in their household; the emperor's physicians, as well as most of the domelists, are chiefly eunuchs. Medicine is not divided in China into distinct branches; the same person acts as physician, surgeon, and apothecary. The surgical part of the profession is still more backward than the other. Amputation in cases of compound fracture is utterly unknown, and death is the speedy consequence of such accidents. The mortality of the small-pox, jined to the observation that it attacked the same person but once, induced the Chinese, at an early period, to expose young persons to its infection when it happened to be mild. This led to the practice of inoculation, which is first mentioned in the annals of China at a time answering to the beginning of the tenth century of the Christian era. The general method of Chinese inoculation is, when the disease breaks out in any district, the physician carefully collects a quantity of proper matter, which is dried, pulverized, and closely shut up in a porcelain jar, so as to exclude it from the air; and in this manner it will retain its property for many years. When the patient has been duly prepared by medicine, and strictly dieted for some time, a lucky day is chosen for the sprinkling a little of the powder upon a piece of fine cotton, which they impart up the nostrils of the patient. No male physician is allowed to attend a pregnant woman, and still less to practise midwifery; in the indicancy of which, both sexes seem to agree in China. There are books written on that art for the use of female practitioners, with drawings of the flate and position of the infant at different periods of gestation, together with a variety of directions and prescriptions for every supposed case that may occur: the whole is mixed with a number of superfluous observations. In China, as in this country, there are quacks, who gain large sums of money by the sale of nostrums, the efficacy of which is set forth in hand-bills distributed among the people. There are in China no professors of the sciences connected with medicine. The human body is never, unless privately, dissected there. Books indeed, with drawings of the external structure, are sometimes published; but these are extremely imperfect, and confuted perhaps often to find out the name of the spirit under whose protection each particular part is placed, than for observing its form and situation. The phytology of the human body, or the doctrine which explains the constitution of man, is neither understood, nor considered as necessary to be known; and their skill in pathology, or in the causes and effects of diseases, is extremely limited and often absurd. The feat of most diseases is supposed to be discoverable by means of the pulse; yet they have no knowledge whatever of the circulation of the blood. They imagine that every particular part of the human body has a particular pulse alligned to it, and that these have all a corresponding and sympathetic pulse in the arm: thus they suppose one pulse to be situated in the heart, another in the lungs, a third in the kidneys, and so forth; and the skill of the doctor consists in discovering the prevailing pulse in the body, and the mummery made use of on such occasions is highly ludicrous. The bell of their medical books are little better than mere herbs, specifying the names, and enumerating the qualities of certain plants. The knowledge of these plants, and of their supposd virtues, goes a great way towards constituting a physician. Those which are most commonly employed are gin-feng, rhubarb, and China-root. A few preparations are also found in their pharmacopoeia from the animal and mineral kingdoms. In the former they employ snakes, beetles, centipedes, and the aures of fijk-worms and other insects; the meloe and the bee are used for blisters. In the latter, saltpetre, sulphur, native cinnabar, and a few other articles, are occasionally specified. Opium is taken as a medicine, but more generally as a cordial to exhilarate the spirits.

There is no branch of science which the Chinese affect to value so much as altronomy. Nothing indeed can be so well calculated to excite curiosity, and occasion admiration, as the sight which the clear atmosphere of China almost always allows to its inhabitants, of an azure firmament studded with stars. The equidistances of day and night, of summer and winter, and the different phases of the moon, exhibit appearances too striking not to claim attention in the rude as well as the cultivated fages of society. The necessity indeed of being able to mark with some degree of precision the returns of the seasons, in so large a community, must have directed an early attention of the government to this subject: and accordingly we find, that an altronomical board has formed one of the late establishments in China from the earliest period of their history. Yet so little progress have they made in that science, that the only part of its functions which can be called altronomical has long been committed to the care of foreigners, whom they affect to hold in contempt, and to consider as barbarians. The principal object of this board is to frame and to publish a national calendar, and to point out to the government the future times and feasons for its important undertakings. Even when the marriage of a prince is about to take place, the commissiorners of altronomy must appoint a fortunate day for the celebration of the nuptials, which is announced, in form, in the Peking Gazette. In this almanack are inserted all the supposd lucky and unlucky days in the year, predictions of the weather, days proper for taking medicines, commencing journeys, taking home a wife, laying the foundation of a house, and other matters of moment, for entering upon which particular times are assigned. To the superintendence of the Chinese members of this tribunal is committed the altronomical, or, a committee of whom is selected annually.
for the execution of this important task. The phenomena of the heavenly bodies, to an enlightened and intelligent mind, furnish the most grand and sublime spectacle in nature; to the ignorant and superstitious the most awful. The com-
mon people in all countries and of all ages have considered the occasional privation of the light of the two great lumina-
ries of heaven as the forerunners of some extraordinary event. The people of China have, from the earliest ages, considered a solar eclipse as omens of some great calamity; and as great pains are taken to inspire them with a belief that their prosperity is owing to the wisdom and virtues of their so-
vereign, so they are tempted to attribute whatever they think portentous to some deficiency on his part. To this convenient prejudice the emperor finds it prudent to accommodate his conduct. He never ventures upon any undertaking of im-
portance at the approach of such an eclipse, but affects to withdraw himself from the presence of his courtiers, to ex-
amine strictly into his late administration of the empire, in order to correct any error, for the commination of which the eclipse may have been an admonition, and invites his subjects to offer him freely their advice. The Chinese government observes on the event of an eclipse ceremonies similar to those that were in use two thousand years ago among the Egypt-
tians, Greeks, and Romans. When the moon is eclipsed, their musical instruments are struck up, under the notion that by their shrill noise they may affit in relieving the labour-
gods. The brazen gong is violently beat by the Chi-
inese on the occasion; and that such an event may not pass un-
observed, and the luminary may thereby be deprived of the usual affluence of music to frighten away the dragon, which they suppose to have feized upon it, the great officers of state in every city and town are instructed to give public notice of the time when it will happen according to the calculations of the national almanack. "A rude representation of the eclipse," says Mr. Barrow, "that happened while we were at Tong-choo, was stuck up in the corner of the streets; all the officers were in mourning, and all bufineses was suspended for that day." When the Dutch ambassadors were at Peking, the sun was eclipsed on the 21st January 1795, which happened to be the first day of their new year; a day observed through the whole empire with the greatest festivity and rejoicings; and almost the only day on which the bulk of the people refrain from their respective occupa-
tions. The embassador and his suite were summoned to court at the usual hour of three in the morning, and on arriving at the palace, they were told that in consequence of an eclipse of the sun, about to happen on that day, which was a most unfortunate event, postponing an unhappy year to the country, the emperor would not be visible for three days, during which time the whole court would go into mourning, and that the amusements usual on that particular day would be suspended from one end of the empire to the other. Just before the eclipse happened, the members of the mathematical board and other learned men assembled near the palace, each having in his hand a sketch of the obstruc-
tion in order to witness the truth of the astronomer's calcula-
tion. The moment the eclipse begins, they fall down on their knees and bow their heads nine times to the ground, during which is struck up the horrible crash of gongs, kettle drums, trumpets, and other noisome instruments, intending to scare away the devouring dragon.

Astronomy, as connected with the first principles of chronology, has however been in high estimation from a very early period of Chinese history. The first mention of it that has come down to us, is, where the emperor Tao instructed his Astronomers Hi and Ho, how to distinguish and determine the four seasons of the year. "Pirl," says the mighty prince, "Tao observes that Hi and Ho will calcu-
late and observe the places and motion of the sun, moon, and stars; and that they will afterwards teach the people whatever relates to the seasons. Secondly, according to Tao the equality of day and night, and the star Niao, serve to determine the vernal equinox. The equality of day and night and the star Hua point out the autumnal equinox. The longest day, and the star Ho, are the signs of the sum-
er fulcrum. The shortest day, and the star Miao, shew the winter. Thirdly, T'ao informs his two astronomers, that the Hi consists of 366 days, and that to determine the year and its four seasons, an intercalary moon must be employed. Hence it appears that the Chinefe astronomers, even at this early period, were reduced to mark the times when the sun and moon entered the different signs, together with the places of the planets, and the times of the eclipses. We know also from other works of authority, that those who neglected to announce these phenomena, were punished with death. It appears likewise, that even at that time, they knew how to determine the equinoxes and fulcrums by the length of the days and nights, and that they availed themselves of the motion of the planets, in order to compare their places with that of the sun in each of the four seasons. It is also evident, though certainly very extra-
ordinary, that the Chinefe were then acquainted with the length of a year of 365 days and six hours. The Chinefe have always fixed the beginning of the astronomical year at the winter fulcrum; but the beginning of the civil year has varied according to the will of the emperors. The Chinefe year has at all times consisted of a certain number of lunations, twelve of which form a common year, and thirteen the em-
boldening year. They reckon their lunations by the number of days which happen to fall between the moment in which the moon enters the new phase with the moon, and the moment of the conjunction following.

The Chinefe divide their days into a greater or smaller number of equal parts, but besides these they generally divide them into 12 hours, which are, of course, double the length of those adopted by us. Their day begins and ends at midnight. The path described by the sun has been known in China from the remotest antiquity, and the Chinefe have always distinguished the ecliptic from the equator. The former they call houng-tao, the yellow way; the other is named tche tao, or the equinoctial line. The year is also, with the Chinefe, divided into four equal parts or seasons, each of which has three smaller divisions, its be-
ginning, its middle, and its end, that is, a lunation for each of the three parts: it is likewise subdivided into 24 equal parts, each of which contains 15 degrees, so that the whole together makes the 360 degrees. "The Chinefe make use of a cycle of sixty years called "kiate," from the denomination given to the first year of it, which serves as the basis of their whole chronology. Every year of this cycle is marked with two letters, which distinguish it from the others; and all the names of the emperors, for two thousand years and upwards, have names in history common to them with the correspond-
ing cycle. The invariable and regular motion of the moon has been long known by the Chinefe. In the reign of Yao the astronomers were able to calculate, with sufficient preci-
sion, the times of new and full moon. The first day of the new moon, they named cho, commencement or beginning, and the day of full moon, eng, which signifies to expect, or hope: because the people expected the kindness and pro-
tection of certain spirits, which they invoked only at that epoch. To express the age of the moon, besides the numbers, they use the words inferior and inferior flinging: they lay chang-hien, a bow having the string uppermost, and hia-hien, a bow.
a bow having the string underneath. It is that they distinguish what are denominated the quarters of the moon. Their method of intercalation has varied, but it has generally admitted twenty-nine or thirty days for one lunation; the former is called a small lunation, and the latter a greater lunation. They divide the latter according to the following order: the *fossor*, or celestial bud of the north, is what we call the urus major: the *notus*, or celestial bud of the south, which comprehends the principal stars opposite to the great bear; and which, together, form a figure, almost like that of the great bear in the north. The five planets called "ou-hang" are next enumerated; these are Saturn, Jupiter, Mars, Venus, and Mercury: and lastly are mentioned 28 constellations, in which are comprehended all the stars of the zodiac, and some of those which lie near to it. M. Grub, one of the learned Jesuits who resided long in China, and who paid great attention to the astronomy of the Chinese, says they have been long acquainted with the motion of the sun, moon, and planets, and even of the fixed stars from early childhood; though they did not determine the motion of the latter till about 500 years after the Christian era.

To the five planets just enumerated they have assigned revolutions which approach very near to ours. They have no notion of their different situations, when stationary and retrograde; and as in Europe, some of the Chinese imagine that the heavens and planets revolve round the earth, and others round the sun. By reading their books we may perceive, that the Chinese have had a perfect knowledge of the quantity of the solar year; that they have also known how to estimate the diurnal motions of the sun and moon; that they have been able to take the meridian altitude of the sun, by the shadow of a gnomon; and that they have then made pretty exact calculations to determine the elevation of the pole, and the sun's declination: it appears that they have had a tolerable knowledge of the right ascension of the stars, and of the time when they pass the meridian; of the reason why the same stars, in the same year, rise and set with the sun; and why they pass the meridian, sometimes when the sun rises, and sometimes when he sets.

In China the first operations of arithmetic are very generally unknown; in the shops regular entries are made of the articles to be disposed of, and the several prices are affixed in the common Chinese characters equivalent to the words which express numbers in other languages; but not by a distinct figure of figures upon a similar sytem to that of those called Arabic by the Europeans. Their arithmetic is mechanical, and to find the aggregate of numbers, a machine called the "swan-pan" is in universal use, from the man of letters to the meanest laborer. See ABACUS and SWAN-PAN.

The knowledge of the Chinese in geography is as limited as that in astronomy. Their own empire was considered by them as occupying the middle space of the square surface of the earth, the rest of which was made up of islands. When the Jesuits went first to China, they found the charts, even of their own country, rude and incorrect, sketches without any scale or proportion, in which a ridge of mountains covered a whole province, and a river swept away half of another. At present they have neat and accurate maps of the country, copied after the original surveys of the whole empire, undertaken by the Jesuits, and completed after several years labour.

State of the Arts. Little can be said of the state of the fine arts in this country. Of their poetry we have already spoken. Mulie does not seem to be cultivated as a science, nor learnt as an elegant accomplishment, nor practised as an amusement of genteel life, except by females who are educated for sale, or by such as hire themselves out for the entertainment of those who may be inclined to purchase their favours. These women play generally upon wind-instruments, such as pipes and flutes, while the favourite instrument of the men is something like a guitar. Tumults and the lowest classes of persons are hired to play, and the merit of their performance appears to consist in the intenseness of the noise they are able to make. The gong is admirably adapted for this purpose. See GONG, and CHINESE MUSIC. Kettle drums and all different sized bells constitute part of their sacred music. They have also an instrument which consists of stones cut into the shape of a carpenter's squire, each stone suspended by the corner in a wooden frame. It is the boul of the Chinese histrions, that the whole empire of nature has been laid under contribution in order to complete their system of music: that the lines of animals, flowers of plants, metals, stones, and baked earth, have all been employed in the production of sounds. A Chinese band plays, or endeavours to play, in unison, but they never attempt to play in separate parts. They have not the least notion of counterpoint, an invention to which even the Greeks had not arrived, and which was unknown in Europe, as well as Asia, till the mornine ages. See CHINESE MUSIC. With regard to painting, they can be considered in no other light than as miserable dabbers, being unable to pencil out a correct outline of many objects, to give body to the same, by the application of proper lights and shadows, and to lay on the nice shades of colour, so as to render the tints of nature. But the gaudy colouring of certain flowers, birds, and insects, they imitate with a degree of exactness and brilliancy to which Europeans have not yet arrived; to give distance to objects on canvas, by diminishing them, by faint colouring, and by perspective, they have no sort of conception. At Yuen-min-yuen Mr. Barrow found two very large paintings of landscapes, which, as to the pencilling, were done with tolerable execution, but they were finished with a minuteness of detail, and without any of those strong lights and mists which give force and effect to a picture; none of the rules of perspective were observed, nor any attempt to throw the objects to their proper distances. In a country where painting is at so low an ebb, it would be in vain to expect much execution in sculpture. Grotelius images of ideal beings, and monstrous distortions of nature are sometimes seen upon their bridges, and in their temples, where the niches are filled with gigantic gods of baked clay, sometimes painted with gaudy colours, plastered with gold leaf, or covered with varnish. Near the gates of cities four-sided blocks of stone or wood are frequently erected, with inscriptions upon them, to perpetuate the memory of certain distinguished characters, but they are neither objects of grandeur nor ornament. The whole of their architecture is indeed unlighted and unoidal, without elegance or convenience of design, and without any settled proportions. Their pagodas are the most striking objects. See PAGODA. Their temples are mostly constructed upon the same plan. See TEMPLE. Next to these the most conspicuous objects are gates of cities, which are generally square buildings carried several stories above the arched gate-way, and, like the temples, are covered with one or more large projecting roofs. But the most stupendous work of this country is the great wall that divides it from northern Tartary, which is built upon the same plan as the wall of Peking, being a mound of earth caled on each side with bricks or stones. The astounding magnitude of the fabric consists not so much in the plan of the work, as in the immense distance of fifteen hundred miles, through which it is extended, over mountains of two and three miles in height, and across deep valleys and rivers. See WALL.

CHINA.
CHINA.

Chinese Trade, Manufactures, Agriculture, &c.

The trade of China is now encouraged by the government. Even the foreign commerce, which was formerly shut up by their jealous monarchs, has been laid open by the Tartars since the conquest, so that they now trade with Japan, Manilla, Siam, Batavia, and other parts of the East Indies. They likewise derive considerable advantage from their traffic with the Europeans. These have indeed fear to any port open to them, except that of Quang-tong, and that only at certain times of the year; neither are they suffered to fall up quite to that city, but are forced to call anchor at Whang-pu, a place about four leagues distant from foregoing place. Where, however, so crowded with trading vessels, that it looks like a large city. This trade was once very advantageous to the Europeans, who brought thicker cloths, swords, clocks, watches, looking-glasses, diamonds, crystals, telescopes, and other mathematical instruments, and sold them at a high rate; but the market is now overstocked with these commodities, and the trade hardly worth carrying on in any thing but silver exchanged for gold, which is sold higher or lower according to the time of the year; it being cheapest in March, April, and May, when there is the greatest number of vessels in the port returned from Quang-tong. But what the Chinese chiefly depend upon is their home traffic. We ought to consider every province as a separate state or kingdom; some of these abound with certain commodities, or provisions, which others want, and, to communicate which to all the rest, the bell methods have been invented, both by land and water-carriage. Thus the provinces of Ho-quang and Kyang-fi, which abound with rice, supply those that want it; Che-kyang furnishes the finest silk; Kyang-nan the finest ink, varnish, and all sorts of curious metals; Shen-fi, and Shan-fi, yield plenty of iron, copper, and other metals, horeses, mules, and furs; Fo-kyn, the best sugar and tea; and Sechewn the greatest variety of medicinal and other plants; all these are conveyed from one province to another, either by their rivers and canals, or by land-carriage; and when brought to the place of sale, are commonly vended in a few days. The next branch of their wealth arises from their manufactures, of which they have great variety. We shall only speak of some of the most considerable, such as their silk and cotton, their porcelain and Japan ware, or varnish. We begin with the silk, the invention of which the Chinese records attribute to one of the wives of the emperor Wang-ti; since which period many other emperors have been recorded for the singular care they took to encourage it, by breeding the silk-worms, spinning the silk, and delivering it to the proper workmen and women to be woven. Their example could not fail of exciting the rest of their sex to put their hands to such a profitable, as well as delightful, work, by which they were enabled to exchange their old goods, of skins, for the more easy and elegant drefs made of this new and valuable commodity. Upon the whole, that manufacture hath been well cultivated among them from time immemorial, that not only the princes, grandees, literati, and other persons of distinction, but their domestics, the merchants, tradesmen, and mechanics, can afford to clothe themselves with it; none, except those of the meanest fort, and the peasants, appearing in cotton. The quantity they send abroad of it is prodigious, and plainly proves that it employs an infinite number of hands; so that it is not without reason that China is styled the silk country. Neither are the Chinese to be less admired for their surprising ingenuity, diligence, and skill, in the management of every branch of it, the contrivance of their looms, and other instruments for spinning and weaving it in a beautiful variety of colours and patterns; their great care and skill in breeding, hatching, and propagating their worms; and their excellent way of cultivating mulberry-trees to the best advantage for their nourishment.

The Chinese appear to have strong claims to the credit of having been indebted to themselves only, for the invention of the tools required in the primary and necessary arts of life. The traveller will observe, in relation to common tools, such as the plane and anvil, that whether in India or in Europe, in ancient or in modern times, they are found manufactured in the same form, denoting one common origin. In China alone, these tools have something peculiar in their construction, clearly indicating that they are of an original invention. Thus, the flat and somewhat inclined, is among the Chinese swelled into a convex form. The common plane, too, is distinguished by some minute particulars, which characterize it to be original. There is reason to believe, that not only inventions of the first necessity, but those of decoration and refinement, were known among the Chinese in remote antiquity. The annals of the empire bear testimony to the fact, and it is confirmed by a consideration of the natural progress of those inventions, and of the state of the Chinese artists at this time. In the first establishment of an art, it is practised awkwardly, and this state is supposed to continue stationary, until at length it advances to its second period, when it becomes improved, and the artist is enabled to avail himself to the utmost of every tool and machine that can assist him. The last period of perfection is that in which the artist is become so dextrous, as to complete his work with few, or awkward tools, and with little or no assistance. And such is the character of the Chinese potter, weaver, worker in precious metals, and in ivory, and of most others in the several trades commonly practised in the country. The procés of smelting iron from the ore is well known to them, and their cast ware of this metal is, as we have already observed, remarkably thin and light. Of all the mechanical arts, that in which they seem to have attained the highest degree of perfection, is the cutting of ivory. Nothing can be more exquisitely beautiful than the fine open work displayed in a Chinese fan, the flicks of which would seem to be finely cut by the hand; for, whatever pattern may be required, as a shield with a coat of arms, or a cypher, the article will be finished according to the drawing, at the shortest notice. Out of a solid ball of ivory, with a hole in it not larger than half an inch in diameter, they will cut from nine to fifteen distinct hollow globes, one within another, all loofe, and capable of being turned round in every direction, and each of them carved full of the fame kind of open work that appears on the fans. A very small sum of money is the price of one of these difficult trifles. Models of temples, pagodas, and other pieces of architecture, are beautifully worked in ivory, and from the shavings, interwoven with pieces of quills, they make baskets and hats, which are as light and pliant as those of straw. In short, all kinds of toys and trinkets are executed in a neater manner, and for less money, in China, than in any other part of the world.

The various uses to which that elegant species of reed called the bamboo, is applied, would require a volume to enumerate. Their chairs, their tables, their fereens, their bedheads and bedding, and many other household moveables, are entirely constructed of this hollow reed. It is used on board ship for poles, for salls, for cables, for rigging, and for caulking. In hubandry, for carts, for wheel-barrows, for wheels to raise water, for fences, for forks to hold grain, and a variety of other utensils. The young shoots furnish an article of food, and the wicks of their candles are made of its fibres. It serves to embellish the garden of the prince,
and to cover the cottage of the peasant. It is the instrument in the hand of power that keeps the whole empire in awe. Indeed there are few uses to which a Chinese cannot apply the bamboo, either entire, or split into thin bars, or divided into fibres, to be twisted into cordage, or macerated into a pulp, to be manufactured into paper. The discovery of making paper from straw is of very ancient date in China. The draw of rice and other grain, the bark of some trees, and various plants, are employed in the paper manufactures of China, where sheets are prepared to large, that a single one will cover the sides of a room. The finest sort of paper for writing upon, has a surface as smooth as vellum, and is washed with a solution of alum to prevent it from bleaching. Many old persons and children obtain a livelihood by washing the ink from written paper, which is afterwards re-manufactured into new sheets; the ink is also extracted from the water, and preferred for future use. See Paper.

There is no doubt that the art of painting is of great antiquity in China, yet they never proceeded beyond a wooden block. With the Chinese the art consists in nothing more than in cutting in relief the forms of written characters on wood, daubing afterwards these characters with a black glutinous substance, and prefixing upon them different sheets of paper. It has not yet occurred to them to form moveable and separate types; they are satisfied, whenever the same characters very frequently occur, as in the public calendars and gazettes, to use types for such cut apart and occasionally inserted. See Painting.

In China, the chain-pump, nearly in its primitive state, constitutes an essential part in their slips of war, and other large vessels; the principal improvements since its first invention, consist in the substitution of boards, or balketwork for wips of draw. Its power with them has never been extended beyond that of raising a small stream of water upon an inclined plane from one reservoir to another, to serve the purposes of irrigation. They are of different sizes, and worked in different ways, some by oxen, some by treading in a wheel, and others by the hand. The power of the pulley is underflood by the Chinese, and is applied on board all their large vessels, but always in a single flat. The lever is also well known among them, and is applied to weighing all their valuable wares; and the tooth and pinion wheels are used in the construction of their rice-mills, that are put in motion by a water-wheel. But none of the mechanical powers are applied on the great scale to facilitate and expedite labour. Simplicity is the leading feature of all their contrivances, that relate to the arts and manufactures. The tools of every artisan are of a simple construction, and yet each tool is contrived to answer several purposes; thus the bellow of the blacksmith, which is nothing more than a hollow cylinder of wood with a valvular pinion, besides blowing the fire, serves for his flat when set on end, and as a box to contain the rill of his tools. The joiner makes use of his rule as a walking stick, and the chisel that holds his tools serves him as a bench to work on. The pedlar’s box and a large umbrella are sufficient for him to exhibit all his wares, and to form his little shop. Besides the variety of trades which are itinerant in China, there are many thousands of the people, in every large city, who cry their goods about, as is done in our metropolies. Barbers also are keen running about the streets with instruments for shaving the heads and cleansing the ears. They carry with them, for this purpose, a portable chair, a portable table, and a small vessel of water; and, whoever wishes to undergo either of these operations, sits down in the street, while the operator performs his office. To distinguish their profession, they carry a large pair of metal tweezers, with which they make a great noise, in order to obtain employment. There are perfons also engaged in the open streets selling off their goods by auction, and the butchers of Peking not only sell, but dress the meat for their customers, who eat in the shops what is necessary, and having paid the price, go about their business.

The Chinese government has, in all ages, bestowed the first honours on every improvement in agriculture. The husbandman is considered an honourable as well as a useful member of society; he ranks next to men of letters or officers of state, of whom he is frequently the progenitor. The felder, in China, cultivates the ground. The priest also are agriculturalists whenever their estates are endowed with land. The emperor is considered the sole proprietor of the soil, but the tenant is never turned out of possession as long as he continues to pay about the tenth part of what his farm is supposed capable of yielding. And, though the holder of lands is only considered as a tenant at will, it is his own fault if he is disposed. If any one happens to hold more than his family can conveniently cultivate, he lets it to another, on condition of receiving half the produce, out of which he pays the whole of the emperor’s taxes. A greater part of the poor peasantry cultivate land on these terms. In China there are no immense estates, no monopolizing farmers, nor dealers in grain. Everyone can bring his produce to a free and open market; no fisheries are here let out to farm. Every subject is equally entitled to the free and uninterrupted enjoyment of the sea, of the coasts, of the estuaries, of the lakes, and rivers. There are no manor lords with exclusive privileges, nor any game laws.

The Chinese never divide their fields into ridges and furrows, but plant their grains in drills on an even surface. They are not inattentive to the direction of their rows, or doubling their grain, as may be inferred from the solemn regulations, made concerning the annual ceremony of the emperor’s act of husbandry in ploughing the ground. It is felted that he shall plough with his face turned towards the south, and taking hold of the plough with his right hand, he shall turn up a furrow in that direction. The collection of manure is an object of so much attention with the Chinese, that a prodigious number of old men, women, and children, incapable of much other labour, are constantly employed about the streets, public roads, banks of canals and rivers, with baskets tied to them, and holding in their hands small wooden rakes to pick up the dung of animals, and offal of any kind, that may answer the purposes of manure; this is mixed sparingly with a portion of fill, loamy earth, and formed into cakes, dried afterwards in the sun. It sometimes becomes an object of commerce and is sold to farmers, who never employ it in a compact state. Their first care is to construct very large weterns or containing, boxlike those cakes, and dung of every kind, all sorts of vegetable matter, as leaves, or roots, or, iles of plants; mud from the canals, and offals of animals, even to the shavings collected by the barbers. With all these, they mix as much animal water as can be collected, or of common water, as can dilute the whole; and, in this state, generally in the act of putrid fermentation, they apply it to the ploughed earth. In various parts of a farm, and near the paths and roads, large earthen vessels are buried to the edge in the ground for the accommodation of the labourer or passer by who may have occasion to use them. In small retiring houses, built also upon the brink of roads and in the neighborhood of villages, reservoirs are constructed of compact materials, to prevent the absorption of whatever they receive, and draw is carefully thrown over the surface,
from time to time, to prevent evaporation. Such a value is

fet upon the principal ingredient for manure, that the oldest

and most helpless perons are not deemed wholly unuseful
to the family by which they are supported. The quantity of

manure collected by all these means is still inadequate to the
demand. It is referred, therefore, for the purpose of pro-
curing a quick successeion of culinary vegetables, and for

forcing the production of flowr, and fruit. Among the

vegetables raised in the greatest quantities, is a species of

brassica, called by the Chinese P Invoice, which resembles cox

lettuce, and is much relished both by foreigners and natives.

Whole acres of it are planted in the neighbourhood of

populous cities, and it is difficult on a morning to pass through

the crowds of wheel barrows and hand-carts loaded with this

plant, going into the gates of Peking. It is salted for win-
ter consumption, and, in that state, exchanged, in some of the

provinces, for rice. That grain and that herb, together with

onions, serve as a meal for the Chinese peasants and me-

chines. The husbandman always keeps the grain he de-

fends to low in liquid manure until it germinates, which has

the effect of halting the growth of plants, as well as de-

fending them from insects. The great object of Chinese

agriculture, the production of grain, is generally obtained

with little manure, and without letting the land lie fallow.

A mixture of earth, in due proportion, is sometimes substi-
tuted with succes in the deficiency of manure; and a sur-

face of strong loamy clay may, with the addition of sand

and water, be rendered an advantageous medium of support

of vegetable life. Sea-fod is likewise used for this pur-
pose, and, if laid on in proper proportions, it tends to prome

fermentation, which is favourable to the growth of vege-
tables. By practices similar to these, the Chinese supply the
deficiency of manure. They are constantly changing earth

from one piece of ground to another; mixing sand with

that which they find to be too adhesive, and clay or loam

where the foil appears too loose; and having thus given their

land the constituency that it requires, their next care is to

prevent it from becoming dry.

Besides the great plenty of corn, grain, and pulse of

all sorts, which almost every part of this country produces,
it hath likewise a sufficient quantity of pillage-ground, which

feeds a vast quantity of cattle of all sorts; whilst

their spacious woods and forests supply them with as great

plenty and variety of wild beasts; such as buffalos, wild

boars, deer of several kinds, elephants, leopards, tigers, bears,
wolves, foxes, and a variety of others, not known to us,
which afford the Chinese the diversion of hunting, as well
as the commerce and profit of their furs, which are commonly
very fine and valuable. This country also produces the

mulke-cat, a profitable creature. They have, likewise, a fort

of roebuck which they call byang-chang-tie, the male of which

has a bag of a very odorous substance. This creature,

which breeds mostly on the northern ridge of mountains

beyond Peking, is first hunted, then killed; the bag above

mentioned is immediately cut off and tied very hard. that it

may lose none of its effluvia. The flesh is also good to eat;

but the bag is esteemed of more value than the rill of

the carcase. The most delightful, however, of the whole

quadruped kind, is a small flag bred in the province of Yung

nan, and no where else; bought at a high rate by the

princes and nobles, merely to be kept for show in their

gardens. These are exactly shaped like the common fort,

but their size scarcely exceeds that of our ordinary dogs, on

which account they are esteemed as curiosities; but they

have a great variety of flags of different kinds in the other

provinces, some of which are reckoned as extraordinary for

their large size. Birds and fowl, both of the wild and tame

kind, are here in great plenty and variety; such as eagles,

cranes, storks, hawks, falcons, pelicans, birds of Paradise,

peacocks, peafants, partridges, turkeys, geese, ducks, swans,
cocks, and hens, and a vast variety of water-fowl on their

lakes, rivers, and canals. Among the tame and curious fort, they

have a variety of beautiful parrots, not inferior, either in

plumage, colours, or facility of talking, to any that are

brought from America; but the most surprizing and delight-
ful of all the flying kind, is the little bird called kin-kik,

or golden-hen, which is commonly found in the provinces of

Yunnan, Shen-fu, and Se-chwan. This admirable creature
derived its name from the exquisite symmetry of its shape,

the beauty, lufure, and variety of its plumage, the complete

mixture and arrangement of light and flaxe, both in its

wings and tail, and the fine plume that crowns its head:

but what renders it still more valuable among the epicures

is the delicate taste of its flesh, which, we are told, greatly

exceeds that of peafants. China seems to be designed by

nature to produce not only all the fruits which grow in

other parts of the world, but likewise many others peculiar
to its soil and climate; so that, if they have not fo great

a plenty and variety of the former, it is owing to their

neglect of cultivating them; for, in general, they grow na-

turally almost in every province, and many of the more deli-
cate kind in the southern parts to greater perfection than any

in Europe. Apples, pears, plums, quinces, apricots,

peaches, figs, pomegranates, mulberries, melonies, grapes,

oranges, lemons, citrons, melons, walnuts, egeefe, pine-

apples, and other fruits, grow almost everywhere in great

plenty. Yet they are not so curious as the Europeans in

cultivating and improving them, but content themselves

with having three or four different sorts of apples, seven or

eight sorts of pears and peaches; and as for their cherries,

they are hardly worth eating. The only fruits that exceed

ours are their pomegranates, a fine sort of muscadine grapes

of exquisite taste and flavour, and their te-fe, called by the

Portuguese macau, which is a kind of fig. Olives are here

in great plenty and variety, and, though different from ours,

have a very fine taste; but whether out of dislike, or that

they do not think it worth their while, they extract no oil

from them. Among those fruits which grow in the

southern provinces, the h-it is most esteemed. It is shaped

like a date, and hath an oblong tone. The fruit is full of

moisture, of an excellent taste and flavour when full ripe;

but dryed, and grows blackish, like our prunes, by keep-

ing. Next to that is the long-ten, or dragon's-eye, which

is round, and yellowish, the main white, and a little pin-

Both these are esteemed very wholesome, especially the late-
ter, which is taken to create an appetite. They have likewise

some singular as well as useful trees, particularly that

they flyle the pepper-tree, which bears a sort of grain like

a pea, but of too hot a nature to be eaten; but the hulk,

which is less pungent, is used by the common people.

The pea-tree produces a sort of pulse, like our common

pea, only a little more rank. Their wax-tree is so called

from the wax that is produced on it by a kind of little

worm which runs up and falls to its leaves, and quite cov-

ers them with combs. This wax is hard, firming, and consid-

erably dearer than that of common bees; though this last they

likewise have in much greater quantities. When these worms

are once used to the trees of any district, they never leave

them, unless some thing extraordinary drives them away. The

nau-mu is a tall draught tree, the wood of which is incor-

ruptible like the cedar: it is commonly used to make pillars,

doors, windows, or ornaments for palaces, temples, and large

buildings; but it is in other respects much inferior to the

tsse-tau, or ree-wood, which is of a reddish black, streaked,
and full of fine varnished, which appears to be painted by some artist. The furniture and ornaments made of this wood are much esteemed all over the empire, and sold at a greater price than those which are varnished or japanned. We omit a great variety of other valuable and curious trees, such as the cedar, ebony, sanders, pines, oaks, &c., which we have not room to describe. But that which is justly esteemed the most profitable among the Chinese, and hath most excited the envy of the Europeans, is their ti-flu, or varnish-tree, that yields the gum with which they make their fine gian-varnish or japan, which keeps such an infinite number of hands employed in most provinces of the empire, and furnishes it with such a prodigious variety of chests, cabinets, boxes, and other household ornaments, so beautifully painted and varnished, and sent abroad into most parts of the world. The next to that in usefulness is the tong-flu, or oil tree, from which a liquor or oil is drawn, not much differing from the varnish above-mentioned, and used almost to the same end, but chiefly in larger work, such as pillars, cornices, galleries, triumphal arches, and fine floors. This oil, when boiled into a consistency, not only preserves the wood over which it is laid, but gives it a fine luster, and, like the varnish, may be mixed with any colour to great advantage. China is likewise famous for producing the camphor-tree, which grows to a prodigious size, and yields often to the height of 300 feet; its wood is of a firm texture, of great use in ship-building, as well as in joiners' work, from the beautiful gloss it acquires in polishing; but the most valuable part is the gum, which the Chinese are extremely expert in extracting, piercing, purifying, and subliming.

The bark of the tree kind, worth our particular notice, is what they call tie-li-mu, or iron-wood, from its extreme hardness. It is, indeed, very remarkable for its strength and durability, beyond any other wood; the tree is as tall and spreading as our large oaks, and the wood is of a much deeper brown, as well as more weighty and tough.

Almost every part of the country being intersected by rivers and canals, abundance of water is always near at hand; and it remains only for them to contrive the means to convey as much of it as is necessary to the planted grounds. Thus they reap full and constant crops without following, and sometimes without manure. The drained cattle most generally in use are oxen, mules, and asses; horses are scarce, of a miserable breed, and incapacious of much work.

No pains, however, are bellowed to improve the breed, for the Chinese imagine that this animal requires no other attention than that of giving it food. Mistreated for the support of government are neither exorbitant nor burdensome; they consist in the tenth of the produce of the land, in a duty on salt, on foreign imports, and a few smaller taxes that do not affect the bulk of the people. The total amount of taxes and impositions, which each individual pays to the state, does not exceed four shillings a year. With such advantages and such encouragements given to agriculture, one would imagine that the condition of the poor must be better than elsewhere. Yet, in years of scarcity, either from unfavourable seasons of drought or inundations, which are perpetually occurring, in one province or other, thousands perish from an absolute want of food. There are few public charities; no poor laws; and it is not a common custom to ask alms: Mr. Barrow says he did not see a single beggar from one end of China to the other, except in the streets of Canton. The children, or next of kin, must take care of their aged relations; and the parents dispense of their children in what manner they may think best for their family interest. As several generations live together, they are subjected at a cheaper rate than if they had separate house-holds; and in cases of real distress, the government is supplied to act the parent; and whenever any of its officers, through neglect or malice, with-hold grain from the poor, they are punished with singular severity, and sometimes even with death. Another great advantage enjoyed by the Chinese subject is, that the amount of his taxes is ascertained. He is never required to contribute, by any new assessment, to make up a given sum for the extraordinary expenses of the state: except in cases of rebellion, when an additional tax is sometimes imposed on the neighbouring provinces.

We shall conclude this article with a short account of their coin. Silver and copper are the two metallic metals in China; gold being on the same footing as precious stones, purchased, like other valuable mercantiles, according to its weight and fineness. Silver, though used in payment, is not coined, but cut into pieces, smaller or larger, as occasion requires; so that its value is rated according to its weight and goodness. The scales, or rather scales, with which they weigh the silver or gold, and which they commonly carry about them in a neat japanned case, consist of a little round plate, an ebony or ivory beam, and a weight. The beam, which is divided into minute parts on three sides, is suspended by fine silk strings at one of the ends, in three different points, that they may more easily weigh their pieces. These kinds of scales are so exceedingly exact for weighing any money, or small pieces of silver, that from fifteen or even twenty crowns, down to the twelfth part of a penny, and less, may be weighed in them with great accuracy, that the one thousandth part of a crown will turn the scale. The Chinese chafe to have it in that manner rather than coined. If, like the Europeans, they had flamped pieces of determinate value, they say their country would swarm with clippers and coiners, and the dealers be forced to have recourse to their scales and touchstone. The only expeditions they have to pay any sum in silver, is to keep by them a variety of plates of that metal, beaten, either thinner or thicker; besides the ingots, which are reserved for larger sums; and these, by long use, they can cut to a very great nicety. The only coin, properly so called, in use among them, is of copper, and of a very incomparable value, fearfully amounting to the third part of one of our farthings. It is of a round figure, with some Chinese characters on each side, and a square hole in the middle, through which they may be strung to any number. They, however, had, in ancient times, a great variety of coins of gold and silver, which are now only to be seen in the cabinets of the curiosities, and more particularly in that of the late emperor Kang-hi, who caused a noble collection to be made of all that could be found of that kind in the empire, and to be deposited there as curiosities. The noble collection, pound, or liang, weighs fifteen ounces, but is divided into only ten parts, called tien, this into ten fwen, which are equivalent to about seven pence English; the fwen into ten fu of silver. The beam of the Chinese scale carries these divisions no farther; and yet, with respect to gold or silver of a cunfable weight, the division is more minute, and almost extreme imperceptible parts, for which reason it is scarce possible to convey a just idea of them in our language. They divide the h by ten, the h the ten, the ten by ten, the ten by ten, the ten by ten, and the ten by ten. There were periods at which the scarcity of specie obliged their monarchs to raise the value of the small copper pieces to excessively high, that one of them was worth ten of the same face current in former times. This scarcity of copper coin, occasioned either by some vio-
fent irritation of foreigners, who came and carried it away, or through the cautiousness of the people, who buried it in time of war, and died, without discovering where it lay hid, hath been to terribly felt, that at one time an emperor caused near fourteen hundred temples of Fo to be demolished, and all the images and copper work to be call into coin; and at other times the people have been expressly forbid the use of any veils, or other utensils of copper, and obliged to deliver up those they had to the mint.

Penal Laws and Punishments. The laws of China define, in the most periphrastic manner, almost every shade of criminal offences, and the punishment awarded to each crime, and the greatest care has been taken in contriving the scale of crimes and punishments, which are very far from being garrisonary. Of all the despotic governments existing, there is certainly none where the life of man is held so sacred as in the laws of China. A murder is never overlooked, except in the horrid practice of expelling infants; nor does the emperor himself take away the life of the manuelt subject without the formality of a regular process. So tenaciously, however, do they adhere to the principle, "At the hand of every man's brother will I require the life of man: whoso sheddeth man's blood, by man shall his blood be shed," that the good intention is sometimes defeated by requiring of the perfon laft seen in company with one who may have received a mortal wound, or who may have died suddenly, a circumstantial account, supported by evidence, in what manner his death was occasioned. In attempting to proportion punishments to the degrees of crimes, the Chinese seem to have made too little distinction between accidental manslaughter and premeditated murder. To constitute the crime it is not necessary to prove intention or malice; if a man should kill another by accident, his life is forfeited by the law. And however favourable the circumstances may be, the emperor alone has the power of remitting the sentence; a power which he rarely, if ever, exercises, to the extent of a full pardon. The process of every trial for criminal offences, of which the punishment is capital, must be transmitted to Peking, and submitted to the supreme tribunal of justice, which affirms or alters according to the nature of the case. The execution of all capital crimes takes effect once a year, at the same time; and the number, seldom above two hundred, is very small for so populous an empire. In most cases, indeed, fine and imprisonment, flagellation and exile, are the usual inflictions, except in cases of murder, and in crimes against the state or emperor. The punishment of treason extends even to the ninth generation. A traitor's blood is supposed to be tainted, though they usually satisfy the law by including only the nearest male relations, then living, in the guilt of the culprit, and by mitigating their punishment to that of exile. Theft is never punished with death; nor is robbery, unless it be accompanied with personal injury. The moderation of these punishments seems to imply the infrequency of the offence. In a variety of capital punishments, intortulation is deemed less infamous than decapitation: the separation of any part of the body from the remainder being considered as particularly disgraceful. The punishment of the Gangue, which consists of an enormous block of wood, with a hole in the middle, to receive the neck, and two smaller ones for the hands of the offender, is generally inflicted for petty crimes. This ambulatory pillory the culprit is sentenced to wear for weeks or months together, provided lie is able to walk about, but he is generally glad, for the support of his degrading burden, to lean against a wall or a tree. If a servant of a civil magistrate takes it into his head that the culprit has relented too long, he beats him with a leather whip till he rises. The punishment of the bamboo, however degrading it must appear to an European, is ordered upon a very summary hearing upon any individual not in the rank of mandarins; and a victor has not only the power of degrading lower officers, but directing, without the form of a trial, any punishment, not capital, on them. Every mandarin may make use of the haton, or pan-tze, which is a flat piece of bamboo, broad at the bottom, either when any one forgets to salute him, or when he administers public justice. On such occasions, lie sits at a table, upon which is placed a bag filled with small sticks, while a number of petty officers stand around him, each furnished with some pan-tzes, and waiting only for a signal to make use of them. The mandarin takes one of these little flicks and throws it into the hall of audience, upon which the culprit is seized, and receives five smart blows from the pan-tze; if the mandarin draws another flick from the bag, a second officer bellows five more blows, and the punishment is thus continued till the judge is pleased to make no more signals; when the criminal is expected to prostrate himself in gratitude for the paternal discipline. Some crimes are punished either with banishment, or by being condemned to drag the royal barks for a term of years, or to have their cheeks branded with a hot iron. Children who are deficient in duty, are condemned to receive a hundred blows; and if they lift up their hands against their parent, or use abusive language, they are punished with death. The flight of punishment in China is the baltandao, which is only used for chastizing those who are guilty of very trivial faults, and the number of blows is determined according to the nature of the offence. The lowest number is twenty, when the punishment is considered as paternal correction. The emperor even orders it to be inflicted upon some of his courtiers, which, however, does not prevent them from being afterwards received into favour.

The order and administration of the jails are said to be remarkably good. The debtor and felon are confined in separate places, it being thought impolitic and immoral to associate guilt with imprudence or misfortune. The two sexes are likewise kept carefully apart. Confinement for debt is only temporary; but if after the delivery of all, the debtor's property is insufficient to satisfy the demands against him, he is liable to wear a neck-pace in public, for a certain period, to induce his family, if able, to discharge the debt. If his insolvency has been incurred by gaming or other improper conduct, he is subject to corporal punishment and exile. A man may tell himself in China in certain cases, such as discharging a debt to the crown, or to afford a father in distress, or to bury him in due form. If his conduct is unimpeachable, he is entitled to his liberty at the end of twenty years; but if otherwise, he continues a slave for life, as do his children also, if he had included them in the original agreement. The emperor's debtors, if fraudulently so, are flung into a dungeon; if through misfortunes, their wives and children, and property of every kind, are sold, and they themselves are sent to the new settlements in Tartary. In China, the intercessors of the emperor are always made the first object; a property can be sequestrated against his claims. Disputes among individuals concerning property, do not fill up a large space in the tranfactions of Chinese affairs. Property, whether real or personal, is held by tenures too simple to occasion much difference of opinion as to the right to it. There are no entails nor settlements, and the little commerce they maintain with foreigners, together with the university of their own principles, customs, and opinions; but above all, the union which exists in families, among whom, elsewhere, the exclusive right of individuals occasion the greatest feuds; and the sort of community in which most of them continue in China, cut off the principal sources of dissipation.
The halls of audience are, in fact, more engaged in solicitations than in contests, and men of talents are employed, sometimes, to support the cause of others, who are young, ignorant, or incapable; but there is no particular order of men, who submit to influence, as lawyers and attorneys; or who arrive at dignities like the former. The impartiality of the judge is endeavoured to be secured by appointing no man to that office in the province of which he is a native. He is, however, liable to be swayed by the weight of presents. Such offerings are universal from an inferior to a superior, and from a pleader to his judge. They are paid by both parties, and the value of the presents is not ascertainned; it is even expected, that the offerings should be in proportion to the opulence of the donor. By the laws relating to property, women in China are excluded from inheriting, where there are children, and from disposing of property; but where there are no male children, a man may leave by will the whole of his property to the widow. The reason assigned for women not inheriting is, that a woman can make no offering to deceased relations, in the hall of ancestors. And it is deemed one of the first blessings of life, for a man to have some one to look up to, who will transmit his name to future ages, by performing, at certain periods, the duties of this important ceremony.

Natural Productions and artificial Curiosities of China.

Among the natural productions of China must be mentioned the tallow-tree, called by Linnaeus croton feliferum, from which the Chinefe obtain a vegetable fat for their candles. This fruit, in its external appearance, bears some resemblance to the berries of the ivy. As soon as it is ripe, the capsule opens and divides into two or three divisions containing kernels, each attached by a separate foot-Stalk, and covered with a white flaky fat substance. The fat is separated from the kernels by crushing and boiling them in water, and the candles made of it are firmer than those made of tallow, and free from all offensive smell; the wicks are generally made of a light inflammable wood, in the lower extremity of which is pierced a small tube, to receive an iron pin, which is fixed on the flat top of a candlestick, and thus supports the candle without the necessity of a socket. The tallow-tree is said to have been transplanted to Carolina, where it flourishes as well as it does in China. Sugar canes are very much cultivated in China; the plantations of which belong to individuals, and being but of little extent, the expense of erecting sugar-mills is too heavy to have one upon each plantation. The business of extracting the juice of the cane, and of boiling it into sugar, is therefore a separate undertaking from that of him who cultivates the plant. The boilers of sugar travel about the country, with a small apparatus sufficient for their purpose, but which a West India planter would consider as ineffectual and contemptible. It is not a matter of great difficulty to travel with this apparatus, as there are few plantations of which some part is not accessible by water-courses. A few bamboo poles and mats are deemed sufficient for a temporary building; within which, at one end, is fixed a large iron cauldron, with a fire-place and flue, and about the middle, a pair of cylinders or rollers, fixed vertically in a frame. Upon the top of the axis of one of the cylinders, prolonged above the frame, are fixed two shafts or levers, curved in such a manner as to clear the frame in turning round the rollers, and to the end of these shafts are yoked two buffaloes, who, moving round as in a common cattle mill, pref the canes between the cylinders, and express their juice, which is conveyed through a tube into the cauldron. The canes, deprived of their juices, become fit fuel, by means of which these juices are boiled into a proper confluence for granulation. The boiler of sugar endeavours to enter into an agreement with several planters at a time, so that his works, erected near the centre of their several plantations, may serve them all, without changing his establishment. During the time he is employed, the servants and children of the planter are busily engaged in carrying canes to the mill. The canes are planted very regularly in rows, and the earth carefully heaped up about the roots; and under the roots of the canes is found a large white grub, which, bred in oil, is eaten as a dainty by the Chinese. In the neighbourhood of the canes are like-wise several groves of orange trees, of the fruit of which there is a great variety in size and colour. The trees are propagated by suckers, which bear large cones, have kernels much refined by the Chinese; and every mountain, either too steep, or too rocky, to be applied to any other use, is planted to the top with various kinds of pines, but most generally with the larch, as preferred for the purposes of building.

On the sides and tops of earthen embankments, dividing the garden grounds and groves of oranges, the tea-plant is seen growing like a common shrub scattered carelessly about. Whatever it is regularly cultivated, it rises from the seed sown in rows, at the distance of about four feet from each other, and is kept very free from weeds. Visit tracks of hilly land are planted with it, particularly in the province of Fu-chien; its perpendicular growth is impeded for the convenience of collecting its leaves, which is done first in spring, and twice afterwards in the course of the summer. The largest and oldest leaves, which are the least cleft, and defined for the uses of the lowest classes of the people, are often exposed to sale with scarcely any previous preparation, but the young leaves require much trouble before they are fit to be delivered to the purchaser. Every leaf passes through the fingers of a female, who rolls it up almost to the form it had assumed before it became expended in the progress of its growth. It is afterwards placed upon thin plates of earthen ware or iron, made much thinner than can be executed by artists out of China; these plates are placed over a charcoal fire, which draws all the remaining moisture from the leaves, and renders them dry and crisp. The colour and astringency of green tea is derived from the early period at which the leaves are plucked. The tea is packed in large chests, into which it is pressed down by the naked feet of the Chinese labourers. It is sometimes made up into balls, and sometimes a black extract is drawn from it, to which many virtues are attributed. This plant is cultivated in several of the provinces of China, from the very northward by thirty degrees beyond the equator. It thrives best between that parallel and the line which separates the temperate from the torrid zone. Such immense quantities of tea are raised in China, that a sudden failure of a demand from Europe would not be likely to occasion any material diminution of its price at the Chinese markets, though it might be attended with inconvenience to particular cultivators. See Thea.

Another natural production of China is the pe-tun-te, used in the manufacture of porcelain, which is a species of fine granite, or a compound perhaps of quartz, felspar, and mica, in which the quartz seems to bear the largest proportion. It appears from experiment that it is the same as the granite found of the Cornish miners. The mucuous part, in some of this granite, often contains particles of iron, in which case it will not answer the potters' purpose. This material can be calcined and ground much finer by the mills of England than by the imperfect machinery of the Chinese, and at a cheaper rate than the prepared pe-tun-te of their country, notwithstanding the cheapness of labour there. See Porcelain.
CHINA.

The bamboo is a curious and beautiful, as well as a valuable plant. It is properly a reed, hollow, and generally jointed; it is supposed to throunph most on dry ground in the neighbourhood of running water. Its growth is quick, attaining its height, about twenty feet, in a year and a half. It has the properties of being equally light and solid, and it rises out of the ground with a trunk of which the diameter contracts as its length increases; the branches of the bamboo are few, and of a light shining green; the leaves are long and delicate. Within the hollow of its joints is frequently found a singular substance of a silexious nature, which has been used in some countries as a medicine. The Chinese reckon above sixty varieties of the bamboo, and apply it perhaps to as many uses. See Arundo.

Of all the artificial curiosities in China, their flately towers are the most striking to strangers, though built in a style peculiar to this country. There are two of these without the walls of Nan king, the most beautiful of which, fyled the Porcelain Tower, because it is lined all over the inside with China tiles, beautifully painted, is the most admired by all travellers, for its height, symmetry, and variety of carving, gilding, and other ornaments. It is of an octagonal form, nine stories, or two hundred feet high, and lofty feet in diameter; so that every floor is fifteen feet in length. The whole is built on a large basis of brick, strongly cemented, which forms a flately peron, or flight of nine or ten steps, like one of an octagonal figure which you ascend to the first story; and this peron is surrounded with a bannister of unpolished marble on the outside. The first story, or, as it is called, the hall, is the highest of all, but has no windows, nor any light but what comes in at three spacious gates, which open into it. The wall is said to be about twelve feet thick, and eight and a half high, faced with porcelain, but of the coarser sort, and not a little damaged by age. From this you ascend to the second, and thence to all the other stories, which are of equal height, by a very inconvenient stair-case, the lips of which are ten inches high, and very narrow. Every story has eight large windows, one at every front. They all open, as they mount one over the other, so as to form, in the whole, a kind of cone, or sugar-loaf; and between each of them is a bellows or fhed, which projects some feet from the wall all around, and leffens in the same proportion the higher they rise. Each room is adorned with paintings and other ornaments, after the Chinese taste, both on the sides and on the ceiling, whilst the outside is embellished with variety of work in baillo-trench, riches, and imagery. But the most beautiful part of the whole fabric is a kind of cupola, which rises thirty feet higher than the uppermost story, and is supported by a brick wall, fixed at the bottom of the floor of the eightih story. This piece seems to be included in a large iron hoop, all the way, which winds round it like a spiral line or screw, at the distance of several feet, so that the whole looks like a hollow cone rising in the air, and supporting on the top a golden ball of an extraordinary size. Such is the structure of that famed tower, which, whether of brick, marble, or whatever other material, is looked upon by Le Compte, and other authors, as the best contrived, most found and magnificent work in all the East. Nieuhoff adds two circumstances concerning it, viz. that the ball, or pine-apple on the top, is reported by the Chinese to be of mally gold; and the other, that the tower hath flood seven hundred years, and was erected by the Tartars, as a monument of their having made themselves masters of the Chinese empire; whereas Le Compte affirms it to have been, in his time, of no more than three hundred years standing, and to have been built, together with the Temple of Gratitude, by the emperor Yong lo, to which opinion Du Halde seems to subscribe. Most of these towers have in the uppermost gallery, and at every angle, small bells hanging at some distance, by chains or wires, which are easily moved by every blast or wind, and make an agreeable tinkling. But the greatest delight which these kinds of structures afford, is the charming prospect of all the country, exhibiting an incredible number of villas, orchards, gardens, meadows, towns, and monuments. They have a prodigious number of temples, both in town and country. The most celebrated of them are built in barren mountains; to which, however, the industrious and native kings have given beauty which were denied to them by nature, such as canals, cut at a great expense, to convey the water from the adjacent heights into proper refineries, for the use of the bionese and their votaries; gardens, groves, and deep grottoes, cut into the rock, to shelter them from the excesfive heat; circumstances which render these solitudest delightfully romantic. These structures consist partly of line porticoes, paved with large square polished stones, and partly of halls and pavilions, reated in the corners of the courts, having a communication with each other by galleries, adorned with statues either of stone or brass. The roofs of these buildings shine with beautiful japanned tiles, of green or yellow, and are embellished at the corners with dragons of the same colour. The rest of these buildings are built of timber, and most of them have high towers. Most of the cities have large bells set up in their high towers, by which they give notice of the different watches of the night; and those which have no bells make use of large drums. Some of their bells are of a monstrous size and weight; but the largest of all are those of Nan king and Peking. Le Compte mentions fewer they have in the latter of these cities, that weigh one hundred and twenty thousand pounds. This is nearly five times the weight of that at Erfurth in Saxony, which Kircher supposed to be the largest in Europe. But the Chinese bells are very much inferior to those of Europe in sound; their clappers are of a hard wood. Their metal is very coarsen, and full of knots, and their shape is contrived, for they are almost as wide at top as at bottom, their thickness gradually lessening from the bottom upwards; so that, upon the whole, they are mere unwieldy masses of metal, without musical tone, or any thing worth notice, but their huge, dull, heavy sound, and prodigious weight. The last artificial curiosity we shall mention, is their furpling fire-works, in which they may be justly said to excel all other nations. This was the chief use they made of gun-powder, which it is said they had among them many centuries before it was known in Europe; they used to exhibit these fire-works at their feaons fallals and other grand occasions, and in a great variety of figures and representations. They have carried this art to such perfection, that they can give to every object its true form and of its natural colour. Magan takes this to be fruit, that he saw one of them which represented a vine-arbor, that burned without ceasing, the root, branches, leaves, and grapes of which appeared in all their true shape and colour; the grapes were red, the leaves green, and the vine and branches exactly imitated nature.—Anstett Recherches. CHINA.
China, broken, a certain | See Cambodia
China pink, in Botany. | See DIANTHUS Chinensis
China rose, See Hibiscus | Rosa Chinensis.
CHINALP, in Ancient Geography, a river of Africa, the | most considerable in the Numida Maffetorum, or pre-
ferent flake of the Algerines, who call it Seth; it takes | its rife in the Sahara, or Desert, at a distance of about 80 | miles to the S.E. in N. lat. 25° 2'. The fountain which | form its source, from their number and contiguity, are | known amongst the Arabs by the name Sbihiene Aine, | or Shaamun Aion, the fountains. In its course it receives | the Midroen, the Habbeene at the town of Medina, the | Toddsah, or Silver river, the Archew, the Mine, Woraifs, | and Fagin. See SHELLIF.
CHINCHA, in Geography, a fertile valley of South | America, in the province of Peru, where the ancient Incas | had a temple dedicated to the Sun. It was formerly very | populous, but now contains about 500 families. The town, | whence the valley derives its name, is situated about 16 | miles S. of Pisco.
CHINCHE, in Zoology; Buffon calls the Vicarrra | Melifera by this name. New world of Pennant.
CHINCHILLA, in Geography, a town of Spain, in the | province of Murza; 25 leagues S.W. of Valencia.
CHINCHIMEN, in Zoology, a name given by Molina, | and Pennant to the Lutra japonica, or otter, with the | shape and appearance of a cat; its length from nose to | tail is 20 inches. Molina (Chil. 25') says, that it inhabits | the seas of Chili. It lives about in trees, and loves to | bask in the sun, on the tops of rocks; and, when taken, | has all its furs of a wild cat.
CHINCHINA, in Botany. See CHICONA.
CHINCHO, in Geography, a town of European Turkey, | in the province of Dalmatia; 6 miles E. of Spalatro.
CHINCON, a town of Spain, in New Cadile; 15 miles | E.S.E. of M. del.
CHIN COUGH, also called Kink cough, and Hooping- | cough. See Pertussis.
CHINCULAGUA, in Geography, a snowy mountain of | South America, in the Cordilleras of the Andes, in | the province of Quito, N. of Cotopaxi, and of a somewhat | lefs fize.
CHINE, in the Mange, is used for the back-bone, or | the ridge of the back of a horse. The French call it | chine; and the ancient Italian makes offinje.
CHINE, Lai, in Geography, a village of Canada, seated on | the island of Montreal, about 9 miles higher up, whither | goods are sent from Montreal in carts, on account of the | rapids in the river St. Lawrence just above the town. This | village is built on a fine gravelly beach, at the head of a | little bay near the lower end of lake St. Louis, which is a | broad part of the river St. Lawrence. Its situation is very | agreeable; and from some of the three houses belonging to | the king and to the merchants of Montreal, are charming | views of the lake and of the country on its opposite side. | In the king's three houses, the presents for the Indians are | deposed as soon as they arrive from England. In flight of | La Chine, on the opposite side of St. Lawrence, stands | the village of the Cachecnoga Indians, containing about | 50 log houses and a Roman Catholic church, built in the Cana-
dian style, and ornamented within with pictures, lamps, &c. | The number of the Cachecnoagas in this village is esti-
inated at about 150; the other Indian villages in the civil-
ized parts of Lower Canada are, one of the Canadeogas, | situated near the mouth of the Ottawas river; one of the | little Aborg, near Trons River; one of the Abera-
ches, near the same place on the opposite side of the river:
and one of the Hurons, near Quebec; but none of these | villages are as large as that of the Cachecnoagas. The bateaux | that navigate the river St. Lawrence ascend from this place | by means of poles, oars, and falls.

CHINESE NAYLOR. This subject, of which we knew so | little, except from Père du Halte, whose information did | not much enlighten us, has been so amply treated of late | years, by Père Amiot, the Abbé Rouffier, M. L. Boëde, | and the authors of the Encyclopédie Méthodique, that little | would remain to be said, if we had not other references from | which to draw that which may, perhaps, vary our narrative, | if not instruct the reader. The author of the present artic- | le, when collecting materials for his "General History of | Music in every civilized part of the Globe," did not forget | China, the most ancient, extensive, and polished, empire | that exists. He first quotes to an English gentleman, a | good judge of music, who had resided many years at Canton, | and who transmitted them to different distant provinces, | whence he obtained answers in French and Italian, from | missionaries long resident there; and our correspondent at | Canton not only transmitted to us their answers, but sent | with them a complete set of Chinese instruments; among | which there was every species of flutes, several stringed | instruments of the lute and guitar kind, the piano formerly | called jo, telon, be, and ching, the appellation to which we | shall adhere in the course of this article. The ching is a | beautiful instrument, which has a gourd, or bamboo, for | its body, and represents in the arrangement of its reeds | or bamboo pipes, the column of an organ; with these we | received the largest gong which had ever been brought to | England. These instruments were accompanied by Chinese | airs in Chinese character, of notation, and in those of Eu-
rope, with a treatise on music translated into French from | the Chinese, and a poem by the late emperor, Kien Long, on | the suppression of a rebellion in a distant province from the | capital. These are dated Canton, 1775 and 1777. Fur-
ther information from books and various other inquiring | friends, was accumulated before lord Macartney's embassy | took place; when, by his lordship's friendship and liberal | spirit of research, not only for the satisfaction of his own | mind, but the service of others, he extended his patronage | so far as to define the musical hitorian to write down a fe-
cies of questions, not only concerning music, but any thing | else that was wished to be investigated; and satisfactory | answers were received to most of the queries delivered, at | his lordship's return; drawn up by the learned and ingenious | Mr. Hütter, traveling tutor to the son of the late Sir | George Staunton, a gentleman, who, previous to the Chi-
nefe voyage, had resided a considerable time at Naples, | and is a well-informed musician. Another choral of | instruments, and a gong were added to the collection by the | kinchness and liberality of lord Macartney, and from all these | materials, we shall endeavour to furnish curious inquirers after | Chinese music, with as much information as can be com-
pressed into the space usually allowed to articles of a similar | kind.
Music has powers so opposite over human affections, that | whenever it is cultivated it is sure of at least two sets of | friends of very different dispositions, the grave and the | gay. It can equally sooth and exhilarate. The Chinese, the most | grave, formal, and rigid people on the globe, boast the | having framed the proportions of musical tones into a re-
gular sytem 4500 years ago, not only long before the time of | Pythagoras, but that of the Egyptian "Hermes Thri-
 megillus,;"
CHINESE MUSIC.

megillus," or the establishment of their mythalogues or priefets. But music, like other ancient arts, has so much depended on the tranquil and prosperous state of the nations by which it has been patronized, that, after being invented, cultivated, and brought to a certain degree of perfection, it has partaken of all the vicissitudes and calamities of states, and has been so totally lost during the horrors of invasion, revolution, and ruin, that, if, in a long series of years, prosperity should return, neither its music nor its figures is to be found, unless such fragments as, according to M. Baillaire's astronomy, we now possess of the theory and practice of the ancient Greek music. The Chinese, in their books, have preserved the numbers of their ancient feasts as we have preserved the books of Euclid and Ptolemy, which give us (according to the abbe Rouffeur) the "true dimensions of each tone, and their reciprocal generation," which are inapplicable on our key-symbols. So that music being lost after the crash of kingdoms, is again to be found by long labour, study, and experience; again to be lost, and again to be found! per annos statu feudorum.

It is well known in Europe (says and believes the amanuensis, that Egypt had its Mercury Trimegillus, (thrice great,) who, by the sweetSteel of his lyre, civilizèd mankind. It is likewise as well known that Greece had its Ophius and Amophon, who by their strains floated the course of rivers, made rocks dance, and even in the inferior regions silenced Cerberus himself; but Europe has faild to learn that China has had its philosophical musician, its Lyng-tun, its Konèl, and its Pin-mou-kia; whose strains have been equally miraculous in taming the most furious wild beasts, and in civilizing mankind, often more ferocious than beasts themselves. The first chapter in the history of every great nation is mythological, and never to be literally understood. And to say the truth, there seems at present in the music of China less enchantment than in our own. Yet the vulgar of all nation prefer their old traditional tunes to the most compositions, and most exquisite performances that have ever been heard in an opera-house.

"During the first years of my residence at Peking," says the reverend missionary, "I lost no opportunity of trying to convince the Chinese, that our music was superior to theirs. I was pretty well versed in the art; I performed on the German flute and harpschord, and thence I wished to please were not of an ignorant or mean order, but persons well educated and qualified to compare and judge; in short, persons of the first rank, who, honouring the French missionaries with their benevolence, frequently came to their house to converse with them on objects of science, and such arts as were cultivated in China.

"Les Sauvages, and Les Cyclopes, the most admired harpschord lollions of the celebrated Rameau, the most beautiful and brilliant solos of Blavet for the German flute, made no impression on the Chinese. I saw in their countenances only a cold and absent air, which convinced me that nothing I played was at all felt. I talked them one day what they thought of our music, and begged them to speak freely. They answered with the utmost politeness possible, that, "our music not being made for their ears, nor their ears for our music, it was not surprising that they did not feel its beauties, as they did those of their own country." The airs of our music (adds a doctor among them, called Haou-lin, and then in the service of the emperor) pass from the ear to the heart, and from the heart to the soul. We feel, we understand it: what you have been playing has no effect on us: the airs of our ancient music were filled of a higher idea. They were not to be heard without rapture. All our books abound with the most pompous encomiums of its charms; but at the same time they inform us how much the excellent methods employed by the ancients in producing such marvellous effects were lost, &c." If Pere Amiot had tried to convert the Chinese to a love for European music by French singing, we should not have wondered at his failure; but the instrumental pieces of Rameau and Blavet were justly admired in their day; and there have been long a neatness and precision in the execution of instrumental music in France, which has not been exceeded in any other country; so that if Pere Amiot did judge proper to touch the flutes with which he tried the feelings of the Chinese, it was natural to expect a different result.

But a similar disappointment happened to the English musicians during lord Macartney's embassy. His lordship took with him a complete military band of wind instruments, several of whom were able occasionally, to perform well on the violin and the violoncello. But the Chinese seemed wholly unmoved by the perfect execution of the bell pieces, of the bell composers, in Europe. Among the presents which his excellency took to the court of China, was a good barrel organ, made by Gray, as a curious specimen of our mechanism, upon which, besides our bell popular tunes, were set several favourite airs of our own country; to some of which a bass was added, and others were set on the barrel in their native skates, without any accompaniment whatever. The first they did not feel, and the others, perhaps, from not being played in the time and with the expression to which they were accustomed, they would hardly acknowledge. As it was well known that, with all their long cultivation of music, the Chinese had not arrived at counterpoint, or music in parts, the author of this article tried to betray them into a love of harmony, and "the concord of sweet sounds."

"Beings in possession of the melody to the hymn that is annually sung by the Chinese with the utmost pomp, reverence, and solemnity, in honour of their ancestors, in the presence of the emperor, entitled, "The Son of Heaven," attended on this occasion by his sons, all the princes of the blood, the great officers of state, the Mandarins, the letters, men of science, &c., and whose arrival is the signal for the commencement of the hymn; and the melody to this hymn being, like our plainsong, entirely composed of short notes of equal length, it was thought a good foundation on which to build harmony in plain counterpoint; and as there are many stanzas to this hymn, a fundamental base was only added to the melody at first; then a second treble; and, afterwards, a tenor; after which a little motion was given to the base, followed by other additional notes to the tenor and base, but always taking care to enforce the principal melody by one of the other parts, either in unison, or in the octave. But this had no other effect than to try the patience and politeness of the Chinese, who heard it without emotion of any kind. And when it was over, one of the Mandarins, an accomplished man of good sense and good breeding, who attached himself to our ambassador, and seemed impressed with a sincere friendship for him, said, but with the utmost politeness, that "he doubted not but that our music was very fine to ears accustomed to it; but that they were not able to understand it. The additional parts confused and bewildered them; they disputed the air, and needed it doubtful which was the principal sound, adding that much music was too complicated for them, and required more attention than they were accustomed to give to their own airs."

