KILN.

KILN, in Agriculture, a kind of oven or flove for admitting heat, in order to dry substances of various kinds, as corn, malt, hops, &c. It also signifies a fabric or building constructed for the purpose of burning lime-flour, chalk, and other calcareous stones, into lime. KILNS are of different kinds, and formed in different ways, according to the purposes for which they are designed.

KILN-Ashes, the ashes made in kilns where wood, straw, furze, &c. are burnt. These ashes are useful as manures for almost any kind of soil, but especially such as poffefs much vegetable matter. In the western districts, the farmers sift them over their corn and grass; but this must not be done in windy weather, becaufe they are so very light, that they would easily be blown away and loft. They are found to succeed best when laid on just before rain falls. See Ashes.

KILN, Brick. See BRICK-KILN and BRICK.

KILN, Hop, a flove or kiln constructed for the purpose of drying or inflowing hops. See Hop and OAST.

KILN, Lime, a sort of kiln constructed for the purpose of burning various kinds of calcareous substances, such as lime-flour, chalk, shells, &c. into lime. They are built of different forms or shapes, according to the manner in which they are to be wrought, and the kinds of fuel which are to be employed. It has been remarked, in a work on landed property, that, in places where materials are dear, from their being fetched from a distance, and where the fuel is coals, and also expensive, the form of a kiln is mostly that of an inverted cone, a form which has its inconveniences; but in districts where the art of burning lime is practised with superior attention and correctness, the form has of late years been gradually changing from conical to elliptical. But, in his opinion, "the best form of a lime furnace, in the established practice of the present day, is that of the egg placed upon its narrower end, having part of its broader end struck off, and its sides somewhat compressed, especially towards the lower extremity; the ground plot or bottom of the kiln being nearly an oval, with an eye, or draft-hole, toward each end of it." It is suppos'd that "two advantages are gained, by this form, over that of the cone. By the upper part of the kiln being contract'd, the heat does not fly off so freely as it does out of a spreading cone. On the contrary, it thereby receives a degree of reverberation, which adds to its intenfity." But the other, and full more valuable effect is this: "when the cooled lime is drawn out at the bottom of the furnace, the ignited mafs, in the upper parts of it, settles down, freely and evenly, into the central parts of the kiln; whereas, in a conical furnace, the regular contraction of its width, in the upper as well as the lower parts of it, prevents the burning materials from settling uniformly, and levelling downward. They "hang" upon the sides of the kiln, and either form a dome at the bottom of the burning mafs, with a void space beneath it, thereby endangering the ftructure, if not the workmen employed; or, breaking down in the centre, form a funnel, down which the under-burnt mafs find their way to the draft-holes." And "the contraction of the lower part of the kiln has not the fame effect; for, after the fuel is exhausted, the adhesion ceases, the mafs loosens, and, as the lime cools, the left room it requires. It therefore runs down freely to the draft-holes, notwithstanding the quick contraction of the bottom of the kiln or furnace."

And, lastly, that, "with respect to the lime-furnace (which is, he thinks, entitled to the most feudulous attention of agricultural chemistry), the fire requires to be furnished with.
with a regular supply of air. When a kiln is first lighted, the draft-holes afford the required supply. But after the fire becomes stationary, in the middle, or towards the upper part of the kiln (especially of a tall kiln), while the space below is occupied by burnt lime, the supply from ordinary draft-holes becomes insufficient. If the walls of the kiln have been carried up dry or without mortar, the air finds its way through them to the fire. In large deep kilns that are built with air-tight walls, it is common to form air-holes in their sides, especially in front, over the draft-holes. But these convey the air, in partial currents, to one side of the kiln only, whereas that which is admitted at the draft-holes palls regularly upward to the centre, as well as to every side of the burning mass; and, moreover, tends to cool the burnt lime in its passage downward, thereby contributing to the cæse and health of the workmen. Hence he is of opinion, that the size of the draft-holes ought to be proportionate to that of the kiln, and the size of the flones taken jointly (air passing more freely among large than among small flones), and that the required supply of air should be wholly admitted at the draft-holes. By a sliding or a shifting valve, the supply might be regulated, and the degree of heat be encreased or diminished, at pleasure," according to circumstances.

The most ancient kind of lime-kiln is probably that which is made by excavating the earth in the form of a cone, of such a size as may be necessary; and afterwards building up the sides, or not, according to the circumstances of the cafe; the materials being then laid in, in alternate layers of fuel and flone, properly broken, until the whole is filled up. The top is then covered with fods, in order that the heat may be prevented from escaping; and the fire lighted at the bottom, and the whole of the contents burnt, in a greater or less space of time, in proportion to the nature of the flone, and the quantity that is contained in the kiln. From the circumstance of the top parts of these kilns, in some districts, being covered over, and the sides sometimes built up with fods, they are termed sod-killns, in order to distinguish them from the other forts. When the whole of the contents of such kilns are grown cold, they are drawn out or taken out from the bottom; and the kiln again filled, if necessary. These kilns are obviously intended for burning only one kiln-full at a time. But as the burning of lime in this way is tedious and uneconomical, other methods and forms of kilns have been had recourse to. Where lime is much wanted, either for agriculture or other purposes, they therefore use perpetual kilns, or what are more generally known by the name of drae-co-kilns. These, as all lime-kilns ought to be, are, the author of Modern Agriculture says, situated by the side of a rising bank, or sheltered by an artificial mound of earth. They are generally built either of flone or brick; but the latter, as being better adapted to stand excessive degrees of heat, is considered as preferable. The outside form of such kilns is sometimes cylindrical, but more generally square. The inside should be formed in the shape of a hogfhead, or an egg, opened a little at both ends, and flat on the smallest; being small in circumference at the bottom, gradually wider towards the middle, and then contracting again towards the top. In kilns constructed in this way, it is observed, fewer coals are necessary, in confluence of the great degree of reverberation which is created, above that which takes place in kilns formed in the shape of a sugar-loaf reverfed. Near the bottom, in large kilns, two or more apertures are made: these are small at the inside of the kiln, but are floped wider, both at the sides and the top, as they extend towards the outside of the building. The uses of these apertures are for admitting the air necessary for supplying the fire, and also for permitting the labourers to approach with a drag and shovel, to draw out the calcined lime. From the bottom of the kiln within, in some cases, a small building, called a horie, is raised in the form of a wedge, and so constructed as to accelerate the operation of drawing out the burned lime-flone, by forcing it to fall into the apertures which have been mentioned above. In other kilns of this kind, in place of this building, there is an iron grate near the bottom, which comes close to the inside wall, except at the apertures where the lime is drawn out. When the kiln is to be filled, a parcel of furze or faggots is laid at the bottom; over this a layer of coals; then a layer of lime-flone, which is previously broken into pieces, about the size of a man's fist; and so on alternately, ending with a layer of coals, which is sometimes, though seldom, covered with fods or turf, in order to keep the heat as intense as possible. The fire is then lighted in the apertures; and when the lime-flone towards the bottom is completely calcined, the fuel being considerably exhausted, the lime-flone at the top subsides. The labourers then put in an addition of lime-flone and coal at top, and draw out at bottom as much as they find thoroughly burned; and thus go on, till any quantity required be calcined. When lime-flone is burned with coals from 2 ½ to 3 ½ bushels, on a medium, 3 bushels of calcined lime-flone are produced for every bushel of coals used in the process.

A lime-kiln of this sort is described in count Rumford's Effays, which is in possession of the Dublin Society, as well as the principal objects that ought to be had in view in constructing of the kiln pointed out: the first of which is, "to cause the fuel to burn in such a manner as to consume the smoke, which has here been done by obliterating the smoke to defend and pass through the fire, in order that as much heat as possible might be generated. Secondly, to cause the flame and hot vapour, which rife from the fire, to come in contact with the lime-flone by a very large surface, in order to economize the heat, and prevent its going off into the atmosphere; which was done by making the body of the kiln in the form of a hollow truncated cone, and very high in proportion to its diameter; and by filling it quite up to the top with lime-flone, the fire being made to enter near the bottom of the cone."

"Thirdly, to make the process of burning lime perpetual, in order to prevent the waste of heat which unavoidably attends the cooling of the kiln, in emptying and filling it, when, to perform that operation, it is necessary to put out the fire.

"And, fourthly, to contrive matters so, that the lime in which the process of burning is just finished, and which of course is full intensely hot, may, in cooling, be made to give off its heat in such a manner, as to affit in heating the fresh quantity of cold lime-flone with which the kiln is replenished, as often as a portion of lime is taken out of it.

"To effectuate these purpofes, the fuel is not mixed with the lime-flone, but is burned in a close fire-place, which opens into one side of the kiln, some distance above the bottom of it. For large lime-kilns on these principles, there may be several fire-places all opening into the same cone, and situated on different sides of it; which fire-places may be constructed and regulated like the fire-places of the furnaces used for burning porcelain.

"At the bottom of the kiln there is a door, which is occasionally opened to take out the lime.

"When, in confluence of a portion of lime being drawn out of the kiln, its contents settle down or subsides, the
the empty space in the upper part of the kiln, which is occasionally taken by the subtractions of the burned lime, is immediately filled up with fresh lime-flour.

"As soon as a portion of lime is taken away, the door by which it is removed must be immediately shut, and the joinings well closed with moist clay, to prevent a draft of cold air through the kiln. A small opening, however, must be left, for reasons which are explained below.

"As the fire enters the kiln at a certain distance from the bottom of it, and as the flame rives as soon as it comes into this cavity, the lower part of the kiln (that below the level of the bottom of the fire-place) is occupied by lime already burned; and as this lime is intensely hot, when, on a portion of lime, from below, is removed, it descends into this part of the kiln, and as the air in the kiln, to which it communicates its heat, must rise upwards in consequence of its being heated, and pafs off through the top of the kiln, this lime, in cooling, is by this contrivance made to assist in heating the fresh portion of cold lime-flour, with which the kiln is charged. To facilitate this communication of heat from the red-hot lime just burned to the lime-flour above in the upper part of the kiln, a gentle draft of air through the kiln, from the bottom to the top of it, must be established, by leaving an opening in the door below, by which the cold air from without may be suffered to enter the kiln. This opening (which should be furnished with some kind of a regifter) must be very small, otherwise it will occasion too strong a draft of cold air into the kiln, and do more harm than good; and it will probably be found best to close it entirely, after the lime in the lower part of the kiln has parted with a certain proportion of its heat."

The height of the kiln, which is represented in Plate (Kiln) Agriculture, fig. 1, is on a scale of 15 feet: its internal diameter below, two feet; and above, nine inches. In order more effectually to confine the heat, its walls, which are of brick, and very thin, are double, and the cavity between them is filled with dry wood-aashes. To give greater strength to the fabric, these two walls are connected in different places by horizontal layers of brick, which unite them firmly: a is the opening by which the fuel is put into the fire-place: through this opening the air descends which feeds the fire. The fire-place is represented nearly full of coals, and the flame passing off laterally into the cavity of the kiln, by an opening made for that purpose at the bottom of the fire-place. The opening above, by which the fuel is introduced into the fire-place, is covered by a plate of iron, moveable on hinges; which plate, by being lifted up more or less by means of a chain, serves as a regifter for regulating the fire. A section of this plate, and of the chain by which it is supported, are shewn in the figure: b is an opening in the front wall of the fire-place, which serves occasionally for cleaning out the fire-place, and the opening by which the flame passes from the fire-place into the kiln. This opening, which must never be quite closed, serves likewise for admitting a small quantity of air to pass horizontally into the fire-place. A small proportion of air, admitted in this manner, has been found to be useful and even necessary in fire-places, in which, in order to confume the smoke, the flame is made to descend. Several small holes for this purpose, fitted with conical stoppers, may be made in different parts of the front wall of the fire-place.

The bottom of the fire-place is a grate constructed of bricks placed edgeways, and under this grate there is an ash-pit; but as no air must be permitted to pass up through this grate into the fire-place, the ash-pit door, c, is kept constantly closed, being only opened occasionally to remove the ashes. d is the opening by which the lime is taken out of the kiln; which opening must be kept well closed, in order to prevent a draught of cold air through the kiln. As only as much lime must be removed at once as is contained in that part of the kiln which lies below the level of the bottom of the fire-place, to be able to ascertain when the proper quantity is taken away, the lime, as it comes out of the kiln, may be directed into a pit sunk into the ground in front of the opening by which the lime is removed; this pit being made of a proper size to serve as a measure for it. And while the lime is removing from the bottom of the kiln, fresh lime-flour should be put into it above; and during this operation, the fire may be damped by closing the top of the fire-place with its iron-plated. Should it be found necessary, the fire, and the distribution of the heat, in burning the lime, be further regulated by closing more or less the opening at the top of the lime-kiln with a flat piece of fire-flour, or a plate of cast-iron. The double walls of the kiln, and the void space between them, as also the horizontal layers of bricks by which they are united, are clearly and distinctly expressed in the figure in the plates.

This method of constructing lime-kilns, though ingenious and philosophical, is probably much too expensive for general use.

It is a common practice to burn lime-flour with furze in some places. The kilns which are made use of in these cases are commonly known by the denomination of flame-kilns, and are built of brick; the walls from four to five feet thick, when they are not supported by a bank or mound of earth. The infide is nearly square, being twelve feet by thirteen, and eleven or twelve feet high. In the front wall there are three arches, each about one foot ten inches wide, by three feet nine inches in height. When the kiln is to be filled, three arches are formed of the largest pieces of lime-flour, the whole breadth of the kiln, and opposite to the arches in the front wall. When these arches are formed, the lime-flour is thrown promiscuously into the kiln to the height of seven or eight feet, over which are frequently laid fifteen or twenty thousand bricks, which are burned at the same time with the lime-flour. When the filling of the kiln is completed, the three arches in the front wall are filled up with bricks almost to the top, room being left in each sufficient only for putting in the furze, which is done in small quantities, the object being to keep up a constant and regular flame. In the space of thirty-six or forty hours, the whole lime-flour, about one hundred and twenty, or one hundred and thirty quarters, together with the fifteen or twenty thousand bricks, are thoroughly calcined. Kilns constructed in this way may be seen near Wellingborough, in Northamptonshire, and other places in the northern parts of the kingdom. And in many of the northern counties of Scotland, which are situated at a great distance from coal, it is also a common practice to burn lime-flour with peat; and, considering the rude ill-constructed kilns which are used for this purpose, it is astonishing what success the operations are performed. In some of these districts, it is stated that lime-flour is sufficiently calcined with peats, laid

*flatus super flatus*, in kilns formed of turf; but, owing to the quantity of ashes which fall from the peat, the quality of the lime is considerably injured; and from the open and exposed situation of many of these kilns, the waste of fuel is immense. But the most common method of burning lime-flour with peat, is in kilns constructed somewhat similar to those in the districts where furze is used as the only fuel. There are in general only two arches, or fire-places, and the peats are thrown into the bottom of these arches, the fronts of which are seldom closed up, by which means the wind has
often great influence in retarding the operation, and frequently prevents the complete calcination of the lime-flour. An improvement might, if supponed, be made on these kilns at a trifling expense: if an iron grate were laid across the bottom of the arch, with a place below for the ashes to fall down, and the front of the arch closed up by a door made of cast-metal, one-third of the fuel might be saved, and the operation performed in a shorter time, and with a much greater certainty, than by the method now practised in such kilns.

In the Communications to the Board of Agriculture, Mr. Rawfon afferts, that he has produced a considerable saving in the burning of lime, by constructing his kilns in the manner shewn at fig. 2. "It is made twenty feet in height; at the bottom a metal plate is placed one foot in height, intended to give air to the fire; over this plate the flue that draws the lime runs. The flopped fides are fix feet in height, the breadth at the top of the flope is eight feet, the fides are carried up perpendicular fourteen feet, so as that every part of the infide, for fourteen feet, to the mouth, is exactly of the fame dimensions. On the mouth of the kiln a cap is placed, built of long ftones, and expeditiously contracted, about seven or eight feet high. In the building of the cap, on one side of the flope, the maffon is over the centre of the kiln, fo that any thing dropping down will fall perpendicular to the eye beneath. He is here to place an iron door of eighteen inches fquare, and the remainder of the building of the cap is to be carried up, until the hole at the top be contracted to fourteen inches. The kiln is to be fed through the iron door, and when filled, the door clofe shut. The outside wall will be three feet at the bottom to batter up to two feet at top, and made at fuch a distance from the infide wall of the kiln, that two feet of yellow clay may be well packed in between the walls, as every kiln built without this precaution will certainly split, and the strength of the fire be thereby exhausted. At eight feet high from the eye of the kiln, two flues fhould be carried through the front wall, through the packed clay, and to the opposite fides of the kiln, to give power to the fire." It is obferved, that with this kiln, he has produced one-third more lime from a given quantity of fuel; and ftones of bad quality will be here reduced into powder, and may be put into the kiln without the neceflity of being broken so small as is ufual. As many situations will not admit of building a kiln twenty feet high, while other situations may allow of its being built thirty or even forty feet (for it cannot be made too high), the diameter of the kiln should be proportioned to the height to which it is carried up.

And it is further related, as another application of this fort of contrivance, that "for several years he has made nine of a small kiln in an outside kitchen, the height nine feet, the diameter three feet and a half. In the fide of the kiln next the fire, he had three fquare boilers placed, one of them large, containing half a barrel, with a cock, which fupplied the family with confant boiling water; for the two others, he had tin vefiels made to fit the infide with clofe covers, in which meat and vegefables with water were placed and put into the two smaller boilers, which never had any water, but had clofe covers. The tin boilers were heated sooner than on the strongest fire, and when the meat, &c. were sufficiently dressed, the whole was taken out of the metal boilers. At one fide he had an oven placed for roasting and boiling meat; the bottom was metal of twenty-six inches diameter, and one inch and a half thick, a flue from the fire went underneath. Even with the bottom of the oven, a grating nine inches square was placed, which opened a communication between the oven and the hot fire of the kiln. The height of the oven was fourteen inches, that close by a metal door of eighteen inches square, and the top, level with the mouth of the kiln, was covered by another metal plate of half an inch thick, on which was placed a fecd oven; the heat which escaped through the half-inch plate, though not near the fire, was sufficient to do all small puddings, pies, breakfast-cakes, &c. &c. The meat in the large oven was placed on an iron frame which turned on a pivot and stood on a dripping-pan, and was turned by the cook each half hour. And over the kiln he had a tiled flage for drying corn, and a chimney at one fide, with a cafl on the top, which carried off all fteam and sulphur; a large granary was attached to the building. It is added, that the lime, if fold, would more than pay for fuel and attendance; and he has frequently had dinner dreif for fifty men, without interfering with his family busines in any great degree.

There is another form of lime-kiln, which answers extremely well for general use, reprefented at fig. 3, in the fame plate. This is capable of being built without any very considerable expence.

It has been found, by experience, in some of the northern districts, that lime-kilns are rendered much less liable to crack and burn, by having the outside walls carried up in a square manner, than on the ufual circular plan.

KILN. Malt, a fort of kiln contrived for the purpofe of drying malt or any kind of grain upon. In the conftuction of kilns of this fort many improvements have lately been made. A decription of a kiln of this kind by Mr. Pepper, of Newcastle-under-Line, has been given, in which fig. 4, is the ground plan, fupponed to be twenty feet fquare, but, if required larger or smaller, by following the fame proportion, it may be made to any fize or fituation. The dark fhaded walls rife four feet high, to put the reftector upon over the fire, and also what the fide arches stand upon, the brick piers, that carry the fpark-flone, and bearers that the tiles lie upon. Letter a, the fire-grate, which lies nine inches below the bottom edge of the reftector; b, bottom edge of the reftector; c, e, c, c, brick pillars nine inches square, that carry the fpark-flone; d, d, d, d, d, d, brick pillars nine inches square, that carry the bearers for the floor tiles to lie upon; e, fhews the bottom of the fide arches on each fide of the kiln; f, exhibits the space between the fire-place and the fide arches, for the man to go round to clean the kiln; g, the wall on each fide of the kiln, that the fide arches stand upon. Fig. 5, is a fection of it; g, fhews the fection of the wall which the fide arches fand upon; h, the door to go to the fire-place; j, the reftector of caft iron that covers the fire; k, small door in the reftector to feed the fire; l, the ears of the reftector that the iron pipes are fifted upon, which convey the fmoke, &c. from the reftector round the kiln, to the chimney; m, what is commonly called the fpark-flone; n, the reft of the kiln from being too hot in the middle, and afflictions in spreading the heat to the outfides; o, bearers of caft iron or wood, that carry the kiln floor; p, q, fwoed the ends of the ribs that carry the tiles; r, the kiln tiles, that the malt lies upon; s, t, the beam-pipe that conveys the fream from the malt; e, c, brick pillars nine inches square, that carry the fpark-flone; d, d, brick pillars nine inches square, that carry the bearers for the floor tiles to lie upon; e, c, fwoed the arches on each fide the kiln; w u, v, w, denotes the situation of the pipes under the floor. And fig. 6, is a plan of the kiln floor, and fwoes the ribs that the kiln-tiles lie upon; o, o, the caft iron or wood ribs that the tiles lie upon; n, n, the bearers that carry the ribs; d, d, the tops of the brick pillars.
K I L N.

Pillars that carry the bearers, &c.; b, the reflector that covers the fire, which is of cast iron, about an inch thick, hollow, and on a semicircular plan, as shewn in the figures; r, r, the iron pipes that convey the smoke and heat from the reflector, round the kiln, to the chimney, which lies about three feet under the kiln floor, and about the same distance from the side walls, which are supported by iron stays from the side arches; \( f, f, \) the ends of the iron pipes that go into the chimney; \( t, t, \) registers to regulate the draught and heat of the kiln; and \( f f, f f \), is a feather the chimney.

It is noticed that in the plate the pillars, bearers, &c. that belong to the same thing, are marked with the same letters in all the different figures.

Another kiln of the same sort, invented by Mr. Joseph Copping, r, of Harbour View, near Cove, Ireland, is represented at fig. 8. This is slated to be particularly adapted to the use of farmers, who, in wet seasons, often lose quantities of grain for want of such convenience. The advantages it appears to possess above the kilns now in common use, are many: first, it may be erected for one-tenth of the expense, if the value of the separate buildings be taken in, which are now almost invariably allotted for this purpose; secondly, any kind of fuel may be used without prejudice to the malt or corn to be dried in it: thirdly, the heat (by the construction of the flues) will be more regularly and evenly distributed without any waste, as at present: fourthly, the health of the people attending, will not, as at present, be exposed to certain injury, by always breathing and sleeping in a heated and wholesome atmosphere, as their beds will be placed in a shed on the outside of the building. This, in his mind, is the most important part of the plan, and highly worthy the attention of every humane and considerate employer in this way: fifthly, this construction of a kiln may be erected on a loft or ground floor. If in the latter situation, sufficient elevation should be given to the fire-place, so as not to impede the draught. These are the principal advantages that occur to the writer. If the experience of others confirm them, he will be highly gratified: \( a, \) the main walls; \( b, \) the flues; \( c, \) the chimneys; in each of which may be placed a metal damper to regulate the heat.

It is recommended, in the case of a new building, to carry up the flues of the chimneys in the thickness of the walls. In a house already built, they may be carried up either inside or outside the building: \( d, \) the fire-place, which may be divided, or in one, as desired, by which the half or the whole may be heated, as is most convenient.

It is stated that kiln tiles eighteen inches square, and two inches thick in the solid, with a lapping of half an inch broad and one inch deep round the edge of each tile, are proposed for covering the flues, which, if fairly cast, may be laid dry, without mortar. If it should be difficult, or too expensive, to procure tiles of eighteen inches, nine inches can be made to answer. The flues are proposed to be divided by a brick, on edge, so as that every eighteen-inch tile will cover two flues. The breadth of the flues may be six inches and a half, and ten inches high. This proportion, it is hoped, will be found to answer in most cases; but it may be varied according to the better judgment of the party erecting. The sides and bottoms of the flues should be plastered. The platform of this kiln should, in all cases, be well rammed with earth, and made perfectly level before laying out the flues. Iron grate-doors are intended to be hung on hinges, in a race, at the mouth of each flue, to prevent them being choked with large pieces of cinder, or other substances. It is also intended that these doors should shut and open at pleasure, as may be found necessary in carrying on the business.

KILN Tiles, in Rural Economy, the name of that sort of tiles which are employed in malt and other similar sorts of kilns.

KILN for tin-ore. The place where the tin-ore is roasted in order to burn away the muriate, and other sulphurous matters that are mixed with it, is called the tin-kiln. This is of a very plain structure; its hearth or floor is made of one large flue, and this is covered with another, supported at six inches height above it. The uppermost has a hole in the middle, through which the ore is poured on the under one; and when it is distributed over it in a bed of three or four inches thick, it is burnt by means of a fire of furze bushes kept underneath, and communicating with the space between the two flues by an aperture behind; the lower flue not reaching the wall by six inches.

When the sulphur is all burnt away by the fire, and the flame is no longer blue, the whole bed of roasted ore is thrust off the flue by the rake into the aperture behind, through which it falls into the open fire. The fire is kept up with new bulk, and there is a new bed of ore thrown in at the hole above. Thus the fire is kept up day and night, and supplies of fresh ore made through the hole by the black tin brought from the boulders of washing troughs. When the lower part of the furnace is filled up with the ore thrown into it, there is a hole behind the kiln, through which this ore, and the coals and ashes, are all raked out together, and left in the open air to cool; and the whole mass thus raked out, will sometimes be several days in cooling, the mixture of coals among it keeping it red-hot for a considerable time. When it is taken away from behind the furnace, it is washed again before it is put into the melting furnace. It is observed, that the different ores require for this half operation a different proportion, and different sort of fuel. The moor-tin, that is, such ore as is dug up in the moory countries, melts first with moor-charcoal charred; but that dug on the hills is found to run belt with a mixture of charcoal and peat in equal quantities. The flues used for the kilns are always mortar-flue. Phil. Trans. No 60.

KILNS, in Ship Building, a convenience for boiling or faying planks to make them pliable. A boiler-kiln is either made of sheet-copper, bottom and sides riveted together, or the bottom of sheet-copper and the sides of lead, rivetted and folded together. This is fixed in a body of brick-work, and under each end, in the middle, are furnaces to cauge the water to boil after the planks are in. The upper part, to preserve the steam and facilitate the boiling, is inclosed by shutters, opening by hinges and small tackles.

Dimensions of a Copper Boiler.

A steam-kiln is a tank composed of deals grooved and tongued together edgeways, and is from three to four feet square, and from 40 to 60 feet long, and has a door at each end. It is continued together by bolts driven through the sides at certain distances, which answers the purpose of bearers, whereon the planks rest while faying. It is supported, about four feet above the ground, upon a strong framing of wood. Underneath it, in the middle, is fixed, in brick-work, a large copper or iron boiler, or, which is better, one towards each end; the steam from the boilers, sifting into the trunk wherein it is confined, enters into the pores of the plank, and renders it very pliable.
KILONDA, in Geography, a town of Africa, in the kingdom of Benguela; 15 miles S. of Benguela.

KILONGO, a province of Loango, the oil of which is fertile. It was formerly an independent kingdom; the governor is absolute, and is elected by the people, without consulting the king of Loango. The chief article of trade is elephants' teeth. Kelingo, the capital, is situated on the coast; 30 miles N.W. of Loango. S. lat. 4° 25'.

KILPATRICK, Old and New, two parishes in the west of Scotland, and county of Dumbarton. Old Kilpatrick is situated on the banks of the river Clyde, about five miles east from Dumbarton, and within one mile of Bowling bay, where the great canal, or Forth and Clyde navigation, falls into the Clyde. It is one of the most pleasantly situated villages in Scotland, being directly opposite to the pleasure grounds of Erskine-house, the residence of Lord Blantyre, the superior of the parish. The parochial stipend being paid in grain is considered to be one of the best in Scotland.

The church is a very ancient building of the Gothic kind, and here are laid to be deposited the remains of the tutelary saint of Ireland, from whence the village takes its name. There is an extensive manufactory of rolled and malleable iron conducted here, and there are two large cotton mills in the neighbourhood. The spinning of woollen by machinery was attempted, but did not succeed. Those engaged in the cotton manufacture are employed from Glasgow and Paisley. New Kilpatrick is about four miles distant from Old Kilpatrick. There is no manufacture of any importance about it, excepting some large flour mills upon the river Kelvin, which are the property of Sir Ilay Campbell, of Garvaben, bart. lord president of the Court of Session.

KILSYTH, a town of Dumbartonshire, bordering on Stirlingshire, in Scotland, about thirteen miles north-east from Glasgow, upon the old or north road from Edinburgh to Glasgow, and near the banks of the great canal; or Forth and Clyde navigation. The country about Kilsyth is level to the south, east, and west, but very mountainous to the north. The valley is in general fine arable land, and the cultivation is now extremely good and most rapidly improving, for which there are the greatest facilities afforded by the inexhaustible supplies of coal and lime, which are found in every part of the neighbourhood. Kilsyth is of no importance as a commercial or manufacturing place, its chief manufacturing trade being confined to the Labour of operative tradespeople in weaving, tambouring, and sewing muffins for the manufacturers of Glasgow. There are, however, some extensive printfields at no great distance. Kilsyth gave the title of an earl to an ancient and noble family of Scotland, but the title and estate were forfeited by the rebellion, in the year 1715. Cumbernauld-house, in the neighbourhood, is the residence of Lord Elphinstone, the chief perfon in rank in this quarter, and lord lieutenant of the county. A very great proportion of the adjoining lands, formerly attached to the earldom, now belong to Sir Charles Edmonstone, of Dunleath.

KILZESTI, a town of Walachia, on the Tiflama; 12 miles S.S.W. of Tergovyl.

KILWARA, a town of Hindooefan, in the circuit of Rantapour; 32 miles S. of Suipour.

KILWINNING, a small town and parish in Ayrshire, upon the coast, about two or three miles from Irvine. It contains but little population, and is not remarkable for any particular art or manufacture. The land around it is chiefly the property of the earl of Eglinton, whose superb castle is in the immediate vicinity. Kilwinning is chiefly remarkable for the attention paid in it to the order of freemasonry, the lodge of Kilwinning claiming precedence, in point of antiquity, to every other lodge in Scotland, which, in their turns, assert their antiquity to be greater than those of England; the Scotch malons affirming the title of ancient as a mark of their priority, and refusing to acknowledge or receive those whom they denominate modern malons until they have qualified themselves to be received, by undergoing certain ceremonies of initiation only known to the brethren. The claim of the Kilwinning malons is so far admitted, that many of the lodges of Scotland receive charters of constitution from them in place of the grand lodge of Scotland. These lodges generally distinguish themselves by adding the word Kilwinning to the title which they have assumed. They are numerous through every part of the country, and the circumstance alluded to creates no kind of rivalry or dissention between them and those constituted by the authority of the grand lodge.

KILY HARBOUR, a bay on the W. coast of the island of Cebelles. S. lat. 1° 53'. E. long. 119° 20'.

KIMALISHA, an island of Russian Lapland, lying between the mouths of the rivers Shuya and Soroka, off the coast of the White sea; where the granite veins of micaceous earth are richly mixed with a beautiful brown, frequently glandulous, with granites and green transparent shor.

KIMBOLTON, a small market town in the hundred of Leightonolne and county of Huntingdon, England, is situated 10 miles from Huntingdon, and 63 from London. In the population return of 1820, the number of houses was stated to be 252; of inhabitants 1266. A weekly market is held on Fridays; and here are two annual fairs. The only object in the town of particular interest is Kimbolton-castle, a seat of the duke of Manchester, which is of unknown, but very remote origin. Leland says, "the castle is double walled, and the building of it nothing strong; it longed to the Marches, and was chaced by the Efsex. Sir Richard Wingfield built new, fair lodgings and galleries upon the old foundation of the castle. There is a plot now clene defolated, not a mile by well from Kimbolton, called Castlehill, where appear ditches and tokens of old buildings." This castle was the joynure, and became the retirement, of queen Catherine, after her divorce from Henry VIII. Henry, first earl of Manchester, expended large sums in making it a comfortable residence; and his grandson Robert, the third earl, made very considerable alterations and many additions. It is a quadranular building; the inside is most superbly fitted up, and decorated with numerous paintings. Beauties of England, vol. viii.

KIMBULA, in Zoology, the name of a species of crocodile found in the island of Ceylon, and of a very beautiful variegation of colours, being mottled all over with extremely elegant black spots shining with the gloss of black velvet.

KIMCHI, David, in Biography, a learned rabbi, who acquired high reputation as a copyriture commentator, was a native of Spain, and flourished in the twelfth and thirteenth centuries. His father, Joseph, was a bitter enemy to Christians, and wrote some severe treatises against them, but the subject of the present article speaks of Christians with moderation, and he is highly celebrated for his philological labours, which reflect infame on his name. His works are held in the highest estimation by the Jews, who maintain that there is no true science without Kimchi. Most of his commentaries have been incorporated in the great bibles of Venice and Babil; and Pfeiffer, in the "Critica Sacra," remarks, that his grammar is like the Trojan horse, from which crowds of Christian grammarians have issued forth, of whom those have shewn themselves most learned who have
have been most perfectly acquainted with Kimochi. He took a decided part in the controversy concerning the writings of Maimonides, and so far moderated the temper of the contending parties, as to produce a revocation of the sentences of excommunication on both sides. It is not known at what particular period he died. His commentaries extend to the greater number of the books of the Old Testament, and from the bibles of Venice and Basle have been transplanted into the labours of Catholic and Protestant commentators, and have unquestionably afforded much valuable assistance in illustrating the true sense and meaning of the Hebrew text. Kimochi's philosophical works consist of a Hebrew Grammar, called "The Book of Perfection," and of a Hebrew Dictionary, intitled "The Book of the Roots." They were first published at Constantinople, but have been several times reprinted. Buxtorf made these works the foundation of his "Theaurus Linguæ Hebrææ," and his "Lexicon Linguæ Hebrææ." Several of Kimochi's letters may be found in a volume of "The Letters of Maimonides," published at Venice in the year 1545.

KIMOSDY, in Geography, a town of Hindoostan, in the circuit of Ciacole; 30 miles N.W. of Ciacole.

KIMI. See KEMI.

KIMITO, a town of Sweden, in the government of Abo; 23 miles S.E. of Abo.

KIMKIM, a town of Valachia; 55 miles N. of Bucharest.

KIMLASSA, a town of Hindoostan, in the country of Malwa; 35 miles S. of Chanderee. N. lat. 24° 15'. E. long. 78° 42'.

KIMMOK. See KEMMOO.

KIMMULO, a town of Hindoostan, in Orissa; five miles N. of Sonepour.

KIMNIK, a town of Walachia, on the Alaut; 44 miles E.S.E. of Tergovista.

KIMOS, a lake of Russia, in the government of Olonetz; eight miles N.W. from lake Nuk, with which it communicates by a small river. N. lat. 64° 45'. E. long. 30° 14'.

KIMOSSES, or KUMOSSES, a name given in the language of Madagascar to a race of pigmies, or human beings of a diminutive size, who inhabit the interior parts of the island, and there form a considerable national body. M. de Commeron, cited by M. Kochin in his "Voyage to Madagascar," gives the following account of them: "The natural and distinctive character of these little men is to be white, or, at least, of a paler complexion than all the different blacks ever known, to have very long arms, so that their hands reach below the knee, without bending the body; and that of the women, to have scarcely any breasts, except when they nurse their infant offspring; so that many of them are obliged to have recourse to cow's milk, for feeding their new-born infants. As to intellectual faculties, the Kimooffes surpass all the rest of the Maleganes, who are known to be very ingenious and adroit, though abandoned to the greatest idleness; but the Kimooffes are more active, and also more warlike; so that their courage being, as it were, double in proportion to their size, their neighbours have not been able to apprize them, they have attacked them by a superiority of number amounting to 10 to 1. Attacked as they have been by unequal weapons, (for they do not use gunpowder and muskets, like their enemies,) they have always fought courageously, and supported their independence among their rocks, which being difficult of access, have, without doubt, contributed to their preservation. There they live upon rice, different fruits, vegetables, and roots, and rear great number of cattle, (bullocks with lumps on their backs, and sheep with long, broad, fat tails,) which serve them as part of their food. They have no intercourse with the different tribes of Maleganes, who surround them, neither by trade, nor by any other method, because they derive all they want from the territory they inhabit. As all the little hillmishes or wars which take place between them and the other inhabitants of the island, have no other object than to carry off some cattle or slaves, the diminutive size of the Kimooffes exempts them from the latter injury. In order to compromise the former, they contrive, when from the summits of their mountains they perceive preparations for war in the plain, to take all the superfluous cattle they can spare, and tie them to the openings of the defiles which must be passed by the enemy in penetrating into their mountains, of which, they say, they make a voluntary sacrifice to the indignity of their elder brethren; but they protest, at the same time, to fight to the last drop of blood, if they should penetrate further into their territories by force of arms. Their arms are the lance and the arrow, which they dart in the most masterly manner. At three days march from fort Dauphin, the natives show, with great complacency, some elevations of ground resembling graves, which owe their origin, as they affirm, to a great massacre of the Kimooffes, who were defeated in the open field by their ancestors." M. de Commeron says further, that he is able to certify, as an oculiar witness, that in the voyage which he made to fort Dauphin, about the latter end of the year 1770, count de Modeve, the late governor, who communicated to him part of the preceding observations, gave him the satisfaction of shewing to him, among his slaves, a Kimooff woman, about 30 years of age, three feet seven inches high, whose complexion was one of the clearest and brightest he ever saw among the natives of the island. He remarked, that notwithstanding her low size, she was very strong-limbed, not resembling a slender diminutive person, but rather a woman of common proportion, her defect of height excepted; her arms were long, and reached, without slopping, the knee; her hair was short and woolly; her physiognomy tolerably good, and more like that of the Europeans than of the people of Madagascar. She seemed constantly to smile, her temper was sweet and complaisant, and she seemed, from the tenor of her conduct, to be perfectly of much good sense. Her breasts were flat; but this circumstance of itself is far from being sufficient to establish an exception from the general law of nature. The desire of recovering her liberty, as much as the fear of infant embakment, made the little slave escape by running away into the woods. This shortness of size, as Commeron farther observes, compared with that of the Laplander, is almost graduated in both; the Laplander and the Kimooff inhabiting the most frigid zones, and the most elevated mountains on the globe. Those which form the retreat of the Kimooffes at Madagascar, are from 16 to 18 hundred fathoms above the level of the sea. The production of the vegetable kingdom, which naturally grow on these high mountains, seem to be abortive: e. g. the pine, the birch, and many other trees, appear like creeping bushes or shrubs. M. de Modeve also gives an account of this race of beings, who inhabit the centre of the island, in the 22d degree of latitude. The middling size of the men, he says, is three feet five inches, and they have a long round beard; the size of the women is somewhat shorter than that of the men. The Kimooffes are thick and strong-limbed; the colour of their skin is leat tawny than that of the other natives, and their hair short and woolly. They forge iron and steel, of which they make lances and arrows; which are the only arms they use. In other particulars he confirms the account already given of their mode of self-defence, from
From other reports, he informs us, that the valley of the Kimffes is rich in cattle and other provisions. These dwarfs are hideous, and very good husbandmen. Their chief has an authority more absolute and more respected than that of the other chiefs of the different districts of Madagascar. The extent of the valley which they inhabit was not able to ascertain; but he knew, that it was surrounded by very high mountains, and that its situation is 60 leagues N.W. from Port Dauphin, and it is bounded by the country of Mantanana. Their villages are erected on little eminences, whose steep sides are the more inaccessible, since they have multiplied the obstacles which forbid approach to them.

KIMOZERSKAIA, a town of Russia, in the government of Olonecz, on the lake Kimos; 88 miles N. of Kemi. KIMPINA, a town of Walachia; 36 miles S. of Cronstadt.

KIMPOLUNG, a town of European Turkey, in Moldavia; 116 miles W.N.W. of Jassy. N. lat. 47° 42'. E. long. 25° 8'.

KIMPUR, a town of Bengal; 27 miles E.N.E. of Purnah. KIMBA, a town of Sweden, in East Gotland; seven miles S.S.W. of Nordkoping.

KIM-TCHA, a town of Tibet; 15 miles W.N.W. of Tehfurecong. KIM-TCHEOU, a town of Chinese Tartary. N. lat. 44° 2'. E. long. 126° 26'.

KIN, a town of Persia, in the province of Segestas, situated at the foot of a chain of mountains near the lake Zurrab; the air is pure, and the soil of the environs fertile, especially in fruit; 127 miles W. of Candahar. Also, a town of Arabia, in the province of Nedsed; 153 miles N.E. of Hajar.

Kin-Jats, compensation for the slaughter of a kinsman.

See Bote.

KINAKINA AROMATICA, in the Materia Medica, a name by which some authors have called the cortex elutherti.

KINASKA, in Geography, a town of Russia, in the government of Irkutsk; 25 miles W. of Nertchinsk.

KINASSO, a town of Africa, in Congo; 30 miles S.E. of Pango.

KINATJURA, a town of Japan, in the island of Ni-phon; 94 miles S.W. of Macao.

KINBURN, a fortress of Russia, in the government of Ekaterinoslav, on a bay of the Black Sea, at the mouth of the Dnieper. It stands close to the frontiers, opposite the Turkish fortresses of Ochakov, which being a place of superior strength, must, while it continues in the hands of the Turks, be held, in case of a rupture, the navigation of the Dnieper; but as the harbour, on account of its quick-land, affords no security for anchorage, the town of Kherson or Cherfon is at present the great emporium for trade; 16 miles S.E. of Ochakov. N. lat. 46° 35'. E. long. 31° 36'.

KINCARDINE, a town of Perthshire, Scotland, is seated on the banks of the river Forth, in a small tract of the county, which is nearly surrounded by Clackmannanshire. It was formerly called Wilt-Pans, from the number of salt-pans used here. In 1780, it was 15; but at present these are reduced to two or three. The houses are mostly well built, and the streets assume a regular appearance. Here are two weekly markets, and several annual fairs. A valuable salmon-fishery is established on the Forth, at this place; and here is a commodious harbour: nearly opposite the town is an excellent roadstead, where 100 vessels, or more, may be anchored in safety. Ship building is carried on to a considerable extent, and vessels from 200 to 300 tons burden are often built here. In the year 1792, there were 75 vessels belonging to this port, to which were annexed 300 sailors. In 1793, the town contained about 900 inhabitants.

KINCARDINESHIRE, or the county of Mearns, a district of Scotland, is surrounded by the counties of Aberdeen, Angus, and the British ocean. The area thus enclosed is nearly of a triangular form, and extends along the coast from the bay of Aberdon, to the North-Elk river, an extent of about thirty miles; and from Dunnottar Castle, to mount Battack, nearly 20 miles. The superficial contents of lands, are 191,575 acres, of which 242,444 acres lie under cultivation, and 115,131 acres of the North-Elk, which separates this county from that of Angus, on the south. Here the continuation of the Sidlaw hills runs under different names, from the banks of the North-Elk, to the neighbourhood of Stonehaven, and bounds Strathmore on the south, or south-east. The line or valley of Strathmore, was the tract formerly pursued by all the invaders of Scotland, who, on account of the mountainous ridge between the two kingdoms, must either have entered by Berwick on the east, or by Dumfries on the west, where the mountains terminate before reaching the sea.

Among the Grampians, none are of very considerable height. That of the greatest altitude is mount Battack, in the parish of Strachan, which is said to be 1150 yards above the level of the sea. Kerlock, in the same parish, is 1896 feet high, and Kloochakbane 2370 feet. To the northward of the Grampians, only a small strip of hills, or spots and glens, of no great extent of cultivated land, are to be found in the south. The Grampian hills are either covered with heath or moss, and afford but very little pasturage. In the glens and valleys, and on the sides and towards the bottoms of the hills, where cultivation has taken place, the soil is either light or gravelly, and full of small stones; but on the banks of the brooks and streams, peat commonly prevails. In the level part of the county, the soil is generally clay. That strip of fine fertile land, lying along the sea-coast from North-Elk river, to Stonehaven, is chiefly a deep brown loam on a clay bottom, but in some places obliterate clays occur. The soil in the valley of Strathmore is similar to that along the coast; but in practice it is found, that the clays in Strathmore do not carry beans, even after being properly limed; although the lands along the coast, when manured with lime, sea-weeds, or dung from the fishing towns, produce abundant crops; the reason of which seems to be, that in the interior part of the county the land is of a lighter nature, lying upon a cold clay. The coast land is a rich loam, fit for wheat and beans.

The mineralogy of this county is of no great importance. In many places, however, there are lime quarries; and as the stone is of the best quality, abundance of fuel only is wanting to render them of great value. They are wrought in the parishes of Eccles Craig, Laurencekirk, and others. In the parishes of Arbuthnot, and on the sea-shore near St. Cyrus, beautiful pebbles and fine jaspers are found.
great part of the coast, which is bold and dangerous, con-

fits of rocks of that singular character called Brecia, or

"plumb-pudding stone," having the appearance of loose

stones bound together by an artificial cement. In the north-

eastern part of the county, near Aberdeen, granite quarries

are wrought for exportation.

In this county is only one royal borough, Inverurvie, or

Bervie; but there are several populous villages, of which

Stonehaven, Johnshaven, and Laurencekirk, are the chief.

The principal rivers connected with this county, are those

of the North-Elk on the west and south, and the Dee on the

north. The other streams, which are but of little note, are

called the Dye, the Cowie, the Carron, the Bervie, and the

Luther.

The most remarkable remnant of antiquity in Kincardine-

shire, is Dunnottar castle. It stands on the eastern coast, on

a rock projecting into the sea, accessible from the land on

the west side, and that only by a narrow, steep, and winding

path, over a deep gully, by which it is connected with the

main land, and which serves as a kind of natural fosse or
ditch, the adjacent rock having been scarped and rendered

inaccessible by art. Here are various buildings and conven-

iences necessary for a garrison; such as chapel, barracks,
a bafton or cistern of water twenty feet in diameter, a bowling-
green, and a forge, said to have been used for casting iron-

bullets. On this rock, notwithstanding its difficulty of ac-

cess, the church and burial-place of the parish were origi-
nally situated; the building now called the chapel being

formerly the parish-church. In this castle, the regalia of

Scotland, (the crown, sceptre, and sword,) were deposited in

the year 1651, to preserve them from the English army,

which overran this country during the civil wars of that

period.

In the parish of Eccleslaig, are the ruins of a fortress,

formerly a place of great strength, being erected on a per-

pendicular and perpendicular rock sixty feet above the sea.

In the parish of Fettercairn is a ruined building, called

Fenella's castle, said to be the place where Kenneth III.

was assassinated. In Fordun parish a house still remains,

called St. Palladius's chapel, where the image of the saint

was kept, and to which pilgrimages were performed from the

most distant parts of Scotland. In the parish of Ar-

buthnot, was born the celebrated Dr. Arbuthnot, physician

to queen Anne. He formed a distinguished literary trium-

virate with Mr. Pope and Dr. Swift.

In the population return to parliament in the year 1801,

Kincardineshire was stated to contain 3590 houses, and

26,349 inhabitants.

KINCHA, a river of Affia, which rises in Thibet, passes

through the Chinese province of Se-chuen, and enters the

province of Hon-guang, where it changes its name to Yang-

tze, after which it crosses the province of Kiang-nan, and

runs into the sea, N. lat. 31° 55'. E. long. 112° 44'.

KINDELBRUCKEN, a town of Saxony, in Thuringia,

on the Wipper; 21 miles N.E. of Erfurt. N. lat. 51° 16'.

E. long. 11° 10'.

KINDERHOOK, a port-town of America, in Columb-

nia county, New York, on the E. side of Hudson's river,

containing 50 dwelling-houses and a Dutch church; 13

miles N. of Hudson's city. The township contains 4398

inhabitants, of whom 383 are slaves. N. lat. 42° 25'.

W. long. 73° 34'.

KINDRED, in Law, are a certain body of persons of

kin, or related to each other. See Administration, Ae-

nati, Consanguinity, and Degrees.

KINE, in Zoology. See Bull and Cow.
KING.

riage with Sigismund, at which time she took the title of queen.

By our laws the supreme executive power of these kingdoms is vested in a single person, the king or queen: for it matters not to which sex the crown descends: but the person entitled to it, whether male or female, is immediately invested with all the ensigns, rights, and prerogatives of sovereign power, as is declared by statute 1 Mar. fl. 3. c. 1. (See Queen.) As the executive power of the English nation is vested in a single person, by the general consent of the people, manifested by long and immemorial usage, it is become necessary to the freedom and peace of the state, that a rule, uniform, universal, and perpetual, should be laid down, in order to make out, with precision, who is that single person, to whom are committed (in subervience to the law of the land) the care and protection of the community; and to whom, in return, the duty and allegiance of every individual are due. Accordingly our constitution has not left the decision of this important question dark or doubtful. It has marked out the right of succession in characters sufficiently obvious. See the article Right of Crown.

The king's title having been ascertained, the next point of principal importance is the affiance which the law has provided for him in the discharge of his duties, the maintenance of his dignity, and the exercise of his prerogative. For this purpose a diversity of councils has been established: such are, the high court of parliament, the peers of the realm, the judges of the courts of law, and more especially the privy council, generally called, by way of eminence, "the council." (See Parliament, Peers, Judges, and Privy Council.) The next object of consideration will be the duties incumbent on the king by our constitution; with a view to which his dignity and prerogative are established by the laws of the land: it being a maxim in the law, that protection and subjection are reciprocal. (7 Rep. 5.) These reciprocal duties are, according to the statement of judge Blackstone, what were meant by the convention in 1688, when they declared that king James had broken the original contract between king and people. (See Original Contract.) The principal duty of the king is to govern his people according to law. "Nec regibus infinita aut libera potestas," was the constitution of our German ancestors on the continent. (Tac. de Mor. Germ. c. 7.) And this is not only consonant to the principles of nature, of liberty, of reason, and of society, but has been always esteemed an express part of the common law of England, even when prerogative was at the highest. "The king," says Blackstone, (l. i. c. 8.) who wrote under Henry III. "ought not to be subject to man, but to God, and to the law; for the law maketh the king. Let the king, therefore, render to the law what the law has invested in him with regard to others; dominion and power; for he is not truly king, where will and pleasure rule, and not the law." And again, (l. 2. c. 16. § 3.) "the king also hath a superior, namely, God, and also the law by which he was made a king." For this, also having well distinguished between a monarchy absolutely and despotically regal, introduced by conquest and violence, and a political or civil monarchy, which arises from mutual consent, such as he supposes the government of England to be, lays it down as a principle, that "the king of England must rule his people according to the decrees of the laws thereof; infomuch that he is bound by an oath at his coronation to the observance and keeping of his own laws." Moreover, it is expressly declared by statute 12 and 13 W. III. c. 2. "that the laws of England are the birthright of the people thereof; and all the kings and queens who shall ascend the throne of this realm ought to administer the government of the same according to the said laws; and all their officers and ministers ought to serve them respectively according to the same; and therefore all the laws and statutes of this realm, for securing the established religion, and the rights and liberties of the people thereof, and all other laws and statutes of the same now in force, are ratified and confirmed accordingly." The terms of the original contract between king and people, the learned judge apprehends to be now couched in the Coronation Oath; which see.

In order to enable the king to maintain the executive power in due independence and vigour, and to discharge with honour to himself, and benefit to his subjects, the duties of his high station, the constitution and laws have invested him with a variety of prerogatives, some of which are direct and others incidental. (See Prerogative.) The former, or direct and substantial prerogatives may be distributed into three kinds; such as regard, firstly, the king's royal character; secondly, his royal authority; and lastly, his royal income. These are necessary to secure reverence to his person, obedience to his commands, and an affluent supply for the ordinary expences of government. We shall refer to the article Revenue, what relates to the royal income; and here content ourselves with enumerating some particulars that pertain to the king's political character and authority; or, in other words, his dignity and regal power; to which last the term prerogative is frequently restricted. In order to exhibit and support the royal dignity, the law ascribes to the king, in his high political character, not only large powers and emoluments, which form his prerogative and revenue, but likewise certain attributes of a high and transcendent nature; by which the people are led to consider him in the light of a superior being, and to pay him that awful respect, which may be termed, with greater ease to carry on the business of government. First of all, the law ascribes to the king the attribute of sovereignty, or pre-eminence. "Rex eft vicarius," says Bracton, "et minimus Deus in terra. Omnis quidem sub eo eft, ipsis sub nullo tantum sub Deo." He is said to have imperial dignity; and in charters before the conquest, is frequently styled basileus and imperator, the titles respectively assumed by the emperors of the East and West. His realm is declared to be an empire, and his crown imperial, by many acts of parliament, particularly the statutes 24 Hen. VIII. cap. 12. and 25 Hen. VIII. cap. 28, which at the same time declare the king to be the supreme head of the realm in matters both civil and ecclesiastical, and consequently inferior to no man upon earth, dependent on no man, and accountable to no man. (See also 24 Geo. II. cap. 24. 5 Geo. III. cap. 27.) Hence it is that no suit or action can be brought against the king, even in civil matters; because no court can have jurisdiction over him. Hence it is likewise, that by law the person of the king is sacred, even though the meafures pursued in his reign be completely tyrannical and arbitrary; for no jurisdiction on earth has power to try him in a criminal way; much less to condemn him to punishment. If any foreign jurisdiction had this power, as was formerly claimed by the pope, the independence of the kingdom would cease; and if such a power were vested in any domestick tribunal, there would soon be an end of the constitution, by destroying the free agency of one of the constituent parts of the sovereign legislative power. It may be asked, however, are the subjects of England totally delittae of remedy, in case the crown should invade their rights, either by private injuries, or public oppression? To this, says judge Blackstone, we may answer, that the law has provided a remedy in both cases. As to private injuries; if any person has, in
point of property, a full demand upon the king, he must petition him in his court of chancery, where his chancellor will administer right as a matter of grace, though not upon

iud. in being fuch but, vi-z., fmce no each judge compilation. The p. will without declared preTitions, deed, preTitions, fuch wicked figncd

afei-bes fafety maxims, vide created affairs vcrigiial clares improper (though unfortunately has fundamental of whatever the king; the crown for whatsoever is, therefore, there is

of that therefore, of his king, which can made for it by nature, the crown.

15. Nay more, the law ascribes a kind of perpertuity, or immortality to him. Rex Anglia non moritur. Henry, Edward, or George, may die; but the king survives them all. His death is termed his demise, because the crown is thereby demised to another. He is said not to be liable to death, being a corporation of himself, that lives for ever. There is no interregnum, but the moment one king dies, his heir is king, fully and absolutely without any coronation, ceremony, &c.

IV. To thefe it may be added, that the law attributes a kind of abstinence to the king; he is in a manner every where, in all courts of judicature, which he alone has the right of erecting, and therefore cannot be nullified. In the exertion of lawful prerogative, says judge Blackstone, the king is and ought to be absolute; that is, so far absolute, that there is no legal authority that can either delay or reftrint him. He may reject what bills, may make what treaties, may coin what money, may create what peers, may pardon what offences he pleases; unless where the constitution hath expressly, or by evident consequence, laid down some exception or boundary; declaring that thus far the prerogative shall go and no farther.

Some things there are which the king cannot do; viz. he cannot divell himself, or succedors, of any part of his regal prerogative, authority, &c. There are several things also which he cannot do falvo jure, falvo juramento, & salvo conscientia fua: in particular, there are two things which he cannot do without the consent of parliament; viz. make new laws, or raife new taxes.

In the exertion of those prerogatives, which the law has given him, the king is irreparable, and absolute, according to the forms of the constitution, and yet, if the consequence of that exertion be manifeftly to the grievance or dishonour of the kingdom, the parliament will call his advisers to a just and fere account. For prerogative confilling, as Mr. Locke has well defined it, (On Govern. 2. § 106.) in the discretionary power of acting for the public good; where the positive laws are silent, if that discretionary power be abused to the public detriment, fuch prerogative is exerted in an unconstitutional manner. Thus the king may make a treaty with a foreign state, which shall irrevocably bind the nation; and yet when fuch treaties have been judged pernicious, impeachments have purfied fuch-ministers, by whose agency or advice they were concluded.

The king, with regard to foreign concerns, is the deleg- gate or repreentative of his people; and as fuch, he has the fole power of fending ambaffadors to foreign states, and receiving ambaffadors at home. See EMBASSADOR.

The king has power, by his prerogative, without any act of parliament, to make war or peace, to conclude leagues, treaties, and alliances with foreign states, and to grant safe- conduct.
conducts. The king is considered as the generalissimo, or the first in military command, within the kingdom: and in this capacity he has the sole power to give commissions for raising and regulating fleets and armies, as well as for erecting, manning, and governing forts, and other places of strength, to appoint ports and havens, to erect beacons, light-houses, and lighthouse-marks, to prohibit the exportation of arms or ammunition out of the kingdom, dispense of magazines, calli, ships, public moneys, &c. He convokes, adjourns, prorogues, and dissolves parliaments; and may refuse his assent to any bill passed by both houses, without giving his reasons for it.

In domestic affairs the king is considered as the fountain of justice and general conservator of the peace of the kingdom. However, by the fountain of justice the law does not mean the author or original, but only the distributor. Justice is not derived from the king, as from his free gift; but he is the steward of the public, to dispense it to whom it is due. (Bract. 1. 3. tr. 1. c. 9.) In this capacity the king alone has the right of creating courts of judicature; and all jurisdictions of courts are either mediately or immediately derived from the crown; their proceedings run generally in the king's name; they pass under his seal, and are executed by his officers. In early times, our kings, probably in persons, often heard and determined causes between party and party. But by the uniform usage of many ages, they have delegated their whole judicial power to the judges of their several courts, which are the grand depositories of the fundamental laws of the kingdom, and have gained a known and rated jurisdiction, regulated by certain and established rules, which the crown itself cannot now alter but by act of parliament. (2 Hawk. P. C. 2.) In criminal proceedings it would be in the highest degree absurd, if the king personally sit in judgment; because in regard to these he appears in another capacity, that of "protector." But though the king is not personally present in his courts of law; yet he is understood to be virtually present; his judges are the mirror by which the king's image is reflected; so that it is the royal office, and not the royal person, that is always present in court, always ready to undertake proceedings, or pronounce judgment, for the benefit and protection of the subject. See Court and Judge.

As the king is the fountain of justice, the prerogative of issuing proclamations is vested in him alone. (See Proclamation.) The king is likewise the fountain of honour, of office, and of privilege. Accordingly he is enthroned with the sole power of conferring dignities and honours, so that all degrees of nobility, knighthood, and other titles, are received by immediate grant from the crown; either expressed in writing, by writs or letters patent, as in the creation of peers and baronets; or by corporeal investiture, as in the creation of a simple knight. And as the king may create new titles, so he may create new offices, but with this restriction, that he cannot create new offices with new fees annexed to them, nor annex new fees to old offices; for this would be a tax upon the subject, which cannot be imposed but by act of parliament. (2 Ingl. 333.) The king has also the prerogative of conferring privileges upon private persons; such as granting place or precedence to any of his subjects (4 Ingl. 301); such is also the power to enfranchise an alien, and make him a denizen. Such is likewise the prerogative of erecting corporations; which fee.

The king is also the arbiter of commerce. Under this branch of the prerogative he has power to establish public marts, or places of buying and selling; such as markets and fairs, with the tolls belonging to them; and likewise to regulate weights and measures; to give money, which is the medium of commerce, authority, or to make it current; and the coining of money is the act of the sovereign power, and the settling of the denomination or value for which the coin is to pass current. The king may also at any time decree or cry down any coin of the kingdom, and make it no longer current. Among the incidental prerogatives belonging to the king, and which are exceptions, in favour of the crown, to those general rules that are established for the rest of the community, we may mention the following. Debts due to him are always to be satisfied in the first place, in case of execution, &c., and till his debt is discharged, he may protect the creditor from the arrests of others. He may distrain for the whole debt on a tenant that holds but part of the land; is not obliged to demand his rent as others are; may sue in what court he pleases, and distrain where he lists. In all doubtful cases, of the jurisdiction of the king, his officers may enter with an arrerell; and, if entrance be denied, break open a house, and seize the party; though in other cases a man's house is his castle, and has a privilege to protect him against all arrests. Moreover no seizes shall be recovered against the king; and the king can remove a joust-tenant.

He has also custody of the persons and estates of idiots and lunatics; he is ultimate reversioner, and to him revert all estates, when no heir appears. All tenure-fore (i.e. money, plate, or bullion, found, and the owners not known) belongs to him; so all waifs, eblays, wrecks, lands recovered from the sea, gold and silver mines, royal fishes, &c. belong to him. See Revenue.

The king is considered by the laws of England as the head and supreme governor of the national church. (26 Hen. VIII. cap. 1.) In virtue of this authority, he convenes, prorogues, refraint, regulateth, and dissolves, all ecclesiastical synods or convocations. See Convocation.

He has the supreme right of patronage, called patronage paramount, over all the ecclesiastical benefices in England.

From this prerogative of being the head of the church arises the king's right of nomination to vacant bishoprics, and certain other ecclesiastical preferments. As head of the church, the king is likewise the "dernier resort" in all ecclesiastical causes; an appeal lying ultimately to him in chancery from the sentence of every ecclesiastical judge; which right was restored to the crown by statute 25 Henry VIII. c. 19. The king can unite, separate, enlarge, or contract the limits of bishoprics, or ecclesiastical benefices, and by his letters erect new bishoprics, colleges, &c. See Regalia.

He can dispense with the rigour of the ecclesiastical laws, except those which have been confirmed by act of parliament, or declared by the bill of rights; as, for a bastard to be a priest, for a bishop to hold a benefice in commendam, &c. He has also power to dispense with several acts of parliament and penal statutes, by a non-obstante, where himself alone is concerned; to moderate the rigour of the law, according to equity; to pardon a man condemned by law; except in appeals of murder, and in case of impeachments by the house of commons; and to interpret by his judges, in statutes and cases, not defined by law.

King of the Sacrifices, rex sacrificulor, or fociorum, was a title of an ancient priest, or minister of religion, at Rome; who was superior to the flamen Dialis, but inferior to the pontifex maximus.

He was created at the comitia centuriata, or assembly of the centuries, and was at first chosen out of the number of the patricians. He could not, during his office, hold any magistracy, nor harangue the people. He presided at all the sacrifices, proclaimed the feasts, &c.

His wife bore the title of queen of the Sacrifices, regina foceorum; and had herself a part in the sacred ceremonies.

King at Arms, or of Arms, is an officer of great antiquity, and anciently he was of great authority; his business is to direct the heralds, preside at their chapters, and have the jurisdiction of armorial.

The origin of this title is doubtful. Some of the French writers imagine that it was given to heralds because they attended upon and regulated military ceremonies. Others attribute to them the title of kings, because they governed and presided in ceremonies of tournaments, in like manner as the master of the ceremonies at Athens was styled Ephanes. Others again ascribe the title to them, because in alligning arms, as expressions of honour to any person, they resembled the kingly prerogative. But this supposes that the custom of granting arms by the kings of heralds is as ancient as their titles: whereas Mr. Edmondson observes, in his "Complete Body of Heraldry," that it doth not any where appear that these kings had anciently the addition armorum given to them, they being then called, as they truly were, reges heraldorum; which for the most part continued till about the reign of Henry IV., when they began to be entitled reges armorum, although their primitive appellation was also used for some ages. The latter title of reges armorum was attributed to them before such times as those officers made any grant of arms.

Sir Henry Spelman is of opinion, that the title of King of arms was attributed to such officers in England as belonged immediately to the king's majesty; whilist those who appertained to princes of the blood royal, or to the nobility, were styled simply heralds. The most probable conjecture is, that this denomination "king of heralds," of later times called "king of arms," was given to that person who was the chief, or principal officer presiding over the heralds of any kingdom, or of any particular province, usually termed by heraldic writers "the marches," or of any order of knighthood; and owing its rise probably to the French dialect.

Among the French, the word reges, or king, and from them in their and our histories and records, the Latin word rex hath been frequently referred to the principal, the governor, the judge, the visitor, the supreme, the president, or chief, of many professions, arts, or communities. In the most ancient writers, these officers are styled merely "kings of heralds," without the addition of any title of office; but in course of time they became distinguished by the appellations of their different provinces.

In England we have three kings of arms; viz. Garter, Clarenceux, and Norroy.

Garter, principal King at Arms. See Garter.

The two last are also called provincial heralds, because they divide the kingdom between them into two provinces, which are separated by the river Trent.

These, by charter, have power to visit noblemen's families, to set down their pedigrees, distinguishing their arms, appoint persons to their arms, and, with Garter, to direct the other heralds.

Anciently the kings at arms were created, and solemnly crowned, by the kings of England themselves; but of later days the earl marshal has a special commissiun, at every creation, to perfonate the king. See CLARENCEUX, and NORROY.

To these may be added Lyon King at Arms, for Scotland, who is the second king at arms for Great Britain; he is invested and crowned with great solemnity. To him belong the publishing the king's proclamation, marshalling funerals, revering arms, &c. And also Ulter, king of arms, in Ireland.

Ulter was sublimated, as some say, in the room of Ireland king of armes, by Edward VI.; though the king himself in his journal takes notice of it as a new institution. "There was a king of arms made for Ireland," says he, "whose name was Ulter, and his province was all Ireland; and he was the fourth king of armes, and the first herald of Ireland." The patent passed under the great seal of England, with an ample testimony of the neediness and dignity of the office. Whether Ulter was sublimated in the room of Ireland king of armes, or else was newly erected, such an officer of the crown of England, on which Ireland is dependent, still continues, and may execute his heraldic order in this kingdom, though out of his province, in as extensive a manner as either Clarenceux or Norroy may do without the limits of either of their marches. We here add, that each of the military orders of knighthood established in England, viz. the Garter and the Bath, give titles to kings of arms. Garter has been already mentioned. (See Garter.) Bath king of arms was created in the eleventh year of king George I. for the government of the order of the "Bath," then newly created, by virtue of letters patent, bearing date at Westminster, May the 18th, in that year. In conformity to the list above-mentioned to this order, he was nominated and created, by the great master of the order, with the ceremonies usually observed in the creation of other kings of armes, to continue in his said office during good behaviour, denominated Bath, and enjoined feodally to attend the service of the order. His habit and service are particularly prefixed. In the year 1725, his majesty, by his mainual, conformed and ordained, the then Bath king of armes, "Gloucester king of armes, and principal herald of the parts of Wales;" and letters patent passed the great seal, granting to him the said office of "Gloucester," empowering him to grant arms and crests to persons residing within the dominions of Wales; and also perpetually consolidating the office of "Gloucester" with that of "Bath" king of armes; ordering, moreover, that in all assemblies, and at all times, he should take precedence above and before all other provincial kings of armes. See College of Heraldes, and Herald.

King's Band, in Musical History, a royal household establishment. In the reign of king Edward IV., Music, after leading a vagrant life in our country, and being passed from parish to parish, seems at length, by the favour of this monarch,
N

Arion
governor

and the eleventh year of Charles I., when that monarch was petitioned to grant a new patent to the professorship of the art and science of music, the form of that which had been from Edward IV. was made the ground-work of the new charter. For a further account of this institution, see Chapel Royal Establishment.

The splendid robes and gorgeous attire of bards and minstrels at all times are upon record. The flowing vest of Orpheus in the triple capacity of priest, legislator, and musician, is specified by Virgil; Arion is related by Herodotus to have leaped into the sea in the rich vestments he usually wore in public; Suidas speaks of the saffron robe and Miletian slippers worn by Antigenides; and the performers in the tragic chorus, which used to be furnished at the expense of some wealthy citizen of Athens, wore also splendid and costly uniform.

Indeed the custom of presenting state musicians with superb and expensive dresse during the fourteenth century, seems to have travelled into England from the continent, and to have continued here till after the establishment of the king's band of four-and-twenty performers; part of their present salary being paid at the wardrobe-office, as an equivalent for the annual drets with which they used to be furnished at his majesty's expense. The children of the king's chapel still continue to wear the scarlet uniform of the original establishment. And the waits, or musicians who attend the mayor and aldermen of our cities and incorporate boroughs, are still furnished with splendid cloaks. See Minstrels and Waits.

King of the Minstrels, in Musical History. Dr. Plot, in his History of Staffordshire, has minutely related the origin of an ancient and curious, though barbarous, privilege in favour of English minstrels, granted by John of Gaunt, duke of Lancaster, at his exile of Tutbury, in the year 1380, at the inauguration of the first king of the minstrels. Du Cange gives several more early instances of minstrels having arrived at the honour of sovereignty in France: particularly Jean Charmillons, rex jugulatorum at Troyes, in Champagne, 1296. Robert Cavaron, roi des menestrers du royaume de France, 1318; and others in 1357, and 1362. Copin de Broquin, roi des menestrers du royaume de France. Computum de auxilis pro redemptione regis Johannis, A.D. 1367. For a couronne d'argent qu'il donna le jour de la tiphaine au roi des menestriers. And one about six years later than John of Gaunt's institution is mentioned in Rymer, tom. vii. p. 555, where John Cauntz, king of the minstrels, confedered to supplicate for leave to visit foreign countries.

During the time in which ancient earls and dukes of Lancaster, who were ever of the blood royal, great men in their time, and had their abode, and kept a liberal hospitality here, at their honour of Tutbury, there could not but be a general concourse of people from all parts hither; for whose diversion all sorts of musicians were permitted likewise to come to pay their services; amongst whom, being numerous, some quarrels and disorders now and then arising, it was found necessary, after a while, they should be brought under rules, divers laws being made for the better regulating of them, and a governor appointed them by the name of a king, who had several officers under him to see to the execution of these laws, full power being granted them to apprehend and arrest any such minstrels appertaining to the said honour, as should refuse to do their services in due manner, and to constrain them to do them; as appears by the charter granted to the said king of the minstrels, by John of Gaunt, king of Castile and Leon, and duke of Lancaster, bearing date the 22d of August, in the fourth year of the reign of king Richard II., entitled "Carta le Roy de Minstrellez," which is as follows:

"John, by the grace of God, king of Castile and Leon, duke of Lancaster, to all them who shall flee or here thefe letters, greeting—Know ye, we have ordained, constituted, and assigned to our well-beloved the king of the minstrels in our honour of Tutbury, who is, or for the time shall be, to apprehend and arrest all the minstrels in our said honour and franchise, that refuse to do the services and minstrelly as appertain to them to do from ancient times at Tutbury aforesaid, yearly on the days of the Assumption of our Lady; giving and granting to the said king of the minstrels, for the time being, full power and commandment to make them reasonably to justify, and to constrain them to do their services, and minstrelly, in manner as belongeth to them, and as it hath been there, and of ancient times accustomed. In which of which thing we have caused these our letters to be made-patent. Given under our privy seal, at our call of Tutbury, the 22d day of August, in the fourth year of the reign of the most sweet king Richard II." For a further account of this establishment, see Burney's General History of Music, vol. ii. p. 361, &c. and the article Minstrels.

King's Palace. The limits of the king's palace at Westminster, extend from Charing Cross to Westminster Hall, and shall have such privileges as the ancient palaces. (23 Henry VIII.) If any person shall strike another in the king's palace, he shall have his right hand cut off, be imprisoned during life, and also be fined. 32 Henry VIII. cap. 12.

King-piece, in any Buildings, is a piece of timber standing upright in the middle, between two principal rafters, and having struts or braces going from it to the middle of each rafter.

King Charles I. in Biography. See Charles.

King Charles II. See Charles.

King of Prussia, Frederick. Among German deditantes in music, his late Prussian majesty is entitled to the first place, in talents as well as rank. This heroic and accomplished prince having had Quantz early in life for his master on the German flute and in composition, played no other pieces than his own and those of his master, which were never allowed
allowed to be printed. His majesty, during more than forty years of his busy reign, when not in the field, allotted four hours a day to the studies, practice, and performance of music. All the German masters allowed him the first place among dilettante composers, as well as performers on the flute. Tiffet, however, who was some time in his service before he first came to England, did not seem to like his musical productions, thinking them, even then, somewhat dry and old fashioned. This prince had certainly great proficients in his service, though he was never partial to Emanuel Bach, the greatest of them all. His majesty, besides a great number of pieces for the flute, and some for the harpsichord, composed sometimes for the voice; particularly in the pastoral opera of "Galatea et Alcides," in 1747, of which the overture and recitatives were Graun's, and the airs by the king jointly with Quantz and Nichollmann. Sometimes, the day before performance, his majesty would send a new song to the maestro di cappella to be introduced in an opera, and this was universally believed to be his own production in all its parts. During the last years of his life, according to his chapel-master, Rechardt, his Prussian majesty having lost some of his front teeth, not only discontinued the practice of the flute, but his evening concerts, and became totally indifferent to music; a proof that his majesty's chief pleasure in the art was derived from his own performance.

King, Charles. Of this choral musician, Sir John Hawkins, who seems to have known him personally, gives the following account in the fifth volume of his history:

"Charles King, bred up in the choir of St. Paul's under Dr. Blow, was at first a supernumerary finger in that cathedral, for the small dipend of 1/4 a year. In the year 1704, he was admitted to the degree of bachelor in music in the university of Oxford; and upon the death of Jeremiah Clark, whose sifer was his first wife, was appointed almoner and master of the children of St. Paul's, continuing to sing for his original dipend until the 31st of October, 1730, when he was admitted a vicar choral of that cathedral, according to the customs and statutes thereof. Besides his places in the cathedral, he was permitted to hold one in a parish church in the city, being organist of St. Bennet Fink, London; in which several factions he continued till the time of his death, which happened on the 17th of March, 1747. With his second wife he had a fortune of seven or eight thousand pounds, which was left her by the widow of Mr. Primatt, the chemist, who lived in Smithfield, and also in that house at Hampton, which is now Mr. Garrick's. But notwithstanding this accesion of wealth, he left his family in but indifferent circumstances. King composed some anthems, and also services to a great number, and thereby gave occasion to Dr. Greene to say, and indeed he was very fond of saying it, as he thought it a witty sentiment, that "Mr. King was a very serviceable man." As a musician he is but little esteemed. His compositions are uniformly restrained within the bounds of mediocrity; they are well known, as being frequently performed, yet no one cares to confine or commend them, and they leave the mind just as they found it. Some who were intimate with him say, he was not void of genius, but averse to study; which character seems to agree with that general indolence and apathy which were visible in his look and behaviour at church, where he seemed to be as little affected by the service as the organ-blower."

King, Robert, bachelor in music, of Cambridge, 1666, one of the royal band of William and Mary. He composed several of the airs that were printed in the "Tripla Concordia," as well as many of the songs that were published in the "Theatre of Music."

King, John Glen, an English divine, was born in the county of Norfolk about the year 1732. He completed his youthful studies at Cains college, Cambridge, where he took his degrees of B. A. and M. A. in the years 1752 and 1763, and at subsequent periods he was admitted to the degree of D. D., and received a member of the Royal Society, and of the Society of Antiquaries. In 1764, he obtained the appointment of chaplain to the English factory at Petersburg. In this situation he was led to inquire into the ceremonies of the Russian church, which he continually saw practised, and determined to give a faithful description of the same in his own language. He accordingly published, in 1772, in a handsome quarto, illustrated with engravings, a work, entitled "The Rites and Ceremonies of the Greek Church in Russia; containing an Account of its Doctrine, Worship, and Discipline." In 1778, he wrote and published a letter to the bishop of Durham, containing some observations on the climate of Russia, and the northern countries, with a view of the flying-mountains at Zariko Sello, near St. Petersburg. Soon after his return to his native country, he was preferred to the rectory of Wornley, in Hertfordshire, in 1783, and 1786 he purchased the chappelry of Spring Garden, in which he officiated as preacher. While he resided at Petersburg, the emperors of Russia had appointed him her medalist, and he was engaged in a medallistic work at the time of his death, which happened Nov. 3, 1877, when he was about fifty-five years of age. Besides the works already mentioned, Dr. King was author of "Observations on the Barberini Vase," which are printed in the eighth volume of the "Transactions of the Antiquarian Society."

King, Peter, baron of Ockham, was born in the year 1669, at Exeter, of which city his father was a considerable tradesman. He was intended to succeed in the bufiness, but having a strong inclination for reading, he purchased books, and spent all the time he could command in improving his mind. He was related to the celebrated John Locke, who, discovering the bent of his inclinations, advised that he should be sent to Leyden for literary improvement. At this period his attention was chiefly turned to theology, and in 1691 he published "An Inquiry into the Constitution, Discipline, Unity, and Worship of the Primitive Church, that flourished three hundred Years after Christ; faithfully collected out of the extant Writings of those Ages." In the first volume, only three of the subjects were treated on, and he afterwards published a second part on worship. The chief object of this work was to prepare the way for that comprehension of the dissenters within the pale of the established church, which the revolution was supposed likely to effect. After his return from Leyden, he was persuaded by Mr. Locke to make choice of the law for his profession, and he accordingly entered himself of the Inner Temple. He now employed all his powers in acquiring an extensive knowledge of the laws and constitution of his country, and obtained a reputation which introduced him into the house of commons in 1699. This situation he held during six successive parliaments, but his legal and political avocations did not allow him to abandon his former theological studies; but having been led by his inquiries to examine the origin of the Apostles' Creed, he published, in 1702, a volume, entitled "The History of the Apostles' Creed, with critical Observations on
on its several Articles." Mr. King's employment as a lawyer increased with his general reputation, and in 1708 he was chosen recorder of London, and about the same time he received the honour of knighthood: in the following year he was appointed by the house of commons to be one of the managers on the trial of Dr. Sacheverel, and in 1712 he boldly appeared as gratuitous counsel for Mr. Whitton, on his prosecution for hereby before the court of delegates, and in the end, obliged the bishops and civilians to desist. On the accession of George I, he was appointed to the lord chief justicehip of the common pleas, and was sworn of the privy council. In 1725, the judge was raised to the peerage by the style and title of lord King, baron of Ockham, in Surrey, and was created lord-chancellor in the room of the earl of Macclesfield: the labours of this high office being too great for his strength, in 1733 he resigned the seals, and in a few months afterwards, viz. July 1734, departed this life, leaving behind him a character of great virtue and humanity, and of ready attachment to civil and religious liberty. Biog. Brit.

King, William, a miscellaneous writer, born in London about the year 1663, was educated at Westminster school under Dr. Bulby, whence he was removed to Christ-church college in Oxford. He took his degree of M. A. in 1688, and in that year made his appearance as an author in a refutation of Varilla's account of Wickliffe, in his "History of Heresies." About this time he began the professional study of the civil law, in which he took a doctor's degree, and obtained a large practice as advocate in Doctor's Commons. In 1694, he published, in answer to lord Mollesworth's account of Denmark, his "Animadversions upon the pretended Account of Denmark," which were so highly approved by prince George of Denmark, that he was appointed secretary to the princes, afterwards queen Anne. In some subsequent years he published several works of the humorous kind, such as "A Journey to London," intended as a burlesque on Dr. Martin Lister's journey to Paris; and a satire on Sir Hans Sloane and the Royal Society. His habits were now become adverse to every exertion of regular industry, he deserted all his professional prospects, and, in 1702, he accepted an offer to go to Ireland, where he had several appointments under government, by which he might have been fully employed, and derived wealth and even influence. He returned to England in 1708, but by no means improved in his fortune, and retired to his student's place in Christ-church college, where he finished his largest poem in imitation of Ovid's Art of Love, and composed several other pieces. He closely connected himself with the Tory party, and wrote in defence of Sacheverel. He was concerned in the periodical paper, intitled "The Examiner," and such were his services to his party, that he obtained the place of gazetted; but the duties attached to the office were more than he liked to perform, and he resigned it in a short time. He died on Christmas-day, 1712. As a prose writer he is forgotten, but his account of ancient mythology was long a popular book in the schools. His works have been collected and published in three vols. 8vo., under the title of "Original Works in Prose and Verse." Biog. Brit. Johnson's Lives of the Poets.

King, William, a learned Irish prelate, was born at Antrim, in the province of Ulter, in the year 1650. From the grammar school, in which he had made great progresses, he was sent to Trinity-college, Dublin, in 1667; here he was remarkable for his attention to the studies of the place, and took his degrees in 1670 and 1673, and in the latter of these years he was ordained deacon. In the following year he was admitted to priest's orders, and was patronized by Dr. Parker, archbishop of Tuam, who appointed him his chaplain in 1679. From this period ecclesiastical honours and preferments began to flow rapidly upon him, till at length, in 1688, he was elected dean of St. Patrick's. He had already published three tracts on the controversy between the Papists and Protestants; and no sooner had the revolution taken place in England, than the dean became active in promoting the fame establishment in Ireland, both before and after the landing of king James there in 1689. That prince, fully sensible of the dean's influence, and of the weight of his opposition, confined him twice in the tower of Dublin castle on that account. This did not prevent him taking the degree of D. D. the same year; but the Jacobite party continued to inveigle against him, that they threatened to take away his life, and actually made two or three unsuccessful attempts for the purpose. Upon the flight of king James into France, after the battle of Boyne, in the year 1690, and the appointment of a day of thanksgiving for the preservation of king William's person, the dean preached the sermon on the occasion, at St. Patrick's cathedral, and, in 1691, his zeal and activity in favour of the revolution were rewarded with the bishopric of Derry. He now published "The State of the Protestants in Ireland under the late King James's Government," &c. This treatise was so well received, that a third edition of it was called for in a few months, and bishop Burnet observes, that it was universally acknowledged to be as truly as it was finely written, referring to it, in the "History of his own Time," as a full and faithful account. When public tranquility was restored, the bishop applied himself very diligently to the immediate duties of his pastoral care, and was exceedingly defierous of converting the Presbyterian party to the episcopal forms. With this view, he published, in 1694, a treatise, intitled "The Inventions of Men in the Worship of God:" this drew him into a controversy with Mr. Joseph Boyle, a diligent minister of Dublin, which terminated without effecting the object which the learned prelate had at heart. In 1702, bishop King published at Dublin his celebrated work, intitled "De Origine Mundi," which was reprinted the same year at London. The object of this work is to shew in what way the several kinds of evil with which the world abounds, are consistent with the goodnes of God, and may be accounted for without the supposition of an evil principle. The bishop was attacked by Bayle, Leibnitz, and others, upon different parts of his work; but he did not make any public reply during his life-time, being unwilling to enter again into the lists of controversy. He was not, however, an inattentive observer of the arguments adduced against him, but left behind him a great number of MSS., in which he considered their several objections to his system, and laboured to vindicate it from the leaf cavil: the substance was afterwards given to the public. In 1702, Dr. King was translated to the archbishopric of Dublin, and, in 1709, he published a sermon, preached before the Irish house of peers, intitled "Divine Predestination and Free-knowledge consistent with the Freedom of Man's Will," in which he maintained that the moral attributes of God were different from the moral qualities of the same name in man. This doctrine was attacked by Dr. John Edwards and Mr. Anthony Collins, to neither of whom did the archbishop reply, though he had prepared answers, which were found among his MSS. at his death. In the year 1717, archbishop King was appointed one of the lords justices of Ireland, and he held the same office in the years 1721 and 1723. He died in May 1729, when he had nearly completed his 70th year. He was a prelate of great learning, and steadily attached to the principles of the Revolution;
olution; zealous for the prosperity of the established church, to which he belonged; and of an unblemished and exemplary moral character. He was ambitious of the

precacy of Ireland, which was refused him, under the pretence of his being too old to perform the duties of the office. This reason, it is said, was as little agreeable as the refusal itself; and when the new primate called upon him after his elevation, archbishop King received him in his own house, without rising from his chair, making this apology, in a sort of

caricature manner, "My lord, I am certain your grace will forgive me, because you know I am too old to ride." After his death, the papers which he left were put into the hands of Mr. Law, afterwards bishop of Carlisle, who published a translation of his work "De Origine Mæli," corrected and enlarged from the author's notes, to which were added two sermons on the Divine Providence, and the Fall of Man, 2 vols. 8vo. "B. G." Brit.

King, or Kin-yuen, in Geography, a town of China, of the first class, in the province of Quang-ni. N. lat. 24° 27' E. long. 108°.

King, a town of Africa, in the kingdom of Caconda; 40 miles S.E. of Effena.

King's, a maritime county of New York, in the United States, containing that part of the State that is bounded E. by Queen's county; N. by New York county; W. partly by Hudon river, and partly by the ocean; and S. by the Atlantic ocean, including Coney islands. This fertile tract of land, situated on the W. end of Long island, and separated from Staten island by the Narrows, furnishes very much to the supply of the New York market with butter, vegetables, fruit, &c. It is divided into six townships, and contains 57,490 inhabitants, including 1479 slaves. Its chief towns are Brooklyn, and Flatbush—Allo, a county of Nova Scotia, comprising the islands on the S.W. and S. sides of the basin of Minas. The rivers Habitant, Canda said, and Cornwallis, are navigable to some distance. The lands on these rivers afford arable and pasture soil; the rivers abound with fish; and in the basin of Minas are fine coal, haddock, and different kinds of flat fish.

King's, or Pearl Island, a small island in the bay of Panama; belonging to Spain, and famous for its pearl

fishery. N. lat. 7° 12'. W. long. 81° 36'.

King's Bay, a bay on the S.E. coast of Nova Scotia. N. lat. 44° 32'. W. long. 59° 10'.

King's Bridge, a populous town of New York, 15 miles N. of New York city. The bridge connects New York island with the main land.

King's County, a county of Ireland, part of the old district of Ophale, which, having been confiscated in the reign of the first Mary, was called the King's county, and its chief town Philip's-town, in compliment to her husband, Philip II. of Spain. It has Wilmeth and Meath on the N.; Kildare and the Queen's county on the E.; Tipperary on the S. and S.W.; and part of Galway and Roscommon on the W. Its chief natural boundary is the Shannon, which separates it from Galway. The little Brofna and the Barrow serve, each of them, to mark its limits for a few miles. Its breadth, in the northern and broadest part, is 32 Irish miles (39 English), but it contracts very much as it stretches to the southward. In this part of the country it extends 34 Irish (43 English) miles from N. to S. It contains 252,290 acres, which make upwards of 440 square miles, equal to 453,370 acres, or 707 square miles English. There are 52 parishes and 25 churches, and, according to Dr. Beaufort, a population of about 74,500. The completion of the grand canal has, however, tended much to increase the population of this county. The only

mountains in it are the Shille-Ioom, in the S.E. which extend into the Queen's county. These run in a range of about 15 miles, having but one pats, called the gap of Glendine, which is very difficult of approach, steep and craggy, and not five feet wide. The soil in the northern part is mostly argillaceous, and requires a great deal of lime to make it arable. The rocks are red argillite and freestone, which intersect each other. In the centre there are various soils, light sandy loam, stiff yellow clay, gritty shallow gravel, and deep brown earth. In this part of the range the land is often fertile in pasture, and grazed throughout the year with numerous flocks of sheep and young cattle: limestone is thickly interspersed, and the bottom is a stiff clay, where abundant crops of corn are yielded. In another part we find a cold, spongy clay, and at the foot, where the declivity vanishes, a deep irrecalculable bog, which can be approached only in very dry seasons. The mineral productions of this mountainous district have not been yet ascertained. In the arable parts of the county, we are informed that the soil is not naturally fertile, and is only rendered so by manures, and proper attention to a rotation of crops. The quality of the soil is either a deep moor, or a shallow gravelly loam; the moor is often mossy and favourable to the produce yielded by the latter, and the moors very productive in dry summers. There is everywhere abundance of lime-flour and lime-flour gravel, which is found the best manure. The pastures, though not luxuriant, are kind and fattening, and well adapted for sheep-walks, where numerous flocks are supported, the wool of which is abundant, and of a very fine quality. The coarsest pasture, which is the unrecalculable moor, is highly nutritious to young cattle. The surface is rather an uninterrupted flat, unfavourable to dairy hus

bandry, and the corn crops are principally oats and barley. In some parts, however, improvements in husbandry are attended to, in the raising of green crops, introducing artificial gracies, and drilling potatoes. Considerably more than a third part of the whole county is occupied by bog and mountain. The bogs, however, supply an abundance of moss excellent fuel, which not only serves the inhabitants, but is sent by the canal to Dublin. They also yield, when cultivated, an excellent and lasting manure, both for their own improvement and that of the high grounds. As there is a natural fall in many places, these bogs are very capable of being drained and reclaimed by lime-flour. Such land is fit for all the purposes of husbandry, and will be found more productive, either in pasture or tillage, than the general run of the best lands in the county. This reclaiming of bog is now pursued with much spirit in many parts; and nothing surely can be more gratifying than to behold rich carpets of white clover and trefoil in spots which had been dark and barren moor. These bogs have been lately surveyed by the direction of the commissioners for the investigation of bogs, and it is to be hoped that some extensive plan of drainage will be carried into effect. The mineral productions of the county are inconsiderable. Sir C. Coote, author of the Statistical Survey, mentions only manitate, iron ores in small quantity, ochre, marle, lime-flour, free

stone, and potter's clay. There is a great scarcity of timber, except ornamental plantations, though the bogs afford abundant proof of its having once been an almost uninterrupted forest. The alder appears to have been a native of this county, and a few of them still rear their venerable tops in a park at Droghville. This county is well watered. Besides the Shannon and the little Brofna, before mentioned, the greater Brofna, after winding through a great part of it, between pleasant banks, loses itself in the Shann

non.
non. There are also several small rivers, and some lakes, of which Lough Pallis and Lough Annagh are the largest; and the Grand Canal crosses the northern part of the county. Of the towns, Birr is the most considerable; but Philip's-town is the county town. Talluram is a pretty and thriving place. The county is represented in parliament by the two knights of the shire only; the boroughs of Philip's-town and Banagher having been disfranchised by the Union. Coote's Statistical Survey. Beaufort's Memoir.

King's Court, a post-town of the county of Cavan, Ireland; 30 miles N.W. from Dublin.

King's Creek, a river of Virginia, which runs into the Chesapeake, N. lat. 37° 20'. W. long. 76° 2'.—Alfo, a river of North Carolina, which runs into the Cangaree, N. lat. 35° 8'. W. long. 81° 40'.

King's Island, an island in the East Indian sea, near the W. coast of Suma, about 51 miles in circumference. N. lat. 12° 18'. E. long. 98°.—Alfo, a small island in Bering's straits. N. lat. 65° 2'. W. long. 168°.—Alfo, an island near the W. coast of North America, sepated by Fillier's canal from the southernmost of Princes Royal's islands, and by Burke's canal from New Hanover; so called by captain Vancouver, after captain James King, of the British navy. It is about 33 miles in length, and rather more than six in breadth. Point Edward is the farthest point to the N. and point Waller to the S. N. lat. 51° 56' to 52° 20'. E. long. 232° 9' to 233° 43'.

King's Keys, little islands and rocks in the Spanish main, near the Mosquito shore, N. lat. 12° 42'. W. long. 82° 35'.

King's Point, the N.W. extremity of the island of Sumatra; 15 miles W. of Acheen. N. lat. 5° 50'.

King and Queen, a county of Virginia, on Mattapony river, which separates it from king William's county. It is about 25 miles long and 20 broad, and contains 4499 free inhabitants, and 5380 slaves. At King and Queen, in this county, is a post-office.

King George, a county of Virginia, between the Patowamac and Rappahannock rivers. It is 22 miles long and 14 broad, and contains 2762 free inhabitants, and 3927 slaves. In the county house is a post-office.

King George Island, two islands in the South Pacific ocean, discovered by commodore Byron in 1765, and visited by captain Cook in 1773. The commodore's landing was opposed by the natives, when, a shot or two being fired, one man was killed, and the rest fled. The canoes were curiously wrought with planks, ornamented with carving, and the seams filled up by strips of tortoise-shell. They were about 32 feet long, very narrow, with bottoms as sharp as a wedge. Two of them were joined together laterally by strong spars, so that between them there was an interval of about six or eight feet; each had a mast, and the sail was neatly made of matting. The houses were low mean hovels, thatched with branches of cocoa-nut tree; but they were delightfully situated in a grove of latticed trees. The cocoa-nut tree seemed to afford them almost all the necessaries of life; particularly food, falls, cordage, timber, and vessels for holding water. The shore appeared to be covered with coral, and the shells of large pearl oysters. The island was covered with feerivy-grafs. The fresh water is good, but scarce, being furnished by very small wells, which are soon emptied, and as soon filled again. In one of the islands was a lake or lagoon, in which were observed two or three whales, one of which had two masts, and some cordage aloft to support them. S. lat. 14° 35'. W. long. 149° 2'.

King, George the Third's Archipelago, a group of islands in the North Pacific ocean, extending from N. to S. about 150 miles in length; about 15 miles broad towards the N. and diminishing to little more than a mile at the southern extremity. N. lat. 56° 10' to 58° 18'. E. long. 225° 45' to 223° 40'.

King George the Third's Island. See Otahete.

King George the Third's Sound, a harbour on the S.W. coast of New Holland, discovered by captain Vancouver in 1791. In approaching it from the westward, it is the first opening that appears like a harbour southward of Cape Chatham. The Eclipse Islands are an excellent guide to the Sound, having between them and Bald-head some rocks on which the sea breaks with great violence. The port is safe, and easy of access any where between its outer points of entrance; Bald-head and Mount Gardner lying N. 62° E. and S. 63° W., 11 miles distant from each other. S. lat. 35° 5'. E. long. 118° 17'.

King George's Sound, a name given by Captain Cook to Nootka found. See Nootka.

King William's Island, a small island in the East Indian sea, near the N. coast of the island of Poggy. S. lat. 2° 33'. E. long. 90° 43'.—Alfo, a small island in Dampier's strait, near the S. coast of the island of Waigoo. S. lat. 0° 32'. E. long. 130° 51'.—Alfo, a cape on the eastern extremity of New Guinea. S. lat. 6° 45'. E. long. 148° 5'.

Kingdom, the dominion of a king. See King and Monarchy.

Kingdom, among Chemies, is a term which they apply to each of the three orders or classes of natural bodies; animal, vegetable, and mineral.

Kingdom of God, or of Heaven, in the Gospel History, is a phrase, according to Dr. Campbell, has a manifest allusion to the predictions in which this economy was revealed by the prophets in the Old Testament, particularly by Daniel, ch. ii. 44, vii. 13, 14; by Mica, ch. iv. 6, 7; and by other prophets. To these predictions there is a manifest reference in the title of βασιλεία τοῦ Θεοῦ, or των θεων, or ἄνωθεν, given, in the New Testament, to the religious constitution which would obtain under the Messiah. In most cafes βασιλεία answers to the Latin regnum. But this word is of more extensive meaning than the English, being equally adapted to express both our terms royalty and kingdom. The first relates to the time or duration of the sovereignty; the second to the place or country over which it extends. Nevertheless, though it is manifest in the Gospels, that it is much oftener the time than the place that is alluded to; it is never, in the common version, translated reign, but always kingdom. Yet the expression, says Campbell, is often thereby rendered exceedingly awkward, not to say absurd. In order to prevent this misapplication of terms, βασιλεία ought sometimes to be rendered reign, and not kingdom. When it refers to the time, it ought to be rendered reign, and when to the place, kingdom. There are, however, a few passages in which neither of the English words can be considered as a translation of βασιλεία strictly proper. In some of the parables (Matt. xviii. 23.) it evidently means administration, or method of governing; and in one of them (Luke, xix. 12. 15.) the word denotes royalty, or royal authority, there being a manifest allusion to what had been done by Herod the Great, and his immediate successor, in returning to the Roman senate in order to be invested with the title and dignity of king of Judea, then dependent upon Rome. Upon the whole, we may observe, that the phrase, kingdom of God, and kingdom of heaven, are synonymous; and that they sometimes denote the state of the blessed, and sometimes the gospel dispensation. Campbell's Prel. Diff. p. 150, &c.
KINGHALE, in Geography, a town of Africa, in Caconda, situated on the Louina. S. lat. 5° 20'. E. long. 12° 16'.

KINGHORN, a small sea-port town in the county of Fife, in Scotland, situated on the north bank of the Firth of Forth, nearly opposite to the city of Edinburgh and port of Leith, from the latter of which it is about seven miles distant. Kinghorn is principally inhabited by fishermen and boatmen employed on the ferry, which is one of the chief routes of intercourse between the metropolis and the counties of Fife and Angus. The boats employed on the ferry are large, well built, double-bottomed, and pinnaced; and there are handsome small pinnaces for pleasure parties, and passengers who have no equipage or horses. The fares are regulated, and the conduct of the ferrymen supervised by the magistrates of Edinburgh, who punish offences and fines upon passengers upon a summary complaint. In the middle of the ferry is a small peatland island, about a mile in circumference, called Inch-Keith, upon which is the ruins of an old castle, which was once a place of some strength. About the commencement of the present war some fortifications were made, and guns mounted upon this island for the protection of the shipping in the Firth from any surprise, probably from the recollection of the daring but nugatory attempt of Paul Jones, during the American contest; but hitherto there has been no occasion to employ them. Inch-Keith, we believe, is the property of the city of Edinburgh.

KINGIKSOK, a town of West Greenland. N. lat. 67° 55'. E. long. 47° 35'.

KING-KI-TAO, a city and capital of Corea, situated in the province of King-kí, and the ordinary residence of the sovereigns. N. lat. 47° 38'. E. long. 126° 41'.

KI-NGAN, a city of China, of the first class, in the province of Kiang-fi, on the river Kan, which is difficult and hazardous of navigation, on account of its numerous rocks and currents, and which requires the assistance of persons provided in this city. The adjoining fields and valleys are agreeable and fertile; and the mountains are laid to contain mines of gold and silver. N. lat. 27° 7'. E. long. 114° 32'.

KINGROAD, a part of the Severn below Bridgford, from whence the outward-bound ships from that city take their departure.

KING, Books of, in Scripture History, two canonical books of the Old Testament, so called, because they contain the history of the kings of Israel and Judah, from the beginning of the reign of Solomon, down to the Babylonian captivity. The first book of Kings contains the latter part of the life of David, and his death; the flourishing state of the Israelites under Solomon, his building and dedicating the temple of Jerusalem, his amiable election from the true religion, and the sudden decay of the Jewish nation after his death, when it was divided into two kingdoms: the rest of the book is taken up in relating the acts of four kings of Judah and eight of Israel. The second book, which is a continuation of the same history, is a relation of the memorable acts of sixteen kings of Judah, and twelve of Israel, and the end of both kingdoms, by the carrying off the ten tribes captive into Assyria by Sennacherib, and the other two into Babylon by Nebuchadnezzar.

It is probable that these books were composed by Ezra, who extracted them out of the public records, which were kept of what passed in that nation. These are the only books which the Hebrews call "Malachim or Kings," though the two books of Samuel have been also mentioned under this general title; and authors have enumerated four books of Kings, those of Samuel (which see) being the first and second. The four books contain the history of almost 600 years.

KINGSBRIDGE, in Geography, a small market town and parish in the hundred of Stanborough, and county of Devon, England, is situated on a branch of the Salcombe river, and, according to Ridolfi, derives its name from the bridge which connects it with Dodbrooke. The town is generally well built. A freestone church was founded here by Mr. Griffin of Exeter, and has obtained some degree of reputation. The parish was returned, under the population act of 1800, as containing 155 houses, and 1117 inhabitants. Kingsbridge is distant from Dartmouth 13 miles, from Exeter 39, and from London 207. It has a weekly market on Saturdays, and three annual fairs. David Tolley or Tolbery, called by Leland Tavelegus, an eminent Greek and Latin scholar in the time of Henry VIII., was a native of this town. Beauties of England and Wales. Polwhele's History of Devonshire, folio.

KINGSBURY, a township of America, in the county of Washington, and state of New York, situated on the bend of Hudson's river, on the N.E. side; containing 1657 inhabitants.

KINGSLER, a small market town and parish in the hundred of the same name, Hamphire, England, is situated on the edge of a chain of hills, 17 miles from Reading in Berkshire, and 55 from London. It is mentioned by Camden as being a considerable town, but is now of a mean appearance, and only remarkable for having been the residence of the Wilt Saxon kings. The church is a small Jacobean building, with a low tower. This parish was returned in the year 1801 as containing 794 houses, and 1539 inhabitants, of whom 402 were employed in trade, principally in the melting line, which produces a considerable traffic with London. A weekly market is held on Tuesdays, and here are three annual fairs. It is probable that the palace of the Saxon sovereigns was connected with Freemantle Park, a short distance to the south, as that is known to have been a royal residence in the time of King John, and was in the possession of the crown fo late as the reign of queen Elizabeth. The mansion has been lately pulled down, and the park ploughed up and converted into a farm. Beauties of England.

KINGSEY, a township of Lower Canada, N.W. of Sifton, adjoining on both sides of Nicolet river, having about 30 inhabitants.

KINGSLAND CREEK, a river of Virginia, which runs into James river. N. lat. 37° 24'. W. long. 70° 46'.

KINGSTON, or ESOPUS, a post-town of America, in New York, in Ulster county, on the west side of Hudson's river, six miles west of Rhiinebeck, and on the easterly side of Esopus hill, or creek. In 1777, this town was burned by the British troops, under the order of general Vaughan. It has been since rebuilt on a regular plan, and contains about 150 houses, a court-house, jail, a Dutch reformed church, and an academy. Its situation is pleasant, being surrounded by a spacious plain; 56 miles S. of Albany. N. lat. 41° 57'. W. long. 73° 56'. The township contains 4615 inhabitants.—Also, a township in Addison county, Vermont, containing 185 inhabitants.—Also, a post-town in Plymouth county, Massachusetts, on the western part of Plymouth bay, bounded northerly by Duxbury, and containing 1035 inhabitants. It was incorporated in 1707; 38 miles S.E. of Boston.—Also, a post-town in Rockingham county, New Hampshire, on the road that leads from Exeter to

Haverhill
Haverhill in Massachusetts; 6 miles from the former, and
12 from the latter. It was incorporated in 1694, and con-
contains 755 inhabitants.—Also, a town, now "Conway-
borough," in Horry district, South Carolina, on the west
side of Wakkamaw river, having an episcopal church, and
about 36 houses; 41 miles N. by E. from George town.
Also, the chief town of Lenoir county, Newbern district,
in North Carolina. It is a port town, situated on a beau-
ful plain on the north side of Neus river, and containing a
courthouse, jail, and about 300 houses; 40 miles W. of Newbern.—Also, a township in Luzerne county, Pennsyl-
vania, containing 772 inhabitants.—Also, a town of Upper
Canada, at the head of the river St. Lawrence, on the north
shore, opposite to Wolf island; occupying the site of old
fort Frontine, laid out in 1784, and now advanced to a
considerable size. It has a barracks for troops, a house for
the commanding officer, an hospital, several store-houses,
and an episcopal church. About Kingston there are several
valuable quarries of lime-stone, and the country in general
is rather stony, though not detrimental to the crops. It is
200 miles S. of Montreal, and 150 N. of Niagara. Large
vessels go no farther than this place; thence to Niagara, &c.
stores and merchandise are conveyed in boats.—Also, a
township of Upper Canada, being the fourteenth and upper-
most in advancing the St. Lawrence. It is in the county of
Frontine, and lies partly open to lake Ontario.—Also, the
capital of the island of St. Vincent's, in the West Indies, and
the seat of government. It lies at the head of a bay of the
fame name, on the south-west shore of the island, in St.
George's parish. N. lat. 13° 6'. W. long. 60. —Also, a
town of Jamaica, in the county of Surrey, situated on the
north side of a beautiful harbour, and founded in 1693;
when repeated deflections by earthquake and fire had driven
the inhabitants from Port Royal. It contains 1665 houses,
besides negro-huts and warehouse. The number of white
inhabitants, in the year 1788, was 6539; of free people of
colour, 3280; of slaves, 16,659; total number of inhabi-
tants, of all complexion and conditions, 26,478. It is a
place of great trade and opulence. Many of the houses in
the upper part of the town are extremely magnificent; and
the markets for butchers' meat, turtle, fish, poultry, fruits
and vegetables, &c. are inferior to none. From compara-
tive registers of mortality it appears, that since the sur-
rounding country is cleared of wood, this town has been
proved to be as healthful as any in Europe. Alizze courts
are held every three months in Kingston, for the county of
Surrey. N. lat. 18°. W. long. 76° 33'.

KIN KIN

Moulsey, Thames-Dittoon, Peterham, and Kew, into two
vicarages and two perpetual curacies. In this town is Can-
bury-houfe, a seat of the late lord Dillon, near which is a
very large barn, which has four entrances, four threshing
floors, and is supported by twelve pillars; twelve waggons
may be unloaded at once within its walls.

The historical annals of Kingston relate many interesting
events, as having occurred here. In the year 838, a grand
council was assembled at this place, and was attended by
Egbert, 6th Saxon king of all England, his son Ethelwulf,
and the principal nobles and bishops of the land; at the fame,
the archbishop of Canterbury presided. Other monarchs
were crowned here, of which the following are specified by
our ancient historians: Edward the Elder, crowned A.D.
900; his son Athelstan, in 925; Edmund, in 940; Eldred, or
Edred, in 946; Edwy, or Edwin, in 955; Edward the
Martyr, in 975; and Ethelred, in 978. Previous to the
reign of Henry III. a castle was standing here, as that mon-
arch, in the year 1264, marched out of London, and
seized the castle of Kenington, or Kingston, which then
belonged to Gilbert Clare, earl of Gloucester, and which is
not mentioned in any subsequent period. In the civil wars
of the seventeenth century, Kingston was again a place of
public celebrity; for the first armed force is said to have
been assembled here under the command of colonel Lunsford,
with a troop of 400 or 500 horse. The colonel was pro-
claimed a traitor, as having levied war against the parlia-
mant, and was apprehended. Respecting this event, and
some other contemporaneous proceedings, the different party
writers are very contradictory. In the month of October
1642, the earl of Effex was in this town with 3000 men
under arms; and at several other times, during the parlia-
mentary civil war, Kingston was poffessed by both parties:
but the townsmen were mostly in favour of the royalists.
Lenth takes, that "many old monuments be found in the
decaying doun of Come-Parke towards the galowys":—
also, "fundation of waulls of houfes, and divers coynes
of brasse, fylver, and gold, with Romayne incriptiones,
and painted yerieth potses; and yn one, yn cardinal Wolfe's
tyme, was founde much Romayne money of fylver, and
plates of fylver to coyne, and maifes to bete into plates to
coyne, and chaynes of fylver." The bishops of Winchester
formerly had a hall here.

In the market-place is the town-hall, which was built in
the time of queen Elizabeth. In this are held the Lent
affizes for the county of Surrey; and in a room adjoining,
the corporation hold their courts of assembly.

Adjoining the town is an old manilion, called Ham-houfe,
which was intended for Henry, prince of Wales, son of
James I. It afterwards belonged to the duke of Lan-
dale, who furnished it in a very expensive and gorgeous
style. In the centre of the house is a large hall, surrounded
with an open gallery. Some of the ceilings are painted by
Verrio; and several rooms are ornamented with paintings by
the old masters, among which are a few valuable portraits.
In this house was born John, duke of Argyle, and his
brother Archibald, who was also created duke, and made
lord keeper of Scotland. The church of Kingston has some
ancient parts. On its south side was the chapel of St. Mary,
which fell down in the year 1770, and buried the sexton, his
daughter, and another person, in the ruins. The daughter,
however, was rescued alive, and succeeded her father.
In the church are several monumental memorials, some of
which are for persons of eminence. Near Kingston is a bridge
across the Thames, said, by Mr. Lyfons, "to be of the most
ancient on the river, except that of London. It is men-
tioned
TION in a record of the eighth of Henry III." An act of parliament was obtained in the thirteenth year of George, for lighting and watching this town. In 1800, Kingston contained 532 houses, and 3793 inhabitants. Lyfons' Environs of London, vol. i. 400. 1796.

KINGSTOWN, a town of Africa, in the kingdom of Kautor.

KINGSTREE, a post-town of America, in Williamsborough county, South Carolina; 450 miles from Washington.

KING-TCHEOU, a city of China, of the first class, in the province of Hou-ouang, seated on the Yang-tse river. The district of this town has two cities of the second order, and eleven of the third class. It is surrounded with lakes, which contribute to render the land about it fruitful and pleasant. It is well-built and populous; and its trade is great. A wall divides it into two parts, one of which belongs to the Chinele, the other to the Tartars, of which the garrison consists. N. lat. 30° 28'. E. long. 111° 37'.

KING-THE-CHING, a village belonging to the district of Jao-tcheou in China, in which are collected the best workmen in porcelain, and as populous as the largest cities of China. It is reckoned to contain a million of inhabitants, who consume every day more than ten thousand loads of rice. It extends 15 leagues along the banks of a beautiful river, with crowded buildings, and its streets are thronged with inhabitants; for a great number of whom it furnishes employment. The river in this place forms a kind of harbour, about a league in circumference, which accommodates a great number of barges. This village contains about 500 furnaces for making porcelain; and to those who approach it at night it appears like a large city on fire. Strangers are not permitted to sleep here, but they are required either to sleep in their barges, or with their friends. N. lat. 26° 25'. E. long. 116° 56'.

KINGTON, or KINSETON, a small market town and parish in the hundred of Huntingdon, and county of Hereford, is situated on the Black Brook, under Bradnor mountain. A castle was constructed at this place, at a former period, for the defence of the marches; but the whole is now destroyed. The church is a very irregular structure, having a detached tower, with a spire of singular form. The town is in general well built, and has a free grammar school, erected and endowed by lady Watkins. The inhabitants of this parish, as ascertained by the act of 1805, amounted to 1424; the number of houses to 311. The principal manufacture is that of woollen cloth. Kington is distant from Hereford 20 miles, and from London 155. Here are four annual fairs, and a weekly market on Wednesdays. The markets immediately before Easter, Whitmonday, and Christmas, are very considerable for corn, cattle, and cloth; and are equal to most fairs. On the summit of Bradnor mountain are the remains of a square entrenchment.

About two miles eastward of Kington are the ruins of Lyons-hall castle, a very ancient structure, of which scarcely any thing now remains but fragments of the outer walls; the castle having been demolished in the reign of Edward II. Beauties of England, vol. vi.

KING-TONG, a city of China, of the first class, in the province of Yung-nan, on the Pa-pien river. It is surrounded with very high mountains, in which it is said, there are silver mines. The adjacent country abounds with rice, and the valleys are well watered. N. lat. 24° 30'. E. long. 102° 39'.

KINGUA, a town of East Greenland. N. lat. 65° 21'. E. long. 45° 26'.

KING-WILLIAM, a county of Virginia, between Mattatony and Pamunkey rivers. It is 47 miles long, and 15 broad, and contains 5744 free inhabitants, and 331 slaves. At the court-house is a post-office.

KINGWOOD, a township in Huntingdon county, New Jersey, containing 1436 inhabitants, of whom 105 are free. It is the name of a small river of New Jersey.

KING-YANG, a city of China, of the first class, in the province of Chieh-fu. N. lat. 36° 6'. E. long. 107° 20'.

KING-YOEN, or KIN-YEN, a city of China, of the first class, in the province of Quang-fu. This city is built on the banks of a large river, and surrounded with lofty and craggy mountains. The valleys between these mountains are full of villages and forts, and in the rivers is found gold. Under its jurisdiction are two towns of the second order, and five of the third. N. lat. 24° 26'. E. long. 108°.

KIN-HOA, a city of the first class in China, in the province of Tche-kiang, situated in the midit of the province, on the banks of a fine river; formerly distinguished both as to the extent and beauty of its buildings, but much injured by the attacks of the Tartars. It has eight towns in its district, situated partly in a level country, and partly among mountains. Rice grows plentifully, and the wine made of it is much esteemed. The inhabitants carry on a large trade in dried plums and hams, which are sent into all provinces of the empire. Near it are small shrubs, resembling jaffamine, which produce tallow, that make very white candles. N. lat. 29° 16'. E. long. 119° 16'.

KINIC Acid, in Chemistry, is a peculiar substance, recently found in Peruvian bark, where it exists in combination with lime. We are indebted for the discovery to a Mr. Defchamps, apothecary at Lyons, who described the fact in the 48th volume of the Annales de Chimie. He obtained it by macerating the bark in cold water; afterwards evaporating the solution, and leaving it to crystallize. The crystals produced were equal to about 7 per cent. of the bark employed. He did not prosecute his inquiry further; and it was not until some experiments which were afterwards undertaken upon it by Vauquelin, that the fact in question was found to contain a new acid. The researches of this excellent chemist, however, appear fully to have established the fact; and he has denominated it the kinic acid, from the word quinina, which is a name given by the French to the yellow kind of bark from which the salt described was extracted.

The kinic of lime, obtained by the foregoing process, is a white colour, and crystallizes in plates. It is devoid of taint, dissolves in about five times its weight of water, at the temperature of 55°. Alcohol exerts no action upon it. By exposure to heat it is decomposed, and carbonat of lime and charcoal are the products. Its solutions are not altered by ammonia; but the fixed alkalis precipitate the lime. This also takes place with the oxalate and sulphate of lime. It appears to be composed of 90 acid, and 10 lime.

To procure the free acid, M. Vauquelin precipitated the lime by an oxalate, and afterwards concentrated the liquid by evaporation. It was of a fuyrupy consistence; and on being set aside to crystallize, was found, at the end of a week, to have undergone no change; but the moment he touched it with a glass rod, the whole mass assumed the form of divergent crystalline plates. The colour of the acid was of a light brown; occasioned, probably, by the evaporation
poration having been carried too far. Its tafle was extremely four, and there was also a bitterness in it, which might be owing to an imperfect separation of the other constituents of the bark. Exposure to the air effected no alteration upon it.

By heat, kinic acid is decomposed, and converted into charcoal. It combines with different bases; and with the earths and alkalies, produces soluble and crystallizable salts. On the nitrates of silver, mercury, and lead, no change is occasioned by it. Annales de Chimie, t. 59.

KIN'IT'S, in Geography, a town of Moravia, in the circle of Olmutz; 24 miles W. of Olmutz.

KINK'COUGH, in Medicine. See Pertussis.

KINK', in the Sea Language. When ropes are new, or too hard laid, they are apt in foldings to make turns, which are called kinks.

KIN-LI, in Geography, a town of Corea; 15 miles E.N.E. of Cou-fon.

KIN-MEN-LO, an island in the Chinese sea, near the coast of China, about 24 miles in circumference, of a triangular form. N. lat. 24° 30'. E. long. 118° 20'.

KINNAIRD's HEAD, a promontory on the east coast of Scotland, forming the south boundary of the horse of Murray; supposed to be the "promontorium Tazialium" of Ptolemy. N. lat. 57° 53'. W. long. 1° 54'.

KINNARAS, or CINNARAS, in Hindoo Mythology, are male dancers in Sverga, or the heaven of Indra.

KINNEBACK, in Geography, a small island on the west side of the gulf of Bothnia. N. lat. 65° 9'. E. long. 21° 30'.

KINNEGAD, a poff-town of Ireland, in the county of Weftmeath, province of Leinifter. A kind of cheese, of a very inferior quality, made in this neighbourhood, is called Kinnegad cheese, from this town. It is 20 miles W. by N. from Dublin.

KINNEL, in Rural Economy, a provincial term sometimes applied to a powdering tub or salting vessel.

KINNEYETO, in Geography, a confiderable town of Africa, in the kingdom of Manding; about 24 miles N.E. of Kamah. N. lat. 12° 55'. W. long. 2° 52'.

KINNOR, in the Jevcuj Antiquities. See CINYRA, and ChINNXOR.

KINO, in Chemistry, is an afftrangent substance, of a black colour, supposed to have been originally introduced into this country from Africa. It is commonly called a gum, but very improperly; for, as Vaquelin has remarked, it has neither the phytical nor chemical properties characteristic of that class of vegetable products. According to Dr. Duncan, the kino now known in the shops is principally imported from Jamaica; and is an extract from the eucalyptus wofera, or fagula gum. It is nearly wholly soluble in hot water and hot alcohol, and chiefly consists of gum in a particular state; which has the property of precipitating the salts of iron of a green colour, instead of black. With gelatine it forms a red coloured congeum. We are indebted to Dr. Duncan for the first description of its properties; and he has published the result of his observations in the New Edinburgh Dispensatory, p. 242. Vaquelin afterwards took up the subject; but the kino that his experiments were made upon, Dr. Duncan suspects to have been the product of some of the species of eucalyptus, particularly the refinierea; being the substance called Botany Bay gum, a quantity of which was some years ago imported into Europe. It differs from the kino of the eucalyptus in being of a much finer quality. Nichollson's Journal, vol. vi. No. 24. p. 232-234.

KINO, in the Materia Medica, or "Gunni rubrum asfringens gambienis," the gum resin of a non-descript African tree. Although the tree, from which this resin is obtained, is not yet botanically ascertained, it is known to grow on the banks of the river Gambia in Africa. The first account of this drug is related by Moor in his "Travels into the Interior Parts of Africa," ed. 2. p. 113, by which we learn, that in wounding the bark of this tree, the fluid kino immediately issues by drop, and by the heat of the sun is formed into a hard mass. This, which was for some time considered as a species of Sanguis draconis, was afterwards fully explained, and its medical character established, by Dr. John Tithmarsh. (Med. Obs. and Enq. vol. i.) Kino has a confiderable resemblance to Catechu, but redder, and is more firm, refrinous, and affrangent. It is now in common use, and is the most efficacious vegetable affrangent, or styptic, in the materia medica. The "tincture of kino" is prepared by macerating three ounces of kino powdered in two pints of proof spirit, for 14 days, and straining it. All the affrangent of kino is included in this preparation. The dose is from one fluid-drachm and a half to two fluid-drachms. The "compound powder of kino" consists of 15 drachms of kino, half an ounce of cinnabar, and a drachm of hard opium, which are to be reduced separately into a very fine powder and then mixed. This affrangent powder was first introduced into the London Pharmacopeia of 1800; the proportion of opium contained in it being one in twenty. The dose is from five gr. to 2j.

KINOGAM, in Geography, a river of Canada, which runs from lake Winkwa to the river Saguenay. N. lat. 48° 34'. W. long. 71° 51'.

KINOLI, a town of Afiatic Turkey, in Natoila, on the coast of the Black sea; 16 miles N.W. of Sinob.

KINOSA, St., an island in the Grecian Archipelago. N. lat. 36° 53'. E. long. 25° 34'.

KINROSS, the chief town of a small county of the same name, bordering N.E., E., and S. upon Fife, and the other part on Perth, in Scotland. The number of inhabitants of this county in 1801 was 6725, of whom 888 were employed in trade and manufactures, and 667 in agriculture. Kinrois is a small town of little consequence, excepting as a market for the neighbouring country. It is situated on the border of Lochleven, a fine fresh water lake, with two small islands in it, on one of which is a castle, which was one of the many places in which the unfortunate Mary Stuart, queen of Scots, was confined, and from which she effected her escape. The lands near Kinrois, like those of the adjoining counties of Fife and Stirling, are fertile and well cultivated. The county returns a member to parliament alternately with the small island of Cackmannan. The town was formerly famous for its cutlery; but the chief manufacture now is Silexian linen. In 1801, the number of inhabitants was 2124, of whom 394 were employed in trade and manufactures; 818 miles N.N.W. of Edinburgh. N. lat. 56° 13'. W. long. 3° 25'.
a half. The general figure of the county is circular, though the line of its boundary is very irregular. That which limits with Perthshire measures twenty-one miles; but when taken in a right line is only about fourteen: the boundary with Fife measures nearly twenty-eight miles, but in a straight line does not exceed nineteen. The county contains 78 square miles, or about 39,732 Scotch acres; comprehending one town, Kinross, with six other parishes; and was returned under the population act of 1801 as containing 14,609 souls, and 6,724 inhabitants. The surface of the county is greatly varied. The middle portion occupies a situation comparatively low, and may be considered as a kind of plain slightly varied with gentle rising grounds. The boundaries, in every direction, are hilly, or formed of a higher land than the high or vale of Kinross, with a single exception, at the narrow passage at the eastern extremity of the county, where the river Leven issues from the celebrated loch of that name. The Ochil hills form the northern boundary of Kinross-shire; the Cleish hills, the southern; and Balnacartie hill, with Welt Lomond, or Bishop's hill, as it is called, bound it on the east and south-east quarters. The frides of the fmall hills, which face the central part of the county, are for the most part excellent pastures, generally retaining beautiful verdure; patches of moorland occurring only near their summits. In the interior and higher part of the Ochils, however, heath becomes more abundant. The chief variety in the appearance of the low grounds is produced by the mixture of corn and grazz-land, and by a few thriving plantations interlaced with villages. Some intervening moorlands, and extensive moors, likewise variegate the surface. Even the margin of Lochleven is ornamented in this way by a common moor of more than 300 acres, in the vicinity of the town of Kin- rofs, in the very centre of the county. The aspect of the whole shire is open and exposed, there being but a small part inclosed, and many of the inclosures formed not of hedges but of stone walls.

Of the waters of this county, the most remarkable is the lake called Lochleven, on the western banks of which stands the town of Kinross. This lake, though inferior in magnificence and grandeur to Lochlomond, is a noble expanse of fresh water, about fifteen miles in circumference, including its angular juttings, and covering nearly 3,300 acres. The surface of the water at its highest level and lowest fall, varies about three feet. Lochleven is bounded on the east by the Lomond hills, on the south by that of Balnacartie, and on the west by the plain of Kinross. It is remarkable for producing trout of a large size, with flesh of a reddish colour, nearly approaching to the tale and appearance of salmon. Some of them weigh from two to eight, and even ten pounds each. The high colour of these trout is ascribed to the great quantity of small red shellfish which abounds at the bottom of the loch; the trout have often their stomach full of them. Lochleven receives the waters of three small rivers; Gairny, the founthermost stream in the county, South Queich and North Queich, which both have their rise among the Ochil hills. Lochleven gives rise to the river Leven, which passes through a considerable part of Fife into the sea, forming the largest water in that county. In September, the eels, which greatly abound in Lochleven, begin to emigrate in great numbers to the sea; but only attempt this passage during the night. The county contains several small lakes; of these four are in the parish of Cleish: the largest is about a mile and a half in circumference: the four cover about 250 acres. The climate in the higher grounds of this county is cold and wet; owing to the elevation of the land, and chiefly to the hills, which attract the clouds and vapours. Frosts set in earlier, and continues longer, than in the adjacent districts towards the south. The county is well intersected with roads, which are, in general, kept in excellent repair by the ratepayers. The carriages and the personal duty may be furnished in kind, or committed, at the option of the persons chargeable. The principal turnpike roads are those from Perth to Queens- ferry, and from Stirling to Kinross: they are kept in the highest preservation.

Of the antiquities of Kinross-shire, those connected with Lochleven are the most remarkable. The castle of Loch- leven, now in ruins, stands upon an island of about two acres in extent. The circuit of the outer rampart is 535 feet. This castle is said to have been built by Congal, son of Dorgart, king of the Picts: but it has been rendered particularly conspicuous in Scottish history, by the confinement of the unfortunate queen Mary. In the largest island of the lake was formerly situated a priory dedicated to St. Serf; or, Servanus; and said to have been founded by Brudo, the lord but one of the Pictish fowreigns.

KINSALE, a sea-port and port-town of the county of Cork, Ireland. It is situated at the mouth of the river Ban- don, which forms a fine harbour, and is navigable for large vessels near 14 miles above the town, though a bar prevents large men of war from coming into the bay. In this port there was formerly a dock furnished with wharves for the use of the navy, but this has lately been removed to the neighbouring harbour of Cork, where the accommodations are greater, and which is the chief naval station in Ireland. The entrance of Kinsale harbour is defended by a fort, which having been constructed in the reign of Charles II is called Charlesfort, in which there is always a good garrison. Kinsale is the town which the Spaniards took possession of, and in which they were besieged and taken prisoners, at the latter end of queen Elizabeth's reign. The town, which contains at least 10,000 inhabitants, is built at the site of Compaifs hill; the streets are narrow and the houses indifferent, yet in the bathing season it is the resort of much fashionable company, and there are at all times many genteel residents, too as to afford good society. Kinsale is represented by one member in the imperial parliament, who is chosen under the influence of the lord de Clifford, chief proprietor of the town. It gives title of baron to the descendant of the famous John de Courcy, who procured for himself and posterity the privilege of being covered in the king's presence. Kinsale is 156 miles S.W. from Dublin, and about 12 miles S. from Cork. N. lat. 51° 42'. W. long. 8° 30'.

KINSALE, Old Head of, a cape of Ireland, projecting a considerable way into the sea, and forming a very noted land mark. N. lat. 51° 37'. W. long. 8° 30'.

KINSALE, a port town of Virginia, 16 miles from Westmoreland court-house, and 12 from Northumberland court-house.

KINSOMRA, a town of Africa, 25 miles S.E. of New Benguela.

KINTAL, or QINTAL, a weight of one hundred pounds, more or less, according to the different usages of divers nations.

The kintel of Smyrna is 123 pounds three ounces nine drachms, or 120 pounds seven ounces twelve drachms; but that of Aleppo is 307 pounds 11 ounces 15 drachms.

KIN-TAM, in Geography, an island in the China-fosea, near the coast of China, about 24 miles in circumference. N. lat. 36° 38'. E. long. 121° 24'.

KINPAR. A, a town of Hindoostan, in the circum of Ceylon; 10 miles N. of Colimantora.

KIN-TCHO, a town of Corea; 80 miles E. of King-kii-to.
KIN-TCHIN, a city and capital of the islands of Lieou-
kien. This city is situated in the S.E. part of the large
island called "Cheou-l," where the court resides.
The king's palace, which is reckoned to be four leagues in cir-
cumference, is built on a neighbouring mountain. It has
four gates, which correspond to the four cardinal points;
and that which fronts the west, forms the grand entry.
The view which this palace commands is most extensive and
delightful; it reaches as far as the port of Napa-kiang, at
the distance of 10,000, (2000 making 50 geographical
miles), to the city of Kin-tching, and to a great number of
other cities, towns, villages, palaces, temples, monas-
teries, gardens, and pleasure-houses. N. lat. 26° 2'. E. long.
140° 25'.

KINTEN, a town of Braifian Lithuania; 15 miles S.
of Memel.

KINTORE, a small borough town and parish of Aber-
deenshire, Scotland, in the district of Garwik, is feated
on the river Don, at the distance of 15 miles N.W. of the
county town, and 137 N. of Edinburgh. It is said that
this place obtained a charter in an early period, but the
only authentic deed of his description was granted by
James V.; its government is vested in a provost, two bailiffs,
a dean of guild, a treasurer, and a council of eight other
burgesses.
The first of these offices has long been vested in
the earls of Kintore. In this place are a town-house and
a prison; and in the year 1800 it contained 190 houses and
840 inhabitants. In conjunction with Banff, Cullen, Elgin,
and Inverurie, it returns one member to the British parlia-
ment. The parish of Kintore is about six miles in length
by eight in breadth, and lies gradually from the river Don
to a range of hills. In it is Thainldone, the seat of Forbes
Mitchell, esq. and in one part of it are several cairns and
tumuli, which are traditionally said to mark the scene of
an action between Robert Bruce, and the army of Edward I.
Sinclair's Statistical Account of Scotland.

KINTYRE, or CANTYRE, one of the three diocises of
Argylethie, in Scotland. Of the three diocises or divisions
of the county of Argyle, viz. Lorn, Knapdale and Kintyre,
the latter is the most level and best adapted to the purposes
of agriculture. It forms a long narrow peninsula, bordered
by Loch Fyne and the Firth of Clyde on the east side, and
by the western sea on the west. Of this peninsula, by much
the greatest part belongs to the duke of Argyll, who has a
chamberlain or factor resident at Campbeltown, for the
superintendence of this part of his estate. There is also a
custom house at Campbelltown, for the regulation of the
collection and prevention of frauds on the revenue, and some
of the cruisers are generally on this station, for the detection
and capture of smugglers. The loch or harbour of Camp-
beltown is excellently adapted for this, as from it a vessel of
force can with ease command the whole shipping of the
Clyde in moderate weather, and may board, over-haul, and
inspect almost every vessel in the leaf fished. The ter-
mination of the peninsula is called the Mull or Moyle of
Kintyre.

KINVACA, a town of Africa, in Pooladoo. N. lat.
53° 16'. W. long. 6° 2'.

KINURE Point, a cape of Ireland; in the county of
Cork, at the entrance of Oyler haven, and about three miles
east from Kinfare harbour.

KINWAT, a town of Bengal; 17 miles S.E. of Cur-
ruckpouri.

KINYALOO, a town of Africa, in the town of Man-
ding, N. lat. 12° 5'. W. long. 6° 5'.

KIN-YANG, a city of China, of the first class in the
province of Chen-ki; which, being regarded as a barrier
against the incursions of the Tartars, is strongly fortified in
the Chinese manner; the adjacent country is very fruitful;
and produces a kind of herb, called "Kinfee," i. e. golden
flax, to which is ascribed some medicinal virtue, and also a
kind of bean which is said to be an admirable specific against
any sort of poxion. This city has in its district one town of
the second order and four towns of the third order. N.
lat. 36° 6'. E long. 107° 19'.

KINTAKORA, a town of Africa, in the kingdom of
Gadou; 36 miles S.W. of Kamalia.

KIOANON Point, called in some maps Kikelone, is
the extremity of a large peninsula which projects far into
the S. side of Lake Superior.

KIO-PEOU, a celebrated city of China, in the province
of Chang-tong, which was the birth-place of Confucius.
Several monuments are still to be seen there, erected in ho-
nour of this eminent man.

KIOGE, a sea-port of Denmark, situated on the island
of Zealand, in a bay at the mouth of a river, formerly a
place of considerable trade, with manufactures of valuable
tapelry. In 1699, it was fortified by Charles Gustavus,
kings of Sweden, with ditches and ramparts; 10 miles
S.S.W. of Copenhagen. N. lat. 55° 28'. E. long. 12° 12'.

KIOLEN, a town of Sweden, in Warmeland; 48 miles
N.W. of Carlstadt.

KIONGONG, a town of Bengal; 30 miles N.E. of
Burdwan. N. lat. 23° 41'. E. long. 88° 10'.

KIONTONA, an Indian town on Conewango river, in
Pennsylvania; 11 miles N. from its mouth in the river Al-
legany.

KIORING, a town of Sweden, in Westmanland, on a
river of the same name, communicating with Malar lake.
It is a place of good trade; 10 miles W. of Strooomholm.
N. lat. 59° 53'. E. long. 16° 43'.

KIOREAH, a town of Hindoosian, in Boggielund; 27
miles N.E. of Rewah.

KIOREHVESI, a town of Sweden, in Tavaufland; 58
miles N. of Tavauflus. N. lat. 61° 50'. E. long. 24° 33'.

KIOV. See KIEV.

KIOVA, a town of Africa, in the kingdom of Congo,
and province of Sogno.

KIOUMZEIK, a well built town of Aus, situated on
the Irawaddy, and gradually improving. The manufacture
of cotton cloth is the source of its prosperity. A town
called "Hinzaelah" near it, is of much greater antiquity; 76
miles N.N.W. of Rangoon. N. lat. 17° 43'.

KIOZDI, a town of Wallachia; 77 miles N. of Bu-
charef.

KIP, a kind of oyster basket, wide in the middle, and
narrow at both ends; used for taking fish.

KIP, is also a game, which confounds in throwing someth-
ing into a hole, called the kipe-hole.

KIPHAINTA, in Geography, a town of European Tur-
key, in the Morea; 20 miles E. of Mistra.

KIPPER. See Salmon Fishery.

KIPPER-TIME, a space of time between the festival of
the finding of the Holy Cross, May the 3d and 12th day;
during which, salmon-fishing in the river Thames, from
Gravelend to Henley, is forbidden by Rot. Parl. 50.
Edw. 111.

KIPPS, ANDREW, in Biography, an eminent noncon-
formist minister of the last century, was born at Notting-
ham on the 26th day of March, in the year 1725. He was
defended, both by the father's and mother's side, from
ejected ministers of the names of King and Ryther, who are
mentioned with respect in Dr. Calamy's Account of the
Ministers
Ministers ejected and silenced by the Act of Uniformity. Upon the death of his father, when he was about five years of age, he was removed to his grandfather at Sleaford in Lincolnshire, where he received his grammatical education. His talents and application attracted the peculiar notice of Mr. Merriwail, who was pastor of a congregation of dissenters in that town; and by his advice and encouragement, his views were directed to the profession of a dissenting minister, and to those literary pursuits in which he afterwards so much excelled. At the age of sixteen, he was admitted to the academy at Northampton, under the care of Dr. Doddrige; and in that seminary he prosecuted his studies with such diligence and improvement, and conducted himself with such exemplary propriety, as to conciliate the affectionate esteem and partial attachment of his tutor. Having completed his course of five years at the academy, he undertook the charge of a dissenting congregation at Boston, in Lincolnshire, with which he settled in September 1746. From Boston he removed to Dorking in Surrey, in 1750; and in 1753, he succeeded Dr. Hughes as pastor to the society in Prince's street, Weuitminster. In the same year he married Miss Elizabeth Bott, the daughter of a respectable merchant at Boston, in whom he found a sensible, prudent, sprightly, and cheerful companion, and by whose attentions his mind was relieved from all family concerns; so that he was left at full leisure to prosecute the various duties which his numerous engagements devolved upon him. Whether we consider the literary talents, the ministerial abilities, or the external accomplishments of the subject of this article, no person could have been better qualified for the situation into which he was introduced than himself. His settlement with the society in Westminster laid the foundation of that celebrity which he afterwards acquired, and of that extensive usefulness which distinguished his future life. He was thus soon introduced into a connection with the Presbyterian fund, to the prosperity of which he was afterwards very ardently devoted. In June 1762, he became a member of Dr. Williams's trust; and this appointment afforded him an additional opportunity of being eminently and extensively useful in a variety of respects. His connection with the general body of Protestant dissenting ministers, belonging to the cities of London and Westminster, and with many charitable institutions, which the liberality of dissenters has established, gave him frequent occasion to exercise his talents for the honour and interest of the cause, to which, both by his sentiments and profession, he was zealously attached.

His literary abilities and attainments were acknowledged by all who knew him. It was, therefore, natural to imagine, that when a favourable opportunity offered, he would be employed in the department of public education. Accordingly, when the death of the reverend Dr. Jennings rendered it necessary to make a new arrangement of tutors in the academy, supported in London by the funds of William Coward, esq., the trustees directed their views to him; and in the year 1763, he was appointed classical and philosophical tutor to that institution.

In 1767 he received the degree of doctor in divinity from the university of Edinburgh; an honour, in the unfilled grant of which the principal and professors very cordially concurred. No one can dispute his peculiar claim to such a token of respect.

In March 1778, he was elected a fellow of the Society of Antiquaries; and in June 1779, a fellow of the Royal Society. He was a member of the council of the former society from 1782 to 1784, and of that of the latter from 1786 to 1787. In both these societies he was a regular attendant, and a respectable and useful member.

Having, in the year 1794, quitted his connection with Dr. Coward's academy, which, upon the resignation of the two other tutors, was discontinued, he cordially concurred with his very respectable body of dissenters, in 1786, in establishing a new institution in the neighbourhood of London, with a view of educating dissenters and other young gentlemen intended for civil life. Dr. Kippis was very affiduous and active in his endeavours to accomplish this laudable design; and though his other engagements rendered it very inconvenient for him to accept any official connection with it, he was urged to unite with other persons, for whom he entertained a peculiar respect; and he at length, though not without reluctance, acquiesced in the appointment to be one of the tutors of this new institution. The diligence of his residence from Hackney, where the college was fixed, and some other circumstances which it is unnecessary to recite, induced him in a few years to withdraw from it, as a tutor: though he still continued to serve it by a liberal subscription, and by his interest with opulent friends.

Dr. Kippis continued to prosecute his other useful labours without intermission; and till within a fortnight of his death, his friends had no reason to imagine that they were to see their close. In the course of the summer, a few weeks before his death, he took a long journey on public business, and returned, as his fellow travellers apprehended, with recruited spirits and embellished health; and they were equally surprized and grieved when they heard that he was confined to his bed with a fever, which baffled the skill of the most eminent physicians, and which haftily advanced to the fatal crisis. His disorder was of such a nature, that he found himself both disinclined and unable to make any exertion, or to converse much even with his most confiding attendants. There is reason, however, to believe, that in a very early stage of his disorder he was not without apprehensions of its terminating in his dissolution. The last public service he performed was on the 20th of September; and on Thursday evening, the 5th of October, he awoke after a tranquil sleep of some continuance, and in a little while expired: having left his generation according to the will of God, and attained the age of 70 years and 6 months.

It is not easy to do sufficient justice to the eminent talents, the extensive labours, and exemplary character of Dr. Kippis. His mild and gentle temper, his polished manners, his easy and graceful address, and a variety of external accomplishments, prepossessed those who first saw him in his favour, and could not fail to conciliate esteem and attachment on a more intimate acquaintance. These qualities contributed very much to recommend him to persons in the higher ranks of life, to several of whom he had occasional accefs; and qualified him, in a very eminent degree, for the situation in which he exercised his ministerial office. But he was no less condescending, courteous, and affable to his inferiors, than to those who occupied superior situations. Dr. Kippis had nothing of that austerity and reserve, of that haughtiness and superciliousness, of that parade and self-importance, and ostentations affectation of dignity, which forbid access, and which mar the freedom and the pleasure of all the social intercourse of life. And yet these diffident and odious qualities sometimes accompany literary men, and especially those who have acquired any considerable degree of eminence and reputation.

The mental abilities of Dr. Kippis were of the superior kind. He possessed a comprehensive understanding, a sound judgment,
judgment, a retentive memory, a correct imagination, a refined taste, a quickness and a facility of exerting his faculties on any subject or occasion, however suddenly they might occur.

The natural powers of his mind were cultivated with an affinity and perseverance of application, in which he had few superiors, and not many equals. They had been habituated through life to regular and constant exercise, and had acquired strength and vigour from use. He was never hurried and distracted by the variety of his literary pursuits; and though he had many engagements which required his attention, and which diverted his mind from the objects of study to which he was devoted, he never seemed to want time. Every kind of business was referred to its proper season. By a judicious arrangement of his studies, as well as of his other occupations, the number and variety of which he never voluntarily displayed, and by the punctuality of his attention to every kind of business in which he was employed, he avoided confusion; he retained on all occasions the possession of himself; and he found leisure for reading and writing, and for all his literary avocations, without encroaching on that time which he appropriated to his professional duties and social connections.

Indeed, there have been few persons, says his biographer, who read so much, and with such advantage to themselves and others, as Dr. Kippis. Hence he acquired that extensive acquaintance with books, and with the literature of ancient and modern times, and particularly of the last century, which rendered him an instructive companion, and which directed him where to apply for necessary information on any subject that employed his own attention or that of others. But though he read much, he was not one of those who waste their time in dilatory reading, and who make no addition to their stock of useful knowledge by the volumes which they turn over for mere present amusement. He read with attention and discrimination. He formed an accurate judgment of the intrinsic value of every publication, to which he had recourse; and there have been few works, in the department of literature with which he was conversant, that have elapsed from the press, for many years, of the specific objects and real merit of which he could not give a just and satisfactory account.

There is one circumstance, to which it was principally owing that Dr. Kippis seemed, in the midst of a great number of engagements, to have time at his own command, and which enabled him to dispatch much business without apparent hurry and confusion.

We mention it here, for the direction of young persons, and especially of young students, whose habits are not established. He had been accustomed from his youth to early rising; and he thus secured to himself a certain portion of time, during which he was not liable to be interrupted by any foreign avocations. This habit was no less conducive to his health, than to the discharge of his various literary and professional obligations. Providence had blessed him with an excellent constitution. He had preferred it unpimpaired by a course of uniform regularity and temperance. He was little interrupted through life by any bodily disorder in any of the occupations to which he was devoted. If we except a fever, which laid him aside for some years before his death, and a constitutional cough which was rather beneficial than injurious, he enjoyed an unusual share of health and spirits.

Dr. Kippis possessed other qualities, besides his mental abilities, however excellent, however affluently cultivated, and however usefully employed, which rendered his character in a full higher degree estimable and praiseworthy. In private life, his disposition and deportment were amiable and exemplary. His piety originated in honourable sentiments of the perfection and providence of God; and its practical influence was uniform and permanent. He exhibited, in all his connections and concerns, a humble, meek, placable, forgiving, and benevolent temper. The gentleness, mildness, and philanthropy of his disposition formed very distinguishing traits of his character. With these virtues, so congenial to the spirit of the religion he professed, so conducive to the tranquility of his own mind, and so powerful as incentives to activity and usefulness, he united an inflexible integrity, and an independence of spirit, which disdained every thing that was mean, selfish, and servile.

If we accompany Dr. Kippis from private and domestic life into the various stations of public usefulness, which Providence assigned him, we shall find him eminently qualified, and ardently disposed to serve his generation according to the will of God. His knowledge of the world, the rectitude of his judgment, and the mildness of his temper, gave him considerable influence in various connections to which he belonged. At the Presbyterian Board, in Dr. Williams’s Tract, and in the general body of associated ministers, his opinion always claimed peculiar deference. As he was become the father of several societies of this kind to which he had related, his age commanded respect; and his condoning, complying disposition rendered it easy and pleasant to act with him on every occasion. Notwithstanding the variety of his engagements, he was a constant attendant. He never pleaded them as an apology for absence. He never wished to decline any public service, whatever personal inconvenience or trouble might attend it. He preferred the concerns of others, who needed his assistance, to his own.

As a scholar, the literature of Dr. Kippis was various and comprehensive. But the studies to which he principally applied, and in which he most excelled, were those of the classics, the belles lettres, and history; besides those which were immediately connected with his profession. The history of his own country had been the subject of his long and laboured investigation; and the principles of the British constitution he had diligently studied. To these he was zealously attached; and he ably defended them, though he was not unapprized of the corruption which time had introduced, and of the necessity and wisdom of a speedy reformation. He was a ready, uniform, and ardent friend to the cause of civil and religious liberty; and in the course of his life he had various occasions of avouching himself the advocate of this cause. But whilst he detested tyranny and oppression, he dreaded anarchy and tumult. In the political contests, which have lately agitated this country, the moderation of his temper was eminently conspicuous. His disposition was gentle and conciliating. He was an enemy to every species of violence; and he thought that calms, firmness, and perseverance in the pursuit of constitutional measures, were the most likely means of obtaining a reformation of acknowledged abuses, and a termination to public calamities and evils. Though he thought it most prudent to withdraw from some societies of a political nature, with which he had been long connected, he never abandoned the principles upon which his first connection with them was founded; nor did he ever disguise his sentiments either of men or of measures, whenever a proper occasion for declaring them occurred.

In many other societies of a different kind, that were established for literary improvement or friendly intercourse, Dr.
Dr. Kippis was a very valuable and useful member. Whilst his modesty prevented his obtruding his sentiments on others, or afluming the lead, and preferring to dictate amongst those who were in various respects inferior to himself, he was always communicative and entertaining. He never offended either by an ungracious reserve or affected silence, on the one hand, or by an intrusive and troublesome loquacity on the other. His literary character was universally acknowledged by persons of this description, with whom his acquaintance was intimate and extensive. The course of his studies furnished him with a variety of anecdotes, that rendered his conversation, on particular occasions, interesting and inductive. His knowledge of books, and his judgment of their respective merit, which was always formed with candour and pronounced with modesty, were very comprehensive and accurate; and he was often appealed to by those who wished to obtain information on subjects of this nature. In those friendly associations to which he belonged, he was always placid and cheerful; placid without dulness, and cheerful without an unbecoming levity. In him were invariably united, the knowledge of the scholar, and the judgment resulting from experience and an attentive observation of the course of the world, with the manners of the gentleman, and the decorum belonging to his public character as a Christian, and his profession as a minister.

Amidst a variety of other occupations, Dr. Kippis sustained the office of tutor, for more than 25 years, with singular reputation to himself, and with great benefit to the young persons who were under his care. His lectures and his general conduct conciliated the elee, and promoted the improvement of his pupils. They all honoured and loved him; for he had a happy talent of attaching their affection and respect. They lamented his removal from this sphere of public service. To young men, and particularly to young ministers, Dr. Kippis was always attentive and friendly. He was ready, on all occasions, to affix them with his advice in the prosecution of their private studies and public labours; and to those who needed pecuniary aid, his hand was extended for the distribution of his own property, as well as that of others entrusted to his disposal. As an author, Dr. Kippis commenced his career in early life, as many other young men have done, by contributing to the magazines of the time, particularly the Gentleman's Magazine. He afterwards became a more constant writer in the Monthly Review. His articles were chiefly historical and theological, with occasional strictures on works of general erudition. He also furnished a periodical publication, called the Library; with several valuable papers. He laid the foundation of the New Annual Register; and suggested the improved plan upon which that work is conducted. The History of Ancient Literature, and the Review of modern Books, were, at its first commencement, written by him, and continued to the year 1783, inclusive. He was also the author of the "Review of the Translations of the present Reign," prefixed to the Register for 1782; and of the "History of Knowledge, Learning, and Taste, in Great Britain," prefixed to the succeeding volumes, to the year 1794 inclusive.

During the application of the differing ministers to parliament, for the enlargement of the Act of Toleration in the year 1772, to which he devoted much of his time and attention, he published a valuable pamphlet, indicating that measure as to the matter, manner, and time of it. It was intended as an answer to a publication ascribed to a writer who afterwards filled a very high station in the church, and was entitled "A Vindication of the Protestant Diffusing Ministers, with regard to their late Application to Parliament," 8vo.

Soon after his admission into the Royal Society, he published a pamphlet, entitled "Observations on the Late Contests in the Royal Society," 1784, 8vo.; with a view of allaying the animosities that subsisted in that body, which produced a good effect. His intimate connexion with Sir John Pringle, bart. who was formerly a very respectable and useful president of the Royal Society, led Dr. Kippis, after his decease, to republish his Six Dissertations, delivered at the allegation of Sir Godfrey Copley's medal, to which he has prefixed a valuable life of the author, 1783, 8vo. At the close of the American War he published a political pamphlet, formed from materials which were communicated to him by persons of eminence, and designed to justify the peace, which terminated that unhappy contest. This pamphlet was entitled "Considerations on the Provisional Treaty with America, and the Preliminary Articles of Peace with France and Spain." He also published several single discourses, which were delivered on particular occasions; some of which are reprinted in his volume of sermons, 1794. Not should we omit to mention his account of the life and voyages of captain Cook, 1788, 4to.; his new edition of Dr. Doddridge's Lectures, with a great number of additional references; his life of this excellent preacher, prefixed to a new edition of his Exposition of the New Testament, 1792; his life of Dr. Lardner (to whose abilities, character, and writings he has paid the just tribute of respect) prefixed to the complete collection of his works; in 11 vols. 8vo. 1788; and "An Address delivered at the Interment of Richard Price, D.D. F.R.S., &c. 1791;" and "An Ordination Charge," 1788, 8vo. He also assisted in selecting and preparing "A Collection of Hymns and Psalms, for public and private Worship," 1795, 8vo. and 12mo. which is used in many places of worship among Protestant dissenters, and has passed through several editions. But the work, to which Dr. Kippis devoted his principal attention for many of the last years of his life, and by which he has acquired singular reputation, was the Biographia Britannica. His indefatigable industry in collecting materials for it, his access to the best sources of information, his knowledge of men and books, his judgment in selecting and marking every circumstance that could serve to distinguish talents and character, and the habit which he had acquired by long practice of appreciating the value of different works, qualified him, in a very high degree, for conducting this elaborate performance. It has been much regretted, that he did not live to carry on this edition of the "Biographia," farther than to about a third part of the sixth volume, which has not yet made its appearance.

Notwithstanding the time that must have been devoted to the several objects now recited, and to the correction and publication of the works of friends, who respected his judgment and wished to avail themselves of his assistance, which he could never refuse to those who requested it; Dr. Kippis never neglected the studies and duties more immediately pertaining to his character as a divine, and his profession as a minister. His acquaintance with the various branches of theology, and with subjects subversive to his critical study of the scriptures, was very extensive. He was in the daily habit of reading some portion of the New Testament in the original language. He was conversant with the best writers on Jewish and Christian antiquities; and in the course of his reading no work escaped him, that was designed to illustrate the evidence, to establish the truth and divine
Mr. Kip, divine original, and to investigate the genuine doctrines of the Christian Revelation.

He was a believer in Christianity upon the matured examination and the fullest conviction. No person was better acquainted with the controversies which Revelation has produced. He had studied them in his earlier and riper years with great attention; and though he was ready to allow the force of every difficulty and objection, yet he was convinced of their weakness and fallacy, and it is not sufficiently just to the original. In delineating a character, which exhibits so many excellencies and so few defects, none can object me of approaching to adulation. My respect for him was great. I honoured him as a father. I loved him as a brother. But my affection, I am confident, has not misled my judgment. By the favour of Providence, which marks the bounds of our habitation, I was led early in life into an intimate connection with him. Our acquaintance, as co-tutors and co-adjustors in public benefices, ripened into an established friendship; and our friendship continued, without so much as a momentary interruption, and with increasing attachment, for more than 32 years, to the day of his death. It must have been my own fault, if I have not derived advantage from his extensive literary knowledge, from the wisdom of his counsel, and from the exemplars of his conduct. No apology, I trust, will be thought necessary for introducing myself on this occasion. As it was my ambition to cultivate the friendship I enjoyed, it is my pride to have it publicly known, that I valued that friendship, as one of the chief honours and pleasures of my life. The friend I have lost cannot be easily replaced. See Rees's Funeral Sermon, preached at the Meeting-house, in Prince's-street, Westminster, Oct. 18, 1795.

**KIP**

KIPPURE, in Geography, the name of the highest mountains in the chain extending into the counties of Wicklow and Dublin, about ten miles south of the city of Dublin.

**KIRA**, a small island in the gulf of Engia; nine miles W. of Engia.

**KIRAHIANA**, a town of Hungary; 15 miles E.S.E. of Munkacz.

**KIRALI**, a town of Asiatic Turkey, in Caramania; 35 miles W.S.W. of Cogni.

**KIRANOOR**, a town of Hindoostan, in the Carnatic; 22 miles N. of Nattam.

**KIRANORE**, a town of Hindoostan, in Marawar; 20 miles of Tripator.

**KIRBYE, GEORGE**, in Biography, an excellent English madrigalist on the Italian model; but who was more remarkable for simplicity than taste and fancy. In 1597, he published his first set of madrigals to 3, 4, 5, and 6 voices; several of which were successfully revived at the concert of ancient music and the Catch-club, during the first years of those institutions. They are now suffered again to sleep in peace, with those of Walker, Wilbye, Elt, and Bennet, our principal madrigalists, perhaps never to be waked again.

**KIRKAGATCH**, in Geography, a town of Asiatic Turkey, about 40 miles N.E. of Magnini or Magnedia, on the route to Prusa, which has risen to considerable population, from the cultivation of cotton.

**KIRKAJAN**, a town of Persia, in the province of Kerman; 117 miles E. of Sirjan.

**KIRCALDY**, a small town of Fifeshire, on the N. coast of the North of Firth, about three miles east of Kinghorn, from which also there is a ferry to Leith and Edinburgh. Besides the ferry and the fishing, Kirkaldy is noted to employ a considerable number of flaps, brigs, and other vessels, in the trade with the eastern countries of Europe and the Baltic, but these were more frequently chartered or freighted from other ports than their own. It has also been long a considerable
able place for the manufacture of coarse goods both of linen and cotton, and this trade is still prosecuted to a very considerable extent. The chief article of their manufacture consists in low-priced blue and white checked goods, used for seamsters' shirts, and for clothing for the negroes in the West Indies. So great has been the demand for these articles at particular times, that shortly after the capture of Trinidad by the British, the writer of this article was requested by an eminent West India house in Liverpool, to endeavour to procure for them seven thousand pieces of these checks, or any quantity which could be supplied. Upon application, however, he found the demand from other quarters so great, that only a very small proportion of the supply could be procured. Coarse low-priced checked handkerchiefs are also manufactured to a very considerable extent.

Kircaldy was erected into a royal burgh in the fifteenth century, and its charter was ratified by Charles I. in 1644, and is governed by a provost, bailiff, and council, at which time it is said that 100 ships belonged to the port; the chief article of export is coal; and the importation consists of corn, flax, flax-seed, linen-yarn, wood, iron, tallow, bark, hide, &c. Kircaldy is united with Dysart, Kinghorn, and Burntisland, in electing a member to serve in parliament. In 1801, the number of inhabitants was 32,48 of whom 700 were employed in trade and manufactures; 13 miles north of Edinburgh. N. lat. 56° 7'. W. long. 3°.'

KIRCH. GODFREY, in Biography, an able astronomer, was born at Guben, a town in Lower Lusatia, in the year 1640. He professed his studies at Leipzig, where he acquired considerable reputation by the almanacs which he published. In 1662, he married Mary Margaret Winckelman, who rendered him much useful assistance by making astronomical observations for the construction of his Ephemerides. In 1701, on the establishment of the Academy of Sciences at Berlin, by Frederick I., king of Prussia, that prince invited M. Kirch to be a member of the society, and to take upon himself the office of astronomer in ordinary, with an honourable pension for his support. He died at Berlin 1719, at the age of seventy-one years. He had been in the service of the king, and was a member of all the learned societies of Europe, and published a variety of astronomical treatises, which are in considerable estimation.

KIRCH, MARY-MARGARET, wife of the preceding, was daughter of a Lutheran clergyman at Panitzitz, a village near Leipzig, where she was born in the year 1670. Having left her father when she was only twelve years of age, she was educated by his successor, and indulged the inclination which she discovered for the acquisition of knowledge, and particularly that of astronomy. This partiality for his favourite pursuit was a recommendation to M. Kirch, who obtained her hand in marriage, and found her a most valuable assistant in his scientific labours. She was not contented, however, with rendering her husband important services, but shewed herself capable of viewing the heavens with the eye of a discoverer, and in 1725, the first saw of a comet, upon which M. Kirch published his observations. In 1707, she discovered a peculiar Aurora Borealis, of which mention is made in the Memoirs of the Academy of Sciences at Paris, for the year 1716. These exertions of her genius procured her the esteem of the learned at Berlin, notwithstanding which she was in very low circumstances when her husband died. She continued to maintain herself and educate her children, by contracting alliances, and, in 1711, she published a dissertation, intitled "Preparations for observing the grand Conjunctions of Saturn, Jupiter, &c."

Soon after this she found a patron in the baron de Throsack, who furnished her with apartments in his own house, adapted to the carrying on her astronomical observations. Here she lived till the baron's death, which happened about two years afterwards. She now removed to Dantzic, where Peter the Great wished to engage her to settle in his empire. She preferred her native country, and, in 1716, accompanied her son to Berlin, where she was appointed astronomer to the Academy of Sciences in that city. She was now introduced to the notice of the royal family, and secured the patronage of some of the branches of it. She died in 1723, in her fifty-first year.

KIRCH, CHRISTIAN FREDERIC, son of the preceding, was born at Guben, in the year 1694, and discovered an early and very strong bias for scientific pursuits. He commenced his studies at Berlin, and afterwards continued them at Halle, whence he made excursions, for improvement, to Nuremberg, Leipzig, and Prussia. He was employed a considerable time in the observatory at Dantzic, and during his residence here the czar, Peter the Great, offered him an establishment at Moscow; but his attachment to his mother, who was averse from leaving Germany, led him to decline it. In 1717, he was made member of the Academy of Sciences at Berlin, and, in 1723, he was chosen a corresponding member of the Royal Academy of Sciences at Paris, and he shewed himself worthy of that distinction, by the frequent valuable contributions which he transmitted to them during the remainder of his life. He died in 1740, in the forty-sixth year of his age. He published several works connected with astronomy, which were in considerable reputation at the period in which he flourished. Mорери.

KIRCHBACH, in Geography, a town of the duchy of Styria; 14 miles S.E. of Graz.

KIRCHBERG, a town and castle of Bavaria; 12 miles N of Landshut.—Alto, a town of Germany, in the principality of Hohenlohe, on the Jann; 28 miles W of Ansfach.—Alto, a town of Saxony, in the circle of Erzgebirg; six miles S. of Zwickau.—Alto, a town of the principality of Naftau-Dietz, capital of a bailiwick; five miles S.E. of Dietz.—Alto, a town of Austria; 11 miles S. of St. Polten.—Alto, a town of France, in the department of the Rhine and Moselle; and chief place of a canton, in the district of Simmern. The place contains 772, and the canton 6491 inhabitants. in 35 communes.

KIRCHEAN MUSEUM at Rome, was founded by father Kircher about the middle of the seventeenth century. This celebrated museum is full of ancient paintings, vases, gems, intaglios, cameois, and other antiquities, which are in such abundance, that a spectator might fancy himself at Portici; but the curiosities which we were most eager to see and examine, were father Kircher's musical instruments and machines described in his Musurgia. They were almost all out of order in 1770, and in decay; and it is to be feared that time has not improved them. Their construction was not only curious, but manifested the ingenuity as well as zeal of the learned father, in his musical enquiries and experiments.

KIRCHEIM-BOUILLANDEN, in Geography, a town of France, in the department of Mont Subirous, and chief place of a canton, in the district of Mayence; 28 miles N.W. of Manheim. The place contains 1873, and the canton 9415 inhabitants, in 22 communes. N. lat. 49° 39'. E. long. 7° 50'.

KIRCHER, A thanaius, in Biography, a celebrated mathematician and philosopher, was born at Fulda in the year 1601, and when he was seventeen years of age he commenced his noviciate in the society of the Jesuits, among whom
The time of his death is not yet precisely determined, but it is
probably in 1702. He was at that time writing a great
work on the history of music, entitled "Musurgia," which
was not printed until some years after his death.

KIRCHHORN, in Geography, a town of Carinthia, on
the borders of the Tyrol; 16 miles N.N.W. of Greifen-
burg.

KIRCHHAYN, a town of Heiligenstadt, in the Wurz-
hof, containing more than 400 houses; 35 miles S.S.W. of Caffel.

KIRCHHEIM, a town of Wurtemberg, on the Lauter;
24 miles N.W. of Ulm.--Alfo, a town of Germany, the
capital of a lordship belonging to the family of Fuggler;
25 miles E.S.E. of Ulm.

KIRCHLAUTERN, a town of the duchy of Wurz-
burg; 8 miles N.W. of Bamberg.

KIRCHPERG, a town of Bavaria; 13 miles N.W. of
Moiburg.--Alfo, a town of Austria; 8 miles S.W. of Son-
neberg.

KIRCHSCHLAGEN, a town of Austria, with a medi-
cinal bath; 10 miles S. of Zvetl.

KIRCHWALDSEE, a town of Germany, in the
county of Verden; 11 miles N.E. of Verden.

KIRCKMAN, Jacob, in Biography, an excellent har-
psichord-maker from Germany, who came to England about
the year 1740, and worked with the celebrated Tabel, as
his foreman and finisher, till the time of his death. Soon
after which, by a curious kind of courtship, Kirckman
married his master's widow, by which prudent measure he
became possessor of all Tabel's patrimonial wealth, tools,
and flock in trade. Kirckman himself used to relate the singular
manner in which he gained the widow, which was not by
a regular siege, but by florn. He told her one fine
morning, at breakfast, that he was determined to be
married that day before twelve o'clock. Mrs. Tabel, in
great surplice, asked him to whom he was going to be mar-
rried, and why so soon? The finisher told her, that he had
not yet determined whom he should marry, and that, if she
would have him, she would give her the preference. The
lady wondere at his precipitancy, hesitated full half an
hour; but he continuing to swear that the business must be
done before twelve o'clock that day, at length she forren-
dered;
Theodorus, the father of Isocrates, was a flute-maker, who acquired wealth sufficiently by his employment not only to educate his children in a liberal manner, but also to bear one of the heaviest public burthens to which an Athenian citizen was liable; that of furnishing a choir or chorus for his tribe, or ward, at festivals and religious ceremonies.

Each tribe furnished its distinct chorus; which consisted of a band of vocal and instrumental performers and dancers, who were to be hired, maintained, and dressed, during the whole time of the festival: an expense considerable in itself, but much increased by emulation among the richer citizens, and the disgrace consequent to an inferior exhibition. The fluctuations of trade and public favour have rendered the businefs of boring flats for less profitable at present, than it was in the time of Theodorus. But our harpsichord maker, Kirckman, who was known to be worth 90,000l. twenty years before he died, doubled the profits of his instruments, by becoming a pawnbroker and a furfer; obliging young heirs with money as kindly, and with as much liberality, as a Hebrew.

At a time when ruin flared harpsichord-makers in the face, by the rage with which married ladies were feized for the guitar, in preference to all other instruments, Kirckman hit on an ingenious expedient which saved himself from bankruptcy, and restored the harpsichord to all its former favour. (See Guitar.) He did not live to see his excellent double harpsichords of fifty or seventy guineas price, sold at auctions for twelve or fourteen pounds, and the original purchasers turn them out of their houses as useless lumber. But such are the vicissitudes of this world, that our protagonists will, perhaps, know as little about the pianoforte, as we do now of the lute or lyre. Kirckman is supposed to have died in 1773, worth near 200,000l.

KIRKODRE, a town of Upper Heffe; 54 miles W. of Caffel.

KIRENSK, a town of Russia, in the government of Irkutsk, on the Lena. N. lat. 57° 20'. E. long. 108° 14'.

KIRENSKOf, a town of Russia, in the government of Irkutsk, on the borders, built in the year 1655, on a fertile foil, but now decaying; 112 miles W. of Daroumisn.

KIRGANELIA, in Battny, from Kirgaolii, a name in the Hortus Malabaricus for several species of Phyllanthus. Jull. 387. This genus is founded by Jussieu on a shrub called in the island of Mauritius Bois de demaillée, and which Commerson, in conformity perhaps to that appellation, defined to commemorate a botanical Neapolitan lady, Maria Angela Ardinghelli, who translated the works of Dr. Hales into Italian. Our specimen from Commerson is marked Ardinghelli, and we cannot account for Jussieu's passing this name over in silence. How far the genus is distinct from Phyllanthus, or from Cica, with which latter its pulp fruit nearly accords, we are not furnished with materials sufficient to decide.

KIRGISES, KIRGISES, or Kirgises, in Geography, a tribe of Tartars, who occupy about one-half of Independent Tartary, in the north. They are also called "Kaisaks," and are of undoubtedly Tartaric origin, so that they seem to live in perfect amity with their southern brethren, the Uzbekhs. They Kirgises are divided from Siberia by the great Stepp, or desert of Ilim, which is intersected by a river of the same name. On the west of the Kirgises there still remain some tribes of Kalmuks, though the most of them migrated from the Volga in 1770, when they sought the protection of the Chinese. The Kirgises are supposed to derive their name from the founder of their horde: and from time immemorial have been classed under three divisions, of great, middle, and lesser, though quite unknown to Europe till the Russian conquest of Siberia, at which time they nominated at the superior Yeniffy, the Yufis, the Ababkhan, &c.; and in the year 1766, some tribes of them became subject to the Russian empire, at the same time with the Barabines. From that period, by their pugnaciously, their faithful allies, their frequent rebellion, and the subjugation of correlative nations, they have had the character of an extremely turbulent people. The revolutions which have thus been produced in their political condition, induced them to remove from the Yeniffy to the Oby, and gradually farther to the west and the south. They at present inhabit the prodigious desert between the Urals and the Irtysh, denominated by the Russians the Kirghisian steppe, and bordering westward on the Caspian and the government of Caucasus, northwards upon the parts about the Ufa and the Tobol, and eastwards on the government of Kohlyan.