Such are the effects which our harmony has on the ears of the most enlightened Chinese; a fact indeed on the ears of all nations out of Europe. So that the opinion of Rouffeur, that
that "our harmony is only a Gothic and barbarous invention, which we should never have thought of, if we had been more sensible to the true beauties of the art, and to music truly natural," almost ceases to be a paradox.

We shall now endeavor to give a synopsis of the ancient musical system of the Chinese, which, if its chronology is just, must have preceded every other regular system upon earth.

The system of Chinesc music dates from the beginning of the monarchy, at least 2617 years before the Christian era; a proof, according to Pere Amiot, that the Chinese are the original authors of the system of music, which has been too long known in their country; and if it has been altered and abridged in later ages, it must have been from the corruption and decay of the first principles upon which it was founded; and from its being mixed and united with you and abridged sciences, such as divination by numbers, and judicial astrology, that men of true science have abandoned.

The Chinese had, at every period of their history, an universal system, united in all its parts, to which every thing was connected and referred, as well in politics, as physics and morality. To this system they have wished, in some way or other, to make the rules of music accord as well as those of other sciences, connected with their religions and civil establishments. And Pere Amiot, being prefixed to declare what were the peculiar excellencies of the primitive music of the Chinese, from which it derived its miraculous powers, and whether he thought they had ever known harmony or music in parts, similar to that of modern times? he answered in the affirmative; and added, that he thought the Chinese were probably the nation in the world that has best known harmony, and most universally offered its laws. But what is this harmony? It is that which conforms in the general accord of all things, natural, moral, and political, including whatever constitutes religion and government; an accord of which the science of sound is only the representation and the image." So that the expressions concerning this divine music, of which the learned millenarians and the Abbé Roussel have laboured so much to explain the laws, are all allegorical and figurative! even the form of their musical instruments was metaphorical.

Their historians tell us, that Fohi, the founder of the Chinese empire, 2617 B. C., was likewise the inventor of music; that in framing the instrument called tain, a long instrument stringed with flaken strings; the head of which was curved to represent the heavens; the back was level to represent the earth; he placed the dragon (the symbol of China) eight inches from the bridge to represent the eight points of the winds, and gave four inches to the neck of the Fong-Hoang to represent the four seasons of the year. This instrument was furnished with five strings to represent the five planets and the five elements, and its total length is fixed at seven feet two inches to represent the universality of things. By means of this instrument he began by reiterating his own birth, and containing his patriotism within just bounds; he afterwards laboured at the civilization of mankind; he rendered them capable of obeying laws, performing actions worthy of recompense, and of peaceably cultivating the earth, which gave birth to the arts. Fohi had patriarchal longevity, having reigned 115 years.

This is all symbolical and imaginary music; all that concerns real music that is intelligible is, that (according to Pere Amiot) long before Pythagoras, or any of the ancient sages of Greece, had travelled into Egypt, before the establishment of Hierophants, and even before the time of Mercury himself, the Chinese knew the division of the octave into twelve semitones produced by a gammat or series of fourths

and fifths by the Abbé Roussel's favourite triple progression. Of this series of perfect fifths, however, the ancient Chinese used only five, beginning at F, the fundamental of their system, which produced the following treble scales either way, by beginning at the top or bottom of their great L, as each distinct arrangement of sounds is called.

[Diagram of musical scale]

And by giving to these sounds a regular diatonic progression, they furnish the following scale without semitones:

[Diagram of musical scale]

Had they pursued the series of five two degrees further, they would have had E and B, which would have furnished the two semitones necessary to complete the scale in C natural.

The tain (which may be called the lyre of Fohi), all agree, had at first but five strings, which were afterwards increased to seven. But in process of time, they were again reduced to five, on which the tunes in different modes chiefly to be formed, as those that are genuine, and not adulterated by Europeans, who write them down by memory, have no semitones.

Pere Amiot's book is crowded with scales, pyramids, calculations, and diagrams, which leave us as much in the dark as ever; as to what this learned music was, which ancient sages regarded as the universal science, the science of sciences, sciences all other sciences flowed.

Father Amiot did not well know what to do with his Chinesc musical discoveries, till he saw the Abbé Roussel's Treatise on the music of the ancients; nor the Abbé how to illustrate his Pythagorean ideas, till he saw the papers of Pere Amiot, of which papers he afterwards became the editor, and published them in the sixth vol. of his Mémoires concernant l'Histoire, la Science, etc., des Chinois. In explaining and commenting the work of Pere Amiot, the Abbé had a good opportunity, which he did not neglect, of harmonizing the Chinese system with his own.

Not a passage of the ancient music is preferred, or the least
Chinese Music.

First idea suggested of what kind it literally could be; but after all these scales and calculations which seem to imply that real practical music, "which at once delighted the sense and gratified the mind, by the evidence of demonstration;" we find that it was an allegorical music, as inaudible as that of the spheres.

Father Amiot observing that the Abbé Rouffier spoke favourably of the Chinese, in his Memorie für die Musik der Anciens, says, the Abbé Rouffier might, with the assistance of the Chinese, have become the flameau; at once to enlighten men of letters and harmonists; the first by a research into ancient usages, and the last in recovering to China that kind of musical omnipotence which it formerly enjoyed, and which it has unhappily since lost.

"This is another specimen of the wide extent of father Amiot's musical creed.

But one of his countrymen, a gentleman to whom queries concerning Chinese music had been sent, who had resided many years at Peking, and who seems to have understood the subject better than Pere Amiot, says, "To hear the Chinese talk of their music in ancient times, we should suppose it to be something marvellous; they confect, themselves, that not a vestige of it remains, and never cease deploring its loss: but for my part, I can hardly believe that their ancillers had carried the art of music to such a high degree of perfection; if they had, the present Chinese could not fail to have a kind of music at least tolerable, and I am inclined to be of the same opinion as one of their letter's, who told me, that what we read in their books concerning the excellence of their ancient music, should not be understood literally, but figuratively, of the good harmony between the prince and people, and the different orders of the state."

The emperor Kan-hi, the grand-father of the late emperor Kien-long, who began his reign in 1662, and reigned 62 years (Eloge de la Ville de Moutkden, Poeme par l'Empereur Kien-long, 1770, 8vo.), was a true lover of arts and sciences, who tried to procure from the Europeans residing at Peking all the knowledge possible on every foot of subject. With their assistance he had new books written in the Chinese language upon astronomy, mathematics, geography, medicine, &c., which ought to be recorded in our histories, that if in future times it is said that excellent books on these subjects have been written in China, it might be known to whom the debt is due.

The ancient Chinese had no notation; but at present they express sounds by the characters of their language, in imitation of the Europeans. But they have no modulation, and consequently know not what is meant by a, &c., or half note.

In the southern part of China they have only five notes or tones in the octave; but in the north, bordering on Tartar, seven can be distinguished. The generation of the 12 la, or scales, in this MS. treat, differ considerably from those of Pere Amiot. But these scales, in Chinese characters, for which we have no types, though they might gratify curiosity, could convey no more intelligence to the reader concerning the practical music of the Chinese, than those in the treatise of Alyppus, in Musbonius, of the practical music of the Greeks, concerning which we know little more than the alphabet.

After the scales and table of the twelve la, or orders of sounds, combined with the five tones, or rather table of the variations of different la, the very intelligent correspondent of our zealous friend (Mr. R.) concludes thus: "This, sir, is all that I can at present communicate concerning the music of the Chinese, of which Kan-hi said with great truth, the more pains were taken to understand it, the more obscure and perplexing it became, for want of being able to trace it up to its true principles.

"It was said, whether eunuchs were employed as singers on the stage, or in the palace; and the answer was, that since from Europe had been introduced in the palace early in the reign of the late emperor, as musicians, to sing, play on instruments, and teach others; but that was not of long continuance; and now, as formerly, no other use is made of them than as guardians of the wives and concubines of the emperor and of great persons." This communication bears date, Peking, 1785.

We have a letter, likewise procured by Mr. R. from an Italian missionary, on the same subject, who had been near thirty years in China, and had been admitted into the imperial palace to perform to the emperor, among European musicians, who had been sent for, expressly, for that purpose.

Of the ancient music of the Chinese we can have no account but from books, equally fabulous with Egyptian mythology and the Grecian pantheon. But of the modern, we can form an idea, not very wide of the truth, by correspondence and conversation with intelligent persons, judges of European music, who have long resided in China, as well as by drawings of their instruments, and by the instruments themselves in our possession, and by specimens of Chinese melodies (they have had nothing else) current from time immemorial, and they are still current throughout the empire.

But the national airs of China being appropriated to particular times and occasions, are constantly recognized, felt, and understood; so that no Chinese Fontenelle need ask, "Sone ante vent-ru?" the times and the seasons would give him that trouble. Some of these airs are only publicly performed once a year, others twice, and the rest are usually confined to one particular occasion. In high antiquity the nobles of the Greeks had all appropriate names and applications; and their ancient modes the fame, which must greatly brighten their popular effects. "God save great George our King," in turbulent times, and "Rule Britannia" (which has supplant "Britons strike home") in time of war, are proofs of the effects of appropriate tunes.

But the variety after which musicians and dilettanti are ever craving in Europe, prevents all popular effects from new music, however good the composition and performance. Fine music can never have the general effect of familiar and simple airs, which require no science to comprehend. Mr. R.'s friend says, that Pere Amiot has written a treatise of great length on the music of the Chinese, chiefly the ancient, which has certainly suffered many changes from time, and which is now very difficult to verify. It is by the Europeans that the notation which the Chinese now have been furnished, from their own alphabetic characters. That given for the instruments does not correspond with the same European notes as the vocal.

The Chinese, formal and symmetric in every thing, have a specific number of airs for great occasions, which are never changed or varied.

1. The court airs, performed on the emperor's birth-day, and on days of ceremonial, but always when his imperial majesty is present.

2. Airs to inspire true concord and national felicity, performed at the beginning and end of each year, when the emperor ascends his throne.

3. Airs of immolation to virtue, when an eloge on the emperor is read, and his imperial majesty offers sacrifice in a temple to the gods of his ancestors.

4. Ditto, on another day of sacrifice.

5. When his imperial majesty dines in public.

6. Aria.
The Chinese began with simplicity, and habit has fixed that simplicity into an immovable law. The Europeans began their present polyphonic music with complication and eternal change of style; and effusions of unbounded imagination will precede simplicity, and prevent any music from living to be imperfectly comprehended, or becoming venerable for its antiquity.

It is hard to say whether it was an invention of the original inhabitants, or brought thither by colonial invaders. The instrument is called the king, is made of all shapes and sizes, hanging like a bell, and that with a covered mallet, like a gong. Its tone is as clear as if of glass or metal. This sonorous tone Pere Amiot believes to be metallic crystallized, of five different properties; hardness, weight, colour, grain, and tone. It is as hard as agate and precious stones; so that it resists the heat tempered steel. The harder it is, the higher it can be polished, and the clearer its sound. It is so heavy, that a rude piece of it, such as one man might be thought able to carry, requires four to move it. As to colour, it takes of yellow, carnation, white, red, crimson, and deep brown. It oft resembles mahoe of five colours.

The principal use made of these pieces sonorous, is giving signals for a concert to begin or end: the entrance or exit of the emperor, or other great personages, as in Europe by a great bell or cannon.

As to the pitch and tuning of these lapidary instruments, the Abbé Roufier tries hard to prove it to be from the datum F, in the triple progression.

These instruments are suspended by a ring, or rings, to a frame, and the largest give the national pitch, F, to which the rest are proportioned. (See Plute, Music.)

One of the most useful qualities of the king, is, that its pitch is never subject to variation, by heat or cold, like instruments of wood or metal.

The Chinese have such a reverence for this instrument, that they hold it preeminent to use it on common occasions, as the Germans do an organ; and think the English very profligate in using it any where but in a church.

Pliny l. 3. c. 10. mentions a sonorous flone, under the title कादीप; "Caleophonos nigra euf ; sed illius, nisie
tumum reddit."

But the Ching is the only instrument that we have received from China which would please European ears. It is composed of reeds of different lengths, arranged into columns of organ pipes. See Plute, Music. Its tone is more sweet and delicate than that of any of our wind instruments. It is not loud enough for a theatre or concert room; but in a small apartment of a mansion, if cultivated by a musician of taste and science, it might be made the most exquisite and captivating of instruments. It has from 13 to 19 pipes, which speak either by blowing or inhaling, so that a tone may be continued to any length. It never speaks till a hole is open, and as many vintages as are covered by the fingers, so many sounds will be produced; so that duets may be played on a single individual instrument, or even chords, which, if harmonically proportioned, like the tones of our instruments, would greatly delight ears well organized. But no scale has ever been sent to Europe which has come to our knowledge.

Pere Amiot evades giving one. The master of the Ching is equivalent to organist or maestro di capella. These regals, as we may call them, are of different size and compass, and composed of a different number of reeds. The small Ching, of which we have three in our own possession, has 13 pipes or reeds. which, says the Abbé Roufier, gives the 12 semitones of the scale above the generator, or principal. But query, how can we reconcile this to there being no semitones in Chinese melodies?

The belly of several stringed instruments in China is a fection of the gourd or pumpkin.

Such is that of the Ye-Cyen, which is played with a bow, and has two strings which are tuned fifth.

But the Ching has sometimes a section of the cocoa-nut for its base. This instrument is composed of many pipes; each of its reeds has a different tone, produced by a very narrow, thin, brass or copper plate, such as is used in the reed-work of an European organ.

The scale to this sweet little instrument, remains the grand delineament in Chinese music. The Chinese vocal music is not likely to please any other ears than their own. Most of them, even boys not excepted, sing in falsetto, and it seems as if a natural voice was as much disliked by them, as the original shape of a woman's foot. Nor did the officers or attendants in lord Macartney's embassy ever hear in China a base or tenor voice. This unnatural method of singing is not improved by the perpetual tumultuous motion of the voice.

The sound of a double bafe they detest; yet, notwithstanding their dislike of low tones, on their seeming to like the bassoon better than any other of our wind instruments, lord Macartney offered to give it them; but they declined the acceptance, and immediately set a joiner to work, who placing it on the ground, took the exact dimension of its several joints, keys, &c, and made one for themselves.

The Chinese have theatrical dramas, with and without music. Of the latter kind are their comedies and farce. But their tragic scenes are generally accompanied with all the noise of drums, gongs, &c., and the screaming and bawling of mandarins, after which they commonly introduce love scenes and pastoral entertainments.

All the Chinese airs which we have fecor heard, are in common time. "At Canton (says Mr. Huttner) we were surprised by an opera confiding of recitatives and airs that did not want expression. At last I observed that most of our party seemed to be highly pleased with them, and though ignorant of the Chinese language, to understand in some measure the meaning of the words, which, if I am not mistaken, was entirely
entirely owing to the excellent imitation of the different accents of the passions, and to their adequate movements and gestures. These players, natives of Nanking, reminded me of the famous harpists of ancient Rome. The instrumental music which constantly accompanied both recitatives and airs, was very pleasing and in excellent time.

"The military music of the Chinese is indeed miserable, and certainly not at all calculated to inspire courage. It has neither melody, expression, nor time. Hautbois and horns together make such a continued and jarring noise, as if they vied with each other to imitate the howling of cats. Their horns, however, have a very good tone, and resemble our serpents.

"The bell music we heard, was at the presentation of the ambassador at Gecho. After the emperor had ascended the throne, and a religious silence prevailed through the numerous assembly, we were struck with a delightful music from the great tent. The soft sound, the simple melody, the solemn progress of a flow' hymn, gave at least to my mind that elevation to which only Handel's music can raise it. For a long time I remained doubtful whether I heard human voices or instruments, till the latter were seen by some that stood nearer; they were flanged instruments, and a fort of bamboo lyra. The bell resembled those found in profane churches, but had no parts. Between each bar a semimetal metal cymbal followed the tone of the following bar, which had a very good effect; but this was probably a large pierre foncre, and the bamboo lyra was doublets a ching.

"What the Chinese judged of the ambassador's suite, I am not able to determine, but our interpreter told me, they liked their own music much better. They took great notice of the construction, receipts, and management of our musical instruments, as well as of our musical notation.

"For though the missionaries have introduced musical signs in China, they seem to be known only by a few individuals, more as a curiosity, than as the easy and most accurate method of communicating musical ideas. All the music we heard was played by rote, yet I have seen several printed Chinese books of music or musical notes.

"The gentlemen in the ambassador's suite, who are fond of music, sometimes used to take a part in the concerts performed by the band. At this some of the mandarins were surprised; upon my inquiring the reason, I learnt that they, like the Romans, thought music no proper amusement for a gentleman.

"That the exquisite harmony with which Mr. Hüttner was so surprised and pleased on the day of presentation in the great imperial tent, was produced by the Chinese, we have no doubt. That instrument, of which the tones are so extremely sweet, has harmony in itself, as every ventage in the fawzzuds, or pipes of which it is formed, when flot by a finger of the player, produce a different tone; and as many holes are as flot produce an equal number of sounds; and though we know not the scale, nor how to find the several notes, so as to form melody or harmony, yet, by chance at different trials, we have found 3ds, 5ths, 8ths, and every interval consonant and dissonant in the diatonic scale.

Mr. Barrow's account of the music that was prepared for the ambassador and his suite at Canton, is the following:

"On the arrival of Lord Macartney and his officers at the factory, they found in the midst of a garden prepared for them on the opposite side of the river, "a company of comedians hard at work in the middle of a piece, which it seemed had begun at sun-rise; but the squalling, and their shrill and harsh music, were so dreadful, that they were prevailed upon, with difficulty, to break off during dinner, which was served up in a veranda directly opposite the theatre."

"Next morning, however, at sun-rise, they set to work a-feast, but at the particular request of the ambassador, in which he was joined by the whole suite, they were discharged, to the no small astonishment of our Chinese conductors, who concluded, from this circumstance, that the English had very little taste for elegant amusements. Players, it seems, are here hired by the day, and the more incessantly they labour, the more they are applauded. They are always ready to begin any one piece out of a list of 20 or 30 that is prefixed for the principal to make his choice."

"Travels through China.

But though the music of the Chinese is feverly confounded by the gentleman of the embassy, they all agree that they are excellent actors. The best of those that perform at Canton generally come from Nanking.

CHINEY, or CIVI, in Geography. See CHINY.

CHINEY, a town of China, is the third rank, in the province of Tche-kiang; 10 leagues S. of Chao-hung.

CHING, or CHING-TING-FU, a town of China of the first rank, in the province of Pe-te-lu-li, situated near a fine river, of an oblong figure, and walled, and near 4 miles in circuit. Under this are 32 cities, 5 of the second, and 27 of the third rank. Upon the adjacent mountains N. of it, which produce a great variety of medicinal herbs, are several superb monuments erected to the heroes of the Chinese, and one in particular, consecrated to the memory of the first emperor of the dynasty of Han.

CHING-CHEW, a city of China of the first rank, in the southern district of the province of Hou-quang.

CHING, or CHING, in Zoology, the name given by Molina, who has described it, (Culi c.60,) to the Rivera Chingle, or black wazle, with changable calls of blue, with a row of white spots from head to tail. In shape and general form, it resembles the Chincha, which feel. It is a native of Chili; and Molina says, that the fish turning from it is owing to a certain green oil, ejected from a follicle or receptacle near the tail. The Indians are said to value the skin of this species on account of its beauty, and to use it for various purposes, quits, c. c. &c. Shaw.

CHING-HAI, in Geography, a town of Asia, in the kingdom of Corea, 60 miles E.S.E. of Kang-teenth.

CHING-HO-ANG, a mountain of China, in the province of Tche-kiang, near its capital, Hang-chien, or Hang-teenth-flou; on which stands a high tower, which, by the help of a large water glass that is made to turn the hand of a dial, shews the hour of the day at a considerable distance: the figures of the hours being gilt, and about 18 inches long.

CHING-KYANG, or CHING-ANG-FOU, a city of China, of the first rank, in the province of Yunnan.

CHINGOLEAGUL, a small American island, near the coast of Virginia. N. lat. 37° 50'. E. long. 75° 26'.

CHING-GONGO, a river of Hindustan, which rises in the Ellichpou country, and runs into the Godavery, 16 miles S.W. of Nereeul.

CHING-NGHAN, or CHING-NAN-FOU, a city of China, of the first rank, in the province of Quang-ti.

CHING-TU, or CHING-TAO-FOU, a city of China, the capital of the province of Se-chwen, or Se-tchuen, formerly the residence of the emperors, and one of the largest
and most beautiful cities of China; but in 1646, it was almost entirely destroyed during the civil wars which preceded the last invasion by the Tartars; its temples, bridges, and the ruins of its ancient palaces, are still objects of admiration to strangers. Father Martini, in his Chinese Atlas, mentions a singular bird that is seen in the neighborhood of this place, called "tong-hoa-fang," or the bird of the flower; "tong-hoa," from which the vulgar pretend that it is produced, on account of the resemblance of its plumage to the colour of this flower; so that it is called the "living flower." This city has under its jurisdiction 6 cities of the second, and 15 of the third rank.

CHINAIA, Sr., a town of France, in the department of Hérault, and chief place of a canton, in the district of St. Pons. The place contains 28,38, and the canton 710,5 inhabitants; the territory includes 230 kilometres, and 10 communes.

CHINZ, a town of Peru, in the province of Farfílan, situated on the Perion gulf; 140 miles W. of Cíchara.

CHIN KEIOU, a town of China, of the third rank, in the province of Ho-nan; 15 leagues N.E. of Yen-hing.

CHIN-LI, a town on the N.W. coast of the island of Ho-nan, of the third rank; 12 miles W. of King-tshên-tou.

CHIN-MOU, a town of China, of the third rank, in the province of Chên-fê, on the river Kin; 50 miles N.W. of Kia.

CHINNA, in Ancient Geography, a town of Europe, in Dalmatia. Polonymia. This is named Cinn in Antioch's itinerary.

CHINNABALABARAM, in Geography, a town of Hindooostan, in the Mofor country; 87 miles N.E. of Sereigapetum. N. lat. 12° 25', E. long. 77° 54'.

CHINNAPUTTU, a city of Hindooostan, with a fort of stone, in the Nuzam's territories, 97 miles, or about 564 geographical miles W.N.W. from Sairone-Dancapour.

CHINNOR, an instrument of music among the Hebrews, consisting of thirty-two chords. Kircher has given a figure of it.

CHINON, in Geography, a town of France, and principal place of a district, in the department of the Indre and Loire; situated on the Vienne, and defended by a strong castle. The place contains 6156, and the canton 15,549 inhabitants; the territory includes 247.5 square kilometres, and 13 communes. It is distant 8 leagues W. S.W. from Tours, and 21 S.E. from Saumur.

CHING-I, in Ethnology, the name given by some writers to the Tibet peaceock, Pavo Tibetanus, which see.

CHINSE, in Sino Language, is used for thrilling oxum in to a frain or chin, with the point of a knife or chisel.

CHIN-SHAN, or the Golden Mountain, in Geography, an island of China. Situated in the middle of the river Yangtze-kiang, which rises almost perpendicularly out of the river, and is intersected with gardens and pleasure-houses. Art and nature seem to have combined in giving to this spot the appearance of enchantment. It belongs to the emperor, who has built upon it a large and handsome palace, and on the highest eminence several temples and pagodas. The island also contains a large monastery of priests, by whom it is chiefly inhabited. In one of the plates annexed to the "Emphasis to China," we have a view of this island.

CHINSURAH, called also Howgly, a town of Hindooostan, in the province of Bengal, situated on the western bank of the Ganges, 40 leagues from its mouth at Calcutta, about 10 from Patna, and 17 miles W. from Calcutta. The Dutch, who established a settlement in this place, obtained it by gift, or rather by purchase, from the Mogul government. It is partly built along the river, and requires three-quarters of an hour to walk round it. On the land side it is closed by barrier-gates; within, it is very irregularly built; it has many markets or bazaars, which are plentifully supplied with all kinds of goods and provisions; that of the money-changers, which is a long and broad street, is the handomest. The principal houses are built of brick, with terrace-roofs, in the Moorish style; they consist only of one story, and are whitened on the outside with lime, which gives them an elegant appearance. Little wood is used in the buildings, because it is liable to be destroyed by the white ants. Instead of glass windows, frames of twisted cane are used. The apartments, thus guarded from the extreme heat which prevails for four or five months in the year, are spacious and airy, and provided on the fourth floor with galleries or porches, resting upon pillars. On the terrace-roofs the inhabitants take the evening air, and sometimes pass a part of the night with their friends. The houses, or rather the huts, of the poor Bengalees are mostly made of mud and straw, and receive their light through the entrance. The town has a handsome little church with a steeple. The lodge, formerly belonging to the Dutch East-India Company, is an oblong figure with stone walls, and called Guldenuf fort. A battery of 21 pieces of cannon is thrown up, by the river side, for the purpose of firing salutes. Howgley is a Moors fort, about half an hour's walk from Chimbhurah; but it is not in a very defensible state. The English are now in possession of Chimbhurah.

CHIN-TCHEN, a town of China, of the third rank, in the province of Chên 8; 25 miles N. of Tseng.

CHINY, or Chinee, a town of France, in the department of the Sambre and Meuse; and chief place of a canton, in the district of Dinant, seated on the Semoy, 9 leagues W. of Luxembourg. The place contains 1257, and the canton 5978 inhabitants; the territory includes 275 kilometres and 18 communes. Before the revolution, this town was the capital of a comte in the duchy of Luxembourg, which was of great extent, and included 13 cities or capital towns, and it was sometimes called imperial. After passing through the possession of several proprietors, since Bruz, the 12th archbishop of Cologne, and chancellor of the empire, erected it into a comte, about which time it was surrounded with walls; it was adjudged to the house of Austria, by the treaty of Ryswick.

CHIN-YANG. See CHEN-YANG.

CHIHO peer, a name given to a small species of pears, called also the honey-pears. The fruit resembles the little mulberry in its sweet flavour. Its skin is yellow streaked with red; its flesh is round, white, and not hang in clusters, but singly on the tree.

CHIJOCCO, ANDREW. In Geography. Of the life of this ingenious and learned physician, we have few memoirs. We only know he was a native of Verona, where he appears to have practiced medicine, towards the end of the 17th and the beginning of the 18th centuries, and that he died there on the 3d of April, 1724. From his works it is that we obtain the information that he was well versed in the learning of the classics; that is, that he was unacquainted with the writings of Aristotle, and of Galen, whose dogmas he everywhere defies; and that he was more than moderately imbued with critical and polemical literature. The following are among the most esteemed of his productions: "Quaestionum Tabaram et Medicam Litera transt.," 4vo, 1744. He defended the practice of giving antimonial vomits, and infuses the tincture of hasty excreta more frequently in the body, than in the kaduce." "Dicroa de Sacra Litera, de contagiis, &c. Carmina decrptur," 4to, 1797. He also gives a full description of the flowers, fruits, and vegetables, of the country.
character of this poem, which we have not seen, also of his defence of the Sibyls of Frazerius, against the
fictions of Scaliger. "De Aereus Verom's elen cens, 1597, 4to: from the general longevity of the inhabitants,
many of them having attained a great age, he argues for
the salubrity of the soil and atmosphere of that city. He
also wrote a treatise on contagious fevers, and of the utility
of bleeding, with the view of removing obstructions: Also
"De Collegiis Veroniis illustribus Medici: &c," 1623, 4to: The account of the writings of the per-
tems commemorated, which should have formed a principal
feature in the work, is very imperfectly performed." Haller
Bot. Med.

Eff. Ch. Corolla quadripartit; divisions extremely long; drupes with a striated nut.

lanceolate, somewhat pubescent underneath; drupes globu-
lar," Lam. A shrub from six to ten feet high. Leaves opposite, petioled, entire, from five to seven inches long, and
about three broad. Flowers white, in pendulous panicle
racemes; segments of the corolla eight or nine lines long,
whence it has been called fringe-tree. Lam. A native of
South Carolina and Virginia, in moist places on the banks
of rivers; flowering in June. 2. C. zeylanica. Linn. Sp.
Pl. 2. Mart. 2. Linn. Decay. 2. Illuf. 2. tab. 9. fig. 2. (C. cotinifolia, Willd. Arbutus zeylanica cotitii folia, Pulk. Alm. 241. fig. 4.) "Pedicules panicled, many-
flowered." Linn. "Leaves egg-shaped, villous underneath;
drupes inerfylly egg-shaped." Lam. Nearly allied to the
preceding, but differs in the shape of the leaves; the seg-
ments of the corolla also, as figured by Pluknet, are five
in number, and shorter in proportion than those of C. viri-
ngica. A native of the island of Ceylon. 3. C. parviflora, Lam.
Pl. 3. (C. zeylanica, Willd. ? Thunia mutata, Linn. jam. Sup. 89.) "Leaves elliptical, quite smooth, veined;
flowers purple, nodding." Lam. A native of Ceylon.
2. Wild. 3. (C. caribæa, Jacq. Collec. tab. 6. fig. 1.
Linn. Illuf. 5.) "Pedicel striatominous; the last flowers
somewhat epicate; calyces villous; leaves lanceolate-ob-
long; anthus acuminate," Swartz. "Leaves smooth on both sides, very acuminate; calyces ciliated." Jacq. A
tree fifteen feet high, with a darkly ah-coloured bark.
Leaves about half a foot long, an inch and a half broad, op-
oppose, on short pedicles, quite entire, thickish, firm, thinning.
Flowers snow-white, with long linear segments; bractes at
the divisions of the peduncles, opposite, small, narrow, con-
cave, sharp, somewhat villous; calyx deeply cleft; segments
egg-shaped, acute, somewhat villous, ciliated at the edge;
styles twice as long as the calyx. Jacq. A native of the
tab. 39. fig. 6. "Drupe egg-shaped, attenuated at both
ends, angularly furrowed." Fruit described and figured by
Garriner from a specimen belonging to the botanic gar-

CHIOCOCA paniculata, Linn. Jun. Lam. See Psycho-
Tria paniculata.
eden at Levden. Plant unknown. 7. *C. inaequalis*, Swartz. Prod. 13. Wild. 5. (C. meyaea, Vahl. Syn. 2. 1. Mart. 4. Caravus, Schrebri, Gmel. Sys. Veg. 1. 26. Mayerea, guianensis, Aub. Guin. tab. 31. Lam. Encyc. Illust. tab. 72. Juss. 319. Vent. 2. 312.) "Panicles axillaries, trichotomous; flowers all distinct; authors obsolete." A shrub five or six feet high, covered with a whitish bitter bark. Leaves five inches long and two broad, oval-oblong, entire, thin, firm, ending in a point; petals short, few and hard at the base. Flowers bracteate, small, white, of an agreeable smell Fruit oblong, about the size of an olive; the fleshy part two lines thick, violet, succulent, bitter. To deference to the high authority of Swartz and Vahl, we have placed this plant under the present genus; although we are slow to believe, if we can rely on the accuracy of Anubt's description, which appears to be the only original one in existence, a very considerable alteration must be made in the genuine character, before it can be fairly admitted. This alteration, however, we have not ventured to make, much doubting whether it would not be better to follow the French botanists in keeping it distinct. See *Mayrepa*. A native of the forests of Guiana.

CHIONIS. In *Ornithology*, one of the synonymous names of the Sheshthell, *Vagnalis alba*. Poult. Lat. &c.

CHIONITE. In *Antient Geography*, a people of Asia, neighbour, and allies of the Persians, according to Ammianus Marcilalinus, who inhabited the vicinity of the Calypian sea, near the Gilonian and Albani.

CHORME, a band or crew of galley-lives, and of Bonavaghers, or volunteers, who pull the oars in a galley.

CHIOS, now Skio, in *Antient Geography*, an islet of the Egean sea, about 500 leagues in circuit, lying between Lesbos and Samos, and opposite to the peninsula of Ionia, from which it was probably detached, as it is now separated from the continent only by a canal or strait three leagues wide.

To the ancients this island was known by the names of Athalia, Maris, and Pithyusa; but the most prevalent name was Chios, which some have derived from the Greek word *chios*, signifying snow, the mountains of the island being often covered with snow; but others, as Siodorus, are of opinion, that the name of Chios was borrowed from the Syrinx, in which language it signifies m小時ch, with which this island abounds. Athanesius calls it a rugged and mountainous country; however, it produced excellent wine, and, on that account, it is highly commendcd by the ancients. Athnesius fuggefits, on an ancient authority, that the Chians were taught the manner of cultivating the vine by Oenopion, the son of Bacchus, and that they communicated this art to the rest of mankind. He adds, that the first red wine was made in this island. Strabo mentions the quaries of this island; and Phyllus says that here was discovered the first Jasper; but its chief produce is mitalize. Vitruvius mentions a spring in Chios, the water of which deprived those of their tenes who tailed of it, and therefore passengers were warned of the danger by an epigram inscribed over it.

Chios was also the name of the chief town of the island, which was seated on the eastern coast, in the most pleasant and fruitful part, and, according to Strabo, was 40 itdias in circumference. This city pretended to be the birth place of Homer; however this be, it had the honour of producing several extraordinary persons: such were Ion, who flourished in the eighty-second Olympiad, and is celebrated as an elegant writer of tragedies.—Theopompos, the disciple of Iocrate, who, as some have thought, excelled his master, and wrote several books, and who flourished in the reigns of Artaxerxes Ochus in Perse, and Philip the father of Alexander the Great, in Macedon.—Theopompus, the contemporary of Theopompos, who wrote some learned epistles, and the history of Libya; and Metrodorus, a philosopher and physician, and the author of several books relating to physic, who flourished in the reign of Artaxerxes Mnemon, king of Persia, and, according to Suidas, was preceptor to Hippocrates and Anaxarchus. This city had a spacious harbour, capable of containing 80 vessels. Strabo says that this island was first peopled by the Pelasgi: D'Orous maintained that Macaron and his followers settled here, after they had made themselves masters of Lidos; but Herodotus's opinion, that the Chians were Ionians, has been more generally received. Their first government was monarchical; but Hippocrates, one of their kings, being murdered by his subjects, for a pretended alms offered to the bride of one of the chief men of the island, the Chians formed themselves into a republic. In process of time, by the assistance of Hicocrates, they formed their republic on the plan of that of Athens; but they did not long enjoy the blessings of liberty, being, like the other small states of Greece, brought under subjection by their democratic tyrants. In ancient times, the Chians seem to have been a numerous and powerful people. They afforded the Mileians against the kings of Lydia; but after the defeat of Cretes by Cyrus, they submitted, with the other islanders, to the conqueror; and in recompense for having delivered up Pahyas the Lydian who had excited his countrymen to revolt against the Persian, Mazares, the Persian general, conferred upon them the city of Atarneas in Mysea, reduced by the Persians; they were employed in all their naval expeditions, and they served Darius against the Scythians. However, in the Ionian revolt, the Chians readily joined Ariltagoras, the last of the Persian yoke, and equipped 100 ships, each of which had 40 chofen citizeus on board. In the battle at Lade they distinguished themselves by their persevering valor; but at length, abandoned by their allies, they were overpowered, and obliged to run their ships aground at Mycale; whence they marched into the territory of Ephesus. Arriving thither in the night, while the women were celebrating the rites of Ceres, the Ephesians supped them to be robbers, who were come to trip the women, falled out of the city with their whole force, and killed them on the spot. After the defeat of the Ionians, Hiltius, who had been the principal cause of their revolt, availing himself of the assistance of the Lesbians, reduced the whole island. But Hiltius, unable to maintain possession of it, abandoned it to the Persians, who punished the Chians with the utmost severity. The most handsome of their youths they made eunuchs, and their daughters they sent to the king of Persia, after having destroyed their houses and temples, and ravaged their territories, and reduced the few inhabitants that remained to a state of slavery. Having for some time continued subject to the Persians, they recovered their liberty, and flourished, according to Thycydides, above all the states of Greece, Lacedemon alone excepted. They were favoured by the Athenians, who obtained the supreme command, above all their other allies, being exempted from tribute, and obliged only to furnish a certain number of ships. After some severe contests with the Athenians and with the Lacedemonians, they returned to their ancient confederacy, in which they continued till the social war, when, becoming weary of their alliance with Athens, they joined the Rhodians and others, with a view of emancipating themselves from the Athenian yoke. After a war which lasted three years, they concluded an advantageous peace. Until the destruction of the Persian empire, they enjoyed uninterrupted tranquility, and then they, together with the
the other Greek states in Europe and Asia, became subject to the Macedonian princes. Their city was unsuccessfully besieged by Philip, father of Pericles; and when he had abandoned the siege, they joined the Aegarians in their war against him, and Pericles, king of Bithynia; and, in consequence of this impious alliance, their territories were laid waste, and all the open places in the island were utterly destroyed by the troops of the confederate princes. For the afflication they afforded to the Romans in their wars against Phleges and his son Pericles, and Antiochus the Great, king of Syria, they were not only declared free, but honoured with the appellation of the friends and allies of the people of Rome. Sulla recommenced their perverting attachment to Rome, by restoring them to the possession of all their ancient rights and privileges, which they maintained, without disturbance, living in ease and plenty, till the reign of Theophanis, who reduced Chios, with the other islands of the Aéran sea, to the state of a Roman province; but at the same time he allowed the Chians to live according to their own laws, under the superintendence of a Roman pretor, whose province comprehended all the islands in the Aéran sea, from the mouth of the Hellespont to Rhodes. See Scio.

CHIOS, a town of the island of Euba. Steph. Byz. CHIOURLIC, in Geography, a town of European Turkey, in Romania, the see of a Greek bishop situated on a river of the same name; 50 miles N.W. of Constantinople.

CHIOZ, a town of Poland, in the patriciate of Sandomir; 35 miles N. of Malogoscz.

CHIOMMA, a small island of the Adriatic, near the coast of Italy, not far from the mouth of the Drinata, with a town of the same name, the see of a bishop, suffragan of Venice, containing three churches and eight monasteries; 31 miles S. of Venice. N. lat. 45° 15'. E. long. 12° 14'.

CHIPAWAS. See CHEPENYAN.

CHIEPAU, (Buffon), in Ornithology, the anus freepera of Linnaeus.

CHIPEOS, (Buffon). In Geography, see Pampas del Sacramento.

CHIPEWYAN. See CHEPENYAN.

CHIPENHAM, a market and borough town of Wiltsire, in England, is situated on the banks of the river Avon, and on the great road leading from London to Bath; at the distance of 95 miles west of the former, and 13 east from the latter. It is noted in the Anglo-Saxon annals as a principal place of residence for the Welsh-Saxon kings, and was bequeathed by the great Alfred to his youngest daughter, Ethelfleda. Of the ancient history of this town we have little on record; the most to be depended on is, that when Alfred, with his inferior forces, had conquered the Danes, and made them sign a treaty, by which they engaged to quit the kingdom, they treacherously pollished themselves of this place, and, being strengthened by numbers of their countrymen, soon obliged the Saxons to disperse, and their monarch to seek security in defensive, and take refuge in the cottage of a weaver.

This town, in the time of Richard II., belonged to the Hungerford family, but reverting to the crown by the death of Lord Hastings, was given, by Richard III., to John Howard, duke of Norfolk. It was restored by Henry VII. to the heirs of its former possessors.

Chippenham was a borough by prescription; but queen Mary, by charter, dated the 21st day of May, in the first year of her reign, ordained, "that the village, town, and borough of Chippenham, should be a free borough, corporate in deed, fact, and name for ever, of one bailiff and twelve burgesses." The charter then states the limits of the borough, names of burgesses, manner of appointing them; and for keeping in repair the bridge and causeway, gives to the bailiff and burgesses several parcels of grounds, the names and extent of which are specified, and called the "borough lands." This, with many other charters of the kingdom, were surrendered into the hands of Charles II. A.D. 1684. Another charter was granted by James II. in the first year of his reign, by which the same privileges were restored, and the revenues of the corporation were valued at 51. 5s. 8d. The free houses, at this period, amounted to 149 in number; and the spots then occupied are the only parcels of free land where burbage hounes are still kept up, and the inhabitants of which, with the bailiff and burgesses, have the exclusive privilege of returning two members to parliament. The town is populous, and of considerable extent; the principal street is about half a mile in length. Chippenham, like many other towns in this part of the country, is celebrated for its clothing and manufacturing factories. The church is a large pile of building, displaying some curious specimens of ancient architecture; but the greatest part of it is modern. On the north of the town there is a handsome free-stone bridge of twenty-one arches, ornamented with balustrades, lamps, &c. and near the middle a road branches off to Bath and Bifflo. Close to this is a large modern factory. On the banks of the river are several dying-houses. Chippenham has a weekly market on Saturday, and four annual fairs. By the last returns made to parliament of the population, &c. of the county, here were 683 hounes, and 3366 inhabitants, most of whom were employed in manufactures. For more copious particulars relating to the borough history, and manufactures of the town, see Beauties of Wiltshire, 2 vol. 1st.

CHIPPEWAY, FORT, a small blockaded fort of Lower Canada, situated on the borders of a creek of the same name, about 200 yards distant from Niagara river. The fort occupies about one road of ground, and consists of a small block-hace, enclosed by a blockade of cedar posts, about 12 feet high, which is merely sufficient to defend the garrison against musket shot. Adjoining to the fort, there are about seven or eight farm houses, and some large dore-houses, where goods are deposited preparatory to their being conveyed up the river in bateaux, or across the portage in carts, to Queenston. A canal from hence to Queenston would be extremely convenient. About 15 men, under the command of a lieutenant, are usually quartered at fort Chippeway, who are mostly employed in conducting, in bateaux from thence to fort Erie, the llores for the troops in the upper country, and the presents for the Indians.

CHIPPEWAY River, a river of N. America, that runs south-westward into the Mississippi river, in that part where the confluent wates form Lake Pepin, in N. lat. 44°, and W. long. 93° 54'.
none of the varnish which they use for their vesseis; they next take the vesseis when dried, and not yet baked, to the wheel, and turning them hastily round, they, with a pencil dipped in this paste, cover the whole circumference with a thin coat of it. After this, the vesseis are again dried; and the border made with this paste appears of a pale greyish colour when it is thoroughly dry. They work the paste downwards in the common way, covering both this edge and the roll of the vessei with the common varnish. When the whole is baked on, the colour given by the ashes disappears, and the edges are as white as any other part; only when the baking has not been sufficient, or the edges have not been covered with the second varnishing, we sometimes find a dusky edge, as in some of the ordinary thin tea-cups.

It may be a great advantage to our English manufacturers to attempt something of this kind. The willow is known to make a very light and black charcoal; but the elder, though a thing seldom used, greatly exceedeth the young green shoots of this shrub, which are almost all pith, make the lightest and the blackest of all charcoal; this readily mixes with any liquor, and might be very used in the same way that the Chinese make the charcoal of the bamboo cane, which is a light hollow vegetable, more resembling the elder shoots than any other English plant. It is no wonder that the fixed salt and oil contained in this charcoal should be able to penetrate the yet raw edges of the ware, and to give them in the subsequent baking a somewhat different degree of vitrification from the other parts of the vesseis; which, though if given to the whole, it might take off from the true vitrified state of that ware; yet at the edges is not to be regarded, and only serves to defend them from common accidents, and keep them entire.

The Chinese use two cautians in this application: the first in the preparation: the second in the laying of it on. They prepare the bamboo canoe for burning into charcoal, by peeling off the rind. This might easily be done with our elder shoots, which are so succulent, that the bark flakes off with a touch. The Chinese say that if this is not done with their bamboo, the edges touched with the past will not be in the baking: this does not seem indeed very probable; but the charcoal will certainly be lighter made from the peeled flicks, and this is a known advantage. The other caution is, never to touch the vesseis with hands that have any greasy or fatty substance about them; for if this is done, they always find the vesseis crack in that place. Obs. sur les Cout. de l’Alde.

CHIPPINGAVEL, or CHEAPINGAVEL, in our OLE

CHIPPING-NORTON, in Geography. See Norton.

CHIPPING-ONGAR. See Ongar.

CHIPPING-BODSBURY. See Bodsbury.

CHIPPIONA, a town of Spain, in the country of Seville, seated on a rock near the coast of the Atlantic; 35 leagues from Seville, in the diocese of Lucar Serremeda.

CHIQUE, in Commerce, a weight in Smyrna, equal to 5lb. 7oz. 12dr. aver., weight.

CHIQUITOS, a chain of mountains in South America, lying between 15° and 23° of S. latitude. This chain of primitive mountains unites the Andes of Peru and Chili with the mountains of Brazil and Paraguay, stretching from La Paz, Potosi, and Tucuman, through the provinces of Moxos, Cuiquitos, and Chaco, towards the government of the mines, and of St. Paul in Brazil. The highest summits appear to be between 15° and 25°; the rivers there falling to that of Amapas, or the of La Plata.

CHIQUITOS, INDIOS, or Little Indians, a name given by the Spaniards to Indians of South America, on account of the extreme smallness of the doors of their houses. The country lies between Santa Cruz de la Sierra, a province of the second bishopric in the archdiocese of Chaco, or new vice-royalty of Buenos Ayres, and the lake Xarayes, where the river Paraguay has its rise, and being encroached by the current of others, forms the famous river de la Plata. The Indians who inhabit the mountains are said to have been pressing to this nation about the close of the 15th century, and their facts is reported to have been so great that, in 1533, they had formed seven towns, each consisting of above 200 families, and the number of their cultivants has since considerately increased. These Indian Chiquitos are well made and active; and their courage has been often experienced by the Portuguese, who used to make incursions, in order to carry off the inhabitants for slaves; but the valor of these people has taught them to defend from such inman attempts, and, for their own safety, to keep within their limits. The arms of these Indians are muskets, lances, and poisoned arrows. Though their language is different from that of the other nations of Paraguay, the same customs nearly obtain here as among the other Indians. These Chiquitos have no regular religious orders, nor civil life, but in matters of public concern they listen to the advice of their old men, and usually follow it. The dignity of cacique is not hereditary, but conferred according to merit, as the reward of valor in war. The union among them is imperfect. Their society resembles a republic without any head, in which every man is master of himself, and upon the least disgust, separates from those with whom he seemed to be connected. The tree which bears the quinquina or cinch's bark, is frequent among the Chiquitos; and vanilla is also found among them, though not equal to that of New Spain.

CHIRAC, an island on the N.W. coast of New Mexico, 15 leagues to N.N.W. from Hurrarda cape; having the town of Landecho, about midway between them, and the river of Champa: two leagues beyond it. Chiria by Chila is another small island; and both abound with cattle, especially sheep and hogs.

CHIRAC, PETR., in Geography, born at Conques, a small town in Languedoc, in the year 1670, was at first intended for the church. In 1678 he was sent by his father to Montpellier, to complete his education. As the allowance made for his provision was scanty, he undertook to instruct the son of an eminent apothecary at Montpellier in classical literature and by conversing with that family was induced to turn his mind to the study of medicine. In this he made such progress, that Michael Chicoineau, chancellor of the university, placed two of his sons under his tuition. As he had paid particular attention to the study of anatomy, he was soon enabled to give lectures in that branch of science. In 1687, he was admitted doctor in medicine and under the patronage of Barbeau, the full physician at Montpellier, obtained a considerable share of practice. In 1692 he was appointed by the Duke de Noailles, physician to the army of Roussillon, and at the siege of Rolete, in which the army was engaged, was singularly successful in stopping the ravages of the dysentery, with which the men were severely afflicted. He was next appointed physician to the port at Rochford, and obtained similar credit for his successes in treating the diseases called "Le Mal de Siam," then epidemic there, and for his management of persons affected with the small pox, whom he frequently directed to be bled, contrary to the generally received opinion, and practice in that complaint. After residing two years at Rochford, he returned to Montpellier, much elated with the successes, and consequent reputation he had acquired. At Montpellier he continued until the year 1706. In this interval
val he published his hypotheses on the structure of the hairs. He supposes them to be derived from the tendons of the skin, and to contain in their bulbs, and to the extent of about two inches, a medulla: Also "De Marti Cordis," in which, he contends, depends upon an innate power in its muscular fibres. These opinions engaged him in controversies with Senac, Velleius, and other anatomists, which were on his part conducted with great acrimony. In 1726 he accompanied the duke of Orleans, who went with the army, first to Italy, then to Spain. On his return he went to Paris, where he penned the remainder of his life. In 1715, Homb-berg, the duke's physician, being dead, he was advanced to that honour. He was soon after made honorary member of the Academy of Sciences, and in 1718, on the death of M. Fagan, he was appointed superintendent of the royal garden. Some time after he projected a plan for the improvement of medicine. A society was prepared to be formed of thirty or forty physicians, who were to hold their meetings at Paris. They were to collect the correspondence, and observations on the methods found most successful in curing diseases, of physicians and surgeons to public institutions, in all parts of Europe. From these he hoped a code of practical maxims might be drawn, that would have been generally beneficial. A more useful project, or one promising more advantage to the public, could not well have been conceived, and it would have succeeded, had it been proposed by a character least haughty and obstinate. It failed through the want of the concurrence of his brethren, who wished to humble, rather than increase, his importance. His reputation, however, was not diminished by their jealousy and opposition. In 1727 letters of nobility were awarded to him, and in 1739 he was made first physician to the king, though, as he was then 80 years of age, it could scarcely be with the view of using his affluence. Two years after he died. By his will he left a considerable legacy to the university of Montpellier, for the foundation of two lectureships, one on comparative anatomy, the other for the explanation of Borelli's doctrine on animal motion. For an account of the remainder of his works, see Haller Bib. Elyo. Dict. Hist. Gen. Biography.

CHIR, in Geography, a town of France, in the department of the Loire, and chief place of a canton in the district of Orange; one league S.W. of it. The place contains 2092 and the canton 7067 inhabitants; the territory comprehends 23243 square metres and 8 communes.

CHIRACA, in Medicine, from 20 feet, the hand, and 20 years, I.J. coarse, the goat in the hand. The goat attacks the segments about the hand and writ occasionally, as also those of the feet. The local and general symptoms which accompany it, are the same in both instances, and require similar treatment. See Podagra.

CHIRAMAXIUM, in Antiquity, a kind of chariot, or conveyance, which was drawn by men instead of horses. This word is derived from 20 tet, the hand, and ago, a chariot.

CHRICEES, or CHIRCEES, a small town of Hindoos- tan, about 14 league from Amedabud. It has a great number of the tombs of the kings and princes of Gujarat, which have led the Indians to believe, that it was, in ancient times, the capital of that kingdom; but it is more probable that it was only the burial-place of their kings, and that Amedabud was the capital. The Dutch, in 1620, established a factory in this place for the purchase of indigo; but it was aban- doned before the year 1672.

CHIRCHED. See Churches Scot.

CHIRENS, in Geography, a town of France, in the depart- ment of the Yorre, and district of La Tour-du-pin; 5 leagues N.N.W. of Grenoble.

CHIRIZOUR, a town of Asia Minor, in the province of Korontan; 63 miles S. of Mosul.

CHIRIGUANOS, or CHIRIGUANAS, a tribe of Pagan Indians in South America, bordering on the Chiquitos, who have always refused to hit them to the missionaries; though the fathers who visit them, when accompanied with some Chiquitos for their facility, occasionally succeed in making a few converts, who are sent to their towns, and there lead a civil life. This custom occurs after some misfortune that happens in the wars continually carried on between them and the Chiquitos; when in order the more easily to obtain a peace, and to prevent being exterminated by the Chiquitos, they lead for missionaries; but soon diffuse them again, pretending that they cannot hear to see punishments inflicted on persons merely for deviating from the rules of reason. This, it is alleged, is a proof that the object of their wish and aim is an unbounded licentiousness of manners.

CHIRIPHE, in Ancient Geography, a town of Asia, in Babylonia, according to Ptolemy; siterate near the marshes of Arabia Delma.

CHIRIQUI, or CHIRIQUITA, in Geography, a town of New Mexico, in the province of Veragua, on the coast of the Pacific ocean, with a harbour about a league from the sea, and 5 miles from the town: 30 leagues west of St. Jaguer. N. lat. 14° 20'. W. long. 83° 0'.

CHIRITES, in Natural History, a name given by authors to a fome refmiribing the human hand. The accounts we have of it say, that it is of a white colour, and of the nature of gypsum or paller stone; and that it represents the palm of the hand with the fingers, and their nails on the other side. This seems to have been a name given to some fingle specimen in a cabinet of fome collectors; for it is certainly no distinct species of felli, but a mere hystr nature, in the configuration of some accidental piece of gyp-fum.

CHIRIVICOLA, in Geography, a town of Naples, in the province of Capatanata; nine miles S.W. of Viella.

CHIROGRAPH, Chirographum, compounded of chiro, hand, and graph, a script. I write, q. d. hand-writing, every public instrument or gift of conveyance, attested by the subscription and crosses of witnesses, so called in the time of the Saxons, which being somewhat changed in form and manner by the Normans, was by them styled "charta." In succeeding times, for the prevention of frauds and concealments, they made their deeds of mutual covenant in a "script" and "scrip," or in a part and counterpart; and in the middle, between the two copies, they drew the capital letters of the alphabet, and then tallied or cut asunder, in an indelible manner, the sheet or skin of parchment; which being delivered to the two parties concerned, were proved authentic, by matching with and corresponding to one another; and when this prudential custom had for some time prevailed, then the word "chirographum" was appropriated to such writings. When they amicably made a chirograph or deed, which required a counterpart, they engraved it twice on the same piece of parchment, counterpart, leaving a space between, wherein was written chirograph; through the middle whereof the parchment was cut, sometimes straight, sometimes indently; and a moiety given to each of the parties. This was forwards called divincula and charta divisa; and was the same with what we now call charter-party.

The first use of these chirographs with us, is said to have occurred in the time of King Henry III. According
According to some, a deed was properly a choregraph, when it was subscribed by the hand writing of the vendor, or debtor, and delivered to the vendor, buyer, or creditor. These authors make the choregraph differ from a "syngraph," in this; that in the latter, the word syngraph was wrote in the middle, and cut through, in the manner just observed of choregraph. These authors therefore make the syngraph and the choregraph a different thing.

Choregraph was also anciently used for a fine: the manner of inscribing the fines, and cutting the parchment in two pieces, is still retained in the office called the choregrapher's office.

CHIROGRAPHER of fines, an officer in the common pleas, who inscribes lines, acknowledged in that court, into a perpetual record (after they have been examined and sealed by other officers); and writes and delivers the indentures of them to the party. He makes two indentures: one for the buyer, the other for the seller: and a third inscribed piece, containing the effect of the fine, and called the foot of the fine; and delivers it to the exchequer breviary.

The same officer also, or his deputy, proclaims all fines in court every term, and inforizes the proclamations on the back-side of the foot; keeping always the writ of covenant and the note of the fine. The choregrapher shall take but 4s. for a fine, on pain of forfeiting his office, &c. Stats. 2 Hen. IV. c. 8. 23 Eliz. c. 2. 2 Inst. 458.

CHIROGYLUM, in Ancient Geography, an island of the Mediterranean, placed by Pany on the coast of Lyca. CHIROGRACY, from κηραγενής, band, and μετρηος, divination, the art of divining the fate, temperament, and disposition, of a person, by the lines and incisions of the hard: this is otherwise called palmistry.

We have a great number of authors on this vain and trifling art; as Artemidorus, Fludd, and Johannes de Indagine. Tafriencis, and M. de Chavre, are esteemed the best.

Chiron, in Biography, denominated, by Plutarch, the "wife centaur," was born in the first age after Dacaliana's deluge, commonly called the golden age, according to Sir Isaac Newton; who adds, that he formed the constellation for the use of the Argonauts, when he was 88 years old; for he, as well as his daughter Hippo, are said to have been practical astronomers. By this account, Chiron must have flourished in the earliest ages of Greece, as he preceded the conquest of the golden fleece and the Trojan war. He is generally called the son of Saturn and Philyra, and is said to have been born in Thessaly, among the centaurs, who were the first Greeks that had acquired the art of breaking and riding horses. See Centaurs.

Chiron was regarded by the ancients, as one of the first inventors of medicine, botany, and surgery, or chirurgery, which some etymologists have derived from his name. He inhabited a grotto, or cave, called "Chironicum Specus," at the foot of Mount Pelion, which, from his wisdom, and universal knowledge, became the most famous and frequented school throughout Greece. Almost all the heroes of his time were ambitious of receiving his instructions; and Xeropenon classed in the number of his disciples, several of the most illustrious personages of antiquity; and yet he has omitted, in his enumeration, some of his most celebrated scholars. Among these we may reckon the Grecian Bacchus, who, as it is pretended, was the favourite scholar of the centaur, and learned of this master, the ravels, orgies, Bacchandia, and other ceremonies of his worship. Plutarch says, that Hercules studied music, medicine, and justice, at the school of Chiron; but among all the heroes who have been disciples of this centaur, no one reflected so much honour upon him as Achilles, whose renown he in some measure shared, and to whose education he particularly attended, being his grandfather by his mother's side. Apollodorus informs us that the study of music employed a considerable part of the time, which he bestowed upon his young pupil, as an incitement to virtuous actions, and a bridge to the imputation of his temper. One of the best remains of antique painting now subsisting is a picture upon this subject, dug out of Herculanum, in which Chiron is teaching the young Achilles to play upon the lyre. See Achilles.

The death of this philosophical musician was occasioned, at an extreme old age, by an accidental wound in the knee with a poisoned arrow, shot by his scholar Heracles, at another. After his death he was placed by Museus among the constellations, from respect for his virtues, and gratitude for the great services which he had rendered the people of Greece. Accordingly, Sir Isaac Newton alleges, (Chron. ly. p. 171.) as a proof that the constellations were formed by Chiron and Museus for the use and honour of the Argonauts, that nothing later than that expedition was delineated on the original sphere; and the fame author intimates, that Chiron lived till after the Argonautic expedition, in which he had two grandsons. The ancients have attributed to Chiron several writings; among which, according to Suidas, he precrites, υπονομεν, in verse, composed for the use of Achilles; and a medicinal treatise on the "Diseases incident to Horses," and other quadrupeds, περιδιαιτηθων; and the lexicographer even pretends, that it is from this work that Chiron derived his name. Fabrius (Bib. Græc. vol. i.) gives a list of the works attributed to Chiron, and discusses the claims which have been made for others to the same writings; and in vol. xiii. he gives him a distinguished place in his catalogue of ancient physicians. Burnet's Hist. Musc. vol. i.

Gen. Ch. Cal. Periarchu one-leaved, five-cleft, erect, permanent; segments oblong, acute. Cor. monopetalous, falver-shaped, or almost wheel-shaped, regular; tube fearlessly longer than the calyx; border five-cleft, spreading; segments egg-shaped, open. Stam. Filaments five, short, attached to the tip of the tube; anthers oblong, erect, convinging, spirally twisted after shedding the pollen. Pfål. Germ superior, egg-shaped; style filiform, a little longer than the stamens, declining; stigma capitate, ascending. Pericarp. Capsule or berry egg-shaped, two-celled. Linn. Smith (one-celled; Lam. Gært.) valves indexed. Smith. Stnls numerous, small, attached to the sides of the receptacle. Efl. Ch. Corolla falver shaped. Stamens inserted into the tube; anthers finally becoming spiral. Style declining. Pericarp superior, two-celled; valves indexed. Smith. Obl. In some of the species the anthers have not been observed to become spiral.

than the internodes. Stem about two feet high, glabrous, with few leaves near the top. Leaves opposite, sessile, erect, smooth, quite entire. Picnium terminal, dichotomous, erect, few-flowered; bracts opposite, awl-shaped; segments of the calyx, narrow, lanceolate, very acute, as long as the tube of the corolla; corolla divided half way down; segments oval lanceolate, acute, spreading. A native of the Cape of Good Hope.

3. C. feidsidei, Linn. Sp. Pl. 127. Mart. 3. Linn. Encyc. 3. Ilid. 3. Willd. 1. Stem stipes; leaves linear-lanceolate, longer than the internodes. Stem a foot or more, herbaceous, cylindric, soft and striate. Leaves opposite, filiform, forked at the decurrent, cottony and glandular. Flowers purple, disposed three or four together in a terminal panicle; peduncles longer than the leaf; lateral ones with a pair of awl-shaped bracts; segments of the calyx lanceolate-awl-shaped, keeled; tube of the corolla the length of the calyx; segments acute, longer than the tube. (AUTHORS NOT BEING STATED)

4. C. felmpijfructa, Linn. Linn. 4. “Leaves lanceolate, ifi-lic, deciduous; calyx tube” the tube.” Border of the corolla longer than the tube. A native of the Cape of Good Hope. From a specimen in the herbarium of La Mare.

Smith Flor. Brit. Eng. Bot. Pl. 417. Woodville Med. Bot. tab. 157. Schmidel bohmen. 1. n. 130. (Centaurium; Linn. Sp. Pl. Mart. Lam.) Common centaur. “Stem herbaceous, dichotomously panicked; leaves ovate-lanceolate, three-nerved; calyx shorter than the tube.” Root annual, small, branched. Stem about a foot high, erect, Falte, with four sharp edges, then broadened from the bottom. Leaves opposite, filiform, quite entire, smooth. Flowers pink-coloured, proceeding from the fork of the stem, filiform, expanding o’/ to a bright ftd; calyx funnel-shaped; segments awl-shaped, calyx, adnate to the tube of the corolla, and only half as long as the tube of the corolla. Petals spreading, shining; segments elliptical, somewhat concave; ament of 12 to 15; Bicn capitatus; with a transverse notch. Whole plant smooth, and very bitter. A native of dry gravelly pastures in Great Britain, and other parts of Europe. Obs. Dr. Bollocks, and Mr. Shepherd of Liverpool, have observed two remarkable varieties growing intermixed with the common plant on the sandy shores of that neighbourhood. The first resembles the common plant in its size, general appearance, and the form of its flowers; but differs in having narrow, spatulate-linear leaves; the segments of its calyx elongated and narrowed, exceeding the tube of the corolla. The other is a much humbler plant; with broad, angular leaves; small, clustered flowers; segments of the calyx longer, but not so much narrowed as in the preceding variety. Dr. Smith expresses a doubt whether they may not be distinct species. See Flor. Brit. vol. iv. p. 172. 12. C. polechella, Willd. 7. Sert. Act. Holms. 1. 1783, 2. 1835. tab. 3. fig. 8. 9. Smith Flor. Brit. Eng. Bot. Pl. 458. (Centaurium centaurium; Linn. Sp. Pl. Centauriun minus plantare; Vull. Parif. 32. tab. 6. fig. 1.) “Stem herbaceous, sometimes simple, but generally branched, and often much lo; leaves egg-shaped; segments of the calyx awl-shaped, a little shorter than the tube. Root annual, small, branched. Stem scarcely two inches high, dichotomous, with four sharp edges. Leaves ovate-elliptical; lower ones very broad; upper ones lanceolate, shining, three or five-nerved. Flowers pink-coloured, from the fork of the stem, often p-swelled, erect; calyx tive-cleft to the base; segments awl-shaped, attenuated, free, about the length of the tube; corolla very slender; segments of the border elliptic-lanceolate; anthers not twisted so much as those of the preceding species, feebly making one turn. A native of dry places about the sea coast in Great Britain and other parts of Europe, flowering in August and September. 13. C. impertusa, Willd. 10. (C. Vaillantii; Schmidt bohmen. 1. n. 132. Centaurium plantare flore inaperto; Vul. Parif. 32. tab. 6. fig. 2.) “Stem herbaceous; much branched, dichotomous; leaves oblong, three-nerved; segments of the calyx awl-shaped, somewhat spreading; border of the corolla connivent.” Allied to C. centaurium, but not a variety of it. A native of pastures on the continent of Europe. 14. C. ficata, Willd. 12. (Gentiana ficata; Linn. Mart. Lam. Centaurium minus ficatum; Buth. p. 278. Prod. tab. 130.) “Stem herbaceous, biped; leaves lanceolate, three-nerved; flowers alternate, filiform. Differs from C. centaurium chiefly in the disposition of its flowers. Root annual. Stem from five to ten inches high, erect, branched, angular. Leaves opposite, filiform; lower ones egg-shaped; middle ones lanceolate; upper ones linear-lanceolate, almost awl-shaped. Flowers purple, sometimes white, filiform, alternate, forming a loose terminal spike; segments of the corolla very acute. A native of moit places in Italy and the south of France. 15. C. lindiiis, Linn. Sp. Pl. 2. M. 6. Linn. Encyc. 6. Ill. 10. Bot. Mag. 511. “Stem somewhat
somewhat shrubby; leaves linear, glaucous; calyces cloven half way down; segments rather obtuse. Stem a foot high or more, slender, cylindrical, smooth, branched near the top. Leaves saucer-shaped, narrow, acute, felled, smooth, rather cleft. Flowers pale red solitary, at the summit of the upper branches; calyx a little bell-shaped, narrowed at the base; tube of the corolla shorter than the calyx; segments of the border oval-oblong, almost erect; anthers not becoming spirial. A native of the Cape of Good Hope. 16. C. baccifera, Linn. Sp. Pl. 7. Matt. 9. Lam. Encycl. 7. ill. 11. Willd. 14. Curt. tab. 147. Bot. Mag. 213. (Centaurium pulcherrimum, Comm. Rat. tab. 9.) "Stem shrubby at the base, much branched, four-corned; leaves linear, green; pericarp resembling a berry." Root perennial. Stem two feet high, cylindrical, naked near the bottom, panicked upwards; branches slender, smooth, compound. Leaves near an inch long, opposite, narrow, acute, smooth, spreading, decurrent. Flowers pale red, small, terminal, on short peduncles; calyx short; segments almost obtuse, keeled; tube of the corolla shorter than the calyx; segments oval-oblong; anthers not becoming spirial. Linn. Pericarp resembling a berry, succulent, somewhat transparent, globular, didymous, red, or faffron-coloured, one-celled; skin very thin; pulp watery; receptacles two, spongy, fixed to the internal side of the berry, corresponding with the external groove; two-lobe, within; lobes curved back to the sides. Gart. A native of Africa. Mr. Curtis (Bot. Mag.) observes, that the feed-veil is by no means a proper berry. For when cut transversely, it is hollow, and divided into two cells, the sides of which are fleshy, and do not appear to split in any regular manner for the discharge of the seeds. 17. C. fruticosus, Linn. Sp. Pl. 8. Matt. 10. Lam. Encycl. 8. ill. 12. Bot. Mag. 37. (Centurian, Comm. Rat. tab. 8. Burm. Afr. tab. 74. fig. 1.) "Stem shrubby; leaves linear-lanceolate, fleshy, somewhat toothed; calyces somewhat egg-shaped, inflated, pubescent." Stem a foot and half high, woody; branches upright; cylindrical, pubescent. Leaves an inch and half long, opposite, oblong. Flowers bright red, at the summits of the branches; anthers spirial. Gartner observes, that the feed-veil of this species has somewhat the appearance of a berry, but less so than the preceding, lying entirely concealed within the calyx. It is egg-shaped, acuminate, red, and finally divides by the future into two valves; so that it is a proper capsule, and forms the connecting link between C. baccifera and the other species. We are even inclined to conjecture, that the feed-veil of C. baccifera, if observed in its left stage, may be found to split into regular valves. A native of Africa. 18. C. demeana, Bot. Mag. 757. Ventenat Hort. Cell. 31. "Stem shrubby, somewhat toothed; leaves crowded, deciduous, oblong, obtricate; calyces globular, five-cleft." According to Ventenat it is distinguished from the preceding by its smaller stem, its very short branches, its larger flowers, and more globular calyx, deeply divided into five segments, and its broader leaves growing in two ranks. But Dr. Sims observes (Bot. Mag.), that there are so many intermediate varieties, as to leave it doubtful whether it be a genuine species. It has been long known in the English nurseries by the name of latifolia. 19. C. angyptiferus, Bot. Mag. 813. "Stem shrubby, smooth; leaves linear, spreading; calyces egg-shaped; segments connivent; segments of the corolla wedge-shaped, ending abruptly in a remarkable tooth-like point." Whole plant smooth. Tube of the corolla longer than in the preceding, extending considerably beyond the calyx. Raised from Cape seeds by Mr. Whiteley of Brompton. 20. C. tetragona, Linn. jun. Sup. 131. Matt. 8. Lam. Encycl. 11. ill. 12. Willd. 16. "Stem shrubby; leaves egg-shaped, three-cleft, rather obtuse; segments of the calyx rather obtuse, keeled." Flowers large, yellow. A native of the Cape of Good Hope. CHIRONIA maritima. Wild. See GENTIANA maritima. CHIRONIA dodcandra, Linn. Sp. Pl. 8. See CHLORA dodcandra. CHIRONIS, Villa, in Ancient Geography, a town of Greece, in the Peloponnesus, according to Polybius: who places it near the town of Messala, and says that it was destroyed by pirates. CHIRONIUM, in Medicine, is sometimes used to signify a great ulcer, and of difficult cure. CHIRONOMI, on the Greek Stage, were those actors who performed, without using words, by the motion of the hand. CHIRONOMIA, in Antiquity, the art of representing by the motions of the hand, and other gestures of the body, any past transactions, whether of true or fabulous history. This made a part of a liberal education among the ancients: it had the approbation of Socrates, and was ranked by Plato among the political virtues. CHIROPAN, in Geography, a bay on the W. coast of New Mexico, situated in about N. lat. 72; into which the river of Para discharges itself, about 130 miles from Pitya. This bay being full of islands is seldom frequented. CHIROTHECA. See GLOVE. CHIROTHECA marina, in Natural History, the name under which Rumphius describes Spongias aculeata, which see. CHIROTHESIA, the imposition of hands on conferring any priestly orders. The word comes from χερος, manus, and ποιειν, pont, which signifies the laying hands upon another. CHIROMONIA, the stretching forth, or holding up of hands, in electing any magistrate, &c. The word comes from χερος, manus, and τενειν, teni, the action of stretching out the hands; and because the ancients gave their suffices by stretching out their hands, they gave the name chironomia to the election of magistrates. This custom was first established in Greece; as appears from an oration of Demothenes against Neka, and that of Lichines against Ctephylos: hence it passed to the Romans. From profane authors it passed to ecclesiastical ones; and was used by them, not only in speaking of elections, but also of ordinations. See IMPOSITION, and ORDINATION. For the difference between chirothelia and chironomia, see Harrington's Preceptor of Popular Government. CHIRP, in Ornithology, is the name of the first sound which a young bird utters, as a cry for food, and is different in all nations, if attentively regarded; so that the hearer may distinguish the species of the birds, though the note should hang out of his sight, and be heard. This cry is weak and curious; it is dropped entirely as the bird grows stronger, nor is it afterwards intermixed with its song; the chirp of a nightingale (e. g.) being hoarse and disagreeable. The chirp consists of a single sound repeated at very short intervals, and is common to nightingals of both sexes. Phil. Trans. vol. liii. CHIRURGEON, an obsolete word, from χερος, the hand, and γεωργος, work; denoting a manual operator, and now always pronounced, as well as written, SURGEON. The conduct of surgeons was formerly so much under the guidance and control of physicians, that Dr. Samuel Johnson defines a surgeon to be "one whose duty it is to act in external maladies by the direction of the physician." See the article SURGEON. CHIRURGERY, belonging to the practice of a surgeon,
geon, and now universally written and pronounced Sur-

CHIRURGICAL, pertaining to surgery, or manual operations.

CHIRURGIEN noir, in Ornithology, the Black Jacana, PARRA nigra of Gmelin, is so noted by Buffon.

CHIRRY, in Geography, a town of France, in the department of the Oise and district of Compiegne, 3 miles S.S.W. of Noyon.

CHISELY 1nd, in Agriculture, a term appropriated to that sort of land which breaks, when it is turned up by the plough, into pieces like the chips made by the hom-puter's child in the hewing of stones. It is of a middle nature, between the tandy land that falls off from the plough-share, like bran or sawdust, and the clayey, that is raised in large globes.

It is of several colours, grey, brown, reddish, and blackish, and usually contains a large quantity of sand, and no small number of pebbles.

CHISHULL, EDMUND, in Biography, a learned divine and antiquary, was born at Eyworth, in Bedforshire, and educated at Corpus Christi college, Oxford, where he obtained the degree of master of arts in 1693, and was also chosen a fellow of his college; previously to this he had published a Latin poem, on the battle of La Hogue, and in 1694 he published another ode on the death of the queen, which is preferred in the third volume of the Musæ Anglicæ, though it does not display poetical fervour so much as a true classical taste. Four years afterwards Mr. Chishull obtained a traveller's exhibition from his college, and failed for Smyrna. Before he left his native country, he preached a sermon to the Levant company, which was published, and which obtained for him the chaplainship to the English factory at Smyrna, in which station he continued till the spring of 1702. In June 1705 he was admitted to the degree of bachelor of divinity, and soon after he engaged in a controversy with the learned Mr. Dodwell, by publishing "A Charge of Heresy maintained against Mr. Dodwell's Dis-course concerning the Mortality of the Soul," which is reckoned one of the principal books written in this controversy. In 1707 Mr. Chishull preached a sermon against the absurdities and enthusiasm of the French prophets, which he published in the ensuing year, with an historical appendix, containing collections applicable to all such prophecies as were condemned in the sermon. Immediately after this he was presented with the vicarage of Walthamlow in Essex, and in 1711 he was appointed one of the chaplains in ordinary to queen Anne. Besides the above, he published several other theological discourses; of which, one was on ducings, preached before the queen, and published by her special command. As an antiquarian, one of his first works was entitled "Inscriptio Sigae antiquillni na abnormalities, this was illustrated with a learned commentary; to which he afterwards added "Notarum ad Inscriptionen Sigaram appendices." These pieces were afterwards incorporated in his "Antiquitates Africane." When Dr. Mead published his Harveian oration in 1724, Mr. Chishull added to it, as an appendix, "Differtatio de Nummis quibusdam a Smyrnæis in Medicorum honorum percollos," This dissertation excited a controversy concerning the condition of physicians at ancient Rome. The question was whether they were usually vile and detestable beings; or, at least, some among them, those who enjoyed the privileges of a free condition. The greatest literary work of Mr. Chishull was entitled "Antiquitates Africane;" it ran through several editions, and the "Patri-"

num Ancyranum," This work was printed by subscription to which Dr. Mead contributed fifty-one guineas. The inscriptions contained in it were collected by confidit Sherrard, Dr. Piccinini, and Dr. Lilly, afterwards bishop of St. Aphas; they were afterwards deposited in the Earl of Oxford's library, and are now preserved in the British Museum.

Mr. Chishull added to his "Antiquitates:" two small pieces addressed to the Rev. John Horn. He formed a delin of publishing a second volume, the printing of which was actually begun, when death put a stop to its progress, and it has never been ascertained in what manner the manuscripts were disposed of. In 1731 Mr. Chishull was presented with the rectory of South-church in Essex, where he did not long enjoy. He died at Walthamlow on the 15th of May 1733, sincerely regretted by his friends, and by those who were capable of daily appreciating his learning and talents. One of his contemporaries, Dr. Taylor, styles him "Vir celeberrimus ingenii acuminis et literarum peritissimus, quius excellens maxime," and Dr. Mead has allowed on a very high encomium in the preface which introduced Mr. Chishull's dissertation on the Smyrna coins; he likewise testified a sincere regard to the memory of his friend, by publishing an account of his travels in Turkey. Mr. Chishull's knowledge of the ancient languages gave him an excellent character as a divine.

CHISOING, or CISOING, in Geography, a town of Flanders, with an abbey; 2 leagues N.N.W. from Orcheis.

CHISME, or CHISME, a sea-port town of Afsatiki Turkey, on the west coast of Natalia, opposite the island of Scio, between which and the continent is a narrow strait, where the Turkish fleet was destroyed by the Russians in the year 1779; 40 miles W. of Smyrna. The ancient name of this town was Cyllus. N. lat. 38° 24'. E. long. 36° 16'.

CHISSAMA, a province of the kingdom of Angola in Africa, situated under the 9th degree of S. lat. near the mouth of the river Coanza. It is a Portuguese settlement, consisting of three commanderies, whole despotic governors exercising a tyrannical cruelty over the natives. The soil abounds with a peculiar salt, formed of a briny water, which the inhabitants call into oblong pieces like bricks, about 5 or 6 inches long, and exchange with the Portuguese for meal, oil, and other commodities. This salt is reckoned of such excellent quality, not only for food, but also for physic, that the merchants convey it through all Ethiopia, and derive from it an extraordinary gain. The province abounds likewise fine honey and wax, but water is extremely scarce, as this province has no rain from May to October, and its mountains are destitute of springs; so that the inhabitants who are near the Coanza supply themselves from that river, at the hazard of being devoured by the wild beasts, which swarm along its banks.

CHISSEL, an instrument much used in sculpture, masonry, joinery, carpentry, &c.

There are chisels of different kinds; though their chief difference lies in their different fize and strength, as being made of steel well hardened and tempered; but they have different names, according to the different uses to which they are applied.

The chisels used in carpentry and joinery are, 1. The former, which is used first of all before the paring chisel, and just after the work is scribed. 2. The paring-chisel, which has a fine smooth edge, and is used to pare off or smooth the irregularities which the former makes. This is not struck with a mallet, as the former is, but is pressed with the shoulder of the workman. 3. The miter former, this is used for cleaning acute angles at the point, or corner of its narrow edge. 4. The mortise-chisel, which is narrow, but very thin and strong, to ensure hard blows; and it is cut in a very
very broad basil: its use is, to cut deep square holes in the wood, for mortises, 5. The gorge, which is a chisel with a round edge; one side Whereof serves to prepare the way for an auger, and the other to cut such wood as is to be rounded, hollowed, &c. 6. Socket chisels, which are chiefly used by carpenters, &c. to have their flanks made with a hollow flank, that they may receive a strong wooden peg, fitted into it with a mallet. These chisels are distinguished according to the breadth of the blade, into half-inch chisels, three-quarter of an inch chisels, &c. 7. Ripping-chisels, which is a bucket chisel of an inch blade, having a blunt edge, with no blade to it; its use is to trip or tear two pieces of wood sundry, by forcing in the blunt edge between them.

CHISEL, in Geography, a foot in the state of the Tremper, 21 miles from the English ferry on New River, 43 from Argillev, and 105 from Long island, on holiton. CHIT, is the name of an instrument used in cleaning lather.

CHITARONE, A large Semitic guitar.

CHITARRA. Lat. See Guitar.

CHIT, in Geography a towns of the island of Cyprus, near Larnaca, much celebrated among the ancients. See CITHUM.

CHIFFIQUE, Du, lake, called also Phileum lake, a L. of North America, separated from lake Miron, in N. lat. 55° 7', by a short, narrow, and small tract. It is not more than 7 miles long, and its course is about N. W. and is succeeded by the lake Des Bois, which runs about 24 miles in a S.S.E. and N.N.W. course, and is full of islands; the passage to it being through an intricate, narrow, winding, and shallow channel for 8 miles.

CHITON, in Zoology, a genus of Testacea, or shells, the animal inhabitant of which is a deres (see Dories), and the shell, which is multivalved, consisting of several segments or valves disposed into the back.

Species.

HETERODUS. Shell of six diurated valves. Schrot.

This is of a moderate size; the color blackish-grey, with white spots and dots, and very finely marked with minute granulated lines. A native of America.

Inhabits America. The farm is an oblong, oval, narrow, with tubercles above disposed in a quincunc, sides convex, mixed with white and marked with brown undulated bands; back greenish, with a broad deep band of black.

ACULEATUS. Shell of eight valves, diurated; body somewhat acutated. Linn. A. monac. Acad. Limax marginata, Rumpf.

An Asiatic species. The shell is tuberculated, oval, rough on the upper part, with narrow, pubescent, somewhat curved, unequal red prickles.

PASCALURUS. Shell of eight valves; body with a tuft of hair on each side of the valves. Schrot.

Described as a native of the coast of Barbary; the valves are cuneiform, smooth, and slightly crenated; the lateral tufts of hair white.

SQUAMOSUS. Shell of eight valves and semi-durated; the margin covered with minute feakes. Linm. &c.

There are many varieties of this species; one (3) is rough and variegated, Obtusus fischeri variegatus, Gmel. And another smooth and variegated (3) Chiton levis variegatus, Gmel. The obtusus gillicum of Argenville, and Chiton fumosus,吁tia setentus; of Schroeter, are also deuided varieties of this species. The valves are partly granulated, and partly fluted very finely; the extreme valves lustrated. Found chiefly in America.

RUBENS. Shell of eight valves; somewhat diurated, the first curved; body red. Linn. Fr. Stur.

This is of an oval and sub-elliptic form, with the back caraolated or elevated into a keel. Colour tawny, with a darker streak on the back bordered with white; margin of the animal brown or yellow with red spots and dots. Inhabits the North Sea. Chemnitz describes a variety of this species that is marked with white and red.

PUNCTATUS. Shell of eight valves, smooth; body with excavated dots. Gmel. Chiton Punctatus, Gmel. Linn. Colva Punctata, m. & m. Linn. nat. cur. A general inhabitant of Europe, Asia, and Africa.

ALBIS Shell of eight valves, smooth, first emarginated behind; body white.

This is of an oval shape. It inhabits the North Seas. Linn. Fabre. &c.

CENTRUS. Shell of eight valves, fimbriated; body reddish, with a fimbriated elevated border. O. Fabr. Found among the rocks of the Bide in the Nonya Sea. It is of a small size, measuring only two inches in length; the form is depressed, and narrower below, with a longer longitudinal groove down the back, one on each side the middle dorsal ridge. Colour reddish when the animal is alive.

COLORUS. Shell of eight valves, thick; outside sea green; inside snowy white, edged with black. Gmel. &c. Native country unknown. The size is rather large.

CERASINUS. Shell of eight valves, smooth, and cherry-coloured, with snowy marginal teeth. Chemn. &c. Native place unknown.

MAGELLANICUS. Shell of eight valves, thick, black; brown; above convex, with a black fimbriated band in the middle of the back, and lateral yellowish edge. Gmel. Saba. &c.

Inhabits the limits of Magellan. This species is of a large size; shell fine green, bordered with brown, and black within the middle.

PURPUSUS. Shell of eight valves, brown, smooth; insides and teeth of the margin brown; back with triangular black spots, and obscure yellowish bands on each side. Chemn. &c.

This is found in India. It is of a narrower form than the last; marginal teeth are numerous, and largest on the two extremity valves; and the back is more elevated and carinated.

MACULATUS. Shell of eight valves, smooth; within sea-green; margin covered with greenish white feakes; an arrow part of the middle valves, and lides of some spotted with brown. Chemn. A rare species. Country unknown.

MARMORATUS. Shell of eight valves, smooth, black and white variegated; middle valves greenish within. Gmel. Chemn. &c.

Inhabits the American seas. Size variable: colours black and white, variously disposed in alternate blackish and white bands, spots, and valleys; the fibrous border tumid with alternate white and black spots, and obscure yellowish bands on each side. Gmel. A variety with seven valves is described by Schröeter.

GRANULATUS. Patchy, above flat, with numerous elevated dots disposed in regular series; border broad, crenate, with alternate black and white patches. Chemn.

A native of the American ocean. Valves usually eight, rarely seven.

PIXUS. Shell eight valued, above smooth, patchy, black variegated with white. Chemn.

Inhabits the American and Red seas. This is allied to the preceding species. The inside of the shell is black in the
the middle, at the sides greenish; and the back is marked with alternate black and white spots, bands, and veins. Rarely found with only two or three valves.

**INDEX.** Shell of eight valves; whittish ash colour, with the border fleshy; middle valves very finely punctured. Chemn. A native of the American seas.

**MEX{
**

**CHIT Ting,** fab-cylindrical, with thin wall. Fab. inhabits the Norwegian seas, near Bergen. Size very small.

**CHITTEN,** fab of eight valves, carinated, diaphanous, and banded; each of the extreme valves very finely punctured. Chemn. This species is of a small size, and inhabits the Norwegian seas. Within the colour is whitish, with alternate blackish and paler bands.

**CHITTEL,** or CHITTIP, or CHITTIP, probably the ancient UPHAR, in Geography, a town of Hindoostan, in the country of Guzerat, celebrated for its manufacture of chintzes; 172 miles S.W. of Amadabad. N lat. 24° 22'. E. long. 75° 3'.

**CHITRO,** a town of European Turkey, in the province of Macedonia, situated in the bay of Salamchi; 56 miles S.S.E. of Edessa. N lat. 40° 50'. E. long. 2° 10'.

**CHITISE,** in Buymy, the name of a Chinese tree, called also Sette.

**CHITTAGONG,** CHITTICONG, or ISLAMABAD, in Geography, the name of a province of the poutinoff, which separates the gulf of Bengal from the Chineese sea, between the Burampioter river and the borders of Arracan, and the Birmen empire. Its chief town of the same name, situated at a considerable distance from the river Nest, which bounds the British and Birman territories, is the seat of the provincial government, and residence of the English magistrature. The banks of the river are covered with deep jungles, interspersed with bracken spots of cultivation, and a few wretched villages, inhabited by the poore clans of herdsmen, and the families of roving hunters, whose occupation it is to catch and tame the wild elephants, with whom the foresters abound. Such unfrequentad places afforded to perfons, concerned in a lawf. traffic, an affluence, where they escaped the cognizance of the English officers of justice, and furnished the emperor of the Birmans with occasion for complaint and remonstrance, or rather for aggressions on the territries of the English East-India company, which terminated, after a threatened conflict, in compromise and conciliation. The Portuguese made their first settlement in this country. The capital, called afoe, Islamabad, is 1° 43'. E. of Bafalor, in N lat. 22° 50', and E. long. 91° 5'. From this town the coasts of Arracan and Pegu take a S.S.E. course to Cape Negro, the extreme point of Pegu to the S.W. the latitude of which is under 16 degrees, and distance from Islamabad about 117 geographic miles.

**CHITTELDROOG,** a town of Hindoostan, and capital of a province of the same name, in the Mysore country; though which passes the river Hagner. It is distant 85 miles N.W. from Binaupetam, and 95 E. of Bednore. N lat. 19° 30'. E. long. 75° 5'.

**CHITTENDEN,** a county of America, in the state of Vermont, situated on the lake Champlain, between Franklin county on the N. and Addison on the S.; the Mule river passes through its N.W. corner, and Otter river divides it nearly in the centre. Its chief town is Burlington. This county contained, by the census of 1790, 44 towns, and 7395 inhabitants. Since that time the northern counties have been taken from it. In that matter its line nor number have been ascertained. Also, a township in Rutland county, and state of Vermont, containing 159 inhabitants. The road over the mountain passes through this township. It is distant 7 miles E. from the fort on Otter creek, in Pittsfield, and about 60 N. by E. from Bennington.

**CHITTENGO,** or CANNIDGE, a considerable stream, which runs northercly into lake Oneida, in the state of New York.

**CHITTEPUT,** a town of Hindoostan, in the Carnatic; 14 miles N. of Ginger.

**CHITTIGON, or ISLAMABAD.** See CHITTAGONG.

**CHITTIM,** in Scripture Geography, denotes, according to Balafras, the Cuthimans, who inhabited Sufiana, near Babylon, and who, marching under Nebuchadnezzar, contributed to the siege of Tyre. Bochart supposes the Romans to be meant by Cuthim; but as the Cuthimans are never called Chttim in Scripture, and the Romans were not concerned in the siege of Tyre, mentione by the prophet I'asha (ch. xxiii. v. 1, &c.), Calmer supposes that the appellation of Chttim is applied to the Macedonians, and that the prophet speaks of the country of Macedonia as an island, denoting it the land of Chttim, after the manner of the Hebrews, who thus call peninsulas and maritime counties. However, there seems to be no sufficient reason for retaining the term Chttim to Macedonia, which was not particularly a maritime country, but it may include all Greece, and more especially the islands of the Archipheage, and perhaps up the Bolphorous, since vessels might navigate from thee to Tyre, as they now do to Egypt, &c. The Greek colonists, differing about the Mediterranean, might also be comprehended under the denomination; and, consequently, Sicily, Sardina, and a great part of Italy.

**CHITTING,**
CHITWA, in Geography, a town of Hindooften, in the Carnatic; 38 miles N.W. of Arcot, and 70 W. of Madras.

CHITWA, a town of Hindooften, in the Bahar country; 87 miles S. of Patna, and 72 S.S.W. of Bahar.

CHITWA, in the Materia Medica, a name used by some authors for a kind of Agnum abietis, which is reddish, and of a very fine scent.

CHITWA, in Geography, a town of the peninsula of India, in the province of Cochin, near the coast of Malabar. N lat. 10° 37' 15". E. long. 76° 5'.

CHIVA, a town of Spain, in the province of Valencia; 15 miles W.N.W. of Valencia.

CHIVALRY, See CHEVALAGE.

CHIVALRY, an Antiquity, an institution which, according to some writers, took its rise from the crusades, but according to others, gave occasion to that enterprise, and which, though founded in captivity, and productive of extra­vagance, had a very considerable influence in refining the manners of the European nations, during the 12th, 13th, 14th, and 15th centuries. This institution naturally arose, says Dr. Robertson, (obi infra,) from the rise of society at that period. The feudal state was a state of perpetual war, rapine, and anarchy; during which the weak and unarmed were exposed to perpetual insults or injuries. The power of the sovereign was too limited to prevent these wrongs; and the administration of justice too feeble to redress them. Against violence and oppression there was scarcely any protection, besides that which the valour and generosity of private persons afforded. The fame spirit of enterprise which had prompted so many gentlemen to take arms in defence of the oppressed pilgrims in Palestine, incited others to declare themselves the patrons and avengers of injured innocence at home. When the final reduction of the Holy Land under the dominion of Infidels, put an end to these foreign expeditions, the latter was the only employment left for the activity and courage of adventurers. The objects of this institution were to check the insolence of overgrown oppressors, to succour the distressed, to relieve the helpless from captivity, to protect or to avenge women, orphans, and ecclesiastics, who could not bear arms in their own defence, to redress wrongs, and to remove grievances. These were considered as acts of the highest prowess and merit. Valour, gallantry, and religion, were blended in this institution, humanity, courtesy, justice, and honour were its characteristic qualities; the enthusiastic zeal produced by religion served to give it singular energy, and to carry it even to a romantic excess; men were trained to knighthood by long previous discipline; they were admitted into the order by solemnities no less devout than pompoms; every person of noble birth courted the honour; it was deemed a distinguishing privilege, inferior to royalty, and monarchs were found to receive it from the hands of private gentlemen. These various circumstances contributed to render a whimsical institution of sublimal benefit to mankind.

Another ingenious writer, who traces the origin of chivalry to the crusades, thus represents the occasion and manner of its introduction. On the crumbling of the western empire into small states, with regular subdivisions of vassals and their chiefs, who looked up to a common sovereign, it was soon found that these chiefs had it in their power to make themselves very formidable to their masters; and just in that crisis of European manners and empire, the Saracens having expelled Christianity from the East, the western princes seized the opportunity, and with great craft turned the warlike genius of their feudataries, which would otherwise have preyed upon themselves, into the spirit of crusades against the common enemy. See CROSS. But when, afterwards, the ardour of the crusades was somewhat abated, though not extinguished, the pious princes and their families had fitted it into established monasteries. At this juncture, when the relics of the spirit of their vassals had little employment abroad, and was restrained, in a consider­able degree, from exerting itself with success in domestic quarrels, it broke out in all the extravagance of "knights-errantry." Military fame, acquired in the Holy Land, had enticed the adventurers to the insignia of arms, the source of heraldry; and inspired them with the love of war and the passion of enterprise. Their late expeditions had given them a turn for moving in quest of adventures; and their religious zeal had inflamed high nations of priests, judges, and chivalry. The scene of action being now more confined, they turned themselves from the "world's debates," to private and personal amusements. Chivalry was employed in refining humble and faithful vassals from the opinions of petty lords; their women from savage lust; and the lowly heads of hermits (a species of calein monks, much re­verenced in the Holy Land) from rapine and outrage. In the mean time the courts of the feudal sovereigns became magnificent and polite; and, as the military institution had fulfilled, military merit was to be upheld; but, delitute of its former objects, it naturally softened into fictitious images and courteously exercised of war, in "julls" and "tournaments," where the honour of the ladies supplied the place of zeal for the holy sequeleure; and thus the courtesy of elegant love, but of a wild and fanatic species, as being engraved on spirit­ual enthuiasm, came to mix itself with the other charac­ters of the knights-errant.

Dr. Hurd, in his "Letters on Chivalry and Romance," observes, that chivalry, properly so called, and under the idea of a distinct military order, conferred in the way of investiture, and accompanied with the solemnity of an oath and other ceremonials, as described in the old historians and romances, was of later date than the feats of Charlemagne and our Arthur, and seems to have sprung immediately out of the feudal constitution. This constitution produced a very great change in the politics of Europe; and its first and most sensible effect was the erection of a prodigious number of petty tyrannies, exercised by the great barons over their dependent vassals. These barons, though closely attached to the service of their prince by the conditions of their tenure, became kind of absolute sovereigns, at least with regard to one another; and as their aims and interests often interfered, the feudal state was, in a great degree, a state of war; the several combinations of feudal tenants were so many separate armies under their head or chief; and their castles were so many fortresses, as well as palaces, of their petty princes. Hence arose the peculiar encouragement which was given to the use of arms, under every different form of attack and defence, as the safety of these different communities, or the ambition of their kiders, might require.

This condition of the times is supposed by the ingenious prelate to have given rise to that military institution, which we know by the name of "Chivalry." In the intervals of peace, the military discipline of the followers of these independent nobles was not to be relaxed, nor their armour suffered to cool, by a total diffuse of martial exercises. To this circumstance, he conceives, may be traced the proper origin of "julls" and "tournaments." Those images of war, which were kept up in the castles of the barons, and, by an useful policy, converted into the amusements of the knights, when their arms were employed on no serious oc­casion. See just and TOURNAMENT.
CHIVALRY.

From the circumstances of the feudal government, which gave rise to chivalry, the author accounts for the various characteristics of this singular profession. Hence were derived the passion for arms, the spirit of enterprise, the rewards of valor, the splendid of equipage, and, in short, everything that raises our ideas of the heroes, gallantry, and magnificence of the sons of Mars. He also proceeded their romantic ideas of justice, their passion for adventures, their eagerness to run to the succour of the distressed, and the pride they took in redressing wrongs and removing grievances, which are distinguishing characteristics of genuine chivalry. Moreover, the courtesy, affiliation, and gallantry, for which these adventurers were so famous, are but the natural effects and consequences of their situation. The castles of the barons were the courts of those little sovereigns, as well as their fortresses; and the refort of their vaillants, in honour of their chiefs, and for their own proper security, would render that civility and politeness, which are seen in courts and insensibly prevail there, a predominant part in the character of these assemblies. Besides, the prudence of the ladies, in those courts and circles of the great, would operate so far on the chivalric knights, as to give birth to the attentions of gallantry: and as violations of chastity were the most atrocious crimes which they had to charge on their enemies, they would pride themselves in the magnificence of being its protectors; this virtue furnishing the fairest and finest claim of the sex itself to such protection, it is no wonder that the notions of it were, in time, carried to so Platonic an elevation. To this purpose the great matter of chivalry expresses his sentiments on the subject:

"It hath been throu' all ages ever seen,
That, with the praise of arms and chivalry,
The prize of beauty still hath joined been;
And that for reason's special privy:
For either doth on other much rely;
For He meecmons molt fit the fair to serve,
That can her bold defend from villany;
And She molt his service doth deserve,
That taint is, and from her faith will never forwe.

Spenfer, b. iv. c. 5.

As to the character of religion, which was so deeply imprinted on the minds of all knights, and was essential to their infliction, insomuch that, it is said, "the love of God and of the ladies," went hand in hand in the duties and ritual of chivalry, two reasons may be aligned for this singularity; viz., the superlition of the times in which chivalry arose, which was so great, that no institution of a public nature could have found credit in the world, that was not consecrated by the churchmen, and closely interwoven with religion; and also the condition of the christian states, which had been harassed by long wars, and had but just recovered a breathing time from the brutal ravages of the Saracen a.miss. The remembrance of what they had lately suffered from these grand enemies of the faith, made it natural and even necessary to engage a new military order on the side of religion. See RECREANT. The preceding characteristics of chivalry, which Dr. Hurd deduces from the essential properties of a feudal government, are made to result from the spirit of crusades, by those who trace their origin to these military enterprises; whereas this author considers the latter as only an accidental effect of the former. He allows, however, what indeed cannot be reasonably contested, that chivalry as it is represented in books of romance, (so much posterior to the date of that military institution) took its colour and character from the impressions made on the minds of men by the spirit of crusading into the holy land. Accordingly there are, as he apprehends, two distinct periods, which ought to be carefully observed in a deduction of the rise and progress of chivalry. The first is that in which the empire was overturned, and the feudal governments were everywhere introduced on its ruins, by the northern nations. In this era, that new policy settled itself in the west, and operated so powerfully as to lay the first foundations, and to give the remote causes of what we know by the name of chivalry. The second, which is when these causes had taken a fuller effect, physicists themselves in that signal enterprise of the crusades; which not only concurred with the spirit of chivalry, already pulling it in the minds of men, but brought a prodigious increase, and gave a singular vigour and force, to all its operations. In this era, chivalry took deep root, and at the same time shot up to its full height and size. From this last period the Romances both in prose and verse, derive all their ideas of chivalry. See ROMANCE. But it was, as our learned prelate conceives, the former period that gave birth to this institution; as he infers not only from the reason of the thing, but from the clearer information of authentic history. For there are traces of chivalry, in its most peculiar and characteristic forms, to be found in the ages preceding the crusades; and even jults and tournaments, the image of serious knight-errantry, was certainly of earlier date than that event. Our author, referring to the "Memoirs of the Academy of Inscriptions and Belles-Lettres," T. xx., proceeds to show that there is a remarkable correspondence between the manners of the old heroic times, as painted by their great romancers, Homer, and thence which are represented to us in books of modern knight-errantry; and this is a fact which is accounted for by the assistance of another, viz., that the political state of Greece, in the earlier periods of its history, was similar in many respects to that of Europe, as broken by the feudal system into an infinite number of petty independent governments.

This similitude is illustrated in the following particulars.
The military enthusiasm of the barons is but of a piece with the fanaticism of the heroes, as they are exhibited by the Gothic romances and by the Greek poet. We also hear much of knights-errant encountering giants and quelling savages, in books of chivalry. These giants were opprobrious feudal lords, occupying their strongholds or castles; and their dependants of a lower form, who imitated the violence of their superiors, and though delithete of castles, had their lurking places, were the savages of romance. The greater lord was denominated a giant, for his power; the less, a savage, for his brutality. Another terra of the Gothic ages was monsters, dragons, and giants. In all these respects, Greek antiquity very much resembles it. For what are Homer's Labyrinth and Cyclops, but bands of lawless savages, with each of them, a giant of enormous size at their head? And what are the Greek Jason, Minos, and Minos, but knights-errant, the exact counterparts of Sir Lancelot and Amadis de Gaul? Moreover, the oppreession which it was the glory of the knight to avenge, were frequently carried on, as we are told, by the charms and enchantments of women. Similar to stories of this kind are those of Calipho and Circe, the enchantresses of the Greek poet. Besides, robbery and piety were favourable to both; so far were they from reflecting any different on the ancient or modern redressors of wrongs. To account for this odd circumstance, we ought to recollect, that in the feudal times, and in the early days of Greece, when government was weak, and unable to redress the innocent injures of petty sovereigns, it would be glorious for private adventurers to undertake this work; and if they could
could accomplish it in no other way, to pay them in kind by
downright plunder and rapine. Their manners, in another
respect, were the same. Barbarity was in credit with both.
Whilst they were extremely watchful over the chastity of
their own women, that was the only safeguard, they were
armed lawful prise. Or, if at any time the demands of war
at home  were compulsory enough to cover the facts by an
ingenious fiction. The off-spring was regard divine. We
also find, at this period, the grandilocutions of character,
and tenderness of the particular, that took upon them the
names of the heroic ages. Achilles was at once the most
relentless, vindictive, implacable, and the friendliest of
men. Similar to this is the repetitio antithesis that occurs
in the Gothic romances, where it is almost true what
Butler says humorously of these heroic beings, that
"They did in fight but cut work out
To employ their countries about."

These contradictions in the characters of ancient and
modern men of arms can be reconciled only by observing, that,
as in these latter times dangers and disasters of all sorts
abound, there would be the same demand for compulsion,
gentleness, and generous attachment to the unfortunate,
those especially of their own class, as of the retainers, rage,
and animosity against their enemies. Further, if we advert
to the main games which ancient Greece delighted to
celebrate on great and solemn occasions, we shall perceive
that they had the same origin, and served the same purpose,
as the tournaments of the Gothic warriors. And, lastly,
the passion for adventure, to natural in their situation, would
be as naturally attended with the love of praise and glory.
Hence the same encouragement, in the old Greek and Gothic
time, to panegyrists and poets: the bard being as welcome
to the tables of the feudal lords, as the AODIOLO of old
to those of the Gothic heroes.

Bishop Warburton (in a note to Locke's Labour lost) and
Warren (Dict. pref. to the History of English Poetry, vol. 1)
invoke to the hypothesis which traces the first idea of
chivalry and romance to Spain, where it was introduced
by the Saracens or Arabsians, who having been for
some time settled on the northern coasts of Africa, entered
Spain about the beginning of the 8th century. Maddox,
in his "Introduction to the History of Denmark," followed
by Pinkerton's (Hist. of the Scythians and Goths) and Percy
(in the Ancient Metrical Romances), ascribes to the texts
and rites of chivalry a Scandinavian origin. An anonymous
writer, however, is of opinion, (Month. Magaz. Feb. 1813)
that neither Moorish Spain, nor Gothic Scandinavia gave
this very decisive impulse to the chimer of early modern
civilization; but rather Armories, and the connected
princes of Britain. In support of this opinion it is urged,
that all the European nations take their renaissance of
chivalry from the French; and that the heroic age of
Europe in the north of France; that the older races of
chivalry have especially celebrated the heroes of Greece
or Lycia; and are therefore of Armoric origin, that the
time derived from the language of Armorica, and true
chivalry, though of obscure origin, is also probably Armorican.
Accordingly it is all said, that chivalry resembles in
the spirit of its operation, a confederacy of country-gentle
men, to ward off from each other the dangers and evils
of anarchy. A defensive, not an offensive spirit characterizes
the obligations of a knight; and his oath required him to
protect the church against heathens, ladies against ravens,
orphans gild enroaching guardians, and the conquered
equal against infliction. An exclusive care for the interests of
gentlemen distinguishes the practice of the initiates; and
whilst the personal rights of women of the lower classes were
never crossed by the feudal process, the order of ladies were regarded
with superstitious politeness. Such features, it is felt, seem
to be rather the relics of a receding than the tokens of a
reviving civilization. The whole spirit of chivalry, the nobility
of the towns, the prowess of the feudal princes, and its
religious character imply an advancement in society, to which
the Scandinavians could not be attuned. The second reference
for ladies cannot have proceeded from the Mahomedan
Armories alone, as the anonymous writer maintains, it was
adapted by its political circumstances, its Christianity,
and its long participation of Roman culture, to become the
source of such peculiarities. Some certain, however, be it
admitted that a strong resemblance to those barbaric
orders which were common to the Nordic provinces of Gaul
and Britain, which retain, till this time among the Welsh,
that some influence. See ROMANS.

Chivalry, whatever may be the source of its original
in England during the more recent years of the 14th and
15th century, Edward III had revived under Edward I. This
phase was one of the most remarkable features of the era, in
which it flourished, and both delighted and excited its
followers. As a proof of this, it will be sufficient to
consider, that when he was on his return from the Field
after his father's death, and knew at his presence was
ardently desired in England, he accepted an invitation to
a tournament at Chalons in Burgundy, where he displayed
his skill and valour to great advantage, and gained a com-
plete victory. Edward III, was no less true of chivalry, and
encouraged it both by his example and his income.
Having formed the design of affixing his crown to the crown
of France, he laboured to imbue his faithful with the spirit
of chivalry, and to inculcate his virtues as possible into his
service. With this view, he instituted several tournaments,
which he solicited the masters who delighted in such arts of
combat, or who were skilled in hospitality, and loaded such of them as
excelled in martial sports with honours and rewards, in order to
attract them to his person and engage them to fight in his cause
with the same fire, and at the same time, to maintain the
most honourable order of the garter, which he, as his own
commander-in-chief, the Black Prince, was the first to
understand. Their first companions were persons famous for
their victory at tournaments, and in real wars. The reigns of
Edward I and Edward III continued not a little to promote
valour, munificence, and a kind of gaudy among persons of
condition, who aspired to the honours of knighthood, which were then
objects of ambition to the greatest princes. At
the home courts, it was felt, that the nobility who resided
in the feverish rates of Cambrai, were the focus of
activity. Although this may be regarded as an engine
and the tournaments, the spirit of the nobility and the
courtiers were fixed by the same virtue. By these lines, in other
places of an inferior character could obtain the
knighthood, which were conferred with much solemnity in
the annual public occasions, and in the presence of the most
notable assemblies. After the candidate had taken
practically of his proctors, and other virtues, to make that
formation, he had prepared himself for the morning of his
life, consisting of his must, his defence, and his arguments;
he took an oath, which consisted of 24 articles, in
amongst other things, the two that he would be a good,
brave, loyal, just, generous, a diligent, knight, a champion
of the church and clergy, a protector of the ladies, with a
redresser of the wrongs of widows and orphans. To a purpose.
purpose we may observe, that when Alphonso V. king of Portugal, conferred the honour of knighthood on his son, he commanded him to kneel down by his side, and instructed him in the nature and duties of the order into which he was admitted; and, amongst other things, directed him to consider, that as the priesthood was instituted for divine service, so was chivalry for the maintenance of religion and justice. A knight, he adds, ought to be the husband of widows, the father of orphans, the protector of the poor, and the prop of those who have no support; and who they do not act thus, are unworthy to bear that name. Those who acquitted themselves of these obligations in an honourable manner were favoured by the fair and courted by the great; but those who were guilty of base dishonourable actions, were degraded with every possible mark of infamy. (See Knight.) All this could hardly fail to have some influence on the conduct of those who were invested with that dignity; though, from the rudeness of the times, and the general dilution of manners which then prevailed, that influence was probably less than might have been expected. However, the spirit and practice of chivalry did actually produce a very beneficial effect. “I will venture to say,” as Lord Lyttelton observes (Hill. Hen. II. vol. iii. p. 161, 8vo.) “that from the 9th to the 16th century, the brightest virtues which dignified either the history of this nation or that of any other people in the whole Christian world, were chiefly derived from this source. Had it not been for the spirit of chivalry, the corruption of religion, the want of all good learning, the superstition, the ferocity, the barbarism of the times, would have extinguished all virtue and sense of humanity, as well as all generous sentiments of honour, in the hearts of the nobility and gentry of Europe; nor could they have been able to repel the military enthusiasm of the Saracens and the Turks, without the aid of another kind of fanaticism, which was excited and nourished in them by means of that spirit.”

“This singular institution,” says Dr. Robertson (ubi infra), “in which valor, gallantry, and religion, were so strangely blended, was wonderfully adapted to the taste and genius of martial nobles; and its effects were soon visible in their manners. War was carried on with less ferocity, when humanity came to be deemed the ornament of knighthood no less than courage. More gentle and polished manners were introduced, when courtesy was recommended as the most amiable of knightly virtues. Violence and oppression decreased, when it was reckoned meritorious to check and to punish them. A scrupulous adherence to truth, with the most religious attention to fulfill every engagement, became the distinguishing character of a gentleman, because chivalry was regarded as the school of honour, and inculcated the most delicate sensibility with respect to that point. The admiration of these qualities, together with the highest distinctions and prerogatives conferred on knighthood in every part of Europe, inspired persons of noble birth, on some occasions, with a species of military fanaticism, and led them to extravagant enterprises. But they imprinted deeply on their minds the principles of generosity and honour. They were strengthened by every thing that can affect the senses or touch the heart. The wild exploits of those romantic knights who fell in quest of adventures, are well known, and have been treated with proper ridicule. The political and permanent efforts of the spirit of chivalry have been less observed. Perhaps, the humanity which accompanies all the operations of war, the refinements of gallantry, and the point of honour, the three chief circumstances which distinguish modern from ancient manners, may be ascribed to a great measure to this ameliorated institution, seemingly of little benefit to mankind. The sentiments which chivalry inspired had a wonderful influence on manners and conduct during the 12th, 13th, 14th, and 15th centuries. They were so deeply rooted, that they continued to operate after the vigour and reputation of the institution itself began to decline.” In a word, chivalry, which is now an object of ridicule, was, at the period to which we have above referred, a matter of the greatest influence, and had no little influence on the manners of mankind and the fate of nations. Robertson's Ch. V. vol. i. Henry's Hist. vol. viii. Lyttelton's Hist. vol. iii. Third's Moral and Political Dialogues, vol. iii. Memoirs of Ancient Chivalry, &c. translated from the French of M. de St. Palaye, by the translator of the Life of Petrarch (Mrs. Dobson), 8vo. 1754.

CHIVALRY, or chivalry, in Latin, a tenure of land by knight-service; whereby the tenant was anciently bound to perform service in war, to the king, or to the man or kind of whom he held by that tenure.

By a statute of 12 Car. II. cap. 24. all tenures by chivalry, in capite, &c. are abolished. See Court and Guardian.

CHIVALRY, Court of. See Court.

CHIVAZZO, or Chivas, in Geography, a town of Piedmont, situated near the union of the river Oco with the Po, on a large plain, part of which is converted to tillage, and produces Turkey corn, but towards Zigianno a barren waste in many places, covered with a kind of reddish heath. It is defended with ancient and new walls, battions, and large fosses filled with water; and well supplied with artillery and a numerous garrison, especially in time of war. Its situation is so advantageous, that those who are masters of it are said to possess the key of the country of Turin, the Canavos, the country of Vercelli, Monteferrat, and Lombardy, all which they may enter at pleasure. It has several churches and convents; 11 miles N.E. of Turin, and 12 S. of Ivrea. N. lat. 43° 1' E. long. 7° 43'.

CHUDENDO, in Italian Music, to conclude; as chindendo col ritornello, col prima, signifies to end with a ritornello, or some passus which has been before sung in some parts of the piece.

CHIVEN, in Ornithology, a name given by some old writers to the fly-catcher, Moschacca grisea.

CHIVERNY, in Geography, a town of France, in the department of the Loir and Cher, situated on the south side of the Conon; 3 leagues S.E. of Blois.

CHIVES, or Chives, in Botany, the small knobs growing on the ends of the fine threads, or filaments of flowers: by Ray, and others, called also spicis. See Anthrae.

Dr. Grew calls the filaments, or threads themselves, on which the spicis are fixed, the chives.

Chives, a very small species of the onion kind, is also called by this name. See Allium.

CHIUM marinar, See Marble.

Chium vinum, Chian wine, or wine of the growth of the island of Chios, now Scio, is commenced by Diodorus, as affording a good nourishment, fit to be drunk; lets diluted to intoxicate, ended with the virtue of refreshing delusions, and a proper ingredient in aphthamical medicines. Hence Scribonius Largus directs the dry ingredients in colofia for the eyes, to be made up with Chian wine.

CHIUN, or Chives, in Hebrew Antiquity. We meet with this word in the prophet Amos (ch. v. 29) cited in the Acts of the Apostles, (ch. xiv. 45.) St. Luke reads the passage thus: "Ye took up the tabernacle of Moloch, and the altar of your god Ramphan, figures which ye made to worship them." The import of the Hebrew is as follows: 4 X, "Ye
"Ye have borne the tabernacle of your kings, and the pedestal (the chion) of your images, the altar of your gods, which ye made to yourselves." The Septuagint in all probability read refrigerium or raphan, instead of chion or chiron, and took the pedestal for a god.

Some say that the Septuagint, who made their translation in Egypt, changed the word chion into that of raphan, because they had the same signification. M. Bajnace, in his book entitled Jewish Antiquities, after having discussed a good deal upon chion or raphan, concludes that Moholch was the sun, chion, char, or raphan, the moon.

CHIURA, in Zoology, a name given by Carlen, Oviedo, and some others, to the Opolium, Dodephus opolium.

CHIUSA, L., in Geography, a town of Italy, in the Venetian, belonging to the state of Venice; 9 miles N.W. of Verona.—Allo, a town of Italy in the Friuli, seated on a small river, called the Fella, which runs into the Tagamenta; taken by the French in 1797; 14 miles N. of Friuli.

CHIUSANO, a town of Naples, in the province of Principato Citera; 13 miles S.S. E. of Benevento.

CHIUSELLE, a river of Piedmont, which runs into the Ore; 1 mile W.S.W. of Foglio.

CHIUSI, a town of Italy, in the country of Sienna, containing about 1000 inhabitants, the fee of a bishop; 31 miles S.S.E. of Sienna.

CHIUSO, Ital. Cloae, concealed, locked up: as in Mufic, canone chiron, is a canon, not in score, but written entirely on one leaf, sometimes without any indications of keys, signals when the several parts come in, or information of any kind to point out the solution. See Canon.

CHIUSTENGI, in Geography, a town of European Turkey, in the province of Bulgaria; 70 miles E. of Silhislia. N. lat. 43° 2’. E. long. 27° 30’.

CHIUTAYA, Kutiya, or Kutaja, a town of Aflatic Turkey, and capital of a district in Natalia, situated at the foot of a mountain, in a fertile and healthy country, and defended by a casle on a rock. It contains several monasteries, and three Armenian churches; 136 miles S.S.E. from Constantinople. N. lat. 39° 14’. E. long. 30° 44’.  

CHIZE’, a town of France, in the department of the Two Sovers, and district of Niort, situated near the Bouteonne; 3½ leagues S. of Niort.

CHIZILABBAD, a town of Afia, in the kingdom of Kurditian; 70 miles S.S.E. of Kerku.

CHLÆNA, in Antiquity, a kind of thick, shaggy, upper garment; its use was very ancient; for we find Homer makes his heroes first put off their chlamys, and afterwards their tunics or coats.

CHLAMYDA, in Botany, Genr. See Phormium.

CHLAMYDULA, in Antiquity, a small upper garment worn by children. See Chlamous.

CHLAMYDS, among the Romans called paludamentum, in Antiquity, a military habit, worn by the ancients over the tunica. Chlamys was the same, in time of war, that the toga was in time of peace; each belonged to the patricians. It did not cover the whole body, but chiefly the hind-part; though it also came over the shoulders, usually the left shoulder, so as to leave the right arm at liberty, and was fastened with a buckle on the breast. There were four or five kinds of chlamys: that of children, that of women, and that of men, which laft was divided into that of the people, and that of the emperor. The conful and generals, before they set out for the field, went to the capitol dressed in this robe, in order to pray and make vows to the gods, and throw it aside on their return, entering the city in the toga.

CHLIENN, in Geography, a town of Bohemia, in the circle of Königgrätz; 16 miles S.E. of it.

CHLIASMA, in Medicine, a warm fomentation of the moist kind: as pyria is of the dry kind.

CHLOEIA, in Antiquity, a festival celebrated at Athens, in honour of Ceres, to whom, under the name χλοία, e. g., they sacrificed a ram.

CHLOPAN, in Geography, a town of Poland, in the patinate of Vollynia; 72 E.N.E. of Lucko.

Gen. Ch. Calyx eight-leaved; leaves linear, permanent. Cor. monopetalous, falver-shaped; tube shorter than the calyx, costing the germ; border eight-cleft; segments lanceolate, longer than the tube. Stam. Filaments eight, very short, frted in the throat; anthers linear, erect, shorter than the segments of the corolla. Pyfl. Germ ovate-oblong; style filiform; stigma four-cleft. Peric. capsule ovate-oblong, somewhat compressed, furrowed, one-celled, two-valved; valves incurved on the side. Seeds numerous, minute.

Sp. 1. C. perfoliata. Linn. Syll. Nat. 1. Mart. 1. Lam. Ence. 1. Wild. 1. (Gentiana perfoliata; Linn. Sp. Pl. Centaureum lateum perfoliatum, Bauh. Pin. 278.) Yellow centaury. "Leaves perfoliate." Root annual, small, twisted. Whole herb glaucous, intensely bitter. Stem from three inches to three feet high, erect, cylindrical, dichotomous near the top. Leaves quite entire, smooth, egg-shaped, acute. Flowers from the forks of the item, solitary, peduncled, of a golden hue; leaves of the calyx generally eight, border of the calyx generally eight-cleft; filaments generally eight; stigma red, two-cleft; segments bifid. A native of a calcareous soil in England, and the southern part of the continent of Europe. 2. C. quadrifolium. Linn. Syll. Nat. 2. (Gentiana: Linn. Sp. Pl. Plant.) "Leaves growing by four." Stem about seven inches high, simple, somewhat quadrangular, jointed. Leaves in whors, linear, a little broader towards the top, rather obtuse, the length of the internodes. Peduncles five, terminal; the fifth intermediate; each with two opposite bracts about the middle; corolla eight-cleft as in the preceding, but the segments smaller. A native of the south of Europe. Linnaeus supposed it a hybrid plant produced from Chlora perfoliata, and Linum quadrifolium. 3. C. doecandra. Linn. Syll. Nat. 3. Mart. 4. Lam. Ence. 3. Wild. 3. (Chromia; Linn. Sp. Pl. Gentiana; Gron. Virg.) "Leaves opposite; corollas twelve-cleft." Flowers flesh-coloured; calyx twelve-cleft; segments linear, erect; corolla twelve-cleft, longer than the calyx; segments lanceolate. Stamens twelve; anthers oblong, spiral; germ roundish; style long, twisted; stigma simple. A native of Virginia. 4. C. imperfoliata. Linn. jun. Sup. 218. Mart. 2. Lam. Ence. 4. Wild. 5. "Corolais six-cleft." Root annual. Stem about four inches high, herbaceous, quite simple, erect, quadrangular. Leaves opposite, filifl, half-embracing the stem, egg-shaped, smooth, acute, shorter than the internodes. Flower yellow,
low, larger than the leaves, terminal, peduncled; calyx one-lobed, campanulate, the length of the corolla, held beyond the middle, spreading, permanent; segments lanceolate; corolla monopetalous, lacerated; tube short, spreading; border longer, with six oval segments; filaments falcate, awned, a little longer than the tube, and attached to it; anthers roundish; germ oblong; styles two, aggriguated together; stigma obtuse. A native of Italy. The fruit of this plant is unknown, and nearly all its known parts of fructification are totally at variance with the generic character; it cannot therefore be a chora, as that genus is at present understood, notwithstanding its agreement in habit with C. perforata, from which the generic character was originally formed. C. dodecandria is in the same predicament; and, on account of its spiral anthers, had perhaps better have been left with Chironia, where Linnaeus once placed it.

Eff. Ch. calyx none. Petal scale-like, three-lobed, fixed to the side of the germ. Anthers adnate to the inner side of the petal. Berry one-seeded.

Sp. C. inconspicuous. A floriferous underbush. Stems about a foot high, cylindrical, procumbent at the base, throwing out roots from the lower knots. Leaves about two inches long, and opposite, oblong-ovate, rotund, somewhat wrinkled, spreading, flat, permanent; pectoles thor, opposite, uniting at the base into a kind of ring, which supports two awl-shaped erect filipes. Flowers pale yellow, in a terminal panicle composed of opposite spikes, arranged in pairs on a common receptacle, each accompanied by a small scale-like bracte. The ripe fruit is marked towards the top with the scars of the corolla, and its bracte, which, as Juffieu observes, proves it to be truly inferior. A native of China and Japan, and cultivated by the Chinese in their gardens. It was introduced into the royal garden at Kew in 1781, by Dr. James Lind.

CHLORAS, in Zoology, one of the synonyms of Simia. Linn. Briffler.

CHLORUS, in Ornithology, a name given by Turner and others to the common yellow-hammer, Emberiza Citrinella; which see.

CHLORUS, is also a name assigned by several of the early writers to the golden oriole, Oriolus galbula.

CHLORION, of GfNger, in Ornithology, the golden oriole, Oriolus galbula of Linnaeus.

CHLORIS, Chloë urticaei usoneo Pappo dicta. Briffl.

See Emberiza citrinella.

CHLORIS indica, Briffl. the yellow finch. See Fringilla lutyrina.

CHLORIS labamansis. Briffl. See Fringilla bicolor.

CHLORITE, in Mineralogy, Saint Erde, or pearls of the Cornith mines, a species of the mutrician genus in the arrangement of Kirwan, (Vol. I.) which he distributes into 3 families. The first is in a loose form; colour, grana-green, or greenish-brown, or dark-green inclining to black; external liatre 0.1.; it feels greatly, shews a white break, and gives an earthy smell when breathed on. It is found in seashells; its beautiful, combining other stones or heaped together. It melts into a dull black compact flag, and then becomes magnetic. By the analysis of Mr. Hespfiner it contains 0.4757 magnesia, 0.375 flex, 0.017 argill, 0.0176 cais, and 0.1929 iron. Tab. Briefe. 43. According to Hespfiner, it contains 0.415 flux, 0.3947 magnesia, 0.0133 argill, 0.0115 cais, 0.1015 iron. 4. Clay, 1790.56. The third family is flatly. It is said to abound with garnets and magnetic iron stone.

CHLOROPSIS, in Ornithology, the common water-hen or moor-hen of Will. Penn. &c. The common gallinule of Latham Syn. and falica-chloropus of Linnaeus and Guettin, which see.

CHLOROSIS, in Medicine, the green-flecked, from χλωρος, green, or pale, a disease peculiar to young women, about the period of the commencement of menstruation; the most obvious and characteristic symptom of which is an extremely pallid complexion, frequently with a tinge of yellow, sometimes verging towards green. It has hence been also called occasionally, from the days of Hippocrates, igitur albus, or substantive jaundice.

This disease usually commences with languor, latitude, and indisposition to motion or exertion; and a failure of animation or depression of spirits. The stomch is deranged in its functions, and various symptoms of dyspepsia, such as heartburn, nausea, acid eructations, &c. appear; the appetite for natural food is diminished, and a depraved appetite for indigestible substances, such as chalk, or earth, ensues. The respiration becomes short and difficult, especially upon every slight exertion, such as ascending the stairs, or any activity; and on these occasions the heart is frequently seized with palpitation. The patient complains of considerable pain in the loins and head, and frequently in the whole of the muscles of the limbs. The bowels are often irregular in their evacuations, most frequently inclined to constipation. The skin over the whole body becomes extremely pallid, sometimes nearly white, more frequently fallow, and in the advanced stages a flight greenish-tinge is occasionally observed; the lips lose altogether their redness; and the eyes become of an excruciatingly white whiteness. As the disease proceeds, the legs and feet become edematous, especially in the evening, and the serum flows into the cellular membrane of the eyelids, which are swelled and livid in the morning, and at length into that of the whole body, producing a general anaesthesia. In this condition of the body, some of the viscera, as the stomach, liver or spleen, become occasionally affected with some organic diseace, the functions generally fail, and the patient dies, tabid or dropsical. This termination, however, is rare; for the chlorosis, in general, is readily removed by medicine and regimen. It
It is obvious, from this enumeration of the symptoms, that the disease is connected with a great debility or atony of the whole system, and especially of the circulation. Hence the languor and lassitude, and pains in the muscles, especially on being exercised; hence the imperfect secretions of the stomach and liver, and indigestion, which give rise to flatulency, constipation, &c.; and hence the deficiency of that healthy complexion of the skin, which the free and vigorous circulation of the blood through the cutaneous vessels produces. The pain of the back, which is an almost constant symptom of chlorosis, arises partly from the state of atony in the muscles, as in other diseases where the strength is much impaired, but chiefly perhaps from the disordered state of the uterus.

The chlorotic condition of the body is so commonly connected with a partial or complete retention of the menstrual discharge, or amenorrhoea, that the latter is frequently considered as an almost synonymous term, and by the females themselves all the symptoms of chlorosis are attributed solely to the amenorrhoea. This, however, is undoubtedly an erroneous notion. The general debility of the system is the common cause of the menstrual retention, and of those other symptoms which constitute chlorosis, both the one and the other are symptoms of the general morbid state of the habit. Thus all the symptoms of chlorosis occur occasionally when the menses continue to appear at the regular periods. Many of the symptoms are sometimes observed, in which neither the colour of the skin, which characterizes chlorosis, is present, nor are the catamenia suspended. And a fullness of the catamenia, where the chlorotic condition does not take place, is a very common occurrence. Indeed, whatever occasions a considerable reduction of the strength, at any period of life, generally causes a suppression of the menses; such as a want of nutritive food, watching, chronic diseases, &c. But it is chiefly about the period, when the discharge of the menses first appears, or when it has already appeared partially, but not yet attained its regularity, that this debility, which induces chlorosis, is readily excited. Why the body should at that period be thus easily affected, it is very difficult to explain satisfactorily.

The causes which induce chlorosis are more easily ascertained. Whatever contributes to reduce the strength of the system, or greatly to disturb the digestive organs, at the period of life just alluded to, tends to produce a chlorotic condition. Hence the occasional causes of chlorosis are as various as the sources of debility. Fatigue, loss of sleep, deficiency of nutritive food, previous diseases, exposure to cold, a sedentary mode of life, grief, and other depleting passions, are frequent causes of this disease. But of all the mental causes, love, which "feeds on the damask cheek," and to be the most common source of chlorosis. The habit, therefore, of all conditions of society are favourable to the frequent production of the complaint. The crowded and close streets, the small unfertilized tenements, in which young females of the poorer class, occupied in sedentary occupations, fearlessly ever enjoy the benefit of free air, together with their scanty and poor diet, render this class of girls very susceptible to the attacks of chlorosis. And to the words of an intelligent physician, "we cannot be surprised that young ladies of the highest rank should suffer equally; eight months of the year they fit on thick carpets, in close rooms, heated by register stoves; have large fires kept in their bed rooms, never lie out except in carriages, and are often too much restricted in their diet. The weakens and extreme irritability, induced by this mode of living, not only bring on the chlorotic state, but after the slightest exposure to damp or cold air, render them also liable to be affected with pains and inflammations of the bowels, rheumatism, headache, cataarrh, phthisis, &c." See William Diff. of London, p. 175.

With respect to the prove style of chlorosis, perhaps little is satisfactory can be said. As the disease is not commonly connected with a retention of the catamenia, and occurs solely, or almost solely, at this period of life, when the organs defined for the work of generation are evolved, or attain their mature condition, the general laxity and debility of the system, upon which all the symptoms, even the amenorrhoea, depend, have been attributed to some morbid condition of the ovaries. Thus a celebrated professor has remarked, that as a certain state of the ovaries in females prepares and disposes them to the excite of venery, about the very period at which the menses first appear, it is to be presumed that the state of the ovaries and that of the uterine vessels are in some measure connected together; and as generally symptoms of a change in the state of the former appear before those of the latter, it may be inferred, that the state of the ovaries has a great share in exciting the action of the uterine vessels, and producing the menstrual flux. But analogous to what happens in the male sex it may be presumed, that in females a certain state of the genitals is necessary to give tone and tension to the whole system; and therefore that, if the stimulus arising from the genitals be wanting, the whole system may fall into a torpid and flaccid state, and from thence the chlorosis and retention of the menses may arise. Cullen, first lines, 1701. This hypothesis produces the recommendation of ingenuity, but it does not remove every difficulty. It is not clear that the morbid condition of the ovaries, like that of the uterine vessels, or of the constitution at large, is not rather a consequence of the general debility, than a cause of it.

It is fortunate, that in this, as in many other diseases, concerning the nature of which physicians have differed in sentiment, we have a more solid basis than that of hypothesis, on which the cure is accomplished; namely, experience. In the disease in question, as general debility is the apparent source of all the symptoms, so experience has shown, that those expedients and medicines which relieve the strength of the constitution, remove all the symptoms of the disease. In a state of mere debility of the system, unconnected with any organic disease, although medicine can do much, yet much is also to be done by regimen and the general conduct of the patient. One of the most powerful means of strengthening the frame is regular exercise in the open air. This should, therefore, be steadily and daily referred to, according to the condition of the constitution, increasing the quantity and degree of it in proportion to the increasing powers of the patient. It is most effectual in the pure air of the country, and hence it is advisable to refer to it, where it is in the power of the patient, as a regularity of diet and hours will also materially aid the general plan. It is, doubtless, in these circumstances principally, that numbers of chlorotic females speedily recover their strength, complexion, and the healthy functions of the uterus, at the watering-places, where exercise, temperance, regularity, and good air, contribute to the attainment of health. And among those who are unable to obtain that fort of benefit, the effects of medicines are aided in a most important degree by regular exercise in the open air.

A variety of medicines have been employed by different practitioners for the cure of chlorosis and amenorrhœa; some, with a view of strengthening the flaccid and languid system, and others, with a view of stimulating the uterine vessels in particular. The latter, from their supposed effect, in
in exciting the flow of the menes, have been termed emmenagogues.

Among the general tonic, or strengthening medicines, iron, or, as it is improperly named, field, in its different preparations, is the most valuable and effectual remedy. Some physicians have gone so far as to consider it as a specific in chlorosis, a notion which, though in itself absurd, implies the general success with which they have employed this medicine. It has been administered in almost all its preparations with advantage; most frequently in the form of a sulphate, or saline compound with the sulphuric acid, (ferrum vitriolatum of the Pharmacopoeias), or of rutf (ferri rubigo). A mixture, which was administered with considerable success by Dr. Grifiths, and is now celebrated under his name, has been universally employed; it consists of the ferrum vitriolatum, with the vegetable alkali, and myrrh. It is obvious, however, that the result of this mixture must be a decomposition of the sulphate of iron, a formation of a neutral salt (the sulphate of potash) and a precipitation of the oxyd of iron in an impalpable powder. Instead, therefore, of taking the salt of iron, the patient swallows a nauseous mixture of Glauber's salt, with the oxyd of iron, and myrrh. This precipitate, freed from the Glauber's salt, is a carbonated oxyd of iron, and may be collected and given in a more simple form, or combined with other ingredients; it is, perhaps, the least offensive to the stomach, and one of the most efficacious preparations of iron. Being in a more impalpable powder, it may supersede the ruf of iron, which has been long administered with success, as it may be retained on the stomach in a larger dose. In whatever form the iron is given, it contributes greatly, with exercise and good air, to improve the digestive powers, and to promote a more perfect assimilation of the food, and also, by accelerating the circulation, to re-store the impeded secretions, and the languid action of the uterine, as well as the other parts of the system. The small quantity of iron contained in the chalybeate waters is very minute, in comparison with the quantity which may be received into the system in the forms of artificial combination; and the advantages of a watering-place are therefore probably not to be imputed to this source, as has been already hinted.

With the same intention of supporting the strength, other tonic medicines may occasionally be employed; such as the various bitters, bark, gentian, &c.; combined with cordials, where the action of the stomach is extremely feeble; or with anticitrants, such as magnesia, where there is a prevalent acidiety in that organ. The aromatic gums, or gum-rhins, seem to afford a grateful stimulus to the digestive organs, and are often conjoined with the preparations of iron, especially in the form of pills. The cautious application of cold, where there is still sufficient energy in the constitution, has been attended with great benefit, as in the form of a shower-bath; and a bath of the temperature of about 80°, such as that of Buxton, has proved efficacious. But on the whole, the practice may be considered as unsafe, until the patient is in a state of convalescence, and has regained a considerable portion of her strength.

In the writings of the older physicians many medicines are enumerated under the title of "Emmenagogues," and their specific action on the uterus is contended for; and among the vulgar, at present, several articles are believed to be poissled of that power, which they administer on every occasion of menstrual floppage. But the evidence in favour of the existence of such powers is so unsatisfactory, that the notion of a specific emmenagogue is now generally discredited. The melampodium, or black hellebore, was recommended in the strongest terms by Dr. Mead; he affirmed that it rarely failed to produce the menes, and that, when it did, hemorrhages occurred from some other part. But frequent experience has not confirmed this extraordinary encomium. The medicine is a strong general stimulant. Savin is another hot and irritating vegetable, which has been said to exert powerful effects on the uterus, which it perhaps may sometimes excite, in common with some of the body, by its diffusible stimulus. Dr. Home (Clinical Obs. and Exp. p. 385.) considers it as possessed of emmenagogue qualities.

There are two other classes of medicines, which sometimes induce a flow of the menes, by their action upon the parts adjoining the uterus; these are purgatives which stimulate the rectum or lower end of the intestines; and those medicines, which, being carried off in the urine, dilate the bladder; such as cantharides, the balsams, and other terebinthinate sublimates. The powers of the latter are but slight; but an acid purgative is perhaps one of the most direct promoters of the catamenia in the catalogue of the Materia Medica. The pedunculus is occasionally employed to relieve the menstral discharge, and frequently with the desired effect, it is to be referred to about the regular period at which the discharge is expected, and when the pains of the back, &c. are present, a disposition in the constitution to perform its healthy function. The strong stimulus of the electric fluid has been frequently directed to the region of the uterus, by falling into the veins, and the effect of bringing on the catamenia. Like the remedies just mentioned, it is very uncertain in its operation, and may be referred to with the greatest prospect of success at the approach of the regular period.

We have said nothing of the rubia tinctorum, or madder, and some other sublimates extolled as emmenagogues; nor of the inspiration of oxygen gas, recommended by Huseland and Dr. Thornton, because the evidence in favour of these remedies is altogether unsatisfactory.

But after all that is said respecting emmenagogues, it must be remembered, that the amenorrhoea, or retention of the menes, is not the cause, but one of the symptoms of the chlorotic condition; and, therefore, that a partial stimulus to the uterus can but partially remove the disease, which will escape only with the removal of the general debility.

It may be added, that the natural stimulus to the uterus is the exercise of venery, and that where marriage is impending, it may be delicately recommended to be accelerated according to circumstances.

Dr. James Hamilton of Edinburgh, in a valuable treatise on purgative medicines lately published, observes, that chlorosis is often attended with a torpor of the intestines and coniputation, and that the daily use of purgatives, in laxative doses, until the black and solid stools assume a natural appearance, is followed with great success. It will not be denied, that a sluggish action of the bowels frequently accompanies chlorosis, and that the colour of the stools is dark in consequence of the morbid secretions of the intestines and the liver, and also that the state of the canal, though perhaps an effect of the first instance, becomes a cause of aggravation to the dis ease in general. Hence, there is an obvious necessity of observing a regularity of the intestinal evacuations in this disease. And hence, perhaps, Dr. Friend found mercury a good emmenagogue, and Dr. Darson referred the dis ease to torpor of the liver. Nevertheless, the general languor and debility oppose the idea of active purgation, and suggest the propriety of combining the general tonic plan, with a careful relaxation of the bowels.

CHLORUS.
CHOBAT, in Ancient Geography, a river of Asia, placed by Pliny in Cilicia.

CHLUMETZ, in Geography, a town of Bithynia, in the circle of Konungvaruz; 5 miles S. of it.

CHMICLOWKA, a town of Poland, in the palatinate of Bracau; 46 miles E.N.E. of Bracau.

CHNA, in Ancient Geography, a name which, according to Steph. Byz. was formerly given to Phoenicia; but according to Bochart, it is the diminutive of Canaan.

CHNIM, in Geography, a strong town of Bosnia, belonging to the Venetians; 13 miles S. of Banjaluka.

CHNUMBIS, or CHNUS, in Ancient Geography, an ancient town of Egypt, placed by Ptolemy in the name of Thebes.

CHNUS, in Hippocrates, is a fine soft wool, to which he compares an exquisite flax, on account of its softness.

CHOAKING the left, in Rigging, denotes placing the bight of the leading part, or fall of a tackle, close up between the nelt part and jaw of the block.

CHOAM.YU SO, in Geography, a town of China, in the province of Quang-tung; 16 leagues E.S.E. of Kao-techen.

CHOAN, in Grecian Antiquity, so called from the χαν, a libation, an epithet applied among the Athenians to sacrifices that were offered for appeasing the manes of the deceased. They consisted of honey, wine, and milk.

CHOANA, in Ancient Anatomy, a cavity in the brain like a funnel, called also peri.

CHOANA, in Natural History, one of the synonymous names of Madrepora indufidaflerina. Guatl. (tcll. 24.) calls it Choana faxa crsparata rugofa, minimum poris.

Choana, or Choaya, called Chasana by DioDorus Siculus, in Ancient Geography, an ancient town of Asia, in Media, according to Ptolemy. — Also, an ancient town of Asia, placed by Ptolemy in Baktriana. — Also, a town placed by the fame geographer in Parthia.

CHOANI, the name of an ancient people placed by Pliny in Arabia Felix. — Also, a people placed by Marcian of Heraclea in Europe, near the Borylthenes and the Alauri.

CHIOAPA, in Geography, a small harbour on the coast of Chili in South America, in about 8. lat. 31° 42'

CHIOARA, in Ancient Geography, the name of a country of Asia, placed by Pliny in the western part of Parthia.

CHOARAXES, a river of Asia, which served as a boundary between the Colchide territory and Armenia, according to Strabo.

CHOARENA, or CHORAINA, a district of Asia in the country of the Parthians according to Strabo; it was that region of Parthia which was nearest to India.

CHOASPA, a town of Arachofia, according to Ptolemy.

CHOASPES, a river of India, according to Strabo. It discharged itself into the Cophes on the confines of Arachofia.

CHOASPES, or CHOASPIS, the modern Alwaz, a river of Asia, the source of which is placed by Pliny in Media, and he says it ran into the Pactigiris. According to Strabo, this river had its source in the country of the Uxians, traversed Sufiana, and discharged itself into a lake which also received the Euxus and the Pactigiris. This river is said to have flowed into the Perian gulf by a separate mouth, though it had a communication with the Tigris. Herodotus says, that the Choaspe washed the walls of Sufa, and that the Perian kings drank no other water besides that of this river, which they carried about with them in silver vessels, with which they went. Pliny places the city of Sufa on the banks of the Euxus, or the Ulac of the prophet Daniel, and according to this writer, the Persians drank no other water; whence it is inferred, that the Choaspes and the Euxus were the same river, at least at Sufa. From this city they flowed in one stream, and were afterwards distinguished, sometimes by one name, sometimes by the other. Although the ancient Sufa decorated the banks of this river, the modern towns of Kibd and Abwaz are of small account.

CHOASPITES, in Natural History, a name given by the ancients to a species of the erythrophalus, a gem of a colour between yellow and green. It was called choaspis from the name of a river in which it was frequently found.