The great horde, defended by mountains on the south and east, asserted its independence in repeated contests with the Kalmuks of Soongair. The middle and little hordes have acknowledged the Russian sovereignty ever since the year 1731; but having always been unfaithful allies, and a very piratical people, the Russians have been obliged to construct lines of small forts along the frontier rivers. Each of these two hordes is estimated at 30,000 kibitkies, or families; and supposing the great horde to contain 60,000, and each family to consist of six persons, the population of this wide region may amount to 720,000; but it probably does not exceed half a million. Their manners have been minutely described by Pallas. Their tents are constructed of a kind of felt; their drink is kumis, made of acidulated mare's milk. The great horde is considered as the source of the others. Being settled near the mountains of Alak, called also Ala Taï, this horde has been denominated the Alaschian Kirgises. They lead a wandering life from the borders of the Upper Sbir, or Syr, near Tafikund, to the Stepp of Ilim. Each horde has its peculiar khan; but the middle horde, when Pallas approached this country, was contented with a prince, who acknowledged the khan of the lesser horde; and in 1777, this khan of the lesser horde, whose election had been confirmed by Russia, was called Nur Halï, a sensible and equitable prince. The features of the Kirgises are Tartaric, with the flat nose and small eyes; but not oblique like those of the Mongols and Chineses. They have horese, camels, cattle, sheep, and goats. Some individuals in the middle horde are said to have 10,000 hores, 300 camels, 3 or 4000 cattle, 20,000 sheep, and more than 2000 goats; while some in the lesser horde were proprietors of 5000 horses, and a proportionable number of the other animals. Their camels are furnished with a considerable quantity of woolly hair, which was fold to the Russians and Bucharians, being annually clipped like that of sheep. Their chief food is mutton, of the large-tailed sort; and so exquisite is the lamb,
lamb, that it is sent from Orenburg to Petersburg for the tables of the palace. The lamb-skins are the most celebrated after those of Bucharia, being damasked as it were by clothing the little animal in coarse linen. But the wool of the sheep being coarse, is used only in domestic consumption for felts and thick cloths. The fleeces supply them with objects of the chase, wolves, foxes, badgers, antelopes, ermines, weasels, marmots, &c. In the southern and eastern mountains are found wild sheep, "ovis mufimon," the ox of Thibet, "bos grunniens," which seems to delight in snowy Alps; with chanoyes, chalacs, tigers, and wild ailes.

As the Kirguisians regard one another as brethren, they are obliged to employ slaves, being captives whom they take in their incursions. Their dress is the common Tartaric, with large trousers and pointed boots. A thin veil supplies the place of a skirt, and they commonly wear two short robes. The head is shaved, and covered with a conic bonnet. Their clothes are numerous and light, so that if they fall from horseback, they are seldom hurt; their saddle-horses are richly ornamented; but their riders are short in stature, and their trousers ascend to the arm-pits, so that they resemble a pair of pantaloons on horseback. The ladies ornament their heads with the necks of herons, disposed like horns. They appear to be Mahometans, though rather of a relaxed creed.

"The Kirguisians carry on some trade with Russia. The chief traffic, which is wholly by exchange, is at Orenburg; but the middle horde proceed to Omluk. Sheep, to the amount of 150,000, are annually brought to Orenburg; with horses, cattle, lambs, skins, camel-wool, and camels; sometimes they offer slaves, Persians or Turcomans. In return they take manufactured articles, chiefly clothes and furniture. From Bucharia, Khiva, and Tashkund, they receive arms and coats of mail, which Russia refuseth, in return for camels and cattle. They are extremely fond of the Kalmuk women, who long retain their form and charms; and often marry them, if they will adopt the Mahometan religion. There is an annual festival in honour of the dead. About the beginning of the 17th century this people, who were formerly Slamanians, became children of circumcision, by the exertions of the priests of Turkistan; but Pallas, in 1769, found them addicted to forgeries and other idle superstitions."

This barren country, now inhabited by the Kirguises, has been the scene of considerable events: and it is not improbable, that its numerous deserts and plains have been formerly more fertile, at least in pasture. However this be, these regions have been held by successive nations of high repute, from the Mafageas of early times to the Turks. Pallas, cited by Pinkerton in his Geog. vol. ii. Tooke's View of the Russian Empire, vol. 1.

KIRIAN, a town of Tibet. N. lat. 33° 12'. E. long. 79° 44'.

KIRIANI, a town of European Turkey, in Livadia; 8 miles S.E. of Athens.

KIRLOV, a town of Russia, in the government of Novgorod; 52 miles N.W. of Vologda.

KIRIN, or KIRES-OLA, one of the three grand departments of the country of the Mantchow or Mandchur Tartars, or Eastern Chinese Tartary, bounded on the N. by the river Saghalien, on the E. by the Sea of Corea, and on the W. by the province of Lenao-tang. This country, which is rendered extremely cold by the number of forests that cover it, is scarcely inhabited; it contains only one or two ill-built cities, surrounded by plain mud-walls. The valuable plant "gingfong" grows here; and the emperor fends either those criminals, who are condemned to banishment by the laws. The capital is also called Kirin, or Kerin, and is situated on the river So-gari, called at this place Kirin, which falls into the Saghalien or Amur, and was the residence of the Mantchow or Mandchur general, who was invested with all the powers of a viceroy; inspecting the troops and having authority over all the Mandarians; 500 miles N.E. of Peking. N. lat. 43° 43'. E. long. 126° 24'.

KIRKBY-LONSDALE, a market town and parish in the valley of Lonsdale, whence its second, or distinctive name, on the bank of the river Lune, at the southern edge of the county. It is 12 miles south-east of Kendal, and 252 north of London. In the year 1800, the town contained 260 houses, and 1253 inhabitants. At this place Kirkby, bishop of Carlisle, repelled the Scots. He was a native of this town. Over the Lune is a curious bridge of three arches, and in the market place is a cross of rather singular character. The church is a large building, 120 feet in length, by 102 in breadth. In the church library is the following inscription: "This library, pulpit, and new box, together with the school-house, were founded by Mr. Henry Wilfor, of Underby, who gave to the college 1000l. besides 350l. yearly to seven poor scholars going to Queen's-college in Oxford; and to this church and school 200l. to the poor of Kirkby-Lonsdale lordship 500l.; besides many other gifts to pious uses in other places: by all which, he, being dead, yet speaks." About two miles from the town, towards Lonsdale, is Borrow-hall, the seat of Thomas Fenwicke, Esq. It is seated in a narrow dale, and nearly surrounded by mountains. At Kirkby are a weekly market and three fairs, annually. Nicholson and Burn's History, &c. of Westmoreland, 2 vols. 4to. 1777.

KIRKLEY-MOOREDALE, a market town and parish in that part of Yorkshire called the North-Riding, England, as its name implies, is seated among the moors, or mountains, which abound in that part of the island. This town is 28 miles N. of York, and 233 from London. In the year 1800, it contained 287 houses, and 1396 inhabitants. By the statement in Domestick-book the manor of this place, then called Chirchabi, was one of the heads of the ancient family of Stutevilles, one of whom founded an abbey at Keldholme, about one mile from this town. On the top of a hill, to the north-east of Kirkby, is the seat of an ancient building, said to have been the seat of the above-mentioned family, who continued to reside here till the reign of Henry III. The Neville's, lords, Latimer, had also a manor-house here. George Villiers, the dillisate duke of Buckingham, part of whose estates lay here, and at Helmsley, where he had a seat, died in a miserable condition, in a mean house in this town. Pope, in his Moral Essays, has characterized the place, and severely reproved the man in lines of peculiar force and severity.

"In the worst inn's worst room, with mat half-hung, The floors of plaster, and the walls of dung, On once a flock-bed, but repaired with straw, With tape-tied curtains, never meant to draw, The G. forge and garter dangling from that bed, Where tawdry yellow straw with dirty red, Great Villiers dies."
Kirkby-Stephen, a market town and parish in the county of Westmorland, England, is seated on the western bank of the river Eden, in a mountainous part of the country. The town consists of one street, running north and south, at the extremities of which are prospets of the Helvec and Wildbore mountains. Formerly here was a spacious area for a market place, which has been nearly covered with buildings. A market is held here every Monday, and is chiefly occupied by the manufacturers and dealers in stockings. This town is four miles from Brough, and 266 north of London. The parish church is a large building, and contains some old monuments. Adjoining it is a handsome parsonage-house, built by the late Dr. Chaters, prebend of Durham, to whose family the living belongs. In the town is a free grammar-school, which has two exhibitions.

Near Kirkby are the ruins of Pendragon-castle, which was formerly the seat of the lords Clifford; and about one mile south of the town are Wharton-parks, the ancient seat of the Wharton family. This place is deserted, and the haunt of decay. Nicholson and Burn's History, &c. of Westmorland, 2 vols. 4to. 1777.

Kirkcaldy. See Kirkcaldy.

Kirk-Classick, or Kirklessan, a town of European Turkey, in the province of Romania; formerly called "Tessaraconta Eccelesia," or forty churches; at present it has neither walls nor churches, and but few Christian inhabitants. It is inhabited by many Jews, who are chiefly employed in making butter and cheese, for which they have a ready market among their friends at Constaninople; 30 miles E. of Adrianople.

Kirkcudbright, the chief town of one of the five counties into which the county of Dumfries in Scotland is divided. Kirkcudbright is situated on the Solway Firth, near the mouth of the river Dee, and, excepting as a market town for the adjacent district, is not eminent for any species of commerce, manufacture, or trade. The harbour is safe, fair, with good anchorage, and sheltered from all winds; but being a tide-harbour is well fitted for vessels that can take the ground. It was anciently a burgh of regality, and held by the Douglass, lords of Galloway, as superiors. On the forfeiture of the earl of Douglas, lord of Galloway, in 1455, it was by James II. erected into a royal burgh, and is now governed by a provost, three bailiffs, and town-council. In the environs are many traces of ancient camps, British and Roman. Its Castle, the mount and dikes of which are still remaining, was evidently constructed to defend the entrance of the river Dee. In 1802, the number of inhabitants was 2390; 28 miles S.W. of Dumfries. N. lat. 54° 55' W. long. 4° 5'.

Kirkcudbrightshire, a division or county of Scotland, called the Stewartry of Kirkcudbright, forms the eastern, and by far the most extensive portion of Galloway. The latter name was anciently applied to an independent principality, which included the greater part of Ayrshire and Dumfrieshire, but is now limited to the two counties of Wigton and Kirkcudbright. The Stewartry is situated between 54° 40' and 55° 20' of N. latitude, and contains 825 square miles, on 440,313 Scotch acres. It is bounded on the south by the Solway firth, which divides it from England; by Dumfrieshire and the estuary of the Nith on the east, by the fame county and Ayrshire on the north, and by the latter, with the Nith of Wigton and the bay of that name, on the west. Kirkcudbright has no subdivisions, except that four of the most northerly parishes, Caivefarm, Dalry, Kells, and Balmacellan, are commonly called the district of Glencairn. The aspect of the country, however, affords a very natural division into two parts. Its line is drawn from the centre of Irongray parish to the Gatehouse of Fleet, all to the west and north, with little exception, is wild and mountainous, that it may be properly termed a Highland district; while the south and east exhibit a fine champaign and cultivated country. The parishes are 28 in number, the whole population of which, according to the parliamentary returns of 1802, amounted to 29,217 persons. Kirkcudbright, Gatehouse of Fleet, Creetown, Castle Douglas, and New Galloway, are the principal towns. Besides these there are several considerable villages, which will not be necessary to particularize in this place. Kirkcudbright is the county town, and a royal borough, as is also New Galloway. Creetown, which is situated at the upper part of Wigton bay, has lately been constituted a borough of barony; for likewise has Castle Douglas, a thriving village, not much above thirty years old, but which now contains nearly a thousand inhabitants. Some attempts have been made to introduce the cotton manufactures here, but the high price of coal opposes an almost unfavourable impediment to continued success. The same circumstance operates, in no inconsiderable degree, against the establishment of manufactures, requiring large quantities of fuel, in every part of the Stewartry. Those villages which are situated on the coast, however, being supplied with coal from England, have made more rapid progress, even in the manufacture of cotton, than could reasonably have been expected.

Though, as mentioned above, the greater part of this Stewartry is hilly; yet, upon the whole, it contains few mountains remarkable for their size or height. The most lofty of those in the western division is that called Cairnmuir, within the parish of Minigaff, which rises 1275 feet above the level of the sea, and is surrounded by several others of equal altitude, though less striking to the eye, from the greater elevation of the circumjacent grounds. The hill called Cairnbarrow, in the parishes of Anworth and Kirkmabreck, is 1100 feet in height, very little encumbered with rocks, and commanding a very beautiful and extensive view, not only of the Stewartry of Kirkcudbright and the coast of Wigton, but also of the Isle of Man, and the opposite coasts of England and Ireland. Crowell, which terminates a lofty ridge of hills in the south-eastern part of the county, was formerly one of the alarm-polls for giving notice of the incursions of the English. The elevation of Douglas-Cairn, on the summit of this mountain, is said to be about 1900 feet, and Knockendoch, which surmounts the north wing, 1500 feet above the level of the sea. From this range of hills, the country descends towards the shore in the most regular and beautiful manner, exhibiting a delightful view of well-inclosed fields in a state of excellent cultivation. Immediately upon the sea, the scene is of a very different description: the coast here being remarkably bold and rocky, ditches from the land, and low water, some grand and picturesque appearances; tremendous and rugged precipices; high and pointed spires, under the bases of which are passages resembling the form of rude arches; large and regular amphitheatres, leading into caverns, the extent of which no human being has yet ventured to explore.

At this point, and indeed on almost every part of the coast of this county, a great variety of marine plants are found. Among these the most remarkable are: the fuculent Sempervivum, used for preservs or pickles; and the water Polypus, or sea anemone, which naturalists consider as the connecting link between the animal and vegetable kingdoms: too, though delitute of the faculty of locomotion, it possesses a degree
of irritability and sensibility much superior to any other known vegetable production. For a particular account of this very curious subject, see the article Anemone.

The strewthry of Kirkcudbright gives rise to several rivers, besides a number of smaller streams. The most remarkable of these are, the Orr or Urr, the Ken, the Dee, the Fleet, and the Cree. The Urr, which is also called the Urr or Whurr, flows from a lake of the same name, in the parish of Balmacadran, situated in the district of Glenkens. Hence it runs almost directly south, and falls into the Solway frith near the village of Colvend. This river is navigable for vessels of 80 tons burden, to the distance of eight miles from its mouth. By means of it, therefore, coal, lime, and other articles, imported from England, are conveyed thus far up the county, and hence distributed to the more interior parts. The dangers and difficulties, however, attending this trade, owing to the numerous sand-banks in the channel of the Solway, which are every day becoming more extensive, oppose powerful obstructions to its increase, either here or at any other port on this coast. One advantage possessed by this river, is a large basin called Gibb's-hold, which it forms within land, about two miles from its confluence with the sea, from which large vessels in many cases may shelter themselves during stormy weather. The Ken, the second river above mentioned, takes its rise also in the northern part of the strewthry, near the borders of Nithsdale. Flowing hence, at first in a south-westerly direction, it separates the parishes of Dalry and Cavesiphain; then proceeding towards the south, with an inclination eastwards, it falls into Kennuir-loch, and forms a junction with the Dee. This river begins its course among the hills in the north-western division of the county. After receiving the Ken, it flows towards the Solway frith, into which it discharges itself, after passing the town of Kirkcudbright. The Dee is remarkable both on account of its breadth and depth, particularly at the place called Kennuir-loch. It is navigable to the village of Tongland, two miles above the town of Kirkcudbright; and, were it not for the number of rocks and shallows with which it abounds beyond this point, might be the means of introducing an inland navigation to the very centre of the county. A survey was made some years ago, with a view to supply the defects of the river by a navigable canal, but the plan was not successful in meeting the approbation of parliament. A small canal, however, has been cut by the steward of the county between the Dee and a lake called Carlinwark-loch, which is situated above the shallows of Tongland, and furnishes much in great abundance. The Fleet and the Cree are also navigable for several miles. The former rises out of a lake called Lochfleit, and pours its waters into the bay of Wigtown, at a short distance from the village called Gatehouse-of-Fleet. The Creek takes its rise among the mountains which separate the northern part of the county from Ayrshire, forming, for several miles of its course, the boundary of the strewthry. It serves as a continuation of the navigation of Wigtown bay, and produces fish of various kinds, particularly salmon, in great plenty.

Few counties can boast of a greater number of lakes or lochs than Kirkcudbright. With the exception, however, of Lochken, or Kennuir-loch, already mentioned, as formed by the waters of the Ken and Dee, which is ten miles in length, they are, generally speaking, of small extent. The parish of New Abbey, in the calen district of the strewthry, contains three lakes, Lochkendan, Lochend, and Craigend, the two last of which are nearly a mile long, and more than one half of a mile broad. Lochruutton, which gives name to a parth, is of similar dimensions. In the centre of it is an artificial island, nearly of a circular form, and soome what more than half a rood in circumference. It is completed on the surface, of a vast collection of large stones. In Balmacadran parish there are five lakes. One of these, though very small, is famous for a particular species of trout, many of which weigh ten English pounds each. Carling wait-loch, in the parth of Kelton, formerly covered 116 acres, but since the canal joined it to the Dee, it has been reduced to less than 80. This loch contains an inexhaustible fund of the very best shell marble. Before it's extent was contracted, there were two isles in it, upon which the country people pay two churches or chapels formerly stood. Indeed, the tradition in the neighbourhood is, that there had been a town in the loch, which was drowned or swallowed up. The discovery of an iron forge, on the south side, some years ago, seems to give some probability to this idea. It was surrounded by the remains of a thone building or rampart, and communicated with the opposite side of the lake by a causeway or road of stones, secured by piles of oak wood, and having an opening in it, supposed to have been for a drawbridge. Several canoes, hollowed by fire, after the manner of the American savages, and a large iron gantlet, have also been found in this loch. Besides those already noticed, there are a number of smaller lakes in different parts of the county. None of them, however, deserve to be particularized except Loch Kohn or Kean, which is situated in the parth of Croomichin. It extends over 40 acres of ground, and is from 10 to 20 fathoms deep. No rivulets or streams flow into it, nor indeed has it any visible source of supply excepting the clouds. It never freezes but during the most intense frost.

This county contains a variety of minerals and mineral springs. The want of coal, however, and the difficulty of shipping them, in general prevents the farmer from being turned to advantage. A rich iron-mines, in the parth of Kerrick, was wrought for some time by an English company, but they were at last obliged to abandon it. A lead mine, however, has been opened, and is still successfully carried on in the western division of the strewthry. Both these metals are found in abundance in many other parts. Appearances of copper have also been observed; but it is not known that any trial of it has been made. There is also great plenty of limestone, though of an inferior quality, as yet untouched; and a vast fund of excellent shell-marble for manure, which is too much neglected by the farmers, and lime exported in its stead, at a very considerable expense.

The remains of antiquity in this county are still very numerous, and many of them in no small degree interesting. The abbey of Sweetheart, or New Abbey, in a parth of that name, is a beautiful lofty building in the light pointed style. It was founded in the 13th century by Devorgilla, the mother of John Baliol, king of Scotland. This structure stands in a fine level field about 20 acres in extent, which is enclosed by a stone wall ten feet high, built of granite stones, some of which are of immense size.

Hill's castle situated near Lochruutton, and about three miles from Dumfries, was one of the many fortified places which belonged to the Douglas family, as lords of Galloway. Belvedere the Douglas kept on his way to Kirkcudbright in the year 1300. A tower and a few small buildings, which surround a square court, are all that remain of this edifice. Buitcle castle, the favourite residence of king John Baliol, is still to be seen in the parth whence it derives its name. The hand of time, however, has nearly levelled it with the ground. An old coin was discovered...
here some years ago, bearing the date 1220. This neighbour hood is remarkable for a number of vitrified forts, the nature and formation of which antiquaries have found it difficult to determine; and respecting which various opinions are entertained.

One of these forts appears also on the top of a small hill in the parish of Anworth. The summit forms an area of thirty paces long and twenty broad, and is nearly surrounded by an irregular ridge of loose stones, intermixed with large portions of vitrified matter. These stones are of the common blue schistus kind, and from the manner in which they lie scattered about, it would seem that the fort has either been deficient in regularity of structure originally, or been intentionally demolished. Some coins of Edward VI. and queen Elizabeth were lately found near this spot. Threaff castle, which is situated in an island formed by the river Dee, is famous for having been the chief residence of the Douglases. A great square tower is all that remains of the once proud and lofty mansion of these celebrated warriors.

Lindaludden college was founded in the reign of Malcolm IV. It was originally a Benedictine monastery, but afterwards converted into a manor, in the chancel of which is an elegant monument, erected in honour of Margaret, daughter of Robert III. and wife to one of the earls of Douglas. The college is situated upon a small stream called Cluden, about two miles from its junction with the river Nith, and presents in its ruins many marks of its former magnificence and grandeur.

Dundrennan Abbey, which stands in the parish of Kerrich, about a mile and a half from the Solway frith, is also a fine ruin. It was founded in the year 1142, and has acquired celebrity as the asylum of Mary queen of Scots after the battle of Langside. Besides these, the flewartry contains several other curious remains of antiquities. The most remarkable are the rocking stone, in the parish of Kells, which is so nicely balanced, that it can be moved by the slightest preasure; the monastery of Tongland, the Dun of Bareland, the most of Urr, probably the largest work of the kind in Scotland, and the castle of Kennuir, situated near the lake of that name. To these may be added the tomb of king Galdbus, called Caithnholly, said to have been erected to commemorate the fall of that prince in a battle between the Scots and Piets about the year 822, or, according to another tradition, in memory of bishop Whitehorn and other gentlemen, who were killed in an action with the English about the year 1150. Which of these accounts is the correct one it is perhaps impossible to determine. This, however, is certain, that this flewartry was the scene of many fangious contests, particularly during the invasions of the Romans, and during the conten tions of Bruce and Bahlol.

The principal country seats in the flewartry are those of the earl of Selkirk, Mr. Murray of Droughton, and a large house built by the late sir Samuel Hannay, the exterior of which is wholly formed of the most beautiful granite. The chief products of this district, besides those already noticed, are sheep and black cattle for the English market. It has given birth to few remarkable characters, except Thomas Gordon, famous for his writings in the Bangerian controversy, and Paul Jones, the celebrated pirate, who spread so much terror over different parts of the coast during the American war.

A very intereding and well written account of this district, was published in 1819, entitled "General View of the Agriculture of Galloway; comprehending two counties, viz. the Stewartry of Kirkcudbright, and Wigtonshire," by the Rev. Samuel Smith, minister of Borgue.

KIRKHAM, a small market town and parish in the hundred of Amounderness, Lancashire, England, is situated in a tract of country called the File-lands, between the Ribble and another small river. It is 12 miles distant from Lancaster, and 225 from London; and contained, according to the return under the population act of 1801, 363 houses, inhabited by 1261 persons. The chief trade is in coarse linen and fall cloth. Here are a well endowed free-school for the education of 160 boys, and a charity-school for 40 girls; two fairs are held annually, and a market weekly on Tuesdays. The Lancaster canal passes by this town, from Lancaster to Liverpool. One mile west of Kirkham is Ribby-hall, a large well built brick mansion, belonging to Joseph Hornby, esq., author of "The Beauties of England, vol. ix.

KIRKI, a town of Grand Duchy; 100 miles S.E. of Bokhara.

KIRKIE, a town of Hindooslan, in the circur of Chardance; 24 miles S.S.W. of Chatterpore.

KIRKINTULLOCH, a small town of Dumbartonshire, situated about nine miles from Glasgow, and four from Kilfady. The Forth and Clyde canal is carried over the small river Logie, about half a mile from this place, by an aqueduct of a single arch of great dimensions, which was considered at the time it was built as a very extraordinary specimen of masonic art. Kirkintulloch is not a place of any importance, but the country round it is populous and well cultivated, and many respectable land-holders of middling fortunes reside upon their estates, and contribute much to its improvement. It is a burgh of barony, governed by two bailiffs, annually chosen. In 1801, the number of inhabitants was 5210, of whom 1785 were employed in trade and manufacture. Its manufactures are linen and cotton.

KIRK-MOTE, a fynod. See SYNOD.

Sometimes the word is also taken for a meeting in the church, or veftry. See NOTE.

KIRK-OSWALD, in Geography, a market town and parish in the ward of Leath and county of Cumberland, England, is seated in the pleasant vale of Eden, and is a place of some note in the early annals of the kingdom. The church dedicated to St. Oswald, the king and martyr of Northumberland, is a large irregular building, evidently ered at different periods; probably at the expense of the Dacre family, whose arms appear in various parts of the building. Here is a handsome monument raised to the memory of fir Timothy Featherstonehouse, a noted supporter of king Charles I. He was beheaded, and his two sons were slain in the battle of Worcester. A descendant of the same name resides near this town. At the west end of the church lies a copies spring of excellent water; which, in the reign of Monachim, was deemed to possess miraculous powers. The belfry tower stands on an eminence some distance from the church. In the town is an endowed free school, and a meeting house for dissenters. On an elevated spot, about a quarter of a mile from the town, are the ruins of a castle, which Sandford describes as "the fairest fabric that ever eye looked upon." At present only a small tower and some vaults are all that remain; but originally it was extensive, of a square form, and bounded on three sides by a fos, and on the fourth by a brook. Hugh de Morville procured a licence from king John to include his woods at Kirk-Oswald, to fortify his manor house, and to have there an annual fair and a weekly market. This Hugh was one of the murderers of archbishop Becket; and the weapon of assassination was kept for a long time in this fortref.

On a hill about three miles from Kirk-Oswald, near the vil lage, F 2
lage of Little Salkeld, is a noted Druidical monument, called "Long Meg and Her Daughters." It consists of a circular arrangement of unhewn stones; the circumference of the circle is about 350 yards. Some of the stones are 10 feet high, and from 12 to 15 feet in girth. The stone called Long Meg, about 17 feet out of the circle, is 18 feet in height, and nearly 14 feet in circumference. Pennant's Tour to Allon-Moor, 420. Hutchinson's History, &c. of Cumberland, 2 vols. 41o. Beauties of England, vol. xi. svo. 1782.

KIRK-SESSIONS, the name of a petty ecclesiastical judicature in Scotland. Each parish, according to its extent is divided into several particular districts, every one of which has its own elder and deacon to oversee it. A consistory of the ministers, elders, and deacons of a parish, form a kirk-fellows.

These meet once a week, the minister being their moderator, but without a negative voice. It regulates matters relating to public worship, elections, catechizing, visitations, &c. It judges in matters of lefe seall but greater, as adultery, are left to the prebendary; and in all cases an appeal lies from it to the prebendary.

KIRKSTALL, in Geography, a village in Yorkshire, was formerly a place of note, and adorned with a most splendid and richly endowed abbey, of which the ruins of the church present a grand and interesting mass of ancient ecclesiastical architecture. It was founded in the reign of King Stephen for Cliternian monks. Parts of the original building still remain: the columns of the nave are massive, and support heavy, pointed arches. The side aisles are nearly perfect, as are also the nave, transepts, and choir. At the west end is a fine door-way with a semi-circular arch, and above it two handsome windows, curiously ornamented. On the south side are several ruinous apartments, among which the dormitory and some other rooms are still covered in. "Kirkstall will be found highly interesting to the picturesque traveller, as it affords a variety of subjects for the pencil, both architectural, and where the ruins will unite finely with the landscape." This place is three miles from Leeds, and 101 from London. Dayes's Excursions in Yorkshire, 1805, in which work is a neatly engraved view of Kirkstall, and an interesting account of the picturesque features of the country around that grand pile of ruins.

KIRKULET, a river of Asia, which rises in the mountains of Armenia, and traversing the principality of Gurieh, runs into the Black Sea. N lat. 41° 35'. E. long. 41° 25'.

KIRKUR, a town of Hindustan, in Rohilcund; 35 miles S. of Bareilly.

KIRKWALL, the chief or principal town of the Orkney islands, Scotland, is leant on the northern coast of the Mainland, in the latitude of 59° 48' N. and in the longitude of 2° 30' W. of Greenwich; towards the S.E. side of the bay of the same name; and is divided into the old town that bends along the bay, and the new, which stretches a considerable way to the south. Its original name appears, from ancient authorities, to have been Kirkiovog, or the kirk on the bay. The town has only one street, nearly a mile long, with many excellent houses ranged on each side, which, for the style of their building, and the manner in which they are finished and furnished, may bear a comparison with those of any small town in the kingdom. Several gentlemen of property reside here, and also a considerable number of shopkeepers; but the bulk of the people is composed of tradesmen, boatmen, servants, and day-labourers; and when the population of the country parish, which makes a fourth of the whole, is considered, the united parishes of Kirkwall and St. Ola, in which are two established clergymen, contain, the former about two thousand, the latter five hundred inhabitants. The town was erected into a royal borough by charters from the Scottish sovereigns, confirming all its ancient privileges: and all its rights and advantages were at last solemnly ratified by act of parliament. The government is vested in a provost, four magistrates, a dean of guild, a treasurer, and fifteen other members, who together compose a council. In this town, the sheriff, the admiral, the commissary, and the justice of peace courts, are also occasionally convened for the administration of law; and for the cognizance and regulation of ecclesiastical matters: the three prebendaries, of which the provincial synod is composed, and sometimes the synod itself, meet at least once a year, or oftener, according to circumstances. There are also a custom-house, a post-office, and a flour-house, into which are collected the rents, that are mostly paid in kind, of both the bishopric and earldom, which are generally let on lease to merchants, who sometimes dispose of them here, and sometimes send them out of the country. Kirkwall, with the northern burghs, Wick, Dornock, Tain, and Dingwall, choose a burgess to represent them in the British parliament. The principal modern building is a town-house, divided into apartments respectively appropriated to a prison, an assembly-hall, a court of justice, and a lodge of freemasons. At a small distance are school-houses for the several branches of education. These structures, however, are but trifling, compared with the relics of the bishop and earl's palaces, the castle, once a place of great strength, and the venerable cathedral of St. Magnus; but for nothing is the town more celebrated than for its excellent harbour, which is broad, safe, and capacious, with a bottom of clay so firm, and a depth of water so convenient, as to afford anchorage for ships of a large size, and in great numbers. Towards the south-east side, are still visible the vestiges of a rude temporary fort, thrown up on an emergency by Oliver Cromwell; and on the opposite side another of the same kind has been evidently marked out for co-operation in either annoying or protecting the harbour. Most of the lands in the parish of St. Ola, which surround Kirkwall, formerly made part of the temporalty of the bishopric of Orkney, and were separated at the Reformation, or on the prospect of the abolition of episcopacy. Some additional particulars relating to this town, and to places in its vicinity, will be given in a subsequent article, under the word ORKNEYS. In the interim, the reader is referred to an interesting volume published in 1689, entitled "History of the Orkney Islands," &c. by the Rev. Dr. Barry: second edition, with corrections and additions, by the Rev. James Heidrick.

KIRLAK, an island of a triangular form in the Frozen sea, about 240 miles in circumference. N lat. 71° 30' to 72° 15'. E. long. 32° to 36°.

KIRMANSHA, or Kirmancha, a town of Peria, in the province of Iran; 145 miles N.E. of Bagdad. N lat. 34° 35'. E. long. 46° 30'.

KIRN, a town of France, in the department of the Rhine and Moselle, and chief place of a canton, in the district of Simmern; 17 miles W. of Creutznach. The place contains 1240, and the canton 4084 inhabitants, in 18 communes. N lat. 49° 47'. E. long. 7° 26'.

KIRNBERGER, John Philip, in Biography, a German musician, much respected as a learned contrapuntist, was born in 1721, at Saalfeld, in Thuringia, a province of Saxony; at the age of eighteen he went to Leipzig, where he studied under Sebastian Bach till 1741, when he went into Poland, where he was admitted into the service of several Polish princes; and afterwards appointed di-
rector of the music at a convent. In 1774, he went to Dresden, where he studied the violin under Fickler, and some time after entered into the service of the king of Prussia, as a performer on that instrument. About the year 1756, he was appointed court musician to her royal highness princess Amelia of Prussia. The harpsichord, which was his first, was likewise his last instrument, and his compositions for that and the organ were very numerous, as well as his polonical and theoretical writings. Besides these publications, he was editor of four collections of harpsichord pieces, which included several of his own; and of all these he marked the fingering according to the rules of Emanuel Bach.

During the last years of his life, his knowledge in the laws of harmony made him regarded as the Popsuch of Berlin; but being gifted with less temper than the venerable organist of the Charter-house, his critical quarrels kept his mind in perpetual perturbation. Naturally grave and austere, he was said to be rendered more by opposition and disappointment.

His fugues and church music are models of correct counterpoint, but too elaborate and dry for the public. He never seems to have desired, or thought of, facility, grace, and elegance. His ambition seems to have been to show what could be done by labour and study, which had never been attempted before, and which, when achieved, amused the eye much more than the ear. He seems to have created giants which none could vanquish but himself. His musical institutes manifest great meditation and science; but will be intelligible to none but those who have already advanced far into the mysteries of counterpoint.

This profound musician, whose knowledge in all the laws and subtleties of canon, fugue, and modulation, were indubitable, but who, in his latter days, appeared to be more ambitious of the character of an algebraist than a musician of genius, now and then suffered fine paffages, and even whole movements, to escape him; which proves that, like his great master Sebastian Bach, if he had condescended to be less artificial, he was possessed of the means of exciting, by his abilities, delight as well as wonder. See his Institutes, pp. 242 and 243, where the composition is admirable, clear, neat, and pleasing. This able profefor died at Berlin, in 1773, at the age of sixty-two years.

KIR, in Geography, a town of Hindooftan, in Bahar; 48 miles S.W. of Arrah.

KIRROLL, a town of Hindooftan, in Doob; 28 miles N. of Etaya.

KIROO, a town of Bengal; 24 miles N. of Tomar.

KIRRIEMUIR, commonly pronounced Killamoor, a town and parish of Angus-shire, Scotland, is built on the S.W. side of a hill near a romantic glen, through which flows the small river Gairr. This town is 16 miles from Dunder, 20 from Arbroath, fix from Forfar, and 73 from Edinburgh. Here is a large weekly market; and the town contains some considerable manufactories for Orna- burghs and coarse linens. In the year 1793, the value of these goods, manufactured here, and in the immediate neighbourhood, was about 30,000l. sterling. The town is a burgh of barony, but the date of its charter is unknown. In the population report of 1800, this town was returned as containing 9,400 houses, and 44,211 inhabitants; but it is presumed this total must include the whole parish, as in a previous census for 1792, the town is said to have comprised only 1,364 inhabitants. The parish consists of an area measuring about eight miles in length by fix in breadth, and is beautifully diversified by hills, dales, woods, and plains.

At Kimnordy, Mr. Lyall has a handsome seat, with fine plantations; and at Clova, the seat of Mr. Ogilvie, the woods are abundant, and serve to beautify the aspect of the country. At Invercararie is a large castle formerly belonging to the Ogilvies. Sinclair's Statistical Account of Scotland.

KIRSANAFF, a town of Russia, in the government of Tambof, founded on the Voron, which falls into the Kerper; 56 miles S.E. of Tambof.

KIRSHKEHR, a town of Asiatic Turkey, in Notolia, and capital of a district; formerly a considerable city, and called " Dioecesaria." In the vicinity is a fortress; 84 miles N.E. of Cogni. N. lat. 39° 12'. E. long. 31° 34'.

KIRSHETCH, a town and district of the government of Volodimir, in Russia, seated on a rivulet that falls into the Kliafna.

KIRKOVA, a town of European Turkey, in Bulgaria, on the Dandar; 30 miles S. of Galatz. N. lat. 44° 50'. E. long. 27° 30'.

KIRSTENIUS, Peter, in Biography, a learned physician, was born at Breflau, in Silficia, on the 25th of December, 1577, where his father was a merchant. He left his parents when he was very young, but his guardians took good care of his education, intending him for his father's profession. He early evinced, however, a passion for letters, which they did not think proper to control, and left him to indulge it to the utmost. He learned the Greek and Latin languages, and paid considerable attention also to the Hebrew and Syriac; at the same time, as he now began to look to medicine as his object, he cultivated natural philosophy, anatomy, and botany, with the greatest industry. He afterwards studied at the universities of Leipsic, Wittenberg, and Jena, where he was much distinguished among his fellow-students, and determined upon farther improving himself by travelling. He had been told, that no person could obtain a high rank in the practice of physic, unless he understood Avicenna; and knowing the translation of that physician's work to be bad, he had a strong inclination to learn Arabic. To this he was urged by Joseph Scaliger and Iaac Caluanus, who preached that he was capable of rendering great service to the republic of letters in that way: and he resolved to read not only Avicenna, but also Mefus, Rhufes, Avenzoar, Albakasis, and Averroes. This passion, however, did not prevent him from gratifying the inclination which he had to travel, and he accordingly spent seven years from home. He first went through the Low Countries into France, and thence to Switzerland, where he received the degree of M.D. from the university of Basle, at the age of twenty-four. He then continued his travels, visiting Italy, England, and Spain, and reaching even Greece and Asia.

Soon after his return to Silficia, he was appointed by the magistrates of Breislaw to be director of the college and schools of that city. But he afterwards resigned that difficult employment, and applied himself entirely to the practice of physic and to the study of Arabic, with which he became so enamoured, that he resolved to promote the knowledge of it by establishing an Arabic press, and employed all the money he could spare in accomplishing that object; refusing, at the same time, the most honourable offers from courts and universities, which would have interfered with his project. He afterwards retired to Prussia, still with the intention of fulfilling his design, and pursuing his favourite studies; but obtaining the friendship of chancellor Oxenfltern, he was induced to accompany him in a journey to Germany. While at Erfurt, Kirstenius received the offer of
of a professorship, which he accepted. But his patron induced him, nevertheless, to quit this university, and to accompany him to Sweden, where he was appointed prosector of medicine, in 1636, and soon afterwards physician to the queen. His constitution, however, was considerably impaired, and he did not enjoy these advantages above four years; for he died on the eighth of April, 1640, in the sixtieth year of his age. The epitaph, inscribed by Schröder, in his memory, eulogizes his extraordinary knowledge of languages, of which, it is there said, he was acquainted with twenty-six.

KIRSTENIUS, GEORGE, also a physician, was born at Stettin, in January, 1613. He purified his studies, during several years, at Jena and Strasburg, and afterwards traveled through Germany and the Low Countries. He was invited to professorial chairs in the universities of Grippwald and Dérp; but the political troubles of the times prevented him from accepting them; he determined at length to settle at his native place, and contented himself with a professorship in the Royal College of Stettin. He died on the 4th of March, 1660. The greater part of his life was palled in useful research, and he obtained a high reputation in his profession. He left several learned essays, in Latin, on the secretion of milk, on wounds of the head, on the fight, smell, taste, &c. which were esteemed in their day; and he published also the following works: "Oratio de Medicinae dignitate et praebentia," 1647.—"Adversaria et Animalverien in Joannis Asclepias Commentarium in Poppium et Chirurgiam parvam," 1648.—"Disquisitiones Phytologie," 1651. Elyo. Dic. Hift.

KIR, in Hindoo Mythology, a name of Parvati, the consort of Siva.

KIRTE, a term used for a short jacket; also for a quantity of flax, about a hundred weight.

KIRTON, or KIRKTONS, in Geography, a large village and parish in the division of Holland, and county of Lincoln, England, has been formerly of considerable size and importance, but from having lost its weekly market, and being out of a public road, and dispersed of manufactory, is now reduced to the rank of a village. In the year 1800, it contained 269 houses, and 1238 inhabitants. Kirton has long been famed for its large and elegant church, which was formerly collegiate, and, according to some writers, was built by Alexander, bishop of Lincoln, in the time of king Henry I. This statement is, however, evidently erroneous, for the style of architecture marks it to be as late as the early part of the 15th century. Being much injured by neglect, and larger than necessary for the population of the parish, the chancel, tower, and transepts were taken down in the year 1806. A new tower was, however, erected at the west end of the church with the original materials. At the western end of the nave is a semicircular arch, probably of the age of the bishop above named. In the church is a handiome triangular font, on the pediment of which is an inscription, rating, that it was made for Aluin Burton, in the year 1405. Kirton Lindsay, a market town and parish, is situated 20 miles from Lincoln, and 147 from London. The inhabitants were returned under the population act as 1692, the houses as 243. Dr. Stukeley states, that John of Gaunt had a palace here. At this place Mr. Pegge places the Sidnecester of the Romans. See Gough's edition of Camden's Britannia, vol. ii. p. 266. ed. 1789.

KIRWAN, a town of Africa, in the county of Den-
tela, in which Mr. Park saw some iron smelting-furnaces; 20 miles W. of Baniferi. N. lat. 12° 30'. W. long. 11°. 30'.

KIRWEILER, a town of France, in the department of the lower Rhine; 15 miles N. of Strafsburg.—Allo, a town of France, in the department of Mont Tonnerre; 18 miles S. of Lauterburg.

KIRZAK, a town of Ruffia, in the government of Vladim; 48 miles W.S.W. of Vladimir.

KIS, in Natural History, a name given by some people to the common pyrites; and by others to a peculiar kind of it, containing copper, and a small quantity of silver.

KISAK, in Geography, an island near the S.W. coast of Earl Greenland. N. lat. 59° 51'. W. long. 45'.

KISERIA, a town of Hindoostan, in Bahr; 32 miles S.S.E. of Bettiah. N. lat. 26° 20'. E. long. 85° 0'.

KISH, or KISHI, a poll-town of Ireland, in the county of Fermanagh; 93 miles N.W. by N. from Dublin.

KISH, a land-bank in the Irith sea, about six miles long, and hardly one wide, 7 miles from the coast of the county of Dublin. N. lat. 53° 15'. W. long. 50° 4'.

KISHCORRAN MOUNTAINS, a long ridge of mountains in the southern part of the county of Shigo, Connaught, Ireland, on the summits of most of which are very large cairns. Beaumont.

KISHENAGUR, a ciairc of Bengal, lying on the E.
side of the Hoogly, about 110 miles long, and from 7 to 30 broad.—Allo, the capital of this ciairc; 45 miles N. of Calcutta. N. lat. 23° 25'. E. long. 88° 38'.—Allo, a town of Hindoostan; 15 miles S. of Aamerre.

KISHMA, KISHMISH, KISHMISH, or DASS, the largest island in the Persian gulf, 30 miles long and from 1 mile to eight broad. A narrow channel separates it from the continent of Persia, navigable, but dangerous, on account of pirates. This island contains three or four towns or villages, one of which, on the N. coast, is called by the same name. N. lat. 26° 25'. E. long. 56° 50'.

KISIUKOOD, a town of Persia, in the province of Sogdian; 36 miles W. of Candahar.

KISHTAC, an island in the N. Pacific ocean, E. of Foggry Cape, opposite to the mouth of Cook's river; about 100 miles long, and from 30 to 50 broad. N. lat. 57° to 58° 40'. W. long. 152° 30' to 154° 50'.

KISHTEWAR, a country of Asia, lying S.E. of Caffmere, near the banks of the river Chumab. Its capital, called Mundul, or Mundul-Minder, is situated about three coss E. of this river.

KISI-HISAR, a town of European Turkey, in Bul-}

KISILE-DARIA. See KISIEL.

KISKEMANITAS, a river of America, which is a branch
branch of the Alleghany, into which it discharges itself. N. lat. 40° 40'. W. long. 79° 42', in Westmoreland county, Pennsylvania. Its headwaters are, Little Conemaugh and Stone creek, which after their junction assume the name of Conemaugh river. After receiving other waters it takes the name of Kiskim nanitas. It is navigable for ba-

teaux 40 or 50 miles, and good portages are found between it and Juniatta and Potowmac rivers. Coal and salt are discovered in the vicinity of these rivers.

KISKIN-OSTIOG, a town of Russia, in the peninsula of Kamtchatka; 52 miles W. of Verchuei-Kamtchatka.

KISKO, a town of Sweden, in the province of Nyland; 12 miles N. of Ek nas.

KISLAK, a town of Poland, in the patinate of Brac la; 20 miles E.S.E. of Brac la.

KISLAR. See KIZLAR.

KISMA, a town of Pefia, in the province of Ghilan;

21 miles W.N.W. of Refd l.

KISMALO, a town of Hungary; 12 miles N.E. of

Gran.

KISSABATTY, a town of Bengal; 22 miles S.E. of Burdwan. N. lat. 23° 2'. E. long. 88° 18'.

KISSAMOS, a small town, formerly the harbour of "Aptera," which gives name to a district or province in the north-western part of the island of Crete. This town would be of some importance, if the pachas had not prohibited the exportation of the commodities of the island, except from the chief place of their government. This province is one of the best cultivated and most productive of the island; it furnishes a tolerably large quantity of oil and wine; it produces honey, wax, and silk; but little barley and wheat. Its mountains are for the most part wooded; and among the trees are scattered many common and holm oaks, the acorns of which allow the Greeks to breed a large number of hogs. Here are also many carob-trees, whose fruits are carried to Canea. In this province the vine dev-

erses attention, which produces grapes with one hoeing and without any manure. The wine of Kifamnos is a claret, spirituous, and of a tolerably good quality. As it is not an article of commerce, the Greeks convert a part of it into brandy for their winter flock. On the gulf of Kifamos is a quary of beautiful gyphos. The fort of "Gra-

buna," situated on a steep hill, at the most western and northern part of Crete, is comprised in the district of Kifamos. The junction of these small islands and an advanced cape form a natural harbour, in which the largest ships anchor in safety. The population of the Turks of Kifamnos is estimated at up wards of a third of the inhabitants. See CANDIA.

KISSEE, or KISSEY, a town of Africa, in the country of Sierra Leone, at the head of a river of the same name, eight journeys from Teembo. According to Dr. A ffeus the town of Kissey may be, in direct distance, about 50 geo-

taphical miles to the N.E. by E. of Sierra Leone.

KISSEL, JOHN VAN, in Biography, a painter of por-

traits and still life. He was born at Antwerp in 1626. Nature was his guide in the practice of the art he professed, and it was his constant custom to make sketches of all his various productions at the different seasons of the year; merely sketching fome, and colouring and even modelling others; by these means he possessed a large fock of things ready to his hand for composition, and he executed them with great taste and delicacy.

He demanded so high a pric e for his productions, that few could purchase them. Among those who did was the king of Spain, who, after having obtained many of his works, at last gained possession of the painter also. He was appointed painter to the queen of Spain, and was retained in her service as long as he lived.

His portraits are very highly eulogized, being executed with a light free touch, and a tone of colour that very much resembles Vandyke's. He died in 1708, at the age of 92.

KISSELPOUR, in Geography, a town of Bengal; 35 miles S.S.W. of Dacca. N. lat. 22° 32'. E. long. 84° 41'.

KISER, a town of Africa, in Tunis; 18 miles S.E. of

Sbeba.

KISSI, Sr., a small island in the Grecian Archipelago. N. lat. 38° 45'. E. long. 24° 16'.

KISSIMA, a town of Japan; 45 miles N. of Nangafaki.

KISSINGEN, a town of the duchy of Wurzburg, on the Saale, in the environs of which are some medicinal and salt springs; 24 miles N. of Wurzburg. N. lat. 50° 14'. E. long. 10° 17'.

KISSOREGUNGE, a town of Hindoostan, in Bund-

deuland; 18 miles S.E. of Chatterpour.

KISSUNPOUR, a town of Hindoostan, in Bahar; 11 miles N. W. of Bahar.

KIST, a word used by Paracelsus as the name of a weight, equal to 14 grains.

KISTNA, in Geography, a town of Hindoostan, in the Carnatic.

KISTNABARAM, a town of Hindoostan, in My fore; 13 miles S. of Tademeri.

KISTNAGHERI, a town and forterefs of Hindoostan, in the Myfore country; 90 miles E. of Seringapatam. N. lat. 12° 30'. E. long. 75° 22'.

KISTNAGUR, a town of Bengal; 24 miles N. of Goregaon.—Algo, a town of Bengal; 16 miles S. of Na-

gore. N. lat. 22° 52'. E. long. 87° 21'.

KISTNAH, a river of Hindoostan, which rises in the mountains of Vifapour, about 20 miles from Sattarah, and after obliquely traversing almost the whole extent of Hindoostan, from W. to E., discharges itself, by several mouths, into the gulf of Bengal, between Mafulpatam and Nizapatam, in the circur of Guntooer. The Godavery and Koll-

nah, approaching one another in their descent towards the sea, incline a tract of country, for an account of which, (see DELTA.) The islands, formed by the mouths of the Kollnahn, are very fertile, and produce grain, excellent timber, and some of the best tobacco in India; and besides, the low grounds, which at spring tides are overflowed, produce a furrow of great used in dyeing chintzes and callicoses.

KISTNAPORAM, a town of Hindoostan, in the Carnatic; 15 miles W.N.W. of Trichinopoly.

KISTNAPORAM, a town of Hindoostan, in Gol-

conda; 48 miles S. of Hyderabad.

KISTNAVERAM, a town of Hindoostan, at the mouth of a river, which runs into the bay of Bengal; 15 miles S.E. of Nellore. N. lat. 14° 16'. E. long. 80° 11'.

KISTVAEN, or CST-VAEN, in British Antiquities, a stone chef, coffin, or cavity for the interment of the human body, after its decease. Many antiquaries have con-

founded this subject with the Cromlech, and have thus confused their readers, and indeed have bewildered them-

selves. Some even call the perpendicular, or standing stones of the Cromlech, by the appellation of Kiltvaen, and the horizontal, or covering-stone, the Cromlech. This is mul-

tiplying terms without meaning or utility. Kiltvaen is a compound word from the British language, and literally signifies a chef or stone; i.e. Gyld, a chef or coffee, and

vaen.
The Kilt, in Geography, a town of Japan, on the N.W. coast of the island of Nippon. N. lat. 36° 40'. E. long. 137° 20'.

KITCHANG, a town of Corea; 65 miles S.E. of Kang-tchou.

KITCHEN, a room appropriated to the dressing of meat, and furnished with suitable accommodations and utensils for that purpose. See BUILDING.

The kitchen in the king's household is under the direction and management of a clerk-comptroller, who has a salary of 500l. a-year, subordinate clerk at 250l. a-year, first clerk at 150l. a-year, junior clerks, two master-cooks, the salary of the first being 375l. 10l. a-year, and of the second 217l. 10l. a-year, yeomen, grooms, &c.

KITCHEN-GARDEN, that fort of garden which is principally destined to the growth of different sorts of culinary vegetables and roots.

The land designed for this fort of garden should be sufficiently spacious, of a good depth and quality of mould, dry, and at the same time well situated for warmth, and the influence of the sun.

The foils and situations which are the most adapted for this purpose, as well as the forms and modes of laying them out, have been already fully explained in speaking of gardens in general. The great expense of cultivating kitchen gardens by means of hand-labour, however, renders it essentially necessary that they should be so contrived, as to have the principal part of the work executed in other ways, as by the use of small teams. In this way much money may in numerous instances be saved, and at the same time the labour be equally well performed. Mules and large asses have been found extremely beneficial in this intention, in a great number of situations. See GARDEN.

KITCHEN-GARDEN PLANTS, the common name of all such plants as are cultivated for the purpose of food, in gardens of this kind.

Names and Sorts of Plants, with Modes of Culture respectively.

Agaricus cantabricus, the field agaric or mushroom. Cultivated by the spawn of the root, or invisible seed, running in lumps of earth or dung, in the autumn season.

Allium, garlic, onion, leek, &c., of the first kind, large white
white garlic and red garlic——By the cloves of the root when separated.

In the second, or racemose form——By the root and bulbs from the stalk.

In the third, or onion kind, as the common oval Strabburg onions, great oval Portuguese onion, flat white Spanish onion, flatted Spanish onion, silver-skinned onion, bulblets rooted Welsh onion——By feed annually, which should be fown at different times in the early spring months.

In the fourth fort, as chives or cives——By dividing the roots, and planting them out in the spring.

In the fifth fort, as scallot or shallot——By offsets of the root planted out in spring.

In the sixth fort, or Canada tree onion——By offset bulbs of the root, and the bulbs at the top of the stalk, planted out in spring.

In the seventh, or the leek kind, as the broad-leaved London leek, narrow-leaved leek——By feed annually, which should be fown in the early spring.

Lactuca, diii, &c. common dill——By feed annually, fown in the spring.

Fennel, light-green leaved, dark-green fennel, sweet-seeded fennel——By feed fown in spring; also by flaying the old roots, and planting them out in the autumnal season.

Italian fennel——By feed annually, fown in the spring.

Angelica fava, common angelica——By feed annually, fown in spring.

Apium, parley, celery, &c.; parley, common plane-leaved parley, curled leaved common parley, broad-leaved, or large rooted parley——By feed fown in spring.

Celery, common upright celery, upright celery with solid stalks, turnip-rooted spreading celery——By feed fown in the spring, for transplanting in winter and autumn.

Asparagus officinalis, common asparagus——By feed fown in the autumn, and when once raised, the roots abide for some years.

Atriplex hortensis, garden orach, white-leaved garden orach, green orach, purple orach——By feed annually fown in the spring seafon.

Beta vulgaris, beet, common culinary beet, green-leaved culinary beet, white beet, chard, or great white Swifis beet, mangel wurzel beet——By feed annually fown in the spring months.

Red beet, large long red-rooted beet, turnip-rooted red beet, red-rooted beet with green leaves, pale-red beet——By feed annually fown in the early spring.

Borago, borage——By feed annually fown in autumn or spring.

Brassica, the cabbage, cauliflower, broccoli, turnip, &c. The cabbage fort, small early summer cabbage, dwarf early fugar-loaf-shaped cabbage, large hollow fugar-loaf-cabbage, early Ruffia cabbage, common round white cabbage, long-sided hollow cabbage, oval hollow cabbage, flat-topped cabbage, multi-lobed cabbage, giant cabbage, red cabbage——By feed annually fown at different times, in spring and autumn, for use all the year, by having the plants set out at various times.

Savoy cabbage, common green curled savoy, large green Dutch savoy, yellow savoy——By feed annually fown in spring, for autumn and winter use.

Laciniated, and other open-leaved coles, green curled borecole, red curled borecole, thick-leaved curled borecole, finely fringed borecole, broad erect curled-leaved Siberian borecole, or Scotch cole or kale, red and green common

plane-leaved green colewort——By feed annually fown in spring and summer, for plants for autumn and winter use.

Turnip cabbage, turnip cabbage with the turnip above ground, with the turnip under ground——By feed fown annually in spring and summer.

The cauliflower fort, early cauliflower, late cauliflower——By feed fown annually in spring and autumn, for plants for summer and autumn use.

Italian brassica, or broccoli, early purple broccoli, late large purple broccoli, comprehending varieties, with blue, brown, green, and yellowish heads, dwarf purple broccoli, white or cauliflower broccoli, black broccoli——By feed fown in spring and beginning of summer, for plants for autumn, winter, and spring use.

The turnip, early Dutch turnip, white round turnip, green-topped turnip, red-topped turnip, yellow turnip, oblong white turnip, long white-rooted French turnip, round purple French turnip——By feed fown in spring and summer, for plants for use moft part of the year.

Calendula officinalis, common marigold——By feed fown annually in spring, summer, or autumn.

Chicorium endivia, endive, green curled endive, white curly endive, broad-leaved Batavian endive——By feed fown annually, in summer, from May till July, for plants for winter and autumn use.

Cochlearia armoracia, horfe radish——By pieces of the roots planted out in spring, for use for moft part of the year.

Crambe, sea-cabbage or colewort, the different varieties——By feed fown in spring; but when once raised, the roots remain for years, sending up shoots for use in spring and summer.

Cucumis, cucumber and melon, the cucumber, early short prickly cucumber, early cloister cucumber, long green prickly cucumber, long white prickly cucumber, long smooth green Turkey cucumber, large smooth white cucumber, large smooth green Roman cucumber——By feed annually, at different times on hot-beds, in the early spring and summer.

The melon, Romana melon, Cantaleupe melon; varieties of each, and several other sorts——By feed fown annually at different times, on hot-beds, in the spring months.

Cucurbita, the gourd and water melon——By feed fown annually in the spring seafon.

Cynara, artichoke and cardoon, the common artichoke, globular-headed red Dutch artichoke, oval-headed green French artichoke——By eaters from the fides of the old plants, in spring, of many years duration.

The common cardoon——By feed fown annually in the early spring.

Daucus carota, the carrot, orange-coloured carrot, red carrot, yellow carrot, white carrot——By feed fown annually in spring, summer, and autumn, for use moft part of the year.

Helianthus tuberosus, tuberous sun-flower, or Jerusalem artichoke——By pieces of the root planted annually in the spring seafon.

Hoffias officinalis, common hyssop, the several different varieties——By feed fown in spring, and by planting slips and cuttings of its branches.

Lactuca, lettuce, early green cabbage-lettuce, white cabbage-lettuce, brown Dutch cabbage-lettuce, great admirable cabbage-lettuce, green and white ball cabbage-lettuce, green cos-lettuce, white cos-lettuce, black cos-lettuce, spitted Aleppo cos-lettuce, brown Cicilia lettuce, Imperial lettuce, red Capuchin lettuce, green Capuchin lettuce, curled-
lettuce — By feed fown annually, at different times, in spring, summer and autumn, for plants for setting out for use most part of the year.

*Lavandula* — lavender, spike-flowered common lavender, common narrow-leaved, broad-leaved, blue-flowered, white-flowered, and dwarf lavender — By slips planted out in spring, which are of many years continuance.

*Stoechas* or French lavender — By planting slips or cuttings, and by seed, which are of many years duration.

*Lepidium sativum* — garden-cress, common small-leaved, broad-leaved, curled-leaved — By fowing seed at different times of the year, according as the plants are wanted.

*Melissa officinalis* — balm, common balm — By dividing and planting the roots in spring or autumn, which are of many years duration.

*Mentha* — mint, penny-royal, &c., green common spearmint, curled-leaved spearmint, variegated spearmint — By dividing the roots, by young plants, and by cuttings of the thalcs, planted out in spring, and which continue many years.

Peppermint — By roots and plants, &c., like the former.

Penny-royal — By dividing and planting the plants, as for the mint, and planting them out.

*Ocimum basilicum* — basil, common sweet basil, several varieties — By feed fown in spring on a hot-bed, the plants being afterwards planted out.

*Origanum majorana* — common, wild, perennial pot marjoram, winter perennial sweet marjoram, marjorana, or annual sweet marjoram — By fowing seeds in spring, and the two former also, by planting the roots, and planting them.

*Poffinacea sativa* — parsnip, common garden parsnip — By feed fown annually for winter use.

*Paeonia vulgaris* — common kidney-bean, dwarfs and runners, dwarf kinds, early white, early yellow, liver-coloured speckled dwarf, Canterbury white dwarf, Battersea white dwarf, large white dwarf, cream-coloured dwarf, black dwarf, sugar-gg dwarf, amber-speckled dwarf — By feed fown annually, at different times, from April till July, or the following month.

Running kinds, fearl runner, white variety, large Dutch runner, Battersea white runner, negro runner, variable runner — By fowing the seed like the former, but principally in the summer months.

*Pisum* — the pea, Charlton pea, golden Charlton, earliet golden Charlton, long Reading hotspur, Maiter's hotspur, Spanish morotfa, green nonparcil, early dwarf marrowfat, large marrowfat, green rounckial, white rounckial, Ledman's dwarf pea, small sugar pea, large sugar pea, chuf ter pea, crown pea, egg pea, fickle pea, &c. — By feed fown annually, at different times, from October till June, but principally in the early spring months.

*Portulaca oleracea* — purslane, green purslane, golden purslane — By feed fown in different times in April and May, *Potenum vanguisb* — burnet, common garden burnet — By feed fown in autumn or spring, and sowing the roots.

*Raphanus sativus* — the radish, short-topped early radish, long-topped radish, deep-red radish, pale-red, transparent, mild radish, salmon-coloured radish, small white turnip-rooted radish, small white turnip radish, large white turnip-rooted Spanish radish, large black turnip-rooted Spanish radish — By feed fown at different times, from Christmas till July or August; but the latter sorts fown principally in June and July, for autumn and winter use.

*KIT*  
*Rhosmarinus* — rosemary, some varieties — By planting layers, slips, and cuttings in spring.

*Rumex acetosa* — sorrel, common long-leaved forrel, round-leaved French forrel, barren forrel — By paring the roots and the first fortnight also plentifully by feed.

*Ruta graveolens* — rue; several varieties — By planting slips and cuttings: after by feed.

*Salvia* — sage, clary, &c. The forst are; common fage, red fage, broad-leaved green fage, narrow-leaved green fage, broad-leaved hoary fage, fage of virtue, wormwood fage, &c. — By planting slips in April, May, and June; also by sowing the seed in the spring feason.

*Clary* — By feed fown annually in the spring.

*Saturja* — favary, winter perennial favory, summer annual favory — Both by feed fown in the spring feason, and the former also by planting slips.

*Stevia corymbolus* — chervil, annual garden chervil — By feed annually, in August, for winter and spring use, or fown also in spring and summer, for succedan crops.

*Erzoes* — scorzonera, Spanish scorzonera. *An eatable root, raised from feed fown in spring.*

*Solanum nigrum* — black multhead, white multhead, blue multhead, field or wild multhead; the former to use young in fallad, and the two last for their feeds, to make the table sauce called multhead — By feed in spring; or, if for fallads, at any time of the year.

*Sinum fision* — fision, fision or fisket. *An eatable root, raised by planting offsets commonly of the root; also by feed.*

*Smorium bulbiflom* — Allifanders, or common Alexanders — By feed annually in spring.

*Solanum nightshade* — furnishing the potatoe and tomatoe, tuberous-rooted solanum or potatoe, the common found red potatoe, early round red, oblong red, red, pale red, rough red, white kidney-shaped, large redheaded kidney, white round, white chuffer, prolific American — By planting pieces of the roots or the roots whole in fpring; also by fowing feed occasionally to obtain new varieties.

*Tomatoe* or love-apple; varieties — By fowing the seed annually, on a hot-bed, in the spring.

*Spinacia* — spinach, round thick-leaved or smooth-feded, triangular leaved or prickly feded; the former for spring and summer crops, the latter to stand the winter — By fowing annually in spring, summer, and autumn, for most part of the year.

*Tinactum vulgaris* — common tanfey — By paring the roots, and planting in spring or autumn.

*Thymus vulgaris* — common thyme, the varieties with broad leaves, with narrow leaves, with striped leaves — By fowing feeds in March and April; also by planting slips of the roots and branches, and by cuttings; but feed is the only way to raise a quantity of the common fort; and the other methods to continue the varieties, or for a general supph.

*Tragopon porrifolium* — fallalfy. *An excellent root, by feed fown annually in spring.*

*Traganium* — Indian cress, or nauturium, nauturium minus, nauturium magus; their flowers for garnish and fallads, and their feeds to pickle — Raised fannually from feeds fown at different times in fpring.

*Valeriana locusta* — corn fallad or lamb's lettuce — By feed fown in spring and autumn.

*Vicia faba* — the bean, early Mazagan, early Libon, long-pod, Turkey long-pod, toker bean, Sandwicb bean, Wind for bean, white blossomed, red-blossomed, Spanish bean, nonpareil bean, dwarf fan bean, very low — By feed fown annually.
Kit

KIT, in Geography. See St. Christopher's.

KITWADA, a town of Japan, in the island of Nippon; 45 miles N.W. of Meaco.

KITZBUHL, a town of the county of Tyrol, on the Ach; 36 miles E. of Innsbruck. N. lat. 47° 25'. E. long. 12° 27'.

KITZINGEN, a town of the duchy of Wurzburg, on the Main; it is a large, handsome town, owing its rise to a convent of Benedictines, founded in 745 by duke Pepin. Most of the inhabitants are Lutherans; 19 miles E.S.E. of Wurzburg. N. lat. 49° 42'. E. long. 10° 12'.

KIU, a city of China, of the first class, in the province of Tche-kiang; pleasantly situated near a fine river, and between two others that run into it. It borders on Kiang-fu and Fu-kien; but to the last province the passage is difficult on account of the intervening mountains. N. lat. 29° 2'. E. long. 118° 39'.

KIVA. See Khiva.

KIVAK, a town of Persia, in the province of Khorasan; 300 miles N. of Herat.

KIVALORE, a town of Hindooftan, in the Carnatic; 8 miles W. of Negapatam.

KIVIARVI, a town of Sweden, in the government of Valla; 70 miles S.E. of Jacobstad.

KIUKA, a town of Sweden, in the government of Abo; 30 miles S.S.E. of Borneborg.

KIULO, a town of Sweden, in the government of Abo; 30 miles S.S.E. of Borneborg.

KIUN-TCHEOU, a city of China, of the first class, and capital of the island of Hainan, which face. It stands on a promontory, and ships often anchor at the bottom of its walls. Two different kinds of Mandarins command here, as in all the other provinces of China; the first are called literati; the second, mandarins of arms, or military officers. Its jurisdiction extends over three cities of the second class, and ten of the third. N. lat. 20°. E. long. 109° 38'.

KIURAWASI, town of Sweden, in the government of Kuopio; 15 miles N.N.W. of Kuopio.

KIUSIU, an island of Japan, also termed Saikoku, or the western country, situated on the S.W. The length of Kiuzu from N. to S. is about two degrees, or 140 British miles, and the greatest breadth about 90. See Xino.

KIUTAJA, or CUTAJA, a town of Aftatie Turkey, capital of a fangiakate, and residence of the beylerbeg of Natalia, situated at the foot of a mountain, near the river Purfak, which runs into the Sakaris. It contains several mosques, and three Armenian churches. The soil is fertile, and the air healthy. Near it are some warm baths, in high estimation for several disorders; 156 miles E. of Constan- tiopol. N. lat. 39° 14'. E. long. 30° 30'.

KIWACZE, a town of Poland, in the palatinate of Breslau; 20 miles E. of Breslau.

KIZ, a town of Kharasan; 290 miles N.W. of Samar- cando.

KIZEGICK, a town of Natalia, on or near the site of the ancient Euromos; 9 miles N.N.W. of Melias.

KIZIDANY, a town of Samogitia; 20 miles E.S.E. of Resiene.

KIZILBASCH, or KIZELBASCH, a Turkish term signifying red-head: applied by way of obloquy to the Persians, ever since Timuel Sophi, founder of the family last reigning in Persia, who ordered his soldiers to wear a red cap, round which is a scar or turban with a dozen plaits in it, in memory of twelve imans, succellers of Ali, from whom he pretended to descend.

Viginecre writes the word Kizilbasch, and adds, that according
to the vulgar interpretation among the Persians, the twelve plaits signify the twelve sacraments of their law. But not contented with this, he looks out for another original, and tells us there is a mystery in it, derived from the ancient paganism, when the Persians adored fire, whose heat is denoted by the red colour, which in some measure symbolizes with the fun, held by them in the highest veneration. He adds, that the twelve plaits flew the twelve months of the year, and twelve signs in which that luminary performs his course.

KIZILERMAY, or KIZIL-IRMAK, the celebrated Holy of antiquity, in Geography, a river of Asia, Turkey, which rises in mount Taurus, a few miles S. of Kaisareli, in Caramania, and runs into the Black sea, N. lat. 41° 40'. E. long. 36°, on the coast of the gulf of Sanfoun. KIZIL-KHAN, a town of Asia, Turkey, in Diarbekir; 12 miles W. of Merdin. KIZILAGADJE, a town of Persia, in the province of Ghilan; 25 miles N. of Arana. KIZILHIZAR, a town of Syria; 8 miles E. of Antab.

KIZIL-IZAN, or Sefid Bud, called by Hanway Siflrood, a river of Persia, which M. D'Anville derives from the mountains of Elwend, not far N. of Hannadan; so that, by a very winding course to the Caspian sea, its length doubles what is alligned in more recent maps. This river is the Mardus of antiquity, and the Swidura of Gmelin, rising on the confines of Turkey, and falling into the sea below Langorod. It supplies numerous pike, carp, and other kinds of fish, esteemed by the Persian. Gmelin says that it abound: inurgeon.

KIZILKABAT, a town of the Arabian Iraq; 10 miles N. of Shemiran. KIZIL,TAMAN, an island at the mouth of the river Kizil, between the Taurus and the sea of Azar: inhabited by Cossack Tartars. N. lat. 45° E. long. 47°.

KIZIZAN, a town of Moravia, in the circle of Brunn; 15 miles S.E. of Brunn. N. lat. 49° E. long. 16° 57'.

KIZLIAR, or Kislar, a Russian town, fortres, and port, in the government of Caucasus, established in the year 1735, near the eastern coast of the Caspian, and covering the fortresses towards the limits of Persia. Vessels formerly entered the southern branch of the Terek; but as the mouths of that river are now choked up, the merchandise is landed in a small bay, at the distance of 34 miles. Kislar draws from Avaran the European commodities necessary for the Russian traffic, together with corn and provision for the Russian colonies on the Terek, and for the neighbouring district of mount Caucasus. Besides the goods which are disposed of at Kislar, and sent to the Persian ports, the inhabitants carry on a contraband trade to Shamakhe, Derbent, and even Tiflis, in Georgia, which is exceedingly precarious from the number of bandits who pillage the caravans. The environs of Kislar are very fertile in corn and fruit, with plenty of game; 160 miles S.S.W. of Alkirchan. N. lat. 44° 50'. E. long. 46° 44'.

KIZILUK, a town of Russia, lately in the palatinate of Bracław; 16 miles E. of Bracław.

KLAKS, a small island on the W. side of the gulf of Bothnia. N. lat. 67° 21'. E. long. 17° 4'.

KLADNO, a town of Bohemia, in the circle of Sclan; 10 miles N. of Prague.

KLAN, a town of Ilria; 13 miles N.E. of Pedam.

KLAN, or Clana, a town of the duchy of Carniola; 28 miles E. of Trieste.

KLANG POINT, a cape on the S. coast of the island of Java, S. lat. 7° 40'. E. long. 109° 32'. KALTGAU, a town of Bohemia, in the circle of Pilsen, built in 775, and surrounded with walls in 1000; having some silver mines in its vicinity; 21 miles S. of Pilsen. N. lat. 49° 24'. E. long. 13° 15'.

KLEBANI, a town of Poland, in the palatinate of Bracław; 10 miles S. of Bracław.

KLEBANON, a town of Poland, in Podolia; 60 miles N. of Kamieńe. KLEBER, J. B. in Biography, a French general, was born at Stralsburgh in 1759, and was bred an archi-tect. Accident led him to enter himself into the Austrian service, in which he continued eight years, and then returning to his native country, became inspector of the public buildings in Upper Alsace. The revolution of France rekindled his military ardour, and he obtained a commission in the service. He displayed great bravery and judgment at the siege of Mayence, after which he was employed in La Vendée, but the singular scenes there so disfigured him, that he obtained his recall, and was afterwards engaged in the north, where he defeated the Austrians, took Mons, and drove the enemy from Louvain. He captured Maestricht, and contributed to the taking of several other strong places. Discontented with the Directory, he left the army and returned to Paris, where he led a private life, writing his military memoirs, till Bonaparte, being appointed general of the army of Egypt, chose Kleber as his companion. At the siege of Alexandria he was wounded on the head as he was climbing the ramparts, but he did not retire till he received a second wound. He defeated the Turks in several actions; and Bonaparte, on quitting Egypt, left Kleber in the chief command. In a short time he signed the treaty of El-Arish with Sir Sidney Smith, by which the French agreed to leave Egypt; but it was annulled by the British government; and hostilities were renewed. Kleber, though reduced, did not bend under his misfortunes, but defeated the Turks at the battle of Heliopolis. He next took Cairo by storm, and formed an alliance with Murat Bey; but he was affianced by a Turk, named Sobyman, who gave him four lari with a dagger, in the year 1800.

KLECK, in Geography, a town in Lithuania, in the palatinate of Nowogrudek; 24 miles W.N.W. of Sluck.

KLEIN, a town of the duchy of Stria; 12 miles E.S.E. of Landenburg.

KLEINENBERG, a town of Westphalia, in the bishopric of Paderborn; 8 miles N.W. of Warburg.

Gen. Ch. Cal. Perianth deciduous, of five, oblong, nearly equal leaves; the lower one rather shorter than the rest. Cor. Petals five, lanceolate, feable, a little longer than the calyx; the upper one shorter, broader, curved and trun-cated; nectary central, supported by a column the length of the calyx, surrounded with glandules at the base, ascending at the top, bell-shaped, very small, divided half way down into five recurved segments. Stam. Filaments 15, very small, three placed on each segment of the nectary; two of them are terminal, the other rather lower; anthers of two lobes. Pijl. Germen superior, ovate, five-lobed, placed in the hollow of the nectary; style simple; stigma slightly
KLE

Obf. This genus is, according to Linnæus, who places it in *Gynandria*, allied to *Aegia*, but perfectly distinct from it.

Eff. Ch. Calyx of five leaves. Petals five. Nectary bell-shaped, five lobed, bearing the stamens, and annexed to the column of the germen. Capsule five-sided, inflated, consisting of five single-seeded cells.

1. *K. Hepatica.* Linn. Sp. Pl. 1365. Cavan. Diff. v. 2. t. 145.—(Cati-marus; Rumph. Amboin. v. 3. 177. t. 113.) A native of Java, Amboina, and the Philippine islands, flowering throughout the year, and bearing fruit in October. — *Stem* like that of a common apple-tree, thick, incurved, and knotty. *Branches* smooth. Leaves alternately feathered, somewhat heart-shaped, broad, ovate, acute, seven-ribbed, with arched veins. *Stipula* lanceolate. *Flowers* bright purple. *Fruit* at first greenish purple, afterwards red. Rumphius has remarked, that the younger leaves, when bruised, emit an odor like violets, on which account the natives of Amboina wash their heads with an infusion of them. This handsome tree is universally admired among the Malays for the beauty of its foliage as well as for the firmness and excellence of its wood, of which their quivers are generally formed.

KLEINIA, named in honour of the celebrated German zoologist, James Theodor Klein, F.R.S. well known for his critical opposition to Linnæus in that department of natural history. His claim to botanical distinction is founded chiefly on a treatise concerning the plant now called *Cacalia Kleinia*; nor would this perhaps have excited much attention, but for the absurdity of the phrase by which he distinguishes it, *Nee Cacalia, nee Calagryphis, an Tithymalides*. This is cited in the *Critien Botanica of Linnæus*, as an instance of the confusion that must ensue from botanists not hallowing new names upon new plants. — *Klein* flourished in the first half of the eighteenth century, having been born in 1685, and living till 1759.—Schreber, 545. Wild. Sp. Pl. v. 3. 1738. Jacq. Amer. 215. — *Clas and order, Syngenesia Polycymia Aegialia*. Nat. Ord. Composita Difsecta, Linn. Corymbifera, Joff.

Obf. For an account of the separation of this genus from *Cacalia*, see that article.

Gen. Ch. *Common Calyx* perfectly simple, oblong, cylindrical, composed of five, linear, lanceolate, pointed, equal leaves. *Cor.* compound, uniform, tubular. *Florets* all fertile, numerous, equal, a little longer than the calyx, funnel-shaped; tube slender, very long; limb somewhat bell-shaped, five-cleft. *Stam.* Filaments five, capillary, very short; anthers cylindrical, tubular. *Pil.* Germen superior, linear, half as long as the calyx; style thread-shaped, the length of the filaments; stigma bifid, revolute. *Peric.* none. The whole calyx is bent backwards when in fruit. *Seeds* solitary, linear; feed-down capillary. *Recept. naked, flat-tish.*

1. K. ruderalis. Wildl. n. 1. Jacq. Amer. t. 127. (Cacalia ruderalis; Swartz. Prod. 110.)—Leaves oblong-lanceolate, acute at each end, nearly entire. — *Found in gravelly waste ground, and on walls, in Jamaica, St. Domingo, and Martinico.—Root* annual. *Stem* erect, about three feet high, very smooth. *Leaves* more or less entire, sometimes unaided, sometimes waved or cut, of a glaucous green. *Flowers* greenish-yellow, inodorous.

2. K. Porphyrum. Willd. n. 2. (Cacalia Porphyrum; Linn. Sp. Pl. 1169. Cavan. Ic. v. 3. 111. t. 222.)—Leaves elliptical, obtuse, bespotted with transparent dots.—A native of Peru. It flowered in the royal garden of the Ecurial during the month of November. — *Stem* straight, simple, smooth, slightly fluted, about a foot and half high. *Leaves* numerous, scattered, on footstalks, oval or elliptical, crenate, and dotted with small diaphanous spots. *Flowers* terminal, cylin- drical.

3. K. angustata. Wildl. n. 3. (Cacalia angustata; Vahl. Synb. v. 3. 92. C. fuschiiola; Forth. Egypt.-Arab. 1845.)—Leaves on footstalks, oblong, toothed, angulated; upper ones lanceolate, entire. — *A native of Arabia Felix.—Stem* herbaceous, divided at the upper part, fluted. The flow- ering branches elongated and naked upwards. *Leaves* very smooth, about an inch and half long. *Flowers* coriaceous.

4. K. satureifolia. Willd. n. 4. (Cacalia satureiifolia; Linn. Mant. 109, C. Linaria; Cavan. Ic. v. 3. 29. t. 257.) — *Leaves* linear, entire, with pubescent dots. *Stem* rather frouby. — *A native of New Spain, and sent by Arduino to Linnaeus from Brazil.—Stem* about six inches high, thread-shaped. *Leaves* scattered, entire, small, flabby. *Flowers* terminal, single-flowered, erect. *Flowers* numerous, of a purple-colour, and very similar to those of *K. Porphyrum*, but the herbage is totally unlike that species.

KLEIST, Christian Waldo Von, in Geography, was born at Zeebien, in Pomaran, in 1715. His parents, who were of the order of nobility, sent him to the Jesuits' college in Upper Poland, whence he was sent to the academy of Danzig, and afterwards to the university of Konigberg. At the age of twenty-one he entered the Danish military service, but having an attachment to literature he did not forget the Muses amid all his other avocations. Once he was so intent on reading Milton, that he forgot to relieve guard. He did not remain long in the Danish service, but entered into that of Prussia. Frederic the Great gave him a commision in the regiment of prince Henry, and in this situation he formed an intimacy with all the great characters at Potsdam. He was particularly noticed by the king, and advanced in the army. He requested and obtained leave to take an active part in the campaign of the year 1759, but this instance of military ardour proved fatal to him, and deprived Germany of one of its best poets. He was present at the battle of Kumberfofs, and after the most heroic displays of valor in the successive attacks of four batteries, he fell covered with wounds, of which, after much suffering, he died in the forty-fourth year of his age. His principal work, as a poet, was entitled "Spring," which was first published in 1749. On account of this poem he was called the imitator of Thomson; he is reckoned to excel in painting the sweet and beautiful scenes of nature, in a style singularly elegant and harmonious. The Spring was translated into several languages. He wrote Ilditis in the manner of Geffen, which poises great simplicity and neatness. He was author, likewise, of some moral treatises, and "Reflections on the Art of War." He published an edition of his works in 1756, with additions, among which is a description of an inundation, a piece of the terrific kind. Gen. Biog.

KLEMPENOW, or Clemenow, in Geography, a town of Anterior Pomerania; eight miles N. of Treptow.

KLEMS, a town of Moravia, in the circle of Olmutz; eight miles S.E. of Olmutz.

KLEPET, a town of Transylvania; 14 miles S. of Hunyad.

KLEPS, a town of Norway; 11 miles S. of Stavanger.

KLESKU, a town of Walachia; 21 miles W.S.W. of Bucharest.
KLETTGAU, a landgrave of Germany, called also "The county of Sulz," situated near the Rhine as it leaves the lake of Constance.

KLEWAH, a town of Russian Poland, in Volhynia; 24 miles E.N.E. of Lucko.

KLIMATOVSKOI, a town of Russia, in the government of Novgorod; 44 miles W.N.W. of Novgorod.

KLIMATZSKOI, an island of Russia, in the lake of Osetzkoi; 48 miles N.N.E. of Petrovadsk.

KLIM. or CLIMA, in the Materia Medica, the name given by the Arabian writers to the lapsi calaminaris. Avicenna and Serapion never call it by any other name. Some pronounce the word calamina. Hence the modern Greeks have formed their calamin, which is the name of the same substance; and our calamina is evidently deduced from the same original.

KLIMOVA, in Geography, a town of Russia, in the government of Tobol'sk, on the Tunguska; 200 miles E. of Eniseišk.—Also, a town of Russia, in the government of Tobol'sk, on the Murz; 232 miles E.S.E. of Eniseišk.

KLIMOVIČI, or KLIMOVITCHI, a town of Russia, and district of the government of Mognyl, or Mohile, on the Odej, which falls into the Soft; 80 miles E. of Mognyl.

KLIN, a town of Russia, and district of the government of Moscow, on the river Selr, falling into the Dubnian, which joins the Volga; 36 miles N.N.W. of Moscow.—Also, a small island in the N. Pacific ocean, near the E. coast of Kamtschatka.

KLINGENFEL, a town of the duchy of Carniola; nine miles S.W. of Landšraf.

KLINGENTHAL, a town of Saxony, in the Vogtland, inhabited chiefly by miners and woodmen, driven out of Bohemia as an account of their religion; 12 miles E. of Odleinz.

KLINGSKROI, a town of Russia, in the government of Irkul'sk; 76 miles S.S.E. of Nertchinsk.

KLINGNAN, a town of Switzerland, in the county of Baden; nine miles N. of Baden.

KLINGSTEIN, in Mineralogy, Pierre Sonante, Broch. Its colour is dark greenish-grey, passing into yellowish and ash-grey, a light olive-green or liver-brown. It occurs in mafs. The crofs fracture is almost dull, the longitudinal fracture is glistening. The former is splintery, passing into conchoideal, the latter is more or less flat. It branches into indeterminate sharp-edged, sometimes tabular fragments. Usually translucent on the edges, considerably hard, and not easily frangible. When struck with a hammer, it gives a ringing metallic sound, whence its name. Sp. gr. 2.57. It melts easily before the blow-pipe, and yields a clear, almost colourless glass. According to Klaproth's analysis, it consists of:

Werner refers it to the floetz-trap formation, resting upon basalt, into which it frequently passes. It often contains crystals of feldspar, and then forms slate porphyry. Reuß reckons it to belong to the primitive rocks. It occurs in the middle mountains of Bohemia, particularly the Donaumberg, near Milbach, a conical mountain about 2500 feet high, which consists entirely of this mineral. It has also been observed by Jameson in the island of Llandaff, in the Frith of Clyde. Very beautiful varieties of it also occur in rock maffles between Llanberris and Caernarvon in North Wales. Aikin's Dict. of Chem. and Miner.

KLINKETS, in Fortification, a sort of small gates made through palisades, for falles.

KLINKOSE, in Geography, a town of Poland, in Podolia; 52 miles N.N.E. of Kaminiec.—Also, a river of Poland, which runs into the Dnieper; eight miles S. of Kaminiec.

KLIP Fish, in Ichthyology, a name by some authors supposed to mean the lupus piesz, or wolf-fiish; and by others, the common cod-fiish.

Of the former opinion is Fabricius, who supposes the lupus fo called, because it is able to climb up rocks, or generally lies hid among rocks: the word klip, in the German, signifying a rock. Of the other is Schopenhälder, who supposes the cod has its name of klip-fiish, or rock-fiish, from its being usually dried upon the rocks.

KLIP-foil is also a name by which the Dutch in the East Indies call a flat fiish, caught frequently on those shores, and sometimes called also folden wiše, or the soldier's fiish. It somewhat resembles the bream in shape. Its general size is about six or seven inches in length, and it is of a very white and flivery hue. It differs very greatly, however, from the bream in many particulars. The nerves of its back fin are prickly, as in the perch; its tail is pointed, not forked; and the irises of its eyes are yellow. It is one of the finest fiishes of the East Indies. Its flesh is very firm, and falls into large pieces, when dressed, like that of the cod, and is very well tasted. See CASTREDOX tiera, coroneus, and stiriens.

KLIPPEN, in Geography, a small island in the Atlantic, near the coast of Africa. S. lat. 32° 10'.

KLOBUK, a town of Moravia, in the circle of Hradisch; 20 miles E. of Hradisch.

KLODAWA, a town of the duchy of Warsaw; 12 miles N.W. of Lenseicz.

KLOETZEN, a town of Westphalia, in the principality of Luneburg-Zelle; 45 miles E. of Zelle. N. lat. 53° 41'.

KLOKLSBERG, a town of Bohemia, in the circle of Bechin; 12 miles S.E. of Rosenberg.

KLOKOTZ, a town of Croatia; 24 miles S. of Carlstadt.

KLOPSTOCK, Frederic Theophilus, in Biography, a German poet, was born at Quedlinburg in 1724. He was the eldest of eleven children, and distinguished himself in his youth among his companions in bodily and mental exercises. At the age of sixteen he went to college, and being placed under an able tutor, he made himself familiar with the languages, and acquired a taste for the beauties of the best classical authors. He made attempts in composition both in profe and verse. In the latter he wrote some pastoralts, but not contented with these humbler efforts, he formed the resolution of composing an epic poem, and fixed upon the "Meßhaf" as his subject. In 1745, he went to the university of Jena, where he commenced the study of theology, but in the midst of his academical pursuits he was planning his projected work, and sketched out his three first cantos. In 1746, he removed from Jena to Leipzic, and became a member of a society of young men who had formed themselves into a literary club for mutual improvement. About this time he exercised his genius in lyric compositions. Several of his odes, together with the three first cantos of his Meßhaf,
Meiffish, appeared in a periodical paper, entitled "Bremen Contributions." The publication of ten books of his Meiffish made his name known throughout Germany, and raised his reputation very high. This work was extremely popular among those who had hearts to feel the beauties of poetry and the warmth of devotion. The Meiffish was quoted again and again from the pulpit by the younger divines, while those more advanced confounded the fictions in which the poet had indulged himself on sacred topics, and rigid grammarians made severe strictures on the style and verification.

He travelled into Switzerland in 1750, to pay a visit to Bodmer of Zurich, in consequence of an invitation, where he was received with every token of respect. The sublime scenery of that country, the simplicty of the inhabitants, and the freedom they enjoyed, were much suited to the taste of Klopstock. Here he intended to have spent the remainder of his life, but baron Bernstorff caused an invitation to be sent to him to reside at Copenhagen, with assurances of such a pension as would make him independent. Klopstock acceded to the proposal, and set out in 1751, by the way of Brunswick and Hamburg, at which latter place he became acquainted with Mils Muller, a lady perfectly adapted to his own mind, whom he soon after married. They seemed by Providence destined to be one of the happiest couples upon earth, but he was soon deprived of her, for she died in childbed: her memory, however, was sacred to Klopstock till the last moment of his existence. He lived chiefly at Copenhagen, till the year 1771, after which he retired to Hamburg as Danish legate, and counsellor of the margrave of Baden, who gave him a pension. The latter part of his life was little varied by incidents, and after he had brought the Meiffish to a conclusion, he continued to employ himself in composition, and in the correction and revision of his works.

He died at Hamburg, in March 1803, being 79 years of age. By those who were intimate with him, he is represented as a truly amiable man, happiness in a small circle of private friends, and particularly fond of the society of young persons. The character of Klopstock, as a poet, is that of exuberance of imagination and sentiment. His sublimity is almost unparalleled, he is apt to lose himself in mystical abstractions, and his excess of feeling sometimes betrays him to vanity and extravagance. As able critics claim for the author of the Meiffish a rank among the first poets. His odes and lyric poems have likewise been much admired by his countrymen, and his dramas display great force and dignity, but they are better adapted to the closet than the stage. To his talents as a prose writer, his "Grammatical Dialogues" will bear witness: they abound with judicious remarks, and the object of them is worthy of a true patriot, viz. an attempt to prove that the German tongue is capable of all the strength and nobleness of a classical language.

- KLOTEN, in Geography, a town of Switzerland, in the canton of Zurich; 5 miles N. of Zurich.

KLOTZ, Christian Adolphus, in Biography, an eminent German critic, was born in the year 1738 at Bischofswerden, near Dresden, where his father was settled as a clergyman. He displayed, at an early period, such an attachment to letters, that his parents spared no expense to gratify his taste, and to enable him to cultivate his talents to the best advantage. He employed those leisure hours, which other lads devote to amusement, in composing and reciting German versets. At Gotfortz, he studied under Baumgarten the Greek and Roman classics, and gave a specimen of his powers in verification, by a poem composed on the "Destruction of Zittau," which was laid waste in the year 1757. In 1758, he proceeded to Leipsic to study jurisprudence, and while here, he published several papers in the "Acta Eruditorum," and some separate pieces. In 1761, he published his "Opuscula Poetica," containing twenty-three odes, three satires, and as many elegies. From Leipsic he repaired to Jena, where he opened a school, which was well attended. Having accepted an invitation to a professorship at the university of Gottingen in 1762, he set off for that place, and almost immediately after his arrival he was attacked by a severe illness, from which, however, he recovered, and immediately published a treatise, "De Verecundia Virgilii," to which were added three dissertations relative to the eulogies of the poet. He also published "Miscellanea Critica," and applied himself to the study of ancient gems and paintings, with which he became well acquainted. His celebrity had now increased so much, that he received two offers in the same day, one from the prince of Hesse Darmstadt, to be professor of the Oriental languages at Giessen, and the other from his Prussian majesty, to be professor of eloquence at Halle. While he was deliberating respecting the choice he should make, he was nominated by his Britannic majesty to be professor of philosophy at Gottingen, with an increased salary, which induced him to remain in that city, till some attempts were made to ruin his reputation. He then quitted Gottingen, and accepted an offer made him by his Prussian majesty, of being professor of philosophy and eloquence at Halle, with the rank and title of auflie counsellor. While preparing for his departure, he published "Histoire Nummorum Contumulorum et Satyriorum," containing a history of these coins; and on his removal to Halle he gave the public another work of the same kind, and at the same time he effected, what had been often attempted before without success, the institution of a new society, called the "Literary Society of Halle," which afforded great satisfaction to the liberal-minded part of the learned in Germany. In 1766, he was invited by his Prussian majesty to Warsaw to superintend the education of the children of the Polish nobility, which he would gladly have accepted, as it afforded him an opportunity of visiting new countries, but the king ordered him to remain at Halle, conferred upon him the rank of privy-counsellor, and accompanied this mark of honour with a considerable addition to his salary. He died in 1771, leaving behind him many other works besides those to which we have referred. Before his death, he revised every thing which he had written on coins, and published "Opuscula, nummaria quibus Juris Antiqui Historiae nonnulla Capita explicantur." Gen. Bieg.

KLUMP-FISH, in Ichthyology. See TETRODON Mola.

KLYDAU, LILL, in Geography, a small island on the E. side of the gulf of Bothnia. N. lat. 60° 37'. E. long. 20° 54'.

KLYDAU, Stor, a small island on the E. side of the gulf of Bothnia. N. lat. 60° 20'. E. long. 20° 48'.

KLYSSA, a town of Prussia, in Pomernia; 33 miles S.S.W. of Dantzig.

KMDIDOMOUKA, a town of Poland, in the paleatitude of Kiev; 32 miles S.S.E. of Balacekiew.

KNAG, a term used by country people for a knot in wood; also for the branches which grow out in the hort's horn, near the forehead.

KNAP'S BAY, in Geography, a bay in Hudson's bay. N. lat. 61° 15'. W. long. 94° 54'.

KNAPPIA, in Botany, so named by the writer of the present article, in honour of John Leonard Knapp, eqq. F. L. S. and A. S. author of "Gramina Britannica, or Representations of the British Grasets, with Remarks and occasional Descriptions," an elaborate work in quarto, with

Gen. Ch. Cal. Glume of two erect, equal, oblong, abrupt, keeled valves, without awns, containing a single floret. Cor. the length of the calyx, ovate, obtuse, closed, consisting of innumerable, simple or branched, parallel fibres, densely matted together, united at their base, without awns. Stem. Filaments three, capillary, twice as long as the corolla; anthers of two elliptical pointed lobes. Separe at the base and summit. Pyl. German superior, ovate, smooth; style two, very short; stigma very long, capillary, acute, downy. Peric. none, except the permanent corolla and calyx. Seed one, elliptical, unconnected with the glumes, but enveloped in them.

t. K. agrostis. Engl. Bot. t. 1127. Knapp Gram. t. 110. Hull. ed. 2. 23. (Chamagrostis minima; Scrad. Germ. 158. Agrostis minima; Linn. Sp. Pl. 93. Wildl. Sp. Pl. v. 1. 372. Sm. Fl. Brit. 82. Huds. 32. With. 134. Gramen minimum, paniculatus elegantilimis; Bauh. Theatr. 26. G. minimum, Anglo-Braamicum; Rauy. Spec. Ind. Pl. Dub. G. partula, capillaceo folio minimum; Diet. Giff. 172. t. 16. excellent.)—A native of sandy pastures, especially near the sea, in various parts of Europe; as Germany, the south of France, and the south-west coast of Anglesea, at which half place it has been observed in plenty by the Rev. H. Davies. It is a small, delicate, annual grass, flowering in the early spring, after which it soon withers and disappears. The root consists of a few long simple fibres. Stems from one to three inches high, simple, slender, straight, smooth, naked, except at the bottom. Leaves almost entirely radical, short, linear, channelled, blunted, with very broad feathering membranous bases. Spike simple, terminal, hardly an inch long, of eight or ten little purplish or green flowers, placed alternately, each on a short flake, on a slender, zig-zag, common flake, to which, when in seed, they become closely preflled.

The name of Knappas cannot be superseded by Chamagrostis, the latter being untenable, as composed of another established generic name Agrostis, and contrary to the rule of Linnæus. Phil. Bot. sect. 225, "a generic name, with one or two syllables prefixed, so as to make it apply to a totally different genus from what it originally designated, is to be rejected." We cannot but wonder, therefore, that the excellent Schradler should have been led, by any of his lefs learned countrymen, to adopt such a name, when another was already before him, liable to no objection. S.

KNAPSACK, in Military Language, is a rough leather or canvas bag, which a soldier carries on his back, containing all his necessaries. Square knapsacks are most convenient; and should be made with a division to hold the shoes, black-balls, and brulhes, separate from the linen. White goat-linns are sometimes used. Soldiers are put under top-pages for the payment of their knapsacks, which, after five years, become their property.

KNAPWEEED, in Botany. See Jacea.

Knapweed, a common name given to a kind of weed, which is sometimes called blue-bottle. It infects arable land greatly in many cafes.

KNARED, in Geography, a town of Sweden, in the province of Halland; 14 miles E.S.E. of Halmstad.

KNARESBOROUGH, a borough, market-town, and parish in the wapentake of Claro, West-Riding of Yorkshire, England, is situated on a rocky mountain, at the foot of which runs the river Nid. It is one of the ancient boroughs that were part of the demesnes of the crown, found under the title of Terra Regia, in Domeday Book, and other records. The site of Knareborough corresponds with the description given of the towns of the Britons; being placed on the bank of a river for the supply of water, and on the skirt of a forest, for convenience of hunting and purlue. The remains of a ditch and rampart, which may yet be traced, include an area of 900 feet in length, and 600 in breadth. Soon after the Norman conquest, a strong castle was built here by Serlo de Burgh, who accompanied the conqueror to England, and received this manor, with several others, as a reward for his services. The castle, having fallen to the crown, was granted by Henry III. to his brother Richard, earl of Cornwall, in the year 1257. In 1327, it was taken by John de Lillburn, an officer belonging to the earl of Lancaster's but, being besieged by the king's order, and Lillburn finding no prospect of relief, he surrendered, having first destroyed all the records, and every memorial of the liberties and privileges of the burgh. In 1271, the castle and manor were granted by Edward III. to his son, John of Gaunt, duke of Lancaster: from whose time it has been an appendage to the duchy of Lancaster. The castle and palace had a considerable share in the civil war of the 17th century: after a brave resistance, the castle surrendered to lord Fairfax; and was ordered by the house of commons to be rendered untenable. The walls and towers have ever since been moulderling away. This castle contained nearly two acres and a half within its walls, which were flanked with eleven towers: these, with several other buildings in the different wards, afforded accommodation for a numerous garrison. Part of the principal tower is still remaining, and appears to have been built about the time of Edward III. It consists of three stories above the keep or dungeon. The third room on the ground-floor has been, from time immemorial, the repository of the ancient records. On the second story is a flate-room, called the king's-chamber, in which Richard II. was imprisoned after his deposition. Beneath this tower is the dungeon, to which there is a descent by twelve steps: the roof is arched with stone, and supported by one round pillar, nine feet in circumference. In a part of the ruins are the remains of a secret cell, or hiding-place, constructed in the middle of the wall: this receptacle is three feet four inches high, two feet eight inches wide, and more than twenty feet in length. In the castle-yard is the entrance to an arched subterraneeous passage leading to the moat. Leland, speaking of this castle, says, "It tandeth magnificently and strongly on a rock, having a deep ditch hewn out of the rock, where it was not defended by the river Nid."

The church of Knareborough, dedicated to St. John the Baptist, was a grant from the crown at the beginning of the 12th century. On the north side of the choir is a chapel belonging to the Slingby family: on an altar-tomb are whole length figures of sir Francis Slingby and his lady; the knight in complete armour; the lady in a long robe, with folding plait down to the feet: here are also figures of sir William Slingby and Henry Slingby, esq. and various other monuments and inscriptions. On the south side of the choir is a chapel belonging to the Plumptons of Plumptson, though no traces now remain of that ancient family, except their arms hewn in the glass in the window. The seats on either side of the choir, and a pulpit facing the east window, appear to be ancient.

Knareborough was summoned to send members to parliament in the first year of queen Mary; from which time
time it has returned two representatives; the right of election is vested in the holders of burgage tenures, 84 in number. In the diary of Sir Henry Slingsby, who was elected in 1640, is the following note:

"There is an evil custom at such elections, to betchow wine on all the town, which cost me sixteen pounds at least." The practice of purchasing the burgage-houses began about the year 1714; since which a majority of the votes have been in the possession of the dukes of Devonshire, who have nominated the two members. The town, though a borough, is not incorporated; but is governed only by a bailiff and constable. Here are a spacious market-place, and a neat market-crofs, which was erected in the year 1716. Over the river is a good stone bridge. On the east side of the church is a free-school, endowed, in 1616, by the Rev. Robert Challoner, a native of Goldborough, and rector of Amer, in Buckinghamshire. The present building was erected by subscription in 1741. In Windfor-lane is a Difenters' chapel, founded by lady Hewley, of Bell-hall, near York; the present edifice was built, on the ancient site, in 1778. In Gracious-street is a Quaker's meeting-house, erected in 1701. A considerable manufacture of linen has been carried on here for many ages, and is still in a flourishing condition; upwards of 1000 pieces, each 20 yards in length, being often woven in a week. In the year 1764, an act of parliament was obtained for the better supply of river water, of which the conveyance before was, from the elevated situation of the town, rendered difficult and expensive. In the Long walk, close by the river Nid, is the Dropping well, or Petrifying spring, which issues from a lime-stone rock, about 40 yards from the bank of the river; and, after running about 20 yards, divides, and spreads itself over the top of a ledge of rock, whence it trickles or drops down from 30 or 40 places, into a channel hollowed for the purpose. The spring is supposed to fend forth 20 gallons in a minute. This rock, which is about 10 yards high, 16 long, and from 10 to 16 broad, about the year 1704, started from the common bank, and left a chain between them. Tradition states, that near this rock the famous Yorkshire fybil, Mother Shipton, was born, about the year 1458. From the Dropping well, the walk extends along the river side to the High-bridge; producing, as the river meanders very much, every 10 or 20 yards, a new point of view, which, though composed of the same objects, is surprizingly variegated. From some parts of this walk are seen the venerable ruins of the castle, the hermitage, &c. with an intermixture of rocks and trees, over which part of the tower of Knareborough church makes its appearance. On the other side of the river, at the foot of a perpendicular rock, is St. Robert's chapel, supposed to have been made, in the reign of king John, by a learned and pious hermit of that name. This chapel is hollowed out of the solid rock; its roof and altar are beautifully ornamented; at the entrance is the figure of a knight templar in the act of drawing his sword. Near Grimhald-bride is a hermitage called St. Robert's cave, supposed to have been the dwelling of the hermit above-mentioned. This cave has been rendered remarkable by a circumstance, which, in the year 1758, led to the discovery of the murder of Daniel Clarke, committed 14 years before, by Eugene Aram, a school-master of this town, a man of extraordinary learning, who pleaded his own cause in the most able manner. He was, however, convicted and executed. About half a mile from St. Robert's church, stood the priory, founded by the great earl of Cornwall, about the year 1257, for a society of friars of the order of the Holy Trinity. The feite, at the dissolution, was granted to the earl of Shrewsbury. It soon after became the property of the Slingfolds, in which family it has ever since remained. This chapel, priory, and other buildings, are now entirely demolished; the ruins lying scattered in "many a mouldering heap." The remains of the fishponds shew them to be of a singular construction, so that the water might be drawn off at pleasure. On the opposite bank of the river stands a high rock, called Grimhald-cragg; from the top of which is a line prospect of the subjacent vale, the river, Birkham-wood, and the lofty summit of Alms-cliff. On the side of the rock is a cataract, which, by its rude remains, appears to have been the residence of a hermit, of the name of Grimbold.

Knareborough is 17 miles distant from York, and 202 miles north of London. The population, as returned to parliament in the year 1801, was 3,358, inhabiting 766 houses. A market is held on Wednesday, which is pleasantly supplied with all kinds of provisions; the quantity of corn sold here weekly, is superseded to exceed that of any other market in the county. In the year 1708, queen Anne granted to the burgesses five annual fairs, with a court of Pe-ponds; a court held in fairs to redress disorders committed in them.

On the east side of the town is Hay-park, containing about 1200 acres, granted by the crown to an ancestor of the late Lord Bingley; and afterwards in the possession of sir John Hewley, whose widow appropriated the rents to charitable uses.

Knareborough forest extends from east to west upwards of twenty miles, and in some places eight miles in breadth. By the Domeday survey, there were then only four townships in this forest; Birrith with, Fulton, Beckwith, Rollett. But in the year 1368, there appear to have been three principal towns and sixteen hamlets.

At a short distance from Knareborough is Milton park, formerly in the possession of the Slingfolds family, afterwards in that of Stockdale for above an hundred years, from whom it passed by sale to the Watsons; John Fairdine Watson, esq., is the present possessor.

On a small elevation above the river Nid, stands Conyngham house, formerly called Coghill hall; which for several centuries belonged to the Coghill family; but was purchased of sir Thomas Coghill, bart., with 51 acres of land, by the counts of Conyngham in the year 1764. Harrove's Hillock of the Castle, Town, and Forest of Knareborough, 1708, 12mo.

KNAV, an old appellation for a man servant, and was used in 14 Edw. III. lib. 1. cap. 3.

The word is formed from the Saxon nope, or Flemish knop, which signify the same.

KNAVE also signifies a male-child, or boy, in which sense knew-child has been frequently used in contradistinction to a girl; and in this sense Wicksiffe uses the word in his translation of Exod. i. 16. and other places of the Bible. In the old Saxon translation of Matt. viii. 6. "Puer meus jacet in domo paralytica," was termed Man knape.

KNAVE has sometimes also been used as an addition; as Williedmus Cowper de Denbigh, knave, &c.

It is a common opinion, that Rom. i. 2. was translated, Paul, a knave of Jesus Christ. This mistake was occasioned by a Bible in the duke of Lauderdale's library, where the word knave is inserted in less characters than the others, and a rasure might easily be discerned.

KNAVE-Line, in a Ship, a rope fastened to the cross-trees, under the main or fore-top, whence it comes down by the ties to the ram-head, and there it is reeved through a piece of wood of about two feet long, and so is brought to the ship's side, and there hauled up taught to the rail.

Gen. Ch. Call Common perianth, containing the florets disposed in a fimple orb, cylindrical, oblong, erect, divided into as many segments as there are florets; proper perianth very fmall, crowning the german. Cor. univerfal, equal; proper of one petal, unequal; tube the length of the calyx; limb unequal, in four segments, of which the outer one is larger and ovate. Stem. Filaments four, longer than the tube of the corolla, inferted into the receptacle; anthers oblong, incuubent. Pf. Germin inferior; ftyle thread- shaped, as long as the flaments; flamin thickith, bifid. Peric. none. Sefts solitary, square with a woolly tip. Recept. common, very fmall, flat, naked.

Obi.f. This genius is diftinguifhed from Scabiosa in having a tubulated calyx, and the florets arranged in a fimple orb.

1. K. orientalis. Linn. Sp. Pl. 146. Till. Pf. t. 48.—

"Leaves cut. Florets five, longer than the calyx."—A native of the Levant, flowering from June to September, and frequently to be fenn in our gardens. Root annual. Stem branched, about four feet high. Branches terminated by fingle peduncles, each supporting a flower. Florets of a bright-red colour. Leaves on the middle of the stem pinuated; the fide are ferrated. Sect. producifed hairy, many-toothed at top. Down a concave crown, with many brifle-shaped, unequal teeth.

2. K. propeira. Linn. Sp. Pl. 1666. Wild. n. 2. (Scabiosa orientalis vilifoa, flore inuenientis, fructu pulchro oblongo; Tourn. Cor. 35.)—"Upper leaves lanceolate, entire. Florets ten, equal with the calyx."—A native of the Eafl, from whence Forikel fent feeds of it to Linneus, who raised plants from them in his garden, from one of which he made the following defcription.—"Stem biennial, the thicknefs of a finger, two feet in height, vilifoa, refembling Choranthus infERM. Leaves rough, ferrated; the upper ones a span long. Calyx oblong, cylindrical, com- posed of eight or ten leaves, awl-shaped at the point. Corolla four-cleft, purplith; anthers of the fame colour; flaments and piths white. It differs from the laft species in having the upper leaves undivided; florets about ten, instead of five, whilft the feed-crown is fifteen-toothed and fringed."—It appears to us, neverthelefs, to be a mere variety.

K. pallifina and pamlfosa of Linneus are referred by Dr. Smith, in his Prodromus Filara Græce, to the genus Scabiosa, to which they most indubitably belong.

KNAUTIA, in Gardening, contains plants of the herbaceous, annual, and bienniel kinds; of which the species cultivated are, the oriental knautia (K. orientalis); and the Levant knautia (K. propeira).

Method of Culture.—Plants of this kind may be easily increased by seeds, which, when permitted to scatter in the

autumnal feafon, produce good plants. After they may be taken up, and planted out in the clumps and borders of pleafure-grounds, among other low shrubs near the walks. In this way the plants live through the winter, and flower in June. There is no particular fort of culture requisite afterwards, but to keep the plants perfectly clean from weeds. The feeds fall to the ground as soon as they become fully ripe.

These plants are capable of affording variety among other hardy flowering-plants which are of similar growths.

KNAVEL, in Botany, failed to be a word of German origin, but of its pronunciation Didelius confecdes himself, "though a German, to be ignorant. He adopts it, in his Novo Plantarum Genera, 94- t. 5, for what Linneus more happily called Sclerantha, of which we shall treat in its place.

KNEC, in the Sea Language, the twifling of a rope or cable, as it is veering out.

KNEE, Genus in Anatomy. See Extremities.

Knee, in the Manje, is the joint of the fore-quarters, that joins the fore-thigh to the fank.

Knees, in a Ship, are the crooked parts of oak timber which fecure the beams to the fides of the ship, and are dillinguifhed by the terms hanging-knees and lodging-knees; the former are those whose arms fall to the fide in a perpendicular direftion, whereas the latter fay next the timber upon the clamps in the direftion of the hang of the deck. The scarcity of thofe articles has compelled the ship-builder to introduce knees of iron; but being inferior in point of contact with the fish's fides, and as the bolts cannot be drive tight in the iron-knees if the ship fhrains, they confequently must work loose, whence, therefore, thould only be reckoned as an inferior Subfittute.

Knee of the Head, by failors called the cutwater, an affemblage of pieces of oak timber, tailed or coaked together edgeways, upon account of its great breadth; it extends from the fore-part of the ftem to the figure-head, which it supports, as likewife the rails and all other compartments of the head, and is fecured to the bows by large knees, called checks of the head, and through the ftem, &c., by bolting.

Knee Holm, or Knee Holly, in Botany. See Rhus acutif-
with the same portion of real power in the art of painting. A rapid pencil and a ready talent of taking likenesses were the foundation of his reputation; and a most fortunate ignorance of the art among the best informed even of the public, by whom he was employed, aided his prosers. Not but that he was equal to the production of good works if he had been more carefully trained, and had lived amongst those who knew how to value works of art upon just principles; but he was amongst the most vain of mankind, and had no regard whatsoever for that polhumous fame which leads men to sacrifice present enjoyments to future glory. His motto was, "to live whilst he lived," and, consequently, to make money was a matter of greater moment with him than to make good pictures; and he succeeded fully; for although he left 20,000l. by the South Sea speculation, he left, at his death, an estate of 2000l. a-year. His prices, whilst he painted here, were 15 guineas for a head; 20 if with one hand; 30 for a half, and 60 for a whole length.

He was born at Lubeck about the year 1646. His father was surveyor-general of the mines, and inspector of count Mansfeldt's revenues. At first Godfrey was destined for a military life, but painting was his passion. His father acquiesced in his wishes, and placed him under Vol, at Amsterdam. He had even some instructions from Rembrandt. He visited Italy in 1671, and remained some time at Venice, where he painted some of the first families, and amongst them the cardinal Baffadonna. It is probable that he here learnt that free, loose style of execution in which he delighted, but by no means excelled; with him it fell to negligence and cluminess, particularly in his draperies, wht sometimes his heads exhibit a perfect master of the pencil.

Kneller did not stay long in Italy, as in 1674, he came to England with his brother, John Zachary, who assisted him in painting, without intending to reside here; but being recommended to Mr. Banks, a Hamburgh merchant, he painted him and his family. Mr. Vernon, secretary to the duke of Monmouth, saw them, and fat to Kneller; and persuaded the duke also to fit. His grace was delighted, and engaged the king his father to have his picture by the new artist, at a time when the duke of York had been prom- nised the king's picture by Lely. Charles, unwilling to have double trouble, proposed that both artists should paint him at the same time. Lely, as the established artist, chose his light and station: Kneller took the next belt he could, and performed his talk with so much expedition and skill, that he had nearly finished his piece when Lely's was only nearly coloured. The circumstance gained Kneller great credit; and Lely obtained no less honour, for he had the candour to acknowledge and admire the abilities of his rival. This success fixed Kneller here, and the immense number of portraits he executed, prove the continuance of his reputation.

He was equally beloved by Charles, James, and William; and had the honour of painting the portraits of ten sovereigns (viz. Charles 11. James 11. and his queen, William and Mary, Anne, George 1. Louis XLV. the czar Peter the Great, and the emperor Charles VI.), which is more than can be said of any other painter. His best friend was William, for whom he painted the beauties of Hampton Court; and by whom he was knighted in 1692, and presented with a gold medal and chain worth 300l. In his reign, he also painted several of the admirals for Hampton Court, and the Kit-Cat club. He lived to paint G-orge 1. and was made a baronet by him. In 1722, sir Godfrey was seized with a violent fever, from the immediate danger of which he was rescued by Dr. Meade. He languished, however, some time, and died in October 1723. His body lay in state, and was buried at his country-seat called Wilton; but a monument was erected to him in Weftminster Abbey, for which he left 500l. and gave particular instructions for the execution of it to Ryther.

During the latter part of his time, that is, after the death of Lely, in 1680, Kneller stood at the head of the professors of his art in this country, and that most conspicuously. It is not therefore surprising that he experienced the encouragement he did. He has left some few good pictures behind him as proofs of the natural powers he possessed; but his most sincere admirers, who are judges, must acknowledge that the far greater portion of those he allowed to pass into the world under his name, are a disgrace to him and his patrons. His picture of the converted Chinese at Windsor, he is said to be most proud of, as justly he might be. This, however, shows his profuse in principle, as it exhibits that he really knew what was good, and could produce it if he chose. According to his own doctrine, he did as much and no more than was necessary to pass current among his employers. "History painters," he said, "make the dead live, and don't begin to live till they are dead. I paint the living, and they make me live."

There is a singular paucity of imagination in Kneller's pictures. He did indeed (and Walpole justly commends him for it) indulge in an ideal drapery for women, instead of the monstrous dresses they wore at the time; but his ingenuity does not appear equal to affix them so much; so that there is a ridiculous mixture of positive formality in the fliff neckcloths and wired skirts of coats of the one, and of an affected flow and grace in the loose robes of the other, which confit of nothing more than a chemise thrown open, and discovering the bofom, and a robe-de-chambre loosely drawn over it.

All that Kneller can be justly praised, or defended effeemed fo, generally speaking, is, that his heads, or rather his faces, have a good deal of liveliness and gentility. It seldom amounts to character in the general run of his por- traits. Now and then the maller-hand appears, when the subject or the moment were favourable. There is, at Pet- worth, a head of Sir Isaac Newton that would be an honour to any man to have produced; and portraits of branches of the Seymour family, which are a disgrace to the name they bear.

The artists who succeeded him, dazzled by his successes, and allured by the professed admiration of his taffe, molt unaccountably lost sight of the infinitely greater beauties of Vandyke's manner, and followed his alone. In confluence, the art sank to the lowest ebb, till it was somewhat redeemed by Richardson's writings, and Hudson and Ramsay's talents in painting. But true talent was not restored till Reynolds took up the pencil; and now, happily, the weaknesses as well as the merits of Kneller are duly appreciated, and hundreds of his works consigned to the oblivion he probably wished they might experience. When the mafs be may be thus dispersed of, and the select only remain, then he will obtain, unalloyed, the praise his talents, when carefully exercised, fully deserved.

KNEMA, in Botany, a genus named by Loureiro, is derived from $\text{knema}$, the spoke of a wheel, on account of the authors being dispersed into a star-like, or wheel-shaped form. — Loureiro. Cochinch. 604.—Classe and order, Diteria Monadelphia. Nat. Ord. .

Gen. Ch. Male, Cal. none. Cor. of one petal, fleshly; tube thick, short; limb in three, acute, segments, woolly on the outside. Stam. a single filament, short, turbinate;
The order of knights, as distinct from the people, did not begin before the time of the Gracchi; others say, the privilege was then first granted them, that no judge should be chosen, but out of their order; some time after which they admitted them into the senate. This, however, is certain, it was only from that time that a certain revenue was necessary, and that this entitled them to the knighthood, without being descended from ancient knights.

The word knight, in its original German, knicht, signifies a servant; and has since been used for a soldier or man of war. We have but one instance among us where knight is used in the first sense, and that is in knight of the shire, who properly serves in parliament for such a county. In the Latin, French, Spanish, Italian, and Dutch languages, knight is expressed by a word (equites) which properly signifies a borcher, as being usually employed on horseback. Indeed our common law calls them militiae, soldiers, because they formed a part of the royal army, in virtue of their feudal tenures: one condition of which was, that every one who held a "knight's fee" immediately under the crown was obliged to be knighted; to cut off the king as soldiers in his wars, in which sense the word miles was used pro vasso: or fine for non-compliance.

The exertion of this prerogative, as an expedient to raise money, in the reign of Charles I, gave great offence, though warranted by law, and the recent example of queen Elizabeth; but it was by the statute 16 Car. I. c. 16. abolished: and this kind of knighthood has, since that time, fallen into great disrepute.

Knighthood was the first degree of honour in the ancient armies, and was usually conferred with a great deal of ceremony on those who had distinguished themselves by some notable exploit in arms. They were originally liable to be adopted, adoptabantur in militem, which we now call dubbed: or being foppelled, in some measure, the sons of these who knighted them.

The custom of the ancient Germans was to give their young men a shield and a lance in the great council: this was equivalent to the "toga virilis" of the Romans. Before this, they were not permitted to bear arms, but were accounted as a part of the father's household; after it, as part of the community. (Tacit. de Mor. Germ. § 13.) Hence, some derive the usage of knighting, which has prevailed all over the western world, since its reduction by colonists from those northern heroes. See KNIGHTHOOD, Military, infra.

The ceremonies at the creation of a knight have been various. The principal were a box on the ear, and a stroke with a sword on the shoulder. Then they put on him a shoulder-belt, gilt sword, spurs, and other military accoutrements; after which, being armed as a knight, he was led in great pomp to the church.

The manner of making a knight with us, is described by Camden in a few words: "Qui equefrum djdinitatem cepit, flexis genibus leviter in humero percusit: princeps his verbis Gallicae affutur: fus vel foio chevalier au nom de Dieu, surfe vel fis eques in nomine Dei." This is meant of...
of knights-bachelors, which are the lowest, though the most ancient order of knighthood among us; for we have an instance of king Alfred's conferring this order on his son Athelstan. Will Malmib. lib. ii.

Knights grew to be numerous, and the dignity became of much less repute. Charles V. is said to have made five hundred in a single day: on which account, therefore, new orders of knighthood were instituted, in order to distinguish the more deserving from the crowd. For the several kinds of knights among us, see BACHELOR, BANNERET, BARONET, BATH, GARTER, &c.

Knight is also understood of a person admitted into any order either purely military, or military and religious, instituted by some king or prince, with certain marks and tokens of honour and distinction.

Such are the Knight of the Garter, of the Elephant, of the Holy Ghost, of Malta, &c. All which see under GARTER, ELEPHANT, &c.

Knights of the Shire, or Knights of Parliament, are two gentlemen of worth, chosen on the king's writ in pleno comitatu, by such of the freeholders of every county as have the value of 40l. per annum, within the county, clear of all taxes and deductions except parliamentary and parochial taxes, to represent such county in parliament.

This qualification of electors for knights of the shire or county members, is settled by Stat. 8 Hen. VI. c. 7, and 10 Hen. VI. c. 2, amended by 14 Geo. III. c. 58. According to the estimate of bishop Fleetwood in his "Chronicum Preciosum," 40l. in the reign of Henry VI. was equal to 22l. per annum in the reign of queen Anne; and as the value of money has been lowered since, judge Blackstone concludes that 12l. in the bishop's days must have been equivalent to 20l. in his own time; and the depreciation of money in later times must have made the difference much greater. (See DE-EX-PENSIS.) The other qualifications of the electors for counties in England and Wales, collected from statutes are: that no person under twenty-one years of age shall be capable of voting; nor any person convicted of perjury or subornation of perjury: that no person shall vote in right of any freehold granted to him fraudulently to qualify him to vote; that every voter shall have been in the actual possession or receipt of the profits of his freehold to his own use for two calendar months before election; except in the ease of marriage, marriage settlement, will, or promotion to a benefice or office: that no person shall vote in respect of an annuity or rent-charge, unless registered with the clerk of the peace twelve calendar months before; that in mortgaged or tilled estates, the person in possession shall have the vote: that only one person shall be admitted to vote for any one house or tenement, to prevent the splitting of freeholds: that no estate shall qualify a voter, unless the estate has been afflicted to some land-tax aid, at least twelve months before the election; and that no tenant by court-rolls shall be permitted to vote as a freeholder. (7 and 8 W. III. c. 27. 10 Ann. c. 23. 2 G. II. c. 21. 10 G. II. c. 18. 31 G. II. c. 14. 3 G. III. c. 24. 14 Geo. I. c. 57. 2 & 3 Geo. III. c. 43.)

For the number of knights, of the house of commons, employed in managing the duties of excise, customs, stamps, falls, windows or houses, or revenue of the post-office, shall be capable of voting in the election of a member of parliament.

Thee knights, when every man who had a knight's seat was e Lovesomarily constrained to be a knight, were of necessity to be militiae gladio einit, for so the writ runs to this day; but now custom admits equeires to be chosen to this office.

It is required by 25 Hen. VI. c. 15. that all knights of the shire shall be actual knights, or such notable equeires and gentlemen as have eftates sufficient to be knights; and by no means of the degree of yeomen: and more precisely by 9 Ann. c. 5, that every knight of the shire shall have a clear estate of freehold or copyhold to the value of 60l. per annum, except the eldest sons of peers and of persons qualified to be knights of shires. For other qualifications, see PARLIAMENT.

The expences of knights of the shire, are to be defrayed by the county, during their sitting in parliament, at the rate of four shillings a day. This rate of wages was established in the reign of Edw. III. (See also 35 Hen. VIII. c. 11.) It is hardly necessary to add, that these are never now required.

Knight's Cross, in Botany. See CAMPION.

Knight's Heads, or Bollard Timbers, are oak timbers with large upper parts or heads, which are fayed and bolted together, one on each side the stem, or with a filling between, as they must open at the heads sufficient to admit the bowspur between them, and running high enough to support the fame above the ftern.

Knots, or knots, an ancient law-term, signifying so much land of inheritance as was esteemed sufficient to maintain a knight with suitable retinue; which, in the days of H. III., was reckoned at 12l. per annum. And by Stat. 1 Edw. III. fuch as had 20l. per annum, in fee, or for life, might be compelled to be knights. But this statute is repealed by 16 Car. I.

Sir T. Smith rates a knight's fee at 40l. yearly. According to Coke, a knight's fee contained twelve carucates, or plough-lands. Stow says, that there were found in England, at the time of the Conqueror, 66,211 knight's fees: according,
In consequence of the introduction of the feudal system upon the Norman conquest, all the lands in the kingdom were divided into knight's fees, in number, as Stow says, above 60,000; and for every knight's fee, a knight or soldier, miles, was bound to attend the king in his wars, for 40 days in a year; in which space of time, before war was reduced to a science, the campaign was generally finished, and a kingdom either conquered or victorious. By this means, the king had, without any expense, an army of 60,000 men always ready at his command. Accordingly we find among the laws of William the Conqueror, one (c. 58.) which in the king's name commands, and firmly enjoins, the personal attendance of all knights and others; "quod habitant et tenent se tamper in armis et equis, ut decet et aportet: et quod eum prorsum promit et paratiam servitium sub integrum nobis expendiam et peragendum, eum opus adseriac servitum domus quod decente de feudis et tenementis suis de jure nobis facere." This personal service in time degenerated into pecuniary commutations or aids, and at last the military part of the feudal system was abolished at the restoration, by Stat. 12 Car. II. c. 24.

**Knights.** In Geography, an inlet of the Pacific ocean, on the W. coast of North America, extending in an E. and N.E. direction about 50 miles. Its entrance from an arm of the sea lies in N. lat. 50° 45'. E. long. 253° 16'.

**Knight's Island,** a small island in Bering's bay, N.W. of Eleanor's found, separated from the American continent by a narrow channel, which is navigable. N. lat. 52° 45'. E. long. 220° 47'.—Also, an island in Prince William's found, about 30 miles in length from N. to S., and from two to five broad. N. lat. 68° 24'. E. long. 120° 52'.—Also, a small island in Hudson's bay. N. lat. 61° 59'. W. long. 99° 27'.—Also, an island in the Pacific ocean, and the largest of those called by Capt. Vancouver the "Snares," discovered by Broughton, commander of the Chatham under Vancouver, in November 1791. Some parts of the island presented a very barren appearance, not unlike the W. side of Portland, composed of whitish rocky cliffs. The rocky iflets are five in number, some of which are of a pyramidal form. It did not appear to be inhabited. The south point is situated in S. lat. 48° 15'. E. long. 166° 44'.

**Knights, Poor,** a group of small islands, so called by lieutenant Cook, who discovered them in November 1781, on the coast of New Zealand, when he was in S. lat. 30° 36'; at the distance of three leagues N.E. by N.

**KNIGHTEN-GILD,** in our Old Writers, a gild or company in London, consisting of nineteen knights, which king Edgar founded, giving them a portion of void ground lying within the walls of the city, now called Portfokenward.

**KNIGHTHOOD,** a military order, or honour; or a mark or degree of ancient nobility, or reward of personal virtue and merit.

There are four kinds of knighthood; military, regular, honoraory, and jocose.

**KNIGHTHOOD, Military,** is that of the ancient knights, who acquired it by high feats of arms.

There are called miles, in ancient charters and titles, by which they were distinguished from mere bachelors, &c. These knights were girt with a sword, and a pair of gilt spurs; whence they were called equites aurati.

**Knighthood** is not hereditary, but acquired. It does not come into the world with a man like nobility; nor can it be revoked. The sons of kings, and kings themselves, with all other sovereigns, heretofore had knighthood conferred on them as a mark of honour. They were usually knighted at their baptism or marriage, at their coronation, before or after a battle, &c.

Between the age of Charlemagne and that of the Crusades, the service of the infantry was degraded to the Plebeians; the cavalry formed the strength of the armies, and the honourable name of miles, or soldier, was confined to the gentlemen who served on horseback, and were invested with the character of knighthood. The dukes and counts, who had usurped the rights of sovereignty, divided the provinces among their faithful barons; the barons distributed among their vassals the fiefs or benefices of their jurisdiction; and these military tenants, the peers of each order, and of their lord, composed the noble or equestrian order, which delighted to conceive the peasant or burgher as of the same species with themselves. The dignity of their birth was preferred by pure and equal alliances; their sons, a one, who could produce four quarters of a line of ancestry, without spot or reproach, might legally pretend to the honour of knighthood; but a valiant plebeian was sometimes enriched and enrolled by the sword, and became the father of a new race. A simple knight could impart, according to his judgment, the character which he received; and the warlike sovereigns of Europe...
rope derived more glory from this personal distinction than from the laitude of their diadems. This ceremony, of which some traces may be found in Tacitus and the woods of Germany, was, in its origin, simple and profane; the candidate, after some previous trial, was invested with the sword and spurs; and his cheek or shoulder was touched with a flight blow, as an emblem of the last afront, which it was lawful for him to endure. But superstition mingled in every public and private action of life; in the holy wars, it sanctified the profession of arms; and the order of chivalry was assimilated in its rights and privileges to the sacred orders of priesthood. The bath and white garment of the novice were an indecent copy of the regeneration of baptism; his sword, which he offered on the altar, was blessed by the ministers of religion; his solemn reception was preceded by feasts and vigils; and he was created a knight in the name of God, St. George, and St. Michael the archangel. He swore to accomplish the duties of his profession; and education, example, and the public opinion, were the inviolable guardians of his oath. As the champion of God and the ladies (“i.e.,” says Gibbon, “to unite such discordant names”), he devoted himself to speak the truth; to maintain the right; to protect the distressed; to practise courtesy, a virtue less familiar to the ancients; to pursue the invidious; to depose the allurements of ease and safety; and to vindicate in every perilous adventure the honour of his character. The abuse of the name spirit provoked the illustrious knight to disdain the acts of industry and peace; to eleight himself the fole judge and avenger of his own injuries; and proudly to neglect the laws of civil society and military discipline. Yet the benefits of this institution, to refine the temper of barbarians, and to inculcate some principles of faith, justice, and humanity, were strongly felt, and have been often observed. The aperity of national prejudice was soothed; and the community of religion and arms spread a similar colour and generous emulation over the face of Christendom. Abroad, in enterprise and pilgrimage, at home in martial exercise, the barriers of every country were perpetually associated; and impartial title must prefer a Gothic tournament to the Olympic games of chasse antiquity.

The lance was the proper and peculiar weapon of the knight; his horse was of a large and heavy breed; but this charger, till he was routed by the approaching danger, was usually led by an attendant, and he quietly rode a pad or palfrey of a more easy pace. His helmet and sword, his greaves and buckler, is needless to describe in this place; but at the period of the crusades the armour was less ponderous than in later times; and instead of a moyf cyrafs, his breast was defended by a hauberk or coat of mail. Each knight was attended to the field by his faithful squire, a youth of equal birth and similar hopes; he was followed by his archers and men at arms, and four, or five, or six followers, were computed as the furniture of a complete “lance.” In the expeditions to the neighbouring kingdoms or the Holy Land, the duties of the feudal tenure no longer sufficed; the voluntary service of the knights and their followers was prompted by zeal or attachment, or purchased with rewards and promises; and the number of each squadron were measured by the power, the wealth, and the fame of each independent chieftain. They were distinguished by his banner, his armorial coat, and his cry of war; and the most ancient families of Europe must seek in these achievements the origin and proof of their nobility. Gibbon’s Decl. and Fall of the Rom. Emp. vol. xi. For a further account of the character of the ancient knights and the beneficial effects of chivalry and the crusades see the articles CHIVALRY and CRUSADES.

These services, both of chivalry and of grandeur, were all personal, and as to their quantity or duration uncertain. But personal attendance in knight-service being found inconvenient and troublesome, the tenants found means of compounding for it; first, by finding others to serve in their stead, and in process of time by making a pecuniary satisfaction to the lords in lieu of it. (See KNIGHT.) When knight-service, or personal military duty degenerated into censure, or pecuniary alleviations, all the advantages (promised or real) of the feudal constitution were destroyed, and nothing but the hardships remained. These hardships, which were numerous and grievous, were from time to time palliated by succour in the form of parliament, till at length the humanity of King James I. confented, (4 Ill. 293), in consideration of a proper equivalent, to abolish them all, upon a plan similar to that, which he had formed and began to put in execution, for removing the feudal grievance of hereditary jurisdiction, in Scotland, which has since been pursued and effected by the statute 20 Geo. ii. c. 43. By another statute of the same year (20 Geo. ii. c. 52.) the tenure of “ward-holding” (equivalent to the knight-service of England) is for ever abolished in Scotland. At length the military tenures, with all their heavy appendages, (having during the usurpation been discontinued) were totally destroyed by the statute 12 Car. ii. c. 2. Blackl. Com. b. ii. See TENURE.

KNIGHTHOOD, Regular, is applied to all military orders, which profess to wear some particular habit, to bear arms against the infidels, to succour and assist pilgrims in their pilgrimage to the Holy Land, and to serve in hospitals where they should be received; such were the knights Templars, and such are the knights of Malta, &c.

KNIGHTHOOD, Honorary, is that which princes confer on other princes, and even on their own great ministers and favourites; such are the knights of the Garter, St. Michael, &c.

KNIGHTHOOD, Social, is that which is not fixed, nor confirmed by any formal institution, nor regulated by any lying statutes; of which kind there have been many orders been erected on occasion of factions, of tilts and tournaments, masquerades, and the like.

The abbot Bernardo Jullianini, at the beginning of his history of knighthood, gives us a complete catalogue of the several orders; according to this computation, they are in number ninety-two. Favin has given us two volumes of them under the title of Theatre d’Honore & de Chevalerie. Meunius has published Delicieux Equafriment Ordinum, and Andr. Mendo has written De Ordinibus Militaribus. Beloi has traced the original, and Geliot, in his Armorial Index, has given us their institutions.

To these may be added, Father Menefrier de la Chevalerie Ancienne & Moderne, Michiel’s Trefor Militaire, Carmine’s Theologia Regolare, Vitruvius’s Origins Equafrum quin Militarum Ordinum: but above all, Jullianini’s Historie Chronologique de l’Origine de gl! Ordine Militari, e di tutte le Religione Cavalerese: the edition which is fullest, is that of Venice in 1692, in two vols. fol.

KNIGHTON, Henry, in Biography, who flourished at the close of the 14th century under Richard II. is celebrated as an ancient chronicler. He was a canon-regular of Leicester abbey, and wrote a history of English affairs in five books, from the conquest to the year 1395. He wrote likewise an account of the deposition of Richard II. His works are printed with the ten English historians published by.
by the learned Selden. He is reckoned an exact and faithful narrator of events within his own times.

KNIPTON, or TRYFY-DECHWAUL, in Geography, a market-town and parish in the hundred of Knighton, and county of Radnor, South Wales; is seated in a valley, through which the river Teine meanders at the distance of 17 miles W. of Ludlow, and 32 S. of Shrewsbury. The valley of Teine, in the vicinity of this town, is skirted by lofty hills, the sides of which are well clothed with wood and verdure. The town contains some good houses, ranged on the sides of streets, which in parts are steep. Here is a free grammar school. The church has rather a singular appearance, from its irregular form, detached tower, with strange spire. Knighton has a weekly market, and an annual fair: and contained, in the year 1820, 221 houses and 785 inhabitants.

On the western side of the town, is part of the noted boundary embankment called Offa's Dyke, which was formed in the year 760, and intended to be the line of demarcation between England and Wales. Harold made a law, that if any Welshman was found on the eastern side of this dyke, he should lose his right hand. See PRESTEIGN.

KNIN, a town of Bohemia, in the circle of Beraun, near which is a gold mine, 12 miles S.E. of Beraun. N lat. 49 49'. E. long. 14 18'.—Alfo, a fortified town of Dalmatia, strengthened by a deep ditch, and situated on a narrow neck where the river Kerkla is joined by another stream, called Butum-fichiza. This is supposed to be the ancient castle called "Arduba," taken by Germanicus, 40 miles E. of Zara. N lat. 43 55'. E. long. 16 55'.

KNIP BAY, a bay on the W. coast of the island of Curacoa.

KNIPHAUSEN, a sea-port town of Germany, in the lordship of Jever, taking its name from an ancient castle, where the tribunal of justice is held; 5 miles E.S.E. of Jever. N lat. 53 29'. E. long. 8'.

KNISTENEAUX, otherwise called Killstinos or Kipstinos, the name of a people, who are spread over a considerable extent in the centre of the northern part of America. We are indebted to Mr. Mackenzie (see Voyage from Montreal, &c. &c.) for a particular account of these people. Their language is the same as that of the people who inhabit the coast of British America on the Atlantic, the Equinoceans excepted, and continues along the coast of Labrador, and the Gulf and banks of St. Lawrence to Montreal. The line then follows the Utawas river to its source, and continues from thence nearly W. along the highlands, which divide the waters that fall into Lake Superior and Hudson's Bay. It then proceeds till it strikes the middle part of the river Winnipeg, following that water through the lake Winnipeg, to the discharge of the Sackatchewan into it; from thence it accompanies the latter to Fort George, when the line, striking by the head of the Beaver river to the Elk river, runs along its banks to its discharge in the lake of the Hills, from which it may be carried back E. to the ilea la Croisse, and so on to Churchill, by the Missisipi. The whole of the tract between this line and Hudson's bay and friths, that of the Equinoceans in the latter excepted, may be said to be exclusively the country of the Knisteneaux. Some of them, indeed, have penetrated farther W. and S. to the Red river, to the S. of lake Winnipeg, and the S. branch of the Saskatchewan.

These people are of a moderate stature, well proportioned, with few examples of deformity, and very active. Their complexion is copper-coloured, and their hair black, in which they resemble all the natives of North America. It is cut in various forms, according to the fancy of the several tribes, and by some it is left in the long, lank flow of nature. They very generally extrafl their beards, and both sexes manifest a disposition to pluck the hair from every part of the body and limbs. Their eyes are black, keen, and penetrating; their countenance is open and agreeable, and they are fond of decorating their persons. In the use of vermilion, to which they are much accustomed, they contrast it with their native blue, white, and brown earths, to which they frequently add charcoal. Their dres is simple and commodious. It consists of tight leggins, reaching near the hip; a strip of cloth, or leather, called Affian, about a foot wide, and five feet long, whole ends are drawn inwards and long behind and before, covering a belt tied round the waste for that purpose; a close vest or shirt reaching down to the former garment, and cinctured with a broad strip of parchment fastened with thongs behind; and a cap for the head, consisting of a piece of fur, or small skin, with the brush of the animal as a furbanded ornament; a kind of robe is thrown occasionally over the whole of the dres, and serves both night and day. These articles, with the addition of shoes and mittens, constitute the variety of their apparel. The materials vary according to the season, and consist of dreffed moofe-skim, beaver prepared with the fur, or European woollens. The leather is neatly painted, and fancifully wrought in some parts with porcupine quills, and moofe-deer hair; the shirts and leggins are also adorned with fringe and taffels; nor are the shoes and mittens without somewhat of appropriate decoration, and worked with a considerable degree of skill and taste. Their head-dresses are composed of the feathers of the swan, the eagle, and other birds. The teeth, horns, and claws of different animals are also the occasional ornaments of the head and neck. Their hair is always bejewelled with greafe. The making of every article of dres is a female occupation; and they pay particular attention to the appearance of the men, whilst they neglect no decoration of their own persons; and their faces are painted with more care than those of the women.

The female dres is formed of the same materials with those of the men, but they are differently made and arranged. Their shoes are commonly plain, and their leggins gathered below the knee. The coat, or body-covering, falls down to the middle of the leg, and is fastened over the shoulders with cords, a flap or cape turning down about six inches, both before and behind, and agreeably ornamented with quill-work and fringes; the bottom is also fringed, and fancifully painted as high as the knee. Being loofe, it is inclofed round the waist with a flift belt, decorated with taffels, and fastened behind. The arms are covered to the wralt, with detached sleeves, sewed as far as the bend of the arm, from thence they are drawn up to the neck, and the corners of them fall down behind, as low as the waste. The cap, when a cap is used, consists of a quantity of leather or cloth, sewed at one end, by which means it is kept on the head, and, hanging down the back, is fastened to the belt as well as under the chin. The upper garment is a robe like that of the men. Their hair is divided on the crown, and tied behind, or sometimes fastened in large knots over the ears. They prefer European articles to their own commodities. Their ornaments, like those of savages in general, consist of bracelets, rings, and similar baubles. Some of the women tattoo three perpendicular lines, which are sometimes double: one from the centre of the chin to that of the under lip, and one parallel on either side to the corner of the mouth.

The Knisteneaux women are the most comely of any seen by Mr. Mackenzie on the American continent: they are well proportioned, and the regularity of their features would
KNISTÈNEAUX.

These people have frequent feasts; and at stated periods, as in spring and autumn, they practice long and solemn ceremonies. Dogs, and particularly those that are fat and milk-white, are offered as sacrifices. They also make large offerings of their property, of whatever kind it be. These ceremonies are performed on the bank of a river or lake; and if any stranger, who is in want of anything that is displayed as an offering, chance to pass by, he has a right to take it, upon replacing something of inferior value; but to take or touch anything wantonly is considered as a sacrileges act, and highly insulting to the great Master of life, to adopt their expression, who is the sacred object of their devotion. The scene of private sacrifice is the lodge of the person who prepares it, and it is conducted with a variety of ceremonies. He begins by spreading the contents of his medicine-bag, containing various articles, on a piece of new cloth or well-dressed moose-thin neatly painted. The principal of these articles is a kind of household-god, which is a small carved image about eight inches long, and is an object of the most pious regard. The next article is his war-cap, decorated with the feathers and plumes of rare birds, beaver, eagle's claws, &c. From this is suspended a quill or feather for every enemy whom the owner of it has slain in battle. The remaining contents of the bag are a piece of Brazil tobacco, several roots and simples in repute for their medicinal qualities, and a pipe. After certain previous ceremonies, an assistant lights the pipe, and presents it to the officiating person, who, turning to the east, draws a few whiffs, which he blows to that point. He practises the same ceremony towards the other three quarters, with his eyes constantly directed upwards. After some other ceremonies performed with this pipe, he makes a speech, explaining the design of the attendant's being called together, and concludes with an acknowledgment of pait mercies, and a prayer for the continuance of them, from the Master of life. He then sits down, and the whole company declare their approbation and thanks by uttering the word *bus!* with an emphatic prolongation of the last letter. The Assistant or Michinwais again takes up the pipe, and holds it to the mouth of the officiating person, who, after smoking three whiffs out of it, utters a short prayer, and then goes round with it in a courfe from east to west, to every person present; and thus the pipe is smoked out; when, after turning it three or four times round his head, he drops it downwards, and replaces it in its original situation. He then returns the company thanks for their attendance, and wishes them, as well as the whole tribe, health and long life. These smoking rites precede every matter of great importance, with more or less ceremony, but always with equal solemnity. The public feasts are conducted in a similar manner, but with some additional ceremony. At these several chiefs officiate, and the guests assemble upon public topics, repeat the heroic deeds of their forefathers, and excite the rising generation to follow their example. From these feasts the women and children are excluded; but the women, who are forbidden to enter the places sacred to these festivals, dance and sing around them, and sometimes beat time to the music within them; thus forming an agreeable contrast.

As to their divisions of time, the Knistèneaux compute the length of their journeys by the number of nights passed in performing them; and they divide the year by the succession of moons, the names of which are descriptive of the several seasons. These people are acquainted with the medicinal virtues of many herbs and simples, and apply the roots of plants and the bark of trees with judiciousness. But the conjurers, who monopolize the medical science, blend mystery with their art, and conceal their knowledge. Their materia medic
medica they administer in the form of purges and cryders; but the remedies and surgical operations are supposed to derive much of their effect from magic and incantation. A sharp dart serves them as a lancet for letting blood, as well as for prurification in bruises and swellings.

Among their various superfluities, they believe that the vapour which is seen to hover over moils and swampy places is the spirit of some person lately dead. They also fancy another spirit which appears in the shape of a man, upon the trees near the lodge of a person deceased, whose property has not been interred with him. He is represented as bearing a gun in his hand, and it is believed that he does not return to his rest, till the property that has been withheld from the grave has been sacrificed to it. Mr. Mackenzie has given examples (ubi fugax) of the Knitkeneaux and Algonquin languages, between which there is a considerable resemblance. See Algonquins.

KNITTERFELDT, a town of the duchy of Sireia, on the river Muehr; 20 miles S.W. of Pruck. N. lat. 47° 14'. E. long. 14° 36'.

KNITTE, in Sea-Lyngs, a small line, which is either plaited or twisted, and used for various purposes at sea; as to fallen the service in the cable, to reef the sails by the bottom, and to hang the hammocks between decks, &c.

KNITTLEING, in Geography, a town of Wurtemberg, the birth-place of Fault, one of the first printers; 22 miles S. of Heidelberg.

KNOCK-HEAD, a cape of Scotland, on the north coast of Banffshire; 3 miles W.N.W. of Banff.

KNOCKING MILL. See Stamping.

KNOCKLAYD, in Geography, a mountain in the northern part of the county of Antrim, Ireland; about two miles S. of Ballycastle.

KNOCKMEADOW, a chain of mountains in Ireland, between the counties of Waterford and Tipperary, and extending into both. These are rated by Smith amongst the highest mountains in Ireland. On the summit of one of them, major Eades, the electrician, was buried by his own desire.

KNOCKNAREA, a cape of Ireland, in Sligo bay; 6 miles W. from Sligo.

KNOCKTOPHER, a post-town of the county of Kilkenney, Ireland; 63 miles S.W. from Dublin.

KNOLL, a term used in many parts of the kingdom for the top of a small hill, or for the hill itself.

KNOLOSES, Richard, in Biography, an English historian, a native of Northamptonshire, was entered at the university of Oxford about the year 1560. He was afterwards chosen master of the free-school at Sandwich, and proved his worths for this post by publishing a compendium of Latin, Greek, and Hebrew grammar. In 1610 he published, in folio, "A History of the Turks," which had been the labour of twelve years, and was executed in a manner highly creditable to his reputation. It has passed through many editions; and continuations have been made to it, of which the last is that of Paul Rycaut, confid at Smyrna. Mr. Knolles likewise wrote "A Brief Discourse of the Greatness of the Turkish Empire." He died at Sandwich, in 1610.

KNOLES, Francis, an English statesman, was born at Grays, in Oxfordshire; and after receiving an university education, he went to court, and became a zealous friend to the reformation, in the reign of Edward VI, at whose death he went abroad. On the accession of queen Elizabeth he returned, and was made privy counsellor, and vice chamberlain of the household. He was employed in several important matters of state; was one of the commissioners who sat in judgment on Mary queen of Scots; was appointed treasurer of the royal household, and knight of the Garter. He died in 1596. Sir Francis wrote a treatise against the usurpations of papal bishops, printed after his death in 1608; and a general survey of the Isle of Wight, which has not been printed.

KNOLLS, in Agriculture, a provincial term used in some counties to signify turnips.

KNOTAU, in Geography, a bailiwick of Switzerland, in the canton of Zurich.

KNOTTERS, a superior kind of Call-nuts; see which.

KNORR a Russenroth, Christian, in Biography, a learned German orientalist, was born in the year 1656. He purified his studies at various colleges, and then travelled for improvement into France, England, and Holland. The subjects which had engaged his attention were chemistry and the cabalistic art, of which he had been from his youth a great admirer. At Amsterdam he was introduced to the knowledge of the Oriental tongues, and Hebrew; and made such progress in his favourite studies, as to obtain the esteem and friendship of Lightfoot, More, and Van Helmont. By the latter of these learned men he was introduced to the count palantine of Sulzbach, who, in 1688, nominated him one of his privy council, and afterwards gave him the appointment of his chancellor. The duties of these offices did not divert him from his literary, chemical, and mystical pursuits. He translated, into the German language, Sir Thomas Brown's "Inquiry into vulgar Errors," and various other pieces; but his reputation is chiefly founded on a work, entitled "Kabbala Denudata, seu Doctrina Hebraorun transcendentals, et metaphysica, atque theologica," in 3 vols. 4to. This work abounds in wild reveries, fanciful chimeras, and mystical absurdities; but it contains, at the same time, very learned and valuable researches relative to the philosophy of the Hebrews.

KNOTS, in Gardening, a term used to express the rudiments of the first branches of plants, as they grow up from the seed. Thus, in the melon, the two first leaves or feed-leaves are called the ears, and the branches that grow from them are called, according to the order of their growth, the first, second, and third knots. Mr. Quintinye's famous method of raising the bell melons, depended principally on the cutting off every third knot of the plant as they grew up. Philos. Trans. N° 45.

In trees, the knot denotes that part from whence it shoots out branches, roots, or even fruit.

The wood is harder and clover in the knots than in any other part, but it is also more subject to split there.

The use of the knots of plants is to strengthen the stem; they serve also as leaves to filtrate, purify, and refine, the juice raised up for the nourishment of the plant.

KNOT, in Military Language, the wing or epaulette, commonly made of worked, of a non-commissioned officer or corporal. When epaulets and corporals are sentenced to be reduced to the ranks, the knot is generally cut off by the drum-major, in the presence of the battalion, as a mark of infamy.

Knot on board a Ship, is a large knob formed on the extremity of a rope, by untwisting the ends thereof, and interweaving them regularly among each other. Of this there are several forts: the chief of which are the wale knot, which is so made with the lass of a rope, that it cannot slip, and serves for sheats, tackles, and runners; the bow-line knot is so firmly made, and fastened to the crengles of the sails, that they must break, or the sails slip; before it will slip; the shee-fank knot, which serves to shorten a rope without cutting it, which may be presently loofened; the diamond knot,
The term knot, the rope knot, &c. The knots are generally used to fasten one rope to another, by means of a small cord attached to the neck of the knot, called the laniard, which is firmly tied about both ropes. They are also designed to prevent the end of a rope from slipping through an eye, which the knot is intended to confine in a particular situation.

**Knot-Berries.** See Raspberries.

**Knot-Grass in Botany.** See Polygonum.

**Knot-Grass in Rural Economy**, a common name often given to couch-grass. See Couch-Grass.

**Knot-Grass, Mountain.** See White-Grass.

**Knots of the Log-Line**, at sea, are the divisions of it. See Log.

Knot is also used for the intrigue of a romance, or dramatic piece; being that part where the persons are the most embarrassed, by a conjuncture of affairs, whole end it is not easy to fucce.

Aristotle, under this term, includes all the incidents of a tragedy, from its beginning to the place where it begins to unravel. The knot holds as long as the mind is kept fupended about the event. The knot ought always to lie to the middle of the fifth act, otherwise the rest of the piece languishes.

**Knot, Order of the.** was the name of a military order in the kingdom of Naples, instituted in 1352, by queen Jane I. on occasion of the peace established between her and the king of Hungary, by means of her marriage with Louis prince of Tarantum. It was so called because the knights wore for their badge a knot, like a true-lover’s knot, embroidered on the breast of their coat in purple silk, intermixed with gold.

The order consists of sixty knights. Clement VI. approved of this order, and gave it the rule of St. Baill; it chose St. Nicolas for its protector; but it dwindled away after the death of its foundress.

**Knot, in Ornithology, the name of an English bird of the snipe kind, not known among authors by any particular Latin name, unless it be the calidris nigra, or black calidris of Bellonius, which is doubtful from his description; and said to have obtained its English name from Canute, one of the Danish kings of this island, who was particularly fond of it: it is the tringa canutus of Linnaeus, which see.

**Knot, or Bosia, in Painted Architecture, the key stone of the groin, where all its springers or ribs meet together.**

**KNOOLTON LAKE, in Geography, a lake of America, in the state of Vermont. N. lat. 44° 48’, W. long. 71° 50’.**

**KNOTOUT, or Knot, is the name of a punishment inflicted in Russia, with a kind of whip called knot, and made of a long strip of leather prepared for this purpose. This instrument is a hard thong, about the thickness of a crown piece, and ¾ of an inch broad, and tied to a thick plaited whip, which is connected, by means of an iron ring, with a small piece of leather fastened to a short wooden handle. With this whip the executioners dextrously carry off a slip of skin from the neck to the bottom of the back laid bare to the waist, and repeating their blows, in a little while rend away all the skin off the back in parallel strips. In the common knot, the criminal receives the lathes suspended on the back of one of the executioners: but in the great knot, which is generally used on the same occasions as racking on the wheel in France, the criminal is raised into the air by means of a pulley fixed to the gallowes, and a cord fastened to the two wrists tied together; a piece of wood is placed between his two legs also tied together; and another of a crucial form under his breast. Sometimes his hands are tied behind his back, and when he is pulled up in this position, his shoulders are dislocated. The executioners can make this punishment more or less cruel: and, it is said, are so dextrous, that when a criminal is condemned to die, they can make him expire at pleasure, either by one or several lathes.

**KNOWING, Principles and Rules of.** See Principles, and Rule.

**KNOWLEDGE may be considered either as an operation of the mind, or as the result of that operation. In the former sense, it denotes the clear perception of truth; and in the latter, it signifies the treasure of associated ideas, that are tied up in the mind, in consequence of clear perceptions; thus, mathematics, astronomy, ethics, history, &c. are branches of knowledge.**

**Knowledge, according to Mr. Locke, consists in the perception of the connection and agreement, or disagreement and repugnancy, of our ideas. See Idea.**

In which sense, knowledge stands opposed to ignorance.

To know that white is not black, is only to perceive that these two ideas do not agree. So, in knowing that the three angles of a triangle are equal to two right ones, what do we more than perceive, that equality to two right ones necessarily agrees to, and is inseparable from, the three angles of a triangle?

**Knowledge, Kinds of.** As to what relates to the agreement or disagreement of ideas, we may reduce the whole doctrine, and consequently the whole stock of our knowledge, to four heads, viz. identity or diversity, relation, co-existence, and real existence.

With respect to the identity or diversity of our ideas, we may observe, that it is the first act of the mind to perceive its own ideas; and, so far as it perceives them, to know what each is, and thereby to perceive their difference; that is, the one not to be the other; by this the mind clearly perceives each idea to agree with itself, and to be what it is: and all different ideas to disagree. This it does without any pains, or deduction, by its natural power of perception and distinction; and, for doing this, men of art have established certain general rules or principles; as that, what is, is; and that it is impossible for the same thing to be, and not to be. But no maxim can make a man know clearer, that round is not square, than the bare perception of the two ideas, which the mind, at first sight, perceives to disagree.

The next kind of agreement, or disagreement, the mind perceives, in any of its ideas, may be called relative, and is nothing but the perception of the relation between any two ideas, of what kind soever; that is, their agreement or disagreement, one with another, in the several ways, or respects, the mind takes of comparing them.

The third kind of agreement, or disagreement, to be found in our ideas, is co-existence, or non-co-existence, in the same subject; and this belongs particularly to substanaces. Thus when we pronounce concerning gold, that it is fixed, it amounts to no more but this, that fixedness, or a power to remain in the fire unconsumed, is an idea which always accompanies that particular sort of yellowness, weight, fusibility, &c. which make our complex idea signified by the word gold.

The fourth kind is that of actual and real existence, agreeing to any idea.

Within these four sorts of agreement, or disagreement, seem contained all the knowledge we have, indeed all we are capable of; for all that we know, or can affirm, concerning any idea, is, that it is, or is not, the same with some other; as, that blue is not yellow: that it does, or does not, coexist with another in the same subject; as, that iron is susceptible of magnetic impressions: that it hath that or
this relation to some other ideas; as, that two triangles upon equal bases, between the same parallels, are equal; or, that it has a real existence without the mind; as, that God is.

The mind becomes possessed of truth in several manners, which constitute so many different species of knowledge. Thus, when the mind has a present view of the agreement or disagreement of any of its ideas, or of the relation they have one with another, it is called actual knowledge.

Secondly, a man is said to know any proposition, when, having once evidently perceived the agreement or disagreement of the ideas whereof it consists, and lodged it in his memory, that whenever it comes to be reflected on again, the mind attends to it without doubt or hesitation, and is certain of the truth of it: this may be called habitual knowledge. And thus a man may be said to know all those truths which are lodged in his memory, by a foregoing, clear, and full perception.

Of habitual knowledge, there are two sorts: the one consists of such truths, laid up in the memory, as, whenever they occur to the mind, it actually perceives the relation that is between their ideas; and this is in all those truths where the ideas themselves, by an immediate view, discover their agreement or disagreement one with another. The other is of such truths, whereof the mind having been convinced, it retains the memory of the conviction, without the proofs. Thus a man that remembers certainly, that he once perceived the demonstration, that the three angles of a triangle are equal to two right ones, knows it to be true, when that demonstration is gone out of his mind, and cannot possibly be recollected; but he knows it in a different way from what he did before: namely, not by the intervention of those intermediate ideas; whereby the agreement, or disagreement, of those in the proposition was at first perceived; but by remembering, that is, knowing, that he was once certain of the truth of this proposition, that the three angles of a triangle are equal to two right ones,—the immutability of the same relation between the same immutable things, is now the idea that shews him, that if the three angles of a triangle were once equal to two right ones, they will always be so. And hence he comes to be certain, that what was once true, is always true; what ideas once agreed, will always agree; and consequently, what he once knew to be true, he will always know to be true, as long as he can remember that he once knew it.

Knowledge also may be usefully distinguished into three kinds; historical, philosophical, and mathematical.

Knowledge, Historical, is merely the knowledge of facts, or of what is or happens in the material world, or within our own minds. Thus, that the sun rises and sets, that trees bud in the spring, that we remember, will, &c. are instances of historical knowledge.

Knowledge, Philosophical, is the knowledge of the reasons of things, or of what is or happens. Thus he has a philosophical knowledge of the motion of rivers, who can explain how it arises from the declivity of the bottom, and from the pressure which the lower part of the water fills from the upper. So likewise he the flowing how, and by what reason, desire or appetite arises from the perception or imagination of its object, would be philosophical knowledge.

Knowledge, Mathematical, is the knowledge of the quantity of things, that is, of their proportions or ratios to some given measure. Thus he who knows the proportion of the meridian heat of the sun at the summer solstice to its meridian heat at the winter solstice, might so far be said to have a mathematical knowledge of the sun's heat. So likewise he has a mathematical knowledge of the motion of a planet in its orbit, who can distinctly shew, from the quantity of the impressed and centripetal force, the velocity of the planet is produced; and how, from the action of the double force, the elliptical figure of the orbit arises.

These three kinds of knowledge differ evidently, it being one thing to know that a thing is; another, the reason why it is; and a third, to know its quantity or measure.

It is also evident, that historical knowledge, though extensively useful, and the foundation of the rest, is the lowest degree of human knowledge. Those who aim at the greatest certainty ought to join mathematical with philosophical knowledge. Nothing can more evidently shew that an effect arises from a certain cause, than the knowledge that the quantity of the effect is proportional to the force of the cause. Besides, there are many things in nature, the reasons of which depending on certain figures or quantities, are not assignable but from mathematical principles.

Knowledge, Degrees of. As to the different degrees, or clearness of our knowledge, it seems to lie in the different way which the mind has of perceiving the agreement or disagreement of any of its ideas. When the mind perceives this agreement or disagreement of two ideas immediately by themselves, without the intervention of any other, we may call it intuitive knowledge; in which case the mind perceives the truth, as the eye doth light, only by being directed towards it. Thus the mind perceives that white is not black; that three are more than two, and equal to one and two. This part of knowledge is irrefutable; and, like the bright sunshine, forces itself immediately to be perceived, as soon as ever the mind turns its view that way. It is on this intuition that all the certainty and evidence of our other knowledge depends, which certainly every one finds to be so great, that he cannot imagine, and therefore cannot require a greater. The next degree of knowledge is, where the mind perceives not this agreement, or disagreement, immediately, or by the juxtaposition, as it were, of the ideas; because those ideas, concerning whole agreement, or disagreement, the inquiry is made, cannot, by the mind, be so put together as to shew it. In this case, the mind is obliged to discover the agreement, or disagreement, which it searches for, by the intervention of other ideas: and this is that which we call reasoning.

Thus, if we would know the agreement, or disagreement, in bigens, between the three angles of a triangle and two right angles, we cannot do it by an immediate view and comparison of them, because the three angles of a triangle cannot be brought together at once, and compared with any other one or two angles; and so of this the mind has no immediate or intuitive knowledge. But we must find out some other angles, to which the three angles of a triangle have equality; and, finding those equal to two right ones, we come to know the equality of those three angles to two right ones.

Those intervening ideas, which serve to shew the agreement of any two others, are called proofs; and where the agreement, or disagreement, is by this means plainly and clearly perceived, it is called demonstration; and a quickness in the mind to find those proofs, and to apply them right, is that which is called sagacity.

This knowledge, though it be certain, is not so clear and evident as intuitive knowledge; it requires pains and attention, and steady application of mind, to discover the agreement, or disagreement, of the ideas it considers; and there must be a progression by steps and degrees, before the mind can, in this way, arrive at any certainty. Before demonstration, there was a doubt, which, in intuitive knowledge, cannot happen to the mind, that has its faculty of perception
In the mind ideas clearly distinct, these ideas, as we see in colours of different kinds, blue and red for instance, are as capable of demonstration as ideas of number and extension; and what is here said of colours, holds true in all secondary qualities.

These two then, intuition and demonstration, are the degrees of our knowledge; and whatever comes short of one of these, is only faith, or opinion, not knowledge, at least in all general truths.

There is, indeed, another perception of the mind, employed about the particular existence of finite beings without us, which going beyond probability, but not reaching to either of the foregoing degrees of certainty, passes under the name of knowledge.

Nothing can be more certain, than that the idea we receive from an external object is in our minds: this is intuitive knowledge; but whether we can thence certainly infer the existence of anything without us, corresponding to that idea, is that whereof some men think there may be a question made; because men may have such an idea in their minds, when no such thing exists, nor any such object affects their senses.

But it is evident, that we are invincibly conscious to ourselves of a different perception, when we look out on the fun in the day, and when we think on it by night; when we actually taste wormwood, or smell a rose, or only think on that favour or odour: so that we may add, to the two former sorts of knowledge, this also of the existence of particular external objects, by that perception and consciousness we have of the actual entrance of ideas from them; and allow these three degrees of knowledge, viz. intuitive, demonstrative, and sensibler.

But, since our knowledge is founded on, and employed about, our ideas only, will it follow thence, that it must be conformable to our ideas, and that where our ideas are clear and distinct, obscure and confused, our knowledge will be so too? We answer, No; for our knowledge concerning in the perception of the idea, or disagreement, of any two ideas; it clearness or obscurity consists in the clearness or obscurity of that perception, and not in the clearness or obscurity of the ideas themselves. A man (for instance), who has a clear idea of the angles of a triangle, and of equality to two right ones, may yet have but an obscure perception of that idea, and so have but a very obscure knowledge of it: but obscure and confused ideas can never produce any clear or distinct knowledge; because, as far as any ideas are obscure or confused, so far the mind can never perceive clearly, whether they agree or disagree; or, to express the same thing in other words, that has not determined ideas to the words he uses, cannot make propositions of them, of whose truth he can be certain.

From all this it follows; 1. That we can have no knowledge farther than we have ideas.

2. That we have no knowledge farther than we can have perception of the agreement, or disagreement, of our ideas, either by intuition, demonstration, or sensation.

3. We cannot have an intuitive knowledge, that shall extend itself to all our ideas, and all that we would know about them; because we cannot examine and perceive all the relations they have one to another by juxtaposition, or in immediate comparison one with another. Thus, we cannot intuitively perceive the equality of two extensions, the difference of whose figures makes their parts incapable of an exact immediate application.

4. Our rational knowledge cannot reach to the whole extent of our ideas; because, between two different ideas which
KNOWLEDGE.

we would examine, we cannot always find such proofs, whereby we can connect one to another with an intuitive knowledge in all the parts of the deduction.

5. Sensitive knowledge, reaching no farther than the existence of things actually present to our senses, is yet much narrower than either of the former.

6. From all which it is evident, that the extent of our knowledge comes not only short of the reality of things, but even of the extent of our own ideas. We have the ideas of a square, a circle, and equality; and yet, perhaps, shall never be able to find a circle equal to a square. See Circle.

KNOWLEDGE, Extent and Limits of. The affirmations or negations we make concerning the ideas we have, being reduced to the four forts above-mentioned, viz. identity, co-existence, relation, and real existence, let us inquire how far our knowledge extends in each of these.

1. As to identity and diversity, our intuitive knowledge is as far extended as our ideas themselves; and there can be no idea in the mind, which it does not perfectly, by an intuitive knowledge, perceive to be what it is, and to be different from any other.

2. As to the agreement or disagreement of our ideas of co-existence, our knowledge herein is very defective, though it is in this that the greatest and most material part of our knowledge, concerning subsistences, consists: for our ideas of subsistences being nothing but certain collections of simple ideas co-existing in one subject (our idea of flame, for instance, is a body, hot, luminous, and moving upwards); when we would know any thing farther concerning this, or any other fort of subsistence, what do we but enquire what other qualities, or powers, these subsistences have, or have not? which is nothing else but to know what other simple ideas do, or do not exist with those which make up such complex ideas. The reason of this is, that the simple ideas, which make up our complex ideas of subsistences, have no visible necessary connection, or incompatibility, with other simple ideas, those co-existence of which we shall inform ourselves about. These ideas being likewise, for the most part, secondary qualities, which depend upon the primary qualities of their minute or insensible parts, or on something yet more remote than these from our comprehension, it is impossible we should know which have a necessary union, or incompatibility, one with another; since we know not the root from whence they spring, or the figure, figure, and texture of parts on which they depend, and from which they result. Besides this, there is no discoverable connection between any secondary quality, and those primary qualities that it depends on. We are so far from knowing what figure, size, or motion produces (for instance) a yellow colour, or sweet taste, or sharp found, that we can by no means conceive how any size, figure, or motion, can possibly produce the idea of any colour, taste, or found, whatsoever; there being no conceivable connection between the one and the other.

Our knowledge, therefore, of co-existence reaches little farther than experience. Some few, indeed, of the primary qualities have a necessary dependence, and visible connection, one with another: as figure necessarily supposes extension; receiving or communicating motion by impulsion supposes solidity; but qualities co-existent in any subject, without this dependence and connection, cannot certainly be known to co-exist, any farther than experience, by our senses, informs us. Thus, though, upon trial, we find gold yellow, weighty, malleable, fusible, and fixed; yet, because none of these have any evident dependence, or necessary connection, with the other, we cannot certainly know, that, where any four of these are, the fifth will be there also, how highly probable forever it may be. But the highest degree of probability amounts not to certainty, without which there can be no true knowledge; for this co-existence can be no true knowledge; for this co-existence can be no farther known than it is perceived; and it cannot be perceived, but either, in particular subjects, by the observation of our senses, or, in general, by the necessary connection of the ideas themselves.

As to incompatibility, or repugnancy to co-existence, we know, that no subject can have of each fort of primary qualities more than one particular at once, as one extension, or one figure; and so of sensible ideas peculiar to each sense: for whatever, of each kind, is present in any subject, excludes all other of that sort; for instance, one subject cannot have two smells, or two colours, at the same time.

As to powers of subsistences, which make a great part of our enquiries about them, our knowledge extends little farther than experience; because they consist in a texture and motion of parts, which we cannot by any means come to discover; and I doubt, whether, with those faculties we have, we shall ever be able to carry our general knowledge much farther in this part. Experience is that, which, in this part, we must depend on: and it were to be wished, that it were more improved. We find the advantages some men’s generous pains have this way brought to the stock of natural knowledge; and if others, especially the philosophers by fire, had been so, vary in their observations, and sincere in their reports, as those who call themselves philosophers ought to have been, our acquaintance with the bodies here about us, and our insight into their powers and operations, might have been yet much greater.

As to the third fort, the agreement, or disagreement, of our ideas in any other relation; this is the largest field of knowledge, and it is hard to determine how far it may extend: this part depending on our fagacity in finding intermediate ideas, that may shew the limitations and relations of ideas, it is a hard matter to tell when we are at an end of such discoveries. They who are ignorant of algebra, cannot imagine the wonders of this kind that are to be done by it: and what farther improvements and helps, advantageous to other parts of knowledge, the sagacious mind of man may yet find out, it is not easy to determine.

This, at least, we may believe, that the ideas of quantity are not the only ones capable of demonstration and knowledge; that such, and perhaps, more useful parts of contemplation, would afford us certainty, if wise, patience, and continuous search, did not oppose or menance endeavours of this kind.