CHOATRAS, or CHOBATRAS, in Ancient Geography, a mountain of Asia, which branched out from the Gordyean mountains on the confines of Asia and Armenia, and which separated Media from Affria.

CHOBAR, a river which discharged itself into the Euphrates. See CHOBARAS.

CHOBAT, a town of Africa, in Mauritania Cæsariensis, called in the Itinerary of Antonine Coba, represented as a municipium, and placed between Mufflibius and Iggilis.

CHOBATA, a town of Asia in Albania, placed by Ptolemy between the rivers Albanus and Canus.

CHODOLTIVO, in Geography, a town of Poland in the province of Volynia; 36 miles W. of Lucko.

CHOBUS, KIMHAN, in Ancient Geography, a river of Asia in the Colchide territory, between the Charius and Simgama, according to Arrian. Pliny calls it Cobus, and adds, that it had its source in mount Caucarus, and traversed the country of the Suanus. It ran from the north to the south, and fell into the Euxine sea to the north of the mouth of the Phasis.

CHOC, SHOCK. This word or term is employed, in Military Language, to express the act of two corps encountering or engaging each other. In speaking also of two hostile corps, who have only had a brush, or some skirmishing, it is said, that there has been choc, a shock between them.

CHOC Bay, in Geography, a bay on the W. coast of the island of St. Lucia, a little to the N. of Carnage bay.

CHOCCHARMO, a town of Asia in Thibet; 27 miles N.E. of Tofon-Hotun.

CHOCHE, in Ancient Geography, a town of Arabia Defera.

CHOCHE, a village of Asia, situated near the Tigris, according to Arrian.

CHOCK, in Sea Language, a wedge used to confine a case or other heavy body, to prevent it from fetching away when the ship is in motion.

CHOCK is also a triangular piece of wood fastened occasionally in the flap at the arse of the block: on the base of which wedges are driven to force the block into its place.

CHOCK is also a short mail for boats, by which they are towed along.

CHOCKS, denote, in Mart-Making, pieces made to fashion out some part that is wanting, or to place between the head of a lower mail and heel of a top-mail.

CHOCO, in Geography, a province of South America, in the vice-royalty of New Granads, bounded on the N. by the province of Darien and Cartagena, on the E. and S. by Popayan, and on the W. by the Pacific Ocean. The soil, climate, products, &c. are similar to those of Popayan.

CHOCOLATE, a kind of cake or confection, prepared of certain drugs; the basis or principal wherof, is the cacao. See THEOBROMA.

The trees that produce these nuts grow plentifully on the banks of the river Magdalena in South America, and in other situations where the soil is adapted to them; but those
in the jurisdiction of Cartagena are said to excel those of the Caracaces, Maracaibo, Guayaquil, and other parts, both as to the size and goodness of the fruit. The Cartagena cacao or chocolate is little known in Spain, being only sent by way of presents; for, as it is more esteemed than that of other countries, the greater part of it is consumed in this jurisdiction, or sent to other parts of America. It is also imported from the Caracaces, and sent up the country; that of the Magdalena not being sufficient to supply the great demand of these parts. The former is mixed with the latter, as it serves to correct the extreme oiliness of the chocolate when made only with the cacao of the Magdalena. The latter, by way of distinction from the former, is sold at Cartagena by millers, whereas the former is dispolved by the bulhet, each weighing 110 pounds: but that of Maracaibo weighs only 95 pounds. The cacao tree abounds in the districts of Guayaquil, and is generally not less than 15 or 20 feet high. It begins from the ground to separate into four or five items, according to the vigour of the root from whence they all proceed. They are commonly between four and seven inches in diameter; but they first grow in an oblique direction, so that the branches are expanded and separated from one another. The length of the leaf is between four and six inches, and its breadth three or four. It is very smooth, soft, and terminating in a point, like that of the China orange tree, but differing from it in colour: the former being of a dull green, and having no glows which is observable on the latter; nor is the tree so full of leaves as that of the orange. The pods, that contain the cacao, grow from the item, as well as from the branches. The first appearance is a white bloom, whose pithil contains the embryo of the pod, which grows to the length of fix or seven inches, and four or five in breadth, resembling a cucumber in shape; and fricated in a longitudinal direction, but deeper than the cucumber. These pods are proportionable in their dimensions to the item or branch, to which they adhere in the form of excrecences, some smaller and others larger. When two happen to grow in contact, one of them attains all the nutritious juice, and thrives on the decay of the other. The colour of the pod, while growing, is green, like that of the leaf; but when arrived at its full perfection, it gradually changes to a yellow. The shell that covers it is thin, smooth, and clear. When the fruit is arrived at its full growth, it is gathered; and being cut in sections, its pulp appears white and juicy, with small seeds regularly arranged, and at that time of no greater confidence than the rest of the pulp, but whiter, and enclosed by a very fine delicate membrane, full of liquor, resembling milk, but transparent and somewhat viscid: in this state it may be eaten, like any other fruit; its juice being a sweetish acid, but thought in the country to promote fevers. The yellowness of the pod indicates that the cacao begins to feed on its sublimate, to acquire a greater confidence, and that the buds begin to fill; the colour gradually fading till they are fully completed, when the dark brown colour of the shell, into which the yellow has deviared, indicates that it is a proper time to gather it. The thickness of the shell is now about two lines, and each seed found included in one of the compartments, formed by the transverse membranes of the pod. After gathering the fruit, it is opened, and the seeds taken out and laid in skins kept for that purpose, or more generally on vijuela leaves, and left in the air to dry. When fully dried, they are put into leather bags, sent to market, and sold by the carga or load, which is equal to 84 pounds; but the price is not fixed, as it is sometimes sold for six or eight rials per carga, though less than the charge of gathering; but the general price is between three and four dollars, and at the time of the armadas, when the demand has been very large, rife in proportion. This tree produces its fruit twice a-year, and in the same plenty and goodness of quality. The quantity gathered through the whole jurisdiction of Guayaquil amounts at least to 50,000 cargas. The cacao trees so much delight in water, that the ground where they are planted must be reduced to a mere; and if not carefully supplied with water, they die. They must also be planted in the shade, or defended from the perpendicular rays of the sun. Accordingly, they are always placed near other larger trees, under the shelter of which they grow and flourish. No foil can be better adapted to the nature of these trees than that of Guayaquil, as it favours them in both respects; in the former, as confiding wholly of savannahs, or wide plains overflowed in winter, and in summer plentifully watered by canals; and with regard to the latter, it abounds with other trees, which afford them the requisite shelter. The culture of this tree requires no other attention besides that of clearing the ground from the weeds and shrubs that are abundant in so wet a soil. This, indeed, is so necessary, that, if neglected, these vegetables will, in a few years, destroy the cacao plantations, by robbing the foil of all its nourishment. See Guayaquil.

The name chocolate is also given to a drink, prepared from the above-mentioned cake, of a dulcif colour, soft, and oily; usually drank hot, and esteemed not only an excellent food, as being very nourishing, but also a good medicine; at least a diet, for keeping up the warmth of the stomach, and afflicting digestion.

The Spaniards were the first who brought chocolate into use in Europe; and that, perhaps, as much out of interest, to have the better market for their cacao-nuts, vanilla, and other drugs which their West Indies furnish, and which enter the composition of chocolate, as out of regard to those extraordinary virtues which their authors so amply enumerate in it. The qualities above mentioned are all that the generality of physicians, and others, allow it.

Chocolate, original manner of making. The method first used by the Spaniards was very simple, and the same with that in use among the Indians: they only used cashew-nut, maize, and raw sugar, as expressed from the canes, with a little achiotte, or rocon, to give it a colour: of these four drugs, ground between two stones, and mixed together in a certain proportion, they made a kind of bread, which served them equally for solid food, and for drink; eating it dry when hungry, and steeping it in hot water when thirsty. The Indians, to one pound of the roasted nuts, put half a pound of sugar, diffused in rose-water, and half a pound of flour of maize.

This drink the Mexicans called chocolate, from chaco, found; and alte, or atte, water; q. d. water that makes a nofe: from the nofe which the instrument, used to mill and prepare the liquor, made in the water.

But the Spaniards, and other nations, afterwards added a great number of other ingredients to the composition of chocolate; all of which, however, vanilla alone excepted, spoil rather than mend it.

Chocolate, method of making, now in use among the Spaniards of Mexico. The fruit, being gathered from the cacao-tree, is dried in the sun, and the kernel taken out, and roasted at the fire, in an iron pan pierced full of holes; then pounded in a mortar; then ground on a marble stone, with a grinder of the same manner, till it be brought into the confidence of a pail: mixing with it more or less sugar, as it is to be more or less sweet. In proportion as the pail advances,
CHOCOLATE.

It is to be kept in brown paper, put up in a box; and then in another, in a dry place.

CHOCOLATE, Laws relating to. By 43 Geo. III. c. 68. all your duties of customs are repealed, and the foregoing worders are repeated; and an act for confinements of the persons of any British colony or plantation in America, and of theproduce of any other country or place, on importation, 6d. per cwt. For the conditions, regulations, and restrictions, with which cocoa-nuts shall on importation be secured in warehouses, see 10 Geo. c. 12. 6 Geo. III. c. 72. A 3 Geo. III. c. 118. When taken out of such ware- houses for consumption in Great Britain, they are charged with a duty of 26. per lb. By 42 Geo. III. c. 67. all former duties of excise are in like manner repealed, and in lieu thereof the following are imposed; viz. for every lb. weight of cocoa-nuts of the produce of any British colony or plantation in America, imported into Great Britain, 12s. 4d.; for ditto, if imported into Great Britain by the East India company, 25s.; for ditto, of all other cocoa-nuts imported into Great Britain, 32s. 10d.

Cocoa-nuts shall not be taken out of the warehouses, either for home consumption or exportation, but upon payment of the inland duties. 21 Geo. III. c. 55. §. 10. 11. Cocoa-nuts for which the duty has been paid, or the chocolate made of such nuts, may be exported, on security given that they shall not be re-imported; and under certain regulations, specified in 27 Geo. III. c. 13. §. 12. Every person, who shall keep a shop, &c. and have in his custody above 6 lbs. of chocolate or cocoa-nuts, shall be deemed a dealer in the said commodity, 11 Geo. c. 30. §. 4. By 20 Geo. III. c. 55. no person shall trade in chocolate without an annual licence, for which he shall pay (by 4. Geo. III. c. (60) 51. 6d. under penalty of 200l. Housfs of manufacturing and sale are to be entered, on pain of forfeiting 200l. and costs, &c. 10 Geo. III. c. 10. §. 10. The said houses shall be marked over the doors with the words "dealer in cocoa-nuts, chocolate, &c." on pain of 200l. 19 Geo. III. c. 6. §. 15. Any dealer buying these commodities of any person, not having his shop, &c. to marked, shall forfeit 100l. Any person, not having entered his shop, &c. who shall paint over his door the above said words, shall forfeit 500l., besides other penalties. If any person, not being a dealer, shall buy these articles, not having these words over his door, he shall forfeit 12l. Notice shall be given to the next officer of the custom, of bringing in these commodities into any shop, &c., and a certificate duly signed, expressing that the duties have been paid, and that they were condemned and forfeited, and all the quantity and quality thereof, &c. shall be delivered, on pain of forfeiting the same and treble value. And a permit shall be given to the buyer, &c. 10 Geo. c. 10. §. 11. 13. Officers shall enter at all times by day warehouses, shops, &c. and survey, the owner affixing and keeping all weights and seales, on pain of 100l. and forfeiture of the commodities, which may be seized by the officer. 10 Geo. c. 10. §. 12. 10 Geo. III. c. 44. §. 1. 28 Geo. III. c. 57. §. 15. Deceiving or obstructing the officer incurs a forfeiture of 100l. 28 Geo. III. c. 77. §. 8. Search shall be made for goods concealed, and if any person obstruct the officer, he shall forfeit 100l.; and if any factor or dealer shall concei

The little proportion of chocolate, which is used in and ordinary place, is made of cocoa-nuts, 2 lbs. of vanilla, and 1 lb. of cinnamon.
any of the said goods, he shall forfeit the same and treble value; and if any person shall obstruct the officer in seizing such goods, or endeavour to rescue the same after seizure, he shall forfeit 50l. 10 Geo. c. 10. § 13. 39. 40. If any article made of reemolbe cocoa shall be found in the possession of any dealer, under the name of American cocoa, or English or British cocoa, or any other name of cocoa, it shall be forfeited, and the dealer shall forfeit 100l. 4 Geo. III. c. 119. § 5. The molder of chocolate, within the half, weekly, and elsewhere every 6 weeks, enter in writing at the next office the weight of chocolate made by him, and clear off the duties. On pain of 50l; nor shall he, after default in payment, sell or deliver any out till the duty is paid, on pain of treble value. 10 Geo. c. 10. § 17. 18. He shall also produce at the place and time of entry the chocolate made, (on pain of 20l. for every pound not produced,) which shall be tied up with thread in papers of 1 lb., ½ lb., or ¼ lb. each, and neither more or less; which shall be marked or stamped by the officers. 32 Geo. II. c. 10. § 16. Offences against these regulations incur a forfeiture of 25l. The counterfeiting of the stamp, or the knowingly filling of any chocolate, or the fixing of any paper with a stamp on such chocolate, as has not been entered, and on which the duties have not been paid, incurs the penalty of a forfeiture of 500l., and of commitment to the next county jail for 12 months. 10 Geo. c. 10. § 22. 11 Geo. c. 30. § 13. Notice shall be given by those who make chocolate for private families, and not for sale, three days before it is begun to be made, specifying the quantity, &c.; and within three days after it is finished, the person for whom it is made shall enter the whole quantity on oath, and have it duly stamped, and pay the duty, under penalty of forfeiting the same and treble value. Nor shall any person be permitted to make into chocolate for their own private use lees than half a hundred weight of cocoa-nuts at a time. 10 Geo. c. 10. § 23, 24. 25.

Mr. Henly, an ingenious druggist, discovered that chocolate, fresh from the mill, as it cools in the tin pans into which it is received, becomes strongly electrical; and that it retains this property for some time after it has been turned out of the pans, but soon loses it by heating. The power may be once or twice renewed by melting it again in an iron ladle, and pouring it into the tin pans as at first; but when it becomes dry and powdery, the power is not capable of being revived by simple melting; but if a small quantity of olive-oil be added, and well mixed with the chocolate in the ladle, its electricity will be completely restored by cooling it in the tin pan as before. From this experiment he conjectures, that there is a great affinity between phlogiston and the electric fluid, and indeed they bear not the same thing.

Phil. Trans. vol. liv. part 1. p. 94, &c.

Chocolate Creek, in Geography, a head-water of Tioga river in the state of New York, whose mouth lies 10 miles S.W. of the Painted Pott.

Chocolate-but trees, in Botany. See Theodroma.

CHOCOLOCO-CA, in Geography, called by the Spaniards Catro Fircaya, a town of Peru, famous for its silver mines, which are at the top of a mountain always covered with snow, and 2 leagues from the town. Its wine also is plentiful and good. See CASTRO FIRCEA.

CHOCOPE, a town of South America, in the country of Peru, and jurisdiction of Truxillo, 13 or 14 leagues distant from St. Pedro, and 11 leagues from Truxillo, in 8° lat. 7° 4′ 40″. The town consists of between 80 and 90 houses, covered with earth: occupied by between 60 and 70 families, chiefly Spaniards, with some of the other calls, but not above 20 or 25 Indian families. It has a large and de-
cent church, built of bricks. In 1726 a rain which continued 40 nights, from 4 or 5 in the evening till about the same time in the morning, entirely ruined the houses, and even the brick church, so that only some fragments of its walls remained. Two years afterwards a similar phenomenon occurred, which lasted 11 or 12 days, but much less violent and destructive. For an account of the adjacent country, see GEOGRAPHY.
equal laws, and were very severe and impalpable against offences, were no less celebrated for the procuring of corn and oil and other provisions, and for supplying the Romans with them after they had experienced the want of them. The colour of the blue robe, it is said, befits the severity of their nature and their names, and the balance are the well-known emblem of justice, as well as an intimation of scarcity.

Lowman (Paraphrase of the Revolutions) refers this period of prophecy to that interval, which succeeded the reigns of Trajan and Hadrian. Antoninus Pius succeeded Hadrian A.D. 138. Antoninus the philopber, partly with Verus and partly alone, and after him Commodus, governed the Roman empire, till within a few months of the reign of Severus, who began his empire, A.D. 193, a space of about 50 years. The fourth general persecution was within this period, nearly 60 years after the third general persecution by Trajan, A.D. 167. Moreover, it appears from the concurrent testimonies of Tertullian (ad Sept. c. 5.), Aurelius Victor, Julius Capitol. Antoninus Pius, and Anton. Philo. and Xiphilin ex Dion. that a severity of provisions, approaching to famine, which occurred in every reign of the Antonines, continued to the empire of Severus, who exerted himself in redressing this evil; and thus the reign of Severus appears to be a proper termination to the judgment of this prediction.

CHOREADES, in Ancient Geography, an island of the Ionian sea, on the coast of Italy, near the Iapigian promontory. Thucydides.—Alfo, islands of the Euxine sea, near the Hellespont, supposed by Ortoius to have been the Cymean sile.—Alfo, a name given to the Barbaric islands.—Alfo, islands of the Persian gulf. Alfo, islands on the coast of Eubea, near mount Chaphares, where Ajax is said to have fallen shipwreck, after having violated Cufandra.—Alfo, a town of Alfris, in the country of the Myfons, inhabited by Greeks. Steph. Byz.

CHOREAGIA, a place of Thrace, in the vicinity of Constantinople.

CHOREEAS, a place of the island Eubea, according to Herodotus.

CHOREEAT, a lake of Peloponnesus in Siconya, according to Herodotus.

CHOREINÆ, in Antiquity, a kind of sea shells, with which the ancient Greeks used to give their suffrage, or vote.

CHOREIUS SALTIUS, in Ancient Geography, a forest of Peloponnesus, placed by Paulianus near the town of Genfis, in Melfenia.

CHOREOGYLLUS. See Hedge-Hog.

CHOES, or the Lenaean, in Antiquity, an Athenian festival in honour of Bacchus, celebrated on the 12th of the month Anthednon. It lasted only one day; and as the inhabitants of Attica were only permitted to be present at the celebration of this festival, authors referred their new pieces for the greater Dionysia, which were performed a month after, and which attracted from all parts an infinite number of spectators. It was usual at the festivals of Bacchus, to present tragedies and comedies to the public, and the authors thus contended for victory. See Dionysia.

CHOES, in Ancient Geography. See Cepheus and Cow river.

CHICER, French, a chorus, or a musical composition of never less than three or four vocal parts, in which the harmony is complete, and performed simultaneously by all the voices, enforced by the orchestra. See Tenor, and Base.

CHOHAN, in Geography, a circar of Hindooftan, in the country of Allahabad.
body of the church, separated by a grate, where the religious sing the service.

Choir music, musical song in a chorus, as in churches. It is sometimes used for musica pianissima, cantus fermo, or what we call plain chant, or song. See CHANT and CHORAL Service.

CHOIROS, in Ichthyology, a name given by Aristotle, and others of the old Greek writers to the Ceratodus or Actinopterus of the Latins. This fish has been called by a variety of names, but it is a species of perch, the Percus scolopax of modern naturalists, and the pope or ruffe, of the English fishermen. It is by no means so abundant as the common perch, neither is it of the same family, for it has only one dorsal fin, while the common perch has two; it is also a smaller fish, seldom exceeding the length of six or seven inches. The body is more elongated, and the back less prominent and arched. The colour is oliveaceous green on the back, yellowish on the sides, and spotted with black; belly whitish. Donov. Brit. Fishes. See Perna scolopax.

CHOISEUL, in Geography, a town of France, in the department of the Upper Marne; 4 leagues N. of Langres.

CHOISEUL Bay, a bay that lies on the N.W. coast of the islands of Arctides, W. of Port Praslin. The ancient inhabitants, like those of Port Praslin, powder their hair with line, which burns it and gives it a red appearance.

CHOISEUL Bay, a bay that lies on the S. side of Magellan Straits, between Swallow Harbour and the channel of St. Barbara.

CHOISY, Francis-Timoleon de, in Biography, was born at Paris in the year 1664. He is reckoned among the celebrated writers and extraordinary characters that have flourished in France. In his infancy he was taught to pay the greatest deference to persons of rank, and to endeavour to attach himself to those who might hereafter promote his interests. He was intended for the church, but the habits of his youthful years were irregular, and he afforded opportunity for scandal to the decent part of society, by appearing perpetually in public in female habiliments. He was handsome and delicate, and having been accosted by his mother, from his childhood, to appear in this disguise, the habit of it had grown into a kind of passion. He palled some years under the name of the countes de Barres, indulging in gallantries which were inspired or facilitated by his assumed character. Such, indeed, were the manners of the higher ranks in France, that he was admitted at court in the Confraternity, and few were found in that circle who did not encourage a character which they ought to have frowned at with indignation. Of these few was the duke de Montaufier, who meeting him one day in the queen's drawing-room, said in a tone of angry contempt, "Sir, or madam, I know not how to address you, you ought to die of shame for appearing dressed like a woman, when God has done you the favour to make you a man: Go, hide yourself." While he lived in this state he had been inducted to the office of abbé, and it was not till he was thirty years of age, that he thought it expedient to change his course of life, and to obliterate the remembrance of the scenes that he had exhibited, from his own mind, as well as from the minds of others. He went to Italy in 1676, and took an active part in promoting the election of Innocent XI. and was so far beneficial to the interests of the pontiff, that he was employed to draw up a letter from the French cardinals to Louis XIV. for the purpose of engaging him in his favour, who had been devoted to his enemies. De Choisy succeeded, but gained nothing by it but the honour of being the first to kiss the toe of the new pope. On his return to France he was attacked with a severe illness, which excited in him compassion for the poor, and the poet's terrible apprehensions for the future. He at length recovered, and during his convalescence he held religious conversations with the abbé Dangeau, the result of these were published in four dialogues: on the Immortality of the Soul; on the Existence of God; on Religious Worship; and on Providence.

From this period, 1684, de Choisy engaged in a new career: in the following year he went on an embassy from the sovereign of France to the king of Siam, whom the Jesuits had represented as willing to become a convert to Christianity. But on arriving at Siam, he found that the royal conversion was no more than a comedy planned by the Jesuits, in order to procure an embassy that might be serviceable to their commercial plans, and that the embassador and himself were intended to act parts in their favour. He was resolved that the voyage should not, with regard to himself, be without its uses: he took priest's orders, and he was apparently very much impressed with the sacredness of his new character. He would not venture to say masstills till he had been a month on board the ship which brought the mission back to France. He then became a zealous preacher to the crew, who were much edified by his pious exhortations.

He brought home with him a complimentary messsage from the king of Siam to his patron the cardinal de Bouillon, who unfortunately was not in favour at court. Louis was therefore displeased that this mark of distinction should have been obtained for his disgraced minister. Choisy, finding himself slighted, retired to a religious retirement, and employed himself in writing a life of David, and a translation of the Psalms. These he was allowed to present to his sovereign, whose smiles now abundantly repaid him for past neglect. He was immediately elected a member of the French academy; and his eulogy on the death of cardinal de Richelieu in 1687 was greatly admired. He was indeed a very useful member of that society, and drew up a sort of journal of all that passed at its meetings, which on account of the anecdotes that were interwoven with it, was not published by the academy, though it was printed in the Opuscules of the abbé d'Olivet in the year 1734. De Choisy was chief of 1697 dean of the cathedral of Bayeux, which was the highest post he ever obtained in the church. He early adventures, of which he himself has given an account, afforded him a distinguished ecclesiastical preferment. Besides the life of David, he published lives of Solomon, St. Louis, and of several of the French monarchs; but his most considerable work was an Ecclesiastical History, in eleven volumes, which was undertaken at the desire of Fauquet; and it comprised the most interesting facts of general history, written on a plan of ing and popular plan. His last work, which did not appear till after his death, was Memoirs of Louis XIV. in 2 vols. 12mo. This has been reckoned the most agreeable of his writings. His style and manner were particularly adapted to the composition of memoirs; yet in all the biographical pieces which he drew up, he has been charged with having paid too little regard to truth. He published a translation of the celebrated "Imitation of Jesus Christ;" to the first edition of which he prefixed a print of Madame de Maintenon on her knees before a crucifix, with the following inscription: "Hearken, O daughter, and consider the rhings that are here: forget also thine own people, and thy father's house: that the king greatly desire thy beauty." The text was in the subsequent editions omitted. To this writer has been ascribed a licentious work, in which his own gallantries are supposed to have been portrayed:
it is entitled Memoirs of the Countes de Barras. This was not printed till the year 1736; but the abbe de Choisy died in 1744, after completing his eightieth year. His character could not command the respect of the really wise, nor the estimation of the truly virtuous. After he had reformed the manners of his youth, which cannot be too severely rebated, he exhibited those symptoms of triviality which were highly unbecoming his rank and station in life. He was nevertheless beloved, on account of his disposition, which was kind, and of his manners, which were gentle, easy, and very instructing. Gen. Bueq. De Presby.

CHOIX, Port a. lies on the N.W. side of Newfoundland, N. by W. from the bay of Highgournachat, and S.E. from point Riche.

Chlo, Old Port a, a semicircular bay on the N.W. side of Newfoundland, round point Riche from the E. to the W.; the N.W. point of which is called Point Perral. Within this point are several islands; but the interior bay is impassable.

CHOFER, a town of Asia, in Tibet; 145 miles E.S.E. of Lhasa.

Chore-Word, in Botany, See Orobranch.

CHOLAGOGUE, in Medicine, tr. m χολαγογος, to excite, to cause a flow of bile.

CHOLALIAN, in Geography, one of the most considerable states on the eastern slope of the mountain of Popoca-pep, in Mexico. This, and the state Haemastizeno, having, with the affinities of the Tlascals, shaken off the Mexican yoke, re-established their former autocratical government.

CHOLARGUS, or Collargos, in Ancient Geography, a town of Greece, in Attica, belonging to the Acamantida tribe, according to Steph. Byz. and Suidas.

CHOLAWIA, in Geography, a town of Lithuania, in the parish of Mink; 42 miles S. of Mink.

CHOLEESNA, in Ancient Geography, a town of Asia, in Sogdiana, situated near the Oxus.

CHOLEDOCHUS, in Anatomy, a term derived from χολη, bile, and δοξα, glory. The hepatic duct, having been named by the ancient, takes the name of ductus communis choledochus, and proceeds to open into the duodenum. For a further account of this duct, see Liver.

CHOLELITHUS, in Medicine, from χολη, bile, and λιθος, a stone, a term applied to the concretions, which occur in the gall-bladder and biliary ducts. See Gall-stone.

CHOLER. See Bile.

CHOLEREA, χολερεα, sometimes written with the addition of the word morbus, disease, is so called from χολη, bile; the leading character of the disease being a copious evacuation of bilious matter both by vomiting and by stool.

The phenomena of cholera, as well as the successful mode of treating it, have been well known, and described, in very similar terms, by physicians from the earliest dawn to the present times. In the writings of Hippocrates, Arcteus, Celsus, Sydenham, and Cullen, we trace the same opinions respecting the disorder, and the same precepts as to its cure. The attack of this complaint is generally sudden. The bowels are fleeted with gripping pains, and the stools, which are at first thin and watery, as in a common diarrhea, are passed frequently; the stomach is felted with hicknfly, discharges its contents, and rejects what is swallowed. In the course of a few hours the matter vomited, as well as that which is discharged by stool, appears to be pure bile, and passes off both ways in considerable quantities. The gripping pains of the intestines now become more severe, in consequence of the extraordinary irritation of the passing bile, which excites them to partial and irregular spasmatic convulsions. These spasmns are often communicated to the abdominal muscles, and generally to the muscles of the lower extremities; so that the cramps in the legs become very distressing. The stomach is also affected with considerable pain, and a fent of great heat, in consequence of the same irritation: there is usually great thirst, and sometimes a feverish head-ache, from the symmetry of the head with the stomach. The skin becomes very hot, and the heat of the skin is increased. A great degree of dryness and languor, and faintness, amounting even to syncope, speedily comes on, in consequence of the sudden and copious evacuation of the fluids; sometimes attended with a colliquative sweat, coldness of the extremities, and such like symptoms,” Sydenham says, “as frighten the bystanders, and kill the patient in 24 hours.” Syd. sect. iv. chap. 2. In this climate, however, though the powers of life are often too rapidly reduced by an attack of cholera, as to excite considerable alarm for the safety of the patient, yet it seldom terminates fatally. Though both the pulse and respiration are hurried and irregular during the course of the disease, yet, it is remarked by Dr. Cullen, that there is no proper fever, but merely a few feverish symptoms, as these symptoms are generally removed entirely by those remedies which quiet the spasmatic affections attendant on the disease.

It is scarcely necessary to point out the diagnosis of cholera, and the diseases which bear some resemblance to it, since the discharge of almost pure bile by vomiting and stool, simultaneously or alternately, is not observed in any other disease. Vomiting and purging do, indeed, frequently occur at the same time, as after a surfeit, or taking a large quantity of indigestible food, or from other causes; but the matter discharged is not biliary. The practice, however, must be similar in both; the object being to get rid of an irritating matter from the intestinal caecal in both cases, which, in the true cholera, is bile, in the other influences a mass of undigested aliment.

The true cholera occurs in temperate climates, only during the hot season. Sydenham remarks, that it appears as certainly in the month of August, as follows in the early spring, or cucking at the approach of summer; and that the patient, when recovered, becomes frail and thin, in which state it begins. This observation, however, does not accord with the experience of the present times. Cholera is now seen perhaps more frequently in September than in August; and cases occasionally occur, though it be not epidemic, considerably earlier than August; even in June or May. Sydenham seemed to consider the copious use of the summerfruits as the general cause of cholera; although the observa-
that notion. "For though the same causes," he remarks, "wholly remain, so that many should be seized with this disease, as well in September as in August, by reason of eating too much fruit, yet we see the same effect does not follow." Probably this notion, which is still adopted by many practitioners, originated merely from the concurrence of the season of the disease, with that of the ripening of fruit. But when it is considered that the hot season is also coincident; that in all hot countries the bilious febrifugia is usually increased, and thus gives rise to this and similar dif-eases; that in this climate cholera attacks those who procure much fruit, and those who are unable to procure it, indiscriminately; and that the disorder ceased, even while the fruit remained abundant, according to Sydenham; there can remain little doubt that it is the heat of the atmosphere which produces cholera. Hence it is, that cholera is sometimes most prevalent in August, sometimes in September, according to the earlier or later occurrence of a high temperature; and that after a few hot days, even in May or June, a few cases of the disease are sometimes observed to ensue. It has been remarked, however, that, both in hot climates, and in the hot feasons of mild climates, occasional falls of rain have been particularly followed by an epidemic cholera. In some cases, indeed, it is probable that the heat of the season may give only a predisposition, and that certain inguinal, sudden change of temperature, or other causes in this state, readily excite the disease. Hence various circumstances are enumerated by authors, as having produced cholera; such as cold drink, drudg purgeatives, acids, fear, &c. But it is certain that the disease constantly appears during a hot season, ofReady temperature, and often without any obvious change or error in the diet or manner of life.

In the cure of cholera, which conflicts in the production of a large quantity of bile by the liver, and its necess ary passage through the alimentary canal, the experience of all ages wholly concurs. A summary of this experience is given by Dr. Cullen in such copious terms, that we shall prefer transcribing it.

"In the beginning of the disease the evacuation of the redundant bile is to be favoured by the plentiful exhibition of mild diluents, both given by the mouth and injected by the ars; and all evacuant medicines, employed in either way, are not only superfluous, but commonly hurtful.

"When the redundant bile appears to be sufficiently washed out, and even before that, if the spasmodic affections of the alimentary canal become very violent, and are communicated in a considerable degree to other parts of the body, or when a dangerous debility seems to be induced, the irritation is to be immediately obviated by opiates, in sufficiently large doses, but in small bulk, and given either by the mouth or by glycer.

"Though the patient be in this manner relieved, it frequently happens, that when the operation of the epigus is over, the disease shews a tendency to return; and, for at least four days after the first attack, the irritability of the intestines, and their disposition to fall into painful spasmodic contractions, seem to continue. In this situation, the repetition of the opiates, for perhaps several days, may come to be necessary; and as the debility commonly induced by the disease favours the disposition to spasmodic affections, it is often useful and necessary, together with the opiates, to employ the tonic powers of the Peruvian bark." First Lines, p. 1462.

Thus, by commencing the cure with the free use of di luents, we partly contribute to the expulsion of the bilious matter, and partly correct its astringency. To employ evacuant, as Sydenham quaintly observes, is to increase the disturbance, and, as it were, to endeavour to quench fire by oil; and, on the other hand, to commence with opiates, is shutting up the enemy in the bowels.

Although this simple and rational practice has flood the teft of experience from the earliest date, yet other modes have been occasionally resorted to as auxiliary, or superfcic- ing it. The Columbo-root has been employed, it is said, with considerable efficacy in the cure of cholera. Dr. Percival, speaking of this root, says, "in the echoboa murous it alleviates the violent torments, checks the purging and vomiting, corrects the putrid tendency of the bile, quiets the inordinate motions of the bowels, and speedily recruits the exhausted strength of the patient." In confirmation of this, he adds, that an eminent surgeon, who, in 1758, had the care of an hospital-ship in the East Indies, gave the Columbo-root in that climate (in the dose of half a drachm or more), to a great number of patients, often twenty in a day, attacked with this disease. "He seldom employed any means to promote the discharge of the bile, or to cleanse the stomach and bowels, previous to its exhibition; and he generally found that it soon stopped the vomiting, which was the most fatal symptom, and that the purging and remaining complaints quickly yielded to the same remedy. A mortality on board his ship, after he used this medicine, was remarkably less than in the other ships of the same fleet." Percival's Essays Med. and Exp. vol. ii. p. 7. We have seen the Columbo-root remain on the stomach, when almost every thing else was rejected in this disorder; but we think it may also that we have observed the mischiefs inflicted by Sydenham from stopping the evacuation; the purging has assumed the form of dityentery.

Dr. Douglas (see Edin. Med. Essays, vol. v. part ii. p. 619.) recommends a simple, but, he affirms, an efficacious remedy, after the bile has been conformationally thrown off; namely, a decoction of oat-bread, boiled as brown as possible, but not burnt. A copious draught of this is extremely powerful, he says, in settling the nausea and vomiting. If the patient is greatly exhausted, he renders it more cordial by an admixture of wine. This, Dr. Douglas remarks, is nearly the practice of Celsus, who recommends, first, repeated draughts of warm water to clear the stomach, and a little after that, he advices the patient to take wine and water mixed with polenta. Now this was, according to Piny, barley, fried or toasted brown, and ground to powder; it was an astringent, and good for a diarrheac. Dr. Douglas supposes that wheat bread, or meal, treated in the same manner, would answer every purpose.

The warm bath, or warm fomentations, have been used with advantage, when the spasmodic affections of the bowels were severe. And in other instances cold drink has been given with beneficial effects. Dr. Cleghorn observes, (Obit. on Diseases of Muniqera, p. 224.) "The Spanish physicians have often sufficed me, that they found nothing more beneficial in violent deplorable choleras than drinking of cold water: which practice is recommended by many of the ancients." Thus Aretaeus remarks, "Sin autem omnia antiqua illecera dejecta fuerint, et bividi humores trancient, biliosionem vomitus et diabetis adit, siihium, animas, virtum labfactors, tunc frigidii aqua symphy doua aut tres propinaudi sunt ad ventris affinitionem, ut retrogradus humorum curfus cohiscatur, atque ilodium arcens refrigeretur.

C1101 ET, in Geography, a town of France, in the department of the Maine et Loire, and chief place of a canton in the district of Beaupic, 9 leagues S.S.W. of Anges.
gert. The place contains 4,799 and the canton 15,220 in-
habitants: the territory includes 347.8 kilometres and 12
communes. N. lat. 47° 5', W. long. 9° 56′.
CHOLIMMA, in Ancient Geography, a town of Asia,
placed by Ptolemy in Greater Armenia.
CHOLLE, a town of Asia, in the Palmyrene. Ptolemy.
—Allo, a town of Africa, according to Appian.
CHOLVE, Cape de la, in Geography, the most prominent
part of the coast, on the N.W. part of the island of Corfu,
between the Gulf of Floriozu to the S.E. and the harbour
of Cali to the S.W.
CHOLIDE, in Ancient Geography, a people of Greece,
CHOLM, or KOLUM, in Geography, a town of Raffia,
in the government of Phalos, seated on the River Lovat, and
also one of the 9 districts included in this government;
180 miles S. of Petersburg. N. lat. 57°. E. long. 1° 14′.
CHOLMADARA, in Ancient Geography, a town of
Asia, in the Comagene, seated on the right bank of the
Euphrates, N.E. of Samosata and near it.
CHOLMGO, or KOMOSORI, in Geography, a town
and district of Raffia in the government of Archangel,
faced on the well ride of the Dvina; 28 miles S. of Arch-
angel.
CHOLOBAPHIS, in Natural History, a name given by
some of the ancient Greeks to a peculiar kind of emerald
which was inferior to many others, and was of a colour tend-
ing to yellow.
It is plain that the Romans called all the green cry-
flats found in copper-mines by the name of emeralds; for they
express in their descriptions all the defects we find in their
cryflats, such as their having hairs, or subitance like hairs,
within, as also faults, and the like.
CHOLOBETANA, in Ancient Geography, a country of
Asia, in Armenia.
CHOLEE, an ancient town of Pontus Galaticus, in Cap-
padocia.
CHOLOMA, or CHOLOSIS, signified, according to Ge-
en, any distillation of a member or deprivation of it with
respect to motion. It is taken also, in a particular sense, for
halting or lameness of a leg, arising from luxation.
CHOLONG, in Geography, a town of Asia, in Thibet;
57 miles N.N.W. of Chou-mahing-Hotun.
CHOLTITZ, a town of Bohemia, in the circle of Chru-
dim; 6 miles N. of Chrudim.
CHOLUA, in Ancient Geography, a town of Asia, in
Greater Armenia.
CHOLULA, in Geography, a town of Mexico, in
the province of Tolcan, which formerly formed an in-
dependent state. It was held by the people of Mexico as
a sacred spot, and the sanctuary of the gods, with a temple,
in which they offered more victims than in that of Mexico;
5 leagues from Tolcan. The treachery of the Cholulans
was very severely punished by Cortes, when he took pos-
fession of this place in 1519. The Spaniards and Tolcanas,
under the direction of their commander, fell upon the multi-
tude, and killed the streets with bloodshed and death.
The temples which afforded a retreat to the priests, and some of
the leading men, were set on fire, and they perished in the
flames. This scene of horror continued two days; during
which, the wretched inhabitants suffered all that the destruc-
tive rage of the Spaniards, or the implacable revenge of their
Indian allies, could inflict. At length the carnage ceased,
after the slaughter of 6,000 Cholulans, without the loss of
a single Spaniard. Cortes then released the magistrates,
whom he had previously seized, and reproaching them bit-
terly for their intended treachery, declared, that as justice
was now appeased, he forgave the offence, but required them
to recall the citizens who had fled, and re-establish order in
the town. Bartholom de las Casas says, there was no occasion
for this mistake, and that it was an act of wanton cruelty,
perpetrated merely to strike terror into the people of New
Spain. But the zeal of Las Casas often deceived him.
On the other hand Bern. Diaz affirms that the first
missionaries sent into New Spain by the emperor, made
a judicial inquiry into this transactions; and having examined
the prudens and elders of Cholula, found that there was a real
conspiracy to cut off the Spaniards, and that the account
given by Cortes was exactly true. However this be, the
severity of the punishment was certainly excessive and atro-
cius. Robertson's Amer. vol. ii.
CHOMA, in Ancient Geography, a town of Asia Minor in
Lyca, according to Ptolemy; which had been episcopal.
Allo, the name of a place of Peloponnecis, in Arcadia,
according to Paunias.
CHOMARA, a town of Asia, in Baetritania. Ptol.
CHOMASI, a people of Baetritania, mentioned by Mela
and Pline.
CHOMEL, JAMES FRANCIS, in Biography, born at
Paris, towards the end of the 17th century, studied medicine
at Montpellier, where he took his degree of doctor in
1738. Returning to his native city, he soon so far dis-}
gnified himself as to be appointed physician and counsellor
to the king. The following year he published, "Universelle
Medecine Theorique et Pratique, fea Physiologie, ad ufm
cholre accommodata," 12mo.; and in 1734, "Traite des
Eaux Minerables, Sans et Douches de Vieii, 12mo." This
work passed through several editions. To that of the year
1738 the author added a preliminary discourse on mineral
waters in general, with accounts of the principal of the me-
dicinal waters found in France. His eldest brother,
CHOMEL, PETER, John Baptiste, studied medicine at
Paris, and was admitted to the degree of doctor there in
1697. Applying himself more particularly to the study of
botany, while making his collection, he sent his observa-
tions to the Royal Academy of Sciences, who elected him one of
their members. He was also chosen, in N vember 1728,
deal of the faculty of medicine, and the following year, was
re-elected but died in June 1750. Besides his "Memoirs"
sent to the Academy of Sciences and his "Defence de Tourne-
fort," published in the Journal des Savans, he published
"Abrégé de l'Histoire des Plantes utiles," Paris, 1724,
12mo. This was, in the year 1715, increased to two, and
in 1750, to three volumes in 12mo., and is esteemed an
ufible manual.
CHOMEL, JOHN BAPTISTE. Lewis, his son, educated
also at Paris, took his degree of doctor in Medicine, in
1753. He was several years physician in ordinary to the king,
and in November 1754 was chosen dean of the faculty.
He died in 1765. He published in 1745, "An Account of the
Disent:; then 174. enme amongst sallest, and builts of great
effects in the cure, which was elected, he says, by using fettar,
imbed with white helbore; "Diferation histoire, fur la
Mal de Gorge Gengre aux qu ils a regne parmi les Enfans,
in 1748;" the maignant tore throat, first tratd of in this
country by Dr. Forbing, about ten years later than this
period. Chomel recommends bleeding, vomiting, and buf-
ters, and bad then recours to cordials. "Effai histoire fur la
Medicine en France," 12mo. 1702. He also wrote, " Vie
de M. Morin," and " Eloge historique de M. Louis Durat,"
which

CHOMELIS, in Geography, a town of France, in the department of the Upper Loire; 4 1/8 leagues N. of Le Puy.

CHOMERAC, in Geography, a town of France, in the department of the Ardèche, and chief place of a canton, in the district of Privas; 3 miles S.E. of Privas. The place contains 1566 and the canton 6,223 inhabitants: the territory includes 110 kilometres and 9 communes.

CHOMONCHOUAN, a lake of Canada; 73 leagues N.W. of Quebec. N. lat. 49° 20'. W. long. 75° 40'.

CHOMSK, a town of Lithuania, in the palatinat of Brzez; 50 miles E. of Brzez.

CHONAD, a town of Hungary, seated on the Ma- roch, the see of a bishop, suffragan of Colocza; 25 miles N. of Temefvar.

CHONÉ, in Ancient Geography, a town of Acha Minor, in Phrygia. It had been episcopal and metropolitan.

CHONAS, in Geography, a town of France, in the department of the Ilie, and district of Vienne; 15 miles S. of Vienne.

CHOND, a town of Arabia; 190 miles S.W. of Amen- zinfabn.

Gen. Ch. Calyx common calyced, cylindrical; scales of the cylinder numerous, parallel, linear, equal; those of the base few, very short. Corolla compound uniform; florets all flat-shaped, linear, truncated, four or five-toothed; herma- phrodite ones very numerous, in several ranks. Stam. Filaments long, capillary, very short; anthers forming a hollow cylinder. Pist. Germ somewhat egg-shaped, flat; style filiform, the length of the lamens; fligmas two, reflexed. Peric. none, except the permanent common calyx. Seeds ovate, compressed, mucrinated; down capillary. Rec. naked.

Sp. 1. C. junca. Ruby gum-lacceory. Linn. Sp. Pl. Gert. tab. 1358. fig. 6. Jacq. Auff. 3. tab. 427. Baath. pi. 70. (C. vinvulna; Baath. ill. 2. 1821. fig. 1. Rais. hist. 227.) "Root-leaves runcinate; stem-leaves linear, entire." Root perennial. Stem two or three feet high, branched, erect, hard, villous near the bottom, smooth and fibrated above. Flowers yellow, flatter, like those of Lettuce, solitary or in bunches, sessile or on short peduncles; flipes of the down long, attenuated above. A native of the southern parts of Europe, flowering in July and ripening its seeds in September. 2. C. cripeolae, Murray Swt. Veg. 715. Mart. Lam. Willd. (C. junca: Linn. Syst. Nat. 52.) "Leaves arrow-shaped, embracing the stem; leaf simple; flowers nearly sessile, lateral." Root annual. Stem a foot and half high, fibrated, purple at the base, bespinkleed with a few white bristles. Leaves resembling those of Turritis, undivided, oblong, rough about the edge, and especially about the keel, with white hairs, glossy on the upper surface; lower ones with small teeth. Flowers yellow, purplish underneath, alternate, on a peduncle nearly longer than the calyx, with one or two bracts; calyx fibrated, beee with black tubercles and a white bristle; calyee very short, with awl-shaped permanent kafkis. It may perhaps be associ- ated with the genus Crepis. Native country unknown.

Such is the description of this plant copied verbatim by all recent botanists from the Syllema Nature of Linnaeus, where it unaccountably appears under the name of junca to the total exclusion of the well-known original junca of the Species Plantarum. No one since Linnaeus appears to have seen even a dried specimen; and as it is not known whence it came, or whether it is gone, it must surely be considered as a vagabond of very dubious character. 3. C. nudicilia, Linn. Mant. 2. Mart. Lam. Willd. (Laetica nudicilia; Murr. in Comment. gott. 1722. tab. 4.) "Stem nearly naked; flowers Panicled." Stems few, a foot high, panic- led, straight, cylindrical, glody, furnished with a small leaf or two. Root leaves runcinate, obtuse at the end, ciliated with small teeth. Flowers pale yellow; calyx right-leaved, glody, inarticulated below with a few caducous leaves; ray conflating of about twenty-four florets; disk composed of flowers resembling the florets in colour; down fusile. Seeds black. A native of the East Indies, and not of North America or of Egypt, as Linnaeus supposed.

Obi. La Marg has included in his chondrella the whole Linnaean genus prenanthes, and has divided it into two sections.

1. With florets in several ranks, comprehending the three preceding species with the crepis pulchra of Linnaeus, which, he says, cannot be a crepis, as its calyee conflatis of clove scales.

2. With florets in a single rank, the prenates of Linnaeus. The only point at issue is, therefore, whether a difference in the number of ranks in the florets of the ray be sufficient to constitute a generic character; for it is evidently no consequence whether the down be fibrated or sessile. We shall adhere to the Linnaean distribution.

CHONDILLA
CHONDROGLOSSUS, in Anatomy, a name applied, by Albinius, and some other anatomists, to a number of the hyoglossus muscles which arise from the corona mamms of the os hyoides. See Tongue.

CHONDROPTERYGII, in Ichthyology, the sixth, or last order of fishes, in the Linnean system. All fishes that have the gills cartilaginous are comprehended under this order; as acipenser (sturgeon), chimaera syphus (shark), perissus (faw-fil), rija (ray), and petromyzon (lamprey). See article Ichthyology.

The word is derived, by Arctioli and others, from χόνδροες, a cartilage, and πτερυγια, a wing or fin, and may therefore be understood as comprehending all fishes that have a cartilaginous instead of bony skeleton. The French term chondroptérygiens applies precisely to this description of fishes in the latter to the former rank.

CHONDROS, in Ancient Medical Writers, the same as alcira. It signifies also some gummos concretion, as of mastic, or frankincense. It is, besides, the Greek word for a cartilage.

CHONDROSYNDESMUS, signifies a cartilaginous ligament. The word is derived from χόνδροες, a cartilage, and συνδέος, a ligament.

CHONE, or CHONIS, in Ancient Geography, a town of the Oenotrians in Italy, the capital of a country of the same name, near the territory of Crotona.

CHONG, the name of a spirituous liquor, similar to whisky, extracted in B'utan from grain. It is slightly acid and spirituous, and externally prepared by the infusion of a meal of grain in a large of fermentation. Capt. Turner, in his Embassy to Tibet (p. 24, &c) has detailed the process employed in the preparation of it. Wheat, rice, barley, and other kinds of grain are indiscriminately made use of for this purpose. To a given quantity of grain is added rather more water than will completely cover it, and the mixture is placed over a slow fire till it begins to boil; it is then taken up, and the water drained from the grain, which is spread abroad upon mats, or coarse cloths, to cool. When it is cold, a ball of the composition, here called "Bakka," (which is the blossom of the Caecilia farracea Linnei, collected and rolled together in small balls), is crumbled, and floured over the grain, and both are well mixed together. The usual proportion is a ball of the size of a nutmeg to two pounds of grain. The grain thus prepared is put into baskets lined with leaves, and pressed down with the hard flints, to draw off the superfluous moisture. It is then covered with leaves and cloths, to defend it from the external air, and put in a place of moderate warmth, where it is suffered to stand three days. It is afterwards deposited in dry earthen jars; a little cold water is sprinkled upon the top in the proportion of about a tea-cup full to a gallon of grain; the vessel is then covered close, and the cake fortified with some strong compoit, or flay clay. It remains thus at least 10 days, before it is fit for use; and, if it be suffered to continue longer, it always improves by age.

To make the chong, when required, they put a quantity of the termented mass into some copacious vessel, pouring boiling water upon it, sufficient completely to cover it, and stirring the whole well together. A short time is sufficient for it to digest; a small wicker basket is then thrust down in the centre, and the infusion, called Chong, immediately drains through, and occupies the vacant space. This liquor is, at entertainments, expeditiously distributed to the guests; the segment of a gourd, fastened upon a staff, serving the purpose of a laddle. Each person holds a shallow wooden cup upon the points of his fingers, for its reception, and is seldom satisfied with one supply. This liquor, which is slightly acid, and without any powerful spirit, furnishes a grateful beverage; and it is usually drank warm. From chong an ardent spirit is obtained by distillation; this spirit is denominated "Arra," it is fiery, and powerfully incenrating.

CHONG-TCHEOU, in Geography, a town of Afn, in the kingdom of Corea; 25 miles S.W. of Ou-tchou.

CHONNAMAGARA, or CHONNARARGA, in Ancient Geography, a town of India, on this side of the Ganges. Probable.

CHONOS gulf, in Geography, or the archipelago of Geys-
tecas, lies towards the southern extremity of the continent of Chili, in the southern Pacific Ocean. The most remarkable island in it is that of Chiloé, which lies. The islands, called Chonos, are inhabited by Indians, who use the fallen flower of the species of fern, called the kva-wood, as common food. To the south of Chilloé and the archipelago of Chonos is the peninsula of the three mountains, followed by three considerable islands, that of Campana, lat. 43° 17' 22", explored by Mallespera; that of Madre de Dios; and that of St. Francis, by some called Roca Partida. The rigour of the climate renders these islands of little importance.

CHOOK-TCHOO, in Geography, one of the Ladrone islands, under the lee of which the ships of the embassy to China came to anchor, in 12 fathoms water, on a muddy bottom. N. lat. 21° 35'. E. long. 115° 44'. See Ladrone.

CHIOZ, a town of France, in the department of the Ardennes, and district of Recot.

CHOP-CHURCH, or CHURCH-CHOPPER, in Law, a name, or rather nick-name, given to paupers, who make a practice of exchanging benefices.

Chop-church occurs in an ancient statute of King Henry VI. as a lawful trade, or occupation; and some of the judges say, it was a good addition. Brook holds, that it was no occupation, but only a thing permissible by law.

CHOPER, or KOPPER, in Geography, a river of Asiatic Russia, which runs into the Don, near Choperskaia.

CHOPERSK, or KOPERSK, formerly Novokraskaya, a town of Asiatic Russia, in the government of Saratoff, situated on the Choper; and one of the 11 districts of the government: 140 miles W. of Saratoff, and 498 S.E. of Petersburg.

CHOPERSKAIA, a town of Russian Tartary, in the country of the Collaes, on the Don: 191 miles N.E. of Alphoi, and 40 south west of Archangel."
CHO
on the ground with his books about him. He was afflicted with the
fehe, and died under an operation in 1636.
CHOPIN, or CHOPPE, a French and Scotch liquid
mixture, containing half their pint.
CHOPS, in Geography. See SWAN ISLAND.
CHOPTANK, a large navigable river of America, on
the eastern shore of Maryland, which discharges itself into
Chesaapeake bay.
CHRISTE-BAY, lies on the W. side of the island of
St. Lucia, between Gros Iflet bay on the N. and Carenage
bay to the S.
CHORA, in Ancient Geography, a place of Thrace on the
Euxine sea, at a small distance N. E. of Mauroon-Tichos
and near Gnoo.—Also, a place of Gaul, on a river of the
same name. (La Cure) between Avalon and Anzérie. The
abbé de Beuf supposed it to be Glevant; but M. d'Avuille
places it on the confines of the diocese of Auxerre, on the
side of Aetum, in the situation which now bears this name.
Sanfon has confounded it with Corbel. It is
mentioned in the Notitia Imperii in the following terms:
"praefectus Sarmentorum gentilium a Chora Pariisii uique."
CHORAGIUM, in Antiquity, was used to denote the
funeral of a young unmarried woman.
Some think it should be written coragium, from χοράς, χοράς,
and χοράς. But Prouiett chooses rather to derive it from
chorus because a chorus or company of virgins always at-
tended such funerals.
CHORAGUS, in Antiquity, he who had the superin-
tendence of the chorus, whose business it was to take care
they observed the rules of the music, and performed their
parts with decorum.
It was the province of the master of the chorus, in the
absence of the poet, to exercise the actors for a long time
before the representation of the piece. He beat the mea-
sure with his feet, his hands, or by other means which
might give the movement to the performers in the chorus,
who were attentive to his gestures. It was also his duty,
not only to guide the voices of those who were under his
direction; but he gave them lefions in the two kinds of
dances which were adapted to the theatre. See DANCE.
Choragi were likewise certain Athenian citizens chosen
annually, who were obliged to be at the expense of
players, singers, dancers, and musicians, as often as there
was occasion, at the celebration of their public festivals on
occasion of the greater Dionysia, or festivals of Bacchus,
which were celebrated with extraordinary magnificence, when
tragedies and comedies were exhibited in the theatre;
and hymns in honour of Bacchus, accompanied with flutes,
were chanted by the chorus in the Odeum. Each of the ten
Athenian tribes appointed a choragus to lead his chorus, who
was to be at least 30 years of age, and whose province it
was to choose the performance and to prepare them for the
exhibition by previous instruction. With this view the
chorus for some months previous to the festivals took the
performers, that they might be duly instructed, into his house,
and provided for their support; so that it was an office of great
importance. At the festival he appeared, as well as his follow-
ers, with a gilt crown, and a magnificent robe. These
functions, consecrated by religion, were still further ennobled
by the example of Aristocles, Epaminondas, and the greatest
men, who deemed it an honour to discharge them; but
they were so expensive, that many citizens declined the
dangerous honour of sacrificing part of their fortunes to the
precarius hope of rising by this means, to the first offi-
CHORAMNEI, in Ancient Geography, a savage people
of Asia, in Peria, who, according to a passage of Ctesias,
cited by Steph. Byz., ran to futility that they were able to
overtake a flag.
CHORAN-KIAMEN, in Geography, a port of Chinefe
Tartary; 20 miles W. S. W. of Nimgoua.
CHORASAN. See KOHRASAN.
CHORASMI, in Ancient Geography, a people men-
tioned by Athenaeus and placed in Asia. They occupied the
territory to the north and east of Parthia, and extended
themselves, according to T'okmen, to Sogdiana. Accordingly
they were found in the vicinity of the river Aces, and of
the plain through which this river flowed. They chiefly inha-
bited the mountains, and, according to Strabo, they were not
very remote from the Bactrians and Sogdians.
CHORASMENI, a people of Asia, mentioned by Ar-
rian, who places them in the neighbourhood of the country of
the Amazons and of the Colchide territory.
CHORASMIA, a country of Asia, in Sogdiana, ac-
cording
C H O

cording to Ptolemy, whose situation he assigns near to that of the Malagew, Alto, a town of Aria, E. of the Parthians.

CHORAULES, Lat. A mundif.

CHORAILSRTIA, Lat. A female minifred.

CHORAZIN, in Ancient Geography, a town of Palestine, in Galilee, which our blessed Lord deplores for incruciity.

(Math. xii. 42) Dr. Lightfoot expresses his surprize how such a woe should be denounced against it, when we do not read, in the whole N. Testament, that our Lord had ever been there; however we read that he had frequently been at Bethsaida and Capernam. Now, Chorazin being placed by Dr. Lightfoot between these two towns, and being, according to St. Jerome, but two miles distant from Capernam, and in many maps at a small distance from Bethsaida, and it being expressly said that mighty works were done in her, Christ must, without doubt, have been often there.

CHORD, or Cord, primlyly denotes a flender rope or cordage. The word is formed of chorda, and that from χορδή, a gut; whereof flings may be made.

CHORD, CHORDA, in Anatomy. See CHORDA.

CHORD, CHORDS, in Geometry, a right line connecting the two extremes of an arc. Or, it is a right line, terminated at each extreme in the circumference of a circle, without passing through the centre; and dividing the circle into two unequal parts, called segments. Such is the line AB, Plate III. Geometry, fig. 43.

Chord of the complement of an arc is the chord that subtends the rest of the arc; or so much as makes up the arc a semicircle.

The chord is perpendicular to a line drawn from the centre of the circle to the middle of the arc, as CE; and has the same disposition to it, as the chord, or string of a bow, has to the arrow: which occasioned the ancient geometers to call this line the chord of the arc, and the other the sagitta, or arrow, the former of which names is still continued, though the latter is diffus'd. What the ancients called sagitta, is now termed the versed sine.

Half the chord of the double arc BD, is what we now call the right sine; and the excess of the radius beyond the chord DE, the versed sine.

The chord of an angle, and the chord of its complement to a whole circle, are the same thing; the chord of fifty degrees is also the chord of 310.

It is demonstrated, in geometry, that the radius CE, bisecting the chord BA in D, does also bisect the arc in E, and is perpendicular to the chord AB and vice versa; and again, if the right line NE bisect the chord AB, and be perpendicular to it; that it passes through the centre, and does bisect both the arch AFB, and the circle ANB.

Hence we derive several useful corollaries: as, 1. To divide a given arc AB into two equal parts; draw a perpendicular to the middle point D of the chord AB; this bisects the given arc AB.

2. To describe a circle, that shall pass through any three points, A, B, C, fig. 44. From A and C describe arcs intersecting in D and E; and also others. G and H, from C and B: draw the right lines DE and GH; the point of intersection I, is the centre of the circle to be described through A, B, and C.

Demonstration. For the points A, B, and C, are in the periphery of some circle; and therefore the lines AC and CB are chords, but ED is perpendicular to AC, and GH to BC; D and E bisect AC, and G and H bisect BC; whereof each passes through the centre. Now as DE and GH only intersect in I, I will be the centre of a circle, passing through the given points, A, C, and B. Hence, assuming three points in the periphery, or arc, of any circle, the centre may be found, and the given arc completed: hence, also, if three points of one periphery do agree or coincide with three points of another; the whole peripheries agree, and therefore the circles are equal.

And hence, lastly, every triangle may be inscribed in a circle.

The chord of an arc AB (fig. 13.) and the radius CE, being given; to find the chord of the half-arc AE. From the square of the radius CE, subtract the square of half the given chord AD, the remainder is the square of DC; from which, extract the square root; and then DC subtracted from the radius EC, leaves DE. Add the squares of AD, and FO; the sum is the square of AE; whence, the root being extracted, we have the chord of the half arc AE.

Chords, line of, is one of the lines of the sector and principal. See its description and use under Sector and Plain Scale. See also Sine.

Chords, or Cords, in Ml. 52, denote the firings, or lines, by whose vibrations the liftuation of sound is excited; and by whose divisions the several degrees of time are determined. They are called cords, or chords, from the Greek χορδή, a name which the physicians give to the intestines; in regard the firings of musical instruments are ordinarily made of guts: though others are made of brafs or iron wire; as tofe of flpiets, harpichords, &c. See String.

Chords of gold wire in harpichords, yield a sound almost twice as loud, as thofe of brafs; cords, or firings, of steel, yield a febler sound than thofe of brafs; as being both lefs heavy, and lefs ductile.

Mr. Kevalt observes, that of late they have invented a way of changing the chords, to render the sound stronger, without altering the tone.

The fifth chord of bas viols, and the teeth of large organs, confist of fifty threads, or guts; there are fome of them a hundred feet long twisted and polished with equineum, or horfe-tail.

Chords for the division of: 1. To find such part of a chord AB, as shall conftitute any concord, v.g. a fifth, or any other interwal, with the whole.

Divide AB into as many parts, as the greatest number of the interval has units; v.g. the fifth being 2: 3, the line is divided into 3. Of these take as many of the lifter number, v.g. 2: 3AC, then is AC the part sought; that is, two lines whose lengths are to each other as A B to AC, make a fifth.

Hence, if it be required to find several different ficctions of the line AB, v.g. such as shall be fifth, and 3d g.; reduce the given ratios 2: 3, 2: 3, and 4: 5, to one fundamental; the feries becomes 30, 24, 20: 15. The fundamental is 30, and the fictions found are 24, the third g.; 20, the fifth; and 15, the octave.

2. To find fcveral ficctions of a line AB, that from the leaf, gradually to the whole, ftiall contain a given feries of interwalogs in any given order; viz. fo that the leaf to the next greater contains a third g.; that to the next greater, a fifth; and that to the whole, an octave.

Reduce the three ratios 4: 5: 2: 3: 1: 2, to one feries; hence we have 81: 10: 15: 30: divide the line into the number of parts of the greatest extreme of the feries; viz. 30, we have the fictions fought at the points of division, anfwering...
frowing to the several numbers of the series, viz. at the points C, D, and E; so that AC to AD is a third, AD to AE a fifth, and AE to AB octave.

3. To divide a line AB into two parts, to contain between them any interval, v. g. a fourth.

Add together the numbers containing the interval of the two parts as the sum contains, v. g. 7; taken to any of the given numbers, v. g. 4, or C, gives the thing sought.

4. For the harmonical division of Chords. To find two sections of a line, which with the whole shall be in harmonical proportion, with regard to their quantity.

Take any three numbers in harmonical proportion, as $3, 4, 6$; and divide the whole line into as many parts as the greatest of these three numbers, v. g. 6; and at the points of division answering to the other two numbers, v. g. 3 and 4, you have the sections sought.

5. To find two sections of a line, which together with the whole shall be harmonical, with respect to quality or tune.

Take any three numbers, concords with each other, v. g. 2, 3, and 8, and divide the line by the greatest; the points of division answering to the other two, give the sections sought.

6. To divide a Chord, A D, in the most simple manner, so as to exhibit all the original concords.

Divide the line into two equal parts at C, and subdivide the part C B into two equal parts at D; and again, the part C D into A —— $| C D | E —— B$
two equal parts at E.

Here A C to A B is an octave; A C to A D a fifth; A D to A B a fourth; A C to A E a third; A E to A D a third $\frac{1}{2}$; A E to E B a fifth $g$; and A E to A B a sixth $l$. Malcolm's Treat. of Music, ch. 6. sect. 1, 2, 3.

To find the number of vibrations made by a musical chord or string, in given time, its weight, length, and tension being given.

Before we proceed to the solution of this problem, we shall premise and demonstrate the principle on which it is founded; and, with this view, we shall adopt the method of demonstration presented to the Royal Society by Dr. B. Taylor, and published in the Philosophical Transactions, No. 357; or Jones's Abr. vol. iv. p. 351.

Lemma 1. Let A D F B, A $\Delta$ F, B, (Plate III. Geometry, fig. 45.) be two curves, the relation of which is such, that the ordinates $C A D$, $\Delta$, $E F$, being drawn, it may be $C A D : E F = \Delta$. Then the ordinates being diminished ad infinitum, so that the curves may coincide with the axis $A B$; the ultimate ratio of the curvature $\Delta$ in $C D$ will be in the curve of $D$, as $C A \Delta$ to $C D$.

Demonstr. Draw the ordinates $C \beta d$ very near to $C D$, and at $A$ and $D$ draw the tangents $D i$ and $A \alpha$, meeting the ordinate $D i \beta$ in $\beta$. Then because of $C \beta d : C \beta : C D$ (by hypothesis), the tangents being produced will meet one another, and the axis, in the same point $C$. Whence, because of similar triangles $C \beta D P$ and $C \alpha D P$; and $C \beta P$ and $C \alpha P$, it will be $c \beta : c \alpha :: C \beta C D :: c \beta : c \alpha$ (by hypoth.): $\beta \alpha$ : $(c \beta - c \alpha) : d t (c \beta - c \alpha)$. But the curvatures in $A$ and $D$ are as the angles of contact $\Delta \alpha$ and $\alpha D$; and because $\Delta \alpha$ and $\alpha D$ coinciding with $C$, those angles are as their subtended $\beta \alpha d t$; that is, by the proportion above, as $C A \Delta$, $C D$. Therefore, &c. Q. E. D.

Lemma 2. In some instance of its vibration, let a string, stretched between the points A and B, fig. 46, put on the form of any curve $A \beta B$; then the increment of the velocity of any point $o$, or the acceleration arising from the force of the tension of the string, is as the curvature of the string in the same point.

Demonstr. Conceive the string to consist of equal rigid particles, which are infinitely little, as $o p$, $o q$, &c. and at the point $o$ erect a perpendicular $o R$, equal to the radius of the curvature at $o$, which let the tangents $p t, q t$, meet in $t$, the parallels to them $t r, s r$, in $t$, the chord $p r$ in $r$. Then by the principles of mechanics, the absolute force by which the two particles $p o$ and $o q$ are urged towards $R$, will be to the force of tension of the string, as $t s$ to $t p$; and half this force by which one particle $p o$ is urged, will be to the tension of the string, as $t e$ to $t p$; that is, (because of similar triangles $t e, t p, R$) as $t p$ or $o p$ to $t R$ or $o R$. Wherefore, because of the force of tension being given, the absolute accelerating force will be as $o p$ or $o R$. But the acceleration generated is in a compound ratio of the ratios of the absolute force directly, and of the matter to be moved inversely; and the matter to be moved is the particle $o t$ or $o p$. Wherefore the acceleration is as $\frac{1}{o R}$; that is, as the curvature in $o$. For the curvature is reciprocally as the radius of curvature in that point. Q. E. D.

Prob. 1. To determine the motion of a stretched string.

In this and the following problem, we suppose the string to move from the axis of motion through an infinitely little space; that the increment of tension from the increase of the length, also the obliquity of the radius of curvature, may safely be neglected.

Therefore let the string be stretched between the points A and B, fig. 47, and with a bow let the point $o$ be drawn to the distance $C o$, from the axis A B. Then taking away the bow, because of the flexure in the point C alone, that will first begin to move (by Lem. 2.). But no sooner will the string be bent in the nearest points $a$ and $d$, but theses also will begin to move; and then E and e; and so on. Also because of the great flexure in C, that point will first move very swiftly; and hence the vibrating being increased in the next points D, E, &c. they will immediately be accelerated more swiftly, and at the same time the curvature in C being diminished, that point in its turn will be accelerated more slowly. And, in general, those points which are slower than they should be, being accelerated more, and the quicker left, it will be brought about at last, that the forces being duly attempered one with another, all the motions will converge together, and all the points will at the same time approach to the axis, going and returning alternately, ad infinitum.

Now, that this may be done, the string must always put on the form of the curve $A C D E B$, the curvature of which, in any point E, is as the distance of the same $E a$ from the axis; the velocities of the points C, D, E, &c. being also in the ratio of the distances from the axis C, D, E, &c. For in this case the spaces C x, D x, E x, &c. described in the same infinitely little time, will be as the velocities; that is, as the spaces described C x, D x, &c.

Wherefore the remaining spaces k x, l x, &c. will be to each other in the same ratio. Also (by Lem. 2.) the accelerations will be to one another in the same ratio. By which means the ratio of the velocities always continuing the same with the ratio of the spaces to be described, all the points will arrive at the axis at the same time, and always depart from it at the same time. And therefore the curve A C D E B will be rightly determined. Q. E. D.
Moreover the two curves $ACDEB$ and $A \times \frac{r}{2} B$, being compared together, by Lemma 1, the curvatures in $D$ and $E$ will be as the distances from the axis $D$ $S$ and $E$ $S$, and therefore, by Lemma 2, the acceleration of any given point in the string will be as its distance from the axis. Whence (by Sect. 10, Prop. 51, of Newton's Principia), all the vibrations, both great and small, will be performed in the same periodical time, and the motion of any point will be similar to the oscillation of a body vibrating in a cycloid. Q.E.I.

Cor. Curvatures are reciprocally as the radii of circles of the same degree of curvature. Therefore let $a$ be a given line, and the radius of curvature in $E$ will be equal to $\frac{a}{E}$.

**Prob. 2.** The length and weight of a string being given, together with the weight that stretches the string, to find the time of a single vibration.

Let the string be stretched between the points $A$ and $B$, fig. 48, by the force of the weight $P$, and let the weight of the string itself be $N$, and its length $L$. Also let the string be put in the position $A F \parallel C B$, and at the middle point $C$, let $C S$, a pendulous string, be raised equal to the radius of the curvature in $C$, and meeting the axis $A B$ in $D$; and taking a point $p$ near to $C$, draw the perpendicular $p c$ and the tangent $p t$.

Therefore it appears, as in Lemma 2, that the absolute force by which the particle $p C$ is accelerated, is to the force of the weight $P$, as $e$ to $p f$; that is, is $p C$ to $C S$. But the weight $P$ is to the weight of the particle $p C$, in a ratio compounded of the ratios of $P$ to $N$, and of $N$ to the weight of the particle $p C$, or of $L$ to $p C$; that is, as $P \times L$ to $N \times C$. Therefore, compounding these ratios, the accelerating force is to the force of gravity, as $P \times L$ to $N \times C$. Let therefore a pendulum be constructed, whose length is $CD$; then (by Sect. 1, prop. 52, of Newton's Principia) the periodical time of the string will be to the periodical time of that pendulum as $\sqrt{N \times C S}$ to $\sqrt{P \times L}$. But by the same proposition, the force of gravity being given, the longitudes of the pendulums are in a duplicate ratio of the periodical times. Whence $\frac{P \times L}{N \times C} \times \frac{a a}{C D}$, or writing $\frac{a a}{C D}$ for $CS$ (by Cor. Prob. 1.), $\frac{P \times L}{N \times a a}$ will be the length of a pendulum, the vibrations of which are isochronous to the vibrations of the string.

To find the line $a$, let the absciss of the curve be $A E = x$, and the ordinate $E F = x$, and the curve itself $A F = x$, and $C D = b$. Then (by Cor. Prob. 1.) the radius of curvature in $F$ will be $\frac{a a}{C D}$. But $d$ being given, the radius of curvature is $\frac{\pi x}{x}$. Whence $\frac{a a}{x} = \frac{d x}{x}$, and therefore $a a = \frac{d x}{x} + a a$. Here the given quantity $\frac{a a}{x}$ $+ \frac{d x}{x}$ is added, that it may be $\frac{d x}{x}$ in the middle point $C$. And hence the calculus being completed, it will be $\frac{d x}{x} = \frac{d x}{b x} \times \frac{d x}{x}$. Now let $b$ and $x$ vanish in respect to $a$, that the curve may coincide with the axis, and it will be $\frac{d x}{x} = \sqrt{c b \times c b}$. Now, with the centre $C$, and radius $D C = b$, fig. 49, a quadrant of a circle $D P E$ being described, and making $C Q = x$, and erecting the perpendicular $Q P$; then the arc $D P$ being $= y$, it will be $y = \frac{b x}{a z}$. Whence $y = \frac{a}{b} z$, and $x = \frac{a}{b} y$. And making $x = b = C D$, in which case it is also $y = \text{quadrantal arc } D P E$, and $z = A D = \frac{1}{2} L$; it will be $\frac{1}{2} L = a \times \frac{D E}{C D}$, and $a = L \times \frac{C D}{2D E}$. Let it be therefore $C D = 2 D E$; diameter of a circle; circumference :: $d : e$; and it will be $a a = L \times \frac{d d}{e e}$. Therefore this value being substituted for $a a = \frac{N}{P} \times L \times \frac{d d}{e e}$ will be the length of a pendulum, which will be isochronous to the string. Therefore let $D$ be the length, whose periodical time is $t$, and $\frac{d}{e} \times \sqrt{\frac{N}{P} \times L}$ will be the periodical time of the string. Q.E.I.

For the periodical times of pendulums are as the square roots of their lengths.

**Cor. 1.** The number of vibrations of the string in the time of one vibration of the pendulum $D$, is $\frac{1}{d} \sqrt{\frac{P \times D}{N \times L}}$.

**Cor. 2.** Because $\frac{d}{e} \times \sqrt{\frac{1}{D}}$ is given, the periodical time of the string is as $\sqrt{\frac{N}{P} \times L}$. And the weight $P$ being given, the time is as $\sqrt{\frac{N}{L}}$. And the strings being made of the same thread, in which case it is as $N$, the time will be as $L$.

If we take $L$ for the number of inches and decimals contained in the length of the chord, and the proportion of the tension to the weight of the chord as $n$ to $1$, then the number of vibrations of the chord in one second is (by Cor. 1.) $\frac{355}{113} \sqrt{\frac{39.12 \times n}{L}}$. Where $\frac{355}{113}$ denotes the proportion of the circumference to the diameter of the circle; and $39.12$ is the length of a pendulum vibrating seconds, in inches and decimals of an inch, English measure. This last expression coincides with Mr. Euler's rule (Tentam. Nov. Theor. Muf. p. 6, 7.), only we here express in English what he gives in Rhinland measure. To illustrate this rule by an example: suppose the length of the chord to be 18.7 inches, its weight 6\frac{1}{2} grains, and the tension or weight extending this chord to be 8lb. troy, or 450.605 grains. Then $L = 18.7$, and $n = \frac{450.605}{6.2} = 7432$. The number of vibrations therefore by the rule will be $\frac{355}{113} \sqrt{\frac{39.12 \times 7432}{18.7}} = 391.4$. See Taylor's Method. Inclem. Prop. 29. MacLaurin's Fluxions, § 920. Smith's Harmonics, Prop. 23 and 24. Malcolm's Music, ch. ii. § 2.

By logarithms the rule may be thus expressed $L + W = C = V$. Where $L$ is the logarithm of the ratio of a pendulum, vibrating seconds, to the length of the given string, $W$ the logarithm of the ratio of the tension to the weight of the string; $C$ the logarithm of the ratio of the circumference
The length of the string is reckoned from one bridge to the other, or from one resting place to the other. The tension of the string is measured by the weight which is suspended to one end of it. If instead of stretching a string by suspending a weight to it, the string be twisted round a peg, after the manner commonly used in musical instruments, then the tension will be expressed by a weight; meaning a weight which may be capable of stretching the string as much as it is stretched by turning the peg.

If various chords differ in tension only; then the number of vibrations which each of them performs in a given time, is as the square root of the stretching weight. Thus, if a chord be stretched by a weight of 16 pounds, and another chord be stretched by a weight of 9 pounds; then the former will perform 4 vibrations in the same time that the latter performs 3 vibrations.

If cylindrical chords differ in thickness only, then the number of vibrations which they perform will be inversely as the diameters, viz., if the diameter of a chord be equal to twice the diameter of another chord, then the former will perform one vibration in the same time that the latter performs two vibrations.

By a proper adjustment of the lengths, thicknesses, and stretching weights, similar chords may be caused to perform any required number of vibrations; which is evidently derived from the preceding paragraphs.

The actual number of vibrations, which are performed by a given stretched cord, may be determined, without any great error, by using the following rule; provided the length and weight of the stretching part of the chord, and likewise the stretching weight be known. Rule. Multiply the stretching weight by 39.12 inches (which is nearly the length of the pendulum that vibrates seconds). Also multiply the weight of the chord by its length in inches; divide the first product by the second; extract the square root of the quotient; multiply this square root by 8.1416, and this last product is the number of vibrations that are performed in one second of time by the given chord. — The resilience of the air, as also some other fluctuating causes of obduction, not being noticed in this rule; it is most probable that the real vibrations are not quite so numerous as they are given by the rule.

The pitch in music is denoted by the number of vibrations that are performed in a given time, or by the length of the string which emits each of those sounds; for it has been already shown that, when stretched strings are alike in all other respects, excepting in their lengths, then the duration of a single vibration of each string is proportionate to the length of the string; or (which amounts to the same thing) that the number of vibrations performed by each string in a given time, is inversely as the length of the string.

If you take several strings, or chords, precisely of the same length, the same form, and the same thickness, and stretch them equally by suspending equal weights at their extremities, or otherwise; and their respective lengths be made of the due proportions; then these strings, when struck, will express the proper musical sounds or tones, and the whole set is called a "Scale of Music." See Scale, String, and Vibration.

Mr. Euler informs us, that he found the chord, making 392 vibrations in a second, to be at unison with the key called a in a, that is, an octave and sixth major above the lowest C in our harpsichords or violincellos. Consequently the note C, being to a as 3 to 10, will make 118 vibrations in one second. And the highest C, or c'', as Mr. Euler calls it, being four octaves above the lowest c, will make 1888 times in one second of time. Mr. Euler inverts the limits of the human ear to be, with respect to gravity, two octaves lower than C; and with respect to strumens, two octaves higher than c''. See Interval and Vibration.

Chord is sometimes also used for accord. Thus we say, the common chords to such a base note, meaning its third, fifth, and octave. See Accord.

Chord is also used, in Music, for the note or string to be touched or founded, in which sense it is applicable to all the intervals of music.

Chord is also a technical term in music, implying a combination of not less than three sounds, as the third and fifth to any base, or the

8 which compose what, in practice, is called a common
5 chord:
3 which may be written and played three several ways, as

8 3 5 The first of these is called the common
5 8 3 chord; the second, the chord of the 6th; the
3 5 8 third, the chord of the 4th; yet still each of these is but the common chord to C, the fundamental or principal base, revered. See Common chords, Fundamental Base, Accompaniment, and Thorough-bass.

CHORDA Tympani, in Anatomy, a very slender nervous twig, forming a communication between the facial nerve, (portio dura of the 7th pair) and the lingual branch of the inferior maxillary. In its course it crosses the cavity of the tympanum. See Nerves and Ear.

Chordale Mobiles, Lat. in Ancient Music, strings in the tetrachords which were changeable in the chromatic and enharmonic genera.
CHO

CHORDAE flabiles, flanges at the top and bottom of tetrahedrons of the ancient lyre, of which the tuning was never altered by change of genius.

CHORDAPSUS, in Medicine, a term used by some of the ancient physicians, to denote a violent pain in the abdomen. There is a difference among them as to the precise figure or figure of the term; some giving it only to spasmodic affections of the bowels, and others to inflammatory pains, or to both. Celsus (lib. iv. cap. 13) observes, that Diocles Carpusius denounced the acute disease of the small intestines chordapsus; and that of the large intestines, which is sometimes chronic, ideas; but he adds, that by most physicians the former is called ileus, and the latter colic. Celsus Aurelianus remarks, that some physicians denominate the acute disease (or ileus) chordapus, because the intestines are fretted, as it were, like clers. But he adds, that others apply the term to pains of the bowels in general, among whom are Hipocrates, Protagora, and Euromphon the Gildian. De Acut. Morbo. m. 17.

By some the word is derived from χορδή, a string, and ἀπόφθεγμα, a figment, because the bowels are hard and are fretted like a cord to the hand, applied to the abdomen; by others, probably with more correctness, from χορδή, a string, and ἀπάτεω, to cheat, from the tension and affection of the bowels during these pains. For Celsus Aurelianus observes, the ancient Greeks used the term χορδής for intestine. See Cole and Enteritis.

CHORDEE, in Surgery, (from χορδής, the string of a musical instrument;) denotes a painless, involuntary, and sometimes dilated, resection of the penis, happening at all times, but more commonly when the patient is warm in bed; under which circumstance the penis becomes hard and painful to the touch, and is most frequently curved downwards in a considerable degree. It sometimes remains, after the heat of urine, and other symptoms of gonorrhoea, are gone off; but is usually more severe during the continuation of the inflammation, and becomes more or less violent, according to the greater or less urgency of that symptom.

Mr. Benjamin Bell states, that chordee is the effect of inflammation, arising from irritation, communicated from the nerves of the urethra to those of the contiguous muscles, whereby those unequal degrees of contraction are produced over the whole sublimity of the penis, which universally take place in this disease.

Mr. Hunter says, the chordee appears to be inflammatory in some cases, and spasmodic in others. Speaking of the inflammatory, he says, "When the inflammation is not confined merely to the surface of the urethra and its glands, but goes deeper and affects the recticular membrane; it produces an extravasation of coagulable lymph, as in the adhesive inflammation, which, uniting the cells together, destroys the power of dilatation of the corpus spongium urethrae, and makes it unequal in this respect to the corpora cavernosa penis; and therefore a curvature on that side takes place in the time of erection, which is called a chordee. The curvature is generally in the lower part of the penis, arising from the cells of the corpus cavernosum penis of that side, having their folds united by adhesions, sometimes, as it were spontaneously, at other times, in consequence of the inflammation attending bad chances. Besides this effect of inflammation, when the chordee is violent the inner membrane is probably so much upon the stretch, as to be in some degree torn, which frequently causes a profuse bleeding from the urethra, that often relieves, and even sometimes cures. As chordee arises from a greater degree of inflammation than common, it is an effect which may, and often does, remain after all infection is gone, being merely a consequence of the adhesive inflammation."
nervous disorders, with which it exhibits only a few symptoms in common.

The disease, anciently denominated *febrity* or *febrity* (γυμνη εκτύμβων), appears to resemble chorea in several circumstances, inasmuch that some modern authors have considered the terms as synonymous. Sauvages treats of chorea under the appellation of *febrity*. *Chorea*. Nol. Meth. Ch. IV. See Langius, Epit. Med.—But the definitions of febrity, left us by the ancients, fearcely apply to chorea, as it has been understood since the time of Sydenham. Galen describes it as a sort of paralysis of the legs, which renders the patient unable to walk in a straight direction; he turns from one side to the other, crossing the left foot over the right, or the right foot over the left, or both alternately; and sometimes elevates the feet as if ascending a great acclivity. This description will also apply to a partial or incontinent palsy of the lower extremities: and indeed the term itself excludes the notion of any affection of the muscles of the arm, or superior parts of the body. Piny mentions the febrity, as a disease which occurred together with the febry (febrity) among the Roman soldiers encamped near the Rhine, in consequence of drinking for a considerable time the waters of a certain spring. He designates it in a few words: "'Compages in genibus solvere tur!' which seem to imply a simple paralysis of the legs. Nat. Hist. lib. xxx. cap. iii.

The disease, of which we now treat, is widely different in its nature: and the appellations of *Chorea Santit Viti, Salus Viti, &c.* imply that it has been first distinguished from other affections in modern times. The writers, however, who have adopted these appellations, have by no means agreed in the conceptions of symptoms to which they apply them. The connection of the name of this febry (Vitus) with a convulsive disease seems to have originated among the continental writers, during the days of fanaticism and superstition in the seventeenth century. Gregorius Horlius and Juncker relate, that a superstitious belief prevailed in Germany, among the people addicted to worship the images of the fants, that by preening grits, and dancing before the image of St. Vitus, on his festival in the month of May, they should live in health and safety during the ensuing year; and that for this purpose they repaired to a chapel dedicated to this fante, where they danced night and day, until they were seized with a delirium, and fell down in a sort of trance. They then returned home, having undergone a supposed renovation. But on the return of May, in the following year, they began to perceive a relapse and agitation of their limbs, as if a fresh regeneration were become necessary, and were compelled to assemble again in the chapel, on the festival of the fante. This Juncker attributes to the force of imagination and habit! There were two chapels sacred to St. Vitus, the one near Ulm, the other near Ravensberg; both famous for the annual assemblies of dancing fanatics. Gregorius Horlius affirms that he had converted with several persons, who re-attended to this superstitious dance, as a preparative to disease, and who were frenesi advocates of its efficacy; one of them had paid the annual visit for the space of 24, and another for 50 years. Greg. Horli. Opera Med. tom. ii. lib. ii. obi. 45. Juncker Conspic. Patholog.

Such is the origin of the appellation given to this disease. It was applied, it would seem, in the first instance, chiefly to cases of infancy, in which there was an extraordinary disposition to violent exercise; whether of running, dancing, or otherwise; and as well to the temporary delirium of the fante, as to the more permanent derangement of the maniac. Such were two cafes related by Platerus, if they are not altogether fabulous; in one of which, a woman danced vehemently, night and day, until the skin was worn off her feet. Obst. Med. lib. i. p. 88. Tulpius records the history of a man fitzed with a familiar inanity, who ran about night and day, until he suffered the most prodigious peripherations, and was unable to cease from his exertions, except when over-powered by sleep. Obs. Phys. lib. i. obs. 16. See also Jo. Rud. Camerar. Sylophz Mon. cent. xi. obs. 84—88.

Our countryman, Sydenham, was the first writer, we believe, who described the series of symptoms, which is now comprehended under the term, *chorea*, or *Saint Vitus's Dance*; and he has been copied or followed, in this description, by most of the ablest writers on the subject. Sydenham, however, speaks of it as a disease, which was vulgarly called *chorea fanéti Viti* in his time. Dr. James Hamilton, in a late excellent treatise, on the utility of purgative medicines, has, from a more extensive experience in the disorder, given a more correct and ample view of chorea. It is characterised by the following symptoms.

The approach of the disease is commonly slow, and is indicated by a loss of the usual vivacity and playfulness, by a variable and often ravenous appetite, a dwelling and hardness in the lower belly in most cases, in some a lank and soft belly, and, in general, a conplicated state of the bowels, which is aggravated as the disease advances. Slight irrefractory involuntary motions are frequently observed, especially o the muscles of the face, which are thought to be the effect of irritation, and are the harbingers of the more violent convulsive motions, which now attract the attention of the friends of the patient.

These convulsive motions vary considerably. The muscles of the extremities, and of the face, those moving the lower jaw, the head and the trunk of the body, are, at different times, and in different intervals, affected by it. In this state the patient does not walk readily; his gait reembles a jumping or starting; he sometimes cannot walk, and seems palsied, nor can he perform the common and necessary motions with the affected arms. In a word, when the patient wishes to be at rest, the muscles are perpetually moving, and distorting the limbs, face, and trunk; and when any motion is attempted by the will, it is performed irregularly, and with difficulty, after several useless efforts. *Thus if the patient take a cup of drink in his hand, he performs,* as Sydenham has remarked, *"a thousand ridiculous gesticulations, before he is able to bring it to his mouth; for he cannot direct it in a straight line, his hand being drawn higher and thither by the convulsions, but is compelled to move it about for some time, till at length, reaching his lips, he flings the liquor suddenly into his mouth, and drinks it greedily, as if the poor creature designed only to excite the laughter of the spectators."

These convulsive motions are more or less violent, and are constant, except during sleep, when, in most instances, they cease altogether: but sometimes they continue, and, when the disease is greatly aggravated, even severer, in much that the sleep becomes unfound and disturbed by the incessant motions. Although different muscles are sometimes successively convulved, yet, in general, the muscles affected in the early part of the disease, remain to during the course of it. The disease advancing, articulation becomes impeded, and is frequently completely suspended. Deglutition is also occasionally performed with difficulty. The eye loses its luster and intelligence; the countenance is pale and expressive of vacuity and languor. These circumstances give the patient an appearance of fatuity; and indeed there is little doubt, that, when the disease has subsided for some time, fatuity, to a certain extent,
Chorea.

interrupts the exercise of the mental faculties. Fever, such as afflicts morbus, is not a necessary attendant on chorea; nevertheless, in the advanced periods of the disease, fecundity and wasting of the muscular bulk take place, the consequence of constant irritation, of abating appetite, and impaired digestion, the common attendants of protracted chorea; and which, doubtless, may, in some instances, have been the forerunners of death; although no fatal instances of chorea have been recorded.

Chorea attacks the male and female sex indifferently; and those chiefly who are of a weak constitution, or whose natural good health and vigour have been impaired by confinement, or by the use of scanty or improper nourishment. It appears most commonly from the eighth to the fourteenth year of life; but sometimes, especially in females, it has been observed at the age of sixteen or eighteen years. Sydenham Schedul. Monitor, de nov. febris ingreñi. —

Hamilton Obs. on Purgative Med.—Biffet Med. Eflays and Obi.

Although chorea, in the precise form above described, seldom, if ever, attacks adults, yet a series of irregular, disturbing, and unwholesome motions in the muscles of the extremities, abdomen, neck, and face, occasionally occur in adults, which bear a great resemblance to the motions of the chorea of children; and what curiously arises from this disorder is sometimes connected with a derangement of the biliary system and the organs of digestion; sometimes with anxiety or distress of mind; sometimes it is combined with symptoms of hysteria, and we have seen it succeed to a state of mental irregularity and deprecation, bordering on melancholy. Dr. Darwin has attempted to distinguish these motions from those of chorea; but he has obviously mistaken the nature of the latter. He has termed the disease of adults, connusio dolorifica, (painful convulsion,) because the excitation of the muscles, he affirms, is made to relieve some uneasy sensation, especially the pains left after rheumatism in young and delicate people: but in chorea, "the undue motions only occur when the patient endeavours to exert the natural ones; are not attended with pain; and cease when he lies down without trying to move." See Zoonomia, Cls. IV. 2. 3. and Cls III. 1. 1. This statement, however, is incorrect; since, as we have before mentioned, the motions of chorea are almost incessant, and ever being filled with invertebrate cafe. An intelligent young man, who now labours under this convulsion, expressed his conviction, that Dr. Darwin's conception is correct, and affirmed, that he could, by a strong exertion of the will, prevent the motions from taking place at any time, but that such exertion was extremely painful, and was followed by languor and distressful sensations. Whether this be also the case in the chorea of children, we know not; since their immature understanding precludes the possibility of making the experiment.

Many cafes have been assigned to chorea. It is often attributed to the presence of worms in the alimentary canal, and to the repulsion, or drying up of cutaneous eruptions: Dr. Darwin seems to have conceived that its most common cause was the repulsion of the itch. Rheumatism, acute fevers, diæases of the stomach, the use of mercury, terror, and other strong mental impressions, are also enumerated among the occasionals causes of chorea; but these relate chiefly to those convulsive affections which occur in adults. Dr. Monro, the son, used to affirm, in his lectures, that he had several times observed the diæase to occur in children about the period of the second dentition, when the former set of teeth remained, or when the new set were filling through the gums; and that he had speedily cured the diæase, by drawing the first teeth, or lancing the gums. Dr. H—

ilton believes that chorea is connected with a flagitious action and conglutination of the bowels, and the consequent large accumulation of feaces in the canal. He observes, with regard to one of his patients: "This boy was emaciated and exceedingly puny, and his abdomen was lank; yet, from the 15th day of December, when the commencement of his recovery was observable, to the 25th day of the same month, the quantity of feaces decharged was more wonderful, such as I had never seen before. If an enema is given during the above period, to have nearly equalized in weight, that of the whole body of the exterminated patient." Page 68.

The cure of chorea has been variously attempted, according to the particular notion entertained by the practitioner, of the nature and cause of the disease. All the remedies, however, which have been adopted, may be considered as belonging to two classes, tonics and evacuants; such as tone, on the one hand, to support the strength of the constitution, and to diminish the susceptibility of irritation, or, on the other, to evacuate the bowels, or lessen the quantity of the circulating fluid. The two plans of cure have been combined with lucius.

The systems of modern medicine, and more particularly the diapeutistical doctrines of Brown, have led their followers to conclude that every antifeptic: remedy is calculated for the cure of which tones and stimulus medicines are alone adequate, and to which the slightest evacuation is greatly detrimental. Numerous examples of chorea, among the relics, are recited in the periodical journals, in which a cure was obtained under the employment of medicines of this nature. Thus we find cures attributed to the use of affatina, valerian, mule, camphor, the flowers of cardamine, and belladonna; to electricity and the cold bath; to Peruvian bark and other vegetable bitters; and, of late years, more particularly to the virtues of the metallic tonics, especially the oxyed of lime, and sulphate of zinc, the ammoniated copper, and nitrate of silver. See Biffet loc. cit. Edinburgh Med. Com. vol. x. and xii. Memoirs of the Lond. Med. Soc. vol. iii. Forthgill, Phil. Tran. 1779, &c. Under the administration of remedies of this class, the diæase unquestionably occasionally disappears; sometimes in consequence of the casual extirpation or removal of the irritation which excited it; and sometimes, no doubt, from the direct effects of the medicines, in rendering the body less susceptible of the ill effects of the existing irritation, in flight cafes. It is certain, however, that the symptoms of chorea have often continued with unmitting severity, under the employment of the most powerful of tereic tonics and anti-spasmodic medicines, during many months, with even for years; terminating only, on some occasions, about the age of puberty, and even leaving the unconquerable remains of its grotesque and irregular motions imposed on the young sufferer for life.

To the opposite mode of employing evacuants, especially purgatives, different physicians have been led by some peculiar notion of the diæase which they entertained; which, however different, conducted them to the same conclusion. Sydenham ascribed the convulsions of chorea to a humour failing upon the nerves, (humor aqvus in nervis aqvas,) and stimulating them to extraordinary action: hence he inferred that the indications of cure were to diminish or remove this supposed humour by blood-letting and purging; and to strengthen the nerves, by administering tonics and anti-spasmodics in the intervening days. He cured five cafes, the only ones that he had seen, by this method. It is probable, however, that the purgatives were the only useful evacuants that Sydenham employed, and the protracted curés may be attributed partly to the interruption of the use of them,
them, and partly to the debilitating effects of blood letting, which appears to be decidedly prejudicial, and is no longer recommended. But the general diffuse of purgatives is chiefly to be attributed to the opinion of Dr. Cullen, and the more dogmatic doctrines of Dr. John Brown, which inculcate that all spasmodic diseases are diseases of debility; and, consequently, that all evacuations are hurtful, and strengthening or stimulating medicines are required.

But Dr. Hamilton, in a late excellent treatise "On the Utility of Purgative Medicines," has brought forward the refult of a long experience in the infirmary at Edinburgh, which establishes the propriety of the purgative plan in the cure of cholera. He has seen twenty cases of the disease, and has generally found it connected with a state of irregularity in the action of the bowels, frequently with a tumid abdomen, and has effected many and comparatively speedy cures by the regular administration of purgative medicines. It appears that, so far from increasing the state of debility, the evacuation of the intestines contributes to relieve the strength, by reducing the functions of the vitreous. He particularly recommends the inspection of the faces of the patient, as a guide to the practic-er in the administration of his medicines, and to the alteration of the dose as circumstances may require. The usual practice of Dr. Hamilton is, to administer three grains of coloquint, with six or eight of jalap daily, till the feces begin to assume a natural appearance, and the spasmodic symptoms to abate, which are generally observed at the same time. By this plan, he affirms, that "chorea is speedily cured, generally in ten days or a fortnight, from the commencement of the course of purgative medicines."

The torso of the intestines in this disease is, however, sometimes extremely great, and, in such instances, more active purgatives must be resorted to, and repeated until the end is accomplished. In the early stage of the disease, while the intestines yet retain their sensibility, and before the accumulation of feces is great, gentle purgatives, repeated as occasion may require, will readily effect a cure, or rather prevent the full formation of the disease. But in the confirmed stage more sedulous attention is necessary. Powerful purgatives must be given in successive doses, in such a manner that the latter doses may support the effect of the former, till the movement and expulsion of the accumulated matter are effected, when symptoms of returning health appear. Whoever undertakes the cure of cholera by purgatives must be decided, and firm to his purpose. The confidence which he allines is necessary to carry home, to the conviction of the patient, conviction of ultimate success. Their prejudices will otherwise throw insurmountable obstacles in the way. Half measures, in instances of this kind, will prove unsuccessful; and were it not for perseverance in unloading the alimentary canal the disease would be prolonged, and recurring, would place the patient in danger, and thus bring into discredit a practice which promises certain safety.

Here, as in all other cases of extreme debility induced by disease, the recovery is at first slow and gradual. A regular appetite for food, a more intelligent eye, and lightened constancy, cheerfulness, and playfulness of temper, inciting aptitude for fiercer motions, the restoration of arti- culation, and of the power of deglutition, a renovation of flesh and strength succeed each other, and being more and more confirmed, are, ere long, followed by complete recovery.

For some time after these salutary changes take place, the state of the bowels must continue an object of attention. An occasional stimulus from purgatives will be requisite to support their regular action, and to render their healthy Vot. VII.

tone, the only security against the recurring accumulation of feces, and of a confestent relapse. About this time also, remedies, poiffied of tonic and stimulant powers, may be used with propriety and effect; they restore energy to the torpid bowels, aid the purgative medicines in obviating colicinenvs, and thus confirm a recovery already advanced. Vegetable bitters, or the preparations of feeb, may perhaps be most useful for accomplishing these ends. I have not felt the necessity of having recourse to medicines of this kind: under a proper regimen of light and nourishing food, and of exercise in the open air, my patients, in general, quickly recover their strength. But many practitioners find it advantageous to make use of a liquid upon tene medicines; and the usual routine of practice demands them." Page 99, et seq.

This tone of confident experience from a cautious and sagacious practitioner, supported by the successful practice of Svedenham, De Haen, Stoll, &c. will, doubtless, have its due influence on the general practice. For a detail of cases treated in this way, the reader may consult the appendix to Dr. Hamilton's treatise, the Edinburgh Medical and Surgical Journal, No. 1 vol. i. 1805, and Maximilian Stoll. Ratio Medendi, pars 4th.

From five cases described in the Edin. Journ. the writer observes that the following facts appear to be established:

18. From the exhibition of even two or three cathartics, the involuntary motions and other symptoms were much abated.

20. Although the cathartics were continued daily for a consideruble length of time, the patient, instead of becoming more debilitated, became stronger, and walked with a firmer pace.

2d. During the progress of the cure, if at any time the cathartics did not produce an evacuation, the involuntary motions recurred, and all the symptoms were aggravated.

4th. The feces, before the exhibition of the cathartics, were small in quantity, and, in every instance, black and fetid.

And, lastly, when the disease was cured, the appearance of the feces became natural.

Thus the connection of the disease with the state of the alimentary canal and its contents appears very convincingly, and the disappearance of the symptoms was proportionate to the obvious effects of the remedies; affording a degree of evidence in favour of the practice, such as is seldom obtained in medicine.

CHOREOGRAPHY, as defined by Noverre, is the art of expressing a dance in writing, by means of different characters or notes in a similar manner to music; with this difference, that a good musician will read 300 bars in an instant, and an excellent choreographist will not be able to decipher 200 bars of a dance in two hours.

Thoinet Arbeau, canon of Langres, was the first who acquired reputation by a treatise in 1588, which he entitled "Orchesographia." He wrote below the notes of the air such movements and steps of the dance as he thought suitable. Beauchamps afterwards gave a new form to choreography, and perfected the sketch of the ingenious Thoinet Arbeau: he found the means of writing the steps by signs to which he added a different signification and value; so that he was declared the inventor of this art by a decree of the French parliament. Feuillet applied himself entirely to this art, and has left several works on the subject.

It was much used in France by the ballet-masters till about the year 1754, when it was confirned by Cahusac "Traité Hill. de la Danse anc. et mod." and by the admirable Noverre in his "Lettres sur la Dance, 1760," who regarded it as too mechanical, and incapable of expressing the grace of
the countenance of the performers. "I learned choreography, (says Noverre,) and have forgotten it; if I thought it useful to my plans, I would learn it again. The bellet dancers and most renowned ballet-masters disdain it, because it teems to be of no real use. If all the figures and steps of the great dancers were to be recorded, it would reduce the art to servile imitation; like modern Latin, where no expression or word must be used for which classical authority during the Augustan age cannot be produced." Mr. Steel published an essay in 1775, towards establishing the melody and measure of speech to be expressed and perpetuated by peculiar symbols.

By means of a great number of new charactars, the author undertook to record in his notation not only how Garrick played his principal parts in general, but any particular night, how, from different degrees of animation and feeling, he varied from himself. But we believe this ingenious book was not only never well understood by the public, but never entirely read by any individual purchaser.

The choreographic art, we believe, is now wholly laid aside in France, and we have heard nothing of it in England for a long time. In 1716, however, Mr. Ellis, a celebrated English dancing-master in London, applied the choreographic art to country dances, and published a little book engraved on copper, in which beneath a line of music he delineates, on the same page, the steps and movements in characters. Mr. Weaver, a billlet-master, who wrote after Richard Steele's request, the three spectatours on dancing, Nos. 67, 334, and 370, translated, at the request of Mr. Isaac, another eminent dancing-master, from the original of M. Feuitillet, this then new art of dancing by notation, to which all the dancingmasters of eminence subfcribed; and we remember it in general use even in the country, among the professors of the Art. Mr. Weaver, besides his professional knowledge, was a man of infinite wit and considerable learning, who, after retiring from the capital, ended his days at Shrewsbury, where he had established a boarding-school of great reputation, and continued teaching to dance till he was 90 years of age. At his balls the children, besides the minuet, rigadon, and loulre, performed figure dances, such as the wooden-foot dance, Mars and Venus, with Vulcan's discovery and imprisonment of the lovers in a cage, in Pantomimes &c. in which our own juvenile vanity was highly excited by being honoured with a part. See Dance.

CHOREIS, in Ecclerical History, rural or country bishop, an officer in the ancient church, about whose function the learned are extremely divided. The word comes from χωρεός, a region or little country, and πατήρ, a bishop, or overseer.

The choreiepoci were suffragan or local bishops, holding a middle rank between bishops and prebysters, and delegated to exercise episcopal jurisdiction within certain districts, when the boundaries of particular churches, over which separate bishops presided, were considerably enlarged.

It is not certain when this office was first introduced; some trace it to the close of the first century; others tell us, that choreiepoci were not known in the East till the beginning of the fourth century; and in the West, about the year 439. In a council held at Antoch, in 344, they were forbidden to ordain priests or deacons, and had only the power of appointing prelates to inferior offices in the church. They ceased, both in the East and West, in the tenth century; when rural deans and arch-prelates were instituted in their places. After this the sylen of diocesan episcopacy was fully established.

CHOREIS, in the name of a dignity held suffragan in some cathedralls, particularly in Germany; signifying the same with chori episcopus, or bishop of the choir. The word, in this sense, does not come from χωρεός, place, but χωρης, choir, &c. In the church of Cologne, &c. the urll chantor is called choreipocus.

CHOREUS, a foot in the ancient poetry, more commonly called trochæus, or trochee.

CHORIACK, or Cerfucan, in Geography, a town of Arabia, in the country of Oman, pillaged by the Portuguese in 1508; 64 miles S.E. of Jafiir.

CHORGES, a town of France, in the department of the Higher Alps, and chief place of a canton in the district of Embrun; 10 miles W. of it. The place, which was burnt by the duke of Savoy in 1692, contains 1577 and the canton 4242 inhabitants; the territory includes 1471 kilometers and 8 communas.

CHORIAMBUS, in the Latin Poetry, a foot compounded of a choras, or trocheus, and an iambus.

It consists of four syllables; of which the first and last are long, and the two middle ones short: as fidiulium.

CHORIER, Nicholas, in Biography, a lawyer and man of letters, was born at Vincennes in Dauphine in 1669. He spent the greater part of his life in the profession of an advocate at the parliament of Grenoble, employing his leisure in the composition of historical and literary works. He died at Grenoble in 1693. The principal of his writings are "La Philosophie de l'homme," "Histoire general de Dauphine," 2 vol. fol. of which the abbe Leuglet says that Chorier is an author of little accuracy, and that the knowledge of a fact fenced him to build a history upon it. In these and many other volumes Chorier appears in the character of a grave scholar and industrious inquirer; but his name must defend with infamy on account of a licentious work, entitled "Aloizet Toletanx Satyre Sodalie de Arcanus Amoris & Veneris," which he published under the name of a lady celebrated for her learning.

CHORIN, in Geography, a town of Germany, in the circle of Upper Saxon, Ueker mark of Brandenburg; 6 miles S. of Neu Angermunde.

CHORINEUS, in Entomology: the Papilio or butterfly of this name in Cramer's exotic insects is the Papilio Faunus of Fabricius. Spec. Inf., and Pop. Citius of that author's Mammals, and Entomologia Syntemat. See Papilio Citius.

CHORION, in Anatomy, one of the membranes of the human ovum. It surrounds the amnion, and contains therefore that membrane, with its fluid. (the liquor amnii,) the fetus, and the navel string. See Generation, female organs of.

CHORIST, or CHORISTER, a chantor or singer in the choir.

CHORIZANTES, in Ecclerical History, the name of a sect in Germany, ann. 1774, laid to be demonsiacs that assembled in streets and churches.

We may suppose their enemies called them demonsiacs. Du Cange does not mention any of their texts.

CHORLEY, in Geography, a market and manufacturing town of Lancashire, England, is situated near the springs of the Chor, which issues from several springs on the east side of the town, and flowing through one part thereof along the picturesque and pleasant valley of the river Yarrow southwards, and for many miles round, are great numbers of bleaching grounds and printing works, with some cotton factories intermixed. Chorley has an ancient chapel, lately made
made parochial, supposed to be of Saxon structure, dedicated to St. Lawrence, the walls of which are ornamented with coats of arms and Saxon characles: the windows with hieroglyphic paintings. Here are other places of worship, a grammar-school, a poor-house, six alm-houses, and Sunday-schools. At the south end of the town is a dungeon or prison for the confinement of malefactors or disorderly persons. The bishop of Chelten holds his court twice a-year by proxy. The cotton manufactory, in all its branches, is carried on with great success, as also the trade of bleaching and printing cottons, fullers, calicoes, and muffins. The town and its vicinity abound in mines of coal, lead, and alum; in beds of gravel, sand, and marl; in rocks of stone, and quarries of flag and flate, ashlar and mill-Bone. Chorley is N.W. of London 208 miles, and contains, according to the latest return, 805 houses, and 4516 inhabitants; the population as well as the trade having greatly increased for several years past. Here are two weekly markets, one on Thursday, plentifully supplied with every necessary article of life, the other on Saturday, for meat and vegetables only. Another market for silk continues for two or three days in the week, when all sorts in feason, fresh and salt, are brought from Lancaster and Preston. Four fairs are annually held here, three for horned cattle, and one for toys, small wares, and Yorkshire clothes; All-houses, six alm-houses, and Sunday-schools.

CHORNOY Kuban river, a branch of the Kuban, falling northward into the sea of Azoph to the E. of Caffa or Caffa-Braits; probably the same with Aganyal, at the mouth of which, on the W. side of the river, stands the town of Amuev.

CHIRO favorita, in the Italian Musie, a chorus, in which are employed the bell voices and instruments to sing the recitatives, play the ritornellos, &c. It is otherwise called the little chorus, or chora recitante.

Choro flourato, a composition of two, three, or more choruses. It is often met with instead of tutti or da capella, which mean the grand chorus. A solo, a tre, a quatro chorus, is for two, three, or four choruses. When after the name of a part we find primo, 1° chorus, we must understand that it is to be played in the first chorus; if 2, 2°, or secondo chorus, the part must be sung or played in the second chorus. And consequently it shews, that the composition is for eight voices or different parts.

CHOROANA, in Ancient Geography, a small country of Asia, which Ptolemy places in Parthia. Strabo calls it Choroneas.

CHOROBATES, from χοροβντω, to overrun a country, a kind of water-level, used among the ancients; composed of a double square, in form of a T, decribed by Vitruvius.

CHOROCHOAD, in Ancient Geography, a town of Asia, in Armenia.

CHOROCITHARISTRIA, in Musie, he who accompanies dances on the cithara or harp.

CHORODNA, or CHORODAX, a town of Asia in Persia Propria.

CHOROGRAPHY, the art of making a Map, or description of some country, province, or district. The word comes from χορογνωσις, region, and γνωσις, I defcribe. Chorography is distinguished from Geography, as the description of a particular country is from that of the whole earth. And from Topography, as the description of the fame country is from that of a single place, town, or district in it.

CHOROIDEA TUNICA, in Anatomy, or choroid coat of the eye, is the vacular and delicate membrane, which invests the globe of the eye within the fclerotes. See Eye.

CHOROIDES Plexus, a vascular production of the pia mater, contained in the lateral ventricles of the brain. See Brain.

Choroides, in Optics, is applied to the inner and posterior tunic of the eye, immediately under the sclerotes. It is soft, thin, and black; and its inner, or concave surface, is very smooth and polished. It has its name from its being interposed with sifts. Its anterior part is called the vortex; or rather the iris, as the internal surface is called the Ryschian coat.

Next under the choroides is the retina. Ruyfch, indeed, says, he has found another tunic between the choroides and retina; and denominates it from himself, tunica Ruyfchiana. He adds, that it grows firmly to the choroides, that it is over-looked in the common dissections.

But Verheyen, though he found the choroides of a bird divisible into two membranes, could never separate those of the human eyes; and therefore he thinks there needed not any new name. The choroides is, for the most part, black in men; though it appears often, as M. Pequet has observed, in very different shades: in lions, camels, bears, sheep, cattle, dogs, cats, and mole flines, it is of a shining colour, like the brillians of silver, or the lufire of oriental pearl; and makes what naturalists cal! the topis, or colour of the eye.

Mufchenbroeck also says (Introduct, vol. ii, p. 748) that in many animals, as the lion, camel, bear, ox, flag, sheep, dog, cat, and many birds, the choroides is not black, but blue, green, yellow, or sone other colour.

M. Marriotte maintains, that vifion is performed rather in the choroides than in the retina; in which he agrees with Bar. Torinus, and is feconded by M. Mery; but most other authors are of a different sentiment.

He was led to this hypothesis by observing that part of the retina, at the interion of the optic nerve, is insensible to the impression of light, and that in this part the choroides is wanting.

He was confirmed in opinion, that the retina could not be the seat of vifion, because of its transparency; though M. Pequet observes in reply, that it is very imperfectly transparent, only resembling oiled paper. He urges likewise the greater sensibility of the choroides than that of the retina, as is evident by the alternate contraction and dilatation of the iris, which is a continuation of the choroides, in light and shade.

It has been replied, that some creatures, such as the porcupine and sea-calf, have the optic nerves inserted into the axes of their eyes, exactly opposite to the pupil; and hence it has been inferred, that, in these animals, the retina is perfectly sensible to the impression of light, at the interion of the nerve. This fact, according to Dr. Porterfield, overturns Marriotte’s hypothesis of the choroides being the principal and immediate organ of sight.

Mr. Le Cat strenuously defends Marriotte’s opinion, that the choroid coat, which is the production of the pia mater, and not the retina, is the immediate organ of vifion. The retina, according to him, is to the choroid what the epidermis is to the skin; receiving the impression of light, and preparing it for its proper organ. Mr. Michell has likewise urged some farther considerations in favour of the choroides as the proper seat of vision, deduced from its greater sensibility, and from the variety of its colours in different animals, according to their situation and necessity. He adds that the choroides is in no case transparent, and has no reflecting surface beyond it, and that it is better formed as an organ of distinct vision than the retina.

To the hypothesis of the seat of vision being in the choroides,
CHORUS, a river of the Colchide, according to the
periples of Scylax.

CHORTACANA, an ancient town of Asia, situated
in the northern part of Arisa, according to Diodorus Siculus. Strabo and Quintus Curtius
call it Artacana.

CHORUM, an ancient place of Thrace.

CHORUS, in Drama and Poetry, one or more persons,
present on the stage during the representa-
tion, and supposed to be by flanders without any particular role or instinct in
the action.

Tragedy, in its origin, M. Dacier observes, was no
more than a single chorus, who trod the stage alone, and
without any other actors; fusing dialectics, or hymns, in
honour of Bacchus, so that the chorus was the basis or founda-
tion of the ancient tragedy. Thespius, who lived about
566 years before the Christian era, to relieve the chorus,
added a second, who, during a dialogue between these two persons or actors,
in which he contrived to interweave some interesting story,
brought his actors on the stage, adorned with proper scenery and
decorations; and at the same time greatly reduced the
fusing of the chorus, to make more room for the recitation.

Every thing introduced between the four fongs of
the chorus, they called by the term episoden; and these four
fongs made the four intervals, or acts of the piece.

But when once tragedy began to be formed, those reci-
tives, or episodes, which at first were only intended as neces-
"sary parts, to give the chorus a breathing time, became now
the principal parts of the performance; and whereas, before,
they were taken from various subjects, they were now all
drawn from one and the same, or the subject of the story in
which the actors were principally concerned.

The chorus, as the subject demanded, was composed
of men and women, old men or youths, citizens or slaves,
priests, soldiers, &c. to the number of 15 in tragedy, and
24 in comedy; and the persons of it were always supposed
to be of inferior condition to the principal characters of
the piece. As it usually represented the people, or at least a
part of them, foreigners, even though settled at Athens,
were forbidden to act in the chorus, for the same reason
as they were prohibited from being present in the general ar-
my of the people. The actors, who composed the chorus,
came on the stage preceded by a flute-player, who regu-
lated their steps, sometimes one after the other, but more
frequently, in tragedy, 3 in front and 5 in depth, or 5 in
front and 3 in depth. In comedy, they were usually ar-
anged 4 in front and 6 deep, or 6 in front and 4 deep.

The chorus by degrees, became inflected and incorpo-
rated into the action, to which it served as an addition or orna-
ment. Sometimes the chorus was to speak, and then their
chief, whom they called Corypheus, spoke in behalf of all the
rest: the singing was performed by the whole company;
so that when the Corypheus struck into a song, the chorus
immediately joined him.
Besides the four songs, which made the division of the piece, and which were managed by the chorus, the chorus sometimes also joined the actors in the course of the representation, with their plaints and laments; on occasion any unhappy accidents befal them.

Thus, in the course of the piece, the chorus sometimes performed the part of an actor, and sometimes it formed the interlude. In the first cafe it took a part in the action, and sung or declaimed with the persons of the drama, the corollary speaking for it. On certain occasions it was divided into two parts, headed by two leaders, who related certain circumstances of the action, or mutually communicated their hopes and fears. Scenes of this kind, which were almost always sung, were sometimes concluded by the union of the two parts of the chorus. In the second cafe the chorus confined itself to lamenting the calamities incident to humanity, or imploring the assistance of the gods for the dramatic peripage whose fate it espoused. In the interlude the chorus sung; and the actors declaimed when the chorus was silent; but when it entered into dialogue with the actors, its coryphæus recited with them, or they sang alternately with the chorus. During these scenes the chorus rarely quitted its place. In the interludes, and especially in the first, it executed different evolutions to the sound of the flute. The verses which it sung were like those of the ode, diffus'd in florishes, antiphrases, epodes, &c. At the first florish, the chorus performers prided from right to left; at the first antiphrase, from left to right, in an equal time, and repeating the same air to other words. They afterwards flapped, and turning towards the spectators, sung a new melody. Frequently they repeated the same evolutions with sensible differences in the words and music, but always with the same correspondence between the march and the counter marches.

The proper function of the chorus, when tragedy was formed, and that for which it seemed chiefly retained, was to shew the intervals of the acts; while the actors were behind the scenes, the chorus engaged the spectators; their songs chiefly turned on what was just exhibited; and were not to contain any thing but what was suited to the subject, and had a natural connection with it: so that the chorus concurred with the actors for advancing the action.

It is a fault observed in Euripides' tragedies, that his choruses are detached from the action, and not taken from the same subject. There were some other poets, who, to save the pains of composing choruses, and adapting them to the piece, contented themselves with inventing songs, which had no relation at all to the action. These foreign choruses were the less pardonable, as the chorus was esteemed to act a part in the piece; and to represent the spectators, who were looked on as interluders therein; insomuch that the chorus was not always to be mute, even in the course of the acts. In the modern tragedies the chorus is laid aside, and the muse supplies its place. At first the chorus was not a mere ornament added to the drama, or a contrivance designed to render it more perfect: but, in reality, the dramatic dialogue was an addition to the chorus, which was the original entertainment. In process of time, the chorus, from the principal, became only the accessory in tragedy; till at last, in modern tragedy, it has altogether disappeared; which forms the chief distinction between the ancient and the modern stage.

That which occasioned the suppression of the chorus was its being incompatible with certain compases, and secret deliberations of the actors. For it is in no-wis probable, that such machinations should be carried on in the eyes of persons interested in the action. As the chorus, therefore, never went off the stage, there seemed a necessity for laying it aside, to give the greater probability to those kinds of intrigues which require secrecy.

M. Dacier observes, there was a chorus, or grew, also in the ancient comedy; but this too is suppressed in the new: chiefly because it was made use of to represent vice, by attacking particular persons.

The chorus in comedy was at first no more than a single person, who spoke in the ancient composes for the stage; the poets, by degrees, added to him another; then two, afterwards three, and at last more: so that the most ancient comedies had nothing but the chorus, and were only so many lectures of virtue.

The suppression of the chorus has given rise to a question, much agitated between the partisans of the ancients and the moderns, whether the drama has gained or suffered by the abolition of the chorus. It must be admitted, that the chorus tended to render tragedy both more magnificent and more instructive and moral. It was always the most sublime and poetical part of the work; and being carried on by singing, and accompanied with music, it must, without doubt, have diversified the entertainment, and added to its splendour. The chorus, at the same time, uniformly conveyed lessons of virtue. It was composed of such persons as might most naturally be supposed present on the occasion; inhabitants of the place where the scene was laid, often the companions of some of the principal actors, and therefore, in some degree, interlaced in the issue of the action. This company, which, in the days of Sophocles, was restricted to the number of 15 persons, was constantly on the stage, during the whole performance, mingled in discourse with the actors, entered into their concerns, faggotted counsel and advice to them, and on all the incidents that were going on, and during the intervals of the action, sung their odes, or songs, in which they addressed the gods, prayed for favours to the virtuous, lamented their misfortunes, and delivered many moral and religious sentiments.

The office of the chorus is thus described by Horace (De Art. Poet.):

"Astoris partes chorus, officinique virile
Defendat: ne quid medius intercinct actus
Quod non propolito conducat, et herce apta
Ille bonis favatque, et conciliatur amicus,
Et regat iratos, et amet peccare timentem
Ille dapes laudet mense brevis, ille fulbren
Jutitiam, legeficet, et apertis ostia portas.
Ille regat commilla, dedicat poetar, et orct
Ut redeat miseras, abeat fortuna superba."

"The chorus must support an actor's part,
Defend the virtuous, and advise with art;
Governing the choleric, and the proud appease;
And the short feasts of frugal tables praise;
Applaud the justice of well-govern'd states,
And peace triumphant with her open gates.
Intrusted secrets let them ne'er betray;
But to the righteous gods with ardour pray.
That fortune, with returning smiles, may best
Aff'end worth, and impious pride deprest;
Yet let their songs with apt coherence join,
Promote the plot, and aid the jilt design."

Francis.

The judgment of two such critics, as Horace in the passage above cited (i. i.), and also Arbtonthus (τον | τον τον γιατί τον γιατί), and the practice of wise antiquity, concerning the suppression of the chorus, it should be needless, one would think (says Dr. Hurd, Notes on the Art et Poetry),
Poetry), have become a fundamental rule and maxim of the drama. And so indeed it appears to the French writers. The most admired of the French tragic poets ventured to introduce it into two of his latter plays, and with such success, that, as one observer, "it seemed, in all reason, have disabused its countrymen on this head?" Peffai, historique de M. Racine, que les (chours) a fait revivre dans Athalie et dans Ellyer, devront, co female, nous avoir detrompez fur cet article. (P. Bruniol, vol. i. p. 107.) And before him, our Milton, who, with his other great talents, possessed a supreme knowledge of antiquity, was so struck with its use and beauty, as to attempt to bring it into our language. His "Samphor Agonides," was, as might be expected, a master piece. But even his credit hath not been sufficient to restore the chorus. Hear a late prospector of the art declaring, "De choro nihil difficult, quia non eft essentiarum dramatis, atque a neutron penitus, quid, ut justice, natura, oporteat. ([P. Poet. vol. ii. p. 115.]) Whence it hath come to pass, says Dr. Hurd, that the chorus hath been thus neglected is not now the enquiry. But that this critic, and all such, are greatly out in their judgments, when they presume to censure it in the ancients, must appear (if we look no farther) from the double use, inferred by the poet. For, 1st, A chorus interposing, and bearing a part in the progress of the action, gives the representation that probability (Le Theatre des Grecs, vol. i. p. 107.), and striking resemblance of real life, which every man of sense perceives, and feels the want of upon our stage; a want, which nothing but such an expedient as the chorus can possibly relieve. And, 2nd, The importance of its other office (Ile bonis favecur, &c.) to the utility of the representation, is so great, that, in a moral view, nothing can compensate for this deficiency. For it is necessary to the truth and decorum of characters, that the manners, had as well as good, be drawn in strong vivid colours; and to that end, that immoral sentiments, forcibly exprested, and speciously maintained, be sometimes imparted to the spectators. Hence the sound philosophy of the chorus will be constantly wanting, to rectify the wrong conclusions of the audience, and prevent the ill impressions that might otherwise be made upon it. Nor let any one say, that the audience is able to do this for itself: Euripides did not find even an Athenian theatre so quick-fashioned. The folly is well known (Sen. Ep. 115.), that when this painter of the manners was obliged, by the rules of his art, and the character to be fulfilled, to put a run of bold sentiments in the mouth of one of his persons, the people instantly took fire, charging the poet with the impudent villany, as though it had been his own. Now if such an audience could so easily mistake an attention to the truth of character into the real doctrine of the poet, and this too, when a chorus was at hand to correct, and diffuse these judgments, what must the cafe, when the whole is left to the fancy and penetration of the people? The wiser fort, it is true, have little need of this information. Yet the reflections of sober sense on the course and occurrences of the representation, clothed in the noblest drefs of poet, y, and enforced by the joint powers of harmony and action (which is the true character of the chorus) might make it, even to such, a no unpleasant or profitless entertainment. But then, we are a small part of the ut of the chorus; which in every light is seen so prominent to the truth, decorum, and dignity of the tragic scene, that the modern stage, which hath not thought proper to adopt it, is even, with the advantage of, sometimes, the judicious moral pairing and sublime imagery, but a very faint shadow of the old; as must needs appear to those who have looked into the ancient models, or, dwelling themselves of modern prejudices, are disposed to confut the dictates of plain sense. Dr. Hurd, for a fuller view of the important benefits arising to the drama from the observance of Horace's rule, refers to 1st tome of the History of the Academy of Inscriptions and Belles Lettres; or, he says, it may be sufficiently refer the English reader to the tragedies of "Elfida" and "Caractacus," which furnish a better apology than he could make for the ancient chorus.

To the above reasoning it has been replied by Mr. Colman, in his "Translation of Horace's Art of Poetry," 1740, that the judgment of two such critics as Aristotle and Horace, cannot be decisively quoted as concerning with the practice of wise antiquity, to establish the chorus. Neither of these two critics, it is said, have taken up the question; each of them giving directions for the proper conduct of the chorus, considered as an embellished and improved part of tragedy, and indeed originally, as they both tell us, the whole of it. Aristotle, in his "Poetics," has not much on the subject; and from the little he has said, more arguments might perhaps be drawn in favour of the omission than for the introduction of the chorus. It is true that he says, in his 4th chapter, that "tragedy, after many changes, paused, having gained its natural form." This might, at first sight, seem to include his approbation of the chorus, as well as of all the other parts of tragedy then in use; but he himself expressly tells us in the same chapter, that he had no such meaning; saying, that "to enquire whether tragedy be perfect in its parts, either considered in itself, or with relation to the theatre, was foreign to his present purpose." In the passage from which Horace has, in the verses above cited, described the office, and laid down the duties of the chorus, the passage referred to by Dr. Hurd, the words of Aristotle are not particularly favourable to the institution, or much calculated to recommend the use of it. For Aristotle there informs us, "that Sophocles alone, of all the Grecian writers, made the chorus conducive to the progress of the fable; not only even Euripides being culpable in this instance; but other writers, after the example of Agathon, introducing odes as little to the purpose, as if they had borrowed whole scenes from another play."

Mr. Colman concludes upon the whole, that, whatever may be the merits, or advantages of the chorus, the judgment neither of Aristotle nor of Horace can be adduced in recommendation of it. As to the probability given to the representation, by the chorus interposing and bearing a part in the action, the public, he adds, who have lately seen a troop of fingers assembled under the stage, as a chorus, during the whole representations of "Elfida" and "Caractacus," are competent to decide for themselves how far such an expedient gives a more striking resemblance of human life, than the common usage of our drama. As to its importance in a moral view, to correct the evil imprestion of vicious sentiments, imparted to the spectators; the story told, to enforce its use for this purpose, conveys a proof of its inefficacy. To give due force to sentiments as well as to direct their proper tendency, depends on the skill and address of the poet, independent of the chorus. M. Dacier, as well as Dr. Hurd, confines the modern stage for having rejected the chorus, and having left thereby "at least half the probability and its greatest ornament" so that our tragedy is "but a very faint shadow of the old." Learned critics, however, ought to consider, that if it be expedient to revive the chorus, all the other parts of the ancient tragedy must be revived along with it. Aristotle mentions mimic as one of the fixed parts of tragedy, and Horace no sooner introduces the chorus, but he proceeds to the pipe and lyre. It is a chorus be really necessary, our dramas, like those of the ancients,
ents, should be rendered wholly musical; the dancers also will then claim their place, and the pretensions of Veltis and Noverre must be admitted as classical. Such a spectacle, if not more natural than the modern, would at least be consistent; but to introduce a group of declamatory actors, speaking in one part of the drama, and singing in another, is as strange and incoherent a medley, and full as unseemly, as the dialogue and airs of the "Beggar's Opera." Admitting the full force of Mr. Colman's arguments, nothing, it may be said, though somewhat hardly, but the most invincible pedantry can with for the revival of the ancient chorus on the modern stage.

Notwithstanding the advantages, which were obtained by means of the chorus, it is alleged, (see Blair's Lectures, vol. iii. part 45,) that the inconveniences on the other side are so great, as to render the modern practice of excluding the chorus far more eligible upon the whole. For if a natural and probable imitation of human actions be the chief end of the drama, no other persons ought to be brought on the stage, than those who are necessary to the dramatic action.

The introduction of an adventitious company of persons, who have but a flight concern in the business of the play, is unnatural in itself, embarrassing to the poet, and though it may render the spectacle splendid, tend, without doubt, to render it more cold and uninteresting, because it becomes more unlike a real transaction. The mixture of music, or song, on the part of the chorus, with the dialogue carried on by the actors, is another unnatural circumstance, removing the representation still farther from the resemblance of life.

Besides, the poet is subjected to innumerable difficulties in so contriving his plan, that the presence of the chorus, during all the incidents of the play, shall conflict with any probability. The scene must be constantly, and often absurdly, laid in some public place, that the chorus may be supposed to have free access to it. To many things that ought to be transacted in private, the chorus must ever be witness; they must be the confederates of both parties who come successively upon the stage, and who are, perhaps, conspiring against each other. In short, says Dr. Blair, the management of a chorus is an unnatural concomitant to a poet; it requires too great a sacrifice of probability in the conduct of the action; it has too much the air of a theatrical decoration, to be consistent with that appearance of reality, which a poet must ever preserve in order to move our passions. The origin of tragedy among the Greeks, as we have above observed, was a chorale long, or hymn, to the gods. There is, therefore, no wonder, that on the Greek stage it so long maintained possession. But it may confidently, as Dr. Blair thinks, be asserted, that if, instead of the dramatic dialogue having been superadded to the chorus, the dialogue itself had been the first invention, the chorus would, in that case, never have been thought of. One use, however, might still be made of the ancient chorus, which would be a considerable improvement of the modern theatre; if, instead of that unmeaning, and often improperly chosen music, with which the audience is entertained in the intervals between the acts, a chorus were then to be introduced, whose music and songs, though forming no part of the play, should have a relation to the incidents of the preceding act, and to the dispositions which these incidents are presumed to have awakened in the spectators. By these means, the tone of passion would be kept up without interruption; and all the good effects of the ancient chorus might be preserved, for inspiring proper sentiments, and for increasing the morality of the performance, without those inconveniences which arose from the chorus forming a constituent part of the play, and mingling unfeasibly, and unnaturally, with the perfunqueries of the drama. See DRAMA, and CHORUS infra.

Chorus, to give the, among the Greeks, was to purchase a dramatic piece of the poet, and defray the expenses of its representation.

The person who did this was called choragus. At Athens, the office of choragus was imposed on the archontes; and at Rome on the curates.

Chorus, in Musc. It has already been said, (see Chorus) that there are choruses of various kinds: ecclesiastical choruses, such as those in the mass of Roman Catholics, in the service of the Lutheran church, in the polyphonic and hymnology of the Celibates, and in the cathedral service of the church of England. In this last, a species of music has been retained to English words, such as had been cultivated in all Christian churches before the reformation, to Latin words. In our choral music, fugues, canon learning and complication, with what was called by the Puntans curious facing, have been allowed to have place with propriety in our services and anthems on Sundays and festivals, regarding them as the voice of prayer, supplication, or jubilation, by voices of different pitch, harmonized; but always with one mind, addressing the Supreme Being, sometimes together, and sometimes after each other, as the psalms and responses are uttered in a parish-church, but with less regularity and reverence.

To dramatic choruses there are many objections, on the side of probability, to elaborate counterpoint, when different perfunqueries are uttering different words at the same time, all talking together, without listening to each other. This is unnatural, and as difficult to perform without book, as if it were extempore.

There are few dramatic situations where a chorus, even in plain counter-point, can have place with propriety. It may happen, indeed, that the representatives of a whole people at once shall cry out with joy, sorrow, or even demand concessions with united clamour; as the citizens in Metastasio's oratorio of Betulia liberata did, to surrender the town, uttering the same words in the language of the piece, in fang or declaimed. This may, for a short space, be reconciled to probability; but for a whole nation to continue a long discourse in the same words, is improbable, unless they were supposed to be formed into an harmonie, and gotten by heart, as a hymn to some divinity, or on a solemn celebration of rites.

A distinction should therefore be made between an extemporaneous chorus, and a chorus repeated by memory, as well as between an oratorio chorus performed by book, and an opera chorus sung in action by heart. Handel, whose sublime choral genius enabled him with facility to produce choruses of all kinds, never exerced that genius in composing elaborate choruses for his operas, all which were as short and simple as those of the Italians in present use; all built on a short air easily retained in memory. But Sacchini, and other Italian masters, finding how much Handel was admired and revered for his oratorio choruses, composed some to be performed in action on the stage; but though many of these, particularly Sacchini's, were admirable productions, full of grace, pathos, and dramatic effect; yet, being performed by occasional fingers, unaccustomed with the Italian language and vocal expression, they produced no other effect than that of exciting as much laughter as our early operas did, when sung half in Italian and half in English. See Speculator, No. 18.

An ecclesiastical chorus may be extended to what length the composer pleases; but a dramatic chorus, analogous to the fable, and situation of the interlocutors, must be of a length,
length and character suitable to the drama, and the scene in which it is introduced. See Genera, and Ancient Greek Music.

CHORZENA, in Ancient Geography, a country of Asia, in Greater Armenia, situated according to Strabo, towards the north, in the mountains of Caucasus, and belonging to Iberia and the Colchide.

CHORZIANI, a people of Asia, in the Aitiant territory, a country of Armenia; placed by Ptolemus in the environs of fort Cithara. 4 journeys from Theophractus.

CHOSCIABAD, in Geography, a town of Persia in the province of Kerman; 57 miles S.W. of Sirgun.

CHOSE, thing. This word, in Latin, is used in various circumstances, and with various epithets: as,

Chose in action, which is not any thing corporeal, but only a right, e.g. an annuity, obligation, covenant. &c. the possession of which may, however, be recovered by a suit or action at law; from whence the thing so recoverable is called a thing, or chose, in action. Thus money due on a bond is a chose in action; for a property in the debt veils at the time of forfeiture mentioned in the obligation, but there is no possession till recovered by course of law. If a man covenants with me, or promises, to do any act, and fails in it, by which I suffer damage, the recompence for this damage is a chose in action, for though a right to have recompense veils in me, at the time of the damage done, yet what and how large such recompense shall be, can only be ascertained by verdict; and the possession can only be given me by legal judgment and execution. If a person diffuses me of land, or takes away my goods, my right or title of entry into the lands, or action and suit for it, and so for the goods, is a chose in action; a condition and power of re-entry into land upon a feuility, gift, or grant, before the performance of the condition, is of the nature of a chose in action. Co. Lit. 214. 6 Rep. 50. Dyer, 244. If one has an ad

vowson, when the church becomes void, the presentation is but as a chose in action, and not grantable, but it is otherwise when the church is void. Dyer, 296. Where a man hath a judgment against another for money, or chattels, these are choses in action. An annuity in fee to a man and his heirs is grantable for ever; but it has been held, that an annuity is a chose in action, and not grantable. 5 Rep. 89. Fitz. Grant. 44.

Chose in action may also be called chose in jussio, as having no real existence, and not being properly in possession: being a thing, as it is expressed, rather in potentia than in fact.

No chose in action could, by the ancient common law, be transferred or assigned; but this is now allowed; and the form of doing it is in the nature of a declaration or trust, and an agreement to permit the assignee to make use of the name of the assignor, in order to recover the possession: and when a debt or bond is assigned over, it must still be fixed in the original creditor's name: the person to whom it is transferred being rather an attorney than an assignee. The king, however, is an exception to this general rule; for he might always either grant or receive a chose in action by assignment; and our courts of equity, confiding that in a commercial country almost all personal property must necessarily lie in contract, will protect the assignment of a chose in action, as much as the law will that of a chose in possession. The legal possibility and convenience of assigning a chose in action, which our ancestors to long doubted, have been sufficiently evinced from the introduction and establishment of paper credit by indentures upon bills and notes.

Close local, is something annexed to a place, e.g. a mill.

CHOSE of History, something moveable, and which may be transported from place to place.

CHOSE in Possession. See Possession, and Property.

CHOSISTAN, in Geography. See Chosistan.

CHOSROES I. or Khosrou, in Biography, king of Persia, celebrated as the Magnanimous, was the third son of Cabades or Cobad, by whose appointment he succeeded to the throne in 5%1, to the prejudice of his elder brothers. The example of his father, a prince of a proud and imperious disposition, and who was a bitter persecutor of those who did not embrace the Persian religion, had, in some measure, blunted the moral feelings of the son, who commenced his reign with acts of great severity. A conspiracy was indeed formed in behalf of his brother, which having discovered, he put to death all who were in any respect engaged in it. He then executed Mazdak, the head and leader of a new sect, who preached a community of all things, even of property and women; and he treated the Jews with still greater rigour than they had experienced from his father. He next removed such governors of provinces as, during his father's reign, had rendered themselves obnoxious to the people, and for the better administration of justice, he divided his dominions into four viceraphys, viz. tho:he of Affyrria, Media, Persia, and Bactriana. At his accession to the crown, Persia was involved in a war with the Roman empire under Justinian, to whom he granted a peace, having accepted a large sum of money as its price. This peace, which was denounced perpetual, was soon broken, and in 529, Chosroes invaded Syria, and marched to Antioch, which he soon reduced to ashes. After an unsuccessful attempt upon Dara, he returned across the Euphrates laden with spoil, leaving his generals to contend with Belarius, who had come to the defence of the Roman empire. Chosroes then made an expedition into Colchos, at the extremity of the Euxine sea, whether he had been invited by the inhabitants as their protector from the oppression of Justinian. It would not comport with our limits to follow this prince in all his expeditions: he went on conquering, and received as tokens of homage, embassadors from the greatest potentates of the East, at his splendid palace at Ctesiphon, one of the wonders of that part of the world. In the midst of his prosperity one of his sons, whom he had by a Christian slave, railed the standard of rebellion; but in an engagement with the general sent against him by his father, he lost his life. Chosroes, having invaded Syria, marched to the opposite quarter of his vast dominions, and entered Arabia Felix, where he dispossessed many usurpers of their power, restored the ancient lords, and sued the people with so much kindness that he obtained the title of just. Towards the conclusion of Justinian's reign, Chosroes was attacked with a dangerous disease, from which he sought relief from the physicians of Constantinople, whose aid he borrowed of the emperor. This interchange of kindness did not prevent a renewal of hostilities between the two empires after the accession of Julian. Chosroes took the field, and reduced and sacked the principal cities of Mesopotamia and Syria. These and other serious disasters obliged the imperial court to solicit a truce, which Chosroes granted for three years. In the mean time Tiberius succeeded to the imperial throne, who improved the discipline and strength of his army so as to be able to contend with and finally overcome the Persian monarch. Chosroes, in his retreat, was so closely pursued, that he was forced to pass the river Euphrates on an elephant, while several of his lords and great men were drowned in attempting to follow him. The Roman general took up his winter quarters in the Persian provinces, an indignity which Chosroes severely felt, and which, joined to the infirmities...
CHOASTITE, a town of Bohemia, in the circle of Czastau; 2 miles N. of Czastau.

CHOTIEBOR, a town of Bohemia, in the circle of Czastau; 8 miles N.E. of Tentech-Brod.

CHOTIN, in Czestochowa, a name given by Adamkow to a hill of the cone kind, found in the Well Indies. Cosa, jom- 

PHILIPPINES, or Kitchmisk, in Geography, a town of Ruby, in the government of Charkow, or Karkof; 

fed on the Vorstia; 52 miles N.W. of Charkov, and 

CHOTOW, a town of Lithuania, in the palatinate of Minsk; 22 miles S.W. of Minsk.

CHOTUSITZ, a town of Bohemia, in the circle of 

Czastau.

CHOTZEMITZ, a town of Bohemia, in the circle of 

Czawim, near the Ehrle.