As to the fourth fort of knowledge, viz. of the real, actual existence of things, we have an intuitive knowledge of our own existence, a demonstrative knowledge of the existence of God, and a sensitive knowledge of the objects that present themselves to our senses.

Hitherto we have examined the extent of our knowledge, in respect of the several forts of beings that are; there is another extent of it, in respect of universality, which will also deserve to be considered; and this, in regard to our knowledge, follows the nature of our ideas. If the ideas, whose agreement, or disagreement, we perceive are abstract, our knowledge is universal; for what is known of such general ideas, will be true of every particular thing, in which that essence, that is, that abstract idea, is found: and what is once known of such ideas, will be perpetually and for ever true; so that, as to all general knowledge, we must search and find it only in our own minds;
minds; and it is only the examining our own ideas that furnishes us with it. Truth belonging to essences of things (that is, to abstract ideas) are eternal, and are to be found out by the contemplation only of those essences; as the existence of things is to be known only from experience.

Knowledge. Reality of. It is evident, that the mind knows not things immediately, but by the intervention of the ideas it has of them. Our knowledge, therefore, is real, only so far as there is a conformity between our ideas, and the reality of things. But howshall we know when our ideas agree with things themselves? It is answered, There are two sorts of ideas, that we may be assured agree with things: these are,

1. Simple ideas, which, since the mind can by no means make to itself, must be the effect of things operating upon the mind in a natural way, and producing therein those perceptions, which, by the will of our Maker, they are ordained and adapted to. Hence it follows, that simple ideas are not fictions of our fancies, but the natural and regular production of things without us, really operating upon us, which carry with them all the conformity our state requires, which is to represent things under those appearances they are fittest to produce in us. Thus the idea of whiteness, as it is in the mind, exactly answers that power which is in any body to produce it there; and this conformity between our simple ideas, and the existence of things, is sufficient for real knowledge.

2. All our complex ideas, except only those of substances, being archetypes of the mind’s own making, and not referred to the existence of things, as to their originals, cannot want any conformity necessary to real knowledge; for that which is not designed to represent any thing but itself, can never be capable of a wrong representation. Here the ideas themselves are considered as archetypes, and things are no otherwise regarded than as conformable to them. Thus, the mathematician considers the truth and properties belonging to a rectangle, or circle, only as they are ideas in his own mind, which possibly he never found existing mathematically, that is, precisely true; yet his knowledge is not only certain, but real, because real things are no farther concerned, nor intended to be meant by any such propositions, than as things really agree to those archetypes in the mind.

3. But the complex ideas, which we refer to archetypes without us, may differ from them; and so our knowledge about them may come short of being real: and such are our ideas of substances. These must be taken from something that does, or has existed, and not be made up of ideas arbitrarily put together, without any real pattern. Herein, therefore, is found the reality of our knowledge concerning substances, that all our complex ideas of them must be such, and such only as are made up of such simple ones as have been discovered to co-exist in nature; and our ideas, being thus true, though not, perhaps, very exact copies, are the subjunct of real knowledge of them. Whatever ideas we have, the agreement we find they have with others will be knowledge. If those ideas be abstract, it will be general knowledge; but to make it real concerning substances, the ideas must be taken from the real existence of things. Wherever, therefore, we perceive the agreement, or disaffection, of our ideas, there is certain knowledge; and wherever we are sure those ideas agree with the reality of things, there is certain, real knowledge.

Knowledge, method of improving or enlarging. It being the received opinion amongst men of letters, that maxims are the foundation of all knowledge, and that sciences are each of them built upon certain præcognitae, from whence the understanding is to take its rise, and by which it is to conduct itself in its enquiries in the matters belonging to that science: the beaten road of the school has been to lay down, in the beginning, one or more general propositions, called principles, as foundations whereon to build the knowledge that was to be had of that subject.

That which gave occasion to this way of proceeding was, the good success it seemed to have in mathematics, which of all the sciences have the greatest certainty, clearness, and evidence in them. But, if we consider it, we shall find, that the great advancement and certainty of real knowledge men arrive to in those sciences, was not owing to the influence of those principles, but to the clear, distinct, and complete ideas their thoughts were employed about, and to the relation of equality and excess, so clear between some of them, that they had an intuitive knowledge, and by that a way to discover it in others, and this is without the help of those maxims. For is it not possible for a lad to know, that his whole body is bigger than his little finger, but by virtue of this axiom, the whole is bigger than a part; nor be assured of it till he has learned that maxim? Let any one consider which is known first and clearest by most people, the particular instance, or the general rule; and which it is that gives life and birth to the other; these general rules are but the comparing our more general and abstract ideas, which ideas are made by the mind, and have names given them; for the easier dispatch in its reasonings; but knowledge began in the mind, and was founded on particulars, though afterwards, perhaps, no notice be taken thereof, it being natural for the mind to lay up those general notions, and make the proper use of them, which is to disburden the memory of the cumbrous load of particulars. The way to improve in knowledge is, not to swallow principles with an implicit faith, and without examination, which would be apt to mislead men, in stead of guiding them into truth; but to get and fix in our minds clear and complete ideas, as far as they are to be had, and to annex to them proper and constant names; and thus, barely by considering our ideas, and comparing them together, observing their agreement or disagreement, their habits and relations, we shall get more true and clear knowledge by the conduct of this one rule, than by taking up principles, and thereby putting our minds into the dilapidal of others.

We must, therefore, if we would proceed as reason advices us, adapt our methods of enquiry to the nature of the ideas we examine, and the truth we search after. General and certain truths are only founded on the habits and relations of abstract ideas; therefore, a sagacious, methodical application of our thoughts for the finding out these relations, is the only way to discover all, that can with truth and certainty be put into general propositions. By what steps we are to proceed in this, is to be learned in the schools of the mathematicians, who from very plain and easy beginnings, by gentle degrees, and a continued chain of reasonings, proceed to the discovery and demonstration of truths, that, at first sight, appeared beyond human capacity. This may reasonably be laid, that, if other ideas that are real, as well as nominal essences of their species, were pursued in a way similar to that of mathematicians, they would carry our thoughts farther, and with greater evidence and clearness, than possibly we are apt to imagine. This is reason sufficient to advance that conjecture above mentioned; viz.

"That morality is capable of demonstration, as well as mathematics;" for moral ideas being real essences, which have a discoverable connection and agreement one with another, so far as we can find their habits and relations, so far we shall be possessed of real and general truths.
In our knowledge of substances, we are to proceed after a quite different method; the bare contemplation of their abstract ideas (which are but nominal essences) will carry us by a very little way in the search of truth and certainty. Here experience must teach us what reason cannot; and it is by trying alone, that we can certainly know what qualities co-exist, with those of our complex idea; for instance, whether that yellow, heavy, fusible body, we call gold, be malleable, or not; which experience (however it prove in that particular body we examine) makes us not certain that it is so in all, or any other yellow, heavy, fusible bodies, but that which we have tried; because it is no confluence, one way or other, from our complex idea. The neceffity or inconftituency of malleability has no visible connection with the combination of that colour, weight, and fusibility, in any body. What is here said of the nominal essence of gold, supposed to confift of a body of such a determinate colour, weight, and fusibility, will hold true if other qualities be added to it. Our realnings from these ideas will carry us but a little way in the certain discovery of the other properties in those natures of matter, wherein those are to be found.

As far as our experience reaches, we may have certain knowledge, and no farther. It is not denied, that a man, not accustomed to rational and regular experiments, shall be able to fee farther into the nature of bodies, and their unknown properties, than one that is a stranger to them: but this is but judgment and opinion, not knowledge and certainty.

This would make it suspected, that natural philosophy is not capable of being made a science. From experiments, and historical observations, we may draw advantages of ease and health, and thereby increase our flocks of conveniences for this life; but beyond this, it is to be feared our talents reach not, nor are our faculties able to advance farther. See Pursuits.

The ways to enlarge our knowledge, as far as we are capable, seem to be these two: the first, is, to get and settle in our minds, as far as we can, clear, distinct, and constant ideas of those things we would consider and know; for it being evident that our knowledge cannot exceed our ideas, where they are either imperfect, confused, or obscure, we cannot expect to have certain, perfect, or clear knowledge. The other art is, of finding out the intermediate ideas, which may shew us the agreement or repugnancy of other ideas, which cannot be immediately compared.

That these two (and not relying on maxims, and drawing consequences from some general propositions) are the right method of improving our knowledge in the ideas of other modes, besides those of quantity, the consideration of mathematical knowledge will easily inform us; where, first, we shall find, that he, who has not clear and perfect ideas of those angles or figures, of which he desires to know any thing, is utterly thereby incapable of any knowledge about them. Suppose a man not to have an exact idea of a right angle, a parallelogram, or triangle, and it is clear, that he will in vain seek any demonstration about them.

And farther, it is evident, that it was not the influence of maxims or principles that led the masters of this science into those wonderful discoveries they have made: let a man of good parts know all the maxims of mathematics ever so well, and contemplate their extent and consequences as much as he pleases, he will, by their assistance, scarce ever come to know, that the square of the hypotenuse in a right angled triangle, is equal to the squares of the two other sides. This, and other mathematical truths, have been discovered by the thoughts otherwise applied. The mind had other objects, other views before it, far different from those maxims, which men, well enough acquainted with those received axioms, but ignorant of their method who first made those demonstratons, can never sufficiently admire.

Our knowledge, as in other things, so in this also, has to great a conformity with our right, that it is neither wholly necessary, nor wholly voluntary. Men, who have senses, cannot choose but receive some ideas by them; and, if they have memory, they cannot but retain some of them; and if they have any distinguishing faculty, cannot but perceive the agreement, or disaffreement, of some of them with another. As he that has eyes, if he will open them by day, cannot but see some objects, and perceive a difference in them; yet he may choose whether he will turn his eyes to-wards an object, curiously survey it, and observe accurately all that is visible in it. But what he doth see he cannot see otherwise than he doth; it depends not on his will to see that black which appears yellow. Just as it is with our understanding: all that is voluntary in our knowledge, is the employing or withholding any of our faculties from this or that sort of objects, and a more or less accurate survey of them; but, they being employed, our will hath no power to determine the knowledge of the mind one way or another; that is done only by the objects themselves, as far as they are clearly discovered. Thus, he that has got the ideas of numbers, and has taken the pains to compare one, two, or three, to six, cannot choose but know they are equal. He also, that hath the idea of an intelligent, but weak and frail being, made by, and depending on, another, who is eternal, omnipotent, and perfectly wise and good, will as certainly know, that man is to honour, fear, and obey God, as that the sun shines when he fees it. But yet, be these truths ever so certain, ever so clear, he may be ignorant of either or both of them, who will not take the pains to employ his faculties, as he should, to inform himself about them.

KNOWLTON, in Geography, a township of America, in Suffolk county, New Jersey, containing 1377 inhabitants.

KNOWLTONIA, in Botany, so named by Mr. Salisbury in memory of Mr. Thomas Knowlton, who is said to have been Sherard's gardener at Eltham. Salis. Prodr. 372. Sims in Curt. Mag. vol. 22. 775. (Anamnia; Venten. Malmais. 22.)—Clades and order, Polyandra Polygynia. Nat. Order. Multiflora, Linn. Rammunculaceae, Juff.

Gen. Ch. Cal. none. Cor. Petals numerous, from ten to twenty, oblong, without any nectary, deciduous, the innermost elongated and nearly linear; outermost somewhat ovate, externally hairy. Stam. Filaments numerous, thread-shaped, much shorter than the petals; anthers vertical, two-lobed, roundish, thick-edged, burling at the edges. Pist. Germ. superior, numerous, ovate, collected into a round head; styles lateral, awl-shaped; stigmata simple, slightly recurved. Peric. Berries numerous, distinct, elliptical, pointed, of one cell. Seed follicular, large, smooth, of the shape of the pericarp, and attached to its base. Receptacle globose.

Obf. Mr. Salisbury separated this very distinct genus from the Linncean Adonis, and published it in 1756, by the above unexceptionable name, which therefore takes place of Ventenat's Anamnia, published several years after; the latter being moreover liable to objection, from strict Linncean scholars, as being formed of an Arabic word.

Suppl. 272. Anememia biflata; Venten. Malmaif. 22. n. 4. Cithrophoria trifolia: folliciis levis, flos in pluribus oriferis; Burm. Afr. 145. t. 21. —Hairy. Leaves twice ternate; leaflets elliptico-ovata. Petals linear. Native of the Cape of Good Hope. With us it is a hardy green-house plant, flowering in the spring. Root perennial, and, as appears from Dr. Sim's description, of long duration, the plant from which his figure was taken, in 1804, having come out of Dr. Fothergill's collection near 25 years before. Leaves several, radical, on long hairy stalks, twice ternate; their leaflets elliptical, or somewhat ovate, serrated, more or less hairy, the terminal ones usually largest. Stems taller than the leaves, branched near their very bottom, hairy, almost leafless; their branches elongated, subdivided, somewhat conjunctive; ultimate ones umbellate, single-flowered, very hairy. Bracteae leafy; the upper ones narrow, lanceolate and entire. Flowers an inch broad, spreading, of a light yellow with green.

2. K. veficatoris. Blistering Knowltonia. (Adonis vi-eficatoris; Linn. Suppl. 272 Wild. Sp. Pl. v. 2. 1307. Anememia coriacea; Venten. Malmaif. 22. n. 1. t. 22. A. Iaperitifolia; ibid. n. 2 Ranunculus athiopicus, foliis rigidis, floribus ex luteo viridiflentes; Comm. Hort. v. 1. t. 1. Imperatoria ranunculoides africana ephemerata, Iaperitifolia lobata foliis rigidis, margine spinosis; Pluk. Phyt. t. 93. f. 2J. Smooth, leaves twice ternate; leaflets nearly heart-shaped, coriaceous; the lateral ones unequal at their base. Petals elliptico-oblung. Umbels compound, many-flowered.—Native of the Cape of Good Hope, and occasionally kept in green-houses, like the preceding, from which we cannot but think it specifically different. The leaves are much larger, smooth, very thick and rigid, with strong, almost pungent, serratures or teeth; sometimes they are thrice compound. Stems more umbellate in all their subdivisions, the ultimate umbels consisting of very numerous flasks, which are but slightly hairy. Bracteae rather elliptical. Petals elliptico-oblung rather than linear. Berries purpureus black. Thunberg states that the leaves are used at the Cape to raffle blisters, they having that property in common with some species of Ranunculus and Osmorhiza, their near allies.

3. K. gracilis. Slender Knowltonia. (Anememia gracilis; Venten. Malmaif. 22. n. 3. Adonis athiopicas; Thunb. Prodr. 94:—"Leaflets ovate, deeply serrated, rigid, hairy. Stems branched at the top; branches erect, with few flowers." Vent. —We know nothing of this but from the definition of Ventenat, who saw it in Juffieu's hortus. Thunberg, whom we quote with doubt, defines his plant thus. "Leaves more than twice compound; leaflets deeply toothed, divaricated. Stem villous." —With this we have no further acquaintance, unless, as we strongly suspect, it is the same as the following; but if so, it by no means answers to the character given in Ventenat's work.

4. K. filia. Fine-leaved Knowltonia. (Adonis filia; Linn. Suppl. 271. A. athiopicas; Thunb. Prodr. 94: A. daucifolia; Lamarck. Dict. v. 1. 46. Anememia daucifolia; Venten. Malmaif. 22. n. 5)—Leaves twice ternate; leaflets pinnatifid, deeply cut, smooth, their segments decurrent. Flower-flasks hairy. —The only specific we have been given is that of the plants, by Thunberg, who gathered it at the Cape. We presume, therefore, it must be his Adonis athiopicus, with the character of which, cited under our last species, it sufficiently tallies. The leaves are finely divided, but not sufficiently like a Daucus to warrant Lamarck's change of the original name, however unmeaning that may be. The stem is tall and flender, bearing two hairy-flaked umbels. Lower bracteae compound. Petals nearly linear. Lamarck's account seems entirely taken from the Supplementum of Linnaeus.

KNOX, JOHN, in Biography, the intrepid and successful promoter of the Reformation in Scotland, was descended from an ancient family, and born near Haddington, in East Lothian, in the year 1505. Having received the elementary parts of a good education, he was, at a proper time, sent to the university of St. Andrews, where he applied himself with uncommon diligence in the studies of the place, made a very rapid proficiency, and was admitted to the degree of M.A. at an early age. Having determined to embrace the ecclesiastical profession, he was admitted to priest's orders before the period usually allowed by the canons. He now commenced teaching, and acquired great applause in that capacity. But by instructing others, he discovered the errors of the common syllenm in which he had been educated, and which he had endeavoured to establish in the minds of the people. Feeing dissatisfied with what he was engaged in, he chose rather to be a preacher than a teacher, and frequented the discourses of Thomas Williams, a black-friar, who publicly preached against the pope's authority, and who was the first from whom Mr. Knox received any taste for the truth. About the same time, Mr. George Wilhart, another celebrated reformer, coming from England, with the companions sent by king Henry VIII. Knox learned from him the principles of the reformed religion, and with these he was so well pleased, that from this moment he renounced Popery and became a zealous Protestant. Mr. Knox had quitted St. Andrews a little before this entire change of his opinions, having been appointed tutor to the sons of the lairds of Ormonie and Langimdy, who were both followers of the Reformation. Knox indulged into the minds of his pupils the principles of pietie and the Protestant religion, notice of which being given to David Beaton, cardinal and archbishop of St. Andrews, that prelate professed them with such severity that he was obliged to abscound, and frequently to change the place of his concealment. He thought of retiring into Germany, but was dissuaded from it by the fathers of his pupils, and he took shelter with them in St. Andrews castle, which was then in possession of the Ledies, the determined friends of the Reformation. In this asylum he continued to instruct his pupils, and he gave them public lectures in theology, which he delivered at a flat hour in the chapel, within the walls of the castle. These were frequented by several persons of note in the city, who entertained Mr. Knox to take upon himself the office of preacher, to which, though with great reluctance, he agreed to comply. He began his public ministry at St. Andrews, in the year 1547, with that success which always accompanies a bold and popular eloquence. He without hesitation struck at the root of Popery, and attacked both the doctrine and discipline of the establised church with a vehemence peculiar to himself, but well adapted to the temper and wishes of the age. In his first sermon he proved, to the satisfaction of his hearers, that the pope was antichrift, and that the doctrine of the Roman church was contrary to the doctrine of Christ and his apostles. He shortly made converts of all the people in the castle, and of great numbers in the city, who even joined him in partaking of the Lord's supper. In the month of July 1547, an interruption took place in the exercise of Mr. Knox's ministry, in consequence of the surrender of the castle to the French, when he was carried prisoner with the garrison to France. He remained in confinement in the galleys till the latter end of the year 1549, when, being let at liberty, he passed over to England, and arriving at London, was licensed either by Cranmer, or Someret, K.
the protector, and appointed preacher, first at Berwick, and afterwards at Newcastle. In 1552, he was appointed one of six chaplains, whom the council thought proper to retain in the service of King Edward VI., not only to attend the court, but to be itinerant preachers of the Protestant religion throughout the kingdom; he had also the grant of forty pounds a year till some benefits should be procured for him. Shortly after he was offered the living of All-hallows, which he refused, not choosing to conform to the liturgy. Soon after the accession of Queen Mary, he thought it right to retire from the impending storm; he accordingly went to Geneva, where he had not resided long before he was invited by the English refugees at Frankfurt to become their minister: this invitation he accepted, though against his will, through the interference of John Calvin, and he continued his services among them till some internal disputes about ceremonies broke up their society. Some of the English, particularly Dr. Cox, afterwards bishop of Ely, wished for a liturgy according to King Edward’s form, but Knox and others preferred the Geneva service; at length the party of Cox, to get rid of the Scotch reformer, taking advantage of certain unguarded expressions in one of his former publications, threatened to accuse him of treachery unless he quitted the place, which he did, and went again to Geneva. In 1555, he went to Scotland; upon his arrival, finding the professors of the Protestant religion greatly increased in number, he formed them into a society, associated with them, and commenced his preaching with the usual vehemence. He had an opportunity, in the course of a few months, to preach in various parts of Scotland, and in all the places the people flocked in great crowds to hear him. The Popish clergy began to be alarmed at the conceptions of his discourses, which were daily making converts, and fummoned him to appear before them in the church of Blackfriars in Edinburgh; he, having received assurances of support from various persons of rank and estimation, determined to obey the summons, but before the day arrived, his enemies thought it fit to abandon the prosecution. Knox, however, went to Edinburgh, and as he was not allowed to vindicate his cause in the presence of his opponents, he preached twice every day for ten days to the people, and had on these occasions more numerous audiences than he had before witnessed. Emboldened by success, he wrote a letter to the queen-regent, urging her to hear the Protestant doctrine, which she declined, and Mr. Knox afterwards published his letter with some additions. In the summer of 1556, Mr. Knox sat out for Geneva, at the earnest entreaty of the English congregation, and almost the moment in which he embarked, the bishops summoned him to appear before them, and upon his non-appearance, they passed sentence of death upon him as a heretic, and burnt him in effigy at Edinburgh. Against this wicked sentence he appealed, in a work which he printed at Geneva, and which contains a masterly defence of religious independency, and is distinguished for purity of style. In 1557, he was invited back to Scotland, and having consulted Calvin and other preachers as to the prudence and necessity of the step, he set out, and had proceeded as far as Dieppe, when he was advised that some of his best friends feared, through timidity, to be abandoning their principles, and that therefore it would not be safe for him to proceed. He immediately wrote letters to those who had invited him, complaining of their irresolution, and then denounced the severe judgments of God on all those who should betray the cause of truth and of their country, by weak-kneed or apostate. These letters made such an impression on those to whom they were immediately addressed, that they all came to a written resolution, “that they would follow forth their purpose, and commit themselves, and whatever God had given them, into his hands, rather than suffer idolatry to reign, and the subjects to be defrauded of the only food of their souls.” To secure each other’s fidelity to the Protestant cause, a common bond, or covenant, was entered into by them, dated at Edinburgh, December 3, 1557, and from this period they were distinguished by the name of “The Congregation.” In the mean time Mr. Knox returned to Geneva, where, in 1558, he published his treatise, entitled “The First Blurt of the Trumpet against the Monstrous Regiment of Women;” which was written in detestation of the cruel and infamous government of Queen Mary, and of the endeavours of the queen-regent of Scotland to establish arbitrary government in that kingdom. He intended to have followed this with “The Second Blurt,” but the death of Mary prevented him going any further. He expected much from the government of Elizabeth. She had, however, been so disgusted with what he had written against the government of women, that she embraced an early opportunity of displacing her renunciation against him. She refused his request of preaching to his friends in England, in his way from the continent, and rendered his abode there so uncomfortable, that he was glad to make the best of his road to Scotland, where he arrived in the month of May 1559. At this time a public prosecution was carried on against the Protestants, and their trial was just ready to commence at Stirling: Knox heartily hurried to share with his brethren in the threatened danger, or to afflict them in their common cause. Dr. Robertson, in describing this business, says, “While their minds were in that ferment which the queen’s peridious and their own danger occasioned, Knox mounted the pulpit, and, by a vehement harangue against idolatry, inflamed the multitude with the utmost rage. The indigoration of a priest, who, immediately after Knox’s discourse, was seen preparing to celebrate masses, and began to decorate the altar for that purpose, precipitated them into immediate action. With tumultuous, but irresistible violence, they fell upon the churches in that city, overturned the altars, defaced the pictures, broke in pieces the images, and proceeding next to the monasteries, laid those rampalian fabrics almost level with the ground. This riotous insurrection was not the effect of any concert, or previous deliberation. Confused by the reformers, and publicly condemned by the persons of most power and credit with the party, it must be regarded merely as an accidental eruption of popular rage.” From this time Mr. Knox continued to promote the reformation by every means in his power, sparing no pains, nor fearing any danger. Mr. Knox, by his correspondence with secretary Cecil, was chiefly instrumental in establishing those negotiations between “The Congregation” and the English, which terminated in the march of an English army into Scotland to assist the Protestants, and to protect them against the perfections of the queen-regent. This army, being joined by almost all the great men of Scotland, proceeded with such vigour and success, that they obliged the French forces, who had been the principal supports of the tyranny of the regent, to quit the kingdom, and restored the parliament to its former independency. Of that body, a great majority had embraced the Protestant opinions, and encouraged by the zeal and number of their friends, they improved every opportunity in overthrowing the whole fabric of Popery. They fancied the confession of faith preferred to them by Knox, and the other reformed teachers: they abolished the jurisdiction of the ecclesiastical courts, and transferred the
the caufes to the cognizance of the civil courts; and they prohibited the exercife of religious worship, according to the rites of the Romifh church. In the year 1561, Mary queen of Scots, the widow of Francis II. king of France, arrived in her native country, from which she had been abfent more than twelve years, though she was then fearcely nineteen. On the Sunday after her arrival the commanded mafs to be celebrated in the chapel of her palace; the Protcfants, from low murmurs, began to exclain loudly againft the practice, and Knox, with his ufnal vehemence, declared from the pulpif, "that one mafs was more ftrifeful to him than ten thofand armed enemies landed in any part of the realm." Knox himfelf frequently infulted her from the pulpif, and when admitted into her prefence, regardles of her lex, her beauty, and her rank, behaved to her with very unjuftifiable freedom. He avowed himfelf the author of "The Blat," and contended for the right of teaching and propagating doctrines contrary to the common opinion, and concluded a long conference by faying, "If the realm finds no inco:nuenfly in the regimen [government] of a woman, I fhall be well content to live under your Grace, as Paul was under Nero. And my hope is that lo long as ye defire not your hands with the blood of the faine of God, neither I nor the book fhall either hurt you or your authority; for in word and action, that book was written more especially againft the wicked Jezebel of England." In 1562, Mr. Knox was employed in bringing about a reconciliation between the ears of Bothwell and Arran, which fhews in what estimation he was held by perfons of the highest rank in the flate. In the fame year he was appointed, by the general afembly, commiffioner to the counties of Kyle and Galloway, and by his influence several gentlemen entered into a bond or covenant at Ayrr, fimilar to that entered into at Edinburgh in 1557. About the fame time he accepted a challenge, made by the prior of Whithorn, to a public difputation upon the mafs, which continued for the space of three days, and the fubfiance of which was afterwards published. In 1563, during the queen's abfence on a progress to the wef of Scotland, the Protcfants at Edinburgh excited a riot in the chapel royal while mafs was celebrating: of these fome of the moft active were feized in order to be brought to trial. Knox, determined to affift and fuccour them, and being authorized by the laft general afembly to give information to the whole body of Protcfants in Scotland, fhould any circumstance arise that might threaten danger to the reformation; ifued circular letters, requiring all who profefled the true religion, or were concerned in its prefervation, to afemble at Edinburgh on the day of trial, that they might comfort and affift their diftreffed brethren. One of these letters fell into the hands of the queen, and it was immediately conftrued into an act of treason, for which he was indicted, brought to trial, and acquitted. His conduct was also approved by the general afembly of the church, which mefio afterwards. In 1565, lord Darnley, who had lately married the queen, contemned, at the defire of his friends, to hear Mr. Knox preach, in hopes thereby of conciliating him, instead of which he took occafoon to declaim againft the government of wicked princes, who, for the fins of the people, are fent as tyrants and fcurvies to torment them. Darnley complained of the infult, and the council fentence the preacher for feveral days. In the fame year he was appointed by the afembly to write and eftablfih the churches in the fouth; and he was the bearer of a letter from the afembly to the bishops of England, drawn up by himfelf; the purpofe of which was to complain of the fevere treatment of the Eng- liffh Puritans, and to solicit indulgence for them. In 1571, he found it expedient to confult his own fafety by withdrawing from Edinburgh, and in the following year, as he knew his enemies were plotting his deftruction, he went forth to Abbot's-hall, in Fife, and from thence to St. Andrews, where he remained till Auguft 1572. When the troubles of the country were in fome meafe abated, the people of Edinburgh, who had been obliged to leave it, returned, and fent a deputation to St. Andrews, to invite Mr. Knox to re-fume his miniftry among them. He accepted the invitation, on condition that they would allow him to speak to them according to the dictates of his confience, as in former times, and on the lat day of Auguft he preached to them in the great kirk. His voice was, however, very weak, and his health was evidently declining. The news of the accurred massacre of Protcfants at Paris gave the fmifhing blow to his already fatterted confitution: he, nevertheless, muftered fufficient ftrenght to preach againft the bloody deed, and with much energy denounced God's vengeance on the wicked actors in it, of which he declared the French ambafador might be informed. From the moment that he had finifhed his confcription, his approaching defolution was obferved with the utmost concern by his friends. During a long infirm he discovered the utmost fortitude, and met the approaches of death with a magnanimity worthy of his high character. He anticipated with joy the prospects of immortality, and exulted in the expectation of being releafe.d from the infirmities of the body. He died November 24th, 1572, in the fift-efventh year of his age: his corpe was attended to the grave by feveral of the nobility then in Edinburgh, particularly by earl Morton, who was regent at the time, and who exclaimed, when he faw the body defeft in the ground, "there lies he, who never feared the face of man; who hath often been threatened with the daguer, but hath yet ended his days in peace and honour: for he had God's providence watching over him in an efpccial manner, when his very life was fought." The private life of this eminent reformator was irreproachable and exemplary, and the world is not a little indebted to him for that degree of light and religious liberty which it enjoys: "He was," says Dr. Robertson, "the prime inftrument of spreading and eftablifhing the reformed religion in Scotland. Zeal, intrepidity, dilufenrolened, were virtues which he poifoned in an eminent degree. He was acquainted, too, with the learning cultivated among divines in that age, and excelled in that species of eloquence, which is calculated to roufe and infifne. His maxims, however, were often too fere, and the impetuoiity of his temper exceflive. Rigid and uncomplying himfelf, he fhowed no indulgence to the infirmities of others. Regardles of the diftinctions of rank and character, he uttered his admonitions with acrimon, and ve-hemence, more apt to irritate than to reclaim. This often betrayed him into indecent and undutiful expreffions with refpect to the queen's perfon and confid. Thofe very qualities, however, which now render his character lefs amiable, fitted him to be the inftrument of Providence for advancing the reformation among a fierce people, and enabled him to face dangers, and to fummon opposition, from which a perfon of a more gentle spirit would have been apt to fhrink back." After the death of this great man, his "History of the Reformation of Religion in the Realm of Scotland, &c." was published in a folio volume. To the fourth edition of which, printed in 1752, feveral of his other pieces were added. Three pieces, among the Harleian MSS. in the British Museum, two pieces attributed to Mr. Knox, one is a letter to his wife, and the other a treatife addrefled to the faithful in London, Newcaflle, and Berwick. By g. Brit. Robertson's Hisl. of Scotland.
Knox, in Geography, a county of Kentucky, containing 11,920 inhabitants. Also, a county of Tenessee, in Hamilton district, bounded on the S. by Blount county and W. by the Indiana territory, and watered by the rivers Robbin and Clinch. It contains 11,384 inhabitants, of whom 2,622 are slaves. Also, a county in the Indiana territory, erected in 1795, and containing 1,711 inhabitants, of whom 25 are slaves. Fort Knox is in the same territory. Also, one of the two islands discovered by Captain Kingham; the other being Hancock, called by captain Roberts, who soon after discovered them, Freeman and Langdon. These islands had every appearance of fertility. Their latitude is from 83° to 85° 30′, and their longitude very nearly 141° W. from Greenwich.

1. K. zeylanica. Linn. Sp. Pl. 151. Fl. Zeylan. 189. Burm. Ind. 34. t. 13. f. 2. (Vernonice affinis; Pluk. Phyt. t. 114. f. 2.)—Flowers in spikes. Leaves smooth.—Found in Ceylon, upon the trunks of rotten trees. This plant in appearance is like a Pluntago or Lichanis. Stem erect, a foot high, smooth, jointed. Leaves opposite, lanceolate, nearly sessile. Spike long, narrow, with scattered, fleshy flowers.

2. K. coronalis. Posthumus of the Malbars. Wild. n. 2. (Planta Maderaspatana; Pluk. Amal. 172. t. 454. f. 2.) K. striola; Gaertn. v. 1. 121. t. 25. f. 87.—"Flowers corombole. Leaves downy beneath."—A native of the East Indies and found near Ceylon. Stem pubescent. Leaves two together, pointed, on footstalks, lanceolate, smooth above, covered on the under side with short thick hairs. The inferiority in size and habit is that of Vahliana dioica. Flowers on footstalks. Seeds small, flattened, discoed and dispersed in an umbel at the summit of the dome. We have little doubt but that Willdenow is perfectly correct in presuming this to be the K. striola of Gaertner.

KNOXVILLE, in Geography, a poll-town of America, the metropolis of the State of Tenessee, situated in Knox county, on the N. side of Holton river, where it is 300 yards wide, on a beautiful spot of ground, 22 miles above the junction of the Holton with the Tenessee, and four below the mouth of French Broad river. This town is flourishing, and communicates by post with every part of the United States. It is regularly laid out, and contains 518 inhabitants, a court-house, jail, and barracks large enough to contain 700 men. The supreme courts of law and equity for the district of Hamilton are held here every half year, and the courts of pleas and quarter-sessions for Knox county are also held here. A college has been established in this town by government, called "Blount college." N. lat. 35° 48′. W. long. 83° 44′.

KNUCKLEPOINT, a cape on the N.E. coast of New Zealand. S. lat. 34° 51′. W. long. 160° 21′.

KNUCKLE-TIMBER, in Ship, are the upper or top timbers next the beak head, whose heads flanging perpendicular, and the heels or lower part partaking of the hollow of the top side, form an angle or knuckle near the plankshee.

KNUD'S HOYED, in Geography, a cape on Denmark, on the E. coast of Siefwich, eight miles N.E. of Haderleben. N. lat. 55° 20′. E. long. 9° 40′. Also, a cape of Denmark, on the E. coast of the island of Fyn, projecting into the Great Belt, and forming a bay on the S. of the town of Nyborg. N. lat. 55° 17′. E. long. 10° 52′.—Also, a cape of Denmark, on the S.W. coast of the island of Zealand. N. lat. 55° 3′. E. long. 11° 5′.

KNUTSFORD, a considerable market town in the hundred of Bucklow, and county of Chester, England, is seated on the great road from London to Liverpool, being 173 miles from the former, 30 from the latter, 24 from Chester, and 15 from Manchester. It was formerly a chapelry within the parish of Rothemere, but was made a distinct parish, by act of parliament, in the year 1741, and comprises the townships of Over-Knutsford, Nether-Knutsford, Bexton, Ollerton, and Toft.

William de Tabley, who was lord of both the Knutsfords, about the year 1202, granted a charter of privileges to his burgesses of Knutsford, which is printed in Sir Peter Liccestier's History of Bucklow hundred; this William, about the same time, procured a charter for a market on Saturday, which still continues, and a fair for three days, at the festival of St. Peter and St. Paul; the charter was confirmed to William Tabley the younger, 1332; this fair also is still continued; there is another on the 8th of Nov., and a third has been established within these few years on the 23d of April; none of them are noted as great marts for the sale of any particular commodities, A charter for a Wednesday's market at Over-Knutsford, on Knutsford-Booth, was granted in 1355, to Ellen Legh, with a fair on Tuesday and Wednesday in Whit-fun-werk; this market has been long discontinued, but the fair is still held.

Knutsford is not a corporate town, but it appears that its chief officer was called a mayor in the reign of King Edward I; it has now no peculiar government. The quarter-sessions for the county are held in this town at Midsummer and Michaelmas. In the year 1777, an account having been taken of the population of Knutsford, it was found that there were 3575 families, and 1674 inhabitants; annual average of deaths for the ten years then preceding had been only one in forty, being about the same proportion as in the city of Chester, and very much below the usual average of towns. According to the returns made to parliament, under the population act in 1801, there were then 5434 families in Over and Neth. r. Knutsford, and 2372 inhabitants, of whom 782 were employed in trade, manufactures, or handicraft. A manufacture of thread has been long established in this town. There is no cotton factory, but
but a great deal of cotton spinning and weaving is done in private houses.

Under an act of parliament passed in the year 1741, Knutsford was made a distinct parish and vicarage, and the ancient chapel in Nether-Knutsford taken down; the new parish church, then built in the Tventry-croft, was consecrated in the year 1744, and dedicated to St. John the Baptist; the patronage is vested, by the act, in the lords of Over-Knutsford, Nether-Knutsford and Ollerton, Toft, and Bexton, who present in rotation. Knutsford is divided into two parts by a small rivulet, and from the relative situation, these divisions are called Upper and Lower. Annual races are held in the vicinity of this town. Immediately in the neighbourhood are some feats distinguished for their antiquity and picturesque features. To the north is Tatton-hall, the seat of Wilbraham Egerton, esq., a large stone mansion, recently erected from the designs of Samuel Wyatt, esq. The adjoining park comprises about 2000 acres of land, some of which is annually in tillage. West of the town is Tabley-house, the seat of Sir John F. Lecester, bart., a large brick mansion, in a spacious park, which is ornamented with a large lake and fine forest trees. The house is particularly noted for its noble gallery of pictures, all executed by English artists. Lylyon's Britannia, vol. ii. 4tto. 1810.

Knutten, Mathias, in Biography, a native of Oldenworth, in the duchy of Sleewick, was educated at Konigberg, in Prussia. He is the only person on record who openly professed and taught the principles of Atheism. It has been asserted that he had, at one time, 1000 disciples in the different parts of Germany. They affirmed the title of "Confessarii," because they maintained that people were bound to lay aside all consideration of God and religion, and to follow the dictates of reason and conscience alone. Reafon, said Knutten, teaches every man the three fundamental principles of the law of nature: "to hurt nobody" — "to live honestly" — and "to give to every man his due." In the year 1674, he delivered a Latin letter, and two dialogues in German, explanatory of his doctrines, which affirmed that there was neither God nor devil; that neither magistrates nor priests were to be regarded, and that there is no life but the present. Muserus published an answer to his Letter and Dialogues, as well to refute the absurdity and wickedness of his system, as to contradict the fact respecting the number of the disciples. He probably died in contempt, as no notice is taken of the latter part of his life by historians. Moreri, Bayle.

Knutzen, Martin, a professor of philosophy in Prussia, was born at Konigberg in the year 1715. He filled, for some years, the philosophical chair in the university of his native place, and occupied the post of librarian. He died in 1751, when he was only about thirty-eight years of age. He was a writer of several learned works, of which the principal are, "Systema Caufarum Efficientium;" "Elementa Philofophicæ Rationalis, Methodo Mathematico demonstrata;" "Theoremata de Parabolis infiniti;" and "A Defence of the Christian Religion." This last is said to be a very excellent piece, and one that is honourable to his virtues and talents.

Knysna, in Geography, an arm of the sea on the coast of Africa, in the colony of the Cape of Good Hope, at the distance of about 18 miles to the westward of Plettenberg's bay, which, in the opinion of Mr. Barrow, may one day become an important station. He has given a plan of it in the second volume of his "Travels in Southern Africa."
the tail is about a foot long, and is covered with longish black hairs.

**KOBACK**, in Geography, a town of Scelovia, on the Sava; 20 miles E.S.E. of Belgrade.—Allo, a town of Africa, in the kingdom of Yafi.

**KOBAD**, a district of Persia, in the N.W. part of Farriquin.

**KOBAK**, a town of Sweden, in Weft Botnia; seven miles N.W. of Umea.

**KOBAN Kupri**, a town of Turkish Armenia; 27 miles E. of Erzerum.

**KOBELENIKA**, a town of Austrian Poland, in Galicia; 24 miles W. of Lemberg.

**KOBELEWIES**, a town in the canton of St. Gallen, in Switzerland, at the foot of the Karnor. About two miles above Kobelwies are the caves known by the name of the Crystal Caves. These are difficult of access, the only possible mode of entering them being in a creeping posture. From the first of these cavés you descend into the second, and ascend again in order to arrive at the third, out of which issues a brook, which supplies forty baths at Kobelwies. The interior of the caves is fluted all over, not with rock crystalls, but with calcareous spar, which is partly coated with a yellow kind of clay; it is found white and of an ash-grey colour, separates into brilliant large grains with a smooth surface, and when burnt yields the finest and whitest flint of fine which is applied for the purposes of art. The water issuing out of the caves is very clear; it is impregnated with lime and sulphuric acid, and the baths it supplies (especially when taken warm) are very efficacious in the cure of the &eprevailing in the marshy parts of the country bordering on the Rhine.

**KOBEN**, a town of Sleifia, in the principality of Glogau, on the Oder. N. lat. 51° 31'. E. long. 16° 26'.

**KOKI**, a town of Rußia, in the government of Caucasus; 60 miles S.E. of Ekaterinograd.

**KOBELE**, a town of Lithuania, in the palatinat of Troki; 20 miles N.N.E. of Grodno.

**KOBELEN**, a town of the duchy of Warsaw; 28 miles W. of Kalisz.

**KOBIL**, a town of Rußia, in the government of Peterburg, on the E. coast of the Tchudchoi lake; 24 miles N. of Plock.

**KOBLINKAIKA**, a town of Rußia, in the country of the Coiffacks; 156 miles E.N.E. of Azoph.

**KOBIN**, a town of Perfa, in the province of Segellan; 50 miles S. of Zarepp.

**KOBINIKE**, a town of Lithuania, in the palatinat of Wilna; 52 miles E.N.E. of Wilna.

Gen. Ch. Male, Cal. the inner scales of a catkin, each oblong, slightly concave, finger-flowered, permanent, sometimes wanting. Cor. none. Stam. Filaments three, capillary, erect, longer than the calyx; anthers vertical, linear, erect.

Female, Cal. the outer scales of the same catkin, rather larger, feathery, elliptic-oblong, finger-flowered, permanent. Cor. none. Pist. Germen superior, triangular; style cylindrical, short; stigmas three, bristle-shaped, downy. Peric. none, except the permanent scales. Seed one, triangular, pointed, hard, naked.

Eff. Ch. Male, Calyx the inner scales of an imbricated catkin, solitary. Corolla none.

Female, Calyx the outer scales of the same catkin, feathery, permanent. Corolla none. Stigmas three. Seed triangular, naked.

Obs. This genus differs from Carex in the want of a tunic to the seed, which is so remarkable in that, and has been called sometimes a corolla or nectary; as well as in the disposition of the flowers. These in Kobresia stand in pairs, the males being internal, and smaller. In one known instance only they want their scale or calyx, so that there is no separation between the flaments and pili, and the flowers become apparently united, or hermaphrodite. Three species only are known.

—Native of dry elevated spots on the mountains of Savoy, Dauphiny, Italy, Carinthia, Styria, and the Tyrol, flowering in July and August. We have gathered it high on Mount Cenis, in company with the abate botanist whose name it bears. Linneus had specimens from Italy, which he never described. Mr. Davall found this plant on the mountain of Valsorey, though Haller has it not. The root is perennial, tufted, consisting of numerous blackish, zig-zag fibres, running deep into crevices of rocks. Stems numerous, a span high, or less, simple, naked, round, fimbriated, smooth, erect or slightly curved, compounding denfe tufts, with numerous, feathery, brown, polished radical scales, Leaves radical, erect, shorter than the stems, narrow, acute, involute, rough-edged. Spike terminal, solitary, erect, about an inch long, obtuse, slender, of ten to twenty pair of flowers, most lax in its lower part. *Glumes* brown, shining, with membranous edges, awl-shaped. Schuhk. figures but two fligms; we find three, as all other writers describe them. The permanent glumes, involving the seed, look like the torn tunic of a *Carex*, as Villars represents them. That of the male flower is much the smallest and most membranous.

2. *K. caricina*. Willd. n. 2. (Carex hybrida; Schuhk. Car. t. Rrr. f. 161. Wildt. Schloes. monocus; Sm. Eng. Bot. v. 20. t. 1410.)—Spikes compound, dense, somewhat ovate; spikelets alternate, imbricated.—Native of Mount Cenis, in rather moist muddy spots, flowering in August; gathered by the writer of the present article in 1787. Mr. Dickson observed it in the county of Durham in 1799. The Rev. Mr. Harris makes the mountain of Cronkley, and the neighbourhood of Waddy bank, in Teesdale forest, as its particular stations. At the suggestion of the late Mr. W. Brunton, it was referred in *Eng. Bot.* to Schloes. monocus, proving, on examination, no *Carex*. Its habit and size are much like the preceding, except that the *flumes* grow less crowded or tufted, and are flatter, and the leaves shorter, somewhat broader, as well as more spreading. The *spikes* is essentially different, being composed of four or five alternate, short, elliptical spikelets, making all together an ovate figure. *Glumes* rather more pointed, keeled, and less membranous, than in the foregoing species. *Stigmas* three. Seed elliptic-oblong, triangular, pointed, hairy.

3. *K. cyperina*. Willd. n. 3. (Carex hermaphrodita; Jacq. Coll. v. 4. 175. Ic. Rar. t. 615.)—Umbel twice compound, leafy; spikes cylindrical; spikelets spreading. Male flowers without their proper calyx.—Jacquin received this from the Caraccas, where it grows in wet situations, and it flowered with him in the *flows* at Vienna, from May to August. The habit is that of a *Cyperus*, or a *Kyllingia*. Root perennial. *Stems* annual, triangular, smooth, about two feet high, with several long, feathery, linear, roughish leaves, half an inch broad at their base, and many smaller ones.
KODAJA, a town of Arabia, in the province of Nedsjud; 50 miles W. of Janam.  
KODAILLY, a town of Hindooistan, in Myfورية; 27 miles E. of Chamba Balabaram.

KODDE, VANDER, in Biography. There were three brothers of that name, viz. John, Adrian, and Gilbert, inhabitants of Warnam, near Leyden, who were entitled to notice from their having been founders of a religious community known by the name of COLLEGIANTS, which fee. The founders passed their days in the obscurity of a rural life, but were said to be men of eminent piety, well acquainted with sacred literature, and enemies to religious controversy. Gilbert was an elder of the Remonstrant church at Warnam, and professed a fluent eloquence. In the year 1619, when the persecution of the Calvinists had driven the Remonstrants from their churches, the three brothers joined together for the purpose of the church at Warnam, at which one or more of their number should preach one of the two out of the Bible and pray; and if any person had any thing to offer by way of exhortation, instruction, or the education of others, he should be at liberty to do so. Hence they soon inferred the mutuality of the ministration, as the people were sufficiently qualified to teach and instruct one another. From this origin sprung a sect, or community, already referred to, consisting of persons of all sects which spread very widely over the Dutch provinces. Mohamet's Eccleft. Hist.

KODEN in Geography, a town of Lithuania, in the palatinate of Brezec; 12 miles S. of Brezec.

KODGIA-HISAR, a town of Asiatic Turkey, in the province of Diarbekir; 10 miles S. of Merdin.

KODGIA-SHEHR, a town of Natalia; 12 miles N. of Kustaj.

KODLAK, a range of islands, consisting of one large, bearing this name, and several smaller, in the North Pacific ocean, extending about 120 miles in length from S.W. to N.E., about 50 miles in breadth; above 20 miles from the W. coast of America, and 50 S. from the entrance into Cooke's inlet. N. lat. 56° 45' to 58° 28'. E. long. 200° 12' to 205° 45'.

KODJA. See the next article.

KODJAKANS, or Kodjas, a numerous class of persons in the Ottoman empire particularly in the capital, which holds the middle rank between the military men and the lawyers, and which is become sufficiently powerful, since the influence of the Ulemas has declined, as the divan is composed of them, and as some of them obtain fiefs, military rank, and governments. Almost all the ministers, all the agents in the different administrations of the capital, the customs, and the muleti; all the principal offices, all the secretaries, all the clerks, all the school-masters; in a word, all the writers from the simple "kaiats," who copies books, petitions, or memorials, and him who applies himself to writing purely and correctly the language, to the "reis-effendi," who is at the head of them, are all distinguished by the name of Kodja, and make part of that fort of corporation. The art of transcribing the national books, and especially the koran, is a kind of nursery for this class of persons. The Muffulmen are indebted to the Kodjas for a great number of works, which they hold in high estimation, relative to the Arabic and Persian languages, philosophy, morality, Mahometan history, and the geography of their provinces; and among them are generally found the most intelligent men.

KOC, in Geography, a town of Walachia, on the Arges; 45 miles N. of Buchareft.

KOCYCK, a town of Poland, in the palatinate of Lublin; 24 miles N. of Lublin.

KOCZARAWAC, a town of Poland, in the palatinate of Braslaw; 48 miles S.S.W. of Braslaw.

KOCZMYN, a town of Lithuania, in the palatinate of Novogrorder; 28 miles N. of Sluck.

KOCZOWA, a town of Poland, in the palatinate of Kiev; 22 miles S.S.E. of Bialacerkiew.
flate or those who are most capable of serving as auxiliaries.

KODI-AISSAR, a town of Natolia; 18 miles N. of Kangari.—Allo, a town of Ahfat Turkey, in Adaladia, 18 miles N.E. of Siwas.

KODINSKA, a town of Russia, in the government of Tobolsk; 224 miles E. of Enisilin. N. lat. 53° 56'. E. long. 69° 1'.

KODMA, a town of Persia, in the province of Kerman; 40 miles N. of Kermanhir.

KODMAN, a town of Waclavia; 10 miles S. of Kordedardara.

KODNA, a town of Russian Poland, in Volhynia; 10 miles S. of Zytomier.

KOEG. See Daczebiter.

KOEG, or KOEI-YANG, a city of China, of the first class, and capital of the province of Koei-techo. It is a small city, being only about three miles in circuit; its houses are partly of earth, and partly of brick, and as the river that approaches it is not navigable, it is a place of no trade. It was once the residence of the ancient kings; the remains of temples and palaces announce its former magnificence; but the monuments of grandeur are mouldering into ruins. Within its jurisdiction there are three towns of the second order, and four of the third; about it are many forts. N. lat. 26° 50'. E. long. 106° 10'.

KOEI-TECHO, the smallest province of China, bounded on the N. by Se-tchuen, on the E. by Hon-quang, on the S. by Quang-f, and on the W. by Yunnan. The whole country is almost a desert, and covered with inaccessible mountains; so that it may be regarded as the Siberia of China. The inhabitants are independent and ferocious. The Mandarins and governors, who are sent into this province, are sometimes disgraced noblemen, for whom the emperor wishes to provide; the garrisons are entrusted to their charge, in order to overawe the country; but no troops of the empire are found sufficient to subdue the intractable mountaineers of this province. Many efforts have been made for this purpose, forts have been erected, and troops sent to conquer them; but they retire within the fastnesses of their mountains, and seldom issue forth, but to destroy the Chinese works, or ravage their lands. Neither silk stuffs, nor cotton cloths, are manufactured within this province; but it produces a plant, resembling our hemp, of which they make cloth for their summer dresses. It has mines of gold, silver, quicksilver, and copper; and of the latter metal, they make those small pieces of coin, which are in circulation throughout the empire. This province contains 10 cities of the first class, Koei-yang being the capital, and 38 of the second and third. Some of these cities, which are constructed of earth and brick, and which may be said to resemble heaps of cottages, are situated on the banks of agreeable rivers and in fertile valleys; and though a quantity of land might be found in this province, which by proper cultivation would yield a considerable produce, the Chinese are so averse by the mountaineers, that they dare not leave the neighbourhood of their fortresses.

Koei-techo furnishes the best horses in China; an immense number of cows and hogs are raised here, and wild poultry, of a mottled exquisite taffe, are every where to be found. Sir George Staunton estimates the population of this province at 9,000,000.

KOEI-TECHO, a city of China, of the first class, in the province of Se-tchuen; seated on the banks of the great river Kineha, or Yang-tse-kiang, and forming the key to the province with a custom house for receiving the duties of the merchandise which is brought thither. Its trade is great, and of course it is opulent. Its jurisdiction comprehends one city of the second class, and nine of the third. The adjacent country is mountainous, but is rendered fruitful by the industry of its occupiers, who are polished husbandmen. The neighbourhood affords great quantities of musk, and several springs from which salt is procured. Orange and lemon trees are very common. N. lat. 31° 10'. E. long. 109° 14'.

KOELCOTTY, a town of Thibet, on the Ganges; 30 miles S. of Gangotri.

KOEL, a ridge of mountains between Sweden and Norway.

KOEL-PINIA, in Botany, so named by professor Pallas, in the third volume of his Russian Travels, p. 755. to L. l. f 5; 2, in memory of "his highly meritorious friend," Alexander Bernard Koelpin, Professor of Physic at Stettin, in Pomernia, author of several botanical tracts. Pallas submits this genus to the decision of those who, as he modestly says, take the lead in botany. Few are more worthy to do so than himself, and his Koelpinia is established as a genus by Schrober and Willdow, though they found themselves obliged to adopt a different name, this identical genus being the Rhagadiolus of Carpilipns, Tournefort, Vaillant, Juffieu, and Gaertner, confounded by Linnaeus under Lapifinia. The name they have retained seems to us expressive and unexceptionable, though Ambrofino surely gives a wrong explanation of its meaning. See Rhagadiolus.

Gen. Ch. Cal. Perianth inferior, of five, ovate, obtuse, concave, membraneous, unequall leaves, ascending towards the upper side; gaping below. Cor. Petals four, equal, ascending towards the upper side; the lower ones opposite; claws cylindrica, straight, the length of the calyx; borders lanceolate, recurved at the top, spreading. Nectary composed of four erect, deeply cloven scales, affixed to the claws of the petals, forming a crown to the orifice; with three glands between the flaminis and pitif. Stem. Filaments eight, awl-shaped, erect, affixed to the columnar receptacle; anthers oblong, obtuse. Pijl. Germen superior, oblong, triangular, standing upon the columnar receptacle; fyls simple, three-fidged, ascending, as long as the petals; stigma trifid, spreading, small. Peric. Capsule oblong, of three cells, and three valves, the partitians from their centre. Seeds in pairs, attached to the partition, one of them generally abortive.

Eff. Ch. Calyx of five leaves. Corolla of four petals, irregular. Nectary of four cloven scales, and three glands. Capsule of three cells, with two seeds in each.

1. K. paniculata. Wildl. n. 4. L'Herit. Sert. Angl. t. 19. (Sapindus chinensis; Linn. Suppl. 228.)—A native of China, hardy with us, flowering in July and August. Stem arboreous, upright, round, smooth, branched, six or seven feet high. Branches scattered, twisted; the younger ones glandulous and dotted. Buds conical, imbricated. Leaves on long, club-shaped, channelled foot-stalks, unequally pinnate, with about six pairs of ovate, laciniate, serrated,
KOEPFFERIA. See KEMPFERIA.

KOENIG, SAMP., in Biography, a learned philosopher, distinguished by his mathematical abilities, was a Swis by birth. He filled the chair of philosophy and natural law in the university of Franeker, whence he removed to the Hague, where he had the appointment of librarian to the stadtholder, and to the princes of Orange. He was elected a member of the Academy of Sciences at Berlin, but was afterwards expelled from that body, on account of an attack upon Maupertuis the president, charging him with plagiarism. The learned in every part of Europe felt interested in the dispute. Koeg published an "Appeal" written with much animation, which procured him many supporters. He died in 1777, leaving behind him the character of being one of the best mathematicians of the age. He was author of several other pieces. According to Voltaire "he was a great metaphysician, a good geometerian, and, what is of still greater moment, a very good man."

Gen. Ch. Cal. Perianth inferior, in three deep, ovate, concave, permanent segments. Cor. none. Stam. Filaments three, capillary, shorter than the calyx; anthers roundish. Pist. Germen superior, ovate; styles none; stigmas three (often but two), close together, downy, coloured. Peric. none. Seed solitary, ovate, as long as the calyx.

1. K. ylandica. Linn. Mant. 35. Fl. Dan. t. 418.—Native of Iceland, from whence sir Joseph Banks brought seeds to Kew garden in 1753, and where Mr. William Jack son Hooker observed it on his late eventful visit to the same country, of which he has favoured the public with so pleasing and unaffected a narrative. This humble plant is chiefly calculated to attract the scientific botanist, being an annual, scarcely two inches high, with a few alternate, obovate, or spatulate, entire leaves, and small, green, filibracteate, terminal flowers. The whole herb is smooth, a little succulent, turning red in decay, or from exposure to much light, like its allies the tribe of Docks and Sorrel.

KOERTEN, JOHANNA, in Biography, was born at Amsterdam in 1650. She had a fine taste for drawing in water colours and for embroidery. She also modelled in wax, and made artificial ornaments and flowers; but her chief excellence consisted in cutting out figures in paper with feiffers only, and her portraits and landscapes in this way were so much

KOE
talked of that foreigners from all countries visited Amsterdam to see them, among whom was Peter the Great of Russia. She made a magnificent display of her art for the comfort of the emperor Leopold, confuting of trees, arms, eagles, &c. for which she was very handsomely paid. She died in 1715.

KOETKOIE, in Geography, a small island in the East Indian sea. S. lat. 4° 38'. E. long. 132° 8'.

KOEWAK, a town on the S. coast of the island of Cey- ram. S. lat. 3° 14'. E. long. 129° 18'.

KOJ, a town of Japan, in the island of Nippon; 27 miles S.E. of Nagata.

KOFE, a town of the county of Tyrol; on the borders of the Vicentin; near which is a celebrated pass, with a fort erected on a high and steep rock, in which is a spring of water for the supply of a small garrison, which can only enter by means of pulleys. The road below is scarcely wide enough for two carriages. On the side opposite to the fort is the precipitous bank of the Brenz; 21 miles E. of Trent.

KOFJ, mountains of Persia, between Meem and Kerman.

KOGETIN, a town of Moravia, in the circle of Olmutz; 14 miles S. of Olmutz. N. lat. 49° 22'. E. long. 17° 15'.

KOGIL, a town of the dukcy of Styria; 17 miles N.W. of Rakepfur.

KOGONG, a town of Africa, in the country of Sierra Leone. N. lat. 10° 45'. E. long. 12° 12'.

KOHALTL, a town of Candahar; 130 miles S.E. of Cabul. N. lat. 33° 5'. E. long. 70° 20'.

KOHEL, a town of Arabia; in the province of Yemen; 10 miles N. of Debin.

KOHLBERG, a town of Bavaria, in the principality of Sulzbach; 11 miles N.E. of Sulzbach.

KOHLMEISE, in Ornithology, the Colomys of Pennant, &c. See PARUS alter.

KOHLMULFEN, in Ichthyography, a name given by some to the aelius flavuscent, or yellow cod, called by others blank and gilbe. See GADUS PALLIDUS.

KOHLRABI, in Agriculture, the name of a fort of tur- nip cabbage, which is probably capable of being cultivated to advantage as an article of cattle food, though it is not yet much known to the farmers of this kingdom. It has the edible part, or bulb, above the ground upon the stem, and there are two varieties, the green and the blue, which are both equally good and hardy in their nature.

In the rating of plants of this kind, the seed should be sown at the same period as for the common cabbage, and the plants, when of proper growth, be transplanted out in the same manner about the beginning of June, allowing good distances both between the plants and rows. In performing this work, it is advised to cut off about one-third of the roots of the plants, care being taken to plant them sufficiently deep in the ground, as by this means the bulb grows to a much larger size without becoming tough.

Plants of this fort succeed well on soil as also are not too much disposed to moisture. This plant is found to withstand the severity of frosts much better than the Rota bagii, or Swedish turnip. And it is further observed, that in the botanical garden at Brompton, some of the plants weighed seven or eight pounds; and that though many of them were notched and hacked on purpose for the experiment, the turnip remained perfectly sound and uninjured, while a bed of Swedish turnips new planted was quite rotten. The fasci- charine quality of it is equally remarkable, and both its leaves and bulb are very useful as kitchen vegetables.
KOK

In our own trials, we found it to land the severity of the winter without the least injury, and to be perfectly well tailed, though the bulbs did not increase to a large size. It has every appearance of being a variety of the turnip cabbage. But few experiments have, however, been made upon it, either in regard to its culture or application as a green cattle fodder.

KOHMU, in Geography, a town of Bengal; nine miles N. of Toree.

KOHONE, a town of Africa, in the kingdom of Burfali. KOHTAUM, a town of Bengal; 18 miles W. of Doera.

KOH-ZERDEH, mountains of Persia, in the province of Chaffilian, bordering on the Iraq. See Hetzardaka.

KOJAJ-KIZ, a town of Kharalim, near lake Aral; 18 miles N.E. of Urkone.

KOIDANOW, a town of Russian Lithuania; 15 miles S.W. of Minile.

KOLLEN, or Kognd, a town of Greater Bucharia, on the left bank of the Sev, on the borders of Turkellan.

In 1220, it was taken and plundered by Jenghiz Khan, after a brave defence; 120 miles N.E. of Samarcand.

KOLIRVIRAH, a town of Persian Armenia; 18 miles S. of Erivan.

KOISJU, a town of Japan, in the island of Ximo; 26 miles W. of Naka.

KOIVISTA, a town of Russia, in the government of Viborg; 20 miles S. of Viborg.

KOKANO, a town of Poland, in the patinate of Bracilaw; 28 miles N. of Bracilaw.

KOKAR, a small island of Sweden, in the Baltic, about 40 miles S.E. from the island of Aland. N. lat. 59° 58'. E. long. 20° 46'.

KOKERWARA, a town of Hindooftan, in Guzerat; 15 miles N.W. of Amedabad.

KOKETERARA, a town of Hindooftan, in the circar of Gangpouri; 16 miles N.E. of Pada.

KOKLOT, a small island on the E. side of the gulf of Bothnia. N. lat. 62° 17'. E. long. 21° 23'.

KOKOB, in Zoology, the name of a species of serpents found in the West Indies, and very fatal by its bite. It is smaller than our viper, and of a brown colour, variegated with green and red spots.

KOKONOR, Tartars or, in Geography, a tribe of Tartars, who are, by nation, Eelutes or Kalmucks, and subjects of the emperor of China, and who occupy an extensive country to the W. of China, and the province of Chen-fl, from which they are separated by lofty mountains. See Kalmucks.

KOKONOR, or Koknod, Lake, is the largest in Tartary; it is about 26 leagues in length, and 10 miles in breadth, and is situated between latitude 3° 45' and 38° 15' N. lat. and 100° and 101° E. long.

KOKORIE, a town of Hindooftan, in the circar of Kitchwara; 15 miles E.N.E. of Shajehapour.

KOKORO, the eastern branch of the Senegal river, which rises about N. lat. 13° 50'. W. long. 6° 40', and joins the westerly branch about N. lat. 14°.

KOKORY, a town of Moravia, in the circle of Prerau; six miles N.W. of Prerau.

KOKRA, a town of Hindooftan, in the circar of Ruttumpour; 20 miles S. of Ruttumpour.

KOKURA, a sea-port town of Japan, on the N. coast of the island of Ximo; surrounded with walls, and having a citadel, it is a place of extensive trade, but the harbour is nearly choked with mud. N. lat. 33° 50'. E. long. 130° 20'.

KOLA, a sea-port town of Russia, in the government of Archangel, situated near the North sea, on the river Kola, forming a bay at its mouth, in which is a considerable fishery for whales, seal-dogs, and other fish, which the inhabitants cure for sale. N. lat. 68° 52'. E. long. 35° 26'. According to Mayer, it is 420 feet above the level of the sea. The thermometer was once, in May 1769, at 73°.

Also, a town of European Turkey, in Servia; five miles S. of Semenaria.—Also, a town of Turkish Armenia; 40 miles N.E. of Karsh.

KALABOOY, a town of Hindooftan, in Orissa; 20 miles N.E. of Sambulpour.

KOLAH, a town of Natolia; 36 miles N.E. of Alash-Sehr.

KOLAR, a town of Africa, in the kingdom of Burfali, near the coast of the Atlantic. N. lat. 13° 50'. W. long. 15° 55'.

KOLASIN, a town of Dalmatia; 24 miles S.E. of Moltar.

KOLAY, a river of Cochininira, which runs into the Chinefe sea. N. lat. 13° 51'. E. long. 108° 54'.

KOLBE, or KOLBEN, Peter, in Geography, was born at Dollas, a village in the principality of Baireuth, of which place his father was a judge, and afterwards a receiver of taxes. When he had attained the first principles of knowledge, he was sent to Nuremberg to pursue his matuer studies. Here he lived some time in great poverty, being unknown, and having brought with him a single dollar only. In 1666, he was received into the house of Einart, a great astronomer, under whose directions, and by whose aid, he made considerable progress in the sciences. He entered himself at the university of Halle in the year 1720, and in the following year he disputed "De Natura Cometarum," after which he gave a course of lectures in mathematics and philosophy. He was introduced to baron von Kroke, privy counsellor to his Prussian majesty, to whom he became secretery, and whom he accompanied in his travels. It being known that he had a great delire to visit foreign countries, a propolal was made to him to go to the Cape of Good Hope, which he gladly embraced. Here he remained ten years, making observations on the country and the people, till he was afflicted with the misfortunes of blindness, which came on without any external injury. He now returned to Europe, and by means of medical assistance he so far recovered his health to be able to read with the assistance of glasses. In 1716, he entered in the Acta Eruditorum a treatise "De aquis Capitis Bona Spei." This work introduced him into farther notice, and he was invited to travel with two Austrian counts, but his passion for foreign countries had subdued, and he preferred remaining at home, and taking upon himself the office of rector of the school of Neuf-landt. He discharged the duties of his situation with much diligence till the year 1726, when he died, in the fifty-second year of his age. His busses, as an instructer, had not prevented him from publishing his great work, entitled "A Description of the Cape of Good Hope," in folio, with twenty-four plates. This work was translated into the Dutch language in 1727; and at London, into the English, in 1731. It was afterwards abridged, and published in French in three vols. 12mo. Kolbe has been charged with receiving information without much examination, and with having published, as true, many false and incredible stories; but when the proper deductions are made that severe criticism has suggested, there still remains much important information with regard to a country, which, at that time, was scarcely known. Gen. Bieg.
KOLBENDORF, in Geography, a town of Bohemia, in the circle of Königgrätz; nine miles N.N.W. of Trautenau.

KOLCHY, a town of Poland, in the palatinate of Volhynia; 52 miles N. of Zytomery.

KOLEI-HISAR, a town of Aseri, in the government of Sivas; 45 miles N.E. of Sivas.

KOLÉN, a chain of mountains, extending between Norway and Swedish Lapland, and afterwards bending, in the form of a horse-shoe, on the S. of Finnmark.

KOLGAPARI, a town of Rusiia, in the government of Olonetz; 80 miles N.N.W. of Olonetz.

KOLIAKOV, a town of Russia, in the government of Simbirsk, on the Sura; 80 miles W.S.W. of Simbirsk.

KOLASIN, a town of Russia, in the government of Tver, on the Volga; 68 miles E.N.E. of Tver.

KOLIKUNDA, a town of Africa, in the kingdom of Jarannov.

KOLMA, KOLMA, or Kowmyn, a river of Russia, which rises in the Stanovoi-Krebet, almost over-against Ochottâ, and after receiving several other rivers, particularly the Ochottâ, forms a multitude of islands, and, by means of four broad arms, flows into the Frozen ocean, N. lat. 71° 25'. E. long. 172° 24'.

KOLIN, a town of Bohemia, in the circle of Kurszam, on the Elbe; 50 miles E.S.E. of Prague. N. lat. 49° 58'. E. long. 15° 15'.

KOLYAN, KOLYAN, or Kolyan, a city of Russia, and capital of the government of the same name, situated on the Oby, near the mouth of the Berda; known before the institution of this government under the name of "Berdskoi Florod." Kolyan is famous for the silver mines discovered in its vicinity. They lie between the rivers Oby and Iritche, near the mountains which separate Siberia from the Chinese empire, or rather from the territory of Kalmucks dependent on the Chinese. They were discovered in the year 1725 or 1728, and appropriated to the crown by the empress Elizabeth in 1744. They produced annually, between 1740 and 1762, from 8,000 to 16,000 pounds of silver; between 1763 and 1769, from 20,000 to 32,000; and since that period to 1778, from 40,000 to 48,000. The silver contains upwards of three per cent. of gold; the separation of which is made in the imperial laboratory at Peterburgh. Upon the whole, it appears from the accounts of the board of mines, that they have produced, from their discovery to the year 1790, about 3,520,000 pounds of silver, and 48,000 pounds of gold, which, if we may draw an average, a produce of 50,000 pounds of silver, and 1000 pounds of gold per annum. The mines and foundries of the Kolyan employ nearly 40,000 colomits, besides the peasants in the districts of Tomak and Kuknets, who, in lieu of paying the poll-tax in money, cut wood, make charcoal, and transport the ores to the foundries. In the year 1767, a mint was established at the foundry of Sufomik, for the coining of the copper supplied from these mines, the greater part of which had been, till that period, of no use. Pieces of one, two, five, and ten copecks (the copeck being nearly equal to a halfpenny) are flarked and dispersed over Siberia. Of this currency, the amount of 500,000 roubles is annually coined, which is sufficient for reimbursing the poll-tax, paying the miners, transporting the ore, purchasing the lead, which must be brought from Nerhink, and defraying the expense of sending the gold and silver as far as Tobolsk. The silver melted in the foundry is conveyed on large sledges twice a year; the first convoy sets off in the beginning of winter, and reaches Peterburgh a little after Christmas; the second in the middle of winter, and arrives there towards spring. Kolyan is distant 480 miles S.S.W. of Tobolsk. N. lat. 54° 20'. E. long. 81° 20'. Coxe's Travels in Russia, vol. iii.

KOLYAN, Kolyan, or Kolyan, is also a government of Russia, bounded on the N. by the government of Tobolsk, on the E. by that of Irkutsk, on the S. by China, and on the W. by Tartary; about 720 miles in length, and from 240 to 360 in breadth. This government was formerly included in that of Tobolsk; it contains five districts, viz. Kolyan, Semipalat, Birsk, Kufennsk, and Kralhoiard.

KOLYAN, or Kolyan, is also the name of a range of mountains, constituting the principal part of the Altay mountains, or the proper ore-mountains of Altay. (See ALTAI.) The Kolyan-yos-krefenki mountains derive their appellation from the adjacent lake Kolyan, which has given its name to the whole chain between the Iritshe and Oby, as well as to the government, and from the first copper-mine, called Volfs-krefenki. These mountains are bounded on the S. by the granitic ridge, which parts them from the Korbo-A7h//-W., which fee. They are confined to the E. by the deep valley in which the line of the present fire-ports is drawn, and by the lofty Tigeretzki snow-mountains and bounded on the N. by the river Tiharyzh, whose course is accompanied by considerable high schist and chalk mountains; towards the W. they lose themselves in the north-western Steppes. The greatest elevation of these mountains is the Simma-fonka, or Blue-mountain, which is computed to ascend 2814 Parian feet above the level of the sea. At the middle and greatest height, this range consists of a molybdo-carboniferous granite, composed of Spatum comprife, quartz, and blackish mica. In the angle formed by the little Biela with the great Biela, at the foot of the Blue mountain, are found felsitus and chalk-flone, in which latter are some little cavities, containing lapis calcareus flataetites. From the little Biela the mountains rise again toward the south, elevating themselves to the Revennafonka, or Rhapontic summits, which is surrounded by the ore-mountains, and consisting of felsites cornues, mixed sparingly with mica spathola and crumbs of mica campellia, in which latter are a few small hollows, in which are found flataetites. Towards the west, from the Blue mountain, runs the granite-mountains range, in bulk from 15 to 30 versts, interrupted by a multitude of valleys, proceeding 100 versts to the Alay, and there uniting with the Alashkot granite-hills. The northern foot of this granite-ridge runs under powerful felsitus and chalk mountains, and in between which the two first Kolyan mines were dug. Another mighty ridge of granite runs from the Blue mountain northwards to the river Tiharyzh, under-run on the western side by felsitus and chalk. The component parts of these granite ridges are various. In some parts the fieldspar, in others the quartz, has the ascendant. In one place the component parts are coarse, and then so delicate and so poor in mica, that one might be induced to take the granite proceeding from them for sand-flone. This track of mountains is uncommonly rich in silver, copper, and zinc ores. Tooke's Kafkia, vol. i.

KOLKI, a town of Poland, in the palatinate of Volhynia; 22 miles N.N.E. of Luchko.

KOLKOTOVATOLI, an island in the Caspian sea, near the W. coast. N. lat. 44° 43'.

KOLLAT, a town of European Turkey, in Bulgaria; 72 miles E.S.E. of Driftra.

KOLLOW. See KILLOW.
KOLIUVI, a country of Africa, between Aben and Cathna, inhabited by the Tuareg.

KOLLYRITE. Under this name an argillaceous toff is mentioned in Karsten's Mineralogical Tables, which is found at Stepighi-Schacht, near Semnitz. Dr. Townson, we suppose, is one of the first naturalists who observed it here. This mineral substance, which was first considered as pure alumina, is light, very friable, and snow-white; it foils the fingers, and adheres strongly to the tongue, which last property has procured it the name of kollyrite (from kol'yon of Dioscorides and Pliny). According to Klaproth's analysis of the Hungarian kollyrite, it consists of

</tbody>
</table>

This substance, which may be considered as a pure variety of clay, has also been found, by Friedlein, in Thuringia, in a stratum of sandstone.

According to Brongniart, it has a tolerable degree of tenacity, and the water it absorbed is seen to ooze out on the application of pressure, but it retains the liquid with such force, that more than a month is required to dry even a small quantity of it. By digestion, it separates into basaltic prisms, like arches, loses half of its weight, and becomes very light.

KOLMOGOR, in Geography, a district of the government of Archangel, situated on the Dvina.

KOLNO, a town of the duchy of Wawlaw; 80 miles N.E. of Warsaw.—Alfo, a town of Lithuania, in the palatinate of Minneapolis; 88 miles E. of Pink.

KOL, a lake of Russia, in the government of Archangel; 28 miles S. of Archangel.—Allo, a town of the duchy of Warsaw; 24 miles N.E. of Kaliseh.

KOLCKEN, a town of the duchy of Courland; 32 miles N.E. of Piltyn.

KOLGRIN, a town of Russia, in the government of Kollorna, on the river Unzas; 116 miles N.E. of Kollorna. N. lat. 58° 57'. E. long. 44° 14'.

KOLOMA Moskva, a town of Russia, and district of the government of Moscow, about five versts from its junction with the Oca; the fee of a bishop; 48 miles S.E. of Moscow. This town is reckoned to contain about 60,000 inhabitants.

KOLONEI, a town of Austrlian Poland, in Galicia, on the Pruth; 86 miles S.S.E. of Lemberg.

KOLOR, a town of Africa, in the kingdom of Wooll; 20 miles E.N.E. of Medina.

KOLOSVAR. See Cososvar.

KOLOSZE, a town of Transylvania; 14 miles S.S.E. of Huysad.

KOLPAK, a town of European Turkey, in Bessarabia; 40 miles W. of Akerman.

KOLSKO, a town of Russia, in the government of Archangel, on the E. side of the Dvina; 96 miles S.S.E. of Archangel.

KOLLIER, one of the Faroe islands.

KOLTYNANY, a town of Lithuania, in the palatinate of Wilna; 32 miles E. of Wilkomierz.—Allo, a town of Samogitia; 28 miles N.W. of Koenne.

KOLVERIAD, a town of Norway; 95 miles N.N.E. of Drontheim.

KOLUMBATZ, a town of European Turkey, in Macedonia; 68 miles N. of Akrida.

KOLZUM, or Colsum, anciently Chyoin, (which fey,) a town of Egypt, which formerly existed near the E. coast of the Red sea, but the sea has long since left the coast; and the town has been destroyed. From Volney we learn, that the name is still attached to a hilllock of sand, bricks, and stones, on the coast of the Red sea, about 300 paces to the N. of Suez; whereas D'Anville places it 16 miles S. of Suez.

KOM, or Kuins, a large and populous city of Peria, in the province of Irak, at the foot of high mountains, and near a considerable river, which is lost in the great desert. When Chardin visited it, the houses were computed at 15,000; and the chief manufactures were white earthen ware, loom, and sword-blades, fabrics, and pots. The walls are lofty, and the town has seven gates. The public squares are small; the grand bazaar crosses the town from one gate to the other; and there are others, which are furnished with coffee-houses, and shops of various kinds. Here are a celebrated mosque, and an asylum for debtors, who are protected and supported. One of the mosques is highly esteemed by the Persians, on account of the sepulchres of Shah Sefi I. and Shah Abbas II., and also that of Sady Fatima, grand-daughter of Mahomet. These tombs are frequented by pilgrims from all parts of Persia, who reft on their journeys a year to pay their devotions, and are supported by a fund assigned to this purpose. The city is governed by a vizier, and the residence of a khan. The adjacent country is fertile in rice and fruit; 150 miles N. of Ipshian. N. lat. 34° 20'. E. long. 51° 14'.

KOMA, a town of Lithuania, in the palatinate of Wilna; 42 miles S. of Biala.—Alfo, a town of Persia, in the province of Khorasan; 227 miles N.N.E. of Herat.

KOMANA, in Botany, an arbitrary name given by Adanson to Hypericum monogynum of other authors, which he established as a genus, on account of its solitary style. Jullieu, however, afferts that this supposed simple style is composed of five, closely united. The capsule is described as of one cell, but we have never seen it at all advancing towards maturity, so as to form an opinion on the subject. See Hypericium and Kniph.

KOMAN, in Geography, a town and abbey of Walschach; 18 miles S. of Buchach.—Allo, a district of Africa, on the Slave coast.

KOMANGO, or AMANGO, one of the Friendly islands; 5 miles E. of Amamoeoka.

KOMARA, a town of Hindoostan, in Myfore; 65 miles E.N.E. of Harponelly.

KROMA, a town of Austrlian Poland, in Galicia; 24 miles S.S.W. of Lemberg.

KOMBAH, a town of Africa, in the country of Gaia; 170 miles E. of Kaffraria. N. lat. 11° 25'. E. long. 2° 30'.

KOMBO, a kingdom of Africa, near the Atlantic, S. of the Gambia.

KOMBREGUDU, or COMBOEG-ADOU, a kingdom of Africa, situated on the banks of the river Gelam, about N. lat. 14° 10'. W. long. 10'.

KOMCHA, or KOMSHA, a decayed town of Peria, in the province of Irak, celebrated for its gardens and dove-houses, and degraded by the bad character of its inhabitants; 39 miles S. of Ipshian.

KOMENTING, the name of two towns in the island of Borneo; one 42 miles N. and the other 13 miles S.S.W. of Negara.

KOMMANICK, in Omniteology, the German name for the large-crested lark, common in many parts of Germany, but not known in England. See Alauda cristata.
KONOL, or Conoil, in Geography, a foot-port town of Nubia, with a small but safe harbour in the Red Sea. N. lat. 22° 45'. E. long. 35° 15'.

KOMRI, Ait., a mountainous ridge in the interior part of Africa, called also the "Mountains of the Moon," terminating the country of Donga. N. lat. 7°.

KONAPOUR, a town of Hindooltan, in the country of Swore; 50 miles E.N.E. of Goa. N. lat. 15° 45'. E. long. 74° 32'.

KONDOZ, a town of the Greater Bucharla; 60 miles N.W. of Anderab. N. lat. 36° 50'. E. long. 67° 21'.

KONDRA, a town of Bengal; 36 miles S.W. of Dacca.

KONDUR, a town of Hindooltan, in Dowlatabad; 100 miles S.E. of Aurungabad. N. lat. 18° 54'. E. long. 77° 10'.

KONEVETZ, a small island of Russia, in lake Ladoga; 60 miles N.N.E. of Petersburg.

KONEZKOI, a town of Russia, in the government of Vologda, on the Vym; 56 miles N.E. of Yarenfsk.

KONG, See G. N.A.H.

KONGA, a town of Africa, in the kingdom of Loango.

KONG-FORS, a town of Sweden, in Well Bothna; 16 miles N.W. of Umea.

KONGHELL, Kongshele, or Kong-elf, a town of Sweden, in the province of West Gotland, on an island in the Goth; formerly the capital of Norway, and residence of kings, but now decayed; 10 miles N. of Gothenburg.

KONGSBACKA, a sea-port town of Sweden, in Halland; 13 miles S. of Gothenburg. N. lat. 57° 30'. E. long. 12° 56'.

KONGSBERG, or Conisberg, a town of Norway, celebrated for its silver mines. It stretches on both sides the river LŒve, which, in its course through the town, falls in a series of small but picturesque cataracts over the bare rocks. The crags which border the town are in some parts naked, in others clothed with wood, and intermixed occasionally with slips of corn and pasture; nevertheless, the prominent features of the circumjacent scenery are ruggedness and horror. Kongborg contains about 1000 houses, including those of the miners, and 6000 inhabitants. The mines are distant from the town two miles. They were discovered and opened during the reign of Christian IV. Thirty-six mines, says Coxe, are now working; the deepest is 652 feet perpendicular. The matrix of the ore is the jasper of Læsnes; the silver is extracted according to the usual process, either by smelting the ore with lead, or by pounding. Pure silver is occasionally found in small grains, and in small pieces of different fixses, seldom weighing more than four or five pounds. One mine has been found which weighed 469 marks, and was worth 3000 rix-dollars (600l.). This piece is preserved in the cabinet of curiosities at Copenhagen. Formerly these mines produced annually 70,000l.; in 1769, 70,000l.; at present, (says Mr. Coxe) they yield only 50,000l. to 54,000l.

The expenses, it is said, generally equal, and sometimes exceed the profits. The largest piece of money struck at Kongborg is only eight skillings, or four-pence.

KONGSWINGER, a town of Norway, in the province of Christiania; 42 miles N.E. of Christiania. N. lat. 60° 12'. E. long. 12° 8'.

KONG-TCHANG, a city of China, of the first class, in the province of Che-ni, seated on the banks of the river Ho-er, and surrounded by very high mountains. This city is very populous, and has great trade. A tomb is shown here, which the Chinese pretend to be that of Fo-hi. The jurisdiction of this city extends over three others of the second class and seven of the third. N. lat. 34° 56'. E. long. 104° 19'.

KONI, a town of Imerita; 30 miles S.W. of Corsica.

KONJADA, Goss, and Klein, two towns of Prussia, in the palatinate of Culm; the former 12 miles N.N.W. of Stralsburg; and the latter 14 miles.

KONJAWA, a town of Lithuania, in the palatinate of Traki; 36 miles N.E. of Grodno.

KONECPOLE, a town of Poland, in the palatinate of Breslaw; 60 miles S.E. of Brachaw.

KONINGGRAETZ, or Kradowe Hradetz, a city of Bohemia, and capital of a circle of the same name, seated on the Elbe, built in the year 783, and the see of a bishop, under the archbishop of Prague; 58 miles E. of Prague. N. lat. 50° 10'. E. long. 15° 39'.

KONIGSBERG, a large and beautiful city and sea-port of Prussia, situated on the river Pregel, which has seven bridges; founded in 1255, rebuilt in another situation in 1264, and well fortified in 1260, by a rampart about seven English miles in circumference. The rampart includes the gardens, the large castle moat, with some meadows and fields. The number of houses is about 6000, and of inhabitants about 55,000. This city properly consists of three towns that are joined together; viz. Alstadt, Lobenicht, and Kniephof, and of several suburbs. Alstadt, or the old town, contains 16 streets, and 550 houses, of which more than 100 are malt-houses and brew-houses. It is embellished with six gates, two strong-built towers, and four bridges. Lobenicht, built about the year 1350, was formerly called Newstadt, or the new town. Kniephof is the most modern, as it was founded in 1324. This stands on an island formed by the river Pregel, the buildings of which are erected on piles of alder-trees, which by length of time are become as hard as iron. It has five large gates, and 13 streets. The cathedral of this town has a famous organ, which consists of 5600 pipes, and was finished in 1721. The university was founded, in 1544, by the margrave Albert, and has 38 professors, exclusive of the tutors. The number of students in 1802 was 350. The town-house is a fine building, where the magistrates of the three towns, which were incorporated in 1724, meet every day. The strong citadel, called "Fredericksburg," was built in 1657, and directly faces Kniephof, at the confluence of the two branches of the Pregel. This fort is a regular square, surrounded with broad ditches and the river Pregel, which is here navigable, and from 120 to 240 feet in breadth. In 1752, 493 large ships, and 723 vessels of timber, arrived in this port, besides smaller vessels. A colony of French Calvinists excepted, the inhabitants of Königsberg are chiefly German of the Lutheran persuasion. In 1758, this city was taken by the Russians, and in 1807 by the French. N. lat. 54° 45'. E. long. 20° 38'.

KONISBERG, or Kleinbawe, a town of Slefsia, in the principality of Troppau; 13 miles S.E. of Troppau. N. lat. 49° 46'. E. long. 18° 10'.

KONISBERG, a town of Brandenburg, in the New Mark; 24 miles N.N.W. of Ctharin. N. lat. 53° 5'. E. long. 11° 34'.—Alfo, a town of Germany, in the principality of Coburg, situated on the side of a mountain, on which is an ancient castle; 20 miles S.S.W. of Coburg. N. lat. 50° 3'. E. long. 10° 45'.

KONIGS-
KONIGSBRÖN, a town and convent of Wurtemberg; 20 miles N.N.E. of Ulm.

KONIGSSEGG, a principality of Germany, comprehending Konigseggt-Rottheinsfeld, and Konigseggt-Aulendorf. The former poffeffes the county of Rothenfeld and lordship of Staufers; and the latter the county of Konigseggt, and lordship of Aulendorf. The lordship of Konigseggt confits only of an ancient castle, 8 miles N.W. of Ravenzburg, and a few hamlets.

KONIGSK, a town of Bohemia, in the circle of Bohumin; 10 miles E.S.E. of Neuhaus.

KONIGSFELDEN, a town and citadel of the duchy of Berg; 26 miles S.S.E. of Cologne.—Alfo, a town of Bavaria, in the bishoppic of Bamberg, on the Auffes; 10 miles N.E. of Bamberg.

KONIGSFELDEN, a bailiwick of Switzerland, in the canton of Berne, situated between the town of Bruck and the river Reuss. The monastery of this place, belonging to the monks of St. Francis and the nunns of St. Claire, founded in commemoration of the death of the emperor Albert, who was affifinated in 1308 by his nephew John, duke of Swabia, became very rich by grants from the house of Austria, and other nobility.

KONIGSHEIM, a town of Germany, in the county of Wurttemberg; 14 miles S. of Wurttemberg.

KONIGSHOF, a town of Bohemia, in the circle of Konigigratz; 14 miles N. of Konigigratz.

KONIGSHOFEN, a town of the duchy of Wurtzburg, on the Tauber; 20 miles S.S.W. of Wurtzburg.—Alfo, a town of the duchy of Wurtzburg, on the Saal; 28 miles N.E. of Wurtzburg. N. lat. 50° 12'. E. long. 10° 27'.

KONIGSLEUTER, a town of Welfenbuttel, in the principality of Wolfenbuttel, situated on a stream, called the "Lutter," 12 miles N.E. of Wolfenbuttel. N. lat. 52° 17'. E. long. 10° 56'.

KONIGSTEIN, a town of Germany, and capital of a county of the same name, with a castle built on a rock; 11 miles N.W. of Francfort on the Maine.—Alfo, a town of Bavaria, in the pricipality of Sulzbach, near Sulzbach.—Alfo, a fortress of Norway, in the diocese of Chiritania, built for the defence of Fredericia.—Alfo, a town of Saxony, in the margravate of Meifen, situated on the left side of the Elbe, with manufactures of linen and woollen. It is situated on a mountain, and rendered, as it was formerly, impregnable. It is accessible only in one place, and supplied with water from a very deep spring in the mountain; 16 miles S.E. of Drebden.

KONIGSTUHL, i.e. King's Chair, a head-land on the N.E. coast of the island of Uledom, in the Baltic. N. lat. 54° 37'. E. long. 13° 58'.

KONIGSWALD, a town of Bohemia, in the circle of Leitmeritz; 13 miles N.N.W. of Leitmeritz.

KONIGSWALDE, a town of Brandenburg, in the New Mark; 22 miles E. of Culintra. N. lat. 52° 25'. E. long. 15° 26'.

KONIGSWERT, a town of Bohemia, in the circle of Pilpen; 12 miles W.N.W. of Topel.

KONIN, a town of the duchy of Warsaw; 20 miles N. of Kalisch. N. lat. 52° 6'. E. long. 18° 15'.

KONIN, or KONING, DAVID DE, in Biography, a painter of birds, animals, and still life. He acquired the principles and executive powers of the art under the tuition of John Fytt; whose jealousy is said to have been excited by the praisefellow upon his disciple.

On this account De Koninck left him, and travelled to Italy, from Antwerp, where he was born. He arrived in Rome in 1668, having refused engagements to paint upon his journey, offered him by the duchies of Bavaria and the court of Vienna. In Rome he was highly honoured. Balthasar, who lived at the time, speaks of him as employed by the greatest among the nobles there; and receiving commissions from foreign kings and sovereign princes.

His works and manner resemble those of Fytt, with whom, on his return to Antwerp, he was a constant competitor. But he is not to perfect, his effects are not fo brilliant, nor is his touch so fine. He died in 1678; his age is not known.

KONINCK, or KONING, PHILIP DE, a portrait painter, who, having studied in the school of Rembrandt, proceeded in his course with great success, obtaining in early life a good reputation, and maintaining it in the great number of pictures which he produced. His style is, necessarily, almost an imitation of that of his master. It is too captivating for a man that had once obtained possession of the court to quit it easily. His likenesses were esteemed, and he had great choice and variety of attitude. He is among the number of those whose portraits are honoured with a place in the gallery at Florence. He died in 1689, at the advanced age of 70.

KONINGH, SOLOMON, a portrait and historic painter of the Flemish school. He was the disciple of Vermond and Moujart, and rose to a certain degree of eminence, but not among the first clafs.

KONIT, or CONTI. Professors Retzius and Schramacher describe under this name a calcareous-filicious rock of a whitish-grey, or white colour, found in Norway, Iceland, &c. It has only been seen in detached pieces, most of which bear the marks of being rolled. It is faintly glimmering; in some pieces its lustrous approaches to the vitreous, and even the opalescent lustrous. Its fracture is uneven, flat conchoidal, sometimes obsolescent foliated, sometimes even and sphenoid, not unlike that of some varieties of hornblend. The fragments are indeterminately angular. The varieties having an opalescent lustrous, and obsolescent foliated fracture, are translucent at the edges. Its hardness is far superior to that of common compact limetone, and it even resists fire with the heel. It is not easily frangible. Specific gravity 2.8. When reduced to powder, and thrown on burning charcoal, it emits a greenish light, but it is not phosphorescent from friction. It effervesces with diluted nitric acid, and is partly dissolv'd in it; the remainder is siliceous earth.

The proportion of the calcareous and siliceous earth, of which the konit consists, is not yet ascertained.

Upon the whole, we know too little of this mineral substance to assign it its proper place in the system. Hairy refers it, with a query, to his quartz-sagmat calcite, which is the filicate of Saffure. See Hairy and Broun. vol. 1. p. 325.

The specimens of conite described by Schumacher were from Iceland; the one which we had an opportunity of examining came from Kenrudvern, near Dramen, in Norway.

Among the many new names which a modern writer on rocks is desirous of stamping upon the world, we have also that of konite, which, without mentioning that it has been previously given to a different rock, he applies to the variety of compact lime-stone, called freiglone.

KONITZ, in Geography, a town of Germany, in the county of Schwartburg-Rudolfsfiadt; where are mines of silver and copper; 6 miles E.S.E. of Rudolfshof.—Alfo, a bailli.
a bailiwick of Switzerland, in the canton of Berne.—Alfo, a town of Moravia, in the circle of Olmutz; 15 miles W. of Olmutz.—Alfo, a town of Prufia, in Pomerelia; 8 miles E. of Schluckow.

KONKODOO, a country of Africa, bounded on the N. by Bambool, on the E. by Gadon, on the S. by Worada and Jallonkaddo, and on the W. by Sadaado; about 60 miles from N. to S., and 40 from E. to W. N. lat. 12° 10' to 13° 10'. W. long. 9° to 10°.

KONN, a town on the N. coast of the isle of Timor. S. lat. 8° 18'. E. long. 126° 16'.

KONNARUS, a name given by Agathocles in Athens to a plant of Arabia, which the description shows to be the same with the fadac of the later Arabians, the fruit of which is called nabac or nabac. See CONNARUS.

This tree is the lotus of Dioscorides, and the acanthus of Virgil, whose berries he mentions. The fruit of this tree is like a cherry, but smaller, and is ground to powder by the Africans when dried. It is very well known to all who are acquainted with the writings of the old physicians, that the berries of the lotus or nabac were ground down, by the Egyptians and other nations where they grew, to a fine powder for medicinal uses. They were astringents, and used both externally in poultices and fomentations, and internally in decoctions and other forms where astringents were required.

KONNO, in Geography, a town of Japan, in the island of Nyphon; 70 miles N.W. of Mexico.

KONOE, one of the Faroe islands; 2 miles N. of Bardoe.

KONOS, a town of Asia, Turkey, in Natolia; 20 miles N.E. of Dnegziu.

KONOTP, a town of Russia, and district of the government of Novgorod Steverkov, seated on a rivulet falling into the Serm. N. lat. 5° 41'. E. long. 33° 34'.

KONSAN, a town of Africa, in the country of Sierra Leone. N. lat. 10° 44'. W. long. 12° 15'.

KONSBERG. See KONGSBERG.

KONSTANTINGRAD, a town of Russia, in the government of Ekaterinofla, on the borders of Turkey. N. lat. 49° 15'. E. long. 34° 52'.

KONTOP, a town of Sileria, in the principality of Glogau; 15 miles E. of Grunberg.

KOOCHE, a town of Hindoostan, in the country of Agra; 60 miles E. of Gwalior. N. lat. 26°. E. long. 79° 35'.

KOOHANGAN, a small island in the Sooloo Archipelago. N. lat. 6° 3'. E. long. 121° 18'.

KOOKAR, a town of Africa, in the country of Wooll; 54 miles E. of Medina.

KOLASSIAH, a small island in the Sooloo Archipelago. N. lat. 6° 22'. E. long. 120° 58'.

KOLBARY, a town of Hindoostan, in Golconda; 35 miles S. of Combamet.

KOLIKORRO, a town of Africa, in the kingdom of Bambarr, on the Niger; which is a great salt-market; 130 miles S.W. of Segoi.

KOLUMONDA, a town of Hindoostan, in Myfore; 13 miles N.E. of Nagamangalum.

KOOMAR, a town of Hindoostan, in Bahar; 13 miles E.N.E. of Bahar.

KOOMBOW, a town of Africa, in the kingdom of Tenda. N. lat. 12° 42'. W. long. 12°.

KOOND, a town of Hindoostan, in Bahar; 17 miles N. of Salarum.

KOONDA, a cireart of Bengal, bounded on the N.E. by Bahar, on the E. by Ramgur, on the S. by Toree, and on the W. by Palamow; about 25 miles long, and 16 broad; the capital is Koonda; 92 miles S. of Patna. N. lat. 24° 11'. E. long. 84° 48'.
KOOSAMBO, a town on the N. coast of the island of Bali. S. lat. 8° 24'. E. long. 114° 46'.
KOOSHAUB, a town of Hindooslan, in the subah of Lahore, on the Behut; 95 miles W. of Lahore. N. lat. 31° 47'. E. long. 71° 5'.
KOOSHINJEE, or Peshawar, a town of Candahar; 80 miles S.E. of Candahar. N. lat. 22° 14'. E. long. 66° 50'.
KOOTAICONDA, a town of Africa, in Wolof; 16 miles W.S.W. of Medina.
KOOTAKOO, a town of Africa, in Fooladoo. N. lat. 13° 30'. W. long. 7° 40'.
KOOTY, a town of Hindooslan, in Bahar; 84 miles S.S.W. of Patna. N. lat. 24° 23'. E. long. 84° 45'.
KOPACZOW, a town of Poland, in the palatinate of Bracelaw; 72 miles N.W. of Bracelaw.
KOPAN, a town of Hungary; 18 miles W.S.W. of Symontorina.
KOPANITZ, a town of Selavonia; 21 miles S.S.W. of Efzer.
KOPASH, a town of Dagestan; 45 miles N.W. of Derbend.
KOPIGOWKA, a town of Poland, in the palatinate of Bracelaw, on the Bug; 16 miles S.W. of Bracelaw.
KOPIL, a town of Lithuania, in the palatinate of Novogrodek; 45 miles S.E. of Novogrodek.
KOPIN, a town of Poland, in Podolia; 28 miles N. of Karnicke.
KOPOLET, a sea-port of the principality of Guriel, on the Black Sea. N. lat. 41° 35'. E. long. 41° 22'.
KOPORE, a town of Russia, in the gulf of Finland; 32 miles W. of Petersburg.
KOPYL, a town of Lithuania, in Novogrodek; 16 miles N.W. of Shuck.
KOPYS, a town of Russia, and district of the government of Mobile, situated on the Dnieper.
KORA, a town of Russia, in the government of Irkutsk, on the Ilga; 35 miles N.W. of Verbelenko.—Also, a town of Africa, in the kingdom of Jemarrow.
KORACHORNYCHUS INDICUS, in Ichthyology, the name of a sea-fish of the East Indies, called by the Dutch the ravenbeek. It has its name from its noise resembling the beak of a raven or crow, and is about seven inches long; its back and tail are red, and its belly yellow; it has also, on each side, two pale yellow longitudinal lines, running from the gills to the tail. It is a wholesome and well-flavored fish. Ray.
KORALLEN-ERTZ, i. e. Coral-Ore, a name given by the miners of Idris, in Tripoli, to a variety of bituminous shale, with tuberculated shining surface, and containing much hepatic and some other mercurial ores. See Mercury.
KORAMO, or CURAMO, in Geography, a town of Africa, in the kingdom of Benin.
KORAN. See ALCORAN.
KORASAN, or CHORASAN, a province of Persia, terminating it in the N. E. is bounded on the N. by Charum and the country of the Ulbeck Tartars, on the N.E. by the Gihon or Oxus, on the E. by Bucharie and Candahar, on the S. by Segelatan and the lake of Zare, or Zarra, the Aria palace of antiquity, and on the W. by the province of Mazanderan and the Calpian sea; about 450 miles in length and 430 in breadth. This country formerly comprehended Margiana in the north and Ariana in the south. It was conquered by Timur Bex in the year 1366, and granted by him to his son Mirza Choro, together with Mazanderan and Segelatan. The principal towns are Herat, Kencf, Talekan, Merwah, Zuwah, &c.
KORBETH.
KOR

KORBETH, a town of Peria, in Irak; 126 miles S. of Hamadan.
KORBlA-HOU, a town of Africa, on the Ivory Coast.
KORBOLE, a town of Sweden, in Helisingland; 53 miles W.N.W. of Hudwickwall.
KOROLIKINSKOI MOUNTAIN, a mountain of Russia, part of the range of Kolivan (which fee), which has its name from the brook Kolrhlkha, which runs through it. It is enclosed from the S., E., and W., by granite mountains; but on the N.E. is bounded by the great Biela, together with fchill and chalk mountains. It consists, except in some few points, which are covered with sea-bottom materials, for the most part of clay, fchill, marl-wacke, lapis cornues, and quartz, here and there underlayed by granite and porphyry. Although the height of these mountains, between the origin of the Kolrhlkha and the little Biela, is considerable, yet the mountain on the great Biela, such as the Revennaia-Sopka, and the Karaulnna-Sopka, remarkably distinguish themselves on account of their stately summits. The mineral of this mountain consists of a fchilitose marl-wacke and horn-fchill, in which here and there hornblendi are mixed with feldspar, which are to be met with. The chain of mountains, in conjunction with the north-western and south-eastern rivers of the Revennaia-Sopka, the Blue mountain, and the Kolylvan granite mountain, and in the south-east, after they have encompassed the klimthefskoi majak, terminate at the foot of high granite fnow mountains. The Revennaia-Sopka is the highest point of these mountains, being estimated at 2213 Paritan feet higher than the Slangenberg; it is faid not to consist of granite, but of firm horn-schilus. In this Korolikinskiot tract of mountains, the rishesh of all the Altay mine-works are carried on. See Kolivan and Altai.

KORCHELEN, a town of the duchy of Warfaw; 52 miles N. of Warfaw.
KORCHINO, a town of Russia, in the government of Nizegorod; 80 miles S.S.W. of Nizei-Novgorod.
KORCK, a town of Norway, in the diocese of Drammen; nine miles S.W. of Romsdal.
KORCZANY, a town of Samogitia; 24 miles W.N.W. of Miednik.
KORCZIK, a town of Poland, in Volynia; 15 miles N.E. of Olrog.
KORDEARDA, a town of European Turkey, in Walachia; 80 miles N.W. of Bucharest. N. lat. 45° 15'. E. long. 24° 24'.
KORDOFAN, a country of Africa, between Dar-Fur and Sennaar, subject to the sultan of Dar-Fur, by whom it was conquered in 1795. Mr. Brown informs us in his "Travels in Africa, Egypt, and Syria," that an invertebrate animality subsists between the natives of Dar-Fur and those of Kordofan; insomuch that wars have been almost continual between the two countries, as far as the memories of individuals extend. One of the caufes of this hostility appears to be their relative position; the latter lying in the road between Dar-Fur and Sennaar, which is considered as the most practicable, though not the direct communication between the former and Mecca. Nor can caravans pass from Susakem to Fuir, unless by the permission of the governors of Kordofan. The jealousy of trade is, therefore, in part the origin of their unvaried and implacable animosity. A king, or the name of "Abli-Calik," is the idol of the people of Kordofan, where he reigned some years ago, and was renowned for probity and justice. The kings of Kordofan had been depired by the meque of Sennaar, till after the death of the son of Abli-Calik, when it was usurped by Vol. XX.

Für, in consequence of the weakenss and dissensions of the government at Sennaar. The people of Kordofan are reported to be not only indifferent to the amours of their daughters and sisters, but even attached to their seducers. The father or brother will even draw the sword against him who offends the "Refik," or companion of his daughter or sister. Kordofan extends from N. lat. 12° to 14° 40', and from E. long. 29° 25' to 32° 30'.
KORDYN, a town of Poland, in the palatinate of Kiev; 44 miles W.S.W. of Kiev.
KOREPSKOI, a cape on the N. coast of Russia, in the North sea; 124 miles N.W. of Archangel.
KORIAKI, an oilrog of Kamtschatka, on the Awatilka; 27 miles W. of Awatilka.

KORIAKS, the denomination of a people who inhabit the northern parts of the Penhinikoi golf, and of the peninsula of Kamtschatka, near and among the Kamtschatadets, Tungusas, Lamuts, and Tchuckzties. They are supposed to derive their name from the word Kora, which in their language signifies a rein-deer. The great likensc they bear to many islanders of the Eastern ocean, and to the nearest Americans beyond the finest, afford reason for supposing that they, and also the Tchukzties, are the primitive potfetlers of these coasts; who either came over from the continent of America, or were separated from it by the probable infrarctions of the sea, and the consequent division of the two quarters of the world. With respect to number they are about equal to the Kamtschatadets, who, according to the enumeration of 1760, amounted to about 2000 males, though it is not unreasonable to conclude, that their number is in reality three or four times larger. According to Leflpefs the Korias are supposd to exceed 2000 families. These people are divided into two classes, viz. the wandering and the fixed Korias. The latter inhabit the northern part of the isllands of Kamtschatka, and the whole coast of the eastern ocean, from thence to the Anadyr. The country of the former stretches along the N.E. of the sea of Ochoch, to the river Penikina, and westward towards the river Kovyma. The fixed Korias have a strong resemblance to the Kamtschatadets; and, like them, depend altogether on fishing for subsistence. Their drefs and habitations are of the same kind. They are tributary to the Russians, and under the district of the Ingiza. The wandering Korias occupy themselves entirely in breeding and paffuring deer, of which they are paid to po11s for immense numbers; so that it is not unusual for a single chief to have a herd of 4 or 500. They despise fish, and live altogether on deer. They have no balanks, and their only habitations are like the Kamtschatadets. Jords, with this difference, that they are covered with raw deer-skins in winter, and tanned ones in summer. Their flegges are drawn by deer, and never by dogs; which, like the latter, are always fpayed, in order to be trained to this bunsell. The draft deer pallure in common with the others; and when they are wanted, the herdman makes use of a certain cry, which they instantly obey, by coming out of the herd. Captain King was informed by the priest of Kamtschatka, that the two nations of the Korias and the Tchukzties speak different dialects of the same language, and that it does not bear the least resemb lance to the Kamtschatadets. According to the account of Leflpefs, the manners of the fixed Korias are a composition of duplicity, mirthful, and avarice; and they are said to have all the vices of the northern nations of Asia, without the virtues. Robbers by nature, they are f blasphemous, cruel, and incapable either of pity or benevolence. Perfidious and savage in their disposition, they are in a state of..
perpetual hostility with their neighbours; and hence every individual is led to cherish a ferocious spirit. Hence also they acquire an inflexible courage, and glory in a contempt of life. Superstition also impales upon them a law which obliges them to conquer or to die. The vicinity of the Russian settlements has hitherto produced no change in the mode of life of the sedentary Koriaks. Their commercial intercourse with the Russians merely seem to render them more avaricious and more addicted to plunder; and they relish every attempt of civilization. The wandering Koriaks were for a long time more intractable. Their regular occupation is hunting and fishing, and when the season does not allow of their pursuing it, they sleep and smoke, and indulge themselves in drunkenness. Their passion for strong liquors has led them to invent a drink, equally powerful with brandy, which is scarce and dear, and which they extract from a red mushroom, known in Russia as a strong poison, under the name of "moun-hamorr." With a preparation of this they entertain their guests for one, two, or three days, till their stock is exhausted. The features of a majority of the Koriaks are not Asiatic; but they might be considered as Europeans, if they were not for their low stature, ill shape, and the colour of their skin. Others of them have the same characteristic outlines with those of the Kamtschatkaes. Among the women particularly, there are very few who have not sunk eyes, flat noses, and prominent cheeks; the men are almost wholly delitute of beards, and have short hair. The women carry their children in a sort of arched balst, in which the infant is placed in a sitting posture, and sheltered from the weather. When a Koriak dies, his relations assemble, erect a funeral pile, and place a portion of the wealth of the deceased, and a flock of provisions, confining of rein-deer, fish, brandy, and whatever else he conceived will be wanted by him for his journey, and prevent his lingering in the other world. The body is exhibited in his best attire, and lying in a kind of coffin; and after receiving the adieu of his attendants, who have torches in their hands, they hasten to reduce it to ashes. They wear no mourning, as they feel only the regret of a temporary absence, and not of an eternal separation; and the funeral pomp generally terminates in the temperate use of liquor and tobacco. Death is regarded by them as a passage to another life, in which other joys are reserved for them. They acknowledge a supreme being, the creator of all things, whose reidence is the sun; but they neither fear nor worship him. Goodness, they say, is his essence; and it is impossible, as all good proceed from him, that he should do any injury. The principle of evil they consider as a malignant spirit, who divides with the sovereign good being the empire of nature. To this evil spirit they pay respect, and perform their devotion, in order to pacify his wrath, and to avert the calamities which he inflicts. Accordingly, they offer him, as expiatory sacrifices, various animals that have begun to exist: rein-deer, dogs, the first fruits of their hunting and fishing, and the most valuable of their possessions. Supplications and thanksgiving constitute their devotional exercises. His votaries have no temple nor sanctuary. This imaginary god is worshipped in all places; and they conceive that he hears their prayers in the solitude of the desert, as well as in society; and that he is rendered propitious by their indulging to drunkenness in their jovets; for, strange as it may seem, drunkenness is among these people a religious practice, and the halts of all their solemnities. See Kamtschatka and Tschultsk.

KORKAL, or Jordan, a flat district on the east side of the Caspian sea, subject to great heat, frequent inundations, and an unhealthy climate; but the soil is fertile, and productive of dates, wine, cotton, silk, and corn.

KORKINA, a town of Russia, in the government of Tobolik; 20 miles S.W. of Ichiim.

KORKUB, a town of Persia, in Chushitan; 30 miles W.S.W. of Jondishapur.

KORMAND, a town of Hungary, on the Raab; 52 miles S. of Vienna.

KORMESHTY, mountains of Ireland, in the county of Mayo; 17 miles N.W. of Castlebar.

KORMUDSEEN, a town of Persia, in the Farzistan; 100 miles S.W. of Shiraz. Lat. 38° 37'.

KORNBURG, a town of Styria, on the Raab; 24 miles S.E. of Grazt.

KORDYCK, a small island of Holland, in the Meufe, with a town of the same name; about 7 miles W.N.W. of Willemstadt.

KORN-NEUBURG, a town of Austria, on the north side of the Danube, opposite to Clofetter-Neuburg; 8 miles N. of Vienna. Lat. 45° 10'; Long. 14° 40'.

KORNOCK, an island near the west coast of West Greenland. Lat. 51° 38'; Long. 47° 40'.

KOROL, a town of Hindooftan, in Guzerat; 20 miles E. of Barosch.

KORLOVETZ, one of the eleven districts of the government of Novgorod Severkoi in Russia, situated on a rivulet falling into the Dobra; 40 miles S.E. of Novgorod Severkoi.

KOROMANTEES, a general appellation given in the British West Indies to most of the negroes purchased on the Gold Coast, from Koromantyn, one of the earliest of our factories on this part of the African coast; which is now become an insignificant village, or factory, in possession of the Dutch. It is situated in the kingdom of Fanny, two miles from the fort of Anamabo. The Koromantyn or Gold Coast negroes are distinguished from all others by firmness both of body and mind, a ferociousness of disposition, and, at the same time, activity, courage, and a kind of stubbornness, which prompts them to enterprize of difficulty and danger, and enables them to meet death, in its most dreadful forms, with fortitude or indifference. Many of them had been slaves in Africa, and others had been engaged in perpetual hostility with one another; and they were, therefore, prepared for endeavouring, even by means the most desperate, to regain the freedom of which they had been deprived. Accordingly they have been disposed to excite or to encourage rebellion. This was the case in Jamaica in the year 1760. The firmness, and intrepidity, and contempt of death, which are distinguishable in adults, brought from the Gold Coast, are visible even in boys at the age of ten years. Edw. W. Indies, vol. ii.

KOROP, a town of Russia, and district of the government of Novgorod Severkoi, situated on the left shore of the Dobra.

KOROROFAH, a country of Africa, situated eait of Wangara.

KOROTCHA, a town of Russia, and district of the government of Kurik, situated on a rivulet of the same name, that falls into the Donetz; 44 miles E.S.E. of Kurik.

KOROTOIAN, a town of Russia, and district of the government of Voroznetz, situated on the Don; 20 miles S. of Voronetz.

KOROVA, a small island in the sea of Ochotik; 240 miles E. of Ochotik. Lat. 57° 20'; Long. 130° 40'.

KORPIKYL, a town of Sweden, in Well Bothnia; 14 miles N.N.W. of Torne.

KORPILAX, a town of Sweden, in Tavalland; 68 miles N.N.E. of Tavalland.

KORPO, an island of Sweden, in the Baltic, near the fourth.
KOR

South-west coast of Finland, of an oval form, about 20 miles in circuit; having on the north-west coast a town of the same name, and several villages. N. lat. 60° 9'. E. long. 21° 25'.

KORPONA, a town of Hungary; 28 miles N.E. of Gran.

KORS, a town of Persia, in the province of Adirbitzan; 80 miles S.S. E. of Erivan.

KORSÁ, a town of Hindostan, in the fubah of Delhi; 26 miles W. of Delhi.

KORSÁKI, or CORSA, in Zoology. See Fox.

KORSIČ, in Geography, a town of Poland, in Woldynia; 32 miles E. of Lucko.

KORSENIEC, a town of Lithuania; 60 miles E. of Wilna.

KORSEWAŁAN, a small island in the East Indian Sea. S. lat. 7° 39'. E. long. 128° 40'.

KORSNÁS, a town of Sweden, in Earl Bothnia; 25 miles S.S.E. of Wafa.

KORSØER, a fortified town of Denmark, lying at the mouth of a small bay, forming a well-protected harbour, on the Great Belt. It has a few good houses, which belong to merchants, &c. Some trade is carried on from hence up the Baltic, and in the vicinity. The fortifications are in ruins, and the town is chiefly inhabited by fishermen and seafaring people. The breadth of the Great Belt between Korsør and Nyborg is about 22 miles.

KORSUN, a town of Poland, in the palatinate of Kiev; 43 miles S.S.E. of Bialacerkiew.

KORSZANY, a town of Samogitia; 25 miles N.W. of Midukii.

KORTECHERA, or KORTCHER, a town of Russia, and district of the government of Iver, on the Volga.

KORTHOLT, CHRISTIAN, in Biography, a native of Holbien, was born at Burg, in the isle of Femenen, in the year 1633. Having acquired the rudiments of learning, he was, at the age of sixteen, sent to Slefwic, where he pursued his studies two years; and from this place he went to the college of Steitn, made great proficiency in learning, and obtained high applause by the able manner in which he maintained two theses. He continued his literary studies at Roftock, to which place he removed in 1652; and afterwards delivered lectures, in his own apartments, on logic, metaphysics, and Hebrew. In 1656 he took his degree of doctor in philosophy, after which he went to study at the university of Jena, where he distinguished himself by his academical acts, and by his private lectures on philosophy, the oriental languages, and divinity. In 1661 he went to the court of Schwerin, at the invitation of the duke of Mecklenburg, in whose presence, as well as in the presence of a great number of the nobility, he disputed two days on theological topics with two learned Roman Catholics, one an Austrian, and the other a Pole: and on a similar invitation he disputed, in the following year, with a Roman Catholic of Paris. On these occasions he acquired universal applause from the auditors. In 1662 he was nominated to the chair of the Greek professor at Roflock, and took his degree of doctor of divinity. From thence he removed to Kiel, became second professor of divinity, and afterwards vice-chancellor and first divinity professor. In 1680 the duke of Holbien bestowed upon him the professorship of ecclesiastical antiquities, and, in 1689, declared him vice-chancellor for life. Five times he had the honour of being nominated vice-rector at Kiel; and it is universally allowed that he performed the duties of his various offices with great ability and perseverance. He died in the year 1694, at the age of sixty-one, much respected and honoured by his friends and the university of Kiel. To the republic of letters he had been an ornament by a number of curious, learned, and useful works; the titles of which are given in Moreri, and also in Bayle, to which the reader is referred for further information.

KORTISJarve, in Geography, a town of Sweden, in the province of Vasa; 45 miles E.N.E. of Vasa.

KORTRIGHT, a post-town of America, in Delaware county, New York, in which are 1513 inhabitants.

KORTSCHIN, a town of Poland, in the palatinate of Sandemirz; 40 miles S.W. of Sandemirz.

KORTY, a town of Africa, in Senaar, on the borders of the Nile, where the caravans quit the river, and turn to the Defert, in order to avoid the pirates of the Nile; 60 miles E. of Dongolu.

KORYSOWA, a town of Poland, in the palatinate of the Kiev; 32 miles S.W. of Kiev.

KORZECZOW, a town of Poland, in the palatinate of Sandemirz; 23 miles S. of Sandemirz.

KORZELIAN, a town of the duchy of Warfaw; 70 miles N.W. of Warfaw.

KORZYMIECK, a town of Poland, in the palatinate of Lublin; 35 miles N.N.E. of Lublin.

KOS, in the Juvit's Antiquities, a measure which held the quantity of four cubic inches, and something over. This was the cup of blessing, out of which they drank when they gave thanks after solemn meals, as on the day of the slaughter.

KOSA, in Geography, a town of Russia, in the government of Perm; 48 miles W. of Solikamsk.

KOSARIA, in Botany, Forf. Εὐγενίττακτον-Αριαν. 164. I.c. t. 20. A lacerteous lufitid very singular plant, found by Forskall in the coffee plantations at Hadle. Juffieu, on the authority of Sieburh, refers it to Dorfonymia. and it is D. raduata of Willdenow, Sp. Pl. v. i. 685. Chyar is its Arabic name. The stem is thick and fleshy, like that of some African Euphorbias, bearing on the upper part several oblong, jagged, falcate leaves. The flowers have a radiated compound receptacle, and grow on falkes, from tubercles at the sides of the stem. The plant bruised is applied as a cure for eruptive disorders.

KOSCEA, in Geography, a town of Walachia; 16 miles N. of Kimmick.

KOSCIABAD, a town of Persia, in the province of Kerman; 60 miles S.W. of Sirjian.

KOSCLOW, a town of Austrian Poland, in Galicia; 60 miles E. of Lemberg.

KOSSEL, a town of the county of Tyrol, on the Brenta; 21 miles E. of Trent.

KOSHA, in Zoology. See Sibirian Doc.

KOSHAB, in Geography, a town of Curdißan; 20 miles S. of Van.

KOSHANIA, a town of Great Bucharia; 30 miles W. of Samarcard.

KOSHANIKUT, a town of Persia, in the province of Segefian; 110 miles N.E. of Bost.

KOSKANUADEGO, a river of Pennsylvania, which runs into the Alleghany, N. lat. 41° 32'. W. long. 79° 20'.

KOSKIN, a town of Norwegian Lapland; 168 miles S.W. of Pofanger.

KOSKIS, a town of Sweden, in Tavalland; 22 miles E. of Tavallhus.—Alsö, a town of Sweden, in the government of Abo; 20 miles E.N.E. of Abo.

KOSL, a town of Arabia, in the province of Yemen; 18 miles W.N.W. of Chamar.

KOSLOP, a town of Russia, and district of the government of Kostroma;
KOTCHENGSKA, a town of Russia, in the government of Irkutsk, on the Ilim; 60 miles W.S.W. of Orel
lou.

KOTCHUG, a town of Russia, in the government of Irkutsk, on the Lena; 16 miles E. of Vercholensk.

KOTELNA, a town of Poland, in the government of Kiev; 60 miles W.S.W. of Kiev.

KOTELNITCH, a town of Russia, and district of the government of Viatka, on the Viatka; 36 miles S.W. of Viatka.

KOTIAKOF, a town of Russia, and district of the government of Simbirsk, on the right side of the river Sura.

KOTIGNOW, a town of Poland, in Podolia; 34 miles N. of Kaminiec.

KOTINGHY, a town of Hindooftan, in the circum of Ruttumpour; 36 miles N.E. of Raypoure.

KOTLAN, a town and capital of a district of the same name, in Great Bucharia; 200 miles S.E. of Samarcand.

KOTMANA, a town of Walachia, near the source of a river of the same name, which runs into the Danube; 45 miles N.W. of Bucharest.

KOTNA, a town of Great Bucharia, on the Gihon; 40 miles S. of Bokhara.

KOTRAR, a town of Moldavia; 24 miles W.S.W. of Jaffy.

KOTO, or LAMI, a small and barren district of Africa, on the Slave Coast, in the Whidah country, extending about 18 miles along the Atlantic; the land is flat and the soil sandy. Slaves have been the chief article of trade with the Europeans. The chief town is called Koto, or Verku.

KOTONA, a town of Hindoostan, in Mewat; 25 miles N.N.W. of Cotputly.

KOTOO, one of the small Friendly islands, surrounded by coral reefs, and here and there accessible by boats; not more than 1/4 mile, or two miles long, but not so broad. The N.W. end of it is low, like the islands of Hapeae; but it rises suddenly in the middle, and terminates in reddish clayey cliffs at the S.E. end, about 30 feet high. In that quarter the soil is of the same sort as in the cliffs; but in the other parts, it is a loose black mould. It produces the same fruits and roots which are found in the other islands; it is tolerably cultivated, but thinly inhabited. The water is dirty and brackish. The burying places are nearer than those of Hapeae; 16 miles N. of Anamooka. S. lat. 19° 58'. E. long. 185 11'.

KOTRA, a town of Lithuania, in the patinate of Troki; 15 miles S.E. of Grodno.

KOTROU, a town of Africa, on the Ivory Coast.

KOTSKA, a town of Russia, in the government of Irkutsk, on the Tunguska; 140 miles N.N.W. of Irkutsk.

KOTLA, or KOTAI, a cecir of Hindooftan, in Malwa; bounded on the N. by Rantampour, on the E. by Yehud and Chandaree, on the S. by Kitchwara, and on the W. by Meyvas, or Oudipour. It is crooked in the centre by the river Jeful.—Alfo, a town, which is the capital of the cecir, seated on the Jeful. This town is of considerable extent, of an irregular oblong form, included with a stone wall and round bastions. It contains many good stone houses, and several handsome public edifices. The palace of the rajah is an elegant structure. The streets are paved with stone. It has, on the W., the river Chumbul, and on the N.E. a lake, smooth and clear as crystal, which, on two sides, is bordered with stone, and has, in the middle, a building called "Jug-mundul," which is consecrated to religious purposes. Near the N.E. angle of the town, and

only
KOUDRA, a town of Hindooftan, in Bahar; 27 miles S. of Burwah.

KOUDUR, a town of Hindooftan, in Dowlatabad; 7 miles N.N.W. of Beder.

KOUE-HOA, a city of China, of the first class, in the province of Yun-nan. N. lat. 23° 26'. E. long. 104° 56'.

KOUEIT, GREEN, Cath럼, or Kadheva, a sea-port town of Arabia, in the province of Lachfa, situated in a bay of the Persian gulf, and governed by a shefich, who is vassal to the shefich of Lachfa, but occasionally aspires to independence. Whenever the shefich of Lachfa advances with his army, the citizens of Koutre treat with their effects into the little island of Pelusjge. The inhabitants are chiefly occupied in fishing, and particularly for pearls; in which business they are said to employ more than 300 boats. N. lat. 27° 42'. E. long. 48° 10'.

KOUEI-TE, a city of China, of the first class, in the province of Ho-nan, situated in an extensive and fertile plain, between two large rivers; but in order to render it opulent, it wants an increafe of inhabitants and trade. The air is pure, and the fruits, especially oranges and pomegranates, are excellent. The inhabitants are diftinguifhed by their mildnefs and hospitality. The jurifdiction of this city comprises seven towns. N. lat. 34° 30'. E. long. 115° 29'.

KOU-HISAR, a town of Afitic Turkey, in Caramana; 12 miles N.W. of Akfear.

KOVINSKOL, Newtown, Sred, and Turabia, towns of Russia: the first, on an island in the river Kolina, N. lat. 65° 46'. E. long. 156° 42'.—the second, in the government of Irkutsk, on the Kolina, N. lat. 65° 5'. E. long. 153° 14'.—the laft, in the fame government, on the fame river, N. lat. 66° 15'. E. long. 149° 14'.

KOU-KOU, or KOU-OU, a town of Afia, in the kingdom of Gaaga; the residence of a powerful king in the twelfth century.

KOULIK, in Ornithology. See RAMPHASTOS Piperivorus.

KOULI-KHAN, THAMAS, or NADIR SCHAH, in Biography, was born in the province of Khorasan; his father was chief of a branch of the Afghans, which rank descended to Nadir when he was a minor, but his uncle usurped the government. On this he entered into the fervice of the Beglerbeg, governor of Mufcada, in Khorasan, who gave him the command of an army fent against the Tartars. Nadir, on this occafion, gave fignal proofs of his prowefs and military fkill; he gained a complete victory with an inferior force, and took the Tartar general prisoner. For this able conduct, the Beglerbeg appeared extremely grateful, and, at firft, treated Nadir with great diftinction; but at length he became jealous of his affuring spirit, and refufed to promote him in the army as he had promised, and when Nadir complained of his breach of faith, he caused him to be banilhed. Driven to defperation, he joined a banditti of robbers, and committed great ravages. The Afghans having made themselves makers of Ifpahan, and the Turks and Muftcovites ravaging other parts of Persia, Schah Thomas applied to Nadir for affifiance. He, without hesitation, entered into the fervice of the fchah; but one of his firft actions was to murder his uncle, who had usurped his title. For his great services against the Turks, he was ennobled with the title of khan, and honoured with other distinctions; nevertheless, he depofited Thomas, and placed a fon of that prince on the throne by the name of Abbas III. to whom he became regent. Under a prince, six months old only, Kouli-khan mediated to be the real sovereign of Persia. He difposed of every thing according to his own plafure: he defeated the Turks, and obliged them to sue for peace. Within a few months the prince died,
KOW, a town of Poland, in Volhynia; 25 miles N.W. of Lucko.

KOWERO, a town of Sweden, in the government of Kuopio; 80 miles E.S.E. of Kuopio.

KOWNO, or Kowis, a town of Lithuania, in the palatinate of Troki, at the conflux of the rivers Wilna and Niemen, containing eleven churches, one of which is Lutheran; 40 miles N.W. of Troki. N. lat. 54° 54'. E. long. 23° 45'.

KOWRA, a town of Birmah; eight miles N. of Raynangong.

KOWRAH, a town of Hindoostan, in Guzerat; 10 miles S. of Gogo.

KOWROWA, a village in Karakakoo bay, rendered infamous by the murder of captain Cook. See Cook, and Karakakoo.

KOYAHIT, a small American isle, at the S. end of Washington's isle, at the entrance of a strait separating a small isle from the largest.

KOYDANOW, a town of Lithuania, in the palatinate of Minfia; 16 miles S.W. of Minfl.

KOZAK, John Sophronius, in Biography, a physician of some celebrity, was a native of Bohemia, and practised his profession at Bremen during a series of forty-five years, and died there on the 30th of January 1685, at the age of 82. He was an admirer of Robert Fludd, the rosicrucian, and adopted many of his fanciful notions in his writings. He left the following works: "Difcurfus Physici quatuor, de rerum naturalium principiis, de generationum et transplantationum modis, morborum caulis et speciebus, methodo curationum," Bremen, 1631.""Anatomia vitalis Microcosmi," ibid. 1636.""Tractus fpagyriici de Phlebotomia, et Fontanellis," ibid. 1635.""Tractus Medicus de Sale, euidemque in corpore humano resolutionibus falatariibus et eternis," Francfort, 165;""Tractus de Hemorrhagia," Ulm, 1666. Eloy, Diet. Hist.

KOZANGRODEK, in Geography, a town of Lithuania, in the palatinate of Brzefc; 42 miles E. of Pinsk.

KOZAR, a town of Persia, in the province of Adirbeiztan; 75 miles W. of Tabris.

KOZAR, a town of Asia, in the kingdom of Candahar, on the borders of Persia; 180 miles S.S.E. of Candahar. N. lat. 30° 30'. E. long. 67° 15'.

KOZELSK, a town of Russia, and district of the government of Kaluga, seated on the left side of the small river Shidra, which falls into the Oca; 36 miles S.S.W. of Kaluga.

KOZELUCH, John Anthony, in Biography, music director in the Metropolitan church at Prague, was born at Wellburn, in Bohemia, 1758. He studied and lived privately many years at Prague, long before he obtained any professional honors or preference. His first advancement was to the place of chapel-master of Chrift-church, and the next, in 1784, was that of organift of the dan kirk or cathedral. He afterwards distinguished himself as a composer both for the church and theatre. Among his productions for the latter are his Italian operas of Demofoonte, and Alessandro nell' Indie, by which he very much increased his reputation. It is a pity, says Gerber (Mufical Lexicon) that more of his works have not been published!

KOZELUCH, Leopold, a celebrated harpichord-mafter and composer for that instrument at Vienna, was born at Wellburn in 1753. He had learned the principles of music regularly at 18 years old, and the art of finging. At 19, he was brought to Prague, where he studied at the same time composition and the harpichord. But before he was 18, he produced specimens of his genius and talents. In 1771,
1771, he published his first essay at composition, in a ballet for
the Prague playhouse. This was followed by 24 others and two
pantomimes. After this he was invited to Vienna, where he established himself, and whence his fame and works were
circulated all over Europe, with those of Vanhal, Haydn, and Mozart. His style is more easy than that of
Emanuel Bach, Haydn, or Mozart; it is natural, graceful, and
flowing, without imitating any great model, as almost all
his contemporaries have done. His modulation is natural and
pleasing, and what critics of the old school would allow
to be warranted. His rhythm is well phrased, his accents
well placed, and harmony pure. He published 20 or 30
different sets of harpsichord and piano-forte sonatas, some
with and some without accompaniments, which were not
only in high favour with the ladies of Vienna, but with
female dilettanti all over Europe. The adagios and violin
accompagniments to all his pieces have been universally
admired. If any one feat of his sonatas was more in favour at
Vienna than another, it was his 12th set. He was the first
in Vienna who published duets for two performers on one
keyed instruments, and several of them are excellent. He
published likewise a duet for two harpsichords, or piano-
fortes, with many concertos for the harpsichord à grand
orchestre.

Nor has he confined himself to instrumental music; he has
set a French comic opera, Le Muret; Didone abbandonata,
a serious opera in Italian; Moses in Egypt, a grand
oratorio, in Italian, 1787, the best for the widows and
children of decayed musicians, that had been composed for that
society. The same year he was engaged, by a society of 150
subscribers, to compose for the Italian opera: and for the
national theatre, or German playhouse, he composed airs,
cantatas, and ballads without end. In 1781, on the death
of the empress queen, he composed the music to a very
pathetic dirge. Josepfi and his Brethren, a cantata, with a
harpsichord accompaniment only. Pfeifel's cantata for Mad.
Paradis, his scholar in 1784, with innumerable lefions and
certos express for that blind but admirable performer; 15
songs to German words, and cantatas in Italian, with
accompaniments for two French horns, two violins, hautbois,
tenor, and bass; three symphonies, various sets of trios,
and quartets; two concertos for clarinet, and two for the
violoncello.

KOZIN, in Geography, a town of Poland, in Volhynia; 24
miles S. of Lucko.

KOZLAN, a town of Bohemia, in the circle of Rakoni-
itz; 12 miles S.W. of Rakonitz.

KOZLOV. See KONLOF.

KOZMODEMIANSK, or KUSMODEMIANSK, a town of
Russia, and district of the government of Kazan or Cafan,
on the Volga; 100 miles N.W. of Kazan.

KOZLU; a town of Poland, in the patinate of Volhynia;
56 miles E. of Lucko.

KRABBEN, a small island in the Atlantic, near the
cost of Guiana. N. lat. 0° 20'. W. long. 57° 50'.

KRAFT, George Wolfgang, in Biography, a cele-
brated mathematician, was born at Duthingen, where his
father was pastor. He received a good education, but ap-
plied himself chiefly to geometry and natural philosophy, in
which he made great progress under the celebrated Bellanger,
whose friendship and patronage he enjoyed. In 1728, he
took his degree of master of arts, and almost immediately
set out for Peterburgh, and was appointed teacher, in that
city, of mathematics in the New college, founded by the
Imperial Academy of Sciences. At the end of five years,
he was appointed a professor of natural philosophy. He
was, in consequence of his great reputation, recalled to his
native country, which obliged him to solicit permission to
resign his professorship. This was accompanied with the
most distinguished testimonials of high esteem; the academy
elected him an honorary member, and settled upon him a
handsome pension. He quitted Peterburgh in 1744, and
arrived at Tubingen, where he entered on his office as pro-
fe sor of mathematics and natural philosophy, which he re-
tained till his death in 1754. He was author of many very
valuable works, among which are "Institutiones Geometri-
æ Sublimioris," "Praelectiones Academicae publice in Physi-
cam Theoreticam;" "De vera experimentorum Physicorum
coniunctione;" "De Hydrostatica Principiis generalibus;"

KRAGG STONE, a rock found near Eifalit, belonging to the
setztrauff formation, but which, together with these
rocks called wacke and mullen, is kept distinct from
basalt by Mr. Kirwan, who gives the following description of
the krang stone. Colour greyish-red or reddish-grey,
ceeding porous: the pores often filled with various crys-
allizations. Lustre and transparency none. Fracture uneven
and earthy; fragments 2; hardness from 5 to 7. Spec.
grav. 2.414. Feels rough and harsh; gives a yellowish-
grey streak. At 158 it melted into a reddish-brown porce-
lain mass. It is often mixed with globules of magnetic
iron-stone, which adds considerably to its specific weight.

Wacke, mullen, and krang (Mr. Kirwan adds) have been
by most writers confused with what he considers as trap;
but their colour, specific gravity, and fusibility, shew
that they must be distinguised.

KRALIKIU, in Geography, a town of Moldavia; 95
miles N.N.W. of Jassy.

KRAGOJEVA, a town of Servia; 45 miles N.E. of
Novibafar.

KRAKOWATZ, a town of Servia; 30 miles N.N.W.
of Belgrade.

KRAKA, a town of Walachia, on a considerable lake,
that communicates with the Danube; 30 miles S.S.E. of
Bucharest. N. lat. 44° 5'. E. long. 26'.

KRAKAN, a small island on the W. side of the gulf
of Bothnia. N. lat. 63° 30'. E. long. 19° 33'.

KRAKATOA, a small island in the Straits of Sunda.
S. lat. 6° 6'. E. long. 105° 21'.

KRAKAW, or KRAKO, a town of the duchy of Meck-
lenburg, on a lake; 10 miles N. of Gutlow.

KRAKEN, in Zoology, a marine animal of most stupen-
dous magnitude, said to have been seen in the northern seas,
and particularly near the coasts of Norway and Sweden. The
existence of such an enormous creature is attested by bishop
Pontoppidan, who, in his "Natural History of Norway,"
affords an entertaining, if not a very satisfactory and accu-
rate, account of this surprising creature. From his details
we learn the kraken lies in the deeper parts of the sea, in
eighty or one hundred fathoms water, and at some leagues
from land. This mighty, and as it seems unwieldy mass of
animated substance, very rarely rises near the surface; when it
does, the calmest sea becomes troubled to a vast distance
around it, the heaving billows point out the more immediate
space in which it will emerge, and when it has risen, those
parts visible above the surface of the water assume the
aspect of so many islands, variable in dimensions as well as
shape, at every motion of the kraken. The form of this
efformous being is compared to that of a crab; the back or
upper part, (so far as can be probably estimated,) is said
to be a mile and a half in circumference, (or, as some affirm,
even more.) Its limbs, and of these it is furnished with
several, are truly gigantic, appearing, when elevated above
the water, as thick and long as the masts of vessels of a
moderate size, and are besides endowed with so much strength,
that with one of these it can seize on boats and the smaller kinds of vessels, and draw them under water. The defeat of this monster from the surface of the sea to the bottom, is said also to be not less terrible than its rising, since it occasions a swell and whirlpool so violent and irreducible, that ships of the largest burthen, drawn within its vortex, inevitably sink into the abyss of the waters, and sink to rise no more.

These, and various other circumstances equally calculated to excite astonishment, are related of the kraken by the learned prelate before mentioned, the particulars of which have been differently received. Many having placed an implicit confidence in his relations, and others as strenuously determining to reject them as tales unworthy of belief. In justice to Pontoppidan, we should observe, however, that though we are principally indebted for our knowledge of the kraken to this writer, it must be understood that the existence of such an animal as the kraken is not testified on his authority alone; nor is it in his volumes only that details so marvellous have appeared; his accounts in general are in a greater or less degree corroborated by several northern writers, and with such internal evidence of truth, that we cannot reject their reports as wholly fabulous, or conceive the kraken to be the mere creature of fiction. Still we must receive their observations deliberately; we may, and certainly do, on their veracity, admit the probable existence of a marine animal, such as the kraken is described, of a size very far surpassing that of the whale, and consequently, of any animal at present known, but here we pause; we have yet to be informed how far the truth has really been exaggerated as to the actual magnitude, and powers of this tremendous creature. As to the nature of this being, that particular appears to be pretty clearly defined; we have little doubt, if any confidence can be placed in the confusedly imperfect descriptions left us by different authors, that it is a creature by no means analogous either to the whale tribe, or any kinds of fishes; it is shrouded, on the contrary, of the mollusca order or family of worms peculiar to the sea.

Denys Montfort, a writer who seems to have considered its nature with attention, believes it to be a sort of sepias, an idea not improbable, or perhaps rather, should fortune ever favour the naturalist so far as to decide the point in question, it may prove to be one of the medusa tribe; this we suggest, though we should still rather be inclined to imagine it an animal of a distinct genus not at present ascertained, as being most likely partaking in some degree of the characters both of the genera Sepia, and Medusa, and yet not strictly appertaining to either. See Sepia and Medusa.

KRAKO, in Geography, a town of Sweden, in the province of Upland; 17 miles N. of Uppsal.

KRAKON, a small island on the W. side of the gulf of Bothnia. N. lat. 61° 33'. E. long. 17° 9'.

KRALAM, a town of Bohemia, near the river Mislav; 34 miles S. of Senoju.

KRALITZ, a town of Moravia, in the circle of Olmutz; 8 miles S. of Olmutz.

KRALOVAVELKA, a town of Slavonia; 30 miles W.N.W. of Pozyca.

KRALOWIDWUR, or Königshof, a town of Bohemia, in the circle of Königigratz, on the Elbe; 13 miles N. of Königigratz.

KRALOWITZ, a town of Bohemia, in the circle of Rakonitz; 13 miles S.W. of Rakonitz. — Affo, a town of Bohemia, in the circle of Čazlu; 16 miles S.W. of Čazlu.

KRIMER, in Biography. See the next article.

KRAMERIA, in Botany, received its name from Linnaeus, in commemoration of two German botanists, John George Henry Kramer, the father, and William Henry, the son, both of whom flourished towards the middle of the last century. The former, a physician to the army, published at Dreilien, in 1728, an anomalous arrangement of plants, partly by the system of Rivinus, and partly by that of Tournefort, dividing them according to the months in which they flower. This same book, amended and enlarged, was reprinted at Vienna in 1744, &c. interspersed with various remarks upon the technical terms of botany, anecdotes of what happened to the author in various journeys, and, according to Haller, many fabulous absurdities.

Gen. Ch. reformed. Cal. Perianth inferior, of four or five oblong, acute, unequal, spreading leaves, internally coloured, decussate. Cor. irregular, much shorter than the calyx, of five petals; the three uppermost with long claws, reflexed, and a small ovate limb, which is sometimes wanting in the middle one; two lowermost ovate, concave, fleshy, at each side of the germen, scarcely spreading, much shorter than the others. Stam. Filaments four, at the upper side of the germen, awl-shaped, parallel, ascending, two of them rather shorter than the rest; anthers terminal, fissa, ovate, erect, opening by two terminal pores. Sty. Gernem superior, fleshy, ovate, fleshy, awl-shaped, reflexed, nearly equal to the stamens; stigma simple, acute. Peric. Legume? globoso, of one cell, not bulging, arched on all sides with barbed projecting bristles. Seed solitary, ovate, hard, smooth.

Eff. Ch. Calyx of four or five leaves. Petals five; the three uppermost with long claws; two lowermost fleshy, ovate. Fruit globoso, prickly, of one cell. Seed solitary.

Obv. It does not appear that Linnaeus ever saw this genus; all that he says of it being taken, not very exactly, from Druce; nor is there a specimen of his herbarium. Neither does Mares seem to have known any thing of it,

when he sent Linnaeus a description of the Acesa, Mant. 2. 145, under the denomination of "Krameria affinis," for these two genera have nothing in common, except a slight coincidence in their artificial characters, not founded in nature. This Acesa indeed was never seen by Linnaeus, being adopted entirely from his friend's account. It is, with great judgment, referred by Jussieu to his own natural order of Rudis, after Ancistrocerus, with which Krameria has no relationship whatever. — The description and figure of a second species of Krameria, in Cavallin, have enabled us to form some idea of its natural affinities, hitherto left in the dark, as well as to venture on a reformation of its generic characters; though all this is done from the above authorities alone, without inspection of any specimen. The genus in question will not conveniently go into any of Jussieu's present sections of the Leguminosae, but a comparison of its anthers with those of Caffis, its hard ovate seed, and its anomalous corolla, will, we presume, confirm those more obvious indications which have led us to the above conclusion, notwithstanding the strange and peculiar feed-veil.

Only two species have hitherto been described by authors, both natives of South America.

1. K. Ixina. Linn. Sp. Pl. 175.—Leaves all simple. Calyx four-eleft. — Gathered by Locshe near the town of Comana, on the coast of the Caracas, latitude about 10° S. The inhabitants
KRA

Inhabitants call it Cardillo Brown, or rather, as we presume, Cardillo Brown, Teafol Fig, from the shape of the fruit and its barbed bristles. Whether there be any thing visible in its habit, which might induce its discoverer to adopt the Greek name Leina, does not appear from his description here subjoined. "Roots fibrous. Stems thrumbly, prostrated, in their lower part, and spreading every way, but soon ascending and wavy-like - their branches flattened and cresct. Leaves alternate, lanceolate; the upper ones linear, acute, nearly fusiform. Flowers alternate, in a terminal (leafy) cluster, their flasks axillary, furnished about the middle with two small acute linear bracteas. Calyx of a rosy purple. Upper petals pale at the tils, lower ones rufous, dark purple. The plant itself is of a brownish hoary hue."

2. K. cyrtifolia. Cavan. loc. v. 4. ot. t. 392. - Leaves tertiary; the floral ones simple. Calyx five-cleft. - Found by Lewis Née, near the town of Cimápin in New Spain, especially on the hill commonly called del carpillero, bearing flowers and fruit in September. The stem is thrumbly, three feet high, with a grey bark; its branches numerous, alternate, downy when young. Leaves alternate, on longish, downy, compressed footstalks, ternated; leaflets elliptical, fuscous, entire, downy. Flowers forming a simple cluster at the end of each branch, with a simple elliptic-lanceolate leaf at the base of each of their flasks, and a pair of smaller ones above the middle, the flacks all single-flowered, rather longer than the leaves, and downy. Calyx externally downy, internally of a violet red. Stamens equal, red, inserted into the receptacle, all at the upper side of the germin, and within the upper petals, which latter therefore cannot, as Cavallones suggests, be abortive filaments. The lower petals are dark violet; the central one of the three upper is elongated, taper-pointed, and recurved, not dilated at the summit like the others. Petals hairy. Fruit globular, the size of a currant, downy, muricate on all sides with longish projecting bristles, barbed at their points only with three or four sharp reflexed teeth. S.

KRAMERSKY, in Geography, a town of Ruffia, in the province of Ermland; 15 miles S. of Heilberg.

KRAMICHEN, a town of Saxony, in the principality of Altenburg; 12 miles S.E. of Erfurt. N. lat. 50° 43', E. long. 11° 4'.

KRA NOWITZ, a town of Silisia, in the principality of Troppau; 11 miles N.E. of Troppau. N. lat. 49° 55'. E. long. 18'.

KRANDT, Albert, in Biography, a native of Hamburgh, of whose early life we have no information, became professor of canon law and theology in the university of Rottock, and afterwards rector of it about the year 1482. He took his degree of doctor of divinity in 1492, and then removing to Hamburgh was elected dean of the cathedral there. He obtained great reputation for his abilities and prudence, and was consulted on various occasions. Of such consecration was his opinion reckoned, that in the year 1500, the king of Denmark and the duke of Holstein made him their umpire in a dispute with the people of Dithmarth. He died in 1517, leaving behind him a character for integrity and industry in his search. His works are, "Chronica Regnorum Aquiloniorum Dania, Suecia, Norvegiae;" "Vandalia, sive Historia de Vandalorum origine;" "Metropoli's, sive Historia Eglestlaphia de Saxonia." Morei.

KRAPERNA, in Geography, a town of Ruffia, and district of the government of Tobla.

KRAPINA, a town of Croatia; 8 miles W. of Agram.

KRAPOITZ, or KRAPOKOWITZ, a town of Silisia, in the principality of Oppeln, near the Ober; 12 miles S. of Oppeln. N. lat. 50° 25'. E. long. 17° 52'.

KRA, a town of Poland, in the palatinate of Lublin; 26 miles S. of Lublin.

KRAZINS, a town of Poland, in Volhynia; 18 miles W. of Constantinow.

KRAHSENINNIOVIA, in Botany, a genus formed by Schedler, Nov. Comm. Petrop. v. 16. 551, of the Asyria Ceratoidea of Linneus, and which is retained in Schreber's Genera 633 under the name of Dois. Of the propriety of its establishment we have some doubts, having never examined the living plant, nor traced the progress from the flower to the fruit. It possibly, however, bears the fame analogy to A. Erinus that Aristophanes does to Che

KRAUSE, in Geography, a town of Poland, in the palatinate of Bracaw; 24 miles N.W. of Bracaw.

KRASTENPOL, a town of Poland, in Podolia; 32 miles N.E. of Kamieniec.

KRASTENBORSK, a town of Russia, and district of the government of Volgola, in the province of Veliki-Uping, on the left side of the Dvina; 60 miles N.W. of Uling.

KRASTENBROD, a town of Poland, in the palatinate of Beleth; 28 miles W. of Beleth.

KRASTEN, a town of Russia, and district of the government of Smolenke, on a rivulet which falls into the Dnieper; 28 miles S.W. of Smolenke.

KRASTENKAR, a town of Russia, in the government of Upha; 16 miles N.W. of Upha.

KRASTENKAR, a town of Russia, and district of the government of Kolyvan, on the Yenisei, where it receives the Katcha: it was built in 1618, surrounded with palisades, small towers, and some batteries. The inhabitants, who occupy about 350 houses, principally trade in cattle, horses, and furs; 100 miles S. of Eniseif. N. lat. 56°. E. long. 66° 14'.

KRASTENIKSKAIA, a town of Russia, in the government of Irkutsk, near the confluence of the Oka and Angara; 64 miles W.S.W. of Ilimik.

KRASTENKAR, a town of Russia, and district of the government of Tver, on the river Schoea, which falls into the Mologa; 60 miles N. of Tver.

KRASTENKUTSK, a town of Russia, and district of the government of Klarkof, or Hellkov, on the Merlo; 40 miles W.S.W. of Klarkov; which see.

KRASTENOLAW, a town of Poland, in the palatinate of Chiem; 26 miles S.S.W. of Chiem.

KRASTENOLAWSKE, a town of Russia, and district of the government of Penza, on the Molovka, or Molva; 83 miles N.W. of Penza.

KRASTENOUFTSK, a town of Russia, and district of the government of Perm, on the Upha; 95 miles S.E. of Perm.

KRASTENOSOK, a town of Russia, in the government of Cacnaca, at the mouth of the Volga; 16 miles N. of Anfachan.

KRASTENUKKA, a small island on the E. side of the gulf of Bothnia. N. lat. 65° 22'. E. long. 24° 46'.

KRASTENPOL, a town of Poland, in Bracaw; six mile E. of Bracaw.

KRASTENZNA, a town of Hungary, on a river of the same name, which runs into the Samos; 16 miles S. of Zatmar.

KRAUFEN, or KROPPA, a town of Bohemia, in the circle of Leitinartz; 14 miles W.N.W. of Leitinartz. N. lat. 50° 41'. E. long. 13° 54'.

KRAUS, Martin, in Biography, an eminent scholar in polite literature, the son of a Lutheran clergyman, was born

Vol. XX.
in 1526, at Grebern, in the bishopric of Bamberg. He received his classical education at Ulm, where he acquired himself with so much credit, that the magistrates of the city allowed him a pension to assist him in his future studies. He went to Strasbourg, and added to his former acquisitons theology and the Hebrew language. He afterwards undertook the direction of the public school at Memmingen, which he rendered celebrated by adopting the methods pursued at Strasbourg. In 1559, he was appointed professor of moral philosophy and the Greek language at the university of Tubingen, where he resided till the time of his death, which happened in 1607. He published a great number of works, grammatical and critical, with orations, Greek and Latin, but his most valuable publication is entitled "Turco-Grece libri octo," containing an excellent collection of pieces relative to modern Greece, with the language and literature of which he was well acquainted. He was a well-known scholar and an excellent musician of his time.

KREUTZBURG, a town of Russia, in the government of Podolisk, on the Duna; 60 miles E.S.E. of Riga.

KREWITZ, a town of the duchy of Mecklenburg; 10 miles E. of Schwerin. N. lat. 53° 40'. E. long. 11° 45'.

KREWIS, a town of Lithuania, in the patriminate of Wilna; 42 miles S.E. of Wilna.

KRIEHEISKAIA, a town of Russia, in the government of Archangel, on the Dwina; 16 miles S. of Kolmogor.

KRIEBEL, KRAKOW, the German appellation of the diocese said to arise from the eating of the roots of the raphan- nut, and thence called Raphania by Linnaeus and others. See that article; also EUGER and IGNIS FACER.

KRIEGSTETTEN, in Geography, a bailiwick of Switzerland, in the canton of Berne.

KRIEN, and HORN, a bailiwick of Switzerland, in the canton of Lucerne.

KRICHEVA, in Botany, named by Schreber, apparently in honour of Dr. David Krieg, a German physician, mentioned in the preface to the third volume of Ray's Historia Plantarum, who is there said to have accompanied Mr. William Vernon, fellow of St. Peter's college, Cambridge, in a botanical excursion through the province of Maryland. In this journey they discovered and collected some hundreds of new and rare plants, many of which are described in the work of Ray, above cited. Schreb. 532. Wild. Sp. Pl. v. 3. 1618—Cliffs and order, Syngenea Polymagia Equa. Nat. Ord. Composita Semifoliosa, Linn. Citius, Julian.

Gen. Ch. Common calyx simple, cylindrical, of about ten, lanceolate, erect, acute, equal leaves, shorter than the corolla. Cor. compound, somewhat imbricate, uniform, each flower hermaphrodite; proper, of one petal, tongue-shaped, linear, truncated, five-toothed. Stam. Filaments five, capillary, very short; anthers cylindrical, tubular. Pist. Germin nearly ovate; style thread-shaped, the length of the filaments; stigmas two, reflexed. Peric. none. Common permanent calyx ovate, at length reflexed. Seeds filiform, five-sided, flattened, with a membranaceous crown of five, roundish, erect leaves; down capillary, consisting of five long, rough, bristles, alternating with the crown. recess. naked.

Eff. Ch. Receptacle naked. Calyx simple, of many leaves. Seed down of five membranaceous leaves, with five alternate bristles.

K. virginica. Wild. (Hypoferis virginica) Linn. Sp. Pl. 1138. Michaux Boreal-Amer. v. 2. 88. Lamark in Journ. d'Hist. Nat. v. 1. 222. t. 12.—A native of Virginia and Pennsylvania, found even from Canada to Florida. The habit of this plant is very similar to that of a starved Dandelion. Radicles leaves at first ovate, then lanceolate, and at length lyrate, acute, smooth. Stalks naked, single-flowered, thrice as long as the leaves. Calyx perfectly simple, not imbricate, of ten lanceolate leaves. Flowers deep yellow. Seeds square, crowned with five short, rounded, membranous scales, and as many alternate, long, rough, straight bristles.

K. virginica. Wild. (Hypoferis virginica) Linn. Sp. Pl. 1138. Michaux Boreal-Amer. v. 2. 88. Lamark in Journ. d'Hist. Nat. v. 1. 222. t. 12.—A native of Virginia and Pennsylvania, found even from Canada to Florida. The habit of this plant is very similar to that of a starved Dandelion. KRIJMINAGUR, in Geography, a town of Hindooistan, in Mewat; 18 miles N.E.E. of Alwar.—Alfo, a town in Aginere; 15 miles E.N.E. of Roopmagur.

KRIKA, a district of Africa, in the kingdom of Calbari.

KRIM, See CRIM, CRIMEA, and TAURIDA.

KRINK, a town of Ithria; 12 miles S.S.E. of Capo d'Itria.
KRIS, the denomination of Indians that inhabit the banks of lake Chritline, who can raise 1000 warriors.

KRISHNA, in Hindoo Mythology, one of the avatars, or incarnations of the god Vishnu, in which he is said by the sectaries, who exclusively worship him under this name, to have magnified himself in a degree of power and glory far exceeding any other of his forms. They maintain, indeed, that under the other avatars, he assumed only an *aspect, or portion* of his divinity, while Krishna was Vishnu himself in mortal mould. A numerous sect, called Gokalaka, from Gokula, one of Krishna's names, worship him exclusively, or conjointly with his consort Radha; this sect are miraculously lavish in their praises, and vehement in their adoration of this deity, while other sects of Hindoos call Krishna an impious wretch, a merciless tyrant, an incarnate demon, now expiating his crimes in hell. As information is received from these different descriptions of sects, so consequent will it differ in the account of the character and actions of this morty perforence, of whom as much is recorded as of any of the Hindoo deities. His life and actions have occupied the attention of many voluminous writers; and if taken literally he led a life of excessive libertinism, but his followers maintain such appearances to have been the result of *maya*, or delusion, for that in reality his life was chaste and holy. The Gita Govinda, a beautiful poem by Jayadeva, is a series of mystical rhapsody in praise of Krishna, and a relation of his loves with his consort Radha, and although warm, and indeed loofe, in a degree not admitting of literal translation into our language, is said to be purely mystical, and to mean the *reciprocal attraction* between the divine goodnens, and the human soul. This poem has been finely translated by Sir W. Jones, and appears in his works, and in the third volume of the Atheic Researches. The same subject is whimsically handled in the tenth book of the Sri Bhagavata, a life of Krishna, not biortho translated, so much venerated among certain sects, as to be esteemed as the eighteenth Purana. (See Jayadeva, Mystical Poetry, Sri-Bhagavata, and Purana.) Most of the extravagant tales related of Krishna, may be resolved into a continued foliar allegory, for he is a personification of the fun, and corresponds with the Apollo of the Greeks. (See Kaliya.) His mortal parents were Vafu-deva and Devaki. He was fathered by an honest herdsman named Ananda, or the happy, and his amiable wife Yasuda; and passed his youth in dancing, sporting, and piping among a multitude of young Gopas, or cow-herds, and Gopias, or milk-maids, from whom he selected nine as favourites. As a specimen of the tales of the Bhagavata, it may suffice to relate, that on one occasion the Gopas, his playfellow, (that is, the Mufes) complained to Tofuda, that he had pestered and ate their curds; and being reproved by his folter mother, he directed her to examine his mouth, in which, to her just amazement, she beheld the whole universe in all its plenitude of magnificence. Another of his miracles is given under Kajsa, which see.

Innumerable are the extravaganzas related of Krishna, whom some French writers have impiously compared with Jesus Christ. On this subject the following passage occurs: in Moor's Hindoo Pantheon, whence this article is taken. Describing a plate of Krishna destroying Kalya, "It has," he says; "been furnished by respectable writers, that the subject here represented has reference to an awful event figuratively related in our scriptures, and Krishna is not only painted, as seen in the plates, bruising the head of the serpent, but the latter is made to retort by biting his heel. Among my images and pictures of this deity (and they are very numerous, for he is enthusiastically and extensively adored, and his history affords great scope for the imagination) I have not one original, nor did I ever see one, in which the snake is biting Krishna's foot; and I have been hence led to suspect, that the plates engraved in Europe of that action are not solely of Hindoo invention or origin. I may easily err in this instance; but I am farther strengthened in the suspicion, from never having heard the fact alluded to, in the many conversations that I have held with Brahmans and others on the history of this avatar.

"Sonnerat was, I believe, the first who exhibited Krishna crushing a snake; how, otherwise would he or any one kill it so easily and obviously, as by biting on its head? Nor can the reptile in any mode retort but by biting the foot of its affiant. Zeal sometimes may have in its results the same effects as indulgence; and one cannot help lamenting that a superstructure requiring so little support, should be encumbered by awkward buttresses, so ill applied, that they would, if it were possible, diminish the stability of the building that they were intended to uphold. Of this description were the zealous researches of some millionaires, who in Brahma and Saraswati easily found Abraham and Sarah; and the Christian Trinity is as readily discovered in the monstrous Trimurti of the Hindoos." (See Saraswati and Trimurti.) Of this description also, I am disposed to think, are the attempts at bending so many of the events of Krishna's life to tally with those real or typical of Jesus Christ's. That Krishna, according to his historians, passed a life of a most extraordinary and incomprehensible nature, may be admitted; and that his name, and the general outline of his story, existed long anterior to the birth of our Saviour, is very certain, and probably to the time of Homer. His miracles are amazing, but ridiculous; a term that may, perhaps, be applied to a majority of the legends detailed with such proximity in the modern poem, the Sri Bhagavata. He is represented as the meekest, tenderest, and most benevolent of beings; still, however, he fomented the terrible war described in the Mahabarat: he washed the feet of the Brahmans: he exhibited an appearance of excessive libertinism: but it was, they say, all *maya*, or *deception*, for he was pure and chaste in reality; he uplifted mountains, raised the dead, (see Kasya,) descended into hell, and performed such exploits, as induced sir William Jones (Af. Ref. i. 274.) to think that "the spurious gospels, which abounded in the first ages of Christianity, were carried to India, and the wildest parts of them repeated to the Hindoos, who engrafted on them the old fable of Kefava, the Apollo of Greece."
mon, Murari, Heri, Madhava, and Baghavan, among them; Govinda, Gopala, Gokula, are derived from his occupation of herdsman; Gopisath, or the Gopi's god; Murdhar, the benevolent; Kruha, Kefava, or Kefaw, are said to refer to the blemishes of his hair; Vamana to his petulant garland; Yadava, Vadhunya, and Vasudeva, to his tribe and family.

He is usually painted of a dark blue colour; his name Krishna denotes this; and with four arms; elegantly dressed with a profusion of jewels, and often playing on a pipe. Many places of him are given in the Hindu Pantheon, from original images and pictures, and many legends are there related, connected with their subjects. In the Gita Govinda he is thus described: "His azure breast glittered with pearls of unmixed fire, like the full bed of the cerulean Yamuna, interlaced with curls of white foam. From his graceful waist flowed a pale yellow robe, which reflected the golden dust of the water by scattered over its blue petals. His passion was inflamed by the glances of Radha's eyes, which played like a pair of water birds with azure plumage, that sport near a full blown lotus, on a pool in the fen of dew. Bright ear-rings, like two fans, displayed, in full expansion, the flowers of his cheeks and lips, which glittered with the liquid radiance of smiles. His locks, interwoven with bobbylocks, were like a cloud variegated with moon-beams; and on his forehead shone a circle of dolorous eyes, extracted from the sandal of Malay, like the moon just appearing on the dusky horizon; while his whole body seemed in a flame, from the blaze of innumerable gems."

In that very curious work translated by Mr. Wilkins, entitled 

Bhagavat-Gita, Arjun, the son of Pandu, address-es Krishna as "the supreme Brahman: the most holy; the most high god; the divine being before all other gods; without birth: the mighty lord: god of gods; the universal lord." In different parts of the Gita he says of himself, "I am, of things transient, the beginning, the middle, and the end: the whole world was spread abroad by me in my invisible form. At the end of the period kalpa (see KALPA) all things return into my primordial source; and, at the beginning of another kalpa, I create them all again. I am the creator of all mankind, uncreated, and without decay. There is not anything greater than I, and all things hang on me, as precious gems on a string. I am the underlining of the vine, the glory of the proud, the strength of the strong. I am the eternal feed of all nature; I am the father and mother of this world, the grandparent and the preverber. I am death and immortality; I am entity and nonentity; I am never falling time; I am all-grasping death, and I am the resurrection."—"I am the emblem of the immortal, and of the incorruptible; of the eternal, of justice, and of endless bliss."—"Neither the sun nor the moon, nor the fire, enlighten that place, whence there is no return, and which is the supreme mansion of my abode."

Sañjay, one of the interlocutors of the Gita, describes Krishna, as he revealed his "million forms divine," to Arjun, "covered with every marvellous thing-the eternal god, whose countenance is turned on every side. The glory and amazing splendour of this mighty being may be likened to the fun, riling at once into the heavens with a thousand times more than usual brightness. The fun of Pandu then beheld within the body of the god of gods, flaring together, the whole universe divided forth into its vast variety." Arjun, terrified at this wondrous exhibition, exclaims: "Thou art the supreme being! I see thee without beginning, without middle, and without end; of colour infinite, of arms innumerable; the sun and moon thy eyes; thy mouth a flaming fire; and the whole world shining with thy reflected glory."

Having beheld all this dreadful sight, and gazed on thy countenance, emblem of time's last fire, I know not which way to turn; I find no refuge. Have mercy then, O god of gods! thou mansion of the universe: and show me thy celestial form, with the diadem on thy head, and thy hands armed with the club and chakra. Alas! then, O god of a thousand arms! image of the universe! thy four-armed form."—Krishna is here, as usual by his followers, identified with Viñnu, and as "emblem of time's last fire," and other passages of the above extracts, is apparently alluded to in the character noticed under Kalpa, as the ruling Kalka-rupi, or Chronus.

It is believed by some of the most respectable researchers into Hindu theology, that the worship of Krishna, Rama, and other deified personages, is modern compared with the institutions of the Vedas (see VEDA), in which no mention is made of such deities. As noticed under the article JAGANATHA, one of the names of Krishna, he is principally worshipped at that extensively revered temple. Under JAMAIVANTI is related a legend of this frolicsome deity, who espoused a bear of that name. (See also KANSA.) Many plates, and legendary particulars and speculations, are given of Krishna and his extraverent history, in the work whence this article is taken, to which we refer the reader desirous of farther information thereon.

The name of Krishna is variously written in European languages: Crifhna, Crifna, Kruhna, Kifshna, Kifshnha, Quixena, Kifhen, &c. and is differently pronounced in different provinces of India.

KRIS. See CRESEN.
KRITANTA, a name of Yama, the Hindoo Plut. Kritamata is the name of a river connected with the history of this perionage under some of his forms, and may have a common origin. See YAMA.

KRITIKA, in Astronomy, the Hindoo name of the Pleiades, respecting which their poetical mythologists have related many pleasing tales, every thing connected with Hindu science being veiled in allegories. This constellation personified as, one of the manions of the moon, or Soma (see Soma), failed to be a beautiful nymph receiving the incumbent deity in his nocturnal wanderings. (See NAKSHA-TARA.) The fix Kritikas are feigned also to have been the wet-nurseries of Kariyka, as mentioned under that article. Other legends make them the wives of the Rihis, who, among other characters, are made to shine with four bright stars in Ursa major; but being unequal in number, farther fables became necessary to reconcile the difference, and an astronomical legend is related in the Hindu Pantheon, affording a specimen of the manner in which the Brahms have huddled, in mythological fictions, historical or scientific facts, and of the coincidence of those fictions with the tales of western fabulists. "It is related that Agni, or Pavaka, the ardent deity of fire (see PAVAKA), was charitably and gallantly disposed to communicate a portion of his warmth to these ladies, wives of the frozen Rihis; and situated as they were in the arctic circle, their comeliness to such a comfortable suitor is not surprising. But it is said that he had not, in fact, complete success, for that his wife (see SWAHA), dreading the resentment of the holy Rihis, assumed successively the shape and countenance of each of their desirable wives, and this personifying them, satisfied her husband's ardour. Arundhati, however, the wife of Vasitha (see VASIMTA), having always been exemplary, as to holiness and sanctity, was not suspected on this unlucky occasion; but the other fix Rihis, in consequence of scandalous reports, not only dismissed their sparkling lovelies, but, like great bears, drove them out of the arctic circle, and they now shine the Pleiades.
It would appear that they had qualified themselves for writer, and accordingly were buried young at Karlskrona, as noticed under that article, or were entrained with his education, and were placed by him in the zodiac."

"In this wild tale we see an allusion to the disapparition of the seventh star of the Pleiades. Arundhati, the wife of Vasa, is retained by him. The star called by his name is in lat. 61° N. and she is the smaller star near him. They are proverbial for constancy; and astrologers carefully watch their motion, as their influences are variously modified: whatever newly married couple fee them in an auspicious conjunction or position, are surely to live happily together for a hundred years. People as these stories appear, they are matched by others that we have been taught to listen to with more attention perhaps than they deserve. "The Pleiades, according to mythologists in the west, were entrained likewise with the education of Baco (who, according to Macrobius, was the fame with Mars, or Kartikya), and on that account he transplanted them into heaven. According to these writers they suffered a real bodily pollution; and the seventh, says Hyginus (Poet. Astr. p. 471) left her filters and fled to the regions of the heavens; and this is the Arundhati of the Hindoos. Hist. Pan. p. 88.

KRIVENA, in Geography, a town of European Turkey, in Bulgaria, on the Danube; 33 miles E. of Nicopolis.

KROBE, or Sulpava, a town of the duchy of Warsaw; 32 miles S. of Polen.

KROKEPELIN, a town of the duchy of Mecklenburg; 12 miles W. of Kollock.

KROKE, a town of Sweden, in East Gothland; 11 miles N.E. of Nordkioping.

KROKINOW, a town of Samogitia; 22 miles E. of Rofienne.

KROKY, a town of Samogitia; 18 miles S.E. of Rofienne.

KRELENDORF, a town of Austria; 16 miles E. of Steyr.