CHOTZEN, a town of Bohemia, in the circle of Chru-

dim: 3 miles N.E. of Bohemiam.

CHOVACOURT, a river of North America, in Ca-

nada.

CHOUAN, in Ichthyology, synonymous with Chevannes, names by which the Linnaean Cyprinus cæpius is known in 

some parts of France.

CHOUAN, in the Materia Medica, the name of a small fish, called by some also carmine feed. It is a very light and 

chaffy feed, in a great measure resembling worm-feed, 

of an acid taint, and a yellowish-green colour, but is larger 

than worm-feed. It is brought into Europe from Turkey, 

and many parts of the Ealt, and the choice should be made 

of such as is largest, cleanest, of the greenest colour, and 

leak marked with specks or holes. It is not used in medicine, 

but is of some value among the people who make carmine 

for the painters. It is called Santoonium viridé, or the green 

worm-feed, in our catalogue of the Materia Medica, but is 

unknown in the shops. Lemery.

CHOUANS, in Modern History, the denomination of a 

powerful body which sprung up in France, during the late 

revolution, derived from three sons of a blacksmith of the 

name of Chouan, near Foquest. They were at first no 

better than highway-robbers; but their number was in-
creased by the Gystem of terror, which induced all perfons, 
declared to be suspected by Robespierre's government, to 
fly for safety to the woods, and joim the Chouans. They 
were at last fai'd to amount to near 30,000 men, differed 
in different bodies through the woods of Brittany, from 
the north to the south, from Foquest to Vannes; and they 
gave occupation to upwards of 80,000 republicans, who were 
encouraging to enclote them in that great extent, and starve 
them into a surrender. They submitted to organization and 
discipline, and dropping the trade of robbers, declared for 
the king, and put themselves under the command of officers 
of reputation.

CHOUANG-LEOU, in Geography, a town of China, 
of the third rank, in the province of Se-chéuen; 10 miles S.W. of Tching-tong.

CHOUANG-TAL, a town of Tartary, in the country of 

Hami; 9 miles N.W. of Tchantoni.

CHOVANNA-MANDAR, in Botany, Rhed. Mal. 
Burm. Ind. See Bauhinia variegata & parpurea.

CHOUCAIR de la nouvelle Géotis, in Ornithology. The 
Corvus papiaen of Latham is described under this name by 
Buffon.

CHOUCAS, the generic name under which several spe-
cies of the Corvus genus are described by Buffon, and later 
French writers; as choucast, the jackdaw, Corvus monedula, 
Linn. — Choucas mouflache, & Choucas ou Cap de Bourre Effe-

Vol. VII.
CHOU, in Geography, a town of Asia, in the kingdom of Corea; 35 miles N.E. of Haimen.

CHOU-LOU, in Geography, a town of China, of the third rank, in the province of Chieh-li; 12 leagues W. of Kien-kiang.

CHOU-SONG, in Geography, a town of China, on the coast of Tien-tcheou, a city of China, of the first rank, in the province of Kiang-si; 712 miles S. of Peking. This town is situated on the bank of a river, in a fertile country; and the adjacent mountains contain mines of lapis lazuli, N. lat. 38° 25', E. long. 113° 14'.

CHOU-CHANG, a town of China, of the third rank, in the province of Tche-kiang; 12 leagues W. N.W. of Tchü-teho.-Alo, a town of the third rank, in the province of Kiang-si; 6 leagues W. of Kien-kiang.

CHOU-CHANG, in Geography, a town of China, of the third rank, in the province of Tche-kiang; 712 miles S. of Peking. This town is situated on the bank of a river, in a fertile country; and the adjacent mountains contain mines of lapis lazuli, N. lat. 38° 25', E. long. 113° 14'.

CHOU-VUEN, a town of Asia, in the kingdom of Corea; 35 miles N.E. of Haimen.

CHOU-LAI, William Du, in Biography, a Lyonnaise gentleman, and one of the earliest Frenchmen who applied to antiquarian pursuits. He lived at the summit of the mountain Gourgillon, where the ground could scarcely be dug without discovering Roman inscriptions, medals, stelae, lamps, &c. Du Chou made a collection of these remains, with a view of deciphering them; the fruit of his labours he published in a "Dissertation on the Calixtenation and Military Discipline of the Romans, their Baths and Antiquities, and Greek and Roman Excavations." This work was printed in folio at Lyons, in 1556. It was afterwards reprinted in 1558, in 4to, with the addition of a "Dissertation on the Calixtenation and Military Discipline of the Romans, their Baths and Antiquities, and Greek and Roman Excavations." The work in this form has been highly celebrated, and translated into the Latin, Italian, and Spanish languages. The Latin edition was printed at Amsterdam in 1681, 4to.

CHOU, in Geography, a river of the duchy of Luxembourg, or the department of the Forêts, in the Ardennes, which discharges into the Meuse.

CHOULE, a town of India, on the coast of Corea, with a fortified harbour for small vessels, belonging to the Portuguese; 25 miles S. of Bombay. N. lat. 18° 37'; E. long. 73° 40'.

CHOU-LOU, a town of China, of the third rank, in the province of Pe-ch'ing; 12 miles S.W. of Choung.

CHOU-LI, a town of China, of the third rank, in the province of Pe-ch'ing; 12 miles S.W. of Choung.

CHOU-CHI, a name given in India to houses built for the accommodation of travellers, which are frequent in every part of the country, and are useful, whilst they are noble monuments of Indian munificence and humanity. The structure of these choulties is described by Dr. Robertson (Hist. Disq. concerning India), as one evidence of the high state of civilization to which the Indians had attained. On the ceilings of these buildings, as well as in other ancient edifices, the twelve signs of the zodiac are frequently delineated; and from their resemblance to those which are now universally used, it is highly probable, says this judicious historian, that the knowledge of these arbitrary symbols was derived from the East. Col. Call has published a drawing of the signs of the zodiac, which he found on the ceiling of a choulty at Verapettah, in the Madura country. (Phil. Trans. vol. lxi. p. 357.)

CHOU-PATOU, in Geography, a town of Asia, in the country of Tibet; 265 miles E. of Laffa.

CHOURAGUR, a town of Hindoostan, in the country of Gurry Mundela; 57 miles S.W. of Gurrah.

CHOURTONG, a town of Asia, in the country of Tibet; 2.5 miles E.S.E. of Laffa.

CHOUS, in the Eastern Military Orders, the title of the menders of the diana of janizaries. There are several degrees of honour in this post. When a pension is first advanced to it, it is called chabuck, or little chous; after this he is advanced to the alloy chous, that is, the mender of the ceremonies; and from this, having passed through the office of pettus, or procurator of the effects of the body, he is advanced to be the bar chous.

CHOUSGIMAYAN, in Geography, a town of Peeld, in the province of Chorascan; 220 miles N.N.E. of Uiestro.
CHOU-TCHUEN, a town of Asia, in Corea; 30 miles S. of Haimen.

CHOUX, in Natural History, a name given by the French to a species of shell-fish of the cardiform or buccarum kind. Fabius Columba has elegantly described it, and Lifer has given a figure of it twice over, in two different parts of his book. There is another species less elegant, and wanting the hollowed ribs. See Cordiformis.

CHOUYANG, in Geography, a town of Asia, in Corea; 40 miles N.E. of King-kiaoo.

CHOUZE, a town of France, in the department of the Indre and Loire; seated on the Loire; 4 leagues E. of Saumur, and 6 leagues N.W. of Tours.

CHOWAN, a county of North America, in Edenton district, North Carolina, on the N. side of Albemarle found; containing 5011 inhabitants, of whom 2588 are slaves. The chief town is Edenton.—Alfo, a river of North Carolina, which falls into the N.W. corner of Albemarle found. At its mouth it is 3 miles wide, but quickly becomes narrower, as you ascend it. It is formed 5 miles from the Virginia line, by the confluence of Micherrin, Nottaway, and Black rivers, all which rife in Virginia.

CLOUDER-BEER, a provincial phrase of Devonshire, denoting a cheap and easily prepared drink, highly commended for preventing the fever in long voyages, or for the cure of it where it may have been contracted. It is prepared in the following manner: take twelve gallons of water, in which put three pounds and a half of black store; boil it for three hours, and having taken out the fir or spuce, mix with the liquor seven pounds of molasses, and just boil it up; strain it through a sieve, and, when milk warm, put to it about four spoonfuls of yeast to work it. In two or three days fop the bung of the cask, and in five or six days, when fine, bottle it for drinking. Two gallons of molasses are sufficient for an hoghead of liquor; but if molasses cannot be procured, treacle or coarse sugar will answer the purpose.

CHOWRY, in Geography, one of the Nicobar islands, in the Indian Sea. N. lat. 8° 27'. E. long. 93° 32'.

CHO-YANG, a town of China, of the third rank, is in the province of Hou-quant; 10 leagues E.N.E. of Siang-yang.

CHOZALA, or CHOIZALA, in Ancient Geography, a town of Africa, in Mauritania Cafrarisiens; situated at the foot of a craggy rock, about 4 miles S.E. of Julia Cafrica.

CHOZEVA, in Geography, a town of Siberia, on the river Tchitun; 180 miles E.S.E. of Emifick.

CHRABAZA, in Ancient Geography, a town of Africa Propria. Ptolemy.

CHRABRATE, in Natural History, a name given by the writers of the middle ages to a politicelled flame, said to have great virtues against disorders of the liver and spleen, and many other imaginary qualities. It appears by their descriptions to have been no other than the common bubble crytal.

CHRAS, in Geography, a town of Bohemia, in the circle of Boleflau; 6 miles S.E. of Mchik.—Alfo, a town of Bohemia, in the circle of Claudiun; 5 miles S.E. of Claudiun.

CHREBAT Chandaya, a range of mountains, between Russian Tartary and Chinefe Tartary. N. lat. 52°. E. long. from 60° 14' to 104° 14'.

CHREBAT Dirjak, a range of mountains similarly situated with the preceding. N. lat. 52° to 53°. E. long. 60° 14'.

CHREMETS, in Ancient Geography, a river of Africa, the mouth of which is placed in the Atlantic Ocean by Aristotele and Helychius; supposed to be the Zaire.

CHREMPS, in Ichthyology, a name given by the old Greek writers to the fish hence called chromis.

CHRENDI, in Ancient Geography, a people of Asia, in Hurania. Ptolemy.

CHRENECRUDA, a term occurring in Writers of the Middle Age, and expressing a custom of those times, but its signification is doubtful. It is mentioned in Leg. Saliaca, Tit. 61, which says, who kills a man, and hath not where withal to satisfy the law, or pay the fine, makes oath that he has delivered up every thing he was posseffed of; the truth of which must be confirmed by the oaths of twelve other persons. Then he invites his next relations by the father's side to pay off the remainder of the fine, having first made over to them all his effects by the following ceremony. He goes into his house, and, taking in his hand a small quantity of dust from each of the four corners, he returns to the door, and, with his face inwards, throws the dust with his left hand over his shoulders upon his nearcft of kin. Which done, he trips to his flirt; and, coming out with a pole in his hand, jumps over the hedge. His relations, whether one or several, are upon this obliged to pay off the composition for the murder. And if these (or any one of them) are not able to pay, iterum super illum chreneurga qui paguerior ofi, iactat, & ille totam legem componat. Whence it appears, that chreneurga jactare, is the fame with throwing the dust, gathered from the four corners of the house. Golofaus and Spelman tranflate it viridem herbae, green grafts, from the German, gruen krant, or from the Dutch, green, and gruen, grafts. Wendelins is of a contrary opinion, who thinks that by this word denotari purificatis approbationem, from chren, pur, chyle, clean; and krenen, to prove; fo that it must refer to the oaths of the twelve jurors. Be this as it will, king Childsbert reformed this law by a decree, chap. 15, both because it favoured of pagan ceremonies, and because several persons were thereby obliged to make over all their effecta: De chreneurga lequ, quam paganorum tempore observabat, incepto nonquam valens, quia per ipsam eccele multorum pastelas.

CHRES, in Ancient Geography, a large river of Libya, on the western coast of Africa, and near the island of Cerne, according to the Periplus of Hannon.

CHRESTOIA, in Geography, a town of Ifria; 9 miles E.S.E. of Capo d'Ifria.

CHRETIES, in Ancient Geography, a lake of Libya, containing, according to the Periplus of Hannon, three islands.

CHRETIEN, FLORENT, in Biography, a French poet and man of letters, was born at Orleans in 1541. He was educated in the Protestant religion, and having made considerable progress in literature, was appointed preceptor to Henry IV. of France. He wrote poems in the learned and dead languages, as well as in his own. In the French he composed a severe satire against Rouard, with whom he had a quarrel. He translated Oppian, some plays of Aristophanes, and other Greek works into the French. He composed tragedies and Greek epigrams, and also learned and considerable annotations on various classical authors. He died at the age of 55, having first been reconciled to the Catholic church. Though he wrote satires, his temper was mild and friendly, and his mind was elevated above mean and servile complaisance, and he was incapable of uttering a sentiment that he did not believe.

CHRETFINA, in Geography, a town of Spain, placed by Ptolemy in Lusitania Propria.

CHREWITZ. See Greitz.

CHRISM, from chrism, + aminta, oil consecrated by the bishop, and used in the Romish and Greek churches, in the 5 B administration.
administration of baptism, confirmation, ordination, and extreme unction, which is prepared on Holy Thursday with much ceremony. In Spain it was anciently the custom for the bishop to take one third of a foil for the chrism distributed to each church, on account of the balsam that entered its composition.

Du Cange observes, that there are two kinds of chrism; the one prepared of oil and balsam, used in baptism, confirmation, and ordination; the other of oil alone, consecrated by the bishop, used anecdy for the catechumens, and still in extreme unction.

The Maronites, before their reconciliation with Rome, besides oil and balsam, used musk, saffron, cinnamon, roses, white frankincense, and several other drugs mentioned by Rynaldus, in 1541, with the doses of each. The Jafuit Dandini, who went to mount Libanus in quality of the pope's nuncio, ordained, in a synod held there in 1596, that chrism, for the future, should be made only of two ingredients, oil and balsam; the one representing the human nature of Jesus Christ, the other his divine nature.

The action of imposing the chrism, is called chrismation; this the generality of the Roman divines hold to be the next matter of the sacrament of confirmation.

The chrismation in baptism is performed by the priest; that in confirmation by the bishop; that in ordination, &c. is more usually called unction, which see.

CHARISMATE, CHRISMAMIS DEVARIS, OR CHRISMALES DEVARIS, a tribute anciently paid to the bishop by the parish-clergy, for their chrism, consecrated at Easter for the ensuing year: this was afterwards condemned as simoniacal.

CHRISMON, CHRISTMAS, has been said to have been anciently the face-cloth, or piece of linen laid over the child's head when it was baptized. Whence, in our bills of mortality, children who die in the month, or such as have not been baptized, are usually called chrifonos. The time between the child's birth and baptism was also called chrifonos.

But the chrism was, in reality, a white vesture or garment, which, immediately after the child was baptized, was put upon it by the priest, who with the act pronounced these words: "Take this white vesture as a token of the innocence, which, by God's grace in this holy sacrament of baptism, is given to thee, and for a sign whereby thou art admonished so long as thou livest, to give thyself to innocence of living, that, after this transitory life, thou mayest be partaker of life everlasting. Amen." As soon as the priest had pronounced these words, he anointed the infant upon the head, saying, "Almighty God, the father of our Lord Jesus Christ, who hath regenerated thee by water and the Holy Ghost, and hath given unto thee the remission of all thy sins; may he vouchsafe to anoint thee with the unction of his Holy Spirit, and to bring thee to the inheritance of everlasting life. Amen." From this anointing, or chrism, the white garment obtained the name of "Chriftom," which, after being worn a few days, was presented to the priest to be kept in the church, or vestry, in order to be produced as evidence against the perfon whose chrism it was, if he afterwards denied the faith in which he was baptized. These ceremonies were retained, for some time after the reformation, in the church of England, which ordered the mother of the child, if the child was then alive, to offer, when she was churched, the chrism, and other accoutemon offerings. If the child died before its mother was churched, the chrism was not given to the priest, but employed as a thurif, in which the body was buried; and hence it is that chrismos are now enumerated in the weekly bills of mortality, very absurdly; because, children who die unbaptized are called chrifomath, though the chrism, when it was used, was never put on till baptism was administered. Whitty on the Book of Common Prayer, &c.

CHRISTOM, an appellative synonymous with MESSIAH, usually added to Jesus and, together with them, denoting the Saviour of the world. The word χρισμα signifies anointed, from χρίνην, unction, I anoint. Sometimes the word Christ is used singly, by way of autonymy, to denote a person sent from God, as an anointed prophet, king, or priest.

Christ, says La Chastanier (de Vera Sapientia, l. iv. c. 6.) is no proper name, but one denoting power; for the Jews used to give this appellation to their kings, calling them Chrirh, or anointed, by reason of their sacred unction. But he adds, "the Hethite, as milltike, call Jesus CHRIH, Cherfris."

Accordingly, Suetonius, speaking of Claudius, and of his expelling the Jews from Rome, says, that he banished them because they were continually promoting tumults, under the influence of one "Chrielis." "Judaius, impulso Christo, affide tumultuarum, Romae expulsit."

The names of Messiah and Christ, which, as we have already observed, are synonymous, were originally derived from the ceremony of anointing, by which the kings and the high-priests of God's people, and sometimes the prophets (1 Kings, xix. 16.) were consecrated and admitted to the exercise of their holy functions; for these functions were accounted holy among the Israélites. As this consecration was considered as adding a sacrament to their persons, it served as a guard against violence, from the respect that was paid to religion. The term "anointed," in Hebrew "Mefialiah," and in the Greek of the LXX, "Chrilh," was, in its original use, applicable to the whole Office of kings and priests, both god and bad, of the people of Israel. But, as the king and the high-priest were the heads of the whole nation, the one in civil, the other in religious matters, the term "anointed," that is "Messiah" or "Christ," might not improbably serve, by a figure, to denote the chief, head, or principal of any class or people. This, however, is the opinion of the learned Grotonius. Accordingly the high-priest is sometimes distinguished from ordinary priests by the title of "the anointed priest," in the LXX Eilijorfla, 15; but the word is sometimes applied, when, in the literal sense, no anointing had been used. Thus it is applied to Cyrus, the Persian monarch, by the prophet Isaiah: (Isai. xlv. 1.) The word was also employed to denote those especially favoured of God, as were the patriarchs Abraamn, Isaac, and Jacob; concerning whom he is represented by the psalmist (Ps. cv. 15.) as having said; "touch not mine anointed." From scripture there is no ground for concluding that any one of them was in the literal sense anointed. But the most eminent use and application of the word concern the title of that illustrious personage, typified and predicted from the beginning; who is described by the prophets, David (Ps. ii. 1.) Isaiah (ch. xli. 1.) and Daniel (ch. ix. 25, 26.) under the character of "God's anointed," the "Mefiiah," or the "Christ." As to the use of the term in the New Testament, if we were to judge by the common version, or even by most versions into modern tongues, we should consider it rather as a proper name, than an appellative, or name of office, and should think of it only as a surname given to our Lord. To this mistake our translators have greatly contributed, by seldom prefixing the article before "Christ," though it is rarely wanting in the original. The word "Chritos" was at first as much an appellative as the word "baptiz" was, and the one was as regularly accompanied with the article as the other. Yet our translators who would always say "the "baptiz"
CHRISTian name, never to be understood in the New Testament as a proper name, but always as having a direct reference to the office or dignity? It may be replied, that this word, though originally an appellation, came at length, from the frequency of application to some individual, and only to one, to supply the place of a proper name. It would also very much accelerate this effect that the name "Jefus" was common among the Jews at that time, and this rendered an addition necessary for distinguishing the persons. To this purpose Grotius remarks, that in process of time the name "Jefus" was very much dropped, and "Christ," which had never been used before as the proper name of any person, and was, for that reason, a better distinction, was buttressed for it; infomuch that, among the Heathens, our Lord came to be more known by the latter than by the former. This ufe seems to have begun soon after his ascension. During his life, it does not appear that the word was ever ufed in this manner: pax, the contrary is evident from several passages of the gospels. The Evangelists wrote some years after the period above mentioned; and, therefore, they adopted the practice common among Chriftians at that time, which was to employ the word as a surname for the fake of distinction. See Matt. 1. 18, Mark. 1. 1. In all the three places it is Ιησους, Jefus Christ, not Ιησους του Χριστου, Jefus the Chrift, or the Mofhiah. Afterwards, in their history, Matthew and Mark neither name him to themselves, nor mention this name as given by him of any of his contemporaries. The word was never applied to him as a proper name, whilfe he remained on this earth. It was at that time always ufed as the denomination of the dignity or office to which some believed he entituled, others dilbeciled, and men doubted. The fame reason which induced our translators to have rendered Ιησους του Χριστου uniformly "the baptifl" with the article, fhould have led them to render Ιησους του Χριστου, "the Chrift," or the Mofhiah, with the article. By not doing this, they have thrown much obscurity on some passages, and weakened others. Upon the whole we may conclude, that one mark of distinction, by which the title Ιησους may be difciminated from the name, is its being attended with the article. When the article is inferted between the words Ιησους and Χριστου we have reason to consider the latter as ufed emphatically, and pointing directly to his office.

As a conclusion of this subject it may be added, that the word Ιησους is frequently ufed by St. Paul as a trope, denoting sometimes the Chriftian spirit and temper, as in Gal. iv. 19. Eph. iv. 20. Campbell's Prelim. Disc. to the four Gospels, vol. i. p. 165, &c.

CHRIST, Order of, a military order, founded in 1317, by Dionysius I. King of Portugal, to animate his nobles against the Moors.

Pope John XXII. confirmed it in 1319, and appointed for the knights the rule of St. Benedict. Alexander VI. permitted them to marry.

This order had been under the control of 12 grand masters, when Pope Adrian VI. in 1522, confirmed the administration of it on John III. In 1551, pope Julius III., vested in the crown a perpetual right to the grand mastership: from which time the kings of Portugal have taken the title of perpetual administrators of the order, which consists of 417 commandaries. Before the grand mastership was united to the crown, it was by election of the knights, who are now under the same regulations, and enjoy the same privileges, as those of the order of Calatrava in Spain.

According to the statutes, the candidate should prove himself noblemen of blood for four generations; but this is usually dispensed with by the sovereign. The badge of the order is a cross patté-guêrs, charged with a cross argent, pendant to a collar of gold, composed of three rows of chains; on common days the knights also wear round their necks a scarlet ribbon with the badge of the order pendant to it. They have their residence, at first, at Callromarin; afterwards they removed to the city of Thomaí, as being nearer to the Moors of Andalusia and Estremadura.

CHRIST is also the name of a military order in Livonia, instituted in 1205, by Albert bishop of Riga. The professed end of their institution was to defend the new Christians who were successively converted in Livonia, but were persecuted by the heathens.

The first occasion of their institution is said to have been as follows: In 1158 some merchants of Bremen, bound to Wifby, in the isle of Gothland, driven by ftrees of weather, landed at the mouth of the Luna, trafficked with the natives, and gradually established a settlement. A German monk of the Augustine order, who accompanied the new colonists, acquired the language of the country, converted several of the natives to christianity, and perfused them to be baptized. According to the custom of that barbarous era, an order of knighthood, first called "the knights of Christ," and afterwards with greater propriety "the knights of the sword," was instituted for the propagation of Christianity by force of arms. These military missionaries, equally fanatic and languidary, gradually overrun the country, and reducing the ancient inhabitants, rendered them at the same time Christians and slaves. In 1231, these knights, being incorporated in the Teutonic order, styled themselves "knights and lords of the cross," and purchased Ethelonia, in 1251, from the king of Denmark. Walter Plenchurch, chief or general, having obtained from the grand master of the Teutonic order the jurisdiction of Livonia, was considered as independent, and admitted by Charles V. among the princes of the empire. The knights continued in possession of Ethelonia and Livonia, until the impolitic conduct of their masters, and civil difficulties, incited the ambition of the neighbouring powers, and involved the country in a series of bloody wars. See LIVEONIA. These knights wore on their cloaks a sword with a cross over it; whence they were also denominated "brothers of the sword."

CHRISTBURG, or Geography, a town of Prussia, in the territory of Cobern; 12 miles S.E. of Marienburg.

CHRISTBURG, or Alt-CHRISTBURG, a town of Prussia, in the territory of Oberland; 4 miles S.W. of Pruefheim.

CHRIST-CHURCH OF CHRIST-CHURCH-TWYNESS, but more correctly Twynham or Twycon-ca, as it was called in the Saxon Chronicle, is situated near the sea-coast on the S.W. verge of Hampshire, England, between the rivers Avon and Stour, which unite their streams at a short distance below the town, and then afterwards join with the waters of the ocean at Chrift-Church Bay. It is a market and borough town; and though it presents no claim to a British or Roman origin, it certainly has been a place of note in the Anglo-Saxon dynasties. From their Chronicle it appears that Ethelwold, cousin-german to Edward the Elder, took
took possession of it during his short-lived revolt. Christ-Church is mentioned in Doomeaday as a Royal Manor; and continued to be a part of the crown demeine till it was given, with other possessions of immense value, by Henry I. to Richard de Reparisi, or Redvers; who is supposed to have strengthened the town by walls, and to have erected a castle here. Its erection is attributed to Edward the Elder: that it must have been built previously to the twelfth century is evident from the *fodidum caelitii* being expressly mentioned in a charter granted to the priory by Baldwin, son of the above Richard de Redvers. This family retained possession of the town, except a short alienation by the marriage of an heiress, till Isabella de Fortibus released it to Edward II. The borough, manor, and hundred of Christ-Church, after passing through the families of Sir William de Montacute, Richard Neville Earl of Salisbury, and several others, were purchased by the right honourable George Rofe in 1795. Parts of the castle, by which the town was formerly defended, are now standing: the principal appear to be portions of the keep, and of the flat apartment or governor’s refidence. The latter is upwards of forty feet long, and above thirty broad; its walls, like those of the keep, being of immense thickness. On the ground floor are a number of loop holes, formed by a large semicircular arch within, lessen’d by degrees, and terminating in a chink. The access to the upper apartments was by a stone spiral staircase, part of it is yet remaining. “The place for receiving the floor of the first story is very visib; it seems to have had one room only, lighted by three large windows on the east, and as many on the west side; they were all included in the semicircular arches, formed of stones very neatly cut, and divided by a small pillar in the centre. In the east side, and somewhat north of the centre, was a very large fireplace, worked circularly into the main wall, having also a high cylindrical stone chimney, seemingly the only (original) one in the building. At the north end there appears to have been a large arched window: the columns and part of the internal arch are still remaining and answer to a handsome semicircular arch on the outside, decorated with zigzag ornaments. From what remains of the ornamental parts of this building, it appears to have been elegantly finished, and cased with squared stones; most of which, however, have been taken away: by the ruins of several walls, there were some ancient buildings at right angles to this hall, stretching away towards the keep.” (Grote’s Antiquities, vol. ii.) The priory of Christ-Church was, according to Camden, founded early in the Saxo(non times: its inmates were peculiar canons of the order St. Augustine, and the establishment, as early as Edward the Confessor’s reign, confided of a dean and twenty-four canons. The church and convent were given by William Rufus to the minion of his tyranny, Ralph Flambard, bishop of Durham, who in his early days held this deanery. This pretate determined to rebuild the church, and the other conventual edifices, which he found extremely out of repair, on a scale more extensive and superb than their original construction; and for this purpose freed the revenues of the canons, merely allowing to each a bare subsistence. Codrice, then dean, strenuously opposing this arbitrary measure, was deprived of his dignity, and forced to seek an asylum on the continent; but had afterwards permission to return and re-assume his office. The bishop having thus subdued all opposition to his designs, levelled the ancient building with the ground; and, having completed his undertaking, solemnly dedicated the church to Christ. At the dissolution, its revenues were valued, according to Speed, at 544l. 6s. od.: the site was given by Henry VIII. to Stephen Kirton, and Margaret his wife. In the following year, the church, with the church-yard, and all appurtenances, were granted to the churchwardens and inhabitants of the town for ever. This grant was confirmed by James I., and has undoubtedly operated to the preservation of the church from the destruction in which the other buildings situated to the south were involved. The church is a very large and elegant building, and with great alterations have taken place in it since the time of Flambard, yet the nave, the south-western aisle, and the northern transept still display considerable portions of his work. The nave is formed by a double row of massive square pillars, ornamented with semi-columns: between these pillars are semicircular arches springing from grouped pilasters, which are lateral projections from the main pillars. The south-western aisle, called also the Lower Walk, exhibits some semicircular arches, with zigzag moulding, and other ornaments. At the end of this aisle is a neat chapel, which is said to have been erected by John Draper, the first prior of that name, who was installed in 1277. The north transept, though greatly altered, still displays evident marks of the Norman style; especially on the outside in the ornamental and other work ornaments. Here are two small chantries or oratories, adjoining each other, supposed to have been built by some earl and countess of Salisbury, as the pavement within and contiguous has been composed of square tiles ornamented with the family arms. The chancel, and all that part which is call’d of the transept, is of more modern date. Most of the windows are large, and decorated with mullions and tracery: from the low aisles at the sides the upper part is strengthened by flying buttresses. The altar-piece is a very curious specimen of ancient carving in wood, which Mr. Warner considers as coeval with bishop Flambard. It represents the genealogy of Christ by a tree springing from the hands of Jefse, who is represented in a recumbent position, supporting his head with his left hand: in niches, on each side of Jefse, are David playing on his harp, and Solomon in a musick posture. Above are the Virgin, infant Jefus, and Joseph, with several other figures illustrative of the circumstances of our Saviour’s birth. North of the altar is a beautiful, but now mutilated, chapel, erected in the reign of Henry VII. by the venerable Margaret, countess of Salisbury, for her burial-place: the sculpture of the ornaments is excellent, and the most florid style of that age pervades the whole interior. At the eastern extremity of the church is a spacious chapel, dedicated to the Virgin Mary, and supposed to have been built by the Well family, ancestors of the lords Dewar, about the close of the 14th century: it is now Thomas Welle, by whom was built April 1435, ordered his body to be interred in the new chapel, and bequeathed 100l. towards the completion of the works of the church. Immediately over this chapel is a large room, called St. Michael’s Loft, which is recorded, in the old register of this parish, to have been let apart and used as a free grammar schoolroom ever since the year 1662. A school is known to have existed in this town fo early as the time of the first Baldwin de Redvers, as appears from his confirmation of his father’s grant to the priory. The dimensions of the church, and its principal parts, are as follows: whole length, including St. Mary’s chapel and the tower, 311 feet; breadth 24; chanctel in length 70 feet, in breadth 27; breadth of the nave 27 feet; the great pillars in circumference 36 feet 6 inches, in height 30 feet; height of the tower 120 feet. In the reign of Edward I. Christ-Church received a precept, ordering the return of two members to the national council. This was repeated in the first and second
second years of Edward II., but no returns were made, through the "poverty of the burgesses." It was again summoned 13 Ediz. as a prescriptive borough; and the circumstances of the times inducing compliance, it has ever since been represented by two members. The right of election is exercised by the corporation, which consists of the mayor, recorder, aldermen, bailiffs, and common council; in all 24: but Browne Willis and others have flated the real right to be in the inhabitant householders paying Feast and lat. Chrift-church is 135 miles S.W. of London; has a market on Mondays, and two annual fairs. The inhabitants, according to the return to parliament in 1801, were 1410; the number of houses 295. Many of the former found employment in two large breweries that have been established here; others in the falamon fishery on the rivers Avon and Stour, or in fishing round the neighbouring shores, where various kinds of fine fish abound. The lower order of females, both in the town and its vicinity, are mostly engaged in knitting fockings; and children derive employment from a manufactory of watch-firing chains lately established here. The poor-house is conducted on a very excellent plan, by which considerable sums are faved to the parish. The former expenditure has also been greatly reduced by the establishment of several friendly societies; the advantages arising from which have been considerably increased under the influence of Mr. Rofe.

The Bay or Harbour of Chrift-church is spacious; but, from various local caufes, it is too shallow and dangerous to be frequented by vessels that draw more than five feet and a half of water. This imperfection is chiefly owing to a bar or ledge of mud that extends from the point called Hen-giftbury-head, on the Hampshire fide, to St. Christopher's Cliff, in the Isle of Wight. The fition of this bar is occasionally thifted, either by a fecceffion of heavy rains, which increase the force of the water discharged into the bay by the rivers Avon and Stour, or by fea furms attended by fouthwester winds. Another circumstance peculiar to this harbour, and the neighbouring port of Poole in Dorsetshire, is that of every tide producing two high waters. This phenomenon, so inexplicable from the general laws of tides, is occasioned by the fition of this coast with refept to the Isle of Wight, and from the contraction of the channel by the jutting out of the point of land on which Hurst Cake flands. The tide flows into this channel from the well; and though it fets in with uncommon violence at Hurst Cake, it does not meet the tide that piles round the ifland, till it has reached Spithead: the paffage being too narrow for all the water to pass through, the time of high water at Hengiftbury-head is of course much earlier than either at Portland or Chichefetter; at the fof and change of the moon the diference is three hours and a half. When the water begins to ebb, by flowing off from the well, the contraction in the channel at Hurst Cake operates in a contrary direction; and, by confining the water that has spread itself over the whole surface of the Southampton water, and of the channel within the ifland, gives the water in Chrift-church bay an opportunity of flowing off much quicker, by which means it becomes fo low, that the water that now pours through with great velocity at Hurst Cake is sufficient to produce a feccond tide in Chrift-church and Poole harbours of nearly three feet.

CHRISTENING. See Baptism.

CHRISTIAN, in a general fense, fomething that relates to Chrift.

The king of France bore the title or surname of the most Chriftian king. The French antiquaries trace the origin of the appellation up to Gregory the Great; who, writing a letter to Charles Maff, occasionally gave him that title, which his successors during the existence of the French monarchy retained.

Lambecius in the third tome of his Catalogue of the emperor's library, holds, that the quality of most Chriftian was not ascribed to the ancient French kings, Louis le Debonair, &c. as kings of France, but as emperors of Germany: but the French historians endeavour to refute this plea.

Chriftian, in a more reftriited and peculiar fense, denotes a disciple of Chrift. The followers of Chrift, or the profelesy to his religion, from among both the Jews and Gentiles, were distinguishing by various appellations. Those by which they generally appropriated to one another were believers, brethren, faithful, faints, holy, and disciples. By the Gentiles and their adversaries, they were called Nazarenes and Galileans. They were first called Christians at Antioch; about A.D. 43 or 44, according to the vulgar computation, (Acts xi. 26.) "The name of Chriftian," says Tertullian, (Apol.) "comes from the union received by Jesus Chrift; and that of Chriftianus, which you sometimes through mistake give us (for you are not particularly acquainted with our name) signifies that gentlefnes and beneficence of which we make profession;" thus deriving the name of Chriftian from the Greek Χριστιανός, good or useful. It was in consequence of the converion of Cornelius and his family, that the believing Jews and Gentiles were formed into one church; and, therefore, in order to prevent the continuance of that separation and diflance which subsifted between them, under the former apppellations of Jews and Heathens, this new name of Chriftians was given them; as some conceive according to the prophecy mentioned (Is. ii. 15). It has been maintained by learned commentators, (in loc.) among whom we may reckon Benfon and Dod-didge, that this name was given them by divine direction or appointment; accordingly, they allege that the word Χριστιας implies as much, and Dr. Doddridge has translated the paffage: "and the disciples were by divine appointment first named Chriftians at Antioch." (Compare Matt. xi. 22. Luke, ii. 26. Acts, x. 22. Heb. viii. 5. xi. 7. xii. 25.) Some have faid, that Euodius was then bishop of Antioch, and gave the disciples this name; but the silence of St. Luke with regard to this circumstance renders it improbable; nor is there any fufficient evidence that it was given by Barnabas or Saul, as bishop Pearson (on the Creed, p. 105.) feems to think. There is, however, a manifest propriety in the name, as it expresses their relation to Chrift; and reminds them of their obligation to adhere to his doctrine; and it is certain that they gloried in it, and avowed it before the face of their enemies. (Tertull. Apol. c. 5. Eufeb. Hi. Eclef. i. v. c. 7.) Witius (de Vit. Paul. cap. iii. § 5.) thinks it a circumstance of remarkable wisdom, that this celebrated name should arise from Antioch, a church confiding of a mixture of Jews and Gentiles, rather than from Jerusalem, dignified in so many other refpects; and that it was a kind of victory, gained over Satan, who from Antioch had, some ages before, raised so many cruel percutors of the church of God. Witius, however, does not difcern any particular emphafis in the word Χριστιας, and readily admits the interpretation of Grotius, that the Greek word, according to its usual meaning in the late Greek writers, and in the New Testament itself, signifies named, or called. And he inclines to the conjecture of archbishop Ulher, that this appellation was given to the believers by the Romans then at Antioch. Sucer, in his "Thesaurus," explains the original word, and understands this text exactly as Grotius did. Dr. Hume has a diftention concerning the origin of the name of Chriftians, in which he shews it to be very probable, that this name had not
its rite from the Jews. Nor did the disciples of Jesus take it
to themselves. But, probably, they were first so called by
Illethens, particularly the Romans, as archbishop Usher had
argued; the name not having a Greek but a Latin termina-
tion. St. Paul, therefore, did not give the name, as bishop
Pepys, after Chariton, conjectured; and indeed Dr.
Humean shows, that both St. Luke and St. Paul seem to
have declined the use of it; possibly left our Saviour's name
have been esteemed an ordinary leader of a sect, like the
philosophers at that time much celebrated among the
Greeks and Romans. However, it was not long before it
obtained, and was very acceptable to the followers of Je-
rus. It is used by St. Peter i. iv. 16. And some have
thought it to be the "worthy name," intended by St.
James, ch. ii. 7. And it is certain, that afterwards it was
much, and justly valued by those who bore it. In the epif-
ople of the churches of Vienna and Lyons, giving an account
of their late sufferings, it is styled an honourable, and glo-
rious, and reviving appellation. Benfon's Hill: Plant.
Chrift. Rel. vol. i. ch. i. § 6. Dodd. in loc. Lardner's

The conduct of the first Christians corresponded to the
name by which they were distinguished. They were humble,
upright, and diligent in availing themselves of the in-
structions of the apollos; they were reticent and persever-
ing in maintaining their profession of Christianity amidst va-
rious reproaches and sufferings, and they testified their sincerity
by numerous acts of self-denial, fortitude and patience,
and by submitting even to death, in its most awful forms,
rather than incur the guilt of renouncing their faith in the
gospel and its divine author. Their general character was
not only irreproachable, but exemplary; and they recom-
manded their religion by their uniform temper and practice,
as well as by verbal declarations of its excellence and invin-
cible adherence to their profuction. We have many early
testimonies to this purpose, delivered not only by persons of
unquestionable integrity among themselves, but also by their adveraries and persecutors. To their lives they were able
to appeal, and did frequently appeal, in vindication of their
character against the accusations of their enemies; and they
thus evinced the falsehood and inverteate malice from which
such accusations originated. We shall here select, out of a
variety of ancient documents to the same purpose, the letter
of Pliny the younger, who was proconsul of Bithynia, in the
third year of the reign of Trajan, about the 63rd year after
our Lord's ascension, A. D. 102. In this letter Pliny, who
was a person of good sense and moderation, explained to Tra-
jan the difficulties which occurred to him in the execution of the
severe laws that were enacted against the Christians. He
informs him concerning the method which he had observed in
punishing the Christians, gives him an account of their
faith, worship, and manners, according to the account which
he had received from those who had apostatized to avoid per-
secution, and requests the emperor's advice how he should act
in reference to them for the future. This letter is cited by Ter-
tullian and Athenaeus: and being still extant, does great
honour to the Christian religion and its votaries. In the pro-
cess of his examination of those who were brought before him under the charge of being Christians, he says,
that some of them denied that they were Christians, or even
had been of this number; and to other evidence of their not
being jutly subject to this charge, they added, as he informs
the emperor, that of reviling Christ; which none of those, as
they themselves acknowledged, who were really Christians,
could be compelled to do. Others of them affirmed, that
the whole of their fault or error was, that they were wont
on an appointed day to meet before it was light, and to sing
with one another a hymn to Christ as a God, and to bind
themselves with an oath, not to do any wicked thing, but to
commit no thefts, no robberies, no adulteries, to break on
promise, and to refuse giving back any pledge when asked.
These things finished, it was their custom to depart, then
to meet again in order to take food, which, however, was innoc-
cent and eaten in common. He adds, as a reason for not
proceeding against them with rigour, and fear, that it
was a matter worthy of deliberation, "chiefly because of the
number of those who are in danger. For many of all ages,
of every rank, and of both sexes also, are called to account,
and will be called. Neither through the cities only, but the
villages also, and the country, is the contagion of that supcr-
bition spread, which, it appears, may yet be stopped and cor-
correct: at least it is very certain, that the almost deolate temples
are begun to be frequented, and the feared rites long neglected to
be renewed. Moreover the victims everywhere are told, of
which hitherto fearely any buyer was found. Hence it is
caly to collect, what a multitude of men may be reclaimed,
if there be allowed place for repentance." A re-proof of
Antinoumius Fios (see his article) also bears honourable tes-
timony to the character of the Christians. In this re-proof
Antinoum intimated that the Christians gained advantage
over their opponents, and manifested their superiority by their
readiness to lay down their lives in support of their cause; and
that they incurred enemy and persecution on account of
their greater regard to religion; and he illud an edict,
ordering among other things, that "if any fliall illude
prove to create trouble to one that is a Christian, or to accuse
him of crimes merely because he is a Christian, let him who is
indicted be discharged though he is found to be a Christian,
and let the informer himself undergo the punishment." But
it is needless to multiply instances of this kind.

CHRISTIAN persecution of. See PERSECUTION.
CHRISTIAN Religion, or CHRISTIANITY, that instituted
by Jesus Christ, comprehending doctrines of faith and rules
of practice, all of which are contained in the New Testa-
ment, and are designed to recover mankind from ignorance
and vice, from guilt and death, to true knowledge and virtue,
to the divine favour, and everlasting life. Its aptitude
to this end, its conformity to reason, and to the state of
man, the sublimity and excellence of its doctrines, the equally
venerable and lovely character of its author, the purity of
its precepts, its benign tendency and salutary effects, concur,
with the external evidence of PROPHECY and MIRACLES,
to establish its divine origin and truth.

Dr. Gerard, in the introduction to his "Discorations on
Subjects relating to the Genius and Evidence of Christi-
nity," observes, that the evidences of the Christian religion
may very properly be distinguished into two kinds: the di-
rect and the indirect. "The direct evidences are internal
and external. The external evidences of Christianity are
miracles and prophecy: these are the most direct proofs of its
divinity. The internal evidence, arising from its excellence,
has also great force. But when its excellence is urged as a di-
rect proof of its truth and divinity, it should be considered
in reference to the principal end of Christianity. The end
which Christianity professedly aims at is the spiritual im-
provement of mankind, the present virtue and comfort, and the
future perfection and happiness of all who yield themselves
up to its power. This end it keeps continually in view; it
represents all its doctrines and precepts as means of pro-
moting this end; and it is careful to let them in that attitude
in which they may most directly and powerfully contribute

10
Christian religion arises from particulars in its nature, or from effects produced by it, or from facts in the Gospel-histoy which cannot be at all accounted for but on the supposition of a divine original, or which are, at least, most naturally explicable on that supposition. Such arguments produce conviction, not by simply exciting a perception of excellence, but by making us feel, that we must offer violence to the natural principles of our understanding, and be involved in absurdities, if we deny the divinity of Christianity. Whatever circumstance is unaccountable, without supposing the truth of Christianity, affords a real presumption for it. See Duchal’s ‘presumptive Arguments, &c. in 10 Sermons, 1753.’

Some of these presumptive arguments, with respect to the circumstances from which they arise, and the manner in which they affect the understanding, are allied chiefly to the internal evidences of Christianity; others to the external. The circumstances from which some presumptive arguments for our religion arise, are such in their nature as, while they are inexplicable without supposing its divinity, excite at the same time a perception of excellence. Thus, the character of Jesus is such, and so uniformly supported, that, if it had not been real, the evangelists cannot be supposed capable of deluding it. There are several circumstances in our Saviour’s last discourses with his disciples which prove that, if he had not really spoken them, the evangelists could never have invented or ascribed them to him. The characters of some of the apostles of Christ; the controversy among Christians, in the apostolic age; the practice of Christ and his apostles in uniformly referring their claim to the impartial inquiries of men, and renouncing every other method of recommending it, have been shown by Dr. Duchal to contain strong presumptions of the truth of Christianity. All these arguments have an affinity to the internal evidence of Christianity. There are others which bear affinity to its external evidences. They add credibility to them; they predispose the mind to admit them; or heighten its acquiescence in their sufficiency. They contain a mixture of something miraculous, which, by being such, implies the divinity of this religion, and which carries along with it satisfying evidence of its own reality. Thus, Bell, in his ‘Inquiry into the divine Mission of J. the Baptist and Jesus Christ,’ has shown, that the claims of both mutually support each other; and that the circumstances attending their births, many of which were miraculous, and their whole conduct towards one another in their public life, afford a full proof that Jesus was the Messiah, and John his forerunner. The case is the same with regard to the miraculous conversion and subsequent conduct of the apostle Paul, forbidding us to ascribe the origin and prevalence of Christianity either to enthusiasm or imposture; as has been displayed with great strength of reason by Lord Lyttelton and by Dr. Duchal. See Paul.

There are other arguments, which corroborate the truth of Christianity, by adding weight to its external evidence in a manner still more direct. They arise from circumstances not absolutely necessary for rendering these evidences complete; and therefore they may be considered as separate and independent evidences of the collateral kind. Thus, when we consider that many of the particulars predicted concerning the Messiah and accomplished in Jesus are perfectly extraordinary in their own nature, and seemingly incompatible with one another, this affords evidence of the truth of our religion, additional to what arises merely from the accomplishment of any prophecy. A similar confirmation of Christianity has been deduced by Dr. Duchal, from some circumstances in the character of the Man of Sin, foretold by Paul, so singular, that mere imagination could scarcely have suggested them; and if it had, they never could have
have taken place. These influences have an immediate relation to the proof of Christianity from prophecy, which see. Others are related to the proof from miracles, which see; such is the argument from the quick and extensive propagation of the Gospel, illustrating the evidence from miracles in the same way as the efficacy of the Gospel corroborates its internal evidence: and the argument from the confessions of ancient infidels, stated by Gerard, in one of his dissertations. The argument for Christianity from the continuance and present state of the Jewish nation, is almost equally related to the proof from miracles and to that from prophecy. See "Lardner's Discourses on the Circumstances of the Jewish People, an Argument for the Truth of Christianity." There are other arguments, which have an equal relation to the internal and external evidences for Christianity, and which add weight equally to both. Such are the two arguments illustrated by Dr. Gerard; the one deduced from the manner in which Christ and his apostles prosecuted the evidence of their mission, which was the most proper, and the other, from the result of the scrutiny and examination of infidels. There are other arguments, deducible from the permanence of the positive institutions of Christianity, which are a kind of monuments of its truth and divinity original; and others again, of the presumptive kind, furnished by the history of the Acts of the Apostles; which see. Dr. Leland has given an excellent summary of the evidences of Christianity, in his "View of the Deistical Writers, vol. i. p. 411, &c." See also Beattie's "Evidences, &c." and Paley's "View of the Evidences of Christianity, vol. i." Macknight's "Truth of the Gospel History," "An Answer to the Question, Why are you a Christian?" by John Clarke, minister of a church in Bolton, 6th ed. Lond. 1803. See APOSTLES, BIBLE, CANON, GOSPEL, RELIGION, REVELATION, TESTAMENT, &c.

The argument in proof of the truth of Christianity, to which we have above referred, deduced from its sudden and extensive propagation, and permanent duration, deferves, on various accounts, to be more amply stated, and to be vindicated from the objections that have been alleged against it. No just and satisfactory reason can be given for its speedy diffusion, general prevalence, and continued subsistence in the world; without admitting its divine original, and the supernatural efficacy that contributed to its reception and propagation. In its own nature and avowed design, it had to encounter with a host of enemies both among Jews and Heathens; whose passions and prejudices, secular interest and honour, and established habits and usages, would combine in discouraging its advocates and raising obstacles, which it would be difficult to surmount. More especially when we consider that independently of its claims to a divine origin, and of the supernatural power which accompanied it, the millionaires in the Christian cause laboured under a variety of personal and local disadvantages. They were delitute of those natural talents and acquired accomplishments, and of that authority and influence usually resulting from rank and opulence, which would of themselves have contributed to their favourable reception with the multitude. Nevertheless, Christianity "grew mightily and prevailed;" of the weapons that were wielded against it by prejudice and error, talents and learning, wealth and worldly power, none eventually proved. Many circumstances concurred, indeed, to favour its reception and spread soon after the time, when it was introduced. This was the precise period, which had been predicted many ages before it occurred. This was the time in which a general expectation of the Messiah or Saviour prevailed. At this time the Jewish system both of doctrine and practice was become extremely corrupt, and the inquiries of the studious heathens had been found insufficient to satisfy them on the most important and interesting subjects. There are also several other collateral circumstances, which mark the period in which our Saviour appeared as the most proper for the introduction, establishment, and propagation of the religion which he communicated to mankind. This was an age of general knowledge and inquiry, when genius and science were cultivated and promoted, both in Greece and Rome, and when the human mind was beginning to emancipate itself from that blind and obstinate attachment to old opinions and fictions, venerable merely on account of their antiquity, which is inseparable from ignorance and barbarity. This was an age in which men began to discover a very general disposition for moral inquiries; and in which some of the most distinguished sages and philosophers flourished. The Augustan age is proverbially celebrated for its refinement and culture; for the knowledge and investigation by which it was distinguished. This was a period of general peace through the whole Roman empire. It was likewise a period of general toleration and liberty; it was also a time, in which by the wide extent of the Roman empire, an intercourse was opened and maintained between the inhabitants of very distant nations; and this intercourse was farther promoted by the dispersion of Jews and Christians in consequence of the destruction of Jerusalem and the dissolution of the Jewish state. The Greek language at this time was almost universal; and, therefore, the inspired writers, whose gospels and epistles were published in this language, enjoyed peculiar advantage for extending the knowledge of the sacred doctrines, precepts, and institutions of Christianity. Our limits will not allow our enlarging on these particulars; and we must, therefore, content ourselves with merely fiegulating them.

Of the success and prevalence of Christianity, during the apostolic age, we have already given a brief account under the article APOSTLES. In process of time, it made a wonderful progress through Europe, Asia, and Africa; and its progress was much accelerated by means of the wide extent of the Roman empire, and by a variety of circumstances which took place, at and soon after the period of its first introduction. In the third century there were Christians in the camp, in the senate, and in the palace; in short, everywhere, as we are informed, except in the temples and the theatres; they filled the towns, the country, and the islands. Men and women of all ages and ranks, and even those of the first dignity, embraced the Christian faith; insomuch that the Pagans complained that the revenues of their temples were ruined. They were in such great numbers in the empire, that, as Tertullian expresses it, if they had retired into another country, they would have left the Romans only a frightful solitude. For the further illustration of this argument, we may observe that the Christian religion was introduced everywhere in opposition to the sword of the magistrate, the craft and interest of the priests, the pride of the philosophers, the passions and prejudices of the people, all closely combined in support of the national worship, and to crush the Christian faith, which aimed at the subversion of heathenism and idolatry, and the abrogation of the Jewish law. Moreover, this religion was not propagated in the dark, by persons who tacitly endeavoured to deceive the credulous; nor delivered out by little and little, so that one doctrine might prepare the way for the reception of another; but it was fully and without disguise laid before men all at once, that they might judge of the whole under one view of it. Consequently mankind were not deceived into the belief of it, but received it upon proper examination and conviction.
CHRISTIAN RELIGION.

tion. Besides, the gospel was first preached and first believed by multitudes in Judaea, where Jesus exercised his ministry, and where every individual had access to know whether the things that were told him were matters of fact; and in this country, the scene of the principal transactions on which its future glory was to depend, most of the faithful witnesses have been received, unless it had been true, and known to all as truth; again, the doctrine and history of Jesus were believed and lived in the most noted countries and cities of the world, in the very age when he is said to have lived. On the 50th day after our Lord's crucifixion, 5000 persons were converted in Jerusalem, by a single sermon of the apostles; and a few weeks after this, 3000 who believed were present at another sermon preached also in Jerusalem. (Acts ii. 44. 4 v. 7. viii. 1. ix. 20.) About 8 or 10 years after our Lord's death, the disciples were become so numerous at Jerusalem and in the adjacent country, that they were objects of jealousy and alarm to Herod himself. (Acts, xiii. 1.) In the 23d year after the crucifixion, the disciples in Judæa are said to have been many myriads. (Acts, xxi. 20.) See Apostles. The age, in which Christianity was introduced and received, was famous for men, whole faculties were improved by the most perfect state of social life, but who were good judges of the evidence offered in support of the facts recorded in the gospel-history. For it should be recollected, that the facts of the gospel was not restricted to Judæa; but it was preached in all the different provinces of the Roman empire. The first triumphs of Christianity were in the heart of Greece itself, the nursery of learning and the polite arts; for churches were planted at a very early period at Corinth, Ephesus, Berœa, Thessalonica, and Philippæ. Even Rome herself, the seat of wealth and empire, was not able to resist the force of truth, at a time when the facts related were recent, and when they might, if they had been false, have easily been disproved. From Greece and Rome, at a period of cultivation and refinement, of general peace, and extensive intercourse, when one great empire united different nations and distant people, the confession of these facts would very soon have prevailed from one country to another, to the utter confusion of the persons who endeavoured to propagate the belief of them. Farther, although most of the early converts were persons in the middle and lower classes of life, yet even these, in an age of such general knowledge and intercourse, were sufficiently secured against every kind of false pretensions; and as for the more ignorant, their attachment to their birth religious notions would be strong; and consequently, miracles, or unquestionable operations of divine power, would be necessary to convince persons of this rank and character, and to induce them to change their principles. Their conversion, therefore, affords an incontestible argument in proof of the facts by which it was accomplished. It should here be considered that the religion to which they were proselyted was exclusive. It denied, without reserve, the truth of every article of heathen mythology, the existence of every object of their worship. It accepted no compromise; it admitted no comprehension. If it prevailed at all, it must prevail by the overthrow of every statute, altar, and temple in the world. It pronounced all other gods to be false, and all other worship vain. These are considerations which must have strengthened the opposition to it, augmented the hostility which it must encounter, and enhanced the difficulty of gaining proselytes. More especially when we recollect, that among the first converts to Christianity in the earliest age, a number of persons remarkable for their station, office, genius, education, and fortune, and who were personally interested by their emoluments and honours in the continued subsistence either of Judaism or heathenism, appeared among the Christian proselytes. Its evidences approved themselves, not only to the multitude, but to men of the most refined taste and most distinguished abilities; and it dissolv'd the attachments of all-powerful interest and authority created and upheld. Along the prospect to Christianity we find NICODEMUS, and Joseph of ARIMATHÉA, and members of the senate of ISRAEL; JARUS, a ruler of the synagogue; ZACCHÉUS, the chief of the publicans at Jericho; APOLLOS, distinguished for eloquence; Paul, learned in the Jewish law; SÉRGIUS PAPUlius, governor of the island of Cyprus; CORNELIUS, a Roman captain; Dionysius, a judge and senator of the Athenian Areopagus; Erastus, treasurer of Corinth; Tyrannus, a teacher of grammar and rhetoric at Corinth; Publicius, governor of Malta; Philemon, a person of considerable rank at Colosse; Simon, a magician in Samaria; Zenas, a lawyer; and even the domelictes of the emperor himself. These are noticed in the sacred writings; and the heathen historians also mention some persons of great note who were converted at an early period. To all the preceding circumstances we may add a consideration of peculiar moment, which is, that the profession of Christianity led all, without exception, to renounce the world, and to expose themselves to the most ignominious and execrable sufferings. On the other hand, we should reflect on the character and condition of the persons, who endeavored to change mankind to their belief, and to abandon all their former convictions and habits. They were a few, selected from the meanest of the people, and they belonged to a nation that was despised on account of the ill-will which they bore to the rest of mankind. By such persons were thousands prevailed upon in a very short time to change their belief and to reform their lives. And, without adding any more in this way, the Christian religion, thus introduced by the power of God and of truth, has been supported in the world by the fame powers through a course of many ages, amidst the corruptions of its friends, the opposition of its enemies, the dangers of prosperous periods, and the perfections and violence of adverse circumstances: all which must have destroyed it, if it had not been founded in truth, and guarded by the protection of an Almighty providence.

Mr. Gibbon, the elegant and instructive historian, has endeavoured to account for the wonderful propagation of Christianity, independently of its truth and divine original, in a manner which tends, in our opinion, to make an impression on the mind of his reader not at all advantageous to our holy religion. To the inquiry by what means the Christian faith obtained so remarkable a victory over the established religions of the earth, he says, an obvious but satisfactory answer may be returned; that it was owing to the convincing evidence of the doctrine itself, and to the ruling providence of its great Author. But afterwards, in alluding to this astonishing event, five secondary causes, derived from the passions of the human heart and the general circumstances of mankind, he seems to have inculcated that Christianity, like other impostures, might have made its way in the world, though its origin had been as human as the means by which he supposes it was rapidly spread. Whether it was his intention to depreciate the primary means by which Christianity prevailed, and to intimate its dissatisfaction with the obvious answer which others have returned to the inquiry concerning its reception and spread, we shall not presume to determine; but we may b. allowed to say, without incurring the charge of want of candour, that his reasoning on this subject has a tendency to divert the attention of his readers from the principal cause of the triumph of Christianity to other causes less favourable to its truth: C. C. and
and divine original, and altogether inadequate to this great event. As the subject is in a high degree important and interesting, we shall here avail ourselves of the replies that have been made by the advocates of Christianitv, and particularly by the learned and ingenious Dr. Watfon, bishop of Landaff, to the remonstrance of the native Liberalian.

The feeble cause, which he alleges, is, "the inflexible, and, if we may use the expression (he says), the intolerant zeal of the Christians, derived, it is true, from the Jewish religion, but purified from the narrow and unfocial spirit, which, instead of inviting, had deterred the Jews from embracing the law of Moses." The zeal of the Christians is allowed to have been inflexible, as far as it concerned a steady adherence to their religious principles and profession, and intolerant, in not admitting to Christian worship those who professed the image of Cefar, who bowed down at the altars of Jovian, who mixed with the votaries of Venus, or wallowed in the filth of Diucaiihan festivities; but, instead of deducing it, as Mr. Gibbon does, from the Jewish religion, it ought to be ascribed to a full persuasion of the truth of Christianity. The zeal of the apostles or primitive Christians did not bear the slightest hintitude to the fierceness and bigotry of the Jews; it was derived from very different causes, and aimed at far nobler ends. It is not conceivable, that a zeal resulting from the Jewish religion should urge the Christians to propagate the gospel amongst Jews as well as Gentiles; and that such a zeal as Mr. Gibbon has described, whatever might be its principle, should ever have been devised by any human understanding as a probable means of promoting the progress of a reformation in religion; much less that it should have been thought of or adopted by a few ignorant and unconnected men.

The second cause to which Mr. Gibbon has attributed the rapid growth of Christianity is, "the doctrine of a future life, improved by every additional circumstance which could give weight and efficacy to that important truth." Such a doctrine is unquestionably congenial to the nature of man as a moral and accountable agent; it is repeatedly inculcated in the gospel, and most adequate to the purposes of the dispensation of this age, has increased its efficacy; but, considering the circumstances of the persons to whom this doctrine, in its whole extent, as comprehending punishments and rewards, and the immortality of the soul, in connection with the resurrection, was delivered, it is not likely that, abstracted from the supernatural testimony by which it was enforced, it could have met with any very extensive reception among them. It was not the kind of future life, which they expected. Future punishments, which constituted a prominent part of this doctrine, were reckoned by the philosophers among the aniles fabula; nor was the abfurdiy of this part of the Christian doctrine confined to the writings of the philosophers, and to the circles of the learned and polite; but Cicero makes no secret of it in his public pleadings before the people at large. Besides, its rewards were not attractive, nor were they such as the multitude wished. The pride of the philosopher was shocked by the doctrine of a resurrection, the mode of which he was unable to comprehend; and the imaginations of other men were feebly impressed by the representation of a future life, which did not portray the serene sky, the verdant garden, and the luxurious enjoyment of an Elysium. Upon the whole, the Christian doctrine of a future life was neither agreeable to the expectations, nor corresponding with the wishes, nor conformable to the reason of the Gentiles; and it, therefore, afforded no inducements for their receiving it, and, in consequence of their belief, regulating their loose morals according to the rigid standard of gospel purity, upon the mere authority of a few contemptible fishermen of Judaea. Mr. Gibbon himself observes in another place, that the "Pagan multitude, retaining their gratitude for temporal benefits alone, rejected the inculcable present of life and immortality, which was offered to mankind by Jesus of Nazareth." When this writer ascribes the conversion of the Gentiles to the influence of their fears, excited, as he pretends, but without sufficient reason, by the expectation of Christ's speedy appearance, of the millennium (which fict.) and of the general conflagration; it is natural to ask from what sources they derived those fears which converted them? not, we may say, from the labours of such men, as the apostles and first preachers of Christianity, who from their mean condition and rude speech were very ill adapted to inspire the hasty and the learned Romans with any other affections than those of pity or contempt.

"The miraculous powers ascribed to the primitive church," are the third of the secondary causes to which Mr. G. ascribes the rapid propagation of Christianity. It must be allowed that the miracles, not merely ascribed to the primitive church, but really performed by the apostles, ought to be considered not only as a secondary, but as one great primary cause of the conversion of the Gentiles. But the miraculous powers attributed by Mr. Gibbon to the primitive church, and which he ascribes with a degree of derision, implying his scepticism or incredulity concerning them, were by no means calculated, at least in any eminent degree, to spread the belief of Christianity amongst a great and enlightened people. When we consider that the pretended miracles of the heathens were so numerous as to have inestimably lost their force, and sunk in their deceit, those that were ascribed to the first propagators of Christianity must have created an immediate and abhorred prejudice against their cause; and nothing could have subdued that prejudice, but miracles, really and visibly performed. See Miracle.

The utility of Mr. Gibbon's fourth cause, viz. "the virtues of the first Christians," cannot be disputed; as they very much conducted to the spread of their religion: but those virtues are depreciated by his representation of them, as proceeding from their mean and timid reputation for having been the most abandoned sinners, or from an impetuous zeal in supporting the reputation of the sect or society to which they belonged. "After the example of their divine master," says Mr. G. in language that more than infames unmerited reproach, "the millionaries of the gospel disdained not the society of men, and especially of women, oppressed by the conscientious, and very often by the effects of their vices." The pernicious tendency of such a declaration, connected with the gross misrepresentation implied in it, reflects reproach on the character of the historian, and seems to indicate a design to degrade the importance of Christianity and to excape to it contempt. But whatever may be its effect on the heedless and dissipated, it supplies its own antidote in the elimation of the impartial, thoughtful, and judicious, who will not fail to distinguish between allusion and fact. Very contrary to the declaration of Mr. G. was the conduct enjoined on the first teachers of Christianity; for they were ordered to turn away from, to have no fellowship or intercourse with, such as were wont "to creep into houses, and lead captive sly women laden with sins, led away with divers lusts." And if a few women, who had either been seduced by their persuasion, or had fallen victims to the licentious manners of their age, should be found amongst those who were most ready to receive a religion that forbade all impurity; this circumstance cannot warrant an imputation of discredit, either upon the sect, or upon the
CHRISTIAN.

those who wrought their reformation. The attention mani-

fested by the primitive Christians with regard to their

conduct is inviably ascribed to improper motives;

whereas their solicitude to avoid reproach in this respect

might as candidly, perhaps, and as reasonably, be derived

from a sense of their duty, and an honest endeavour to
discharge it, as from the mere desire of increasing the
honour of their confraternity by the illustrious integrity of
its members. After all, the ascetic morality of the primi-
tive Christians, which Mr. G. describes as adverse to the

proprieties of life, and abhorrent from all the innocent
pleasures and amusements of life, is exhibited under such
difficult colouring, that instead of alluring persons to a closer
inspection of it, it must have made every man of pleasure or
of sense to turn away from it with horror or disgust; and so
far from contributing to the rapid growth of Christianity, it
must excite wonder, how the first Christians ever made a
single convert. The averseion of Christians from the busi-
ness of war and government is charged upon them by Mr. G. as
criminal disregard to the public welfare. By way of gen-
gerally reply it may be observed, that Christianity does not
concern itself with ordering the constitutions of civil societies,
but levels its whole influence at the hearts of individuals who
compose them; and, as Origin said to Celsus, if every indi-
idual in every nation was a good Christian, there would be
neither internal injustice, nor external war; there would be
none of those passions which embitter the intercourse of civil
life, and defolate the globe. It can therefore be no reproach
to the Christian religion, that it should instruct doctrines,
which, if universally practised, would introduce universal
tranquility, and the most exalted happiness amongst man-
kind. Nothing but a total misconception of the design
of the Christian dispensation, or a misinterpretation of the
peculiar injunctions, forbidding its votaries to make
riches or honours a primary pursuit, or the prompt
gratification of revenge a first principle of action, can
lead any one to infer, that a Christian is obliged to
offer his throat to an assassin, and his property to the first
plunderer; or that a society of Christians may not repel, in
the bell manner they are able, the unjust assaults of host-
ile invasion. No precepts of the gospel, whatever may be
affected or infiltrated to the contrary, debar a man from the
possession of domestic comforts, or deaden the activity of his
private friendships, or prohibit the exertion of his usual
ability in the service of the public.
The fifth and last secondary cause of the rapid and extensive
spread of Christianity, mentioned by Mr. G. is "the union
and the discipline of the Christian church." Union, it must
be allowed, is strength to every association; and it is much
to be wished, that it could be found even in the early period
of the Christian dispensation, and much to be lamented that
the too general defect of it has been the reproach of Chris-
tians from the apostolic age to our own. There was, in-
deed, a certain community of doctrine, an intercourse of ho-
spitality, and a confederacy of discipline established among
the individuals of every church; so that none could be ad-
mitted into any assembly of Christians without undergoing a
previous examination into his manner of life, and without
protesting in the most solemn manner that they would not
be guilty of murder, adultery, theft, or perjury. It may
be also granted, that those who broke this compact
were ejected by common consent from the confraternity
into which they had been admitted; and this confede-

racy extended itself to independent churches; so that
those who had, for their immorality, been excluded
from Christian community in any one church, were rarely, if
ever, admitted to this privilege by another:—but it is not
admitted, that this severity and this union of discipline
could ever have induced the Pagans to forsake the gods of
their country, and to expose themselves to the contemptuous
hatred of their neighbours, and to all the severities of per-
fecution, exercised with unrelenting barbarity, against the
Christians. After this brief abstract of the reasoning of Mr.
Gibbon, and the replies of the advocates of Christianity on
the subject of its propagation, we must refer to Gibbon's History
of the Decline and Fall of the Roman Empire, vol. ii. chap.
15. D. Watton's Apology for Christianity, pp. 118, 119. White's
Sermons, Serm. III. and other writers who have either di-
rectly or indirectly written on the same subject. See Com-
munity of Goods, Excommunication, Famine, Per-
secution, etc.

CHRISTIAN I., in Biography, king of Denmark, son of Theodoric count of Oldenburg, was elected to the throne in the year 1448, and in him we behold the founder of the royal house of Oldenburg, which still poises the throne of Denmark. He owed his elevation as well to his inelab-
dent from Eric VII. as to the moderation of his uncle Adolphus, duke of Slefwick, to whom the crown was of-
fered upon the death of Christophe of Bavaria without if-
sue. Adolphus declined the honour on account of his ad-
vanced age, and recommended, in his stead, Christian, then
twenty-two years of age. In the same year that he ascend-
ed the throne of Denmark, he was married to the crown
of Norway, in right of his descent from one of their ancient kings.
After some struggles he obtained also the crown of Sweden in 1558, upon the deposition of Charles Canuton. About the same time the duchy of Slefwick reverted to the crown
of Denmark, and Christian obtained possession of the coun-
ties of Holstein and Stormar. The Swedes, in a short
time, grew discontented with the government of Christian,
who neglected to visit them, and had applied the public money in the purchase of Holstein and Stormar. To put
an end to their machinations, Christian sent the archbishop
of Ufal, whom he suspected, and sent him prisoner to
Denmark. This action caused an open revolt, and led to the
deposition of the king. From this period Christian aban-
donned all projects of ambition, and attended to the con-
cerns of his own kingdom. He was distinguished for his liberality
to the clergy, and in 1472 made a pilgrimage to Rome,
where he was received with extraordinary honours. On his
return he founded the university of Copenhagen, and died
in 1481, after a reign of thirty-three years. He was a so-
vereign of great moderation and humanity, whose qualities,
being his shining than told, were more adapted to the ad-
ministration of his own government, than to the exploits
of war. By Mallet, the most celebrated of Danish histo-
rians, Christian I. is characterized as one of those princes
who do not attract the admiration of mankind, yet whom
Providence never bellows upon a nation but as a signal mark
of favour. Christian was succeeded by his son John, whom
he had already associated with himself in this throne.