KROMAY, Johann, in Biography, a learned German divine, who acquired a very high reputation as a preacher, and was appointed chaplain to the court of the duchess dowager of Saxony. The duke Weimar afterwards nominated him superintendent-general of the churches in that district, and the senate of that city chose him as pates of their church. He died at the age of sixty-seven. He was author of "Harmonia Evangelica;" "Historia Ecclesiastica Compendium;" "Specimen Fontium, Scripturae Sacrae aperitur;" "A Paraphrase on the Prophecy and Lamentations of Jeremiah," &c. &c.

Kromayer, Jerome, nephew of the preceding, was brought up chiefly at Leipzig, where he took his degree of M.A. in 1632. From that time he became lecturer on logic, rhetoric, natural philosophy, and astronomy. In 1634, he was appointed professor of history and oratory in the leifer college of princes, at Miinnich. Four times he was called to the office of dean of the university; twice he presided as provost; and in the leifer college he was honoured three times with the post of provost. He filled several other high posts in the university with great advantage to the place, and died at the age of fifty, in the year 1670. He was author of "Commentaries on divers Parts of the Holy Scriptures;" of an "Ecclesiastical History," and other works.

KROM, in Geography, a town of Russia, in the government of Orel; 16 miles S. of Orel.

KROMME, a river of Africa, forming a bay at its mouth in the Indian sea, S. lat. 34° 6'.

KRONENBURG. See Kronenburg.

KRONIHAR, a small island on the W. side of the Gulf of Bothnia. N. lat. 69° 25'. E. long. 17° 26'.

KRONOBY, a town of Sweden, in the government of Ulen; seven miles S. of Garna Karlby.

KRONOR, a small island on the W. side of the Gulf of Bothnia. N. lat. 69° 27'. E. long. 15° 8'.

KROTSKOY, a cape in the northern part of Kamchatka, about which the land is very high. N. lat. 54° 42'. E. long. 162° 17'.

KROPPA, a town of Sweden, in the province of Warmeland; 30 miles N.E. of Carlstadt.

KROPPENSTADT, a town of Sweden, in the principality of Halberstadt; nine miles N.E. of Halberstadt.

KROPSUNKARI, a small island on the E. side of the Gulf of Bothnia. N. lat. 69° 10'. E. long. 25° 6'.

KROENEN, a lake of Norway; 33 miles N.W. of Christiania.

KROSKA, a town of Servia, on the right bank of the Danube; 10 miles S.E. of Belgrade.

KROSNO, a town of Austrian Poland, in Galicia; 25 miles N.W. of Sanock.

KROTTAU, a town of Bohemia, in the circle of Bohemb; 46 miles E. of Drefden.

KROUEN, a town of Bohemia, in the circle of Chudim; 12 miles S.E. of Chudim.

KROUSTA, in the Ancient Myth, is a term purely Greek, implying the third species of musical instruments, which the Latin term pulsulation, and the English, instruments of percussion; their tones being produced by beating with the hand, as drums, tabours, timbrels, &c. or with small sticks or iron rods, as the pealtry, tympanum, and dulcimer, or by being struck with hammers, as bells, gongs, pianofortes, &c.

Representations and descriptions of all these instruments may be seen in Lucianus, Hermogenes, Kircher, Bonanni, Laborde, and in almost all histories of music.

KROVE, in Geography, a town of Samogitia; 20 miles N.W. of Rofienne.

KRUCKEN, a town of Prussia, in the province of Brandenburg; 20 miles N.W. of Rofienne.

KRUDSEDEL, a town of Prussia, in the province of Weihenstephan; 12 miles S.E. of Weihenstephan.

KRUZWEWO, a town of Lithuania, in the patriciate of Wilna; 16 miles S.E. of Wilna.

Krug, Louis, in Biography. See German School of Engraving.

KRUGLIKIN, in Geography, a town of European Turkey, in Moldavia; 12 miles S. of Choczim.

KRUMPACH, a town of Austria; 20 miles S. of Ebenfurth.

KRUPA, a town of Poland, in Volhynia; 60 miles E. of Lublin.

KRPKA, a town of Lithuania, in the patriciate of Minile; 60 miles N.E. of Minil.

KRUPULIK, a town of European Turkey, in Macedonia; 84 miles N.N.W. of Salonika.

KRUSCHIN, a town of Prussia, in the patriciate of Psel; 24 miles E. of Psel.

Kruszwica, or Krutswica, a town of Poland, in the patriciate of Breslau; 28 miles W. of Breslau. This place deserves to be recorded, as it was the birth-place of...
Plaat, who, occupying the flation of a private citizen, was
elected king of Poland in 842.

KRUTAIA, a town of Russia, in the government of Tobolsk, on the Irtysh; 36 miles N. of Omsk.

KRYLOW, a town of Comland; 32 miles S.S.W. of
Goldingen.

KUTGORSKOI, an offtr of Russia, in Kamtchata. N. lat. 54° 50'. E. long. 155° 54'.

KRUWOTOW, a town of Austrian Poland, in Galici;
22 miles S.E. of Halicz.

KRYLOW, a town of Galicia; 10 miles N. of Belz.
KRYOLITE, or Cryolite; Alumina fluore alcaine, Hauy. The colour of this mineral is snow-white, sometime brownish-yellow, by the admixture of a small proportion of iron ochre.

It occurs massive, generally in angular fragments with faint fritz, indicating a rhomboidal nearly cubical nucleus; secondary forms have not yet been observed.

Its lustr is vitreous, often inclining to pearly.
Fracture imperfectly foliated, smooth in one direction, and uneven in another.

It is translucent even in fragments of considerable size; small pieces approach to transparent, and when immersed in water for some time become completely so.

It is soft, so as to be scratched by fluor, particularly in the principal direction of the lamin.
It is easily frangible.

The specific gravity of kryolite is 2.928; that of a small fragment immersed in water for twelve hours was 2.941, Schumach. Haiy(flat it to be 2.949; Karlien 2.957; and Andrada 2.969.

Before the blow-pipe it soon melts, (though certainly not with sufficient ease or rapidity to warrant the incorrect appellation of kryolite, supposed to be derived from this circumstance) and is afterwards converted into a white opaque pearly flag, of a slightly alkaline taste. With borax an opaque pearl is formed, which, some time after cooling, shows a degree of deliquescence. It is not operated on by the muriatic and nitric acids, but is disolved by concentrated sulphuric acid under development of greyish-white vapours that corrode glasses.

Professor Abildgaard, who was the first who analyzed this mineral, which had before been mistaken for a substance related to barytes, found it to be composed of alumine and fluor acid. Vauquelin, who examined it after him, obtained the same results, and both chemists account for the small proportion of alumine which they found, by the possibility that part of the earth might have been carried off by the sulphuric acid. Klaproth was enabled to aflign the true cause of the apparent disproportion by the discovery of a considerable proportion of foda, till then but little known as an ingredient of fomy substances. His analysis, and the subsequent one by Vauquelin, have given the following results.

The only place where kryolite has been hitherto found is Greenland; but nothing is known respecting its geomorphic situation. Werner, we are told, has adopted this mineral as a species of a genus of his, called the Hallite genus, which is to comprehend such substances as bear great resemblance to folid salts, without poffefling all the requisite characters to entitle them to be enumerated as such.

KREZEMIEJ, in Geography, a town of the duchy of Warfaw; 34 miles S.W. of Bieków.

KRAZEMIEJEC, a town of Poland, in Volhynia; 40 miles S.E. of Lucko.

KRZEPICE, a town of Poland, in the palatinate of Cracow; 52 miles N.W. of Cracow.

KRIEPE, a town of Syria, anciently called Adarife; the last town in the pahalich of Damacus, encompassed with walls, as a defence against the Arabs; 22 miles N.E. of Damacus.

KUAN, a town of Persia, in Farafstan; 16 miles S.S.W. of Schiras.

KUAR. See KIWAR.

KUASHKIR, a town of Imiretta; 21 miles S.S.W. of Cotatis.

KUAVER, a town of Persia, in Galia; 90 miles N.W. of Raldu.

KUBA, a town of Persia, in Schirvan; 30 miles S. of Derbend.

KUBAN. See KUBAN.

KUBBEISSH, a town of Arabia, in Yemen; 44 miles N. of Chamir.

KUBBOOLEAH, a town of Hindooftan, in the subah of Moutan; 45 miles E. of Moutan.

KUBONSHOH, a town of Raffia, in the government of Vologda, on a lake of the same name, about 40 miles long and eight broad; 16 miles N.W. of Vologda.

KUBLICK, a town of Lithuania; 15 miles S.E. of Brachaw.

KUBouchanshoh, a town of Raffia, in the government of Irkutsk, on the Amul; 86 miles S.E. of Doro-

ninsk.

KUCHAVIE, a town of Poland, in the palatinate of Kieve; 60 miles N.N.W. of Kieve.

KUCHTA, a town of Prufia, in the province of Ole-

netz; 52 miles N. of Povonetz.

KUCKENDORF, a town of Prufia, in Ermeland; 24 miles S.W. of Heilberg.

KUDA, a town of Mingrelia, on the coast of the Black sea; 10 miles S.E. of Ilori.

KUDCOIL, a town of Bengal; 26 miles S.E. of

Defa.

KUDAMIA, a town of Egypt, on the E. branch of the Nile; 20 miles N. of Cairo.

KUDASEISKO, a town of Raffia, in the government of Tobolsk. N. lat. 67° 15'. E. long. 81° 14'.

KUDDA, a town of Hindooftan, in Viliapour; 20 miles N. of Poona.

KUDDANO, a town of Africa, in Bergoo; 65 miles N.W. of Wara.

KUDEEL, a town of Hindooftan, in Bahar; 20 miles W. of Rangpur.

KUDEZA, a town of Raffia, in the government of Kolyvan; 32 miles S.E. of Kuznetik.

KUDINSKA, a town of Raffia, in the government of Irkutsk; 32 miles N. of Irkutsk.

KUTLEL, a town of Turkish Armenia; 27 miles W.S.W. of Akalizé.

KUFFSTEIN, or Kontstein, a town of the county of Tyrol, near the borders of Bavaria, on the Inn; built at the foot of a stupendous rock, on which is a cave, that serves for a fortrefs; 32 miles E.N.E. of Innspruck. N. lat. 47° 32'. E. long. 12° 14'.

KUGNA,
KUGNA, a river of Beb·arabia, the waters of which begin to expand into a lake at Tobak, 30 miles from its union with the Danube.

KUHDEAL, a town of Bengal; 34 miles W. of Ramgur.

KUHESTEN, a sea-port of Persia, at the entrance of the Persian gulf; 36 miles W. of Ormus.

KUHISAR, a town of Caramania; 15 miles N.W. of Aksera.

KUHMOIS, a town of Sweden, in the province of Taviland; 59 miles N.E. of Cjana.

KUHMONIEMI, a town of Sweden, in the government of Ule; 50 miles E.S.E. of Cjana.

KUHN, JOACHIM, in Biography, a learned critic, son of a rich merchant at Gripswalde, in Pomerania, was born in 1647. He studied at the university of Jena, and after visiting several parts of Germany, was appointed, in 1669, principal of the college at Oetingen in Swabia. In 1676, he was chosen professor of Greek and Hebrew at Strasbourg. He died in 1697, and after his death appeared his "Qæstiones Philofophiae ex facris Veteris et Nov. Test. aliiffe scriptoribus." He is well known in the learned world by his editions of Jelian, Paulanius, and Diogenes Laertius.

KUHN, JOHANN, the son of a fisherman of Gryfingen, a town near Altenberg, on the borders of Bohemia, four miles distant from Dresden, was a learned and skillful musician of the higher class, among those who have composed and established the German school of music, particularly in the ecclesiastical style, and in organ playing.

In the year 1683, he was organist of the church of St. Thomas at Leipzig; and while in that station, he wrote a dissertation of "De jurisbus circa musicos ecclesiasticos," and afterwards defended it against the censures of his adversaries.

In 1689, he published lessons for the harpsichord in two volumes, and in 1696 feven fonatas, entitled "Exercitationum," fruits of the keys of or keyed instruments; and in 1700, six fonatas, entitled "Instructi Dialogo," a simple narrative. Here Luther of Groningen, in a Dutch treatise entitled "In- leiiding tot de Musikkuand," takes notice of this work, and says that it is a lively representation, in musical notes, of David's mentally combating Goliath. In the same year (1700) Kuhnau, to silence the clamours of some ignorant men of his profession, who, envying his merit and reputation, had labelled him, he wrote a small tract, which he entitled "The Musical Quack, or Mountebank." In the same year (1700) Kuhnau was appointed director of music of the university of Leipzig, in which station he died in 1722, in the 63rd year of his age; and was succeeded in that honourable post by John Sebastian Bach. Kuhnau was celebrated immediately after his death in a Latin discourse by a count palatine and magistrate of Merseburg for his skill, not only in music, but theology, law, eloquence, poetry, foreign languages, algebra, and mathematics.

Mattheson, in his life of Händel, as the highest praise he could bestow on his performance, says, that he was even more powerful on the organ than the famous Kuhnau of Leipzig, who was then (in Handel's younger days) regarded as a prodigy.

KUHNFIELD, in Geography, a town of Bavaria; 17 miles S.S.W. of Bamberg.

KUHNIA, in Botany, so named by Linnaeus, after his pupil Adam Kühle, a native of Pennsylvania, who travelled to Upsal for the sole purpose of improving himself in natural history, and brought this plant with him for the examination of Linneus; in whom it excited considerable attention, as having distinct anthers, though in every other respect ap-
KUL, or Kool, a Turkish term, probably signifying a slave or servant.

Mencikly tells us, the name is given to all the soldiers in the Ottoman empire, particularly to those of the grand feignior's guard, and the infantry. The captains of the infantry, and those who command the guards, are called kül zabberles, and the folders of the guard kül killeri, i.e. slaves of the court. Others inform us, that all who hold any places depending on the crown, or receive wages from it, in a word, all who are, in any measure, the grand feignior's servants, take the title of kül, or kül, i.e. slaves, as more creditable than that of subject; even the grand vizier and the bailiffs value themselves upon it. A kül, or slave, of the grand feignior, has authority to abuse any who are only his servants; but a subject, who should confront a kül, or slave, would be severely punished. The kül are entirely devoted to the will of the grand feignior, and look on it as a kind of martyrdom, that merits heaven, when they die either by his order, or in the execution of his commands.

KULAI, in Geography, an island of Russia, in the Calpian Seas. N. lat. 45°.

KULB, a town of Aulria; 10 miles S.S.W. of St. Polten.

KULBA.EVA, a town of Russia, in the government of Uplia; 48 miles E. of Menzelinsk.

KULDATZKOL, a town of Russia, in the government of Irktufk, on the borders of China; 80 miles S.W. of Seldinsk.

KULEBA.KINA, a town of Russia, in the government of Irktufk, on the Lena; 20 miles S. of Kirend.

KULEBRUN, a town of Prussia, in the province of Oberland; 12 miles S. of Elbing.

KULEBUGAGE, a town of Asiatic Turkey, in Caramania; 40 miles N. of Tarsus.

KULICHOW, a town of Aulrian Poland, in Galicia; 10 miles N.E. of Lemberg.

KULING, a town of Grand Duchari, in the kingdom of Balk; 30 miles N.E. of Balk.

KULLA, DAR, a small country of Africa, situated to the S.W. of Dar-Für. The natives of kull are partly negroes, and partly of a red or copper colour. Their language is nafal, but very simple and easy. It is said they worship idols. They are very cleanly, to which the abundance of water in their country contributes, and they are remarkable for honesty and even punctilious in their transactions with the Jebals. They have ferry boats on the river, which are impelled partly by poles, partly by a double oar, like our canoes. Slaves are obtained in Dar-Kulla, either by violence, or by the following method. The smallest trefpals on the property of another is punished in this country, by enflaving the children or young relations of the trefpaller. The least offence in this way is followed, after previous proof, by the forfeiture of a son, daughter, nephew, or niece of the offender to the person aggrieved. Accidents of this kind are continually happening, and produce a great number of slaves. A commission to purchase any thing in a diftant market, not exaxly fulfilled, is attended with a like forfeiture. But above all, if a perlen of note die, the family have no idea of death as a necessary event, but lay it that it is effected by witchcraft. To discover the perpetrator, the poorer natives, far and near, are obliged to undergo expurgation by drinking a liquor, which is called in Dar-Für “king,” or something that resembles it; and the person on whom the fopposed signs of guilt appear, may either be put to death, or fed as a slave. The people of Kulla are strangers to venereal complaints, but are subject to the small-pox. In that part of the country that is visited by the Jebals, there is a king; the reit is occupied by small tribes, each of which is ruled by the chief who happens to have most influence at the time. The “Kumbay,” or pimento tree, is found there in such plenty,
plenty, that a ryal or pound of salt will purchase four or five mid, each mid about a peck. The trees are so large, from the quantity of water and deep clay, that canoes are hollowed out of them of sufficient capacity to contain 10 persons. The Jelabs of Bergoo and Fur sometimes journey to this country in order to procure slaves. The chief article they carry hither is salt, 12 pounds of which are estimated as the price of a male slave, about 12 or 14 years of age. A female brings three pounds more, w^hich is computed by the natives, as a pound for the girl’s eyes, another for her nose, and a third for her ears. If copper be the medium, two rotals are reckoned equal to four of salt. “Hoddür,” a large fort of Venetian glass beads, and tin, are in great estimation. Of the latter they make rings, and other ornaments.

Brown’s Travels in Africa, p. 30, 8vo.

Kulla, a town of Sweden, in the province of Upland; 17 miles N. E. of Stockholm. — Alfo, a town of Sweden, in Abo; 10 miles E.S.E. of Bironeborg.— Alfo, a town of Hindooistan, in Guzarat; 60 miles S.W. of Gogo.

Kullapolam, a town of Hindooistan, in the circuit of Indian, 32 miles N.N.E. of Moopatapam.

Kullaut, a town of the kingdom of Candahar; 55 miles E. of Candahar.

Kullen, a town of Sweden, in the province of Skone; 15 miles N. of Helingborg.

Kullerwa, a town of Hindooistan, in Gurry Mandella; 15 miles E. of Mandella.

Kullo, a country of Africa, E. of Konkoro.

KullowGuy, a town of Africa, in the country of Kullo. N. lat. 12° 24'. W. long. 8° 28'.

Kum, see Culum.

Kum, a town of Grand Eucharia, in the country of Balk; 30 miles N.E. of Balk. — Alfo, a town of Bohemia, in the circle of Letternitz; 9 miles S.W. of Kamnit. — Alfo, a mountain of Dalmatia; 15 miles N. of Ragusa.

Kumala, a town of Sweden, in Tavaitland; 31 miles N. of Tavaitland.

Kumet, a town of Algiers, on the left side of the Tellif, near its mouth; 6 miles N. of Muytygamin.

Kulsage, or Sugar-town, a little Cherokee town in the vale of Keowe.

Kulsi, a river of Ruffia, which takes its rise in the government of Archangel, and falls into the White sea, in the district of the town of Mefenik.

Kull-Tchat, a town of the north coast of the island of Formosa. N. lat. 25° 16'. E. long. 131° 34'.

Kulsutansko, a town of Ruffia, in the government of Irkutsk; 100 miles S.W. of Nertenchik.

Kumader, a town of Japan, in the island of Ni-phon; 10 miles N.E. of Moroja.

Kumala, a town of Sweden, in the province of Ta-vaitland; 65 miles N.N.E. of Jamfio.

Kunano, a town of Japan, in the island of Niphon; 6 miles N.E. of Ixo.

Kumant, a town of Japan, in the island of Niphon; 70 miles N.N.W. of Mexico.

Kumbo, a kingdom of Africa, near the mouth of the Gambia.

Kume Jacob, a town of Egypt; 16 miles S. of Girge.

Kumegan, a town of Ruffia, in the province of Samland; 16 miles N.W. of Konigberg.

Kumara, in Hindoo Mythology, a name of Karkiny, which see.

Kumba, and Nukumba, names of islands, in Hindoo mythological legends, said by some accounts to have been destroyed by Krishna; according to others, by Kama.

Vol. XX.

Kumi, in Geography, an island in the East Indian sea, the most westerly in a cluster of six or seven others, from which it is separated by channels from eight to ten leagues wide, between Formoso and Japan, seen by M. La Perouse, who did not land upon it. These islands are neither Japa-nese nor Chinese, but seem to be a mixture of both people. They were covered with a thrift and a pair of cotton drawers. Their hair, stuck up on the crown of the head, was rolled round a bodkin, which appeared to the voyagers to be gold. Each of them had a dagger, the handle of which was also gold. Their canoes were made of hollowed trees, and they were awkward in the management of them. Vessels that had been long at sea might procure wood, water, and provisous in this island, and also trade here in a small degree. But as it is scarcely three or four leagues in circumference, its population does not probably exceed four or five hundred. N. lat. 24° 53'; E. long. 124° 16'. Perouze's Voyage, vol. ii.

Kuminge, a town of Sweden, in the government of Uka; 12 miles N.E. of Ulea.

Kumiss, or Koumis, a kind of liquor made in Tartary, used by the natives as their common beverage, and often serving them instead of all other food. It is said to be so salutary and nourishing, that the Bashicks, though emaciated in winter, return to the use of it in summer, and become strong and fat. The Russians have borrowed it from the Tartars, and use it medicinally. It is made with fermented mare’s milk, according to the following receipt, communicated by Dr. Grieve in the Edinburgh Philosophical Transactions, vol. i. p. 181, as he obtained it from a Russian nobleman, who visited that part of Tartary where it is made, for the sake of the medical use of it: — Take of fresh mare’s milk, of one day, any quantity; add to it a fifth part of water, and pour the mixture into a wooden vessel; let it stand, as a ferment, an eighth part of the four feet cow’s milk that can be got; but at any future preparation, a small portion of old Koumis will better answer the purpose of fouling; cover the vessel with a thick cloth, and let it in a place of moderate warmth; leave it at rest twenty-four hours, at the end of which time the milk will have become four, and a thick substance will be gathered on the top; then with a flick, made at the lower end in the manner of a churn-flaff, beat it till the thick substance above-mentioned be blended intimately with the subjacent fluid. In this situation, leave it again at rest for twenty-four hours more; after which pour it into a higher and narrower vessel, resembling a churn, where the agitation must be repeated as before, till the liquor appear to be perfectly homogeneous; and in this state it is called Koumis, of which the taste ought to be a pleasant mixture of sweet and sour. Agitation must be employed every time before it be used.—To this detail of the process the nobleman subjoined, that, in order to obtain milk in sufficient quantity, the Tartars have a custom of separating the foal from the mare during the day, and allowing it to suck during the night; and when the milk is to be taken from the mare, which is generally about five times a-day, they always produce the foal, on the supposition that she yields her milk more copiously when it is present.

To the above method of making Koumis, our author has added some particulars taken from other communications with which he was favoured by Tartars themselves. According to the account of a Tartar who lived to the south-east of Orenbourg, the proportion of milk and fouiring ought to be the same as above; only, to prevent changing the vessel, the milk may be put at once into a pretty high and narrow vessel; and in order to accelerate the fermentation,
tion, some warm milk may be added to it, and, if necessary, more fouling.—From a Tartar whom the doctor met with at the fair of Macarieff upon the Volga, and from whom he purchased one of the leathern bags which are used by the Kalmucks for the preparation and carriage of their koomifs, he learned that the procés may be much shortened by heating the milk before the fouling be added to it, and as soon as the parts begin to separate, and a thick substance to rise to the top, by agitating it every hour or oftener. In this way he made some in the doctor's preference, in the space of twelve hours. Our author learned also, that it was common among some Tartars to prepare it in one day during summer, and that with only two or three agitations; but that in winter, when, from a deficiency of mares' milk, they are obliged to add a great proportion of that of cows, more agitation and more time are necessary. And though it is commonly used within a few days after the preparation, yet when well secured in clofe vessels, and kept in a cold place, that it may be preferred for three months, or even more, without any injury to its qualities. He was told farther, that the acid fermentation might be produced by four milk as above, by a four pail of rye flour, by the rennet of a lamb's flomach, or, what is more common, by a portion of old koomifs; and that in some places they faced much time, by adding the new milk to a quantity of that already fermented; on being mixed with which, it very soon undergoes the vinous change.

It was according to the procés first mentioned, however, that all the koomifs which the doctor employed in medicine was prepared. It has been found serviceable in hæmorrhages and in nervous complaints; and our author relates some very striking cases which the use of it had completely cured. All those who drank it, our author informs us, agreed in saying, that, during its use, they had little appetite for food; that they drank it in very large quantities, not only without disgust, but with pleasure; that it rendered their veins turgid, without producing languor; and, on the contrary, they soon acquired from it an uncommon degree of sprightliness and vivacity; that even in cases of seme excess, it was not followed by indigestion, headache, or any of the symptoms which usually attend the abuse of other fermented liquors.

The utility, however, of this preparation as a medicine, supposing it completely ascertained, would among us, as our author observes, be greatly circumscribed by the fear of mares' milk in this country. "Hence," says he, "inquiries will naturally be made, whether other species of milk admit of a similar vinous fermentation, and what proportion of spirit they contain. As these have never been the object, however, of my attention, I will here give the substance of what I have been able to learn from others respecting that which is the most common, the milk of cows.

"Dr. Pallas says, that cow's milk is also susceptible of the vinous fermentation, and that the Tartars prepare a wine from it in winter, when mares' milk fails them; that the wine prepared from cows' milk they call airin; but that they always prefer koomifs when it can be got, as it is more agreeable, and contains a greater quantity of spirit; that koomifs, on distillation, yields of a weak spirit one third; but that airin yields only two ninth parts of its whole quantity, which spirit they call airis.

"This account is confirmed by Oferetkovsky, a Russian, who accompanied Lepechin and other academicians, in their travels through Siberia and Tartary. He published lately a dissertation on the ardent spirit to be obtained from cow's milk.
KUN

KUNOW, a town of Poland, in the palatinate of Sandomirz; 16 miles S.S.E. of Radom.

KUNTE, a town of Japan, in the island of Xiicoco; 18 miles S. of Ito.

KUNTZEN, a town of Prussia, in the province of Samland, on the Curich Neung; 28 miles N. of Konigberg.

KUNTZEN, Adolph Carl, in Biography, born at Wittenberg in 1720, was an excellent performer on the harpichord and organ, who in early youth, about the middle of the last century, came to England, where his mallely and powerful manner of treating these instruments, both as a performer and composer, may be still remembered with pleasure by those who heard him. On his return to Germany, he was appointed organist of Lubec, where he died in 1771.

KUPOIO, in Geography, a town of Sweden, and capital of Savolax, and that part of Carelia referred to Sweden, formed into one province under the appellation of Hoe-dingedomo of Kuopio. The town stands on the west side of an extensive lake; 150 miles S.S.E. of Utea. N. lat. 62° 54'. E. long. 27° 28'.

KUORTANE, a town of Sweden, in the government of Wafa; 52 miles E.S.E. of Wafa.

KUPENKA, a town of Russia, in the government of Voronetz; 128 miles S.S.W. of Voronetz.

KUPERPEH, a town of Natolia; 35 miles W.N.W. of Boli.

KUPFENBERG, a town of Bavaria, in the bishopric of Bamberg; 32 miles N.E. of Bamberg.—Allo, a town of Bavaria, in the bishopric of Aichfalt; 10 miles E.N.E. of Aichfalt.

KUPFER, see Nickel.

KUPFERBERG, in Geography, a town of Silefia, in the principality of Jauer; 15 miles S.S.W. of Jauer. N. lat. 50° 40'. E. long. 15° 55'.—Allo, a town of Bohemia, in the circle of Saat; 22 miles W.S.W. of Saatn. N. lat. 50° 23'. E. long. 13° 5'.

KUPH, a decayed town of Syria, bearing amongst its ruins marks of ancient splendour. Its houses are constructed of yellow hewn stone; the walls are about eighteen inches thick, and are neither fastened with iron, nor laid in mortar. The houses are built round courts, and appear like palaces. Crosiers over the doors indicate that they were erected by Christians; and from the style of architecture, Dr. Pococke fapposes that it was about the fourth or fifth century; 35 miles S.S.W. of Aleppo.

KUPHE, a name given by Guettard to a petrifaction, the body of which is conical, the anterior part blunt, and the posterior part forked, while the interior is divided into two hollows or tubes.

KUPINATZ, in Geography, a town of Croatia; 14 miles N.E. of Carllldatt.

KUPISZKI, a town of Lithuania, in the palatinate of Troki; 30 miles S.S.E. of Bira.

KUPIAIGHISI, a town of Natolia; 16 miles S. of Sinob.

KUPPENHEIM, a town of Baden; 3 miles S.S.E. of Raffalt.

KUPPOREAH, a town of Hindoostan, in the circle of Sirtind; 50 miles S.W. of Sirtind.

KUPRI, a river of Natolia, which flows into the gulf of Satalia, N. lat. 36° 59'. E. long. 37°.

KUPRIBAZAARI, a town of Aziatic Turkey, in Carmania; 6 miles W. of Satalia.

KUPSINGA, a town of Hindoostan, in the circle of Gangpour; 10 miles S.S.W. of Gangpour.

KUR,
KUR, a river of Asia, the ancient Eurus (which see), rises in the Caucasian mountains, and pursuing a rapid course through Georgia, Schirwan, &c. falls into the Caspian Sea, 70 miles S.S.W. of Baku. In the vicinity of this river the land is subject to inundations, and overgrown with high rich grass; towards the sea it is brackish and barren, but fertile towards the mountains. About 14 miles upwards from its mouth, the Kur receives from the right the Aras, or ancient Araxes; and there on the left bank is situated a large village, named Dschawat. After its junction with the Aras, the Kur is about 70 fathoms broad, and only so far navigable; the rocks in the bed of the river hindering the navigation higher up. At about four German miles from the sea, it branches out into a number of arms, the northernmost and southernmost of which are the most considerable. The islands thus formed belong to Schirwan. On the northern main arm lies the town of Sallian, which properly consists of a number of villages extending along the river, and owes its prosperity to the uncommonly productive fisheries of the Kur; for this river abounds withurgeon and other fish. Between the Kur and the Terek lies a tract of land, along the Caspian Sea, extending in length from the 30th to the 44th degree of N. latitude, and of various breadth, though for the most part inaccessible in proportion to its length. This tract contains somewhat more than 2500 French square miles, and is divided into three provinces, viz. Kumak, Daghestan, and Shirwan, of which the first is now dependent on Russia, and the second on Persia. See each respectively.

KURA, a small island in the Caspian Sea, with steep shores round it. N. lat. 39°.

KURABAD, a town of Candahar; 8 miles W. of Attock.

KURAGGI, a town of Japan, in the island of Niphon; 45 miles N.N.E. of Jodo.

KURCH, a town of Natalia; 34 miles W. of Sinob.

KURDUM, a town of Russia, in the government of Saratof, on the Volga; 16 miles N.N.E. of Saratof.

KURGAN, a town of Russia, and district of the government of Tobolik. on the river Kurgan; 68 miles S.W. of Yalutorovsk. Also, a river of Asia, which rises in Khurasan, and runs into the Caspian Sea, W. of Aftabat.

KURIAT, a town of Arabia, in the country of Oman, at the mouth of a river of the same name, which runs into the Arabian Sea, S. of Cape Kuriah; 20 miles S.E. of Mafcat.

KURIAT, Cape, or Ras Kuriah, a cape on the coast of Arabia. N. lat. 23° 27’. E. long. 57° 59’.

KURJAN, a town of Hindooostan, in the cirrass of Gohud; 25 miles S.W. of Gwalior.

KURIKKA, a town of Sweden, in the government of Wafç; 36 miles N.E. of Christiania.

KURILA, a town of Sweden, in Earl Bothnia; 20 miles S.W. of Brabectad.

KURLAUT, a town of Karlism; 60 miles S.S.E. of Urkope.

KURILE, or Kuriliscoi, Islands, a chain of islands, running in a S.W. direction from the southern promontory of the peninsula of Kamtschatka, or the Kuriloy Lopatka, to Japan, extending from N. lat. 51° 4’ to 45°. They obtained this name from the inhabitants of the island of Lopatka, who being near to the coast, called them Kurile, gave their own name to these islands, and first commenced a racooning with them. Some of them are inhabited and wooded, others quite bare and rocky, and a few that are volcanic. According to Stenboke, they are 22 in number, without reckoning the small ones. Of the two Kurile islands that lie nearest to Lopatka, the first accounts were brought to Russia in the year 1713. The others have been successively known from that period to 1779, by means of Russian navigators, who, at the time, put them under contribution to the crown. The 22 islands are Shoonnofa, Shoomofs, Poromofhur, or Paramounhur, Sherikso, Mak-Kur-Alley, Anakutan, Ar-Amakutan, Syakutan, Ikarka, Thirikuts, Mufay, Ruch-Koko, Matova, Rafy, Ulaffy, Ketoi, Smnuffy, Thirupa-On, Urup, or Oroop, Tertopa, Kunaffy, Thirikota, and Matum. Arakutan is distant from the fourth island (in the order of enumeration) 35 miles; it has about 100 miles long and 15 broad; has three elevated summits of mountains, of which two have exhausted craters; the wood is scrubbed and stunted; red foxes are pretty numerous, but on the coast are few beavers, &c. Several streams of hard water flow from it into the sea. From this Ar-Amakutan is distant six miles; its length is twenty miles and breadth ten; in the centre of the island is a rocky mountain, which was formerly a volcano, and towards the flat between it and the fifth island, on the eastern shore, islands another, which is reputed to have been a burning mountain. This island is uninhabited, and is only visited by the Kurils, on account of the chase, as it abounds with foxes; and on the shores are sealions and sea-otters. Ikara is about 12 miles from the seventh island, and is eight miles long. Upon it is a volcano, which occasionally emits flames; the shore is rocky, preventing here and there a sulphureous spring. It has neither lakes nor rivers; and with respect to wood and animals, it is in the same state with Syasukan. For an account of the other islands, see the respective articles. Of these 22 Kurile islands, the fifth are subject to Russia; and all of these do not pay tribute. The islanders are reported by their missionary, the paller of Paratouche, who visits them once in three years, to be a friendly, hospitable, generous, humane race of people, and excelling their Kamtschatlade neighbours, not less in the formation of their bodies than in docility and quickness of understanding. Of these islands it is said, that four only are inhabited, and their population is estimated at 1400 persons. The inhabitants are generally hairy, wear long beards, and live entirely upon seals, fish, and the produce of the chase. The more southerly and independent islanders sometimes pass in canoes the channel that separates them from the Russian Kuriles, in order to give some of the commodities of Japan, such as silk, cotton, iron, &c. in exchange for furs, dried fish, and oil. The inhabitants of many of the islands as are brought under the Rurilian dominions are, at present, converted to Christianty; and probably the time is not very distant, when a friendly and profitable intercourse will be brought about between Kamtschatka and the whole of this chain of islands; which will be followed by a communication with Japan itself. These islands extend from N. lat. 42° to 51°. Tucker’s Ship. Env. vol. 1. Cook’s Third Voyage, vol. iii.

KURISOND, a town of Atlasic Turkey, in Carmania; 60 miles N.N.E. of Tocat.

KURISSIMA, a town of Japan, in the island of Xicco; 16 miles W. of ljo.

KURT, a town of Candahar; 25 miles E. of Cabul.

KURKIN, a town of Bengal; 11 miles N.E. of Ramgar.

KURKUMBA, town of Hindooostan, in the cirrass of Ruttunpour; 32 miles E. of Ruttunpour.

KURKUNA, a town of Hindooostan, in the cirrass of Surgoopa; 25 miles N.E. of Surgoopa.

KURKUST, a town of Sweden, in the province of Eylund; 18 miles W. of Hellingfors.

KURMA. See Kourma.
KURMAVATARA, in Mythology, the second of the ten incarnations of the Hindu god Vishnu, of which the following account is given in the Hindu Pantheon. "The second grand avatar of Vishnu, in the form of a tortoise, evidently refers also to the deluge. In that of Matsya, or the fish, (see Matsyasavatara) we find the necessity of a deluge to cleanse the world from its sinful taints. By the demon Hyagriva having slain the Vedas while Brahma was doing, we must understand the dereliction of mankind from the doctrines and conduct prescribed in the scriptures, and the criminal indifference of their pastors. The preferring attribute of the deity interpolated, faced a remnant of creatures from destruction, and by recovering the scriptures, reclaimed mankind to purity of faith and conduct. For the purpose of restoring man some of the comforts and conveniences that were lost in the flood, Vishnu is fabled to have become incarnate again in the form of a tortoise; in which shape he fulfilled the mountain Mandara placed on his back to serve as an axis, whereas the gods and demons, the vaft serpent Vasuki serving as a rope, churned the ocean for the recovery of the amrita, or beverage of immortality." (See Kurta.) Plate 49, of the Hindu Pantheon exhibits this process, where Vishnu is seen in his place with the two other great powers opposed to the Asuras, or demons; and appears again on the summit of the mountain, and again beneath it in the form of the tortoise. The history of this avatar forms an episode in the Mahabarat, and Mr. Wilkins has introduced a fine translation of it in his elegant version of the Gita, where, however, the metamorphosis of Vishnu into the tortoise is not directly mentioned. But each is the usual mode of telling and receiving the story, which is one of the most popular, both in recitation and painting, among the monotonous reliefs of subjects derived from the copious Pantheon of the Hindoos.

Kurma, or Koorna, is the Sanscrit appellation of the avatara. Among the Maharrattas, and others in the western parts of India, it is more commonly called Katch, that word, or Katchiva, meaning, like Kurma, a tortoise or turtle. The refult of the operation, in view to which the incarnation appears to have occurred, was obtaining from the churned ocean fourteenth articles, usually called fourteen gems, or chateau-defa-ratana; in common language chawda-ratay; usually thus enumerated: 1. the Moon, Chandra or Soma; 2. Sri or Lakshmi, the goddess of fortune and beauty; 3. Sura, wine, or Suradevi, the goddess of wine; 4. Oochirrava, an eight-headed horse; 5. Kurubba, a jewel of inestimable value; 6. Paryata or Pariyata, a tree that spontaneously yielded every thing desired; 7. Surabhi, a cow similarly beautiful; 8. Dhavanatara, a physician, or the god of physic; 9. Iravat, the elephant of Indra with three proboscies; 10. Shank, a shell containing victory on any one who should found it; 11. Darbha, an unerring bow; 12. Biksh, poison, or drugs; 13. Rhemba, a beautiful woman, corresponding in many points with our popular Venus; 14. The Amrita, or beverage of immortality, which appears, though last obtained, to have been the primary object of this churning process; the other gems appear to have been obtained incidentally.

Under most of the articles whose foreign names occur in this, some notice is taken of them, and we refer thither respecting and generally for further information thereon.

KURMDYA, in Geography, a town of Bengal; 55 miles S.S.W. of Dacca.

KURMUK, a town of the principality of Georgia; 105 miles S.E. of Teliss.

KURMY, a town of Russia, and district of the government of Simbirsk, on the Sura; 104 miles N.W. of Simbirsk.

KUROPATNIKI, a town of Austrian Poland, in Galicia; 45 miles E.S.E. of Lemberg.

KUROSAKI, a town of Japan, in the island of Ximo; 27 miles N. of Taifero.

KUROW, a town of the duchy of Holstein; 9 miles N.N.W. of Lubeck.

KURRA, a river of Hindoostan, which runs into the Beima; 32 miles N. of Vifapour.

KURRABAGH, a town of Candahar, in the province of Ghizni; 20 miles W.S.W. of Ghizni. N. lat. 33° 30'. E. long. 67° 50'.

KURRERA, a town of Hindostan, in the circur of Gobud; 12 miles S.S.E. of Narwa.

KURRIGOORA, a town of Bengal; 45 miles S.S.W. of Dacca.

KURRYA, a town of Bengal; 30 miles S. of Palamow.

KURSK, a government of Russia, which was formerly part of that of Biegorod; comprehendmg 16 districts: it is bounded on the N. by the government of Orel, on the E. by that of Voronet, on the S. by Voronet and Khar-koft, and on the W. by Tcheretof; about 111 miles from N. to S., and generally 100 from E. to W., extending, however, by a narrow part, about 12 miles wide, 40 miles further west.—Also, the capital of the above-mentioned government, on the river Tukar, which falls into the Seim or Sem. N. lat. 55° 40'. E. long. 36° 24'.

KURSY, a town of Hindostan, in Candia; 45 miles S.W. of Burhanpour.

KURTACULAC, a town of Asiatic Turkey, in Al- dalia; 25 miles S.E. of Adana.

KURTAPOUR, a town of Hindostan, in Lahore; 10 miles S. of Jallindar.

KURTCHI, an order of brotherhood among the Persians. The word, in its original, signifies army, and is applied to a body of cavalry, consisting of the nobility of the kingdom of Persia, and the potesty of those conquerors, who placed Ismael Sophi on the throne. They are in number about eighteen thousand men.

Their commander is called kut-chi bakhsh, which was formerly the first poet in the kingdom; equivalent to a constable in France.

KURTIUS, in Ichthyology, a genus of the jugulares, consisting only of a single species, called Indicus from its being an inhabitant of the Indian seas. The body in this genus is carinated each side, the back elevated, and the Gill-membrane furnished with two rays. The species known subsists on crabs and shells, or tellaceous animals: the body is short, slender, golden, and appearing as if covered with silvery plates: the head is large, compressed, and obtuse; eyes very large, with black pupil, and iris above blue, beneath white; mouth large; jaws with numerous teeth; tongue short and cartilaginous; lateral line straight, and commencing above the pectoral fin; first ray of the dorsal and ventral fins hard, and two fin of the anal finous.

KURU, in Geography, a town of Sweden, in the government of Abo; 63 miles E.N.E. of Birnernog.

KURU, in Hindoo Mythological Legends, was the brother of Pandu, who was the father of the five heroes of the Mahabarat. Kurru had a hundred sons, whose contests with the Pandus are the subject of that poem, which is a continued allegory of the struggles between man's virtues and vices, personified in the offspring of the brothers. See Mahabarat, and Pandu.
KURUMA, in Geography, a town of Japan, in the island of Ximo; 16 miles E.N.E. of Ikua.

KURYMA, a town of Hungary; 12 miles N.E. of Szében.

KUSA, in Botany, the species of grass poa cynocephaloides, esteemed by the Hindus very sacred and mystical, and used by the Brahmins in many of their sacred or superstitious ceremonies. Among this race of fabulists some poetical legend exists, accounting, in their way, for every subject and allusion in their complex mythology and theology. Of the kra grafts this is related in the Hindu Pantheon. "Some legends make Garuda the offspring of Kasyapa and Dit. (See KASYAPA.) This all-potential demon laid an egg, which, it was predicted, would produce her deliverer from some great affliction: after a lapse of five hundred years, Garuda or Suparna (see SUPERNA) sprang from the egg, flew to the abode of Indra, extinguished the fire that surrounded it, conquered its guards, and bore off the amrita, (see KUMAVATARA,) which enabled him to liberate his mother, at that time afflicted in captivity. A few drops of this immortal beverage falling on the kra, it became a kra eternaly consecrated; and some kamas, greedily licking up the ambrosia, so lacertated their tongues with the sharp blades of the kra, that they have ever since remained like kamas; but the boon of eternity was conferred upon them also by their thus partaking of the immortality-conferring fluid. (See KETU.) This cause of kamas having forked tongues is still popularly, in the tales of India, attributed to the above graffins." B. 341.

KUSAMO, in Geography, a town of Sweden, in the government of Uleä; 85 miles E. of Torcen.

KUSBAH, a town of Hindooftan, in Benares; 22 miles N.W. of Benares.

KUSCAN, a town of Pelfia, in the province of Se-gefán; 21 miles N.E. of Kim.

KUSCARI, a town of Mingrelia; 30 miles N.E. of Anarghia.

KUSCHAIL, a town of Russia, in the government of Tobolsk; 28 miles S. of Tomsk.

KUSAH, a town of Poland, in Podolia; 32 miles E. of Kaminiez.

KUSHAL, KUSHEL, or Kuthul, a fortress of Asia, in Kuttore. N. lat. 35° 17′. E. long. 79° 39′.

KUSHKAT, a town of Great Bucharia; 72 miles W. of Kojend.

KUSKO, a town of the duchy of Warsaw; 18 miles W. S.W. of Kalrich.

KUS-KUSER, a town of Pefia, in Farfsilan; 31 miles N. of Schiras.

KUSMA, a small town of Arabia, standing upon a high hill, in the province of Yemen, inhabited by free Arabs; 50 miles E. of Hodeida. The mountains, which extend far into the country, produce coffee.

KUSSI, a town of Japan, in the island of Niphon; 65 miles N.E. of Jedo.

KUSNACHT, a bailiwick of Switzerland, in the canton of Zurich.—Alfo, a town of Switzerland, in the canton of Schwytz, near which is a chapel, erected on the spot where William Tell flew the Auffrian governor; 10 miles W. of Schwytz.

KUSSOOR, a town of Hindooftan, in Lahore; 26 miles W.N.W. of Firofppour.

KUSTANGI, or CHUSTENGI, a town of European Turkey, in Bulgaria, on the Black sea, formerly called Con-ffenizia. N. lat. 44° 30′. E. long. 28° 37′.

KUSTER, Ludolph, in Biography, was born in 1670, at Blomberg, in Westphalia, of which town his father was a magistrate. He studied under his elder brother at the Joachim college of Berlin, and was afterwards appointed tutor to the two sons of the count Schwering. On quitting that station, with a pension, he went to Frankfort on the Oder, and there published, in 1696, his "Historia Critica Homeri." He was promted a professorship in the university of Joachim, and till that should be vacant he resolved to travel, and visited Leyden and Utrecht; at the latter place he delivered a course of lectures on the law of nations, and published his "Bibliotheca Librorum." He then went to England, and thence to France, for the purpose of collating MSS. for a new edition of Suidas. Having furnished himself with many very valuable materials and fragments for his work, from the king's library, he returned to England.

Here he lived in great familiarity with Bentley and other learned men, and upon the publication of his work, which was printed partly at the expense of the university of Cambridge, he was honoured with the degree of doctor of laws. Several advantageous offers were made him if he would remain in England, but he was called back to Berlin, and installed in the professorship promised to him. The situation did not answer his expectations, he was rendered uncomfortable by disputes respecting his salary, and by having incurred the suspicion of being addicted to the principles of Arianism, so that in a short time he found it expedient to retire to Amsterdam. Here he was reduced to absolute poverty by the failure of his bank.

He afterwards went to Antwerp, embraced the Catholic religion, and was rewarded by a pension from the crown, and with an admittance into the Academy of Inscriptions. He died at the age of forty-fix. He was a great master of the Latin tongue, and wrote well in it; but his chief excellence was his skill in the Greek language, to which he almost entirely devoted himself. Besides the works already referred to, he published "Jambliche Porphyrius, et Anonymus apud Florium de Vita Pythagorae.

"Arilophanes Gr. et Lat." "De vero ufui verborum mediorum," which has been much esteemed as a grammatical treatise.

KUSTUBHA, in Hindu Legends, is an ineffable gem, of which many wonderful tales are related. It is one of the fourteen precious things recovered from the ocean when churned for the amrita, by gods and demons, in the Kumavatara, which see.

KUTALI, in Geography, a small island, in the sea of Marmora. N. lat. 40° 30′. E. long. 27° 2′.

KUTAN, a town of Hindooftan, in Oude; 50 miles E. of Kairabad.

KUTAPS, a town of Japan, in the island of Niphon; 25 miles E. of Musco.

KUTINA, a town of Sclavonia; 33 miles W.N.W. of Pofzeega.

KUTSCHINA, a town of Servia; 16 miles S.S.W. of Orfova.

KU-TSING, a city of China, of the first rank, in the province of Yun-nan; surrounded with mountains, about which the foil is fruitful. Its jurisdiction comprehends five towns of the second class, and two of the third. The inhabitants are industrious in cultivating the ground. N. lat. 25° 34′. E. long. 103° 27′.

KUTSKOL, a town of Russia, in the government of Irkutsk, on the Kuta, where it joins the Lena; 60 miles E. of Ihimik. N. lat. 56° 40′. E. long. 123° 20′.

KUTKENBERG, or KUTNA-HORA, a town of Bohemia, in the circle of Czeblau, famous for its silver mines, formerly
KUY, a landscape painter of much merit. From his father he first learnt the rudiments of the art; but surpassed him infinitely in his progress. He was one of the most agreeable painters that ever lived; imitating with the greatest perfection the purity and brilliancy of light. No artist ever represented the atmosphere which surrounds all objects more completely than Kuyt; nor even Claude: and in the effect of fun-fhine, none ever approached him. The simplest scenes and combinations of objects were sufficient for him to exert his talents upon; and he never failed to give an interest to them by the sweetness of his colour, and the beauty of his light and shade.

Little or nothing is known of his life. His works are numerous, and therefore he must have lived long; for they are of so highly finished a quality that he must have given much time to them.

In the various collections among the nobility in England, works of his shine with almost unrivalled lustre; and are not very uncommon. At the marquis of Stafford's is a very fine one of the landing of prince Maurice at Dort. There are also several others of great merit.

KUZNETCHIKA, in Geography, a town of Russia, in the government of Simbirsk, on the Volga; 16 miles N.E. of Simbirsk.

KUZNETZK, a town of Russia, and district of the government of Saratof, seated on a rivulet, falling into the Sura; 96 miles N.N.E. of Saratof.

KUZNETZK, a town of Russia, and district of the government of Kolyan, situated on the river Tom, opposite to the mouth of the Kondama; built in 1618, on a place whither the Tartars generally reftored, and colonized from Tomfik, and some other towns. It contains about 500 houses, and the inhabitants are chiefly employed in the manufacture of iron; 188 miles E.S.E. of Kolyan. N. lat. 52° 40'. E. long. 86° 49'.

KUZNETSKOI MOUNTAINS, a range of mountains, forming one of the sub-divisions of the Russian thare of the Altaien mountains, the other being the Oby and the Yenifey. See ALTAY.

KUZNIK, a town of Russia, in the government of Viatka; 48 miles S.S.W. of Glazov.

KUZOMEN, a town of Russia, in the government of Archangel, on the coast of the White sea; 124 miles N.W. of Archangel.

KUZREKA, a town of Russia, in the government of Archangel, on the N. coast of the White sea; 140 miles S.E. of Kola.

KWASITZ, a town of Moravia, in the circle of Hradisch; 14 miles N. of Hradisch.

KWASSOWA, a town of Poland, in Volhynia; 28 miles N. of Zyтомiers.

KYANITE, or CYANITE, Wern.; Drijbene, Haify; Sappare, Sauflure. Other names derived from fancied resemblances, are blue-shorl, blue tacle, blue mica, foliated beryl, faphir fpar, blue feldspar, &c. Haifi's name implies the power this substance possesses of acquiring both vitreous and refrinos electricity; all the other denominations are expressive of its characteristic.

Colour, which is generally azure-blue, light Prussian blue, or smalt-blue; but it is also seen blueish-grey, milky, greyish and greenish-white, and more seldom celadon, and other shades of blueish-green. Thefe colours are either uniform or mixed: the blueish-grey, striped or fiammed with various shades of Prussian blue, is the most common mixture.

It occurs mafive, diñferentiated in blunt-edged pieces, and crystallized. The following are the modifications we are acquainted with: 1. The oblique quadrangular prifm, (which

KUY, a town of European Turkey, in Romania; 27 miles E.S.E. of Filippopolis.

KUYNDER, a sea-port town of Holland, in Friesland, on the W. side of the river of the same name. At its entrance into the Zuyder sea; 23 miles S. of Lewarden. N. lat. 52° 48'. E. long. 5° 46'.

KUPP, or Chyp, Albert, in Biography, a painter who ranks among the best and most original artists. He was born at Dort in 1606, and was the son of Jacob Gerritz
KYA

(Kya)

which appears also to be the primitive form of this substance, with two opposite sides very narrow, which give the crysil a contracted tabular form. 2. The lateral edges formed by the acute angles of the preceding crystals, intercepted each by a plane, or truncated; this plane is generally very narrow. 3. The lateral edges formed by the obtuse angles of N1, intercepted each by a plane, or truncated. This modification appears to be very scarce. 4. Four of the terminal edges of N2, intercepted each by a plane, or truncated. This modification appears to be very scarce.

The lateral edges formed by the obtuse angles of the preceding crysil, intercepted each by a plane, or truncated. This modification appears to be very scarce. 4. Four of the terminal edges of N2, intercepted each by a plane, or truncated. This modification appears to be very scarce.

The crysil is infusible before the blow-pipe, a property which, according to Sauflerre, renders it a convenient support for substances to be tried by that infra-red.

This substance is found only in primitive mountains, imbedded in mica slate and talc slate, accompanied by granate or flaurolite and garnets, with now and then iron ochre, iron pyrite, calcarious spar, &c. In Moravia and Saxony it occurs in small groups imbedded in a variety of a primitive rock called weils-lim, or white-lime. Its principal localities are Switzerland (especially at Airolo, on the fourth side of Mount St Gotthard); Salzburg and Tyrol (in the Zillerthal); Carinthia (on the Saul-Alpe); Scotland (Aberdeenshire, near Banchory, and in the Mainland, one of the Shetland Islands; France (in the neighbourhood of Lyons); it has also been found in Norway, in Siberia, in Dairei, &c.

When cut and polished it resembles in colour some varieties of fapphire, and specimens of it are sometimes exhibited under this name; but, not to mention the felsie always observable in the interior of crysil stones, their inferior lustre, and comparative softness, will soon clear up all doubts respecting their nature.

Sauflerre has endeavoured to introduce the name Sapphire for this mineral, and he tells us, that in Scotland it is known by that appellation. Some authors have lately criticised this name as being derived from the bad pronunciation of the word sapphire, with which the crysil is said to have been confounded by the person who pointed it out to Sauflerre: but this is a mistaken notion, the name sapphire being known to occur in several old works on mining; and as it appears to have been a very vague sort of name, it is not improbable that it may also have included the subject of this article.

KYBAR, in Geography, a town of Norway; 6 miles S.S.W. of Wardhuy.

KYBURG, a bailiwick of Switzerland, in the canton of Zurich.

KYDREDAB, a town of Hindooistan, in Oude; 8 miles N.E. of Fryzabad.

KYOHLM, a small island of Denmark, near the island of Samoe.

KUL, a town of Sweden, in the province of Warmeland; 25 miles S.E. of Carliladt.- Alfo, a town of Sweden, in the province of Nercia; 8 miles N.W. of Oreb. KUL, a town of Sweden, in Warmeland; 23 miles S.W. of Carliladt.

KYLE of Durants, a bay on the N. coast of Scotland, at the mouth of the river Durnans: the entrance, W. of Parout head, is in N. lat. 58° 40'. W. long. 4° 42'.

KYLE of Rhea, a narrow strait between the island of Sky, and the main land of the county of Inverness. N. lat. 57° 15'. W. long. 5° 40'.

KYLE Scoone, a bay on the W. coast of Scotland, and county of Sutherland. N. lat. 58° 16'. W. long. 5° 5'.

KYLE of Tongue, a bay in the N. of Scotland, and county of Sutherland; 13 miles W.S.W. of Strath-head. N. lat. 58° 55'. W. long. 4° 15'.

KYLLINGA, in Botany, so called by Rottboll, in memory of his countryman, Peter Kylilng; a Dane, who, in 1688, published at Copenhagen, the Fridtartum Danicum, which is a catalogue in Latin, Dairei, and German, of the native

The two following analyses differ from the preceding, particularly in the absence of magnesia and lime: 
KYL

native plants of Denmark, making 174 quarto pages.—
Am. Acad. v. 10. 2. 24. t. 1. Suppl. i. Schrebe. 40.
v. 1. 218. Juff. 27 Lamarck Illustr. t. 38.—Clad's and
Cyperaceae, Juff.

Gen. Ch. Flowers aggregate, in an oblong scaly head.
Cal. Glume of two unequal valves, compressed, nearly
single-flowered, single-seeded; valves lanceolate, chart-ribbed,
acute, much shorter than the corolla. Cor. Glume of two
unequal valves, compressed, larger than the calyx, keeled,
spreading; the larger lanceolate, folded, very acute, em-
bracing the smaller. Stam. Filaments three, awl-shaped,
flat; anthers terminal, linear, erect. Pet. Germen super-
ior, obovate, compressed, gibbous at one of its edges, with-
out any bristles at the base; style thread-shaped; 
filaments two or three, capillary. Peric. none, except
the permanent corolla. Seed oblong, triangular, heartshaped.—The same
calyx sometimes contains also either a male or a neutral
flower.

Eff. Ch. Flowers aggregate, in an oblong, imbricated,
head. Calyx of two valves. Corolla of two valves. Seed
without bristles at the base.

This genus, adopted from Rottboll by the younger
Linnæus, had by his father been confounded with Schoenus,
which its flowers in some measure resemble; but the habit,
epecially the aggregate, long, floral leaves, are akin to
Cyperus. In the Supplémentum four species are defined; Will-
denow has eight; and a new one, K. intermedia, is described
by Mr. Brown in his Prodrumus, as found at Port Jackson,
New South Wales.—They are all natives of warm countries,
chiefly in the East or West Indies, and moist situations.
Their roots seem to be perennial. Their herbage is slender.
Stem simple, triangular, fluted, and roughish. Leaves
narrow, rough-edged. Heads pale or white, terminal, usually
feathery, among the floral leaves, either solitary or sev-
eeral together, roundish or oblong, consisting of numerous,
small, densely crowded flowers, whose glumes are more or
less ribbed or fluted, deliquet of awns.

Examples of this genus are,
K. monochropha. Rottb. Gram. 13. t. 4. f. 4. (Schoenus
cobratus; Linn. Sp. Pl. 63.)—Stem flaxen, triangular.
Head globose, feathery, solitary. Floral leaves three, very
long.—Native of both Indies. Root creeping. Stems—solit-
ary, a fash long, bearing two or three leaves at the base,
and as long at the top, accompanied sometimes by a
smaller one. The head of flowers are feathery bigger than
a large pea, whitish, very dense.—Thysaphilon monorale
of Forlitz, from Oratell, appears to be precisely this plant.

gramineus; Linn. Sp. Pl. ed. 1. 52. Schoenus niveus;
Syll. Veg. ed. 13. 81.)—Heads about three together, clus-
tered, feathery, somewhat ovate.—Native of both Indies.
Rather larger than the last, of which, in the 2d edition of
Species Plantarum, it is made a variety, but it is a smoother
plant, and the clustered rather Les globular heads dilligently,
the present species.

Umbel compound. Spikes numerous, cylindrical. Calyx
of one valve.—Native of the Caracas. This is a very
large species, with a sharply triangular stem three or four
feet high, very long floral leaves under the general umbrella,
and many small leaves under the partial ones. The num-
ernous clustered heads, or rather spikes, are oblong, various in
size, greenish, of numerous spreading flowers, whose calyx,
according to Jacquin, has but one valve.

K. monocarpa, triphysa, and umbellata, are cultivated in
the spikes at Kew, where the flowers in summer or autumn,
but probably excite little attention, except among curious
botanists.

KYLY, or KYLYA, in Geography, a sea-port on the W.
coast of the island of Celebes, with a spacious harbour. S.
lat. 1° 15'.

KYMTTS, an island in the Baltic, near the coast of
Finland; 20 miles long, and from one to two broad. N. lat.
60 16'.

KYMYN, a river of Finland, which flows from the
lake of Pajend, or Pjéna, into the centre of the gulf of
Finland.

KYNE, a town of Sweden, in East Botnia; 18 miles
N.E. of Vaasa.

KYNETON. See KINETON.

KYNTO, a lake of Ruffia, in the government of Olo-
netz, about 48 miles long, and from 12 to 16 broad. N.
lat. 65 43. E. long. 28 40'.

KYPER, ALBERT, in Biography, a physician, was born
at Konigsberg, in Prussia, and probably took the degree of
M. D. at Leyden, where he was Rodyting in the year 1642.
He was afterwards chosen fellow professor of physics, in
the new medical school established at Breda in 1646; but he
quitted this station two years afterwards, in order to take
possession of a medical chair, to which he was elected,
at Leyden; an appointment which he held till his death, which
curred in September, 1655, at the time when he was rector
of that university. He published several works.  "Me-
thodus Medicum rite difcendi et exerceendi," Leyden,
1642. "Institutiones Physicae," ibid. 1647. "Anthropo-
logia, corporis humani contentorum, et animae naturam
et virtutes, secundum circulationem sanguinis motum,
explicans," ibid. 1647 &c. "Institutiones Medicae ad hypothesin de
circulli sanguinis motu composita," Amsterdam, 1654.
"Collegium Medicum, xxvi. Disputationibus breviter comple-
tens qua ad Institutiones pertinent," Leyden, 1655.
This volume contained also some miscellaneous and political

KYPHONISME, KYPHONISME, or CEYPHONISME, an
ancient punishment, which was frequently undergone by the
martyrs in the primitive times; wherein the body of the
person to suffer was anointed with honey, and so exposed to
the fun, that the flies and wasps might be tempted to tor-
ment him. This was performed in three manners; some-
times they only tied the patient to a stake; sometimes
they boiled him into the air, and suspended him in a basket;
and sometimes they stretched him out on the ground, with
his hands tied behind him. The word is originally Greek,
and comes from ΚΥΨΩ, which signifies either the stake
by which the patient was tied, the collar fitted to the neck, or
an infirmity whereby with which they tormented him; the
scholeiat on Aristophanes says, it was a wooden lock, or cage;
and that it was called fo from ΚΥΨΩ, to crook or bend, because it
kept the tortured in a crooked bowing posture; others take
the ΚΥΨΩ, for a log of wood laid over the criminal's head to
prevent his standing upright: Hesychius describes the ΚΥΨΩ
as a piece of wood, wherein criminals were stretched and
tormented. In effect, it is probable the word might signify
all these several things. It was a generic name, whereof
there were the species.

Suidas gives us the fragment of an old law, which punished
thos who treated the laws, with contempt, with kyphoism
for the space of twenty days; after which they were to be
precipitated from a rock, dreffed in women's habit.

KYRA,
KYRA, in Geography, a town of Hindoostan, in Rohil-clud; 20 miles S. of Будавон.

KYRADAW, a town of Hindoostan, in Malwa; 7 miles S.W. of Kinkaffa.

KYRADEE, a town of Bengal; 14 miles W.S.W. of Curruckdeagh.

KYRALFALVA, a town and castle of Hungary; 12 miles S.W. of Svat.

KYRANTY, a town of Bootan; 60 miles S. of Taflafudon.

KYREZYCE, a town of Poland, in the palatinate of Volhynia; 56 miles N.W. of Zytomiers.

KYRIE, in Ecclesiastical Music, the first word of every psalm in music. It furnishes, with eleison, the only articulations of the first movement of all masses ancient and modern. Kyrie, the vocative case, implies O Lord, and joined with eleison, is equal to “Lord have mercy on us.” Kyrie, in speaking of a mass in music, is often used substantively, as “there is a well written kyrie in that mass or service.”

KYRILA, in Geography, a town of Sweden, in East Bothnia; 56 miles E.N. of Christianfadt.

KYRITZ, a town of Brandenburg, in the Mark of Prignitz; 40 miles N.W. of Berlin. N. lat. 52° 26'. E. long. 12° 26'.
I. 25 and but when according 6 found several miles about the peace ancient versus. The produces E. Rolbcick. 1° low, the eight miles east, river versus, thoufiind. was was was used to versify, a poetic word, unknown in common speech, versifying anna, and which it is probable was more used in Egypt than Greece.

L as an abbreviation stands for Lucas; and LLS. for a sergeant. In English, it denotes a pound tierling.

LA, in Malay, is the sixth found of the Guido scale. See Gammut, and Solmisation.

LAB, or Lava, in Geography, a town of Austria, on the river Taya; 26 miles N. of Vienna. N. lat. 48° 39'. E. long. 16° 16'.

LAADSTEE, a town of Norway; 112 miles N. of Bergen.

LAGE, a town of Mecklenburg; 14 miles S.E. of Rollasck. N. lat. 55° 58'. E. long. 13° 59'.

LALAND, or Laland, an island of Denmark, situated at the entrance into the Baltic, from the Great Belt; about 50 miles long, and 20 in its mediul breadth, and reckoned the most fertile spot in the Danish dominions. It produces variety of grain, particularly wheat, and also peas; and is chiefly appropriated to the cultivation of corn. Its woods, in which it is not deficient, are more frequent in the east, than on the west side of the island. As its situation is low, the air is damp and the climate is insalubrious. Of all the inhabitants, the clergy are most liberally provided for, according to their rank. The nobility are numerous, and possess large estates with fine houses. This island, like Teallier, has a peculiar governor; but both are under the spiritual jurisdiction of the bishop of Funen. The capital is Nalkow. N. lat. 54° 40' to 55°. E. long. 10° 59' to 11° 52'.

LALGUNGE, a town of Hindooslan, in Oude; 25 miles E. of Manichpour.

LAARET, an island in the East Indian sea, about 50 miles in circuit. S. lat. 6° 48'. E. long. 13° 30'.

LAAS, or Lasch, a town of Carnioli, with a citadel; 23 miles E.N.E. of Trieste. N. lat. 45° 58'. E. long. 14° 25'.

LASPHA, or Laspa, a town of Germany, in the county of Wittenfein; 64 miles E. of Cologne. N. lat. 50° 53'. E. long. 8° 30'.

LÁB, a town of Germany, in the bishopric of Wurzburg; 6 miles E.S.E. of Volkach.

LÁBAR, a town of Germany, in the confuh of Agra; 75 miles S.S.E. of Agra.

LABACCAN, a northern province of Celebes, which, together with Bouguro and Sageroo, are the plains lying between Tello and Tanete, the proper granaries of Celebes.

Labaccan has one native regent, who has the appellation of "Crain."

LABADDA, a town and district of Africa, on the Gold Coast.

LABADIE, John, in Biography, a celebrated enfuflad, was born at Bourg, in Guienne, in the year 1610; when he was six years old he was sent to Bourdeaux to be instructed in the Jesuits' school, and was at an early age admitted into the order, of which he continued a member fifteen years: He was so highly esteemed for piety and learning, that it was with the utmost difficulty he obtained his dismission when he asked for it. At length he quitted the society and became an itinerant preacher. The austerity of his manners, his great zeal, and affected piety, procured him many admirers wherever he went. At Amiens he obtained a canonry, but being detected in some criminal intrigues, the bishop ordered him to be arrested; he, however, escaped, and concealed himself at Paris. On this and some other parts of Labadie's conduct, Bayle makes the following remarks, which, in some degree, are probably applicable to religious enfuflads of other countries besides France: "I do not," says the biographer, "warrant the certainty of all these facts, but I affirm that it is very probable, that some of those spiritual devotiovs, who make people believe that a strong meditation will ravish the soul, and hinder it from perceiving the actions of the body, have a mind to toy with their devout filters with impunity, and to do still worse. In general, there is nothing more dangerous to the mind than too miraculous and too abstradted devotions; and, doubts, the body in that cafe runs some hazard, and many are glad to be deceived." Labadie became a director of a convent of nuns, among whom he introduced a new rule, and the notions of the Quietists, with additions of his own; viz. that the scriptures were not necessary to salvation: that outward worship is of no avail: that all prayer ought to be mental; and that there are two churches, that of Christians in degeneracy, and the other regenerate. About the year 1650, Labadie renounced the Roman religion at Montauban, at the same time declaring he had contemplated this measure more than fifteen years. His conversion excited much conversation and many discourses among the Catholics; several attempts were made to engage him to return to the bosom of the true church, but without producing any effect on his mind. His licentious practices were now exposed, and probably very much exaggerated: the Protestants, proud of so important a convert to their cause, would listen to none of the accusations, and he was chosen pastor of the reformed church at Montauban in the year 1651. Here he exerted the duties of the ministerial office for eight years, and then, on account of some disputes on subjects which he was unable to justify, he went to Geneva. Here his devout manners and popular preaching gained him a vast multitude of adherents, but by others every mean was taken to drive him from the town, and in 1666, these people accomplished their purpose, by procuring an invitation to be sent to him from the Walloon church at Middleburgh, the capital of Zeeland, which he readily accepted. He made many converts in this place, among whom was the celebrated Anna Maria Schurrman, of Utrecht, whose great learning rendered her so famous in the republic of letters during the seventeenth century. Labadie sent disciples to propagate his doctrines, and to gather contributions in different parts of Holland, on which account he was obliged to withdraw to Erfurt, the capital of Thuringia, and from thence to Altona, where he died at the age of sixty-four, in the year 1674. After his death, the community settled at Wievert, in North Holland, where it
found a peaceful retreat, and soon fell into oblivion. Labadie was author of many works which are full of mysticism: but they carry evident marks of a lively and glowing imagination. Bayle, Mofheim.

LABADISTS, or LABADISTS, in Ecclesiastical History, a sect of religious enthusiasts, followers of the opinion of Jean de Labadie, who lived in the 17th century, and was contemporary with Madame Mlle Bourignon.

Some of his tenets were, that, 1. God could and did deceive men. 2. That in reading the scriptures, greater attention should be given to the internal inspiration of the Holy Spirit, than to the words of the text; that the Scripture was not sufficient to lead men to salvation, without certain illuminations and revelations from the Holy Ghost; and that the efficacy of the word depended upon him that preached it. 3. That baptism ought to be deferred till mature age. 4. That the good and the wicked entered equally into the old alliance, providing they defecnded from Abraham, but that the new admitted only spiritual. 5. That the observation of Sunday was a matter of indifference. 6. That Christ would come and reign a thousand years on earth. 7. That the eucharist was only a commemoration of the death of Christ; and that though the symbols were nothing in themselves, yet that Christ was spiritually received by those who partook of them in a due manner. 8. That a contemplative life was a state of grace, and of divine union during this life, the summit of perfection. &c. 9. That the man whose heart was perfectly content and calm, half enjoys God, has familiar entertainments with him, and fees all things in him. 10. That this elate was to be come at by an entire self-abnegation, by the mortification of the fenses and their objects, and by the exercise of mental prayer. He also maintained, that the faithful ought to have all things in common, and that there is no subordination or distinction of rank in the church of Christ. It is said that the Brownists, and afterwards the Quakers, offered to connect themselves with this sect, but were rejected. See Journ. des Auteurs for October, 1727, where we have some account of Labadie and his followers, which were mostly women; and with some of whom, it has been said, he took criminal liberties.

LABAREES, in Geography, a town of Spain, in the province of Albac; 12 miles W. of Santillana.

LABARIFERI, among the Romans, standard-bearers, who carried the labarum.

LABARIUM, a looseness of the teeth.

LABARUM. in Antiquity, the manner or standard borne before the Roman emperors in the wars.

The labarum consisted of a long lance, or pike, with a staff at the top, crouching it at right angles; from which hung a rich streamer, of a purple colour, adorned with precious stones, and curiously wrought with the images of the reigning monarch and his children.

Till the time of Constantine, this standard had an eagle painted upon it; but that emperor introduced in lieu of it a cross. Accordingly, the summit of the pike supported a crown of gold, which inclosed the mysterious monogram, at once expressive of the figure of the cross, and the initial letters of the name of Christ, as represented under the article Cross. The safety of the labarum was entrusted to 50 guards, of approved valour and fidelity; their station was marked by honours and emoluments; and some fortunate accidents soon introduced an opinion, that as long as the guards of the labarum were engaged in the execution of their office, they were secure and invulnerable, amidst the darts of the enemy. This standard the Romans took from the Germans, Dace, Sarmatae, Pannonians, &c. whom they had overcome.

The name labarum was not known before the time of Constantine; but the standard itself, in the form we have described it, abating the symbols of Christianity, was used by all the preceding emperors.

In the second civil war Licinius felt and dreaded the power of this consecrated banner, the sight of which, in the din of battle, animated the soldiers of Constantine with an invincible enthusiasm, and scattered terror and dismay through the ranks of the adverse legions. Eusebius (in Vit. Consta. i. ii. c. 7, 8, 9) introduces the labarum before the Helvic expedition; but his narrative seems to indicate that it was never flown at the head of an army, till Constantine, above 10 years afterwards, declared himself the enemy of Licinius, and the deliverer of the church. The Christian emperors, who respected the example of Constantine, displayed in all their military expeditions the standard of the cross; but when the degenerate successors of Theodosius had ceased to appear in person at the head of the armies, the labarum was deposited as a venerable, but useless, relic, in the palace of Constanopole. Its honours are still preferred on the medals of the Flavians family. Their grateful devotion has placed the monogram of Christ in the midst of the ensigns of Rome. The solemn epitaphs of, safety of the republic, glory of the army, reformation of public immoralities, are equally applied to the religious and military trophies; and there is still extant a medal of the emperor Constanient, where the standard of the labarum is accompanied with these memorable words, "By this sign thou shalt conquer."

The derivation and meaning of the word labarum, or laborum, which is employed by Gregory Nazianzen, Ambrose, Prudentius, &c. still remains totally unknown; in spite of the efforts of the critics, who have ineffectually tortured the Latin, Greek, Spanish, Celtic, Teutonic, Illyric, Armenian, &c. in search of an etymology.

Some derive the word from labor, as if this finished their labours; some from vales, reverence, pietys others from vales, to take; and others from vale, to hold up the labarum has afforded very ample matter for criticism, and has been disavowed by Fuller, Alcuin, Cujas, Gyraldis, Lipfius, Meurthius, Volfius, Hofman, Valois, Du-Cange, &c.

LABAT, John Baptist, in Biography, was born at Paris in 1663; at the age of twenty he entered into the Dominican order, and made his profession in 1683. Having completed his studies, he became professor of philosophy at Nantz, after which he was, in 1693, sent by his superiors to America as a missionary. He returned to Europe in 1705, and being landed at Cadiz, he travelled through Spain and Italy, where he refixed some years. During this period he employed himself in drawing up a narrative of his observations, which he published at Paris, in 1722, with the title "Nouveaux Voyages aux Iles de l'Amerique," &c. in six volumes. A second edition was given to the world in eight volumes, in the year 1741. He was author likewise of "Travels in Spain and Italy," in eight volumes; and he edited the following, viz. "New Relation of Western Africa," 5 vols.; "Voyages of the Chevalier Merchis to Guinea;" "Historical Relation of Western Ethiopia;" and "Memoirs of Chevalier d'Arvieux," in 6 vols. Labat died at Paris in 1738. Morei.

LABATA, in Geography, a town of Spain, in Aragon; 10 miles E. of Hueca.

LABATA, in Botany, named by professor Swartz, in memory of John Baptst Labat, a Dominican monk, who, between

Gen. Ch. Cal. Perianth inferior, of four leaves; the two opposite ones erect; two smaller ovate, ob- tuse, concave, internal. Cor. of one petal; tube somewhat bell-shaped, shorter than the calyx; limb in four minute, erect, blunted, equal segments, with two opposite, smaller, intermediate, lanceolate ones. Stam. Filaments four, of the length of the corolla, erect, awl-shaped, close to the pistil; anthers erect, pointed. Pflf. Germen superior, roundish, minute; style awl-shaped, equal to the stamens; stigma three, oblong. Peric. Capsule large, roundish, rough, of four cells and four valves. Seeds solitary, oblong, compressed.

1. L. felthiifera. Sw. Fl. Ind. Occ. t. 6.—Flowers fleshy. Leaves filiform.—Found by Swartz in the mountain parts of the mountains of Hispaniola. The flower is shrubby, six feet or more in height, erect, smooth, with a greyish rusty bark; the branches alternate, straight, bearing upright, round, rusty smaller branches. Leaves alternate, fleshy, oblong-lanceolate, pointed, entire, wavy, rigid, two or three inches long, elegantly ribbed and veined beneath; the young ones shining and silky, with a golden rusty hue; the older more silverly. Footstalks short, round, rusty. Flowers axillary, fleshy, mildly solitary, whitish, very small. Fruit the size of a nutmeg, roundish, rough and rusty, the internal partition yell. Sometimes there are but two cells and as many seeds, the fruits of this natural order being liable to vary greatly in the number of their divisions. The flowers appear in May and June; the fruit ripens in December and January.

2. L. pedunculata. With n. 2. (Pouderia guianensis; Aubl. Guian. t. 33.)—Flowers fleshy. Leaves smooth.—Native of woods in Guiana, where it is called by the Indians Petroum. Pouder. Aublet found it bearing both flowers and fruit in November. The trunk, according to this writer, is 40 feet high, and a yard in diameter, with a rough reddish bark, and hard, close-grained, white wood; the branches long and subdivided, leafy at their extremities. Leaves ovate, pointed, entire, smooth, three or four inches long, on footstalks nearly half that length. Flowers small, greenish, on short simple axillary stalks, two or three together. Fruit oval, hard, rough, with rigid short hairs, red internally, as is likewise the skin of the seeds.

LA BÂTIE NEUVE, in Geography, a town of France, in the department of the Higher Alps, and chief place of a canton, in the district of Gap. The town contains 200, and the canton 3130 inhabitants, on a territory of 125 kilometres, in eight communes.

LABBE, PHILIP, in Biography, was born at Bourges in the year 1667, and at the age of sixteen he entered the society of the Jésuits, and became distinguished as a teacher of the languages, of rhetoric, and philosophy, in the college of his native place. He was afterwards professor of moral theology at Paris, where he resided till his death, which happened in 1667. He was reckoned a man of profound learning, and indefatigable industry. He was author of many works, of which several relate to the history of his own order; the most important is "A General Collection of Counsils," with notes, in seventeen vols. fol. His grammatical work for the use of students in the languages, entitled "Erudite Pronuntiationis Catholici Indiciis," has been frequently reprinted in this country. The edition by Edward Leece is well known in our schools. Its object is to point out the quantity of Latin proper names of persons, places, &c. Moreni.

LABEL, in Ornithology. See LARGES parasiticus.

LABBOCK BAY, in Geography, a bay on the N.E. coast of the island of Borneo. N. lat. 6° 2'. E. long. 117° 55'.

LABDACISM, in Philosophy. See LADACISM.

LABDA, in Materia Medica. See LADANUM.

LABDARA, in Geography, a small island in the gulf of Venice. N. lat. 44° 14'. E. long. 15° 19'.

LABEL, a long thin brahs ruler, with a small figure at one end, and a centre-hole at the other; commonly used with a tangent line on the edge of a circumference, to take altitudes, &c.

Among apothecaries likewise, the flip of paper round their phials, containing directions how to use the medicine, is called a label.

LABEL, in Heraldry, a kind of addition to the arms of the heir or first son, to distinguish him from the others. See FILE.

Although the file or label be used as a distinction of house, it is necessarily properly placed by Holme, as an ordinary, because it is variously borne and charged. The label is esteemed the most honorable of all differences; and is formed by a fillet usually placed in the middle, and along the chief of the coat, without touching its extremities. Its breadth ought to be a ninth part of the chief. It is adorned with pendants somewhat like the drops under the triglyphs in the Doric frieze. When there are above three pendants, the number must be specified in blazoning. There are sometimes fix. The label, variously charged, is the difference generally affixed on the coats of arms belonging to any of the royal family, when his majesty shall think fit to command that arms be granted them.

LABELLA LEPORINA, in Surgery. See HARE-LIP.

LABELLED LINES, in Heraldry, a term used by some to express the line in certain old arms, called more usually urdé or champagne. Others apply the same word to express the patee or dove-tail line, called also the incline line by Morin. It somewhat resembles the joint called a dovetail by our joiners, and its points, as they proceed from the ordinary, whether chief or fess, resemble the ends of labels. See URDÉ and PATER.

LABEO, C. ANTISTIUS, in Biography, an eminent Roman lawyer, the son of one of the persons who conspired against the life of Julius Cæsar, was a disciple of Trebatius, and lived under Augustus. He became a very learned man, preferred a free and independent spirit under the rule of a despot, and shewed on various occasions that he had not forgotten,
potten, nor was careless of the liberties of his country. His great rival in jurisprudence was Aicus Capito, and Tacitus, speaking of these two rivals, calls them "the two ornaments of peace in their age;" he however celebrates the

incorrupt freedom of the latter, which was the cause of his rising no higher than the praetorship; while the obsequiousness of the former was rewarded with a consulship. Labo

divided his time between business and study, spending six months at Rome, in giving advice and attending to public duties, and living the other six in a country retreat. He

wrote a number of books chiefly relating to jurisprudence. Aulus Gellius refers frequently to the commentaries of Labo, on the twelve tables. Suetonius, Lempriere.

Labo, in Ichthyology, a name given by the old Latin writers to the fish usually called chelifon and cheloton. See Cyphinus Labo.

LABER, in Geography, a town of Bavaria, in the principality of Newburg; nine miles W.N.W. of Ratibon.

LABERIUS, DECIMUS, in Biography, a writer of dramatic pieces, similar in some respects to our pantomimes, was a knight by birth. He was sixty years of age when Julius Cæsar, in the plenitude of his power, urged him, by the promise of a liberal reward, to appear on the stage, in one of his own pieces. The poet confronted with great reluctance, and showed his resentment during the acting of the piece, by throwing severe aspersions upon Julius Cæsar, and by broadly hinting at the tyranny and despotism of which he was guilty. In pronouncing the following line, he fixed the eyes of the whole assembly upon the usurer: " 

Necesse est multos timent quem multi timent."

"Many he dreads in turn, whom many dread."

Cæsar restored him to the rank of knight, which he had lost by appearing on the stage, but he could not so easily restore him to the good opinion of his friends. When he went to take his seat among the knights, no one offered to make him room, even his friend Cicero facetiously said "Recipiessem ut nih! angulé fedem?"

"I would make you room if I were not so much crowded to which Laberius replied, "Mirum si angulé fedes, qui soleas danaus fellis fedes;" I wonder you should be crowded, who usually sit upon two seats at once; alluding to the orator's maxims and simplicity, during the civil wars between Cæsar and Pompey.

Laberius died in the year 44 B.C. Some fragments of his poetry remain, and are given in Mattaire's Corpus Poetaum, the titles of his several pieces are preserved in Aulus Gellius. Horace alludes, but without any respect to the minis of Laberius, this was, probably, rather in contempt of the species poetry, than the author.

LABES, in Geography, a town of Hinder Pomerania; 30 miles S. of Colberg. N. lat. 53° 39'. E. long. 15° 39'.

LABEZ, a province, sometimes called a kingdom, of Algiers, S. of Boujusah.

LABIA, or lips, in Anatomy. See Deglutition.

LABIAL, a term in the French law, used in the same sense with oral.

LABIAL Letters, among Grammarians, are those whose pronunciation is chiefly effected by the motion of the lips. By which they stand contradistinguished from palatal, dental, guttural, &c. letters.

LABIAL Offers are such as are only made by word of mouth, or even by writing, where there is no valuable consideration. In courts of equity these are not regarded.

LABIALIS, in Anatomy, an epithet given to certain parts belonging to the lips, as the arteries, veins, glands, &c.

LABIATEæ, in Botany, a natural order of plants, so called, after Tournefort, from labium, a lip, in allusion to the shape of the corolla, which resembles the mouth and lips of an animal. This order, the 39th of Jussieu's system, and the 6th of his eighth class, is equivalent to Linnaeus's 42nd natural order, Veratis, or to the Didynamia Gymnospermae of his artificial system; except that the latter necessarily excludes such genera of labiateae as have but two stamens, and which are therefore referred to his second class, Dianandra.

The characters of Jussieu's eighth class are:—

"Cotyledons two. Corolla of one petal, inferior."

(See Gentianæ.) He defines the order in question thus.

Calyx tubular, either equally five-cleft, or two-lipped. Corolla tubular, irregular, generally two-lipped. Stamens four, two longer and two shorter, situated under the upper lip of the corolla; in some cases only two, the others being abortive. Germen four-lobed; style solitary, springing from the receptacle, between the lobes of the germs, stigma cloven. Seeds four, naked, crept, affixed to the receptacle by their base, and concealed in the permanent calyx. Embryo dehiscent of albumen. Stem quadrangular, oppositely branched, for the most part herbaceous, but sometimes shaggy. Leaves opposite. Flowers opposite, often bracteate, or attended by bristles, solitary or whorled, corymbose or spicate, terminal or axillary.

The sections are four.

1. Stamens 300 fertile, two abortive. This contains Leuceus, Amethystus, Cunliffa, Ziziphora, Monarda, Refonius, Scolia and Colchidion, to which are added by Mr. Brown (Prodr. v. 1. 501.) Heringia, Smith's Tracts, 277. t. 3. Microcorpus, Hemigenia and Hemiandra of Brown; see Aucoumea a new genus of Mr. Brown's.

2. Stamens four, all fertile. Upper lip of the corolla wanting, or nearly so. Apogia of Linneus, (which Jussieu chooses to call Bogus after Tournefort), and Teucrum, with Aucoumea a new genus of Mr. Brown's.

3. Stamens four, all fertile. Corolla with two lips. Calyx five-cleft. — Satureia, Hesperos, Nepeta, Perilla, Hyptis, Lavandula, Sideritis, Mentha, Glechoma, Latium, Galeopsis, Betonica, Stachys, Balios, Marrubium, Leonurus, Phlomis and Moluccella, to which are to be added Pidaba (see that article), and Leucus of Burmann and Brown.

4. Stamens four, all fertile. Corolla with two lips. Calyx two-lipped. — Clinopodium, Origamus, Thymus, Thymbra, Melis, Draccephalum, Horminum (now reduced to Melis), Melitis, Pleuranthus (which is Geranium of Lamark and Jussieu). Geum, Tricholema, Prunula, Scutellaria, Presanum and Phrygium, with Chelidonium and Cryptdria of Brown, and Prostanthera of La Billiardere.

The plants of this natural order are for the most part, agreeably aromatic, or bitter, none of them poisons. The root is generally perennial. Flowers of various colours, seldom fragrant in themselves, except as they partake of the aromatic quality of the shrub. The stamens and stigmas are, as Linneus observes, so well sheltered, in most influses, from the rain, while the air has free access at the sides, that impregnation rarely fails. Mentha, however, forms an exception, the stamens being prominent, and the corolla open; and as its seeds are scarcely ever prolific, no plant has a more ample increase by the roots.

LABIAU, in Geography, a town of Preussa, in the province of Salamand, with an ancient castle, on the Deim; 20 miles E.N.E. of Konigberg. N. lat. 54° 10'. E. long. 21° 15'.

LABIEZ, a town of the duchy of Warfaw; 32 miles N. of Gnifsna.

LABINE, in Natural History, a term used by the authors who have written of Switzerland, and other mountains.
In towns, to express those vast masses of snow, which sometimes fall from the hills and bury houses, or even whole towns; and when hardened by the frosts, as is often the case, into solid subfubances, they overthrow woods, villages, and whatever stands in the way of their course, as they roll down the steep sides of the precipices in their way. Some authors have also extended the word to a larger sense, and made it express the falling of vall rocks, or parts of mountains, and their rolling down in the same manner into the flat country: this is a mischief very frequent in the same places, after frosts, and often very fatal. See GLACIERS.

LABIUM, in Anatomy, a term given to various parts in the body, which, from their prominent figure, admit of being compared to the lips. Thus the labia pudendi are the two folds of skin which bound the external female organs of generation laterally. (See GENERATION.) The edges of the cribra of the os innominatum are called its labia.

LABIUM Leperinum, in Surgery. See HARE-LIP.

LABO, in Geography, a town on the W. coast of the island of Sumatra, which chiefly trades in pepper. N. lat. 3° 20'.

LABOMAS, a town of the island of Cuba; seven miles S.E. of Spiritu Santo.

LABON, a town on the W. coast of Sumatra, celebrated for gold dust and camphire; but the inhabitants are reserved in their traffic with strangers: 150 miles S.E. of Acheen. N. lat. 3° 15'. E. long. 96° 40'.

LABOON, a district of Sumatra, on the banks of the river Cattown, bounding the country of the Rejangs on the N. or inland side. Also, a town on the E. coast of the island of Borneo, seated on a peninsula that projects into the sea. N. lat. 5° 0'. E. long. 119° 5'.

LABOR, a town of New Navarre; 280 miles S.E. of Caza Grande.

LABORATORY is a place furnished with chemical apparatus, and entirely devoted to the different operations of chemistry, whether on the scale of chemical manufacture, or for the purpose of experimental research. In the present article, however, we shall confine ourselves to the latter, since it is more proper to describe the apparatus used in the large way under the manufacture of the respective articles. Although many of the most distinguished labourers in chemical science have been content with such apparatus as they have made themselves, or converted from the common domestic utensils; it must, nevertheless, be obvious, that they would have succeeded better with well contrived and appropriate apparatus, and their researches would, in all probability, have been much more extended.

Every chemical experimenter will find a considerable advantage in so much mechanical talent, as will enable him to make, or repair at least, the most common of his apparatus. For this purpose he should possess a set of mechanical tools, such as a lathe and vice, with files and raps for metal and wood. The tools for making screws, as well in the lathe as by the screw-plate and taps, will also be necessary. To these should be added a small forge, anvil, and hammer, for the purpose of forging small articles. A set of brazier's and chimney's tools will be found very useful, and a little experience will enable the operator to make any article of tin or copper, which is not very complicated. In addition to the above, the glas-blower's lamp and bellows will be of essential service for sealing and bending glass tubes, and other purposes.

Some of these may appear unnecessary, especially in large towns, where the different arts are more likely to be strongly in the recollection of all who have had occasion to get apparatus made, that they can seldom get them constructed to their wish, although they stand by the artisan. The want of proper tools, and a little mechanical dexterity, have frequently prevented or put an end to experimental investigations of considerable importance. Independent of the apparatus containing the mechanical apparatus, the chemist will require at least one distinct room for a laboratory. Two rooms, however, should be employed when it is convenient. The principal room of the laboratory should be on a ground floor, for several reasons. A furnace for great heat should be in a low room, in order to have the greatest length of chimney. The ash-pit of this furnace should terminate in a cellar under the laboratory, in order that the air may enter perpendicularly, and of the lowest possible temperature. See FURNACE.

That side of the laboratory allotted for furnaces should have an arch projecting into the room about three or four feet, and of such height that a person may freely walk under it. In the highest part of this arched portion must be an opening into a chimney distinct from the ret, and built up in the same brick. It will be found more convenient to use portable furnaces for most purposes, having none fixed but for producing very great heats, upon a larger scale, and what are generally denominated melting furnaces.

The iron chimney of the portable air-furnace may be carried to any height, and placed under or within the chimney, used for the escape of smoke and vapours.

A chimney with a funnel may, in the same way, be placed over the mouth of the portable blast furnace, invented by Mr. Aikin. This furnace may be so contrived that when the body of it is removed, the base may form a forge hearth, which will be found very useful. For the varieties of furnaces used in the laboratory, see FURNACE.

On another side of the laboratory must be placed a stone trough, or link, joined to a tub or cistern of water, which can be filled and emptied at pleasure, by means of a stop-cock over it, and a plug in the bottom. Over the link-stone should be suspended a rack for holding bottles and glasses to drain after washing. On the same side may be placed a large block of wood or stone, for the purpose of holding a mortar or anvil occasionally.

A third side of this room must be occupied by cupboards and shelves, for holding the different apparatus of glass and earthen ware, and for the different subfubances hereafter to be mentioned.

The fourth side, which should be the lightest, must be provided with a table the whole length of this side, in the front of which, down to the floor, should be a number of drawers for holding all the dry subfubances. This table is for making the experiments upon, and for holding the apparatus in use at any time.

If possible, every laboratory should be joined to a second room, however small it may be, in which to perform the very nice and delicate experiments, and for keeping a few books and choice instruments of metal, such as balances, etc. This room should be kept very clean and dry, and as free as possible from steam and the fumes of acids.

If any part of the furniture require to be painted, the paint should be made with sulphate of lead, since it is not acted upon by acids. This subfance has been used by Dr. Henry not only for this purpose but for repairing broken glas and labelling bottles. The following are the most particular apparatus with which a laboratory should be furnished.

Mortars.—These are of various kinds, cast-iron, bronze, steel, and Wedgewood ware. The cast-iron mortar is generally used for vegetable subfubances, and such as are not liable to grind off the iron. The hardness of this instrument is much
much increased by calling the interior surface upon a metal mould, of the greater weight the better.

The hardens of the bronze mortar, which is generally used for the same purposes, may be increased by the same means.

The steel mortar is used for reducing very hard minerals into small bits, fitted for grinding in the mortar of agate. It consists of a cylinder of hardened steel, with a flat bottom, and a pestle of the same made to fit the mortar, accurately, from top to bottom. It is used by putting the pieces of the mineral into it, and striking the pestle with a hammer. By this means it can be reduced into tolerably small particles, without grinding off any portion of the mortar.

Hardened steel mortars of the common shape would be of great use, but it would be difficult to harden so large a mass without cracking. It might perhaps be made by welding a plate of cast steel upon a thick piece of iron, and afterwards working it into the required shape, and polishing it in the inside. If the substance is not very particular, it may be ground in a mortar of Wedgwood ware. If, on the contrary, it be very hard, the matter from the mortar will be liable to be mixed with the powder. In this case the agate mortar is much to be preferred; some flames are, however, so hard as to act upon the agate. In this instance, the matter to be ground should be weighed before and after grinding, and the increase of weight may be safely deemed flex, and allowed for in the analysis accordingly.

**Balance.**—This instrument is of great importance to the analytical chemist, and ought to weigh 100 grains to the 1/100 grain. A very matterly account of the principles and construction of the balance will be found under the article BALANCE.

It will be almost unnecessary to observe, that to dedicate an instrument should be kept in a separate apartment from the laboratory where fumes of acids do not prevail. It should be closely shut up in a glas cage having a sliding door in the front. The strings to which the scales are suspended, should be of fine gold or silver cord, and the scales of silver or platinum, and very thin. One of the scales should be provided with a loose pan of very thin platinum, and balanced with the other, for the purpose of holding the substance to be weighed. The weights for chemical substances should be reckoned in, and marked with grains and decimals of grains.

**Lamp.**—This valuable instrument is a very great improvement upon the sand-bath. Its heat is regular, and may, by means of the concentric wick, be made of sufficient intensity for most purposes. Its greatest advantage, however, consists in the facility with which it can be applied or withdrawn without loss of time. See LAMP.

For nice and delicate purposes, where the heat of the lamp is required, alcohol, instead of oil, gives an intense and steady heat, and is not very expensive when a proper vessel is used for burning it. The latter kind of lamp is particularly adapted for a public lecture.

**Fig. 1.** Plate XVI. Chemistry, is a stand supporting the lamp, and at the same time the substance to be heated, and the connecting apparatus A B is a frame of wood. F a pillar of wood or iron, smooth and cylindrical throughout, to as to admit of the folding rings, such as g, o move freely without shaking. C is the Argand lamp, having a chimney at o of iron. This chimney consists of two concentric tubes, connected together by small wedges of baked clay, or some other incombustible substance which is a bad conductor of heat. This contrivance not only economizes the heat, but keeps the outer tube so cool, that it may be taken hold of with the fingers. In this lamp the wick is raised by the screw, instead of the rack, which is performed by turning the chimney round.

The funnel-shaped ring D is an improvement upon the common ring used for supporting the retort. It consists of a number of conical hoops, one fitting upon the other, so as to hold different sized retorts. The small end is about two inches in diameter, and the large end, which is attached to the flaring part, about five inches. The conical surface directs the heat to the retort, which on the common plan only serves to annoy the fingers and face of the operator, and at the same time heats the neck of the retort, where the condensation of the vapour should take place: f is a retort supported by the ring: g is a slider, having two progs at p to keep the retort from falling sidewise: E is a receiver to receive the contents of the retort, which may be either used alone, or with Woulfe’s bottles a, b, c, hereafter to be described. G is a stand, with three inclined progs of wood to support receivers of different sizes, and which may be placed at different elevations by means of the screw n.

**Retort.**—Fig. 2. This is a chemical utensil of very ancient origin, and is the most simple apparatus for distillation. Retorts are of glass, earthen-ware, and metal. Those of glass are sometimes of green glafs, particularly when such heat is employed in the naked fire, as might soften the most fusible white glafs. Those of flint-glafs should be as thin as possible, in order to avoid breaking by an unequal expansion. When the retort is provided with a glass stopper, as at a, it is said to be tubulated.

This appendage is necessary only, when some fluid, such as an acid, has frequently to be added, or when it would be difficult to get the materials into the mouth of the retort. In order to add any fluid from time to time while the process is going on, the retort (fig. 3.) called an acid holder is made to lie in the place of the stopper of the retort, the part d beingground to fit the fame. The acid is put into this vessel, and let into the retort, by a little at once, through the glafs stop-cock e.

When the retort is used for purposes of distillation, the neck is fitted or luted into the neck of the receiver (fig. 4.) This receiver is used for the distillation of liquids, the vapours of which are easily condensable, such as water or alcohol. When the vapours, coming over, are accompanied with elastic fluids, which are incondensable, the receiver (fig. 5.) is better adapted. If the elastic fluid be of no importance, and inoffensive, it may escape at the conical stopper of the latter vessel every time the pressure is sufficient to raise it. It is, however, sometimes necessary to collect the gaseous fluid. In this case the bent tube (fig. 6.) is put into the place of the stopper (fig. 5.), the other end terminating in a pneumatic apparatus where the gas is collected. In the distillation of very volatile liquids, such as ether, it is sometimes necessary to remove the receiver to a distance from the retort, by placing between them an intermediate vessel, (fig. 7.) called an adapter. The receiver (fig. 8.) is employed for collecting the product of different degrees of strength by the application of the bottle k.

In the distillation of substanaces, which require a greater heat than glass will bear, earthen retorts are employed. They are of the same shape with those already described, and should be made of the materials with which crucibles are made. This sort of retort is generally used for the distillation of phosphorus. If its texture be not close, the phosphorus will escape in vapours through the pores. This, however, may be prevented by covering the surface with some glazing material. Iron retorts, from their great firmness, are well adapted for distilling such substanaces as will have no chemical
chemical action upon them. Hence they are unfit for distilling sulphur, phosphorus, and acids, but are extremely proper for ammonia, mercury, and pittosol. A retort of lead is used for the distillation of fluoric acid, owing to that acid combining with the fies of glasses.

Woulfe's Apparatus.—In the distillation of substances which are merely to be raised into vapour by heat and condensed by cold, the retort, or still, with the receiver and the proper means of producing cold, are the only apparatus necessary. There is another distinct branch of distillation, in which the product is a gas, which is incondensable at the common temperature, and requires to be absorbed by water, or by some other substance dissolved in that liquid. In these processes therefore, the temperature and size of the receiving vessels are not of so much importance as the exposure of the gaseous product to the greatest possible quantity of the absorbing liquid. Before the discovery of this most useful apparatus by Mr. Woulfe, from whom it takes its name, the common retort and receiver were used for all purposes. The elastic fluids were in conformance either compressed, and the operator was constantly in danger of being injured by the bursting of vessels, or, to remedy that evil, they were suffered to escape, and he was perpetually annoyed by the suffocating fumes which were let at liberty.

In fig. 1, the retort contains the materials for furnishing the elastic fluid to be absorbed by some liquid contained in the receiver E, and the succeeding bottles a, b, c, with their connecting tubes r, s, t, which constitutes the Woulfe's apparatus. A certain portion of the gas is taken up by the liquid in the receiver E. The excess passes through the tube r to the bottom of the liquid into the second receiver, by which another portion of the gas is absorbed. The residual gas passes along the tube b to the third receiver, which gives the gas a third chance of absorption. In this way it may be made to pass through any number of bottles, according to the greater or lesser facility with which the gas is absorbed. The last tube c, which is provided with a column of mercury, conveys the remaining gas, which is presumed to be unabsorbable, into the atmosphere, or it may be collected by a jar in the pneumatic apparatus. When the gas ceases to be furnished from the retort, its quantity equal to the absorption in the receiving vessels, a retrograde motion will begin to take place. Atmospheric air will enter at the tube a. The liquid in the last receiver will be forced by its pressure into the preceding one, and if the absorption were to become complete, the whole of the liquid would be carried into the first receiver, and from thence to the retort. This evil has been very completely removed by what is called a tube of safety f, g, h, i.

Fig. 1.—The bulb f contains as much mercury as will be contained from q to s, so that when the gas, from defective absorption, accumulates in E, till its force is equal to the pressure of such a column, the excess of gas will bubble through the mercury into the atmosphere. On the contrary, when the absorption of the gas exceeds its evolution, the pressure of the atmosphere, to restore the equilibrium, will cause the mercury to occupy the ball f, and common air will bubble through it into the vessel E. Although this ingenious contrivance completely prevents any evil arising from the inequality of internal pressure, it is very objectionable, owing to its delicate structure, on which account it is constantly liable to be broken.

We are indebted to Mr. Knight for a great improvement on the tube of safety. This consists in having a valve of glass, similar to that of the Nooth's apparatus (delineated below), placed between the first and second vessel, so that the liquid in the succeeding bottle may never have a retrograde motion. To this valve there is no other objection than the difficulty of getting it made in places distant from the metropolis, and its liability to be lost, especially in making crystalline salts, such as the oxymuriat or carbonat of potash.

The same objection which we have made to the tube of safety, we are sorry to say applies to the whole of the Woulfe's apparatus. The connecting tubes are with great difficulty ground into bottles, which makes the apparatus very expensive, and then are so liable to be broken, as to render it frequently useless.

We have before hinted, that the essential part of such an apparatus, is to expel the greatest possible quantity of the gas and the liquid to each other in a given time. In the Woulfe's bottles, this advantage does not obtain in so great a degree as might be effected in a simpler apparatus. We shall here subjoin a description of an apparatus of this kind, answering all the purposes to which the Nooth's and Woulfe's apparatus are separately applied. Although it has not been before made known, it has been used with great success by the writer of this article, and will no doubt be found an acquisition to the experimental as well as the manufacturing chemist.

Fig. 9. Plate XVII. Chemistry, is a representation of the apparatus for the absorption of gases. A is a retort from whence the gas is furnished, connected with the first bottle B, which contains the liquid to be impregnated, and into which the tube a is ground, reaching near to the bottom, so that when the gas enters this vessel, the liquid will be raised into the bottle C; at the same time the tube will be constantly filled, with the exception of the space occupied by bubbles of gas passing through it. If the gas is not all absorbed during its passage through this tube, the excess will pass down the tube b into the bottle D, which also contains the absorbent liquid. The same takes place in this bottle which is observed in that of B. The liquid descends into the bottle E, the gas following it as before. The residual gas, should there be any, may either be conveyed into another bottle fitted like D, or may be collected in a pneumatic trough, or escape through the tube of safety f.

This apparatus was invented for the purpose of making the oxymuriats of the earths, for which it is admirably adapted. The earths which are mixed with the water being constantly at the bottom, if not kept in agitation, the absorption is very slow and imperfect. In this apparatus no agitation is necessary. The earth, which is at the bottom of the vessels B and D, is first raised into the tubes a and c, and becomes as much exposed to the gas as any part of the liquid medium. The tubes a and c are each about two feet long, but they do not require to be so long for most experiments of this kind. Their diameter is about 1/4 inch, so that in the course of about one minute, no less than about nine ounces are brought in contact with the gas, independent of the circular surfaces in the bottles.

In the common fixed Woulfe's bottles, the tubes through which the gas enters seldom dip more than three inches into the fluid, so that we may safely rate the apparatus proposed as equal to at least eight of Woulfe's bottles. These bottles are the same with those of Woulfe's; the tubes are much simpler, and being stronger are less liable to break. Another great advantage is that of its not requiring a tube of safety. The great facility with which it can be applied to all the purposes of the Nooth's apparatus, as well as the Woulfe's, and with much more effect, will be soon appreciated. Under the article Woulfe will be found the description of a differently constructed apparatus. See Plate V. Chemistry.

Nooth's Apparatus.—This is represented in fig. 10, Plate XVI. It consists of three vessels fitted together by ground
ground joints. It differs in its use from the Woulfe's, in being solely adapted for impregnating water and other bodies, with such gases as are difengaged from their combinations without heat, such as the carbonic acid, and sulphuretted hydrogen. The lower vessel A contains the substance from which the gas is obtained, such as carbon of lime; the sulphuric acid being introduced occasionally at d; the gas enters the vessel B through the glass valve a b. This is magnified in fig. 12. The tubes b and d are at first in a piece and ground into the part a e; the portion e is then cut away, to make room for the hemispherical valve, the under side of which is ground flat, to fit the end of the tube b. The valve, on being raised by the gas, instantly falls and prevents the water from descending into the lower vessel. The air then enters the liquid in B, fig. 10, through small holes to diffuse it as much as possible. When the gas accumulates in B, a portion of the liquid is driven up into the vessel C, the bubbles of air following it tending still more to promote the absorption. The air in C, if not absorbed, will at certain intervals raise the conical stopper c. This stopper should be so heavy as just to rise before the vessels would burn, and should be so conical as not to flick in the least degree. After the liquid is impregnated it is drawn off at the cock D.

Fig. 11, is a simpler and better apparatus for this purpose, invented by Dr. Hamilton. It is simpler, because the vessels are fewer, and the valve, which is complicated and liable to be faulty, is dispensed with; and it is better because the gas comes in contact with more of the liquid in a given time, and consequently the absorption is effected sooner. The gas is furnished by the retort B, ground into the vessel A. From the latter the absorbing liquid is raised into the vessel C, till the air bubbles go through it, and if not absorbed pass out at d. This apparatus wants nothing more than a tube of greater length, for the gas to pass through, to make it complete.

In comparing the two last with that of fig. 9, the latter will be found much superior even to that of fig. 11.

Gazometer and Gas Holder.—The difference between these two vessels, consists merely in one having the means of measuring the quantity of gas which it contains at any time, and the other not, while both are employed as gas holders.

The gazometer was made a very expensive and magnificent apparatus by the celebrated Lavoisier, at the time he prosecuted his experiments upon elastic fluids. This instrument, much simplified, we shall describe in fig. 13, Plate XVII. A is a vessel containing water or some other liquid, which will not be acted upon by the gas to be held in it. B is a vessel inverted in the vessel A, and capable of moving up and down in it. E and F are cords by which the vessel B is suspended, the weights and pulleys being concealed in the tube C D. Fig. 14, is a section to show the interior parts of this apparatus. K L is an interior vessel of the same shape, with the vessel B, folded into the bottom of the vessel A, so that no water or other liquid in A can communicate with the interior of it. This is done for the sake of using less of the liquid employed, which in the mercuриal gazometer is very desirable, as well for the sake of economy, as making the apparatus more portable; a is a pipe passing through the middle of the vessel K L, and communicates with the tubes s and d. The air is introduced at the float-cock f, and passing along the pipes s and d, raises the vessel B, which is counterpoised by the weights r and q. These weights are conducted down the middle of the tube C D, by the small pulleys x and y. The tube d, which, with that of s, is common to the tube a, is to let the air out of the gazometer at the float-cock f, so that the air passes through a, both in its entry and its exit; g, fig. 13, is a flexible tube, serving to conduct the air to a pneumatic trough for examination, or for using the blow-pipe when the vessel contains oxygen. This apparatus is provided with a graduated scale G, which tells the number of cubic inches contained in it. It is this scale which constitutes it a gasometer, without which it would be simply a gas-holer.

The mercurial gasometer is on the same plan with the above, but the materials must be unsusceptible of the action of the mercury. The vessels are generally made of caullon. The outer and the fixed inner vessels may be cast in one piece. The moveable vessel may be of the same metal, or of glasses. The pipes must be of wrought iron, and accurately ground into the cast iron. Two gasometers with water, and one with mercury, will be indispensible in experiments in gaseous chemistry.

A very ingenious apparatus, answering the common purposes of gas-holder and gazometer, and in many instances the pneumatic trough, has been invented by Mr. Pepys. It consists of a tin vessel A, fig. 15, and a pan or tray B connected with it by pillars. The pipe a opens into the middle of the tray, and proceeds in a contrary direction near to the bottom of the vessel A: r is another pipe which also communicates with the tray, and just enters the vessel A: s is a glass tube cemented firmly into two brass sockets, which communicate with the top and bottom of the vessel A. This tube is graduated, and shows how high the water stands in the vessel, and consequently tells the quantity of air contained in it. The vessel A is first filled with water by opening the cocks a and q, and flattening that of s, C being closed at the same time. The tray is now filled with water, which descends through the tube r into A, while the air in the same escapes at the opening into the tray, from s. When the vessel A is full of water, the cocks a and r must be closed, and the plug may be taken out of C. If the vessel and ropes be air-tight above, no water will be discharged at C, since this pipe is inserted at such an angle into A, that the lowest part of the outer end is higher than the highest part of the inner end. The next thing is to fill the vessel with gas, and for this purpose the neck of a retort, or other tube from which the gas is to proceed, should be introduced at r till it pales the inner end of the same. The gas will rise in bubbles into the upper part of the vessel, while the same quantity of water will run out at the pipe C into an open vessel placed under it. When the water ceases to run out, and air-bubbles escape at C, the tube from whence the gas was furnished may be withdrawn, and the screw-plug put in its place.

In order to transfer the gas from this vessel into a jar, the tray must be filled with water, and also the jar, which must then be placed over the aperture from q. On opening the float-cock v, that of s being previously opened, the air will ascend into the jar, while the same quantity of water will descend into the vessel A, to supply its place.

This apparatus may be used for several other purposes. A bladder may be tied to the float-cock s, which being opened at the same time a is opened, the bladder will be filled with the gas. A flexible tube may be screwed on the same float-cock for making experiments with the blow-pipe. The gasometer, fig 13, will be found better for the blow-pipe, on account of the equable pressure in the apparatus last described.

Pneumatic Trough.—This is a simple trough or cistern made of tin or copper japanned, and is used for collecting different gases. The size is generally about 18 inches long, 12 wide, and 12 deep. Fig. 16, Plate XVI. represents this trough. A is a sliding shelf which can be taken out. It is formed of two plates laid together; the under plate is made so concave, that when the convex side touches the upper plate in the middle, they are distant at the edges about one inch.
A rim being folded round the two gives the shelf the appearance of a solid, concave on the under side and flat on the upper side.

Any gas coming from the retort B, passing under the shelf in any situation, must be determined to the round hole in the middle, which is about half an inch wide. The trough, when used, is filled with water about an inch above the shelf, the jar C being filled with the same, and placed over the aperture through which the bubbles ascend. The stand D, having a foot of lead or iron, will be found very useful for supporting a retort or other vessel in these experiments. When a number of vessels are occupying the shelf, and frequently some are very tall, and of small diameter, it will be found necessary to support them to prevent their being thrown over. This may be effected by having a number of supporters of different sizes, such as A. This is better represented in fig. 17. At d is a socket to fit the pins which surround the shelf; a, e, are springing claws to embrace the glass.

In making experiments upon gases, a number of vessels, such as fig. 18, will be necessary. These are generally called eudiometer tubes; some of them are graduated into cubic inches, for the purpose of measuring the volume of gas used, or resulting from any experiment. See EUDIOMETRY.

Besides the trough already described, which is used with water, it is necessary to be provided with one for mercury. Indeed the latter is absolutely indispensible when the gases, which are the subject of experiment, are absorbable by water: such as the muriatic acid gas, and ammoniacal gas.

Fig. 19, is a view of the mercurial trough; it is generally made of a solid block of some hard wood, or of marble; or it may be made much neater, and with less labour, of pieces of wood joined together, closely and firmly by iron screws. The first cavity, a e b, may be about eight inches long, four inches broad, and one inch in depth; the second or lower cavity, a d, should be about 6½ inches long, 1½ wide, and the same depth; c is a smaller cavity, about 1½ of an inch wide, 1½ long, and one inch deep. The cavity d is intended to receive the glass jar, fig. 20, for the purpose of filling it with mercury; a e b, are small cavities in which to introduce the fingers for the purpose of raising the jar when full of mercury. The cavity at e is to place the inverted jar over, for the purpose of introducing any gas into it. The side a c answers as a shelf to rest the inverted jars upon; fig. 21, is a ring of iron, with a leg to flip into holes on the side of the trough, for the purpose of supporting the jars, which would otherwise be liable to fall on account of their small bafe.

Eudiometer.—Formerly the use of this instrument was confined to the analysis of the atmosphere. It has now, however, become of great importance in gaseous chemistry, and has been considerably improved within these few years.

In order to ascertain the nature of, and to distinguish the different gases, chemists have generally recourse to some substance capable of absorbing the gas under examination. The eudiometer is the vessel which contains, or communicates with the substance which is to absorb the gas, and the tube being graduated marks out the quantity absorbed, and shews how much of that particular gas was present.

The first instrument of this kind, adapted to general purposes, was invented by Dr. Hope; of which a description will be found under EUDIOMETRY. Under the same article will be found Mr. Davy's eudiometer for the analysis of the atmosphere.

Mr. Pepys has lately invented a very good eudiometer: it differs from Dr. Hope's in the bulb, which holds the absorbing liquid, being an elastic gum bottle instead of glass. A glass neck is tied into the neck of the bottle, into which the graduated tube is ground. When this eudiometer is used, the elastic bottle is filled with the absorbing liquid (lime water, for instance), and the tube filled with the gas under examination (supposed to be carbonic acid), introduced into the neck.

On agitating the liquid to mix it with the gas, as the absorption goes on, the elastic bottle collapses, by the atmospheric pressure, and the liquid occupies the place of the absorbed gas in the tube.

The only objection to this eudiometer is its want of flexibility, and this varying under different circumstances, so that the density of the contained air can never be accurately known. The writer of this article has done away the above objection, by using a bag of oiled silk instead of this elastic gum bottle. The silk must be very well coated, and the coating completely dry.

The eudiometer of Volta, which is found very useful in the presence of the electric machine, is also called the detecting jar. It is used with oxygen to detect the presence of hydrogen, and vice versa. This instrument, fig. 22, consists of a very thick glass tube A B, having two bits of metal a, b, paling into the tube opposite to each other, the inner ends being separated from each other a small distance, so that an electric spark passing between them, may be capable of inflaming hydrogen with oxygen.

The gas to be examined is introduced into this jar, and the electric spark palled through it. If hydrogen and oxygen be present, in sufficient quantity, they will explode, forming water, and producing a diminution of volume equal to the original bulk of gases, which have entered into combination. In the explosion of these gases the water or mercury is apt to be thrown in various directions by the concussion. We are indebted to Mr. Pepys for an ingenious method of preventing this evil. The tube A B is secured to the iron stand D E by means of a socket C. D is an iron tube containing a spiral spring, similar to that of the spring flex-yard. The rod d, which acts upon the spring, is fastened to the foot E, which is so heavy as not to be raised by the force exerted upon the spring. When the detonation of the gases takes place, the force is exerted equally upon the instrument and the liquid, in which it is immersed, and they are both at liberty. Instead of being all exerted upon the latter, it causes the tube to rise, the spring in the socket D giving way; and thus prevents the liquid from being diffused. All the gaseous bodies containing hydrogen can now be analysed by this instrument. Dr. Henry has discovered that ammonia, which does not appear combustible, can be exploded with oxygen: its hydrogen forming water with that substance. See EUDIOMETRY.

Evaporating Vessels.—These are of metal, earthen-ware, and glass. They are generally made broad and hollow, as seen in fig. 25, in order to expose a greater evaporable surface. During the evaporation of any liquid, a current of air should constantly be passing over its surface. This object can be easily attained by placing the vessel under the mouth of a chimney into which there is a considerable draught. By this means also the vapour is prevented from coming into the room.

These vessels are of silver for expelling the water from alkalis, and of glass, or Wedgewood ware, for acids and some solutions of salts.

Sand and Water Baths.—The sand bath, although superheated by the Argand lamp, for distillations in the small way, is, nevertheless, very useful for digetting substances subjected to solution, and for evaporation. Its heat is much more regular than the naked fire, but it may sometimes be too
hot for substances which are liable to be decomposed, such as infusions of vegetable or animal matters. The most useful fand bath is made of a plate of cast iron, under which the flame of a fire plays, and a rim of cast or wrought iron laid upon it and filled with fine Calais sand.

A fand-bath frequently consists of an iron dish or pan made to fit the mouth of a furnace. See Furnace.

When a uniform heat, not higher than 212° of Fahrenheit, is required, or when it will be sufficient, the water bath is found highly useful. Indeed, however, of placing the substance to be heated in a vessel of boiling water, which was formerly the case, the bath may be heated with steam at any distance from the boiler. This bath may be a vessel of any shape, having a cavity for steam on the outside, thickly covered with flannel, or any bad conductor of heat, and the inside filled with sand. This bath is admirably suited for the evaporation of solutions of animal and vegetable substances, and for drying precipitates and other substances liable to be decomposed or changed by great heat.

Materials.—This is a vessel used for making solutions of substances. It is generally of a spherical form, flattened at the bottom, as seen in fig. 24, having a long neck to allow the fluid to condense and return into the vessel. This useful apparatus is made of glass, and thin at the bottom, in order to prevent its breaking. The common Florence flask is a good substitute for the matras. A smaller vessel of this kind is used for boiling a less quantity of any liquid; these are called proof glasses. See fig. 25.

Precipitating Glasses.—See fig. 26.—These are tall cylindrical vessels, in which precipitations are performed, in order to collect the precipitated matter into less room. In washing precipitates it is found, that when hot water is poured into the glass, if the bottom be thick it is liable to break. This evil has existed more or less in all the precipitating glasses in general use. In making this vessel at the glass-house, the part to form the bottom should be blown out thin, like the matras, and then pulled inwards to make it flint firmly. Very small vessels in this shape are used for small quantities of any substance. These are called test glasses.

Gas bottles, such as fig. 27, are vessels for obtaining hydrogen, carbonic acid, and other gases. The materials, such as water and zinc filings, are introduced into the bottle A. The sulphuric acid being put into the bottle B, the plug 8, which is ground into the neck 4, can be raised to let in the acid as it may be wanted. The gas escapes through the crooked tube C, which may be put under the shelf of the pneumatic trough.

Funnels are used generally for filtration; they are commonly, and always ought to be ribbed for this purpose, in order to form channels between the paper and the glass, which greatly facilitates the process. In lieu of a ribbed filter, it is common to place a number of straws, or pieces of glass, between the paper and the vessel, which answers very well.

The separatory funnel, fig. 34, is used for separating fluids, such as water and oil, which do not mix from the difference in specific gravity.

The following articles are also essential to the laboratory, which it will be unnecessary to describe. Thermometers and a barometer. Bottle for ascertaining the specific gravity of liquids. A common still to furnish distilled water. A small one of silver for nice purposes. The different blow-pipe apparatus, with platinum, spoon, and leaf platina. A silver crucible, and one of platina.

Crucibles and crucible flasks of earthen ware. See figs. 29, 30, and 32.
Muffels and cupsels. See figs. 28 and 33.
Iron retort and jointed tube for procuring oxygen gas. Fig. 35.
Glasis jars of different sizes for collecting gases. Filtering papers, and papers coloured with bitumen, turmeric, and red-cabbage.
A general assortment of glases, to filter liquids into, &c.
An assortment of earthen vessels for common purposes. These made of the same materials as the soda water bottles are to be preferred.
Capsules of glass, and watch-glasses. The former may be cut out of broken retorts and receivers with a small hot iron.
Glass tubes of different sizes, and a spirit lamp for burning them.
Glass and porcelain rods and spoons for stirring acids, &c.
Jars of glass and earthen ware, with grooves round the top, for letting them closely from the air. These should be used for containing salts in crystallites.
Roged paper for labels; cupal varnish to cover the frame, to keep off the dampness and fumes of acids.
Sheets and wires of different metals.
Silk and thread of different strength.
Stands made of wood or rushes, for supporting vessels with round bottoms.
Iron ladles of different sizes.
Hammers, shears, and pliers.
Corks, bladders, and sponge.
Tongs of various forms.
Files, diamond, and magnet.
Lutes, linen, cloth, and tow. See Lute.
The following philosophical apparatus:
Air-pump for condensing and exhausting.
Syringes, microscope, and burning lens.
Electric machine and Galvanic apparatus.
Zinc plates and wire, for minor experiments.
Hydrotatic balance and hydrometer.

We shall conclude this article with a list of the chemical substances necessary to be kept in a chemical laboratory. These are divided into wet and dry substances. The first of these must, of necessity, be kept in well-dotted bottles. The latter should also be kept in vessels, the necks of which must be wider than those for liquids.

Substances in common use should be kept in larger quantity than those which are kept as mere specimens, or only used occasionally and in small quantity.

LiQuids in common Use.

Sulphuric acid, pure.
Nitrif acid, pure.
Muriatic acid, pure.
Acetic acid.
Water saturated with ammonia.
Solution of potash.
Carbonate of potash.
Potash.
Super-carbonate of potash.
Foda, and carbonate of soda.
Carbonate of ammonia.
Lime water.
Distilled water.

Alcohol,
Alcohol, pure.

--- common.

The bottles in which the above are kept should hold from a pint to a quart each.

After a change of temperature in the air from cold to hot, we find at the tops of bottles, about the flopper, a quantity of the liquid which has distilled up to the flopper, and been forced out by the expansion of the air in the bottle. This is very troublesome, especially with acids, and may be remedied by giving to the mouth of the bottle a slight funnel shaped, which forms a recept for the liquid.

The following are the dry substances in common use.

Oxid of manganum, and common salt.

Fillings and rods of iron, tin, zinc, copper, and lead.

Chalk and powdered marble.

Quicklime, pipe clay, and sand.

Magnesia, common and calcined.

Sulfur of potash, iron, and lime.

Turmeric and nutgalls.

Brazil wood and turmeric.

Calcined plaster of Paris, and bone ashes.

Black flux and white flux. See Flux.

Charcoal powder and sawdust.

Sulphur of lead, as a body for bastes.

Nitre in crystals.

Borax and alum.

The following are bodies in solution, used as tests and kept in small quantities, in bottles from one to two ounces in size. The bottles should be shaped at the mouth as above recommended, and the diameter should be half the height in the cylindrical part.

The following substances should be kept in the solid state, and free from contact with air and moisture:

Sulphate of iron kept in alcohol.

Muriat of lime.

Oxymuriat of potash.

Barytic earth.

Strontian earth, and all pure earths.

Pure potash.

--- Foda.

Potash and sodium, kept in naphtha. See Potassium and Sodium.

Sulphurets of potash, iron, and lime.

Phosphure of lime.

Phosphorus.

Pyrophorus.

It is also proper that the chemist should possess as great a variety of all the known chemical bodies as possible, both simple and compound. They are worth possessing even as a matter of curiosity. But they will be highly valuable in giving a familiar knowledge of the different substances which the experimentalist may expect to meet with, and enable him to distinguish from what may be new.

Laboratory of an Hospital, is a place where the chemical, &c. remedies are made up.

Laboratory, in a Camp, is a tent were the fire-workers and bombardiers prepare their works, drive their fuses, fix their thills and carcasses, make quick-match, &c.

Laborde, M. de, in Biography, author of an ample and comprehensive work, entitled "Effai fur la Mufique, ancienne et moderne," published at Paris 1780, in four vols., 4to. The accumulation of curious materials for this publication is such, as nothing but a long and unwearied diligence could amass. It has, however, frequently given to much concern, in consulting this work, to see the spirit of fylfem operate so strongly on the author, as to affect both his candour and confidence. The critique upon musical writers in the third volume, seems only a vehicle for general censure of all that have not subscribed to the fundamental base of Rameau, the triple progression of the Abbe Rouffier, and praise of all that bard. There is no middle state, no music or musical merit of any kind, theoretical or practical, anachronosed by these dogmas. But will M. de La borde venture to assert, or can he even believe, that till the publication of Rameau's "Sylviere de la Bale fondamentale," and the Abbe Rouffier's "Mmoire fur la Musique des Anciens," there was no good music in the world, or that all which has been produced since, by innumerable great masters in several parts of Europe, who never studied or heard of either, is execrable? That there are great method and merit in the syllables of both these theories, no candid judges of the subject will deny; and perhaps there are few who will not grant that the principles of harmony have not been formed into a code, equally luminous and useful to students, by any other writers, and yet will not shut their ears to all music not build upon their principles. The inconstancy of individually praising Italian composers in such glowing terms, and yet letting every opportunity to confute and sneer at Italians and foreigners in general, prove the work to have been compiled by persons of different principles. What a coil is made (v.iii. p. 690.) about a sharp fifth used merely as an appoggiatura, or note of taffe, with which the base or harmony has nothing to do, and which, therefore, has no effect on the modulation! And yet M. de Laborde can bear the quinte superflue, and have patience to give a rule for its use in composition! Can any one sincerely praise the compositions of Pecconi, Sacchin, and Pasfieldi, who is disgraced by those happy licences, in which the very soul of Italian music conficts?

M. de Laborde gives us his musical creed in very plain terms, (v.iii. p. 639.) in answer to a remark of Mr. Jamard, who expresses his surprise, that "the Italians, without any formal system, compose better music than the French, who are in possession of the true principles of harmony." This M. de Laborde is so far from granting, that, on the contrary, he is certain the French music, with respect to counterpoint, is infinitely superior to the Italian; and that the Italians sur
pafs the French in nothing but dramatic music, which is not like other music, subervient to the laws of counterpoint!—
"We will allow," continues he, "that the Italians are superior to us in melody; but they in return must grant, that with respect to harmony we write in a manner superior to them in correctness, purity, and elegance." What! superior to Leo, Fét, Durante, Ahos, Jomelli, Caffaro, and Manna? But neither melody nor harmony, alone, can constitute good music, which consists in the union of both; and melody without harmony, or harmony without melody, is as imperfect as a man with one arm, or one leg, to whom nature has originally given two.

With respect to all the feuds and contentions lately occasioned by music in France, they seem to have annihilated the former disposition of the inhabitants to receive delight from such music as their country afforded. There are, at present, certainly, too many critics, and too few hearers with a disposition to be pleased in France, as well as elsewhere. We have seen French and German fondling connexions listen to the most exquisite musical performance, with the name "jargon" as an anatomist attends a dissection. It is all analysis, calculation, and parallel; they are to be wise, not pleased. Happy the people, however imperfect their music, if it gives them pleasure! But when it is an eternal object of dispute; when each man, like Nebuchadnezzar, sets up his own peculiar idol, which every individual is to fall down and worship, or be thrown into the fiery furnace of his hatred and contempt, the bleeding is converted into a curse.

LABOUR, in Agriculture, the work which is necessary to be performed upon a farm, in order to render it fruitful and productive. It is of various kinds, and for the most part either performed by hired servants or day labourers. Where proper attention is paid by the farmer, to see that the labourer understands his business, &c. agricultural labour is probably, in general, better done by the piece, or what in some places is termed task-work. The expence or price of labour varies considerably in different districts, from particular circumstances; such as the situation, the state of manufactures, the condition of agriculture, the facility of getting employment, and the manner of living. See LABOUR.

In the Survey of the County of Middlesex, it is stated, that agriculture may very properly be considered as the art of manufacturing the soil, and unquestionably ranks the highest in the class of manufactures; since it not only makes a greater return for the labour bestowed, than all the rest put together; but it is also of the first necessity, the demands for its products being urgent and irreducible. Any other manufacture, Mr. Diron remarks, may be laid down at pleasure, but agriculture must be supported, as it is the hinge upon which both our lives and actions turn; and the ultimate and only certain resource of the State, both for men and money.

In the above point of view the feed-grain, amounting to about 15s. an acre, may be said to constitute, according to the writer of the Survey of the County of Middlesex, the raw material. When the corn and straw, produced from this seed, are dressed and sent to market, the greater part of it is then fit for consumption, and may be called a finial manufacture. The additional value above 15s. is entirely the produce of labour, at least, in a conjunction with the afflance of nature; but as not one shilling could be procured for the natural products of the world, without the application of labour, the whole may therefore be said to be derived from labour; and amounts to about 9l. 5s. an acre, or 1233l. per cent. on the cost of the raw material. Wheat is still farther manufactured into bread; but, exclusive of

the operations of the miller and the baker, this is certainly not above the average for the produce of the arable land of this county; and some parts of Surrey, Kent, and Essex, yield in the same proportion. The raw material, on an average of the arable of the whole of South Britain, amounts to about 16s. per acre, which is increaced in value by labour to 5l. or 53s. per cent. Hence the labour bestowed on fifteen millions three hundred thousand acres, produce a return of 64,260,000l. sterling.

And the cattle and implements may, it is suppos'd, and suppos'd that in a manufacturing point of view, be deemed the stock; the amount of which, on the meadow-land in this county, is about 4l. an acre, and the produce 11l. The Labour and profits of stock, therefore, are 150l. per cent. On a farm purely arable in this county the stock would be 5l. and the produce 10l. or 100l. per cent. There are not any grazing-farms in the county; if there were, their stock would be greater, and they would not yield so large an increase. The farming capital of South Britain is 5l. an acre, or 200 millions; and its annual produce is about 130, that is, 65 per cent.

He particularizes the annual produce of the soil in this way:

- The arable lands, as before stated, - £64,260,000
- The hop-gardens make returns to the amount of 30l. an acre, for the produce of labour, or about -1,000,000
- Nursery grounds produce upwards of 65l. per acre. Deduct the raw material, and the produce of labour will not be less than 60l. on 10,000 acres, is -600,000
- The fruit and kitchen-gardens are the most valuable resources for labour, and make the greatest return, probably to upwards of 100l. per acre, on an average of Great Britain; but he only estimates them at that sum on 50,000 acres, is -5,000,000
- The grazed land and cider counties, cultivated in South Britain, make returns to the amount of 3l. on twenty millions of acres, is -60,000,000
- The commons, eight millions, at 1s. 3d. an acre -500,000

Total - £131,356,000

It is not presumed to offer the foregoing statement, as one that either is, or can be made out with accuracy and precision. But, under all the circumstances of the case, it may, it is believed, be fairly stated, that the annual agricultural produce of South Britain is not less than one hundred and thirty millions; which must be allowed to surpass all other manufactures that can be brought into competition with it, not only as to the gross amount, but also as to its superior usefulness.

And if it be further suppos'd, that there are two millions and a half of persons employed in agriculture, their average earnings will be, for men, women, and children of all ages, 5l. which is a sum so much exceeding their expenses, that it is evident this employment must enrich society: and it is equally clear, that it contributes at once its surplus, wealth, and population, to make up the deficiencies of the other departments both in men and money. This surely places the importance of rural labour in such a point of view, as should urge the cultivation of as much land of the kingdom as possible.
LABOUR.

Labour, in a general sense, imports the exertion of human strength in the performance of any kind of work.

The annual labour of every nation, says Dr. Smith in his "Inquiry into the Nature and Causes of the Wealth of Nations," (vol i.), is the fund, which originally supplies it with all the necessaries and conveniences of life, which it annually consumes, and which confit always, either in the immediate produce of that labour, or in what is purchased with that produce from other nations. As this produce, or its value in purchase, bears a greater or a smaller proportion to the number of those who are to consume it, the nation will be better or worse supplied with all the necessaries and conveniences for which it has occasion. This proportion, in every nation, is regulated by two circumstances, viz. the skill, dexterity, and judgment with which its labour is generally applied, and the proportion which the number of those who are employed in useful labour, bears to that of those who are not so employed. Whatever be the soil, climate, or extent of territory of any particular nation, the abundance or scantiness of its annual supply must, in that particular situation, depend upon these two circumstances; and chiefly upon the former of them, which has served to improve the productive powers of labour. This improvement has very materially depended on the division of labour, as we may illustrate and evince by a single example taken from a manufacture, that is, on the first view of it, very trifling; viz. that of pin-making. A workman, not educated to this business, (which the division of labour has rendered a distinct trade), nor acquainted with the use of the machinery employed in it, (to the invention of which the fame division of labour has probably given occasion), could scarcely, with his utmost industry, make one pin in a day; and certainly could not make twenty. But as the business is now conducted, not only the whole work is a peculiar trade, but it is divided into a number of branches, confiding, for the most part, of peculiar trades. One man draws out the wire, another straightens it, a third cuts it, a fourth points it, a fifth grinds it at the top for receiving the head; and the making of the head requires two or three distinct operations; the putting of it on is a peculiar business, and the whitening of the pins is another; the putting of them into the paper is a trade by itself. Thus the important businesses of making a pin is divided into about 18 distinct operations, which, in some manufactories, are all performed by distinct hands, though in others, the same man will sometimes perform two or three of them. Dr. Smith mentions a small manufacture of this kind, where 10 men only were employed, and where some of them consequently performed two or three distinct operations. But though they were poor, and their machinery indifferent, they could, with exertion, make among them 32 pounds of pins in a day; each pound consisting of upwards of 4000 pins of a middling size; these 10 persons could therefore, among them, make upwards of 48,000 pins in a day; so that each person might be considered as making 4800 pins in a day. But if they had all wrought separately and independently, and without having been previously educated to this peculiar business, they certainly could not each of them have made 20, perhaps not one pin a day; that is, certainly, not the two hundred and forty, perhaps not the four thousand eight hundredth part of what they are at present capable of performing, in consequence of a proper division and combination of their different operations. This exemplification is applicable, in a certain degree, and with some modifications, to other arts and manufactures; and it shews that the division of labour, as far as it can be introduced, occasions, in every art, a proportionable increase of the productive powers of labour. The separation of different trades and employments from one another, seems to have taken place in consequence of this advantage. The great increase in the quantity of work, which, in consequence of the division of labour, the same number of people are capable of performing, is owing to three different circumstances; first, to the increase of dexterity in every particular workman; secondly, to the saving of the time which is commonly lost in palling from one species of work to another; and thirdly, to the invention of a great number of machines which facilitate and abridge labour, and enable one man to do the work of many. This invention and introduction of machinery seem to have been originally owing to the division of labour. Of machines constructed for abridging and expediting labour, many have been devised by common workmen, who have been employed in some very simple operation, and whose attention has been wholly directed to an easy and ready method of performing it. Many improvements have also been made by the ingenuity of the makers of the machines, when the construction of them became the business of a particular trade; and some by that of those who are called philosophers and men of speculation, whose observation has enabled them to combine together the powers of the most dextrous and different objects. A sub-division of employment in philosophy, as well as in every other business, has taken place among persons of this description; in consequence of which dexterity is improved, and time is saved. Each individual, appropriating himself to a particular branch, performs more work upon the whole, and contributes in a considerable degree to augment the quantity of science. It is the great multiplication of the productions of all the different arts, in consequence of the division of labour, which occasions, in a well-governed society, that universal opulence which extends itself to the lowest ranks of the people. Every workman has a great quantity of his own work to dispose of beyond what he himself has occasion for; and every other workman being exactly in the same situation, he is enabled to exchange a great quantity of his own goods for a great quantity of, or which comes to the same thing, for the price of a great quantity of theirs. He supplies them abundantly with what they have occasion for, and they accommodate him amply with what he has occasion for; and a general plenty diffuses itself through all the different ranks of the society.

The division of labour, from which so many advantages are derived, is not originally the effect of human wisdom, which foresees and intends that general opulence to which it gives occasion. It is the necessary, though very slow and gradual, consequence of a certain propensity in human nature which has in view no such extensive utility; the propensity to truck, barter, and exchange one thing for another. As it is the power of exchanging that gives occasion to the division of labour, so the extent of this division must always be limited by the extent of that power, or, in other words, by the extent of the market. When the market is very small, no person can have any encouragement to dedicate himself entirely to one employment, for want of the power to exchange all that surplus part of the produce of his labour, which is over and above his own consumption, for such parts of the produce of other men's labour as he has occasion for. This leads us to observe, that by means of water-carriage a more extensive market is opened to every sort of industry, than what land-carriage alone can afford it; so it is upon the sea-coast, and along the banks of navigable rivers, that industry of every kind naturally begins to subdivide and improve itself; and it is frequently not till a long time after that these improvements extend themselves to the inland parts of the country. If we advert
ADVERT TO FACT, we shall find, that the nations which appear to have been first cultivated, were those that occupied the countries around the coast of the Mediterranean sea. And of all these countries, Egypt seems to have been the first, in which either agriculture or manufactures were cultivated and improved, and to any considerable degree. Upper Egypt extends itself no where above a few miles from the Nile, and in Lower Egypt this great river breaks itself into many different canals, which, with the assistance of a little art, seem to have afforded a communication by water-carriage, not only between all the great towns, but between all the considerable villages, and even to many farm-houses in the country; much in the same manner as the Rhine and the Meene do in Holland at present. The extent and facility of this inland navigation, was probably one of the principal causes of the early improvement of Egypt. Yet we are informed by Pliny, that the Euxine and Caspian seas, the ancient Scythia, the modern Tartary and Siberia, which in all ages of the world seem to have been in the same barbarous and uncivilized state in which we find them at present. See CANAL, COMMERCIO, and NAVIGATION.

When the division of labour first began to take place, the power of exchanging, upon which it chiefly depended, must frequently have been very much clogged and embarrassed in its operations. In order to avoid part, at least, of the inconvenience arising from this state of society, every proprietor, in every period of society, after the first division of labour, must naturally have endeavoured to manage his affairs in such a manner, as to have at all times by him, besides the peculiar produce of his own industry, a certain quantity of some one commodity or other, such as he imagined few people would be likely to refuse in exchange for the produce of their industry. Many different commodities, it is probable, were successively both thought of and employed for this purpose. In the rude ages of society, cattle were said to have been the common instrument of commerce. Thus we find, according to Homer, that the armour of Diomedes cost only nine oxen; but that of Glauceus cost 100 oxen. Salt is said to be the common medium of commerce and exchanges in Abyssinia; a species of shell in some parts of the coast of India; dried cod at Newfoundland; tobacco in Virginia; sugar in some of our West India colonies; hides or dressed leather in some other countries; and Dr. Smith mentions a village in Scotland in which it was not uncommon for a workman to carry nails instead of money to the baker's shop or the alehouse. Metals, however, have been preferred for this purpose to every other commodity; and different metals have been appropriated by different nations to this use. See CoIN and MONEY.

After the division of labour has been once thoroughly established, it is but a very small part of the necessaries and conveniences of life with which a man's own labour can supply him. The far greater part of these he must derive from the labour of other people; and he must be rich or poor according to the quantity of that labour which he can command, or which he can afford to purchase. The value of any commodity, therefore, to the person who possesses it, and who means not to use or consume it himself, but to exchange it for other commodities, is equal to the quantity of labour which it enables him to purchase or command. Labour, therefore, is the real measure of the exchangeable value of all commodities. This, however, is not the measure by which their value is commonly estimated. It is often difficult to ascertain the proportion between two different quantities of labour. The time spent in two different sorts of work will not always alone determine this proportion. The different degrees of hardship endured, and of ingenuity exercised, must likewise be taken into account. But it is not easy to find any accurate measure either of hardship or ingenuity. Hence it happens, that every commodity is more frequently exchanged for, and thereby compared with, other commodities than with labour. When barter ceases, and money has become the common instrument of commerce, every particular commodity is more frequently exchanged for money than for any other commodity. Nevertheless, labour alone, never varying in its own value, is the ultimate and real standard by which the value of all commodities can at all times and places be estimated and compared. It is their real price; money is their nominal price only. But though equal quantities of labour are always of the same value to the labourer, yet to the person who employs them, they appear sometimes to be of greater and sometimes of smaller value. He purchases them sometimes with a greater and sometimes with a smaller quantity of goods, and to him the price of labour seems to vary like that of all other things. It appears to him dear in one cafe, and cheap in the other. In reality, however, it is the goods which are cheap in the one cafe, and dear in the other. In this popular fable, therefore, labour, like commodities, may be said to have a real and a nominal price. Its real price may be said to consist in the quantity of the necessaries and conveniences of life which are given for it; its nominal price, in the quantity of money. The labourer is rich or poor, is well or ill rewarded, in proportion to the real, not to the nominal price of his labour.

The real value of all the different component parts of price, says Dr. Smith, is measured by the quantity of labour, which they can, each of them, purchase or command. Labour measures the value, not only of that part of price, which resolves itself into labour, but of that which resolves itself into rent (of land), and of that which resolves itself into profit. In every society the price of every commodity resolves itself into some one or other, or all, of these three parts; and in every improved society, all the three enter, more or less, into the price of the far greater part of commodities. In the most improved societies, however, there are always a few commodities of which the price resolves itself into two parts only, the wages of labour and the profits of stock; and a still smaller number, in which it resolves altogether in the wages of labour.

The produce of labour constitutes the natural recompense or wages of labour. In that original state of things, which precedes both the appropriation of land and the accumulation of stock, the whole produce of labour belongs to the labourer; as he has no landlord or master to share with him. If this state had continued, the wages of labour would have augmented with all the improvements in its productive powers, to which the division of labour gives occasion. All things would gradually have become cheaper. They would have been produced by a smaller quantity of labour; and as the commodities produced by equal quantities of labour would naturally in this state of things be exchanged for one another, they would have been purchased likewise with the produce of a smaller quantity. But this original state of things, in which the labourer enjoyed the whole produce of his own labour, could not last beyond the first introduction of the appropriation of land and the accumulation of stock.
LABOUR.

As soon as land becomes private property, the landlord demands a share of almost all the produce which the labourer can either raise, or collect from it. His rent makes the first deduction from the produce of the labour which is employed upon land. A second deduction is made by the profit accruing from the produce of the labour that has been so employed. The produce of almost all other labour, in all arts and manufactures, is liable to the like deduction of profit. What are the common wages of labour, depends very where upon the contract usually made between the two parties, to whom belong the profits of stock, and the wages of labour; and the interests of these parties are by no means the same. The workmen desire to get as much, the masters to give as little, as possible. The former are disposed to combine in order to raise, the latter in order to lower, the wages of labour. The masters commonly succeed, for being fewer in number, they can more easily combine; and besides, the law authorizes, or at least does not prohibit, their combinations, while it prohibits those of the workmen. But though in disputes between masters and workmen, the former must generally have the advantage, there is, however, a certain rate, below which it seems impossible to reduce, for any considerable time, the ordinary wages even of the lowest species of labour. The wages of a labourer must at least be sufficient to maintain him; and indeed, on most occasions, they ought to be somewhat more; otherwise it would be impossible for him to bring up a family, and the race of such workmen could not last beyond the first generation. There are certain circumstances, which sometimes give the labourers an advantage, and enable them to raise their wages considerably above the rate already specified; which is evidently the lowest that is consistent with common humanity. When in every country the demand for those who live by wages, labourers, journeymen, servants of every kind, is continually increasing; when every year furnishes employment for a greater number than had been employed the year before, the workmen have no occasion to combine in order to raise the wages. The scarcity of workmen occasions a competition among masters, who bid against one another, in order to get workmen, and thus voluntarily break through the natural combination of masters not to raise wages. This demand for those who live by wages, it evident, cannot increase in proportion to the increase of the funds, which are destined for the payment of wages; these funds are of two kinds: first, the revenue which is over and above what is necessary for the maintenance; and secondly, the stock which is over and above what is necessary for the employment of their masters. The demand for those who live by wages, therefore, necessarily increases with the increase of the revenue and stock of every country, and cannot possibly increase without it. The increase of revenue and stock is the increase of national wealth. It is this continual increase, and not the whole amount, of national wealth, which occasions a rise in the wages of labour. Accordingly, it is not in the richest countries, but in the most thriving, or in those which are growing rich the fastest, that the wages of labour are the highest. England is, without doubt, a much richer country than any part of North America; yet the wages of labour are much higher in North America than in any part of England. Although North America is not yet so rich as England, it is more thriving, and advancing with greater rapidity to the further acquisition of riches. The most decisive mark of the prosperity of any country is the increase of the number of its inhabitants. In Great Britain, and in most other European countries, they are not supposed to double in less than 500 years. In North America, it has been found, that they double in 20 or 25 years. Labour is there so well rewarded, that a numerous family of children, instead of being a burthen, is a source of opulence and prosperity to the parents. The labour of each child, before it can leave their homes, is computed to be worth 100l. clear gain to them. The value of children is evidently the greatest of all encouragements to marriage. In North America the people generally marry very young; and notwithstanding the great increase occasioned by such early marriages, there is a continual complaint in that country of the scarcity of hands. The demand for labourers, the funds destined for maintaining them, increase, it seems, still faster than they can find labourers to employ. Another circumstance deserves to be mentioned, viz. that the price of provisions is everywhere in North America much lower than in England, so that a family can be maintained at a much cheaper rate. Upon this whole, if the money price of labour be higher there than it is here, its real price, the real command of the necessaries and conveniences of life which it conveys to the labourer, must be higher in a still greater proportion. The liberal reward of labour, as it is the necessary effect, so it is the natural symptom of increasing wealth. The scanty maintenance of the labouring poor, on the other hand, is the natural symptom, that things are at a stand, and their flourishing that they are going back. The liberal reward of labour, as it is the effect of increasing wealth, is also the cause of increasing population.

It deserves to be remarked, that it is in the progressive state, while the society is advancing to the further acquisition rather than when it has acquired its full compliment of riches, that the condition of the labouring poor, of the great body of the people, seems to be the happiest and the most comfortable. It is hard in the stationary, and miserable in the declining state. The progressive state is in reality the chearful and the hearty state, to all the different orders of the society. The stationary is dull, the declining melancholy. The liberal reward of labour not only encourages the propagation, but it increases the industry of the common people. Where wages are high, we shall always find the workmen more diligent, active, and expeditious, than where they are low: in England, for example, than in Scotland: in the neighbourhood of great towns than in remote country places. Some workmen, however, when they can earn in four days what will maintain them through the week, will be idle the other three: But this is by no means the case with the greater part. Workmen, on the contrary, when they are liberally paid by the piece, are very apt to overwork themselves, and to ruin their health and constitution in a few years. Dr. Smith observes, that if masters would always listen to the dictates of reason and humanity, they have frequently occasion rather to moderate than to animate the application of many of their workmen; and it will be found, he says, in every fort of trade, that the man who works moderately, as to be able to work constantly, not only preserves his health the longest, but, in the course of the year, executes the greatest quantity of work.

Although the variations in the price of labour not only do not always correspond with those in the price of provisions, but are frequently opposite, we must not, upon this account, imagine that the price of provisions has no influence upon that of labour. The money price of labour is necessarily regulated by two circumstances: the demand for labour, and the price of the necessaries and conveniences of life. The former determines the quantity of the latter which must be given to the labourer; and the money price of labour is determined by what is requisite for purchasing this quantity. Though the money price of labour, therefore, is sometimes high, where the price of provisions is low, it would be still higher,
higher, the demand continuing the same, if the price of provisions were high. It is because the demand for labour increases in years of sudden and extraordinary plenty, and diminishes in those of sudden and extraordinary scarcity, that the money price of labour sometimes rises in one and sinks in the other. The increase in the wages of labour universally increases the price of many commodities, by increasing that part of it which resolves itself into wages, and so far tends to diminish their consumption both at home and abroad. The same cause, however, which raises the wages of labour, the increase of flock, tends to increase its productive powers, and to make a smaller quantity of labour produce a greater quantity of work. The owner of the flock, which employs a great number of labourers, necessarily endeavours, for his own advantage, to make such a proper division and distribution of employment, that they may be enabled to produce the greatest quantity of work possible. For the same reason, he endeavours to supply them with the best machinery which he or they can think of. There are many commodities, which, in consequence of these improvements, are produced by so much less labour than before, that the increase of its price is more than compensated by the diminution of its quantity.

Labour is distinguished by Dr. Smith into productive and unproductive: the former is that which adds to the value of the subject upon which it is bestowed; the latter is that which has no such effect. Thus, the labour of a manufacturer adds, generally, to the value of the materials upon which he works, that of his own maintenance, and of his master's profit. The labour of a menial servant, on the contrary, adds to the value of nothing. Though the manufacturer has his wages advanced to him by his master, he, in reality, coasts him no expense, the value of these wages being generally restored, together with a profit, in the improved value of the subject upon which his labour is bestowed. But the maintenance of a menial servant never is restored. A man grows rich by employing a multitude of manufacturers; he grows poor by maintaining a multitude of menial servants. The labour of some of the most respectable orders in the society, is, like that of menial servants, unproductive of any value, and does not fix or realize itself in any permanent subject, or vendible commodity, which endures after the labour is past, and for which an equal quantity of labour could afterwards be procured. The sovereign, for example, with all the officers, both of justice and war, who serve under him, the whole army and navy, are unproductive labourers. They are the servants of the public, and are maintained by a part of the annual produce of the industry of other people. Their service, how honourable, how useful, how necessary forever, produces nothing for which an equal quantity of service can afterwards be procured. The protection, security, and defence of the commonwealth, the effect of their labour this year, will not purchase its protection, security, and defence for the year to come. In the same class must be ranked some both of the graved and most important, and some of the most frivolous professions: churchmen, lawyers, physicians, men of letters of all kinds, players, buffoons, musicians, opera-fingers, opera-dancers, &c. like the declamation of the actor, the harangues of the orator, or the tune of the musician, the work of all of them perishes in the very instant of its production. Both productive and unproductive labourers, and those who do not labour at all, are all equally maintained by the annual produce of the land and labour of the country. This produce has certain limits; and according as a smaller or greater proportion of it is in any one year employed in maintaining unproductive hands, the more in the one case and the less in the other will remain for the productive, and the next year's produce will be greater or smaller accordingly; the whole annual produce, if we except the spontaneous productions of the earth, being the effect of productive labour. This produce naturally divides itself into two parts: one of these parts, and frequently the largest, is destined for replacing a capital, or for renewing the provisions, materials, and finished work, which had been withdrawn from a capital; the other for constituting a revenue either to the owner of this capital, as the profit of his flock, or to some other person, as the rent of his land. This is the case with respect both to the produce of land and of a great manufactory. The part of the annual produce of the land and labour of any country, which replaces a capital, never is immediately employed to maintain any but productive hands; it pays the wages of productive labourers only. That which is immediately destined for constituting a revenue either as profit or as rent, may maintain indifferently either productive or unproductive hands. The rent of land and the profits of flock are everywhere where the principal sources from which unproductive hands derive their subsistence. And, therefore, the proportion between the productive and unproductive hands depends very much upon the proportion between that part of the annual produce, which, as soon as it comes from the ground or from the hands of the productive labourer, is destined for replacing a capital, and that which is destined for constituting a revenue, either as rent or as profit. The latter part is not only much greater in rich than in poor countries, but bears a much greater proportion to the whole which is immediately destined for constituting a revenue, either as rent or as profit. The funds destined for the maintenance of productive labour are not only much greater in the former than in the latter, but bear a much greater proportion to those which, though they may be employed to maintain either productive or unproductive hands, have generally a predilection for the latter. The proportion between these different funds necessarily determines in every country the general character of the inhabitants as to industry or idleness. The proportion between capital and revenue influences everywhere where to regulate the proportion between industry and idleness. Wherever capital predominates, industry prevails; wherever revenue, idleness. Every increase or diminution of capital, therefore, naturally tends to increase or diminish the real quantity of industry, the number of productive hands, and consequently the exchangeable value of the annual produce of the land and labour of the country, the real wealth and revenue of all its inhabitants. See on this subject Smith's "Wealth of Nations," p. 606.

Labour, in Middlesex. By the term labour is meant the act of detreading a fetus or child from the uterus; and during the time this process is going on, the woman is said to be in labour. The exertion or efforts used by the woman, or any other animal, in effecting the expulsion of the fetus, are called labour pains, or throes, a Saxon word, meaning suffering or enduring. Labour pains return at intervals of longer or shorter duration. In the commencement of labour, the pains only recur once in an hour or two; but as the labour advances, the return of the pains becomes more frequent; and at length they are almost continual, one pain being scarcely finised when another begins: but in this there is a great variety, not only in different women, but in the same woman in subsequent labours.

The immediate or exciting cause of labour is the existence of a fetus, with its placenta and membranes, in the uterus, now ripe, and fit for expulsion.

Physiologists have in vain attempted to explain why the uterus
uterus should bear the burden of the ovum until the con-
tained fetus has arrived at its maturity, and should then
attempt its expulsion. The mott general and prevailing
opinion has been, that the fetus having acquired sufficient
size and strength, and finding itself pressed upon, and
straightened, it labours to free itself from its confinement, and
that the pains are occasioned by its kicking against the sides
and fundus of the uterus. But as pains equally strong are
excited to expel a dead as a living fetus, or to force away
the placenta after the birth of the child, and as the eggs of
oviparous animals are excluded by similar efforts, it is plain
the fetus is passive in the business.

If the bulk of the fetus was in any way instructive in
occasioning labour, then the period of gestation would vary
according as the fetus happened to be larger or smaller,
which, we know, is not the case; except when it is dis-
turbed by accidental circumstances, as by falls, hurts, fever,
or other diseases. To every animal there is an allotted time
for utero-gestation. This law in the economy of nature is
so uniformly attended to, that even when the fetus is con-
tained in one of the Fallopian tubes, or in a case, in the cavity
of the abdomen, at the end of nine calendar months, the time
appointed for women to carry their young, exertions for its
exclusion are excited, in the same manner as they would
have been if it had been contained in the uterus.

When the fruit is ripe, its connection with the parent tree
is gradually loosened, and at length it falls to the ground.
When the fetus has acquired that degree of maturity it is
intended to attain, in the uteri, the fibres or vessels that
connect the ovum, or bag in which the fetus is contained,
become loosened, and are gradually dissolved or broken;
and the ovum, now an extraneous body, would, like the
fruit, fall or slide through the vagina, if it were not pre-
vented by the straitness of the passage through which it is
to pass. It is for the same reason, viz. that they are be-
comme extraneous bodies, that abortions of two, three, four,
or more months, are excluded soon after they cease to live.

Labours are divided or distinguished by the terms natural,
preternatural, or laborious.

Labours are called natural, when the vertex of the head
of the child presents to the uterine orifice, the face inclining
towards the face, the head-head towards the pubes of
the mother; the size of the head of the child being so adapted
to the pelvis of the mother, that the expulsion of it
may be effectuated solely by the powers of nature, or by the
pains, and within the space of a few hours.

Labours are called preternatural, when any other part
of the child than the head presents to the uterine orifice, as
the feet, the breech, a shoulder, or an arm. In all these cases,
more or less of manual assistance will be required to complete
the birth.

Labours are called laborious or difficult, in which the head
of the child presents, but either in consequence of its
offering in a wrong position, or with an ear, or the face to
the uterine orifice, or on account of its disproportionate size,
or from some diseased or ovum uteri or vagina, or dilatation
of the pelvis of the mother, it cannot be brought safely into
the world, without great difficulty, or without the allowance
of instruments.

Progress and Management of a natural Labour.—Two
or three weeks before the completion of the term of gesta-
tion, the abdomen of the pregnant woman is observed to
fihudge, and become less prominent; there is a secretion
of mucus from the glands of the vagina, and perhaps from
the cervix uteri. This serves to soften and relax the passage,
and to render it more easily dilatable. The uterine links
gradually lower into the pelvis, and the os externum is fre-
quently, from this cause, in a small degree thrust outward.
In some women, slight pains, recurring every three or four
hours, are excited in the course of these periods; and milk
flows from the breasts. These preliminary symptoms occur,
but perhaps in a less degree, in preternatural and laborious,
as well as in natural labours.

The term of gestation being completed, the fundus uteri
begins to contract, and to propel the fetus downwards, by
which the labia of the os internum, called also os tineae, are
fretched, made thin, and at length forced open, at first to the
size only of a pinprick, or so as fearfully to admit the end
of the forefinger of the affiant, if he should happen to ex-
amine the woman at this time. This advance in the labour
is usually announced by the discharge of a thicker mucus
than what had been discharged before, and often tinged with
blood, effused probably by the small vessels which had con-
tributed to connect the membranes to the cervix uteri. This
discharge of mucus tinged with blood is by the woman
called a flow.

Though it may be proper, and is usually expected, that
the accoucheur or midwife should examine into the state of
the uterus, early in labour, by pulling the forefinger of his
right hand, ornamented with hand, into the vagina, in order to
determine what part of the child presents to the os uteri,
in order to repeat the examination every hour or two, to ascertain
the progress of the labour; yet having found it is the head
of the child that presents, and that there is no unnatural
obstacle to the birth, she must be careful to do this in so gentle
a manner as to give no pain to the woman; and he is on no
account to attempt to hasten the dilatation of the os inter-
num, or any part of the passage, that being only safely to
be done by the natural pains.

By the continuance of the uterine contractions, aided by
that of the diaphragm and muscles of the abdomen, the ori-
ifice at the womb becomes more and more thin and dilated,
until it is sufficiently open to admit, during the pains, a
portion of the membranes, filled with the liquor amni, or
fluid in which the fetus is suspended. This bag, which is
gradually enlarged, contributes materially in opening the
uterine orifice, until it becomes sufficiently extended to ad-
mit the vertex of the head of the child, when it usually
bursts, and the contained fluid rushes forth generally with
violence. The women call this the breaking of the waters.
and they expect the birth of the child will soon follow; and
if the bubis has been entirely left to the agency of the
pains, this usually happens in the space of one or two
hours.

After the bursting of the membranes, there is usually a
suspension of the pains for the space of ten or fifteen mi-
utes, when they are again renewed, and the head of the
child is forced down, until it presses against the perineum
and the os externum, or outward orifice. In defending to
this position, the head of the child makes a half turn, to
bring the forehead to the face, the hindhead to the pubes of
the mother. The perineum of the woman be-
comes now so much distended, that the distance from the
edge or frainum of the os externum to the anus amounts to
three inches, or more. The pains now become more strong
and frequent, diminishing and enlarging the os externum,
until it is sufficiently opened to allow a passage for the head
of the child, which is at length forced into the world, when
it is usual to say the head of the child is born. The pains
are now again suspended for the space of ten or fifteen mi-
utes, during which time the fundus uteri gradually con-
tracts, until it comes again into contact with the breech of
the fetus. Two, three, or more pains are required to
expel the shoulders; and as many more to bring the re-

R 2

mainer
minder of the body of the child into the world. The child being born, the woman now enjoys a degree of happiness, of which, if it be her first child, she had never been conscious before. But her trouble is not completely over; for at the end of fifteen, twenty, or a few more minutes, fresh pains arise, but not so violent as those she had before experienced. By the death the placenta is gradually loosened from the uterus, and thrust down into the vagina, and at length expelled from the body.

After the birth of the child, but particularly after that of the placenta, there is a considerable discharge of blood, particularly from the placenta, but, principally, from the uterus. This is called the lochia, and it continues flowing, in greater or less plenty, for five, six, or more days; diminishing every day in quantity, and becoming thinner and paler, and is at length colostrum. This is occasioned by the gradual contraction of the vessels of the uterus, which continues until that which is reduced to nearly the size it was before the woman conceived.

With first children, and, in a few instances, with subsequent births, this contraction of the uterus goes on almost imperceptibly to the woman, more ordinarily pains are excited, similar to labour pains, and are called after-pains. As they are not attended with danger, and generally subside, and entirely cease by the end of three or four days, it is not often found necessary to attempt opposing them by medicines; but when they are unusually frequent and violent, preventing sleep, they may be quieted by opening the bowels with some purging medicine, as calomel, an infusion of fenn, with some of the neutral salts, or by an emollient and opening clyster, and at night giving a draught with ten, fifteen, or twenty drops of the tincture of opium.

The above is the usual progress of a natural labour, but there is a great variety in the number, strength, and frequency of the pains required for the expulsion of the child in different women, as well as in the time taken in completing the labour, which in some women is effected in a few minutes, and with very little pain; more ordinarily, it takes from two to six, eight, or ten hours. In some cases, when the pains are tardy, the term may be extended to twenty-four hours. If delayed beyond that time, the labour will be denounced laborious or difficult, as some affluence will be required to hasten the birth, lest the soft parts of the mother should be hurt, or the strength of the child exhausted, by its too long continuance in a strained condition.

During the progress of the labour, the woman is to be allowed to be sitting, walking, or lying down, as she feels herself most disposed. The friends about her, and perhaps the nurse, generally advise her to hold in her breath, and to press down as strongly as she can with every pain, and to enable her to do this, they are incessant in offering her caudle, or other heating drinks. But these things are not only unnecessary, but likely to do mischief. The accoucheur or midwife will therefore interpose his advice. They must take care to keep the room cool, and not permit more than one or two of the friends of the woman to be in the room together. They may affright the parturient woman, that the pains are of themselves sufficient for the expulsion of the child, and that by endeavouring to increase their force, she will only unnecessarily fatigue herself; and that by taking warm spiced drinks, she will become hot and feverish, the parts will become more irritable and tender to the touch, whence she will indeed suffer more pain, but the birth of the child, instead of being accelerated, will be retarded, and rendered more difficult.

To allay her thirst, if that should be troublesome, toasts and water, barm-tea, or any similar beverage, will be much more useful than wine or other heating drinks.

If she is colicive, and feels uneasiness from that cause, an emollient and gently opening clyster may be advantageously administered. When the pains become more strong and frequent, and from the complaints of the woman it is apparent that the head of the child is felt descending, it will then be proper that the woman be laid on the bed, either on one side or at the foot of it, according as the nurse has arranged it. The usual and most convenient posture for the woman is, that of lying on her left side, her head and shoulders raised, her knees drawn up to her belly, and with her feet supported on the knees of an attendant, or pressing against the bed-post. She is now to be covered with such a portion of the bed-clothes, as the season of the year, or the temperature of the air, may seem to render necessary. The accoucheur will sit down behind her, and taking advantage of a pain, he will introduce his fore-finger into the os externum, which, if the labour is as far advanced as has been supposed, he will find on the full stretch, and the perineum much dilated. This is the only part in which the attendant need or ought to give any manual assistance in a natural labour. It will now be his duty to endeavour, with the greatest care and diligence, to prevent a rupture of the frenum, and of the perineum, which may happen if the head of the child should be allowed to pass into the world with too much rapidity. This deterring accident, which, when the rupture is considerable, extending to the anus, is hardly remediable by any art, rarely happens but with a first child, nor often perhaps with first children, but when means have been used, early in labour, to accelerate the birth. With the view of preventing it, if, on examination, the os externum and the perineum shall be found to be strongly pressed upon, and diffused during the pains, and yielding with difficulty, the accoucheur must seriously admonish the woman to moderate her exertions, affuring her, at the same time, that the child will speedily be born. During the pains he must surround the part of the head of the child which protrudes, or is in the world, with the fingers and thumb of his right hand, the points of them reposing on the edge of the os externum. In this position, the end of his thumb will touch the frenum, the part likely to give way first. If he finds that part too much diffused as to be in danger of burrowing, he will refill the further depths of the head during the pain. This operation will be assisted, by keeping his left hand, covered with a cloth, firmly pressed upon the diffused perineum. When one-half of the head of the child has, by this cautious procedure, been conducted into the world, the accoucheur will find the occiput of the child rising upwards, turning on the pubes of the woman, and drawing the forehead and face from under the perineum. The head of the child being born, it is usual with midwives to draw the shoulders and the rest of the body soon after. But experience has shown, that it is safer and better to wait for the return of the pains, as during the suspension of them, which lasts, as has been before mentioned, fifteen or twenty minutes, the fundus of the uterus contracts and defecst until it comes again in contact with the breech of the child. By this means the sinuies and vessels of the uterus are gradually emptied, and diminished in size, whence one of the causes of inordinate haemorrhage is removed, at the same time the placenta is loosed and prepared for its exit. The first two or three pains occurring after the birth of the head of the child, are usually expended in giving a favourable turn to the shoulders, viz. in bringing one of them to the pubes, and one to the farum of the mother; they are then gradually forced into the world, and soon after the rest of the body
the accoucheur using the same precautions in supporting the perineum, as has been recommended during the paffage of the head.

The child usually announces its birth, by crying more or less violently according to its strength. This serves to open the vessels, and to facilitate the circulation of the blood through the umb. The child may be allowed to lie some minutes under the clothes, before separating it from the placenta, taking care that none of the clothes lie upon its face, which might impede its respiration. In that interval the af- filiant will lay his hand upon the abdomen of the mother, which, if there should be another child, he will find nearly as much distended as it was in the commencement of the labour. In that case, it will be necessary, having previoufly disposed of the first child, that he make a ligature on the end of the funis, which hangs out of the vagina of the woman, but he is on no account to make any effort to bring away the placenta or membranes, which are usually found to be adherent to those containing the twin. As soon as the pains re-commence, which they usually do at the end of three or four hours, (though sometimes they do not return until fix, eight, ten, or more hours,) the accoucheur will pass the forefinger of the right hand into the os uteni, to discover the position of the fetus. If the head presents, he will conduct the labour in the manner above described, but as the parts have been previously completely opened, there will be less difficulty to the woman, and less danger of any accident happening to the perineum. If the face, or any other part than the head of the child should present, it will be necessary that he immediately proceed to turn the child, and deliver it by the feet, in the manner to be described under the article LABOUR, Prenatal.