CHRISTIAN II., king of Denmark, was born in 1481,
the same year in which his grand-father died. In his youth
he discovered a lively genius and a good understanding,
which, if they had been properly cultivated, might have re-
ndered him the ornament, instead of becoming, as he proved,
the disgrace of his country. The young prince was first en-
trusted to the care of a common burgurer of Copenhagen,
and was afterwards removed to the house of a school-maier,
who was canon of the cathedral. In this situation his chief
employment consisted in regularly accompanying his master
to church, where he distinguished himself beyond the other
scholars and choristers in chanting and singing psalms.
He was afterwards placed under the tuition of a German pre-
ceptor,
Christian.

ceptor, under whom he made a considerable proficiency in the Latin tongue. From this humble education, or from other circumstances not known to the world, Christian imbibed a taste for bad company; was accustomd to haunt common taverns, to mix with the lowest of the populace, and was, in short, guilty of almost every excess. The king, his father, who had, unintentionally, been the cause of his son's misconduct, was now indignant at the irregularities which became notorious to the whole country, but the bad habits which the prince had contracted were too strongly rooted to yield to any effort. He nevertheless signified his displeasure, and recalled his father's affections by his military prowess and successes in Norway, and by an unwaried application to the affairs of government.

He succeeded his father in 1513, and during the first years of his reign, his administration was in many respects worthy of praise, and the excellence of his laws induced Holberg to affirm, that if the character of Christian II. were to be determined by his laws, and not by his actions, he would merit the appellation of Good, rather than of Tyrant. Foreseeing the difficulties he should meet with in obtaining the crown of Sweden, he resolved to strengthen himself by an alliance with the house of Austria, and accordingly married Isabella, sister to the emperor Charles V. Notwithstanding this marriage, which was merely political, he kept a mistress named Colombula, in whose favours he suspected that Torbern Oxen, a young nobleman, had participatd. The monarch, amidst the futility of banquets, urged him to avow the fact. The young man professed a mind incapable of falsehood; he acknowledged, that he had loved Colombula, and had solicited, but never obtained her favours. He was instantiy arrested, imprisoned, and arraigned; but by the Senate Torbern was acquitted, because the law had assigned no punishment for simple concubinage. Diffatisfied with this decision, Christian assembled another tribunal, where he had him convicted and immediately executed. In 1517, Lutheranism began to excite attention; and in Denmark it was favoured by the king, who hoped it might lead to the confiscation of the church lands. He was, however, obliged to submit to the pope, and to fuse, through the house of Austria, for a reconciliation with the holy see. The domestic government of Christian became more oppressive, chiefly through the extortions contrived by Sigebrette, the mother of Colombula, who had the complete confidence of the king. This base woman, who felt no compassion for the poor, nor regard for the rich: who paid no respect to the laws, and who acknowledged no other rule than the passions of the monarch, commanded with despotic authority, dispofed of all places and preferments, imposed taxes at pleasure, and excuted them with such rigour, that the household furniture and chattels of those who did not pay them were seized and publicly sold. In 1519 Christian renewed the war against Sweden, defeated and killed the administrator of that country, and through the treachery of the archbishop of Upsal, he was in the succeeding year recognized king of Sweden. He fixed upon the following November for his coronation, and then returned to Denmark, where, with two of his prelates, he concerted one of the most atrocious and fanatical projects that flanked in history. Returning to Sweden, he convoked the assembly of the states, and was publicly crowned at Stockholm. After the ceremonial, the Swedish nobility were invited to a splendid entertainment, and received with the utmost affability. In the midst of the felicity, he caufed the soldiers to arrest the administrator's widow, the fiance, and the principal nobility; and after accusing them of various crimes for which there was no pretence, he instituted a mock prosecution by Danish commissioners. The process was, however, too low for his blood-thirsty disposition; he causd a summary condemnation to be pronounced, and they were led to instant execution. Four core or nucy noblemen and senators of the first rank, both of the lity and clergy, were in one day hanged on gibbets, as felons or traitors. Not contented with this exhibition of his savage cruelty, to conclude the scene, the soldiers were ordered to butcher the surrounding spectators, and the burgurers of the city. He even caufed the administrator's body to be dug from its grave, which, in its putrid state, he tore to pieces with his teeth and nails like a wild beast. His progress on his return to Denmark was marked with blood, and he left no memorials behind him but those of cruelty.

The massacre of Stockholm, in which fix hundred persons were murdered in cold blood, and amidst the rejoicings of a coronation, exhibited such a striking instance of the malignant and implausible character of the king, that upon the revolt of Gustavus Vasa, the spirit of resistance diffused itself rapidly from Sweden to Denmark, where he had exasperated his subjects by repeated cruelties and oppressions. In 1523 he was publicly deposed by the states of Denmark, and the crown transferred to his uncle Frederic, duke of Holstein. The deposition of this infamous tyrant was in consequence only of the just abhorrence in which he was held by all ranks of people. For several years he submitted without a struggle to the ignominy of banishment, but in 1532 he invaded the Danish dominions, and was taken prisoner. The place of his confinement was a dungeon in the castle of Sunderborg, in the isle of Alten. Having entered the gloomy cell, with a favourite dwarf, the sole companion of his misery, the door was instantly blocked up. In this state he remained till the year 1546, when he made a solemn renunciation for himself and heirs of all claims to the crown of Denmark and Norway, and promised never to go out of the tracts of Callemburg without the king's consent, and never to speak to a stranger but in the governor's presence. On these conditions he was allowed the privilege of hunting and fishing, within certain limits, and received a handfome appointment, and other advantages were stipulated for him in a treaty concluded between the king of Denmark and the emperor at Speirs. In this retreat did Christian reach his seventy-eighth year, enjoying a degree of comfort to which his many crimes gave no title whatever. He died in 1559, leaving two daughters, one electress Palatine, the other, duchess first of Milan, then of Lorraine. Of himself is left the character of the Nero of the North. It is said, that during his imprisonment, he was occasionally so much affected with reflections on his past conduct, that he would burst into tears, throw himself upon the ground, utter the most bitter lamentations, and continue for some time in a fitte approaching to infancy.

There were several other monarchs of Sweden of the name of Christian, concerning whom little need be said.

Christian III. succeeded Frederic in 1534; he embraced the Lutheran religion, introduced it among his subjects, and at length established it as the religion of the state. This prince united in his character firmness and moderation: he was a lover of letters and learned men, and founded a valuable library at Copenhagen. He died in 1558, and was succeeded by Frederic II., who was followed in 1588 by

Christian IV. This prince ascended the throne before he was twelve years of age. The regency paid every attention to his education, and masters were procured in all the various accomplishments of mind and body from different parts of Europe, to whose exertions the prince did the greatest credit. He was able to converge with all the ambas- 
sadors from foreign courts, and, at an early period, to dedicate to his own ministrers who were abroad. In 1661 he made war against Sweden, and was elected chief of the Protestant league against the emperor for the re-establishment of the prince palatine in 1652. The several wars in which he was engaged were detrimental to the finances of his country. He died in 1643, leaving a high character for vigour of mind and body. He was a slave to violent passions, which gained strength with increasing years. He was addicted to women, a circumstance that injured his reputation. It must, however, be admitted in his praise, that he was a firm and intrepid warrior, a prince of extensive genius, and possessing great generosily and magnanimity.

CHRISTIAN V. ascended the throne of Denmark in 1670. He founded his kingdom involved in various foreign and domestic disputes, which led him to employ the first years of his reign in putting the revenue into a state of order, reforming discipline among his troops, and strengthening his fortifications. In 1675 he joined the league against Sweden, and in the war between the Danes and their allies with the Swedes, Christian displayed great activity and enterprise. His fleet, in conjunction with that of the Dutch under Van Tromp, completely defeated that of the Swedes. For two years the king was generally successful in all his undertakings, but in 1677 the tide of victory seemed to turn against him, and in 1679 he was glad to conclude a peace. From this period he aimed to settle all disputes with foreign powers by means of negotiation. He attempted to gain possession of Hamburg, and obtained at first a considerable tribute from that city, but his conduct there led the neighbouring princes to guarantee its protection. Christian died in 1699, at the age of fifty-four, when his subjects were enjoying the fruits of his mature wisdom and reputation. As a prince he had established a high character, and claimed respect throughout Europe. As a man, he spoke with fluency moll foreign languages, was a promoter of the sciences, and had made great progress in those branches of the mathematics which relate to the military art. See DENMARK.

CHRISTIAN, ANDREW, born at Rippen, a small town in Denmark, in 1551. He received the rudiments of his education at Wittenburg, which he perfected at Basle, where he took his degree of doctor in medicine. Being called to Copenhagen, he taught medicine there for fifteen years, at the end of which time he was sent by his sovereign, Christian IV. to reside in the college of noblesse lately established at Sorø. In this situation he died in 1605. The work by which he is known, is entitled "Excurdium Medicum, de engynfeciis, curandique externis et internis Humani Corporis Morbis." Batine, 1583, 8vo. It contains, in epoem, the method, then most approved, of treating disesases; as such it was several times re-printed. Hallo. Bib. Eoy. Dist. Hilt.

CHRISTIANA, in Geography, a post-town of America, in the slate of Delaware and county of Newcast, seated on a navigable creek of the same name, which falls into Delaware river from the south-east, a little below Wilmington. The town, consisting of about 50 houses and a Presbyterian church, hands on a clivity, commanding a pleasant prospect of the country towards the Delawarre, and carries on a considerable trade with Philadelphia in flour. This is the greatest carrying-place between the navigable waters of the Delawarre and Cheapeak, which are here 13 miles apart. It was built by the Swedes in 1654, and derived its name from that of their queen. It is 9 miles S.W. of Wilmington, and 37 S.W. of Philadelphia.

CHRISTIANA, Great and Little, two islets in the Grecian Archipelago, situated 2 leagues S.W. of Santorini.

CHRISTIANA, or CHRISTINA, Santa, one of the Marquesas islands, called by the natives Ohikura, or Whaitai, lying under the same parallel with St. Pedro, or Ontoey, 5 or 4 leagues more to the west. Revolution bay, near the middle of the west coast of the island, lies in S. lat. 9° 33' 30", and W. long. 139° 8' 40'; and the west end of Dominica, or Ohehahuna, lies N. 14° W. Capt. Cook gave this bay the name of his ship. By the Spaniards it was called Port Real. It is not more than 3 miles across at its mouth by 2 of a mile in depth; and the two points which form it lie, with respect to each other, in a north by east and south by west direction. The south point is terminated by a steep rock, and a hill of gentle declivity terminates the north point, which is formed by bold and excavated rocks, and is covered with "cañarinas," the large trees, whose hard and heavy wood is used for making clubs and other weapons. The lands at the bottom of the bay pretend a chain of high hills, slightly broken at their summits, and steep in several places. Mr. G. Forster says, that the bottom of the harbour is filled up with a very high ridge, level at top, and resembling the Table-mountain at the Cape of Good Hope. With the exception of two small coves, which both receive a rivulet, and where an accessible beach occurs, the remainder of the circumference of the bay exhibits, throughout, nothing but bold rocks, close to which the lead indicates a coral bottom, with a depth of water of 20 fathoms and upwards. One of these coves is called the "North Cove," the other the "South Cove." Two valies, well covered with trees, terminate at the north cove, and a pretty rivulet, after having fertilised the lands, affords, at its mouth, a good watering-place for ships. The bottom of the bay is sandy, excellent for holding, over a depth of water, which falls, towards the shore, from 9 to 13 or 14 fathoms. Fresh water of the best quality is procured in the North Cove, and wood is also easily obtained. It appears from different accounts, that the springs and rivers of the island are subject to considerable augmentations and diminutions; and alternate inundations or droughts oblige the natives to remove their dwellings from one part of the island to another. The huts or cabins occupied by the inhabitants are built on a little platform of stones, raised somewhat above the level of the ground. The walls are formed with bamboo-canes, 7 or 8 feet high, placed close together; and the roof, the middle of which rests 9 or 10 feet above the foundation, is formed by other bamboo laid in a parallel direction, one above the other, and covered with leaves of a species of the fan-palm, or of the bread-fruit tree. The roofs are ridged, so as to carry off the water by a double slope; and in one of the fronts are a door and window. These cabins are, in general, 9 or 10 feet long, by 5 or 6 broad, and some are square. The floor is paved with large stones, joined together very neatly, and covered with mats. On the outside of these habitations are platforms, on which the natives sit down and amuse themselves; and these are paved, in order to guard against damp in the rainy season. The religious ceremonies of the inhabitants resemble those of the Society Islands. The French, during their stay here, discovered nothing that had the appearance of worship to a Supreme Being. Pleasure is the divinity of the country; they have no superstition, no ceremony, no priests or jugglers, says Mar- chand. In each district they have a mora or, where the dead are buried beneath a pavement of large stones. They have a multitude of deities; and they only offer hogs in their sacrifices, but never men. They have no regular government.
ment, established law, or punishments; but custom is the general rule. Their chief food is the hog, which they eat five or six times a day, without having any regular meals. Their pork, and also their fowls, they dress in oven's dug in the ground, and heated with flaves; sometimes in wooden veflils, where the water is made to boil by means of hot flaves, which they throw into it repeatedly. Not unfrquently they eat hix raw, and even pork. They know how to extract from the cocoa-nut an oil, which is probably employed in the dressing of their dishes; but which is principally used for anointing the whole body: the women confume great quantities of it in maintaining the glows and beauty of their hair. When they are deftitute of animal food, they use the roasted bread-fruit, fish, malib, pudding made of it and other vegetables, a kind of walnuts, and a paste made of a root resembling the yam. Their common drink is pure water, and also cocoa-nut milk. They also prepare a strong liquor, either of pepper-root, which they use as a token of peace, or of the root of ginger; but they are temperate in the use of it, and no infiance of intoxication occurs among them. To their friends they manifest their civility in a fingular manner, by offering to them bits which they have previously chewed, in order to put them to no other trouble than that of swallowing what is thus prepared. The women are not allowed to eat hog, and are probably under other prohibitions, as at Oathette, and seem much more ferile to the men, and more harfthy treated. It has been faid that the women are not allowed to mef with the men, as is the cafe in other ilands; but Capt. Chanal fays that he was several times at their meals, and that he fou the men, women, and children eat in common, and feed on the fame dishes. They are employed in making cloth and matting, but not in cookery, except for themselves. The men seldom work. Some old perons excepted, who make cords and nets. The reft bark indolently in the fun, telling their florises, and thus begging their time. The chief is faid to have three wives, and has feveral children; but polygamy seems to be a privilege restricted to the chief. From what is known, however, of the difpofition and manners of the natives of St. Christiana, we may hesitate in admitting that they are at all acquainted with conjugal union; at least it is certain that the men know no more of jealousy than the women do of fidelity. Every woman seems to be the wife of all the men; and every man the husband of all the women. Every man makes to strangers the offer of every woman without any distinction. The Spaniards lead us to believe that the women are common without any distinction of age or kindred; but furgeon Roblet affures us, that the intimate union of the sexes between relations is rigorously prohibited; but he cannot affign the degree of rela- tionshup to which the prohibition extends. These people appear to be very fond of their children. Before the age of puberty, the operation of fitting the prepuce, is performed; and all the men are tattooed (see Tatfoning), even to the lips and eye-bells. They have few daffes, and, as the mi- fionaries fay, are yet happily free from the fatal malady which has made fuch ravages in the Society Ilands. Capt. Cook, in his Second Voyage, describes them as surpassing all other nations in symmetry of fhape and regular features. His obfervations have been confirmed by those of Capt. Chanal and furgeon Roblet, recorded by Marchand. Not a single deformed or ill-proportioned partion was feen on the iland; all were strong, tall, well-figured, and remarkably active. The men are from 5 feet 10 inches high to 6 feet. Their eyes are not fo full, nor their teeth fo good as thoife of many other nations; but Capt. Chanal fays, that they have fine large black eyes and handfome teeth; their hair is of various co- lours, but none red; some have it long, but the general cuflom was to wear it fhort, except a bunch on each side of the crown, which is tied in a knot. In thefe refpects there is a great variety; and also in their treatment of the beard. Thofe who prefer it at full length, which is commonly the cafe, arrange it in different ways; generally parting it into two tufts, and either shaving or plucking out the portion which belongs to the chin. When it is fuffered to grow to its full length, it is parted into locks, of which they form braids, or to which they fatten the teeth of fifies, or of men, or small pieces of bone, fleifs, and beads of coloured glafs, which they receive from the Europeans. Some eradicate the whole of the beard. On their heads they place various ornaments, formed of feathers, cloth, or cocoa-nut leaves, to which they fuppend pearl oyfier-shells, tortoise-shell, and pieces of mother of pearl, or various fizes and differently ar ranged; all which pieces are offtentatious, and of unequal diameter, form together a large cockade, flipted circularly. This kind of diadem is fometimes fupported by a plume. They also use various kinds of ornaments for the neck, which are composed of small pieces of light wood, with small red feeds attached to them with gum or fize, or of red bulbs, or of polished bone, fleifs, white corn, or bone. Men and women have, in general, their ears pierced; but none habitually wear pendants. In the number of their most curious ornaments, they reckon all that they receive from strangers, and even all that they can fteal from them; and everything is hung to the neck, the ears, and the wait. They also adorn their heads, arms, waift, knees, and even infpefts, as well as clubs and other weapons, with trefles or locks of hair, which may be that of the enemies whom they have slain in battle, or rather, when we consider their mild and placable difpo- fition, that of their friends or relations. To their wait, and on their fhoes, they fuppend two, or, and fometimes three fculs; but they are not to highly appreciated as the hair. They have, among their ornaments, large fcurf of the fibres of grafs and whitened with hine, which they use for cooking themfelves, and parfols made of large palm leaves adorned with a variety of feathers. Their countenances are pleafing and open, and display much vivacity. Their com- plexion is tawny, and rendered almost black by the puncfures of the whole body. Capt. Chanal thinks there are to fea differences among individuals as warrant an inference, that there exist among them species effenfly different. But the physical differences in individuals, noticed by furgeon Roblet, to mend him to indicate a difference in the fpecies. It is also known, that in order to dignitate the fame object, they have feveral names which feem not to belong to the fame language. Probably the Mendorians, from their mild and hospitable difpofition, have been induced to receive strangers among them, fhown by figns and the chances of war on their coasts, and to incorporate them in the primitive nation, with which they are at this day confounded. They were entirely naked, except a fmall piece of cloth round their wait and loins. Their puncfures were defposed with the utmost regularity, fo that the marks on each leg, arm, and cheek, were in general fimilar. The women, who are extolled for their beauty, are rather of tall fature, though well-proportioned, and their general colour inclining to brown. Some few are punctured or tattooed. They wear a long narrow piece of cloth wrapped two or three times round their wait, and having the ends tucked up between their thighs; above this is a bread piece of cloth, nearly as large as a fheet, tied at the upper cornets; they lay the knot over one fhoulder, and the garments, hanging below, reaches half way down the leg. Their garments, however, are of little use to the females;
females; as they are a sort of amphibious animals, who spend a great part of the day in water; and appear there as much at their ease as if they were reclined on a lofty carpet, or sporting on a feather-bed. Among these females a very great degree of libertinism prevails; and they either fell or gratuitously give their favours to any indiscriminately who seek them. Surgeon Roblet describes the licentiousness of their amours, though in guarded language, in a manner that muff disgust every chaste reader, and that throws their extreme degeneracy and indecorum. Their canoes are made of wood, and are backed by a loft tree, which grows near the sea; they are from 16 to 20 feet long, and about 16 inches broad. The head and stern are formed out of two solid pieces of wood; the former is curved, and the latter ends in a point, which projects horizontally, and is decorated with a rude carved figure, having a faint resemblance to a human face. Some of the canoes have a latteen sail, but they are generally rowed with paddles.

Their naval architecture, however, is still in its infancy, if we compare it with that of the Otaheitians. Sometimes two of their ill-constructed and leaking canoes are joined together, but they most commonly content themselves with adapting them an outrigger, composed of two bamboos projecting laterally, and fastened at their outer extremities by a branch of a light wood, which forms the gunwale of the frame. These canoes carry from three to seven men, and from ten to fifteen when two are lashed together. If a canoe overfalls, an accident not uncommon, the men jump overboard, right her bale her out, and get into her again very quietly. Capt. Chunal says, that the construction of their huts and canoes evinces no incomprehensible share of industry and patience. In the fabrication of their weapons, they display great care and ingenuity. These confit of lances from nine to eleven feet long, a fort of fabre, pikes or javelins, and clubs, having at one extremity a large knob, and made of cajuna wood, ornamented with carving. In the rainy season they maintain intercourse with one another by means of flits, composed of two pieces, so adapted to each other, as to admit of being accommodated to shallow or deep water.

Their tools, rude as they are, their fishing implements, differing very little from ours, and the various utensils, articles of furniture, garments and dresses, all announce intelligence and industry in the persons by whom they were invented, and also in those by whom they are fabricated. Their hatchet, which is a black and sharp knife, shaped like an elongated wedge, or a mortice chisel, and fastened to a piece of crooked wood by small finnett made of cocoa-nut bals; their pieces of shefil, formed in sharp-edged instruments and saws, and their rough flint of some flint, serve to fashion and polish their different works of carpentry and of sculpture. Their fishing implements, confitling of the hoop-net and the sweep-net, are made, some of them with cocoa-nut bals, others with the cortical fibres of a species of nettle. The same materials are employed for making ropes, finnett, and mats. Their household utensils confit of calabashes of different capacities, which they contrive to steep fo hermetically, that they may be employed for the conveyance of liquors, and of various wooden vesils used for their food; and on these they amuse themselves in carving and engraving figures of men, fishes, and birds. The fabllance of their cloths is the bark of the paper mulberry tree; and some are 3fo made of the cortical fibres of the bread-fruit tree; and these not only wear tolerably well, but are sometimes dyed yellow. After all, the principal occupation of the natives of St. Christophana is to fingen, dance, and amuse themselves. The music of Otaheite and of this island are much the same, and the inhabitants of both make use of the same kind of drums. They amuse themselves in running on their flits, and also in swimming, to which exercise they devote whole days, without any other nourishment besides the fish and the milk of cocoanuts. Thins devoted to amusement and pleasure, the Mendoças are an amiable, hospitable, and generous people. Although from the levity and indolence that are natural to them, they are addicted to theft, yet they relurn on the first demand, and even with laughter, the articles which they have purloined. Nevertheless, robbery is not authorized, nor even tolerated at Santa Christophana; and whilst they feed from fish, they observe the most temporal fidelity among one another. It is not easy to estimate the population of this island; but Marchand, allowing 1000 inhabitants for every league of coast, estimates the whole number at 7000.

On making a general comparison between the island of St. Christophana and that of Otaheite, it is evident that the former does not exhibit the opulence, the luxury, the profusion of food, the studied variety and vast quantity of cloth, which are remarked in the principal island of the great equinoctial ocean. The Tahiteens have many superficies; they have made great advances towards civilization, and great progress, not only in the useful, but even in the agreeable arts. The Mendoças possess a respectable competence, and in every respect a desirable degree of comfort, and their disposition inclines them not to wish for more than they enjoy; divided between pleasure and delights, they appear sheltered from the political storms which mull freqenly disturb the government, partly monarchical, partly feudal, which is established among the Tahiteens. The latter have left in liberty what they have acquired in civilization; one part lives by the labours of the other, and this is the natural and ordmary routine of great societies; they lead a sensual life, and hereditary differences already begin to punish them for their excesses. The Mendoças have preferred their primitive liberty in its full perfection; and every one lives through himself and for himself: the robust health which they enjoy is, without doubt, far preferable to that voluptuousness to which they are yet strangers. An European, I conceive, (says Marchand) would for himself prefer Tahitee to Wahihetó; but a Mendoça would be much to blame, if he envied the lot of a Tahiteen: by deviating more from nature, he could have little to gain, and, perhaps, much to lose.

The only tame fowls are cocks and hens, and their quadrupeds only hogs; but the woods are inhabited by small birds, whose plumage is exceedingly beautiful, and their notes sweetly varied. The Oceanic birds, which frequent the bay, are man-of-war birds, tropical birds, boobies, and different species of terns and swallows.

Captain Cook, Mr. Reinhold Forfier, and Meffrs. Charal and Roblet, have given a vocabulary of the words commonly used in this island, from which it appears, that the Mendoças employ no difficult articulation, and that their language, notwithstanding the frequent aspirations, and the veneration with which they are accustomed to express themselves, possess sweetness and a fort of harmony.

The language of this island has a great affinity to that of the Society islands, or it is rather, as Marchand fuggles, the same tongue; and if this be true, it proves, that, although the two archipelagos are separated by an interval of sea of 260 leagues, and although it may be presumed, that their canoes do not maintain between them an habitual communication, the people who inhabit them must have had a common origin. A native of the Society islands, who was embarked in the Resolution, conversed fluently with the native
tives of La Madre de Dios; but captain Cook says, that
the Englishi, who must in their visits to Otheite have ac-
quired a knowledge of most of the words spoeke there,
could never succeed in making themselves understood at
Santa Christiana. As far as it has been examined, the lan-
guage of this island employs 5 vowels, a, e, i, o, u, but the
consonants, in 95 words that have been collected by captain
Chanal, are only 8 in number, and perform the office of 12
different sounds, viz. b or p, d, c hard, g hard, k and g, f, m, n,
t. v. The natives of Santa Christiana cannot articulate our
r, and they supply the defect by a fort of aspiration. Our
consonants s, f, s, make no part of the articulations of
the language of this island. -

In Marchand's Voyage, (vol. 1.) we have an account very
much in detail of this island; together with a statement of
the circumstances in which the Spaniards, Englishi, and
French, differ from one another. This island, it is said, pre-
fents itself under an agreeable aspect; being very lofty, as
well as the other islands of the group. A narrow chain of
high hills extends through its whole length, and from the
shore run other chains of equal elevation, which branch out
and join the principal chain; these hills are separated by
confined and deep vallies, into which run rivulants or cas-
cades, that water every part of the island; fruit trees of
various species here occasion coolness, and yield abundance
to its inhabitants. According to the statement of

captain Cook, the island is in length, from N. to S. 3
leagues, of 20 to a degree, and in circuit 7 leagues, whereas
Quirpos extends it to 9 Spanish leagues of 17½ to a degree;
but as neither of them examined more than a portion of the
whole coast of the island, its absolute extent and circumfe-
rence remain still undetermined. The shores of this island
prent hollow rocks, the black, spongy, hard, and brittle
stone of which indicates the effect and the produce of a
great volcanic eruption; so that in regard to its origin and
the nature of its minerals it is similar to the higher of the
Society islands, which appear to have been the seat of an-
cient volcanoes. The foil of the valleys is a very strong
mould, sometimes black, sometimes red, and very fit for ve-
gation, and it produces various species of lichens, grasse,
puirrains, and thurbs. These vallies are covered with trees;
such as the cocoa palm, it produces the bread-fruit tree, the
plantain tree, the caufama, the paper-mulbery tree (mora pap-
fera,) the fibres of the bark of which are employed by the
natives in the fabrication of their cloths, &c. &c. Besides
the fruits of the cocoa-nut, plantain, and bread-fruit tree,
the island furnishes a fort of sweet potato, a species of
apple, ginger, cucumbers like those of the Well-India
islands, water-cres, and purriffin, the yam, the chestnut, the
walnut, &c. Santa Christiana possesses the fuerigar-cane; but
the inhabitants are ignorant of its value. European animals,
tho left there by captain Cook, either could not accom-
modate themselves to this climate, or were neglected, and
perhaps exterminated, by the inhabitants, so that later voy-
gers could not discover any of them; neither could they
find any of the European stenils or commodities, such as
looking-glases, knives, hatchets, nails, glafs-heads, &c. left
there by captain Cook, in 1774. The only quadruped
found in Santa Christiana was the hog, small in fize, but of
delicate and well-tafted flesh: if we except the rat, which,
to the great detriment of the inhabitants, has exceedingly
multiplied in the island. Poultry are scarce; and apparently
reared merely for the fake of placking the cocks, while large

tail feathers, afforred for forming plumes, are employed in fhad-
ring their head-drefles. The sea furnishes excellent rock-filh;

CHR

CHR

the bonito is very common. The bay is often frequented
by porpoifes and flark. The climate is fabulous, and the
natives appear healthy and robust; but the temperature is
subject to great variations from one fason to the other.
In 1774 the variation obferved by Mr. Wales was 4° 22' 15° E.
and in 1791, it was obferved by captain Marchand to be 3°
14' 18'/. From comparing the obfervations of Mr. Wales
and captain Marchand, it may be concluded, that in the
pace of 17 years, the variation of the compafs has not un-
dergone any material change in this latitude.

CHRISTIANIA, a city and fea-port of Norway, in the
government of Aggerhuan; fittated at the extrem-
ity of an extensive and fertile valley, forming a femicircular
bend along the ofore of a beautiful bay, which, being en-
closed by hills, uplands, and forests, has the appearance of
a large lake; and about 30 English miles from the open fea.
The navigation of the bay is somewhat difficult, but it is
fufficiently deep for the largest vessels, having fix or feven
fathoms of water clofe to the quay. It is the eclec-
tal capital of the kingdom; because it contains the fupreme
court of juifice. It lies in N. lat. 59° 56' 37", and E.
long. 10° 50', on the northern extremity of the bay of Bir-
ning, an inlet of the fea, forming the northern extremity of
the gulf of Christiania, whose rocky shores are overfearp
with thick forests. The town is divided into three parts,
viz. the city and the three suburbs of Waterland, Peter-
wigen, and Fierdingen, the forts of Aggerhuan, and the old
town of Opfloe, or Apfloe. The city contains 4,150 froun
the suburbs 682, Opfloe 420, including the epifcopal palace,
the (bifhop of Christiania being metropolitian of Norway,
and the fce yielding an annual revenue of 400l.) and the
number of inhabitants amounts to about 6,000. The city
formerly occupied the fite of Opfloe, and was rebuil'd in its
preffent fition by Christian IV. in 1624, after a plan de-
igned by himfelf: the streets are carried in ftraight lines,
and at right angles to each other, and are uniformly 40 feet
broad, and very neat and clean. It has a Latin school,
founded by Christian IV. in 1655, and a public library.
The caille of Aggerhuan is built on the well fide of the
bay, at a fmall distance from the city; and was erected in
1910 by the Swedes, and flrengthened in 1633 by
Christian IV. and by fuccedings kings of Denmark at sub-
frequent periods. Sce Aggerhuus.

Christiania has an excellent harbour, and carries on a con-
siderable trade. The principal exports are tar, foap, iron,
copper, planks, and deals; flum manufactured at Mr.
Cooper's works for about 3000l.; iron from the four works
of Borum, Edsvold, Narkedahl, and Ondahlen, 14,000l.;
copper from Foldholm, 10,000l.; planks and deals, 90,000l.,
principally to England. The planks and deals are faid to
be of inferior elification to thofe fent from America, Ruffia,
and the different parts of the Baltic; because the trees
grow on the rocks, and are therefore firmer, more compact,
and fels liable to rot than the others, which chiefly fhoit
from a fandy or loamy foil. The planks are either red or
white fir or pine. The red wood is produced from the
Scotch fir, and the white wood, which is in fuch high eli-
uation, from the fpruce fir. Each tree yields three pieces
of timber, eleven or twelve feet in length, and is usually fawn
into three planks; a tree generally requires 70 or 80 years
growth before it arrives at the greatest perfection. The
greatest part of the timber is fewn in the inland country,
and floated down the rivers and cataractes. Saw-mills are
ufed for cutting the planks; but they must be privileged,
and they are refrefted to cut only a certain quantity. The
proprietors are bound to declare on oath, that they have not
exceeded

6
CHR

exceeded that quantity: and if they do, the privilege is taken away, and the saw-mill destroyed. At Christiania there are 136 privileged saw-mills, of which 100 belong to the family of Anker. The quantity of planks permitted to be cut amounts to 20,000,000 standard deals, 12 feet long, and 1 3/4 inches thick.

Christiania, a government of Norway, otherwise called Aggerhus; which fee.

Christianan, Sr. a Portuguese town on the coast of Brazil; off which is a small bay without the northernmost reef of the river Surugippa, which is six leagues from the river Francelico, where is good anchorage.

Christianof, a fortified sea-port town of South Gothland in Sweden. N. lat. about 55° 26'. E. long. 15° 41'. It is four leagues from the S. end of the island of Oeland to the point of Christianopolis, which is the breadth of the S. entrance of Calmar found.

Christianopolis, in Ancient Geography, an episcopal town of the Peloponnes, in Arcadia.

Christians of St. John, in Ecclesiastical History, an ancient seat of Christians, very numerous in Baffora, and the surrounding towns.

They formerly inhabited along the river Jordan, where St. John baptized: and it was thence they had their name. But after the Mahometans became masters of Palestine, they retired into Mcopotomia and Chaldea.

They hold an anniversary feast of five days; during which, they all go to their bishops, who baptize them with the baptism of St. John; their baptism is always performed in rivers, and that only on Sundays.

They have no notion of the third person of the Trinity; nor have they any canonical books, but several which are full of charms, &c. Their biographies descend by inheritance, as our ecclesiastics do; though they have the ceremony of an election. There is no satisfactory account of the origin or principles of this fact. See Balaams.

Christians of St. Thomas, or St. Thomas, a seat of ancient Christians found in the East Indies, where the Europeans touched at the port of Calcut; who pretend to be descended from the house of St. Thomas converted in the East Indies; whence the name.

The natives call them, by way of contempt, Nazarenes; their more honorable appellation is Mappuleyam. See Thomands.

Some learned men in Europe say, it was not St. Thomas the apostle that converted that country, but another St. Thomas; others say, it was a Neftorian merchant, called Thomas. It is certain they are Neftorians, and have been so a long time; inasmuch that Christians of St. Thomas now pass for the name of a fact. They have a patriarch, who resides at Mozoul. The pope has made several attempts to reduce them under his obedience, but to no purpose. The number of these Christians must have been very considerable in the beginning of the 16th century, when the Portuguese became first acquainted with them, since they possewed about 1,100 churches, in the countries now subject to the Travancore and Cochin rajahs; and, at the present time, after the manifold persecutions, oppressions, and successive revolutions, that have almost depopulated the whole coast, they are computed to amount to no less than 150,000 persons. They are indiscriminately called St. Thomé Christians, Neftorians, Syrians, and sometimes the Malabar Christians of the mountains, by the Portuguese writers of that time, and by the subsequent missionaries from Rome. The most common name given to them by the Hindoos of the country is that of "Nazarane Mapila," and more frequently "Surians," or "Sriane Mapila." The appellation of "St. Thomé Christians," which the Portuguese were fond of bestowing upon them, probably originated from the chief who settled the first colony of Syrians on the coast, and who, according to their tradition, was their first bishop and founder of their religion in these countries, whose name was "Mar Thomé." His arrival may, perhaps, be ascertained to have occurred during the violent persecution of the sect of Neftorius, under Theodosius II., or some time after. The Portuguese, however, pretend that St. Thomas the apostle arrived in India, and, having converted a great number of idolaters on the coast of Malabar, and afterwards on the other side of India, as far as Mallaipoor, now St. Thomé, suffered martyrdom there. The Malabar Christians, as they say, remained a long time without ecclesiastical chiefs, and without intercourse with the rest of the Christian world, till they procured bishops from Mozoul in Syria, who introduced into this country the heresy of Neftorius. This, though very improbable, and unsupported by any historical proof, has been repeatedly asserted, even by Protestant writers. Common tradition, which has been admitted by the Portuguese writers of the 16th century, probably on the foundation of written records in the Syriac language, which then existed, and were afterwards all destroyed by the famous archbishop De Menezes at the synod of Oddiamper, mentions Mar Thomé as the first who introduced the Christian religion into Malabar. The Neftorians consider him as their first bishop and founder, from whom they derive their name of St. Thomé Christians. His arrival may be placed towards the middle of the 5th century; as notice is taken by Cofms Indelegleus of Christians in the pepper country or Malé, who received their bishops from Peria, where the Neftorian patriarch of that period resided, whose first seat was at Seleucia in Peria, afterwards removed to Babylon, and at last to Mozoul.

In the Malabar histories the first mention of a Syrian colony of Christians is made in the reign of Coconangom Perumal, who probably lived in the 6th century; and, though we have an account of two Syrian or Chaldaean bishops, named Mar Sapor and Mar Porpho, who arrived at Cochin, about 100 years after its foundation, where they were extremely well received by the rajah, and permitted to build a church, which subsisted when Cabral first visited Cochin. The grants and privileges, which they received from the rajah, were engraved upon copper-plates, which many centuries after were thrown to archbishop de Menezes, probably the same that are now in possession of the Jews at Cochin. Other circumstances, such as the name of Syrians retained by the St. Thomé Christians, their peculiar features and complexion, the style of their buildings, especially of their churches, and above all, the general use of the Syriac or rather Chaldaean language preferred in all their religious functions, concur in confirming the opinion, that the St. Thomé Christians were originally a colony of Neftorians. They formerly possessed, according to the Portuguese account, upwards of 100 villages, situated mostly in the mountainous part of the southern division of Malabar. They were distinguished from the other inhabitants in Asia, by the number of their religious sects; and as to their religious observances, they generally followed the doctrine of Neftorius. Upon the arrival of the Portuguese, attempts were made to proftyle them to the church of Rome; and, when persuasion failed, recourse was had to open force. At length Menezes, archbishop of Goa, made a personal visit to the Malabar Christians, and having appointed a synod at Oddiamper, in the vicinity of Cochin, in 1599, he assembled the Syrian priests of "Caffanis" and 4 elders from each village, and after some fiew of disputation and explanation of the controverted tenets of the church of Rome, he dic-
and overpowered them by his authority, effected in appearance an union of the Nestorianists of Malabar with the Romish church; and they were for some time governed by Roz and his successors, under the title of Vicar-general of Cannyonore, and their ecclesiastical dignity maintained for two years, were, in general, sincere, nor permanent; for soon after some Nestorians, or Nestorian priests, found their way to the mountains of Travancore, where they revived the old doctrines and rites, and ever since kept up their communication with the Jacobites, Maronites, and Nestorians of Syria. At present there are 32 churches of this description remaining, which are called Schismatic Christians by the Portuguese and Roman clergy. They have a bishop or a "Mar Thomé," who resides at Narnatt, about 10 miles inland from Poree, and was consecrated by some Jacobite bishop sent from Antiochia, for that purpose, in 1752. He adheres more to the doctrine of Nestorians than of Nestorians. About 63 of the old St. Thomé churches remain united to the Roman catholic religion, and are governed by the archbishop of Cannyonore, or, as he is himself, the archbishop of the Malabar Christians of the mountains. Since the death of the last archbishop, the government of Goa, which had formerly the nomination, has thought proper to appoint only a vicar-general, who resides at present at Packerpalipore. The Chaldean language is still used in their churches, and they are furnished with the necessary books by the "Congregatio de propagatione fidei."

The St. Thomé or Syrian Christians, of both descriptions, never claimed the particular protection of either the Portuguese or Dutch, as the new Christians do, but considered themselves as subjects of the different rajás-in-whole districts they lived, and for a considerable time remained unmolested. But when the rajás of Travancore and Cochin had succeded in subduing the petty rajás and chiefs, that were situated within the limits of Travancore, they established an oppressive despotism. The new or Portuguese Christians confounded that race of new converts, gained by the Portuguese mostly from the lowest castes along the sea-shore, where they built many churches; which, by way of distinction from the Syrian churches, are generally called the Latin churches. They formerly enjoyed the protection of the Portuguese and Dutch governments, without considering themselves as subjects of the rajás in whose territories they reside; and acknowledged only their jurisdiction in civil and criminal matters, and paid no taxes to their native princes. This exemption they maintained till the year 1785, when the governor of Cochin entered, for the preservation of their privileges, into a written agreement with the rajá of Cochin, which stipulated that they should pay a yearly sum to the rajá, and in delay or failure of payment, the Dutch, and the rajás, were to enforce it; the rajá, however, did not adhere to his stipulations; but, compelled, by oppressive treatment, a great part of them to abandon his dominions. The number of these Christians who consider themselves as under the protection of the fort of Cochin, is estimated at about 30,000. In ecclesiastical matters they were formerly subject to the Portuguese bishop of Cochin; but being expelled by the Dutch, when they got possession of the fort, he fixed his residence at Colan, retaining his former appellation of bishop of Cochin, and also his ecclesiastical jurisdiction over such churches as were not under the immediate control of the Dutch. His successors continue to reside over the same dioceese, which extends as far as the Cavery river, on the other coast, including the island of Ceylon; comprehending more than 100 churches, the new or Latin Christians. When the Dutch had expelled the Portuguese bishops from Cochin, they applied to the see of Rome for a new bishop subject to their control; and the pope sent out a Carmelite prior, with episcopal powers, under the name of vicar-general, to whom the St. Thomé General granted a diploma to that purpose, and this ecclesiastical dignitary has an annual stipend of about 450 rupees, paid him by the "Congregatio de propagatione fidei," and he resides at Varapoly, in a convent of his own order, supported by the "Propaganda." His diploma and power gradually declined; and at present only 14 churches are subject to his episcopal jurisdiction. The St. Thomé Christians formerly possessed a great number of churches or temples, separately built, in the inland parts of the Travancore and Cochin dominions; some of these have fallen upwards of a lack of rupees, and few lefts than half that sum. Now they are reduced to a wretched condition, being scarcely able to erect a shed for their religious meetings over the splendid ruins of their famous churches. As their population has decreased, their population has also diminished. Formerly the converts to Christianity were allowed to retain their patrimonial estates; and under the ancient mild Hindoo government, and even in modern times, till Hyder Ally made his second irruption, impose on landed property were unknown in Malabar. Another source of the opulence of the St. Thomé Christians was trade; for they were, in fact, the only, or at least the principal merchants in the country, till the Arabs settled on the coast. See Asiaf Researchers, vol. viii.

CHRISTIANSTAD, in Geography, one of the governments into which Southern Norway, or Norway Proper, is divided. It occupies the south western part of the kingdom; and contains 113,524 inhabitants. It is a bishopric yielding an annual revenue of 650l.

CHRISTIANSTAD, a sea-port town of Norway in the government or dioceese of Christiansand, opposite to the island of Flekker or Flekeren. N. lat. 58° 10'. E. long. 10° 14'.

CHRISTIANSTUG, a fortress of Africa on the gold coast, belonging to Denmark. It was taken by the negroes in 1693. who pillaged it, and kept it for some time.

CHRISTIANSTUG, the chief town of Montgomery county, in the slate of Virginia, North America. It contains few houses; has a court-house and gaol, situated near a branch of Little river, a water of the Kenawhaw. N. lat. 37° 5'.

CHRISTIANSHAFFEN, a part of the city of Copenhagen, built on the fife of Amak. See AMACK.

CHRISTIANSOE, a fortress of Denmark, built on a rock, on the east coast of the island of Bornholm.

CHRISTIANSTADT, a strong fortified town of Sweden, in the province of Skone, or Scania, built in 1614, by Christian IV, king of Denmark, when this province belonged to the Danes, and finally ceded to the Sweden by the peace of Roschof in 1658. The town is small, but neatly built, and is esteemed the strongest fortress in Sweden. The houses are all of brick, and mostly flucado white. It stands on a marshy plain close to the river Helga, which flows into the Baltic at Alus, at the distance of 20 miles, and is navigable only for small craft of 7 tons burden. English vessels annually refort to this port for alum, pitch and tar. The inhabitants have manufactories of silk, linen, and flax, and carry on a small degree of commerce: 57 miles W. of Carlifornia. N. lat. 55° 58'. E. long. 14° 6'.

CHRISTIANSTADT, a town of Silezia, on the west side of the Bober, 32 miles W. of Glogau, and 54 N.E. of Dresden.

CHRISTIANSTED, the principal town in the island of Santa Cruz, seated on the north side of the island, with a fine
fine harbour. It is the residence of the Danish governor, and is defended by a stone fortres.

CHRISTIANSUND, a small island of the Northern Ocean on the Western coast of the province of Drontheim in Norway. N. lat. 63° 10', E. long. 7° 58'.

CHRISTIGNETH, a river of North Wales, which runs into the Dee, in the county of Denbigh.

CHRISTINA, in Biography, queen of Sweden, the only child of the great Gustavus Adolphus, who succeeded to the throne of her father in 1632, when she was only five years of age. During her minority Sweden enjoyed internal repose, but during her in a long state of warfare with the German empire, in consequence of the invasion of Gustavus, as supporter of the protestant league. The war was conducted by able men whom the king left behind him. The abilities of Oxentier, who pursued the plans laid down by Gustavus, preferred for Christina that preponderance which the cabinet of Sweden possessed in the affairs of Germany. The young queen, at an early age, discovered a taste for the society and occupations of her sex. Her education was conducted upon a very liberal plan. She possessed a strong understanding, and a great turn for abstruse studies. At an early age she was capable of reading the Greek historians. Thucydides, Polybios and Tacitus were her favourite authors, and as she advanced in life, the love of letters became her ruling passion, which influenced the fortune and conduct of her whole life. At the age of eighteen she assumed the reins of government, and proved herself fully able to conduct the affairs of a powerful kingdom. The general peace of Weftphalia had in 1648 restored tranquility to Sweden on terms sufficiently honourable and advantageous to a nation which had attained to a military reputation in no wise inferior to that of any European state. Several princes of Europe aspired to the hand of Christina, but she rejected their proposals, pleading as the motive of her conduct, political interests, contrariness of religion, and diversity of manners. Her people, anxious for her marriage, recommended to her Charles Gustavus, count palatine, her cousin; she rejected their solicitations, having an insuperable aversion to the marriage state, of which she made no secret, declaring, in reply to one of the remonstrances made to her on the occasion, "that there were certain duties required in the nuptial ceremony with which she could not persuade herself to comply."

These words were variously interpreted, but the probably regarded the conjugal connection, as a complete humiliation, as it regards the female sex. To prevent a renewal of applications on this subject, she solemnly appointed Gustavus her successor, but without the smallest participation in the rights of the crown during her own life. In the year 1650 she was crowned with great splendour. From this time she entertained a philosophical contempt for pomp and parade, and a kind of disgust for the affairs of state. She seemed to be only interested in that part of the foreign power which gave her the opportunity of acting as the patron of the learned throughout Europe, and the encourager of the fine arts. She invited to her court men of the first reputation in various studies; among these were Grotius, Leibnitz, Bocchus, Huet, Voltaire, and others who were highly celebrated. Her choice with regard to these seems to have been directed more by general fame, than by her own judgment, or taste for their several excellencies, and in general estimation she has derived no great credit either as a learned lady, or as a discriminating patroness of literature. She was much under the influence of a Bourdlet, a physician who gained her ascendancy by outrageous flattery: and her attention to the high duties of her station disfigured her subjects. She was a collector of books, manu-
C H R

though. She returned to Rome, and cultivated a correspondence with the learned men there and in other parts of Europe, which was her chief solace under the neglect of persons in power. At the peace of Nineggen, she sent a plenipotentiary to take care of her interests, who with difficulty procured remittances of her arrears. In 1170 she took a decided interest in the doctrines of Molinos, the founder of the sect of Quietists, who was persecuted by the French government: and on the revocation of the edict of Nantes, in 1685, she wrote to the French ambassador in Sweden, animadvertting with much freedom and good true on the project of making converstions by permutation, and the want of royal policy in banishing useful artisans on account of differences in religion. Bayle published this letter, with his own remarks, which offended Chritiana, but the dispute was amicably settled. In a letter written in 1687 to Madame-Catherine Scudéry, she expresses herself with great tranquility on the prospect of approaching death, an event, however, which did not take place till 1689. The last scene she passed with philosophical composure; she died at the age of sixty-three, leaving behind her many letters; a "Collection of Miscellaneous Thoughts and Maxims;" and "Reflections on the Life and Actions of Alexander the Great." In Chritiana we behold qualities worthy of commendation and even high applause; but it cannot be concealed that the perplexed faults merit a strong and decided reprobation. In her we see a princeces discrediting her great endowments by a vain parade and affectation of singularity, and apologizing to a religion which she sometimes affected to ridicule and despise. While upon the throne, she was desirous of a private isolation, and after she had attained her wishes by the voluntary sacrifice of her authority, incessantly repining, and anxious to recover, upon the most humiliating conditions, that crown which she had so capriciously renounced. Coxé's Travels. Universal History.

CHRISTINA, SANTA. See CHRISTIANA, ST.

CHRISTINESTADT, in Geography, a sea-port town of Sweden, in the province of Eal Bothnia, built in 1640.

CHRISTIOPOLIS, in Ancient Geography, an episcopal town of Cappadocia.

CHRISTISEE, in Geography, a town of Poland, in the palatinate of Bracław; 44 miles S.S.W. of Bracław.

CHRISTMAS, the feast of the nativity of Jesus Chrift. It appears from St. Chryfoftom, that in the primitive times, Christmas and Epiphany were celebrated at one and the same feast; that father observes, that it was but of a little while that Chritinias had been celebrated at Antioch on the 25th of December, as a distinct feast; and that the use there of came from the West. The Armenians made but one feast of them, as low as the 12th century. It is commonly maintained, that pope Telephorus was the first who ordered the feast of the Nativity to be held on the 25th of December. John, archbishop of Nice, in an epistle upon this subject, relates that at the inftance of St. Cyril of Jerusalem, pope Julius procured a strict inquiry to be made into the day of our Saviour's nativity, which being found to be on the 25th of December, they began thenceforth to celebrate the feast on that day. However, the precise day, or even the month, in which our Saviour was born, is extremely uncertain. Some, as Clemens Alexandrinus informs us, affixed it to the 23rd of the month Pachon, corresponding to the 10th of May. But there are some circumstances which should rather lead us to conclude, that he was born in autumn; as this was, in every respect, the most proper feast of the year for a general aflertainment, which took place at the birth of Chrift, and which required personal att

tendance; and as there were shepherds watching their flocks by night at the time when Chrift was born; and therefore it is probable, that the aza of the Nativity was either in September or October, A. U. 748 or 749. See EPOCAH.

CHRISTMAS harbour, in Geography, a safe and commodious harbour, with good anchorage and plenty of fresh water, situated on the N.E. coast of Kerguelen's land, otherwise called Defolation island. S. lat. 45° 41'. E. long. 69° 4'. Variation, in 1777, 27° 45'.

CHRISTMAS island, an island of the Pacific ocean, so called by capt. Cook, on account of his first landing there on Chriftmas day. It is situated between the Sandwich islands on the N., and the Marquesas on the S., at about an equal distance from the one and the other. It is about 15 or 20 leagues in circumference, covered with wood, and bounded by a reef of coral rocks; having on the W. side a bank of fine sand, which extends a mile into the sea, and affords good anchorage. In digging no fresh water could be found; and this almost desolate and uninhabited island furnishes nothing but turtle, fish, and a few birds. Capt. Cook caured the seeds of the coco-nuts, yams, and melons to be planted in this island. N. lat. 1° 59'. E. long. 203° 30'.

CHRISTMAS CHAI, in Botany. See HELEBORUS NIGER.

CHRISTMAS found, a bay on the S. coast of Terra del Fuego, at the extremity of S. America, in S. lat. 55° 22'. W. long. 70° 3'. The entrance into this bay is 3 leagues wide, and bears from St. Idefonfos' islands, at the distance of 10 leagues, N. 35° W. The shore is generally a rocky bottom, so that ships should not anchor very near it. The E. point of this found is named Point Nativity; and the E. side of York Minster forms the W. point of this found; the variation here is 25° 30', E., and it has high water on full and change days at half past two o'clock. The adjacent land appeared to capt. Cook, when he visited this coast, desolate beyond any thing which he had yet experienced. It seemed to be entirely composed of rocky mountains, without the least appearance of vegetation. These mountains terminate in pointed precipices, which overhang cliffs which rise to a vast height, so that fearlessly any thing in nature can precipitate a more barren and savage aspect than the whole country. Barren and dreary, however, as the coast was, it was not totally diliterate of accommodations about Christmas found. Fresh water and wood for fuel were found about every harbour; and the country every where abounds with fowl, particularly geese. A considerable number of plants was also found upon it, almost every species of which was new to the botanists.

CHRISTO, MONTES, an island in the Mediterranea, S.E. from Corfica, in N. lat. 45° 17'. E. long. 10° 55'.—Allo, an island, due W. from Port Plata, on the N. side of the island of Hispaniola.—Allo, a remarkable mountain on the coast of Peru in S. America, a little to the southward of Point de Cames.

CHRISTO, Ponta, a point of land on the Atlantic shore, forming the S. limit of the gulf of Nicnreadia; nearly S. from Scutari, and almost due E. across the Hellepont, from Condamine.

CHRISTOFHER, in Geography, a town of Poland; in the palatinate of Sandomirz; 16 miles S.S.W. of Sandomirz.

CHRISTOGENON, from XPB, Christ, and τοιον, I am born; in the Greek Church, a sort of 30 days, immediately preceding the suppos'd time of Chrift's nativity.

CHRISTOLYTI, from XPB, Christ, and τις, I dif

difer, a sort mentioned by Damascenus; so called, because they maintained that Chrift descended into hell, body and soul;
foul; and that he left both there; ascending to heaven with his divinity alone.

CHRISTOMACHI, Ἀποτριγετος, from the Greek Ἀποτριγητος, Christis, and μεγαν ρημα, I fight or oppose, a designation given to all sorts of heroes who deny the divinity of our Saviour, or hold heterodox opinions concerning his incarnation.

CHRISTOPHER, HERB, in Botany. See Actaea foetata.

Christopher's, St. commonly called St. Kitt's, in Geography, is one of the leeward Charibbee or Charaibean islands in the West Indies, which was called by its ancient possessors, the Charibees, Lienmioga, or the fertile island. It was discovered, in November 1493, by Columbus, who, pleased with its appearance, gave it his own Christian name. It was neither planted nor possessed by the Spaniards; nevertheless it is said to have been the most early British territory in the West Indies, and the common parent both of the English and French settlements in the Charaibean islands. It was suggested by an experienced friend to Mr. Thomas Warner, that St. Christopher, though despised and deserted by the Spaniards, afforded the prospect of a favourable settlement for a colony; and in 1623, he formed the resolution of going thither with a few of his friends. Accordingly, he and 14 other companions took their passage in a ship bound for Virginia, and from thence they sailed to this island in January 1625, and by the following September they had raised a good crop of tobacco, which they proposed to make the staple commodity. Thus it appears, that the first actual establishment in this island was prior to that in Barbadoes, which did not take place before the latter end of 1624. The plantations of the English settlers were destroyed by a hurricane before the close of the year 1623; and Mr. Warner was obliged to return to England, where he obtained and possessed the valuable patronage and support of James Hay, earl of Carlisle, and thus by a favorable supply in 1624, he preserved the existence of the settlement. In the following year Mr. Warner returned to the island, accompanied by a large body of recruits, and at the same time arrived M.'s D'ÉfNambe, captain of a French privateer, who, after a severe engagement with a Spanish galleon, sought refuge in these islands. Having brought with him to St. Christopher's about 30 hardy veterans, they were hospitably received by the English, who thought themselves thereby secured against an apprehended attack on the part of the Charaibees. The fact seems to have been, that Warner's first colony lived on friendly terms with these savages, who liberally supplied it with provisions; but when their lands were seized by the planters, the latter, conscious of merit in retaliation, apprehended an attack, though none was really intended. The French and English feeling, or perhaps feigning, the alarm of a projected revolt, determined to seize the conspirators. With this view they fell on the Charaibees by night, and having in cold blood murdered from 100 to 120 of the stoutest, drove all the rest from the island, except such of the women who were young and handsome, of whom, says Pere Du Tertre, they made concubines and slaves. The Charaibees who had escaped the massacre, united with their countrymen in the neighbouring islands, made a vigorous attack in order to revenge themselves; and, after a severe conflict, the Europeans, indebted to the superiority of their weapons more than to that of their vaunt, obtained a complete conquest, purchasing their triumph with the loss of 100 men, who were left dead on the field of battle.

After this exploit the Charaibees quitted this and some of the small islands in the neighbourhood, and retired towards the south. Warner and D'ÉfNambe returned to Europe in order to solicit further succour. The former was knighted, and was sent back as governor in 1626, with 450 new recruits, amply supplied with necessaries; and D'ÉfNambe, patronized by Richelieu, the minister of France, projected the establishment of an exclusive company for trading to this and some of the neighbouring islands. The French, however, in general, either misjudged the island or disapproved the project; and though D'ÉfNambe failed from France in 1627 with 532 recruits, they were so feantily supplied with provisions and necessaries, that the greater part perished miserably at sea for want of food. The survivors were kindly received by the English; and for preventing future content, the commanders of each nation agreed to divide the whole island pretty equally between their respective followers. In May 1627 they signed a treaty of partition, which comprehended a league defensive and offensive; but this was of little avail against the Spanish invasion in 1629. For some time the French and English lived amicably; but at length national rivalry and hereditary animosity rendered the island a scene of internal contention and bloodshed.

Who were the first agrifcultors it is not now easy to ascertain; it is probable, however, that each nation would lay the blame on the other. In the reign of Charles II., during the first Dutch war, the French threatened the United States, and his subjects in St. Christopher's, avowing the doctrine of neutrality, attacked the English planters, and drove them out of their possessions; which were afterwards restored to them by the treaty of Breda. In 1689 the French planters, taking part with the interest of the abdicated monarch, again attacked and expelled their English neighbours; and laying waste their plantations, committed outrages that are unjustifiable among civilized nations, even in a time of open and avowed hostility. So cruel and treacherous was their conduct, that it was avenged by William and Mary as one of the causes which induced them to declare war against the French nation. The French, after having continued about eight months before matters of the island, were compelled by the English, under the command of general Codrington, to surrender, and in 1690 of them were transported to Martinico and Hispaniola.

In 1705 many of the English planters were again laid waste by a French armament, which committed such ravages that the British parliament found it necessary to distribute the sum of 100,000l. among the sufferers, in order to encourage them to continue their plantations. At the peace of Utrecht, this island was ceded to Great Britain, and the French possessions were publicly sold for the benefit of the English government; part of this sum, viz. 80,000l., was appropriated in 1733, as a marriage portion to the princesse Anne, who was betrothed to the prince of Orange. Some few of the French planters, who consented to take the oaths, were naturalized, and permitted to retain their estates. In 1782 it was compelled by a superior force to surrender to the French, after a very vigorous and noble defence; but by the general peace of 1783 it was restored to Great Britain.

St. Christopher lies in N. lat. 17° 15', and W. long. 65° 17'; it is about 14 leagues in circuit, and contains 457,66 acres of land, of which about 17,000 acres are appropriated to the growth of sugar, and 4000 to palmage. Sugar is the only commodity of any account that is raised, except provisions and a little cotton; and consequently it is probable, that nearly one-half of the island is unfit for cultivation. The interior part consists of many rugged precipices and barren mountains. Of these the highest is Mount-Mersey, (evidently a decayed volcano), which rises 3711 feet in a perpendicular height from the sea. The fertility of the mountains is, however, amply compensated by the fertility of the plains. The soil, which is peculiar to this island, is in general
ral a dark grey loam, very light and porous; and conceived to be the production of subterranean fires, the black ferruginous pumice of naturalists finely incorporated with a pure foam, or virgin mould. The under stratum is gravel, from 8 to 12 inches deep. Clay is only found at a considerable height in the mountains. Sugar-canes planted in particular spots of this island yield 8,000 lbs of Muscovado sugar from a single acre. The general average produce for a series of years is 16,000 bushels of 16 cwt, which, as one-half only of the whole caneyard, or 8,500 acres, is annually cut, (the remainder being in young canes) gives nearly 2 bushels of 16 cwt per acre for the whole of the land in ripe cane; and even this is a return fuel, it is conceived, as is not equalled by any other sugar country in any part of the globe. The planters of St. Christopher's, it is said, are at a profit by the experience for manure; they never cut ration-canes, i.e. those from old roots; and although springs and rivulets are sufficiently plentiful in the country for the cultivation or the inhabitants, their plantations suffer much in dry weather, as the sub-stratum does not long retain moisture. This island is divided into 9 parishes, and contains 4 towns and hamlets; viz. Duffe-terre, the present capital, containing about 600 houses; Sandy-Point, Old Road, and Deep Bay. Of these, the two first are parts of entry and inhabited by law. The fortifications consist of Charles-Hill and Brimstone-Hill, both near Sandy-Point; three batteries at Duffe-terre, one at Figtree bay, another at Palmetto point, and some smaller ones of inferior importance. The proportion which St. Christopher's contributes, with the other islands, towards an honourable provision for the governor-general, is 1000l. currency per annum; which is allotted on him by the assembly immediately on his arrival. He has also some perquisites, which, in time of war, are considerable. Each island within this government has a separate council, and each of them an assembly, or house of representatives. In St. Christopher's the council should consist of 10 members, but more than 7 are seldom present. The house of assembly is composed of 25 representatives, of whom 15 make a quorum. The requisite qualification to be a holder of 40 acres of land, or a house worth 50l. a year. Of the electors, the qualification is a 6-cheld of 10l. per annum. The governor of this, and the other islands in the same government, is chancellor by his office, and in St. Christopher's sits alone. In this island the jurisdiction of both the King's Bench and Common Pleas centres in one superior court, in which justice is administered by a chief justice and 4 puisne judges. The chief is appointed by the crown, the other by the governor in the king's name; and they hold their commissions during pleasure. The office of chief judge is worth about 600l. The emoluments of the affidavit judges are trifling. The present number of white inhabitants is computed at 4000, and taxes are levied on 26,000 negroes; and there are about 800 blacks and mulattoes of free condition. All the white men from the age of 16 to 60 are obliged to enlist in the militia, and they serve without pay. They form two regiments of foot, although the whole number of effective men in each regiment seldom exceeds 300. There is also a company of free blacks. The natural strength of this island is fuel, that a garrison of 2000 effective troops, properly supplied with ammunition and proviions, would, in all human probability, have rendered it impregnable to the formidable invasion of 1752. St. Christopher's is separated from the island of Nevis by a narrow strait about ½ of a league broad; W. from Antigua, as some say, 15 leagues, and according to others 21; and St. Eustatius is about 3 leagues W. by N. from the W. point of this island. Edward's Hist. of the West Indies, vol. 1.
The Chromati submitted to the emperors of Constantinople; whereas the Bulgarians remained independent.

CHIOBERG, in Geography, a town of Poland, in the palatinate of Sandomierz; 52 miles W. of Sandomierz.

CHIROKIEL, in Ornithology, the common quail, Tetrax coturnix, called Chrokiel, or Grande Caille de Pologne, by Buffon.

CHROMA, in the Botanical Writings of the Ancients, a word used to express a famous root brought from Syria into Greece, and used by the women of that country to paint their cheeks red. It was also called rhizium and focus, and by the Latins radica.

CHROMA, in Geography, a river of Siberia, which runs into the frozen sea. N. lat. 73°. E. long. 139° 14'.

CHROMA, in the Italian Music. The Italians take this term from the Greeks, but use it to signify a note or character of time, by us called a quaver, and when the word sem is added thereto, it means our semiquaver. Eight of the former are contained in a bar, and sixteen of the latter in common time.

CHROMA, in Rhetoric, a colour or fair pretence. The word is Greek, and literally denotes colour.

CHROMA is also a graceful way of lingering, or playing with quavers and ar il ces.

CHROMA also sometimes signifies the same as the chromatic diesis or semitone minor.

CHROMA is also used to signify the genus chromaticum. In this sense we find it used by Arilaxenus, and in Ptolemy's Harmonics.

CHROMATIC, in the Ancient Music, the second of the three genera, or kinds, in which the consonant intervals were subdivided into their concordant parts.

The other two kinds were, the enharmonic and the diatonic. The chromatic confounded of semitones, and minor thirds: it had its name, because the Greeks marked it with the character of colour, which they called χρώμα; or as P. Parran sug gists, because the chromatic kind is a medium between the other two, as colour is between black and white; or else because the chromatic kind varies and embellishes the diatonic kind, by its semitones; which have the same effect in music, with variety of colours in painting. M. Rou leau says, that this species of music was written in coloured notes. Arilaxenus divides the chromatic genus into three species; the molle, hemiolium, and tonieum: Ptolemy, into molle or antiquum, and interium.

These species were also called chromi, or colours of the genera; the molle expresses a progression by small intervals, the interium by greater.

The chromatic and enharmonic kinds only contain the smallest of the diatonic degrees; so that they have the same proportion to the diatonic, as fractions have to integers.

Boethius, and after him Zarlin, attribute the invention of the chromatic genus to Timotheus, a Mileshian, in the time of Alexander the Great. The Spartans banished it in their city, on account of its softness. The characters of this genus, according to Aristides Quintilianus, were sweetness and pathos.

Mr. Malcolm observes, that we are at a loss what use the ancients could make of these divisions and subdivisions, into genera and species. All acknowledge the diatonic to be the true melody; the others seem only humourous irregularities, calculated to pleae the fancy by its novelty and oddness; and were besides to very difficult, that few, if any, are said to have ever practised them accurately.

The moderns have been much perplexed to understand the different species of the chromatic music in use among the ancient Greeks. Most of our musicians have no other notion of the chromatic than of a melody proceeding by semitones, major and minor. This is what Brofka says of it. But this is not sufficient to convey a true notion of the chromatic.

Dr. Pepusch has given us a clearer light in this affair: his doctrine is as follows.

The ancients distinguished three sorts of chromatic, which were denoted by the names, molle, fasquinor, and tonieum.

The chromaticum molle, was a division of the diaterron, or fourth, into three intervals, which were two subseuent semitones minor, and the interval, which is the complement of these two to the fourth; and this interval will be found equal to a third minor added to an enharmonic diesis. This species is not to be met with among the moderns.

The chromaticum fasquinor, or hemiolium, was a division of the fourth into a semitone major, a semitone minor, and a third minor. This is mentioned by Ptolemy as the chromatic of Ddimus. It occurs in modern compositions.

The chromaticum tonieum, or tonicium, was a division of the fourth into a semitone major preceded by another semitone major, and the complement of these two to the fourth, which is the interval, commonly called a superfluous tone. This often occurs in modern music. Dict. de Musique, p. 19 Philos. Trans. No. 481. p. 272. Wallis, Appendix. Ptolem. Harm. p. 164.

Of the modern chromatic, the scale of which is so different from the ancient, we can easily explain the principles upon which it is built, by giving it a fundamental base. The regular chromatic scale in modern music, confining entirely of a series of major and minor semitones, such as the temperament of our keyed and wind instruments allows, ascending and descending, may receive the following fundamental base.

As it can very seldom happen that a complete octave of half notes can be wanted with a base to them, in order to avoid double sharps and flats, we have divided the chromatic octave into two tetrachords.

\[
\begin{array}{cccccccc}
G & A & B & C & D & E & F & G \\
\hline
b7 & b7 & b7 & b7 & b7 & b7 & b7 & b7 \\
\end{array}
\]

These are the general ideas throughout Europe of the ancient and modern chromatic. But the abbe Teyon, who has meditated on these matters more perhaps than any other modern theorist, has furnished an article to the musical Encyclopedists, which, though very ingenious, will, we fear, Vol. VII.
interval which constitutes the chromatic genus; as the tone is that of the diatonic; and the quarter-tone that of the enharmonic; the half-quarter tone that of the diatonic. It is evident, but it remains to be discovered, what ancient Greek, and modern authors, understand by a semi-tone. Aristo- toxianus did not understand himself, in speaking of half toncs, or a third or fourth part of a tone; it is in vain for him to say that he was accused wantonly of dividing a tone rigorously into halves, (Metebonius, p. 45. Aris.ox.) of confuting in his division of tones, only the judgment of the ear, (ib. pp. 14 and 15) rejecting musical ratios of intervals (ib. p. 12) which are their natural signs, and the proof of their degree of consonance and dissonance, i.e. of their harmonic or enharmonic character, it is wholly impossible for him to prove that a nominal semi-tone is, or is not, the precise half of a tone given.

2dly. The Pythagoreans of the last ages of Greece, those who dared to assume that title, after the total extermination of the Ionic sect, were not much more reasonable than the Aristoxianians, their opponents. Neglecting to confute the founds themselves in their theory, they were carried away by certain metaphysical prejudices, to calculate so complicatedly, as to lead to the simplicity of the ratio of sounds. Did they think that the ratio of the interval from the 7th to the 8th of a key (as in C. B C) which is 15 to 16, was with them 243 to 256: that of the major 5th (which is 4 to 5) to be 64 to 81? which rendered it so dissonant, that they agreed with the Aristo- toxianians, that it ought not to be ranked among concords. Aristo- toxianus pp. 20 and 471. Nicomachus, p. 20 and 211. Dacchius, p. 31. Aristox. Qint. p. 16. N. B. These three last were Pythagoreans, that is to say, pretended to profess the numerical theory of the Pythago- reans. Aristox. Qint. Indeed, (p. 144) tells us, that the ancients, meaning the Pythagoreans, had determined the ratio of the semi-tones to be 16 to 17, and 17 to 18: but we do not find that this division had been adopted in the Chromatic genus, with the semi-tones were from 243 to 256.