If there should not be a second child, the abdomen, particularly the upper part of it, will be found loofe and flaccid, and the accoucheur will perceive the fundus uteri contracted to the size of the head of a child.

The more the uterus is contracted, and the lower it is sunk down in the abdomen, with so much the greater care and safety the placenta will be expelled. The affilant will now make a ligature upon the funis umbilicalis, or navel-strong, about five inches from its insertion into the navel of the child, and having done this he will, with a sharp pair of scissors, divide the navel-strong, about an inch beyond the ligature, leaving the other end of the funis hanging out of the vagina. Having then examined the child to see that it is perfect, and that no blood escapes through the ligature or the funis, he will place it in a proper receiver (a flannel cap being first put upon its head) and deliver it to the nurse. By this time, or soon after, the woman will have a bearing pain, pressing down the placenta, or perhaps, at first, only forcing away a clot of blood. During this and subsequent pains, the affilant will aid their effect, by drawing down the funis. If, after waiting twenty or thirty minutes, the placenta should not come away, he will pass his fingers, or, if necessary, his hand, into the vagina, until he gets hold of the placenta, and by this means he will usually easily extract it. It sometimes happens, though rarely, if the labour has been properly conducted, that the cervix of the uterus contracts, and prevents the descent of the placenta, and sometimes the placenta continues adherent to one side, or to the fundus of the uterus, long after the birth of the child. In either case, the accoucheur must pass one of his hands, gradually and slowly up into the uterus, until it reaches the placenta, when the fingers, and by degrees the whole hand, must be immuated between the placenta and the uterus, until it be completely separated; it must then be brought down to the vagina, whence it will be easily extracted by the funis.

In this case the discharge of blood will be sometimes so great, as to endanger the life of the woman. This accident rarely happens but when the birth has been improperly and preposterously accelerated, by giving assistance, as it is called, in the early part of the labour; that is, by dilating the os internum and vagina during the pains, to make room for the head of the child to come down; by giving the woman hot and stimulating drinks to increase the pains, and by advising her to beat down strongly during the pains. As the uterus may from exhaustion have become torpid, and not disposed to contract, so as to lessen the capacity or size of the blood-vessels, large flannels wrung out of cold water, to which about a fourth part of vinegar has been added, should be laid over the abdomen, and over the os externum of the woman. These applications must be renewed every five or six minutes, or as often as they become warm, and they will usuallv have the effect of exciting the action of the fibres of the uterus, on which the cure entirely depends. In the mean while the woman is to be kept, if practicable, in a quiet and easy posture, her head only moderately raised, and covered with a flannel blanket, the door, or one of the windows of the room being opened. and every five or six minutes she should take a few or two of a mixture, containing of fix ounces of distilled water, half an ounce of spirit of nutmegs, as much syrup of red poppies, fifteen drops of the tincture of opium, and as much of the vitriolic acid as will make it grateful to the palate. By these means the heat of the body will be diminished, and the rapidity of the circulation checked. When the pulse, which was usually to be perceived while the discharge was violent, begins to acquire strength, and on examination it appears that little or no blood now flows from the vagina, the cold and wet clothes may be removed, the proper clothes may be put upon the woman, and the may then be placed in the bed in such a position as may be most agreeable to herself.

The proofs by which a child is produced, or brought into the world, is with great propriety called labour, as it is rarely effected without considerable exertion, which has the usual effect, that of exhausting the strength and spirits of the woman. These are to be recruited in the same manner as if the wafe had been occaioned by any other kind of exercise; viz. by rest, and by taking a moderate portion of plain and simple food at small intervals. In the choice of their food, the women may generally be allowed to consult their own tastes, which will rarely, at such times, incline them to spiced meats, or to drinks that are heating. It will be proper that they be kept in a recumbent posture for the first four or five days, only leaving their beds so long as may be sufficient to open and refresh them. By that time the vessels of the uterus will be so much contracted, as to remove all danger of hemorrhage, or of an inconvenient defecf of that viscus, which is sometimes the consequence of leaving the bed too early. It is proper also, on the second, or at the latest, on the third day after being delivered, to procure floods, either by such purging medicines as have been before described, or by giving a clyster. By this means the fever which is usually excited by the secretion of the milk will be moderated. This, which is called the milk-fever, is of short duration, lasting only three or four days, and is not attended with danger. In the cure nothing is required, but to keep the body open, and to supply the patient with diluting drinks, taken warm, with the view of inducing a gentle peristaltic. The child should be put to the breasts a few hours after the completion of the labour, that it may get some mouthfuls of the thin, whey-like fluid which is at first secreted. This will stimulate its bowels, and enable them to discharge the meconium, or black bilic.

mit the head of the child, the membranes may be opened, by
rattling them with the nail of the fore-finger, that the
waters may be discharged. This will enable the uterus to
contract, and press the placenta against the head or body
of the child, and so stop the further effusion of blood.
The completion of the labour may now be effected by the pains,
as in common cases. The placenta being in part detached,
usually comes down soon after the birth of the child. If,
however, it should be delayed, and the discharge of blood
continue, it may be brought away in the manner before de-
scribed. But when the discharge of blood is so considerable
as to endanger the life of the woman, (and this will be the
case when the placenta is placed near to, or, as it sometimes
happens, part of it is detached over the os uteri,) the
labour must now be completed, in the manner
described in the last article.

It sometimes happens, that, on the burling of the mem-
branes, the funis umbilicalis or navel-string falls down into
the vagina, before the head or other part of the child that
prevents. In this case, it has been usual to recommend that
the prolapsed funis be folded in a piece of soft linen, and
returned into the uterus: but experience has shown, that
however carefully this be done, it constantly returns in a
few minutes. If the accoucheur should be present at the
time of the rupture of the membranes, or soon after, and
find a pullation in the navel-string,—a sure sign that the child
is living, he will then, in whatever posture the child may
have happened to present, treat it as a preternatural birth; that
is, he will pass his hand into the uterus, and turn the child,
and bring it by its feet: for if the bulae be left to nature,
the pressure on the funis will put a stop to the circulation
of the blood, and the child will die long before it would be
expelled by the pains.

In some irritable constitutions, the women become con-
vulsed in the course of the labour. This accident more fre-
quently occurs with first than with subsequent children. At
whatever time convulsions make their attack, they never com-
pletely leave the woman until the labour is over, and some-
times not until the next or subsequent day. In very mild
cases, the brain is not much affected by the convulsions,
which partake of the nature of hysterical complaints. These
cases are easily curable, or give way spontaneously when the
labour is completed. More commonly the convulsions are
attended with coma, and other affections, indicating oppre-
sion on the brain. These are of more difficult management,
and often prove fatal even under the most cautious and judi-
cious treatment. Of whatever nature, or from whatever
causes puerperal convulsions may proceed, they slight very
much in forcing down the child.

At whatever period or state of the labour the accoucheur
may be called in, he will generally find it expedient to take
away fix, eight, ten, or twelve ounces of blood from the
arm; and in the space of two hours after, (unless the child
is coming into the world,) this should be followed by a
clyster to empty the bowels. After the operation of the
clyster, from twenty to thirty drops of the tincture of opium
may be advantageously given, which will generally succeed
in making the fits less frequent and violent. The labour
must now be conducted in the same manner it would have
been, if it had not been interrupted by the convulsions. If
the child presents in a natural posture, and the pelvis of the
woman is of the natural form and dimensions, it will be
found that the convulsions have assisted much in dilating the
os internum, and in accelerating the completion of the labour.
If any other part than the head of the child presents, as
soon as the internal orifice is sufficiently dilated, the ac-
coucheur will pass his hand into the uterus, and turn the
child, and bring it by its feet. If, on the other hand, the
birth of the child should be retarded, rendered difficult, or
impossible, without the aid of instruments, from dilatation
of the bones of the pelvis, the accoucheur will use the lever,
forceps, or crutchet, whichever shall be required, in
the manner directed under the article LABOUR, difficul.
the uterus has contracted so as to come into contact with, and
strictly to embrace the body of the child, yet, even in
these cases, if the pelvis of the woman is of the proper form
and dimensions, and the child is not disproportionately large,
by proceeding slowly and cautiously in the manner about to
be described, the resistance of the uterus may be overcome,
and the delivery effected with perfect safety to the mother
and child.

Method of turning a Child in the Uterus, in preternatural
Labour, and bringing it by the Feet.—The woman being
laid across the bed, on her left side, with her knees drawn
up to her belly, a woman sitting on the side of the bed, to
hold her feet, and keep her steady, the accoucheur must in-
troduce, first one, then a second, third, and fourth finger of
either of his hands, anointed with hog's lard, into the vagina,
which he will gradually dilate, so as to make room for his
whole hand, with which he will still further dilate the pa-
fage. Then, pausing a little while, until the straining,
up the part of the woman, which the introduction of his hand
will have occasioned, shall have subsided, he must again push
his hand gently upwards, until it has passed the brim of the
pelvis and entered the uterus; then, again pausing until the
woman ceases to strain down, he must again push his hand
upwards in the intervals between the pains or strainings of
the woman, until he reaches one or both of the feet of the
child, at which time the whole of his arm nearly, to the
elbow, will be in the passage.

When the resistance of the uterus has been very great, it
sometimes happens that the hand of the operator is so
cramped and benumbed, that he has no power to grasp and
bring down the feet of the child. In that case, he must slowly
and gradually withdraw his hand, and wait some minutes
until he has recruited his strength, and the woman is a little
refreshed, and then re-introduce the same, or his other hand,
with whichever he thinks (from the knowledge he has now
acquired of the position of the child in the uterus) he shall
be best able to complete the delivery. This re-introduction
of his hand he will be able to effect much more easily than
before, the uterus being somewhat stretched and loosened
by his former effort. He will now sedulously endeavour to
get hold of, and bring down, both the feet of the child;
but if that is absolutely impracticable, he must be contented
with one of them, which he will bring down slowly, and by
intervals, as he had introduced his hand. It will sometimes
happen that the operator will not be able in this way to
bring the foot into the world, the contraction of the utero-
sus around the body of the child being so considerable, as
to prevent its turning by any effort he can make in this
way. He must then withdraw his hand, and, after recruit-
ing his strength, return it again into the vagina, with a nooafe
or fillet over it, until he has got hold of the foot of the child,
and then, with the fingers of his other hand, push up the
nooafe until it paffes the ankle of the child, by which means
he will have a double purchase; then drawing down with
the end of the fillet that hangs out of the vagina with one
hand, and with the other grasping and pulling down the
foot, he will usually, in a few minutes, succeed in bringing
the leg of the child through the external orifice.

The operator may now again pass his hand up into the
uterus to search for the other foot of the child, and bring it
also down; or, not succeeding in this attempt, he will wrap
the leg that is in the world in a soft cloth, and draw it down-
ward steadily with both his hands, and with sufficient force
to bring the breech of the child into the vagina. He will
now pause a few minutes, both to allow the woman to recover
her strength and spirits, and to give time for the uterus to
contract, and come again in contact with the head and
trunk of the child; then, renewing his efforts, he will con-
tinue drawing down the thigh, until the breech has freed
the external orifice. He must now examine the posture of
the child, and if the fore-part of the child lays to the pubes
of the mother, he will turn it round to the facrum; then
taking hold of the breech with both his hands, he will con-
tinue drawing downward steadily, at the same time moving
it from side to side, until the whole of the body is born; he
will then pass a finger first along one, and then the other
arm of the child, to the joints of the elbows, and draw them
down, and if the child be now living, which may be known
by a pulsation being felt in the navel-string, he will halten
the birth, drawing down steadily and strongly by the shoul-
ders. If he finds much resistance, with a view of ac-
celerating the birth of the child, he must pass the fore-finger
of his left-hand along the back part of the vagina to the
mouth of the child, and draw down the under-jaw, at the
same time that he extracts by the shoulors with his right-
hand. The child being born, he will complete the delivery,
in the manner directed under the article Labour, Natural.

Some writers and teachers of midwifery are very particular
in prescribing the posture in which the woman should be
placed as most convenient for the operator in turning a
child, which they think should vary according to the posi-
tion of the child in the uterus, as whether the face or fore-
parts of the child be turned to the back, belly, or one of the
sides of the mother; they also, from the same circumstances,
determine which hand will be most proper for the accoucheur
to use in performing the operation. But as the exact posi-
tion of the child can rarely or never be known until the
operator has actually introduced his hand into the uterus,
there seems no necessity for embarrassing him with regula-
tions of this kind. The most convenient posture will gene-
 rally be found to be that in which women are usually placed
in a natural labour, and, as has been now described, viz.,
ying on her left side, with her knees drawn up towards her
belly, her feet in the lap of an attendant. In respect to
which hand the operator should use, he will be guided by
circumstances, or by his habit or custom; most perfons using
one of their hands more dextrously than the other. The
most important rule is, that the whole operation be performed
slowly and gradually. Other writers have advised that we
by no means attempt to turn a child in the uterus, fo long
as the woman continues to have pains, lest the uterus should
be ruptured. But as, at every pain, the uterus contracts,
becomes thicker, embraces the body of the child closer, as
well as throtls the presenting part lower into the pelvis, it
is evident that by waiting the difficulty of performing the
operation will be increased. It will be sufficient, in addi-
tion to what has been said of the necessity of proceeding
slowly and leisurely, to warn the operator only to push his
hand on in the intervals of the pains.

It was supposed, by the early practitioners of midwifery,
that when an arm of the child presented, and became con-
ciderably swelled, which it always is, when it has con-
tinued long in the vagina, that it fo filled up the passage,
as to add very much to the difficulty of passing a hand into
the uterus, and sometimes even rendered it impossible to be
done, until the arm was removed; and, accordingly, it was pretty
much the practice in the beginning of the last century, first
to attempt returning the arm into the uterus, but as that
was rarely or never practicable, it was usual in these cases
to make an incision through the integuments, under the
arm-pits of the child, with a pair of scissors, or a scalpel,
and then twist off the limb; and in this mutilated state
the children were sometimes born alive. This practice has long
since been abolished; experience having shewn, that the
obstacle
LABOUR.

obstacle opposed by the tumult arm is very inconsiderable, only affecting the first part of the operation, and by perseverance is easily overcome.

We have been lately told, by a practitioner of eminence, that when an arm or shoulder presents, and, by the continuance of the pains, has been thrufb so low into the pelvis, that it is absolutely impracticable to turn the child (where the pelvis of the mother is too narrow to admit the hand of the operator, we presume the writer means), that by passing a blunt hook over the neck of the child, and drawing down strongly to separate the vertex of the neck, and then twirling the hook round, the integuments of the neck will break, and the head be delivered from the body, which may afterwards be drawn away with the crotchet. From the facility with which this operation is said to be performed, it is to be feared, that perfons of less skill and vagacity than the writer here alluded to, may be tempted to try the experiment on children supposed to be dead, but which are not so, or when there is insufficient room in the pelvis to bring away the child without mutilating it, and thus some lives be lost that might otherwise be preferred. This operation, therefore, should never be performed but in consultation.

It has in a few cases happened, when an arm or shoulder presents and enters first into the pelvis, and the woman has been neglected, or the assistant, not being called in, was not able to turn the child, that by the continuance of the uterine constrictions, of pains, the breech has been gradually forced down, the head and shoulders receding and mounting upwards, and in this posture, viz. breech foremost, the child has been expelled. This turning of the child in the uterus, by the sole agency of the pains, has been called by Dr. Denman the spontaneous evolution of the fetus, and it has sometimes happened, we are told, that the child has, in this way, come into the world alive. It is well, as Dr. Denman justly observes, to know these facts, as in some extreme cases it may afford consolation both to the patient and the attendant; but the existence of the uterus must be very great indeed to induce a practitioner, who regards either his fame or his feelings, to trull to such an event, as in a great majority of cases the child would be lost, and not uncommonly the woman would lose her life also.

It sometimes also happens, in cases where the arm, shoulder, or breast of the child presents, and the expulsion of it has been left entirely to the pains, that at the end of many hours, or of two or three days continued labour, the child becomes soft and putrid, and instead of making the evolution described, is thrust down through the pelvis, and into the world doubled, the head lying on the breast or back, and yet the woman has survived.

This, however, is rather to be expected in premature births, that is, when the woman is only advanced five, six, or seven months in pregnancy. At these periods, particularly at the two first, it will generally be right to let the fetus come into the world in whatever posture it may present; as both the limbs of the fetus are then too tender to bear any considerable degree of force or extension, and the capacity of the uterus is too great to admit the introduction of the hand of the operator to turn the fetus, and deliver it by the feet.

Labour of the third and last class are those which are called difficult or laborious. These vary much in degree, according as the cauces vary. When the difficulty is solely occasioned by a mal--preparation of the head of the child, as when it offers by its face, or by one ear, the head will be frequently forced down in that posture by the pains, and very little more affittance will be necessary than what is given in natural labours, from which it will only differ by its requiring a greater number of pains, and taking up a longer space of time for its completion. The same will happen when the birth is retarded by a disproportion between the head of the child and the pelvis through which it is to pass; that is, when a woman whose pelvis is small, but perfectly in its form, produces a large child, or when the head of the child is more than usually displaced. By the continued force of the pains, the bones of the heads of the generality of children, which do not ordinarily meet, or come in contact with each other, will be pressed together until they ride, or lap over one another, and sometimes until the head assumes a conical form, the vertex being the apex or point of the cone, and in this state it will come into the world. The midwives are accustomed to call the heads of children that have been so pressed, and altered in shape, moulded heads, or hufc-thoo moulds, and are busy, when delivering the children, in forcing the bones back into their places. But this is not necessary, the heads never failing, in time, to assume their proper figure. Children who have been subjected to such a degree of pressure as to occasion an alteration in the shape of the skull, should they be born alive, will generally be found to be so much weakened by the injury they have suffered, as not to be preferred without great care and difficulty.

It has here been supposed, that the expulsion of the head of the child has been left, as in natural labours, to the power of the pains, which will generally be sufficient for the purpose; but this will not happen, in some cases, until by the long detention of the head of the child in the passages, the soft parts of the woman shall be bruised and injured, by the pressure they have suffered, that suppuration or mortification of the vagina shall extend, penetrating into the bladder, or rectum, and sometimes into both, making the vagina the common channel for the urine and the fowels. To avoid these disfiguring accidents, which, when they occur, admit no remedy, or are only in a small degree allsiated by time, various contrivances have been invented to bring away the head of the child, when it is enclaved, or fixed in the pelvis, earlier than it would be forced away by the pains.

Those which have been preferred, and which are now almost universally used, are the forceps, the invention of Dr. Hugh Chamberlen, and the lever of Ronohuyfen, (see the articles FORCEPS and LEVER,) the time and manner of using which will now be described.

In all cases requiring the affittance of instruments to complete the delivery, the progress of the labour will be found, from its commencement, to be slower than in those labours which are denominated natural. The observation of this circumstance will induce the practitioner to be careful that the woman be kept cool, and that no efforts be used to accelerate or strengthen the pains; that she be encouraged from time to time to void her urine; that her bowels be kept open by chylers, or by giving her a gently purging medicine, and that ten or twelve drops of the tincture of opium be given at night to procure sleep. By these means, (which must be pursued the second day also if necessary,) her strength will be preserved, and she will be enabled to meet the difficulties she will have to encounter. Before the end of the second day, she will generally find that the os uteri is completely dilated, that the basins, or largest part of the head of the child, has been forced into the brim of the pelvis, and that the membranes have burst, and that the greater part of the waters has been discharged. At this period, as if nature was tired with the conflict, the pains of delivery, both in frequency and strength; it now, therefore, becomes necessary to watch over the safety of the woman, and if, at the end of two or three
three hours, the head continues still unmoved, to proceed, (having previously informed the woman and her friends of your intention,) to the use of the proper means for expediting the delivery.

*Manner of using the Forceps.*—Having laid the woman on the bed, in the usual position, the accoucheur will sit down behind her, and introduce two or three fingers of his right hand into the vagina, and continue pushing them gently upwards, until he feels an ear of the child, which will generally be found under, or near, the os pubis; he will then take a blade of the forceps, previously moistened with lard, and introduce it between his fingers, and the head of the child, continuing to push it upwards until it pats over the ear, and so on until the whole of the blade is in the vagina; he will then withdraw his fingers, and raise the handle of the forceps towards the pubes of the woman, while he introduces the second blade in the same cautious manner, directly opposite to the first. He will then bring the handles together, and lock them, and that they may not slip, he will confine the handles together with a handkerchief, or any appropriate ligature.

It generally happens, that the forceps used in applying the forceps gives fresh strength to the pains. During each pain the accoucheur will slowly, and gradually, draw the handles of the forceps downwards, with his right hand, moving them, at the same time, from side to side, keeping his left hand against the perineum of the woman, which he will, through the whole process, carefully guard, to prevent, if possible, its being ruptured, an accident more likely to occur in first, than in subsequent labours. Having in this cautious manner extracted the head of the child, the remainder of the delivery will be conducted as directed under the article LABOUR, Natural.

Many practitioners in these cases prefer the use of the lever, which may be considered as a blade of the forceps, and is to be introduced into the vagina between the fingers of the accoucheur and the head of the child, as before directed, and pushed on until it pats over the ear of the child, that lies under or near the pubes of the mother. The accoucheur will then withdraw his fingers from the vagina, and grasping the handle of the lever with his right hand, he will, during every pain, raise it over the pubes, guarding the perineum with his left hand, and continue this movement from time to time, until the head of the child is brought into the world. The plain and simple form of this instrument, and the greater facility with which it is used, have given it a deserved preference over the forceps. For a fuller account of the manner of using the forceps and lever, and for an account of their comparative merit, the reader is referred to Dr. Denman’s valuable Introduction to the Practice of Midwifery, and for the history of the invention of the instruments, to Dr. Bland’s Account of the Invention and Use of the Lever of Roonhuyzen, published in the second volume of Medical Communications, in the year 1790. It is proper to observe, that in all cases in which it becomes necessary to have recourse to the use of instruments to finish the delivery of the child, and, in fact, in all lingering labours, the operator should pay particular attention to the state of the urinary bladder, and if the urine has been suppressed, he must draw it off with a catheter, before he begins to operate.

In the cases that have been described, where the labour has been retarded, and rendered difficult by the causes above enumerated, the methods recommended will generally be found to be competent to bringing it to a conclusion, without occasioning much injury to the mother or to the child. But when the obstacle arises from distortion of the bones of the pelvis of the mother, altering the shape of the pelvis, and diminishing its capacity, means must then be used to lessen the volume or bulk of the head of the child, otherwise both the mother and child must inevitably perish. The persons in whom this defect in the pelvis is found, are usually short and delicate women, whose growth has been checked in infancy by the rickets, or who had been confined too rigidly in their youth, to a sedentary posture, in order to acquire a proficiency in music, drawing, or some other accomplishment, and had thence been prevented taking that portion of exercise in the open air, which is necessary for the growth and strength, as well as for the health of the body.

When called upon to attend a person labouring under this infirmity, the accoucheur will find, on examining, the lower vertebrae of the loins, and the upper portion of the facrum, projecting forward, so as to prevent the head of the child from entering the brim of the pelvis, and the offia ilium, which form the sides of that cavity, approaching too near to each other, thus straightening the capacity of the pelvis, and changing its form from an oval to a triangular figure. On his discovering this arrangement, it will be his duty to inform the friend to the woman of the manner in which he proposes to conduct the labour, and of the necessity he believes there will be of opening the head of the child, in order to preserve the life of the mother. To the parturient woman he will only say, that the labour will be slow and tedious, that it will be necessary that she avoid all heating drinks, and that she manage her strength and her spirits in the best manner she is able. The bowels must be kept fits and open by calyters, the urine must be drawn off, if suppressed, with the catheter, and an opiate given at night, as in ordinary cases of difficult labour. At the end of the second or third day, according as the pains have been more or less severe, and frequent, the water being nearly all of it drained off, and the uterus contracted so as to be in contact with the body of the child, a small portion of the vertex, or presenting part of the head, or perhaps only of the tumid scalp, will be found to be thrust through the brim of the pelvis. As no further assistance can be expected from the pains, which now would only tend to exhaust the strength of the woman, and to excite such a degree of heat and fever, as might not afterwards be extinguished, it will be necessary to proceed to opening the head of the child, and in that manner complete the delivery. The woman being laid on the bed in the manner before described, and the accoucheur placed behind her, he will introduce two or three fingers of his left hand into the vagina, and pafs them upwards until they touch the protruded part of the head of the child, and endeavour to find the fontanelle, or the part where the parietal bones meet; he will then, with his right hand, slide the perforator up into the vagina, which will be guided by his fingers to the place, which it will readily enter, and having, by opening them in various directions, made an aperture into the skull sufficiently large, he will withdraw the perforator, and also the fingers of his left hand, both to give a relief to the woman, and to allow the pains to force a larger portion of the skull, now yielding more easily to the pressure, through the brim of the pelvis. At the end of two or three hours he will re-commence the operation, and will pafs his left hand, or as much of it as he can, into the vagina, and introduce one or two of his fingers into the aperture of the skull of the child; this will serve as a guide to the crotchet, which he will now use. Having further broken the texture of the brain with the crotchet, he will move it about within the cranium, until he finds it firmly fixed, when he will begin to draw downwards, and continue this action at intervals, until he finds he has brought the whole of the head of the child into the vagina. It is useful
to keep the left hand, or two or three fingers of it, in the
pajjage, that if the crotchets should slip, they may prevent
any injury being done to the vagina. Having paused again,
for the space of an hour, to give the uterus opportunity of
contracting, he will easily bring the head of the child, now
emptied of its contents, into the world, and the remainder of
the labour will be conducted as in ordinary cases.

In labours of this clafs, that is, in difficult labours, as the
progres of them is always slow, giving opportunity to the
uterus to contract, the expulsion of the placenta is usually
performed sooner, and more easily, than in natural labours.

LABOURED ACCOMPANIMENT. See ACCOMPANIMENT.

LABOURER, in Agriculture, a person who performs
the manual or most laborious part of the business of a farm.
Labourers are mostly such persons as live in cottages, or
small houses in the vicinity of the farms, or in the houses of
the farmers themselves.

The author of Modern Agriculture, after premising that
in all civilized nations, the great body of the people live by
labour; and that, of whatever nature it may be, the wages
received must be more than sufficient to maintain the la-
bourer, as, were it otherwise, he could not bring up his
family, and consequently these clafs of men would soon be-
come extinct; observes, that in every county or district,
where the useful arts are in a flourishing state, and where
those employed in carrying them on are most successful in
accumulating riches, the rate of wages, or price of labour,
is highest. Luxury is a never-failing attendant on riches,
and the number of servants always increases with the means
of maintaining them. Therefore an increasing demand for
servants or labourers, whether for carrying on agriculture,
the purposes of trade, or for administering to the artificial
wants created by luxury, naturally tends to advance the price
of labour. The very great recent advance in the rate of
wages in some counties in Scotland, as Lanark, Renfrew,
Perth, Angus, Fife, &c. amounts, it is supposèd, to the
most positive evidence, that commerce, manufactures, and
improvements in agriculture have rapidly increased. The
still low price of labour in the counties of Caernarvon, Pem-
broke, Cardigan, &c. in Wales; and Nairn, Inverness, and
the other northern counties of Scotland, notwithstanding the
great emigrations of labourers to those parts of the island,
where they are more certain of finding employment, is a fu-
tn sign that in those remote districts the arts have fearedly ever
been introduced. It flows also, that little attention is
bestowed by the proprietors to improve the situation of the
peafantry, either by inuring them to habits of industry, or
instructing them in the advantages to be derived from a
proper division of labour. In those counties where the arts
have been introduced, and where the rate of labour has con-
tinued for a number of years nearly the same, it will be found
that agriculture, commerce, and manufactures, although
perhaps formerly in a prosperous state, are at present flax-
ary, and that a national exertion is necessary, in order to set
them again in motion.

And further, that the wages of farm-servants, and of
labourers, who are occasionally engaged in the operations of
husbandry, vary nearly as much in the different districts of
Great Britain, as they do in the several kingdoms of
Europe. In the counties in England, where commerce and
manufactures are carried on to the greatest extent, as Mid-
dlesex, Surrey, Kent, Lancashire, Cheshire, the west-riding
of Yorkshire, &c. the wages of farm-servants and day
labourers may, it is conceived, be stated as follows:

<table>
<thead>
<tr>
<th>Wages</th>
<th>Average</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>£  s. d.</td>
</tr>
<tr>
<td>A ploughman by the year, from 7l. to 12l.</td>
<td>12 0 0</td>
</tr>
<tr>
<td>A female servant, do. from 4l. to 6l.</td>
<td>5 0 0</td>
</tr>
<tr>
<td>A labourer in the summer, from 1s. 6d. to 2s.</td>
<td>0 1 9</td>
</tr>
<tr>
<td>A labourer in winter, without board, from 1s. to 1s. 2d.</td>
<td>0 1 1</td>
</tr>
<tr>
<td>A mason ditto, from 1s. 10d. to 2s. 2d.</td>
<td>0 2 0</td>
</tr>
<tr>
<td>A carpenter ditto, from 1s. 8d. to 2s. 4d.</td>
<td>0 2 0</td>
</tr>
</tbody>
</table>

Where agriculture is the chief employment of the people,
as in Hertford, Buckingham, Rutland, Northampton, Wor-
cester, Northumberland, &c.

A ploughman's wages may be stated from 7l. to 12l.

A female servant, from 4l. 10s. to 6l.

A labourer in summer, without board, from 1s. 4d. to 1s. 8d.

Ditto in winter, ditto, from 1s. to 1s. 2d.

A mason, ditto, from 1s. 10d. to 2s. 2d.

A carpenter, ditto, from 1s. 8d. to 2s. 4d.

In those counties in Wales, where improved modes of hus-
bandry are little practised, and where there are scarcely any
commerce or manufactures,

A ploughman's wages are from 4l. to 10s.

to 7l. | 5 1 0 |

A female servant, from 4l. 10s. to 6l. 4s.

A day-labourer in summer, without board,
from 8d. to 1s.

Ditto, in winter, ditto, from 6d. to 8d.

A mason, ditto, from 1s. 6d. to 2s.

A carpenter, ditto, from 1s. 4d. to 1s. 8d.

It has been observed, that the rate of wages has advanced
very rapidly of late years, in many counties in Scotland. In
that part of the kingdom south of the Grampian mountains,
the rise in the price of labour has, he says, been general,
and is now nearly double what it was twenty years ago.

In the northern divisions of the kingdom, where there is
little commerce or manufactures, and where improvements
in agriculture are only partially introduced,

A ploughman's wages is from 7l. to 12l.

A female servant, from 3l. to 4l. 1os.

A day labourer, in summer, without board,
from 1s. 2d. to 1s. 6d.

Ditto in winter, ditto, from 10d. to 1s. 2d.

A mason, ditto, from 1s. 6d. to 2s. 4d.

A carpenter, ditto, from 1s. 4d. to 2s.

In the northern divisions of the kingdom, where there is
little commerce or manufactures, and where improvements
in agriculture are only partially introduced,

A ploughman receives from 3l. to 6l.

A female servant, from 2l. 2s. to 3l. 14s.

A day labourer, in summer, without board,
from 8d. to 1s.

Ditto, in winter, ditto, from 6d. to 8d.

A mason, ditto, from 1s. to 1s. 6d.

A carpenter, ditto, from 1s. to 1s. 4d.

From the above averages, the following table, which may
be considered as containing pretty nearly, he says, the me-
dium rate of agricultural labour in these kingdoms, at the
present period, is formed:

<table>
<thead>
<tr>
<th>Wages</th>
<th>Average</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>£  s. d.</td>
</tr>
<tr>
<td>A ploughman</td>
<td>8 2</td>
</tr>
</tbody>
</table>
In the above statements, the difference in the rate of wages does not, it is supposed, appear so considerable (except in Wales, and the north of Scotland, compared with the better cultivated parts of Great Britain), as, had it been possible to ascertain the price of labour in each particular county, would have been evident; local circumstances frequently operating to augment or depress the rate of wages in particular districts, which is not discernible when numbers are claffed together.

But the rates of wages, or prices of labour, have increased in the proportion of, from a quarter to a half, in the period in which the above was written, which is only a very few years. Thrice, he conceives, affected by famine or some of the following causes, viz. 1st. The increase of commerce and manufactures; 2dly. The depression in the value of money, and its present nominal value, compared with the price of the ordinary articles of provision; 3dly. The general introduction of improvements, and of new modes of cultivation; whereby, although fewer hands are necessary, those poifSeffing superior skill become more in requisit; 4thly. The ease or difficulty of finding constant or regular employment; and, 5thly. The mode in which a farm-fervant, or labourer, maintains his family.

With respect to the first, it is supposed, that the increase of commerce and manufactures of the towns has contributed to the improvement of the country, as well by affording a ready market for the produce of the foil, as by various other means, will not be denied; but that the rapid incrace of them within these few years has had a great effect in raising the price of labour is equally evident. The great numbers of people crowded together in large cities and manufacturing towns, are not only against the increase of population, but also against longevity. There are besides several forts of manufactures, which are well known to be destructive of the human constitution; not to mention the many accidents to which those employed in the various branches of commerce and manufactures are exposed, tending to shorten life, and from which those engaged in the operations of husbandry are exempted. For these reasons, there is a constant demand for people from the country, in order to keep up the population, and to carry on the commerce and manufactures of the towns. The great additional price commonly paid for commercial and manufacturing, beyond that for agricultural labour (except where the influence of the former affects the latter), and the habits of luxury, in which the labouring part of the community live in towns, compared with the generality of their neighbours of the same clafs in the country (particularly in Scotland), are strong inducements, it is contended, with many of the peasantry, either to remove to the towns, or send their children thither: whilst others, in confequence of the too general practice of adding farm to farm, and demolishing cottages, are forced to feel that asylum in towns which is refused them in the country. The demand for labourers from the towns being complied with, the country is thereby drained of useful hands, and the price of agricultural labour advanced. This must necessarily happen, it is thought, in every kingdom during the period that its commerce and manufactures are on the increase; and more especially in those nations where the legislature turns its attention to support commerce and manufactures at the expense of agriculture.

The second, the depression in the value of money, is also another and substantial reafon for the apparent rise in the price of labour. The increase of commerce and manufactures, which has been gradually taking place in this island ever since the beginning of the reign of queen Elizabeth, and the immense additions which have been made every year to the national debt within the present century, seem to have rendered it necessary to increase, nominally, by means of bank-notes, promissory-notes, bills, &c. the quantity of money in circulation. That these subfrates for specie have had the effect to reduce the value of money is an obvious fact. If, therefore, the value of money has fallen, the labourer of the present day requires of course a greater quantity to carry to market than his predecessor, to purchase even such articles as are consumed in the particular district where he resides (whether right or wrong), as indispensibly necessary for the maintenance of a peasant’s family. Whether the Middlesex labourer goes to market to purchase beef or mutton, or the Aberdeenshire cottage oatmeal, it will, it is conceived, be found that nearly double the sum is required to purchase the same quantity now that it did thirty years ago.

After this, some facts are stated in order to shew that, however much the nominal price of labour has increased, its real price, compared with that quantity of provisions it will purchase, remains all over the island nearly the same, except only where a variety of circumftances combine; such as contiguity to large towns, or extensive manufacturies and public works; and the want of due attention to the providing of work, from improved modes of husbandry, not being introduced to raise or depress it beyond its ordinary level.

In regard to the third, it is observed, that besides forming canals and turnpike-roads, which may be considered equally beneficial to the interests of commerce and manufactures as to those of agriculture, there have been many improvements introduced in husbandry, which, while they have contributed to advance alike the prosperity of the nation, the proprietors and farmers have also been the means of bringing about a considerable alteration in the situation of the inhabitants at large, as well as in the price of labour. The immense number of people necessary for carrying on the various operations of inclining, draining, planting, erecting farm-buildings, digging marl, quarrying and burning lime-flour, hoeing potatoes, turnips, and other green crops, must hift have had the effect of giving full employment to the people in those districts where such improvements were introduced, and gradually to advance the rate of wages, in consequence of the increased demand for labourers. The general introduction of new modes of cultivation, whereby, although fewer people are necessary, those possessing superior skill become more in requisit, is another reason of the advance in the wages of the farm-servants. This observation will be considered as well founded by all those who recollect the period, when ploughing with a man and two horses, without a driver, became common in Scotland. The number of horses or oxen formerly worked in the plough varied in some farms, according to the nature of the soil; but was more frequently regulated either by the cultivation of the district, or the fancy of the farmer. When, in confequence of the spirited exertions of some individuals in several counties, the practice of ploughing with two horses was pretty generally introduced, the farmers found themselves thereby relieved.
relieved of a very great share of the annual expense of cultivation; but as it was then considered a very arduous undertaking to manage a two-horse plough, every farmer selected the belt ploughman he could find; and hence becoming thereby in request, it was no difficult matter for them to bargain for an augmentation of wages, which the farmers of that period could very well afford, and which many now living will not hesitate to acknowledge they granted on principles of economy.

In respect to the fourth, it is suggested, that the ease or difficulty which labourers frequently have in finding constant and regular employment; or, in other words, when labourers are only partially employed, the rate of wages must be affected by that circumstance. It has already been observed, that those who live by labour must receive such a compensation as is more than sufficient for their subsistence. When a labourer has constant employment, whatever be the rate of wages, as it must be equal to the price of the ordinary articles of provision in whatever part of the isle he is situated, his incomings and outgoings will be nearly the same. Hence it follows, that when, from the difficulty of finding employment, he can only procure work for three, four, or five days in the week, he must receive the same sum for the three, four, or five days that in the other cases he would do for the labour of six; otherwise his incomings must be less than he is necessarily called to expend. When that happens, labourers are often obliged to remove occasionally to another quarter, or betake themselves to some mechanical employment; and in either case, their services are lost to the farming part of the community where they resided. The want of constant employment, therefore, it is conceived, operates in two ways to raise the price of labour; first, by the necessity the labourer is under while he continues in that capacity of demanding as much for the work of three, four, or five days, as is fully equal to his subsistence for a week; and secondly, many of them being obliged to betake themselves to other means for providing for themselves and families, the number of labourers becomes greatly diminished, and the remainder of course more in request.

And on the last point, it is supposed that the various modes in which farm-servants and labourers maintain their families must necessarily have a very great influence on the expense of agricultural labour in different parts of the isle. In a great part of England, butcher's-meat, dippings or puddings, bread made of fine flour, with beer, ale, and very commonly tea, are reckoned indispensable articles of cottage house-keeping; while in Scotland, oatmeal, cooked in various ways, vegetables, and now and then a little butcher's-meat, are the chief articles which constitute the food of the people employed in husbandry, even in the best cultivated parts of the kingdom. This essential difference in the mode of living must, it is conceived, be a great additional expense in the article of labour to the English farmer beyond what those in Scotland are subject to, and must induce such as are not acquainted with the various circumstances connected with the husbandry of both kingdoms, to give a decided preference in favour of Scotland. It should, however, be remembered, that this kind of additional tax paid by the English farmer more properly affects the landlord, and is one of the principal reasons why lands in England are rented lower than those of the same quality in Scotland; it being an indisputable fact, and which, in Scotland, daily experience proves well-founded, that a great proportion of what the farmers save in the article of labour, or by the introduction of more improved and lens expensive cultivation, sooner or later finds its way into the landlord's pocket.

And a very respectable author, Dr. Smith, in his work on the Nature and Ca" of the Wealth of Nations, vol. i. has observed, that "the difference in the mode of labourers' subsistence is not the cause, but the effect, of the difference in their wages: although, by a strange misapprehension, I have frequently heard it represented as the cause." It is further added, that "it is not because one man keeps a coach, while his neighbour walks a-foot, that the one is rich and the other poor; but because the one is rich he keeps a coach, and because the other is poor he walks a-foot."

The author of Modern Agriculture thinks it will be admitted, that at the period when a general alteration has taken place for the better in the oilabilished mode in which labourers maintain their families (as in the south of Scotland, where the price of labour has nearly doubled within these twenty years), the expense at which a cottager's family is maintained has advanced in the same proportion. They eat better food, wear more expensive clothes, and live in more comfortable dwellings—all which, he says, no doubt, as Dr. Smith observes, is the effect, not the cause, of the recent increase in the price of labour.

But that in England, where the mode of maintaining a labourer's family has undergone little alteration for ages, it is presumed, that although the difference in the modes of living was, at first, the effect naturally to be expected from a rise in the price of labour, yet it is now one cause why the rate of wages continues in that kingdom to advance. Those articles which with that class were once deemed the luxuries are now considered only as the bare necessaries of life, and the prices have advanced in nearly the same proportion as their wages. For instance, those who in that country require labourers, must either pay them such an advance of wages as will enable them to subsist according to the general mode established in the country, whatever the additional price of the ordinary articles of provision may be, or compel them to make use of more simple and less expensive kinds of food, which were used by that class of men a century or two ago. As every person who stands in need of labourers, will adopt the first of these alternatives, it follows of course that the difference which has long taken place in the mode of maintaining a labourer's family in England, compared to that of ancient times, is now one cause for the advance in the rate of wages.

It is stated, that it has now become a general complaint among proprietors, merchants, manufacturers, and farmers, that the price of labour is become too high. That, owing to one or all of the causes before-mentioned, it has advanced in many districts to a degree unknown in any former period of the history of these kingdoms, is a fact well known. Those who regret that the price of labour is advanced, (provided it is kept within proper bounds, and does not arise from a national neglect of the situation of the penury,) ought to comfort themselves with the reflection, that this never happens in any state which is not increasing in wealth and prosperity. It is owing to that cause, and to no other, that the working-people in any nation are more liberally rewarded for their labour; and in place of regret it ought to give pleasure to every friend to his country, that the great body of the community are enabled, from the fruits of their honest labours, to procure themselves a greater share of the comforts of life. At the same time, let it be observed, that those who have occasion to employ labourers pay attention to the advice of the author of the Scalfs.

"Be mindful of the rough, laborious bird That links you in elegance and ease."
They should also consider, that there are bounds beyond which they ought not, in prudence, to pass.

But the mode of maintaining farm-servants in many places of England is both absurd, and, it is conceived, expensive in the extreme, and calls loudly for reform as any error in the whole range of British husbandry. In Northamptonshire, the breakfast consists of cold meat, with cheese, bread, and beer; for dinner, roasted or boiled meat, with pudding; and for supper, the same as at breakfast; and besides ale, which is allowed on extraordinary occasions, they have small beer at command at all hours. And in the Rural Economy of the Midland Counties, after noticing that the beer and ale are brewed uneconomically strong, and that the quantity allowed to a man is unnecessarily great, it is stated, that, in hay and corn harvest, the customary allowance is a gallon (upwards of five bottles) of beer a man per day; and that, during winter, the quantity of small beer used is not much less than in harvest. And it is farther noticed, that the increased expense in the mode of maintaining farm-servants, as now too generally practised in England, is attributed to the following causes. Some few farmers in every county, either from a mistaken idea, that the better their servants are fed the more work they will perform, or from pride, and from a desire to gain popularity among that class of people, lead the way, while their more sensible neighbours, and even those whose situations in life but ill accord with such additional expense, are forced to follow the example, by which means extravagance in the maintenance of servants has arrived at its present height, and seems to be daily gaining ground.

It is suggested, that the wages paid for agricultural labour, or to servants by the year, or to labourers by the day, throughout the better cultivated parts of Great Britain, although considerably different, are, nevertheless, much less so than might have been expected, and appear by no means sufficient to balance the advantages which are derived from superior climate, and more favourable situations in regard to markets. The expensive manner in which the farm-servants are maintained in the greatest part of England, when compared with that of the more improved parts of Scotland, creates a much greater addition to the expense of cultivation in the former kingdom, than that arising from the difference in the money-price of labour. In forming a just estimate of the difference which takes place in the expense of cultivation, in particular districts, beyond that in others, it is necessary, it is said, to consider not only the sum of money paid as wages, and the expense of maintaining servants, but also the quantity of work performed, and the number of men and horses which, according to the practice of particular districts, are considered as necessary to cultivate the same quantity of land. The following statement will shew at one view the difference of keeping a team by the year, and of ploughing an acre of land, in Gloucestershire, in England, where five horses are commonly used; and in the county of Angus, in Scotland, where only two are considered necessary.

The County of Angus.

Annual expense of Angus farmer               | 52 | 0  | 0  |

Yearly difference against Gloucestershire farmer    | 74 | 0  | 0  |

It is stated, that if these men and horses were employed in ploughing the whole year, and that they ploughed an acre a-day, they would each have ploughed 312 acres in the course of the year. The expense to the Gloucestershire farmer would be 8l. each acre, while the Angus farmer would have the same extent of labour performed at about 3l. 4d. per acre. There is also as great a difference in the expense of threshing grain. Since the introduction of threshing-machines in Scotland, the grain can be separated from the straw upwards of 50 per cent. cheaper, and to better purpose, than is to be done in England by manual labour. This comparison might be made to include other operations, which are more or less expensive to perform, in consequence of the peculiar customs and practices of particular districts. But all that is proposed here is to give an idea of the proper mode of calculating the expense of agricultural labour, and an inference or two of the saving which every farmer has in his power to make, by using well-constructed implements of husbandry, and performing the various operations with as few men and horses as possible.

It is added, that the scarcity of farm-servants and day-labourers has of late been considerably felt in many parts of Great Britain, and seems to be gradually increasing. The principal causes to which this evil is to be ascribed are, in the opinion of the above writer, the inclosure bills in England, the enlarging or engrossing farms in both kingdoms, and the general increase of commerce and manufactures. But a more serious and certain cause of this evil is probably to be found in the constant state of warfare in which this country has been engaged for almost the whole of the last half century. The deficiency of labourers is a evil of so serious a nature, (from whatever cause it has originated,) as ought to induce proprietors and farmers of all descriptions to adopt such measures as appear most proper for infusing a future and more abundant supply. That which seems the most likely to effect this desirable object with the greatest certainty is the building of cottages on every farm, in numbers proportioned to the extent of hands necessary for its cultivation. Experience has proved that cottages are the best nurseries for useful farm-servants and labourers; and while nothing would tend so speedily or so effectually to supply this defect as affording the labouring clafs of the people the means of living comfortably in the country, it would also be the means, in a great degree, of silencing the rising clamour against enlarging or engrossing farms. In this view it is suggested, that a tax on every proprietor and farmer in Great Britain, who had not as many cottages erected and inhabited, in a limited time, as there were ploughmen required for the cultivation of the farm; or one cottage for every certain number of acres. Such a tax, if imposed for the express purpose of increasing the population, of
of the country, and thereby keeping the price of all kinds of labour moderate, could not fail in time, it is supposed, to have the wished-for effect.

However, it is observed also, that the practice of joining two or three, sometimes half a dozen, small farms in one, and the consequent demolition of the cottages, has had the effect of bringing about a great alteration, in many counties, in the description of servants employed in husbandry: as, instead of employing married men living in cottages contiguous to the farm, and paying them partly in necessaries of life, young men, brought up in towns or villages, are employed, and their wages wholly in money,—from which many bad consequences proceed. From the advantages to be derived by employing married men, who have families residing on some detached part of the farm, as ploughmen, as well as from the acknowledged scarcity of labourers, may, it is supposed, be inferred the propriety and even necessity of improving, by every proper means, the situation of the paupers. The labourer's situation would be much improved, were his employers to revert to the old practice of paying him a great part of his wages in the necessary articles of provision: he would then be prevented from the necessity of having recourse, for every article he requires, to those worse than pawn-brokers, the keepers of little paltry Chandler's shops; a set of people who, without remorse, appropriate to themselves, under the name of a reasonable profit, a great proportion of the hard-earned wages of the laborious peafant. And next to getting the great article of provision on reasonable terms, the allowing every cottager the means of keeping a cow, and of planting a reasonable quantity of potatoes and other vegetables, would tend, more than any other circumstance, in the writer's opinion, to his happiness and comfort; as it would enable him to procure a considerable share of the sufficiency of his family, without the expenditure of money, or the risk of impostion. It would also, it is imagined, be a great spring to the industry of the labourer, to set him all his labour by the great, or piece. He would be induced to labour with more steadfastness and perseverance, when he was satisfied that it was in his power to apply the fruits of his extraordinary exertions to the benefit of his family. And, lastly, to encourage, by every proper means, the establishment of friendly societies among the labouring classes of people, as a means of provision against accidents, sickness, and old age.

Farm labourers, Mr. Marshall thinks, as being the most valuable classes of men that a populous country possessest, should have every comfort provided for them that is compatible with their situation, and conformable to the general interest of the community:—that their wages ought to be everywhere, and at all times, sufficient for the maintenance of themselves and families while in health, with a surplus to provide against the day of sickness, without their being under the depressing necessity of making applications to their neighbours for relief. Persons so essentially useful to society should not merely support existence, but have the comforts of wholesome habitations, with sufficient spaces of ground to furnish them and their families with changes of proper vegetable food, without much expense. It is, after all, this class of men that constitutes the great half or prop of a country.

Labourers conspiring together concerning their work or wages, shall forfeit 10l. for the first offence, 20l. for the second, &c. and if not paid, to be set on the pillory. (Sta. 2 & Edw. VI. cap. 15.) Justices of peace, and stewards of leets, &c. have power to hear and determine complaints relating to non-payment of labourers' wages. (4 Edw. IV. cap. 1. 28 Geo. II. c. 19. 31 Geo. II. c. 11.)

And labourers taking work by the great, and leaving the same unfini{h{d{, unless for non-payment of wages, or when they are employed in the king's service, &c. are to suffer one month's imprisonment, and forfeit 5l. The wages of labourers are to be yearly allayed for every county, by the sheriffs and justices of peace, in the Easter sessions; and in corporations by the heads of the same, under penalties. (5 Eliz. cap. 4.) And the sheriff is to cause the said rates and allowances of wages to be proclaimed. (1 Sir. I. cap. 6.) All persons fit for labour shall be compelled to serve by the day, in the time of hay or corn harvest; and labourers in harvest time may go to other counties, having testimonials. From the middle of March to the middle of September, labourers are to work from five o'clock in the morning till seven or eight at night, being allowed two hours for breakfast and dinner, and half an hour for flopping in the three hot months; and all the rest of the year from twilight to twilight, excepting an hour and a half for breakfast and dinner, on pain of forfeiting one penny for every hour's absence. (5 Eliz. c. 4.) By Stat. 6 Geo. III. c. 25. artificers, labourers, and other persons, abetting themselves from the service of their employers, before the expiration of the term contracted for, shall be punished by imprisonment for not less than one month, nor more than three. If any labourer shall make an assault upon his master, he shall suffer as a servant making such assault. (5 Eliz. c. 4.) See Manufacturers and Servants.

LABOUREUR, John Le, in Biography, was born, in 1623, at Montmorenci, near Paris. At the age of nineteen he displayed a turn for historical researches by publishing "An Account of the Tombs in the Church of the Celestines at Paris, with brief Memoirs of the Perfons entombed," which was very well received. In 1644, he was at court in the character of gentleman in waiting, when he was sent into Poland, with the marshall of Guebriant, on a mission to Ladislaus IV. to whom the duches of Nevers was contracted. After his return he published a narrative of this embassy. He next entered into the ecclesiastical profession, and was made almoner to the king, and prior of Juigné, and in 1664 he was created commander of the order of St. Michael, and appointed almoner to the king. He wrote the "History of the Marquis de Guebriant," and he was editor of a new impression of the "Memoirs of Michael de Cafelnau," with several genealogical histories, in three volumes, folio, 1731: this performance is reckoned to throw much light upon several parts of French history; "History of King Charles VI. translated from the Latin of a MS. in the Library of de Thou," two volumes, folio; "A Treatise on the Origin of Coats of Arms." He left many MSS. among which is "A History of the Peersage." Moretti.

LABOURSOME, among Sarmos, implies a violent rolling or pitching motion of a ship at sea, by which the mats and even the hull are in great danger. By pitching suddenly the masts are likely to be carried away, and by the heavy rolling motion the masts strain upon the shrouds, and consequently, upon the sides, with an effort which increases as the time of their obliquity, and the continued agitation of the vessel gradually loo{h{ens her joints, and makes her extremely leaky.

LABRADOR, in Geography, an extensive country of North America, so called by the Portuguesse, who first discovered its coast, comprehended in New Britain. It is bounded on the N. by Hudson's strait, on the S. by part of Lower Canada and the river St. Lawrence, on the W. by Hudson's bay, on the N. E. by the ocean and Davis's straits, and on the E. by the straits of Belleisle and the gulf of
of St. Lawrence. The extent of this country has been but imperfectly ascertained: for our knowledge of the eastern coast and of its inhabitants, we are chiefly indebted to Lieutenant Roger Curtis, from whose papers extracts were made and communicated to the Royal Society, in 1774, by the honourable Daines Barrington (Phil. Trans. vol. 64, part 2) and to Mr. Cartwright, who resided at different intervals, for sixteen years, in this desolate country, and whose account of it was published at Newark in 1792. But the knowledge thus obtained principally relates to the coast; for the inland territory remains still unexplored. These writers concur in representing the face of the country, as far as they could discover it, not only hilly, but mountainous; some of the mountains being of a considerable elevation. From the sea the south coast seemed to be fertile and to be covered with a degree of verdure; but the soil, on examination, was poor, and the verdure was that of coarse plants, which might serve for deer and goats, but was not proper for horses, kine, or sheep. To the improvement even of this part, the depredations of the bears and wolves furnish a formidable impediment; and the cattle, on account of the severity of the climate, must be housed for nine months in the year. The whole of the east coast exhibits a very barren appearance; the mountains rising suddenly out of the sea and being composed of rocks, which are thinly covered with black peat earth, that produce but few species and a few other plants. The adjacent sea, however, the rivers and lakes, which are numerous, abound with fish, fowl, and amphibious animals. Springs are rare, and the water is chiefly supplied by melted snow; nevertheless, it is wholesome, and those walled streams which frequently occur in the Alpine regions of Europe and Asia, are unknown in this country. On the coast are several spacious and safe harbours; and at a small distance, and within its capacious bays, there are thousands of islands of different sizes, on which eider-ducks breed in large flocks, and which are fenced with a multitude of sea-fowl. On some of the larger isles there are deer, foxes, and hares. All kinds of fish, belonging to the Arctic seas, abound on this coast; and the rivers are frequented by salmon and sea-trout, pike, barbel, river-trout, eels, and other kinds. At a small distance from the coast in the inland territory, the air is milder; the soil is more fertile, and trees, some of which are of a large size, are more numerous. The ground is covered with spruces and firs, with an intermixture of larches, birch, and aspens, particularly near the shores of the bays, rivers, brooks, and ponds, where alone they arrive at any degree of perfection. Other trees are mere shrubs, and they are the alder, cifer, dog-berries, pears, currants, raspberries, and a few others. The fruits consist of various kinds of berries, viz. currants, raspberry, partridge-berries, cranberries, apples, pears, whortle-berry, and a small berry, the plant of which resembles the strawberry, each producing only a single fruit, of a bright pink colour, granulated like a mulberry, and having a delicate flavour. The vegetables fit for food are wild celery, feewry grats, the young leaves of the order and of the ground whortle-berry, Indian fallad, red docks, and an Alpine plant, of which the reindeer are very fond. The soil, though of a light kind, is not deliltute of clay; nor ores, except those of iron, have been discovered; but there are plentiful. White spar is common, and several samples of that called Labrador spar, have been picked up by the Equinoxx. The birds of the country are the white-tailed eagle, falcons, hawks, and owls of various kinds, the raven, white grouse, ptarmigan, sfruce game, whiUing eagle, grey plover, various species of sandpiper, and other waders, geese, ducks of various sorts, flags, gulls, divers, swallows, martins, some few species of small birds, finipes and doves, the two last being very scarce. The beasts are white and black bears, rein-deer, wolves, wolves, various species of foxes, martens, lynxes, otters, mink, beavers, musquash, raccoons, hares, rabbits, and moles, and probably other kinds. The climate, though severe, is salubrious; there is little appearance of summer till about the middle of July, and in September winter indicates its approach, so that this latter season is long and the cold is severe. In summer the heat is sometimes unpleasant, and in that season the weather is very moderate, and remarkably serene, without those fogs which are more prevalent in Newfoundland, and those violent gales of wind, to which some other parts of the globe are subject. At this season, the musquitoes and sand-flies, which are very numerous, are intolerably troublesome. The winters are said to be less severe than formerly. The greatest heat observed at Nain (N. lat. 57°) in the year 1780, was 84, and this was in July; the greatest cold in 1779 was -36. On the sea-coast it is much colder than farther inland, more especially when the wind blows from the ocean, on account of the immense quantities of ice that are contiguous to the coast; and which, together with the islands already mentioned, render the navigation dangerous. The shoals of ice let in from the north in spring and summer. It is not an unknown phenomenon in these northern and colder climates, that several heaths, and some of the birds, change their colour with the f easons. In the winter, the prevalent colour is white; and against the rigour of the cold, most animals are furnished by the order of providence with a defence. The quadrupeds are clothed with a longer thicker hair, or fur; and the birds have a lofter down and feathers of a closer contexture than those of milder countries.

On the coast of this desolate country there were only a few factories, till the Moravian clergy formed small settlements, particularly at Nain, about the year 1764. Upon barren rocks, covered with snow for more than half the year, and where the winters are so rigorous, and of such long continuance, we cannot expect to find that the inhabitants are very numerous. The native inhabitants of this country are mountaineers and Equinoxx, between whom there subsists an invincible aversion. The mountaineers inhabit the interior parts of the country, towards the north, and with respect to colour resemble our gypsies, which is probably acquired by their being exposed to the weather, and to the smoke of their wigwams. They are of a robust constitution, though their limbs are small, and their frame is well adapted to the rocky country, which they are continually traversing. They have no hair except on the head; and for many years they have dressed their food, which they boil in a jelly, whereas the other Indians eat every thing raw. They chiefly subsist on reindeer, which are very dextrous in killing. They also kill foxes, martens, and beavers. As they live a wandering kind of life, they never build houses; but they construct a kind of tent, covered with deer-skins and birch, and called wigwams; the skins which they use for this purpose, as well as for clothes, are tanned in order to take off the hair, then washed in a lather of brains and water, and afterwards well dried and well rubbed; but for winter use they have jackets of beaver, or deer-skins, with the hair on. They traverse the country by the assistance of canoes in the summer; and of rackets, or snow-shoes, in the winter. Their canoes are covered with the skin of birch; and though they are so light as to be easily carried, they are large enough to contain a whole family, and the materials of their traffic.
traffic. By means of the numerous ponds which are found in this country, they thus convey themselves to a great distance in a short time; travelling by water or by land, as circumstances require. They bear fatigue with incredible resolution and patience; and will travel two days successively, without taking any sort of nourishment. They are esteemed an industrious tribe; and for many years they had been known to the French traders. Their chief employment is to procure fur, and the necessaries of life; they are very industrious, but generally good-natured, and said to be less ferocious than other Indians; and this softness of manners they have probably acquired by their long intercourse with Europeans. They come every year to trade with the Canada merchants, who have seal fisheries on the southern part of the coast, and they bear the character of just dealers, says Curtis, though Cartwright charges them with a proneness to theft. They are, without doubt, immoderately fond of spirits, for which, blanketting, fire-arms, and ammunition, they truck the greatest part of their furs. With regard to religion, they profess themselves Roman Catholics; but know not of it than merely to repeat a prayer or two, count their beads, and see a priest whenever they go to Quebec. It is their custom, says Curtis, to destroy the aged and decrepid, when they become unable to serve the society, and burthensome to themselves. This practice they vindicate from their mode of life; alleging that those who are unable to procure necessaries, should not live merely to consume them.

The *Ejquimaux* (see that article) who inhabit the northern part of Labrador, are indisputably Greenlanders. They are of a deep-tawny, or rather copper-coloured complexion; they are inferior in size to the generality of Europeans, and there are but few of them who are of a good stature. They are flat-nosed, and have short noses; their hair is black and very coarse; their hands and feet are remarkably small. The women load their heads with large strings of beads, which they fasten to their hair above their ears; and they are fond of a hoop of bright brads, which they wear as a coronet. Their drees is entirely of skins; and confists of a fort of hooded close shirt, breeches, stockings, and boots. The drees of the different sexes is the same, except that the women wear very large boots, and their upper garment is ornamented with a tail. In the boots they occasionally place their children; but the youngest is always carried at their back, in the hood of their jacket. They have no sort of bread, but live chiefly on the flesh of seal, deer, fish, and birds. In the winter they live in hovels, or rather caverns, which are sunk in the earth. In the summer they occupy tents, made circular with poles, and covered with skins. They have no sort of beverage among them except water, and are not fond of spirituous liquors. They seem to have no sort of religion, nor to have any object of adoration among them. They have no kind of government; and no man is superior to another, but as he excels in strength or in courage, and in having the greatest number of wives and children. They have no marriage ceremony; a wife is considered as property; and a husband lends one of his wives to a friend. The women marry young. The men are extremely indolent, and the women are mere drudges, doing every thing except procuring food. They few with the sinews of deer, and their needle-work is very neat. They have few diseases, and are consequently without physicians; but they imagine, that tying to their neck or wrists the particular part of some fish or animal, according to the complaint, will effect a cure. They have never been visited with the small-pox. These Indians cannot reckon numerically beyond six; and their compound numbers reach no farther than 21; everything beyond this is a multitude.

Their dread of the mountaineers makes them live always upon the sea-shores. Their canoes are extremely long in proportion to their breadth, being upwards of 20 feet by two, and contain only one person; they are covered with skins, and extremely light, so that they are easily overfet, and yet there is not one among these people who can swim. They navigate their shallop without compass, in the thickest fogs, and are very good coxswains. Their dogs, of which they have a great number, serve as a guard, and as food: their skins supply them with clothing; and in winter they draw their fleges. They cannot bark, but make a mock hideous howl; they are large, and have a head like a fox, whereas the dogs of the mountaineers are very small. The weapons of these Indians are the dart, and the bow and arrow, but they are not very expert in the use of either. Their number cannot be accurately ascertained; Mr. Curtis made some attempt for this purpose by counting the number belonging to each tribe, estimated by the number of boats, and by that of the men, women, and children belonging to each boat; estimating them in this way, he reckons their number to be 1623. Mr. Cartwright says, that these Ejquimaux were the best tempered people he ever met with, and the most docile; nor, as he says, is there a nation under the sun with which he would truit his perfon and property in preference to them; although till within these few years they were never known to have any intercourse with Europeans, without committing theft or murder, and generally both.

The buisness carried on by the English with Labrador is the fame with that on the island of Newfoundland. The exports are cod-fish, salmon, oil, whalebone, and furs; but the latter are much better than any of the fame kind obtained upon that island, nor do few parts of the world produce better. N. lat. 50° 30' to 62° 30'. W. long. 55° 30' to 78° 30'.

**Labrador Lake.** See St. Peter's Lake.

**Labrador Spar.** in Mineralogy. See Feldspar.

**Labrador Stone.** See Feldspar.

**Labrador Tea.** in Gardening, the common name of an evergreen plant of the more hardy kind. See Ledum.

**Labrisulciunm.** a term in Surgery, derived from *labrum*, or habrum, a lip, and *fulcurs*, a deep sore, and signifying sometimes a chap of the lip; but frequently the disease well known under the appellation of the cancerous or gangrenous oris. See Gangrenana Oris.

**Labrit,** in Geography, a town of France, in the department of the Landes, and chief place of a canton, in the district of Mont-de-Marfan. The place contains 584, and the canton 44 inhabitants, on a territory of 4973 kilometres, in nine communes.

**Labrus,** in Ichthyology, a genus of the thoracic order. This tribe of fishes is extremely numerous, and comprehends many species of peculiar beauty and variety both in form and colours; their general aspect is rather more distinguished for elegance than singularity, but the diversity of those brilliant tints with which nature has embellished them is almost endless. We are little acquainted with their manners of life; such as have occurred to our own observation appear to be of the nature of the inhabitants of the marine element; some delight to recline in the shallows and rocky bottoms of the sea contiguous to the bold rockshores, but the fur greatest portion of the species are so widely dispersed through the immense of seas as to rarely occur to notice; and few, or indeed scarcely any, are known in the regular fisheries in any part of the globe. The flesh of these occasionally introduced for the table are of an agreeable and excellent flavour, such...
as the "old wife," and some others. The smaller kinds are
ated chiefly by the fishermen as bait.

The confusion prevalent among authors respecting this
family of fishes is inconceivably great; a circumstance the
more remarkable in our ideas, since the obvious character of
the genus does not appear ambiguous. The confusion arises
from that want of precision in the definition of the true cha-
ter, which is too perceptible in the writings of ichthyolo-
gists in the early part of the last century, and which led them
to admit indiscriminately with the Labri many kinds that
ought not to have been included in the same genus. Some
of these errors have been progressively detected and amended
by referring the fishes improperly classed as Labri to other
genera. But for others apparently not less exceptionable,
we must place our trust in their descriptions only, the objects
described being unattainable; and while this uncertainty con-
tinues, it will be concluded the whole of the preformed
species of Labrus can never be reduced to very satisfactory
order.

On a retrospective view we need not perhaps refer beyond
the 12th edition of the Linnaean "Systena Natutae"; in
this we find the genus Labrus with the following essential
character. Teeth acute; gill membrane with fix rays, and
the covers fealty; and the dorsal fin with a filiform skin ex-
tending beyond the end of the posterior rays. This is the
Linnaean character in its latest state of improvement, ex-
cepting only that it is added, with a judicious degree of cau-
tion, that the two genera Labrus and Sparus are so closely
allied, as to render it difficult to distinguish them: "Labri et
Spast genera ob affinitatem etiamnum difficilis distinguan-
tur." Linnaeus defers altogether about forty species,
some of which had been described in his former works as
of the Labrus, Sparus, and Sechna genera, and for these,
with the exception of a few new kinds in Mus. Ad. Fr. he
injected to the labours of his friend Artedi, or to those of
Gronovius, Ray, and Canetby, by whom some were called
Labri and others Spari.

Gmelin endeavoured to amend the essential character of
Labrus by rendering it more comprehensive, and for this
reason adds to the character before-mentioned that the lips
are simple; the pectoral fins pointed, and the lateral line
straight. Still this was found insufficient, and is, in our
ideas, conceptually inferior to the very excellent and concise
character by which Bloch distinguishes the genus, namely,
the lips large, the upper one double and extensible: the
genus poisons other characters, but this is the most material.

Another attentive observer of nature, Mons. Commercon,
has offered some improvements in the definition of the genus
Labrus, and has added to the genus many new species.
One of the latest and most copious writers on this subject
however remains to be noticed, namely, our friend Lacepede, a
naturalist who undertook the task of reforming the whole
system of classification, and one to whom science is indebted
in a great measure for the number of new species introduced
of late years to the knowledge of the world.

To the Linnaean naturalist, the arrangement proposed by
Lacepede will, rather, we apprehend, appear an innovation,
than improvement. In this respect, considering the very
concise view the limits of our article will allow us to take of
this subject, we are not disposed to exercise much critical
remark, or we conceive it would not be impossible to acce-
tain that it partakes of the character both of improvement and
innovation. Our own opinion is, that the Linnaean de-
inition, though extremely useful, is inadequate, and that
the character assigned by Bloch, though still more concise, is
better. We allow, moreover, the necessity of reformation;
many of the Linnaean Labri belong to other genera, and
there are, besides, species more recently referred to the genus
Labrus which rather constitute new genera. Hence the ne-
cessity of forming a larger number of genera, by dividing the
Labri, is admitted; but in allowing this, it still remains a
question, whether Lacepede has not fallen into a greater error
than that he endeavours to reform; for instead of permitting
them to remain in a single genus, he constitutes no less than
seven new genera of the Labri, and their immediate depend-
dencies. In extenuation, it may be indeed observed, in the
language of one of his continental admirers, "this intelligent
writer found the genus (Labre) so vitiated, that he was un-
der the necessity of forming so many new genera. This
increase of genera might perhaps have diminished the number
of species in the Labru to a trifling amount, but, on the con-
trary, by the introduction of the new kinds very recently dis-
covered, they are again advanced to the number of one hun-
dred and thirty species."

The genera into which Lacepede divides the Labrus of
Linnaeus, and other authors, are Labrus, Hiatula, Os-
phronemis, Cheilinus, Lutjanus, Trichodus, and
Cheilodipterus.

Labrus, according to this writer, is characterized by
having the upper lip extensible; neither incisive teeth nor
grinders; gill covers delitute of spines and denticulations;
dorsal fin one, extending nearly from the nape almost to
the tail, and composed of rays terminating in a filament. This
genus (which Lacepede separates, chiefly according to the
furcate or rounded form of the tail, into three sections) in-
cludes a great number of the Linnaean genus Sechna, as
the species capa, lepifina, unimaculata, gibba, cincte
capata, armata, and forca, with many others; and, on the contrary,
the number of Linnaean Labri is less extensive than might be
imagined, it includes its 6pecies lunaris, venosus, and guttatus;
but the genus consists principally of new fishes.

Hiatula is a genus established for one species (Labrus hi-
atula) of Linnaeus, which, being delitute of any anal fin,
cannot, says Lacepede, remain with the rest. This he calls
Hiatula gaudemense.

Ospberonemis is a genus instituted by Commenson, from
whom it was adopted by Lacepede. Its character consists
in having five or six rays in each thoracic fin, the first of
which is a spine, and the second terminated by a long filament.
This genus contains only the species Gorany and another.

Cheilinus is a genus established for the reception of
the Linnaean Labrus Sechnae, and a new species observed by
Commercon, the species trochle. The upper lip is ex-
tensible; gill covers delitute of spines or teeth, and a single dor-
fal fin.

Lutjanus was originally established by Bloch, from
whom it was adopted by Lacepede; this forms a most exten-
sive genus, and comprehends species from several of the Lin-
naeus genera, as Perco flavigula, clausura, argentea, and nobilis;
Sparus virgincus, and Chlorodon aruntrum, together with the
Labri fluviatus, scina, lapnia, ramentofusa, ocellatus, adriaticus,
&c. Its character is, that one or more plates of the
gill covers have a small tooth; the back a single dorfl fin, and
sometimes a beard to the jaws.

Trichodus includes part of the Linnaean Labri;
the character consists in having a single ray longer than the
bone to each of the thoracic fins, and one dorsal fin.

Cheilodipterus. The upper lip in this genus is exten-
sile; it has neither incisive teeth, nor grinders; the gill
covers are delitute of spines or teeth, and the back is fur-
melled with two fins. This last genus contains nine spe-
cies.

Having thus far stated the most material alterations that
have taken place in this extensive genus, it only remains to
counterate
enumerate the species, the order of which, in conformity with our original plan, will be reduced as nearly to the arrangement adopted in the Gmelinian system, as the introduction of the more recently discovered kinds will permit.

Species.

* Tail forked.*

**SCARRUS.** Transverse appendages at the side of the tail.

A native of the Mediterranean, where it appears in shoals, and feeds chiefly on fish, and other marine plants. The length is about twelve inches, the scales large and thin, and the front teeth broad and blunt. The flesh of this species was esteemed a delicacy among the ancient Romans, and in their days of luxury, obtained, if we may credit Opperian, the most extravagant price. It seems to be most abundant near the shores of Greece.

**ANTHIA.** Body entirely red-fish. Art.

Inhabits southern Europe and America. Gmelin conceives, from the ferrated operculum, it may be a perca. Bloch constitutes it of a distinct genus, under the name of Anthias.

**CRETENSES.** Teeth four, body greenish. Art.

Inhabits Andia, and the adjacent places.

**HERVUS.** Lower jaw longer; body with transverse black lines each side. Art.

An European species found in the Mediterranean sea, and sometimes in the rivers adjacent. The dorsal fin has ten spinous rays, and twenty-one soft ones, and behind the former a black spot.

**CISSEUS.** Tail sub-bifid; body somewhat greyish. Gmel.

*Tur dus pinnis branchiabant orphan.* Catedby.

A native of America. Catedby has figured this species without pectoral fins, Eys Gmelin, and distrust his accuracy; from a reference to the preliminary observations, it will be however remarked, that Lacedoped admits its correctness, and institutes a new genus of this species only.

An inhabitant of the South American and Indian seas. The body is oblong-violet, with bands of yellow disposed transversely; the dorsal and anal fin yellow, except the violet line.

**GALLUS.** Caudal fin truncated in the middle; dorsal and anal with violet lines at the base; lower lip with a double finning each side. Gmel. *Scarus gollus* Forik.

Described by Forikal among the fishes of Arabia; the body is darkly green, with violet lines all over the body, the belly with two blue stripes, and an intermediate one of green; scales lax, articulated, membraneous at the edge, and marked with a transverse purple band; eyes remote, with red pupil; teeth in one row; tail yellow in the middle, violet towards the sides, and edged with blue. The flesh of this kind is accounted poisonous.

**PURPURUS.** Caudal fin truncated in the middle; dorsal and anal with a longitudinal purple repandate stripe at the base. Gmel. *Scarus purpurus* Forik.

Inhabits the shores of Arabia; the length eighteen inches; body somewhat lance-shaped and truncate, colour dulliy-green, with three purple stripes each side, beneath blue; scales broad, rhombic, articulated, and loosely imbricated; crown convex, naked and brown, with a purple triangle each side before the eyes; gill-covers naked, with a square purple spot; lateral line ramose. The flesh of this fish is esteemed good.

**PSITTACUS.** Caudal fin truncated in the middle; edge of the fins, abdominal stripes, and marks on the head blue.

The body of this species is greenish, with yellowish lines; eyes small and remote; jaws of two bones, the lower one with one tooth each side, the upper three; gill-cover with loose tabes; lateral line somewhat ramose, and double, the first near the back, the other in the middle; fins purple. A native of Arabia. Perhaps of the scarus genus?

**PSITTACUS.** Green, with three longitudinal red stripes on each side; dorsal fin yellow, with longitudinal red band. L. *transversa*, Lacedoped. *Parraek labrus* Shaw.

Described from a drawing by Plamier. The species inhabits the American seas. Over each eye is a black streak; tail yellow, with four or five curved bands of blue and red.

**NIGER.** Tail truncated in the middle; down the chin a dusky green longitudinal stripe. Gmel. *Scarus nigrus* Forik.

An Arabian species found near the shores of the sea. The jaws are bifid, the blotes on the head and outer margin of the fins blue-green; lips edged with red, and then greenish-brown; teeth in the upper jaw two, canine and white; fins violet-brown; pectoral obscure, ferruginous and brownish at the base; tail greenish, the angles lancedolate.

**CHIAXUS.** Head with three blueish rivulets each side, under the eye a blue square spot. Gmel.

Colour above brown, beneath white; lower jaw longer, between the eyes two furrows diverging behind; anterior gill-covers ferrated at the back part, posterior truncate; pectoral, ventral, and anal fins yellow; dorsal and caudal spotted with red. Inhabits Turkey, near Constantinople.

**OPEEULATUS.** Body with ten brown bands; gill-covers with a brown spot. Linn. *Amgen* Acad.

A native of Asia.

Length twelve inches. Inhabits the Mediterranean sea, near Syria.

Native of the fresh waters of North America; the iris is yellow; gill-cover with a long, obtuse, black membrane at the tip; the tail bilobate.

Length four inches, the body carinated behind, slightly undulated with brown and pale, the middle of the sides and base of the tail with a round black spot, surrounded by a paler circle. An Indian species of the marine kind.

**FALCUT.** Dorsal and anal fins falcated, the five first rays unarmed. Gmel.

Inhabits America, the colour silvery, and length of the breast; the teeth are cone, and the ventral fins small.

**RUFIN.** Tail truncate; body entirely tawny. Loox. *Tur dus flavus* Catedby.

An American species.

**ZEOLANICUS.** Tail truncate; body above green, beneath pale purple. Ind. Zool.

An edible fish. It inhabits Ceylon. The head is blue, the gill-covers green, with purple lines; pectoral fins with a purple spot in the middle, and edged with blue; ventral blue; dorsal and anal blue-purple edged with green; tail in the middle yellow, each side streaked with red, at the base blue.

**AYNA.** Body silvery; rays of the dorsal fin two—five, and nearly unarmed. Forik.
LABRUS.

Inhabits the sandy shores of Arabia. The length six inches; body oblong; belly plaited, and sometimes marked with interrupted stripes; the lips are equal, the upper pro- tractile; teeth numerous and very short; lateral line nearer the back, and almost parallel; tail bilobate, the lobes lanceolate, and the fins glaucous.

Catenula. Lower jaw longer; back elevated; on each side eight series of very small equal spots, and two transverse bands upon the nape. *Le labre chupelet*, Lacepede.

Observed by Commerfon in the Indian seas. This and several of the following new species are probably species of the Linnean Scinea.

Found with the preceding.

A native of Japan.

Semirubens. Four teeth in the upper jaw larger; anterior half of the body red, the posterior yellow. *Le labre demi-rouge*.

Observed by Commerfon in the Indian seas. The base of the posterior part of the dorsal fin scaly.

Punctulatus. Upper lip large, thick, and plaited; three longitudinal rows of black dots on the dorsal fin, and one on the posterior part of the anal fin. *Le labre tetraconites*, Lacepede.

Native country unknown.

Semidiurns. Pale, with numerous black transverse bands; tail terminated in a clear pale crescent. *Le labre demi-ischne*, Lacepede.

The bands across the body of this fish are about nineteen in number, and the dorsal fin falcate. A species found in the Indian seas.

A native of the Indian seas.

Hirsutus. Six larger teeth in the upper jaw; lateral line bifurcated with small spines; body with numerous longitudinal lines. *Le labre hermès*, Lacepede.

Inhabits the Indian seas.

Furtatus. Lower jaw longer; teeth small; lobes of the caudal fin pointed and very long. *Le labre fourchu*, Lacepede.

Found in the Indian seas as the former.

Sex-Pasciatus. Opening of the mouth very small; lower jaw longer; body with six transverse bands. *Le labre six bands*, Lacepede.

Observed with the preceding by Commerfon.

Octo-Vittatus. Teeth in the upper jaw much longer; on each side the body four somewhat oblique rays. *Le labre haut rain*, Lacepede.

Found in the Indian seas. The tail in this kind is crescent formed.

Levis. Lower jaw longer; teeth large, recurved, and equal; lateral line nearly straight; body with five large transverse spots or bands. *Le labre lisse*, Lacepede.

A native of the Indian seas.

Gouani. Each gill-cover composed of three plates, and terminating in a large rounded projection; lateral line obsolete; between the thoracic fins a pointed process. *Le labre gouan*, Lacepede.

Country unknown.

Machoterus. A black spot on the posterior angle of the gill-covers; nearly all the rays of the fins terminating in filaments. *Le labre macroptere*.

A species met with in the Indian seas by Commerfon, in his voyage round the world.

Found in the American seas.

Ensecanthus. Lateral line interrupted; body with seven transverse bands, and two on the tail. *Le labre enscatanthus*, Lacepede.

Each jaw is furnished with two or four large and very strong teeth, and the scales are considerable in point of size. Its native place is unknown.

Kisima. Head with seven small blue rays each side, and four larger of the same colour each side of the body; tail crescent-shaped. *Le labre kisima*, Lacepede.

Native of the Red Sea.

Tris. Gill-covers composed of four plates, and ending in an angular projection; a large oval black spot with white annulation at the posterior part of the dorsal fin.

Inhabits the fresh waters of Carolina, where it is very common, and is esteemed as an edible fish.

**With tail entire.**

Hiatula. Anal fin none; body with six or seven black bands. Linnaeus.

Communicated to Linnaeus by Dr. Garden. The species inhabits Carolina, and constitutes the genus hiatulæ of Lacepede. Whether L. griffis before mentioned be really of this genus, or is defective only in the representation, appears uncertain. Should it actually be distinct of the anal fin, as described, it must probably be placed in the same genus (hiatulæ) as this species, notwithstanding the difference in the form of the tail.

The lip in the present fish is reticulated, and wrinkled within; jaws beft with sharp teeth, those in the palate orbicular; gill-covers punctured at the edge; spiny rays of the dorsal fin equal, on the posterior part black.

Marginalis. Subfuscous; edges of the dorsal and pectoral fins tawny. Locl. it.

Inhabits the ocean.

Ferrugineus. Sides blueish, with a longitudinal, tawny, indented stripe each side. Gmel.

An Indian species.

**Discovered on the coast of Cornwall in the year 1802.**

As a native of the Mediterranean sea, this fish is mentioned by various writers; but as a British species it is perfectly new, not having been recorded as such either by Wallich, Ray, Bosc, Pennant, or any other writer on the zoology of this country."—"This fish has arrested the attention of many ichthyologists among the ancients as well as moderns, the former of whom pronounced it the most beautiful of European fishes. It may be collected from the works of Ælian, Aristoté, Salvian, Aldrovandus, and others, that this fish is common at certain seasons in the Mediterranean. Ælian speaks of it, however, as a poisonous fih, and of such a venomous nature that it would be unsafe to eat it, or even the fish of any other fish that had been touched by it. Galen mentions it, on the contrary, as wholesome food. The male of this species is distinctly,
LABRUS.

guished, according to some writers, by having the back of a black colour, instead of green, as in the female; but it appears in this and other respects to be an extremely variable species. Neither are its habits and manners correctly known. It is generally asserted that it swims in small shoals; Aristotle speaks to this effect; but this is contradicted by Salvin and others, who describe it as a more solitary fish, &c." Vide Brit. Fishes.

The upper tail is about seven or eight inches. 

Native of America.

Sullus. Dorfai fin filamentous; above the tail a black spot; dorsal spines nine. Linn. Fa. Succ. Sparus bergi f. Struve, It. & Wg.

Inhabits the shores of Europe.

Surius. Dorfai fin filamentous; body with white and brown lines. Linn.

Native of America.

Gula. Fucous; tail rounded, the rays extending beyond the membrane. Loc. &c.

Inhabits the ocean.

Ocellaris. Dorfai fin filamentous; an ocellate spot at the base of the tail. Linn.

Country unknown.

Found in Surinam.

Melos. Dorfai fin filamentous, and with the anal variegated; behind the eyes a brown crescent. Linn.

Inhabits the south of Europe.

Inhabits Egypt.

Osmiragus. Lips doubled; dorfai fin with thirty rays. Linn.

An European species.

Found on the rocky shores of Norway.

Onitis. Dorfai fin filamentous; belly spotted with cinnereous and brown. Linn.

Country unknown.

Vindis. Green, with a blue line each side. Art.

Inhabits the Mediterranean.

Lineatus. Fins greenish, the dorfai one ramentous; body green, with numerous yellow longitudinal lines. Donov. Br. Fishes.

" A new and highly interesting species, described on the authority of an example found by captain Bray on the coast of Cornwall. This specimen, which is in our possession, is seven inches in length; the prevailing colour greenish, with the belly yellowish," &c. Vide Br. Fishes.

Lucus. All the fins yellow; upper eye-lid black. Linn.

Country unknown.

Livens. Tail rounded; dorfai fin filamentous; body livid brown. Linn.

Inhabits the Atlantic and Norway seas, and also Greenland, though rarely.

Sivenus. Dorfai fin filamentous; body livid; crown rufes. Gmel.

An Atlantic species.

Length six inches, and inhabits Japan.

Dorina. Lower jaw longer; dorfai fin two. Houttuyn.

Found in Japan with the latter.

Tinca. Dorfai fin ramentaceous; body yellowish, variegated with blue and red spots; fins red, with fucous margins, and dotted with white. Donov. Br. Fishes.

Most writers concur in admitting the labrus tinca as a fish almost, if not exclusively, peculiar to this country. "Habitat in maris Britannicis profundis scopulosis," says Gmelin; and this opinion is sanctioned by the occurrence of Lacepede and others. Hence it cannot be improper to regard it chiefly as a British production; and as such, it will not be amiss to repeat some observations that have been already delivered by us on this subject, in the volumes of British Fishes to which we have here adverted.—" This charming species of wrasse cannot but be considered as one of the most beautiful of the fish tribe observed to this time on the coasts of Britain," &c.—" We have obtained this species from Scarboroug, and other eastern coasts of England, more than once; but we have received it also from Cornwall, from the Skerry islands, north of Anglesey, and from Scotland; but have been uniformly led to believe it a species not very common on either of these coasts, except near Scarborough. The usual length of this species is about fifteen or eighteen inches, and it's form rather bulky in proportion to the length. The prevailing colour is yellowish, inclining to greenish or olivaceous on the back, and white towards the belly; the markings variable in form, and diff ring much in colour. The whole of the back and sides are spotted with red, varying in different specimens from a deep or purplish crimson to a reddish-orange, and even in some varieties almost or livid, and curiously marked with irregular lines, dots, and specklings of carmine blue, especially about the head; the fins are red, with a broad dusky border inclining more or less to purple, and elegantly marked with numerous roundish dots of white. Bloch considers the dusky border of the fins (which in the specimen he describes is black) as a sufficient indication of the species. In his fish, the black border was distinct only in the ventral, anal, and caudal fins; to which may be added, that the dorfai fin is commonly dusky or purplish, as well as those before mentioned.

" Bloch describes this fish under the title of labrus undula, and as a native of the coasts of Brittany, Normandy, and the North sea; from the lait of which he received it through the medium of his friend, M. Spengler. Gmelin, as before remarked, speaks of it as an inhabitant of the British coasts, probably on the authority of Ray and Willoughby. But the species is not confined to Europe: a specimen of it, taken among a variety of other fishes by captain Cook in the South seas, is at this time in our collection.

" The haunts of this fish are deep waters on the boldest rocky shores, where it happens on crabs and telliwode animals; for the matturation of which, the three tuberculated bony processes of its throat are admirably constructed. This fish takes bait eagerly, and is more commonly caught with the hook and line than in the net, or by any other mode of capture.

" It appears Mr. Pennant had not considered the varieties of this fish attentively, or, we think, the ballan wraffe would not have been described as a species distinct from the labrus.
tinea. The ballan wrasse of that writer is certainly the same as our fish, from which it differs only in being of a paler colour, and in having the body marked with yellowish instead of orange or red. Such pale coloured varieties occur pretty frequently, and are indeed more common than those of deeper or more lively colours. Dr. Turton supposes the ballan wrasse to be a variety only of the labrus tusca of Linnaeus, though he describes it as a species with this distinctive character: "Body yellow, spotted with orange; above the nose a deep fululus; farther gill-cover with a deep depression radiated from the centre." In these particulars Dr. Turton was misled by the account given by Mr. Pennant, without reflecting that the same characters apply precisely to labrus tusca. Mr. Pennant informs us, the ballan wrasse "was the form of the common wrasse, only between the dorsal fin and tail was a considerable finning; above the nose was a deep fululus; on the farthest part of the gills was a depression radiated from the centre." It is already shown that the spots on this fish vary considerably; to which may be added, that the finning between the dorsal fin and tail is conspicuous in all the varieties of labrus tusca, and so also is the fululus above the nose. With regard to the last characteristic, the radiated depression on the gill-covers, one, two, or more such depressions are apparent on those parts, when divided of the large scales that adhere to them; every scale, of which there are several on the gill-covers, leaving such a radiated depression on the thin membrane of the skin, when taken off. These particulars inclined us to believe Mr. Pennant was in some measure deceived by the imperfect slate of the Scarborough specimen he examined; and our opinion has been since confirmed by various circumstances. Mr. Travis, the son of the medical gentleman who furnished Mr. Pennant with the specimen he describes, informs us the ballan wrasse is the individual fifth commonly known by the name of gil. this among the fishermen on the Scarborough coasts, where it appears in shoals during summer, and that there is only one sort found in those parts. This kind we have examined, and have no hesitation in stating it to be the ballan wrasse of Pennant, and the labrus tusca of every other ichthyologist." Vide Brit. Fishes, vol. iv.

In the details above mentioned will be found some further arguments on this subject, which the limits of our article cannot permit us to repeat. For the length of the present digression we must indeed offer an apology, and this will doubtless be accepted on the following grounds. The Ballan wrasse of Mr. Pennant has been almost uniformly admitted as a species by the best writers; when the account from which the preceding extracts were taken was published, we were aware it was received as a species by several respectable writers, and since that period, we have obtained it included as such by a modern continental writer, M.S.C. Baily, under the name of le labre ballan; he speaks of it on the authority of English authors, and as a native of this country only. To correct this error, it will be admitted, was desirable, and it was certainly no less incumbent in declining to describe the ballan wrasse, to explain our motives for such omission.

A very elegant and local British fish. To Mr. Pennant we are indebted for an account of this species; he was so fortunate as to discover it some years ago; he found it on the coast of Anglesea, off the Skerry islands. The length of his specimen was ten inches, but we procured both sexes at the same place, and of a size rather larger, the female measuring fourteen inches in length, and the male twelve. Brit. Fishes, vol. i.

Linearis. Oblong; all the rays of the dorzial fin spinous, except the last. Linna. Inhabits South America and India.

Punctatus. Tail even; back straight; crown smooth; body with indented yellowish stripes each side. Forkl. This and the two following species inhabits the sea about Constantinople.

Scina. Body greenish, with white and yellow waves; between the eyes an impreifed hollow, and before the hollow a groove. Forkl.

The middle teeth large; anterior gill-covers slightly serrated behind, posterior unarmcd; lateral line interrupted; pectoral fins yellowish and without spots, the rest olivaceous, yellow, spotted with blue.

Lupina. Pectoral fins yellow; central blue, the roth violet spotted with blue. Forkl.

Body oblong-oval, above brown, beneath white, the sides greenish-yellow, with three lines each side, each composed of a double row of red spots.

Ramentomes. Greenish-brown; filament of the first dorsal spines twice as long as the ray. Forkl.

Native of Arabia; the body lanceolate, spotted with violet on the fins, crown, and under the eyes; or sometimes fine green; scales large, rounded, ciliate, and disposed in nine rows from the belly to the back.

Ocellatus. Greenish, with a scarlet ocellus spot behind each eye. Forkl.

Inhabits the shores of Syria; the body fuscous, back yellowish-brown, and the head marked with blue irregular lines.

Lusculatus. Greenish-brown with darker bands, scales with each a ferruginous band; breast speckled with red. Forkl.

Length one foot; scales broad and entire. This species inhabits Arabia.

"The length of this species is about twelve inches; its form is graceful, and the colours, when recent, of peculiar elegance and delicacy. A fine orange varying to red upon the back, and becoming paler and whiter towards the belly, is the chief and most prevailing colour. The dorzial fin and tail are fine orange, the former strongly marked with dark orbicular, black, and prettily edged with blue; and the rest of the fins paler. The three dark spots at the posterior extremity of the back, which principally constitutes the specific distinction of this kind of wrasse, are of a rich blackish purple. There are also four other spots of a delicate rofe colour, situated contiguous to these, and which do not appear to have been mentioned by any writer. Two of these spots are disposed in the space between the three darker ones before mentioned, and the third and fourth are placed one at each extremity of the outermost ones, so as to form together a series of seven spots, which are alternately of a pale rose colour and a very deep purple. This species is uncommonly rare. Our specimen was caught on the coast of Cornwall in June 1801." Vide Brit. Fishes, v. ii.

Olivaceus.
OLIVACEUS. Body olive-green; gill-covers blue at the tip; tail with a black spot. Brunn.

Native of the Mediterranean; the length two inches; body oblong, compressed, beneath inclining to silvery.

Length three inches, compressed oblong, beneath whitish. The species inhabits the Mediterranean.

UNICANTUS. Body lined with olive; dorsal fin behind with a black spot. Brunn.

Inhabits the Mediterranean, and a supposed variety of it, which is reticulated with dusky and greenish silvery, occurs in the Adriatic. The body is three inches long, oval, compressed, and marked with about ten pale blue longitudinal lines.

VENOSUS. Green, with anastomosing veins; gill-covers and dorsal fin with a black spot. Bloch.

Native of the Mediterranean; body oval, and compressed; sides of the head with a few longitudinal red lines; filaments and band on the dorsal fin red. Length three inches.

Grises. Body grey, with darker spots; tail with a black spot at the base. Brunn.

Length three inches, oval; cheeks lined with blue; fins reddish, with dusky yellow spots. Found in the Mediterranean.

Guttatus. Body reddish, variegated with black; tail with a spot on the middle of the base. Brunn.

Native of the Mediterranean.

Adriaticus. Body with four broad transverse brown bands; dorsal fin on the anterior part ten-spined; on the posterior part marked with osseous black spots. Brunn.

Length three inches; body pale; head with oblique tawny lines.

Leopardus. Two teeth in the front of each jaw larger; body speckled with brown; from the eyes to the gill-covers a dark line, and on the tail a black band. Le labre jaguar, Lacepede.

A species found in the Indian seas, and called leopardus, from the colours and markings on the body, tail, the dorsal and anal fin, resembling those of the leopard. It was discovered by Commerson.

Bivittatus. Back red, side yellow, with two longitudinal brown rays; the upper one of which extends from the eye, the lower from the pectoral fin. Le labre a deux lignes, &c. Bloch. Le labre blesé, Lacepede.

The country unknown.

Macrolepidotus. Yellow; scales large; nine spines in the dorsal fin; beneath the eyes two rows of pores. Le labre a gants écaille, &c. Bloch.

Supposed to be an inhabitant of the Indian seas.

Albino-radiatus. Lips very thick; body yellowish, with two very long white rays, and a third above shorter. Mem. Acad. Pétr.

Country unknown.

Marmoratus. Marbled with brown and whitish. Le labre maculé, Lacepede.

A native of the Indian seas; discovered by Commerson.

The teeth are equal and distinct.

Bergylta. Scales large; the last rays of the anal and dorsal fin much larger than the others. Bloch, &c. Le labre bergylte, Lacepede.

Found in deep seas in the north of Europe: feeds on crabs and shells, and grows to the length of ten or twelve inches.

Hortulanus. Body and tail decussated with dark stripes, and a spot in each division. Le labre panier, Lacepede.

Native of the Indian seas.

Caloris. Scales large; lateral line straight; near the pectoral fin a large brown spot. Le labre calors, Lacepede.

Inhabits the seas of Europe, and is known at Dieppe under the name of “brune.” The eyes are large and black; the back dusky.

Ancanthis. Above red, varied with green spots and streaks, and the under parts yellowish, spotted with red. Le rorn acesinius.

Length seven inches; green stripes on the dorsal and anal fin about two or three in number; tail green, with the tip red.

Cyanopterus. Above varied with red, green, and yellow; beneath green and brown; fins blue. Chelatophore cyanopterus, Lacepede.

A beautiful species, found in the American seas.

Cingulum. Anterior parts livid, posterior brown, with an intermediate white girdle; dorsal fin edged with white. Lacepede, &c.

Native of the Indian seas.

DIANA. Four larger teeth in the upper jaw; in the lower two; centre of each scale marked with a brown crescent. Le labre diame, Lacepede.

An Indian species.

Macrolepis. Scales large; mouth furnished with four larger curved teeth. Le labre macrolepis, Lacepede.

Neustha. Back varied with brown, orange, and greenish; the sides marbled with brown, orange, and grey. Le labre neusthie, Lacepede.

Found in the Seine, where the fishermen distinguish it by the title of “grande vieille,” and “bandonloue marbe.”

Crinotus. Silvery, with large irregular spots of fangueous. Le labre crinota, Lacepede.

Observed by Plumber in the American seas.

Karuta. Body blackish, with a yellow longitudinal stripe each side, and beneath yellowish with rufous fin. Labrius karuta, Bloch. Le labre karut, Lacepede.

An Indian species.

Cupreus. Somewhat silvery; head, back, and fins, tinged with coppery. Johnius aneus, Bloch.

Shape lanceolate. This species inhabits the Indian seas, and is called Aeci tattali by the natives of Malabar.

Annulatus. Body encircled by nine regular straight bands or rings. Le labre annel, Lacepede.

One of the species found by Commerson in the Indian seas.

Brasiliensis. Two teeth in the upper jaw longer and recurved; dorsal and anal fin with two or three longitudinal lines. Bloch, &c.

Found on the coasts of Brazil, where it is taken with the hook and line; the fillet is excellent.

This kind inhabits the North seas. Some French authors call it “perroquet boîf.”

This beautiful species is about a palm’s length, the back brownish, beneath which the green prevails, and below this the sides and lower part are yellowish silvery; anal fin golden yellow, whence its name.

Cynclus. Pale yellow; back purple; dorsal fin reaching from head to tail. Art. Found in the Mediterranean.

Laburnum, in Botany. See Cy sis and Anagris.

Laburnum, in Gardening, a common name applied to a beautiful, flowering, ornamental tree, for pleasure and other grounds. There are two sorts of this tree in use generally, which, while young, have much the same appearance in the wood and foliage, but are afterwards ready distinguished by the smallness and fineness of the flowers, and of that of the branches. The fine flowered and more branchy sort, is the most proper for situations where ornament is required, such as shrubberies and pleasure grounds; but the more coarse growing kind, succeeds best in poor, gravelly, and rocky situations.

Laby, in Geography, a town of Sweden, in the province of Upland; 12 miles N. of Upfal.

Labyrinth, among the Ancients, was a large and intricate edifice cut out into various illes and meanders, running into each other, so as to render it difficult to get out of it. There is mention made of four celebrated labyrinths among the ancients, ranked by Piny in the number of the wonders of the world; viz. the Cretan, Egyptian, Lemnian, and Italian.

That of Crete is the most famed; it was built, as Diodorus Siculus conjectures, and Piny positively affirms, by Daedalus, by command of king Minos, who kept the Minotaur shut up in it, on the model of that of Egypt, but on a less scale: but both affirm, that in their time it no longer existed, having been either destroyed by time, or purposely demolished. It was hence that Theseus is said to have made his escape by means of Ariadne’s clue.

Diodorus Siculus and Piny represent this labyrinth as having been a large edifice; while others have considered it as merely a cavern hollowed in the rock, and filled with winding passages. If the labyrinth of Crete, says the Abbé Barthelemi (Travels of Anacharsis, vol. iv. p. 441, &c.), had been constructed by Daedalus under the order of Minos, whence is it that we find no mention of it, either by Homer, who more than once speaks of that prince, and of Crete, or by Herodotus, who describes that of Egypt, after having said that the monuments of the Egyptians are much superior to those of the Greeks; or by the more ancient geographers; or by any of the writers of the ages in which Greece flourished? This work was attributed to Daedalus, whose name, says our author, is sufficient to differ a tradition. His name, like that of Hercules, had become the resource of ignorance, whenever it turned its eyes on the early ages. All great labours, all works which required more strength than ingenuity, were attributed to Hercules; and all those which had relation to the arts, and required a certain degree of intelligence in the execution, were ascribed to Daedalus. According to Diodorus and Pliny no traces of the labyrinth of Crete existed in their time, and the date of its destruction had been forgotten. Yet it is said to have been visited by the disciples of Apollonius of Tyana, who was contemporary with those two authors. (Philosorat. Vit. Apoll. I. iv. c. 34.) The Cretans, therefore, believed that they possessed the labyrinth. At Nauplia, near the ancient Argos, says Strabo (I. viii.), are still to be seen vast caverns, in which are constructed labyrinths that are believed to be the work of the Cyclopes; the meaning of which, as Barthelemi understands them, is, that the labours of men had opened in the rock piaffes which crossed and returned upon themselves as in quarries. Such, he says, is the idea we ought to form of the labyrinth of Crete. He then suggests an enquiry, whether there were several labyrinths in that island? Ancient authors speak only of one, which most of them place at Cnossus, and some few at Gortynia. Belon and Tournefort describe a cavern situated at the foot of mount Ida. on the south side of the mountain, at a small distance from Gortyna; which, according to the former, was a quad, and according to the latter, the ancient labyrinth. Besides this another is supposed to have been situated at Cnossus, and in proof of the fact it is alleged, that the coins of that city represent the plan of it. The place where the labyrinth of Crete was situated, according to Tournefort, was, as Barthelmi supposes, one league distant from Gortyna; and, according to Strabo, it was distant from Cnossus fix or seven leagues; with respect to which our author concludes, that the territory of the latter city extended to the vicinity of the former. In reply to the inquiry, what was the use of the caverns, denominated labyrinth, Barthelmi imagines, that they were first excavated in part by nature; that in some places floes were extracted from them for building cities, and that, in more ancient times, they served for an habitation or asylum to the inhabitants of a district exposed to frequent incursions. According to Diodorus Siculus, the most ancient Cretans dwelt in the caves of mount Ida. The people, when inquiries were made on the spot, said, that their labyrinth was originally a prison. It might indeed have been applied to this use; but it is scarcely credible that, for preventing the escape of a few unhappy wretches, such immense labours would have been undertaken. See Crete.

The labyrinth of Egypt, according to Piny, (N. H. v. ii. l. 36.) was the oldest of all; and was subtitling in his time, after having flooded, according to tradition, as he says, 4600 years. He says it was built by king Petefucus, or Thisto; but Herodotus makes it the work of several kings: it stood on the southern bank of the lake Meris, near the town of Crocodiles, or Arinose, and consisted of twelve large contiguous palaces, in which the twelve kings of Egypt assembled to transact affairs of state and religion, containing 3000 apartments, 1500 of which were under ground.

This structure seems to have been designed as a pantheon, or universal temple of all the Egyptian deities, which were separately worshipped in the provinces. It was also the place of the general assembly of the magistrates of the whole nation; for those of all the provinces or nomes met here to feast and sacrifice, and to judge causes of great consequence. For this reason, every nome had a hall or palace appropriated to it; the whole edifice containing, according to Herodotus, twelve; Egypt being then divided into ten kingdoms.
Pliny makes the number of these palaces 16, and Strabo makes them 27. All the halls were vaulted, and had an equal number of doors opposite to one another, six opening to the north, and six to the south, all encompassed by the same wall. The exits, by various passages and innumerable returns, afforded to Herodotus a thousand occasions of wonder. The roofs and walls within were inlaid with marble, and adorned with sculptured figures. The halls were surrounded with pillars of white stone finely polished; and at the angle, where the labyrinth ended, stood the pyramid, which Strabo affirms to be the sepulchre of the prince who built the labyrinth. According to the description of Pliny and Strabo, this edifice stood in the midst of an immense square, surrounded with buildings at a great distance. The porch was of Parian marble, and all the other pillars of marble of Syene; within were the temples of their several deities, and galleries, to which was an ascent of 93 steps, adorned with many columns of porphyry, images of their gods, and statues of their kings, of a colossal size: the whole edifice was constructed of stone, the floors being laid with vast flags, and the roof appearing like a canopy of stone: the pavements met, and crossed each other with such intricacy that it was impossible for a stranger to find his way, either in or out, without a guide; and several of the apartments were so contrived, that on opening of the doors, there was heard within a terrible noise of thunder. Although the Arabs, since the days of Pliny, helped to ruin this structure, yet a considerable part of it is still standing. The people of the country call it the palace of Charon. See a plan and description of this labyrinth, in the present plate of it, in Pococke's Hill of the East, vol. iii. p. 61, &c. See also Perry's View of the Levant, p. 331, &c.

Strabo, Diodorus Siculus, Pliny, and Mela speak of this monument with the same admiration as Herodotus; but not one of them says that it was constructed to bewilder those who attempted to pass through it; though it is manifest, that, without a guide, they would have been in danger of losing their way. The Abbé Barthelami (ubi suprâ) suggests, that this danger introduced a new term into the Greek language. The word labyrinth, taken in the literal sense, signifies a circumscripted space, intersected by a number of passages, some of which cross each other in every direction, like those in quarries and mines, and others make larger or smaller circuits round the place from which they depart, like the spiral lines that are visible on certain shells. Hence it has been applied, in a figurative sense, to obscure and capricious questions, to indirect and ambiguous answers, and to those discursions, which, after long digressions, bring us back to the point from which we set out.

The labyrinth of Lemnos was supported by columns of wonderful beauty; there were some remains of it at the time when Pliny wrote. That of Italy was built by Porphénna, king of Etruria, for his tomb.

Labyrinth, in Gardening, a sort of maze or wilderness plantations, abounding with hedges and walks, distributed into many windings and intricate turnings, leading to one common centre, extremely difficult to be found out, designed by way of amusement. This is commonly formed with hedges, in double rows, leading in various windings and turnings, or backward and forward, with intervening plantations and gravel-walks alternately between hedge and hedge. The greatest object is to have the walk contrived in so many intricate windings, as to cause so much labour and difficulty to find out the centre, or out again in the way a person came in. But they are now rarely introduced into modern garden designs; and rarely to be seen, except in some old gardens.

Vol. XX.

The hedges for this use are usually of hornbeam, but may be of beech, elm, or any other sort of tree or shrub that can be kept in next order by clipping. The walks should be five feet wide at least, laid with gravel, and nearly rolled, and the trees and shrubs to form the thicket of wood between the hedges of any of the hardy kinds of the deciduous tribe intermixed with some evergreens. In the middle, a space should be left open as the centre. The labyrinth which is, we believe, still in existence at Hampton Court, is almost wholly formed of the common elm tree, cut in so as to keep it down to the proper height.

But small labyrinths are occasionally formed with box edgings, and borders for plants, and alleys for walking in, in imitation of the large ones, and which have good effect in small garden-ground.

Labyrinth, in Geography, a cluster of small islands in the Pacific ocean, discovered in 1723, by captain Rogge- wein, 75 miles W. from the Pernicous islands. Also, a chain of shoals, rocks, and small islands on the E. coast of New Holland, extending from Cape Tribulation to Cape York.

Labyrinthus, in Anatomy, a name given, on account of its apparently complicated structure, to the internal organ of hearing; to the part, indeed, which, from its receiving the auditory nerve, is the true seat of the sense. See EAR.

LAC, or LACCA, Gum, as it is commonly, though not very properly, denominated, because it is neither a gum nor a resin, is a kind of compound substanțe, prepared by the female of a minute insect, called by some Coccus Lacus, and by others CHERMES Lacca, which is found in several species of trees in the East Indies, and particularly on the bananatree (Ficus indica and religiosa of Linnaeus), several species of Mimosa, and the Biber on Rhamnus juguba. These insects are nourished by the trees on which they are produced, and fix themselves upon the succulent extremities of the young branches; and around their edges they are envirooned with a fluid sub-pellucid liquid, which seems to glue them to the branch. It is the gradual accumulation of this liquid, which forms a complete cell for each insect, and is what is called Gum Lacca. When the cells are completely formed, the insect is in appearance an oval, smooth, red bag, without life, about the size of a small coelomic insect, emarginated at the obtuse end, full of a beautiful red liquid. When the eggs are hatched, the young insects, or grubs, first feed upon the red liquid above-mentioned, and when this is expended, they pierce a hole through the coat that invests them, and move off one by one, leaving their exuviae behind, which are the white membranous substanțe found in the empty cells of the stick lac. The accumulation of lac appears in the economy of this insect to be the substanțe that answers the double purpose of a nidus and covering to the egg or insect in the first stage of its existence, and of food for the maggot in its more advanced state. The lac is formed into complete cells, filled with as much regularity and art as the honey-comb, but differently arranged. The flies are invited to deposit their eggs on the branches of the trees by befavouring them with some of the fresh lac steeped in water, which attracts the fly, and gives a better and larger larva. For a particular description of these insects, and their cells, we refer to the papers of Mr. James Kerr, of Rattray; Mr. Robert Saunders, surgeon, at Boglepoor, in Bengal; and Dr. Roxburgh, of Samulcotta, in the Philosophical Transactions, vol. xxxix. lxix. and lxxi. Lac is a delicate article of commerce in Assam, a country bordering on, and much connected with, Thibet, which furnishes the greatest quantity of that in use; and it is also found upon the uncultivated
tivated mountains on both sides of the Ganges. The only trouble in procuring it is that of breaking down the branches, and carrying them to market. The price in Dacca, in 1784, was Mr. Kerr, was about 12s. the hundred pounds weight, although it was brought from the distant country of Assam. The bark is of a deep red colour. If it is pale, and pierced at top, it is depreciated in value, because the infects have left their cells, and consequently they can be of no use as a dye or colour; though they may be probably better for varnishes. Of lac there are four kinds known in commerce; viz. 1. Stick lac, which is the lac in its natural state, from which all the others are formed. This is obtained in pretty considerable lumps, with much of the woody parts of the branches on which it is formed adhering to it. 2. Seed lac, which is the former broken into small pieces, gathered, and appearing in a granulated form. 3. Lump lac, which is feed lac liquefied by fire, and formed into cakes. 4. Shell lac is the purified lac, or the cells liquefied, strained, and formed into their transparent lamina. Lac is brought into this state, or purified, by the following process. It is broken into small pieces, and picked from the branches and flicks, and then put into a sort of canvas bag of about four feet long, and about six inches in circumference. Two of these bags are in common use, and each of them held by two men. The bag is placed over a fire, and frequently turned till the lac is liquid enough to pass through its pores, when it is taken off the fire, and squeezed by two men in different directions, dragging it along the convex part of a plantain tree (Musa paradisica of Linneaus), prepared for the purpose; when this is doing, the other bag is lastling, to be treated in the same manner. The mucilaginous and smooth surface of the plantain tree seems peculiarly well adapted for preventing the adhesion of the heated lac, and giving it the form, which enhances its value so much. The degree of pressure on the plantain tree regulates the thickness of the shell, and the quality of the bag determines its firmness and transparency, upon which its value depends.

The lac is applied to various purposes by the natives in India. A great quantity of the shell lac is confounded in making ornamental rings, painted and gilded in a variety of tints, to decorate the arms of the ladies; and it is formed into beads, spiral and linked chains for necklaces, and other female ornaments. It is also used for sealing-wax. For this purpose, take a flick, and heat one end of it upon a charcoal fire; put upon it a few leaves of the shell lac softened above the fire; keep alternately heating and adding more shell lac, until you obtain a mass of three or four pounds of liquefied shell lac upon the end of your flick. Knead this upon a wetted board, with three ounces of levigated cinnabar, and form it into cylindrical pieces; and to give them a polish, rub them while hot with a cotton cloth.

For japanning, take a lump of shell lac, prepared in the manner of sealing-wax, with whatever colour you please, fix it upon the end of a flick, heat the polished wood over a charcoal fire, and rub it over with the half-melted lac, and polish by rubbing it even with a piece of folded plantain leaf held in the hand; heating the lacquer, and adding more lac as occasion requires. Their figures are formed by lac, charged with various colours in the same manner. In ornamenting their images and religious houses, &c. they make use of very thin beaten lead, which they cover with various varnishes, made of lac charged with colours. The preparation of them is kept a secret. The leaf of lead is laid upon a smooth iron heated by fire below, while they spread the varnish upon it.

For grindstones, take of river sand three parts, of feed lac washed one part, mix them over the fire in a pot, and form the mafs into the shape of a grindstone, having a square hole in the centre, fix it on an axis with liquefied lac, heat the stone moderately, and by turning the axis it may be easily formed into an exact orbicular shape. Polishing grindstones are made only of such sand as will pass easily through fine muslin, in the proportion of two parts of sand to one of lac. The sand is composed of small angular crystalline particles, tinged red with iron, two parts to one of black magnetic sand. The stone-cutters, instead of sand, use the powder of a very hard granate, called Corundum. These grindstones cut very quickly; when they want to increase their power, they throw sand upon them, or let them occasionally touch the edge of a vitrified brick. The same composition is formed upon flicks; for cutting stones, shells, &c. by the hand.

For painting, take one gallon of the red liquid from the first working for shell lac, strain it through a cloth, and let it boil for a short time, then add half an ounce of reflex alkali; boil an hour more, and add three ounces of powdered load (bark of a tree), boil a short time, let it stand all night, and strain next day. Evaporate three quarts of milk, without cream, to two quarts, upon a flow fire, curdle it with some milk, and let it stand for a day or two, then mix it with the red liquid above-mentioned; strain them through a cloth, to add to the mixture 1/4 oz. of alum, and the juice of eight or ten lemons; mix the whole, and throw it into a cloth-bag strainer. The blood of the insect forms a coagulum with the caustic part of the milk, and remains in the bag, while a limpid acid, water drains from it. The coagulum is dried in the shade, and is used as a red colour in painting and colouring.

For dyeing, take one gallon of the red liquid prepared as before without milk, to which add three ounces of alum. Boil three or four ounces of tamarinds in a gallon of water, and strain the liquor. Mix equal parts of the red liquid and tamarind water over a brisk fire. In this mixture dip and wring the silk alternately, until it has received a proper quantity of the dye. To increase the colour, increase the proportion of the red liquid, and let the silk boil a few minutes in the mixture. To make the silk hold the colour, they boil a handful of the bark called load in water; strain the decoction, and add cold water to it; dip the dried silk into this liquor several times, and dry it. Cotton cloths are dyed in this manner; but the dye is not so lasting as in silk. The lac colour is preferred by the natives upon flakes of cotton dipped repeatedly into a strong solution of the lac in weak vinegar, and then dried. Mr. Hatchett, as Mr. Charles Wilkins informed Mr. Hatchett, disolve shell lac in water, by the mere addition of a little borax; and the solution, being then mixed with ivory-black, or lamp-black, is employed by them as an ink, which, when dry, is not easily acted upon by damp or water. Mr. Hatchett found this fact to be exactly as it was stated by Mr. Wilkins.

Besides the lac above-mentioned, there is another fort which is white or yellowish, brought from Madagascar, very much resembling the pe-la of the Chines, which has been lately examined by Dr. Pearson. See LACCA Acid.

Mr. Hatchett (Phil. Trans. for 1804, part ii.) has detailed a number of experiments for the analysis of the three common species of lac, with a view of ascertaining its constituent parts and discriminating properties.

Lac, though long known in Europe, has not much attracted the attention of chemists. The first person who subjected it to a regular examination was the younger Geoffroy, the result of which is published in the Mem. de P'Acad. de Paris for 1714. He concluded that this substance is not, as some have supposed, a gum or resin, which has
has exuded from vegetables simply punctured by insects. Geoffroy and Lemery obtained from lac, by distillation, some acid liquor, and a butyraseous substance; and Geoffroy observes, that when flick-lac was thus treated, some ammonia was also obtained, but not when feed-lac was employed. Geoffroy considered lac as a kind of wax, very distinct from the nature of gum or resin. Since his time it has been little examined, and therefore chemists have entertained various opinions concerning it. Chaplet, adopting Geoffroy's opinion, calls it a kind of wax; but Gren and Fourrey regard it as a true resin.

Mr. Hatchett found that when water is poured on flick lac, reduced to powder, it immediately began to be tinged with red, and by heat, a deep-coloured crimson solution was formed. Repeated operations of this kind reduce flick-lac to a yellowish-brown substance, and the water no longer receives any colour. The portion separated from the lac has, on an average, amounted to 10 per cent.; but as it cannot be completely separated, considerable variations must be expected in different samples.

Fine feed-lac does not afford more than 2.5 or 3 per cent. of the colouring substance; and shell-lac, when treated in the same manner, i. e. merely with water, did not yield more than 1.5 per cent. Alcohol dissolves a considerable portion of each of the different kinds of lac; and when heat is not employed, the dissolved part is resin, combined with some of the colouring matter; but if the lac is digested with heated alcohol, the solution is more or less turbid, and it is difficult to obtain it in a state of purity and transparency, either by reboil or filtration. The solution obtained by digesting flick-lac in alcohol, without heat, is of a dark brownish-red colour; and the insoluble part, remaining after the greater part of the colouring matter, most easily soluble in water. The proportion of resin thus dissolved, when flick-lac is treated with alcohol, amounted to 67 or 68 per cent. The feed-lac used by Mr. Hatchett was very pure, and yielded to alcohol about 88 per cent. of resin, containing little of the colouring matter. Shell-lac, in small fragments, by simple digestion with alcohol, afforded in the first instance nearly 81 per cent.; but part of the resin required subsequent operations to separate it, so that the total quantity of resin might be estimated at 91 per cent. Sulphuret ether does not seem to powerfully upon the varieties of lac as alcohol; and, therefore, ether is not the best menstrum for lac. Concentric sulphuric acid acts first on the colouring matter of lac; and after a short digestion in a sand-bath, the whole is converted into a reddish-brown thick liquor, which soon becomes black; and the chief part of the lac is separated in an insoluble state, resembling coal. During the solution of lac in sulphuric acid, a considerable quantity of sulphurous acid gas is evolved. When lac is digested with nitric acid, nitrous gas is at first produced; the lac swells much, and is converted into a deep yellow opaque brittle substance, which, by a sufficiency of nitric acid, and a continuance of the digestion for about 48 hours, is dissolvo.

This yellow nitric solution is converted by evaporation into a deep yellow substance, which burns like resin, but is soluble in boiling water. Muriatic acid dissolves the colouring matter and gluten of lac with a feeble action, unless the resin has been previously separated. Acetic acid much resembles the muriate in its effects. Stick-lac, feed-lac, and shell-lac are partially dissolved by acetic acid; and the dissolved part consists of the colouring extract of resin, and of gluten; the wax being the only ingredient which is insoluble in this menstrum. A saturated solution of boracic acid in water dissolves the colouring extract; but the lac is little, if at all, acted upon by this acid. Suburate of soda or borax has a powerful effect on lac, so as to render it soluble in water; and it is concluded from these facts, that the excess of soda in borax is the active substance, which conclusion is corroborated by experiments made with the alkalis. In order to render lac, especially shell-lac, soluble in water, about one-fifth of borax is necessary. The best proportion of water to that of lac is 18 or 20 to 1; so that 20 grains of borax, and 4 oz. of water, are, upon an average, requisite to dissolve 100 grains of shell-lac.

The general properties of the solution how, that it is a faponaceous compound, which, being used as a varnish, or vehicle for colours, becomes (when dry) difficult soluble in water. The lixivium of pure soda, and of carbonat of soda, completely dissolve the several kinds of lac; and the solutions resoluble thence formed by means of borax, excepting that they are deeper coloured. Lixivium of pure or caustic potash speedily dissolves the varieties of lac, and forms faponaceous solutions, similar to that with borax, exclusive of the colour, which more approaches to purple. Lixivium of carborate of potash extracts a great part of the colouring matter, but less completely dissolves the entire substance of lac than pure potash. Pure ammonia, and carbonat of ammonia, readily act upon the colouring matter of lac; but do not completely dissolve the entire substance.

From a variety of other experiments, as well as those, the results of which we have given, but which we cannot recite, it appears that the different kinds of lac consist of four substances, namely, extract, resin, gluten, and wax. The extract, when dry, is of a deep red colour, approaching to purple, crimson; emitting smoke when laid on a red-hot iron, with a smell that of burned animal matter, and leaving a bulky porous coal; partially soluble in water, hot or cold; more slowly in alcohol, and with a less beautiful colour; insoluble in sulphuric ether; soluble in sulphuric, nitric, and acetic acid; partially in muriatic acid; not very readily in acetic acid; almost perfectly soluble in the lixivium of potash, soda, and ammonia, with a beautiful deep purple colour. When pure alumine is put into the aqueous solution, it does not immediately produce any effect, but with the addition of a few drops of muriatic acid, the colouring matter speedily combines with the alumine, and a beautiful lake is formed. A fine crimson precipitate is also produced by muriate of tin, when added to the aqueous solution; a similar coloured precipitate is also formed by the addition of solution of stibnific. These properties of the colouring substance of lac, especially its partial solubility in water and in alcohol, and its insolubility in ether, together with the precipitate formed by alumine and muriate of tin, indicate that this substance is vegetable extract, perhaps slightly animalized by the coccus.

The resin of lac is of a brownish-yellow colour, emitting on a red-hot iron much smoke, with a peculiar sweet odour, and leaving a spongy coal; completely soluble in alcohol, ether, acetic acid, nitric acid, and the lixivium of potash and soda; precipitated by water from alcohol, ether, acetic acid, and partially from nitric acid; and possessing the other general characters of a true resin.

The gluten is obtainable in two ways; if the pieces of lac, after digestion in alcohol, be digested with dilute acetic, or muriatic acid, most of the gluten is dissolved, and may be precipitated by alkalis, added in due proportion; but is redissolved by an excess of them, and then is separable by acids. It much resembles the gluten of wheat.

The wax of lac is found floating like oil on the surface of a solution of lac, after long and repeated digestion in boiling nitric acid, and may be collected when cold; or it may be
be more easily obtained in a pure state, by digesting the residue left by alcohol in boiling nitric acid. The wax, thus obtained, when pure, is pale yellowish-white, and (unlike bees' wax) is devoid of tenacity, and extremely brittle; it melts at a much lower temperature than that of boiling water, and burns with a bright flame, and an odour resembling that of pernambuco. It is insoluble in water and cold alcohol; but the latter, when boiled, partially dissolves it, and upon cooling, deposits the greater part; soluble in heated fulphuric ether, but upon cooling, nearly the whole is deposited. Lixivium of potash, boiled with the wax, forms a milky solution; but most of the wax floats on the surface in the lake of white flocculi, and appears to be converted into a kind of soap of difficult solubility; it is no longer inflammable; and, with water, forms a turbid solution, from which, as well as from the solution in potash, the wax may be precipitated by acids. Ammonia, when heated, dissolves a small portion of the wax, and forms a solution similar to the former; nitric and muriatic acids do not act upon the wax. When the properties of this substancte are compared with those of bees' wax, a difference will be perceived; and on the contrary, the most striking analogy is evident between the wax of lac and the myrtle wax which is obtained from the Myrica cerifera. The properties of myrtle wax, described by Dr. Boatock in Nicholson's Journal for March, 1803, coincide so perfectly with those of the wax of lac, that Mr. Hatchett is led to consider them as almost, if not altogether, the same substance.

Our作者, from his analysis of the three different species of lac infers, that the substances that compose them bear the following proportions: 100 parts of stick-lac gave 58 of resin, 10 of colouring extract, 6 of wax, 5.5 of gluten, and 6.5 of extraneous substances; 100 parts of seed-lac gave 85.5 of resin, 2.5 of colouring extract, 4.5 of wax, and 2 of gluten; 100 parts of shell-lac gave 90.5 of resin, 0.5 of colouring extract, four of wax, and 2.8 of gluten.

We have already specified several uses to which lac is applied in India, and it is no less important, in a variety of respects in Europe. A solution of lac in water may be advantageously employed as a varnish, which is equal in durability, and other qualities, to those prepared with alcohol; and, of course, much cheaper. It will be found, likewise, of great use as a vehicle for colours; for, when dry, it is not easily affected by damp, or even by water. Mr. Hatchett says, that with a solution of this kind he has mixed various colours, such as vermilion, fine lake, indigo, Prussian blue, sap-green, and gamboge; and it is remarkable, that although the two last are of a gummy nature, and the others had been previously mixed with gum (being cakes of the patent water-colour), yet, when dried upon paper, they could not be removed with a moistened sponge, until the surface of the paper itself was rubbed off. In many arts and manufactures, therefore, the solutions of lac may be found of great utility; for, like mucilage, they may be diluted with water, and yet, when dry, are little, if at all, affected by it.

The colour given by lac is less beautiful, but more durable than that given by cochineal. To render the colouring matter of the lac diffusible in water, so as to be applied to the stuffs to be dyed, Mr. Hellot directs the following process:—Let some powdered gum-lac be digested for two hours in a decoction of comfrey-root, by which a fine crimson colour is given to the water, and the gum is rendered pale or straw-coloured. To this tincture, poured off clear, let a solution of alum be added; and when the colouring matter has suffused, let it be separated from the clear liquor, and dried. It will weigh about one-fifth of the quantity of lac employed. This dried calca is to be dissolved or diffused in warm water, and some solution of tin is to be added to it, by which it acquires a vivid scarlet colour. This liquor is to be added to a solution of tartar in boiling water; and thus the dye is prepared.

The method of obtaining the fine red lac used by painters from this substance is by the following simple process:—Boil the stick-lac in water, filter the decoction, and evaporate the clear liquor to a dryness over a gentle fire. The occasion of this easy separation is, that the beautiful red colour, here separated, adheres only lightly to the outsides of the sticks, broken off the trees along with the gum-lac, and readily communicates itself to boiling water. Some of this stickling matter also adhering to the gum itself, it is proper to boil the whole together; for the gum does not at all prejudice the colour, nor diffuse in boiling water: so that after this operation the gum is as fit for making sealing-wax as before, and for all other uses which do not require its colour. See Lake.

A tincture of gum-lac may thus be prepared:—Take two ounces of gum-lac, reduce it to a fine powder, and make it into a stiff pulp with oil of tartar per delphinium; let this in an open glafs to dry by a gentle heat, then remove it to the open air, that it may relent and grow soft; then dry it again, and repeat this two or three times, at the end of which the hard body of this resin will be found resolved into a purple colour. This may yet again be dried, and when dried must be reduced to powder, which powder will afford a fine strong tincture to spirit of wine, being boiled in it in a tall glas in a land-heat for two or three hours. And by this process strong tinctures may be made from myrrh, amber, gum, juniper, &c. which will yield no tincture of strength to spirit of wine alone, if treated in the usual way.

A spirituous tincture of stick-lac was formerly sometimes given as a mild refrigerant and corruptor in female weaknesses, and in rheumatic and scorbatic disorders. But the principal medicinal use of this concomitant was as a topical corrombator and antifeptic, in lachryms and scorbatic bleedings, and exuberations of the gums. Some employed for this purpose a tincture of the lac in alun water; others a tincture made in vinous spirits, impregnated with the pungent antifebatics. The college of Edinburgh directed an ounce of the powdered lac, with half an ounce of powdered myrrh, to be digested in a land-heat, for five days, in a pint and a half of spirit of fevows grays.

The gum-lac has been lately used as an electric, instead of glafs, for electrical machines. See Lacquer, Lake, and Varnish.

Lac, or Lacca, Ammoniac, in the Materia Medica. See Gum Ammoniac.

Lac, or Lacca, Artificial, or Lacque, is also a name given to a coloured substance, drawn from several flowers; as the yellow from the flower of the juniper, the red from the poppy, and the blue from the iris or violet.

The tinctures of these flowers are extracted by digesting them several times in aqua vitae, or by boiling them over a slove fire in a lixivium of pot-ashes and alun. An artificial lacca is also made of Brazil wood, boiled in a lixivium of the branches of the vine, adding a little cochineal, turmeric, calcined alun, and arsenic, incorporated with the bones of the cuttle-fish pulverized, and made up into little cakes, and dried.

If it be to be very red, they add the juice of lemon to it; to make it brown, they add oil of tartar.

Dove-coloured, or colombine lacca, is made with Brazil of Pernambuc, steeped in distilled vinegar for the space of a month,
LAC

month, and mixed with alum incorporated in cuttle-fish bone. For other proceeses, see Lake and Madder.

LAC, Acid of: See Laccic Acid.

LAC, or Gum LAC. See Croton.

LAC Luna. Dr. Plott gives this fossil as a mark of good lime-rock; but it has been observed, that two quarries in Ireland, where lac luna was found, were of building stone, but would not burn into lime. Phil. Trans. N 477: § 9.

There are many varieties of this mineral, differing in their texture and colour. It is found in many parts of Europe, and also in Asia and America. Many of the English quarries in Oxfordshire, Gloucestershire, Northamptonshire, and Derbyshire, afford considerable quantities of it. It adheres to the roofs and walls of grottos and caverns, and is lodged in the fissures of strata of stone, sometimes in form of a pinnaceous powder, and sometimes concreted into masses. Its surface is rough and dusty; it colours the hands, adheres to the tongue, melts readily in the mouth, without grittiness, yields an inodour tallow, and rates an effulbition in water, which soon dissolves it in a fine white powder. See Mineral Agaric.

LAC Sulphur. In Chemistry, and the Materia Medica, denotes sulphur separated by acids from its alkaline solution, which in the process changes its lemon-yellow colour for a grey or yellowish-white like cream. As a medicine it is thought to be somewhat milder. See Sulfur.

LAC Virginale. See Virgin's Milk.

LAC Virginis. See Virgin's Milk.

LAC, in Geography, a town of Africa, in the country of the Foulis; 10 miles N.W. of Goumel.

LACABEN, a town of Afrom Turkey, in the province of Abadula; 20 miles S.S.W. of Mafatra.

LACANITIS, in Ancient Geography, a country of Asia, in Cilicia, according to Ptolemy, who places it in one city, viz. Irenopolis.

LACARACOONDA, in Geography, a town of Bengal; 10 miles S. of Nagore. N. lat. 23° 48'. E. long. 87° 27'.

LACARIA, a small town of Italy, in the eastern part of Lucania, S. of Hercules, and near the gulf of Tarentum; founded by a colony of Phocaeans, and celebrated for its good wine.

LACAS, LAC, a town of the island of Cuba; 15 miles W. of Villa del Princepe.

LACCA. See LAC.

LACCADIVE ISLANDS, in Geography, a group of small islands in the Indian seas; the nearest being about 15 miles from the coast of Malabar. They are supposed to be the islands called by Ptolemy "Infusa numero 19," though in reality they are 33. All of them are small, rocky on their sides, covered with trees, and separated by deep channels. They are visited by English ships in their passage from India to the Persian gulf, or Red seas. Their principal traffic consists of the produce of the cocoanut, such as the oil, cables, and cordage, and also of fish, which, being dried, is sent to the continent of India, whence rice is obtained in return. They also trade to Malec, in large boats, and for their commodities they bring back dates and coffee. Ambergris is often found floating near these islands. N. lat. 10 to 12° 40'. E. long. 71° 15' to 73° 30'.

LACCIA, in Ichthyology, a name given by Paulus Giovanni to the fish, or, as we sometimes call it, the mother of the pilchards. See Clupea Alya.

LACCIC ACID, in Chemistry, is a substance that was first introduced to the notice of chemists by Dr. Pearson. It is obtained from a peculiar compound called white lac, which Dr. Anderdon of Madras discovered to be the product of some insects of the coccus tribe. Small quantities of it were sent to Europe about the year 1789; and, at the request of Sir Joseph Banks, an examination of it was undertaken by Dr. Pearson, and the results of his inquiries appeared in the Philosophical Transactions for 1794. The lac, in its natural state, is of a grey colour; and occurs in pieces of from three to fifteen grains in weight. Many of its properties present considerable resemblance to those of bees' wax; and Dr. Pearson is of opinion, that these substances are very nearly allied to each other, differing only in the proportion of their constituents. A curious circumstance, connected with this point, is, that the insect which secretes the lac also produces honey; but the phenomena attending the appearance of the latter product have not been examined with the attention which they merit. To procure the laccic acid, it is merely necessary to expose the lac, as afforded by the coccus, to a heat just sufficient to liquefy it. A reddish watery fluid will separate, having the smell of newly baked hot bread; and it is this substance which constitutes the acid under inquiry. The following are some of its properties. At the temperature of 65°, it has a specific gravity of 1.025. Paper stained with laccic acid is reddened by it. It poisons a silk thread, and is somewhat bitter; but is not in the smallest degree fuming. By exposure to the air it becomes muddy, and deposits a small quantity of sediment. Dr. Pearson distilled 750 grams of it, and after evaporation the product until it grew turbid. On standing some hours, acicular crystals were produced, having a bituminous tinge, which amounted to about 34th of the weight of the fluid employed. The acid diffuses carbonic acid with effervescence, and by evaporation yields crystals which are deliquescent. It produces a purplish tint on being mixed with lime-water, but no sediment appears. Transparency aids the supply of a green precipitate, and with acetate of lead a reddish-powder is deposited. This forms nearly the whole of the information that has been conveyed to us with respect to it; and as yet, therefore, nothing either very striking, or very important, has been communicated by the discovery. It is to be lamented that Dr. Pearson had so small a quantity of matter to operate upon in his experiments, as it becomes difficult, from the want of a more complete examination, to ascertain whether the substance is entirely new to us; or whether it is only the modified appearance of some compound with which we had been before acquainted.

LACCOS, AXONES, among the Greeks, a ditch or trench used instead of an altar, when sacrifices were to be offered to the subterranean or infernal gods. See ALTAR.

LACE, in the Manufactures, is formed of thread, cotton, or silk, woven into a net, the meshes of which are varied in their figure, according to the design of the pattern, as octagons, hexagons, &c. &c. The lace is also ornamented by a thread, much thicker than the thread forming the net, which is woven in among the meshes, in the figure of flowers, and other fantastic curves; upon the beauty and elegance of which, the value of the lace depends. This thick thread is called the gimp. Lace is made upon a pillow or cushion, upon which a piece of flinted parchment is stretched, having a number of holes pricked through it, to form a pattern of the intended lace. Through these holes, pins are stuck into the pillow; and the threads, wound upon small bobbins, are woven around the pins, and twisted round each other in various ways, to form the required pattern. This process is extremely tedious, particularly for the wide laces, with complicated patterns; and though it is extremely expensive to
the consumer, the people (chiefly in Bedford and Bucking-
hamshire) who manufacture it can only obtain sufficient to
support a wretched existence, by the most incessant exertion.
Of late years, the manufacturers of Nottingham have di-
rected their ingenuity to imitate this species of lace by ma-
chinery, in which they have succeeded most perfectly: but
still it is only an imitation, the knot or loop of the meshes
being essentially different. In the pillow lace, the net or
meshes may be described, by fupposing a number of ropes,
each formed of two or more threads twisted round each other;
these are extended parallel; but at every two or
two spiral turns of these ropes, the strands or threads com-
poling one rope are twisted around with those of its neigh-
bour, and then return to be twisted with its own; and this
reciprocally of the whole number forms a netting; the figure
of the meshes depending upon the number of turns which
are made, before the twirl is changed from one rope to the
next. To form a lace of this description, it is essential that
the ends of each thread be detached, and capable of being
twisted over the adjacent threads. This is easily done by
the hand upon the pillow, by twisting the bobbins round
each other; but has many difficulties which prevent its per-
formance by machinery.

The Nottingham lace is only a modification of the fitch
or loop of which stockings are made, all the meshes being
formed by a continuance of one thread, which is, by
the machine, formed into loops a whole course (that is, length
of the intended piece of lace) at once, by pilling it down
alternately over and under between a number of parallel
needles; a second course is then made of similar loops on
the same needles, and the loops of the first are drawn through
those of the second, in such a manner as to form meshes by
retaining the first loops; the second are then retained by a
third course, and this by a fourth, and so on. The ma-
chine is very nearly like a common flocking-frame, but pro-
vided with an additional apparatus, which can be readily
applied. It consists of a frame, containing a number of
needles, which we will call points; these are introduced be-
tween the fixed needles of the flocking-frame, and a certain
number (one half, for instance) of the loops in the thread
are taken off the fixed needles upon these points, which are
then moved endways, the space of two, three, or more fixed
needles, and put down upon them again. Another set of
loops is then taken upon the points, and moved in the op-
posite direction; by this means, crossing the loops over each
other, and forming meshes, the figure of which will depend
upon the number of needles it is thus carried over. But as
this admits of no great variety of patterns, another machine
has been invented, which is much more extended in its ap-
lications. Like the former, it has the parts of the flock-
ing-frame, but differently made. The thread is, in this,
rolled upon a cylinder, in the same manner as a weaver’s
beam; as many threads being wound round it as there are
needles in the frame. These threads pass through eyes in
the ends of small points, called guides, which are opposite
the needles; and these guides are fixed on two bars, each of
which has half the guides fastened in it. Thus, one guide is
fast in one bar, and the next in the other, and go on alter-
nately of the whole. Each of the guides presents a thread
to its needle, and are all at once moved by the hand to twist
the threads two or three times round the needles which are
opposite them: the loop is now made in a manner similar to
the other frame. The next time, the alternate guides are
shifted endways, so as to apply themselves to other needles
than those they were opposite before. This crosses the
thread, so as to make a net; but the quantity which is
shifted endways is altered every time, by means of the ma-
chinery, fo as to move a certain number of needles; which
number is altered every time, to produce the pattern. All
the parts of this machine, except the guides, are moved by
means of treadles, instead of using the hands, as in the com-
mon flocking-frame. The net produced by these frames is
woven in bands of the width of the intended lace, leaving a
wider mesh than the others, through which the division is to
be made to separate the lace into narrow strips. Before
cutting up in this manner, the lace is spread in a frame, and
a common needle with a thick thread is worked in the
meshes, to imitate the gimp, according to the pattern for
which the lace is intended.

The lace trade of Nottingham has been carried to a very
great extent, but is at present in a state of stagnation, being
chiefly dependent on foreign trade, as it has never been in
such great repute with the British ladies.

Lace is also made of gold and silver thread (which see),
much in the same manner as the bone or blond lace above
described. The importation of gold and silver lace is pro-
hibited. Great quantities of the finest blond laces have
been imported from Flanders. By 3 Geo. III. c. 21. and
3 Geo. III. c. 48. if any person shall import any ribbands,
laces, or girdles, not made in Great Britain, whether the
lace shall be wrought of silk alone, or mixed with other
materials, the same shall be forfeited, and may be seized by
any officer of the customs, in whatever importers, venders,
or retailers’ hands they may be found; and the importer,
and every person assisting therein, and the venders and re-
tailers in whole custom they shall be found, or who shall fail
or expope the same to sale, or conceal with intent to pre-
vent the forfeiture, shall forfeit respectively 200l. with costs
to the king, and half to the officer who shall inform and pro-
secute.

Lace is also used for a kind of chord made of silk or cot-
ton, chiefly used in lacing women’s stays.

LACE BURY. See DAVH.

LACEDÆMON. In Ancient Geography, a celebrated
town of Greece, in the Peloponnesus, in a country which
was originally called Laconia, and afterwards changed into
Lacedæmon, or Sparta. See SPARTA. See also LA-
CONIA.

LACEDÆMONIANS, the inhabitants of Laconia,
are said to have derived their name from Lacedæmon, heir
and successor of Eurotas, whose daughter he married.
Their ancient name was IDECREMER, which has been found in
some ancient inscriptions. The commencement of their his-
tory is little known. But their first king, according to the
chronology most generally received, was Lelex, famed
among the Greeks, because he was supposed to have been one of
the Aborigines; and from him his subjects bore the ancient
name of Leleges. He began his reign in the year 1516
B.C., was succeeded by his eldest son Mylæ, and Mylæ
was succeeded by his son Eutrobus, who, having no male
issue, appointed for his successor Lacedæmon, the suppos-
ed son of Jupiter by Taygeta, to whom he gave his daughter
Sparta in marriage. Lacedæmon was the first king of the
Lacedæmonian line, which consisted of twelve sovereigns,
the last of whom was Tifamenes, who terminated this line in
1104 B.C., upon the return of the Heracle with the Pe-
loponeus. In 1122 B.C., upon the division of the Pelo-
ponneus by the Heracle, the kingdom of Lacedæmon or
Sparta commences under Procles and Evrylithes, the two
sons of Arilodemos, the chief of the Heracle. Evry-
thene was succeeded by his son Agis, from whom the de-
cendants of that line had the appellation of Agide, or
Agide; and the first princes of the former line were de-
nominated Procles; till Euerytion, or Evrypon, the third
Lacedæmonians.

of this line, exchanged it for Eurynomea, or Enypontida. In the line of Agis succeeded Echestratus 1058 B.C., La-
botas 1023 B.C., Doryes 986 B.C., Agesilaus 957 B.C., and Archelais 912 B.C. The successors of Procles were
Ivas 1060 B.C., Eurypon 1028 B.C., Prytanes 1021 B.C., Eunomus 986 B.C., and Polydectes 977 B.C. Lycurgus,
the son of Eunomus, succeeded Polydectes, but he only re-
tained the kingdom till his sister was delivered of a son, to
whom he immediately resigned it; but his situation being
rendered untenable, he set out for Crete about eight months
after the birth of his nephew. During this voluntary exile
of ten years, he meditated that new form of a common-
wealth into which he afterwards modelled the government;
and for this purpose he returned to Lacedæmon in the year
854 B.C.

The government of Lacedæmon was, as we have seen,
originally monarchical; and though the kings had some sub-
odordinate magistrates, chosen by themselves, of whom coun-
sel they occasionally availed themselves, yet the will of the
sovereign was the supreme law. Thus the sovereign power
pulled through a succession of twelve princes, from Laced-
æmon, the son in-law of Euroras, and founder of this mo-
narchy. Under Eurythèmes and Procles the government
took a new form, and instead of having one sovereign, it be-
came subject to two. These two brothers governed jointly,
and with equal power and authority, each bearing the title
of king of Lacedæmon, and being acknowledged and obeyed
as such. In this bipartite condition the government con-
tinued under a succession of thirty princes of the line of Eu-
rythèmes, and twenty-seven of that of Procles, and it termi-
nated in both about the same time. Discord, however,
were unavoidable, and soon commenced. Two parties were
formed, and they became turbulent and unmanageable. By
devises that were thus occasioned, the regal dignity fell
to such contempt, that the government was upon the
brink of falling into anarchy and confusion, when Lycur-
gus, as we have said, undertook the management of it, dur-
ing some part of his nephew Charilaus's minority. During
the period of his voluntary absence, when he had travelled
through Crete, Asia, and Egypt, the government had
become too corrupt, that not only his friends, but even those
who had been his most zealous enemies, were glad to repeat
their embassies, entreat him to return and save his country
from ruin. These were the inevitable consequences of that
fatal division of the regal authority between two com-
petitors, which Lycurgus took a quite different method
of remedying than by confining it again to either of the
lines. The plan he adopted was that of reducing their au-
thority, by constituting a senate, endowed with the supreme
power in all civil matters, and leaving to the kings, besides
the title and honour, only the management of military and
religious affairs. In order to qualify him for the important
undertaking in which he now engaged, he had paid particu-
lar attention to the laws of Minos at Crete, and in Asia he
had observed the effects which are produced by different go-
vernments and manners, and he had also availed himself of
the opportunities which Egypt had afforded him of gaining
wieldom. With a view of giving greater effect and stabili-
ty to his new constitution, he had, like other legislators,
taken care to secure the approbation of heaven. With this
view, he consulted the oracle at Delphi, and had received
for answer: "the gods accept thy worship, and under their
auspices, thou shalt frame the most excellent of political con-
fstitutions." Nor did Lycurgus ever afterwards neglect to
maintain a correspondence with the Pythia, who successe-
ively implored on his laws the seal of divine authority. He
also, before he commenced his operations, submitted his plan
to the examination of his friends and the most distinguished
citizens; and from these he selected thirty, who were to
attend him completely armed in the general assembly, and to
defend him from those personal assaults which he had reason
to apprehend in the promulgation of his laws. At length
the new constitution was approved by all orders of the state.
Yet, notwithstanding its excellence, it was not afforded of
duration. Lycurgus, therefore, when the people were assembled,
thus addressed them: "it shall remain for me to lay before
you the most important article of my legislation; but I wish
first to consult the oracle of Delphi. Promise me that, un-
til my return, you will make no alteration in the laws already
established." They promised him. "Swear it," said he.
The kings, senators, and citizens, called the gods to be wit-
nesses to their words. This solemn engagement could not
but be irrevocable, for it was his resolution never more to
return to his country. Accordingly he immediately repaired
to Delphi, and enquired whether the new laws were sufficient
to ensure the happiness of the Spartans. The Pythia, having
answered, that Sparta would be the most flourishing of cities
for long as the should continue to observe them, Lycurgus
sent that oracle to Lacedæmon, and condemned himself to
voluntary banishment. He died far from the country of
whose happiness he had been the cause. See Lycur-
gus.

In settling the government of Lacedæmon, Lycurgus was
too wise to abandon the administration of public affairs to the
caprices of the multitude, or to leave it entirely to the will
of the two princes on the throne. He fought, as we have
already said, a mean, by which he might restrain and temper
power by wisdom; and he thought that he had found it in
Crete, where a supreme council moderated the authority of
the sovereign. Such an establishment he introduced at Spar-
ta, under the appellation of an senate. Twenty-eight aged
men, of comminurate experience, were appointed to share
with the two kings the plentitude of power. In this august
enate the great interests of the state were to be discussed;
here the two kings presided, and every question was to be
decided by the plurality of voices; and the determinations
of this council were afterwards laid before the general assem-
blie of the state, which had the power of approving or re-
jecting, but not of altering them. For about 130 years the
enate maintained a just equilibrium between the kings and
the people; but the places of the senators, as well as the au-
thority of the kings being held for life, it was to be feared
that, in time, these might too closely unite, and no longer
find any opposition to their will. It was therefore deemed
advisable, with the sanction of the Delphian oracle, to
transfer a part of their functions to five magistrates, called
Ephori, or inspectors appointed to defend the people in case
of oppression. This new intermediate body was instituted,
with the consent of the state, by the king Theopompus; or,
if it had been originally established by Lycurgus himself,
it was revived, with some additional powers and prerogatives,
by Theopompus. (See Ephori.) The constitution of Ly-
curgus contained a happy mixture of monarchy, aristocracy,
and democracy. Theopompus added to these an oligarchy
which afterwards became tyrannical. Although Lycurgus
limited the authority of the kings, he left them honours and
prerogatives which they enjoyed as the heads of religion, the
administration, and the army. Besides certain priesthoods,
which were hereditary, they regulated the public worship, and
appeared at the head of the religious ceremo-

nies. One of their prerogatives invited them with the
right of maintaining a secret correspondence with the priests
of Delphi, the authors of those oracles which often decided
the fate of an empire; and this may be considered one of
the
LACEDÆMONIANS.

the most important privileges in the possession of royalty. As head of the state, the king, upon ascending the throne, might annul the debts which a citizen had contracted either with his predecessor, or with the republic; and he possessed certain portions of inheritances, affixed him by the people, which he might distribute during life in favour of his relations. The two kings presided in the senate, and proposed the subjects for deliberation. Each gave his suffrage in person or by proxy; and this single suffrage was equivalent to two. When the two kings agreed in proposing any project of manifest utility to the public, no person was permitted to oppose it. All suits relative to the maintenance of the highways, the formalities of adoption, or the choice of the king who should be obliged to marry an orphan heiress, were submitted to the decision of the kings. The kings were not allowed to be absent during peace, nor both at once in time of war, unless there were two armies in the field. They had by right the command of the army, with such appendages of splendid and authority that might ensure them respect and obedience. The state provided for the maintenance of the general and his household, with the necessary attendants. Accordingly, he had full leisure to direct the operations of the campaign, to sign truces with the enemy, and to give audience and answers to the embassadors of foreign powers. In time of peace the kings were considered merely as the first citizens of a free city; appearing in public without a retinue, and without ostentation. As first citizens they occupied the first place, and every person rose in their presence: and in all repasts, public and private, they were allowed a double portion, which they shared with their friends. When the kings died, they were honoured with various tokens of respect.

The senate, consisting of the two kings, and twenty-eight aged persons, were the supreme council, in which were discussed, in the first instance, all questions relative to declaring war, concluding peace, entering into alliances, and other high and important affairs of state. The dignity of a member of this council was never granted but to the citizen who, from his earliest youth, had been distinguished for consummate prudence and eminent virtues; nor could he arrive at it before the age of sixty years, and he retained it till his death. The election took place in the forum, where the people were assembled with the kings, senators, and the different classes of magistrates; and it was attended with various solemnities and acclamations. When it was decided, it was honoured with a kind of triumphal procession, and with ceremonies performed in the temples. Of the functions pertaining to the senator, some respected the state, and others related to particular cases, which were referred to the judgment of the members. On this tribunal depended not only the lives, but the honours of the citizens. When a king was accused of having violated the laws, or betrayed the interests of the state, the tribunal which acquitted or condemned him was composed of the twenty-eight senators, the five ephors, and the king of the other family. However, he might appeal from them to the general assembly of the people.

The ephors were elected by the people from among the citizens of every rank; they were five in number, and changed every year, to prevent their abusing their authority. (See Ephors.) We shall here add, that the kings in their own name, and the ephors in the name of the people, engaged, by a solemn oath, the former to govern according to the laws, and the latter to defend the royal authority so long as it shall not violate the laws.

As the Spartans had interests peculiar to themselves, they had also others in common with them to the deputies of the different cities of Laconia. Hence there were two kinds of assemblies, at which were always present the kings, the senate, and the different classes of the magistrates. When the succession to the throne was to be regulated, when magistrates were to be chosen or deposed, when sentence was to be pronounced on public crimes, or the great objects of religion or legislation were to be decided upon, the assembly was only composed of Spartans, and was called the "lefter assembly." The ordinary assembly of this kind was held every month; the extraordinary whenever circumstances required. Every one had a right to give his opinion, provided that he had passed his 30th year, for before that age he was not allowed to speak in public; and it was required also that his manners should be irreproachable. The general assembly was convoked whenever the question related to making war or peace, or concluding alliances. The deputies of the cities of Laconia were then admitted into it, as were also frequently those of the allied states, and of the nations who came to improve the favour of Lacedæmon. On occasions of this kind, the kings and senators frequently spoke, and their authority had great weight; but that of the ephors was greater. When the question had been sufficiently debated, one of the ephors asked the opinion of the assembly; upon which a multitude of voices exclaimed for the affirmative, or negative. In order to determine the majority, the same magistrate ascertained it by numbering the two parties, which he caffed to separate.

As a general preliminary to the laws of Lycurgus, we shall here observe, that this legislator ordained, that the magistrates should not be appointed by lot, but elected by suffrages. He deprived riches of the influence and respect annexed to them, and divide the love of jealousy. And though he granted some distinctions, the government, having imbibed his spirit, never professedly prided itself, and virtuous men dared not solicit it. Honour was the most valuable reward, and reproach the most cruel punishment. Death was sometimes inflicted, but a sentence of this kind followed a very careful and rigorous examination, for nothing was regarded so precious as the life of a citizen. Execution was performed in the prist, and during the night, that the farmans of the criminal might not move the commination of the people, and his life was taken away by the cord, that the sufferings of the guilty might not be multiplied.

Of all the institutions of Lycurgus, the division of lands was that which required, on his part, the greatest degree of firmness and resolution, because it was likely to be much opposed, and to occasion various and violent contentions. He thought it, however, necessary for establishing peace and good order in the commonwealth. With a view of banishing from the community insolence, envy, fraud, luxury, and at the same time, extreme poverty and excessive wealth, he persuaded the citizens to surrender all their lands to the state, and to allow a new division of them, that they might live together in a perfect equality, and that virtue and merit should establish the only claim to preeminence and honours. This scheme was no sooner proposed than executed. The district of Sparta was divided into 900 portions of land, and the rest of Laconia into 50,000. Each portion assigned to a head of a family must have produced, besides a certain quantity of wine and oil, 50 measures of barley for himself, and 12 for his wife. Thisis Plutarch's account. Others say, that he only bellowed on the Spartans 6000 portions, to which king Polycidas is said afterwards to have added 3000. And others again say, that the Spartans received one half of these 9000 portions from Lycurgus, and the other half from Polycidas. After Lycurgus had made this distribution, he thought it advisable to absent himself, that the passions of the people might have leisure to subside and cool.
On his return, he found the fields of Laconia covered with clusters of thistles, all of the same size, and placed at distances nearly equal. Accordingly he seemed to behold a large domain, the productions of which had been divided among brethren; while the Lacedaemonians believed they saw in him a father, who had manifest no more fondness for one than for the rest of his children. After having divided their immoveables, he undertook likewise to make the same equal division of all their moveable goods and chattels, that he might utterly banish from among them every kind of inequality. But apprehending invincible opposition to this measure, he endeavored to accomplish his object by fapping the foundations of avarice. With this view he cried down all gold and silver money, and ordained that no other should be current besides that of iron; which he made so heavy, and fixed at so low a rate, that a cart and two oxen were necessary to carry home a sum of 40 minas (equal to about 20l sterling), and a whole chamber to keep it in. He next banished all utensils and superfluous arts from Sparta. But without doing this, most of them must have funk of themselves, and disappeared with the gold and silver money; because the tradesmen and artificers would have found no vent for their commodities; and this iron money had no currency among the other Grecian states, which so far from exalting it, made it the subject of their banter and ridicule. The importation of all foreign money was prohibited, that corruption might not enter under the name of commerce. Barter or exchange of one commodity for another, was preferred by law in Sparta, long after it had been discontinued in every other state. Interest was also forbidden in the Spartan commonwealth. According to the laws of Lycurgus, the head of a family could neither buy nor sell a portion of land; he could neither give it during his life, nor bequeath it by will to whom he pleased. He was not even permitted to divide it. The eldest of his children was entitled to the inheritance, in the same manner as in the royal family, the eldest son succeeded by right to the crown. In order to provide for the other children, he established other regulations. The land, as well as the perfons of the Spartans, were free from all impositions. The state had no treasure. On certain occasions the citizens contributed according to their abilities, and on others they had recourse to means which excused their excessive poverty. The deputies of Samos once came to Lacedaemon to solicit the loan of a sum of money. The assembly of the people, having no other resource, ordered a general fast to be observed by the free citizens, slaves, and domestic animals, and gave the sum thus saved to the Samians.

Another regulation of Lycurgus, was that of public meals. That he might entirely suppress the magnificence and extravagance of public tables, he ordained that all the citizens should eat together of the same common victuals, which the law prescribed, and expressly forbade all private eating at their own houses. By this settlement of public and common meals, and by this frugality and simplicity in eating, he depressed the value of riches, and made them of no use as means of procuring the luxuries of life. This regulation, however, was very offensive to the opulent. At these meals, each table accommodated about 15 persons; and every person furnished every month a bushel of flour, eight measures of wine, five pounds of cheese, 2½ pounds of figs, and a small sum of money for preparing and cooking the viands. Every person, without discrimination, was obliged to attend at the common meal. At these public tables the children obtained instruction and improvement; they were likewise trained and accustomed to great feecrety; for as soon as a young man came into the room, the eldest person of the company used to say to him, pointing to the door, “Nothing spoken here, must ever go out there.” The most exquisite of all their estables was that which they called their “black broth;” and the old men preferred it to every thing else upon the table. Dionysus the tyrant, however, thought otherwise, and complained of it as insipid; upon which he was told that the feaoning was wanting. When the tyrant enquired, what seaoning? he was told, running, sweating, fatigue, hunger, and thirst. These, he was told, were the ingredients with which we seaon all our food. As they were moderate in their eating, they were no lees ablemenious in their drinking; the Lacedaemonians only drank to quench thirst; drunkennefs was reckoned infamous among them, and severely punished; and that young men might conceive the greater abhorrence of this species of debauchery, the slaves were compelled to drink to excess, that the baseflines of the vice might appear. When they retired from the public meal, they were not allowed any torches or lights, because it was expected, that men who were perfectly sober, should be able to find their way in the dark; besides, this practice gave them a facility of marching without light, a quality very useful to them in time of war.

As to dresses, there was no distinction between the rich and poor. Their garments were made for use and not for show; and they were taught betimes to dillignifi themselves by their virtue, rather than by their robes. Boys were always used to go without shoes, nor were they permitted to cut or trim their hair. Baths and anointing were not much in use among the Lacedaemonians; the river Eurotas supplied the former, and exercised the latter. Young women wore their veils, or jerkins, only to their knees, or, as some say, not so low; a custom which has been cenfured both by Greeks and Romans as indecent. Gold, precious stones, and costly ornaments were permitted only to common women; which permission was the strongest prohibition to women of virtue, or such as valued their reputation. Virgins went abroad, without veils, with which, on the contrary, married women were always covered. In certain public exercices, to which girls were admitted, they, as well as the young men, were obliged to perform naked.

Lycurgus had very few written laws, because he did not wish to fet bounds to virtues, and left the people, imagining they had done all which their duty required, should defile and not do all which they are able to perform. But he did not conceal them; they were transmitted from mouth to mouth, cited on all occasions, and known to all the citizens, the witnefses and judges of each individual. They were taught and enforced by practice and example. Young persons were not allowed to cenfure them, nor to submit them to examination, since they had been received as the commands of heaven, and since the authority of the laws was founded only on the profound veneration they inspired. Nor was it allowed to praise the laws and usages of other nations; because, unless the people were persuaded that they lived under the best legislation, they would soon be led to defire a new one. Indeed, obedience was, among the Spartans, the firt of virtues.

Lycurgus considered the education of youth, in every stage of it, from the earliest infancy to maturity, as the most important object of a legislator’s care. His grand principle was, that children belonged more to the state than to their parents; and therefore he ordered the fiate to be entrusted with the general care of their education, that they might be formed on constant and uniform principles, by which they might be inspired with the love of their country, and of virtue. As soon as a boy was born, the elders of each tribe visited him; and if they found him well made, strong and vigorous, they ordered him to be brought up at the public charge; but if, on the contrary, they found
him deformed, tender, and weakly, he was cast into a gulf near mount Taygetus. This law, it has been said, seems to have been calculated, in one respect, to reader women very careful, when they were pregnant, of eating, drinking, or using exercise to excess; and it also seemed to make them excellent nurses, for which employment they were celebrated throughout Greece. At his earliest age the child was accustomed to the most hardy treatment in his food, dress, rest and general mode of life. He was to be used to solitude and darkness, and to be brought up a stranger to impressions of terror, useless restraints, and unjust reproaches. At the age of seven years his education according to the laws commenced, and he was trained up under the discipline appointed by the state. Education, in fact, in the whole course of it, was, properly speaking, an apprenticeship of obedience. While they were at table, the master instructed the boys by asking them questions, to which they were to give a quick and concise, or laconic, answer. Lycurgus, it is said, was for having the money bulky and heavy, and of little value, but their language very pithy and short, composing much fene in few words. To literature they paid little attention; for all the sciences were banished from the country. The principal objects of their study were obedience, the patient enduring of hardship and patience, and victory in battle. The superintendent of their education, was one of the most honourable men of the city, and of the first rank and credit, or one of the ephori, who appointed over every class of boys, into which they were initiated, masters of the most approved wisdom and probity. Strict obedience, and great respect to their elders and superiors, were matters sedulously inculcated in the Spartan system of education. To the old men the youth rose up, whenever they came into any public place; when they met them in the streets they gave way; and they were silent, whenever their elders spoke. All the old men were deemed to have the authority of parents and warranted in the exercise of it; and thus Lycurgus provided, that as youth are everywhere too apt to offend, they might be no where without a monitor. The laws went still farther; for if an old man was present when any youth committed a fault, and did not reprove him, he was punished equally with the delinquent. Amongst the youths there was one of their own body, or, at most, two years older than the rest, who was designated "iren"; he had authority to question all their actions, to watch their behaviour, and to punish them if they did amiss; and their punishments were not slight, but severe. Silence was highly commended at Sparta, where modesty, not only in words and actions, but in looks and gestures, was held to be a most becoming virtue in young people. An inconsiderate person, who would not listen to instruction, and who seemed to disregard what the world might think or say of him, was treated by the Lacedæmonians as a disgrace to human nature.

Occupations among the Spartans that were necessary for the benefit of the community, such as agriculture and the like, were left to their slaves, the Helotes; but arts, subservient to luxury, were wholly interdicted. Thus orators or rhetoricians, augurs, bankers, and dealers in money were excluded. The Spartans admitted no theatrical diversions among them; but other kinds of poetry were allowed, provided the magistrates had the perusal of pieces, before they were introduced to the public. Music was much encouraged, provided that it was such as had been in favour with their ancestors; and they would not permit their slaves to learn either the air or the words of their most admired pieces.

Among the effects of ancient music, in softening the manners, promoting civilization, and humanizing men, naturally savage and barbarous, the most singular and striking is related by Polybius, the historian, a grave, exact, and respectable writer, who, in speaking of several acts of cruelty and injustice exercised by the Ætolians, against their neighbours the Cynætheans, has the following remarkable passage, which we shall give at full length, from Mr. Hampton's excellent translation.

"With regard to the inhabitants of Cynæthea, whose misfortunes we have just now mentioned, it is certain, that no people ever were esteemed so justly to deserve that cruel treatment to which they were exposed. And since the Arcadians, in general, have been always celebrated for their virtue throughout all Greece; and have obtained the highest fame, as well by their humane and hospitable disposition, as from their piety also towards the gods, and their veneration of all things sacred; it may perhaps be useful to enquire from whence it could arise, that the people of this single city, though confessed to be Arcadians, should, on the contrary, be noted for the savage roughness of their lives and manners, and distinguished by their wickedness and cruelty above all the Greeks. In my judgment, then, this difference has happened from no other cause, than that the Cynætheans were the first and only people among the Arcadians, who threw away that instruction, which their ancestors had established with the greatest wisdom, and with a nice regard to the natural genius, and peculiar disposition of the people of the country; I mean, the discipline and exercise of music; of that genuine and perfect music, which is useful indeed in every state, but absolutely necessary to the people of Arcadia. For we ought by no means to adopt the sentiment that is thrown out by Ephorus in the preface to his history, and which indeed is very unworthy of that writer, that music was invented to deceive and delude mankind. Nor can it be supposed, that the Lacedæmonians, and the ancient Cretans, were not influenced by some good reason, when, in the place of trumpets, they introduced the sound of flutes, and harmony of verse, to animate their soldiors in the time of battle; or that the first Arcadians acted without strong necessity, who, though their lives and manners, in all other points, were rigid and austere, incorporeted this art into the very essence of their government; and obliged not their children only, but the young men likewise, till they had gained the age of thirty years, to perform in the constant study and practice of it. For all men know, that Arcadia is almost the only country, in which the children, even from their most tender age, are taught to sing in measure their songs and hymns, that are composed in honour of their gods and heroes; and that afterwards, when they have learned the music of Timotheus and Philoxenus, they assemble once in every year in the public theatres, at the feast of Bacchus; and there dance, with emulation, to the sound of flutes, and celebrate, according to their proper age, the children those that are called the puerile, and the young men, the manly games. And even in their private feasts and meetings, they are never known to employ any hired bands of music for their entertainment; but each man is obliged himself to sing in turn. For though they may, without shame or cenfure, difown all knowledge of every other science, they dare not on the one hand dissemble or deny, that they are skilled in music, since the laws require, that every one should be instructed in it; nor can they, on the other hand, refuse to give proofs of their skill when asked, because such refufal would be esteemed dishonourable. They are also taught to perform in order all the military steps and motions, to the sound of instruments; and this is likewise practiced every year in the theatres, at the public charge, and in sight of all the citizens.

"Now to me it is clearly evident, that the ancients by no means introduced these customs, to be the instruments of
LACEDÆMONIANS.

luxury and idle pleasure: but because they had considered with attention, both the painful and laborious course of life, to which the Arcadians were accustomed; and the natural austerity of their manners, derived to them from that cold and heavy air, which covered the greatest part of all their province. For men will be always found to be in some degree affiliated to the climate in which they live; nor can it be ascribed to any other cause, that in the several nations of the world, distinct and separated from each other, we behold so wide a difference, in complexion, features, manners, customs. The Arcadians, therefore, in order to smooth and soften that disposition, which was by nature so rough and stubborn, besides the customs above described, appointed frequent festivals and sacrifices, which both sexes were required to celebrate together; the men with women, and the boys with virgins; and, in general, established every institution, that could serve to render their rugged minds more gentle and compliant, and tame the fiercefens of their manners. But the people of Cynetha, havingflight all these arts, though both their air and situation, the most in- clement and unfavourable of any in Arcadia, made some such remedy more requisite to them than to the rest, were afterwards engaged continually in interjute tumults and contentions; till they became at last so fierce and savage, that, among all the cities of Greece, there was none in which so many and so great enormities were ever known to be committed. To have deplorable a flate this conduct had at last reduced them, and how much their manners were detefted by the Arcadians, may be fully understood from that which happened to them, when they sent an embassy to La- cedæmon, after the time of a dreadful slaughter which had been made among them. For in every city of Arcadia, through which their deputies were obliged to pass, they were commanded by the public crier instantly to be gone. The Mantinians also expressed even still more strongly their abhorrence of them; for as soon as they were departed, they made a solemn purification of the place; and carried their victims in procession round the city, and through all their territory.

"This then may be sufficient to exempt the general customs of Arcadia from all censure; and at the same time to remind the people of that province, that music was at first established in their government, not for the sake of vain pleasure and amusement, but for such solid purposes, as should engage them never to defert the practice of it. The Cynethians also may perhaps draw some advantage from these reflections; and, if the deity should hereafter blest them with better sentiments, may turn their minds to- wards such discipline, as may soften and improve their manners, and especially to music; by which means alone, they can ever hope to be divested of that brutish fercenees, for which they have been fo long distinguished." 

Though Polybius in this passage seems to attribute the happy change that was brought about in the manners of the Arcadians to music alone, it does not appear to merit all the honour, as a confiderable part was doubtless due to the poetry that accompanied it; which being grave, majestick, and full of piety and respect for the gods and heroes, whose glorious actions and benefits were celebrated in it, must have had great influence upon the minds of young persons, in whose education those two arts had so confiderable a share.

Thucydides, as quoted by Aulus Gellius (lib. i. cap. 11.) says, when the Lacedæmonians went to battle, a Thibican played soft and soothing music to temper their courage, left by an ardent temerity they should have rushed on with too great impetuoluty; for, in general, they had more need of having their courage reprefent than excited.

However, in an engagement with the Messenians, they were very near being discomfited, when the celebrated Tyr- tæus, who performed the part of a Tibicen that day, finding the troops give way, immediately quitted the Lydian mode, and played in the Phrygian, which so reanimated their cour- rage, reprefent by the preceding mode, that they obtained a complete victory.

The Lacedæmonians, though a military people, of auftere manners, appear at all times, notwithstanding their inhospitable law again the admifion of strangers, to have invited eminent musicians into their country, and to have encouraged music; not only in order to regulate the fops, and animate the courage of their troops, but to grace their festivals, and fill their hours of leisure in public life.

Athenæus tells us (lib. xiv.), that they had a flate painted on their ensigns and ladders.

There was one kind of theft to which the boys were accustomed, and which was even authorized by the law, and by the confent of the citizens; and this was their stealing herbs or roots from the gardens and public baths; but if they were caught in the fact, they were punished for want of dexterity. The design of the Spartan legislator in allowing this practice, was to inspire the Spartan youth, who were all designed for war, with a view to self-defence, and not to extent of dominion, with boldness, subtility, and ad- drefs; to ensure them betimes to the life of a soldier, to teach them to live upon a little, and to be able to shift for themselves. The patience and constancy of the Spartan youth was signally exemplified in Diana’s festival, called “Orthia,” which fee. The most usual occupation of the Lacedæmonians was hunting; and other bodily exercisés, to which they devoted in private and public much of their time and attention.

Hunting was made a part of the education of the Lacedæmonians, because it had a tendency to prevent corpulence, which incurred public contempt, if not banishment, and to strengthen their limbs, and to render those who practifed it supple and fleet. They had a kind of public dances, in which they much delighted, common alike to virgins and young men. Indeed, in all their sports, girls were allowed to divert themselves with the other youths; insomuch that, at darting, throwing the quoit, pitching the bar, and the like robust diversions, the women were as dextrous as the men. For the manifest peculiarity of this custom, Lycurgus asigned no other reason, than that he fought to render women, as well as men, strong and healthy, that their children might resemble them. The laborious life ceased with the age of 30: and they then employed themselves wholly either in affairs of state, or of war.

As to the laws relating to religion, they preferred that the statues of all the gods and goddeses worshipped by the Spartans, should be represented armed, even Venus her self; that the people might regard a military life the most noble and honourable, and not attribute, as other nations did, floth and luxury to the gods. Their sacrifices con- sisted of things of small value; that indignity might never hinder them from worshipping the gods. They were for- bidden to make long or rash prayers to the heavenly powers, and were enjoined to ask no more, than that they might live honestly, and discharge their duties. Graves were allowed in their city, and they buried close to the temples, that all people might be familiar with death, and not conceive of it as a thing dreadful in itself, or that dead bodies defiled the living. Magnificent sepulchres were forbidden, nor was the plainest or most modell inscription permitted, except for such as were plain in the wars, or for women who had de- voted themselves to a religious life. Tears, sighs, and out- cries were not permitted in public, because they dishonoured Spartans, who ought to bear all things with equanimity. Mournings were restricted to seven days.

Celibacy in men was regarded as infamous, and punished X 2 by
by various tokens of contempt. If a man did not marry when at full age, he was liable to an action; as those also were who married above or below themselves. Such as had three children had certain immunities, and those who had four were free from all taxes. Virginis were married without portions; husbands were allowed to beat their wives; and there were some other laws which we shall not here recite. The men of Sparta are generally said to have been distinguished for their virtue; but the Spartan women have been generally decried for their boldness, and contempt of decency.

No Spartan was admitted to any concern in their judicial proceedings under 30 years of age; and it was held indecent, and in ill repute, for a man to buy himself at the tribunals, when he had no affairs there of his own. By these regulations, Lycurgus thought to prevent litigiousness, and that multiplicity of suits which are always fatal in a state. Persons of abandoned character lost all right of voting or speaking publicly on public affairs; for it was a persecution among the Spartans, that a man of a base character in private life could not serve his country from motives of true patriotism.

At Sparta, it has been said, every thing tended to inspire the love of virtue, and the hatred of vice; the actions of the citizens, their conversations and mutual intercourse which frequently occurred, their public monuments, and their inscriptions. Accordingly Lycurgus would not allow all sorts of persons to travel, lest they should bring home foreign manners, and return infected with the licentious customs of other countries, and thus become averse from the life and maxims of Lacedaemon. On the other hand, he would suffer no stranger to remain in the city, who did not come thither to some useful or profitable end, or out of mere curiosity, lest they should disseminate the vices of their own countries. A soldier was the only reputable profession in Sparta; a mechanic or husbandman was looked upon with contempt. War, indeed, was the trade and busines of the Lacedaemonians, and the first law of war with them was never to fly, or turn their backs upon their enemies, however superior in number; never to quit their post; never to deliver up their arms; in a word, either to conquer, or to die upon the spot. Hence it is, that a mother recommended to her son, who was going to make a campaign, that he should return either with or upon his shield; and that another, hearing that her son was killed in fighting for his country, answered very coldly, "I brought him into the world for no other end." A Spartan lady, having heard that her son had died from a battle, wrote him this short letter, "Fame speaks ill of you; censure it, or be no more." In all expeditions, they were careful in the performance of religious rites; and after their evening meal, the soldiers sang together hymns to their gods. When they were about to engage, the king sacrificed to the Muses, that, by their assistance, they might be enabled to perform deeds worthy of being recorded to latest times. Then the army advanced in order to the sound of flutes, which played the hymn of Callus. The king himself sung the Paeon, which was the signal to charge. When their enemies began to fly they pursued no longer than till victory was ascertained; because they would seem to fight rather for the honour of conquering than of putting their enemies to death. After 40 years' service, a man was, by law, no longer required to go into the field, and consequently if the military age was 30, the Spartans were not held invalids till they were 70. It was one of the wildest maxims in the political system of Lycurgus, that he forbade the Spartans to fight often against the same enemy. They were forbidden to meddle with maritime affairs, though in process of time they were forbidden to transgress this institution.

It has been said that Lycurgus was the author of that political expedient for lessening the number of slaves, or Helotes, in Sparta, called "Cryptia," i.e. the ambuscade, when the slaves were thought too numerous. Such as had the care of educating the Spartan youth, selected the stoutest of them, and having armed them with daggers, sent them out to destroy their unhappy slaves, either by surprising them in the night, or falling upon them in the day, when they were at their work and defenceless. Plato condemns this law, and Plutarch denies that it was made by Lycurgus, whereas Aristotle expressly lays it to his charge; but when or however it was made, it was undoubtedly a cruel unnecessary expedient, in all respects unworthy of a virtuous people. The abbe Barthelemy (Trav. Anach. vol. iv. p. 481.) has, in our opinion, satisfactorily vindicated Lycurgus from the charge of having instituted such a practice. Plato himself recommends, that in a well governed state, the youth, as soon as they are of sufficient age, should, during two years, range the country with arms in their hands, braving the rigours of summer and winter, leading a hardy life, and subjected to a strict discipline. As the Cryptia was only practised among the Spartans, Plato has here described the nature of it. In this and another similar passage the object of the Cryptia is debriefed, but not a word is said of the chace of the Helots; of which no mention occurs in any of the now remaining works of Aristotle, nor in those of Thucydides, Xenophon, Iocrates, and other writers of the same age, though they often speak of the revolts and defections of the Helots, and occasionally confine the laws of Lycurgus, and the customs of the Lacedaemonians. The Abbe concludes, that till about the time when Plato wrote his treatise on laws, the Cryptia was not employed to shed the blood of the Helots. Afterwards, i.e. a short time after the death of Plato, the laws lost their force, and the Spartan youth killed those Helots who made too much resistance, and perhaps gave occasion to the decree of the ephors, which imported that the Helots might be murdered with impunity. The abuse increasing from day to day, the Cryptia was at length confounded with the chase of the Helots. According to Aristotle the Cryptia was instituted by Lycurgus. Plato explains its object and believes it to be extremely useful. When the manners of Sparta became corrupted, the youth of Lacedaemon, we are told, abused this exercise to perpetrated horrid cruelties, which cannot be justified, but which have been transmitted to us with exaggeration, and unjustly charged upon the institution of Lycurgus.

The institutions of Lycurgus have been much extolled both by ancients and moderns, but they are unquestionably liable to many objections. The legislator himself, when he framed them, must have been in a great degree devoid of that comprehension and sensibility of mind, which takes an enlarged view of the frame and condition of men, and which duly attends to the feelings of human nature; particularly those of parents and children. The understanding was left in a great degree uncultivated; decency was proscribed, barbarity rendered familiar; and all those tender sensations that humanize society were smothered, as it were, in the birth. The constitution was a most unnatural effect of speculation, founded upon the miseries of the individuals that composed the community: for if the Spartans were free with respect to other nations, they were slaves to their own legislature. In a word, say the authors of the Universal History, it was a discipline calculated, not for a free people who had a right to cultivate the powers of reason, and taste the noblest enjoyments of life, but for the deperate militia of a despotic tyrant, who wants to extinguish every sentiment of humanity, and produce a contempt of life by stripping it of all its comforts.
LACEDÆMONIANS.

Such an institution as that of Lycurgus, with all its defects and failings, is a just object of admiration: but it would have been less wonderful, if it hadsubsisted only during the life of the legislator; however, we know that it subsisted many ages after his decease in a greater or less degree of vigour and influence. Xenophon, in the encomium he has left us of Agesilaus, and Cicero, in one of his orations (Pro Flacc.,) observes, Lacedemon was the only city in the world that preferred her discipline and laws to forsoTordable a term of years unaltered and inviolate. "Solis" (says Cicero, speaking of the Lacedaemonians), "avare of terrarum septingentos Annos amplius una moribus ad nunquam mutatis legis vivunt." In Cicero's time, however, the discipline of Sparta, as well as her power, was very much relaxed and diminished. But all historians agree that it was maintained in a very considerable degree of vigour till the reign of Agis, under whom Lyssandre, though himself incapable of being blinded or corrupted with gold, filled his country with luxury and the love of riches, by bringing into it immense sums of gold and silver, which were the fruits of his victories, and thereby subverting the laws of Lycurgus. But the introduction of gold and silver, says Rollin, was not the first wound given by the Lacedaemonians to the institution of the legislator. It was the consequence of a violation of another law still more fundamental: ambition was the vice that preceded and made way for avarice. The desire of conquests drew on that of riches, without which they could not have proposed to extend their dominions. The main design of Lycurgus, in the establishment of his laws, and especially of that which prohibited the use of gold and silver, was, as Polybius and Plutarch have judiciously observed, to curb and restrain the ambition of his citizens, to disable them from making conquests, and in a manner to force them to confine themselves within the narrow bounds of their own country, without carrying their views and pretensions any further. Indeed the government which he established was sufficient to defend the frontiers of Sparta, but was not calculated for raising her to a dominion over other cities. That it was not his design to make the Spartans conquerors is evident from his having expressly forbidden them, though they lived in a country surrounded with the sea, to meddle in maritime affairs; to have any fleets, or even to fight upon the sea. Although he made them a nation of soldiers and warriors, it was only that, under the shadow of their arms, they might live in liberty, moderation, justice, union, and peace, by being content with their own territories, without usurping those of others, and by being persuaded, that no city or state, any more than a single person, can ever hope for solid and lasting happiness, but from virtue only. On this subject, see Anc. Un. Hist. vol. v. Rollin's Anc. Hist. vol. ii. Travels of Anacharsis, vol. iv.

The stability, as well as the glory, of the Lacedaemonian government, was derived from the wise institutions of that celebrated lawgiver, of whose government we have given an account. After the death of Lycurgus, the Lacedaemonian history becomes perplexed, being supplied from scanty and scattered materials.

The following table shews the succession of their kings, in both lines, with the duration of their reigns, from Lycurgus until the Achaean league.

Lacedemon becomes a part of the Achaean league, 191 B.C. | 71
It would far exceed our limits to detail minutely the history of the Lacedaemonians during the series of reigns which we have above enumerated. We must content ourselves with marking some of its principal events, and particularly those in which their ambition led them to violate the constitution established by Lycurgus. We shall find that instead of employing their arms and exercising their valor for maintaining their own independence, they were actuated by an ambition for making conquests and extending their territories, by methods directly contrary to the rules of conduct which Lycurgus had prescribed. Charilaus, his nephew and pupil, began with an unsuccessful war with the Argives, and with the Tagesta, a people of Arcadia; and he then turned his arms against the Achaeans, who had taken from the Lacedaemonians several frontier towns, which he and his colleague Teleclus recovered. But a more important event in the Lacedaemonian history was the Messenian war, the foundation of which was laid during the reign, or soon after, the death of Teleclus; but it was actually commenced by Alcamenes, king of Sparta, who made a sudden irruption into the Messenian territory. In the prosecution of this war, the Lacedaemonians and their two kings took a solemn oath not to return till they had thoroughly reduced Messenia, by which oath they entered into an obligation to transgress two of the express laws of Lycurgus; one of which forbade them to make conquests, and the other which prohibited them from prolonging their war against the same people. Polydorus and Theopompus continued the war which had been begun by Alcamenes and Nicander; and constrained the Messenians to fortify a city which was situated on the top of the mountain Ithome, that they might retire into it for safety and self-defence, when they were driven from their other cities and villages, that were more exposed. The Lacedaemonians, according to that clause in the laws of Lycurgus, which cautioned them against besieging fortified places, laid siege to Ithome; and altogether delitute of experience in this branch of military tactics, they were under a necessity of continuing the siege for fourteen years before they reduced the place. It was during this expedition that Theopompus is said to have created the ephori, thus altering the original constitution of the Spartan government. The attention of the Spartans was diverted from the Messenian war by a dispute with the Argives, concerning the city of Thyrrea, and its district, which, lying on the borders of Argolis and Laconia, occasioned great contentions between those states.

The Argives were defeated with great slaughter; but when Polydorus was urged to pursue his victory, and to attack Argos itself, he declined it with this noble declaration, worthy of the institution of Lycurgus, "that the Spartans sent him to assert their rights, but not to rob others." The Spartans, after having provided for the administration of affairs at home, by the appointment of the ephori, renewed the Messenian war, and marched with a great army towards Ithome, but they were defeated with great loss, and constrained to betake themselves to flight. At length, after an obstinate resistance on the part of the Messenians, they were obliged to surrender Ithome to the Spartans, and they themselves were treated with great rigour. The Spartans, during the Messenian war, having been ten years absent from the city, on account of their oath, which obliged them not to return till they had entirely subdued that country, were reminded by a message from the women, that, whilst they were so careful to subdue their enemies, they neglected the city. In consequence of this message, they decreed that the young men among them who came out of Sparta under age, and on this account were not obliged by the oath, should return, and associating themselves promiscuously with the unmarried women, preserve the city from falling into decay. This project being executed, those who were born of such young women were called "Parthenes," that is, sons of virgins. When the Lacedaemonians returned, after having reduced Messenia, they neglected these young men, who, finding themselves involved in difficulties, for want of parents and an inheritance, intrigued with the Helots, and formed a plot against the state. The plot, however, was discovered, and they were sent off to Italy, where they settled near Tarentum. In the reign of Anaxander and Anaxidamus, 685 years B.C., the second Messenian war began, and continued 14 years. It terminated with the capture of Ira or Era, after a siege of 11 years, and by the conquest of Megalopolis, the inhabitants were made slaves, and the whole country was divided by the Spartans among their own citizens, the district of Methone excepted, which they gave to the Argives. Nothing of any great importance occurred in the history of the Lacedaemonians until the Perlian war. When Miltiades, the Athenian, fought the famous battle of Marathon, and defeated the Persians, in the 490th year B.C., the Spartans had promised an army, but sent none; some time after the battle their troops arrived, contemplated the spot where it had been fought, and after having highly commended the Athenians, returned home again to Sparta. When this battle at Marathon excited the Persians to attempt again the conquest of Greece, the Spartans, with a resolution worthy of the disciples of Lycurgus, determined to oppose them. The fleets of Greece, apprized of the hostile intentions of Xerxes, unanimously joined in a general assembly to defend its liberty against the Persians; but in the event, of all the confederates, the Spartans and Athenians were the only states that seemed prepared to execute their purpose. A resolution was formed to defend the straits of Thermopylae; and when 6000 foot were appointed for that service, the command of them was given to Leonidas, who had succeeded Cleomenes in the kingdom of Lacedaemon. Of the 6000 foot, 300 only were Spartans. Leonidas himself considered it as a desperate undertaking, but was determined either to succeed, or to die in the attempt. The issue of this conflict was the death of Leonidas with all his Spartans; but the victory on the part of the Persians cost them 20,000 men. The Grecian fleet, which lay at Artemium, was entrusted to the command of Euribrates, a Spartan, pooleffed of great personal courage, but timorous as a commander, and inexperienced in maritime affairs. When Mardonius attempted the conquest of Greece, Pydna, the son of Cleombrotus, who assumed the character of tutor or protector to Philarchus, the son of Leonidas, had the command in chief of the whole Grecian army, which amounted to 100,000 men. The Persians were undoubtedly double this number. But both armies were afterwards greatly diminished by defection. At length the Lacedaemonians and Tegetobians were forced to engage Mardonius's army without assistance. The Persians, it is acknowledged, behaved well on this occasion; but being neither so well armed, nor so well disciplined as the Greeks, their valor was of no use but to expose them to slaughter. The Persians were defeated and Mardonius killed. The Persian camp was forced; the Lacedaemonians opened a passage; and then a mercenary slaughter ensued. Of 300,000 men, whom Mardonius brought into the field, scarcely 3000 escaped. The number of Greeks that fell is uncertain; Plutarch reckons them at 1500, but Diodorus Siculus affirms positively, that they were very few less than 10,000. On the same day in which the battle of Plataea was fought, (479 B.C.) Leotychides, king of Sparta, with Xanthippe,
pu, the Athenian, gained a glorious victory at Mycale, where the last remains of the Persian fleet, and of the Persian armies, which had been drawn together for the destruction of Greece, were utterly defeated, and Panthinos was afterwards sent to take the command of the fleet, with strict orders to free the Greek cities from the Persian garrisons. But he soon after intrigued with Artabazus, and engaged in a scandalous treaty with the Persians; affecting, by the assistance of the great king, to make himself sovereign of Greece. The allies took umbrage at his conduct, and privately sent to accuse him at Sparta. He was induced, however, by delusion to return to Sparta; where he was seized by the ephors, but for want of sufficient evidence, or dread ing his influence, they released him. He neverthe less pursued his negotiations with Artabazus, till his intrigues were discovered. Upon his retiring to the temple of Minerva Chalcidica, in order to take sanctuary there, the Spartans blocked up the gate, and thus preventing his escape, reduced him to the necessity of starving in the temple. At the end of the 77th olympiad (465 B.C.) a most dreadful earthquake happened at Sparta. Diodorus says, that 20,000 per sons lost their lives, and Plutarch affirms, that only five houses in the city escaped ruin. In this year, 465 B.C., the third Peloponnesian war commenced, by the infliction of the Helots, and lasted ten years. The next war which the Lacedaemonians undertook, was that they called the "Sacred," by some the "Phocian" war; begun in the 448th year B.C. The design of it was to put the temple of Delphi into the hands of the inhabitants of the country, whereas it had before belonged to the Phocians; this design the Spartans effected; and they were recompen ed by a decree on the part of the Delphians, that they should have a right of first consulting the oracle; which decree was engraved on the forehead of a brazen wolf, consecrated in the temple. The Athenians soon after, having re-formed the temple to the Phocians, obtained the fame privilege, and the decree which granted it was engraved on the right side of the wolf. The Lacedaemonians having induced the Boeotians to revolt from the Athenians, and Ephesia at the same time shaking off the yoke, availed themselves of this opportunity for giving a mortal blow to Athens; for which purpose Phileoanax was ordered to invade their territories, at the head of a great army. He was persuaded, however, by his guardian Cleon drides, who accepted a bribe from Pericles, to return home, without effecting any thing, for which corruption the Spartans punished Cleon drides with death, and sentenced their king to exile. Soon after a peace was made between the Spartans and Athenians. This peace was of no long duration; for in the year 431 B.C. the Peloponnesian war began. Archidamus, the king of Lacedaemon, wished to avoid this war, and sent a messenger to Athens, with a commi ssion to this purpose; but he was sent back unheeded. After several incursions into Attica, Archidamus died. He is said to have been one of the best kings that ever reigned in Sparta. Being asked, "Who were governors of Sparta?" he replied, "the laws, and the magistrates according to those laws." During the reign of his son and successor Agis, who invaded Attica, the Athenians took several towns; but at length they were routed with great slaughter by the Spartans under the command of Brasidas, one of the most celebrated men of Sparta. In the year 421 B.C. a peace was concluded, after the war had raged for ten years. But in order to prevent too intimate an union between Sparta and Athens, several of the Peloponnesian states leagues themselves with Argos, which was a very powerful republic, and hostile at this time to the Lacedaemonians. After some flights and afronts, the Spartans, much irritated, resolved on a war against them and their allies; and entered the territory of Argos with a large army. The Argives, being ill prepared for a contest, declined it, and obtained from Agis a truce of four months; which gave great offence to his allies, and for which he was severely mulcted and oppressively treated on his return to Sparta. The Athenians, having obtained a supply of troops, renounced the treaty made with Agis, and the two armies engaged at Mantinea. The Spartans under Agis, though inferior in number to the Argives and their allies, and very obstinately resisted, gained a complete victory. This happened in the year 418 B.C. In the year 414 B.C. Agis entered the territories of Elis, in order to revenge the dishonour that had been done some years before to the republic, by forbidding them to be present at the Olympic games. After repeated irruptions into the country, the Eleans treated with the Spartans, and a peace ensued. At this time the Peloponnesian war was renewed. The Athenians having sent a great army into Sicily, the Lacedaemonians sent Gythippus to affright the Syracusans; among whom he gained great reputation at first, though it was afterwards ruined by his avarice. About this time Alcibiades repaired to Sparta, having been expelled his country by a prevailing faction. By adopting the Spartan mode of living, he became a great favourite, and was treated with particular respect by Agis, who received him into his house; but in return for the hospitality he experienced, he freely debauched the wife of Agis, and was obliged to quit Laconia, and to seek among the barbarians a place of safety. Whill king Agis managed the war in Attica, the conduct of maritime affairs was committed to Lyfander, who proved the great hero of Sparta, and brought to a termination the Peloponnesian war. Lyfander was supposed to be of the royal family, and of the Herculean race; he passed his younger years under all the restrictions of the inftitutes of Lycurgus, and was thus rendered bold, hardy, patient, and resolute; his genius was extensive, and in his disposition and manners, he was affable, modest, vigilant, and indefatigable; but with these great qualities he cherished the most dangerous ambition, in order to gratify which he flopped to every species of flattery and dilimulation; so that to accomplish his ends, he made no scruple to violate the most solemn oaths. When he entered on his command, he found the Athenians greatly superior at sea; but in a few years he deprived them of all power; but, above all things, he sought to advance his own credit and authority. Lyfander soon perceived, that without the Barbarian gold, Sparta could not carry on the war; and he therefore inculcated himself into the favour of Cyrus, who was then at Sardis, and obtained from him 10,000 pieces of silver, which he applied to the purpose of supporting his soldiers, and reftitting his fleet. Whilst he lay at Ephesus, repairing his ships and keeping his soldiers and mariners to their exercise, he projected a scheme for making himself, in a manner, sovereign of Greece. After several previous manœuvre and changes of position, he attacked the Athenians, whose fleet was under the command of Conon, both by sea and by land, and completely defeated and routed them; so that, in a single hour, he put an end to the Peloponnesian war, and to the maritime power of Athens. After this victory (405 B.C.), and the power acquired by it, Lyfander acted rather as an universal monarch than a general from Sparta. He immediately visited all the neighbouring cities, and changed their government, placing in each of them a Spartan magistrate, and with him ten of his friends from Ephesus, where he erected a kind of political univeristy. These men conducted themselves with haughtiness and severity, and the Lacedaemonian government was thus rendered ungrateful; so that the people were universally
LACEDÆMONIANS.

veritably disposed to make it off as soon as they could. Lyfander collected the wealth which his victories had put into his power, and defined it to be sent to Sparta, whither he had sent a messenger with the news of his victory over the Athenians, together with an assurance that he would soon be before Athens with a fleet of 300 sail; upon which, Agis and Paulanias, the two kings of Sparta, were sent, with a very large land army, into Attica. Lyfander entered Athens in triumph, on the anniversary of the great victory at Salamis, April 24, in the year 404 B.C., which completely finished the Peloponnesian war. (See Athens.)

Lyfander, having accomplished this object, sent the immense treasures which he had collected to Sparta, under the care of Gylyphus, whose avarice and fraudulent disposition led him to open the bags which contained them, and to take out what he thought proper. Upon his arrival at Lacedæmon, their contents were examined, and compared with a ticket which Lyfander had put into each sealed bag. The deficiency was soon discovered; Gylyphus was impeached by his servant; and his crime being proved, he was exiled under the scandalous imputation of being a detected cheat. This influx of wealth occasioned great disputes at Sparta: those who were best acquainted with the nature of their constitution regarded the receipt of it as an open violation of the laws of Lycurgus, and they expressed their apprehension, that in process of time they would have reason to repent this accession of opulence. It was at last determined, as a compromise of the fulfilling disputes, that the state might make use of the gold and silver, but that private persons should possess neither, on pain of capital punishments. Lyfander, while he remained in Greece, amply evinced his impenitent disposition; setting up his own flatus, and those of his commanders, who were his favourites, and dedicating two flars in honour of the deities Castror and Pollux, two flars which his sycophants pretended had been seen in the rigging of his ship, at the battle of Ægos. The range of his ambition in Asia was still less restrained. At length the ephori and senate of Sparta dispatched a feylala (which fee) to recall him. After some tokens of displeasure, the Spartans became reconciled to him, and in course of time extolled him for a man of integrity and true public spirit, to the mortification of their king Paulanias, who had endeavoured to humble his pride and restrain his influence. Before Ageælius was well settled on the throne (397 B.C.), the king of Peræa declared war against the Spartans: the king was, not without reason, jealous of the power of Lyfander; and a misunderstanding between them taking place, Lyfander resolved to overturn the government of his country. But new disturbances occurring in Greece, he persuaded the ephori and senate once more to entrust him with an army. An army was soon raised, to the command of which he was appointed; and another army was put under the command of king Paulanias. Lyfander, hastening by quick marches to Haliartus, and unsupported by Paulanias, who was more dilatory in his progress, was attacked by the Thebans and Haliartans, and killed on the ipot, and the Spartans were defeated. A treaty was concluded with Paulanias, on condition of his retiring out of Boeotia. But on his return to Sparta, such a spirit of resentment appeared against him, that he was afraid to undergo his trial, and therefore retired to Tegza, where he led a private life. The memory of Lyfander was held in great veneration, not only for the services which he had rendered his country, but on account of his dying poor, notwithstanding the opportunities he had of enriching himself.

Ageælius, having subjected the greatest part of the coast, determined to march into Peræa, and revenge the cruelties perpetrated by Xerxes, when he invaded Greece; but being recalled, he returned without fray; preferring his duty towards the constitution of his country to the prospect of subduing the whole Peræan empire. During the reign and military exploits of Ageælius (B.C. 393), Conon, the Athenian, threatened the Spartans with the loss of their sovereignty by sea; upon which it was resolved at Sparta to send Antalcidas into Peræa, to appease the great king, and to detach him from the interests of their rivals. The negotiations of Antalcidas prevailed, so that a peace was concluded (387 B.C.), called the peace of Antalcidas, by which the sovereignty of Greece was, in a manner, guaranteed to Sparta, but upon very dishonourable terms, the Greek cities in Asia being entirely abandoned to the Persians, notwithstanding all the promises which had been made to them, and although Ageælius himself had fought in their quarrel. The Lacedæmonians became haughty and insolent, and resolved to punish all who had injured them. They began with the Mantinians, who had been their confederates, and had done them great services. They next extended their arbitrary power to the Phliaians, and then to the Olyanthians, who were reduced to such disfarts, that they made a treaty with the Spartans, by which they engaged to have the same friends and enemies with them, and to follow them as associates in their wars, whithersoever they should lead them. Sparta exercised a government that was arbitrary and cruel over all whom thee had brought most unjustly under her dominion; for, by the peace of Antalcidas, thee had engaged that all the cities should be left free. The Persian king perfisted in his design to bring about a settled tranquillity, which, in the beginning of the 102d Olympiad, (372 B.C.) seemed to be nearly effected; the Athenians heartily concurring with the Lacedæmonians, and giving no countenance to the Thebans, who refused to hear of peace, because the Spartans inflamed they should set the cities of Boeotia at liberty. In this opposition they were encouraged by Epaminondas, who demanded that, before the Lacedæmonians gave laws to others, they should shew a proper regard to those maxims of equity themselves, by giving up Messenia to its ancient proprietors, and setting Laconia free. This obstinacy violently incensed Sparta, and offended Athens. Cleombrotus, with an army of 12,000 men, penetrated into Boeotia, and advanced towards Leuctra. A truce, however, was concluded by the mediation of Jafon, a powerful prince of Thebaly. But as Cleombrotus was retiring, he met Archidasus, the fon of Ageælius, with a reinforcement from Sparta; and these princes, notwithstanding the truce, marched back to Leuctra, in order to fall on the Boeotians, where they found Epaminondas ready to receive them. The Spartans, in the battle of Leuctra, (fought July 8th, 371 B.C.) were defeated with great slaughter; and thus they lost the empire of Greece, which they had held near 500 years. Epaminondas afterwards entered Laconia, and appeared before Sparta; but Ageælius compelled him to retire, though not without defolating the country in his retreat. Epaminondas, when he quitted the territories of Sparta, rebuilt the city of Mefene, and recalled the ancient inhabitants of Mefenia from the several countries where they had taken refuge, and restored them to the possession of their ancient patrimony, after they had lost it 300 years. Having accomplished this object, he offered the Lacedæmonians peace, on condition that they surrender all pretensions to Mefenia, and let Laconia free; terms which they rejected with disdain. At length the Peræan king disposed all Greece to think of peace; and this was effected, after the Laconian or Boeotian war had lasted about five years. In the second year of
of the 104th Olympiad (363 B.C.) new commotions arose in Peloponnesus. Epaminondas made an unsuccessful attempt to surprize Sparta, and afterwards Mantinea; mortified by these disappointments, he determined to attack Agrigentus, who was at the head of the Lacedæmonians and Arcadians, with the rest of their allies; but in his charge against the Lacedæmonians, he exposed his person too much, and fell under a cloud of darts, and was at length killed by a Spartan javelin. Pyrrhus of Macedon, interfering in a dispute about the succession to the throne of Sparta, made several attempts against the city, but was as often repulsed; and before he quitted Greece he was killed in a battle with Aretus the Spartan king. Cleomidas II., who succeeded Aretus II. in the year 257 B.C. had long lived in the court of Scolerus, and acquired a title of pomp and grandeur. At Sparta he had an opportunity of indulging this taste, for the maxims of Lycurgus had sunk not only into disuse, but into contempt. One of the ephors, who had gained influence, and who had conceived a prejudice against his own son, procured a law, by which all men were left at liberty to dispose of their lands by gift or sale, or by testament at the time of their decease. In consequence of this law, which subverted the original constitution, most of the lands were, by degrees, transferred from the ancient Spartan families; and thus the credit and glory of the Spartan state declined. Agis, the colleague of Leonidas, and a perfect counterpart to him in disposition and character, attempted to counteract his conduct, and to restore the constitution of Sparta. Cleombrotus, who succeeded Leonidas, after he had been set aside, concurred with Agis in all his designs; but when Agis was obliged to go with a body of Spartan troops to the alliance of the Achæans, his colleague abused his power to such a degree, that Leonidas was restored upon which Agis, when he returned, fled to the temple of Minerva, and could not be drawn out of his sanctuary by any methods which Leonidas could practise. He was at length treacherously seized, tried, and condemned by the ephors, and at last put to death. On the death of Leonidas, Cleomenes ascended the Spartan throne; and resolved to suppress the ephors, and to restore the ancient constitution of Sparta. In the course of his reign he invaded Achæa, and took several cities. Being informed that Arcus and the Achæans were preparing to give him dilittance, he marched a body of troops into their territories, and gained many advantages over them. At length the Achæans, disheartened by their ill success, offered to submit to any terms which Cleomenes demanded. He acted like a generous victor, declaring that he merely sought to be acknowledged general of the Greeks, and that he was ready to deliver up the prisoners without ransom, and to restore the cities he had taken. But being seized with a disorder, which induced for a time a disability for service, Arcus suffered jealousy, envy, and self-conceit to triumph over his virtue and love for his country; and he, who in his youth had expelled the Macedonians out of Peloponnesus, merely from the love of freedom, now privately recalled them, fearing that Cleomenes, the most worthy of the Spartan kings, should be raised to that dignity which he so highly merit. When Cleomenes recovered from his disorder, he advanced towards Argos, where the Achaeans held their assembly; but when he drew near, Arcus sent to inform him, that he must either enter the city alone, or he content to treat without the place. Cleomenes, in consequence of this treatment, invaded Achæa, and took several cities. He soon after surprized Argos, and advanced himself to greater power than any of his predecessors had possessed; and his city to greater pre-eminence than he had ever held in Greece. At a subsequent period, e. c. in the year 222 B.C. he gave battle to Antigonus at Sallia, where, from the superiority of the Macedonian troops, and the treachery of Damoteles, the Lacedæmonians were defeated with a great slaughter of their mercenary troops, and an almost total destruction of their own. After this disastrous defeat, Cleomenes fled to Egypt, where he put an end to his life. With him terminated the Heraclean race of Spartan kings, if we except the short reign of Agispolis. After the fatal battle of Sallia, Sparta fell into the hands of king Antigonus, who treated the inhabitants with great kindnés, and they for a time behaved very quietly. Lycurgus, the Spartan king, invaded Messenia, and defeated the Messenians. After he had obliged Philip of Macedon to retire from Laconia, the ephors, pretending to have received information that he wanted to make himself absolute, attempted to surprize and murder him; but he withdrew into Arcadia, and when the inquietude of the ephors was discovered by the people, he was recalled. Machaonidas, the successor of Lycurgus, ejected the ephors, averse from having any either equal to, or greater than, himself in Sparta. Abroad, he made all Peloponnesus tremble, and would probably have subduèd it, if Philopæmen, the chief of the Achæans, had not opposed his designs. This leader engaged all the cities in that league to furnish troops for reducing the power of Machaonidas; an engagement took place between the contending parties at Mantinea, in which the Spartans were defeated, and Machaonidas was killed. Nabis, a cruel tyrant, succeeded Machaonidas; and upon his death, by the hand of violence, the chief of the Ætolians broke into his palace at Sparta, and rifed all his treasures. The soldiers followed his example, so that the Lacedæmonians, who had suffered so much from the wanton and savage tyranny of Nabis, looked upon his murder as their misfortune; and a multitude of them assembled, and put many of the Ætolians to death without mercy. In the midst of their confusion, Philopæmen arrived, and having convinced the Lacedæmonians of the madness of their act, engaged them, since they had so happily recovered their freedom, to unite themselves to the Achæans, B.C. 191. (See Achæans.) In the year 188 B.C. upon a quarrel between the Lacedæmonians and Achæans, Philopæmen destroyed the walls of Lacedæmon, abrogated the laws of Lycurgus, and compelled the Spartans to adopt those of the Achæans. Upon their preferring a complaint to the senate of Rome, Callocrates ordered the walls of their city to be re-built; and according to the opinion of Meurinus, which is the most probable, the laws of Lycurgus were not restored till after the Romans had vanquished Perusia, and Achæa was joined to their empire. Lacedæmon was placed under the protection of the Romans. During the civil wars of the Roman empire, the Lacedæmonians attached themselves to the party of Cæsar and Augustus, to whom they consecrated temples. Nero, in his expedition into Greece, durst not enter Sparta, by reason of the severity of its laws. Pliny, the elder speaks of Lacedæmon as a free city under Vespasian. Apollodorus Tyaneus, if we may credit Philostratus, found the Laws of Lycurgus in full vigour in the time of Domitian; but it is probable, that this emperor diminished the liberty of the Lacedæmonians, for Pliny the younger, writing under the reign of Trajan, says, that there only remained the shadow of liberty. From that time no vestiges remain of the institutions of Lycurgus; at least Meurinus could not discover any. When Christianitv became the religion of the empire, the residue, if any, of these institutions must have been abolished. Meurinus cites a passage from Theodoret, which proves that they were entirely abolished by the Romans before his time, that is, before the 5th century. Although, in the preceding article, we have used the appellations...
pollinations Lacedemonians and Spartans as synonymous; yet when they are distinguished, the Spartans denote the citizens of Sparta, and the Lacedemonians are the inhabitants of the province. The number of the former anciently amounted to 10,000. In the time of Xerxes their number was 8000; but by their continued wars they were so much reduced, that very few ancient families were found at Sparta. The new families were descended from the Helots, or slaves, who, being first rewarded with liberty, afterwards acquired the title of citizens. These were not called Spartans, but were differently denominated according to the various privileges they had obtained, and their several names bore some reference to their former condition. The Lacedemonians, properly so called, formed a confederation, the object of which was to unite their forces in war, and to maintain their rights in time of peace. When the interests of the whole state were to be diffused, they sent their deputies to the general assembly, which was always held at Sparta. There were settled the contributions which each city should pay, and the number of troops it should furnish. The inhabitants of the cities of Laconia did not receive the same education with those of the capital. Their manners were more rude, and their courage less brilliant; and hence Sparta obtained an ascendency over the other cities. Anc. Univ. Hill. vol. v. Rollin's Anc. Hist. vol. ii. Trav. of Anacharsis, vol. iv.

LACEDEMONIUM MARINOR, in the Natural History of the Ancients, the name of a species of marble very hard, and of a beautiful green colour; it is a very close, even, and compact marble; of a fine, bright, and bright green, and when polished, is the brightest of all the green marbles, and is remarkable for this, that the colour is not regularly and equally diffused through the whole mass, but leaves in it many spots and lines very bright and pale, and some much deeper than the general colour, though there is no other colour but green in the whole, only in different shades and degrees, some parts approaching to black, and others to white.

It was originally found only in Egypt, and there not in entire slabs, but in large pieces washed off from the flata, and sometimes left on the surface, sometimes buried in the earth, and was greatly valued. It has been found in Italy and Germany, and in England. About five miles from the Hot-Wells at Bristol there is a stratum of it, whence it might be had in considerable quantities. Its beauty would soon recommend it, if it were once known; and though hard to cut, it would make amends for that by the high polish it would take.

LACERATED WOUNDS. See WOUNDS.

LACERNA, a thick coarse sort of military garment worn by the ancients.

The lacerna was a kind of cloak of woollen, only used by the men; who wore it over the toga, and, when that was not on, over the tunic. It was at first very short, but growing popular in the Roman army, it was soon lengthened.

The lacerna was scarcely known in Rome till the time of the civil wars, and the triumvirate; then indeed it came into fashion; for the soldiers being then frequently in the city, or at the city gates, the sight became familiar to the citizens, and they fell into the use of it; inasmuch that it became the common dress of the knights and senators, till the time of Valentinian and Theodosius, when the senators were prohibited the wearing of it in the city.

The lacerna appears to have been much the fame with the dalmata and biretus.

Martial mentions lacerna of ten thousand sesterces price.

LACERTA, LIZARD, in AGRONOMY, a collection of the northern hemisphere, including, according to Hevelius, ten stars, and in the British Catalogue sixteen. See constellation.

Lacerta, in Zoology. See Lizard.

LACERTID, a division of the reptiles, comprehended under the genus of Lacerta.

LACERTUS, and LACERTUS, in Anatomy, names sometimes applied to the bundles of fibres, of which the muscular organs are composed.

LACERNUS, in Zoology. See Manis.

LACERTUS, in Ichthiography, the lizard-fish, a name given by some writers to a fish of the cruciform kind, much resembling the common mackarel in shape and in colour, and more usually called trachurus.

LACERTUS is also used for a fish of the gar-fish kind, or acus Orphinii, but larger than the common species, and called by the Italian fishermen agnata imperiale, or the imperial garfish, and by the fishermen of England, particularly in Cornwall, the girock, in distinction from the common kind which they call sejper. It is thicker in proportion to its length than the common gar-fish, and has a shorter and sharper fin, and instead of teeth, has only its jaws serrated like a file. It is a scarce fish, but is more firm in its flesh than the common gar-fish. See Esox.

LACERUM, in Anatomy, an epithet applied, from their irregular figures, to two foramina of the skull; one in the orbit, the other in the bony cranial. See CRANUM.

LACERUM, in Botany, among Botanists. See LEAF.

LACHAS, in Geography, a town of South America, in the audience of Quito; 60 miles N. of Quito.

LACHALIA, a town of Sweden, in East Bothnia; 13 miles S.S.E. of Vasa.

LACHELS, a town of France, in the department of the Seine; nine miles W.S.W. of Vercelli.

LACHEN, a town of Switzerland, in the canton of Schwyz, on the S. side of the lake of Zurich. Near it are some mineral springs, and alka crystall and petrifications; eight miles W. of Utzenach.

LACHENALIA, in Botany, so named by professor Jacquin, jun, in honour of Werner de Lachenal, professor of botany and anatomy at Basel, a distinguished pupil of Haller and friend of Linnaeus, eminent for his knowledge of European plants, and still more estimable for his candour and liberality. Several of his dissertations occur in the Acta Helvetica, which throw great light upon the botany of Switzerland, and were intended as preparatory to a Flora of that country, disposed after the Linnaean system; but this work has never yet appeared. Whether its author be still living, we have not lately heard. He was born in 1730.—Jacq. fil. in Adv. Nov. Helvet. v. 38. t. 2. f. 3. Murr. in Linn. Syfl. Vog. ed. 14. 314. Schreb. 799. Wild. Sp. Pl. v. 2. 171. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 284. Lamarck. Dict. v. 3. 372. Illufr. f. 1. t. 257. (Phorium ; Juf. 32.)

Gen. Ch. Cal. none. Cor. of fix oblong unequal petals, approximated into the form of a tube, united at their base; the three outer ones shortell, and often callous at the tip. Stain. Filaments fix, erect, awl-shaped, attached to the base of the petals, various in length; anthers erect, oblong. Pfl. German superior, nearly ovate; style awl-shaped, as long as the stamens; stigma fimbriate, obtuse. Pet. Capsule nearly ovate, with three wings, and three cells. Seeds several, globose, attached to the central column.

Ell. Ch. Corolla inferior, regular, of fix petals; the three inner ones longer. Stamens erect. Capsule somewhat ovate, with three wings. Seeds globose.

Obs. Jussieu and Lamarck, following the younger Linnaeus in his Supplemenum, confound this genus with the
**Lachenalia.**

Phormium of Forster, or New Zealand flax, the former retaining this name, while the latter adopts that given by Jacquin as above; but these genera are no less distinct in habit than in their essential characters. See *Phormium.*

The species of *Lachenalia* are beautiful bulbous plants, with the habit of a Hyacinth, having all radical oblong leaves, a simple racemose flower-stalk, and variously-coloured, more or less spreading or drooping flowers. Willdenow has 24 species; the 2nd edition of *Haut. Kcoe.* enumerates 17 as cultivated in that noble collection; but we would premise to remove two species from both these lists. *L. floribunda,* which is *Hyacinthus floribundus* of Linnaeus, a native of Spain, figured in Curt. Mag. t. 859 and t. 1187, is referred by Mr. Ker, in the late-mentioned work, to *Scilla,* a meadow to which we cannot but readily accede; and *L. viridula* may as well, in our opinion, continue, in *Hycacinth,* where Linnaeus has placed it; at least it cannot well be made to agree with *Lachenalia,* see *Jacq. Ic. Rar.* t. 60. The remaining species are all natives of the Cape of Good Hope, and, as far as we know, of no other part of the world. Such as we have in gardens are cultivated in the green-house, being treated like other Cape bulbs, and flowering chiefly in the early spring, a few of them in autumn. Good examples of this genus are,

*L. orchidea.* Orchis-like *Lachenalia.* Jacq. Ic. Rar. t. 390. Curt. Mag. t. 873. 1869. — Flowers bell-shaped, sepallate. Inner petals obtuse, expanding. Style the length of the flaments. Leaves oblong-lanceolate, with a crenate cartilaginous edge. — This is the oaked inhabitant of the English gardens among the whole genus, having been cultivated by Miller in 1772. It appears to be a very variable species, at least if more than one be not confounded under this name. The flowers are more or less spotted, like the stalk. Flowers numerous, varying with pale yellow or purple mingling into shades of brown.

*L. contamina.* Mixed-coloured *Lachenalia.* Curt. Mag. t. 1491. (L. hyacinthoides; Jacq. Ic. Rar. t. 382; Willd. n. 4. L. orchidea; Jacq. Hort. Vind. v. 2. 831. 1783.) — Flowers bell-shaped, somewhat cylindrical, on short stalks, erect. Inner petals lanceolate, obtuse, erect. Leaves linear-awl-shaped, channelled, lax, longer than the stalk. — This has long been at Kew, having been sent from the Cape, by Mr. Maffon, in 1774. The long taper-pointed leaves, deeply-spotted stalks, and spotted flowers, in which white, brown-purple, and tints of green, contend for the superiority, but the two former generally prevail, characterise this species. — Nearly akin to it is *L. angustifolia,* Jacq. Ic. Rar. t. 381. Curt. Mag. t. 735. Redout. Lilac. t. 162; chiefly distinguished, according to Mr. Ker, by the broader proportion and spreading pollure of the inner petals. The leaves also are narrower, but the whole habit and colours of the plant are very similar.

*L. orthopetala.* Straight-petalled *Lachenalia.* Jacq. Coll. v. 3. 240. Ic. Rar. t. 385. — Flowers cylindrical, slightly funnel-shaped, on short stalks, erect. Petals all lanceolate, straight. Bracteae cup-shaped. Leaves linear-awl-shaped, channelled, lax, longer than the stalk. — Of this we have seen no specimen, but Jacquin's figure proves it abundantly distinct from the *contamina,* with which, as Mr. Ker observes, it has been confounded by Willdenow and in the *Hortus Koeniianus.* The petals are white, with a green spot at the back, near the point of each. The above character expresses their form and position.

*L. psolphata.* Blistered *Lachenalia.* Jacq. Coll. v. 3. 244. v. 4. 220. t. 2. f. 5. Ic. Rar. t. 386. Curt. Mag. t. 815. — Flowers bell-shaped, somewhat cylindrical, on very short stalks. Inner petals dilated and obtuse. Stalk triangular, reclining. Leaves two, lanceolate, blistered. — The flowers are remarkable for their blistered upper surface. The flowers are palish and unornamented; their inner petals, at first green-coloured and spreading, become twisted together and yellow in decay.

*L. lanceolata.* Spotted copper-bellied *Lachenalia.* — Jacq. Ic. Rar. t. 432. Curt. Mag. t. 643. Redout. Lilac. t. 59. — Flowers somewhat bell-shaped, spreading, on stalks three times their own length. Petals linear, blunt, nearly equal. Leaves numerous, ovate, pointed. — Chieflv remarkable for its numerous, broad, taper-pointed flowers, spreading in the form of a star, of a graceful hue, more or less speckled with a darker green. The flowers are numerous, pendulous, variegated with dull purple and green.

*L. lutetia.* Curt. Mag. t. 1400; (L. flavum; Andr. Repof. t. 456.)

*L. quadrilobus.* (L. quadrilobus; Curt. Mag. t. 588 and 1097; Jacq. Ic. Rar. t. 399; Andr. Repof. t. 158.)

*L. tricolor;* Jacq. Ic. Rar. t. 61. L. pendula; Willd. Sp. Pl. v. 2. 181.)

Flowers cylindrical, pendulous, flaked. Inner petals twice the length of the outer, dilated, slightly spreading, somewhat emarginate. Bracteae taper-pointed. Leaves two, lanceolate. — This is one of the most common and generally cultivated species. We are so well satisfied of the truth of Mr. Ker's remark, that the *quadriplouz* of the above authors, referred by some to the *pendula,* is most akin to *tricolor,* that we cannot consider it otherwise than as a variety, certainly not more specifically distinct than the *lutetia.* We conceive therefore that either these three plants must constitute one species, or they ought all to be considered as alike distinct. Cultivation by seed must in time decide this question. The flowers in all of them are in pairs, and recurved; those of the first are broad and spotted; the others longer and narrower, generally without spots. Spikc in all somewhat conico, many of the uppermost flowers being abortive, and their pointed bracteae crowded into a tuft. The outer petals of all are tipped with green; those of the first and third varieties more or less tinged with red, those of the second plain yellow. The inner petals of the first are variegated with green and pale yellow; those of the second are of a plain full yellow, being moreover rather broader and more expanded; those of the third are lemon-coloured, elegantly tipped with deep crimson or purple.

*β. tigrina;* Jacq. Ic. Rar. t. 309.

γ. punctata; ibid. t. 307.

Flowers cylindrical, drooping, on short stalks. Inner petals one-fourth longer than the outer, spatulate, somewhat unequal, obtuse. Bracteae scarcely pointed. Leaves two, elliptic-oblung. — This is said to be rather rare in our collec-
tions. The leaves and stalk are speckled with purple, and the flowers dotted with red, in all the three varieties, which have no pretensions to be reckoned species. They differ only in luxuriance, 

L. panulifera. Four-coloured Pendulous Lachenalia.

Flowers cylindrical, pendulous, on very short stalks. Inner petals nearly one-fourth longer than the outer, wedge-shaped, obtuse. Bracteas scarcely pointed. Leaves two, ovato-lanceolate. One of the most commonly cultivated and most beautiful species, flowering in the greenhouse or frame in February. The flowers are broad. Flowers numerous, drooping and somewhat curved, of a fine red at their base, their segments tipped with various degrees of purple and green, the middle part yellow. The main stalk is fluted and straight, speckled; the partial ones very short.—Widllow makes the quadrilateral a variety of this, in which he is inadvertently copied by the editors of the second edition of Hort. Kew.; an error corrected by Mr. Ker in Curt. Mag. v. 26. p. 1020. See also v. 16. p. 585, of the same work.

Lachenalia, in Gardening, comprises plants of the bulbous-rooted kinds, of which the species mostly cut treated are the spotted-leaved lachenalia, L. orchideae, the pale-flowered lachenalia, L. pallida, the three-coloured lachenalia, L. tricolor.

The third sort varies with yellow, fawn-coloured, blood-red purple at the tip, and greenish-yellow corollas; also in the proportion between the inner and outer petals; and in the breadth of the leaves.

Method of Culture.—All these plants may be increased by offsets from the bulbs, and by seeds; when they are produced in perfection.

The offsets should be planted out in pots of light fresh earth, when the bulbare in a state of inactivity of growth, placing them in a warm border to be covered with hand glasses, or, what is better, in a dry flower or greenhouse.

These plants have forcing tolerably, and their flowering is much promoted by being preferred in the warmth of the flower.

They all afford variety among collections of potted bulbous-rooted flowering plants.

LACHES, from the French _lachés_, i. e. _laxer_, or _lachés_, igneurus, in our _Laxer_, signifies slackness or negligence; as it appears in Littkton, where laches of entry is a neglect in the heir to enter, and probably it may be an old English word; for when we lay there is laches of entry, it is the same as if it were laid, there is lack of entry; and in this signification it is used. (Litt. 126.) No laches shall be adjudged in the heir within the age; and regularly laches shall not bar either infants or feme covert for not entry or claim to avoid defections; but laches shall be accounted in them, for non performance of a condition annexed to the estate of the land. (Co. Litt. 146.) The law also determines, that in the king there can be no negligence, or laches; and therefore no delay will bar his right. Co. Litt. 90.

LACHESIS, in Zoology. See _Coluber_.

LACHEZE, in Geography. See _La Chaise_.

LACHISH, in Scripture Geography, a town of Palestine, in the tribe of Dan, S.W. of that of Judah, on the frontiers of this tribe, to which Senacherib laid siege, when he sent his haughty message to Hezekiah. It was a small town, or village, about 7 miles S. from Eleutheropolis, in the time of Eusebius and Jerome. John. x. 25. xl. 39. 2 Kings, xv. 17. xix. 8. 2 Chron. xxxi. 9.

Gen. Ch. Cal. Parter inferior, of one leaf, coloured, permanent; tube long and slender; limb in four deep unequal segments, the uppermost of which is much the smallest and erect, the other three reflexed, the middle one largest. _Cor_. none. _Stam._ Filaments eight, bristle-shaped, erect, inserted into the upper part of the tube, and nearly as long as the limb; a little unequal; anthers simple, roundish. _Pist_. German inferior, ovate; style thread-shaped, longer than the tube, attached laterally to the germen; stigma capitulate, bifid. _Peri._ none, except the permanent bafe of the calyx. _Seel._ Foliar, coated, ovate, with an oblique point.

Effl. Calyx tubular, coloured, with a four-equal unequal limb. Stamens inserted into the mouth of the tube, prominent. Seed one, coated.

Obs. This genus differs from _Paffera_ in having an irregular flower only. We follow Linnæus in his _Gen. Pl._ as to the denomination of the parts of the flower, though in his _Syl Var._ he subsequently termed corolla what he had before called calyx; but the analogy of _Daphne_ compared with _Gnidus_ (see these articles), confirms his original phytology.

1. _L. eriocephala_. Woolly-headed Lachenalia. Linn. Sp. Pl. 514. Andr. Repol. t. 104. Curt. Mag. t. 1295. (Paffera eriocephala and cephalophora; Thunb. Prod. 75.)—Leaves opposite, imbricated in four rows, pointless, keeled underneath. Flowers woolly; segments acute. Named of the Cape of Good Hope, like all the other species. This is laid in the _Hortus Kewensis_ to have been introduced into England in 1793, by Mr. R. Lee and Kennedy. It is a green-house herb, flowering a summer long. The short slender smooth leaves, standing in four rows, resemble those of some kinds of heath. The flowers are large and white, in terminal solitary heads, subtended by bracteas broader than the leaves, of an elliptical figure, and tinged with red. The stalk and base of each flower, as well as the outside of its limb, are very woolly. Nothing is recorded respecting the scent of these flowers, nor have we had an opportunity of examining them sufficiently to ascertain this point; but we should expect them, from analogy, to be fragrant at some time of the day or night. An authentic specimen flows this to be _Paffera cephalophora_ of Thunberg, and we presume it must be _eriocephala_.

2. _L. purpurea_. Purple-flowered Lachenalia. Andr. Repol. t. 105. Leaves opposite, imbricated, in four rows, obtuse, keeled underneath. Segments of the calyx smooth. This elegant species, distinguished by its larger size, and roe-coloured or light purple flowers, whose outside is smooth and naked, except a short pubescence on the tube, was gathered at the Cape by Mr. James Niven, an indefatigable collector sent out by Gen. Hibbert, c. M. P. It flowers in June and July, and is sheltered in the greenhouse in winter, where it is liable to perish from damp. The tube of each flower is white, with a woolly tuft at its base, like the former. The bracteas are broad and almost round.

Some excellent remarks are given by Mr. Salisbury, in his \textit{Paradisus}, in favour of the latter opinion of Linneus concerning the calyx of this genus, which he therefore terms corolla, but the point seems to us still doubtful, at least, and we therefore adhere to what we have always maintained.

4. \textit{L. conglomerata.} Crowded Lachnea. Linn. Sp. Pl. 514. (Parafarma glomerata; Thunb. Prodr. 75.)—Leaves opposite, imbricated in four rows, abrupt. Flowers opposite, crowded about the ends of the branches. Bracteas elliptical, three ribbed. — Gathered by Sparmann and Thunberg at the Cape, but as yet unknown to our cultivators. It is a small branching shrub, very closely resembling \textit{Paffferina filiformis}, but the leaves are shorter, and much more remarkably abrupt or retuse, nor are they at all incurved. The upper ones infeebly become bracteas, being dilated, elliptical, concave, with three, sometimes five, strong projecting ribs; their inner side is clothed with dense prominent wool. These bracteas continue, in three or four opposite pairs, to the end of each little branch, every one of them being accompanied by an axillary, solitary, small flower, whole tube, longer than the bractea, is woolly, its limb nearly or quite smooth and naked. The colour of the flowers is apparently purplish; their segments are sufficiently unequal to make the plant a \textit{Lachnea}, though they and every other part are so very like \textit{Paffferina filiformis}, whose segments likewise we think we perceive an inequality, that we are certain these two plants ought to be placed in one genus. They differ, however, specifically in their bracteas, which in \textit{P. filiformis} are ovate, pointed, strongly keeled, with numerous smaller lateral ribs. We recommend this fact to the notice of botanists who publish figures of plants. Of \textit{L. conglomerata} we can find no representation in books. The synonyms quoted by Linneus and copied by Willdenow, belong to a very different shrub, from which nevertheless the specific character seems to be taken, and which appears to be the following.

5. \textit{L. phytolepis.} Phyllea-leaved Lachnea. Lamarck. Dict. v. 1: 109. (Sammundae tertie Clafion affinis, foliis polin, capitis born carpod?] Breyn. Cent. t. 18. t. 7?)—Leaves linear-ovate, smooth, loosely imbricated. Heads small, clustered, white and downy." Lamarck describes this as "very closely resembling a Phyllea, in which genus he had placed it, till an examination of the flowers let him right. These he found quadrifid and obovate, with 5+8 flight an inequality in the limb, that he doubts whether that character be sufficient to keep the plant distinct from \textit{Paffferina}. It is a branching shrub, the branches straight, slender, leafy, smooth, except the youngest shoots. Leaves numerous, sessile, linear-ovate, nearly triangular, quite smooth, straight, loosely imbricated, somewhat resembling \textit{Daphna rubra}. The flowers are collected, from five to eight together, into corymbose white heads, the eye of a pea, terminating the numerous, very short, crowded little branches, which form a fort of corymb at the end of the principal ones.

The calyx is white, downy; its tube a line and half long, its limb in four oval, concave, unequal segments, nearly as long as the tube." The author received it dried from M. Thouin, as a native of the Cape. He objects to the synonymy of Breynius, which we have, with great doubts, transferred litter from the preceding species. To this plate, in his own copy, Linneus has written the name of \textit{Phyllea imberbis}, a plant adopted by his \textit{Manitio}, p. 269, from Bergius, without having seen a specimen himself; and he there copies this very synonym of Breynius, without recollecting that he had cited it already as \textit{Lachnea conglomerata}. Lamarck thinks it belongs to \textit{Phylica pteropus}. The plant of Bergius is certainly, by his description, a \textit{Phyllea}, and if that of Breynius be the same, it must be eraged from \textit{Lachnea}. We have one more error to correct concerning \textit{L. conglomerata}, which is, that Thunberg thinks it the same with \textit{Paffferina ricoides}, though nothing can be more distinct than the latter in the \textit{Lachnea} herbarium, with the ovate tube and small regular limb of its flower, so exactly resembling some species of \textit{Eria}. This \textit{Paffferina} is, therefore, it seems, erroneously omitted in Thunberg's \textit{Prodromus}. — The author first named, regardless of the irregularity of the flower, unites \textit{Lachnea} altogether with \textit{Paffferina}, a measure we are very unwilling to adopt. It is an opinion of the ingenious Correa de Serra, that, in every natural order, there are one or more genera, differing from the rest in the regularity or irregularity of the flower. \textit{Lachnea} then is the only genus of the \textit{Thymelaeas}, or Mezereum tribe, with an unequal or irregular flower.

\textbf{LACHNIS,} in \textit{Natural History}, the name which some have given to a genus of fossils, attributed to the class of the \textit{fibricia}; the characters of which are, that they are fibroool bodies, not elastic, and composed of short and abrupt fibres, or filaments.

The word is derived from the Greek \textit{a\gamma\i\v\i\v}, a hair, or short capillarity or fibre.

The bodies of this genus have been divided into those which are composed of larger and broader, and those which are composed of smaller and narrower filaments. Hill's fossils. See \textit{Fibricia}.

\textbf{LACHNOSPERMUM,} in \textit{Botany}, a genus so called by Professor Willdenow, from \textit{Lachnea}, wood, and \textit{sperma}, seed; indeed that author distinguishes this plant from \textit{Stachelina}, on account of the woolliness which invests its seed. — Willd. Sp. Pl. v. 1: 1787. (Stachelina species; Thunb. Prod. 143.)

\textbf{1. L. cireifolium.} Willd. (Stachelina fasciculata; Thunb. Prod. 143.)—A native of the Cape of Good Hope—The branches of this shrub are divaricated, rigid, and downy. Leaves very small, about half a line in length, imbricated, round, obtuse, invested with down. Flowers solitary, at the tops of the little branches, on short footstalks, in cymes, in pairs, the size of \textit{Stachelina fruticosa}. Calyx cylindrical, downy; scales ovate, acute, with a naked, elongated, spreading point. Seeds, without a proper crown, enfolded with hairs. Receptacle hairy, the hairs as long as the florets.

\textbf{LACHOW,} in \textit{Geography}, a town of Poland, in Volhynia; 28 miles N.W. of Chersones.

\textbf{LACHOWICZE,} a town of Lithuania, in the pashinate of Brasce; 28 miles S.W. of Pines.

\textbf{LACHRYMAJOVA} in \textit{Botany}—See Coty.

\textbf{LACHRYMA BATAVICA.} — See \textit{Rupert's Drop.}

\textbf{LACHRYMAI.} — See \textit{Lachrymatis.}
The lachrymal gland, however, is subject to febrile induration, which is more frequently noticed in infections, than practice. We allude to cafes, in which the gland is the only part thus diseased; for it is well known by all experienced surgeon, that when the eye-ball is affected with carcinoma, the lachrymal gland is very liable to participate in the dilatation, and for the sake of security, ought generally to be extirpated together with the eye.

A remarkable case is related by M. Guérin, where he extirpated a febrile lachrymal gland, which was so much enlarged, that it covered the whole of the eye-ball. The latter part, indeed, was entirely concealed, and might have been supposed to be confounded with the fellow; had not circumstances excited, which tended to show, that the organ in question was found and situated under the tumour. M. Guérin successfully detached the swelling from the eye and eyelids without injuring the rectus externus muscle.

If this can be received as really and unquestionably an example of a febrile lachrymal gland being found detached quite alone, and extirpated by itself, it is a case which, perhaps, has not its fellow in the records of surgery. Possibly, the swelling might be nothing more than an eneulicated tumour.

LACHRYMATORIES, in Antiquity, small glass or earthen phials, with a long neck, found in the sepulchres of the ancients. Many antiquaries have supposed that these vessels served to collect the tears of the weeping friends that survived, or of persons hired for that purpose. This belief was grounded on the appearance of the opening of these phials, which is generally furnished with a round concave part well adapted for embracing the convexity of the eye-ball. On some lachrymatories are even found impressions of an eye, and sometimes of a pair of eyes. But here, as in many other cafes, the eye appears to be merely emblematical. It may also be said that the opinion of tears being preserved in these vessels is unsupported by any ancient custom we are acquainted with, or by any well interpreted passage in ancient authors. This opinion was first broached by Chillet; it soon spread over Europe, and was, in spite of its improbability, adopted and supported by Kirchmann, Kipping, and many other antiquaries. At last it was combated by Schiap Sin and Paciandri; so that at present it appears to be agreed on all sides that the lachrymatories did not contain any thing but balms designed to moisten the funeral pile or the ashes of the dead, or else the blood of martyrs. There is in the Capitol a large relief which is much in favour of this idea: on this marble, which represents the funeral rites at the death of Melagier, a woman approaches the pile, holding in one hand a large bellied vessel, and in the other a long phial with elongated neck and bottom, and in every respect similar to several earthen lachrymatories preserved in collections. This woman is in the act of pouring out of the large into the small phial what may be supposed to be balms or odoriferous oil for the purpose of perfuming the funeral pile of Melagier. If we may believe Dumolinet, there have been small spoons found in lachrymatories, which may have served for distributing into several small phials the contents of a vessel of greater dimensions. Millin Dict.

LACHSA, denominated also Hadjar, and sometimes Babbein, in Geography, a province in Arabia, bounded towards the E. by the Persian gulf, towards the S. by Oman, towards the W. by the province of Nedsed, and towards the N. by the territories of the wandering Arabs in the vicinity of Baffora. This province affords a great variety of productions. Its wells and cameals are esteemed to be of an excellent breed; and of the latter some thousands are annually sold into Syria. In the interior parts the inhabitants cultivate very much upon dates. Upon the coasts pearl-fishing is pursued with advantage; and there is a considerable trade in foreign commodities. The inhabitants of Lachsa are very much divided with regard to religion. Those who live in the towns are Shiites; but the peasants are, like the Bedouins, Sunnites. Here are also some Jews, and many Szazans, or Chritians of St. John.

Lachsa was once a province of the empire; but the Arabs have long since taken off the Ottoman yoke. Many Turks, descended from the ancient Pachas, still remain in the province, and possess considerable estates, but have no share in the government. At present the sovereignty of this province belongs to the sultan of the Arabian tribe of Beni Khaled, which is one of the most powerful tribes in Arabia. The greater part of Lachsa is inhabited by Bedouins, and other petty tribes; but they all acknowledge the dominion of the sultan of Lachi Khaled. The cities in the interior parts of this province are little known. Nebiahr—Allo, a town of Arabia, capital of this province, where the sultan resides, situated on the river Alfar, near the Persian gulf. N. lat. 29° 56' E. long. 48° 34'.

LACHWA, a town of Lithuania, in the patinance of Berzei: 50 miles E. of Pink.

LACING, in Ship Building, the name of one of the pieces composing the keel of the head, which is continued up to the top of the hair-bracket, and to which the figure and the ends of the head-ribs are secured.

LACINATED LEAF, in Botany. See LEAF.

LACINIUM PERSPECTORUM, in Ancient Geography, Capo delle Colonc, a promontory of Italy, at the eastern part of Britum, and bounding on the south the gulf of Tarentum. This cape was much celebrated on account of a temple of the Lucanian Juno, which was an object of great veneration, and which received many rich offerings from various parts. Authors report that here might be seen a large column of massive gold. The Romans report, that Hannibal, when he was forced to quit Italy by an order of the senate of Carthage, assembled in this place all his Italian allies, and massacred all who would not accompany him into Africa.

Gen. Ch. Cal. Perianth none. Cor. none. Stam. Filaments numerous, about 40, capillary, winged on each side at the lower part, inserted into the receptacle which is surrounded by 12 lipins; anthers oblong, clowen at the base, acute, incumbent. Pyl. Germen superior, oblong, angularly friglit; styles two, incurved; stigmas obtuse. Peric. Caly-
fule ovate, with eight furrows, of one cell and two valves. 

Seds numerous, very small, affixed to an ovate, unconnected receptacle.

Eff. Ch. Calyx none. Corolla none. Capsule of one cell, two valves and many seeds.

1. L. fluviatilis. Wild. (Mourera fluviatilis; Aubl. Guian. t. 253). A native of rivers in Guiana, flowering and bearing fruit in November. Its Caribbean name is Mourera.—Root creeping Stems herbaceous, simple, rough. Leaves alternate, divided into numerous, repeatedly jagged lobes, dark green, curled and veined at the margin, rough, with minute points. Flowers in spikes, terminal, each one, before expansion, invemled with three small deciduous leaves. Filaments violet-coloured; anthers yellow.

We know not how Willdenow came to describe the leaves as smooth, for in Aublet's own specimens we find then extremely rough with minute points.

Gen. Ch. Cal. a common Catkin, cylindrical, imbricated on all sides; scales single-flowered, ovate, concave, with two smaller, linear, lateral, internal scales under the corolla. Cor. of one petal, in four deep, nearly equal, lanceolate, acute, ascending segments, shorter than the internal scales, without any tube. Nectary of one orbicular, concave, entire, central leaf, lea of the petal. Stam. Filament foliary, from the centre of the nectary near the germen, erect, cloven in the upper part and incurved over the nipiil; anthers foliary on each branch of the filament, minute, roundish. Pet. Germen superior, globose; styles two, very short, recurved; stigma simple. Peri. Berry stalked, obovate, of one cell. Seed foliary, oblong.

1. L. myriochila. Swartz. Prodr. 12. Fl. Ind. Occ. v. 2. 1053. Lc. Plant. 5. t. 1. (Piper aggregatum; Berg. in Act. Helvet. v. 7. 1811. 1. 10).—Received by Berigius from Surinam. Swartz found it in bushy parts of mountains, on the westem side of Jamaica, but sparingly, flowering in spring, and ripening fruit in summer. This is a shrub, or small tree, with a smooth bark. The principal branches are round, lax, and smooth, with a few alternate zig-zag subdivisions. Leaves alternate, flaked, two or three inches long, elliptical, pointed, entire, very smooth, brownish-green, with one rib and several transverse veins. Stipules none. Catkins axillary, several together, feathery, loosely spreading, a little curved, about half an inch long, whitish, many-flowered, hairy at the base. The flowers are extremely minute: the corolla white. Berry black and soft, the size of a red currant, with a feathery infundibuliform. There is some difficulty in describing the parts of the flower, especially the inner scales, which Swartz incautiously named bracteas, though situated within each proper scale of the catkin. Nematoceratium of Richard in the Actes de la Société d'Hill. Nat. de Paris. v. 1. 105. is justly indicated as nearly allied in description to this plant, except that it is said to have three fligmas (or rather lylces), and a capsule with three seeds, suspended from its valves by threads. We presume therefore they cannot be the same genus. See Nematocaferatium.

Lack, in Geography, a township of America, in Mifflin county, Pennsylvania, containing 1797 inhabitants.

Lack of Rupees. See Rupee.

Lackah, in Geography, a small river of Ireland, in the county of Donegal, which flows into Sheephaven.

Lackanwaddy, a town of Hindoostan, in the cirear of Arrahingalad; 45 miles E. of Jafferahabad.

Lackar, an island in the East Indian sea, about 20 miles long and six broad. S. lat. 8 18'. E. long. 128° 14'.

Lackara, a town of Africa, in the kingdom of Kafion.

Lackari, a town of Pernia, in the province of Irak; 120 miles W.N.W. of Isphahan.

Lacker. See Lackar.

Lackergault, in Geography, a town of Thibet; 45 miles S. of Deprag.

Lacki, a town of Hindoostan, in Bengal; 55 miles N. of Dacca.

Lackipole, a town of Bengal; 16 miles N.E. of Calcutta.

Lackricotta, a town of Hindoostan, in the cirear of Cicacle; 24 miles S.W. of Vizianagram.—Allo, a town of Hindoostan, in Coimbetore; 13 miles S.W. of Coimbetore.

Lackritapilla, a town of Hindoostan, in the cirear of Cuddapa; 20 miles S.W. of Cuddapa.

Lacmus. See Litmus.

Lacobena, in Ancient Geography, a town of Asia, situated between the mountains N. of Comagene, on a small river, which ran into the Euphrates, S.E. of this town.

Lacobriga, a town of Spain, upon the Piforaca, S. of Julibriga and N.E. of Pallantia, belonging to the Veccel.

Lacock's Bay, in Geography, a bay on the N.E. coast of Barbadoes; one mile N.W. of Cuckold's Point.

Laconcavan, a town of Upper Siam, on the Memo; 80 miles S. of Porcelon.

Lacosndy Isles, two small islands among the Laccadives, about three miles apart. N. lat. 10° 35'. E. long. 71° 40'.

Laconia, in Ancient Geography, a country afterwards called Sparta and Lacedemon, was situated on the S.E. point of Peleponnesus, and bounded on the N. by Argos and Arcadia, on the W. by Megalia, on the E. by the bay of Argos, and by the Mediterranean on the S. On the W. were the mountains named Taygetus, from some of the summit, from which, which are said to have riven above the clouds, the eye might survey the whole of Peloponnesus. The sides of these mountains were every where covered with woods, which were the argus of a great number of goats, bears, wild boars, and fings. The extent of Laconia from E. to W. where it reached forth the isthms was 1145; but it becomes narrower towards the north, and its extent from N. to S. was about 50 miles. As the fourth part of this kingdom was encompassed by the sea, and the exit and north-eall part by the Argelic bay, it had a great number of principalities, the chief of which were those of Melea and Tanaro, now capo Mallo and capo Matapan. These two being situated on the Mediterranean form the large Laconian gulf, which lies between them, and is now called the Golfo di Colchiciana, into which the famed river Eurus, better known by the name of Euphrates, or Royal river, discharged its waters with an easy and gentle course. The sea-coasts of Laconia were furnished with a considerable number of sea-ports, towns, and commodious harbours, of which the largest and most convenient were those of Trinacius and Acria, situated one on each side the mouth of the Eurus, and Gythium, at a small distance from Trinacius; which last is said to have been built by Apollo and Hercules; but the most noted was Epidaurus, now Malvefia, seated on the gulf of Argos, now Golfo di Napoli, a well-built town, famous for its excellent wine.
wine called Malvey, or Malmevi, which was produced from grapes that grew round it. There were about 12 more sea-port towns along the Laconic coast; and they were rendered particularly famous on account of a shell fish caught in the neighbourhood, which yielded a purple dye, inferior to none but that which was brought from the Red Sea. Inland towns likewise abounded in this kingdom, the most considerable of which was the metropolis Sparta, which see. Other citie of note were Amycla, Helae, Thalius, and Leucum. The mountains of Laconia were numerous. Its most considerable rivers, besides the Eurotas, were the Sernus, the Thafus, and the Erycis. The soil was very rich, especially in the low and flat grounds, and being well watered, it was excellent for pasture; but the number of its mountains and hills prevented its being so well tilled, as it might otherwise have been. It was much better situated for trade and navigation, by having the sea round about half the kingdom, and so many good havens about it. How well the inhabitants improved these advantages, how powerful they became, what fleets they maintained, and brave experienced admirals they bred, may be seen in their history. We shall here only observe, that the Laccomonians were a courageous people, hardy, and inured to war both by sea and land, averse from both and luxury, jealous of their honour and liberty, as well as the power of their neighbours; nor were they wanting in any military discipline, in order to secure the one, and curb the other. By these means they became so powerful, and made so considerable a figure in Greece, that the kings of Egypt and Phcenicia did not disdain to pay a kind of homage to them, and own their superiority by solemn embassies. See LACCOMONIANS.

LACONIA, in Geography, a tract of land, extending from the river Mermaack to Sagadoshock, and from the ocean to the lakes and rivers of Canada, so called in the grant of lands, in 1622, from the council of Plymouth to Capt. Maffon, and Sir Ferdinando Gorges. See IOQUOD.

LACONIC STYLE. See Style.

LACONICA SCYTA. See SCYTA.

LACONISM, Δακονισμός, a short, pithy, sententious speech, in the manner of the Laccomonians, who were remarkable for the closeness and conciseness of their way of delivering themselves.

LACOVIA, in Geography, a town of Jamaica; 55 miles W. of Kingston.

LACUER, or LACKER, is a varnish applied upon tin, brass, and other metals, to prevent them from tarnishing, and to improve their colour The basis of lacquers is a solution of the resinous substance called feed-lac, or rather shell-lac, in spirit of wine. This spirit ought to be very much dephlegmated in order to diffuse much of the lac. For this purpose, some authors direct dry pot-alcohol be thrown into the spirit. This alkali attracts the water, with which it forms a liquid that diffuses distinctly from the spirit at the bottom of the vessel. From this liquid the spirit may be separated by decantation. By this method the spirit is much dephlegmated; but at the same time it becomes impregnated with part of the alkali, which depraves its colour, and communicates a property to the lacquer of imbibing moisture from the air. These inconveniences may be prevented by distilling the spirit; or, if the artist has not an opportunity of performing that process, he may cleanse the spirit in a great measure from the alkali, by adding to it some calcined alum, the acid of which uniting with the alkali remaining in the spirit, forms with it a vitriolated tartar, which, not being soluable in spirit of wine, falls to the bottom together with the earth of the decomposed alum. To a pint of the dephlegmated and purified spirit, about three ounces of powdered shell-lac are to be added; and the mixture to be digested during some days with a moderate heat. The liquor ought then to be poured off, strained, and cleared by settling. This clear liquor is now fit to receive the required colour, from certain resinous colouring substances, the principal of which are gamboge and annatto, the former of which gives a yellow, and the latter an orange colour. In order to give a golden colour, two parts of gamboge are added to one of annatto; but these colouring substances may be separately diffused in the tincture of lac, and the colour required may be adjusted by mixing the two solutions in different proportions. When flary-leaf, or tin, are to be lacquered, a larger quantity of the colouring materials is requisite than when the lacquer is intended to be laid on brasses.

There are sundry other materials, from a due mixture of which a like colour may be produced, as turmeric, saffron, dragon's blood, &c. See Gold Coloured Varnish, and Japonier's Gilding.

Instead of shell-lac, used in the composition of varnishes for lacquering, resin or turpentine is substituted for the coarser uses. The following composition for brass-work, designed to resemble gilding, has been much recommended: take of turmeric ground, as it may be had at the dry-fallers, one ounce, and of saffron and Spanish annatto each two drams: put them into a bottle with a pint of highly rectified spirit of wine, and place the bottle in a moderate heat, occasionally shaking it, for several days; then strain off the yellow tincture thus obtained, through a coarse linen cloth, and putting it back into the bottle, add three ounces of good seed-lac grossly powdered; place the bottle again in a moderate heat and shake it, till the seed-lac be diffused. The lacquer strained as before will be fit for use, and must be kept in a bottle carefully stoped. By increasing or diminishing the proportion of annatto, the lacquer will be rendered warmer and redder, or cooler and nearer a true yellow. A cheaper composition little inferior to the former, may be formed of one ounce of turmeric root, half a dram of the belt dragon's blood, and a pint of spirit of wine, managed as the former.

The varnish for tin may be made of one ounce of turmeric-root, two drams of dragon's blood, and one pint of spirit of wine, prepared in the same manner with the other. The dragon's blood may be increased or diminished, as the red or yellow is to be the most prevalent; and for a coarser lacquer the quantity of shell-lac may be lessened, and the deficiency supplied by the same proportion of resin. The lacquer for locks, nails, &c. where little or no colour is desired, may be either shell-lac varnished alone, or with a little dragon's blood; or a compound varnish of equal parts of shell-lac and resin, with or without the dragon's blood. The manner of laying on the lacquer is as follows: the pieces to be lacquered must first be made thoroughly clean; and if they be new founded, aquafortis must be used for this purpose. When they are afterwards heated by a small charcoal fire, the lacquer is laid on with a proper brush, like other varnishes, and the pieces refurred to the heat. After the lacquer is thoroughly dry and firm, the same operation must be renewed for four or five times, or till the work appears of the required colour and brightness.

The lacquering of leather, improperly called gilding, is performed by means of leaf-silver, coloured by a yellow varnish. (See Japonier's Gilding.) For this purpose calf or goatskins are procured in a dry state, after the common dressing and tanning. They are softened by being immerced and lathered about for some hours in a tub of water; and afterwards beaten against a flat stone and smoothed, by spreading them on the stone and rubbing them
them over with an iron instrument: the skin, thus prepared, are joined together in pieces of the dimensions required; and then fixed on the grain of the leather with a kind of soft glue, or stiff size, that answers to the gold-size used in other kinds of gilding or silvering, prepared from parchment or glover's cuttings. The workman next proceeds to cover the whole surface of the fixed skin, before it be quite dry, with lead silver, and with a fox's tail, made into the form of a ball at the end, fettles the leaves, by prelling and striking them; and closes this operation with gently rubbing the whole surface with the tail. When the skins are silvered, they are hung to dry first on cords, and the drying is completed by putting them over a board jointed together, with the silvered side next the boards, where they must be kept stretched out by means of some nails. They are then burnished with a flint burnisher, which operation is performed by spreading the skin even on a smooth stone, and fiding the burnisher backwards and forwards over every part of the skin, with a considerable degree of pressure. In some manufactures the burnishing is performed, by passing the silvered skins between two cylindrical rollers of steel, with polished faces. The skins are now prepared for receiving the yellow lacquer or varnish, which gives the appearance of gilding. Different artists have different recipes for compounding this lacquer. The following is said to be equal to any that have been used: take of fine white resin, 4½ pounds; the fame quantity of common resin; of gum fandarac, 2½ pounds; and of aloes, two pounds: bruise and mix them; and put them into an earthen pot over a good fire of charcoal, or over any other fire which has no flame: when all the ingredients are perfectly melted and mixed, add gradually to them seven pints of linseed oil, and stir the whole well together with a spatula; let the whole boil, stirring all the time, to prevent a kind of sediment, that will form, from sticking to the bottom of the vessel. When the varnish is almost sufficiently boiled, which will generally require seven or eight hours, add gradually half an ounce of litharge, or half an ounce of red lead; and when this is dissolved, pass the varnish through a linen cloth, or flannel bag. A pint of oil, and a corresponding proportion of fine resin and aloes, have produced a very good varnish in an hour and a half. This lacquer or varnish is laid on the silvered leather in the open air; and is best done in summer, when it is hot and dry. For this purpose, the skins are stretched and fastened with nails to the boards, on which the drying was finished, with the silvered side outwards. And when these boards are properly disposed on trestles, the workman generally spreads some white of eggs over each skin; and when this is dry, the varnish, which is nearly of the consistence of a thick syrup, is repeatedly spread with the four fingers of one hand, moved so that each finger paints a kind of S with the varnish, from one end of the skin to the other: and it is then diffused evenly over every part with the flat of the hand; after this it is to be immediately beaten by strokes of the palms of the hands, and principally where the varnish is over the vein of the leather. When this coat of varnish is sufficiently dry, which may be known by the fingers making no impression upon it, another coat is laid on in the same manner. When this coat is dry, the varnishing for producing the appearance of gilding is completed; and if it has been well performed, the leather will have a very fine gold colour, with a considerable degree of polish or brightness. When there is an intention to have one part of the leather silver, and the other gold, a pattern is formed on the surface, by printing, calking or stamping, a design on the surface after the silvering. The skin is then to be varnished, as if the whole were intended to be gold; but after the last coat, instead of drying the varnish, it is to be immediately taken off that part, which is intended to be silver, according to the design printed or called upon it, by a knife; with which the workman scrapes off all that he can without injuring the silver, and afterwards by a linen cloth, with which all that remains is to be wiped or rubbed off. The skins thus silvered and varnished, are made the ground of various designs for embossed work and painting. The embossed work or relief is raised by means of printing with a rolling press, such as is used for copper plates; but the design is here to be engraved on wood. The painting may be of any kind; but oil is principally used, as being durable and more easily performed. Dossie's Handmaid to the Arts, vol. i. p. 454, &c.

LACRIMOSO, It a l. a musical term, seldom used now, which implies a plaintive movement, in a style as weeping.

LACRIMOSA. See LACHRYMAL.

LACRIMOSA. In Natural History, a little round and hard bone, laid to grow in the great corner of a bird's eye after a certain age. Some also preserve under this name a thickened excretion from the inner angle of that creature's eye, in colour and consistence resembling myrrh, or ear-wax, long hardened in the ear. This is of a strong and very disagreeable smell, like the sweat of the same animal, and is affirmed to be fudorific and aperient.

LACRYMÆ CHRISTI, the name of a sort of wine produced by grapes on the lower part of Mount Veluvis; so called from the drops of juice oozing from the grapes, when fully ripe.

LACRYMÆ. See LACHRYMAL.

LACRYMALIS, in Anatomy, an epithet applied to several parts about the eye. The lacrymal gland is the organ secreting the fluid which composes the tears: the puncta lacrymalia are the orifices of two small ducts, by which this fluid is absorbed from the surface of the eye; and the lacrymal sac or bag is the cavity in which the tears so absorbed are received. See EYE.

The os lacrymale is a name applied to the bone in which the lacrymal bag is lodged; it is called also os uuguis. See CRANIUM.

The lacrymal nerve is a branch of the ophthalamic or first branch of the fifth pair. See NERVE.

LACSUR, in Geography, a town of Peria, in the province of Korasan; 50 miles N.E. of Herat.

LACTANTIUS, generally called LUCIUS CELIUS, or CESELIS FIRMUS, in Biography, the most eloquent of the Latin fathers, flourished towards the close of the third and the beginning of the fourth century. Some have conjectured that he was born at Firmum, now Fermo, in Italy, and hence called Firmicus; but as he was a disciple of Arnobius, who taught rhetoric at Sicca in Africa, this was probably the country of his nativity. This latter opinion is confirmed by his itinerary from Africa to Nicomedea, which contained, as we may reasonably imagine, an account of his own journey, when he was sent for by Diculeian. While he was young, he wrote his "Symposium," or Banquet, and thus acquired a degree of reputation, which occasioned his being sent for to teach rhetoric at Nicomedea, where Diculeian proposed to render this city a rival to Rome. Some have supposed that Lactantius was in his youth a heretic, and converted to the Christian faith; but it is most probable, from the arguments alleged by Dr. Lardner, that he was educated in Christian principles, and that he was a

Vol. XX.
LACTANTIUS.

Christian when he taught rhetoric at Nicomedia, at the commencement of Diocletian's persecution, though it does not appear how he escaped the danger to which his Christian profession must have exposed him, at a time when the church of the Christians in that city was destroyed. Nicomedia was at this time chiefly inhabited by Greeks, who had no great taste for Roman eloquence; and the religious profession of Lactanitius, notwithstanding his learning and talents, rendered him unpopular, so that the number of his scholars was small, and he was under the necessity of writing, in order to procure a scanty subsistence. As he was much addicted to reading, and books in MS. were coU. his library made to exhaust his pecuniary supplies. These circumstances will account for the poverty of his condition; without supposing with Dupin and Tillemont that it was voluntary. His situation, however, was improved, when he was invited by the emperor Conlantinus into Gaul, and appointed preceptor to his son Crispus; but when Crispus was put to death by his father, he lost the benefit of this office; nor does it appear that Conlantinus made any permanent provision for him, which might reasonably have been expected. It is generally allowed, that, during the greatest part of his life, Lactantius was in indigent and even delitute circumstances, often wanting necessaries. Of other particulars of Lactanitius's life, which was prolonged to a very advanced period, no records remain; nor has the time of his death been ascertained. It does not appear that he ever pleaded as an advocate at the bar. From his works, which are allowed to be authentic, we may collect his sentiments with regard to some of the distinguting tenets of theology. Lactantius often speaks of the nature and design of the Christian revelation, as suited to promote the general good of all, of every age, sex, and condition; so that all may attain to just sentiments of God, and directed and afflicted in the way of holiness, and obtain everlasting happiness. And he affirms it to be in the power of the meanest and poorest of men to attain to righteousness. He sometimes glorifies in the great and happy effects of the Christian doctrine upon the minds and lives of men; and he recommends this divine religion, as the medicine of the soul, effectual for healing all its diseases. He affords the freedom of man's will, or his power to do good or evil. He openly affords the innocence of Christian people, all whose religion, he says, consists in good works, or a care to live unblamably and inoffensively. And the criminals, who fell under the sentence of the magistrate for robbery and other offences, he observes, were not Christians, but of the same religion with their enemies. He expresses himself as if in his time Christians performed miracles in dispelling demons. Lactantius was of opinion, that another life, or a future state of happiness for good men, may be proved by reason. He did not deny the eternity of hell tortments. With regard to repentance he often affords its great value, and maintains, that whenever sinners repent, they are pardoned. He also thinks, that the divine displeasure against men ceases immediately upon their repentance and amendment. True virtue alone, as he alleges, recommends man to the divine acceptance; and God defires nothing of man but sincere virtue, or true holiness. As to the ends and views of Christ's coming, and particularly of his death, he affirms, that Christ came to be a teacher and a pattern of virtue; and that he died and rose again, to ail the men in overcoming death, and give them also hopes of rising again, and obtaining the reward of immortalit}'. Christ, he says, lived in a mean condition, and underwent the ignominious death of the cross, that he might be a complete example of virtue, and of patience under sufferings; and that he might more especially lead and encourage such as are poor and mean in this world. In a word, he says, Christ came, and was made like unto man, lived, and died, and rose again, that he might clearly teach the precepts of virtue, and afford the bent motives to the practice of it, and effectually help frail man to conquer the darts of the flesh, and the fears of profane evil, and to overcome all the temptations of this life, and thus obtain a happy immortality.

Lactantius has strenuously affirmed the right of private judgment for every man in things of religion, and he exhorts all men to the whole and diligent exercise of it. He also argues excellently against persecution; declaiming it the greatest absurdity that can be conceived, for any to impose on others a worship contrary to their conscience, or to deny men the liberty to choose their own religion; and expressly affirming, that it is not zeal for religion, but a love of power. For religion, he says, is the freest thing in the world; nor can it be promoted by force and violence. Compulsion may make men hypocrites, but it cannot make them religious. He also maintains, that it is no just reason why men should be persecuted, because they defect or oppose ancient and established religions. For there can be no profession against truth; and every man has an undeniable right to search after truth, and to profess it, when he has acquired the knowledge of it;—with much more, admirably expressed, to the same purpose. Of the numerous errors, real or imaginary, charged upon Lactantius, we shall enumerate the following: the first and principal is that of Manicheism, from which he is vindicated by Lardner. It is well known, that he denied the existence of Antipodes. He adopted the common notion of the age in which he lived concerning the fall of many of the angels; and he expected a terrestrial reign of Christ for 1000 years before the general judgment, and he thought it to be very near, within a period of 200 years. (See Millenium.) Lactantius denied the personality of the holy ghost; nor did he consider Christ's death as a propitiatory sacrifice for sin, or a satisfaction made to divine justice for the sins of the human race. These opinions, in which he differs from many others, and some of which are undoubtedly erroneous, have occasioned several reflections upon his judgment and character. Dr. Heumann, in particular, acknowledges that he was pious, learned, and eloquent; though chargeable with several faults and defects; he was no critic, nor philosopher, but a poor divine. Bull says, that he had very little knowledge of the Christian doctrine; and Warburton affirms, that he knew but little of Christianit>'. As a writer, Lactantius has been highly commended. Dupin says, that he is justly esteemed the Christian Cicerone for his style, whilst he greatly surpassed him in his thoughts. Some authors have not only found a striking resemblance between the style of Cicerone and that of Lactantius, but have even preferred the latter to the former. Dr. Lardner says of him, "that the time in which he lived secured him a kind of veneration. He saw the quiet and peaceful state of the church before Diocletian's persecution; he was also witness of that dreadful scene, and afterwards saw the flourishing condition of Christians under Conlantinus. His eminent abilities recommended him to the esteem of two great emperors, of different religions. His uncommon honesty and simplicity, and earnest zeal for the Christian religion, and all truth in general, appear in his works, where also his learning is very conspicuous." He had, as it seems, a certain vehemence and impetuosity of natural temper not uncommon in Africans, which on some occasions hindered
his considering and weighing what might be laid on both sides of a question. At the same time, possibly we are indebted to that fire, which supported him in the fatigues of acquiring knowledge, and then communicating it to others. Upon the whole, he was "an honour and ornament to the Christian profession in his day," for "he employed his fine parts and extensive learning in the service of religion, without worldly views of any kind." A part, it will be allowed, "of this writer's reputation is owing to the charms and beauties of his style; but the matter of his works is also a just recommendation."

The principal work of Lactantius is intitled "Institutionum, libri viii," which was occasioned by the writings of two heathens of note, who published their pieces against the Christians at the beginning of the persecution under Diocletian, and was also intended as a general answer and full confutation of all others, who already had opposed, or hereafter might oppose, the Christian doctrine. The learned are not agreed about the time when this noble work was written. Dr. Lardner, after having examined different opinions on this subject, concludes, that Lactantius formed the design of this work in the year 320, that he composed the greatest part of it under the persecution of Diocletian, and that, probably, it was not published till that persecution terminated. We have also an "Epitome" of the Institutions, inscribed by Lactantius to his brother Pentaudius, which is supposed to have been written not later than the year 317, 312, or 313. This work was imperfect, until a copy of it was found in the library of the king of Sardinia at Turin, by Dr. Christopher Matthew Pafi, and published by him intire, or nearly so, at Paris in 1712, to the great joy of the learned world. This abridgment is an useful book, and contains some things not to be found in the Institutions themselves. His book "De Ira Dei," i.e. of the wrath or anger of God, which is still extant, is particularly commended by Jerom, as a learned and elegant performance, and a complete treatise on the subject. In this work he endeavours to prove that God is capable of anger, as well as of mercy and compassion. In his treatise "De opificio Dei," i.e. of the workmanship of God, he establishes the doctrine of God's providence, by demonstrating the excellence of man, his principal work, giving an elegant description of the parts of the human body, and the properties and faculties of the soul. Of the genuineness of another work, usually ascribed to Lactantius, and intitled "De Mortibus Perfectorum," i.e. of the deaths of perfectors, different opinions have been entertained. Dr. Lardner has referred to the writers who have espoused both sides of the question; and as for himself, he seems to incline to the opinion of those who do not allow it to have been written by Lactantius. He allows, however, that it is a very valuable work, containing a short account of the sufferings of Christians under several of the Roman emperors, from the death and resurrection of Christ to Diocletian; and then a particular history of the persecution excited by that emperor, with the cauces and springings of it; as well as the miserable deaths of its chief instruments. In this work occur also several remarkable facts, that are recorded no where else. This is a work which none of the ancients, after the time of Jerom, have noticed; it was first published by Stephen Baluze in the second volume of his Miscellanea, in the year 1679. It is needless to say anything of the poems de Phaeace, de Pafche, de Paffione Domini, which some have ascribed to Lactantius, and which are joined to his works in most editions. They are not mentioned by Jerom, and are now generally suppos'd not to belong to this author. The "Itinerary" and "Grammaticus," mentioned by Jerom, are irrecoverably lost. A work, under the tile of the "Symposium," or Banquet, long ascribed to Maximian, was not long ago published by Dr. Heumann, who affirms its genuineness. It is a collection of 100 trilingual epigrams, with a prose introduction. All our author's books of Epistles are entirely lost. The editions of Lactantius are very numerous. Fabricius has given a full and copious catalogue of them. The first edition was published at Rome, in 1468, fol. by Conrad Lwennheim; and the last, which is the most correct, was edited at Paris in 1748, in two fol. 4to, by the Abbé Langelot.

Lactantius has, in his various works, references to the gospels, the Acts of the Apostles, and some of the epistles, and to the book of the Revelation, which he expressly quotes as sacred scripture, and written by John. It appears also, that he had a collection of scriptures, consisting of the Old and New Testament; which he esteemed sacred and divine, and of the highest authority. His quotations of Syriac books, and other writings, ascribed to heathen poets or diviners, such as Hydaspes, and Hermes Trismegistus, were intended to serve the cause of Christianity; but he did not reckon them a part of those books which were of authority with Christians. Nor does it appear, that he placed the preaching of Peter and Paul in the rank of sacred scripture, though he has once quoted it. Fabr. Bibl. Ecc. vol. Hieron. cap. lxxx. Cave's H. L. vol. sub fac. Arian. Dupin. Lardner's Works. vol. iv.

LACTARY, in Rural Economy, a term frequently applied to a milch-house, or place where milk is kept.

LACTARY COLUMN. See COLUMN.

LACTATION, the act of giving suck.

The word is also applied to the time during which the mother doth that office to her young.

LACTEA VASA, or Lacteals, in Anatomy, are those absorbing vessels which take up the chyle, and the nutritive matter furnished by the food, from the surface of the intestines. As this fluid is of a white colour, the vessels, when filled with it, appear quite white, and hence their name. They may be seen in vast abundance in an animal killed a few hours after a meal. See ABSORBENTS.

LACTEA VIO, the milky way. See GALAXY.

LACTEAL FEVERS, a term used by Medical Writers, to express what the women call milk fevers, that is, such fevers as attend the difficult ingress of milk to the breast of lying-in women. See LABOUR.

LACTEALS OF BIRDS. See Anatomy of Birds.

LACTEUS LAPS, in Natural History, a name given by some authors to the galacticles.

LACTIFERI DUCTUS, in Anatomy, the tubes of the mammary gland, in which the milk is secreted. See BREAST.

LACTIFEROUS, an epithet applied to such plants as abound with a milk-like juice, such as the tithymal, fowthistle, and many others.

LACTOMETER, in Rural Economy, the name of an instrument for the purpose of ascertaining the different qualities of milk. It was invented by Mr. Dicas, mathematical instrument maker, in Liverpool; and the following description of it is given in the Survey of the County of Lancaster. This lactometer is contrived so as to ascertain the richness of milk from its specific gravity, compared with water, by its degree of warmth taken by a standard thermometer, on comparing its specific quality with its warmth, on a scale constructed for this particular purpose, and by which, if the principle be right, may be discovered not only the qualities of
of the milk of different cows, pastures, food, as turnips, potatoes, grains, &c.; but also probably, which may be the belt milk or belt pastures for butter, and which for cheese. This instrument, however, is but in its infancy. At his own house, the writer has made a number of varied experiments upon different milks from different farms.

It is fitted to be constructed with ten divisions upon the stem, similar to the patent brewing hydrometer, and with eight weights, which are to be applied only one at a time upon the top, to obtain the weight of milk; an ivory sliding-rule accompanies the instrument, upon the middle or sliding part of which is laid down the lactometer weight of the milk, going from o to 80; and opposite thereto are placed the various strengths of the milk, from water to 100; 100 having previously been fixed upon, from a number of experiments, as the standard of good new-milk, and each of the other numbers bearing a proportionate reference thereto. At one end of the sliding-rule the degrees of heat, from 40 to 100, are placed with a flar opposite, as an index to fix the slide to the temperature of the milk; the whole being gradually to show the exact strength of the milk, as it would appear in the temperature of 55 degrees of heat, although tried in any inferior or superior temperature between 40 and 100: thus the great inconvenience which would attend bringing the milk at all times to one temperature is avoided, and a simple mechanical method of allowing for the contraction and expansion subtilitted. And as skimmed milk, being divided of the particles of butter which existed before skimming, appears to have a less degree of affinity with that than the new milk has, one side of the ivory sliding-rule is adapted to skimmed, and the other to new. This simple contrivance is represented in the annexed plate.

General Rule.—First, find the temperature of the milk with the therometer, and fix the sliding-rule so that the star shall be facing the degree of heat the mercury rises or falls to; then put in the lactometer, and try which of the weights, applied to the top, will fix it to some one division upon the stem; add the number of the weight upon the top and that of the division together, and opposite the same, formed upon the slide, will be shown the strength of the milk.

Examples of New milk.—If in the temperature of 72°, the lactometer with the weight 40 fixed to 9 upon the stem, fix the slide so that the star shall be facing 72°; then opposite 49 will be found 100, the strength of the milk. Again, if in 60°, the lactometer with 50 on the top fixed to 6 upon the stem, the slide being fixed for new-milk, so that the star shall be at 60° of heat, then fixing 50 will be found 110, the strength of this milk in proportion to the other, provided it is equally replete with cream. To discover which, it becomes requisite these two samples should stand a certain time, that the cream may rise, which being taken off, they are to be tried with the lactometer again; and as the cream is evidently the lighter part, the milk will appear by the lactometer denser or better in quality than before. Suppose the milk in the first example to be 57 by the lactometer in 60 degrees of heat, then the strength by the skimmed-milk slide of the rule will be 112. And admit the second example of new-milk to be 58 in 64° when skimmed, the strength would be 116.

As a comparison say,

No. 1. New milk 100
Ditto skimmed 112

Difference 12

From which it appears, that No. 1, has produced a larger quantity of cream than No. 2, and consequently may be deemed the better milk. Some instances have occurred where the strength of new-milk has only been about 80, and when skimmed near 100. Thus it may, without the least propriety, be called a milk much better adapted for making butter than cheese; the serum or whey in general being near the same density.

The instances in which the lactometer may be useful, are, according to the same writer, in discovering what breeds of cattle are most advantageous; what food in the winter season, whether carrots, turnips, potatoes, &c. are best; what the effects of different pastures may be; how far particular farms are best adapted to making butter and cheese; how far the inconvenience of large cheeses in some dairies being too rich to stand may be prevented, by discovering when this redundancy of richnefs exits in the milk; and in fixing a standard for the sale of this useful article of life.

A standard for skimmed milk may readily be fixed, by saying what strength the common saleable skimmed milk shall be by the lactometer, or what its specific gravity shall be in relation to that of water in the temperate degree of heat, and that an easy comparison may be made between the specific gravity of any milk, and its lactometer strength; this instrument is to be conctructed, that one of specific gravity shall exactly correspond with three of strength; that is, the strength of 90 by the lactometer is a milk whose specific gravity is 1050, to common pump water 1000. From a number of experiments and observations, it is observed, that the common saleable skimmed milk in Liverpool is from 52 to 64 of strength, and that of new milk from 70 to 80; but it would be difficult to fix any standard for the latter, unless some mode could be devised to discover whether it was mixed with old milk or not. The only method would be, after fixing the strength of it, to try, by letting it stand, to discover if it produced that quantity of cream, which as new-milk it might reasonably be expected to do.

This ingenious contrivance is made use of in the Liverpool workhouse, with great success in ascertaining the goodness of the milk which is there employed.

Gen. Ch. Common Calyx imbricated, nearly cylindrical, of numerous pointed scales, with membranous edges. Cor. compound, imbricated, uniform; the florets hermaphrodite, numerous, equal, each of one petal, ligulate, abrupt, with four or five teeth. Stam. Filaments five, capillary, very short; anthers united into a cylindrical tube. Fil. Germen nearly oval; Style thread-shaped, as long as the filaments; Stigma two, reflexed. Persic. none, except the permanent clefted calyx, become rather ovate at the base. Seeds solitary, obovate, pointed, striated, compressed; down capillary, supported by a long flax tapering at its base. Recept. naked.

Eff. Ch. Receptacle naked. Calyx imbricated, cylindri-

| No. 2. New milk | 112 |
| Ditto skimmed | 116 |
| Difference | 6 |

This genus is most naturally allied to Sonchus, the sow-thistle, in habit and qualities, as well as fructification, the flaked seed-down, and much more slender and cylindrical calyx, constituting its chief marks of distinction. The 14th edition of Syll. Veg. enumerates ten species; Willdenow has 21. Three of them are natives of Britain, occurring chiefly in waste ground, where the soil is calcareous. They are L. cirrus, Engl. Bot. t. 1795; Woody. Med. Bot. Suppl. t. 270; and his L. falcatus, Engl. Bot. t. 268, a more slender and less active plant, distinguished by the vertical posture of its leaves, of much more rare occurrence, being scarcely found wild except in the island of Ely; and L. falcatus, Engl. Bot. t. 707. Jacq. Alstr. t. 270, the most slender of all, which ever since the time of Ray has been statutorily about Pancras, and near the Small-pox Hospital. These are all biennial plants, three or four feet high, more or less glaucous, with small sulphur-coloured flowers, which expand only in bright sunny mornings. The Rev. Mr R. B. Francis found the leaf mentioned at Southend, Essex, but it is among the most uncommon of English plants.

Of the foreign species, L. falcatus, Linn. Sp. Pl. 1118, Ger. em. 356, is well known as the Garden Lettuce, rendered luxuriant, mild, and wholesome by culture; for though we know it not in an actually wild state, some idea of its nature may be discovered by allowing it to itself spontaneously for two or three generations, the produce of which will be found much more bitter and acid, as well as far less luxuriant, than the cultivated plants. Of this species the L. crispus, Willd. n. 2. Ger. em. 356. Dod. Pempt. 644, appears to be a variety, as it has always been thought, till Roth distinguished it. Such is the case with L. palmata of Willdenow, who quotes for this its L. crispus non capitata, Lob. f. 243, which is the very identical wooden cut he had before cited from Dodonaeus for the preceding.

L. graveolens, Linn. Sp. Pl. 1118, has always been a very obscure plant, scarcely known but in the Linnean herbarium. The synonym of Ray is, at best, doubtful, and the figure given by Sir John Hill, in his curious Vegetable Syllebem, is altogether a deception, drawn from description or imagination. What the German writers intend under this name, we have no information. The following is a translation of Linnaeus's account of the L. graveolens, from his Swedish Travels to Oldland and Gothland.—Lactuca with leaves fluted in a pinnate form, finely toothed, acute, without prickles at the back, and a smooth stem. Fl. Suec. ed. 1. n. 646. Found on the south side of the former ridge of Carlston, towards the east. I never had an opportunity of seeing this plant before; and Ray is the only author whose description is sufficiently clear to prove, beyond a doubt, that the Lactuca folia graveolens of his Hist. Plant. v. 1. 219, is a similar plant. The root of our's is flabby and obtuse Stem a cubit high, erect, round, smooth, simple. Cliff r of flowers terminal, close, narrow and long. Leaves like Sonchus oleraceus, but having sharper teeth, as if bitten or jagged. Calyx nearly cylindrical, scaly, smooth, with scattered ruffly spots; the scales erect, furnished at the back with an additional spreading scale."

L. canadensis, Linn. Sp. Pl. 1119, is rightly removed to Sonchus by Willdenow, under the name of paludosus. The same author, on the contrary, removes the Linnean Sonchus tuberosus to Lactua, calling it sonchifolius, and he appears to be right in this instance also, the seed-down being supported by a considerable flake.

L. perennis, Linn. Sp. Pl. 1120. (Chondrilla cærulea; Ger. em. 286.), is one of the more handsome species of this genus, on account of its elegantly pinnaed leaves, and large blue flowers. It grows in the warmer parts of Germany, Switzerland, and France, and is perennial.

A typographical error in our account of Hieracium, column 3, line 6 from the bottom, demands correction. The comma after remarks, and the word last, both require to be expunged.

Lactuca, in Gardening, comprehends a plant of the herbaceous annual kind, of which the species usually cultivated in the garden, is the common garden lettuce, L. sativa, which has several varieties: the principal of which are: — of the cabbage-lettuce kind, the hardy green, white honey, great admirable white, brown Dutch, small early, white ball, green ball; and of the cos-lettuce kind, the green cos, white cos, Egyptian cos, spotted cos, black cos, brown Cichia, green Cichia, red Capuchin, green Capuchin, large imperial, the Roman, the prince; but the three or four first of the different sorts are the most valuable, and it is of much consequence to have the bell kinds employed in cultivation.

Method of Culture.—This species, and all the varieties, are raised by sowing the seed annually, at different times, as in February and the three following months, for the summer supply of plants; and in August and the following month, for the autumn, winter, and very early spring supplies. And all these different sowings should be performed upon beds of fine light dry earth, in an open situation, and exposed to the sun. Some of the late sowings may be made under hand-glasses, or in frames or boxes, in order to have the young plants protected from the frosts. Each of the varieties or sorts should be sown separately, and distinct from the others, and be lightly raked into the soil.

It is sometimes the practice to sow them among other low growing crops, such as radishes, spinach, onions, &c. to have ground; but this should always be avoided as much as possible, as a very small portion of land is sufficient for raising large supplies of plants.

For the very early spring use, as open lettuces, the early white cabbage sorts are the most proper; but for the main crops, to remain for full growth, the principal sorts of the cos and cabbage kind must be employed.

When the plants appear, they must be kept perfectly free from weeds, and properly thinned out. As they attain a proper growth, as three or four inches in height, some of the different sorts must be planted out into beds in the open ground, drawing them up carefully, and planting them immediately. This should be performed by a line and small dibble, in rows, a foot or more distant, with the same space from plant to plant. The quincunx mode is mostly adopted, which affords the most room, and at the same time has the neatest appearance. As soon as the planting is finished, the whole should be well watered; and when the weather is dry, repeated once or twice.

By this planting out, the several sorts at different times, at the distance of three weeks or a month, from the early spring till the latter end of the autumn, due succedances of good lettuces may be provided. In the summer plantings out, when the weather proves very dry, it is sometimes the practice to plant them in small drills, in order to preserve the moisture more effectually.

After the beds of the different principal sowings have been considerably thinned by the several transplantations that have been made from them, the plants that remain may be set out
to proper distances by the hoe, and left to take their full growth.

As soon as the plants of the main spring and summer crops have attained a pretty full growth, especially those of the early kinds, it is necessary to tie the leaves of them up with bafs pretty close, when the plants are quite dry, in order to blanch the inner parts, and render them perfectly crisp, sweet, and tender.

Mode of Culture in the Winter and very early Spring Crops. — For this purpose, some feed of the hardy green and white cabbage sorts, and the brown Dutch, and white and green cobs kinds should be sown about the middle of August, and beginning of September, in open situations, when the plants will come up in a week or ten days, and about the end of September; and in October, a parcel of the best plants of each row should be planted out in a warm dry situation, fifteen or six inches asunder; and at the latter period some in shallow frames, to be covered with glass or cold frames, and in bed weather; or under hand-glasses, or in a bed arched over with hoops or rods, to be covered with mats in winter frosts. Under either of the above shelters the plants should have the free air in the day time in mild dry weather, covering them in cold nights with proper covers, especially after this month; also, in all very cold, and in very wet weather, day or night, particularly those in the frames and under glass; and those in hand-glasses may have the glass raised constantly over them in winter, tilting up one side in mild weather, only setting them entirely off in fine mild or dry days; but in sharp frosty weather keeping those under every kind of shelter quite close; allowing also additional covering of mats or litter, when the frost is very intense. Those in the borders may be defended by some light litter; but the covering should never be suffered to remain longer on any of the crops than the bad weather continues, the free air being admitted every mild day.

In this method lettuces may be had the greatest part of the winter and early in the spring, particularly the cabbage sorts; those planted out first will be fit for use in November and December, and the second plantings come in towards Christmas, and being sheltered by the glasses, continue coming in for use till succeeded by the latter autumn sowings; being careful that, as any are gathered out of the frames or glasses, others be removed from the borders to fill up the vacancies, whereby the glasses may be constantly supplied during the winter season.

It is sometimes the practice where lettuces are intended to be planted in frames late in autumn, for winter use, to have a moderate hot-bed made for their reception, in order that they may be well forwarded in the beginning of winter; and if the heat is continued moderately by aid of linings, allowing plenty of air in mild weather, the plants may be very fine by Christmas, or a little after.

Mode of Culture in the Winter standing Spring Crops.— In order to have good lettuces for spring use, some feed should be sown toward the middle and latter end of August, for the plants to stand the winter, some where found, others transplanted into warm borders, to stand without any other shelter than that of the walls and other fences; and another sowing should be performed about the middle of September, to provide plants for prick ing out under frames, to have the shelter of the glasses all winter, as a reserve in case those in the borders are destroyed; where both stand, one may succeed the other as crops. In the first case a quantity of the best plants, when two or three inches high, should be planted out towards the latter end of October, into a south border, under a wall, &c., and in some other warm dry situation, in rows six inches asunder, and four inches in the rows; or some close under a south wall, or other fence, in a foot wide space all the way along, prick ing them therein four or six inches asunder; as they will have a better chance of standing the winter than those situated more distant from the shelter of the wall. In each method the plants are to remain to take their chance all winter: out of the whole many of them will probably escape the frost; but in very severe weather they may be protected by a light covering of dry long litter, which should be removed again in due time when the frost breaks. In March or April, if they remain too thick, some should be thinned out and planted in another place, in rows twelve or fifteen inches asunder; the crops thus wintered in the open ground, come for use in April and May, to succeed those sown in autumn, and sheltered occasionally all winter, and will remain good till the spring sown plants are ready for use.

But in the latter case, or those sown in September, to be wintered in frames, they should be planted about the latter end of October, or the beginning of the following month, in rows, from the 10th to 24th of November, three inches asunder, closing the earth well about each plant, finishing with a moderate watering all over the plants, and putting on the glasses to promote their more speedy rooting again, pushing the lights, however, two or three inches down, to give vent to the moist vapour arising from the mould. But when the plants have taken fresh root, and are set to growing, the full air should be admitted every mild day, by taking the glasses entirely off, which must be continued throughout the winter season, in all dry mild weather, but putting them on every night in cold or very wet weather; also in the day-time when great rains prevail; and in frosty weather keeping the glasses always on except in the middle of sunny days, and when the frosts is but slight; using also other coverings of mats or long litter over the glasses, and around the sides of the frames, when the frosts are very severe; during the winter keeping all decayed leaves clean picked off; and as the spring and warm weather advance, letting them have the benefit of warm showers. In this way they may be effectually preferred, if those in the open ground should be destroyed by the frosts or excessive moisture. About March some of them should be transplanted into a warm situation in the open ground, in rows, a foot asunder, watering them moderately till fresh rooted; leaving a crop remaining in the frames or winter-bed, a foot apart, to stand to cabbage; which will arrive to perfection a considerable time before the transplanted ones, and those that have been fully exposed all winter, are ready. Where frames cannot be spared, a quantity of the plants may be pricked out under hand or bell-glasses in autumn, to stand the winter, either by themselves for a full crop, or some under the hand or bell-glasses, which are placed over early cauliflowers, as practiced by the London gardeners, planting them round about within the glasses, and managing them as directed for those in the frames; or for want either of a sufficiency of frames or hand-glasses, a quantity may be planted out in October, in four feet wide beds, in a warm situation, arched over with hoops or rods, to cover with mats and other bed weather. In this way they have a better chance of surviving the winter than those fully exposed; and in spring transplanting a quantity, by way of thinning, into other beds, as directed already.

Manner of sowing Seeds. — With this intention some of the bell cabbaged early plants of all the sorts should be chosen, as those of the latter crops rarely run soon enough to ripen seeds perfectly before they are attacked by the autumnal rains
rains and cold, which greatly retard the ripening of the seed.
And it is of much importance to have the different vari-
eties intended for feed at some distance from each other, as, when too near together, the farina of the different sorts may mix and ferment one another, and thereby degenerate plants be produced, instead of such as are perfect in their nature.

The feed usually ripens in August and September, but that of different plants rarely equally together; so that, as it arrives to perfection, the respective items, &c. of ripe feed should be pulled up or cut off in dry days, and spread upon a cloth, or tied in small bunches across lines in a dry airy place for a week or two, for the seeds to harden and become dry; then beaten or rubbed out, and cleaned from the down and other rubbish, and exposed upon cloths a few days to dry for keeping; being afterwards put up in bags for use, and hung in a dry room or other place.

In general these plants may be considered as annuals and biennials, as though grown in spring and summer attain perfection, run up to feed, and perish the same year; while the autumn sowings fland all winter until the spring following, when they attain perfection, shoot up to feed, and perish root and branch. All the sorts are sufficiently hardy to grow in any good dry common soil, in a free situation open to the sun and air.

In regard to the use of these plants it is principally in falks, when arrived at full growth and cabbaged, that the inner leaves become blanched, crisp, and sweet; and sometimes, also, the young open plants of the cabbage-lettuce sorts are used in winter and spring, till the other general crops arrive at perfection. Young open lettuces are also often used as small fallad herbs, flowing them thick in rows, like cresses, &c. and gathering them in the same manner; but this mode is more particularly practiced in winter and early spring. They, however, in general, do not eat any way so crisp, sweet, and palatable, as when fully cabbaged. The fully cabbaged-lettuce are also excellent for stewing and for soups, as well as many other culinary uses.

LACTUCA MARINAE, sea-lettuce, in Botany, a name used by some authors for the LACANA marina, commonly called oyster-green.

LACTUCA VIRGINA, in the Materia Medica, a species of lactues, which grows about ditches, banks, borders of fields, and old walls, flowering in July and August. The plant has a long ungrateful smell, resembling that of opium, and a bitterish acid taste. It abounds with a milk juice, in which its febile qualities seem to reside, and which seems to have been noticed by Dioscorides, who represents its odour and taste as agreeing with that of the white poppy; and Haller says, that its effects are powerfully narcotic. Dr. Collin, at Vienna, first brought this plant into medical repute, and it has been lately imported by the College of Physicians at Edinburgh in the catalogue of the Materia Medica. Dr. Collin mentions more than twenty-four cafes of dropy that have been treated with succces by employing an extract prepared from the expressed juice of this plant, which is stated to be, not only powerfully diuretic, but to promote all the secretions, and to remove vesicular obstructions. In the more simple cafes, proceeding from debility, doses of the extract, from eighteen to thirty grains a day, proved sufficient to accomplish a cure; but as the disease was inveterate, and accompanied with vesicular obstructions, the quantity of extract was increased to three grains; nor did larger doses produce any bad effect besides exciting a nausea. The patients, it is said, continued for strong under the use of this remedy, that it was seldom necessary, to em-
ploy any tonic medicines. In Germany, few physicians have, since the year 1771, when Dr. Collin made his experiments with the lactuca, adopted the use of this plant: and hence Dr. Woodville (Med. Bot.) takes occasion to observe, that the recommendation of Dr. Collin will be scarcely thought sufficient to establish its use in England.

LACTUMEN, from lac, milk, in Surgery, a name sometimes given to Tina capsitis, or the fcald head, on account of the white scabs which are formed in this disease.

LACTUMINA, from lac, milk, little ulcers, or crusty scabs in the skin, chiefly occurring in children at the breast.

LACUNA, Andrew, in Biography, an eminent Spanish physician, was born at Segovia, in Old Castile, in the year 1499. He studied philosophy at Salamanca, and afterwards went to Paris, partly for the purpose of improving his knowledge of the Greek language, and partly for the study of medicine. He took a degree in that capital, but probably only that of master of arts. In 1536, he returned to Spain, and followed the courtesies established in the colleges of Alcalá, Henarez, and Toledo, in the latter of which he received the honours of the doctorate. After this he immediately repaired to the Low Countries, in consequence of a command from the emperor Charles V. and he passed the greater part of his life at the court of that monarch. In 1546, he went to the imperial city of Metz, and resided there five or six years, rendering great services to the citizens during the prevalence of an epidemic pestilence; and by his influence, thus acquired, he contributed to strengthen their adherence to the church of Rome and to the emperor. He visited Italy, Germany, and France again, where he received many honours from the learned corporations, and at Rome was created count palatine, and knight of the order of St. Peter. He died in his native country in the beginning of the year 1560.

He proved himself a learned critic by the corrections and commentaries on the works of Dioscorides, and on many parts of those of Hippocrates, Aristotle, Galen. &c. His own works are numerous, consisting of a treatise on anatomy; an account of the epidemic at Metz; a life of Galen, an epitome of his works, and notes on the labours of his translators, &c. He likewise published a treatise on gout, on excrescences in the neck of the bladder, and on diet, and an epitome to Cornaro; and he translated the works of Dioscorides into Spanish. Eloy. Diclı. Hist. de Med.

LACUNAE, in Anatomy, small cavities in some of the mucous membranes, in which a secretion of mucus is carried on, as in the urethra of the male and female. See a description of them in those organs under Generation.

LACUNARS, in Architecture, are the pannels or coffers formed on the ceilings of apartments, and sometimes on the fofts of the corona of the Ionic, Corinthian, and Composite orders.

In the temple of Minerva at Athens, the lacunars are placed immediately above the frieze within the portico, and formed with a single recce, having an ovolo at the top, which moulding terminates the vertical plane sides, and the horizontal heads of the lacunars. The lacunars are not square, but longer in the longitudinal than in the transverse direction of the building.

In the temple of Theseus at Athens, the lacunars are formed above the frieze, in two rows, between large beams which reach from the rear to the front of the pronaoe; their figures are of a square horizontal section, and have only a single recce upwards, with an ovolo above the recce. The side of the figure of each coper is about one-fifth part of the diameter of the column, and their recce upwards half the side of
of their square. The distance between the beams is equal to
the breadth of the ante at the bottom, or nearly equal to the
diameter of the columns. The beams are not regulated by
the columns, but placed at equidistant intervals, to receive the
two rows of lacunars or coffers. Within the temple or
cella, the beams reach transversely from side to side; but
without, and under the soffit of the pronos, they extend
longitudinally from the front to the rear of the pronos, and
the lacunars in the same direction.

Temple of Minerva at Athens, Plates IV., VII.—The lacu-

nars are placed above a frieze highly decorated with histori-
cal figures.

In this they are formed in one recce, with a moulding
ovolo at the top of the recce, or the fagade extremity of
the sides. The lacunars are not square, but longer from
front to rear of the portico, than in the transverse direction
of the building. Chap. ii. Plate XVIII.

In the soffit of the temple of Pandroseus at Athens, the lacu-
nars are formed immediately above the architrave, each
into three recce, with an ovolo at the bottom of each,
nearly as broad as the perpendicular surface. The whole
depth of the recce is nearly half the side of the square of the
lower part of the said recce. Each part diminishes gradually in
breadth in a slope flowing straight line, till the side of the square
of the upper part is so contracted as to be only half that of
the lower. Each succeeding third part diminishes regularly in
altitude, so that accounting the bottom the first, the alti-
dude of the second, or the one next above, is something less,
and the third about the same quantity less than the second.
Each ovolo is something less in height than the vertical surface
below it, and has the same ratio to its respective surface.

The cella of the temple of Vella at Rome is surronded
with a circular colonnade. The ceiling of the portico has a
double row of lacunars, being two in the breadth of the por-
tico. The lacunars approach each nearly to a square as is con-
fident with their diminution, formed by radiations towards the
centre of the building, and are contructed in two re-
cees. The greatest breadth of the outside lacunar is about
nine three-sixths of the diameter of the columns. The whole
depth of the recce upwards is about one-fourth of a dia-

mater. The radiating sides of the lacunars or coffers are in
vertical planes, and the other two sides of each are vertical
cylindric eccentric surfaces. The greatest breadth of the
upper recce is about two-thirds of the lower. The hollow
of this recce is occupied by a rofe of a circular form. The
recce or cradle vaults of the temple of Peace at Rome are
arched and enriched with octagonal lacunars, each formed in
three recce, which diminish in their margins as they recede upwards. Between the octagonal lacunars are others of
a square form in a diagonal position. The ceiling of the
middle of the chapel of the said temple is compared with
hexagonal and rhomboidal lacunars.

The lacunars of the arch of Titus at Rome are each square,
the side of which being about three quarters of the diameter
of the column.

The entablatures of the Ionic, Corinthian, and Composite
orders, are generally enriched with lacunars between the mo-
ditions

LAC phenies, in Biography, a Greek philospher, and na-
tive of Cyrene, was a disciple of Arceusius, whom he suc-
ceded in the academic chair. He was brought up in very
humble circumstances, but acquired great reputation by
intense application to his studies, and a graceful eloqence.
He was highly esteemed by king Attalus, who gave him a
garden where he might devote himself to study, and to the
instruction of others: this was afterwards known by the

LAD

name of the Lacydean garden. Attalus wished Lacydes to
come and reside at his court, to which he respectfully replied
that the portraits of kings should be viewed at a distance.
He taught his disciples never to be hesitating in their judgments,
and never to speak positively. Having taught philosophy
twenty-six years, he resigned the employment to his scholar
Teleles and Evander, in the second year of the 1418.
Olympiad. In old age he desired himself by giving a
favourite goose a most magnificent funeral, and he fell a vic-
tim to excessive drinking. Bayle, Enfield.

LAD, in Geography, a town of Moldavia, on the Rent 1
36 miles N.E. of Stephanowze.

LADA, in Botany, a name given by some authors to the
plant which produces the common black-pepper.

LADAK, or LAUTA, in Geography, a province of
Thibet, bounding on Cashmir towards the west, towards
the east on Ngar, and towards the north on the Ufeks.
See TIBET.

LADANUM, in Botany. See CISTUS.

LADANUM, or LADANUM, in Pharmacy, a gummos or
a refranal matter, oozing out of the leaves of a shrub
called cistus creticus, or ladanefera, which is very common in
the hot countries of the Levant, particularly in Candia, and
of which there are various kinds. The shrub is also
plentiful in Spain, though no ladanum is brought from
thence.

Dioscorides says, they gather the ladanum by means of
goats, which, browsing on the leaves of this shrub, return
to the stable with their beards loaded with a fat substance,
which the peacans rake off with a kind of combs made for
that purpose. This matter they thus collect into lumps, and,
as it is mixed with the goats' hair, and other impurities,
call it Ladanum in the beard, or natural ladanum. Others are
said to draw cords over the leaves, and other parts of the
shrub; and, scraping off what had stuck to the cords, they
make up the ladanum into little balls.

Tournonfort affirms us, that the common way of gathering
the ladanum at this time is, by brushing it off the leaves
with a spirit of whips, composed of many lalhes, or fraps:
after it is scratched off the fraps, they make it into cakes of
different sizes.

Pietro della Valle tells us, he was informed by the Indians,
that ladanum is formed like dew, and falls from heaven like
manna; that it is gathered on the leaves of a plant a palm and
a half high; that, after gathering, they boil it, by which
means it becomes soft, like wax.

Bellonius says that this juice is collected by lightly brush-
ing the shrub, in the summer heats, with a kind of rake,
called in Candia "ergo-tiri," having several fraps or thongs
of leather fixed to it instead of teeth; the mucous juice
adheres to the thongs, and is afterwards scraped off with
knives, and formed into regular masses for exportation.

There are two sorts of ladanum in the frups: the best,
which is very rare, is in dark-coloured masses, of the confi-
ence of a soft phalfer, which becomes still softer on being
handled. The other is in long rolls, coiled up and much
harder than the preceding, and no so dark. The first has
commonly a small, and the last a very large adnorture of
fine sand, blown upon the juice from the sandy foile where
it is found.

Ladanum has been sometimes exhibited as a preparal and
alriment in catarrhal affections, dyserteries, and several
other diseases, but it is at present wholly employed in exter-
nal applications and perfumes. The soft kind, which has
an agreeable smell, and a lightly punctain bitterish taste, makes
an useful ingredient in the cephalic and ttomachic plasters of
the
the ship's. Rectified spirit of wine diffuses nearly the whole of the pure ladanum into a gold-coloured liquid. Water acquires by infusion much of its smell and taste: and, by distillation in water an effluval oil arises, leaving a brown almost insipid resin and a pale-coloured liquid, which, inspissated, yields a weakly bitter extract. Heat soon destroys the specific flavour of this juice. Lewis.

LADANUM, Liquid, more properly called clear or purified ladanum, is a preparation of the natural ladanum, by melting and purifying it from the hairs, &c.

This hardened is sometimes sold for a sort of black ambergris.

LADDER or Heaven, in Botany. See Lily of the Valley.

LADDERS, Scaling, in the Military Art, are used in escalade. They are of various sorts; some are of ropes and some of wood; some are made of several joints, so as to be capable of being put together, and to form ladders of different length, according to the service required. There is a sort used in England, much of the same make as the common ladders, except that the steps turn about wooden pegs, so that the poles may be brought near each other, or to that like a parallel ruler. These are very convenient for carriage.

LADDERS in a ship, derive their names from the several hatchways or other parts where they are situated. Besides these, there are some of a particular construction, as the accommodation-ladder, and the quarter-ladder. The accommodation-ladder is a sort of light staircases, occasionally fixed on the gang-way of the admiral, or commander in chief of a fleet. It is furnished with rails and entering ropes, covered with red baize, and the lower end of it is kept at a proper distance from the ship's side by iron-bars or braces, to render the passage more convenient to those who enter or leave the ship. Quarter-ladders, are two ladders of rope, depending from the right and left side of the ship's stern, whereby to descend into the boats which are moored afloat, in order to bring them up along-side of the ship, or to use them for any other occasion.

LADDER HAY, the openings in the decks where the ladders are placed.

LADENOPOLEI, in Geography, a town of Russia, in the government of Oboix, 56 miles S. of Petrozavodsk. N. lat. 61° 56'. E. long. 33° 50'.

LADEN, in Sea Language, denotes the state of a ship when she is charged with a weight or quantity of any sort of merchandise or other materials, equal to her tonnage or burthen. If the cargo with which she is laden be extremely heavy, her burthen then is denominated by the weight of the goods; if it be light he carries as much as she can flow, so as to be light for the purposes of navigation. A ton in merchandise is generally estimated at 2000 lb. in weight; and therefore a vessel of 300 tons ought to carry a weight of 600,000 lb. when the matter of which the cargo is composed is specifically heavier than the water in which they float.

LADEN, in Bulk, denotes the state of being freighted with a cargo, which is not in casks, boxes, bales, or cases; but lies loose in the hold, being defended from the moisture or wet of the hold, by a number of mats and a quantity of drapery. Such are usually the cargoes of corn, salt, or such materials.

LADENBURG, in Geography, a town of Welfphalia, in the bishopric of Osnabruck; nine miles S.S.E. of Osnabruck.—Also, a town of the duchy of Baden; six miles E. of Manheim. N. lat. 49° 27'. E. long. 8° 40'.

LADETSCH, a town of Bohemia, in the circle of Czsalau; 12 miles S.S.W. of Czsalau.

LADJA, in Hindo Mythology, a being produced by Brahma, similarly with Ladhana, a being which Brahma, or the creative power of the deity, produced from his skin when peopling the world. Ladhana is a pernicious spirit of appetite or passion, and the word in Sanscrit has, in many other languages, a abominable meaning, indicating the source of the craving thus produced. On that occasion Kama, a personification of love or desire (see Kama), forsook from his heart in the form of a beauteous female, and Brahma, looking on her with amorous emotions, was informed by the Munis, (the Munis,) that she was his own daughter; he shrunk back, and Ladja, a personification of shame, a blushing virgin, was produced. Brahma, deeming her body defiled by its emotions toward Kama, purified it by partially metamorphosing it into a ten females, who were respectively engrossed by the Munis.

LADIKIEH, in Geography, a town of Asiatic Turkey, in Caramania, anciently Ladicia; 20 miles W. of Cegia.

LADINO, See Bill of Lading.

LADISLAUS I., in Biography, king of Hungary, son of Boda I. born in 1041, was a martial prince, and joined his brother Geyfa in a war against Solon, whom he was the chief cause of defeating, at the bloody battle which deprived him of his crown, and placed it upon the head of Geyfa. Upon the death of the latter in 1078, Ladislaus was chosen to succeed him. He immediately attacked and defeated the rebellious Wallachians, and annexed to his dominions Dalmatia and Croatia, through the gift of his sister, who was widow of the last king of Dalmatia. He reduced the Bohemians who had revolted, expelled the Huns, and conquered part of Bulgaria and Russia. He defeated also the Tartars, and having made his dominions secure on all sides, he resided in his flourishing and happy by the arts of peace: he encouraged commerce, and published an improved code of laws. He built several new churches, and made considerable preparations for joining in the first crusade, when in an expedition into Bohemia he was attacked with a disease, which put an end to his life in the year 1095, after a glorious reign of seventeen years. He was distinguished for piety as well as valour, and was canonized in 1108 by pope Celestine III. Univer. Hist.

LADISLAUS II., king of Hungary. The second prince of this name reigned but a few months, and did nothing worthy of record. The third Ladislaus, the subject of this article, surnamed Chun, came to the throne in 1272, after the death of his father, Stephen IV. He obtained the name of Chun from the barbarity of his disposition. Soon after his accession to the throne, he, in conjunction with the emperor Rodolph, defeated the Bohemian king Otho III, who was slain in battle. After this success, he gave himself up to all manner of voluptuousness; divorcing his own wife, that he might indulge his passion with women of the Tartar nation of Cumania. His general conduct was false, and his opinion of the Christians fo erroneous, that the pope, at the desire of the principal people of Hungary, excommunicated him; upon which he resigned a sincere repentance, and built an hospital for strangers. His total neglect of the government, and the disjunction of his subjects, invited the incursions of the Tartars, by whom Hungary was so dreadfully defoliated, that, for want of boats, men, and even those of the higher ranks, were obliged to draw the plough. Hence the Hungarian proverb, "The ploughs of Ladislaus." After a second invasion, which Ladislaus took no measures to repel, he was stabbed, while sleeping in his tent, by some of the Cumanian women in whom he confided, but whom he had offended. Univer. Hist.

LADISLAUS IV., king of Hungary, also king of Poland, under the title of Uladislaus V., was son of Jarezzo, or Aa 3 Uladislaus
Uladius IV., whom he succeeded on the Polish throne in 1435, being then only in the sixth year of his age. He was elected king of Hungary in 1440. As the famous crown of St. Stephen was in possession of the late queen, he was crowned with a diadem taken from the chest containing the relics of that sainted monarch. He declared war against the Turks, and employed as his general John Huniadus, who was very successful in the cause. Ladislaus made peace, which gave much dissatisfaction to the pope, and other Christian princes; so that he was induced to break it. A battle soon after ensued, in which he lost his life at Varna, in the year 1444. His death occasioned the complete ruin of his army. Univer. Hift.

LADISLAUS V., king of Hungary, was born in 1440, and succeeded to the crown in 1444, when he was only in the fifth year of his age. He was, at this time, at the court of the emperor Frederic III.; and it was not till 1452 that he was restored to his country. It was agreed that, during his minority, Hungary should be governed by John Corvin, son of Huniadus; Bohemia by George Podiebrad; and Anfuria by Ulric count of Ciley, the king’s uncle, who was appointed guardian of his person. The count endeavoured to supplant John Corvin, but in vain; and he obtained great honour by the defeat of the Turks before Belgrade. At the death of John, the government was transferred to his son Ladislaus, to the great mortification of the count of Ciley, who endeavoured to procure his assassination; but he was himself killed at Belgrade by the friends or that family. In 1457, Ladislaus went to Prague, in order to celebrate his nuptials with Magdalen of France, daughter to Charles VII.; but in the midst of the festivities, he was taken suddenly ill, and died, not without suspicion of poison. Mod. Univer Hift.

LADISLAUS VI., king of Hungary, son of Calimiv IV. of Poland, was chosen king of Bohemia in 1470, and was soon involved in a war with Matthias king of Hungary, which was terminated by a peace in 1475. At the death of Matthias in 1490, Ladislaus was elected to succeed him. He had, however, to make his way to the throne against the hostile opposition of his competitors, one of whom was his own brother. At length he was quietly feasted; but being of an indolent and pacific disposition, he was ill fitted to contend with the disorders which harassed his kingdom: and from his great bulk and inactivity, he acquired from his subjects the appellation of an ox. The Turks having threatened Hungary, he was, during his whole reign, constantly at war with the Turks, and other neighbouring powers. Ladislaus, though not warlike, was attentive to the duties of his high station, and employed much time in collecting all the Hungarian laws, and the decrees of the monarchs, into one body, which has ever since formed the base of the constitution and jurisprudence of the country. He died in 1490. Univer. Hift.

LADISLAUS, king of Poland. See ULADISLAV.

LADISLAUS, or LANCLEOT, king of Naples, called the liberal and victorious, succeeded his father, Charles Duras, in 1586. He was before count of Provence and king of Hungary. He obtained the latter crown in 1403, during the imprisonment of Sigismund, who compelled him to return to Italy. On the death of his father, he was opposed by Lewis II. duke of Anjou, which occasioned some bloody wars. The pope at first espoused the cause of Lewis; but afterwards took the part of Ladislaus, who, however, marched against Rome, and having taken it, turned his arms on the Florentines, whom he compelled to sue for peace in 1413. He died in 1414, aged 58, being poisoned, as it was reported, by his mistress, who had been bribed to perpetrate the bloody deed by the Florentines. Univer. Hift. Tablettes Chronologiques, par Du Fresnoy.

LADIZIN, in Geography, a town of Poland, in the palatinate of Bracław; 14 miles S. of Bracław.

LADLE OF A Gun, the instrument wherewith the powder is put into the piece. It is made of a plate of copper bowed in form of a half-cylinder, rounded at one end, the other being fixed upon a long staff: this filled with powder, the gunner carries, with his left hand under the end of it, to keep the powder from falling out, till he enters it in the muzzle of the piece; when he has carried the powder home to the charged cylinder, he turns the ladle, that the powder may fall out, and withdraws it.

Ladles are fitted to the bore of each gun, and hold powder sufficient for the charge. Small ladles, with short handles of wood, are also used in filling the fuzes of shells, or any other composition for filling the caffes of rockets, &c.

LADLE-BOARDS, those boards disposed on the circumference of the water-wheels of over-shot mills; forming hollows, or receptacles, not unlike ladles, to receive the water that falls upon the wheel. See WATER-WHEEL.

LADOCO. Los Cadiz e/ is, in Geography, mountains, which commence in Portugal, and are continued into Spain, separating Galicia from the Asturias.

LADODA, a town of Hindostan, in the fubah of Agimere; 20 miles S.E. of Roopnagur.

LADOEA, Nov. a town of Russia, on the south coast of the lake Ladoga; 56 miles E. of Petersburg. N. lat. 60° 5'. E. long. 21° 44'.

LADOGA, or Ladofon, Lake, lies in the government of Vyborg, between the gulf of Finland and the lake of Onega; its south-west extremity lying about 30 miles south of Petersburg. In ancient times it is said to have been called Nebo. Being in length 175, and in breadth 105 versts, it is reckoned one of the largest lakes in Europe. It produces a great number of feais. On account of the perilous forms to which it is liable, and the federal fund-banks that are ever shifting their position, Peter the Great, in 1718, caused the famous Ladoga canal to be dug along its shore, from the Volkhof into the Neva. It was begun by order of Peter, and finished under the reign of the empress Anne. This canal is 105 versts long, 10 fænæ broad, 15 fænæ deep, and has 25 sluices. By the Neva the Ladoga is connected with the Baltic; by the Stier, with the Onega; and by the Volkhof, with the Ilmen. Into the canal flow the rivers Lipko, Nafs, Sheldika, Lava, and Kabona; into the lake the rivers Polka, Snam, Onat, &c. whereas the Neva alone runs out of it. Both shores of the lake belong to Russia, which have every where a flat coast and a sandy beach. On this shore it has also a few low fishery islands, and sandy bottoms. That part of the northern side which lies in the government of Olenetz has marble on its c. s., whence some of these beautiful kinds of Finnish marble are brought to St. Petersburg. As the bed of this lake, for a great extent, is in the lowest part of the country, it receives, besides the above-mentioned rivers, the waters that come from the Alum hills; all of which have no other outlet than the Neva. Tooke's Ruìf. Emp. vol. i.

LADONIS, in the Materia Medica of the Ancients, a name given by some to the laurus or bay-tree. We find the wood in a composition prescribed in Galen, from the works of some of the empirics of his time; but it never was used by the more regular authors.

LADOS, in Geography, a small island in the East Indian Sea. N. lat. 6° 11'. E. long. 99° 40'.

LADRE,
LADRE, in the Mange, denotes dull. See Horse.

LADRONES, MARIAN, or MARY-ANNE, ISLANDS, in Geography, a group of islands in the North Pacific ocean, forming a chain of 200 leagues, and occupying a space of about 350 miles in extent. Magellan, who discovered this archipelago in 1521, imposed on them the name of Ladrones, (Thieves or Robbers,) because the natives, like those of many other islands, had no idea of the exclusive right of property, manifested a disposition to pilfer, and a considerate degree of address in the execution of their designs. These islands were also called "Ilhas de las Velas," from the great number of sailing craft which came from these islands to meet ships, when they preferred themselves there for the purpose of anchoring. Towards the middle of the 17th century, in the reign of Philip IV. of Spain, these islands were called the "Marians," in honour of Mary-Anne, the queen of Philip. In 1564 or 1565, Andreas Miguel Lopes Legazpi took possession of them in the name of the crown of Spain; but he neglected them as unworthy of his attention, and pursued his voyage to the Philippines. The islands of Ladrones were forgotten till the zeal of a celebrated Jesuit, Santeres, interceded the devotion of queen Mary-Anne of Austria, regent during the minority of her son Charles II., and exciited her to cause the gospel to be carried into these islands, which Magellan had found means to annex to the possessions of Spain, by discovering a new route, that eluded the ridiculous line of demarcation established by the see of Rome, in the plenitude of its power. In 1688, the Spaniards preseented themselves at the Mary-Anne islands, with the crofs in one hand and the sword in the other; and with thefetwo weapons, which lent one another mutual aid, their pretended right to the possession of these islands could not fail to be acknowledged. They had no difficulty in making themselves masters of Guahan or Guam (now called Guam), the principal of these islands, and the most southern of the Archipelago; and by degrees they subdued all the others. Pigafetta, who accompanied Magellan, describes the people of these islands as naked, their hair and beards long, tall, and well-proportioned, with an olive complexion. They coloured their teeth black, like the inhabitants of the Peclew islands; and in their manners and customs they resembled one another. Till the arrival of the Spaniards, the inhabitants of these islands considered themselves as the only men in the world, being assured that the first man was made of a piece of rock taken from Funa, a little island near Guam; but, according to others, he was made of earth in the latter island. When they were visited by the Spaniards and Dutch, they inferred that these strangers were brethren, who had left the primitive Guamean language. In colour, speech, manners, and government, they much resembled the Tagals, or people of the Philippines, before the Spanish conquest. They were then very populous; Guam, which is 40 leagues in circuit, having 36,000 inhabitants. The women employed themselves in dyeing their teeth black, and their hair white. The nobles were treated with great respect, and thought it criminal to connect themselves in marriage with a common girl; nevertheless, the people were not enslaved, or even subjects, though they treated their nobles with great reverence.

Their houses were divided into four apartments, separated by palm-leaves. In their absolute independence each man avenged his own quarrel; but though wars were frequent, they were not sanguinary; the los of a man or two deciding the battle. Their magicians invoke the antis, or the dead, whose skulls were preserved in the house; and they manifest an anxiety left the antis, or ghost, should disturb their fishing, or nocturnal repose. Although Guam is the largest of these islands, Tinian has attracted the greatest degree of attention in consequence of the romantic description given of it in Anson's voyage. (See Guam and Tinian.) The number of these islands has been differently flated from 9 to 16; but it does not appear that above three or four are inhabited. Their falling vessels, called jonas, evince considerable skill in naval architecture. For an account of them, see the article Boat. La Perouse leads us to conclude that these islands are volcanic; but their natural history is little known. They cultivate various seeds and fruit, and particularly the bread-fruit. For their productions of this kind, see Tinian. In Sir George Staunton's account of the embassy to China, we have some information of a recent and authentic kind with respect to these islands. The grand Ladrone represents as a high-peaked island; and he mentions another near it, whose summit is somewhat lower and more level. The latitude of the grand Ladrone appeared to be 21° 52' N., and the longitude 113° 56' E. of Greenwich. The latitude of another island, called Choobtehoo was 21° 55' N., and its longitude 113° 44' E. The observations from which these latitudes and longitudes are deduced were carefully made, and therefore they may be deemed correct; though they differ from those flated by other geographers. The margins, or rocks, of the Ladrone islands next the sea are of a black, or dark brown colour, owing to the action of the salt-water; and the spray and dashed of the waves have corroded their surface, so as to give them a honey-comb appearance. Some springs are found on these islands; and the water is neither brackish nor chalybeate, nor in any respect mineral in its taint. The soil upon the surface appears to be of the same nature with the component parts of the rocks below, and, indeed, is merely the upper layer of the rock, decomposed and pulverized by the joint action of the sun and rain in a succession of ages. The rock consists of a mixture of clay, calx of iron in a small proportion, and a great deal of siliceous earth and mica. The sea all round is of a dirty-yellowy muddy colour, and of no great depth. The bottom is mud and clay.

The Ladrones, and clusters of islands between them and the southerly extremity of China, are so near to each other, and to the main land, and are also so broken, as well as so irregular in their form and position, as to appear like fragments, disjointed from the continent, and from each other, at remote periods, by the successive violence of mighty torrents, or in some sudden convulsions of nature. These fragments have now a very barren and unpromising aspect. In particular spots, however, there are some scattered patches of pleasing verdure; but, in general, little better than naked rocks appear; and scarcely ever a tree or shrub is visible among them. These islands serve chiefly as retreats for pirates, and for the temporary abode of fishermen. To the north of the Ladrones are many small islands, extending to Todos los Santos, N. lat. 30°; those farther to the N. belonging to Japan. This group may either be arranged, says Pinkerton, among the Ladrones, or night, perhaps, admit of a different appellation. For a more ample account of the Ladrones, we refer to the Supplement of De Brocques, vol. ii. p. 492, and to the article Tinian.

LADRONES, three small islands in the Pacific ocean, on the coast of Veragua; 8 miles S.E. of Cape Boruca. N. lat. 8° 20'. W. long. 83° 16'.

LADROON, a river of Africa, which runs into the Indian sea, S. lat. 22° 36'.

LADVOCAT, JOHN BAPTIST, in Biography, a man of letters in France, was born in 1709. He was, at the usual age, admitted a member of the society of Jeluites, and for some
some time occupied the cure of Domremi, the birth-place of the celebrated Jean of Arc; but in 1750 he was appointed royal professor at the Sorbonne, and in two years after he was elected librarian. The good duke of Orleans having founded a Hebrew professorship in the Sorbonne, Ladocat was appointed, in 1751, to fill that office, which he kept till his death, in the year 1765. His works are "A Geographical Dictionary;" "An Historical Dictionary;" "A Hebrew Grammar," and several theological tracts. He is represented as remarkably mild, humane, and undistinguished in his manners.

LADOCAT, LEWIS FRANCIS, a philosophical writer, and dean of the chapter of accounts at Paris, where he died in 1752, in the ninety-first year of his age. As an author, his principal work is entitled "Entretiens sur un nouveau Systeme de Morale et de Physique," which abounds in solid reflections, and well digested reasonings. Some objections being made to the principles contained in these conversations, Ladocat, in 1728, replied by publishing "A New System of Philosophy founded on the indisputable Nature of Things, compared with the Opinions of the ancient Philosophers relating to the first Principles of Nature, &c. &c. 4" by which is added a treatise on the nature of the soul, and the existence of God. Ladocat was an able magistrate, and a good man. Miceri.

LADY, in Geography, a town of Russia, in the government of Smolensko, and before the late dismemberment of Poland, a Russian frontier town.

LADY'S, an island in the Atlantic, near the coast of S. Carolina, in America, between Port Royal Island and St. Helena. N. lat. 43° 30'. W. long. 80° 32'.

LADY'S Red-Stem, or Cheest-Rum, in Botany and the Materia Medica. See GALLIUM.

LADY'S Bowser. See Ceramatis.

LADY'S-Bird, in Zoology. See HEMISPHERIA, and SCA-RADUS, Canwellina paniculata. 7.

LADY'S-Chapel, a name invented by modern architects and virtuosi to dignify the chapel which is generally found in one or more ancient cathedrals behind the screen of the high altar. It is so denominated from its being generally dedicated to the blessed Virgin Mary, called Our Lady.

LADY'S Comb, in Botany. See SHEPHERD'S Needles.

LADY'S Cynaleia. See CAXTRAGE.

LADY'S-Day. In Love, the 25th of March, being the Annunciation of the Holy Virgin.

LADY'S Finger, in Botany. See ANTHYLLIS.

LADY'S Mauve. See ALCHEMILLA.

LADY'S Seal. See TAMS.

LADY'S Slipper. See Cyrripedium.

LADY'S Snakes, the common name of a perennial weed often met with in pasture grounds. The plant is upright, fain, and smooth, the leaves are winged, with the lobes of the lower ones roundish, and those on the stalk oblong. The flowers are large, handsome, and white, or purplish, consisting of four oblong veined petals. The seeds are contained in erect compressed pods, about an inch in length, divided into two cells, which, when ripe, burst with a touch, and throw out their seeds to a considerable distance. It has sometimes the vulgar names of cuckow-flower, Canterbury-bells, &c.

LADY'S Trace. See TWINLADE.

LADY of the Thistle. See THISTLE.

LADY, Presentation of our. See PRESENTATION.

LADY KIRK, in Geography, a town of the island of Ronaldina. N. lat. 58° 38'. W. long. 2° 45'.

LAELIUS, CAIUS, in Biography, a noble Roman, the particular friend of the first Scipio Africanus, accompanied that commander to Spain, and was instrumental in the capture of New Carthage. When Spain was reduced under the Roman power, Laelius was sent by Scipio to treat with Syphax, and after this he was employed to ravage the coast of Africa. In conjunction with Maturinus, he defeated Syphax, and brought him prisoner to Rome. He commanded the Italian horse at the battle of Zama, and had a considerable share in the success of the day. He was made confidant in the year 100 B. C.

LAELIUS, CAIUS, named Sulpicius, supposed to have been the son of the preceding, was equally distinguished with the former by his friendship with the second Scipio Africanus, so that Cicero represents him in his treatise "De Amicitia," as explaining the real nature of friendship with its attendant pleasures. In this work, which is known to every well-educated youth, Laelius appears as the chief speaker. He was an eminent orator, and a successful cultivator of polite literature. He was signalized by his proverbs in the war with Spain, but is chiefly celebrated by the civil honours to which he attained. His oratory is described as of the mild and elegant kind. He was a member of the college of augurs, and pronounced one of the most famous orations in that capacity. He was confidant in the year B. C. 140. When his friend Scipio quitted all concern in public affairs, Laelius accompanied him to his country retreat, preferring the pleasures of retirement and friendship to the honours of the world. He is supposed to have had a share in the composition, or, at least, in the correction, of Terence's comedies. His modesty, humanity, and the manner in which he patronized literature and learned men, are as illustrious as the greatness of his mind, and the integrity which he displayed as a statesman. Univer. Hist.

LÆNA, among the Ancients, a thick, flabby, upper garment. See CHILÉNA.

LAER, PETER VAN, in Biography, a landscape, cattle, and conversation painter, known in Italy by the name of Damboecco, from the nature of the subjects he frequently painted during a long residence at Rome, such as vintage-revels, drolleries, quarrels, mummeries, &c. &c. which are termed by the Italians Damboeciate. He was a native of Laer, near Narden, was born in 1613, and being endowed with excellent faculties of perception and imitation, he practiced the art he adopted with very great success. His hand and his imagination were equally rapid; and so readily would the former execute the dictates of the latter, that he rarely found it necessary to make previous studies for his pictures; but sketching lightly the subject on his canvas, he finished the work without more delay. He had the great advantage of possessing an excellent memory, and if he con- sidered any object with an intention to irritate it in a picture, it became so imprinted in his mind, that he could represent it with great truth without its being placed again before his eyes.

His pictures are of a small size, but very pleasingly executed, with an excellent tone of colour.

In the latter part of his life he was severely tormented with an asthma, of which (not being ended with patience enough to bear its miseries tranquilly,) he contrived to rid himself by drowning, in the 69th year of his age.

LAERTA, in Natural History, a name given by authors to a species of vespa or wasp, whose sting is said to be fatal: but this is an erroneous opinion. This wasp is larger and longer-bodied than the common kind, but smaller than the hornet. It feeds of a very irritable disposition, attacking animals of any kind that come in its way.

LAET, JOHN DE, in Biography, director of the East India company, was born at Antwerp, where he died in
2. L. Guidonia. Swartz. Prodr. 83. (Guidonia; Browne Jam. 249. t. 29. f. 4?)—"Petals none. Stalks terminal, single-flowered. Leaves oblong, pointed, serrated and downy."—Native of Jamaica. Swartz. Browne calls his plant Rod-wood, and says it "grows to a considerable size, being esteemed a fine timber, and much used in all sorts of buildings. The lines between the valves of the fruit are of a beautiful red, as well as the placenta." We know not why Swartz quotes him with a mark of doubt, nor have we ever seen any specimen of this species from either of these botanicals.

3. L. Thamnia. Swartz. Prodr. 83. Fl. Ind. Occ. v. 2. 950. (Thamnia; Browne Jam. 245.)—Petals none. Stalks axillary, forked, many-flowered. Leaves elliptic-oblong, somewhat crenate, smooth and shining.—Native of Jamaica. Browne gathered it on the red hills above the Angels, but says it is not common. His own specimen is before us. This is a shrub, six feet high, with roundish, smooth, slightly zigzag branches, whose young ends are compressed and coloured. Leaves alternate, on round smooth stalks half an inch long, elliptic-oblong, with a blunt point, smooth and shining, slightly crenate, two or three inches in length, marked with pellucid dots readily seen when the leaf is held against the light. Flower-flasks from the young shoots, axillary, much shorter than the leaves, forked and as it were jounced, minutely downy, as are the calyx-leaves. The flowers are not numerous, larger than the common Myrtle, the two outer leaves of the calyx purplish, inner white, all reflexed. Simms downy. Anders yellow. Fruit with four, rarely five, angles, and as many valves, as are revolute when ripe. Seeds numerous, with a purplish tunic. Swartz found this plant on the south coast of Jamaica, in bushy chalky woods, flowering in the spring. We have borrowed most of his description, comparing it with Browne's specimen.

4. L. concil. Linn. Sp. Pl. 733.—Jacq. Amer. 167. t. 183. f. 60. Lamarck. Dict. v. 3. 374.—Petals five. Stalks many-flowered, axillary. Leaves ovate-oblong, finely serrated, rugose, smooth.—This was gathered in woods at Cartagena by Jacquin, from whose book alone we have any knowledge of it. The stem is shrubby, branched, nine feet high. Leaves about three inches long, of a broad ovate somewhat oblique figure, rugose, venous, finely but sharply serrated, smooth, flaked. Common flower-flasks downy. Fruit yellowish red, often slightly triangular, ripening in August and September. The flowering season is June. The petals are as long as the calyx, but nothing is said of their colour, Jacquin having seen them in a faded state only.

Not one of this genus is known in the gardens of Europe, nor have any dried specimens, except the above-mentioned, fallen in our way.

LAUANG, in Geography, a town of Norway, in the diocese of Dröntheim; 45 miles E.N.E. of Dröntheim.

LEVUS, in Biography, a Latin poet, who probably flourished about the time of Cicero. He wrote a poem entitled "Erotopagnia," or "Love Games," which is quoted by Aulus Gellius, and Apuleius. He composed also a poem entitled "The Centaurs," which is quoted by Festus under the title of Petrarum.

LA FERRE, in Geography. See La Ferre.

LAPITRAS, JOSEPH FRANCIS, in Biography, born at Bordeaux, entered the society of Jésuits, and became a missionary among the uncultivated nations of North America. On his return home he wrote a work entitled "Les Mœurs des Sauvages Américains compare aux Mœurs des premiers temps," in two volumes 4to.; "A History of the discoveries of the Portuguese in the New World," in two vol.
vols. 410. which maintains a high reputation. He died about the year 1749.

LAVING, Peter Francis, brother of the above, was a native of Bourdeaux, and became distinguished as a preacher among the Jesuits. Being sent to Rome on various negociations he became a great favourite with pope Clement IX. who promoted him to the bishopric of Sitteron in Provence. He died in the year 1764, at the age of seventy-nine. He was author of the "History of the Conlimination Unigenitus," two vols. 12mo. "History of Clement IX.," in two volumes, and "Sermons," in four volumes, besides several devotional and practical treatises.

L.A. FORCE, in Geography. See La Force

LAFORDSWICK, (Saxon, blafadur, i.e. dominus, and swir, predito, infidritis, erga dominum) the betraying of a lord or master. This word is found in king Canute's laws. c. 61, and in the laws of king Henry 1.

L.A. FRENAYE, in Geography. See La Freynay.

LAVFNSARN, a small island in the gulf of Finland.

LAGA, in Antiquity, denotes lex or laci; whence are deduced Saxon-logs, Dane-logs, &c.

LAGA, in Geography, a river of Sweden, which runs into the North sea; four miles W. of Laholm.

LAGAMAN, a town of Candahar; 60 miles N.E. of Cabul.

LAGAN, or LAGON, in our Ancient Sea Laws, ship-wrecked goods, left by the sea, lying on the sand, either ashore, or out at sea.

The word seems formed from the Saxon logan, or lagon, jacer, to lie. Though others deduce it from the Latin littera, to bind; and suppute it to denote goods tied together with a buoy, or the like, to hinder their sinking to the bottom, that they may be found again.

Lagan is usually joined with jeton and flaton; which see.

Lagan, in Geography, a river of Ireland, which rives in the Sheb-drooch mountains, in the centre of the county of Down, and making a sweep to the west by Dromore, becomes the boundary between the counties of Down and Antrim, from the neighbourhood of Noira until it flows a little below Belfast into that large estuary called Belfast Lough. There are many villages, besides the considerable towns of Lisburne and Belfast, on this river, and its banks are adorned with numerous bleak greens. Great excursions have been used to improve the navigation of this river, and a canal joins it to Lough Neagh.

LAGANUM, in Natural History, the name of a genus of the elinii marini, of the general clafs of the plaice. The characters of the lagana are, that they have their mouth in the centre of the pale, and their aperture for the anus in their third region; that their superficies is white, and their edges waved. Of this genus there are five known species.

LAGARES, in Geography, a town of Portugal, in the province of Beira. 14 miles S.S.W. of Vifeu.

LAGAU, a town of Brandenburg, in the New Mark; 25 miles S.E. of Cultrin. E. lat. 52° 28'. E. long. 15° 26'.

LAGEMAN, (Lagammanus) homon habent legem, or homon legalis seu legimus: such as we call now good men of the jury. The word is frequently used in Domestay, and the laws of Edward the Confeffor, cap. 38.

LAGEN, LAGENA, in ancient time, was a measure of wine, containing six sextari: whence probably is derived our fagon. The lieutenant of the Tower has the privilege to take num lagenum vini ante malum et retro, of all wine ships that come up the Thames; and Sir Peter Leiceter, in his Antiquities of Cheflire, interprets lagena vini, a bottle of wine.

LAGEN BAY, in Geography, a bay on the W. coast of the island of Ila, S. of Lagen point.

LAGENS, a town of the island of Flores, one of the Azores, containing near 1400 inhabitants.

LAGENULA, in Botany, from lagem, a bottle, because the form of the fruit is like that of a little bottle or flagon. Lour. Cochin. 88. - Clafs and order, Tersectoria Monogynia. Nat. Ord. Curcurbitaeae, Linn. Syl.

Such is Loureiro's defcription, which in moft respects indicates a plant of the Gourd or Bryony tribe, except the germin being superior. It should fem therefore to range with a few more genera, mentioned by Jullieu, at the end of his Curcurbitaeae, which differ from the character of that order in the situation of their germin.

LAGERSTREMMIA, so called by Linnaeus, in commemoration of his friend Magnus Lagerfrem, a director of the Swedish East India Company, member of the Royal Societies of Upsal and Stockholm, who communicated to him many natural productions, and fome other curiosities, described in the fourth volume of the Amanitae Academicae, under the title of Chinifia Lagerfremiana. Amongl there was an exquisitely carved horn of a Rhinoce.

rors, now in the hands of the writer of this article, which replaces a leaf of the Cyamus Nebumo, accompanied by the flower and fruit in a smaller size, with other memorable plants, and feveral half-formed lizards, crawling as it were out of their native mud, and feizing on the grape, the Litchi, the Mango, and the Mangofian, celebrated oriental fruits. This seems to express the supposed beginning of animal life, with its dependence on the vegetable kingdom, and throws light on the mythological history of the Cyamus, to which article, written by our lamented friend the late Rev. Mr. Wood, in our 10th volume, we refer the reader.

atie, Juff.

Gen. Ch. Cal. Periath inferior, of one leaf, bell-

shaped, angular, permanent, with fix deep, sharpifh, tri-

angular teeth. Cor. Petals fix, roundifh or obovate, wavy; their claws thread-shaped, inferted into the calyx. Stam. Filaments numerous, thread-shaped, unequal, inferted into the calyx, and exceeding it in length; anthers roundifh, in-

crement. Pjft. Germin superior, roundifh; style thread-

shaped, declining, longer than the flamas; stigma obfvue.

Peric.
Peric. Capsule ovate, pointed, of six cells and six valves, rarely but four. Seeds numerous, angular, compressed, attached to the central hexagonal column.

Eff. Ch. Petals fix, their claws inserted between the teeth of the bell-shaped six-cleft calyx. Stamens unequal. Capsule of four or six cells, with many angular seeds.

Obs. L. parviflora has but four, or occasionally only three, cells and valves to the capsule.

1. L. indica. Linn. Sp. Pl. 324. Curt. Mag. t. 425. J. Miller Jr. — (Tajik-jin; Rumph. Amb. v. 7. 61. t. 28.) — Petals pointed, crimped. Six filaments much longer than the reft. Panicle terminal. Leaves roundish-oval, smooth. — Native of China, Cochinchina, and Japan. Krempef says it is very rare. The Hortus Kewensis records its having been introduced into this country by the late duke of Northumberland, in 1759. Nothing could be a more defirable acquisition to the greenhouse or flower. In the latter it blooms most freely, and is increased readily by cuttings. The frub is about the size of a Portugaine-tree, rather fragrant, smooth, with angular twigs. Leaves opposite or alternate, nearly sessile, an inch or two in length, of a broadish rounded elliptical form, slightly pointed, entire, finely dotted, smooth, except some short pubescence at the rib and veins on both sides. Stipulas none. Buds axillary, ovate, compressed. Flowers in a large, terminal, somewhat racemose panicle, of a fine rose-colour, not unlike a double flock at fift figh, but far more delicate and without fcent. The petals are heart-shaped, pointed, excessively crumpled and curled, with long slender flages. Authors yellow.

2. L. Regina. Roxb. Coromand. v. 1. 45 t. 65. (L. Flora Regine; Retz. Obs. fide. 5. 25. Adamea glabra; Lamarck Dict. v. 1. 39. Adamé; Rheed. Hort. Mal. v. 4. 45 t. 28, 29.) — Petals blufhing, wavy. Stamens all nearly equal. Panicle terminal, much branched. Leaves oblong, pointed, smooth. — Native of woody mountains in Malabar and Java, flowering during the hot fefon, and ripening seed in August. A moderate-sized tree, with spreading branches. angular and winged when young. Leaves from three to five inches in length, elliptic-oblong, entire, smooth, generally opposite, on very short flages. Panicle compound, spreading. Flowers two inches broad, with rose-coloured, rounded, blufhing, short-clawed petals, and very numerous, purplish, almost equal flages, with yellow anthers. Capsule the size of a large oblong acorn, pointed, woody, smooth, accompanied by the reflexed calyx at their base, which is Downy while in flower, but velvety.

3. L. hirtula. Willd. n. 3. (Adamea hirtula; Lamarck Dict. v. 1. 39. Katou-Adamé; Rheed. Hort. Mal. v. 4. 47 t. 22.) — Petals pointed. Six filaments much longer than the reft. Panicle terminal, much branched. Leaves oblong, pointed, hairy. — Native of the provinces of Malá and Poiga in Malabar, according to Rheed, from whose work alone we have any knowledge of this species, and who represents it as the wild flate of the preceding, differing in being taller, with downy or hairy leaves and branches. The fruit also is rough with fine hairs. In his plate moreover the petals are less wooly and much more pointed, and he mentions that five flages (we have ventured to premise fix from another) are alone conspicuous in each flower. The flages of L. indica enable us to understand this, and it is probable that the rest of the flages are shorter than the calyx, so as to have passed unobserved. Lamarck, after having first, on Rheed’s authority, defined and named this species, suggests in his Dictionary, v. 3. 376, that it may probably be only a variety of the last. We must leave this point in doubt, after having collected all the information in our power.

4. L. Munichauia. Lamarck Dict. v. 3. 375. Willd. n. 4. (Munichauia speciosa; Linn. Mant. 243.) — Petals blufhing, wavy. Stamens all nearly equal. Cluster terminal, many-flowered, nearly simple. Leaves ovate, pointed, almost entire, smooth. — Native of China, according to Lamarck. His specimen is marked as coming from India. Lamarck, in his Dict. v. 3. 375, confounds this with L. Regina, from which it is nevertheless very distinct. The leaves are not half so long, much thinner, and are ovate, with much longer and slenderer flages. The only leaf we have seen agrees precisely with that drawn by Murray, except in being still less entire, the upper part being bluntly ferrated. The flages are copious, racemose rather than panicled, but they appear to differ very little in themselves from those of L. Regina, the petals in Murray’s plate being erroneously made flat, ovate and obtuse. Willdenow probably took his specific character from thence, the plant being very rare, even in dried collections.