3dly. The moderns make the Chromatic scale proceed by semi-tones major and minor alternately; the frist in the ratio of 256 to 16, the other of 243 to 256. Now an interval from 15 to 16, is not a semi-tone, but a true diatonic interval, a real sound of the natural scale. Modern chromatic theorists, therefore, limit it to a single chromatic interval, which therefore cannot constitute a genus; for the chromatic genus ought to proceed by semi-tones. Now it is impossible in practice, to give to the two equal intervals without changing the key. Chromatic melody therefore would not have place in any of our keys. We must then either suppose that the moderns have no chromatic genus, or that they use many kinds of semi-tones, which are only equalized by temperament.

It is not, however, held by writers on the subject, that moderns have so easily differ from the ancient; but that the ancient composers are too often reason for the difference, we find it, not with a very lively hope that we shall succeed in the Greek Music. It would be of little use to enquire on the ratio of the tone of the first primary, What seems necessary to observe, is, that in the scale of the three genera have to be equal, the lowest not the highest. Thus (as the table, in modern notes, is B C D E), B C D E are primary; the genus common to the three genera; the B C D E are called Chords Staves. Whence I conclude that the Greeks never extended the different intervals above the fourth, but confined them to the intervals of their formule.

2dly. That in each formula of the chromatic genus, the first semi-tone is always equal to the second; (see the table of Aristo- toxianus's system at the head of his treatise). Hence I conclude, that the Greeks had not the least notion of what we call a key; because they had not the curiosity, I don't know, but the desire to use every tetrachord in some folio key. Now it is impossible to produce two consecutive similar intervals in one single key. But Pythamy, in re-establishing the ratios of the Greek system in their ancient simplicity, demonstrated that these semi-tones were rendered equal only by temperament. (What says the abbe Rouffer to this?) What ought to confirm us more and more in this idea, that the Greeks were not the inventors of their system, is their ignorance of its harmonic character, its modulation, and its relations. Though the tetrachord was the most ancient system of the Greeks, we must not conclude that it was the only one in each genus; they had likewise pentachords and diapasons, of which the intrinsic form has not been always the same: (could the diapason or octaves we have a latitude?) But in the last analysis, each of these systems is resolved, ultimately, in the tetrachord, which is properly speaking, the gamut of the Greeks.

"Chromatic, in Modern Music. The chromatic may be practised in modern music by utilizing different gamuts, by singing different passages, transitions, and chromatic graces or embellishments.

18. Of Gamuts. The natural, physical, and progressive form of a gamut is progressive, since every scale is included in a progression of the harmonics of a generator, that is, of a key note. Thus the diatonic gamut is the result of the regular production of sounds, comprehended between the extremes of the 4th octave from C the generator. The chromatic gamut immediately follows the diatonic in the acute, and is comprised between the 15th and 32d harmonics of C. Thus this gamut forms the 5th octave of the key note C, C#, D, D#, E, E#, F.

But much is wanting to render our chromatic gamut progressive, in which the semi-tones decrease uniformly from grave to acute. For including only semi-tones major and minor, its melody is less natural than a melody formed of progressive sounds; and the accompanying is forced, being reduced to three or four chords at most. For, when the chromatic melody proceeds by semi-tones major, in ascending each note is successively 7th and 8th of a key, or 31 and 4th, and reciprocally in descending. When the melody proceeds by semi-tones minor, we are driven to different combinations of the chord of the extreme flat 7th. When a succession of sounds alternately major and minor is used, we have a feint of minor tones. But it is easy to procure a chromatic accompaniment superior to all this, which have been in use hitherto, in supposing our gamut really progressive, and altered only by temperament. Now temperament ought not to change the harmony. Upon this supposition, when we sing C, C#, D, D#, E, we are supposed to sound the natural gamut, C, C#, D, D#, E, and we accompany it with this fundamental燧 of C, E, C, E, E, which is making the intermediate: half tone between C and D, passing notes; and in a rapid succession of half tones, raising or falling, allowing a half to the first and last note is sufficient. And this is the best apology that can be made for rapid semi-tone successions.

Chromatic Paffages, which we have hitherto accompanied by the several resolutions of the extreme flat 7th, and extreme sharp 6th, may be regarded as parts of the natural gamut. With a little use we may refer them to the true chord to which they appertain, in remembering that the major
major semi-tone has no place in the chromatic scale, and that
its true and only place, even in the modern gamut, is be-
tween the sharp 7th and 5th of the key note; and, conse-
quentially, in ascending, it may be accompanied by all the
chords which include the sharp 7th; as in the key of C: G
BDE, CEGB, DFB, DFGAB, FAB, DGe, etc.

4 But a general rule is, that every time the semi-tones
success each other chromatically, that is, without being se-
parated by wider intervals, we ought never to suppose them
equal; but always gradually, and progressively unequal. If
this rule is violated, you will have passages, but never chro-
matic melody, and a harmony which, far from determining
the key of the treble, will have no other effect, than to
puzzle and mislead the hearer.

Chromatic transitions consist in changing the key at each
note of the melody; which is supposing all the half notes
equal. But this supposition is more favourable to the igno-
rance of the composer than to the effect of the harmony and
melody. The composer regards each sound as the 4th and 5th
of a key successively, as superfluously 5th and 6th, or indeed as
3d and 7th below the key note, so that one form only of re-
solution serves him for the most considerable traits in har-
mony; an harmonic mechanism more likely to degrade the
melody than to enforce the effect. In general, it is the ig-
norance of the key of a chromatic melody, and of its true har-
mony, which drives composers to transitions (modulations).
To this there are some exceptions, but they are rare.

Chromatic graces, or embellishments, are passages not al-
lowed for in the time, by which piano-forte players, when
the right hand is low on the keys, mount up to the point
where the melody re-commences. It is, however, a feat
which destroys all idea of the key of the piece, if such runs
are not very short and rapid, and the performer has not the
faith and address to make the principal chords of the key
heard; which would require a profound knowledge of har-
mony, and a very active finger. But good harmonists leave
to mediocrity these childish ornaments, which are truly offen-
sive to delicate ears.

For our own parts, the running up and down the keys in
semi-tones is now become so common, affected, mechanical,
and unpleasant a trick, that we never wish to hear it performed
more frequently than once a year.

The nice discriminations of major and minor semi-tones in
the abbé Fétton’s ingenious article Chromatic, whence we
have made such long extracts, are speculations for discussion,
and materials for disputition, rather than practice. In com-
posing for our keyed instruments, and in playing on them,
both the composer and performer are at the mercy of the tuner,
and of his habitual temperament. The composer writes, and
the performer plays, as if the instrument were perfect. Our
forefathers, knowing where the wool lay in the organ and harp-
ichord, touched that key and its relatives as seldom as possible.
A composition in Eb or E, with a sharp 3d, is hardly to be
found in music of 100 years old; and we have old organs where
Eb and Ab seem, by the dult with which they are covered,
as if they had never felt the finger since the instrument was ere-
cted. But now the bold modulations of Emanuel Bach, Haydn,
and Mozart, have provoked another temperament; the tuners have, by degrees, been obliged, much against their
will, to try at equal harmony, and composers and performers
may now ramble about, without the fear of offending nice ears
by one key more than another. There is not time for calcu-
lation during the performance of a written piece, much less
of a voluntary. If a keyed-instrument is out of tune, the
auditor knows that it is the fault neither of the composer
nor player, and accommodates his auricular organ to the evil;
but if a vocal performer sings out of tune, or the intentions
of a violin player are false, it is never forgotten or forgiven.
Imperfection of intervals in singing, however, depends on the
chord of the finger, and on the strength of hand in the violin
player, more than on the ear of either; the mischief being
done before the ear of either is offended. The abbé Fétton
justly calls chromatic passages in which the key is dis-
guised as not to be known, chromatic graces; very different
things from chromatic modulations. See in Plates of Mus
examples of modern chromatic to a fundamental base; of
contrapunto d’opin in genoa chromaticis; and of Roussian’s
chromatic figurations.

Chromatic in Painting, is sometimes used to signify the
colouring. See Colour.

Chromatic, in Philosophy, denote that branch of the
science of optics, which it sets and explains the properties
of the colours of light and of natural bodies. See the detail
under Colour and Reflection.

Chrome. Chrome is a metallic substance of a grey-
white colour, extremely brittle, acidizable with great
difficulty by nitric acid, and then capable of combining with
caustic potash into a lemon yellow fust. This fust being
added to a solution of nitrat of lead occasions a deep orange-
red precipitate of chromated lead.

Chrome has hitherto been found only in the acid slates
combined with lead and with iron.

The colour of this mineral is aurora red. Passes into hya-
cinth red. It occurs sometimes disseminated, but most com-
monly crystallized, either in rectangular prisms, or in six or
eight sided prisms. The crystals are of moderate fixe, ad-
hering laterally to each other, and generally very imperfect
and ill defined; they have a brilliant external lustre. The
fracture is fine-grained uneven, passing into conchoidal and
irregularly lamellar. It breaks into blunt edged inter-
minate fragments. It is translucent, passing into semi-trans-
parent, is brittle, easily fragilae, and, when scraped, gives
a yellowish orange-coloured powder. Sp. gr. 6.05.

Chromat of lead, when exposed to the blow pipe, cracks
a little, and melts into a blackish flag. With borax it is in
part, reduced to the metallic state, and communicates a
green colour to the flux. It has been analyzed by Vauquelin
with the following result:

| 69.66 | Oxyd of lead |
| 36.40 | Chronic acid |
| 120.06 | |

This mineral has hitherto been found only in the gold
mine of Berezof, to the north of Ekaterenburg, on the
eastern side of the Uralian mountains: it is thinly dispersed
in a vein passing through granite and micaceous schists, ac-
compounded by quartz, ekaena, and felsparous pyrites; none of
the crystallized varieties have been found for some
years.

Sp. 2. Chromat of iron. The colour of this mineral is
greyish, or blackish brown; it occurs in masses; it passes
a slight degree of metallic lustre; its fracture is compact
uneven, sometimes imperfectly lamellar; when pulverized,
it is of an ash-coloured gray. It is hard enough to scratch
glass; is difficultly fusible, opaque, and gives an argilla-
ceous colour when breathed upon. Sp. gr. 4.09.

It is infusible before the blow-pipe without addition, but,
with borax, melts into a beautiful green-coloured glass. It
contains, according to an analysis by Vauquelin,
5 9 2
47 Chronic
Chromat of iron is said to have been found in Siberia; it has also been discovered in France near Goffin, in the department of Var, forming nodules and veins in serpentine.

The method of analysing the chromat of lead is very simple: Vanquelin has pointed out two ways, both of which we shall mention.

Take one part of finely pulverized chromat of lead, three parts of perfectly saturated carbonte of potash, and forty parts of water, and boil the mixture for the space of an hour. As soon as the substances begin to act on each other a brisk effervescence will take place, the orange-colour of the lead will change to brick red, and finally, when the effervescence has ceased, there will remain at the bottom of the vessel a powder of a dirty yellow colour, conflating of carbonat and chromat of lead, covered by a liquor of a bright golden yellow, which is chromat of potash. The liquor being poured off, and the powder well washed, some very dilute nitric acid is to be poured on the powder till it ceases to effervesc; the colourless solution, thus obtained, is nitrat of lead, while the undecomposed residue of chromated lead will remain unaltered, and is afterwards to be decomposed by a second digestion with thrice its weight of carbonated potash. The nitric solutions of lead being mixed together are to be decomposed by sulphat of soda, and the lead contained in the ore is to be eliminated from the nitrat of lead thus procured. The alkaline solutions of chromated potash are to be mixed with weak nitric acid, as long as any carbonic acid from the undecomposed carbonte of potash is given out, and the liquor, by frequent evaporation and cooling, deposits crystals of chromat of potash mixed with nitre.

The other method of decomposing this substance is, to digest together, at a moderate temperature, equal parts of chromat of lead very finely pulverized, thron and pure mutric acid, and water; taking care to stir the mixture from time to time. The chromat of lead will change to a white colour, and will be decomposed, being converted for the most part to mutric of lead. When the acid has ceased to act, the liquor must be poured off, and fresh mutric acid, (diluted as before with water,) to the amount of about one-fourth of the former quantity, is to be digested with the residue, till no more orange-coloured grains appear among the white mutric. This liquor being added to the former, together with the washings, the whole, after being heated, is to be placed for a few days in a cool place, that the small quantity of mutric lead that it holds may be deposited; when this is removed, some oxide of silver (precipitated from its solution in nitric acid by pure potash), is to be added very gradually till the last portions acquire a red purple colour; thus the whole of the mutric acid will be got rid of, and the liquor will contain only chromic acid, which, by slow evaporation, is deposited in small prismatic ruby-red crystals.

The decomposition of chromat of iron is not effected by any means so easily as that of chromated lead. The action of either mutric or oxymutric acids upon it is very slow and imperfect; nor is a boiling solution of either pure or carbonated potash attended with better success. The most effectual way of proceeding is, to fuse in a platinum crucible the finely powdered ore, with an equal weight of candid potash; then to separate by water all that is soluble in this fluid, and treat the residue with hot mutric acid. By the alternate use of these menstrua fix or leave times each, the whole of the ore will be taken up and dissolved. The mutric solution being evaporated to dryness, and then left to cool, will become gelatinous, thus announcing the presence of flixex, which may be separated by drying the jelly, and then dissolving the residue in boiling water, in consequence of which the flixex will remain undissolved; the clear liquor being then treated with ammonia, the iron will be obtained in the state of oxys. The mutric solution being thus exhausted, the alkaline solution is to be carefully neutralized by nitric acid, by which means the alumine will be precipitated, and nothing will remain in the liquor but chromat of potash and nitre, from which the chromic acid may be obtained pure, by adding nitrat of lead till no further precipitation takes place, and then treating the chromat of lead thus formed with mutric acid, as mentioned above.

Chromic acid is of an orange-red colour, and a pungent metallic taste; it is very soluble in water, and by gentle evaporation crystallizes in lengthened prisms. Like other acids it combines with the fusible bases, whence refults a genus of compound salts called chromats, the chief of which we shall proceed to describe.

Chromat of barytes is formed by mixing together the aqueous solutions of barytes and chromic acid: it appears as a pale lemon-yellow precipitate, is sparingly soluble in water, and has no perceptible taste. When heated, it gives out oxygen gas, and assumes a green colour.

Chromat of lime is prepared, like the preceding, by adding the liquid acid to lime water; an orange yellow precipitate falls down; differing from the chromat of barytes only in being less soluble, and in a somewhat different order of affinities.

The carbonated alkalies are decomposed with effervescence by chromic acid, forming very soluble and crystallizable salts of a lemon yellow colour. Chromat of ammonia is destroyed by a red heat, the alkaline base being decomposed, and dioxygenating the acid, so that only a green oxys of chromic remains behind. The alkaline chromats are decomposable with abfraction of their acid by barytes, lime, and bortonton, and with abfraction of their base by the mineral acinds; when added to any of the soluble metallic salts a double decomposition takes place, and the chromated metal is precipitated in the form of a coloured powder; mercury gives a vermilion red precipitate, silver a carmine red, lead an orange yellow, tin a green, &c.

Chromic acid appears to be very easily reducible to the state of oxys, in which state it is generally of a green colour. Thus, when heated on charcoal before the blowpipe, it first boils, and when the moisture is evaporated, a green pulverulent insubile oxys remains. By fusion with borax and glas of phosphorus, it affords vitreous globules of a bright emerald green. With tan it forms an infusible yellowish brown flocculent sediment; and with hydro sulphur of potash a brownish green one.

Muriatic and chromic acids, when heated together in a retort, occasion a considerable effervescence; part of the mutric acid is converted into oxymutric, which flies off; and the chromic acid is changed into the green oxys. Ether or alcohol, when heated for a few minutes with this acid, produce on it a similar effect; as does also muriat of tin, and the same metal in the reguline state, also iron, zinc, and most other metallic substances. Even light will decompose chromic acid, for a paper wetted with it, and exposed for a few days to the sun, assumes a permanent green colour.

In order to reduce chromic acid to a regulus, it is sufficient to heat it strongly in a crucible lined with charcoal; the result
fult will be a brittle, brilliant, greyish white, metallic button, amounting to about 67 per cent. of the acid employed. At a high temperature it assumes the form of feathery crystals. A fragment of this metal, when exposed to the blowpipe, first tarnishes, and then acquires a thin coating of green oxide. When finely pulverized, and treated with boiling concentrated nitric acid, it is oxidized, though with extreme difficulty, and gives the acid a light bluish green colour; by repeated abstractions it is at length completely acidified, and then exhibits exactly the same characters as the native acid.

Chrome, on account of its scarcity, and the short time that it has been known, has not yet been applied to any use; it is probably, however, capable of furnishing some fine pigments to the painter and enameller; in particular it will tinged glass with a true emerald green; the colouring matter of this beautiful gem having been recently proved to be this very metallic oxide.

CHROMIS, in Ichthyology, the name of a little fish caught frequently in the Mediterranean, the chief colour of which is dusky brown. Lineatus describes it after Artedi as Sparus, with the second ray of the ventral fins fuscous. See Sparus chronis.

CHRONIC dysepsia, in Medicine, from χρονος, time, is a disease which, from its nature, may be of long duration. The term chronic is used in contradistinction to acute, which implies a state of violent and febrile action in the constitution, which must necessarily soon terminate, either in recovery or death. See Disease.

Chronic weakness, a term employed by some physicians in a vague and somewhat general sense, to denote a variety of modifications of disease, which have often been called nervous, and which are accompanied with a general debility of the constitution, and a failure in the performance of certain functions, especially that of digestion. It includes those varieties which Dr. Cullen included in his genus of dysepsia, and Sauvages in that of asthenia, as well as hypochondriasis, obstruepsia, and other diseases, where the dyspnoea is symptomatic of some derangement of the stomach and bowels, or of the other viscera. The causes and the means of cure are such as belong to the varieties of dysepsia and asthenia. This term is rejected from the more correct medical vocabulary of the present day. See Chronic Weakness.

See Dysepsia and Asthenia.

CHRONICLE, CHRONICON, denotes a history digested in order of time; though the term is seldom used but in speaking of our old English histories, as Holinshed's Chronicles, Stow's Chronicles, &c. See Annals.

CHRONICLE, Parian. See Arundelian Marbles, and Parian Chronicles.

Chronicles, in the Canon of Scripture, are two faced books called by the Greeks Paralipomena, Paraleipomena, because they contain many fundamental relations omitted in the other historical books. The Hebrews, says Dupin, (Complete Hill of the Canon, &c. p 86.), made but one book of them, under the title of "Dibre-Ha'ananim," the sayings or actions of days or years, i.e. journals or annals; either because the order of time is more exactly observed in them, or else because they were taken out of the records, journals, or annals of history. They are an abridgment of faced history from its beginning, to the return of the Jews from the Babylonian captivity, taken out of the books which we have, and out of other annals which the author had by him in his time. The design of the author was to represent to the Jews the series of their history, which might have been obliterated from their memory during the captivity, and thus to put them in mind of their original. Accordingly, the first book traces the genealogies of the Israelites from Adam, relates the death of Saul, and gives a brief account of David's reign. The second traces the progress of the kingdom of Judah, its various revolutions, its period under Zedekiah, and the reformation of the Jews by Cyrus.

It has been generally supposed, that these books were compiled by Ezra, and that they were written after the termination of the Babylonish captivity, and the first year of the reign of Cyrus, who is mentioned in the last chapter of the second book. Some passages seem to have been transcribed verbatim from the histories and records that were made at the time when the temple stood, and when the Jews were in possession of Judæa; and others were probably interpolated or added after the time of Ezra. Dr. Kennicott has satisfactorily shown (Diffutations, vol. i. and ii.) that several apparent contradictions between the accounts in Chronicles and in the books of Kings, with regard to numbers, have arisen from the corruption of the Hebrew text; which may be easily accounted for when we consider that numeral letters, used in expressing numbers, might easily be changed into one another by transcribers. See Characters, Hebrew. Several words are also omitted, e.g. 34 in Chron. xi. 13, preferred in the parallel place in 2 Sam. xxiii.; and others are interpolated, e.g. two whole verses at the end of Chronicles; which interpolation is discovered by means of the beginning of the book of Ezra, which has the same words, fully proving that part, and a very abrupt part, of the decree of Cyrus had been subjoined to Chronicles, through the inadvertence of some transcriber. Thus, the two verses at the end of the book, which are far from being chronologically connected with the preceding, mention, and merely mention, the decree of Cyrus. They begin that memorable decree, but leave it unfinished; breaking off in the very midst of a sentence, in a manner perhaps unparalleled. These two last verses have, probably, been added improperly. Some transcriber, having finished the book of Chronicles at verse 21, proceeded, without leaving the usual distance between different books, to write the book of Ezra, but, finding his mistake, he broke off abruptly; and began Ezra at the culminating distance, without publishing his error, by erasing or blotting out those lines, which he had carelessly subjoined to Chronicles. Hence we may perceive, that the book of Chronicles once followed that of Chronicles.

CHRONOGRAPH, a kind of composition, whose numeral letters, joined together, make up some date, or epocha. See Anagram.

The word is compounded of χρονος, time, and γραφειν, to write. CHRONOLOGICAL, belonging to chronology. Chronological characters, are characters by which times are distinguished. See Characters. Of these some are natural, or astronomical; others are artificial, or historical. Natural chronological characters are those which men have established, as the solar cycle, the lunar cycle, &c. Artificial chronological characters are those which are supported by the testimonies of historians, when they fix the date of certain events to certain periods. We say also chronological tables, abridgments, machines, &c. See Chronometer, and Chronological Tables at the close of the last article.

CHRONOLOGY, compounded of χρονος, time, and σωζειν, to preserve, is the art of measuring time (See Time), distinguishing its several constituent parts, such as centuries or ages, years, months, weeks, days, hours, &c. (which see respectively) by appropriate marks and characters, and of adjusting
admitting these parts, in an orderly manner, to past transactions, by means of arsas, epochs, cycles, &c. (which see respectively) to the illustration of history. See History.

Stoicums divide chronology into five distinct branches; viz. metaphysical, physical, political, historical, and ecclesiastical; according to the various relations, or habits, in which time is considered; viz. as it is in itself; as connected and fully related to the affections, states, and alterations of natural things; as necessary to civil use; as matched with events that pass in the world; and particularly as it relates to the celebration of Easter, which see. The importance and utility of chronology, as it comprehends the distribution of time into its subordinate parts, and the arrangement of historical events by means of these several divisions, in the order according to which they occurred, so that their respective dates may be accurately fixed, must be universally acknowledged. Chronology has been, therefore, not unjustly designated "one of the eyes of history," and it also serves many interesting purposes in theology, and in various other departments of literature and science. As its use is extensive, the difficulty of acquiring it is not inconsiderable. It derives its chief assistance from astronomy and geography, and also from arithmetic, geometry, and trigonometry, both plain and spherical; and the wife of a Fludous and labourous apposition to various sorts of information. Supplied by the observation of eclipses, by the testimonies of Biblical authors, and by ancient medals, coins, monuments, and inscriptions. Its history, however, is comparatively of modern date, as we shall shew in the sequel of this article.

Edward, China. No nation has boasted more of its antiquity than the Chinese; but though they have shown us records of that country as far back as the Deluge, they have few, if any, authentic records of their history for a long period as five hundred years before the Christian era. This, however, may probably be owing to the general destruction of ancient remains by the tyrant Tin-chih-liang, in the year 215, or, as some say, 216, before the Christian era. We learn from a chronological table of the Chinese history, for which we are obliged to an illustrious Tatter, who was vice-roy of Canton in the year 1744, and a Latin translation of which was published at Rome in 1750, that the most remote epoch of the Chinese chronology does not surpass the first year of a prince called Gru-li-wang, who began his reign four hundred and twenty-four years before the vulgar era. This opinion is confirmed by the testimony of two of the most approved historians of China, who admit nothing into their histories previous to this period. The Chinese in their computation make use of a circle of sixty years, called liang, from the decomposition given to the first year of it, which forms as the basis of their whole chronology. Every year of this cycle is marked with two letters, which distinguish it from the others; and all the years of the emperors, for above two thousand years, have names in history common to them with the corresponding years of the cycle. Phil. Trans, abr. vol. xvi. part iv. p. 15, &c. According to M. Perrot, in his Essay, the Chinese date the epochs of Yao, one of their first emperors, about the year 2145, or as others state it, 2157, or according to Du Halde 2357 years before Christ; and reckon their first astronomical observations, and the composition of their famous calendar, to have preceded Yao a hundred and fifty years: and thence it is inferred, that the astronomical observations of the Chinese are Chaldeans' refence. Accordingly Mr. Wilton (Short View of the Chronology of the Old Testament) maintains that the Chinese chronology, when rightly understood, is exactly applicable to that which he has deduced from the Hebrew treatise of the Old Testament. Later authors date the rite and progress of the sciences in China from the grand dynasty of Tcheou, about twelve hundred years before the Christian era, and show, that all historical relations of events prior to the reign of Yao are fabulous. Mem. de l'Institut des Sciences, &c. Chinoises; a work compiled by the millenaries of Pekin, vol. i. Paris, 1756. See China.

Chronology, History, and Newtonian principles. Many ages must have elapsed before the mode of computing time, or of dating events, was brought into established use. The most ancient philosophers and thinkers must have been in error, and were unacquainted with chronology. In the age of Homer, a formal calendar seems to have been unknown, and at that early period time was measured by the Greeks, the revolution of the sun and moon, and the five fixed returns of labor 1787; but we need not push our inquiries further into that part, as months, weeks, and hours, from the purport of the subject to history or its regular events; nor do we discover any authorities to clocks, dials, or watches.

Several centuries intervened between the Olympian era, and the first historians; and several more elapsed before the period in which the first chronicles appeared. We find that even after the computation of time commenced, its first names were very inexact. See the sequel of this article.

Sir Isaac Newton has shown that all nations, before they began to keep exact accounts of time, have been prone to improve their antiquity. Thus Herodotus informs us (lib. i. c. 42) that the priests of Egypt reckoned from the reign of Menes to that of Sichon, who put Sidonian to flight, 1011 generations of men, as many priests of Velas, and as many kings of Egypt; and 13 generations were compiled to amount to 100 years; the whole interval from Menes to Sichon was estimated at 1340 years. The Chaldeans also boasted of their antiquity; for Calilhodene, the disciple of Aristarchus, sent astronomical observations from Babel to Greece, which were said to have comprised an interval of 100 years before the time of Alexander the Great; and they further boasted, that they had observed the stars 1500 years. There were also others, who made the kingdoms of Asia, Media, and Darius, much older than the truth. Some of the Greeks, says Sir Isaac, called the times before the reign of Ogyges unknown, because they had no history of them; those between his flood and the beginning of the Olympiads, fabulous, because their history was very much blended with fabulous tales; and those after the beginning of the Olympiads, historical, because their history was free from such fables. The fabulous ages, however, wanted a good chronology; and so also did the historical, for the first 60 or 70 Olympiads. Hence it appears, that the chronology of ancient kingdoms was involved in the greatest uncertainty; and this illustrious philosopher has shown, that the Europeans in particular had no chronology before the Persian empire, which began 528 years before Christ, when Cyrus conquered Darius the Medes, and that the chronology which they now have of more ancient times has been since framed by reasoning and conjecture. In the beginning of that monarchy, Aqueinians made Theronus as old as Ogyges and his flood; and that flood 1220 years older than the first Olympiad, or 680 years more ancient than the truth; and in order to warrant this computation, his followers have increased the reigns of kings both in number and duration. The antiquities of the Greeks are full of fables, but we are left to their writings were composed only in verse. The ancient philosophers, as Orphus, Hesiod, Parmenides, Xenophanes, Empedocles, and Thales, anciently delivered their opinions in verse, but this mode was afterwards discontinued. Pausanias farther informs us (Observ. tom. ii. p. 46.) that
CHRONOLOGY.

that Aristarchus, Timoccharis, Aristillus, and Hipparchus, described astronomy in prose, without rendering it the more contemptible, after Eudoxus, Iltedes, and Thales had written concerning it in verse. We learn from Pliny (Nat. Hist. i. vii. c. 56.) that Pherecydes Syrus taught to compose dictionaries in prose in the 59th olympiad, or the reign of Cyrus; and Cadmus Mileus to write history. In another place (ib. v. c. 29.) he says, that Cadmus Mileus, who flourished at a period somewhat earlier than the Persian monarchy, was the first who wrote in prose. Jophbus (Cont. Apion.) informs us, that Cadmus Mileus and Aecilius, the oldest historians among the Greeks, flourished a little before the expedition of the Persians against the Greeks; and Suidas says of Aecilius, not only that he was a most ancient historian, but that he wrote genealogies out of tables of brahs, found in a corner of his father's house. Pherecydes, already mentioned, wrote of the antiquities and ancient genealogies of the Athenians, in ten books, and was one of the first and best of the European writers of this kind, whence he obtained the name of "Genealogus;" and Dionysius Halicarnassenus (lib. i. c. 13.) effects him to be second to none of the genealogers. Euphenides, the historian or genealoger, who was a different person from the Cretan philosopher of the same name, wrote of the ancient genealogies; and Hellanicus, who was 12 years older than Herodotus, digested his history by the ages, or sequentia of the priesthoods of Juno Argeia. Others digested theirs by the archives of Athens, or kings of the Lacedemonians.

Ephorus, the disciple of Herocrates, digested his records by generations. Accordingly Polybius is of opinion, (lib. v. § 33.) that this historian of Cumæ was the first who attempted to reduce chronology into a regular science, under the form of an universal history; and we know that he flourished in the time of Philip of Macedon, about 320 years before Christ. He began with the return of the Heraclids into Peloponnesus, and ended his chronological history with the siege of Perinthus, in the 26th year of Philip, the father of Alexander the Great, that is, eleven years before the fall of the Persian empire. We may observe, however, that the Arundelian marbles (which see), composed 66 years after the death of Alexander the Great, take no notice of olympiads, and reckon backwards from the then present time by years; and that in the histories of Herodotus and Thucydides, the dates of events are not ascertained by any fixed epochs; nor were the olympiads applied to this purpose at so early a period. Times of Sisili, who flourished in the reign of Ptolemy Philadelphus, about the middle of the third century before Christ, or in the 25th olympiad, was the first who attempted to establish an era, by comparing the dates of the olympiads, the Euporean kings, the archons of Athens, and the praefetes of June, and adapting them to one another, according to the best of his judgment. Where he left off Polybius began, and continued the history. Before this time nothing satisfactory on the subject of chronology seems to have appeared; and the true reason is obvious, because before the epochs of Alexander, the Greeks had very scanty materials for such a work, as their knowledge was confined to a very narrow tract of country, and to the annals of a very short period of time. Their travellers could not easily impart the hitorical memoirs of the countries through which they passed, as they wanted the necessary advantages for this purpose; such were a thorough knowledge of the language of the country, a free access to all their principal records, and a perseverance in such laborious researches for several years. But general wars, notwithstanding the number of diabolical calamities that attended them, afforded opportunities for obliterating the situation, nature, and improvements, of other countries; and thus the progress and circulation both of learning and of other useful arts were the more easily propagated into different countries. Strabo informs us (Geog. lib. ii.) that the Greeks derived great advantages, even in their knowledge of geography, from the ancients of Alexander; for by his means they became more perfectly acquainted with the larger tracts of Asia, and all the northern parts of Europe to the river Ister; and he might have added the whole extent of Egypt; so that, at the same time, they obtained the full possession of Babylon and Egypt, the two great fountains of ancient learning. The Romans, says Strabo, in like manner diffused the fame light over the western parts of Europe, up to the river Elbe, which divided Germany into two parts; and they went beyond the Ister even to the Tyras; and as for the countries round the lake Mageticus, and the sea coast to Colchis, they were uncovered till the days of Mithridates named Eupator, king of Pontus; and the Parthian empire made Hyrcania, Bactria, and the Scythians that lived beyond them, to be better known. We may therefore take it for granted that no general history could be properly compared, till the geography of those countries was sufficiently known, in order to describe the strength of each particular kingdom, the number of its inhabitants, the progress of its arms, or the provinces that might be lost or acquired in its quarrels with other kingdoms. But whenever the access to all these countries was laid open by the conquests of Alexander; when so many new kingdoms were established under the Macedonian government, into which the citizens of all the Greek states were freely admitted; when it extended the Greek tongue, as an universal language, over Asia and Egypt; it gave the most favourable opportunity to several eminent men to write histories of different nations. Berosus compiled the history of Chaldaï, from the records of Babylon; and Manetho that of Egypt, from the records of Memphis and of Thebes; and the Arundelian marbles gave a complete series of the annals of Greece from their earliest times; all of which were composed in that age, by contemporary writers. And when we add to this, that the great library of Alexandria was first formed under Ptolemy Philadelphus, into which the writings of all nations were collected; we may well conclude from this induction of particulars, that it was at this period, and not before, that chronology became a science. Moreover, if we consider the situation of the world at this time, we shall be confirmed in the same opinion. For, till there was a collection of proper materials brought together, such as the manuscripts of all nations must contain, it was impossible to separate the truth of history from the rubbish of fable; because facts are only to be canvassed from a multitude of circumstances, which combine together to give light to each other, while the contemporary history of one country corresponds to the contemporary state of another. As a library was necessary to furnish the materials for this purpose, we accordingly find that the first "great father of chronology" was Eratosthenes, appointed by Ptolemy Euergetes, the librarian of Alexandria, who flourished about 100 years after the death of Alexander the Great, who had access to that invaluable treasure of learning. The possession of such a multitude of historical memoirs both prompted and enabled him to determine the dates of many remote facts. And we are informed by Dionysius of Halicarnassus (lib. i. § 46.) that in the execution of this work, he had laid down to himself certain "chronological canons," which that great writer declares he found to be accurate and uncorrected; having examined them, in a treatise...
CHRONOLOGY.

written upon that subject, which, to the regret of the learned world, has been irrecoverably lost. The chronographic canons, or general principles of the chronology of Eratosthenes, are found in the Stromata of Clemens Alexandrinus (p. 145); and they are as follows:

| 8      | Thefe numbers are fortunately confirmed by a passage of Dionysius Halicarnassæus (p. 69); from which we learn, that the 432d year from the taking or Troy was, according to the canons of Eratosthenes, the 1st of the 7th Olympiad; which agrees with the Clementine numbers. Eratosthenes was succeeded by Apollodorus, the disciple of Pantaclus, the Æolic philosopher, who flourished in the time of Polykles Phyicon. The following circumstances may lead us to presume, that in his syllabus of chronology, he followed Eratosthenes. They both agreed concerning the interval, that elapsed between the taking of Troy and the return of the Heraclids, both making it 80 years. They also agreed concerning the age of Homer, and likewise concerning the age of Lycurgus; and they purposed the same method in determining it. Apollodorus adopted Eratosthenes' list of the kings of Thebais. Eratosthenes and Apollodorus have been followed by all succeeding chronologers. Nevertheless, after all the improvements made in chronological computation by the writers above-mentioned, chronology was still, in a very considerable degree, uncertain; and that it was reputed doubtful by the Greeks of those times is evident from several passages in the beginning of Plutarch's life of Lycurgus, and also in his life of Solon, to which we refer the reader.

As Cambyses destroyed all the records of Egypt, imperfect and dubious as they were, we have no account of its inhabitants, which can be depended upon before their intercourse with the Greeks, from whom we derive all that is known of them, and that was not before the time of Pyrametichus, whose reign began in the year 600 B.C. Of this we are informed by Herodotus, who, speaking of those Grecians who had aid in setting Pyrametichus on the throne of Egypt, says, that the Romans and Carians continued for a long time to inhabit those parts which lay near the sea, below the city of Bachdia, on the Pelusiac branch of the Nile, till in succeeding times Anearch, king of Egypt, caused them to abandon their habitations, and settle at Memphis, to defend him against the Egyptians. But from the time of their establishment, he says, they had no communication with the Greeks, that one may judge, we know all this to be true, in Egypt from the reign of Piametichus to our age.

The chronology of the Latins was still more uncertain than that of the Greeks. &c. Plutarch (in Romulo et Numa), and Servius (in Æneid. vi. v. 678.) represent the originals of Rome as attended with great uncertainties; nor can we wonder at this, when we consider that the old records of the Latins, or at least a considerable part of them, were burned by the Gauls in the year 390 B.C., or 120 years after the regignis, in 506 B.C., and 63 years before the death of Alexander the Great; in 374 B.C. Quintus Fabius Pictor, the oldest historian of the Latins, lived 100 years later than Alexander, and took almost every thing from Diocles Preparathus, a Greek. At the time when the Greeks and Latins were forming their technical chronology, there were among them great disputes about the antiquity of Rome. (See Epoche and Rome.)

The chronologers of Gallia, Spain, Germany, Scythia, Sweden, Britain, and Ireland, are of a still later date; for Scythia, beyond the Danube, had no letters, till Ulphilas, its bishop, introduced them, about 600 years after the death of Alexander the Great; and Germany had none till it received them from the western empire of the Latins, above 700 years after the death of that king. The Huns had none in the days of Procopius, who flourished 850 years after the death of that king; and Sweden and Norway received them at a still later period. And it must be allowed, that things, which were done above four or two hundred years before the rise of letters, are of little credit.

After a general account of the defects and obscurity of the ancient chronology, Mr Flane observes, that, though many of the ancients computed by generations and succession, yet the Egyptians, Greeks, and Latins, reckoned the reigns of kings equal to generations of men, and three of them to a hundred, and sometimes to a hundred and twenty years; and this was the foundation of their technical chronology. He then proceeds to vince, from the ordinary course of nature, and a detail of historical facts, the difference between reigns and generations; and that, through the latter, from father to son, may at an average be reckoned about thirty-three years, or three of them equal to a hundred years, yet when they are taken by the oldest sons, three of them cannot be computed at more than about seventy-five or eighty years; and the reigns of kings are still shorter, so that eighteen or twenty years may be allowed a full medium. He then fixes on four remarkable periods, viz. the return of the Heraclids into Peloponnesus, the taking of Troy, the Argonautic expedition, and the return of Scythia into Egypt, after his wars in Thrace; and sets the epocha of each by the true value of a generation. We shall confine ourselves at present to his estimate of that of the Argonautic expedition. Having fixed the return of the Heraclids to about the hundred and fifty-ninth year after the death of Solomon, and the destruction of Troy, to about the seventy-sixth year after the fame period (see Hydraida and Troy); he observes, that Hercules the Argonaut was the father of Hyllus, the father of Cleodes, the father of Arilochmus, the father of Arildemos, who conducted the Heraclids into Peloponnesus; so that their return was four generations, reckoning by the chief of the family, later than the Argonautic expedition, which therefore happened about forty-three years after the death of Solomon. This is farther confirmed by another argument. Epaphus and Hercules were Argonauts. Hippocrates was the eighteenth inclusive from the former by the father's side, and the nineteenth from the latter by the mother's side; allowing twenty-eight or thirty years to a generation, the seventeen intervals by the father, and the eighteen intervals by the mother, will, at a medium, give five hundred and seven years; and these, reckoning back from the commencement of the Peloponnesian war, or four hundred and thirty-first year before Christ, when Hippocrates began to flourish, will place the Argonautic expedition...
tion in the fortieth-third year after Solomon’s death, or nine hundred and thirty years before Christ.

If we date the commencement of the Peloponnesian war in the 20 year of the 57th olympiad, and count back 507 years, we shall come to the 162d before the old annals, which is about the 37th year after the death of Solomon.

Sir Isae Newton ascertains the Argonautic expedition, and several other principal events in the Grecian history, by such a variety of independent arguments, drawn from the same and different mediums, all so agreeable to the present course of nature, that it seems impossible for a person who pays a sufficient regard to it not to be determined by them. It is surprising, indeed, that the manifest inconveniences of the commonly received chronology with the course of nature, should not have prevented the establishment of it; and it is absolutely unaccountable, but upon the disposition which all men have discovered, to admit any hypothesis which tends to give dignity to their nations and families, by adding to the antiquity of them. But must it not be a more accountable attachment to established hypotheses, which can induce any person of the present age, after these inconveniences have so clearly pointed out, still to adhere to a chronology, which, in those turbulent unsettled times, supposes kings to have reigned one with another in some succesions 35, in some 38, in some 43, in some 44, in some 46 years a piece; and which generally allows about 60 years to a generation, and in one instance 82? 2d. With respect to the chronology of the kings of Rome, Mr. Hookes has shown, by several independent arguments, deduced from the connexion of events in the history of their reigns, that to suppoze them to have reigned one with another 19 or 20 years, makes a more confusion of facts, than to imagine them to have reigned 35 years a-piece, which is the common hypothesis.

The chief inconveniences attending the old chronology in the Roman history are, that it supposes an interval of 63 years of peace in that restless nation before the accession of Tullus Holillius. It makes the reign of Servius Tullius fo long in proportion to the few centuries, which (according to the most authentic records) were taken in his reign, as would argue a most unaccountable neglect of his own favourite institution. It obliges us to suppose Tarquinus Superbus not to have been the son of Tarquinius Priscus, Dido not to have been contemporaneous with Æneas, or Numa with Pythagoras, as well as Solon with Crefulus in the Grecian history; all which have the unanimous voice of all tradition in their favour, and which Dionyfus Halicarnassenlis, Livy, and Plutarch, express their extreme unwillingness to give up, but that they were compelled to it by a regard to a chronology which in their times was unquestioned. Indeed, the congres of Solon and Crefulus Plutarch expresses his determination not to give up, notwithstanding his general attachment to a theory which would not admit of it, and the fallacy of which he did not expect. To this purpose he says, ‘The congres of Solon with Crefulus some think they et. confute by chronology. But a history so illusious, verified by so many wittnesses, and which is more, so agreeable to the manners of Solon, and worthy of the greatness of his mind and of his wisdom, I cannot persuade myself to reject because of some chronological canons, as they call them; which 100 authors correcting have not been able to confute anything certain, and have not been able to agree among themselves about repugnances.’

If the number of kings that reigned at Alba be joined to those who reigned at Rome, and they be allowed to have reigned 19 or 20 years a-piece, they will place the coming of Æneas into Italy, and the siege of Troy, exactly at the time in which arguments drawn from generation and succesions in Greece, as well as astronomical calculations (as we shall shew in the sequel), place that event, which is a reciprocal confirmation of the full correction both of the Greek and Latin chronology. For from Latins to Numitor are 16 kings, who reigned at Alba; Romulus was of the house of Numitor, and after him Dionysius and other histotians reckon 6 kings more at Rome to the beginning of the confuls. Now these 22 reigns, at about 15 years to a reign one with another (for many of these kings were slain), took up 336 years, which, counted back from the confulship of J. Brutus and Valerinius Poplecola, the two first confuls, place the Trojan war 78 years after the death of Solomon. See Troy.

This computation likewise agrees, as Sir Isae has shewn, with what Apianus, in his History of the Punic Wars, relates, out of the archives of Carthage, which came into the hands of the Romans, viz. that Carthage had 700 years. This is a round number, but Solinus adds the odd years when he says, ‘Carthago pot est annos 737 quum fuerat ext ucta exi- diritur,’ which places Dido, the founder of Carthage, about 70 years after the death of Solomon. See Carthage. It likewise agrees with the Arundelian marbles, which say that Teucer came to Cyprus 7 years after the destruction of Troy, and built Salamis, in the days of Dido. It is indeed an argument very much in favour of Newton’s computations, that they agree very nearly with all the most ancient monuments, the most correct tradition of antiquity, and the oldest historians; particularly Herodotus and Thucydides, who wrote before chronology was corrupted by the vanity of their nation, or the absurd systems of later histrionia. Moreover, it conducts very much to the credibility of the Old Testament history, that the courses of generations and succesions in the one correspond to those in the other. Besides, in several other respects it brings them to a greater harmony than can be arrived on any other principles; and, in particular, it places the expedition of Scophris (probably the same person with Sisæs) at the precise time in which it is spoken of in the Scriptures. See Sesostris.

The other kind of reasoning, by which Sir Isae endeavours to establish the epocha of the Argonautic expedition, is purely astronomical. The sphere was formed by Chiron and Mafæus at the time, and for the use of the Argonautic expedition, as several of the afterfims, mentioned by Aratus, and referring to this event, plainly shew; and at this time (as several ancient writers testify) the cardinal points of the equinoxes and solstices were placed in the middle of the confullations of Arius, Cancer, Chelaz, and Capricorn. Our author establishes this point by a confideration of the ancient Greek calendar, which consisted of 12 lunar months, and each month of 30 days, and which required an intercalary month. Of course this lunilar year, with the intercalary month, began sometimies a week or a fortnight before or after the equinox or solstice; and hence the first astronomers were led to the above-mentioned disposition of the equinoxes and solstices; and that this was really the case, is confirmed by the testimonies of Endorus, Aratus, and Hipparchus. On these principles, Sir Isaac proceeds to argue in this manner. In the end of the year 1580, the star called the Prima Arietis was in 72 25° 51’ with north latitude 7° 8' 58’; and the star called the Ultima caelest Arieta was in 8° 10° 3’.
CHRONOLOGY.

Consequently the equinoctial colure at this time cut the ecliptic in $8^\circ 6^\prime 44^\prime$; or by the calculations of bishop Horlsey in $8^\circ 6^\prime 50^\prime 26^\prime$, and by this reckoning the equinox was then gone back (according to Newton) $35^\circ 44^\prime$, and according to his editor Horlsey $36^\circ 50^\prime 20^\prime$, since the Argonautic expedition. But it recedes $50^\prime$ in a year, or $1^\circ$ in seventy-two years, and consequently $36^\circ 44^\prime$ in 2642 years; which counted backward from the beginning of 1620, will place this expedition about twenty-five years after the death of Solomon.

According to Horlsey's calculations the equinoctial points recede $50^\prime$ $50^\prime$ in 2642 years. From the end of the year 1659, i.e. of the Julian period 6422, count back 2642, and you come to the year of the Julian period 3760, the 23d from Solomon's death, according to Petravins. But, as there is no necessity for allowing that the middle of the conflagrations, according to the general account of the ancients, should be precisely the middle between the prima Aries, and ultima Canis. Sir Isaac Newton proceeds to examine what were those fires, through which Eudoxus made the colors to pass in the primitive sphere, and in this way to fix the position of the cardinal points. From the mean of five places he finds, that the great circle, which in the primitive sphere, described by Eudoxus, or at the time of the Argonautic expedition, was the equinoctial colure, did, in the end of 1680, cut the ecliptic in $8^\circ 6^\prime 29^\prime 15^\prime$; or according to the calculations of bishop Horlsey, in $8^\circ 6^\prime 30^\prime 05^\prime$, and according to Raper's copy of Newton's chronology, $8^\circ 6^\prime 50^\prime 17^\prime$, written by his own hand in the margin. He likewise, in the same manner, determines the mean place of the full dilution colure to be $8^\circ 6^\prime 28^\prime 46^\prime$, or, as Horlsey states its, $8^\circ 6^\prime 28^\prime 48^\prime$, and as it is at right angles with the other, concludes that it is rightly drawn. Hence he infers, that the cardinal points, in the interval between that expedition, and the year 1689, have receded from these colures $1$ fig $6^\circ$ and $20^\prime$, which, allowing seventy-two years to a degree, amounts to $2627$ years; and these counted backwards, as above, will place the Argonautic expedition forty-three years after the death of Solomon, or about 37 years after this event, as placed by Petravins.

The principles on which the preceding calculation is founded are these: Let $\gamma\rho\psi\chi$ (Plate III. Astronomy, fig. 22.) be an arc of the ecliptic, $\gamma\psi$ being the equinoctial point at the end of the year 1680. Let the point $P$ be the place of the first star in Aries (? of Bayer) and $C$ the place of the star in the tail (r of Bayer). Imagine a great circle of the sphere drawn through $P$, and $\psi$; and erect the arc $PC$ in $H$. Then is $H$ the middle point between $P$ and $C$, through which the equinoctial colure of the primitive sphere passed. Therefore through $H$ draw a great circle $HA$, which may make an angle of $66^\circ 30^\prime$ with the ecliptic, the acute angle looking eastward. Then $HA$ will be the equinoctial colure of the primitive sphere, and $A$ the equinoctial point of that sphere.

To find the distance of $A$ from $\gamma\psi$, the equinoctial point of the sphere of 1620; find the pole of the ecliptic and through $P$, $N$, and $H$, draw circles of latitude, $\Pi\Pi$, $\Pi\psi$, $\Pi\Pi$, $\Pi\Pi$, meeting the ecliptic in the points $p$, $c$, and $b$; and from $P$ and $H$ draw arcs of great circles, $PB$ and $HID$, perpendicular to $PC$. Therefore the arc $\gamma\psi\chi$, are given; being the given longitudes of the stars $P$ and $C$ at the end of the year 1680. Therefore $P$ and the difference of these three, is given, and the angle $\Pi c$, which is measured by that given arc $Pc$. But the arc $\Pi\Pi$ is given, being the complement of the given latitude $Pc$. Consequently in the right-angled spherical triangle, $P\Pi\Pi$, the hypotenuse $PP$ is given, and the angle $P\Pi D$. Therefore both the legs, $PB$, $H$, will be given by trigonometry. But $P\Pi D$ being given; since $\Pi\Pi c$ is also given, being the complement of the given latitude $PC$; their difference, $BC$, is given. Therefore in the right-angled spherical triangle, $PBC$, the two legs, $PB$, $BC$, are given. Consequently the hypotenuse $PC$, and the angle $P\Pi B$ will be given by trigonometry. But $PC$ being given, its half, $HC$, will be given. Therefore, in the right-angled spherical triangle, $HDC$, the hypotenuse $CH$ being given with the angle $HCD$; the legs $HD$, $DC$, will be given by trigonometry. But $DC$ being given, since $\Pi\Pi C$ is also given, their difference, $\Pi\Pi D$, is given. And in the right-angled spherical triangle, $\Pi\Pi D$, the two sides $\Pi\Pi D$, $DH$, being given, the angle $D\Pi H$ and the hypotenuse $\Pi\Pi H$ will be given by trigonometry. \vspace{1em}

But $\Pi\Pi H$ being given, its complement, $Hh$, which is the latitude of the point, $H$, is given. And in the right-angled spherical triangle $HhA$, the side $Hh$ being given with the angle $HhA$; the side $hA$, will be given by trigonometry. But the arc $c\psi$ is given, being the measure of the given angle $D\Pi H$. Therefore the arc $cA$, the sum of $c\psi$ and $hA$, is given. But $\gamma\psi\chi$ is given; consequently $\gamma\psi A$ is given. Q. E. I.

Computation.

Given $\gamma\psi = 28^\circ 51^\prime 00^\prime$; consequently $c\psi = 20^\circ 12^\prime 42^\prime$

$\gamma\psi = 49^\circ 03^\prime 42^\prime$ consequently $\Pi\psi = 82^\circ 51^\prime 02^\prime$

$\gamma\psi = 78^\circ 58^\prime$ consequently $\Pi\psi = 87^\circ 25^\prime 59^\prime$

Hence, in the right-angled triangle $\Pi BP$, $\Pi\psi = 82^\circ 51^\prime 02^\prime$

$PB = 20^\circ 12^\prime 42^\prime$

Therefore the legs $PB = 20^\circ 2^\prime 52^\prime$

$\Pi B = 82^\circ 23^\prime 12^\prime$

But $\Pi C = 87^\circ 25^\prime 55^\prime$

Therefore $BC = 5^\circ 02^\prime 43^\prime$

Hence, in the right-angled triangle $PBC$, $PB = 20^\circ 02^\prime 43^\prime$

$BC = 5^\circ 02^\prime 43^\prime$

Therefore $PCB = 76^\circ 27^\prime 00^\prime$

And $PC = 20^\circ 38^\prime 51^\prime$

Therefore $HC = 7^\circ 10^\prime 25^\prime$

Hence,
Hence, in the right-angled triangle $\triangle HDC$,  
\[ HC = 10° 19' 27" \]
\[ \text{And } HCD = 76° 27' 00" \]
\[ \text{Therefore } HD = 10° 1 59' \]
\[ \text{And } CD = 2° 26' 37" \]
\[ \text{But } \Pi C = 87° 25' 55" \]
\[ \text{Therefore } \Pi D = 84° 59' 18" \]

Hence, in the right-angled triangle $\triangle DH\Pi$,  
\[ \Pi D = 84° 59' 18" \]
\[ \text{And } \Pi H = 10° 1 59' \]
\[ \text{Therefore } \Pi H = 4° 1 15' = b \]

Hence, in the right-angled triangle $\triangle H\Pi A$,  
\[ Hb = 4° 56' 5" \]
\[ \text{And } H\Pi b = 66° 30' 00" \]
\[ \text{Therefore } b \Pi A = 2° 9' 7" \]
\[ \text{But } ch = 10° 4' 15" \]
\[ \text{Therefore } c \Pi e = 13° 13' 22" \]
\[ \text{But } \Pi e = 49° 3' 42" \]
\[ \text{Therefore } \Pi A = 36° 50' 20" \]

It should be observed, says bishop Horsey, that in finding the place of the equinoctial colure of the primitive sphere on the sphere of 1690; the obliquity of the ecliptic, on the primitive sphere, has been supposed to be just 23° 26', and the complement of the obliquity 66° 54'. And computing from these elements, we have found reason to conclude, that the primitive sphere of the Greeks was 2627 years older than the sphere of 1690. But at that distance of time, before the commencement of the year 1690, Dr. Horsey finds, by Mayer's tables, that the obliquity of the ecliptic was 23° 48' 54". He therefore assumes 23° 48' 54" for the obliquity on the primitive sphere, and, repeating his calculations, he found the following five places of the primitive equinox on the sphere of 1690:

The primitive equinoctial colure being drawn
Through $\alpha$ of Aries  $8^\circ 2^\prime 34^\prime$
The middle point between $\alpha$ and $\beta$ of Ceti  $6^\circ 56' 25''$
Through $\beta$ of Cetus  $7^\circ 23' 16''$
Through $\gamma$ of Perseus  $6^\circ 03' 00''$
Through $\delta$ of Perseus  $4^\circ 39' 30''$

The mean place of these five is $8^\circ 25' 23''$, and if this be the place of the primitive equinoctial point on the sphere of 1690, the place of the summer solstice should be $6^\circ 29' 23''$. But by the description of the solstitial colure it should be $6^\circ 28' 46''$. It may be reasonable, therefore, to take $8^\circ 25' 23''$ and $6^\circ 29' 23''$ for the places of the primitive equinox and solstice on the sphere of 1690; by which reckoning these points will be left advanced by $2'$ than for Isaac Newton has supposed. But these two minutes will not make a difference of 3 years in the age of the primitive sphere.

Our illustrious author hath, by other methods of a similar nature, established the epoch of the Argonautic expedition, as well as others, and reduced the age of the world about 500 years. What gives great weight to this argument, from the precision of the equinoxes, is, that if we reckon from whatever time the position of the equinoctial points had been mentioned by astronomers whose age is known, this motion, counted backwards, fixes that great event in the same year. It likewise demonstrates, that the observations of the ancients, though coarse enough, as Sir Isaac Newton acknowledges, are sufficiently exact for the purpose. This being a remarkable circumstance, the particulars of it are as follows. According to Pliny, and the calculations of Petavius, Thales, who wrote a book of the tropics and equinoxes, fixed the equinoxes and solstices in the 11th degree of their respective signs, so that they had preceded 4° 26' 52" from their original place at the time of the Argonautic expedition. This answers to 320 years, and calculated backwards from the 414th olympiad, when Thales was a young man, it to apply to astronomical studies, will place that event 44 years after the death of Solomon.

Petavius, in the calculation above referred to, deriving information from Pliny (I. xix. c. 25), who says, that Thales determined the "octaeus matutinus" of the Pleiades to be upon the 25th day after the autumnal equinox, thence computes the longitude of the Pleiades in $23° 26' 52''$, and consequently that the Lucida Pleiadum had, since the Argonautic expedition, moved from the equinox $4° 26' 52''$, as above stated. From the passage of Pliny, to which we have now referred, an objection has been deduced against the chronological computation of Newton. Pliny's authority, it is said, avails as much to prove, that Hevold places the morning-fitting of the Pleiades on the very day of the equinox, as that Thales placed it 25 days later. And if it be true, that Lucida Pleiadum did really set at sun-rise on the day of the autumnal equinox, in the age of Hevold, this will much more refute Isaac's date of the Argonautic expedition than the assumption, that the morning-fitting of the same star was 25 days later in the age of Thales, confirms it. For it is agreed, that Hevold was some time later than the Argonautic expedition; for we have his own testimony, that he lived after the war of Troy. The Argonautic expedition happened, according to Sir Isaac Newton, in that age when the longitude of Lucida Pleiadum was in the 26th degree of the sign of Aries. But when this star set at sun-rise, on the day of the autumnal equinox, its longitude must have been rather behind the vernal equinox, as an almanac, who will take the trouble to make the necessary calculations, may easily perceive. So that between the age of Hevold, as thus defined by the morning-fitting of the Lucida Pleiadum, and that time which Sir Isaac Newton affirms to the Argonautic expedition, the stars must have advanced more than 20 degrees in longitude; and a change of 20 degrees, at the rate of 1° in 72 years, requires 1440 years. Consequently, it may be said, his date of the Argonautic expedition cannot be less than 1500 years too late.

To this specious objection Newton might have replied, that Pliny reports the leaft of the morning-fitting of this star, in the age of Hevold, from a book of astronomy, of which
which he faves only, that it was extant under the name of 
Hefiod: and that this book could not be Hefiod's. For 
Hefiod speaks of Arcturus as rising at fun-fet 60 days after 
the winter solstice. And it is im-possible that any star of 
the Pleiades could set at fun-fet, on the day of the aumnrnal 
equinor, in the fame age when Arcturus rofe at fun-fet 60 
days after the winter solstice; or that these two circumstances 
of the sphere should be removed from each other by a les 
interval of time than the space of 1450 years. This book of 
almanac, extant in Pliny's time, under the name of Hefiod, 
must have been a fuppofitions work, and probably the im-
position of fome petty retailers of fience in the decline of 
the Grecian learning. The extravagant antipathy, which 
it gives to the Greek almanac, entirely destroys its 
credit.

According to Columella, Meton, and Euclenon, who 
published the lunar cycle of 19 years (see Cycle), and for 
this purpose observed the fummer solstice in the 316th 
year of Nabonafar, the year before the Peloponnewian war began, 
in which year the drive of the degree of Carcin, which is at leaft 7° more backwards than at fun, this 
terval answers to 502 years, which counted backwards from 
the year of obfervation, makes the Argonautic expedition 
fall upon the 44th year after the death of Solomon. Laftly, 
Hipparchus, who firft discovered that the equinoxes had a 
regular motion backwards, made his obfervations about 
the 602d year of Nabonafar, and fixed the vernal equinox 
in the fourth degree of Aries. Consequently, the equino-
cial points had receded eleven degrees since the Argonautic 
expedition, which is equivalent to 792 years, and which 
counted backwards, places the expedition in the 43d year 
after the death of Solomon. These coincidences are 
remarkable, and could not have placed the fame event so near 
the fame year, unlefs all the obfervations had been sufficiently 
exact. And when we cofider the coincidences of a great 
many more independent evidences, derived from the course 
of generation, and the order of fucceffion, with those which 
are deduced from aftronomical principles, nothing feems to 
be better eftablifhed than that the Argonautic expedition, 
and the whole Greek chronology of events, 
really happened about 43 years after the death of Solomon, 
and not in the days of Gideon, above 300 years before, as 
the common opinion has flated it.

The rising and setting of the flars with refpect to the 
rising and setting of the fun depend alfo upon the preceffion 
of the equinoxes. Any writer, therefore, who mentions the 
rising or setting of any flar, at any particular time of the 
year, with refpect to the fun, furnishes us with data fufficient 
to determine the time in which he wrote. Thus Hefiod 
tells us, that 60 days after the winter solstice the flar Arctu-
rus rofe juft at fun-fet; from which circumfance it is easily 
calculated that Hefiod flourifhed about 100 years after the 
death of Solomon, or in the generation, or age, next 
after the Trojan war, as Hefiod himfelf declares; and this 
affords another independent argument for the date affigned 
by Newton to that war, and the whole Greek chronology 
connected with it. Bishop Horfley, in his edition of New-
ton's works, obferves that he cannot deferve for Isaac 
Newton's conclusion from his premises. When Arcturus 
rufe at fun-fet 60 days after the winter solstice, he finds the 
longitude of that flar to have been 19° 28' 28", which 
exceeds its longitude on the primitive sphere by no more than 
1° 48'. Taking the longitude and latitude of Arcturus, 
each as it was in the primitive sphere, viz. the longitude 
19° 26' 52", the latitude 30° 52' 19"; he finds, that when 
the fun rufe at fun-fet, the fun's true place muft have been 
3° 10' 56' ; and according to the situation of the sphelion 
of the earth's orbit, which obferved in that age of the world, 
when the equinoxes were in 8° 6' 27", and 11° 6' 27", the fun was in this place 60 days after the 
winter solstice. So that the conclusion from this paffage of He-
fiot should rather be that he flourifhed in that very age when the 
Greeks firfl formed their sphere, that is, according to New-
ton's fystem, in the age of the Argonautic expedition. 
The bishop fuppofes the truth to be, that before the retrograde 
motion of the equinoctial points was discovered, all writers 
speak of the risings and fettinjs of the flars, as they were 
flated by the almanowers who firfl formed the sphere. This 
was probably the cafe with regard to Hefiod in particular, 
if he lived to near the age of the Argonautic expedition, 
and the beginning of the Greek phere, as fir Isaac fupp-
fores. No conclufion is therefore to be drawn, concerning 
the particular age of any writer, much older than Hip-
parchus, from what he may lay of the phenomena 
of the sphere; unlefs it be certain, that he was a prac-
tical almanower, and lived at fuch a distance of time 
that the diftance of time between Hefiod, and the firft 
maker of his sphere, might produce fensible changes in the 
seasons of the risings and fettinjs of the flars. Such writers might, 
indeed, without any knowledge of the motion of the equi-
noxes, decribe the phenomena according to their own ob-
ervations, and impute the difference, between what they saw 
and what their miflers had delivered, to the coortlenfs 
of the firft obfervations. Bishop Horfley, when he speaks of 
the appearances of the primitive sphere, means the appear-
ances in the latitude of 40° N., at that time when the ver-
al equinox was in 8° 6' 27" on the sphere of 1690.

Sir Isaac Newton having, by the confronting aids of 
Scripture and reafon, rectified the chronology of the Greeks, 
made ufe of this rectified chronology to adjust the com-
temporary affairs of the Egyptians, Affrians, Babylonians, 
Medes, and Persians. His elaborate fystem, however, has 
not elufed confufe. M. Freret and M. Soucek have attac-
hed it on much the fame ground; the former hath com-
ounded reigns and generations, which are carefully dif-
nfinguifhed in this fystem. The aftronomical obfervations of both 
have been confirmed by fir Isaac Newton himfelf, and by 
Dr. Halley. Phil. Tranf. Abr. vol. viii. part iv. p. 42 

Mr. Gibert, in a letter published at Amfterdam in 1754, 
has attempted to reduce the Babylonian, Egyptian, and 
Chaldean annals to our chronology. He begins with shew-
 ing, by the authorities of Macrobius, Eudoxus, Varro, Dio-
dorus Siculus, Pliny, Pinctarch, St. Augulfin, &c. that by a 
year the ancientf were of any planet in the heavens; fo that it confifted fometimes only of one day. 
Thus, according to him, the folar day was the aftronomical 
year of the Chaldeans; and the boifed period of 473,000 
years affigned to their obfervations is reduced to 1267 years, 
9 months; the number of years which elaped, according to 
Eufebius, from the firft discoveries of Atis in aftronomy, in 
the 384th year of Abraham, to the march of Alexander 
into Asia in the year 1588. of the fame era; and the feven-
teen thousand years added by Berofus, to the obfervations 
of the Chaldeans, reduced in the fame manner, will give forty-
seven years, and fix or seven months, being the exact interval 
between Alexander's march, and the firft year of the 151st 
olympiad, or the time to which Berofus carried his history. 
Epigenus attributes 720,000 years to the obfervations 
preferred at Babylon; but these, according to Mr. Gibert's 
fystem, amount only to 1071 years, three months, which 
differ from Calilhenes's period of 1903 years allotted to the 
fofe obfervations, only by 68 years, the period elaped from 
the taking of Babylon by Alexander, which terminated the 
letter
latter account, and to the time of Ptolemy Philadelphus, to which Epigenius extended his account.

Chronology facet. The systems of sacred chronology have been very various. Nor is this to be wondered at, since our three biblical copies of principal note give a very different account of the first ages of the world. The Hebrew text reckons about 4000 years from Adam to Christ, and to the flood 1656 years; the Samaritan makes this interval longer, and reckons from Adam to the flood only 1307 years; and the version of the Septuagint removes the creation of the world to 6000 years before Christ. The interval between the creation and flood, according to Eusebius and the Septuagint, is 2242 years; according to Josephus and the Septuagint, 2156 years; and according to Julius Africanus, Eusebius, Petavius, and the Septuagint, it is reckoned at 2262 years. Many attempts have been made to reconcile these differences; but none are quite satisfactory. See Epocha, Samaritan, &c.

Walton, and I. Volfius, give the preference to the account of the Septuagint. Walton's Prolegomena. Volfius Chronologia Sacra. Others have defended the Hebrew text. The reader may find an abstrait of the different opinions of learned men on this subject, in Strachinian's Brev. Chron. translated by Sauldt, p. 106, &c. and p. 176.

The more eminent writers on chronology, among the ancients are, Julius Africanus, in the third century; Dionysius Exiguus, Eusebius, and Cyril.

Among the moderns, Bede, Fudacius, Mercator, Lilius, Clavius, Scaliger, Vitus, Petavius, Caffini, Munster, Calvius, Hardouin, Capellus, Uther, Newton, Marsham, Helvius, I. Volfius, Pagii, Strachius, Perron, Blair, Playfair, &c.

It will be proper to add to the above account of the history and principles of chronology a few words on the construction and utility of Chronological Tables. By means of such tables history is reduced into a short compass, and the reader is aided in the study of it. Thus an entire course of history is easily comprehended, and at the same time a proper distinction may be observed between its several parts. If such tables confine of nothing more than an enumeration of the capital events in history, thrown together promiscuously, without any distinction of kingdoms, regard being only had to the order of time in which the events happened, they have their use. We thus see, at almost one view, the principal things which history records, and from the dates annexed to each article, we form an idea of the interval of time between one and another of them; such tables are often compiled for single histories; of this kind is the "short Chronicle" prefixed to "Newton's Chronology." But in a more complex and extended history, it will be useful to keep the separate parts distinct, and, for this purpose, to arrange them in different columns. By such means we obtain a distinct idea of the course of any single history, and at the same time a clear comparative view of the contingent state of any other history which was parallel with it. The neglect of this method has introduced confusion into the chronological tables published with the "Universal History," and the advantage resulting from it may be perceived in those of Marshall, Tallents, &c. Besides a distinct view of the succession of events in different histories, it is an advantage to have, in separate columns, an account of the "great men," in arts or in arms, which each age has produced. This has been exhibited by the italic mentioned authors and others. For this purpose two columns are quite sufficient; one for statesmen and warriors, and the other for men of learning and science. Another improvement in chronological tables has been to annex a variety of dates, in distinct columns, to every event, to save the reader the trouble of reducing the different methods of computation to one another.

But many chronologists have multiplied these different epochs far beyond any real use, to the great inconvenience of their page, and leaving little room for more valuable matter. Helvius furnishes an example of this kind. Four years are abundantly sufficient, viz. the year before and after Christ, and the Julian period to run through the whole extent of the work; the Olympiads for the course of the Grecian history; and the year of the city for the Roman. These are used by Blair. The list, and capital improvement in chronological tables, which has been effected in some measure by Tailents and Marshall, more perfectly in Helvius, but most completely by Blair, is to dispose the events in such a manner, that the distance at which they are placed, without attending to the date in the margin, shall give a just idea of the real interval of time between them. This is done by having a single line, or any fit interval appropriated to any certain period of time, or number of years. In the chronological tables engraved by Sturt, we see a great deal of matter, by a singular method, and the help of arbitrary and symbolical characters, crowded into a short compass; so that we see the state of the several kingdoms of Europe for any century since the Christian era in a single page. This author has also annexed an alphabetical index to his work, in which, by the help of symbols, he has exprest the character of every prince mentioned in his tables, and the principal events of his life. This small work is valuable for its equifences, but is not so much recommended by its difficulties. Genealogical tables are of very considerable use in substitution to those of a chronological kind; for an account of which, see Genealogy. Pieldley's Lectures on History, &c. 1788.

### CHRONOLOGICAL TABLE

**Remarkable Events, Discoveries, and Inventions, from the Creation to the Year 1807.**

| B.C. | 4004. — Creation of the world, at the autumnal equinox, on Tuesday, October 23, according to archbishop of the Julian period. | 4004. — Creation of Adam and Eve, on Friday, Oct. 28. |
| B.C. | 4003. — The Birth of Cain, the first who was born of a woman. | 4003. — The Birth of Seth. |
| 3875. — Abel murdered by Cain. | 3875. — The Birth of Seth. |