5. L. parviflora. Roxb. Coromand. v. 1. 47 t. 66. Willd. n. 5. — Petals wavy, blufhing. Six filaments much longer than the reft. Flower-flakes axillary and terminal, about three-flowered. Leaves oblong, obtuse, downy beneath. — Native of the Circar mountains of India, flowering during the hot fefon, ripening seed in August and September. The inhabitants call it Chinamphie, and use the wood for various economical purposes. This is a little tree, differing from all the foregoing in the smallness of its flages, which are less than the common Myrtle, white, chiefly axillary, usually three on each of the flages, which grow in pairs, and are (like the leaves) about two inches long. The petals are fix, round, with an undulated edge. The capsule has but three or four cells. Six of the flages are as long as the corolla. Prefect Willdenow, from misunderstanding the English description, describes the leaves as lacrons. They are smooth and shining above, downy at the back.

Lagerstrœmia, in Gardening, contains a plant of the exotic tree kind, for the greenhouse, of which the species cultivated is L. indica.

Method of Culture. — This plant is capable of being increased, either by layers or cuttings of the young branches. The layers should be made from the young shoots of the preceding summer, and be laid down in the autumn. When they are well rooted in the succeeding summer, they should be taken off and planted out in separate pots. The slips or cuttings should be made from shoots of the same year’s growth, and be planted out early in the summer, in pots of light earth, being plunged in a dark hot-bed, and covered with small bell hand-glasses, due shade and water being given. When well-rooted in the spring following, they may be taken up and planted in separate pots, filled with light mould, being afterwards managed as other greenhouse plants.

These plants afford variety in collections of potted plants of different kinds.

LAGETTA, in Botany, the Lagetia or Lace-bark of Jamaica. Jull. 77. Lamarck. Dict. v. 3. 378. Ilhaur. t. 289. (Daphne Lagetta; Swartz. Ind. Occ. v. 2. 659.) Willd. Sp. Pl. v. 2. 419. Frutex foliis majoribus, cordatis, nictidibus, petaloidis nymphaeis dentibus; Browne Junc. 371 t. 31 f. 5. Laurus corymbulosus, folio latere, longo, macro quo, levis, splendente; coriaceo interiore in tela plumeas, linearum 2nulas, extenuil; Sloane Junc. v. 2. 22 t. 168 f. 1. 3. t. 169 f. 1.) See Daphne.

This tree is a native of the loftier mountains of Jamaica and Hispaniola. Swartz says it is thirty feet high, with a

trunk
Lagny, in Geography, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the district of Meaux, seated on the Marne, and containing three parish churches; 15 miles E.N.E. of Paris. Lat. 48° 53'. E. long. 2° 46'. The place contains 1836, and the canton 12,257 inhabitants, on a territory of 157½ square kilometres, in 31 communes.

Lagoa, in Geography, a town of Italy, in the department of the Lower Po; 4 miles N. of Comacchio.

Lago Maggiore. See Lago Maggiore.

Lago Nero, a town of Naples, in the province of the Apenines, near a lake from which it receives its name; 12 miles N.E. of Policastro.

Lagoa, in Geography, a town of the island of May, one of the Cape Verde Islands.—Also, a town of Portugal, in Algarve; 5 miles N.E. of Silves.—Also, a river of Africa, which runs into the Atlantic. Lat. 6° 55'.—Also, a bay of the Indian sea, on the coast of Africa. Lat. 33° 10'.

Lagoa, See Delagoa.

Lagoa d'Alafafura, a lake on the W. coast of Portugal, near the sea: 12 miles S.S.W. of Lisbon.

Lagoa d'Ouboro, a lake on the W. coast of Portugal, which discharges itself into the sea, four miles N.E. from Cape Carvacho, in the province of Estremadura.

Lagoa de Patos, a bay on the coast of Brazil. Lat. 29° 25'.

Lagoa de Pescara, a bay on the coast of Brazil. Lat. 21° 35'.

Lagoas, As, a town of Africa, in the country of Mataba, on the Sierra Leone. Lat. 5° 40'. W. long. 16° 50'.

Lagoccheilos, (from λαγός, a hare, and χέιλος, a lip), denotes in Surgery, the deformity more commonly named a hare-lip. See Hare-lip.

Lagoda, in Geography, a town of Brazil; 55 miles W. of Fort Rio Negro.

Gen. Ch. Cab. General Involucrum of eight leaves, cut like a feather, fringed, reflexed, containing a small umbel; partial one of four leaves, in feather-like capillary segments, surrounding a solitary flower-flake, shorter than itself. Perianth superior, of five leaves, in many capillary segments. Cor. Petals five, two-horned, shorter than the perianth. Stam. Filaments five, capillary, the length of the corolla; anthers roundish. Fil. German roundish, under the base of the perianth; style as long as the stamen; stigmas two, one of them abrupt. Peric. none. Seed follicular, ovate-oblong, crowned with the perianth.

Obs. Gartner remarks that there are the rudiments of two seeds, though one only comes to perfection.

Eff. Ch. Involucrum both general and partial, pinnatifid. Perianth of five leaves, in many capillary segments. Petals cloven. Seed follicular, inferior.

L A G

519. Kyphos, a memory; Dioec. lib. 5, cap. 69.)—This is the only known species of its singular genus, found in fields and vineyards, not uncommonly in Greece and the Levant. Its name in modern Greek is, according to Dr. Salathorp, Anachemisis, or Wild Marjoram; and Bellomius describes its scent and taste as like that of Origania herbaeolum. Dioscorides speaks of the seed as a warm, rather acrid carminative, more powerful than the Garden Cumin. The root is annual, tapering. Stem ten or twelve inches high, branched, zigzag, round, filiform, smooth, leafy. Leaves pale green, smooth, finely pinnate, with about a dozen pairs of sessile, roundish, deeply cut, nearly opposite leaflets, and an odd one; the upper leaves become very much diminished, and bristle-pointed. Umbels terminal, globose, dense, half an inch wide, bicol with flowering, silvery, bristle points.—A figure of this is defined to appear in the Flora Graeca, v. 3. • 243.

—We know not how the idea of a hare's form can bear any analogy to this plant, except it alludes to the feed, wallowing amongst the fine brightly coverings of the flowers like a hare amongst the grass.

LAGOECIA, in Gardening, contains a plant of the herbageous kind, of which the species cultivated here is the wild or bristly cumin, L. cumminoides.

Method of Culture.—These plants may be increased by sowing the seeds in autumn, on a warm border, soon after they are ripe, or where they are to remain; or when permitted to scatter, they come up and form good plants. They afterwards require only to be kept clean from weeds, and in the former cases planted out when of sufficient growth where they are to grow.

Plants of this kind afford ornament and variety in the borders and other parts of shrubberies and pleasure grounds.

LAGOON ISLAND, in Geography, an island of the Pacific ocean, discovered in Lieutenant Cook's voyage in 1769. It is of an oval form, with a lagoon in the middle, which occupies much the larger part of it: the border of land surrounding the lagoon is in many places very low and narrow, particularly on the S. side, where it chiefly consists of a beach or reef of rocks; it has also the same appearance in three places on the N. side: so that, the land being disjoined, the whole looks like many islands covered with wood. On the west end of the island is a clump of trees, appearing like a tower, and about the middle are two cocoa-nut trees, which rise above all the rest, which in approaching the island appear like a flag. The whole island is covered with trees of different verdure; but none could be distinguished except cocoa-nuts and palm-nuts. The natives appeared to be tall, and to have remarkably large heads; they were of a copper colour, and had long black hair. When they walked on the beach they seemed to be naked; but when they retired they covered themselves with something of a light colour. Their habitations were under rude clumps of palm-nut trees, which appeared to Cook and his companions, who had long seen nothing but sea and sky, except the dreary hills of Terra del Fuego, to be a terrestrial paradise. S. lat. 17° 47', W. long. 130° 28'. Variation 2° 54' E. Hawksworth's Voyages, vol. ii.

LAGOON, Middle, a gulf on the coast of Yucatan, in the bay of Honduras. N. lat. 18° 7'. W. long. 88° 59'. North Lagoon is a gulf in the same bay. N. lat. 18° 40'. W. long. 88° 53'. South Lagoon in the same bay lies in N. lat. 17° 54'. W. long. 88° 59'.

LAGOPHTHALMIA, or Lagophthalmus, (derived from lagos, a hare, and ophalerein, an eye,) denotes, in Surgery, a particular case, where the patient experiences an inability of closing the eye-lids so as to cover the eye. It is the defect to which the term scolos, lipoários, or hare-eye, has sometimes been applied. The ecropium, or gaping of the eye-lids, if the affection is confined to the upper palpebra, now and then receives one of the foregoing appellations. Some writers, however, with much reason, are desert of restricting the term lagophthalmia, or lagophthalma, to cases of simple retraction of the eye-lid, unattended with any degree of eversion.

Various and many are the inconveniences which may be the consequence of this incapacity of properly covering the eye with the eye-lids. The tears are incessantly dropping over the cheeks, because the alternate opening and closure of the eye-lids, so essential to the propulsion of this secretion into the puncta lachrymalia, are impeded. In a strong light the patient is quite blinded; for it is impossible for him to lessen the quantity of rays which fall upon the eye, by making the eye-lids approach each other. From this cause vision gradually becomes very much weakened. Nor can the patient sleep well in any apartments which admit the light. And, in addition to these unpleasant circumstances, we must mention the painful inflamed state of the eye, frequently induced by the irritation which it suffers from the lodging of dust, and other extraneous substances upon it. A preternatural swelling, or protrusion of the eye from the orbit, is sometimes the cause of lagophthalmus, which in this circumstance is to be regarded only as a symptom of another disease, and generally gets well with the primary affection. In the majority of cases the defect is situated in the upper eye-lid.

Several species of lagophthalmus are noticed by Richter. In some, though not many instances, the disease depends upon a weakness, or paralysis, of the orbicularis palpebrae muscle. Here the upper eye-lid may readily be brought down over the eye with the fingers; but the patient is quite incapable of doing this without external aid. The cure can in general only be accomplished with difficulty. The treatment most likely to prove beneficial consists in applying corrodant and fumigating applications. Rubbing the skin of the eye-lids once or twice a day, with a drop or two of fennel, or oil, electricity, frictions upon the eye-lids with the tincture cantharidis, blisters near or immediately upon the eye-lids, the application of cold water to the eye by means of compresses very wet very often in the course of the day; &c. are plans in repute. Letting the water of a flower-bath fall upon the binder part of the head; cold applications with the internal employment of balsam, and camphorated remedies, are all likely means to do good in cases of the pyrathy lagophthalmus.

A fissure in the lower, and especially in the upper eye-lid, whether an original malformation, or the consequence of a neglected wound, may produce a considerable exposure of the eye-ball, when the patient attempts to shut his eye; for at this period the margins of the slit will be drawn further afender. This particular case requires a similar operation to that for the hare-lip. (See HARE-LIP.) But instead of the twisted future, the surgeon is to employ the interrupted. See SUTURE.

The most common kind of lagophthalmus is undoubtedly that which originates from a contraction of the integuments of the upper eye-lid, in consequence of wounds, abscesses, burns, &c. Here the observations, elsewhere made concerning the diagnosis and cure of an analogous case, are strictly applicable. See ECROTISM.

Sometimes lagophthalmus appears to depend upon an induced thickening and contraction of the levator palpebrae superioris, and of the skin of the eye-lid together. In this case no surgical operation will avail in curing the disease, and every chance of benefit lies in a trial of other plans.
In order to preserve the sight, it is proper to guard the eye with a green shade from the effects of strong light, until the infirmity is completely removed.

LAGOPIDES, in Ornithology, a name given to a division of the genus Tetrao, distingiushed by a naked spot above the eyes, and hairy legs. See Tetrao.

LAGOPUS, in Botany, from λαῶος, a hare, and πος, a foot, a name which has been applied to several different plants, whose soft hairy heads of flowers have suggested the idea of a hare's foot. Among these are a species of Plantago; one of Gnaphalium, called by Linneus digitatum; some grasses; and several of the Diadelphus class. There are grounds of suspicion that the Laguncula, (see that article,) might primarily have been named with some allusion to the foot rather than the form of a hare, which its round hairy tufts of flowers might very well justify.

LAGOPUS, in Ornithology. See GRIOS, Red, PTARMIGAN, and TETRAO.

LAGUS, in Zoology, is the name of a species of the canis, with a straight tail throughout of the same color. It is sometimes called the white fox, the isatis, and the sky-colored fox. It is found in Lapland and Siberia. See FOX.

LAGOR, in Geography, a town of France, in the department of the Lower Pyrénées, and chief place of a canton, in the district of Orthès; 8 miles S.E. of Orthès. The place contains 1700, and the canton 10,588 inhabitants, on a territory of 1775 5/10th of a miles, in 23 communes.

LAGOS, a sea-port of Portugal, in the province of Algarve, situated in a bay of the Atlantic, to which it gives name, defended by several forts: the harbour is deep, but full of rocks. This place is the residence of the viceroys of Algarve, and contains two parish churches, four convents, and about 4600 inhabitants; 66 miles S. of Lisbon.

N. lat. 37° 15'; W. long. 2° 58': Alto, a river of Africa, which rises in Benin, and runs into the Atlantic, N. lat. 5° 10'. Its navigation is obstructed by a bar at its mouth. Alto, a town of Mexico, in the province of Guadalajara; 36 miles N.E. of Guadalajara.

LAGOSTOMA, (from lagos, a lake, and stomah, the mouth,) is a term in Surgery, signifying the bare lip.

LAGOUSA, in Geography, a small island in the gulf of Engia; 3 miles N. of Engia.

LAGOW, a town of Austrian Poland; 16 miles N. of Sandomierz.

LA GRAVE. See La Grave.

LAGRIMOSO. See LACRIMOSO.

LAGUA, in Geography, a town of the island of Cuba; 80 miles W.N.W. of Villa del Principe.

LA GUAYRA. See Guayra.

LAGUEN, one of the small Philippine islands, near the north coast of Samar. N. lat. 12° 43'; E. long. 125° 4'.

LAGUERRE, Louis, in Biography, a painter of histories on ceilings, haircafs, halls, &c., and an affilint and imitator of Verrio; with whose name his own has been moft unpropitious immortalized by Pope, in that characteristic verse,

"Where sprawl the fants of Verrio and Laguere,

Laguerre, though the fon of a Catalon, was born in France; and his father being master of the menagerie at Versailles, he had the honour of having Louis XIV.; for his god-father, and after him he was named. At first he was intended for the church, and was placed in the Jesuits' college for education; but having a habitation in his speech, and therefore not suited to support their ambitious projects, and having exhibited some taste in drawing, the god-father recommended to his parents to bring him up to the profession of painting.

He then studied in the school of Le Brun, and in the Royal Academy of Paris; and made so much progress, that, in the year 1683, at the age of 20, he came to England, and was immediately employed by Verrio upon the large work at St. Bartholomew's hospital; in which he succeeded so well, that he soon obtained considerable emolument on his own account, and executed a great number of ceilings, halls, and haircafs, in the houses of the principal nobility of the country, particularly at lord Exeter's at Burleigh, at Devonshire House, Piccadilly, Petworth, and Blenheim. King William gave him lodgings at Hampton Court, where he painted the "Labour of Hercules," and repaired the large pictures called "The Triumphs of Caesar," by Andrea Mantegna.

His talents were not of a cast to demand very high respect, but they were fully equal to the mode in which they were employed,—which requiring a certain portion of ingenuity, is a certain waste of talents of a superior class. In a few years, it is probable his name will reposs the perpetuity on the records of history, and the unlucky fatigue of Pope above mentioned.

His death happened in the year 1721, and in a place very seldom disturbed by such an event, viz. in the theatre of Drury-lane. He had gone there to see the Island Princes acted for the benefit of his son, who was newly entered upon the stage as a farce; but before the play began, he was seized by an apoplexy, and carried away senseless.

LAGUNA, in Botany. See LAGUNA.

LAGUIN, in Geography, a town of South America, in the province of Venezuela, on the west side of Lake Maracaibo; 80 miles S. of Maracaibo.

LAGUR, or St. Chrisîbukuk de la Laguna, a city of Tene- rise, so called from an adjoining lake, which does not now remain, about four miles from Santa Cruz. It used to be reckoned the capital of the island, the gentry and lawyers living there, and the courts of justice being held in this town; though the governor-general of the Canary islands resides at Santa Cruz, as being the centre of their trade both with Europe and America. The place, though pretty extensive, fearlessly deserves to be dignified with the name of a city. The disposition of its streets is very irregular; but some of them are of a tolerable breadth, and have some good houses. In general, however, Laguna is inferior in appearance to Santa Cruz, though the latter is small compared with the former; and it is said to be in a declining state; vineyards being now planted where houses formerly stood; whereas Santa Cruz is daily increasing. Laguna is situated on an eminence, in a fertile plain of considerable extent. Beside vines, it bears wheat, Indian corn, potatoes, and a species of bean not unlike a lupin. From grounds still higher, water is conveyed to a variety of fountains in this city, as at Santa Cruz, in an aqueduct composed of wooden troughs, and supported by poles fixed into the earth. To the plain now mentioned succeeds a ridge of hills, of gentle ascent, from the summit of which may be easily traced the windings of a pleasant valley, stretching to the west- ward, along the feet of a range of hills that separate it from the sea-coast. The town of Ticoronta and numerous little villages form a scene agreeable and picturesque. The bofoms of the mountains are well cultivated, and their more rugged sides are chiefly covered with the spontaneous plants of warm regions, such as the Cacalia kleinia, the Agave americana, the Cactus tuna, besides others of little orna- ment or use. N. lat. 28° 28'; W. long. 16° 20'.

LAGUIN.
LAGUNA Efiura, a cape of Portugal, in the province of 
Beira; 7 miles S.W. of Guarda.

LAGUNAE, in Botany, named by Cavanilles in mem-
ory of Andrew Laguna, a Spanish botanist and phy-
cician of the 16th century, who made a translation of Dioscorides,
with a commentary, into his own language, and wrote also
some botanical as well as medical works.—Schreb. 463. 
Wildl. Sp. Pl. v. 3. 733. Mart. Mill. Dict. v. 3. (La-
Trigueria; Cavan. Diff. 41. t. 11.)—Clasf and order, Mo-
jadophia Polyandria. Nat. Ord. Columnfere, Linn. Mal-
vacci, Juff.

Gen. Ch. Cal. Perianth simple, inferior, of one leaf,
bell-shaped, slightly angular, cut about half way down into five 
segments, perennant. Cor. Petals five, ovate-oblong,
obtuse, spreading, attached to the base of the tube of the 
flamment. Stam. Filaments numerous, 25 to 33, united be-
low into a tube, at the top of which, as well as at its fides,
they become separate and distinct; anthers roundish. Peric.
Germen ovate-oblong, superior; style thread-shaped, longer 
than the flaments, either with five spreading branches at the 
top, or only five notches; fligmas capitate. Peric. Capsule 
ovate-oblong, obscurely five-fidged, with five cells and five 
valves; the partitions contrary to the valves. Seeds several, 
roundish, with three angles.

Obf. The Solandra of Murray has a deeply five-cleft 
calyx, and five distinct stigmas; Laguna of Cavanilles has a 
five-toothed calyx, bunting at one fide, and a stigma with 
five notches or teeth. Schreber has very judiciously united 
the two, from observing similar differences among many 
pecies of the genus Hibicus.

Eff. Ch. Calyx simple, five-cleft. Stigmas five-cleft. 
Capsule of five cells, with contrary partitions.

1. L. lobata. Lobed Laguna. Wildl. n. 1. (Solan-
dra lobata; Murr. in Comm. Gottl. for 1784. 21. t. 1. 
Cavan. Diff. 379. t. 136. f. 1.) Hibicus Solandra; 
v. 2. 455.)—Leaves heart-shaped, three-lobed, unequally 
ferrated.—Native of the Isle of Bourbon. Root fibrous, 
annual. Stem branched, two feet high, round, clothed, like 
every other part of the herbage, with prominent hairs. 
Lagurus alternate, on long flanks, heart-shaped, more or less 
deeply three-lobed, acute, unequally cut or ferrated, two or 
three inches long, and nearly as wide, of a light green. 
Stipulas linear-oblong. Flowers on long flanks, in long 
terminal clusters, with bractes like the flippus. Corolla 
white, about half an inch or more in diameter. It is a plant 
of little beauty, compared at leasf with the generality of its 
natural order.

(Solandra ternata; Cavan. Diff. 279. t. 136. f. 2.)— 
Leaves ternate and simple, entire.—Native of Senegal, 
whence Adamson brought specimens, the only ones of which 
we have any account. The root appears to be annual. 
Stems several, about a foot high, slender, round, downy, 
like the other parts. Leaves alternate, diilant, on long 
flanks, mostly ternate, the upper ones simple; leaflets ob-
long, narrow and entire, the side ones smaller. Stipulas 
small, acute. Flowers on long flanks, simple, foliary, axillary 
or lateral flanks, shorter than the leaves. Of the corolla we 
have no information.

t. 71. f. 1.—Leaves ternate, cut. Stem prickly.—Found 
near Pondicherry. The stem is a foot and half high, muri-

cated. Leaflets nearly equal, obtuse, cut. Flowers yellow. 
Sometimes the leaflets are more than three.

L. Pateronia, Sims in Curt. Mag. t. 769. (L. qua-
mea; Venten. Malmais. t. 42. Hibiscus Pateronia; 
Andr. Repof. t. 286.) found in Norfolk island by Col. 
Pateron, a very handsome shrub with a large purple flower,
appears to us at best but a doubtful Laguna, nor is the ac-
count of the fruit given with sufficient accuracy in Andrews,
for us to judge respecting this matter.

LAGUNILLA, in Geography, a town of South America, 
in the vice-royalty of New Granada; 14 miles S.W. of 
Merida.—Alto, a town of South America, in the pro-
vince of Cordova; 30 miles E. of Cordova.

LAGUNILLAS, Las, a town of Peru, in the diocese 
of La Paz; 39 miles N. of Potosi.

LAGURUS, in Botany, from Ambrosia, a barbe, and 
over, the tail, alluding to the appearance of the spike or head of 
flowers. Hare’s tail Grafs.—Linn. Gen. 37. Schreb. 52. 

Gen. Ch. Cal. Glume single-flowered, of two long, 
linear, very thin, spreading, feathery valves. Cor. of two 
fermer valves; the outermost long, terminating in two 
small straight awns, with a third awn from the middle of the 
back, twined and more or less bent backward; inner 
valve smaller, narrower, pointed, beardless. Nectary of 
two lanceolate blunt scales, tumid at their base. Stam. 
Filaments three, capillary; anthers oblong, pendulous, cloven 
at each end. Pijl. Germen superior, oblong; styles two, 
short; fligmas long, cylindrical, feathery. Peric. none, 
except the permanent corolla attached to the seed. 
Seed solitary, obovate, clothed with the corolla and its 
awn.

Eff. Ch. Calyx of two valves, single-flowered, feathery. 
Outer valve of the corolla with two terminal awns, and a 
dorfall twilled one.

Gram. t. 10. f. 3.—Native of sandy open places in the 
west of Europe and north of Africa, flowering early in 
summer. Being found in Guernsey, it is admitted into the 
list of British plants. The root is annual, composed of 
downy fibres, like all grasses that grow in driving wind. 
Stem solitary, various in height, downy and soft like the 
leaves, whose sheaths are long and rather tumid. Spike 
avate, at first erect, but soon bent to one side, or drooping, 
from the power of the wind; it is not unaptly compared to 
the tail of a hare, which it resembles in densify, shape, 
lightness, and whiteness. The name in modern Greek, 
Layonekex, expresses the same idea.

Lagurus cylindricus of Linnaeus being properly removed to 
Seacharum, the above flaments a solitary species of its genus. 
We know not of its having any useful property, except 
serving to decorate flower-pots in winter, mixed with any 
everlasting flowers.

LAGURUS, in Zoology. See Mus.

LAGUYO, in Geography, a town of Africa, on the 
Gold Coast, in the country of Fantin.

LAHARR, a town of Hindoostan, in the circar of 
Gohud; 40 miles E. of Gwallor. N. lat. 26' 9'. E. long. 
79 35'.

LAHADSI, a town of Arabia, in the province of 
Yemen; 16 miles N.W. of Aden.

B b 2 LAHALL
LAHALL, a town of Sweden, in the province of 
Well-Gotland; 10 miles N. of Gothenburg.

LAHAWANNOCK CREEK, a river of Pennsylvania, 
which runs into the Susquehanna, S. lat. 41° 20'. W. long. 
57° 58'.

LAGHIGIAN, or LANGIAN, a town of Persia, 
in the province of Ghilan, on the Sperand, situated on an emi-
rance; eight miles E. of Relhid.

LAHISZIN, a town of Poland, in the patinate of 
Breze; 12 miles N.E. of Pinka.

LAHMEDIE, a town of Egypt; 14 miles S.S.W. of 
Damietta.

LAHN, a town of Silesia, in the principality of Jauer, 
on the Oder. N. lat. 50° 58'. E. long. 15° 44'—Alto, 
a river of Germany, called Lohn, which rises in the N.E. part 
of the principality of Siegen, about 10 miles E.N.E. from 
the town of Siegen, and runs into the Rhine near Lohn-
stein.

LAHNSTEIN, or Lohnstein, a town of Germany, 
at the conflux of the Lohn and Rhine; four miles E. of 
Coblentz.

LAHO, a town of Africa, on the Ivory Coast, which 
had been represented as a large and populous place, extending 
a league along the coast; the shore being composed of a 
beautiful yellow sand, against which the sea beats with great 
vioence. The natives, who are well supplied with all kinds 
of provisions, are of a mild, tractable, and gentle dispo-
sition; but ready to seize any opportunity for raising the 
price of their ivory, according to the demand, and the 
number of ships they observe on the coast. They are visited 
by interlopers of all nations, the free ships of England, 
Holland, Denmark, and formerly the Hanse town; whence 
the occasions of raising their price frequently occur. Laho 
is planted, like Axim, with a great number of cocoa-trees; 
and thus the neighbouring countries of both districts very 
much resemble one another. Cape Laho is situated in N. 
latt. 5° 10', equally distant from Cape Palmas and Cape Tres 
Puntas, and the western frontier of that district, called the 
country of the "Good People," Beyond Cape Laho the 
coast falls directly N.E., forming a fine bay, at the head 
of which opens the mouth of the little river, called Jaque 
Labu, or Das Balbas, running directly N. and S., but not 
navigable. Further eaitward is Korbi Laho, the little pool, 
called the "Bottomless pit," so called both by the English and 
Dutch, because several unsuccessful attempts had been 
made to find it; but at last it was found to be no more than 
60 fathoms; the difficulty of sounding it resulting from a tide 
at the bottom which carried away the lead faster than they 
could furnish line. Exceping this pool, there is no anchor-
age for several leagues along the coast. The produce of the 
adjacent country consists of cloth and fluffs of Quaquis, 
ivory, and provisions. The negroes of this part are singular-
ly skillful in swimming and diving; for if any pieces of 
coral, iron, glass, &c. are thrown over board, the negroes 
will dive after them with such rapidity as to catch them be-
fore they reach the bottom.

LAHOLM, or Lagerholm, a sea-port town of Sweden, 
in the province of Halland, at the mouth of the Laga, near 
the sea, with a good fishery, fortified by the Dunes, and 
ceded to Sweden by the peace of Stockholm; 12 miles 
S.S.E. of Halmstad. N. lat. 56° 40'. E. long. 12° 45'.

LAHOUR, a town of Thibet, on the Setlega; 24 miles 
N.W. of Gangotri. N. lat. 23° 10'. E. long. 76° 25'.

LAHORE, or Panjab, a subah or province in the 
N.W. part of Hindoostan, bounded on the N. by Cathmure, 
on the E. by the mountains of Thibet, on the S.E. by 
Delhi, on the S. by Moultau, and on the W. by the Indus, 
which separates it from Cabul and Candahar; about 350 
miles in length from E. to W. and about 100 miles from N. 
and S. This country, which is now occupied by the Seiks, 
is extensive, and very fertile; affording, in addition to all 
the necessaries of life, wine, sugar, and cotton-wool; the 
last of which supplies the manufacturers of the province. It 
is watered by the Indus on the W., and the Setlega on the 
E., and also by the Belut, Chumaub, Rauwel, &c. In the 
tract between the Indus and Jhylun (Beluth) there are salt-
mines, which are wonderfully productive, and which afford 
fragnents of rock salt, hard enough to be converted into veolves, 
&c. Gold (according to the Ayin Acbars) was found in the 
channels of its rivers; and the same is related of those of 
Kemaoon, which proceed from the same range of mountains.

See Panjab.

LAHORE, a city of Hindoostan, and capital of the 
country above described, situated on the Rauwel. This city 
was the residence of the first Mahometan conquerors of 
Hindoostan, before they established themselves in the central 
parts of the country. It owes its modern improvements, however, to 
Humamoo, the father of Achar, who made it his residence 
during a part of his troublesome reign. Thevenot says, that, 
including the suburbs, it was three leagues in length at that 
period, and when he saw it, about the year 1665, the city itself 
was above a league in extent. Seuaguis, son of Achar, 
allowed the Portugueze to build a church there; and some 
of its furniture remained at the time of Thevenot's visit. 
It has 12 gates. It is now the capital of the Seiks; but 
for the dilution of its inhabitants, it has lost not only a 
considerable part of its population, but much of its ancient 
splendour. Here are manufactures of carpeva, cotnon, &c. 
Ice is brought from the northern mountains to Lahore, 
and sold there all the year. The famous avenue of shady 
trees, so much spoken of by the early Indian travellers, 
began at Lahore, and extended to Agra, near 500 English 
miles. N. lat. 31° 50'. E. long. 73° 50'. See Seiks.

LAHOREY, a town of Hindoostan, in Baglana; 20 
miles S. of Bahhegong.

LAHORPORUM, a town of Hindoostan, in Oude; 
25 miles W.N.W. of Karibab.

LAHRA, a town of Germany, in the bishopric of 
Munster; 12 miles N.W. of Munster.

LAHR, or Lahr, a town of the principality of 
Nafta Saarbruck Uffingen, the capital of a lordship, on the 
river Schutter; 18 miles S.S.E. of Stralsburgh. N. lat. 48° 21'. 
E. long. 7° 57'.

LAJA, LA, a town of Peru, in the diocese of La Paz; 
14 miles N.W. of La Paz.

LAJAPOUR, a town of Hindoostan, in Guzerat; 10 
miles S. of Surat.

LAIBEEDY, a town of Africa, in the country of 
Tuins; 18 miles S.E. of El Jemna.

LAICA, a town of Abyssinia; 100 miles S. of Minic. 
See VI.

LAID-UP is applied to a ship, when she is either bored 
in a harbour during the winter season, or laid by for want of 
employment; or when she is become incapable of farther 
service.

LAID under metal. See Metal.

LAIDA, in Geography, a town of Bengal; 14 miles S. 
of Curruckdeaghe.

LAID: LLA, a town of Hindoostan, in Gocconda; 
10 miles N. of Warangle.

LAIGLE, a town of France, in the department of 
the Oire, and chief place of a canton, in the district of 
Mortagne.
LAI

LAI

Mortagne. The place contains 5947, and the canton 14,386 inhabitants, on a territory of 207¾ kilometres, in 19 communes.

LAIGNE, a town of France, in the department of the Côte d’Or, and chief place of a canton, in the district of Chatillon; 19 miles W.S.W. of Chatillon-sur-Seine. The place contains 1559, and the canton 11,105 inhabitants, on a territory of 237¾ kilometres, in 23 communes.

LAIKARI, a small island on the E. side of the Gulf of Bothnia. N. lat. 65° 14'. E. long. 25° 9'.

LAinez, James, in Biography, a Spanish Jaffuit, and the first general of the order after the death of the founder, (see Loyola), was born in the year 1512. He studied theology at Paris, became the intimate friend of Loyola, and was one of seven who bound themselves by a vow at Mont-Marte to erect the new community: he is said to have had a great taste in drawing up the constitutions for their government. Upon the death of the general, he succeeded as superior of the society, but was not formally elected till the year 1558. He assisted at the council of Trent, where he supported the papal authority to a very extravagant degree. He obtained from pope Paul IV. the perpetual generalship of the order, together with the following extraordinary privileges, viz. the right of making all manner of contracts, without the privity or consent of the society: that of giving authority and authenticity to all comments and explanations of the constitutions: the power of making new, and altering the old ones, and also to establish priors, for the confinement of refractory and disobedient members, independently of the secular power. In 1561, he went to France in the suit of cardinal de Ferrara, the legate of pope Pius IV., and attended the conference at Pofli, where he disputed with Beza and Peter Martyr. After his return to Rome, he refused a cardinal's hat, which was offered him by the pope. He died in 1565, leaving behind him some theological and moral treatises. Moreri.

LAINO, in Geography, a town of Naples, in Calabria, 19 miles W.N.W. of Caffano.

LAJOUN, a town of Peratia, in the province of Mazandaran, near the coast of the Caspian sea; 12 miles E. of Rehid.

LAIR, in Agriculture, a term applied to land in a state of graves or sward. See Lay and Layer.

LAIR, Lay, or Layer, among Sportsmen, denotes a place where deer harbour by day.

LAIR, or Layer of a deer, is the impression which the beast has made on the graves and ground where he has lain down, or repose.

LAIR, among Haymakers, also denotes a place where cattle usually rest, under some shelter; the ground being enriched by their dung.

LAIRE, Francis Xavier, in Biography, who was born at Vadans, in France, in 1539, and died at Sons in the year 1560, was celebrated for his knowledge of bibliography, and published, 1. Memoirs towards the History of great Men of the 15th and 16th Centuries, with a Supplement to Mattei’s Annals of Typography. 2. Specimen Historicum Typographicum Romanum cum indice Librarium. 3. Epitola et Abhate Urgelin. 4. On the Origin and Progress of Printing in France Complete, and other pieces.

LAIRESSON, Gerard, a painter of history and portraits, born at Liége in 1640. His father first instructed him in the art, and he was suppos'd also to have been a disciple of Balthok, whose manner he very much followed in his practice.

For a long time the art of painting was an unprofitable pursuit to him; but as he made his pictures gay and agreeable, he at last, by the help of Vyetburgh, a picture merchant at Amsterdam, acquired considerable credit.

His style of painting was a compound of those of Poussin and the old French school. While he aimed at imitating the best Italian masters, he never avoided those false airs of the head and limbs, which seem rather taken from the stage than from nature; so that his works do not rise to the level of true merit.

He was blind for some years before his death: but having reflected upon the principles of the art, and being a communicative man, he was constantly attended by artists and amateurs, who were gratified by his instruction. Those treatises on design which go under his name were not written by him, but collected from his observations. Published after his death, by a society of artists. He died in 1711, at the age of 71.

LAIS, the famous courtesan, born at Hyccara, a small city in Sicily; and being carried into Greece by Nicias the Athenian general, began her conquests by music. We mention it not among the encomiums of the art; but almost all the celebrated courtesans of antiquity were originally musicians. According to Athenaeus, (lib. xiii.) music was thought a necessary female accomplishment in the time of Darius; for Parmenio wrote Alexander word, that he had taken at Damascus three hundred and twenty-nine of the Persian monarch’s concubines prisoners, whom were all well skil'd in music, and performed on the flute, and other instruments. Lais was supposed to be the daughter of the courtesan Timandra and Alcibiades. She began first to exercise her powers of enchantment at Corinth, in Greece. She is often called the Corinthian, from having paifed great part of her life in that voluptuous city. She set so high a price on her favours, that Demothenes, of whom she required for one night ten thousand drachmas, refusing to comply with her demands, said, “he would not buy repentance at so high a price.” As a caprice, she was more indulgent to the debauching Cynic Diogenes. Aristippus, another philosopher, but much more amiable, almost ruined himself in sacrifices to this terrestrial divinity, who loved him less than Diogenes. When he was rallied on her coldness, he said, “I cannot flatter myself that either wine or fish is in love with me, yet I enjoy, and feed on them both with great pleasure.” This female sometimes ridiculed the frailty of the philosophers whom she had captivat’d. “I do not undertalaid what is meant by the austerity of philosophers; but with this fine name, they are as much in my power, as the rest of the Athenians.” After having corrupted all the youth of Corinth and Athens, she went into Thessaly, to see a young man with whom she was in love, when, it is said, that some women, jealous of her beauty, affaminated her in the temple of Venus, about 340 years B.C. Greece erected statues to her memory.

LAISBY, in Geography, a town of Swedish Lapland, in the lap-mark of Umea; 100 miles N.W. of Umea.

LAISCHEV, a town of Rulfa, in the government of Kazan, at the union of the Kama and Volga; 20 miles S. of Kazan. N. lat. 55° 20'. E. long. 49' 14'.

LAISSAC, a town of France, in the department of Aveyron, and chief place of a canton, in the district of Milhan. The place contains 1083, and the canton 74,533 inhabitants, on a territory of 1724 kilometres, in 12 communes.

LAITCHEOU, a city of China, of the first rank, in the province of Chantong, is built on a promontory, and has a convenient harbour, a numerous garrison, and several armed vessels to defend the coast. The jurisdiction extends over seven cities, two being of the first class. N. lat. 37° 9'. E. long. 119° 49'.

LAITY
LAITY comprehends such of the people as are not included under the denomination of clergy; and may be divided into three distinct rates, viz. the civil, the military, and the maritime. For the origin of this distinction, see Clergy.

LAKE, in Geography, a town of Hungary; 18 miles E.S.E. of Canafle.

LAKE, in Physical Geography, a body of water, mostly of considerable extent, flat, or the shore of the sea, in an inland place, and commonly in the immediate neighbourhood of lofty mountains. The form of these collections of water is various; but those that receive and emit rivers, are generally of an elongated shape, and their longest diameter is in the direction of the rivers that traverse them. Lakes are generally divided into four classes: 1. Such as neither receive nor emit rivers. 2. Such as emit rivers, without visibly receiving any. 3. Such as receive one or more rivers, without emitting any. And, 4. Such as both receive and send forth rivers.

1. Lakes which neither receive nor emit rivers, are not frequently seen of any considerable extent; but there are countries where they occur in great number, and as it were in groups. This is the case in the deltas northward of the Caspian sea, and in the plains between the Ural mountains and the Irtysh, and in the vall deets of Baraba, between the Irtysh and the Obb. The soil of these countries is described by the accurate Mr. Patrin as being uniformly composed of a marle, varying only in the proportion of the admixed clay and sand. The numerous lakes found in that tract of country are for the most part only depressions or basins filled by the rains and melted snow: their greatest extent is scarcely ever above three leagues in circumference, and generally they are much smaller. Their depth, too, is usually very inconsiderable, for it seldom exceeds a fathom, and is frequently not beyond a few feet. Most of them are only temporary; for towards the end of the summer they are generally found dry.

A remarkable circumstance, as observed by the same naturalist, is that in the same plain, at the distance of a few hundred paces, some of these lakes are fresh-water lakes, while the water of others is abounding either with sea salt, or with sulphur of magnesia (Eppei falt); or they are impregnated with both those salts, either uniformly mixed, or each of them in a separate part of the lake; in some cases the sea-salt and the Epsom falt are formed at the same period; in others the latter of these salts manifests itself only towards the end of the summer.

The cause of the saltiness observable in some lakes has been by most authors on this subject ascribed to salt springs at their bottom; and probably they are in the right with regard to most of them; but in the above instance, several circumstances unfavourable to that hypothesis exist in the nature of the foil, and the mode and determinate quantity in which those salts are deposited at the bottom; whence Patrin conceives that the lakes in question, as well as most other salt lakes of the same kind, owe their saltiness to principles or particles, with which they are furnished immediately from the atmosphere, in the same manner as nitre is formed in particular situations in warm climates, ceasing to be generated as soon as the foil has taken up the quantity of saline matter suitable to its nature. The general rule laid down by Buffon, that lakes which emit rivers are fresh-water lakes, and that such as do not send forth any are salt lakes, appears to be inconsistent with experience; since, on one hand, the great lake Titicaca, in Peru, supposed to be eighty miles in circumference, and giving out no river, is by Lact, Acofia, Garcilasso della Vega, and others, described as a fresh-water lake; while the largest of all salt lakes, the Black sea, discharges its redundant waters, with a rapid course, through the Bosporus into the Mediterranean.

Dr. Halley is of opinion, that all great perennial lakes are saline, either in a greater or less degree; and that this saltiness increases with time; and on this foundation, he proposes a method for determining the age of the world.

To the lakes of this first class likewise belong those lodged in the waters of extinct volcanoes, or at least in depressions confused by most geologists as the remains of volcanic energy. One of the most remarkable, on account of its elevation, is that which travellers relate to exist on the summit of the Adam's peak in Ceylon. This mountain is seen at a distance of forty leagues; which appears to indicate its height to be at least that of Mount Aetna. Its cone, which is difficultly accessible, has 200 paces in diameter at its summit, and in the middle of the platform is situated a lake of considerable depth. Ribeiro's Hif. of Ceylon.

Dolomieu, in a letter to Fanjas Saint-Fond, inferted in this naturalist's work, "Sur les Volcans eteints du Vivarais," describes a lake filling up the crater of an extinct volcano in the Serra de Estrela; a ridge of mountains in the north of Portugal, denominated Mona Herminius by the ancients. All those lakes of Ageno and Arwero, near Naples, are suppos'd by many authors to have been crater's of volcanoes. The former of these lakes, we are told by Lalande (Voyage, t. 6. p. 27.) appears sometimes to boil at its borders, especially when its waters are high. This ebullition, like that of the Acqua Zolfa near Rome, is occasioned by gaseous fluids travelling the water. On the borders of this lake are the vapour-baths of San-Germano.

2. Lakes which emit rivers without receiving any.—These are more numerous than the preceding. The more copious the subterraneous waters by which they are supplied, the more considerable are the rivers sent forth by them. The Seliger lake, in the government of Twer, 60 leagues N.E. from Moscow, gives origin to the larger river in Europe, the Volga; although no river is visibly received by that lake. The name may be said of the lake called Koko-nor, at the north of the eastern ridge of the Tibetan Alps, from which issue two of the largest rivers of Asia, the Huang, or Yellow river, and Kian, or Blue river, which, after having traversed part of the Chinese empire, empty themselves into the Japanese sea.

Of the same kind are the two small lakes in New Castile, in Spain, called los ojos de la Guadiana, situated near the Alcarras mountains, and considered as the sources of the Guadiana.

The lake of Mont-Cenis, though it does not emit a considerable river, is yet remarkable on account of its great elevation, which is 6000 feet perpendicular above the level of the sea. This lake, situated in the Cenife, which rises from it, is supplied by waters conveyed to it by subterraneous channels, and which descend from the neighbouring mountains, which are as elevated above the lake as this latter is above the plains of Piedmont. This lake is three quarters of a leagues long, and from 1800 to 2400 feet broad. Saussure is of opinion that it has formerly been situated at a greater elevation; since, at a height of more than thirty feet above its present level, traces of erosion produced by the Cenife are still remaining, as well as calcareous layers, exactly like those still deposited by the waters of that river.

There are in the Pyrenees lakes which appear to have exactly the same origin as the lake of Mont Cenis, and which equally emit rivers; and several of these lakes occur even
LAKE.

even at a greater elevation, (about 700 feet above the level of the sea,) such as the lakes of Liens, las Cousous, and Oucet, in the mountains above Barege. They are frozen over for the greater part of the summer, and are only partly deprived of their icy covering in the interval between the months of June and August. The lake of Mont Cenis, on the other hand, had, at the end of September, when Saffure observed it, a very mild temperature. It is so well flanked with firs, especially trouts, that, in the year 1780, it produced a yearly rent of 636 livres.

3. Lakes which receive one or more rivers, without emitting any.—Most of these formerly both received and sent forth a river; but the one omitted has become dry, on account of the diminution of the affluent river; or the cavity that contains it may have enlarged to such a degree, that the river it receives is barely sufficient to repair, by new supplies, the losses which the lake sustains by evaporation. To this class belong, among others, the Caspian sea, as it is improperly called, which receives the waters of the Volga, of the Ural, and of some other rivers. This vast lake, which formerly occupied a much more considerable space than at the present day, and not only included the lake of Aral, but probably had even a communication with the Euxine sea, (see Caspian,) still continues to decrease, in proportion as the capacity of the rivers which supply it is found gradually to diminish. Another lake of this kind is the Dead sea, or lake Asphaltites, in Palestine. See ASPHALTITES.

Such was the lake that formerly covered Gascony, which fea. Lakes of this kind will be naturally formed in every cafe, where the waters of a river are inclosed, in any part of their course, by elevated lands. The first consequence of this stoppage is, of course, the conversion of the inclosed lands into a lake; and if this happens near the fountains of the river, and the ground is solid, it is likely to remain a lake for ever; the river not having force enough in its infant state to work itself a passage through the mountains. Hence it is that more lakes are found near the sources of rivers than in the lower parts of their course. If the river be inclosed after it has gained a great accession of water, and, of course, strength; it will, indeed, at first, form a lake, as before; but in time, the place at which it runs over, will be gradually fretted away, as in the case of the Behut. The Euphrates, in like manner, opens itself a passage through mount Taurus; and the Ganges through mount Imaus; and even though the base of the mountain be of the finest texture, it will give way to the incessant friction, through a course of ages; for either of these passages may have been an operation of many thousand years. In the case of the Ganges, which paffes through mount Imaus, it may be suppod that the lower strata were softer than the upper; for the upper still remain to a great height. In that of the Behut, the latter appears to have existed long enough to deposit a vast depth of foil, before it dispered. Rennell's Memoir.

In the interior of Africa a vast lake is said to exist, which is supposed to receive the Niger. In America we have the lake Titicaca in Peru, into which runs a river, the source of which is near Cachco.

4. Lakes which both receive and send forth rivers, are the most numerous of all. They are generally found in valleys, or in plains, in the proximity of great chains of mountains. The most remarkable among those of the Alps are—

The lake of Geneva, traversed by the Rhone. Its elevation above the level of the sea, according to Du Luc, is 1126 feet, according to Shuckburgh 1152, and according to the observations of professor Pictet 1134 feet. The Rhone enters it in the neighbourhood of Villeneuve; at its leaving it, near Geneva, it divides into two branches, which encompass an island, and soon again unite. This lakeformerly extended as far as Bex; and the village Port-Valley, which is at present at the distance of more than an English mile, was situated close to its banks. The lake of Geneva is subject to an annual swelling, by which its waters are raised from five to six feet above the ordinary water-mark. But besides this periodical rising of its waters, a fluctuation is sometimes observed, not unlike that produced by the flux and reflux of the sea. This motion, which generally continues for some hours, is in those parts called Seiches. It is most striking in the neighbourhood of Geneva. The cause of this phenomenon is not well understood. Flatio attributed it to gusts of wind, by which the water of the smaller lake is protruded beyond the sand-bank that separates it from the larger; and on falling back produces a fluctuation. Jalabert, observing that the Seiches take place without any gusts of winds, looked for the cause of this phenomenon in the sudden diffolution of snow by which the river Arve, becoming suddenly turgid, retards the course of the Rhone which issues from the lake. Saffure, on the other hand, has witnesed the sudden swelling of the Arve, without any accompanying Seiches in the lake. Bertrand is of opinion that electrical clouds attract and raise the waters of the lake, which, on falling back, produce that undulation; and Saffure and Vaucher add, that sudden local variations in the pressure of the atmosphere, may contribute to the production of this phenomenon. Patrin is inclined to attribute such sudden fluctuations of lakes to the development of subterraneous gases, which also, by mixing with the atmosphere, produce that violent agitation, which, according to him, cannot be the effect of a simple disturbance of the equilibrium, but must be looked for in a chemical fermentation taking place in the atmosphere. An oscillation similar to the Seiches of the lake of Geneva, though in a less degree, has been observed also in some other lakes of Switzerland. To the same cause Patrin ascribes the hollow found which some lakes are known to emit, and which is not unlike the noise that precedes the eruption of volcanoes. Some writers inform us that several lakes of Switzerland, and among them the lake of Geneva, give out a grumbling noise of this kind. Pallas has seen, in the Suifen mountains, near the source of the Yenifé, a lake called Boulany-Koul, which, according to the account given of it by the Tartars of its neighbourhood, emits, at the approach of winter, sounds compared by them to howling. Alto the inhabitants of the borders of the lake Baikal have informed Patrin, that they have often heard a dreadful howling proceeded from that lake.

The lake of Lucern, in the Swiss canton of that name, (also called the Vierwalli'dter see,) is situated 1320 feet above the level of the sea, according to Pfyfer 1314, according to De Luc 1350, according to Trembley; and 1392 feet, according to Wyys. The river, Reufs enters it at Fluelin, and is again emitted near Lucern. This most romantic of all lakes is surrounded by rocks conflitling partly of limestone, partly of the calcareous breccia, called Nagellhube, and by sandstone mountains. The line of demarcation between these two formations of rocks runs in a direction from E. to W.; and to the S. of this line nothing is seen but limestone, and nothing but calcareous breccia and sandstone in a northern direction. See more of this lake in Ebel "über die Schweiz, &c." 1805.

The lakes of Brienz and of Thun, in the canton of Berne, are both traversed by the river Aar, which enters the former of these lakes at its N.E. extremity, and leaves it at its southern end; when, after the distance of about two miles, its waters unite with those of the lake of Thun. The rocks of both sides of the lake of Brienz consist of lime and clay-slate.
Dr. Ebel tells us, that on the N. side formerly large masses of the most beautiful varieties of red and white fluor spar were found, which, from the pure flint of lime, puffed into blackish-grey granular carbonate of lime. The lake of Thun is situated about 1760 feet above the level of the sea, and a few fathoms higher than the lake of Brienz. Its northern banks are entirely mountainous; half of the southern bank is flat and level. The rocks on the north side consist chiefly of the remarkable breccia and sand-stone formation, of which Mount Rigi, in the canton of Schwytz, is composed. This rock is made up of rolled pieces of all dimensions, from 50 cubical feet, down to the size of large grains of sand; the whole cemented by a coarse grained calcareous grit, potting great tenacity, so that the application of blows, the included flint, instead of becoming detached from their cells, are generally seen cloven asunder. These rolled pieces consist of various kinds of granite, gneiss, porphyry, flint, and flint-flake, horn-stone, granular and compact flint-stone, and a variety of red, clayey, ferruginous boulders, which, on further decomposing and dissolving, stain the cement in which they are imbedded with a red colour. The mountains on the S. and E. sides consist of lime-stone. The temperature of the lake of Thun, in the beginning of the month of July, at a depth of 350 feet, was found by Saffure to be 4 of Reaumur, while, at the surface, the fame thermometer indicated 17°. The water of the lake of Brienz, at the same time of the year, at a depth of 550 feet, showed the temperature of 13° while that of the surface was 16°, and that of the amosphere 16°.

The Lake of Zurich. The principal river which enters this lake, is the Linth or Limmat, which, after having received the Mag, bent forth by the lake of Wallenstadt, falls into the lake of Zurich, near a mountain called the Bubhberg. The elevation of this lake above the level of the sea is 1279 feet. During the hot weather of the summer months its waters are seen to rise higher, and to overflow its banks, owing to the influence of the heat on the vast glaciers, and masses of snow of the Alpine chain of mountains. Several geognostic facts render it highly probable that formerly the Rhine, in its course to Germany, traversed both the lake of Wallenstadt and that of Zurich.

The Lake of Constance, or the Boden See, is traversed by the Rhine, which enters it at the S.W. extremity, and is again given out near Constance. Its elevation above the level of the sea is 1089 feet. It is navigable for vessels of 3000 tons. Within a period of eight centuries, it has only twelve times been covered with ice. This beautiful expanse of water formerly extended as far as the Rheinthal, and the valley of the Rhine; a change effected by the flow but uninterrupted deposition of alluvial land at the mouth of that river.

The Lago Maggiore, or Lago Maggiore of the Italians, the Lago Verbanus of the Romans, a lake on the borders of Switzerland, Piedmont, and the Milanese territory, receives and sends forth the river Tettina. Its length from Tenero to Sello, is 44 Italian miles; its greatest breadth, between Lavino and Ferruelle, is above seven Italian miles; its elevation above the level of the sea 703 feet, according to Pini, but only 665 according to Saffure; its depth, at the chapel of la Bardia, opposite Locarno, is 325 feet. Many considerable rivers empty themselves into this lake, such as the Tettina, the Vareca, the Maggia, the Ticino, and the Treja; in short it receives all the waters of the immense group of mountains that encompass it. The natural character of the Lago Maggiore is a sublime wilderness, blended with the milder beauties of the Italian soil: a narrow compass gradually widening into a vast expanse. Towards the north and westward it is surrounded by elevated granitic mountains; while the east and north sides exhibit a series of smaller hills, which gradually lose themselves in the plain of Lombardy. From Magadino to Locarno, on the N.E., the dark and rugged mountains of Gabogno rise 6000 feet above the surface of the lake; and the wooded Pino, with the mountain of Canobbio, which appear to clofe the lake, form a long baflin, abounding with fish, and known by the name of Lago di Locarno.

On the Piedmontese side of the Lago Maggiore, at Baveno and its neighbourhood, are the quarries of granite, which furnish the magnificent columns that decorate the churches and palaces of Milan. In these parts are likewise found the beautiful crystals of feldspar, that were first discovered by Pini. At the mouth of the river Ticco are the quarries of red and white granite, and behind Mergozzo those of the beautiful variety of marble, of which the cathedral of Milan is constructed. At Grantaola are seen the vellages of an extinguished volcano, which is, however, not considered as such by the learned Abbate Pini, who visited it in 1790.

The Lake of Como, about 24 miles from Milan, receives, among other smaller rivers, the Adda, which is again sent forth at its eastern extremity. The elevation of this romantic lake, the favourite spot of the younger Pliny, is, according to Oriani, 674 feet above the sea.

The Garda, a lake of Italy, between the Veronese and Brailian, is traversed by the Mincio.

A remarkable lake belonging to this class, on the French side of the Alps, is the Lake de Joux, in the Jura mountains. It is traversed by the river Orbe, which, on rising from this lake, is engulfed in vast fannels, hollowed out by its own waters in the calcareous strata, which at present are seen in a vertical position, owing to the effects of the rupture they experienced at the time when the revolution took place, which produced the lake; and this same river, after a hidden course of three quarters of a league, re-appears in a valley, 680 feet below the funnel-shaped cavities that conveyed it to its subterranean channel; from whence it proceeds towards and traverses the lakes of Neufchatel and Bienne.

Sweden, and other mountainous parts of Europe, likewise abound with lakes traversed by rivers. Of this kind is the Lake of Balas, in North Wales. See Bala-pool.

Northern Asia has two very considerable lakes of this description, viz., the lake Norajakin, in Chinese Tartary, at the southern base of the Altai chain, where it is traversed by the Irtish and the Baikal, in East Siberia. This latter is traversed by the river Angara. (See Baikal.) M. Patrin, who has twice visited this remarkable lake, has described the highly deflorting effects which its waters, in their gradual formation of the basin, have produced in the stratified mountains that bound its western shores. But it is not the Baikal alone which has thus formed its own bed, for the same cause has prevailed at the formation of those vast Canadian lakes, the lake Superior, Huron, Erie, and Ontario, connected together by the river St. Lawrence, which takes its course through their stupendous bains.

We are indebted to Saffure for some very interesting observations respecting the temperature of the waters of the principal Alpine lakes. It appears from the experiments of this celebrated naturalist, made with a thermometer of his own invention, that even in the hottest summer months, the cold which prevails at the bottom of those lakes far exceeds that observable in the depth of the sea. The following are among the results he obtained.

In the Lake of Geneva, on the 6th of August, at a depth of 832 feet, the thermometer (having Reaumur's scale) indicated
LAKE.

The temperature of 81°; that of the surface was 15°, and that of the atmosphere 20°. On the 11th of February, in a depth of 950 feet, (namely, near the rock of Meillerie, being the deepest part of the lake,) the temperature was 49°; that of the surface 45°; that of the atmosphere 15°. It is to be observed that as the elevation of this lake (according to Deluc) is 1126 feet above the level of the Mediterranean, the bottom of its basin is situated only 176 feet above the same level.

The waters of the lake of Annecy, situated 210 feet above the lake of Geneva, had, on the 14th of May, and at a depth of 163 feet, the temperature of 41°, while that of the surface was 13°, and that of the air 10°.

In the lac du Bourget in Savoy, the thermometer, on the 6th Oct., at the depth of 240 feet, indicated 48°; at the surface 14°; in the air 10°. Saffouir observes, that the cold of the water of this lake cannot be ascribed to any foreign cause, since it receives no stream from the Alps, and its communication with the Rhone furnishes it with water only during the torpidity of that river in summer.

In the lake of Thun, in the canton of Berne, elevated above 520 feet above that of Geneva, the temperature, on the 7th of July, at the depth of 350 feet, was observed to be 4°; the temperature of the surface was 15°, and that of the atmosphere 16°. At the same time the temperature of the lake of Brienz, which is contiguous to the lake of Thun, was 3°, at the depth of 500 feet.

The waters of the lake of Lucern, situated 191 feet above the lake of Geneva, had, on the 28th of July, and in a depth of 600 feet, the temperature of 3°; temperature of the surface 16°; of the air 18°.

Lake of Constance.—The temperature on the 25th of July, at the depth of 370 feet, was 3°; on the surface of the water 14°; in the air 16°.

Lago Maggiore.—On the 10th of July, at the depth of 335 feet, the temperature was 5°; at the surface 20°; in the air 18°. It is remarkable that though the temperature at the bottom of this lake is so low, yet olive and orange trees are seen to thrive on its borders in the open air.

The comparative experiments which Saffouir made on the temperature of the sea, gave the following results. On the 8th of October, the same thermometer,immered at Porto Fino, on the coast of Genoa, to the depth of 886 feet, indicated 10°, while the temperature at the surface was 16°, and that of the atmosphere 15°. At Nice, on the 17th of October, and at the depth of 1800 feet, the temperature proved to be 10°, while that of the surface of the water was 16°. From this difference between the temperature in the depth of the sea, and that of the bottom of lakes, it has been inferred that it is not the bulk of the mass of water which serves as an obstacle to the free communication of the external caloric, and that the low temperature observed in the lakes of the Alps is owing to a particular and local cause.

Besides the general cause which produces a gradual diminution in the extent and depth of all lakes, there are others, which, operating on particular lakes, effect a more or less sudden change in that respect, according to the circumstances under which they take place. All rivers emptying themselves into lakes, convey thither more or less of the subtilty of the mountains from which they descend, and of the foam of the tracts of country which is traversed by them. The nearer, therefore, a lake is to those high mountains from which streams, in their descent, may carry away the detritus of rocks, the more speedily its basin will be filled up; while, on the other hand, a lake situated at a greater distance, in the middle of a plain, and receiving only sand and mud, part of which is carried off again by its outlet, will experience a much less rapid diminution. Some naturalists have thought it possible to determine the relative antiquity of lakes, by the extent of the alluvial land deposited in their basins by those rivers which enter them; but, according to Patrin, it is a matter of great difficulty to obtain satisfactory data on this head, and no general rules can possibly be laid down without a previous and careful examination of all the circumstances attending the locality of each particular lake. Thus, for instance, (lays the same author,) we see that the lake of Neufchatel, at the foot of the Jura mountains, has already experienced a very considerable diminution through the mechanically forming effects of the waters of the Orbe, while those produced by the Rhone are scarcely perceptible in the lake of Geneva, although this lake is probably of greater antiquity than the other. The lake of Annecy, which is wedged in between mountains, is already in a great measure choked up with their detritus. The valley of Chamouni, according to Saffouir’s observations, was also formerly a lake; but situated at the foot of the highest mountains of Europe its basin has long since been levelled by the alluvial land carried into it from all sides by the Avenon and other streams. The lac du Bourget, on the other hand, which occupies the middle of a vast basin, where it receives its calm waters unfronght with foreign matter, is left then many others subject to the influence of this particular cause of the diminution of lakes.

The large lakes, with which the northern regions abound, serve for very good purposes, inasmuch as the warm vapours arising from them serve for a defensive against the pinching cold of those climates. To this it is owing, that Ireland, Scotland, &c. are left with frosts than much warmer countries.

They also furnish exhalations and vapours, which diffuse on the countries bordering upon them in refreshing showers, and prevent their being barren deserts.

The lake Neuf, in Scotland, has been commemorated by many writers, but never with any degree of judgment, till Mr. Fraer gave a perfect account of it to the Royal Society. It never freezes though the winters be ever so severe, and is full of springs in almost every part; and its waters, in the time of the lowest water, are very fresh, and are discharged, while every thing is frozen about them. The river runs very slowly notwithstanding, and from this smoke of the water there is raised a sort of fog which overpowers the whole country for several miles. There is a mountain near its side, of two miles perpendicular height from the surface of the lake; and on the summit of this mountain there is another lake, which has no spring visibly running into it, nor any outlet, and yet always keeps of the same degree of fulness, summer and winter. Due west from the river into which the lower lake discharges itself, there is an opening of sea, or inlet, of two miles long and six miles wide; the middle of this is sometimes dry, and it is then easily seen that this was once dry land, and an inhabited country. There are found there large bodies of trees felled, and lying straight along; the wood of these is black, but it is very found, and there are many tumuli, or heaps of stones, to be seen under water in different parts of the frith, one of which is accessible at low water, and there have been found in it urns, which prove that they have been all burying-places.

As the sea washes away the banks of this frith, there is found in many places a large quantity of wrought timber; beams of fourteen, or more feet long, with the marks of the axe, and other instruments upon them; and at the depth of
of sixteen feet, in the steep banks of the neighbouring river Beulay, there are found oak-trees and pieces of burnt timber. We find by this, that the face of the whole country about this lake is very different from what it was some ages ago; and there seems some resemblance between the present face of things here, and that in the bags of many parts of England. The trees found buried in these were filled by the conquering Romans, and perhaps these are of some such origin.

We have many singularities offering themselves to our view in the lakes of our own country; of their freezing at peculiar seasons is not one of the least. Philosophical Transactions, No 114.

LAKE. Bituminous. The excellence of an expansive of mineral pitch, sufficiently extensive to merit the appellation of a lake, is a circumstance so very remarkable, that it will not be deemed improper to set apart an article for the description of the bituminous lake of the island of Trinidad. A description of this celebrated pitch lake was first given by Mr. Anderson, in the Philosophical Transactions for 1780, and some notices relative to it were communicated by Mr. Totten, in the eighth volume of the Linnean Transactions; but now poises a more complete account of it by Dr. Nugent, who visited it in October, 1807, and whose memoir is published in the first volume of the Transactions of the Geological Society.

The pitch lake of Trinidad, by the French called La Braye, is situated on the north side of the gulf of Paria, on the high point La Braye, a considerable headland, principally composed, at its southern end, of a kind of porcelain jasper. It is not easy to flate precisely the extent of the collection of pitch; the lines between it and the neighbouring soil not being always well defined; and indeed Dr. Nugent supposes it to form the substratum of the surrounding tract of land. It may, however, be said, that it is bounded on the north and west sides by the sea, on the south by the just-mentioned rocky eminence of porcelain jasper, and on the east by the usual argillaceous soil of the country; the main body may, perhaps, be estimated at three miles in circumference; the depth cannot be ascertained, and no subjacent rock or soil can be discovered. That part of this expanse, which may properly be called a lake, is situated higher than the adjoining land, and you defend by a gentle slope to the sea, where the pitch is much contaminated by the sand of the beach.

On approaching the lake a strong sulphureous and pitchy smell is perceived; and on a nearer approach, the bituminous plain itself opens to the view, appearing at first sight to be an expanse of still water, frequently interrupted by clumps of dwarf trees, or islets of rushes and shrubs. Dr. Nugent (from whose memoir this article is abridged) was struck by the singularity of the scene, that it was some time before he could recover from his surprize so as to investigate it minutely. The surface of the lake is of the colour of ashes; and at the season when this traveller visited the lake, not sufficiently smooth to be slippery; it was not adhesive, though it received the impression of the foot, and the confidence was such as to bear the travellers without any tremulous motion whatever; but in the dry season the surface is probably in a state approaching fluidity, as is shown by pieces of wood and other substances being enveloped in it: different bodies have been known slowly to sink into it. If a quantity be cut out, the cavity left will be shortly filled up. Numberless proofs are given of its being at times in this softened state; the negro houses of the vicinage, for instance, built by driving posts in the earth, frequently are twisted or funk on one side. In many places it seems to have actually overflown like lava, and presents the wrinkled appearance which a flaggish substance would exhibit in motion.

This bituminous plain is interlaced by numerous inter-}
of currents and eddies, may have been arrested and accumulated in particular places; they may there have undergone those transformations and chemical changes which various vegetable sublimes similarly situated have been proved to suffer in other parts of the world. An accidental fire, such as is known frequently to occur in the bogs of the earth, may then have operated in separating and driving off the newly-formed bitumen, more or less combined with siliceous and argilaceous earths, which forcing its way through the surface and afterwards becoming impregnated by exposure to the air, may have occasioned such scenes as I have ventured to describe. The only other country accurately resembling Trinidad, of which I recollect to have read, is that which borders on the gulf of Taman, in Crim Tartary. From the representations of travellers, springs of naphtha and petroleum equally abound, and they describe volcanic mounds precisely similar to that of Point Icaco. Pallis's explanation of their origin seems very satisfactory, and I think it not improbable that the river Don and sea of Azof may have acted the same part in producing these appearances in the one case, as the Ornoko and gulf of Paria appear to have done in the other. It may be supposed that the destruction of a forest, or perhaps even a great savanna on the spot, would be a more obvious mode of accounting for this singular phenomenon; but all this part of the island is of a recent alluvial formation, and the land all along this coast is daily receiving a considerable accretion from the surrounding water. The pitch-lake, with the circumjacent tract, being now on the margin of the sea, must, in like manner, have had an origin of no very distant date; besides, according to the representation of captain Mallet, which has been frequently corroborated, a fluid bitumen oozes up and rises to the surface of the water on both sides of the island, not where the sea has encroached and overwhelmed the ready-formed land, but where it is obviously in a very rapid manner depositing and forming a new foil.

The observations of captain Mallet, above-mentioned, but the accuracy of which Dr. Nugent had no opportunity of ascertaining personally, are, that "near Cape la Brea (La Braye) a little to the S.W. is a gulf or vortex, which in florid weather gushes out, raising the water five or six feet, and covers the surface for a considerable space with petroleum or tar."—"On the E. coast," he adds, "in the bay of Magaro, there is another gulf or vortex similar to the former, which, in the months of March and June, produces a detonation like thunder, having some flame with a thick black smoke, which vanishes away immediately; and in about twenty-four hours afterwards, is found along the shore of the bay a quantity of bitumen or pitch, about three or four inches thick, which is employed with success." The same author likewise quotes Gumilla as stating, in his Description of the Ornoko, that "about seventy years ago, a spot of land on the western coast of this island, near half way between the capital and an Indian village, sunk suddenly, and was immediately replaced by a small lake of pitch, to the great terror of the inhabitants." Mallet's Topographical Sketch of the Island of Trinidad.

**Lake of the Two Mountains**, a piece of water, that lies westerly from Montreal, being properly the mouth of Ottawa river; 20 miles long, and 5 broad. It is surrounded by cultivated fields of the Iroquois and Algonquin Indians, whole village stands on a delightful point of land, that projects into the lake. Each tribe has a Roman Catholic missionary. They attend public worship in the same church. Their pastors have taught them to read and write. Their warriors are about 500.

**Lake of the Woods.** See Woods.

**Lake River**, a river of America, which runs into the Mississippi, N. lat. 46° 30', W. long. 95'.

**Lake River, Little**, a river which runs into the Mississippi, N. lat. 45° 36', W. long. 94° 23'.

**Lakes, Subterranean.** That there are in many places immense subterranean lakes, can scarce be doubted, because we see them in some places; but their effects are often perceived where they are not seen, and puzzle the people who attempt to account for those effects upon other principles. The famous Zirchnitzer lake in Carniola, which fills and empties itself, at times, in an impetuous manner, bringing up with its waters fish, and even wild fowl, communicates with another immense subterranean lake in the mountain Savornick; and according to its filling or emptying, the upper one is also filled and emptied. See Duck.

The grotto Podpetechno, in the same country, gives another instance of such a subterranean lake. The people of the neighbouring country enter the side of the mountain where this lake is, by a small opening, through which they go to a cavern of a great width and height; and at the end of this is a small opening again, through which they go on to the edge of a vast subterranean piece of water. They go with torches, and find the water very clear and fine. It is ten cubits deep at the edge, and doubtless is much more in the middle. The water runs into this lake by a large channel, and runs out of it again by another, falling down a precipice into another lake, and that with such a noise, that the report of a pistol cannot be heard near it. Stones thrown in every way are heard to fall into water, and there is a great reproof to suppose the lake a German mile long; for at this distance there is another water discovered through such another cleft of the rock, which stands at the same horizontal height as this, and is subject to the same accidents at the same time. This vast body of water sometimes all runs off in a few minutes, and leaves the bason dry, and after some weeks it fills again with a frightful noise. As these accidents always happen to both the waters above mentioned, at the same time, they appear very plainly to be only the two sides of the same lake. Phil. Tran. N. 101.

We have in England many of these refervers, the water of which is always remarkably clear and cold, and is often loaded with spar, that it generally incrusts things very quickly that are put into it; and when raised into vapours, as a part of it sometimes is, by the subterranean heat, or carried up with other vapours, floats at the ceiling of the vaults, and there forms stalactites, and other such concretions. In many of these lakes also are found the round balls of spar, called felsapnite. They are composed of several cruts gathering round some central nucleus, and often exceed the size of a school-boy's marble. Phil. Tran. N. 144.

In Pen-Park hole, in Gloucestershire, there is a remarkable instance of this, that strange cavern containing one of the largest of the lakes in our kingdom.

It was accidentally discovered by some miners: it is twenty-nine fathoms deep from the surface, being a vast cavern of the shape of a horse-shoe, surrounded with rugged rocks and rough walls of earth, containing in the middle of it a river or subterranean lake, twenty fathom broad and eight fathom deep, of the same cold and petrifying water with the other refervers of this kind.

**Lake, or Lagoon,** a preparation of different sublimes into a kind of magistery for the use of painters, dyers, &c. One of the first and first invented of which was that of gum increa or lacque; from which all the rest, as made by the same process, are called by the common name lacques. See LAC or LACCE.
L A K

We may observe generally, that all vegetable colours, which are soluble in water, are found to have a certain degree of affinity for some earthy and metallic oxides. These combinations are called lakes. Thus, if a solution of alum is added to an infusion of madder, a mutual decomposition takes place, and part of the alum falls down intimately united with the colouring matter of the madder: the separation is much affinited by the alkali. They are chiefly of two colours only, red and yellow; the red owing their colour to madder, Brazil wood, or cochineal; and the yellow to the different yellow infusions used in dyeing. Both are generally used for water colours, and in oil painting as transparent colours. These pigments are almost invariably composed either of alum, or sometimes the solution of tin, and some other watery solution of a colouring matter.

Of the red lakes, that made with cochineal is the most beautiful, and of the greatest value. It is called carmine, from its being applied to imitate the colour of the flest. For the method of preparing it, see COCHINEAL. See also CARMIN.

On the receipt for making carmine, introduced under the article COCHINEAL, a correspondent has made the following observation.

The carbonat of soda and alum, added in the first instance, would be mutually decomposed, and the alumine, with the colouring matter, would be precipitated with the dregs, which are afterwards separated from the clear liquor; so that when the white of egg came to be added, the earth of the alum and a portion of the colouring matter, left to be carried down by the albumen, cannot be present. Should the process here given have any analogy to that which is practised, it would appear that the solution of cochineal in water has the white of egg added to it, in the first instance, if it is at all necessary, for the purpose of clearing the coloured solution, a property for which that substance is remarkable. That after the liquid becomes clear, and is separated from the dregs, the carbonat of soda and alum are added; when a precipitate, consisting of the alumine united with the finer parts of the colouring matter, may be expected. The remaining colouring matter, which is of less beauty, is then used for the red lake.

Instead of using cochineal for making carmine, a much clearer colour may be extracted from the refuse of scarlet cloth. The bits of cloth are boiled in a solution of potash, which extracts the colour, and holds it in solution. If to this a certain portion of alum be added, the colouring matter will be precipitated with the alumine, of a greater or less intensity, proportionate to the quantity of this earthy basis. In Dolfie's Handmaid to the Arts, we are told that the best of the lakes commonly sold is made from the colour extracted from scarlet rags, and deposited on the cuttle-bone; and that it may be prepared in the following manner: diffuse a pound of the best pearl ashes in two quarts of water, and filter the liquor through paper; add to this solution two more quarts of water, and a pound of clean scarlet shreds, and boil them in a pewter boiler, till the shreds have loft their scarlet colour; take out the shreds and press them, and put the coloured water yielded by them to the other: in the same solution boil another pound of the shreds, proceeding in the same manner; and likewise a third and fourth pound. Whilst this is doing, diffuse a pound and a half of cuttle-fish bone in a pound of strong aqua-fortis, in a glass receiver, adding more of the bone, if it appear to produce any ebullition in the aqua-fortis; and pour this strained solution gradually into the other; but if any ebullition be occasioned, more of the cuttle-fish bone must be diffused as before, and added, till no ebullition appears in the mixture. The crimson sediment deposited by the liquor thus prepared

is the lake: pour off the water, and fill the lake in two gallons of hard spring water, and mix the sediment in two gallons of fresh water; let this method be repeated four or five times. If the lake is not clear enough, or the lake appears too purple, half an ounce of alum should be added to each quantity of water before it be used. Having thus sufficiently freed the lake from the faults, drain off the water through a filter, covered with a worn linen cloth. When it has been drained to a proper dryness, let it be dropped through a proper funnel on clean boards, and the drops will become small cones or pyramids, in which form the lake must be suffered to dry, and the preparation is completed.

Lakes are also made from madder and Brazil wood. The former is much more permanent than the latter, but does not possess the same beauty of tint. In order to make these lakes, strong infusions of the substances are first obtained. The Brazil wood infusion is best made by boiling the chips in pure water, and filtering the solution. (See B R A S I L W o o d.) The infusion of madder (see M A D D E R) is best made in cold water, by which the purest part of the colour is only dissolved. To each of these solutions are added a clear solution of alum, and then as much of an alkali as will precipitate so much of the alumine as will make the colour of the precipitate of proper intensity. A small quantity of muriate of tin increases the brilliancy of these lakes.

A beautiful lake, it is said (ub infra), may be prepared from Brazil wood, by boiling three pounds of it, for an hour, in a solution of three pounds of common salt, in three gallons of water; and filtering the hot fluid through paper, add to this a solution of five pounds of alum in three gallons of water. Diffuse three pounds of the best pearl ashes in a gallon and a half of water, and purify it by filtering; put this gradually to the other, till the whole of the colour appear to be precipitated, and the fluid be left clear and colourless. But if any appearance of purple be seen, add a fresh quantity of the solution of alum by degrees, till a scarlet hue be produced. Then pursue the directions given in the first process with regard to the sediment. If half a pound of feed-lace be added to the solution of pearl ashes, and diffused in it before its purification by the filter, and two pounds of the wood, and a proportional quantity of the common salt and water be used in the coloured solution, lake will be produced that will stand well in oil or water, but it is not so transparent in oil as without the feed-lace. The lake with Brazil wood may be also made by adding half an ounce of anatto to each pound of the wood; but that anatto must be diffused in the solution of pearl ashes. There is a kind of beautiful lake brought from China; but as it does not mix well with either water or oil, though it diffuses entirely in spirit of wine, it is not of any use in our kinds of painting. This has been erroneously called safflower. Handmaid to the Arts, vol. i. p. 61, &c.

In making yellow lakes, the coloured infusions must be such as to make the most permanent dye. (See DYEING.) The precipitation of the colour is performed precisely in the same way, and by the same substances, as the red lakes. A very excellent yellow lake may be made from the infusion of quercus burk. That from turmeric is very beautiful, but is not permanent. The procce{s for the making of this is as follows: take a pound of turmeric-root in fine powder, three pints of water, and an ounce of salt of tartar; put all into an earthen glazed vessel, and let them boil together over a clear, gentle fire, till the water appears highly impregnated with the root, and will stain a paper to a beautiful yellow. Filter this liquor, and gradually add to it a strong solution of roch-alum in water, till the yellow matter is all curdled, together, and precipitated; after this pour the whole into a
LA K

filter of paper, and the water will run off and leave the yellow matter behind. It is to be washed many times with fresh water, till the water comes off insipid, and then is obtained the beautiful yellow, called lacque of turmeric, and used in painting.

In this manner may a lacque be made of any of the tinging substances that are of a somewhat strong texture, as madder, logwood, &c.; but it will not succeed in the more tender species, as the flowers of roses, violets, &c. as it destroys the nice arrangement of parts in those subjects, on which the colour depends.

A yellow lake for painting is to be made from broomflower in the following manner: make a ley of pot-ashes and lime reasonably strong; in this boil, at a gentle fire, fresh broom-flowers till they are white, the ley having extracted all their colour; then take out the flowers, and put the ley to boil in earthen vessels over the fire; add as much alum as the liquor will dissolve; then empty this ley into a vessel of clear water, and it will give a yellow colour at the bottom. Let all settle, and decant off the clear liquor. Wash this powder, which is found at the bottom, with more water, till all the salts of the ley are washed off; then separate the yellow matter, and dry it in the shade. It proves a very valuable yellow.

All the lake colours are changed by acids and alkalises. An acid renders the red lake more scarlet, and the yellow paler; while an alkali gives a purple tint to the red, and an orange or brown tint to the yellow. Artificers sometimes take advantage of this property to change their colours. The acid used for this purpose should be the nitric diluted, and the alkali aqua ammonia.

LAKE, Orange, is the tinging part of anatto precipitated together with the earth of alum. This pigment, which is of a bright orange colour, and fit for varnish painting, where there is no fear of flying, and also for putting under crystal to imitate the vinegar garnet, may be prepared by boiling four ounces of the beet anatto and one pound of pearl-ashes half an hour in a gallon of water; and straining the solution through paper. Mix gradually with this a solution of a pound and a half of alum in another gallon of water; desolating, when no effusion attends the commixture. Treat the sediment in the manner already directed for other kinds of lake, and dry it in square bits or round lozenges. Handmaid to the Arts, vol. i. p. 119.

LAKE, Rose. See Rose Pink.

LAKE of Madder. See Madder.

LAKE, Jatheries, in Rural Economy, a common name applied to such as are carried on in lakes, or other stagnant waters. See Fish and Ponds.

LAKE-vine, in Botany. See Arsmart.

LAKEN, in Geography, a town of Prussia, in the province of Oberland; eight miles E. of Mulhausen.

LAKSHIMAN, in Hindoo Mythology, an incarnation of the mighty serpent Sisna, (which see,) born of Sumitra, second wife of Dafarath, raja, or king of Ayadeha (Oude): Lakshiman was thus the half brother of Rama, and became incarnate for the purpose of assisting him in his wars against Ravana, the tyrant of Lanka. (See LANKA, RAVANA, and RAMA.) Lakshiman was farther connected with Rama by espousing Urmiia, daughter of Janaka, the adoptive parent of Rama's wife Sita. See JANA and SITA.

LAKSHMI, one of the eight regular wives of Krishna; and he being the Apollo of the Hindoos, these eight wives may possibly be only a perfunctior of the natural notes. (See KRISHNA.) Her name is sometimes written Lakshminy.

LAKSHMI, is the faksi or comfort of Vishnu, the preservative power of the deity. (See SAKTI and VISHNU.) The extensive feet of Vishnava, or worhippers of Vishnu, esteem Lakshmi as mother of the world, and then call her Ada Maya; and Vishnavaas are as fiktas, that is, adorers of the supremacy of the female energy, or nature-active, worship her extensively as the type of the eternal Being, and endow her with suitable attributes. (See farther herenon under LINGA, MAYA, and SAKTA, Sects of Hindoos; VISHNU, and the articles before referred to.) She is represented by the poets and painters as of perfect beauty. Hindoo females are now commonly named after her; and there are few in the long catalogue of their deities whose names and functions are so frequently alluded to in conversation and writing, either on theogony, mythology, poetry, or philosophy. Her territonal manifestations have been frequent, and her origin various. As Rama, the ten-born goddes, she arose one of the fourteen gems from the ocean when churned by the good and evil beings for the amrita or beverage of immortality. (See RISHMA.) She then assumes the character of Venus, or Aphrodite, of the Greeks; who, as Hestio and Fiener sing, arose from the sea, ascended to Olympus, and animated all the gods. The operation of churning the ocean is noticed under Kurma-vatara, and the production of Rhuana, Sri, or Lakshmi is thus described in the 36th section of the first book of the Ramayana. (See RAMAYANA.) The gods, the oceans, and the garlands, again agitating the sea, after a long time appeared the great goddes, inhabiting the lotus; clothed with superlative beauty, in the first bloom of youth, covered with ornaments, and bearing every auspicious sign; adorned with a crown, with bracelets on her arms, her jetty locks flowing in ringlets, and her body, which resembled burning gold, adorned with ornaments of pearl. This was produced the goddes Padma, or Sri, adorned by the whole universe, Padma by name. She took up her abode in the bosom of Padma-nabha, even of Heri, that is, of Vishnu, of whom these are names. Sri, as this deity is frequently called, distinguishes her more particularly as the goddes of fortune, the word meaning prosperity; but it is not given exclusively to Lakshmi. (See SRI, PADMINA, AND KAMALA.) Others of her names are derived from the lotus, which is the emblem of female beauty, and especially applicable to this goddes. (See under these articles.) He-rupiya denotes the wife of Heri or Vishnu. As the deity of riches or fortune Lakshmi would be invoked for increase of wealth, by a defering Hindoo, rather than Kuvera, the Plutus of their Pantheon. (See KUVERA.) In this character she is sometimes called Lokki, or Lakhi, meaning fickle; and it may be only a shortening or rapid pronunciation of Lakshimi, her moit common name, which is derived from the Sanscrit word lakshi, light, splendour; equivalent to the Latin lux, and it means further luck, luxury, fortune, &c. This goddes (as the faksi, or comfort of Vishnu, or Krihna) being the energy of the sun, is appropriately designated by a luminous appellation derived from such a source.

In images and pictures of her, which are very common in India, Lakshimi is generally represented as a mere woman; sometimes, however, four-armed; often holding a kamal, or lotus, in an easy and elegant attitude, and always very handsome. With her lord Vishnu she is frequently seen on the serpent Sisna; she repose, she in respectful attendance, while a lotus springing from Vishnu's navel to the surface of the sea (for this scene is fabueous) bears in its expanded calyx, Brahma, the creator of the world, about to perform the work of renovation. (See KALPA and SEHSA.) Sometimes she is seated with her lord on Garuda, or Vespera, cleaving the air, of which Vishnu is a perfunctior. (See SVERNA.)
In Vīshnu's most splendid avatāra, or incarnation of Kṛṣṇa, she became manifested as Rukmēni, or Radha, the most adored of the amorous deities, and mother of Kama, the god of love; here again corresponding with our popular Vīshnus, the mother of Cupid. (See KAMĀ, KṚṢṆA, RADHĀ, and RUKMĪ.) In the avatāra of Rāma, Lakṣmī was his faithful spouse in the form of Sita, as noticed under those articles. In that of Nārāyanī, she was Narājanī, or Nārāyanī; when Yārāṇa, Yārāni; and as the Saktī of Narayanī she is by her own fancies called Narayani; and in most of the many incarnations of Vīshnu she appears to have defended him, frequently under her own celebral name; as his consort generally, she is called Vaiśnavī. See respectively those articles.

The following extract from Moore's Hindoo Pantheon will shew the veneration paid to this popular and beneficent deity, of whom a milk-cow forms an apt symbol. "In the Śraddha, or obsequies in honour of deceased ancestors, Lakṣmī is, among other deities, earnestly invoked, particularly when, as the ritual expresses, a votary is dirous, by gifts to Brahmins, of obtaining celestial bliss for the defunct." A donation of a milk-cow is attended by many appropriate ceremonies, finishting with the following prayers; the acceptor holding, during the sacrificial, the sacred animal by the tail.

1. May the goddess, who is the Lakṣmī of all beings, and resides among the gods, assume the shape of a milk-cow and procure me comfort.

2. May the goddess, who is Rūdrāni in a corporeal form, and who is the beloved of Śiva, assume the shape of a milk-cow and procure me comfort.

3. May she, who is Lakṣmī residing on the bosom of Vīshnu; she, who is the Lakṣmī of the reign of riches; she, who is the Lakṣmī of kings, be a boon-granting cow to me.

4. May she, who is the Lakṣmī of Brahman; she, who is Śvāhā, the wife of fire; she, who is the exerted power of the sun, moon, and stars, assume the shape of a milk-cow for my prosperity.

5. Since thou art Śraddha, the food of them who are the chief among the names of ancestors, and Śvāhā, the consuming power of them who eat solemn sacrifices; therefore, being the cow that expiates every sin, procure me comfort.

6. I invoke the goddess, who is endowed with the attributes of all the gods, who confers all happiness, who behoves abodes in all the worlds, for the sake of all people.

Under the following names and words some particulars will be found of the mythological persons mentioned in the preceding extract, not before referred to from this article. Śraddha, or obsequies in honour of departed ancestors. Rūdrāni, the beloved of Śiva, a name of Parvati. Śvāhā, the boon-granting cow. Śvāhā, Śvāhā, theakti, or energy of Pavaka, or fire.

Lakṣmī also presides over marriages, and is considered, indeed, among certain sects of Hindoos, as the general source of all happiness. She is found, by mythologists, to have characteristic attributes and powers similar to the Ceres of the Greeks. (Śrī, in one calf, Śrī, corresponding here, likewise, in name), and the Isis of the Egyptians. On these, and other points connected with the subject of this article, see Sir William Jones, and Mr. Colebrooke, Ainât. Ref. in, i., iii., and vii. Many plates of her in her various fums, and Pāric legends and anecdotes, are like.

wife given in Moore's Hindoo Pantheon, whence this article is chiefly taken. See also GENTOO.

LAKTEA, in Geography, a sea-port of Sweden, in East Bothnia, at the mouth of a river near the gulf of Bothnia. N. lat. 64° 25'.

LALA, in Ancient Geography, a town of Asia, in the Greater Armenia.

LALADA, in Geography, a town of Hindooostan, in Golconda; 15 miles W.N.W. of Cloolor.

LALAMSERA, a town of Hindooostan; 28 miles W. of Benares.

Lalande. See LALAND.

LALANDE, James de, in Biography, was born at Orleans in 1622, and became distinguished in the profession of the law. He was famed as well for his extensive and very profound erudition, as by the public and private virtues which he manifested, in passing through a long life, in the exercise of various important functions. He attained to the highest rank in his profession in his native place, and was made mayor. He died in 1703, sincerely regretted by all who knew him; he was author of several works, of which the most important were "A Commentary upon the Cufion of Ormio;" and "A Treatise on the Ban, and Arriver-ban." His integrity, beneficence, and zeal for the interests of his countrymen, obtained for him the honourable title of "father of the people." Moreiri.

Lalande, Joseph. LALANDE, Joseph, le Français, a celebrated French astronomer, was born at Bourg, in the department of l'Ain, on the 11th of July 1732, of very respectable parents. His father, who was possessed of property, intended him for the bar, and accordingly sent him to Paris to study the law, to which, for some time, he applied with so much assiduity, as to more than answer the fanguine expectations of his friends, when the sight of an observatory awakened in him a propensity, which deranged the projects of his parents, and became the ruling passion of his life. He put himself under the instructions of Le Monnier, one of the then most celebrated astronomers of France, and profited so much by the lefions of his able instructor, as to afford him the highest degree of satisfaction, who, on his part, conceived for the young man a truly paternal affection, and was determined to promote his interests. An opportunity soon offered; the great astronomer Lacaille was preparing to set out for the Cape of Good Hope, in order to determine the parallax of the moon, and its distance from the earth. To accomplish this purpose, it was necessary he should be seconded by an observer placed under the same meridian, and at the greatest distance that could be conveniently chosen on the globe. Berlin was fixed on, and Le Monnier signified his intention of undertaking the business himself, but the moment when he should be ready to depart, he had the credit to get his pupil appointed in his stead. Frederic, to whom Maupertuis had explained the delicacy and difficulty of the enterprise, could not forbearflowing some admonishment when the youthful astronomer was presented to him. "However," said he, "the Academy of Sciences has appointed you, and you will justify their choice." From that moment his age, being only eighteen, was an additional recommendation; he was admitted at court, welcomed by the academy, and became intimate with the most distinguished persons at Berlin. On his return, the account which he gave of his labours procured him free access to the Academy of Sciences, and its Transcripts were enriched every year by important communications from the young astronomer; the active part which he took in the labours of the academy, was not confined to the astronomical science, we have from his pen, a description of seven arts, as different from each other, as they are re-

Note
mote from the objects of his habitual meditations." He published the French edition of Dr. Halley's tables, and the history of the comet of 1759, and he furnished Clairaut with immense calculations for the theory of that famous comet. Being charged in 1760 with the compilation of the "Compoissance des Temps," he entirely changed the form of that work, and of this collection he published thirty-two volumes, viz. from 1775 to 1807.

In 1761, appeared the first edition of his "Traité Astronomique," which he afterwards completed, and upon which his chief claim to glory rests. Lalande was the first who calculated the perturbations of Mars and Venus, and in the theory of Satellites, in which but little progress had been made, he explained a motion which Bailleaux claimed as his own discovery. A literary dispute arose out of this circumstance, which, however, was conducted with every regard to decency, and the probable result, as seen by disinterested spectators, was, that both had been led to the same discovery. He composed all the astronomical articles for the "Encyclopédie," and for the "Encyclopédie de Paris," and the "Encyclopédie Méthodique," substituting for the articles furnished by d'Alembert, and which he had compiled from the works of Le Monnier, such as were more complete and more modern, from his own observations and improved theories.

To his written works he joined oral instructions during a space of forty-six years; for from the year 1761 he had replaced the first maître, De Lisle, in the chair of astronomy, in the college of France, and gave a new lustre to this curious part of public instruction in a celebrated school, which possessed the most distinguished professors of every kind, and which enjoyed and merited the extraordinary privilege of occupying the tremendous thrones of a revolution, and escaping the almost universal destruction which levelled all around it. As a professeur, he taught with so much ability that his school became a seminary of disciples who peopled the different observatories of the world. In the midst of his other labours he drew up his "Voyage d'Italie," the most complete collection of curious objects that travellers can consult; his "Traité des Canaux," and his "Bibliotheque Astronomique," which is an immense catalogue of all the works that have appeared on the subject of science.

In the year 1793, Lalande published "Abrege de Navigation Historique, Théorique, et Pratique," containing many valuable rules and tables; and in 1802 he published a new edition of Montucla's history of mathematics, in 4 vols. 410. the last two volumes being prepared from Montucla's papers, with the assistance of La Place, La Croix, and other French mathematicians. He published also this year a collection of tables of logarithms, sines, tangents, &c., adapted to the pocket.

Allocated to almost all the distinguished scientific societies in the world, he was their common bond of union by the correspondences which he maintained; and he promoted a circulation of intelligence from one to another. He employed the credit arising from the universal reputation which he enjoyed, for the general benefit of the sciences and their cultivators. To the extraordinary ardour and activity of his character, he joined a love for the truth, which he carried to the borders of fanaticism. Every degree of concealment appeared to him unworthy of an honest man, and he therefore, with reserve, uttered his sentiments on all occasions, and by the bluntness of his manner, he sometimes made himself enemies, who not only called in question his real merits, but who excused against him a crowd of detractors, and because they could not rival his high reputation, they attempted to blight his well earned fame. He was not without his un-
of Lalande, give the French the pre-eminence in this kind of music, over all the nations of Europe." Effai fur la Musique.

The English, the Germans, and the Italians, we presume, will dispute this point with M. Laborde, and remind him of his Purcell, Handel, Leo, &c. We heard some of this sublime music, at the Concert Spirituel, in 1770; and in looking back at our memoranda for the effect which it had on our feelings, we found that it was coarse and noisy, with scarcely a new passage to make amends for the worst turning which we had ever heard, in or out of the church.

LALANG, in Geography, an island near the N. coast of Sumatra, in the frasits of Malaccas. N. lat. 1° 45'. E. long. 99° 20'.

LALASIDE, in Ancient Geography, a country of Asia Minor, which, according to Proklem, made part of Cilicia, so called from the name of Lalasia, its capital. In the 4th century of the Christian era, when the province of Iasia was formed of a part of Cilicia and Catoania, this country became a part of Iasia.

LALASIS, a town of Asia Minor, in Iasia.

LALBENGUE, in Geography, a town of France, in the department of the Lot, and chief place of a canton, in the district of Cahors. The place contains 1924, and the canton 9750 inhabitants, on a territory of 305 kilometres, in 13 communes.

LALCOTTA, a town of Hindostan, in Golconda; 47 miles N.E. of Rachore.

LALL, a town of Thibet; 60 miles. S. of Sarangpore.

LALIBALA, a town of Abyssinia; 140 miles S.S.E. of Gondar.

LALIBALA, a town of Abyssinia; 90 miles S.S.E. of Gondar.

LALIM, a town of Portugal, in the province of Beira; nine miles S.W. of Lamego.

LALINDE, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Bergerac. The place contains 1606, and the canton 8208 inhabitants, on a territory of 185 kilometres, in 16 communes.

LALLARY POINT, a cape on the S.W. coast of the island of Banca. N. lat. 2° 48'. E. long. 106° 2'.

LALM, a town of Silezia, in the principality of Jauer; 20 miles W. of Jauer.

LALODA, a town on the W. coast of the island of Gilo. N. lat. 1° 48'. E. long. 127° 22'.

LALOO, a town of Hindostan, in Bengal; 20 miles E. of Silhet.

LALOUETTE, in Biography, an elve of Lulli, beat the time at the opera in Paris, and composed the music of several ballets and intermedes. He was one of the best performers on the violin of his time, was also music-master at Notre Dame, and died in 1728, aged about 75.

LALPET, in Geography, a town of Hindostan, in the Carnatic; 74 miles N. of Arcot.

LALSK, a town of Russia, in the government of Volgoda, on the river Luzu; 40 miles E. of Uiting. N. lat. 60° 50'. E. long. 47° 14'.

LALSÖND, a town of Hindostan, in the subah of Agimire; 10 miles N. of Rantampour. N. lat. 26° 44'. E. long. 76° 55'.

LAMA, a town on the W. coast of the island of Celebes. S. lat. 1° 48'. E. long. 110° 15'.—Alfo, a town of Naples, in Abruzzo Citra; 12 miles E. of Sulmona.

LAMA, or Lammas, the title of an order of priests among the western Tartars, on the frontiers of China, and particularly in Thibet, who are held in great veneration. Lama, in their language, is a priest or minister of religion; and Lamaila is the wife of the Lama.

About the year 1226, the bonzes of Thibet assumed the title of "Grand Lama." The most powerful among them made Laffa the place of his residence, and was acknowledged chief of all the lamas. He established the law respecting the yellow cap; for it must be observed, that there are two kinds of lamas, distinguished by red and yellow caps. His successor was the first who appointed a "tupa," or prime minister, whom he entrusted with the government of his states. The next in order was the first who took the distinguishing title of "dalai-lama," by which he was raised far above the rest; for "dalai" signifies "morally and physically extended, great, and almost without bounds." The lama princes, however, were not sole sovereigns of Thibet. The dalai-lama was indebted to a prince of the Tartars of Kokonor, named Kouchi, for his sovereignty over all Thibet; and in order to continue his protection to him, he establised himself, together with his troops, in the neighbourhood of Laffa. In 1714, the Eleuthes made an irruption into Thibet, committed the most horrid ravages, put a great number of the lamas to the sword, and sent several of them into Tartary, inclosed in sacks, and thrown on the backs of camels. Their king pretended to be the only and real sovereign of Thibet; and ordered the lamas to renounce their authority over the people, to retire to their monasteries, and to employ themselves only in saying their prayers. The dalai-lama lost no time to implore the protection of the emperor Kang-hi; who assembled a numerous army, and caused it to march into Kokonor, from whence he drove the king of the Eleuthes, and then entered Thibet; while another body of Chinese troops penetrated thither also by the province of Se-tchuen. The dalai-lama was re-establisht, and the rest of the lamas were put in possession of their pagodas. Those that remained of the troops of the Eleuthes made their escape through the defiles of the mountains; and as the reigning emperor has ever since protected Thibet, the Tartians have nothing more to fear from the incursions of the Eleuthes, who, since 1739, have been subjects of the empire. The tribute which the sovereign of Thibet lends to the emperor of China consists generally of gold or copper statues of the god "Fo," perfumes, amber, coral, precious stones, woollen stuffs, and sword-blades. The emperor also requires from the dalai-lama certain number of vessels or small pitchers, filled with water from the Ganges. Ever since the expulsion of the Eluth Tartars, the kingdom of Thibet is regarded as depending on the emperor of China, which they call Cathay; and at Laffa, the capital, two mandarins reside, with a garisson of 1000 Chinese to support the government; but their power does not extend far; for in reality the lama, whose empire is founded on the fierce grounds, personal affection and religious reverence, governs every thing internally with unbounded authority. It is well known, that the dalai-lama is the great object of adoration for the various tribes of Heathen Tartars, who roam through the immense tract of continent which stretches from the banks of the Volga to Corea, on the side of Japan—the most extensive religious dominion, perhaps, on the face of the globe. He is not only the sovereign pontiff, the viceroy of the deity on earth; but as superflition has ever the greatest influence, where it is removed farthest from its object, the more remote Tartars absolutely regard him as the Deity himself. They believe him immortal, and endowcd with all knowledge and virtue. They annually assemble from different parts to worship.
LAMA.

ship and make rich offerings at his shrine; and even the emperor of China does not fail to make acknowledgments to him in his religious capacity, and actually to entertain at a great expense, in the palace of Pekin, an inferior lama, deputed as his munich from Thibet. According to Mr. Turner's account, the Thibetians conceive of him as immaculate, immortal, omnipresent, and omnipotent. They view him only in the most amiable light, as perpetually absorbed in religious duty; and when called to bestow attention on mortal beings, as employed only in the benign office of distributing consolation by his blessing, and in exercising the first of all attributes, forgiveness and mercy. He is also the centre of all civil government, which derives from his authority all its influence. It is an orthodox opinion among the votaries of the grand lama, that when he seems to die either of old age or of infirmity, his soul only quits a crazy habitation to seek another and better; and that it is discovered again in the body of some child, by certain tokens known only to the lamas or priests, in which order he always appears. The daili-lama, who pre-fided in Thibet in 1774, when Mr. Bogle was commission'd by the governor-general of Bengal to visit that country, was an infan; and was discovered a few years before by the Teeshoo lama, who, in authority and sanctity of character, was next to him; and, conseq'ently, during the other's minority, acted as chief. The residence of the daili-lama is at Pateli, or Pontela, an immense palace on a mountain near the banks of the Burrampooter, about seven miles from Laffa. On this mountain there are many pagodas, in the most sumptuons of which he resides. He pays great part of his life on a kind of altar, where he sits motionless, in a crossed-legged posture, on a large and magnificent cushion, and receives with the greatest gravity the adorations, not only of the Thibetians, but of a great multitude of pilgrims, who undertake long and difficult journeys to go and worship him on their bended knees, and to receive his benediction. The grand lama fulfils no one; he neither uncovers nor rises up to any person, whatever his rank may be; with the same eyes he beholds at his feet the greatest princes and the meanest of his subjects. He contents himself with laying his hand on the head of his worshipper, who imagines that he obtains, by this imposition alone, the remission of all his sins. His votaries conceive, that all the divinity of 'Fo' resides in him; and they ascribe to him all the attributes and prerogatives already mentioned. Their whole care is employed in discovering the place where it shall please him to be born again; and even some of the Tartar princes themselves have affiliated in this interesting search; but they are obliged to be directed by certain lamas, who alone are acquainted with the signs by which the new-born god may be discovered, or rather, they only know what child the preceding daili-lama appointed to be his succecor. The Teeshoo-lamas have several palaces or caillies. The castle in which the lama resides is built of stone or brick, with many courts, lofty halls, terraces, and porticos; and the apartments are in general roomy, and highly furnished in the Chinese style, with gilding, painting, and varnish. Stair-cafes and windows are conveniences to which they are utter strangers. There is no access to the upper rooms but by a sort of ladders of wood or iron; and in lieu of windows they have holes in the ceilings, with pent-house covers, contrived so as to shut up on the weather-side. Firing is so scarce, that little is used except for culinary purp'ses; and they tuck altogether for warmth in their houseto their fur and other clothing. In the northern parts of Thibet there are gold-mines, which are the referred property of the lama, and rented out to those who work them. Particular and discriminating respect is paid to the sovereign lamas after their death. The bodies of these are deposited entire in shrines prepared for them, which are ever after consid'red as sacred, and visited with religious awe; whereas the bodies of inferior lamas are usually burnt, and their ashes preferred with great care in little metallic idols, which have places assigned them in their sacred cabinets.

The lamas, who form the most numerous as well as the most powerful body in the state, have the priesthood entirely in their hands; and besides they fill up many monastic orders, which are held in great veneration among them. The inferior gradations, from the president of a monastery, who is always the lable lama, in addition to the name of the nation to which he belongs, are Gylong, Tohba, and Tuppa. On the establishment of the monastery of Teeshoo Loomboo, there were reckoned at that period no less than 3700 gylangs for the performance of daily service in the Goomba, or temple; and four lamas, chosen from among them, superintend and direct their religious ceremonies. (See GYLOKOS). Youth intended for the service of the monastery are received on the establishment at the age of eight or ten years, and then called 'Tuppa'; at fifteen they are usually admitted into the order of 'Tohba'; and from that of Tohba, if they are found, upon examination, duly qualified, they are advanced to the class of Gylangs, between the age of 21 and 24; and with sufficient interest, they may then be promoted to the superintendence of some endowed monastery, and obtain the rank of lama. The priests are habited in long robes of yellow cloth, with a conical cap of the same colour, having flaps to fall down and cover the ears. This peculiarity of colour distinguishes one of the two religious sects that divide almost the whole of Tartary, from Turkellia, to the eastern limits of this continent. The other colour is red; and the tribes are known as belonging to the red, or yellow cap. The former differ principally from the sectaries of the yellow, in allowing the marriage of their priests. But the latter are considered as the most orthodox, as well as polliified of the greatest influence. The emperor of China is decidedly of this tribe, and has functioned his preference of the yellow colour, by a sumptuary law, which limits it to the service of religion, and the imperial use. The two sects are distinguished by the appellation of Gylookpa and Shammar; the former having adopted the yellow colour, and the latter the red. Three lamas are placed at the head of each sect; Dalai-lama, Teeshoo-lama, and Taranant-lama, pre-side over the Gylookpa, who have their residence at Pootabah, Teeshoo Loomboo, and Kharka. This sect prevails over the greatest part of Thibet, and a division of it is established in a province of the Deccan, called Sauria, or Sirrora. In like manner three lamas do pre-side over the Shammar, and have their residence in Bootan, in separate monasteries. Great contentions formerly prevailed between these sects; and the Shammar was under a necessity of retiring, and of fixing in a tract of country bordering on Thibet, towards the south, marked by a line, indistinguishable and intemperate in the extreme. Here theyestablished themselves, as in a secure asylum; while others, styled Dukba, still live in tents and tend their flocks in a vagrant state. But to return from this digression.—The inhabitants of Thibet are not the only people who may attain to the dignity of lama. Tartars, and even Chinese, have aspired to the priesthood, and repaired to Laffa in hopes of obtaining it. If they can be admitted among the disciples of the grand lama, the number of whom is fixed at 200, they consider their admission as the commencement of their profession, and the first step towards dignity and power; the subaltern grand lama being chosen from among those disciples. When
they have arrived at this dignity, they live in splendour and opulence, and are continually surrounded by a crowd of adorers, who lead them with presents. The richest and most considerable of the Tartar lamas, who inhabit Thibet, are those whom the Chinese call "Mong-fam;" they possess extensive domains to the north of the province of Yunnan, between the beautiful rivers of Kinche-king and Youlang. These lands were granted to them by Oufan-guei, who became master of Yunnan, when the Mantchow Tartars subdued China, in order to bring them over to his party, and that by their means he might gain the support of all the lamas of Thibet. Although the Mantchow Tartars had never any lamas, they no sooner undertook the conquest of China, than they protected them openly through policy; and soon after, government caused magnificent pagodas to be erected for them. The example was followed by a great number of princes, princesesses, and wealthy people, who vied with one another in zeal for building temples for them, and thus the lamas greatly multiplied in China. They are also rich there; for most of these lamas appear in public in velments of red and yellow satin, ornamented with the most valuable furs. They are all mounted on excellent horses, and followed by a number of domestics, corresponding to their rank as mandarins; for the emperor permits them to carry a cullion and the other badges of dignity which belong to the quality of mandarin. The lamas of Thibet are less magnificent in their drees; wearing only a mopped kind of woollen stuff, called in China "poulou," which is used for covering feet, because it generally lasts long and retains its colour. Besides a cap, the lamas have several bonnets, or tiaras, that are the distinguishing marks of the different degrees of honour to which they have arrived. The cap, which strikes the European mind, very much resembles a bishop's mitre; it is worn by them on horseback as well as on foot. The obligations which the office of lama imposes are neither few nor trifling; but there is not one among them who engages to discharge them all. They divide and share the burden. One takes the charge of observing one precept, and another obliges himself to practise another. They have also certain common prayers, which they chant in a very agreeable manner; and they are obliged to renounce the vices of the world, to live in celibacy, and to have no concern in trade or commerce.

The lamas are extremely superstitious, and much addicted to magic. Groser's China, vol. i. Phil. Tranf. vol. liv. part ii. Turner's Account of an Embassy to the Court of the Tcheho Lama, in Thibet, 1806.

LAMALMON, in Geography, a lofty mountain and spacious district of Abyssinia, where is the pass through which the road of all caravans to Gendar lies; and where they take account of all baggage and merchandise, which they transmit to the Nagoé Ras, or chief officer of the customs at Gendar. Here is also levied, with great rigour, and for the most part with injustice, a payment due to the proprietor of the ground. From its base this mountain has the appearance of being sharp-pointed; but on the top of it is a large plain, called Lama, part laid out in pasture, but the greater part bearing grain. It abounds with springs, and seems to be the great reservoir from which arise most of the rivers that water this part of Abyssinia. A multitude of streams issue from the summit in all directions; the springs boil out from the earth in large quantities, capable of turning a mill. They plough, sow, and reap here at all seasons; and the husbandman must blame his own indolence, and not the soil, if he has not three harvests. In one place, says Mr. Bruce, we saw people busy cutting down wheat; immediately next to it, others at the plough; and the adjoining field had green corn in the ear, and a little further, it was not an inch above the ground. Lamalmon is on the N.W. part of the mountains of Samen; that of Gingereruh, with two pointed tops, joins it on the north; but neither Lamalmon nor Gingereruh, though higher than the mountains of Tigre, are equal in height to some of those of Samen. The mercury in the barometer on the top of Lamalmon stood at 20° 57 English inches. The language of Lamalmon is Amharic; but there are many villages where the language of the Falasha is spoken. These are the ancient inhabitants of the mountains, who still preserve the religion, language, and manners of their ancestors, and live in villages by themselves. Their number is considerably diminished, and they are now wholly addicted to agriculture, hewers of wood, and carriers of water, and the only potters and masons in Abyssinia. In general they live better than the other Abyssinians, which they, in revenge, attribute to their skill in magic, not to superior industry. Their villages are generally strongly situated out of the reach of marching armies, or otherwise they would be continually pillaged, partly from hatred, and partly from hopes of finding money. The river Macara is the boundary between Lamalmon and Waggora; and the latitude of some small villages called Macara was 13° 6' S. Bruce's Travels, vol. iii.

LAMANON, Robert Paul, in Biography, a member of the Academy of Sciences at Paris, and member of the Museum in the same city, was born at Salon, in Provence, in 1752, of an old and respectable family. He was defined for the church, and sent to Paris to complete his theological studies. He rose to the dignity of canon, but by the death of his father and elder brother he came into property, which enabled him to follow the bent of his inclinations, by devoting himself to the physical sciences. He travelled through Provence and Dauphine, and scaled the Alps and Pyrenees: "at the sight of these vast natural laboratories the bent of his mind burft forth instantaneously; he climbed to the summit of rocks, and explored the abyss of caverns, weighed the air, analysed specimens, and, in this ardent fancy, having attained the secrets of creation, he formed a new sytem of the world." Upon his return home, he applied with great ardour to the study of meteorology, natural philosophy, and the other branches of the history of nature. He spent three years at Paris, and gave to the learned societies there many very valuable papers, particularly a memoir on the Cretan, a memoir on the theory of the winds, and a treatise on the alteration in the course of rivers, particularly the Rhone. He again visited Switzerland and Italy, going first to Turin, where he allied himself to the learned men of that country; after his return, laden with the spoils of the countries which he traveled, he employed himself in the arrangement of the interesting fruits of his journey. It was at the time when Lamalmon was preparing for the press his great work on the "Theory of the Earth," that the French government conceived the vast project of completing the discoveries of captain Cook; the Academy of Sciences was entrusted with the care of selecting men capable of rectifying the common notions of the southern hemisphere, of improving hydrography, and advancing the progress of natural history; they invited, at the recommendation of the illustrious Condorcet, Lamalmon to share the danger, and to partake in the glory, of this great enterprise. He eagerly caught at the offer, halted to Paris, refused, in a conference with the minister, the salary offered him, and taking a hasty leave of his friends, departed for Breit. On the 1st of August,
1785, the armament set sail under the orders of La Perouse, an experienced commander: the commencement of the voyage was highly prosperous. After some delays, and having embraced every opportunity of making observations, the vessels arrived at the island of Mauon, one of the southern Archipelago, Lamanon, eager to assure himself of the truth of the accounts of that country, debarked with Langlo, the second in command. Having explored the place, and being upon the point of returning, they were attacked by the natives; a combat ensued, and they, with several of the boat’s crew, fell a sacrifice to the fury of these barbarians. Thus perished Lamanon, a young man ardent in the pursuits of science, disinterested in his principles, and a zealous advocate for the interests of freedom. His eulogy, M. Ponce, said of him, “that he seemed born to bring about a revolution in science; the depth of his ideas, the energy of his character, the sagacity of his mind, united to that lively curiosity, that can draw instruction out of every thing which he saw, and which leaves nothing unexplored, would have led him to the most valuable discoveries.”

LAMANTEA, in Geography, a town of Naples, in Calabria Cita; 12 miles S.W. of Cosenza.

LAMARCIA, in Botany, is a cryptogamic, and, in every sense, very obscure genus of marine plants, founded by the Abbate Joseph Olivi, in his Zoolonad Adriatica, an Italian work in quarto, published at Baffano in 1792, and treating of various matters relative to the natural history of the gulf of Venice. What relates to the present genus is copied into Ufer's % Annalen, t. 7. 76. It was named in honour of the celebrated French botanist John Baptif Monet, Chevalier de la Mareck, who, since the French revolution, has adopted Lamark as his surname. His indefatigable application and skill in the science of botany, are evinced by his Dictionnaire, and his Illustration des Genres, so often quoted by us. He has, however, for some time withdrawn himself from the former work, devoting his attention to conchology. Of his claims to botanical commemoration, there can be no doubt; but he has already received this reward of his labours, in the Moneta of L’Heritier, adopted in Willdenow, Sp. Pl. v. 1. 669, and the new edition of Hort. Kew. v. 1. 264; nor can we on any occasion consent to the unauthorized and truly foolish contrivance, of naming two different genera after one and the same person. If we retain the Butea of Koenig, for instance, it must be in honour of the late marchioness of Bute, not of the first earl, already unjustly immortalized in the Stauria of Linnaeus. It is however extremely probable that Olivi might be ignorant of the Moneta; or he might prefer for it the name Aetina, subfrequently given by Lamark himself, but whose meaning we know not. See his Dict. v. 1. 345.

The Buria marina of Cusapinus and Bauhin, and the Vermilaxa rufa of Imperato, have given occasion to the establishment of the present genus, whose character is thus given by Olivi:

Plant rooted, somewhat coriaceous, soft, composed of minute bladders, perpendicular to the axis, which are membranous, green, cylindrical, approximated, terminating at each end in very slender, tubular, connecting filaments. Fruitation consisting of small globes, scattered among the bladders and filaments.

The species are

---Globoidea, depressed, hollow, with fine, scattered, internal threads.---Found in the sea in various places, especially upon limpet rocks, most commonly attached by its roots to some small calcareous fragments. Each plant is a hollow pouncy ball, from one to ten inches diameter, green, composed of entangled, pellicial, jointed fibres, bearing numerous concentric oblong vessels, whose obtuse humiuts, reaching to the outside of the ball, give it a papillar or velvety appearance. Such at least was the structure of the specimens described in Engl. Bot. nor have we found the bladders connected at each end with the filaments. The roots were attached to fragments of shells. No frucification could be detected, and the plant was referred to Fucus, after Mr. Turner’s example, merely till the whole subject of submarine plants should be better understood. Olivi says, that when cut it contracts mechanically, by means of the internal fibres, which he supposes gave rise to the opinion of its being an animal, or Alcyonium.

2. L. Vegetalia. Branching obtuse Lamarcia. Vermilaxa rufa; Imperato. Hift. Nat. 646. Ulva decorticata; Woodw. Tr. of Linn. Soc. v. 3. 57.---Branched, somewhat forked, cylindrical, and obtuse.—Native of the Mediterranean sea; in deep water.—This has the form of Fucus lutescens, with a resemblance in its surface and colour to F. tenerrimosus. Mr. Woodward, who saw but one specimen, brought from the Mediterranean, found great difficulty in settling its genus. Its fructification resembles an Ulva stripped of the cuticle. There can be little doubt of its generic affinity to the above. S.

LAMARCIA is also the name of a genus established by Moench, and adopted by Decandolle in his new edition of Lamarcia’s Flora Francai, v. 3. 30, as well as by Bavona Bernardi, in his Sicularum Plantarum, Centuria 1, n. 46. This genus consists of one species only, as far as we are informed on the subject, which is Gymnopus aureus de Linnaeus, figured in the Flora Graeca, t. 79, a beautiful graf, but we are at a loss to imagine any character by which it can be separated from Gymnopus; see that article.

A New Holland shrub, belonging to Tetrandra Mona-gyna, has been called Lamarcia dentata, in Domn’s Hort. Cantab. ed. 5. 32. We are not acquainted with its characters, but presume it is what some have named Hygss ferrata.

LAMAS, in Geography, a town of Portugal, in the province of Tras los Montes; 18 miles S.W. of Dragunza.

Azlo, a town of Spain; in Galicia; 15 miles E.S.E. of Lugo.-Allo, a town of Peru, in the diocese of Truxillo; 180 miles E.N.E. of Truxillo.

LAMB, in Agriculture, a general name applied to the young of the sheep kind. When lambs come early in the season, great care should be taken to keep them dry and warm, as well as to provide a plentiful supply of food for the ewes, and always to let them have the driest pastures, as without due attention to such circumstances, much lost will frequently be made up by their dying, or remaining long in a weakly state, almost without growth.

It is observed by Mr. Young, that “there is no business on a farm that demands more care, attention, and skill,” than that of ewes in lambing season. “As soon as the farmer looks for the ewes beginning to lamb, they ought, he thinks, every night to be folded in the standing littered fold, on one side of which there should be a small cottage hut, built to be warm, with a chimney and flue for heating milk, and a bed for the shepherd to lie down upon. Here he is to sleep through the lambing season, that he may be ready to watch, affect, and tend any ewes that he sees very near lambing.”
ing, and, if necessary, to give the lamb some warm cow's milk. Some of the considerate Norfolk farmers, have, he observes, these huts on four wheels, to draw about with the flock wherever they may be; but to have one littered and well furnished standing-fold on a moderate farm, and two or three conveniently placed on a larger one, to take the flock to, without any distant traveling, is, he supposes, far preferable to that method. And he advises, that upon inclosed farms, where the refuge of roven may be supposed to be much greater than is generally possible on flock-farms, the sheep, as they drop their lambs, should be drawn from the flock of ewes, and put to this food, upon which an entire reliance may be had; and that it should be remembered, that all turnips should be consumed in February, which circumstance proves the vast importance of reeved grais as a substitute. Towards the close of July, the lambs of the flock should be weaned; in this business, it is noticed, that they are much earlier in Suffolk, than in Suffolk. And that "clover in blossom is, of all other food, the most forcing; fainthnour roven excellent; and if the farmer has, he ought to have made a reserve of a sweet good bite of fresh grais for them," and that it is essential that due provision should have been made before this period. See SHEEP.

LAMB-house, in Rural Economy, by the farmer the common name of the place where lambs are fattened. It is sometimes termed suckle. A proper rack and trough should be fixed up in it. See LAMB-fuckling.

LAMB-fuckler, a common name applied to the person who practices or carries on the business of fattening house-lamb. See the next article.

LAMB-fuckling, a name used to signify the art of fattening house-lamb.

It has been observed by the author of the Agricultural Report of the County of Middlesex, that, in the performance of this business, the ewes which begin to lamb about Michaelmas, are kept in the close during the day, and in the house during the night, until they have produced twenty or thirty lambs. These lambs are then put into a lamb-house, which is kept constantly well littered with clean wheaten straw; and chalk, previously baked in the oven, both in lump and in powder, is provided for them to lick, in order to prevent loofeness, and thereby prepare the lambs in health. As a prevention against gnawing the boards, or eating each other's wool, a little wheat straw is placed, with the ears downwards, in a rack within their reach, with which they amuse themselves, and of which they eat a small quantity. In this house they are kept, with great care and attention, until fit for the butcher. The mothers of the lambs are turned every night, at eight o'clock, into the lamb-house to their offspring. At six o'clock in the morning, these mothers are separated from their lambs, and turned into the pails; and at eight o'clock these ewes have loit their own lambs, and those ewes whose lambs are sold, are brought in, and held by the head till the lambs by turn suck them clean; they are then turned into the pailure; and at twelve o'clock the mothers of the lambs are driven from the pailure into the lamb-house for an hour, in the course of which time each lamb is suckled by its mother. At four o'clock all the ewes that have not lambs of their own are again brought to the lamb-house, and held for the lambs to suck; and at eight the mothers of the lambs are brought to them for the night. And where an ewe gives more milk than her lamb will suck, the superabundance is given to the twins, or to any other lamb whose mother may not be able to furnish it with sufficient food. The shepherd must in this case hold the ewe, or she would not suffer the strange lamb to suck. From their timid nature, it is extremely essential that they should be kept free from every species of unnecessary disturbance. This method of suckling is, it is observed, continued all the year. The breeders select fiich of the lambs that become fat enough, and of proper age (about eight weeks old) for slaughter, and send them to market during December, and through the four succeeding months, at prices which vary from one guinea to four, and the rest of the year at about two guineas each. This is severe work for the ewes, and some of them die under extents of exhaustion. However, care is taken that they have plenty of food: for, when green food, viz. turnips, coke, rey, tares, clover, &c. begins to fail, breyer's grains are given them in troughs, and second-crop hay in racks, as well to support the ewes, as to supply the lambs with plenty of milk; for if that should not be abundant, the lambs would become flunted, in which case no food could afterwards fatten them. It is remarked, that grains were first given to ewes by the late Mr. Naylor, of this county, and that he also was the first person who pulled out all the remaining front teeth of a broken mouthed ewe; observing that they fed much better without teeth than with the loss of one or two.

The ewes for this purpose should be kept free from the foot-rot and leuc; and if they have any pitch-mark on them when they lamb, it must be cut off before the lambs be taken into the house, or they will eat it, and thereby greatly prejudice their future growth.

And these ewes are always, the author of the Middlesex Report says, without exception, of the Dorsetshire breed; and even of these there is not more than one in three that will lamb sufficiently early for the purpose of house-lamb. The early lambing ewes are fought for by the breeders of this county, with great diligence throughout the county of Dorset, and at the fairs where such flock is usually sold. The prices vary from 35s. to 42s.

Such lambs as can be warranted of a fair complexion after being butchered, are held in the highest esteem, which those bought promiscuously in Dorsetshire, or at the fairs, cannot be; this preference induces those breeders and sucklers who are in the secret, to select rams which they can depend on for getting lambs whose meat shall be of that quality. The sucklers, falemen, and butchers of London, he affirms, are aware that fch lambs as have sharp barbs on the inside of their lips are certain of a deep colour after being butchered; and all those whose barbs are naturally blunt do as certainly produce fair meat. This knowledge has been the occasion of many lambs of the latter kind being kept for rams, and sent into Dorsetshire, expressly for the purpose of improving the colour of the flesh of the house-lamb. The infusion of such rams can generally be warranted fair, and such meat always sells at a higher price: hence he supposes arose the mistaken notion that Middlesex rams were necessary to procure house-lambs. And it has been further observed, that, "in order to conduct this sport of fattening with profit and success, a lamb-house or flock of proper dimensions must be provided." And that, "it is found from practice, that a range of building from sixty to seventy feet in length, and fifteen or eighteen in breadth, with three or more coops or divisions of different sizes at each of the ends, for separating the lambs according to their sexes, is sufficient for containing and conducing the busines of from one hundred and fifty, to one hundred and eighty lambs. That the lambs may be enabled to find their mothers with facility, the ewes, when they are separated from them, should be kept apart with deal hurdles in the middle of the house, so that they may be convenient for the lambs in the coops at the ends. But this is a practice which can only be undertaken with advantage,
advantage, in situations at no great distance from large towns, where there is great demand for early lamb; as upon their being ready at an early period, as towards the latter end of December, depends the great profit to be derived from the fatteners.

The principal objects in this sort of management are those of attending to the regular feeding of the ewes, the varying of their food with propriety, and keeping the house perfectly warm, clean, and sweet, so that the process of fattening may proceed in a regular manner without any check being sustained.

The writer of the Middlesex Report observes, that a friend of his, who is well acquainted with the subject, says, the farmers of Middlesex do not now rear half so many house-lamb as they did about forty years ago. In Surrey they are likewise falling off. The flocking system is removing to a greater distance from the metropolis, to which place many fat lambs are now sent alive, in light four-wheeled covered carriages.

Lamb, Gosse, the name of such lamb as is principally fattened while the ewes are at grais, or other kinds of green food. In the Report of Middlesex, it is remarked, that the vicinity of Smithfield market, makes early grafs-lamb an object of considerable importance to the farmers of that county. The Dorset ewes are chiefly selected for this purpose. They are purchased at Weyhill, Kingston, and other fairs, forward enough to drop their lambs in January. The price from 35s. to 37s. The breeders keep the ewes and lambs principally on turnips and second-crop hay. They fell the lambs in the months of April and May, fat, at from 25l. to upwards of 35l. each. The ewes, being dried early, are fattened and brought to market about Michaelmas, and sold at the same prices. The wool is about three and a half, which, at 10s. amounts to 25. 6d. The whole of the flock is cleared within the year, and the profit or loss thereby ascertained. The account in general is as follows:

Remains the increase of a ewe in one year 1 10 0

Lamb, House, a term applied to that sort of lamb that is fed and fattened in houses constructed for the purpose. The principal art in this business, as has been seen above, is to have the lambs such as will turn out of a fair delicate colour on being killed, and having them ready at an early period of the season. See Lamb-fattening.

Lamb-Earth, in Hydraulics, is a whitish flinty loam. The name seems only a corruption of the word loam-earth.

Lamb Head, in Geography, a cape of Ireland, forming the northern point of the entrance to Kenmare river, in the county of Kerry. N. lat. 51° 41'. W. long. 10° 1'.

Lamb Head, a cape on the S. E. coast of the island of Strona, one of the Orkneys. N. lat. 53° 57'. W. long. 2° 25'.

Lamb Island, a small island of Scotland, in the mouth of the Forth; one mile N. N. W. from North Berwick.

Lamb's Lettuce, in Gardening, the common name of an early, well-known, herbaceous plant. See Valeriana.

Lamb, Paschal. See Paschal.

LAMBA, in Geography, one of the smaller Shetland islands, between Shetland and Yell. N. lat. 62° 45'. W. long. 1° 39'.

LAMBALE, a town of Africa, in the country of the Fonlis, on the Senegal; 75 miles S. E. of Gournal.

LAMBALE, a town of France, in the department of the Northern Coasts, and chief place of a canton, in the district of St. Brives. The place contains 8500, and the canton 12,685 inhabitants, on a territory of 225 square miles, in 14 communes.

LAMBAN, a town of Asia, in the country of Guriel, on the Black sea; 50 miles S. W. of Cottay.

LAMBANNESS, a cape on the N.E. coast of the island of Unil. N. lat. 61° 10'. E. long. 1° 4'.

LAMBAUST, LAMBAUST, a small island on the coast side of the gulf of Bothnia. N. lat. 61° 35'. E. long. 21° 15'.

LAMBASSA, in Ancient Geography, a town of Africa, in Numidia, which became an episcopal see.

LAMBATIVES, or rather LAMBATIVES, in the Materia Medica, a form of medicine to be licked off the end of a liqueur-stick.

Lambattives amount to the fame with linthees, lechicks, and other medicines.

LAMBAY, in Geography, an island belonging to the county of Dublin, Ireland; situated in the Irish sea; 2 miles east from the Mainland. It is about three miles in length, and 1 mile in breadth, and is remarkable for vast quantities of rabbits and sea-fowl. Crabs, lobsters, and oysters are taken in great plenty; and abundance of herring is made on it. N. lat. 53° 30'. W. long. 6°. Carlisle, &c.

LAMBAYEQUE, a town of the vice-royalty of Peru, and capital of the jurisdiction of Sana, in the diocese of Truxillo, in a fertile and fertile plain, and containing about 1000 houses, some of which are built of brick, some of cane and plaster, and others altogether of cane. The inhabitants amount to about 6000; some are opulent; but the greater number consists of poor Spaniards, Mulattoes, Mestizos, and Indians. The parish church, constructed of stone, is large and beautiful, and splendidly adorned. It has four chapels, called "Ramos," with an equal number of priests. This town is the residence of a corregidor, who has many other towns under his jurisdiction. It is washed by a river of the same name, 97 miles W. N. W. of Truxillo. The high road from Lima to Truxillo passes through this town. Some wine is made in the vicinity, and the poor are occupied in weaving coarse cotton cloths. S. lat. 6° 40'. W. long. 70° 56'.

LAMBOIDES, in Anatomy, the future connecting the occipital to the two parietal bones, and so named because it consists of two lateral divergent branches like those which compose the Greek cardinal lambda. See Cranial.

LAMBEAS, Peter, in Biogrphy, was born at Hamburg in 1618, where he received the early part of his education, and from thence he proceeded to the universities of Holland and France to pursue and complete his studies. He made great progress in polite literature and the law, and at the age of nineteen he became known by a work on Aulus Gallus. He was elected licentiate-in-law at Toulouse; he spent two years at Rome with cardinal Barberini; and on his return to Hamburg he was appointed to the professorship of history in 1652; and in 1656 was made rector of the college in that city. He was rendered extremely uneasy by being charged with skepticism, and by the temper of his wife, whom he had married probably because she was rich, but who refused to let him share in her abundance. In 1662, he therefore abandoned his family and country, and went first to Vienna, and from thence to Rome, where he
LAMBERT, Francis, a French monk, who quitted his convent to embrace the reformed religion, defended from a noble family, was born at Avignon in the year 1587. At the age of fifteen he entered himself among the Franciscan friars, and continued in the community twenty years; during which time he acquired celebrity as a preacher, and was made general of the order. He was a thoughtful man, and a diligent enquirer after the truth; and in the course of his investigations he saw reason to renounce the doctrines of the Catholic church, and to adopt those of the Reformation. He, of course, found it necessary to withdraw from his native country, and in 1532 he went into Switzerland. He became a popular preacher among the Protestants, and having continued some time at Basel, he set out for Wittenberg to visit Luther, in the year 1523. With that eminent reformer he grew into high esteem, and it was determined he should go to Zurich, to assist in disseminating the principles of the reformation through France. The project was abandoned, and he was settled in some employment in the university of Wittenberg, where he most probably continued till the year 1526. In the following year he was appointed divinity-professor of the university of Marburg, and in 1530 he died at the age of forty-three. He was author of commentaries on almost all the parts of the Old and New Testament, and of many theological and controversial pieces. Bayle. Moreri.

LAMBERT, John Henry, an eminent mathematician and astronomer, was born at Mulhhausen, in the Sundgau, a town in alliance with the Swiss cantons, Aug. 29th, 1728. His father was by trade a flax-maker, and with difficulty provided for the wants of his family. Having no better prospects for his son than by bringing him up to his own business, he endeavoured to obtain for him an education suitable to his situation, and sent him to a public school, where he was taught the rudiments of learning, at the expense of the corporation, till he was twelve years old. Here he distinguished himself among his school-fellows, and some attempts were made to provide him with the means of studying theology as a profession. Encouragement sufficient for the purpose could not be obtained, and he was under the necessity of relinquishing all thoughts of a studious life, and obliged to begin learning his father's trade. Though occupied all the day, yet he devoted a considerable part of the night to the prosecution of his studies; and to furnish himself with candles, he sold for half-pence or farthings small drawings which he delineated while employed in rocking his infant father in a cradle. He met with an old book on the mathematics which gave him inexplicable pleasure, and which proved that he had a genius for scientific pursuits. Seeing the turn which the young man had for knowledge, several learned men afforded him relaxation, and advice, and they had the pleasure of finding him improve, under their patronage, with a rapidity beyond their most sanguine expectations. He was now taken from the drudgery of the shop-board, and M. Ifelin, of Bâiff, engaged him as his amanuensis, a situation which afforded him an opportunity of making further progress in the belles-lettres, as well as in philosophy and mathematics. In 1748, his patron recommended him to Baron Salius, president of the Swiss confederation, to become tutor to his children, in which office he gladly engaged. His talents as a philosopher and mechanician began to display themselves in his inventions and compositions. After living eight years at Coire, he repaired, in 1756, with his pupils, to the university of Gottingen, where he was nominated a corresponding member of the Society in that place; and from thence he removed, in the following year, to Utrecht, where he continued eighteen months. In 1758, he went with his pupils to Paris, where he acquired the esteem and friendship of D'Alembert and Meffier; and from thence he travelled to Marfeilles, where he formed the plan of his work “On Perspective,” which he published in the following year at Zurich. In 1760, he published his “Photometry,” and was elected a member of the Electoral Bavarian Scientific Society. Lambert was author of many other pieces besides those which have been already mentioned; among these were his “Letters on the Construction of the Universe,” which were afterwards digested, translated, and published under the title of “The System of the World.” In the year 1764, he made an excursion to Berlin, where he was introduced to Frederick II., who, sensible of his great services to science, gave directions to have him admitted a regular member of the academy; this appointment enabled him to devote himself wholly to the pursuit of his favourite studies. He enriched the transactions of several learned societies with his papers and treatises, some of which he published separately. He died Sept. 25th, 1777, when he was in the 52d year of his age. Most of his mathematical pieces were published in a collective form by himself in three volumes, in which almost every branch of
of mathematical science has been enriched with additions and improvements. Laidy prefixed to "The System of the World." London, 1800.

LAMBERT, John, a distinguished general on the side of parliament during the civil wars of Charles 1, was defended of a good family, and was, at the commencement of the troubles, a student of law. He had a superior command at the famous battle of Naseby, and on account of his skill and prowess he became a favourite of the independent party, who endeavoured to obtain for him the lieutenantcy of Ireland, but the Presbyterianers carried it against him in favour of Waller. He was confined in by Cromwell, to whom he was considered second in figure and military talents, and whom, it is said, he equalled in ambition. He opposed the project of making Cromwell king, though he had a great hand in placing him protector at the head of the late. He fell into disgrace, and retired with a pension to Wembley, where he employed himself in cultivating his garden; but upon the death of the protector he returned to public life, and was extremely useful to the party of Richard. Monk was the great rival of Lambert, and as the former was successful, the latter was not only humbled, but made prisoner and committed to the Tower. At the restoration, he and Sir Henry Vane were excepted from the act of indemnity; he was brought to trial and condemned, but by humble submission he was reprieved at Guernsey, where he survived forty years. Hume.

LAMBERT, George, was among the first English artist who obtained celebrity upon the revival, (it may be so called,) of painting in this country; which now finds so justly excelled in arts as well as arms, among the nations of Europe.

Lambert's taste led him to admire and to imitate the style of Gaipar Poussin in landscape; and he has produced several works of considerable merit; which, if they have not the brilliancy and force of Gaipar, are rich, and abound with beauties of a gentler kind. He also painted scenes from common nature, and at the Foundling hospital may be seen one he preferred to that institution, which is deserving of very great praise. He was engaged to paint scenes for the play-houses, for which his pencil was peculiarly qualified, and, in concert with Scott, painted fix large pictures of their settlements for the East India Company, which are placed at their house in Leadenhall-street. He died in 1767.

Lambert, Michael, was the favourite singing-maister, and composer of songs in France, about the middle of the seventeenth century. He had so many scholars, that he was obliged to teach a considerable number at a time, and at his own house, where he formed a kind of academy, and where he finished every lesson with singing, to his own accompaniment, several songs to a brilliant and enraptured audience. Marcel, the celebrated dancing-master, did the same, dancing with his best scholars at the end of the lessons which he gave at home on his public days. The reputation of Lambert, like that of Athelard, was so great, that his pupils followed him into the country as far as Puteaux, where he had a villa. Lulli married the daughter of this musician, who was born in 1610, and died in 1696.

LAMBERT, Abbé de St. Bertin, in 1693 taught grammar, dialectics, theology, and music. These sciences, at that time, were equally respected, music having no other object than the praises of the divinity.

LAMBERT, de, Saint, published, in 1702, "Les Principes du Clavecin," or Instrucions for the Harpsichord, containing a clear explanation of all that concerns the clavier, or keys, in their rotation on that instrument; and "A Treatise of Accompaniment," for many instruments. St. Lambert, in his instructions for the harpsichord, proposes the reducing all clefs to one, in order that the two hands should play from the same clef. Montclair has new-modelled this system, to adapt it to the five lines, or staff, and general compass of the voice; and the abbe de la Caffagne, in his Elements of Singing, has adopted this system and extended it. The basis of which being nothing more than transposition, it is now become wholly useless, by the clear and simple manner in which music is taught, that is, without transposition, and by playing everything just as it is written. This is M. Laborde's account of these publications, in which he seems not to know, that the plan of abolishing all clefs but one, belongs not to any of the gentlemen who have published it in France, but to our countryman Salmon, who, in the time of Charles II, published "An Essay to the Advancement of Music, by calling away the Perplexity of different Clefs, &c." and when M. Laborde says, that such a reform, is not wanted, because music is now taught in so clear and simple a manner, as to render all clefs but the treble and base used in harpsichord pieces unnecessary; that the intelligent author forgets to tell us how performers on keyed instruments are to be enabled to play, from the score of a chorus for voices and instruments, in which the vocal-parts and many of the instrumental are all written in different clefs. But for a further discussion of this subject, see the article CLEF.

LAMBERT, in Geography, a town of Canada, on the river St. Lawrence. N. lat. 45° 34'. W. long. 73° 14'.

LAMBERT Bay, a bay on the N.E. coast of the island of St. Christopher; two miles S.W. of Muddy Point.

LAMBERT'S Point, a cape of the island of Barbadoes, on the W.S.W. coast.

LAMBERT'S Blax. See Azure, and Blue ultramarine.

LAMBERTIA, in Botany, received its name from the writer of the present article, in honour of his highly valued friend Aylmer Bourke Lambert, esq. F.R.S. and F.A.S. a vice-president of the Linnean Society, one of the most ardent and experienced botanists of the present age, whose ample herbarium and library are ever open to the cultivators of his favourite science, as his heart is to the best feelings of friendship. His botanical treatise on Circaea, his lumpy-tom works on the Fic tribe, and his various essays in the Transactions of the Linnean Society, are eminently sufficient to assert his claim to the honour in question—Sm. Tr. of Linnaeum Soc. v. 4. 214; 120. Cavan. Ed. v. 5. 31. Brown. Tr. of Linnaeum Soc. v. 10. 187. Prodr. Nov. Holl. v. 1. 356. Ant. Hort. Kew. ed. 2. v. 1. 241. Clift and order, Tetrantha Monogynia. Nat. Ord. Aggregata, Linna. Trans. Jaff.

Gen. Ch. Cal. Involventum of many oblong, laminated, coloured leaves, the inner ones gradually the largest, containing from one to seven flowers, deciduous. Perianth none. Cor. Petals four, cohering at the base, linear-lanceolate, equal, revolute from above their point of union bearing the flaments. Nectary of four glandular scales at the base of the germen, sometimes united. Stam. Filaments none; anthers four, sessile at the inner side of the revolute-part of each petal, linear, at length recurved. Fil. Germ. superior, turbinate, fringed at the top; style thread-shaped; stigma rather thicker, prominent,awl-shaped, furrowed. Peric. Fillicle roundish-wedge-shaped, somewhat woody, more or less horned or tubercular, of one cell. Scceds two, orbicular, compressed, each encompassed with a rounded wing. Common receptacle flat, without scales.

eram of many leaves, imbricated, coloured, deciduous. Receptacle flat.

Obs. We have borrowed several corrections of the original characters of this genus, from the able performance of our friend Mr. R. Brown, published in the Transactions of the Linnaean Society, v. 10, illustrative of this whole natural order of Proteaceae. If we differ from him in terming corolla what he calls calyx, it is a matter of opinion, attended with much doubt. 'The late Mr. Dryander, however, agreed in this point with us.

One species of Lambea is only was originally known, the formosus, to which Mr. Brown adds three others. We shall give them in the order he has chosen. He remarks, that "they are all very beautiful shrubs, with whorled branches. The leaves are three in a whorl, mostly undivided, entire. Involucrum terminal, foliaceous, coloured, mostly spongy, rarely single-flowered; in the former case the flowers are ranged in two whorls, corresponding with the disposition of the foliage, and having an odd terminal one; hence it is probable some species with four flowers only may exist. The follicle is almost wedge-shaped, furnished at the edges, upwards, with pointed, sometimes elongated into horns, and sometimes the fides are armed with prominence.

1. L. uniflora. Brown Tr. of Linn. Soc. v. 10. 188. "Flowers solitary in each involucrum. Leaves ovate, with a point, smooth, retrorsate. Follicle pointed at one side, without horns."—Gathered by Mr. Brown in Lewin's Land, on the south coast of New Holland, growing about rocky inlets, near the shore.

2. L. inermis. Ibid. "Flowers seven in each involucrum; twice as long as its inner leaves. Style smooth. Follicles pointed at one side, without horns. Leaves oblanceolate or obovate, pointed."—Native of the flaky sides of hills in Lewin's Land. L. formosus var. longifolia, Andr. Repof. t. 69. agrees in most respects with this, though not cited in Mr. Brown's Prodromus, where he has omitted it as a synonym of true formosus. The fruit drawn in this plate may belong to the latter. The involucrum is represented green.

3. L. formosus. Sm. Tr. of Linn. Soc. v. 4, 223. t. 26. Cavan. Ic. v. 6, 32. t. 54. (Protea nectarina; Wendl. Sert Hanno. falc. 4, 5. t. 21.) "Flowers seven in each involucrum; the length of its inner leaves. Style hairy. Follicle pointed at one side, two-horned at the other. Leaves linear-lanceolate, sharp-pointed, recurved at the edges."—Native of flaky heaths near Port Jackson, New South Wales, from whence we received specimens among the first that were sent to Europe by Dr. John White. The leaves are green and smooth above; white, and reticulated with veins, beneath. Involucrum and flowers of a fine rose-red or crimson.

4. L. echinata. Brown n. 4. "Leaves linear, smooth, reticulated; dilated, lobed and punctured at their extremities. Follicles two-horned, thorny all over."—Native of the flaky sides of hills in Lewin's Land. Where Mr. Brown gathered it in fruit, but never saw the flowers. Hence its genus remains doubtful, especially, as that intelligent writer observes, on account of the leaves being lobed, which is contrary to the nature of the other species.

LAMBEASE, or LAMBE, in Ancient Geography, (Trente), a town of Mauritanit Statifens, situated on mount Audus. It was the most considerable town of the country, and the third legion of Augustus was quartered in it. Its ruins and inscriptions are still noticed.

LAMBESC, in Geography, a town of France, in the department of the mouths of the Rhone, and chief place of a canton, in the district of Aix; 12 miles N.W. of Aix. The place contains 4000, and the canton 10,570 inhabitants, on a territory of 2571 kilometres, in 7 communes.

LAMBESE, a town of Algiers, in which are magnificent ruins of an amphitheatre, a temple of Esculapius, &c.; 45 miles S. of Constantine. See LAMBESE.

LAMBETH, an extensive parish, seated on the southern bank of the river Thames, in the hundred of Brixton, and county of Surrey, England. It is directly opposite to Westminster, to which city it is connected by a handsome stone bridge across the river. The whole is bounded by Southwark to the east, Newington Butts and Camberwell to the south, and Battersea to the west. The circumference is about 15 miles. In Domesday-book, it is said to contain 203 ploughlands. At the beginning of the fourteenth century, it appears, by the churchwardens accounts, to have consisted of 1262 acres of arable land, 1026 of pasture, 125 of wood, 13 of meadow, 27 of garden ground, and 150 of wood, making in the whole 2630; the commons and waste land, supposed to be about 330 acres, not being charged, will increase it to 2953 acres. At present, the whole extent is about 4000 acres; of which about 1390 are occupied by houses and other buildings, wharfs, manufactories, streets, and roads; 415 by pleasure gardens, including those of Vauxhall; 80 by market gardens; 500 by farming gardens; 40 by nurseries; 250 are now including from common; and 30 are to remain common. The parish is divided into six liberties or precincts, respectively called the Bishop's, the Prince's, Vauxhall, Marsh and Wall, Lambeth-Den, and Stockwell; the whole containing, according to the return to parliament in the year 1800, 5000 houles, and 27,065 inhabitants, of whom 514 were rated to be employed in various trades and manufactures, and 955 in agriculture. Archbishop Hubert Walter obtained from King John a grant of a weekly market, and a fair of fifteen days, upon condition that the same should not be detrimental to the interests of the city of London. In the archbishop's MS. library, is a charter from the city, signifying their consent, ratifying only, that the fair should begin on the morrow after the anniversary of St. Peter ad Vincula. The market and fair are both discontinued. The earliest historical fact on record relating to Lambeth, is the death of Harlincote, which happened here in the year 1231, while he was celebrating the marriage feast of a noble Dane. Here also, Harold, who usurped the throne on the death of Edward the Confessor, is said to have placed the crown on his head with his own hands. Henry 111 held a solemn Christmas here in the year 1231; and a parliament on September 14, in the year following. A most violent outrage was committed in Lambeth church, on Sunday February 19, 1642-3. The story is variously told by the different parties; but it stands on record as an influence of the fatal effects of civil discord, from the outrages of which no place, however favored, is exempt.

Of the archbishop's palace, the chief object of note in the parish, it will be proper to relate a few particulars. It is situated near the river; and is certainly a very large pile of building, exhibiting the architectural styles of various ages. It appears that this palace was, in a great measure, if not wholly, rebuilt by archbishop Bosiface in the year 1262. If any part of this structure now remains, it is the chapel; the architecture of which might induce one to aferibe it to a more early period. Under the chapel is a crypt, the arches of which are built with stone, as is the chapel; the roof of the latter is of wood and flat; the windows were formerly of painted glass, put up by cardinal Morton. In the chapel were interred the remains of archbishop Parker. The great hall
LAM

Lambeth. On the site of Cuper's gardens (formerly a place of public entertainment,) are Melffs. Beauty's extensive vinegar works. Mr. Tremain, who went over the premises, mentions a vessel full of fine wine, containing 58,169 gallons, and another full of vinegar, containing 56,799 gallons; besides these enormous vessels there are several others which contain from 32,550 to 165,744 gallons each. In the year 1760, Mrs. Coade established in this parith, near Westminster bridge, a manufacture of artificial stone, which is called a moulds and burnt. It is intended to answer the purpose of stone, for every species of ornamental architecture, at much cheaper rate than carving. Where it has been placed in exposed situations it has been found to end re the flood. Melffs. Watts have lately established a manufacture of patent shot in this parith; the principle of making this shot is, to let it fall from a great height into the water, that it may cool and harden in its passage through the air, and thereby better retain its spheriac shape. The height of the tower at this manufactory is about 140 feet; the shot falls 123 feet six inches. About the same time Melffs. Bolton, Morgan, and Co. established a manufacture here under the title of the woollen yarn company; every branch of the clothing manufacture, from forting the wool to making the cloth, was carried on entirely by machinery; but the undertaking was soon given up. About a century ago, there was a place of entertainment called Lambeth Wells, situated in what is now called Lambeth Walk. A riding-school, for the exhibition of feats of horsemanship, was opened in this parith about the year 1768, by Mr. Philip Allfrey. At first it was an open area; in 1780 it was converted into a covered amphitheatre, and divided into boxes, pit, and gallery. Spring Gardens, Vauxhall, (which is mentioned in the Spectator as a place of great repute,) is open during the great part of the summer, being illuminated with a great number of candles; the entertainment consists of a concert of music performed, in fine weather, in the open air; the price admission, till 1796, was one shilling; it is now three shillings and open three times each week during the summer months.

LAMBIN, DENNIS, in Biography, an eminent cr. was born at Montreuil-sur-Mer in the year 1716. He appointed professor of the belles lettres at Amiens; this he refused long in Italy with cardinal de Tournon, on his return to Paris obtained the Greek profeship of the royal college. He acquired a great reputation at the learned by his commentaries on Lucertus, Cicero, and Horace. He translated from Greek into the language, the Ethics and Politics of Aristotle, and Orations of Demosthenes and Aelidnes. He died in the occasion of his death was the great shock which derived from the news of the murder of his friend Rat the massacre of St. Bartholomew. He was a man of found erudition and great curity. Many mortals.

LAMBOURNE, or LAMBOURNE, in Geography, ancient market town of Berkshire, England, is about N.E. of Hungerford, and 65 W. of London. A fair was established here at a very remote period; an charter of 1227, it is called Chaping-Lambourne, a fair was granted to the family of Fitzwarren. In reign of Henry VI. the charter was renewed, and an additional fairs granted in favour of the dean and chapter of Pauli's, London. The market is much declined; there are still held three fairs annually. In the market is a stone cross of a tall, plain shaft, on steps. The fith is co-extensive with the hundred to which it gives rise. In the year 1800, the population of the town, with dependent hamlets, was 2345. The parish church is spacious

and
and handsome buildings, in the form of a cross; on its southern side are two chanting-chapels, one of which was endowed by John Elbury, who died in 1372, and the other by his descendant of the same name, who died in 1485. Near the church is an almshouse, or hospital, founded by John Elbury, for ten poor men. In the north transept of the church is a monument for Sir Thomas Eflas, who died in 1558, with effigies of himself and his lady, in alabaster. Lycurgus Magna Britannia, vol. i.

LAMBR. A town of European Turkey, in Livadia; 14 miles S.S.E. of Athens.

LAMBDSORFF, a town of Stilea, in the principality of Neisse; 9 miles N.E. of Neisse.

LAMCAL, a town of Pegu, on an island in the Ava; 56 miles N.E. of Pernambuc.

LAME, in the Mange, is used in several phrases of that art, as _lame of an ear_, called in French _boitieux de l'oreille_, in lieu of a horse, when he halts upon a walk or trot; and keeps time to his halting with the motions of his head; for all lame horses do not keep time in that manner. See HALTING.

_LAME of the bridge_, is used by way of raillery, to signify the same thing.

LAMECH, in Scripture Biography, the son of Methuselah, of the race of Cain, the fifth in descent from him, and the father of Jabel, Jubal, Tubalcain, and Naamah. He married two wives, Adah and Zillah, and is supposed to have introduced polygamy. To his wives he said, "Hear my voice, ye wives of Lamech: for I have slain a man to my wounding, and a young man to my hurt: if Cain shall be avenged seven-fold, surely Lamech seven and seven-fold." (Gen. iv. 24, 25.) These words have perplexed Biblical critics. Some interpretations have been given of this passage, which must be considered as founded on mere fables, and they are not worthy of recital. Onkelos, who wrote the first Chaldee paraphrase on the Pentateuch, reads the words with an interrogation: "Have I slain a man to my wounding, and a young man to my hurt?" and accordingly he paraphrases it thus: "I have not killed a man, that I should bear the fin of it; nor have I destroyed a young man, that my offspring should be cut off for it."

Dr. Shuckford has improved this interpretation, by supposing that Lamech was endeavouring to reaoln his wives and family out of their fear of having the death of Abel revenged upon them, who were of the potlarity of Cain. As if he had said, "What have we done, that we should be afraid? We have not killed a man, nor caused any injury to our brethren of any other family; and God would not allow Cain to be killed, who had murdered his brother, but threatened to take seven-fold vengeance on him that should kill him; doubtless they must expect much greater punishment, who should presume to kill any of us; therefore we may surely look upon ourselves as safe under protection of the law and of the providence of God."

Lamech was also the son of Methuselah, and father of Noah; at whose birth he was 182 years of age; and he died after it 595 years, so that his whole life was 777 years, born A.M. 874, and dying 1051. See ANTENITIA-LIT.

MEGAL, in Geography, a town of Portugal, in the Place of Beira; 9 miles N.W. of Pinhel.

MEGO, a city of Portugal, in the province of Beira; the seat of a bishop, suffragan of Braga; situated on a plain near the Duero, and surrounded with mountains. It contains two cathedral churches, an hospital, four convents, and 14,500 inhabitants. The adjacent country produces excellent wines; 36 miles E. of Porto. N. lat. 41° 7’. W. long. 7° 27’.

LAMELAN, an island in the Baltic, near the S.E. coast of the island of Aland; eight miles long and four wide. N. lat. 60° 5’. E. long. 25° 45’.

LAMELLAE, derived of _lamina_, and signifying as much as _little lamina_; little, thin plates, or laminæ, whereof the scales and shells of fishes, &c. are composed.

LAMELE, in Botany, the gills, or thin vertical plates which compose the hymenium, or fructifying membrane of that great genus of fungi called _Agaricus_, to which the common edible mushroom belongs. (See Hymenium and Agaricus.) Scheffer and Hedwig have found the seeds to be lodged copiously in the substance of these plates.

LAMENESS, _Claudicatio_, in Surgery. Lameness arises from a variety of causes. From native deformity, or from the thigh being put out of joint in the birth; from the bad conformation of the cotylody cavity of the osa innominate; from the weakness of the hips; from external accidents; and from diseases. See LEG and LUXATION.

LAMINATIONE, _Ital_. applied to a musical movement, requires that it should be sung or played in a plaintive and mournful manner.

LAMENTATIONI, in the plural, implies complaints and lamentations. Between the time of the reformation and Charles I., there was a kind of maudlin piety, which had feixed Christians of all denominations. Among Calvinists, it exhale id itself in psalmody, and in others in lamentations. The Scots, among their own pathetic airs, have many laments. The Italians sung them in Latin, like the Salmi penitential; and in their own language. The sixteenth century was very prolific in lamentation. But in England even the lute was to weep, and be sorrowful; for Dowland, the famous lutenist, published Lachrimae; or "seven tears, figured in seven passionate Pavins." The poetry of these whippings seems much inferior to that of Sternhold and Hopkins. However, the best English composers of the times thought them worthy of the bell music which they could set to them, in four and five parts. Sir William Leighton, kn., who set many of them himself, was the editor of a collection of lamentations to four and five voices, with an accompaniment for the lute; and in the lilt of the composers we have Bird, Dr. Bull, Orlando Gibbons, Dowland, Robert Johnson, Forde, Hooper, Kinderley, Nat. Gyles, Coprario, Tilton, Luffo, Peri, and Jones, Alfonso Ferrabosco, Ward, Weelkes, Wilbye, and Milton, the father of the great poet.

LAMINATIONES, a canonical book of the Old Testament, written by the prophet Jeremiah, according to archbishop Uf architect and some other learned men who follow the opinion of Josephus and St. Jerom, on occasion of Josiah’s death. But this opinion does not seem to agree with the subject of the book, the lamentation composed by Jeremiah on that occasion being probably fictitious. Some have supposèd that the fifty-second chapter of the book of Jeremiah was probably added by Ezra, as a preface or introduction to the Lamentations.

The learned bishop Lowth, in his admirable book entitled "Prælectiones de Sacra Poeta Hebraeorum," has treated at large of this elegiac poem; illustrating its general nature and form, its metre or versification, and its subject, sentiments, and imagery. The Lamentations, he says, consist of a number of plaintive effusions, composèd upon the plan of the funeral dirges, all upon the same subject, and uttered without connection as they rode in the mind, in a long course of separate litanies. These were afterwards put together, and formed into a collection, or correspondent whole. In the character
character of a mourner he celebrates, in plaintive strains, the
obeisances of his ruined country; whatever pretended itself to
his mind in the midst of dejection and misery, whatever
struck him as particularly wretched and calamitous, whatever
the iniant sentiment of sorrow dictated, he pours
forth in a kind of spontaneous effusion. He frequently
pauses, and, as it were, ruminates upon the same object;
fremitly varies and illustrates the same thought with dif-
ferent imagery, and a different choice of language: so that
the whole bears rather the appearance of an accumula-
tion of corresponding sentiments, than an accurate and con-
nected series of different ideas, arranged in the form of a re-
gular trisyllable. The nature and design of the poem neither
required nor admitted of a methodical arrangement. The
whole poem, however, may be divided, according to our
author, into five parts; in the first, second, and fourth, the
prophet addresses the people in his own person, or else per-
sonifies Jerusalem, and introduces that city as a character:
the third part is supposed to be uttered by the chorus of
Jews, represented by their leader, after the manner of the
Greek tragedies; and in the fifth, the whole nation of the
Jews, on being led into captivity, pour forth their united
complaints to Almighty God. This last, as well as the
other, is divided into twenty-two periods, according to the
number of the letters of the alphabet with this difference,
that in the four other parts the initial letters of each period
exactly correspond with the alphabetical order. The form of
composition employed in this poem is a specimen of the
acrostic or alphabetical poetry of the Hebrew: and the
manner and order of this kind of verse are as follow: Each
of the five parts, or grand divisions, is subdivided into 22
periods, or stanzas; these periods in the three first parts are
all of them triplets, or they consist each of three lines, only
in each of the two former parts. There is one period consis-
ting of four lines. In the four last parts, the initial letter
of each period follows the order of the alphabet; but the
third part is so very regular, that every line in the same pe-
riod begins with the same letter, so as necessarily to aca-
tain the length of every verse or line in that poem; and
though the lines are not thus distinctly marked in the
other parts, their limits may be ascertained by resolving the
sentences into their constituent members. By this method
of computation it appears, that in the fourth part all the pe-
riods consist of syllables, as also in the fifth, which is not
acrostic; but in this last the lines are extremely short, whereas
as in all the rest they are long. In this poem there are lines and
verses which are longer by almost one-half than those
which occur usually, and on other occasions. The length of
them seems, on an average, to be about twelve syllables: and
the prophet seems intentionally to have adapted this kind of
meter, as being more diffuse, more copious, more tender,
in all respects better adapted to melancholy subjects.

That the subject of the Lamentations is the desolation of
the holy city and temple, the overthrow of the state, the ex-
termination of the people, and that these events are described
as actually accomplished, and not in the style of predication
merely, must be obvious, as our author conceives, to every
reader. The prophet has so copiously, so tenderly, and
poetically bewailed the misfortunes of his country, that he
seems completely to have fulfilled the office and duty of a
mourner. In the opinion of the learned prelate, there is not
extant any poem, which displays such a happy and splendid
selection of imagery in so concentrated a style. What can
be more elegant and poetical than the description of that
once flourishing city, lately chief among the nations, fitting
in the character of a female, solitary, afflicted, in a state of
widowhood, deferted by her friends, betrayed by her dearest
connections, imploring relief, and seeking consolation in vain?
What a beautiful personification is that of "the ways of
Sion mourning because none are come to her toilsome scalis?"
How tender and pathetic are the complaints that occur in
ch. i. 12 and 16? But to detail its beauties, says Lowth,
we must transcribe the entire poem. Gregory's Transl.
sent. 22, vol. ii.

Indeed the subject of this book is of the most moving
kind; and the style, throughout lively, pathetic, and affect-
ing. In this kind of writing the prophet Jeremiah was a
great master, according to the character which Gratius
assigns him: "Mirum in affectibus consticandis." See Jer-
emiah.

LAMENTIN, L. A. in Geography, a town of the island of
Martmico, on the W. coast. N. lat. 14° 36'. W. long.
6° 57'.

LAMENTUNG, a town of Thibet; 25 miles E. of
Jiansi Jiang.

LAMETOUNAH, a town of Africa, in Sahara,
about seven days' journey S. of Tripoli.

LAMETUK, a town of the late of New Jersey; 15
miles N.W. of New Brunswick.

LAMIGI, a petty kingdom of Asia, that lies to the
west of Nipal or Napaul; which see.

LAMIA, in Biography, the most celebrated female flute-
player in antiquity. Her beauty, wit, and abilities in her
profession made her regarded as a prodigy. The ho-
nours she received, which are recorded by several authors,
particularly by Plutarch and Athenaeus, are sufficient tes-
momies of her great power over the passions of her hearers.
Her claim to admiration from her personal allurements,
does not entirely depend, at present, upon the fidelity of his-
torians; since an exquisite engraving of her head, upon an
amethyst, with the veil and bandage of her profession, is
preferred in the late king of France's collection, which, in
some measure, authenticates the account of her beauty.

As she was a great traveller, her reputation soon became
very extensive. Her first journey from Athens, the place of
her birth, was into Egypt, whither she was drawn by the
fame of the flute-players of that country. Her perfor-
mandance were not long unnoticed at the court of
Alexandria; however, in the conflict between Ptolemy
Soter, and Demetrius, for the island of Cyprus, about 312
years B. C. Ptolemy being defeated in a sea-engagement,
his wives, domestics, and military forces fell into the hands
of Demetrius.

Plutarch, in his life of this prince, tells us, that the celebrated Lamia was among the female captives taken in
this victory. She had been universally admired, at first, on
account of her talents, for she was a wonderful performer
on the flute ; but, afterwards, her fortune became more
splendid, by the charms of her person, which procured her
many admirers of great rank." The prince whose captive
she became, and who, though a successful warrior, was paid
to have vanquished as many hearts as cities, conceived a
violent passion for Lamia, that, from a sovereign and a
conqueror, he was instantly transformed into a slave; though
her beauty was now on the decline, and Demetrius, the
handsome prince of his time, was much younger than herself.

At her instigation, he conferred such extraordinary ben-
efits upon the Athenians, that they rendered him divine bo-
ners; and as an acknowledgment of the influence, which
she had exercised in their favour, they dedicated a temple to
her, under the name of "Venus Lamia."

Athenaeus has recorded the names of a great number of
celebrated Tibicina, whose talents and beauty had capi-
...
vated the hearts of many of the most illustrious personages of antiquity.

Horace speaks of bands of female flute-players, which he calls *Ambitutum collegia* (*Ambitus* is said), by the commentators, to be a Syrian word, which, in that language, implies a flute, or, the found of a flute), and of whom there were still colleges in his time. But the followers of this profession became so numerous and licentious, that we find their occupation prohibited in the Theodosian code; however, with little success; for *Procopius* tells us, that in the time of Julianus, the follower of the empress Theodora, who was a Tibicina, appeared on the stage without any other dress than a flight scarf thrown loosely over her. And these performers became so common in all private entertainments, as well as at public feasts, obtruding their company, and placing themselves at the table, frequently unsought, that, at the latter end of this reign, their profession was regarded as infamous and utterly abolished.

**LAMIA** in *Ancient Geography*, a town of Greece, in Thessaly, famous for the war which the Greeks waged against the Macedonians, after the death of Alexander the Great.

**LAMIA**, in *Ichthyology*. See *Squalus Carebarias*.

**LAMIAE**, *Lamia*, among the Ancients, a kind of demons, or evil spirits, who, under the form of beautiful women, are said to have devoured children.

Horace makes mention of them in his Art of Poetry.—Some authors call them *Lamia*; *Lamia*, among the Ancients, a kind of demons, or evil spirits, who, under the form of beautiful women, are said to have devoured children. Bochart will have their word to be *Phoenicians*, and derives it from **L**amia, to devour; alleging, that the sable of the Lamia came from Libya. See **Lamium**.

**LAMINAE**, in *Anatomy*, a term applied in anatomical descriptions to parts which take the form of this plates. In this sense we speak of lamina of cellular substance, of membrane, of bone, &c.

**LAMINA**, in *Botany*, the expanded part of each petal of a polypetalous corolla, supported by the sguis or claw, and analogous to the limb of a monopetalous one. (See *Liam**.) It generally spreads, so as to form a considerable angle with the claw, in order that its upper surface may be presented to the strongest light, as in the pink, and wall-flower, or rock. The term lamina is also used by *Forrkalii*, and adopted by some others, for the expanded part of a leaf, that is, for the leaf itself; such application of the word is therefore altogether superfluous. See **Leaf**.

**LAMINAE**, in *Physiology*, thin plates, or tables, wherever any thing confifts.

**LAMIODONTES**, is the name given by Dr. Hill to the glossopteris.

**LAMIOLE*, in *Ichthyology*, is the name given by the modern Italians to a fish called in Cornwall the toe. See *Squalus Galus*.

**LAMIRAS*, in *Biography*, a famous poet and musician of Thrace, who, according to some authors, was the inventor of the Doric mode. He lived before Homer, and is said to have been the first musician who united the voice to the sound of the cithara.

**LAMISA**, in *Geography*, a town of the principality of Georgia, in the province of Carduel; 60 miles W. of Tefias.

**LAMUM**, in *Etymology*, a Latin word of disputed meaning and derivation, used by *Pliny* to designate the Dead Nettle, for which it has ever since served as the botanical generic name. Some derive it from the suppos'd place of growth of the plant or plants in question, *ad lamas*, that is, about ditches or puddles by the way side; but this is by no means appropriate. Linnaeus in his *Philosophia Botanica*, p. 167, explains the word by *Lamia larvata*, a masked forceres, as if the shade of the flower, resembling a mask, or rather a gaping mouth befit with sharp teeth, had suggested that idea. Ambrozinus, however, indicates the most direct etymology, from *lamia*, the throat, alluding to the shade of the flower, from which word also that of *lamis* itself, as the appellation of a certain voracious beast or fish, or of a forceres suppos'd to devour children, evidently originated.—Linn. Gen. 202. Schreb. 288. Willd. Sp. Pl. v. 3. 86. Mart. Mill. Dict. v. 1. Art. Hort. Kew. ed. 2. v. 2. 392. Sm. Pl. Brit. 026. Jull. 113. Tourn. t. 87. Lamark Illustr. t. 506.—Clays and *orders Dydynamia Gymnocorma*. Nat. Ord. Vertebrat., Linn. Labiata, Jull.

*Gen. Ch.* Col. Periander inferior, of one leaf, tubular, dilated upwards, with five, nearly equal, awned teeth, permanent. *Cor.* of one petal, ringent; tube cylindrical, very short; limb gaping; throat inflabes, compressed, gibbous, its margin furnished, at each side, with one or more little teeth; upper lip vaulted, roundish, obtruse, undivided or two-lobed; lower lip shorter, irregularly heart-shaped, emarginate, more or less reflexed. *Stam.* Filaments four, awl-shaped, concealed by the upper lip, two of them longer than the others; anthers incumbent, oblong, hairy. *Fil.* Germen in the bottom of the calyx, four-cleft; style thread-shaped, of the same length and situation as the flaments; stigma cloven, acute. *Peric.* none, except the open-mouthed calyx, containing the seeds at the bottom. *Seeds* four, levelled, short, triangular, convex at one side, abrupt at each end.

*Eff.* *Ch.* Calyx five-cleft, with spreading, bristle-pointed teeth. Upper lip of the corolla vaulted; lower two-lobed; throat inflated, its margin toothed at each side.

A very natural genus, well distinguished by its essential character, of the mouth of the flower being furnished with one or more teeth at each side. These are sometimes slender, and almost capillary; sometimes dilated and oblique. Linnaeus thought the upper lip was necessarily undivided, or at most only toothed; but in some recently discovered species it has a two-lobed termination, above the vaulted part. The species of *Lamium* are as yet but imperfectly ascertained, notwithstanding what has been done in Wildenow and the new edition of the *Hortus Kewensis*. The 14th edition of *Syfl.* *Vg.* enumerates but eight; *Wildenow* has thirteen. To these we have space to add, even from the gardens; and many mistakes to correct, respecting species already established. A review of the whole is necessary, though some may be less particularly mentioned than others. Our whole life amounts to twenty.

1. *L.* *Orodea*. Great Dead Nettle, or Balm-leaved Archangel.—Linn. Sp. Pl. 868. Curt. Mag. t. 172. (L. panonicastrum; Scop. Carn. ed. 2. v. 1. 466. t. 27. L. meliffeforum; Mill. 1. c. t. 158. Galeopis maxima panonica; Clus. Hult. v. 2. 35.)—Leaves heart-shaped, unusually and sharply serrated. Throat of the corolla inflated; upper lip sharply toothed, Calyx coloured, Stem nearly cylindrical, smooth.—Native of Hungary, Carniola, and Italy. We have gathered it, of a very large size, near Caflello Nuovo, 19 miles from Rome. The magnificence of its great crimson inflated flowers entitles it to a place in the flower-garden, where it is a hardy perennial, blooming in April or May, and sometimes suffers from our inclement springs. The *flom* two or three feet high, is remarkable for its roundness and polished smoothness. The *leaves* are three or four inches long, and nearly as broad, rugose, dark, and curly all hairy. *Orodea* is an old name for Clary, used by Dodonæus; we know not why it was applied to this plant.

d

**LAMlUM.**

plant. If Lamium montanum, favatile, feme globiferum, flore ampli, purpureo, cum labio superiori crnato; Toll. Pl. 92. f. 34. f. 1. quoted with doubt by Linnaeus, be he present species, the figure is very bad, yet we know no other to which it is more appropriate.

The *Orvala* garranica, Linn. Sp. Pl. 807. (Papia garranica, falsis urticae, altius et eleganter incisi, flore purpureo; Mich. Gen. 20. t. 17.) is now acknowledged to be a variety of *L. Orvala*, differing only in an accidental deeper division of the corolla, as well as of the leaves. Curtis in his specific character of the species in question, copied from *Syl. Vtg.* ed. 14, retains an error of the transcriber or printer, *calbis coloratis for calbis coloratus*.

2. *L. Levigatum.* Smooth Dead Nettle.—Linn. Sp. Pl. 808. Krock. Silex. n. 926, by the description. Sball. Hort. Rom. v. 3. t. 34. *Wilden.* (L. purpuracens, folio parvo acuminate, 3rre majeure; Pluk. Phyt. t. 198. f. 1. L. folio oblongo, flore rubro; Segn. Veron. v. 3. 131. Galeopsia var urticae inere, flore purpureae majeure, folio non maculato; Bauh. Hist. v. 3. 321.)—Leaves heart-shaped, pointed, strongly serrated, nearly smooth as well as the stem. Upper lip of the corolla abrupt, entire. Calyx nearly smooth, with taper teeth much longer than its tube, and almost equal to the corolla.—Native of Italy. Pallas mentions finding it in Siberia, Krock in Sileria. The Linnaean specimen was sent by Segnieri, with his own synonym and that of J. Bauhin, the latter being verified by the place of growth, near Vicenza. The root is perennial, in some degree creeping. Stem a foot high or more, square, purplish, leafy, smooth, or slightly be- sprinkled with soft hairs curved downward. Leaves broad-ovately, strongly and unequally serrated, with an elongated heart-shaped petiole, scarcely rugose, very little downy, rarely if ever spotted; the lower ones on long stalks, upper on short ones. *Flowers* eight or ten in a whorl. Tube of the calyx curved, but little dilated, pale, viscid, smooth or slightly downy, about a quarter of an inch long; teeth about twice that length, very taper, somewhat hairy, extending beyond the full-grown unopened corolla, widely spreading. Corolla about the size of the stem. *L. album*; upper lip blunt, entire, gibbose, slightly downy within; throat wide, often fringed, with one short narrow tooth, and the rudiment of another, at each side; lower lip small, of two rounded serrated spreading lobes.—Such is the plant the Linnaean herbarium, but the long description in the *Spec. Plant.* seems to agree better with the *mezopetalum* hereafter described, which therefore some have taken for the *levigatum*. Pluknet's figure is totally erroneous as to the calyx. Wildenow retains Boccione's synonym, misapplied to this plant by Linnaeus, and repeats it under *rugosa*, to which it properly belongs! Halleremitook his own N. 270, which is *L. maculatum*, for *levigatum*, and transcribed from Linnaeus *calix brevi* instead of *levi*.

3. *L. rugosa.* Wrinkled Dead Nettle.—Ait. Hort. Kew. ed. 1. v. 2. 266. Wild. n. 3. (L. hirtum; Lamarch Dicr. v. 3. 410. L. ampio, serrato, nigrincante, subrotundo, rugoso folio; flore rubro; Bocc. Muf. 35. t. 23. L. montanum hirtum, folio oblongo, flore purpureo; Toll. Pl. 92. f. 35. f. 1.)—Leaves heart-shaped, acute, roundly serrated, rugose, hairy as well as the stem. Upper lip of the corolla abrupt, notched; lateral teeth solitary, bristle-shaped. Calyx finely hairy, with teeth shorter than its tube.—Native of Italy, Sicily, and France, cultivated in our more curious gardens for at least 45 years past. It is perennial, flowering in July and August. The whole plant is more hairy than the leaf. Leaves rather

crate than serrated, all on longish stalks, dark, rugose, and hairy. *Flowers* purplish red; tube of the corolla smooth, curved, longer than the calyx-teeth; throat and upper lip hairy; teeth at each side of the mouth solitary, very long and narrow; lower lip small. There can surely be no doubt of Tulli's synonym, though hitherto neglected.

4. *L. garranica.* Woolly Dead Nettle.—Linn. Sp. Pl. 828. "Trews. Ehre. t. 75. Sm. Exot. Bot. v. 1. 95. t. 48. (L. garranica submaculata, flave purpureacente, cum labio superiori crnato; Toll. Pl. 93 t. 34. f. 2.)—Leaves heart-shaped, bluntly serrated, rugose, downy as well as the stem. Corolla inflated; with a straight tube, much longer than the calyx; orifice with two teeth at each side.—Native of Italy. It has been cultivated in Chelsea garden ever since 1739, and flowers in May. Its soft downy greyish aspect, and finely rugose leaves, at once distinguishes this species. The stem is thick and clumsy, two feet high. *Flowers* large, copious, and handsome, with a pale tube streaked with red, and light purple lips, the upper one cloven at the summit; the throat is nearly as much inflated as that of *L. Orvala.* Trew's figure was overlooked, or there would not have been another of this plant given in *Exotic Botany,* the latter work being intended for species not properly represented already. It is much to be wished that other periodical publications would so far pay regard to the fame principle, as to give such plants a preference.

5. *L. maculatum.* Spotted Dead Nettle.—Linn. Sp. Pl. 809. (L. Pinnia campocodracia et montanum; Column. Ecphr. 190. t. 192. f. 1. L. n. 270; Hall. Hist. v. 1. 118.)—Leaves heart-shaped, strongly serrated, acute, hairy. Tube of the corolla curved, longer than the calyx; upper lip entire; lateral teeth solitary, slender. Flowers about ten in a whorl.—Native of Italy, France, Greece, Switzerland, and Germany, flowering in the spring; it is imperfectly naturalized about Baywater, having probably elicited formerly from the neighbouring garden of Sir John Hill. Its natural situation is in waste ground, or about banks and hedges, where the radical leaves, distinguished by a broad irregular central stripe, make an elegant appearance through the Italian winter; but this mark commonly disappears from the upper leaves. The root is perennial, somewhat creeping. Stem a foot high, rather hairy. Leaves heart-shaped, rather acute but not pointed, strongly but bluntly serrated. *Flowers* purplish red, downy. Calyx tumid, nearly smooth, with fringed teeth about its own length, and much shorter than the tube of the corolla. The lower lip of the flower is concave and finely crenate.

Haller properly, perhaps quotes the Galiopsis of Rivi君 for this species; but the *Galiopsis* of Camerarius, Epit. t. 86, though said to have a red flower, is manifestly a representation of *Galeobdolon luteum,* Sm. Fl. Brit. 651. Both these are cited by Linnaeus under *Lamium album,* Rivi君 having confused album and maculatum. Pallas, as appears by his herbarium in the hands of A. B. Lambert, elq.‐millok *maculatum* for *purpureum*.

6. *L. album.* White Dead Nettle.—Linn. Sp. Pl. 829. Curt. Lond. falc. 2. t. 45. Eng. Bot. t. 798. —Leaves heart-shaped, pointed, strongly serrated, hairy. Flowers about twenty in a whorl. Tube of the calyx shorter than its teeth. Upper lip of the corolla notched; lateral teeth solitary, lanceolate.—Native of waste ground, almost throughout Europe, flowering in spring, summer, and autumn. The leaves are more pointed than in the last, and unspotted; the flowers white and more numerous, rarely assuming a bluish or pale purple. There is commonly a considerable distance, or naked part of the stem, between the Raïked lower leaves, and.
and the more fleshy upper ones where the flowers are situated. The summit is overtopped by one or two pair of leaves without flowers. The tube of the corolla is longer than the calyx; its lower lip flat, white, feebly crenate.

7. *L. cabitatum*. Muffin Dead Nettle.—Leaves heart-shaped, blunter, crenate, hairy, on longish stalks. Flowers overtopping the stem. Tube of the calyx equal to its teeth. Upper lip of the corolla notched; lateral teeth solitary, very slender. We know not the native country of this species, which we obtained from Chelsea garden, and have long cultivated. It is sometimes overlooked as a variety of the last; sometimes fold for *L. mollis* hereafter mentioned; yet no species can be more distinct. It is perennial, flowering in July; when the copious and delicate semitransparent white flowers, which rise in two whorls above the top of each stem, look as if a thin muffin veil had been thrown over the plant, especially when the dew is upon them. The lateral teeth are peculiarly slender; the anthers pale, with scarlet pollen. The leaves are small, roundish, light green, speckled with paler or whitish spots. *Stems* rather decumbent. We can find no synonym for this plant.

8. *L. fliratulum*. Pencilled Dead Nettle.—Syn. Prod. Fl. Grec. Sibth. 405. Fl. Grec. incud. t. 557.—Leaves heart-shaped, bluntish, serrated, on longish stalks. Upper lip of the corolla cleft; its segments spreading and toothed; lateral teeth double. Found by Dr. J. Sibthorp, (who supposed it to be the *Bockea resonans* of Dioscorides), very plentifully in all the waste ground of Greece and the Archipelago; yet no other modern botanist appears to have noticed this elegant and striking plant. Its habit is not unlike *L. alatum*, but the leaves are rounder, with longer stalks, and the flower is more uninteruptedly leafy. The flowers are singularly large and handsome, white flared with crimson, composing several whorls, the upper ones rising above the top of the stem, as in the last. Their upper lip ends in two oblong toothed dicyclic lobes; the lower is convex and crenate; the lateral teeth are in pairs, acute and spreading.

9. *L. bifidum*. Cloven White Dead Nettle.—Cyrill. Rar. flac. r. 22. t. 7. *Wilden*. (L. purpureum, flore albo, cum labio superiori bifido; Till. Fl. 93. *L. aequicolorum*; Column. Ecphr. 191. t. 192. f. 2.)—Leaves triangular-heart-shaped, deeply cut and crenate; the upper ones crowded. Calyx tymid, with shortish triangular teeth. Upper lip of the corolla cleft; its segments spreading, marginate, lateral teeth solitary.—Found in waste ground about Naples, towards the sea, where the writer of this gathered it in March 1787. Its general habit approaches to *L. purpurum*, but the flowers are snow-white, with a cloven summit, and the floral leaves, crowded (as in that species) above the top of the stem, whose middle part is almost naked, are of a triangular heart-shape, deeply cut and lobed as well as crenate, hairy, and marked with a narrow central white stripe, just as *Columna* represents them, concerning whose synonymy we presume there can be little doubt, though he appears not to have seen the corolla. Spirits of wine extract an orange colour from these flowers, which we do not perceive in any other *Lamium*.

10. *L. mochatum*. Mulky White Dead Nettle.—Mill. Dict. ed. 8. n. 4. Ait. Hort. Kew. ed. 2. v. 3. 394. (L. orientale, nunc mochatum nunc fatidicum, magno flore; Tourn. Cor. 11; according to Miller, but the Hort. Kew. rejects this synonymy, without affording a reason.)—Stem very smooth. Leaves heart-shaped, obtuse, crenate; the floral ones nearly sessile. Calyx-teeth nearly equal to the corolla. Upper lip of the corolla entire; lateral teeth solitary, dilated.—Native of the Levant. Miller cultivated it in 1739, but it found no place in the first edition of Hort. Kew. This we believe arose from its having been taken for, or confounded with, the *levigatum*. Into this error we ourselves have formerly fallen, misled by the long description in Linn. Sp. Pl. 508, which so precisely accords with the *mochatum*, rather than with *levigatum*, that we have no doubt from which of the two it was made. This is an annual species, cultivated, or rather spontaneously sowing itself, from time immemorial in Chelsea garden near the entrance, and flowering in the spring. The leaves of the young plants that come up in autumn remain through winter, and according to Miller, are prettily marked with white like the Cyclamen. The *flora* from 10 to 20 inches high, are remarkably smooth, with blunt edges, and purplish. Leaves of the stem heart-shaped, approaching to triangular, rather elongated but obtuse, veiny, of a light glaucous green, smooth or finely downy, the margin crenate rather than serrated; the floral ones nearly sessile. *Whorals* several, not reaching to the top of the stem, each of about ten white flowers, whose calyx is pale and smooth, with very long tapering rough-edged teeth, extending beyond the mouth of the corolla. The upper lip of the latter is downy, convex, abrupt, and entire; lower of two rounded, flat, finely crenate lobes; lateral teeth solitary, broad, pointing forward. We have not noticed the mulky leaf. 

11. *L. glichonoides*. Ground-ivy-leaved Dead Nettle.—(Moldavica orientalis, ldbera terrellis folio; Tourn. Cor. 11.)—Leaves heart-shaped, strongly crenate, on long stalks. Calyx-teeth short, triangular. Corolla longer than the leaves; upper lip notched; lateral teeth in pairs.—Gathered in the Levant by Tournefort, one of whose specimines is before us. No recent author seems to have known this species, which is perhaps more akin to our *fritatum*, N° 5, than to any other. The leaves are small, not an inch long, correctly heart-shaped, finely crenate, or serrate, finely hairy, on footstalks mostly twice their own length, except those of the floral ones, which scarcely exceed the calyx. The teeth of the calyx are short, triangular, awl-shaped, roughish. Corolla purple, downy; tube full twice the length of the calyx; throat inflated; lateral teeth small, double; upper lip abrupt and deeply notched; lower of two rounded wavy lobes. *Anthers* very hairy.

12. *L. tomentosum*. Downy Dead Nettle.—*Villad*. n. 11. (L. orientale incanum, flore albo, vel purpurascens, cum labio superiori crenato; Tourn. Cor. 11.)—Leaves roundish-heart-shaped, strongly crenate, downy on both sides, flaked. Calyx-teeth lanceolate, very hairy. Upper lip of the corolla crenate, very hairy; lateral teeth solitary, awl-shaped, narrow.—Gathered by Tournefort in Armenia. This is remarkably downy and hoary, especially the younger foliage, the calyx, and the upper lip of the corolla. The leaves are much under an inch in length, very deeply and sharply crenate, the upper ones most pointed, all densely villous, on stalks of various proportions. Teeth of the calyx as long as its tube, lanceolate, narrow, acute, densely villous. *Corolla* about the size of *L. alatum*, purplish or white; its tube as long as the calyx, smooth; throat but little inflated; lateral teeth solitary, long and slender; upper lip much arched, minutely crenate, villous; lower of two rounded, flat, entire lobes.

teeth solitary, awl-shaped. — Native of Virginia, as appears by Pluknet's synonym, overlooked by succeeding writers. This plant seems to have been early in our gardens, but is now little known, if not totally lost. Another species, hereafter described by the name of *encynifolium,* is generally mistaken for it, and is referred to as *viola* in Fl. Brit. under *L. purpureum.* The true *viola* is, however, now well-known to us, a dried specimen from the French gardens. Its habit and five approach to the *albus,* but the leaves are remarkable for being either quite entire, or very slightly toothed about the middle part only; they are an inch and a half long, broad at the base, and often heart-shaped, the extremity pointed and acute; both sides somewhat downy, veiny, even, not rugose. The *flanks* of the floral leaves are very short; those of the petal longer. *Flowers* the size of *L. album,* white; their tube as long as the calyx-teeth, which are brittle-shaped, narrow and hairy. *Seed* very smooth.

14. *L. ocyynifolium.* Baffi-leaved Red Dead Nettle.—(L. pufillum rubrum, parietarian face, americanum; Pluk. Almogr. 204. Phyt. t. 41 f. 2.)—Leaves ovate, obtuse, entire, stalked; the upper ones crowded. Stem naked in the middle. Calyx-teeth lanceolate. —This has long been in Chelsea garden, where it is almost a weed. From Pluknet's synonym it appears to have come from America. No succeeding author has noticed the plant. The root is small and annual. Stem a foot high, or something less, simple, except a small branch or two near the base, erect, square, smooth, leafy at the bottom and top only, being for the greater part of its length entirely naked, like the stem of *L. purpureum,* but still more remarkably so. The lower leaves are few, roundish-ovate, slightly crenate, on longish flanks, and nearly smooth; floral ones about six or eight pairs, crossing each other, crowded together at the top of the stem, forming a fort of pyramid, each leaf about three quarters of an inch long, stalked. ovate, obtuse, tapering at the base, entire, except here and there a cahanal notch in some of them, all slightly hairy, paler underneath. Whorls crowded, of numerous small purple flowers, much like those of *L. purpureum.* Calyx nearly smooth, its teeth as long as the body, spreading, broad at their base, with taper rigid points. *Seed* curiously beprinkled with pale, prominent, minute, tubercles, as is more or less the case in the three following.

15. *L. purpureum.* Common Red Dead Nettle.—Linn. Sp. Pl. 809. Curt. Lond. £.c. 1. t. 42. Engl. Bot. t. 769. Fl. Dan. t. 503.—Leaves heart-shaped, obtuse, unequally crenate, stalked; the upper ones crowded. Stem naked in the middle. Calyx-teeth lanceolate. Tube of the corolla closed with hairs near the bottom. —Very common, in waste as well as cultivated ground, though most parts of Europe, flowering at various seasons. The root is annual. Stem from six to twelve inches high, square, ascending, often branched at the bottom, naked in the middle, crowded with leaves and flowers at the top. Leaves broad-heart-shaped, bluntish, rough, unequally crenate, downy, on flanks of various lengths. *Flowers* in whorls along the upper leaves, reddish-purple, variegated with white, and spotted with dark purple, their lateral teeth small, in pairs, very near the under lip. The inside of their tube was found by Mr. J. D. Sowerby to be closed near its base with a dense circle of hairs; see Engl. Bot. t. 1933. The *calyx* is like the last species. —A curious variety was found near Sudbury, by Mr. Joseph Andrews, who communicated it to the late professor Martin, &c., and whose original specimen is in our hands. In this the margin of all the leaves is perfectly entire. The flowers are rather smaller than ordinary, and were said to produce no seed. This variety is in Engl.

Bar p. 769, at the end, mistaken for our *encynifolium* last described.

16. *L. incisum.* Cut-leaved Red Dead Nettle.—Willd. n. 9. Engl. Bot. t. 1933. (L. difformif; Willd. 527. L. purpureum 2; Sm. Pl. Brit. 267. L. rubrum minus, folia albo-marginata; Rivi. Syn. 1930. Fl. t. 41 f. 2.) —Leaves heart-shaped, dilated, obtuse at the base, irregularly cut; the upper ones crowded. Stem naked in the middle. Calyx-teeth lanceolate. Tube of the corolla pinnate. —Found in cultivated ground in France and England. We have it from Norfolk and Suffolk. This is so like the last, except the leaves being more deeply cut, that we should have still considered it as a variety, but for the want of hairs in the tube of the flower. The whole shape of the corolla, indeed, is more slender, approaching to that of *L. encynifolium,* or of the following *amplexicaule.*

17. *L. amplexicaule.* Common Red Dead Nettle.—Linn. Sp. Pl. 809. Curt. Lond. i. 2. t. 46. Engl. Bot. t. 770. Fl. Dan. t. 792. (Galeapis folio caulem ambiente, major et minor; Rivi. Monop. I. t. 63.) —Floral leaves fiddle, kidney-shaped, obtuse, strongly crenate, or somewhat lobed, embracing the stem. Teeth of the calyx linear-awl-shaped, as long as its tube. —Native of sandy fields of Europe, flowering in the spring. Easily distinguished by the rounded, fiddle, strongly crenate, and often in some degree lobed, leaves of the item, in which it essentially differs from the two last. The *calyx,* moreover, differs in being extremely hairy, with more upright teeth, as long as the body, and of a very narrow awl-shaped, almost linear, figure, by which latter character it is also distinguished from two hereafter described. The little red flowers are singularly pretty, the bright crimson of their downy upper lip, while the rest of the corolla is smooth and paler, glintens, like minute rubies, when moist with dew, and attracts the eye at a considerable distance. A small undivided tooth stands at each side of the mouth, though Willdenow once thought otherwise, and on account of that supposed deficiency, founded a new genus on this plant and Galeobdolon latum, by the name of Polichia; a mixture now happily abandoned, as those two plants have scarcely any character in common. Some of the earlier flowers of *L. amplexicaule* never expand, but the internal organs are perfect, and produce good seed. Linnaeus says all its flowers are generally thus closed in Sweden, owing, probably, to the coldness of the season when it blossoms.

18. *L. palmatum.* Palmate Henbit Dead Nettle.—(L. multiformip; Pallas. It. v. 1. 168.)—Floral leaves fiddle, embracing the stem, palmate; lobes three or five-cleft. Teeth of the calyx lanceolate, pointed, as long as its tube. —Gathered on the banks of the Wolga by Pallas, who, as appears from his specimens lent us by Mr. Lambert, first took it for *amplexicaule,* which it most nearly resembles, and afterwards for *multiformip,* under which name it is mentioned in his travels, quoted by Willdenow. From the latter it differs totally in size and aspect, as well as in the character of its leaves and calyx. From the former it is satisfactorily distinguished, however like at first sight, by the deeply palmate floral leaves, while Lobes are subdivided into three or five broad spreading segments; and still more decidedly by the broad base of the calyx-teeth, which contract suddenly into a sharp point. The corolla varies in size, or degree of expansion, as in the preceding. The root, like that, appears to be annual, throwing up several stems about a span high. The lower leaves are stalked, but otherwise resemble the upper ones, except, indeed, those near the root, which are smaller and less cut.

LAM

Linn. Sp Pl. 809. (L. orientale, folius elegantia inaciniis; Tourn. Cor. 11. Commel. Rar. 26 t 26.)—Floral leaves sessile, divided to the base, into many lobed or pinnatifid segments. Teeth of the calyx triangular, pointed, one-fourth the length of its tube;—Gathered at Tournon in the Levant. He probably brought home seeds, by which it was introduced to the gardens of France, Holland, and, if Miller be correct, Chelsea physic-garden. On his authority this species has found a place in the new edition of Hort. Nov., though long since a stranger amongst us. Indeed the plant is very little known to botanists. We have an indubitable specimen, but whether wild or cultivated we know not. It is in all its parts thrice the size of the two last. The root seems to be annual, throwing up several square, leafy, finely downy, often branched stems. The floral leaves are an inch or inch and half long, sessile, nearly smooth, divided almost, or quite, to the bottom into five segments, the middle one being the largest, all narrow at the base, dilated outwardly, deeply lobed or pinnatifid, the lobes rounded or bluntish. Flowers many in each whorl, as large as those of L. album, or larger, of a fine red, with five hairy an upper lip as to resemble some kind of Pflomis. The lateral teeth are foliary and acute. Calyx densely clothed with silky hairs, its thread broad, about a quarter as long as its tube, pointed, one rather wider than the reft.

LAMNICKI, in Geography, a town of the duchy of Stria; 10 miles N. of Cisely.

LAMO, a sea-port of Africa, on a small island formed by a river on the coast of Zanguebar, dependent on the Portuguese. S. lat. 1° 55'. E. long. 41° 27'

LAMOIGNON, William de, in Biography, marquis of Baiwilly, descended from an honourable family, was born at Niverois in 1617. He was admitted a counsellor of Paris in 1635, made master of requests in 1644, and in 1668, on account of his great probity and honour, was raised to the office of first president of the parliament. Upon his nomination to the presidency, cardinal Mazarin said to him, “If the king had known a worthier and fitter man, he would not have appointed you;” but he paid him a much higher compliment, by retaining a large sum of money, offered by another person for the situation, at the same time observing, “Whatever occasion his majesty may have for money, it would be better to expend it for a good president, than receive it.” Lamoignon did not disappoint the expectations formed of him; he fulfilled all the duties of the situation with equal zeal and prudence, supporting the dignity and privileges of the body over which he presided, discouraging the chicanery of the bar, raising his voice for the people, and ‘devoting his health and life to the public service.’ He was once found with regard to his opinion of a criminal, over whose trial he was to preside as judge, by Colbert the minister, to whom he replied, “A judge gives his opinion but once, and that is from the bench.” He died at the age of sixty, in the year 1677. His “Arétés,” on various important points of French law, were first published in 1702, and again reprinted in 1781. In his manners he was simple, in his conduct rather amiable, but to the widow, the orphan, and the friendless, he was the most delightful of all human creatures. He relaxed from the toils of his office, in the pleasures of literature, and literary men. Boileau, Racine, Bourdaloue, &c. were his particular friends. Mornri.

LAMOIGNON, Christian Francis de, eldest son of the preceding, was born at Paris in 1644. At his education the most exact care was taken by his father, and at a proper age he was placed in the Jefuits’ college, under the particular tuition of the celebrated father Rapin, whose favourite disciple he was. Having finished his studies, he travelled through different countries for the improvement of his mind, and in 1666 he was admitted a counsellor of Parliament. In 1674, he was appointed to the office of advocate-general, which he held during the space of 25 years, with the highest and most unblemished reputation, distinguished as much for his eloquence, as by his zeal for justice and the public good. In 1690 the king nominated him to a post of more ease, and better adapted to his health, but his love of employment retained him several years longer at the bar, till at length, being urged as well by his own feelings, as the representations of his family and friends, he fought for an honourable repose. He then indulged in the love of letters, and, in 1704, was admitted a member of the Academy of Inscriptions, of which he was soon appointed the president. In this situation he displayed as much talent and readiness in discussing a literary question, as he had formerly done a point of jurisprudence. He died in 1709. Many of his speeches were published, but the only work which he lent to the press was “A Letter on the Death of Father B.urdalou.” Mornri.

LAMOILLE, in Geography, a river, which runs into lake Champlain, 28 miles N. of Newhaven, N. lat. 44° 37'; W. long. 73° 14'.

LAMORRA, in Geography, a town, in the English channel,
on the coast of Cornwall, at the mouth of a small river, which joins the Fale; 3 miles S. of Truro.

LAMOTIS, in *Ancient Geography*, a small country of Asia, in Chicia, which took its name from the town of Lamus. Proveney.

LA MOTTE, in *Biography*, an admirable violinist, born in Flanders; when very young, he was regarded as the first folo player at Vienna. In 1777 he came to England. He had his first regular instructions from Giardini, and it is related of him, that when he quitted Giardini, he travelled through Italy, still in search of another master; and being arrived at Leghorn, where Nardini then lived, he would have become his scholar; but after hearing that celebrated performer execute one of his own folas, of the most difficult kind, and being, in his turn, asked to play, he desired leave to perform the fame fola which he had just heard, and which was new and in MS. to that he never could have practised it; however, he acquitted himself so well, that Nardini declined taking as a scholar one who was already fufficient master of his instrument.

The concerts which he played at the Pantheon concerts were full of new difficulties of execution, expression, and double fops, which he performed with such grace and seeming facility, that none but fiddle-players, who know the finger-board of the violin, and the difficulty of bowing certain passages, would imagine that he had any difficulties to encounter. His tone was not very powerful, but perfectly sweet and even, from the lowest note on the violin, to the end of the finger-board. His high notes were of the flute kind, nearly as sweet as the *fons harmoniques*.

This performer, whose constitution was very delicate, seemed consumptive, when he left England in 1779, at which time he returned to the continent, where he died.

LAMOTTE, WILLIAM, an eminent French Surgeon and accoucheur, was of Valognes, in Normandy. He studied his profession at Paris, where he attended the practice of the celebrated hospital, l'Hôtel-Dieu, during five years. He was distinguished particularly by his skill and success as an accoucheur, not only at his native town, but throughout the neighbouring country, during a long period. He left three sons, two of whom were physicians, and the third succeeded him in his own department.

His first publication, entitled "Traité des accouchemens naturels, non naturels, et contre nature," was first published in 1715. It went through many editions, and was translated into several languages; and was generally deemed the best treatise of the time, after that of Mauriceau, which Lamotte confurred. It contained an account of four hundred cases, with judicious practical reflections, the result of thirty years' practice. His next publication was a "Difertation fur la Generation, et fur la Superfification," containing also an answer to a book, entitled "De l'Indecence aux Hommes d'accoucher les Femmes, et fur l'Obligation aux Méres de nourrir leurs Enfans," Paris, 1718. He denied the occurrence of superfication, and combated the opinions of the oraliasts, and the doctrine of animalcules; and in his reply to Heequet, he relates a number of untoward accidents, occasioned by the ignorance of midwives. In 1722, he published, "Traité complet de Chirurgie, contenant des Observations fur tous les Maladies chirurgicales, et fur la Manière de les traiter," which has been several times reprinted. The last edition was published in 1771, with notes by professor Sabatier. This was a valuable practical work, but disfigured by the egotism of the author, and his contempt for his professional brethren; whence Haller observes, "laudes fuis non negligit, non perinde fame collegarum studiofus." Haller Bibl. Chir. Éloy. Déc. Hist. de Med.

LAMP, an instrument used for the combustion of liquid inflammable bodies, for the purpose of producing artificial light.

The most simple lamp consists of a vessel of almost any shape, containing oil or alcohol, with a tube projecting a little above the surface of the liquid, and containing any fibrous substance capable of raising the liquid to the top of the tube, by capillary attraction. The oil, thus raised and diffused through the fibrous substance, is so detached from the main body of the liquid, as to admit of being heated to a temperature sufficient to volatilize the oil, the vapour of which, in a state of combustion, constitutes the flame of the lamp.

In the management of the lamp of the most simple kind, so far as relates to the supply of oil, three things are necessary to be observed. 1. The wick must be of such a flat surface as to promote capillary attraction. 2. It should not be twisted too much, in which case its capacity for the oil is too little; nor should it be so loose as to diminish materially its capillary attractive power. This is frequently the case, when the wick has been too long immersed in the oil. 3. With regard to the distance of the flame from the surface of the oil,—If the flame be too near the surface, a lesser quantity of oil will acquire the intense heat necessary to raise it into vapour, since the heat communicates with the fluid. On the contrary, when the flame is too high above the oil, the capillary attraction, which decreases in the ratio of the distance, is insufficient to supply the necessary quantity of oil.

Experience has long ago established, that cotton is the best medium for the combustion of the oil, which is prepared in a particular way for the purpose.

During the slow combustion of oil, as observed in the common lamp, as well as that of tallow in candles, the fatty matter is decomposed, producing a quantity of vapour, which inflames in contact with oxygen; and a cloudy exhalation in the form of smoke, consisting of numerous small particles of carbonaceous matter, which, if collected, constitute the article called lamp-black. Besides the offensive smell and appearance of this substance, there is an evident waste of combustible matter, capable of producing both light and heat.

The evil arising from the smoke and smell of lamps was formerly so great, as to prevent their introduction into domestic use, notwithstanding the strong inducement of convenience and economy.

The public have long been in possession of a complete remedy for this, and several other disadvantages in lamps, by the invention of the Argand lamp. This invention embraces so many improvements upon the common lamp, and has become so general throughout Europe, that it may be justly ranked among the greatest discoveries of the age. As a substitute for the candle, it has the advantage of great economy and convenience, with much greater brilliancy; and for the purpose of producing heat, it is an important instrument in the hands of the chemist.

We may with some propriety compare the common lamp and the candle to fire made in the open air, without any forced method of supplying it with oxygen; while the Argand lamp may be compared to a fire in a furnace, in which a rapid supply of oxygen is furnished by the velocity of the ascending current. This, however, is not the only advantage of this valuable invention. It is obvious that if the combustible vapour occupies a considerable area, the oxy-
A Lamp.

The current of atmospheric air, through the flame, which, instead of being raised from a solid wick, is produced from a circular one, which surrounds the tube through which the air ascends. Before we enter more fully into the merits of the Argand lamp, we shall give a description of it, with reference to drawings of its different parts. These drawings are taken from the lamp of modern construction, which have recently been much improved. The wick is now raised by a screw, instead of the rack and pinion; which is so great an improvement upon the latter, both in simplicity and convenience, that it is becoming general.

Fig. 1 (Plate Lamps) is a view of the lamp complete, to a scale of one-third the real size. A is a reservoir, which is on the principle of the bird-fountain, keeping the oil always at the same height in the burner B, through the communication C.

The burner B is composed of three tubes, a, b, and c. The two first are seen in section only; while the whole of one side of c is seen.

Fig. 2. The tube c is folded into the bottom of the tube a, and open throughout, communicating with the receptacle D, which screws on the outside of the tube a, and serves at once to catch the oil which may accidentally run over the tube a, and admit the air through the apertures n, p, which has to ascend through the tube c.

The oil which comes in through C will occupy the cavity g b, between the exterior surface of the tube c, and the interior of a, which must, of course, rise to the height of the aperture t, in the reservoir A, as seen in fig. 3. The part d e, fig. 2, called the bucket, is a short tube to receive the circular wick. This part is seen in fig. 4, with the wick upon it, d f. It is made to work freely upon the tube c.

The latter has a spiral groove cut upon it, into which a pin at e enters; so that when the bucket is turned round by a catch r, which works in a longitudinal slit in b, it will be raised or lowered by turning the tube b in different directions, and is, therefore, the means of raising or lowering the wick.

A wire, s, is attached to the tube b, which bends down parallel to t, and touching the outside of the tube a. The part k l x y fits upon the tube a. The part k l is provided with shallow sides to receive the glass E, and is connected with a ring y, by wires x, z, fig. 1. The whole of this part turns with the glass E, and at the same time carries round the tube b, by means of the wire s, which is connected to k l and y, for the purpose of raising or lowering the wick.

When oil is to be introduced into the reservoir, A is screwed off, and inverted. The aperture t, fig. 3, is then opened, by pulling down the sliding socket w, which ought to fit the interior cylinder pretty accurately. The globe must now be filled at the hole t; the socket w is next pulled over the hole. The ball may now be held in an erect position, and replaced in the lamp; after which the socket v may be pulled below the hole t, by means of the handle w.

The oil will now rise to a height in F, and in B, till it reaches the higher part of the aperture t, fig. 3, and will maintain the same height till the oil in the globe gets to the same level. This reason of this hydrostatica phenomenon will be easily perceived. When the oil in B and F gets a little below the aperture t, a bubble of air enters and ascends into the globe, the same quantity of oil descending to give it place.

This reservoir, although it is fully fitted for giving a regular supply of oil, is attended with one disagreeable property. The air in the upper part of the globe being much more expansive by heat than liquid bodies in a warm room, its spring becomes greater than the pressure of the exterior air; in consequence of which, the oil is apt to flow over the tube a, and liable sometimes to overflow the vessel D. Another disadvantage is the difficulty in this bulky reservoir. When the lamp is used on a table, the wick may render one side of it useless. The above inconveniences in the Argand-lamp have been, in some measure, obviated by the invention of Mr. Peter Kier of Kentish Town. He raised the oil by means of a column of a heavier fluid. In the plate, figs. 5 and 6, are exhibited an elevation and section of one of these lamps; the section only requires to be explained.

From the slender figure of the valve, it is evident that the flame is permitted to throw its light in all directions, downwards and upwards, nearly in the same manner as a candle. The interior part is divided into several compartments by the diaphragms at F and C. The space A A above F is open to the atmosphere; but the space B B, beneath C, is close. A tube F G proceeds from the space A A to the space B B, so as to reach nearly to the bottom at G, and another tube, C D, proceeds from B B upwards through A A, without communicating with this last space, and is enlarged at the upper part, so as to receive a wick with the apparatus of Argand, or any other. A solution of pitch, or the mother water of salt, being first poured in, by measure, at E, flows down the tube into B B, and fills that space. A like measure of oil is next poured, which also descends into B B, and forces the dense fatine liquor upwards through G F into the space A A. The specific gravity of this last is adjusted by dilution; so that when the space A A is properly filled, the oil shall stand in equilibrium at the requisite height near E, viz. the surfaces in A and E are elevated above the lower orifice at G, in the inverse proportion of the specific gravities.

This proportion is usually about three to four; so that if any of the oil be taken away from E by combustion, or otherwise, there will be a subsidence of the heavy fluid in A A to preserve the equilibrium; and during the whole subsidence in A A, there will be a corresponding depression of the upper surface of oil, near E, which will be measured by four-third parts of the first elevation of the dense fluid above the partition F D. Now, the fall in A A may be rendered very small, by enlarging the diameter of the vessel at that part, and at B B; and the elevation of E above A A, and, consequently, the inflation of the radiant flame, may be governed at pleasure by prolonging the interval D C.

It is possible, in the manipulation of this lamp, that some oil, or pieces of snuff, may fall into the space A A, and float upon the liquid. This effect is, to a certain extent, beneficial, because the covering of oil prevents evaporation; but if this should require to be remedied, it is easily done, by pouring the whole contents of the lamp into a basin, and after a few moments repose, or straining, returning the liquids again into the lamp at E by a syphon, or funnel, in which they will take their proper places by means of their relative weights.

We may recapitulate the good qualities of this lamp in a few words. It is capable of any form or apparatus for the burners. 2. It presents no obstacle to intercept the emitted light. And, 3. As it raises the oil by the mere gravitation of a non-elastic fluid, it cannot, in any case, like the fountain lamp, raise more than is wanted.

A great variety of other lamps are at present exposed for sale, having different means of supplying the oil, but none so sufficiently striking as to merit minute description.
L A M P.

The grand and most essential properties of the lamp are confined to the means of supplying the flame with oxygen, so as to produce the most perfect combustion, and for which we are almost entirely indebted to Argand. We shall therefore conclude this article with some remarks upon the merits of this valuable invention, and shew in what instances it has been improved in its most essential points.

In the original lamp of Argand, a perpendicular column of air was perpetually ascending through the glass chimney of the lamp; one part of it passing through the central tube $c$, fig. 1 and 2; and the rest through the holes $q$ and $m$, round the circular plate $k l$. This part was formerly a cylinder extending down to the receptacle D.

With this perpendicular current alone, it is well known that the Argand lamp would not burn with oil, and the purification of this oil, to render it fit for the purpose, became a deaderentum, on account of the high price of the spermaceti oil. This great object was not accomplished by purifying the oil, but an improvement was made in the lamp itself, which effectually answered the desired purpose. For this discovery we are indebted to an ingenious and scientific manufacturer of Derby. It is curious to observe, however, that no advantage was taken of this invention for twenty years, while at the same time it had been used in the cotton mills of this disfavourer, and now the same end is accomplished by a simpler contrivance. The above improvement consisted in placing over the mouth of the tube $c$ a plate of metal about the diameter of the tube, and at such a height as to be a little short of the apex of the flame. By this means the ascending column of air was turned out of its perpendicular course, and thrown immediately into that part of the flame where the smoke was formed, and which, by this means, was completely consumed, producing at the same time a more than ordinary brilliant light.

The fame effect is now produced by the shape of the lamp glass $E$, in the figures already alluded to. The exterior current of air which enters the holes $q$, $m$, &c. risers with a velocity proportioned to the length of the glass chimney, and to the rarefaction of air in the flame, strikes upon the shoulders $N$ and $O$, by which it is propelled into the upper part of the flame. This happy form in the glass appears to have been the result of accident. Had the manufacturer been aware of its importance, it would have either been the subject of a patent, or at least strongly recommended to the public in the way of publishing. We fee at the present time different shaped glasses, some of which are rather worse than the original plan, instead of improvements.

The theory of the action of the chimney lamp, is so nearly allied to the principles of furnaces, which we have given under that article, that the reader will do no doubt get some useful hints, relative to the construction of lamps, by perusing the same.

The hydro-pneumatic lamp is constructed upon similar principles to the celebrated water engine erected by father Hell, at Chremnitz, in Hungary; the defect of one-half of the fluid to a certain depth below the source, raises the other half an equal height above the source. This principle has been, with great success, applied to the lamp, we believe at first by the French, but has lately been brought to perfection by Mr. R. W. King, of Holborn, who manufactures these articles. Figs. 1, 2, and 3, of Plate II. explain the construction of this ingenious contrivance. Figs. 1 and 3 are sections to which our description will principally apply; $A A$ is a cylindrical vessel, divided by horizontal partitions into four chambers, viz., $B$, $C$, $D$, and $E$. The upper one, $B$, is to contain the oil which is for the immediate supply of the flame; the next, $C$, is for the portion of oil which descends into the inferior chamber $E$, through the pipe $a$, and forces the contained air up through the pipe $b$, into the upper chamber $B$, and prefusing upon the surface of the oil contained therein, causes it to ascend the pipe $d$, to the lamp $F$, which is on Argand’s principle, and of the same construction as before explained: $e$ is a pipe to conduct the external air down into the chamber $C$; and $f$ is a pipe to convey the waste oil, which may drip down from the lamp, into the middle chamber $D$, which is merely a reservoir for such waste oil. $g$ is a tube passing down to the second chamber $C$, to fill it with oil; it is closed at pleasure by an air-tight plug $h$, fitting into the end of it; the lower orifice of the pipe $a$ is closed by a piece of hat $i$, acting as a valve, which is shut by a spiral spring beneath it, but opened by a wire passing down the tube $a$, and also through the filling tube $G$, the plug of which, when in its place, presses down the wire, and opens the valve: supposing the plug removed, the spring will close the valve. Oil is now poured in at the end of the pipe $G$; it runs down into the chamber $C$, and fills it, then rises in the pipe, which having a hole in one side, near its upper end, the oil also flows into, and fills, the upper chamber $B$. The plug $h$ is now inserted into its place; this shuts off the communication of the open air, both with the chambers $B$ and $C$, but depresses the wire, as before explained, opens the valve $i$, and then, the middle chamber $D$ descends, by its gravity, through $a$, as shown by the arrow, and enters the lower chamber $E$, from which it expels the air by the pipe $b$, into the chamber $B$. The end of this pipe being covered by an inverted hood, the air ascends by bubbles, through the oil, into the top of the chamber, and prefusing on the surface of the oil, forces it up the pipe $d$, to the lamp in which it stands at the level of the dotted line $k$, at which level it will evidently continue, till the upper chamber is exhausted, and the contents of $C$ descended into $E$. The lamp is now replenished by the following means; the whole apparatus is inverted, as shewn in fig. 3; the oil now runs down the pipe $b$, and filling its hood, flows over into the upper chamber $B$, which it fills, the atmospheric air entering the pipe $e$ into the chamber $C$, and thence by the pipe $a$ into the chamber $E$, the air contained in the chamber $B$ escaping at the pipe $d$. The lamp is held inverted for about a minute, and is then set upright. Fresh oil is now poured in at the plug $h$, to fill the second chamber $C$, and then the plug being put in, the above operation is repeated.

By this ingenious application of the principles of hydrostatics, the lamp $F$ is constantly supplied with oil at precisely the same level, which does not vary by any diminution of the quantity of oil, or by the expansion of the air by heat, as in the fountain lamp, the included air being only applied as the medium to transmit the pressure of one column of oil, from $C$ to $E$ to act upon, and raise a similar column from $B$ to the dotted line $k$. The lamp is furnished with a glass chimney $H$, similar to that before described, and for some purposes this is surrounded by a glass globe $K$, ground within a pipe, and which is brought down to the level of the lines $l$, to take off the glare of the light. The cylindrical vessel $A A$ is included in a elegant columnar pedestal, shewn in fig. 2, where the ring $L$ is that which is turned round to elevate the wick. Fig. 4. is a cap to cover the top, when the glass chimney is removed. The principal objection to this lamp, as originally constructed, was, that after inverting it, the oil would, in certain positions of the lamp, return down the pipe, and fill the lower chamber again, in which state it would not burn. Mr. King has completely remedied this, by bringing all the tubes, except the air and filling tubes, as near as possible into the centre of the lamp. Lamps of this kind
kind have been made to contain a sufficiency of oil to last two months, the vessel having the appearance of an elegant pedestal to ornament a hall or a staircase.

A patent lamp, invented by John Barton, esq., is delineated in fig. 5, of our plate; it is contrived so as to always have a supply of oil maintained at a level, very near the point of combustion, by floating the oil upon a fluid of greater specific gravity. The oil is contained in a cylindrical vessel A, fig. 5, having a pipe, B, extending upwards from it to the burners at a, a, where the wicks are placed. The bottom of the vessel takes off with a screw joint similar to a snuff-box, that the inside of the vessel may be cleaned; and in the centre of the bottom is an aperture of about half an inch in diameter always open. This oil-vessel is immersed in a heavier fluid, contained within the external vessel D E F G. A float is attached to the oil-vessel at H, and another, in addition to it, is fixed to the tube B at I. In this situation of things, the column of heavy fluid, which may be salt water, from its surface at e to d, where the oil prevails upon it, (through the hole in the bottom of the oil-vessel,) will support a column of oil, of a greater height, in proportion to the difference of their specific gravities, from d up to e for instance, within an inch of the burners a, a, which is a sufficiently small distance for the capillary attraction to draw up a supply of oil to the wick. As the oil diminishes by burning, the water enters the hole in the bottom of the oil-vessel, and still continues to support the column of oil, as at first, the oil-vessel floating in the water by the floats at H and I. By this means it is freed from the inconvenience we have before ascribed to Mr. Kier's lamp, because the burners descend as the oil is consumed; and therefore, though the oil is not maintained at the same identical level, yet, with respect to the burners, it is always at the same distance below their wicks. The external vessel unfloors at F, to get in the oil-vessel A. The enlarged part or vase D, at the top, should contain very nearly, but not quite, as much as the oil-vessel. In preparing the lamp, the external vessel is first filled with the water (poured in at the top of the vase D) as high as E; the oil-vessel is now full of water, and rests upon the bottom, because the upper float I is not supported. The oil, being poured in at the top of the tube B, expels the water from the vessel, and fills it at the same time, raising the water in the vase D, and floating the oil-vessel. In this state the lamp will continue, with the oil standing at e, until it is all consumed.

A very simple and efficacious lamp has been lately presented to the public, under the title of the Automaton lamp, having something ingenious in the manner of supplying it with oil. We have given three figures of it at figs. 6, 7, 8, of the last plate; it consists of a tin box, a b c d, with a burner consisting of two wicks of cotton at a. The box is suspended upon pivots at e, entering eyes in the wire f, which is similar to the suspension part of a scale-beam. When this lamp is full of oil, which is poured in at d, it assumes the horizontal position fig. 6, because the mass of oil, a b c d, is chiefly situated behind the centre e, and balances the weight of the wick at d; but as the oil diminishes by burning, the weight behind the centre is lessened, whilst that of the wick continues without alteration. This occasions the lamp to librate, as in figs. 7 and 8, so that the oil is always kept very near the wick, by which means it will burn oil which is too impure for the capillary action of a common lamp. The nicety of its performance depends upon the figure of the vessel, and the place of the centre c corresponding with the weight of the tubes at d. This the makers have by experience determined to the greatest accuracy.

The Automaton lamp is in very general use in the north of England in cotton-mills, and other manufactories where the gas-lights are not introduced, which is undoubtedly the best method.

Lamp, Cardan's, is a contrivance of an author of that name, which furnishes itself with its own oil.

It consists of a little column of brass, tin, or the like, well closed every where, excepting a small aperture at bottom, in the middle of a little gullet or canal, where the wick is placed.

Here the oil cannot get out, but in proportion as it wanes, and so opens the passage of that little aperture.

This kind of lamp was much in use some years ago; but it has several inconveniences: such as that the air gets into it by flarts and gluts; and that when the air in the cavity comes to be much rarerfied by heat, it drives out too much oil, so as sometimes to extinguish the lamp.

Dr. Hook, and Mr. Boyle, have invented other lamps that have all the conveniences of Cardan's without the inconveniences.

The flame in a lamp never consumes the wick, till the wick be exposed to the air by the flame's falling downward; and from thence it may be inferred, that a way found out to keep the fuel, and consequently the flame, at the same height upon the wick, would make it last a long time. Many ways have been devised to arrive at this, but it seems only possible to be done, in any degree of perfection, by hydrostatics. Thus, let a lamp be made two or three inches deep, with a pipe coming from the bottom almost as high as the top of the vessel; let it be filled so high with water, as to cover the hole of the pipe at the bottom, to the end that the oil may not get in at the pipe, and so be lost. Then let the oil be poured in, so as to fill the vessel almost brimful, which must have a cover, pierced with as many holes as there are wicks designed. When the wick is thus filled, and the wicks are lighted, if water falls in by drops at the pipes, it will always keep the oil at the same height, or very near; the weight of the water being to that of the oil as 20 to 19, which in two or three inches makes no great difference. If the water runs faster than the oil waxes, it will only run over at the top of the pipe, and what does not run over will come under the oil, and keep it at the same height. Phil. Tranf. No. 245, p. 368.

The access of air is of the greatest importance in every process of combustion. When a lamp is filled up with a very slender wick, the flame is small and of a very brilliant white colour: if the wick be larger, the combustion is less perfect, and the flame is brown: a still larger wick not only exhibits a brown flame, but the lower internal part appears dark, and is occupied by a portion of volatilized matter, which does not become ignited until it has ascended towards the point. When the wick is either very large or very long, part of this matter escapes combustion, and swells itself in the form of coal or smoke. The different intensity of the ignition of flame, according to a greater or less supply of air, is remarkably seen by placing a lamp with a small wick beneath a shade of glass, not perfectly closed below, and more or less covered above. While the current of air through the glafs shade is perfectly free, the flame is white; but in proportion as the aperture above is diminished, the flames become brown, long, wavering, and smoky; it instantly recovers its original whiteness when the opening is again enlarged. The inconvenience of a thick wick has been long since observed, and attempts have been made to remove it; in some instances by substituting a number of small wicks instead of a larger; and in others, by
making the wick flat instead of cylindrical. The most scientific improvement of this kind is the lamp of Argand, described in the preceding part of this article. In this the wick forms a hollow cylinder or tube, which slides over another tube of metal, so as to afford an adjustment with regard to its length; when this wick is lighted, the flame itself has the figure of a thin tube, to the inner as well as to the outer surface of which the air has access from below. And a cylindrical shade of glass serves to keep the flame steady, and in a certain degree to accelerate the current of air. The inconvenience of a long wick, which supplies more oil than the volume of flame is capable of burning, and which consequently emits smoke, is seen at once by raising the wick; and on the other hand, the effect of a short wick, which affords a diminutive flame merely for want of a sufficient supply of combustible matter, is observable by the contrary process. The most obvious inconvenience of lamps in general, arises from the fluidity of the combustible material, which requires a vessel adapted to contain it, and even in the best constructed lamps is more or less liable to be spilled. When the wick of a lamp is once adjusted as to its length, the flame continues nearly in the same state for a very considerable time. Nicholson's Journal, vol. i. p. 40.

By 17 Geo. II. cap. 29, a convenient number of glass lamps shall be put in such places of the city of London, as the mayor, aldermen, and commonalty shall think fit; to be kept lighted and burning from sun set to sun rising throughout the year; and rates shall be made not exceeding £6 in the pound, nor above 50s. a year on any one person, for defraying the charges of them. Every alderman, with consent of his deputy and common council, may contract yearly for the setting up lamps, and their lighting, trimming, &c. and performs maliciously breaking down or extinguishing the lamp, shall forfeit 40s. for the first offence; 50s. for the second; and 1/2 for the third, leviable by justices, or to be sent to the house of correction. By lat. 11 Geo. III. c. 29 for paving and lighting London, the wilfully breaking or extinguishing of any lamp incurs the penalty of £20. for each lamp or light destroyed or extinguished. None but British oil is to be used for lamps in private houses, under penalty of 40s. 8 Ann. cap. 9.

The use of lighted lamps in churches, and places of devotion, is very ancient. In the city of Fez is a mosque, wherein are 900 brazen lamps burning every night. In Turkey, all the illuminations are made only with lamps. Polydore Virgil ascribes the first invention of lamps to the Egyptians; and Herodotus describes a feast of lamps held annually in Egypt.

Kircher shews the manner of preparing lamps, which shall diffuse a light so diffus'd, as to make the faces of those present appear black, blue, red, or of any other colour.

There has been a great dispute among the learned about the sepulchral lamps of the ancients: some maintain, they had the secret of making lamps that were inextinguishable, alleging several that have been found burning, at the opening of tombs fifteen or sixteen hundred years old. But others treat these relations as fables; and others think, that the lamps, which were before extinguished, took light afresh upon the admission of fresh air.

Dr. Plutt, however, is of opinion, such perpetual lamps are things practicable, and has himself made some proposals of this kind. The linum abediniun, he thinks, may do pretty well for the wick, and that the naphtha, or liquid bitumen, constantly springing into some of the coal-mines, would answer for the oil.

If the abediniun will not make a perpetual wick, he thinks there is no matter in the world that will; and argues, that the tradition of such lamps must be fabulous, or else that they made them without wicks.

Such a lamp he thinks it possible to make of the bitumen springing into the coal-mines at Pitchford, in Shropshire; which, he says, like other liquid bitumens, will burn without a wick.

Those lamps that kindle on the immolation of fresh air, the fame author thinks, might be imitated by inclosing some of the liquid phosphorus in the recipient of an air-pump; which, under those circumstances, will not flame at all; but on letting the air into the recipient, there will possibly, says he, appear as good a perpetual lamp as some that have been found in the sepulchres of the ancients.

LAMP, Rolling, in Mechanics, is a lamp A B (Plate I. Lamps, fig. 7.) that has within it the two moveable circles D E and F G, whose common centre of motion is at K, where their axes of motion cross one another, in which point also is their common centre of gravity. If to the inward circle you join withinside the lamp K C, made pretty heavy, and moveable about its axis H I, the centre of gravity is at C, the common centre of gravity of the whole machine will fall between K and C, and by reason of the pivots A, B, D, E, H, I, will be always at liberty to descend; and, therefore, let the whole lamp be rolled along the ground, or moved in any manner, the flame will always be uppermost, and the oil cannot be spilled. In this manner the compas is hung at sea; and thus should all the moon-lanterns be made that are carried upon a pole before coaches or carriages which travel in the night. Delag. Exp. Phil. vol. i. p. 57.

LAMP-black. Of this kind there are two sorts; one of which is the light foot, obtained from burning pine and other resins wood; and another, which is the heavy black, obtained by calcining bones in close vessels. See Black. See also Bone and Charcoal.

LAMP-blowers are persons who form various articles of glass for toys, and for more important philosophical purporses, from tubes, &c. by means of the blow-pipe; which is

The apparatus of these artists consists of a foldable table, to the bottom of which is fixed a double bellows with a foot-board, from which proceeds a pipe that conducts the blast to the lamp. This lamp is a large bundle of cotton, placed in a tin vessel in the shape of a horse-shoe, and supplied by lamps of tallow deposited by it, and pushed into the flame as the continued combustion requires. The smoke is conveyed away by a small chimney suspended over the lamp. The blast-pipe in front of the table, at which the artist is seated, drives the jet of flame away from him, so that he suffers no inconvenience from it.

The other articles of his apparatus are glass tubes of various dimensions, and two or three very simple iron tools, such as a small forceps, files, &c. The flame in full vigour is about four inches in length, which near its extremity is of a clear light blue, when it is the hottest, and beyond of a pale yellow. The tubes, before the operation commences, are well dried, so as to be quite free from moisture. They are then gradually heated by being first held in the flame of the lamp without blowing, and then at the edge of the outer yellow part of the jet of flame, and slowly brought to a state of fusion. The flame is sufficiently strong to bring to a very white-red heat a solid mass of glass, about the size of a playing marble, or even larger; and this, when blown out very thin, will make a bulb of the capacity of three ounces, which is nearly the extent of the power of the common lamp-blowing. The bulbs for thermometers and other philosophical
LAM

LAMM

philosophical purposes are much less. (Aikin’s Dict. vol. i. art. Glasses.) For an account of the operation of hermetical feeling, performed by the lamp-blowers, see HERMETICAL SEALING. For bending and joining glasses, forming bulbs to tubes, and spinning out glasses, see TUBE, THERMOMETER, and THREADS.

LAMP furnace, is a furnace, in which the heat is produced and maintained by the flame of a lamp introduced within it. This furnace has no occasion for an ash-hole, a grate, or a fire-place. It has only one opening below, through which the lamp is introduced, and a kind of small chimney in its upper and lateral part, for circulation of air, to keep up the flame of the lamp, and to give vent to the smoke. For the description of an improved furnace of this kind, see Lewis’s Com. Phil. Techn. p. 29. See Furnace.

LAMPA, in Geography, a town of Chili, situated on a lake; 20 miles N. of Valparaiso. — Alto, a town of Peru, and capital of a jurisdiction of the same name, in the bishopric of Cuero, 93 miles S. of Cuero. The soil is partly fertile and partly unproductive; the vicinity abounds with silver mines. S. lat. 14° 55’. W. long. 81° 44’.

LAMPCAN, a small island in the East Indian sea, a little S. of Junkelion.

LAMPADARIUS, EMANUEL, in Biography, an author who has written on the music of the Greek church. “De Pfallendia arte, et iphus et alienorum Poema Ecclesiastica, ad notas Musicas accommodata.” The Abbate Martini of Venice, to whom we have assigned an article, found this book, and made extracts from it, in Greece; but we never met with it in any public library, either at home or on the continent, except the royal library at Turin. The title of the Greek treatise, by Lampadarius, is the following:

“ΤΕΧΝΟΛΟΓΟΙ ΤΗΣ ΜΥΘΙΚΗΣ ΙΣΤΟΡΙΑΣ.” The extract from it by the Abbate Martini, which is in our possession, is too long for insertion here, nor would it be of much use if we could allow it room, as no equivalents to the Greek characters are given in modern notation; but with respect to the author, we find among the memoranda made in the king of Sardinia’s library at Turin, in 1770, an account of a Greek MS. of the 15th century, No. 553. b. i. 24. in which Lampadarius is often mentioned as author of the music to the hymns and prayers it contains. Fabricius, likewise, Bibl. Græc. vol. ii. p. 269. 504. and 586, speaks of a MS. in the Selden Collection at Oxford, and another in the Jesuits’ library at Louvain, in which there are explanations of the notes used by the modern Greeks, and musical compositions by several authors, particularly Lampadarius.

LAMPADARY, LAMPADARIUS, an officer in the ancient church of Constantinople, whose business was to see the church well lighted, and to bear a taper before the emperor, the empress, and the patriarch, when they went to church, or in procession. The taper borne by the lampadary before the emperor was encompassed with divers circles of gold, in manner of crowns; those held before the empress and patriarch had but one. It seems they were of emblematical use, and were intended to keep those great personages in mind, that their light was to illumine those in inferior stations.

There were also lampadaries in the emperor’s palaces; and others in the houfes of the grandees. At first, the privilege of having a lampadary, or torch-bearer, was only granted to the principal officers of the crown, and the chief magistrates; but afterwards the emperor allowed it to inferior officers, as queitores, treasurers, &c. They also bore before the magistrates the emperor’s image, &c. And it was probably on account of this image, that they were first permitted to have a lampadary.

LAMPADIAS is used by some authors for a kind of bearded comet, which, as they pretend, resembles a burning lamp, being of several shapes; its flame or blaze tapering upward sometimes like unto a sword, and being at other times double or triple pointed.

LAMPADUS, in Biography, a chantor of the church at Luneburg, published a small work in Latin, intitled “Compendium Musicæ,” 12mo. 1537. This short tract, which is in dialogue, and a kind of musical catechism designed for incipient, has, at the end, a few short rules for composition, with examples.

LAMPAS, or LAMPE, a kind of swallowing in the palate of a horse; so called, because it is cured by burning with a lamp, or a hot iron; and arising from abundance of blood referred to the first furrow of the mouth, near the fore-teeth, which causes that furrow to swell as high as his gatherers; it binders the beast’s feeding, and makes him let his meat fall, half chewed, out of his mouth.

LAMPE, FREDERICUS ADOLPHUS, in Biography, ])tctor of St. Stephen’s church in Bremen, became an antiquary at 15 years of age; and in 1702, published, in 12mo., a work of great learning and research, intitled “De Cymbalis veterum, Libri tres, in quibus sequencum ad eorum Nomina, Differentiam, Originem, Historiam, Miniflos, Ritus pertinent, eluidantur, cum Figure in Traiecti ad Rhenum,” 1703.

This author, in a way similar to Bartholinus, in treating of the flutes of the ancients, has given us all the information which could be gleaned from antiquity on the subject of the cymbal, which is hardly a musical instrument, but rather a chronometer to measure and mark the time, in its military use. In its religious employment, indeed, before large bells were cast, it served both Pagans and Christians as a signal and call to temple worship. Its clashing tone in the field may regulate the steps of the soldiery in their march; but even this purpose seems better performed in China by the gong and pierce fonare, or musical flute, used in proceedings, as well as in the army; for these have real musical tones, to which there is no difficulty in tuning other instruments. Our author, by his classical knowledge and diligence, has nearly found as many names in ancient authors for the different kinds of cymbals, as the Persian language furnishes for a horse or lion. As nothing on the subject has escaped the notice of the author, this little book will be found to contain much precious information for a classical antiquity in music. Its learned author died of a hemorrage at Bre- mien, in 1729, at the age of 46.

LAMPE, JOHN FREDERIC, a Saxon, who arrived in England about the year 1726, began first to be noticed as a composer about the year 1732. On the 25th of February of that year, the following paragraph was inserted in the “Daily Post:” “We hear that there is a subscription for a new English opera, called “Amelia,” which will shortly be performed at the new theatre in the Haymarket, by a set of performers who never yet appeared in public.” This opera, written by Harry Cary, and set to music by Lampe, was first performed March 15th, 1732; in the principal character of which, Miss Arne, afterwards fo celebrated as a tragic actress, by the name of Mrs. Cibber, first appeared on the stage as a figure. The music, which, according to the advertisement, was set in the Italian manner, having been much applauded, was soon avowed by Lampe; and Miss Arne’s performance interested every hearer. The
year 1737 was rendered memorable at Covent-Garden theatre by the success of the burlesque opera of the "Dragon of Wanstley," written by Carey, and set to Lampe, "after the Italian manner." This excellent piece of humour had run twenty-two nights, when it was stopped, with all other public amusements, by the death of her majesty queen Caroline, November 26th, but was revived again on the opening of the theatres in January following, and supported as many representations as the "Beggar's Opera" had done, ten years before. And if Gay's original intention in writing his musical drama was to ridicule the opera, the execution of his plan was not so happy as that of Carey; in which the mock heroic, tuneful monster, recitative, splendid habits, and style of music, all conspired to remind the audience of what they had seen and heard at the lyric theatre, more effectually than the most vulgar street tunes could do; and much more innocently than the tricks and transfigurations of the most abandoned thieves and prostitutes. Lampe's music to this farcical drama was not only excellent fifty years ago, but is still modern and in good taste.

In 1741, his wife, (the second daughter of Charles Young, fitter to Mrs. Arne,) with Miss Young, Sullivan, the two Messings, and Jenny Wordsale, went to Freilton Gild, and afterwards to Chester, where they performed the "Dragon of Wanstley," "Marrygor," the "Sequel to the Dragon of Wanstley," &c. all composed by Lampe. He set "Nancy, or the parting Lover," "Pyramus and Thëbe," which had great success; and published, in an octavo volume, a tract, intitled "The Art of Music," in 1740. But in 1737 he had published a treatise, under the title of "A plain and compendious Method of teaching Thorough-Bafe," &c. 40.; a work of great merit, and the first in our language, by which a student can profit much without a master, as the chords, engraved on copper-plates, are all placed over the figured base, and the examples transposed into different keys.

Lampe was a truly ingenious man, well versed in the theory of the art, with a most happy turn for humour, without buffoonery, in his comic operas; and, moreover, a man of probity, with great simplicity of manners, and possessed of a kind and benevolent heart. This excellent musician and worthy man, quitting London, with his family, in 1748, resided two years in Dublin; and in 1750 went to Edinburgh, where he was settled very much to the satisfaction of the patrons of music in that city, and of himself; but in July 1751, he was seized with a fever, which put an end to his existence at the age of fifty-nine.

LAMPE, in Geography, a town of Sweden, in the government of Vasa; 28 miles E. of Gamla Karleby. LAMPEDOSA, an uninhabited but pleasant and fertile island in the Mediterranean. The Catholics and Mahometans visit a building upon it, which is divided into a church and a mosque. Near it is a magazine, containing the deposits of the visitants, which are taken up by some Sicilian monks, and applied to the hospital at Trapani. The island is about 12 miles in circumference, has a good port, is well supplied with fresh water, and has, on the coast, an excellent fishery; 63 miles W. of Malta. N. lat. 35° 40'. E. long. 12° 24'.

LAMPERN, in Ichthyology, a river fish, being the lampetra branchialis of Linneaus, found in many parts of England, particularly in Oxfordshire, and the neighbouring counties, and thence called the pride of the life. The Latin authors call it the lampetra minima and mustela fluviatilis. See PETROMYZON BRANCHIALIS.

The word lampern is used by the common people in England for one species of the lampetra, and is not to be confounded with the other called the lamprey, or the lamprey-eye. See PETROMYZON.

No lampepns are to be taken in the river Thames and Medway, except from August 24 to March 30. 30 Geo. II. cap. 21.

LAMPETER, in Geography, a township of America, in Lancaster county, Pennsylvania, containing 2028 inhabitants. See LAMANEDER.

LAMPETIA, in Ancient Geography, a town of Italy, in Magna Graecia, in the country of the Bruttii.

LAMPE, in Geography, a township of America, in Lancaster county, Pennsylvania, containing 2028 inhabitants. See LAMANEDER.

LAMPETIAN, LAMPETIANS, in Ecclesiastical History, a sect of ancient heretics, in the seventh century, who fell in with some of the opinions of the Arians.

Their founder, Lampetus, is said to have been one of the chief of the Marcionites. They condemned all kinds of vows, particularly that of obedience, as inconsistent with the liberty of the cons of God.

LAMPETRA, LAMPEY, à lamberdo petras, because this species is supposed to lie the rocks, in Ichthyology, belongs, in the Artenian and Linnean systems, to the genus of petromyzon. See PETROMYZON MARINUS.

This is a fish that equally lives in salt and fresh water. In the month of March it commonly runs up into the rivers, and is then most valuable for the table, as being fat and full of eggs; so that the best seafond for lampreys is in the months of March, April, and May, because they are most firm when they first leave the salt water, and become wafted and flabby by the approach of hot weather; they are found in several of our rivers, but the Severn is the most noted for them. They are taken in nets along with salmon and shad, and sometimes in weels laid in the bottom of the river. It has been an old custom for the city of Gloucester, annually, to present his majesty with a lamprey pyle, covered with a large rafed crult; and as the gift is made at Christmas, the corporation procure fresh lampreys at that time with great difficulty. They are reckoned a great delicacy, either potted or rewed; but are a farrething food, as one of our monarchs fatly experienced, Henry the First's death being occasioned by a too full meal of this fish. They are sometimes found so large as to weigh four or five pounds. The leffer lamprey, or petromyzon fluviatilis of Linneaus, sometimes grows to the length of ten inches. These are found in the Thames, Severn, and Dee, and are potted with the large species, and are reckoned of a milder taffe. They are sold to the Dutch as bait for their cod-fishery. Above 450,000 have been sold in a seafon at 40s. per thousand. Of late, above 100,000 have been sent to Harwich for the same purpose. It is said the Dutch have the secret of preferring them to the tubor fishery. Another species is the lampern, which fee.

LAMPETRA Indica, the name of an East Indian fish of the lamprey kind, caught in standing waters, and called by the Dutch there kool ad, and neegen veg, or nine eyes.

LAMPI, in Geography, a district or country of Guinea, governed by a king, subject to Agrambo.

LAMPICHELEON, a town of Hindooflan, in the circur of Adoni; 10 miles E. of Candanore.

LAMPS, a town of Sweden, in Tavallhus; 25 miles E. of Tavallhus.

LAMPO, a town on the west coast of Celebes. S. lat. 3° 55'. E. long. 120° 4'.

LAMPOCAVYRA, in Botany, so denominated by Mr. Robert Brown, from lampym, to shine, and carya, a nut, or any fruit with a hard shell, alluding to the hard and polished seeds. Brown. Prodr. Nov. Holl. v. 1. 238. Clafs and order,
LAM.

2. *L. hexandra.* (Gahnia trifida; La Billard. Nov. Holl. v. i. 89. t. 116.)—Stems six. Panicle close; branches lightly divided. Spikelets collected into round heads. Scales all sharp-pointed. Gathered by La Billardiere in Van Diemen's land. The *Gahnia* is carried into Java and Ceylon, and is also abundant in the Botanic garden at Calcutta.

**LAM, in Geography,** a town of Poland, in the Palatinate of Bracław, near the Dnieper; 56 miles S.S.W. of Bracław.

**LAMON, in Biography,** a performer on the cithara, who taught Socrates music in his old age, and who died at a festival which Xenophon gave to the philosophers. Socrates tells us, that he only began to compeare verses, after he was imprisoned, on account of the many dreams, in which he was advised to attach himself to music; believing that it was impossible to arrive at one without the other. He composed hymns in praise of Apollo, and set them to music; but he was put to death four days after. Others tell us, that Damon was the music-matter of Socrates. See DAMON.

**LAMON, or Lampoon, in Geography,** a country of Sumatra, which is a portion of the southern extremity of the island, beginning, on the west coast, at the river of Padang-gooche, dividing it from Paffamannah, and extending across as far as Palembang, on the north-east side, at which last place the settlements are mostly Javans. On the north and east sides it is washed by the sea, having several ports in the straits of Sumatra, particularly Keyfen and Lampoon bays; and the great river Bango-Boung runs through the heart of it, rising from a considerable lake between the ranges of mountains. That division of Lampoon, which is included by Padang-gooche and a place called Naffall, is distinguished by the name of Brisan; and from that northward to Flat-point, by that of La mounting, although Cavour, properly so called, lies in the northern division. The country of Lampoon is best inhabited in the central and mountainous parts, where the people live independent, and in some measure secure from the inroads of their custom neighbours, the Javans, who, from about Palembang and the straits, frequently attempt to molest them. If you ask the Lampoon people of their parts, whence they originally came? they answer, from the hills, and point out an inland place near the great lake, whence, they say, their forefathers emigrated. These, of all the immigrants, have the strongest resemblance to the Chinese, particularly in the roundness of face, and construction of the eyes. They are also the fairest people of the island; and the women are the prettiest, and esteemed the most handsome. Their language differs considerably from that of the Rejjangs, and they use characters peculiar to themselves. The titles of government are Pangrean (from the Javans), Careeao, and Kudining or Ndekei; the latter answering nearly to Dyupaty among the Rejjangs. The district of Cuan, near mount Poongong, is governed by five magistrates, called Pangreks, and a seventh, superior, called by way of eminence Pangrey; but their authority is said to be usurped, and often disputed. The word, in common, signifies a gladiator, or prize-fighter. The *Pangrean* of Sook in the hills is said to have four or five thousand dependents; and sometimes, in going a journey, he levies a talles, or eighth part of a dollar, on each family; which cheers that his government is more arbitrary, and more strictly feudal, than among the Rejjangs, where the government is rather patriarchal. The Javanese banditti often advance into the country, and make depredations upon the inhabitants, who are not, in general, a match for them. They do not use fire-arms, though in the northern part of the island they are manufactured. Before the common weapon of the country, they fight with a long lance, carried by three men; the foremost guiding the point, and covering himself and his companions with a large shield. Inland of Sumatra, in the straits of Sumatra, there is a district, as the Lampoons say, inhabited by a fierce people, who are a terror to the neighbouring country. Their mode of atoning for offences against their own community is by bringing to their doosoon the heads of strangers. These reports, however, depend on the credibility of a people who are fond of the marvellous, and addicted to exaggeration. The manners of the Lampoons are more free, or rather licentious, than those of any other native Sumatrans. An extraordinary liberty of intercourse is allowed between the young people of different sexes, and the loss of female chastity is not a very uncommon consequence. Both men and women anoint themselves beforehand, when they prepare to dance; the women their necks and arms, and the men their breasts. They also paint each other's faces, making fantastic spots with the finger on the forehead, temples, and cheeks, of white, red, yellow, and other hues. In every doosoon there is appointed a youth, well fitted by nature and education for the office, who acts as master of the ceremonies, regulating every circumstance that pertains to the dances and the assembly. The Lampoons eat almost all kinds of flesh indiscriminately; and their goolies (curries or made dishes) are said by commentators to have no flavour. They entertain strangers with greater hospitality than any that is met with in the rest of the island. One man has been known to entertain a person of rank and his suite for sixty days, during which time there were not less than 100 dishes of rice spread each day. Their dishes of chow or earthen ware are very colly, being valued at 40 dollars a-piece. The terms of the joojoor, or equivalent for wives, is here the same nearly as with the Rejjangs. The father of the girl never admits of the *postos talles* boonde, or whole sum being paid; and thus withholds from the husband, in every case, the right of selling his wife, who, in the event of a divorce, returns to her relations. Where the *postos talles* is allowed, he has a property in her little differing from that of a slave. The value of the maiden's golden trinkets is nicely estimated, and her joojoor regulated according to that, and the rank of her...
LAM

her parents. The fines and compensation for murder are, in every respect, the same as in other countries of the island. The Mahometan religion has made considerable progress among the Lampouris, and most of their villages have mosques; nevertheless, an attachment to the original superstition of the country induces them to regard with particular veneration the cramates, or burying-places of their fathers, which they piously adorn, and cover in from the weather. The Dutch have a resident here. S. lat. 5° 40'. E. long. 10° 15'. Mafden's Sumatra.

LAMPONI, a bay on the east coast of the island of Lycia. N. lat. 14° 45'. E. long. 12° 14'.

LAMPREY, Blind. See Einbinder and Petromyzon branchiids.

LAMPRIDIO, Benedict, in Biography, a distinguished Latin poet, who flourished at the commencement of the fifteenth century, was born at Cremona. He went to Rome in his youth, and was there domiciled with Paul Coten. He then became a teacher in the Greek college, instituted by John Lascaris, in the pontificate of Leo X. After this he went to Padua, and was employed many years as private teacher of the learned languages, and much esteemed by persons of eminence. He was afterwards appointed, with a liberal salary, to undertake the education of the sons of the duke of Mantua. Lampridio died in the year 1540: he is known as an author by his Greek and Latin poems, consisting of epigrams and odes: in the latter he was an imitator of Pindar. There are extant three Latin letters written by him to cardinal Bembo, and one to cardinal Pole. An edition of his Latin poems, together with those of J. Bapt. Amaltheus, was printed at Venice in 1659.

LAMPRID lus, a Roman historian in the fourth century under Diocletian and Constatine. He is supposed to have been the author of the lives of Commodus, Antoninus, Diadumenius, Heliodorus, and Alexander Severus. The style and arrangement of Lampridius will not allow him a place among historians of the superior classes, but he is valuable for his facts. His lives make a part of the Historiae Augustae Scriptores. Moreri.

LAMPRILLO, or Lampredon, a name by which some authors called the particular species of lamprey, which are, by way of distinction, called lampren. LAM PROPHORUS, an appellation anciently given to the neoplies, during the seven days that succeeded their baptism. In the ceremony of baptism, the new Christian was clothed with a white robe, which he wore for the week following; and was thence called lamproporus, which signifies a person wearing a shining garment; from λαμπρος, shining, and ως, I bear. The Greeks also gave this name to the day of the resurrection, because their houses were adorned and illuminated on that day with a great number of torches, as a symbol of the light which that mystery diffused in the world.

LAMPSACUS, in Ancient Geography, a town of Asia, on the banks of the Hellepont, more anciently called Pygáza, which was founded by the Phocaeans. The object of worship in this place was Priapus, the god of the gardens. This town rose from the ruins of Peños, whose inhabitants establihed themselves here. Its territory was fertile; and it was aligned by Artaxerxes to Themistocles, in order to furnish his table with wine.

LAMPSAKI, in Geography, a town of Natolia, celebrated for its wine, anciently Lamproáus; 40 miles W. of Arrak. lat. 45° 20'. E. long. 26° 44'.

LAMPSAMANDUS, in Ancient Geography, a small Vol. XX.

LAMPSANA, in Botany. See LAMPSANA.

LAMPEGNIANI, John Baptist, in Biography, of Milan, an opera composer of great fancy and spirit. He was not a deep contrapuntist, but there was a certain gaiety and spirit in his style, which amused his hearers and engaged attention. He came into England in 1742, during the regency of lord Middlesex, and while Montebello was the chief singer, for whom he composed some very captivating airs. The English, long accustomed to a more solid, grave, and learned style, thought him inaccurate, wild, and frivolous, and his style was only tasted by such of our nobility and gentry as had been in Italy, and had been initiated into the new opera style. The character of this composer is drawn with so much judgment, taste, and discrimination in M. La borde's "Essai sur la Musique," and fo exempt from the national prejudices with which that work abounds, that we shall venture to translate it, and guesst the name of the author.

"Lampugnani was a professor much esteemed among the moderns. He excelled much in his melodies, and owed more to nature than to study. He applied with great perseverance to produce new effects from instruments. Consequently to him has been ascribed the new manner of using the opera orchestra. Instrumental music, and its performers, have doubtless greatly increased their importance by this innovation. But, how has it been abused! It sometimes happens, that the noise of the orchetsra is all that can be heard, from the beginning of the opera to the end. And that a beautiful passage can only now and then penetrate through the instrumental phalanx, to convince us that a voice has any concern in the busines. There are certain composers, who have no resource but in noise. There are others, likewise, who have no time allowed them for any thing else." Voititre, in one of his letters, begs pardon of a friend for writing him so long a letter, as he has not time to write a shorter. But in Italy, an opera must be composed in a fortnight, so that the composer loads his instraments as much as he can, and leaves the voices at full liberty to do nothing, or to do as much as they please. In the operas of Lampugnani, the voice governs the orchestra, and upon her all the instraments wait, as on a superior. He is author of a great number of works, that have had complete success in Italy; but it is in vain to name them, as music of more than a year old, is as difficult to be found as a coin of the emperor Otho.

We saw Lampugnani at Milan, nearly thirty years after he had been in England, where, as a composer, he was laid on the shelf. He taught ladies to sing, and had gained great credit from some of his scholars. He resided constantly in that city, where he played the first harpichord at the opera, in the absence of the composer, and arranged the parloros. He was a pleasant old man, with the spirits and good nature of a young one.

LAMPUGO, in Ichthyology, a name given by many to the hippocus, a sea fish, caught on the coast of Spain. See Coryphila.

LAMPYRIS, in Entomology, a genus of the coleoptera order. The most familiar species of this kind, and which may be considered as an instructive example of the genus in general, is that known in our own language by the name of glow-worm, and in other counties by names of similar tendency, the female being defitute of wings, the body elong-
gated, and the posterior part beneath emitting, during the night time, a brilliant phosphoric light. The species of this genus are rather numerous; the greater part are natives of Africa and America; a few only inhabit Europe, and of these but three kinds are found in Britain, two of which are rare.

The females of the species most commonly known are destitute of wings; all the lampyrids of the latter sex shine during the obscurity of the evening, or at night, and some of the males possess the fame ability, while others are in this respect deficient. The males throughout all the species are furnished with wings; the females, on the contrary, are always apterous.

The luminous property in the lampyrid tribe resides in the two or three posterior rings of the abdomen, and is only visible on the under surface. In the day time the luminous space appears paler, and more inclining to yellow than the rest of the insect: the light, when emitted, partakes of various hues, being either a clear brilliant white, or white tinged with greenish or bluish, and this it can vary or heighten in brilliancy at pleasure, as it does not depend on any external cause: it is an inherent ability, governed only by the will or caprice of its possessor, and, according to the general perusal of naturalists, is an ordinance of nature, by means of which the males, in their excursions through the air, can readily discover their apterous crawling mates among the grubs and herbage beneath them.

This luminous appearance of the glow-worm has at various periods excited considerable curiosity in the minds of speculative men. Forrer first announced that this extraordinary property was so strong and retentive, that he could distinctly read by the light emitted from glow-worms plunged into oxygen gas. The same experiment was verified by Beckerhiem, who proved besides that they live a long time in other kinds of gas, and continued to shed their light vigorously, as in the oxygen gas. With the acid, the nitrous, muriatic, and sulphurous gases, he did not however succeed so well; when placed in either of these, the insects died in a few minutes.

A variety of other experiments have been made on the lampyrids by Spallanzani, Carradori, and others, the result of which proves, among other curious circumstances, that this luminous property is inherent. These insects were observed to possess the power of moving various portions of the visera, independently of the others; and it was likewise ascertained that a portion of the luminous rings of the abdomen, when cut out of the insect, retained its brilliant appearance for some seconds afterwards. These experiments were made chiefly on the L. italicæ, the luminous properties of which are more conspicuously brilliant even than that of our common glow-worm.

The lampyrids are found most commonly about the months of June and July, appearing among the bushes, the grass and herbage on the skirts of lanes leading through meadows, and woody situations. The males of some kinds, as before intimated, are luminous; and thefe, when on the wing during the night time, exhibit a most lively and splendid appearance, like so many sparks of fire darting through the air. The females nearly resemble the larva, being of a lengthened form, divided into a number of distinct segments, the head fealy, and the anterior part of the body furnished with six fealy feet. The larvae feed on leaves. The eggs, which are numerous, are usually deposited near the roots of grasses.

Among the ancients, the names lampyris, noctiluca, cincta, &c., were bestowed, without discrimination, on almost every creature of the insect tribe,不分ing the luminous property of the glow-worm. Geoffroy endeavored to unite the lampyrids together, but with these he confounded some other genera. Linnaeus also blended them with the lucus and pyrochros; and Scheffer followed Geoffroy. Fabricius has adopted the lampyris genus, with some material deviations from either, and his authority is, in this respect, rather generally approved. Linnaeus, so lately in the 10th edition of Syst. Nat. confounds the lampyrids under the genus cantanis; it is in a subsequent edition they appear under the name of lampyris, with the following essential character. Antenne filiform; wing-cases weak and flexible; thorax flat, semi-ornicular, surrounding and concealing the head; segments of the abdomen terminating in folded papila; females in general destitute of wings. This is the character admitted by Gmelin, who, besides the true lampyrids, by this means includes the genera omalysus of Geoffroy, collyphus of Olivier, pyrochros of Geoffroy and Fabricius, and the lucus of Olivier and most other modern authors. The Fabrian character of the lampyris genus consists in having four sub-elevated feelers; jaw bifid; lip horning and entire; antenna filiform.

Species.

Frequent in meadows, and near woods in Europe: the female is rather larger than the male.

"An European species, very rarely found in Britain; the specimens recorded (in Brit. Inf.) were received by Mr. Drury from Yorkshire, and are preferred in his cabinet now in our possession. It resembles the common glow-worm in size and appearance; but is distinguished from that insect principally by the hyaline spot at the anterior apex of the shield above the eyes." This kind is observed by Fabricius to be most refulgent in showery weather.

Corrusca. Dull black; shield with a rosy crescent each side. Linn.

Inhabits North America. Fabricius speaks of a variety twice the ordinary size.

Obscura. Black; shield with a rufous spot each side.

Fabr.

Described from a specimen in the Bankian cabinet, a native of Terra del Fuego. The shield is entire, and depressed at the sides; wing-cases brown and without spots; abdomen and legs black.

Laticornis. Ovate, black; shield with rufous margin; antennæ compressed. Fabr., Olivier, &c.

A species of moderate size; the shield rounded; wing-cases somewhat iriuated; abdomen with two or three white pellucid spots on the left segment.

Pyralis. Shield rufous; in the middle black; wing-cases black, the edges with the abdomen white. Linn.

Native of South America.

Cincta. Fuscous; thorax, edge of the wing-cases, and tip of the abdomen fulvous. Olivier.

Native of Pusilander. The head brown; abdomen black, the last segment but one fulvous; legs black; and thighs fulvous.

From the Bankian cabinet.

Marginata. Oblong, black; margin round the thorax, wing-cases, feutel, and posterior part of the abdomen yellow. Linn.

Native of America; the antennæ fuscous, with the base yellow; the legs variegated.

Pectinata. Black; outer base of the sides of the shield,
Field, and apex of the abdomen and wing-cafes, white; antenna pectinated. Fabr.

An American species. The antenna nearly as long as the body.

FUBELLICORUS. Black; shield before the margin, with marginal line at the base of the wing-cafes and tip of the abdomen, white. Olivier.

Native of the Brazil; the antenna very large, and fan-shaped; wing-cafes slightly irilated.

HESPERA. Ovate; wing-cafes brown, with a triangular marginal yellow spot. Olivier.

Inhabits America.

IGNITA. Ovate; wing-cafes brown, with an ovate marginal yellow spot. Linn.

Native of South America.

LUCIDA. Oblong; wing-cafes brown, the outer margin pale yellow; abdomen yellow. Linn.

Inhabits South America, and resembles the common glow-worm.

NITIDULA. Oblong, fuscos; thorax yellowish, with a black spot in the middle; apex of the abdomen with two yellow spots.

An African species.

PHOSPHOREA. Oblong, sub-teataceous; abdomen black, behind line yellow. Degeer, &c.

Native of America.

JAPONICA. Yellow; last segment but two of the abdomen black. Thunb. Nov. Sp.

This species inhabits Japan, and, according to Thunberg, flies about in the evening during the months of May and June, and emits a vivid phosphoric vapour from two vehicles at the end of the tail. The antenna, eyes, wings, and last segments of the tail, except the two at the apex, black.

ATRA. Deep black; margin of the thorax rufous. Fabr. Lamys atra. Olivier.

A North American species. The antennae serrated.

CAPENSIS. Livid; thorax yellowish; posterior part of the abdomen fine yellow. Olivier.

Antenna fuscos; scutel yellowish.

AUSTRALIS. Yellowish; head and wing-cafes brown; tip of the abdomen clear white. Fabr.

Resembles the following species; the thorax and scutel ferruginous; ends of the legs black, the rest yellow. Inhabits New Holland.

ITALICA. Black; thorax transversely, and with the legs rufous; abdomen clear white at the tip. Linn.

Inhabits among trees in Italy; the antennae are black; thorax without spots.

VITTATA. Rufous; wing-cafes black, with a yellow margin, and abbreviated fillet in the middle. Olivier.

Found in Guadaloupe.

MAURITANICA. Wing-cafes livid; body yellow. Linn.

Native of Africa.

HEMIPERTA. Black; wing-cafes very short. Geoffr.

A small species found in France; the antennae are compressed; shield rounded, entire, black, and without spots; wing-cafes ovate, very short, and black; abdomen flat, and with the legs black.

This appertains to the lycens genus of Fabricius, in which it occurs under the specific name minutus; it is also pyrochroa minute of that author’s Manilla. The species is two lines and a half in length.

LAMSPRINGE, in Geography, a town of Welfphalia, in the bishopric of Hildeheim, at the source of a small river called Lame, which soon after runs into the Inner-pec; 14 miles S. of Hildeheim.

LAMUS, in Ancient Geography, a small river of Greece, in Bocotia, which had its source on the summit of mount Helicon. Paufanias.—Alfo, a town and river of Afia, in Cilicia. Ploclmy places the mouth of the river between Sebast e and Pompeipolis, and the town in a canton, which takes it from the name of Lamotide. This town was episcopal, and is placed by Leon-le Sage and Hierocles in Hausr, under the metropolis of Seleucia.

LAMUZO, in Geography, a town of Afatice Turkey, in Aladulla, on a river of the fame name; 24 miles W. of Tarbus.

LAMY, BERNARD, in Biography, who flourished in the fourteenth and eighteenth centuries, was of noble descent, and born at Mons in the year 1540; having been carefully initiated in the elementary parts of learning, he entered among the religious of the congregation of the oratory at Paris, from thence he went to Saumur to study philosophy. From 1561 to 1567, he was employed in giving instructions in the classics and the belles lettres, and in the latter of these years he was ordained priest. He now taught philosophy at Saumur and at Angers, till the year 1576, and while instructing others, he applied himself with the utmost intenseness to the study of every branch of literature and science, and made a very considerable proficiency. He was now directed by his superiors to go to Grenoble, where cardinal le Camus had established a seminary, for the education of ecclesiastics, in which Lamy was appointed professor of divinity. In every duty in which this excellent priest engaged, he was indefatigable; and as an author he published a great many valuable works; of these the most valuable, and which engaged his attention for thirty years, was entitled “De Tabernaculo Foederis de Sancta Civitate Jerufalem, et de Templo ejus, Lib. feptem,” illustrated with many plates. This work, which was replete with valuable information and very curious diffusion, was not published till the year 1720, five years after the author’s decease. The death of father Lamy was occasioned by the bursting of a blood-veil, though he had been in a declining state some years previously to that accident. He was much esteemed for the modesty of his manners; for his unaffected piety and deep learning. Among the numerous works which he left as memorials of his industry, may be mentioned his “Reflections on the Art of Poetry;” “A Treatise on the Equilibrium of Solids and Fluids;” “A Treatise on Magnitude in general, comprehending Arithmetic, Algebra, and Analysis;” “Dialogues on the Sciences and the last Manner of studying them;” “Elements of Geometry;” and “A Treatise on Perspectiva.”

LAMY, FRANCIS, a French Benedictine monk, born at Montreyau, in the diocese of Chartres, in the year 1536, was intended for the military profession, which, at the age of twenty-three, he exchanged for the ecclesiastical. He made a rapid progress in the several departments of literature, and his writings shew that he was deeply skilled in the knowledge of the human heart. He died in the year 1711, at the age of seventy-five. His biographers have highly praised him for the benevolence which he manifested on all occasions, and likewise for his candour, amiablenes, and extraordinary piety. One of his most popular pieces was, “A Treatise on Self-knowledge,” in fix volumes, which passed through several editions. Many of his other works were highly esteemed; as good defences of natural and revealed religion; among these was his treatise “On the evident Truth of the Christian Religion;” “The New Atheism overthrown,” in answer to Spinoza; “The Unbeliever conducted to Religion by Reason.” Lamy wrote on natural as well as theological subjects;
LAN

subjects; such is his "Physical Conjectures on the Effects of Thunder, and on other Subjects in NaturalPhilosophy." His style, though not wholly free from faults, is laid to be more correct and polished than that of any writer in the French language of that class to which he belonged.

LAN, in Geography, a town of Persia, in Oberland; 14 miles N.N.E. of Joldau.—Also, a city of China, of the second rank, in the province of Pe-cheli, on the river Lan; 113 miles E. of Peking, N. lat. 39° 48'. E. long. 118° 24'.—Also, a city of China, of the second rank, in Chen-fu, on the Hoang. It is situated near the great wall, and in the vicinity of the principal ports on the western coast, and it is therefore classed among the most important cities of the empire, and has been made the capital of the western part of the province, and the seat of government. The trade of this city consists only in flax, which are brought from Tartary, and different kinds of woollen stuffs. A coarse kind of stuff is made here of cow's hair, which is used by the inhabitants for making great costs to defend themselves from the snow. N. lat. 36° 6'. E. long. 103° 29'.—Also, a river of China, in Pe-cheli, which runs into the gulf of Leao-tong, N. lat. 39° 18'. E. long. 118° 36'.

LANÉ PETRA. See Petra.

LANAGLA, in Geography, a town of the island of Fortaventura, situated on the E. coast.

Ell. Ch. Corolla superior, externally woolly, longer than the filaments; its limb in six deep spreading segments. Capsule of three cells.

1. L. plumafi. Woolly Cape Hyacinth. (Hyacinthus lanatus; Linn. Sp. Pl. 455.)—Native of the Cape of Good Hope, from whence it was sent to Kew in 1767, by the late Mr. Maffon, and is kept there in the green-house, but has not yet flowered. Its habit is that of a Digitalis; see that article. Roso thunberg. perennial. Stem erect, angular, hairy, mostly leafy in the lower part, terminating in a dense corymb of numerous flowers. The leaves are linear, keeled and channelled, smooth. The whole inflorescence is densely clothed with white feathery hairs.

LANARIA has formerly been applied as a name to several plants, either on account of their woolliness, as the larger kinds of Veracruz; or of their use in dyeing, or dressing, wool, or woollen cloths. Of the former description is the Dyer's-weed, Refula Luteola; of the latter the Teasel, Dipsacus fullonum. Perhaps Saponaria officinalis. Soapwort, was called Lannaria radix from its feecouring quality.

LANARIUS, in Ancient Geography, a river of Sicily, placed by Antoninus in his Itinerary on the route between Agrigentum and Lilybaea, between Ad aquas and Mazara.

LANARIUS, in Ornithology. See Falco.

LANARK, in Geography, a royal borough, and the county-town of Lanarkshire, in Scotland, is situated about 30 miles to the W. of Edinburgh, near the left bank of the river Clyde. It is a place of great antiquity, having received its original charter as early as the reign of Alexander I. The government is vested in a provost, two bailiffs, a dean of guild, thirteen merchant-counsellors, and seven deacons of trades. The town consists of one principal street, which descends towards the Clyde, and five inferior ones branching off from it, besides lanes and closes. Many new buildings have been added within these few years. The streets are in general well paved with whinlows, and exhibit, especially near the centre of the town, a considerable degree of neatness. In early times Lanark appears to have been a place of some note. The eminence called Castle-hill, which lies between the town and the river, was the seat of a castle, which, according to tradition, was built by king David I. and was for several centuries the residence of the Scottish monarchs. The charter of the town of Ayr, granted by William the Lyon, is dated from this place, and many spots in the neighbourhood are distinguished by names of royal origin. The first assembly or parliament mentioned in the history of Scotland was convened in this town by Kenneth II. in the year 1078. It is also rendered remarkable as the scene of the first great military exploit of the celebrated Sir William Wallace, that patriot having here commenced his glorious but unfortunate career by the defeat and death of William de Hefelrig, or Heffiope, the English sheriff of Lanarkshire. It is said that this town was formerly fortified, but no traces of such works can now be discovered. The rising ground, named Castle-hill, however, bears some resemblance to an artificial mound, and may probably have been fortified in the time of the Romans, as a fine silver coin of Faustina was found on it several years ago. The old parish church lies in ruins about a quarter of a mile to the south-east of the town, and retains considerable marks of former elegance. The hospital of St. Leonard's, which stood to the eastward of the town, was founded by king Robert I. Upon digging up its ruins some time since, to prepare the ground for the plough, an urn, together with a variety of carved stones and other curiosities, were discovered under them. The same monarch was also the founder of a monastery of Franciscan, or Grey friars, situated to the west of the present church, where a general chapter of all the Grey friars in the kingdom was held on the 11th July, 1400. This town unites with Linlithgow, Selkirk, and Peebles in sending one member to parliament. The population of the town and parish, as ascertained in the parliamentary census of 1861, was 4,692 persons, who occupied 613 houses. Sinclar's Statistical Account of Scotland.

LANARK, New, is described in the course of the following article.

LANARKSHIRE, an inland county in the south of Scotland, is frequently denominated Clydesdale, from the river Clyde, which flows through it longitudinally in a winding course of more than sixty miles. The situation of this county is between 55° 21' and 53° 43' north latitude, and between 3° 15' and 4° 35' west longitude. It is bounded by Dumfries-shire on the south, by the shires of Ayr and Renfrew on the west, by the counties of Dunbarton and Stirling on the north, and by those of Linlithgow, Edinburgh, and Peebles on the east. Its length from north to south is about forty-seven miles, and its breadth nearly thirty-two. The parishes it contains are forty-eight in number, inhabited, according to the parliamentary returns in 1800, by a population of 150,600 persons. The surface contents are 927 square miles, or 593,280 statute acres. Lanarkshire anciently formed a great portion of one of the principalities into which Scotland was divided at the time of the Roman invasion. The name given to this kingdom was Strathclyde, which comprehended, besides the county of Lanark, those of
of Stirling, Dumbarton, and Renfrew. This flufe is divided into three districts, or wards, formerly known by the appellations of Clyeddale, Dougladale, and Avondale, but these are now more frequently termed the upper, middle, and lower wards. Each of these districts is subject to the particular jurisdiction of a factorite appointed by the heritat-depute of the county.

With respect to the foil and appearance of this county, the upper parts of it, except in the vicinity of the Clyde, are fo hilly and mountainous, as scarcely to be susceptible of any improvement from agriculture. The elevation of the hills is in general very great; some of them rise to the height of 600 feet above the level of the sea. Notwithstanding this, they exhibit but little grandeur, the perception of their size and altitude being much modified by the clovenness with which they are crowded together. The chief part of the arable lands in the upper district, lies in the parishes adjoining to the hill of Tinto, round which the Clyde flows with a slow and gentle current, washing, in its course to Lanark, twelve miles of the finest meadow-fields in Scotland. In the neighbourhood of Biggar, one of the towns in this district, the foil is uncommonly rich and fertile. This fertility is in many places principally owing to the inundations of the Clyde, which are likewise often the source of irremediable damage, by carrying off, not only the crops, but even the very soil it had formerly enriched. Proceeding down the river, the soil is found to be dry, light, and friable, but less productive than in the vicinity of Tinto. Carlieke parish is of a clayey soil, but excellent in quality. This parish, and indeed all the parishes situated along the river, are particularly distinguished for the richness and variety of their scenery. Within this district are the falls of the Clyde, celebrated both by the poet and the painter. Above, as well as below these falls, the banks of the river are adorned with numerous country seats, and villages filled with industrious inhabitants.

The middle ward, or district of this county, is not nearly so elevated as that above mentioned. When viewed from any considerable height, indeed, it has the appearance of a level country, though in fact it is much diversified with hill and dale, the former being much more abundant than the latter. The foil of this ward is in general of a clayey texture, and within six miles of the river extremely fertile. The scenery here is no lefs beautiful than that of the upper ward, the banks of the Clyde being covered with hamlets, orchards, and plantations of various kinds; beyond the range of six miles, however, the country is of a very different description. It is supposed that there are not less than 40,000 acres of moils-land within this district, and such spots as are free from that covering, display a soft clayey foil, formed from a sort of hard clay, laminated in a horizontal direction, which is called by the farmers silts, and is known to mineralogists by the name of feluics. The lower ward is extremely limited in extent, but may rank as the most important of the three, on account of its containing the city of Glasgow, which is justly designated the Man- chester of Scotland, and is perhaps scarcely inferior to Liverpool in point of commercial importance. The lands in this district are naturally barren and unproductive, but, in the neighbourhood of Glasgow, the overgrowths of a very prosperous commerce have added greatly both to its scenery and fertility. See Glasgow.

The chief towns in Lanarkshire are Glasgow, Lanark, Rutherglen, Hamilton, Douglas, Biggar, and Carluke. Of these the three first are royal boroughs, and will be found described under their respective names. Many considerable villages are likewise scattered throughout the county. The most worthy of notice among these are those of Leadhills and Willtown, which are indebted for their prosperity to the mineral productions of the county. New Lanark, which owes its origin to the cotton works established there by David Dale, eig of Glasgow, is also a thriving and populous place. These works were first erected in the year 1785, and are perhaps the most extensive of their kind in Scotland. They afford employment to upwards of 1500 persons, many of whom are children. Great attention is paid to their morals and education. The situation of the mills is extremely singular and romantic, being near surrounded by high grounds of very steep ascent. They were built on this spot chiefly on account of the great command of water that could be obtained. For this purpose a subterranean aqueduct has been cut through the solid rocks, for the space of several hundred yards. Both the works and the scenery around are objects of peculiar interest and curiosity. One of the mills contains no less than 6080 spindles.

Besides the Clyde, already so often mentioned, there is a number of other streams in this county, all of which, however, discharge themselves into that river. The chief of these on the northern side are, the Elwin, Clegonan, the Little-Clyde, the waters of Dunedean and Cottan, and the two Calders. None of them are remarkable, except that the two latter are well shaded with wood, and adorned with a number of neat villas. The streams on the southern side of the river are rather more deserving of attention. The Mous-water is particularly remarkable for that part of its banks called Cartlane-Craigs. These form a curious and romantic den, or dell, somewhat more than a quarter of a mile in length. The rocks on either side rise to the height of four hundred feet, exhibiting a terrific and rugged appearance in one spot, while, in another, the eye is relieved by a pendent covering of coppice wood. At the bottom runs the river Mous, so closely confined as scarcely to allow room for the lonely traveller to traverse the den. At all the windings of this river the scenery varies, and whenever a rock is found to project on one bank, a corresponding recess may be seen on the other. One of these caverns is still called "Wallace’s Cave," from a tradition of its having been for some time the place of that hero’s concealment. Logan-water, which rises in the mountains separating the parishes of Leimahalo, from that of Muirkirk in Ayrshire, is a beautiful pastoral river. The Avon, which likewise takes its rise on the confines of Ayrshire, after being joined by several minor streams, empties itself into the Clyde near the town of Hamilton. In its course it passes through the inclosures of the duke of Hamilton, where its bold and lofty banks, covered with a variety of shrubs and trees, afford many extremely fine and picturesque views.

No county in Great Britain is more interesting to the geologist, or abounds with a greater variety of mineral productions, than Lanarkshire. The surface of the upper division of the county generally reeds upon whithorne, standing in perpendicular columns. The middle and lower districts, for the most part, exhibit some kind of freestone for their base, but are interfaced, at different points, by ridges of whithorne running off from the rocky mountains, downwards, throughout the whole extent of the country. Under the strata of freestone immense strata, or beds of coal, are discovered, extending over all the plain country, and branching out, more or less, along the course of the principal waters. The seams of this useful mineral are not entirely of one kind. Where the whole strata remain untouched, a variety of thin and less valuable seams, or strata, present themselves in digging down to what is commonly called the upper coal, because it is the first that is found to be worth mining for to any extent. This stratum is composed of the rough coal,
except a small portion in the middle of it, which is of the kind called Sphint. After this, comes the ill coal, which is much esteemed for the blacksmith's forge. At from ten to seventeen feet beneath this stratum, the seam called the main coal is found. It is so named because it possesses all the good qualities of the other strata, and is preferred as consumer in general, to every other species of this mineral. Below the main coal are four more seams. The highest of these is composed of the lump coal, the second of the hard coal, the third of the soft coal, and the fourth and last seam of the iron or four-milk coal. Beneath all are found several strata of excellent limestone, probably as extensive and inexhaustible as the valuable mineral which covers it. Independently of these strata of coal in the plain, there are others in the higher grounds, but of a disimilar nature and arrangement. The hills in the parish of Shotts, like the tracts of the same elevation in the upper ward, are found to consist of an enormous bed of whithorne, but in descending along their sides, the freestone rocks show itself lying in a horizontal position beneath the whithorne. Below the free-coal, ironstone and limestone are discovered in such vast profusion, as seemingly to defy the utmost efforts of human industry to exhaust them. Near the Douglas river also, extensive collieries, similar in quality to those of Shotts, are wrought, which supply the higher districts of this county and Tweeddale, where no coal has yet been discovered. To the vast supplies of this valuable mineral, and its consequent cheapness, the manufacturing prosperity of the west of Scotland is to be principally attributed, as, without abundance of fuel, scarcely any manufacture can be carried on.

Lead and Iron.—Another great source of industry and opulence bestowed on this county by nature, is derived from its mines of lead and iron. The former of these metals is chiefly wrought at Lead-hills, a range of mountains in the uppermost part of the county, immediately adjoining to Nithsdale. These mines belong to the earl of Hopetoun, and are carried on by two separate companies. The number of miners employed in them is very great. They work only six hours out of the twenty-four, so that they have much leisure time, a great portion of which is dedicated to reading. To facilitate this worthy employment of their time, a library was established many years ago by an overseer named Mr. Sterling, who prevailed on the workmen to subscribe for that purpose. Since that event the miners have been remarkable for industry and sobriety of manners, the usual concomitants of a taste for literature; and the example has been followed with similar effects at the neighbouring mines of Wanlockhead.

The iron of this county is found everywhere in the same tract with the strata of coal. In many places it is imbedded between the different veins of that mineral, and is usually wrought at the same time with it. Iron ore, that is, the metal in its richest state, has not yet been discovered here in any great quantity, but ironstone exists in great profusion. It is found either in the form of beds of rocks, or in collections of nodules or ironstone balls, as they are called by the workmen, of various shapes, size, and qualities. Amongst these balls is the curious fossil called Ludus Helmontii, septuariums, or Sphint." It is of a spherical shape, more or less oblate or depressed. Above and below these are the alternate strata of ironstone and schistus. They lie on their depressed sides, in a regular direction, making a strip of interrupted stratum, one stone being several inches and some even a foot or two distant from the other. The ironstone of which they are composed is of excellent quality, yielding sometimes fifty per cent. of iron.

The Antiquities in this county are not so numerous, in proportion to its extent, as in some other counties of Scotland. The Roman road, which formerly crossed the parishes of Lanarkton and Biggar, and defended along the south bank of the Clyde, is now only visible in a few detached spots. Different parts of the upperwards, in particular, abound with excavations in the earth, or vaults which were used as strongholds by the aboriginal inhabitants, when the haughty chieftains of Clydesdale and Annandale were engaged in mutual hostilities and depredations. At Cold-chapel are the remains of a Roman station, and in the same neighbourhood is a spot called Wallace's Camp. It is said that a chair, which formerly belonged to that hero, is still preferred at Borrington.

Near Biggar are several artificial mounds. The church of that town is one of the most venerable relics of monastic architecture in Scotland. Here is preserved an ancient nave or urn, suppos'd to be Roman, which was usually appropriated to sacred purposes by the Popish priests. Boghall castle, about a mile from this church, was formerly surrounded by a marsh, and accessible only by a causeway or mound of earth. The entrance is through a large and magnificent gateway, which leads into a spacious court in the centre. This castle is flanked with towers. It was formerly the residence of the Flemings, earls of Wigton, and has evidently been one of the most extensive and splendid fortresses in Scotland. This neighbourhood is represented in the popular histories of Sir William Wallace, as having been the scene of a fangurious conflict between his band of patriots and the army of Edward I.

Cuthally castle, or, as it is vulgarly called, Cowdaily castle, the seat of the ancient family of Somerville, is situated in the parish of Carnwath, and appears to have been formerly a place of great strength. At the foot of Tinto is an artificial mount, and near it a circle of large stones set up perpendicularly. On an adjacent farm is a place called Sheriff's fields, where it is suppos'd the sheriffs anciently held their courts. Tradition reports, that a bullock's hide, full of gold, is buried under this spot. Here are also the walls of a castle which belonged to the family of Linday. In Pittinair parish are the vestiges of a large encampment, the figure of which approaches to a circular area. A small fort belonging to it is still distinctly visible at a little distance from the walls. Several urns have been lately found here inclosed within four large flag stones. At Douglas are the remains of a castle belonging to the powerful family of that name. The greater part of this building was unfortunately consumed by fire about fifty years ago. In the old church of St. Bride's, in Douglas, are a number of monuments in honour of the Douglases. The parish of Carstairs, in the vicinity of the Clyde, contains the vestiges of a Roman camp, the cañefway leading to which can still be traced for many miles. Pots and dishes of different kinds, as well as the instruments of war and sacrifice, have been discovered here. A number of coins have also been dug up, bearing the inscription of Marcus Aurelius, and Marcus Antoninus. At Cleghorn is another Roman camp, suppos'd by general Roy to have been the work of Agricola. Besides these remains of antiquity there are a number of others; as the priory of Leifhagen, the castles of Cudzow and Avondale, &c. but the limits of this article will not allow us to particularise the whole. Many of them, however, will be found either described or noticed in our accounts of the respective places. Rothwell castle, in this district, is one of the most magnificent ruins in Scotland. The structure itself is superb, and all the objects around have an aspect of grandeur. The whole work is executed with smooth stone of a red colour. It is adorned with lofty towers at both ends,
ends, and has undoubtedly been a place of considerable strength.

The principal seat in Lanarkshire is the palace of Hamilton, belonging to, and the occasional residence of, the Hamilton family. It is a large massive pile, of a dull and heavy appearance, situated in the neighbourhood of the town, from which it derived its name, and deferves notice chiefly on account of the beauty of its scenery, and the valuable collection of paintings it contains.

Lanarkshire has long been celebrated for its horsefles, which are reckoned among the most powerful in the world. As containing the town of Glasgow, it must be ranked among the first manufacturing and trading counties in Great Britain. Forsyth's Beauties of Scotland, vol. iii.

LANAWEN, in Geography, one of the smaller Sooloo islands, in the East Indian sea. N. lat. 6° 15'. E. long. 122° 3'.

LANCARIM SPRING, the name of a medicated water of Glamorganshire. It has its name from a village near which it rises, and has been very long famous in the place for the cure of the king's evil. The body of water is about an ell broad, and runs between two hills covered with wood. About twelve yards from this spring the rill falls from a rock of about eight or nine feet high, with a confiderable noise. The spring is very clear and rises out of a pure white marle. The curers that have been performed there are proofs of a real power in the water; but there is some question, whether the water, or its motion and coldness, does the good; for the people, who come for relief, always drink of the spring, and bathe the part forwards in the fall below. It is generally supposed that the lime-stone rocks communicate a virtue to it, by which it cures internally; but it has been often found, that the holding a limb disordered with the evil, in the strong current of a mill tail, has cured it; and there is the same advantage in the fall of this water. Phil. Tranf. N° 233, or Abr. vol. ii.

LANCASHIRE, in Geography, a county palatine in the northern part of England, surrounded by Cumberland and Westmoreland to the north, by Yorkshire to the east, Cheshire to the south, and the Irish sea to the west. Its area comprises about 1,135,000 acres of land, of which above 350,000 are in a state of tillage, 450,000 in fallow, and about 400,000 in wood-lands, moors, &c. According to Mr. Yates, who has published an Agricultural Survey of Lancashire, the greatest length, from north to south, is 74 miles, by about 44 in breadth: the circumference is 324 miles, and surface 1765 square miles. It is divided into the five hundred of Amounderness, Blackburn, Leyland, Lydendale, Salford, and Wigan: and contains 26 towns, viz. Clitheroe, Lancaster, Liverpool, Newton, Preston, and Wigan. 21 market towns, viz. Blackburn, Bolton, Burnley, Bury, Cartmel, Chorley, Colne, Dalton, Eccleston, Garstang, Hainingdon, Hawdockhead, Horbury, Kirkham, Manchelter, Ormskirk, Poulton, Preston, Rochdale, Ulverston, Warrington; and 62 other parishes. The whole contains, according to the return to parliament in the year 1800, 117,664 houses, and 672,731 inhabitants, of whom 269,259 were employed in various trades and manufactures, and 52,018 in agriculture.

In the ancient history of this country, we find that it was originally inhabited by the Setantii, or Segantii, who were succeeded by the Brigantes, who also had a very extended tract of country. (See Brigantes.) The Romans, under Julius Agricola, appear to have conquered this district in A.D. 79: and soon afterwards, according to Mr. Whittaker, that general established the following stations within the limits of this county: "Ad-Alanum and Bremetonaec in the north; Portus-Siliuon in the west; Rertugarium and Cocmium about the centre; Colnea in the eaf, and Veratim and Mancunium in the south." The precise sites of all these stations are not satisfactorily ascertained: nor is it generally admitted, by other antiquaries, that there were so many permanent stations in the county. In the Itinerary of Antoninus only three are specified: viz. Bremetonaec, xxv. m. p. from Galacum in Wellmoreland; Cocmium, xx. m. p. from the former; and Mancunium, xvii. m. p. from the latter. To connect these towns or stations, roads or military ways were formed, and these were disposed in the most direct line from one place to another, and constructed in the most scientific and skilful manner. Mancunium, now Manchester, was a station of large extent and importance; and from it roads branched off northward to Coccium, (Ribchester,) two north-eastward into Yorkshire, one south-eastward to Condove, now Middlewich in Cheshire, and a fifth south-eastward to Derventio, Derby. The whole of this country was denominated by the Romans, Maxima-Caefarienis, or Britannia-Superior. The Saxons included it in Northumbria; and, according to Mr. Whitaker, "formed it into a separate county about 680, and soon after the conquest of it by Egfrid." At this period, the Roman Alunna was "the metropolis of the hirc, and lent its own appellation to the county." Soon afterwards the whole was divided into hundreds, tythngs, &c. That part called South Lancashire was first divided into three; but subdivided into fix just before the Norman conquest: these are called Blackburn, Derby, and Salford; Newton, Warrington, and Leyland.

The ecclesiastical history of this country commences with the Anglo-Saxons; after the fee of York was established, the kingdom of Northumbria was speedily subdivided into several dioceses, and the whole of North Lancashire was connected with the fee of York. But soon after the confederation of the seven kingdoms into one, the south of Lancashire was severed from the diocese and province of York, and annexed to the province of Canterbury and diocese of Lichfield; and thus continued till the year 1541, when the two parts were again combined, as they have ever since continued, under one bishop, and reunited to their ancient and original fee of York. At the first partition of the hitherto archdeaconries, the principal towns of the latter would naturally be constituted the capitals of them; and the Roman colony of Chester was made the metropolis over the south of Lancashire, as the archdeaconry of Richmond was over the north. The next ecclesiastical division of the country was into rural deaneries, and by the "Valor Beneficiarum," which was taken in 1292 by command of pope Nicholas IV., the whole county of Lancaster, exclusive of Furness, which then belonged to Westmoreland, was partitioned into thirty-six parishes only. By the same record it appears, that these parishes were included in the four deaneries of Blackburn, Leyland, Manchester, and Warrington; all in the archdeaconry of Chester. The deanery of Amounderness and Furness is in the Richmond archdeaconry.

The landed property, which the king possesscd in this county, as duke of Lancaster, is of great extent; but the revenues arising therefrom are but small. The principal part of this property consists in what are generally styled the forests of Myrfcoth, Fulwood, Bleadfield, Wyrefield, and Quern, all situated in the most northern parts of the county. In these the majesty is intitled to the estrays and the game, and the right of holding courts, &c.; and must be considered as lord of the manor of all the forests. The township of Quernmore is situated in the hundred of Lundfield;
LANCASHIRE.

dale, and contains above 3000 acres of inclosed and walled land. Wyerdale, which is similar in situation, contains more than 20,000 statute acres; the greater part is mountainous land, not worth inclosing, but producing abundance of game. Blearfdale is in the hundred of Amounderness, and contains nearly 4000 acres of inclosed land, and about the same quantity not inclosed. Myrscough is situated about eight miles from Preston; and consists of nearly 2200 acres, all inclosed; of which about 1600, belonging to the king, is called Myrscough Park, and is held under a lease by Mr. Healy. The ancient forest of Fulwood comprised a large quantity of land which is now inclosed: the uninclosed parts are about 908 acres. Preston race-ground is a portion of the forest. Besides the duchy lands, a few large proprietors hold extensive estates in this county. But the prevalence of trade, manufacture, and commerce has tended greatly to subdivide the property, in the vicinity of the large towns especially, and hence Lancashire has a greater number of landowners than any other county in England, excepting Middlesex. Camden remarked, that Lancashire was distinguished for the number of ancient families whose names were the same as their manorial estates. This remark still applies, though not to the same extent, as many old family manions are now defunct. Previous to, and under the Norman dynasty, this county was distinguished as an honor, and was of the superior chiefs of feigniers, on which inferior lordships and manors depended, by the performance of certain eulogisms and services to the lords who held them. Lancashire originally belonged to kings exclusively, but were afterwards granted in fee to noblemen. Thefe kept their honor courts 4 every year at least, or oftener if need be; at which court all the freeholders of all the manors that flank united to the said honor, shall make their appearance, which suitsors shall not fit, but stand bareheaded." That the honor of Lan-
caster excelled before the conquest, is demonstrated by an agreement, still preferred, between king Stephen and Henry, duke of Normandy. From this period till the reign of Henry III. the honor was held by several great per sons. That monarch conferred it on his second son Edmond, when it became an earldom. The title of duke of Lancaster was created by Edward III. in favour of Henry Plantagenet, whose daughter and heir was Blanche, married John of Gaunt, fourth son of Edward III., for whom the privileges and revenues were considerably increased; he, being created duke of Lancaster on the death of his father-in-law, obtained a patent for advancing this county to the dignity of the pala
tinate. The court belonging to this duchy has the power of deciding every cause relating to it: the officers are, a chancellor, attorney-general, king's serjeant, king's counsel, receiver-general, clerk of the council and regifter, surveyor of lands, attorney in the exchequer, attorney in chancery, four councillors, &c. The offices of the duchy court are at Somerset place, London.

The soil and surface of Lancashire are various; and its features in some parts, particularly towards the north and along the eastern border, are strongly marked. Here the hills are bold and lofty, and the vallies narrow and irriguous. On the sea-coast, and nearly the whole of the southern side of the county, following the course of the river Merley, the land is low and flat. In the district which lies between the Ribble and the Merley, the greater part of the surface is a sandy loam, well adapted to the production of almost every kind of vegetable, and that to a degree which renders it impossible to estimate the advantages which might be derived from an improved cultivation. The fub stratun is generally the red rock, or clay marle, one of the most desirable soils that can be found. Moor-lands which are in a state of na-
ture, and produce heath and other wild plants, are of vari-
quous qualities; and are much more extensive than might have been expected in a county so populous, where laud must consequently be very valuable.

The mineralogical history of this county has never been publicly developed; and though the internal contents are singularly rich, the varied peculiarities and characteristics of these riches have not been made known. With singular ad-
- vantages of natural and artificial navigation, the coals, which constitute its most prolific and useful production, are cheaply conveyed to the various manufactories of Manchester, Bolton, &c. and also to the coast. Coal is found in im-
mense beds, both on the southern part and towards the middle of the county, but chiefly in the hundreds of Wey-

Derby and Salford, and in part of Blackburn. It is not obtained much farther north than Chorley and Colne; but great abundance of this useful fossil is again procured at Whitehaven, and about Newcastle-upon-Tyne. At Halky, near Wigan, a species of coal is produced, similar in appear-
- ance to black marble, and of a very bituminous quality. It is called Coal coal, and burns with a peculiar clearness of flame, consumes very rapidly, and is apt to fly in pieces in the fire; but if previously immersed in water, it is said to lose this property. It is of a dull black colour, breaks early in all directions, and if broken transversely, presents a smooth concoidal surface. Towards the north and north-eastern parts of the county, lime-flone is very abundant. It is found at Halsall, near Liverpool, at various depths, but inconsiderable in quantity. In the vicinity of Lea, and also at Ardwick, near Manchester, is limestone of such peculiar quality, as to unfit the power of water: it is therefore applied to the construction of cemen, and to making mortar for building under water. Stone of various den-
ominations is produced in this county. Upon the common, near Lancaster, is a large quarry of excellent free-flone, which bears a fine polish, and of which that town, equalled by few in the kingdom for neatness, is wholly built. Flats and grey flates are found at Holland, near Wigan. The mountains, called Conitonite and Telberthwaite fells, near Hawkhead, afford a large quantity of blue flates, of which there is a considerable export: they are divided into three classes, called London, Country, and Tom slate, of which the first is esteemed the best. Scythe-flones are obtained at Rainford, and are well wrought on the spot. Iron-ore is found in abundance between Ulverston and Dalton, in Low Furnees. In the north, some copper mines have been worked; but they have not been productive. At Angle,

fack, near Chorley, is a lead mine belonging to Sir Frank Stanhile, bart. : it consists of several veins, which intersect the strata of the district almost perpendicularly, and run in various directions. The matrix of these veins is formed of carbonat and sulphuret of barytes. The former, which is a very rare mineral, is found in the greatest abundance near the surface; and as it descends, it becomes progressively contaminated by the sulphuret, which, in the lowest strata, seems completely to usurp its place. The existence of car-

bonat of barytes, as a product of nature, was first distinctly ascertained by Dr. Withering: but he seems to have been mistaken as to the place where his specimens were obtained. To James Watts, jun. esq. the public are indebted for a de-
scription of the external character of this substance, and its effects on the animal body, when taken internally. See Manchell Memoirs, vol. iii.

The principal rivers in this county are the Loyne or Lune, the Wyr, the Ribble, the Calder, the Douglas, the Ir

well, and the Merley. Besides these there are several smaller streams or rivers, all which, directing their courses 

towards
towards the west, empty their waters into the Irish sea. The Lune or Lune, emanating from the fells of Westmorland, enters this county near Kirkby Lonsdale. Soon afterwards its stream is augmented by the waters of the Greta and the Wenning from Yorkshire; and the expanded river then passes through the much admired valley of Lonsdale. Pursuing a south-westerly course, it reaches the country town, where it becomes navigable; and at the distance of two miles from Lancaster, is calculated to bear ships of considerable burthen. The approach to Lancaster is indescribably striking, where the river becoming wider, and winding in several bold sweeps, opens to the view of that singular town, descending from a lofty hill, whose summit is crowned by the belfry of its castle, and the lofty tower of its church. The Wyre, which has its source among the moors on the north-eastern part of the county, meanders through a very romantic district; and pursuing a south-westerly course towards the sea, receives the waters of several other mountain-streams before it reaches Garstang-church town. Near this place its current is greatly increased by the waters of the rivers Calder, &c.; and passing near the town of Poulton, expands into a broad bason, called Wyer-water; and, again contracting its banks, joins the Irish sea between Bernard's-Wiif and the North Scar. The Ribble, like the Lune, unites to the sea by a very broad estuary; and, like that also, has a Roman station on its banks.

"This river," Dr. Whitaker observes, "by the general consent of most antiquaries, has been understood to be the Belffima of Ptolemy." The Ribble is one of the largest rivers in the north of England, and has its source in the high moors of Craven in Yorkshire. Taking first a southerly course, it passes by the town of Clitheroe, and, forming the boundary of the county for a short space, is joined by the Hodder and the Winburne from Whalley. The chief course of this river is through a highly commercial and well cultivated country; and near the thriving town of Preston, its banks are bold, and adorned with haging woods. A little to the west of this place, the Ribble forms a spacious estuary, which is enlarged by the mouth of the river Douglas. The latter has its source in the vicinity of Rivington-pike, and, after passing the town of Wigan, proceeds north-westwardly by Newchurch, and near Rufford is joined by the Eelder-brook from Ormfield. After receiving the united streams of the Irwell and Lostock rivulets, it empties itself into the estuary of the Ribble, at a place called Muck-Stool. The Irwell originates in the moors, near the Yorkshire and Lancashire boundaries, whence it flows, followed by other streams, through the town of Bolton to Bury. Hence it proceeds to Manchester, where it unites with the Medlock and the Irk. Palling through Barton, where the duke of Bridgewater's canal is carried over it by means of a grand aqueduct, it falls into the Mersey below Flixton. The Alt, rising near Knowle, and flowing in a north-westery direction, joins the Irish sea near Formby Point. The Crake connects the lake called Thurston-water with the sea at Leven Sands. The waters of Winandermeer lake join the sea through the channel of the Leven nearly at the same place.

Although canals in a commercial and manufacturing country are of almost inestimable utility and importance, yet their origin in this kingdom is but recent; and from the best authority it appears that the first complete artificial canal was planned and formed in Lancashire. This was known by the name of the Sankey; but long previous to the making of this canal, different acts of parliament had been obtained, and companies formed, for rendering the rivers Irwell and Mersey, also the Weaver, &c. navigable. By the affinit
LaNCaSHIrE.

Ashton, was made in consequence of an act of parliament passed in 1792. The whole length of this canal is eleven miles, with a rise of 152 feet. Bridgewater's canal originated, in 1759, with the late patriotic duke of Bridgewater, who devoted an immense fortune to the effecting his plan. That part of the canal more immediately connected with this country, commences at the Castle-field, in the suburbs of Manchester, and terminates at Pennington, near the town of Leigh. At Worsley is a short cut to the entrance basin of the underground tunnels. Here it buries itself in a hill, which it enters by an arched passage, partly bricked, and partly formed by the solid rock, wide enough for the admission of long flat-bottomed boats, which are towed by means of rings and hand-rails on each side. The canal, or tunnel, penetrates above three quarters of a mile before it reaches the first coal-works; where it divides into two channels, branching to the right and left. In the passages, at certain distances, are tunnels cut through the rock, and ifuing perpendicularly at the top of the hill. The arch, at the entrance, is only about six feet wide, and five in height, above the surface of the water. In some places within it widen, to accommodate two boats to pass each other. To this subterranean canal the coals are brought from the mines in low waggons which hold about a ton each, and these are easily pulled down a gentle declivity, on an iron railway by one man. Lancaster canal takes its course through nearly the whole county. Commencing at Kirby Kendal, in Westmoreland, it enters Lancashire near Burton, having passed under ground about half a mile near Medway. At Barwick, a little south of Burton, it links to its mid-level, which it preserves for several miles, making for this purpose a very winding course, in some places approaching almost close to the sea-beach. After passing Preston, it ascends through a series of locks to its highest level, on which it proceeds across the Douglas, and arrives at its termination at West Houghton. The principal object of this canal is to open a ready communication between the coal and limestone countries, thereby interchanging and conveying these articles to different places, and to open the port of Lancaster to other populous towns. All the country north of Preston is destitute of coal, and the canal is directed through a district abounding with this valuable mineral from West Houghton to Whittle Hills. From Kendal to Lancaster, the whole country consists of limestone; and on Lancaster Moor some good freestone is obtained. The Leeds and Liverpool canal enters Lancashire a little north of the town of Colne, near which it crosses the grand ridge by means of a subterranean tunnel at Foulridge, 1630 yards in length. Near Birk Mill, not far from Wigan, it crosses the Lancaster cut by means of an aqueduct bridge sixty feet above that canal. A navigation between the Calvin and western seas has been often proposed: this great defideratum has been at length effected; and a canal has now been made between the towns of Liverpool and Leeds, including a line of 1073 miles, and communicating at the latter place with the river Aire, and at the former with the river Mersey, both of which are navigable to the German ocean on the east, and to the Irish sea on the west. The fall of water in its course, from the high ridge of mountains which divide Lancashire and Yorkshire, is 527 feet westward, and 446 eastward. Manchester, Bolton, and Bury canal takes a north-westly direction from the former to the latter town. Its northern end is considerably elevated, and its whole course comprehends a line of fifteen miles one furlong. The Rochdale canal opens a navigation from the Bridgewater canal at Manchester, to the Calder at Sowerby-bridge, near Halifax. At the commencement of this scheme it encountered much opposition; and the proprietors, in obtaining their acts, were obliged to bind themselves not to use any of the waters of the Irk, Calder, and Roch rivers, so as to affect their mills, &c. They were, therefore, obliged to make several large reservoirs on the hills to supply the wants of lockage and leakage. At Ulverstone is a short cut or canal of about one mile and a half, communicating from that town to the Irish sea. Douglas River Navigation commences in the tideway, in the ebulion of the river Ribble, near Helforth, and terminates in the Leeds and Liverpool canal. Haddington canal, not yet completed, is intended to communicate, in a distance of about thirteen miles, between Bury, where it joins the Bolton and Bury canal, to Church, where it joins the Leeds and Liverpool. The commercial and speculative spirit of the inhabitants of this populous county, is strongly exhibited in the construction of these canals and navigable rivers; the good effects of which are especially felt by the manufacturing towns. To that of Manchester, in particular, the canals have proved eminently beneficial, and the thriving ports of Liverpool and Lancaster, with the central towns of the county, have all derived from the same source many important advantages. Whist the natural produce of the county is readily and cheaply conveyed to various marts, and the coals sent to the devouring factories; the manufactured goods of the latter are thereby distributed over the kingdom, and to the sea-ports for foreign exportation.

Peculiarly characteristic of this county are the bogs and morasses with which it abounds, and which bear the provincial name of Moors. The principal of these are called, from the chief places in their vicinity, Chat, Pilling, Trafford, Riley, Ashton, Road, Bickerstaff, Rainford, Marton, St. Michael's, and Catforth. The component parts of these chiefly consist of a spongy soil, containing roots of decayed vegetables, intermixed with a foot of rotten mould. The origin and peculiarity of moors have occasioned much difference of opinion with the writers on agricultural and natural history, but when their precise situations are accurately defined, it seems easy to account for the latter, and thereby to discover some clue for the former. The laws of nature are immutable; and when certain natural causes are known to produce certain effects, and these are invariable, it does not appear difficult to ascertain the primary source. Thus, moors or bogs are always found near spring-heads, and in such hollows as prevent a regular and continual discharge of the oozing waters. These must consequently remain stagnant, and from the perpetual generation and decomposition of vegetable matter, must progressively acquire substance. Among the most common vegetable substances in these situations, are the Erica vulgaris, the Ornithogalum luteum, and the different species of Erphorum, or cotton-gras; alth, bilberry, cranberry, crowberry, Andromeda polifolia; Lancashire aphodel, gun-dew, and the fragrant myrica-gale, or bog-myrtle. As these plants decay, and deposit their substanccs, a considerable addition is annually made to the moors, in cutting a footing of which, in some places, the progressive stratification or lamina may be distinctly discovered. These plants, and particularly the moors, seem to derive their nutriment and fruitification from their own ruins, and grow more luxuriant as the substance increases: at length the whole takes the appearance and consistency of a large fungus; and continuing to increase, it at length grows greatly above the level of the adjacent lands, till the weight of the surface becoming too great to be supported by the spongy sub stance below, it overflows its original boundary, and covers the adjoining grounds. A remarkable instance of this occurrence, in the year 1771, is related of Solway-moss in Scotland; and, according to some
of our ancient chronicles, a great portion of Chat-mofs was carried to the Irwell, thence to the Mersey, and on to the sea. (See Leland's Itin. vol. vii. p. 46.) It may be proper just to mention three of the mofs in this county which have been brought into a state of improvement. Traford-mofs, on the south side of the river Irwell, containing about five hundred acres, has been brought into cultivation by Mr. Wakchfield and Mr. Rofcoe of Lancashire. They began their improvements about the year 1793; and the whole of this hitherto unfelt tract of land is converted into excellent arable and pasture ground, worth four or five pounds per acre, per annum; but previous to that period it was wholly unproductive. The manures used in the improvement have been blue marle, of a strong calcareous quality, which is found under the mofs itself, and compost brought by the canal from Manchester. Chat-mofs, which lies on the north side of the river, and contains some thousands of acres, has been brought into a state of progressive improvement, with every prospect of similar success, by Mr. Rofcoe, who commenced the drainage in the year 1805. Rainford-mofs, near Prescot, has also been amazingly ameliorated under the judicious management of Mr. Chorley, who began his operations on this apparently sterile waste in 1789, and has rendered it capable of bearing oats, barley, clover, potatoes, &c.

The agricultural productions of Lancashire are principally oats and potatoes; both which are used for human subsistence; and many of the labouring classes, in the northern and eastern parts of the county, are chiefly supported by this food. A considerable quantity of barley, and some wheat, are cultivated in Low-Furnefs, the Fylde, and in the south-western parts of the county; but it is supposed that Lancashire does not produce one quarter of the grain consumed by its own inhabitants. The first potatoes said to be cultivated in England were grown in this county. They were originally introduced into Ireland from North America, about the year 1565; and in consequence of an Irish vessel being cast away on the western coast, near North Mols, in Lancashire, some of those roots were planted in that part of the county; but it was not till many years after that they were adopted as an article of food in London. They are now grown in amazing quantities in this county; and many are annually exported hence to Ireland. They are produced both from cuttings, and from the apple, or feed. The ox-noble and clouter potatoe are chiefly grown for the cattle; and the pink-eye, with various kinds of the kidney, are used for the table. The produce of a crop of potatoes in this county is generally from two to three hundred bushels per acre. Many useful particulars relating to the culture of planting, growing, and preferring potatoes, are detailed in Holt's "General View of the Agriculture of Lancashire."

This county boasts a peculiar breed of horned cattle, which forms a variety with that of Lincolnshire. The cows are rather smaller than those of the latter county, and are known by their wide-spreading horns and straight backs.

The climate of Lancashire is proverbially wet, and this seems a natural consequence of its peculiar situation, between the broad part of the Irish sea and the high ridge of hills which form its northern border. All this side of the county is more subject to rains than the side bordering on the coast; for as the clouds are wafted over the Irish sea from the Atlantic ocean, they are first checked and broken by the mountainous ridge, which has a direction north and south; and hence the rains are almost perpetually falling on the western side of these intercepting eminences. At Town-

ley, near Burnky, it has been found by experiment, that forty-two inches of rain fall annually, at a medium; while the annual fall at Manchester has been only thirty-three inches. At Liverpool the average has been considerably less, whilst that at London has been still lower.

Lancashire sends fourteen members to parliament; two knights for the shire, and two representatives for each of the boroughts of Lancaster, Liverpool, Preston, Newton, Wigan, and Clithero: one of the members for the county is returned through the interef and influence of the earl of Derby; the other by what is termed the independent interef. The county is included in the northern circuit, and the affizes are held at Lancaster, as are also the quarter-

This county, though not abundant in antiquities, formerly possessed a few castles and monastic buildings; viz. castles—Clithero, Gleadston, Holland, Hornby, Lancaster, Preele, and Thurland. Religious houses—at Burfcoogh, Court, and Coninge. Augufline priory—at Cockerdale; a Premontratentian abbey—Furnefcs and Whalley; Ciffrarian abbeys—Holland, a Benedictine priory; Hornby, a Pre-
montratentian priory; Lancaster, Lathom, and Penwortham, Benedictine priories; Manchester, a college.

Lancashire contains 490 public bridges; of which nine are repaired by the county, and the others by the different hundreds.

The manufactures and commerce of this populous county, are both of great extent and importance. Many particular manufactures respecting the former have been already narrated under the article Cotton. Further details will be given under MAN-
CHESTER, and the commerce of the county will be described at LIVERPOOL. Beauties of England, vol. ix. Atkin's History, &c. of the Country round Manchester, 4to. Whita-
ker's History, &c. of Manchester, 2 vols. 4to. Whicker's History of Whalley, 4to. Holt's Agricultural Report relating to Lancashire, 8vo.

LANCASTER, County Palatine of. See County.
LANCASTER, Duchy Court of. See Court.
LANCASTER, in Geography, a sea-port, market, and the county town of Lancashire, England, is situated on the banks of the river Lune, or Lune, 239 miles distant from London. Few of the county-towns in England have been more neglected by the historian, or more inaccurately de-
scribed by the topographer, than this of Lancaster. That it was a Roman station is evident by the Saxon termination calter, or cæter, and the same is confirmed by the various remains of the domestic economy of the Romans that are continually discovered in the town and its vicinity. Camden contends that the Roman name of this place was Long-
ovicum: and Mr. Whittaker affirms, it was the Ad-Alaunum of Richard of Cirencester's Itinerary. Reynolds, in his "Iter-Britanniarum," identifies this place as the Breme-
toncis of Antoninus: but this is improbable; though we do not hesitate in considering it to be the site of one, if not both, of the other names. Dr. Leigh, in his "Natural History of Lancashire, &c." describes and refers to various coins, pieces of pottery, burnt bones, &c. that have been found in this town. In 1772, an altar-plate, with an inscription, was dug up here. In the Archologia, vol. v. is a dis-
fertation, by the Rev. Mr. Leigh, on certain Roman vestigia belonging to Lancaster. This place was a fortres of con-

siderable confection also under the Anglo-Saxon dynasty. Indeed it appears to have been the chief obstacle and barrier to the Picts, or Scots, in the progress of their conquest in England. Having been described by those marauders after the retreat of the Romans, it lay a considerable time in ruins, but was at last rebuilt by the Saxons, who, from
after their settlement in Britain, perceived the importance of this post, and the facility of defence afforded by its commanding site. That it was constituted the chief and designating town of the county, is a sufficient indication of its consequence. This event is flated by Mr. Whitaker to have occurred in the seventh century, when he observes, the "Roman Alauna received the honour which it retains at present, and was made the metropolis of the shire." During the Saxon heptarchy we have no records whatever of this town, but soon after the Norman conquest it assumes some historical consequence. In Domesday-book, however, Lancaster and Chereca-Longealde appear simply as two vills, or Berwic, among the twenty-two which then composed the manor of Halton. At this time there was no church at Lancaster, but the name Chereca-Longealde, affixed to one of the villages, renders it probable that it had a church during the time of the Saxons, which had probably been destroyed during the ravages of the Danes. Lancaster, it is likely, was granted either by the Conqueror or his successor, William Rufus, to Roger de Poitou, for the purpose of erecting a castle upon its hill. This person also founded the church of St. Mary, and granted it as a cell to the abbey of Sées, in Normandy. To this monastery it continued annexed till the abolition of alien-priories, in the reign of Henry V. when it was given to the Carthusian abbey of Sion, in Middlesex, and remained attached to that institution till the general dissolution of monastic establishments by Henry VIII. The great tower of the castle, which is still standing, is an excellent specimen of the mafive style of architecture adopted in that age. The walls are of uncommon thickness, and the buttresses have narrow projections, whilst the lower windows have short rounded arches, with single shaft columns on their sides. This castle was besieged by Hubert, archbishop of Canterbury, in the year 1199, at which time it was held by the brother of John King, in truth for that monarch when he came to the throne. In the seventh year of the reign of the same prince, it was in possession of Ralph Blundeville, earl of Chester, and in the early years of the reign of Henry III. was held by William de Ferrars, earl of Derby.

Lancaster, however important it may have been as a military station, owes its chief celebrity to Edward III., who, upon the completion of the fiftieth year of his reign, solemnly, and in full parliament, created his third son, John of Gaunt, duke of Lancaster. By the charter granted at this period, the duchy of Lancaster was constituted a fort of petty kingdom, and all the privileges of royalty conferred upon the duke within the county. During the civil wars between the houses of York and Lancaster, this town suffered so much by its adherence to the Lancastrian line, that it was nearly depopulated, and even in the time of Camden was only the residence of a few husbandmen. Charles II., having confirmed its ancient charter with additional privileges, it began again to revive, and has ever since been increasing in trade, extent, and population.

The castle, which has successively been the safeguard, terror, and glory of the town, is now fitted up as the county-gaol, with its necessary appendages of a gaoler's house, prisoners' rooms, cells, work-shops, courts of justice, &c. From the appearance of its present remains, and the commanding situation on which it stands, it must, doubtless, have been a grand and magnificent object in former times. Much as it has suffered from the changes it has more recently undergone, its architectural features are still entitled to general admiration. The encircling walls embrace an area of 380 feet from east to west, by 350 from north to south. Within this space is a large court-yard, with several of smaller dimensions, and a number of towers of various shapes. The chief entrance is towards the east, and communicates with the town. It is a strongly fortified tower gateway, consisting of two semi-octagonal projections, which are perforated, near the bottom, with apertures for the discharge of arrows, and on the summit are several bold machicolations with embrasures, &c. Within this entrance is the large court-yard already mentioned, surrounded with towers and fortified walls, and on the opposite side is a large square keep, the walls of which are of amazing thickness, and its apartments of grand dimensions. One of the rooms is nearly sixty feet long, by about thirty in width. The floors are arched, and covered with composition, forming flat surfaces. From the summit of this tower, the views are very grand and impressive. To the north of the keep are the shire-hall and county-courts, with several apartments and offices connected with them. These have been recently erected at the expense of the gentlemen of the county, and from the designs of Mr. Harrison of Chester, an architect, who has displayed so much classical taste and scientific knowledge in the construction of a county-gaol in that city. The finishing of these works has been from the designs of Mr. Joseph Gandy, of London, an artist of eminent talents. The grand jury room here, and shire-hall, are peculiarly elegant and novel: the first being of circular form, and the second being semi-circular; but both finished with clustered columns, paneling, tracery, &c. partly in imitation of the elegant ecclesiastical architecture of the fifteenth century. Over the judges' seats are two full-length portraits of the county members, by Mr. Allen; and a full-length of George III. on horseback, by Northcote. This grand and spacious pile of buildings, whether viewed as an ancient baronial fortress, as a picturesque object, or as a suite of public structures for the gaol and courts of the county, must demand our admiration. An engraved ground plan of this castle is published in a small History of Lancaster, Svo. 1807. On an eminence near it is the parish-church, a spacious building, with a lofty tower, which serves as a landmark for vessels coming up the river. At the east end of the castle is a wooden screen most elegantly carved. Among the monu-ments, is one by Roubillac, for William Stratford, L. D. D. In the church-yard is the shaft of a stone cross, with carving, and an inscription in Runic letters.

The other public edifices of this town, are a town-hall, a chapel of ease to the parish church, a theatre, an assembly-room, a range of shambles, a Quakers' meeting-house, and chapels to the following classes of dissenters, Presbyterians, Quakers, Independents, and Methodists. An ancient bridge, now in ruins, connected the opposite shores of the Lune, near St. George's Quay, but the increasing opulence and population of the town rendered a new and more commodious one necessary. This was erected from the extremity of Cable Street to Skerton, at an expense of nearly 12,000l. paid by the county. The length of this superb structure is 540 feet; the arches, five in number, are equal and elliptical; the design was by Mr. Harrison. Among other benevolent institutions in this town are several alm-houses for men and women, a free-school for the education of 60 boys, a charity for the maintenance of 200 school-girls. The manufactories of the town are inconsiderable, and chiefly consist of cabinet-making, spinning of twine, cotton-printing, and weaving of fail-cloth. Ship-building has been greatly encouraged, and many large vessels constructed, particularly by Mr. Brookebank, who has sent ships, launched at his dock-yard, to London, of 450 tons burthen. Lancaster trades to America with hard-ware and woollen manufac-
three; and a considerable quantity of candles is exported to the West Indies: 40 or 50 ships trade also to Norway.

It appears from the Custin-house entries, that in the year 1799, 52 vessels cleared out for the West Indies, with cargoes to the value of two millions and half pounds sterling. The Custin-house is a small neat building, with a portico supported by four Ionic columns, fifteen feet in height, each a single tone. The Town hall is a large commodious edifice; in the council room is a full-length portrait of Lord Nelson, painted by Mr. Lonsdale, an artist of talents, who is a native of this town. He presented it to the corporation, who have also a similar portrait of Mr. Pitt.

The borough of Lancaster originated from a grant, made in the 4th of Richard I., and members were first sent to parliament in Edward I. Returns were also made at various periods in the two succeeding reigns; after which there were none till the reign of Edward VI., when the privilege was restored. The corporation is composed of a mayor, recorder, 12 aldermen, two bailiffs, 12 capital burgesses, 12 common burgesses, a town clerk, and two ferjeants. In the vicinity of the town is an excellent salt marsh, adjoining the banks of the Lune: this marsh is parcellled and divided into what are termed org grusses; that is, a privilege for the inhabitants of turning a horse or two cows to fummer on the common. By the late inland navigation, Lancaster has communication with the rivers Mersey, Ribble, Ouse, Trent, Derwent, Severn, Humber, Thames, Avon, &c., which navigations extend above 500 miles, into the counties of Lincoln, Nottingham, York, Wellmoreland, Chester, Warwick, Leicester, Oxford, Worcefter, &c. About one mile north-east of the town is a grand aqueduct-bridge, which conveys the Lancastrian canal over the river Lune. This splendid fabric was designed and successfully executed by Mr. John Rennie, civil engineer, who has hereby displayed much skill and science in this and several other similar works.

The bridge consists of five circular arches, each of 70 feet span, rising 30 feet above the surface of the river. The peculiar difficulties which the architect had to encounter, in the bed of the river, made it necessary to have a foundation, a flooring of timber, which alone cost £15,000. The superstructure came to double that sum.

In the return to parliament in the year 1801, Lancaster is stated to contain 1611 houses, and 9090 inhabitants. Markets are held on Wednesday and Saturday: and here are three annual fairs.

About three miles south of the town is Atton Hall, the seat of the Duke of Hamilton and Brandon. Two miles further is Thurnham Hall, the seat of John Dalton, esq. In the vicinity of the town are also Werryide, the seat of John Fenton Cavthorne, esq.; Quernmore Park, the seat of Charles Gibson, esq.; Grais-yard Hall, the property of Thomas Edmonson, esq.; Halton Hall, the seat of W. B. Bradshaw, esq.; and Halton Park, the seat of Thomas Baxter, esq.

Five miles north of Lancaster, is a cavern, called Dunald Mill-hole, of a peculiar grotesque and aweful appearance, which, probably, from its obscure situation, has been but little noticed by topographers. An Historical and Descriptive Account of the Town of Lancaster; with four engravings, 8vo 1807. Beauties of England, vol. ix.

Lancaster, a populous and wealthy county of America, in the interior part of Pennsylvania, extending S. to the Maryland line. It is about 42 miles square, is divided into 25 townships, and contains 566,240 acres of land, and 43,303 inhabitants, including 178 slaves. The lands of this county are rich and well cultivated. The hills in the northern parts abound with iron ore; for the manufacture of which two furnaces and eight forges have been erected. Copper and lead, and abundance of limestone, have been found. Also, a county of Virginia, bounded E. by Chesterfield bay, and S.W. by Rappahannock river. It is about 40 miles long, and 15 broad, and contains 2249 free inhabitants, and 3125 slaves. The lands are generally poor.

Also, a district of South Carolina, containing 5012 inhabitants, of whom 1076 are slaves. Also, a post-town in Gerrard county, Kentucky, 621 miles from Washington. Also, a handsome and flourishing post-town, the capital of Lancaster county, in Pennsylvania, and the largest inland town of the United States. It is pleasantly situated upon the descents of a hill, 14 miles W. of Conestoga creek, which falls into Susquehanna river, nine miles S. by W. of the town. Its trade is already great, and must increase in proportion to the increasing population of the surrounding country. It contains about 900 houses, chiefly of brick and stone. The legislature meet here till a permanent seat of government shall be established. The public buildings are, a handsome court-house of brick, a market-house of the same materials, and a strong stone gaol. Here are six places of worship for German Lutherans, German Calvinists, Presbyterians, Episcopaliains, Moravians, and Roman Catholics.

The manufactures of this town are carried on by individuals. There are three breweries, and two or three valuable tanneries. Franklin college is established here for the Germans. Its endowments are the same as those of Dickinson college, at Carlisle. The truests of the Lutheran, Calvinists, Presbyterians, and Episcopaliains, of each an equal number. The principal is a Lutheran, and the vice-president a Calvinist. 58 miles W. by N. from Philadelphia. N. lat. 40° 3', W. long. 76° 20'. Also, a post-town of South Carolina, 36 miles from Camden. Also, a pleasant post-town in Worcefter county, Massachussetts, settled in 1642, and incorporated in 1673. It is situated on two branches of Nashua river, which runs into the Merrimack: over these branches are nine large bridges, and on their banks the land is excellent. Many pernons of education and fortune have been induced, by the pleasantness of this town, to make it the place of their residence. It is famous for its abundant supply of good flates and of stones for tombs and graves, which are articles of exportation. Cambrey pond in this town is offered to rise as much as two feet before a storm, and Sandy pond rises in a dry season. It contains 1584 inhabitants. Also, a post-town in Grafton county, New Hampshire, on the E. bank of Connecticut river, about 41 miles above Hanover; incorporated in 1763, and containing, in 1800, 440 inhabitants. Also, a fine town, the capital of Fairfield county, in the State of Ohio, on a branch of the Hockhocking river, about 25 miles N.E. from Chilicothe.

Also, a township of Upper Canada, in Glengury county, on the river St. Lawrence, and the lowest in the province adjoining Lower Canada. More.

Lancat, a river on the N.E. coast of Sumatra, which runs into the East Indian sea, N. lat. 4° 5', E. long. 98° 2'.

Lancavy, Lancakly, or Pula Lada, an island in the East Indian sea, near the coast of Queda; about 16 miles long, and from three to eight broad. N. lat. 6° 19', E. long. 99° 40'.

Lancayan, a small island in the East Indian sea, near the N. coast of Borneo. N. lat. 6° 25', E. long. 118° 9'.

Lance, Lancea, a spear, an offensive weapon, borne by the ancient cavaliers, in form of a half pike.

The lance consists of three parts, the shaft or handle, the wings, and the dart. Pliny attributes the invention of lance-
lances to the *Areolans.* But Varro, and Aulus Gellius say, the word *lancea* is Spanish; whence others conclude the name of this weapon was borrowed by the people of Italy from the *Spaniards.* Diodorus Siculus derives it from the *Gaulli,* and *Felix* from the Greek *leptos,* which signifies the same.

The lance, or spear, is among the oldest weapons recorded in history, and is nearly coeval with the sword or bow; it probably originated in a pole or shaft, sharpened at one or both ends, afterwards armed with a head of flint, and, in process of time, on the discovery and use of metals, with copper, brass, and iron. Flint heads for both spears and arrows are frequently found in England, Scotland, and Ireland, and so are also spear, javelin, and arrow heads of a metal nearly resembling brasts. The spear, lance, javelin, darts of different kinds, and even the more modern pikes, are all comprehended under one common description of a long staff, rod, or pole, armed with a pointed head of stone or metal at one or both ends, constructed for the purpose of piercing, or wounding with their points only, either by being pulled or thrown with the hand. Long spears and lances were used by the SAXONS and Normans, both horse and foot, but particularly by the cavalry of the latter, who, in charging, reeled the butt end of the lance against the arçon or bow of their saddle; the mail-armour not admitting of the fixture of lance-crests, as was afterwards practised on the cuirafs. A lance-crest was a kind of movable iron bracket, fixed to the right side of the cuirafs, for the purpose of supporting the lance. It does not appear that there was any established standard for the length or thickness of the ancient lances, or the size or form of their heads; but it rather seems, that every military man had his lance, as well as his other arms, constructed of the dimensions that best accorded with his strength and stature. It is certain, however, that the heads of lances and spears were always made of the best tempered steel, and their flaves of the founded ash, whereas the writers of Latin verse used the word *fraxinus* (Latin for ash) to express a lance or spear. Although lances and spears were chiefly the weapons of harricemen, they were also used by the infantry and dismounted knights, to keep off the cavalry; for this purpose they fixed the butts in the ground, their points sloping towards the breasts of the enemy's horses. In tournaments, the knights sometimes fought on foot with their lances, in which case it was customary to shorten them, by cutting off part of the staff. Tilting lances differed from those used in war, both in their heads and flaves; the heads of tilting being blunt, or occasionally fitted with a contrivance to prevent penetration, called a coronel or cronel, from its resemblance to a crown. The flaves were thick at the butt end, tapering off gradually to the point, and generally fluted; near the butt end they had a cavity for the reception of the hand. The front of it was defended by an iron-plate, called a vam-plat, that is, an avant-plat, and behind it was a broad iron ring, called a buss. These handles were not confined to the tilting lance, but were made also on those designed for war. Faucet says, they were not in use before the year 1600. Lances were ornamented with a bandole near the point, which gave them a handsome appearance; there were also called pencells. Groce on *Ancient Armour,* vol. ii.

LANCE, *Holy,* the lance which, in legendary story, is said to have pierced the side of our Redeemer. In the time of the Crusades, when Antioch was besieged, a priest of the diocese of Marcellis, called Peter Bartholomew, pretended to have received from St. Andrew, during his sleep, the following instruction: *"At Antioch,"* said the apostle, *"in the church of my brother St. Peter, near the high altar, is concealed the steel-head of the lance that pierced the side of our Redeemer.* In three days that instrument of eternal, and now of temporal salvation, will be manifested to his disciples. Search, and ye shall find; bear it aloft in battle; and that mystic weapon shall penetrate the souls of the miscreants." This revelation was respectfully received by count Raymond, whom his faithful subject, in the name of the apostle, had chosen for the guardian of the holy lance. After some previous ceremonies, the ground was opened at the appointed place; and search was unsuccessfully made for the lance. After the count and his companions had withdrawn, the artful priest descended into the pit; and, availing himself of darkness and solitude, contrived to secrete and deposit the head of a Saracen lance; and the first gleam of the file was saluted with a devout rapture. The holy lance was drawn from its recess, and exposed to the veneration of the crusaders, and we may well imagine that the deponding troops would again be inflamed with the enthusiasm of valor. Preparation was made for a conflict, and it may be supposed that the potent energy of this relic or trophy, aided by another miraculous delusion, would ensure victory. In the seafon of danger and triumph, the revelation of Bartholomew of Marcellis was unanimously accepted; but as soon as the temporary service was accomplished, the personal dignity and liberal alms which the count of Thoule derived from the custody of the holy lance, provoked the envy, and awakened the reaon of his rivals. Incredulity, with regard to the truth of the legend, succeeded suspicion and examination, and the author was obliged to submit his life and veracity to the judgment of God. A pile of dry faggots, 4 feet high and 14 long, was erected in the midst of the camp; the flames burnt fiercely to the height of 30 eubits, and a narrow path of 12 inches was left for the perilous trial. The unfortunate priest of Marcellis traversed the fire with dexterity and speed; but his thighs and belly were scorched by the intense heat; he expired the next day, protetling his truth and innocence. Such were the origin, influence, and termination of the legend of the holy lance. Gibbon's Hist. vol. xi.

LANCE la Grace, in Geography, a town of Louisiana; 75 miles S.S.W. of New Madrid. N. lat. 35° 25'. W. long. 90° 27'.

LANCE'S Bay, a bay on the N.W. coast of Jamaica. N. lat. 18° 27'. W. long. 78° 14'.

LANCEA CHRISTI, in Botany, a name given by some authors to the *oehoglanum,* oradder's tongue, a small herb found in moist places, with a single stem of seeds.

LANCEARII, in Middle Age Writers, soldiers whose chief weapon was the lance. They were in great esteem formerly.

LANCEBEARERS, *Island of,* or *Isle des Lanciers,* in Geography, a small island in the S. Pacific ocean, so named by M. Bougainville, in 1768. S. lat. 18° 28'. W. long. 138° 10'.

LANCELOTTO, GIANPAOLO, in Biography, an eminent jurist, was born at Perugia about the year 1510. He was first noticed as a teacher of the law at his native place, and was engaged by pope Paul IV. to draw up an intitute of canon law, in imitation of Justinian's Institutes of civil law. This was published in 1563, and went very quickly through several editions. It was annexed to the body of canon law, and still retains its place in the modern editions of that compilation. He was author of other treatises on legal subjects, and of a life of Bartolus. He died at Perugia in 1591. Moreli.

LANCELOT, CLAUDE, was born at Paris in 1615; at a fit age he was persuaded to join the devout solitaries of

†42
the Port-Royal, by whom he was employed in teaching mathematics, and the languages in their schools, till government thought proper to suppress them. He was afterwards appointed tutor to the young princes of Conti, but upon the death of their mother, he took the habit of St. Benedict, in the abbey of St. Cyran. In 1668, he was exiled to Quimperle, in Lower Brittany, where he continued the same aetic course which he had been used to in the seminary. He died in 1695. He was author of many excellent works, among which may be noticed "Nouvelle Methode pour apprendre la Langue Latine"); " Nouvelle Methode pour apprendre la Langue Greecque." These have been frequently reprinted, and abridgments have been made of both. His "Grammaire generale et raifonnée," is said to be a very excellent work, and has been translated into several languages.

LANCEOLA, in Botany, a name given by some authors to that species of plantain called rib-wort, or plantago quinquenervia, by most authors.

LANCEOLATED LEAF. See Leaf.

LANCEROTTA, in Geography, one of the Canary islands, about 30 miles in length, and in its greatest breadth, containing 800 inhabitants. It is divided by a ridge of mountains, which afford nothing but punicer for cattle, though the valleys are fruitful, but sandy and thin in soil. A principal article of trade is goat's fleas, which the inhabitants sell to the neighbouring islands, under the name of Tuffinetta. In 1739, a volcano broke out in this island. Caryas, called also Rubicon, and Lancerotta, the principal town, contains about 200 houses. The island has several havens or roads; and at the N.E. extremity is one, where ships may come in from the northward, and lie land-locked from all winds in 16, 15, and 20 fathoms. The E. point of the island is in N. lat. 39° 8'. W. long. 26°.

LANCET, a well known surgical instrument, the common form of which is represented in the plates of this work. See the Surgical Plates.

Lancet Arch, in Architecture, the same as the pointed arch.

Lancet Window, those with lancet arches; but the term is more generally applied to windows which are long and narrow, than to those which are wide and low.

LANCETI, a name given by the ancient laws of England to a kind of vaffals, who were obliged to work for the lord one day in a week, from Michaelmas to autumn, either with fork, spade, or flail, at the option of the lord.

LANCH is a sort of long boat belonging to ships; it is not built upon failing principles; it is being flat-bottomed and broader, and is more useful for raising small anchors than the long boat, and watering and carrying the ship's stores.

Lancet of a Ship. See Launch.

LANCHE, in Geography, a town of Anterior Pomerania; 11 miles S. of Bergen.

LANCIANO, a town of Naples, in Abruzzo Citera, of which it is the capital; the see of an archbishop; 84 miles N. of Naples. N. lat. 42° 12'. E. long. 14° 20'.

LANCIEGO, a town of Spain, in the province of Alava; 18 miles S.S.E. of Vittoria.

LANCEIS, JOHN-MARIA, in Biography, a celebrated physician, was born at Rome in October 1654. His parents were rather low in rank, but cherished the disposition for learning which he early displayed; and having finished his classical studies, he went through the course of philosophy in the Roman college, and then commenced the study of divinity. He had always evinced a great taste for natural history, which was so strongly awakened during his theological researches, that it induced him to abandon the study, and apply himself entirely to that of medicine. He pursued the fundamental branches, anatomy, chemistry, and botany with great ardour, as well as the more important object, the observation of diseases; and was created doctor in philosophy and medicine in 1672. In 1675, he was appointed physician to the hospitall of the Holy Ghost, in Saffia, where he pursued his clinical enquiries with great accuracy and acuteness: but he quitted this situation in 1678, when he was received a member of the college of St. Saviour, in Lauro, where he read with zeal all the best authors from Hippocrates downwards. His talents and acquirements were now known and acknowledged, and he was appointed professor of anatomy in the college de la Sapienza, in 1684, and continued his duties as a teacher for thirteen years with great reputation. In 1688, pope Innocent XI. chose Lancisi for his physician and private chamberlain; and some time afterwards gave him a canon's stall in the church of St. Lawrence; but on the death of the pope, in 1689, he resigned it. He was now in high public estimation, and when Innocent XII. fell sick in 1699, Lancisi was called upon, and was never absent from him during his whole illness. He was elected physician to the conclave, and was immediately appointed first physician and private chamberlain to the person of the succeeding pope Clement XI. He was indefatigable in the discharge of all his duties, as well as in the pursuit of his studies, reading and writing at every interval of leisure, and in his attendance on the learned societies of the time. He died in January, 1720, at the age of 65. He was a man of small stature, with a lively countenance, and cheerful disposition; his manners were extremely engaging; and he was possessed of much knowledge of mankind. His ardour for the advancement of his art was extreme and unceasing. He collected a library of more than twenty thousand volumes, which he presented in his life-time to the hospital of the Holy Ghost, for the use of the public, particularly the young physicians and surgeons who attended the patients in that hospital. This noble benefaction was opened in 1716, in the presence of the pope, and a great number of cardinals.

Lancisi left a considerable number of works, many of which have been printed, but several in MS., which he bequeathed to the hospital, and which are deposited in its library. Among his lefser productions, were a synopsis of anatomy; an epitome to Fontoni on the fame subjeet; an epitome to Bianchi on the perspiration of the biles; an essay on the atmosphere and climate of Rome; on physiology and the seat of the soul; on the proper method of studying in medicine; on the origin and structure of fungi, in a letter to count Marsigli; and some others, in the Latin language; and also an adfress to the academy of Sienna, "Del modo di filofofar nell' Arte Medica." His more important works are his treatife "De subitaneis mortibus, Libri duo," Rome 1707. - "Tabula Anatomicum Clarif. vndi Bartholomaei Eulachii, A. d. B. de Subitaneis Mortibus, Libri duo," ibid. 1714. folio.

—"Differtatio Historica de Bovillla Pelte ex Campania finibus, anno 1713, Latio importat. Accedit Consilium de Eorum Epide mia," ibid. 1715. —"De noxis Paludum Effluvis, Libri duo," ibid. 1717. —He likewise edited, in the fame year, under the patronage of the pope, a posthumous work of Michael Mercati, entitled Metallotheca, with plates; and afterwards published, "Appendix ad Metallothecam Vaticanam Michaelis Mercati," 1719. After his death, a treatife, "De motu cordis et aneurismatibus," was printed in folio at Rome, 1728: and a collection of cafe from his MSS.

LANCTAN, a mountain of Thibet. N. lat. 31° 52'. E. long. 85° 54'.

LAND, in a general fene. See Earth, Soil, &c.

Dr. Davenant, from a scheme of Mr. King, flates the quantity of land in England and Wales to be thirty-nine millions of acres; which, reckoning the number of inhabitants, as he does, to be 5,500,000, will at an average be 72 acres per head. Davenant’s Works, vol. vi. p. 5. See ACRE, and Expectation of Life.

LAND, in a legal fene, includes not only the face of the earth, but every thing under or over it; so that if a man grants all his lands, he grants thereby all his mines of metal and other foills, his woods, his waters, and his houfes, as well as his fields and meadows.

LAND, in Agriculture, the earth or foil in which plants fix themselves and grow, or which produces crops of different kinds.

It is rated in an able work on the landed property of England, that "land, viewed in the light of agriculture, is the foundation on which it refts, the materials on which it operates, and the visible source of its productions. And that it may generally be considered as being composed of three different parts: the foil, the sub-foil, and the base, or substructure, on which they reft." It is added, that "the foil, or plant-feeding stratum, is not more various in quality than it is in depth. The foils of cultivated lands, however, have their limits as to depth. These limits may, it is conceived, be fixed at three and fifteen inches. For although, in many inftances, the component parts of land are perfectly uniform, to a greater depth than fifteen inches, a uniformity of colour and vegetative quality seldom reaches to that depth. The influence of the atmosphere, the fubf-trate of vegetables living and decayed, the operations of animalcule, and larger animalcule, in habit foils, and, above all, the powerful effects of manures, tend to furch the surface mould with qualities which the sub-foil or sub-ftrat has not the means of acquiring. The medium depth of cultivated foils, in England, may, it is imagined, be laid down, with fufficient accuracy for this purpose, at nine inches. For although a majority of the cultivated foils of the kingdom may not reach that depth, the writer is of opinion that the major part of them might, under proper management, be funk to nine inches deep, with advantage in many repects." See Soil.

And it is further rated, that "the sub-foil, or intervening stratum of land, is still less definite with regard to depth. In some inftances, where the cultivated foil refts upon rock, it may be faid to be wanting; though, in most cases of this kind, a stratum of a gravelly nature, composed of broken rock and earth, is found between them. And in many cases, a regular bed of gravel, sand, or other earth, intervenes between the foil and the sub-structure. While in others, an uniform mass of earthy materials reaches to a great depth. If, therefore, a definite thickness, or depth, may be affigned to the sub-foil, it must be, in a degree, arbitrary; or without any degree of accuracy or correctness.

It seems evident, that "the foil, affords nourishment and capability to agricultural plants, and that the sub-foil affigns them temperature, with respect to moisture and internal warmth. If the sub-foil is of such a nature, or is so situated as to receive and retain more moisture than is requisite for the natural growth of plants, their health is injured. If it not only holds water in its own pores, but freely communicates to that of the foil, the more valuable plants in agriculture give place to ranker herbage, let the surface foil be what it may. On the contrary, if an open stratum of sufficient depth intervenes between the cultivated foil and the base, to permit the superfius moisture which filters through the foil, or which is communicated subterraneously, to pass off, the plants in cultivation will be relieved from collected moisture, in the immediate region of their feeding fibres; though the sub-structure may be charged to the fill with water. Hence, where nature has not furnished land with this valuable interstratum, it is the business of art to remedy the defect, in some way or other, and which in general "is to be done by draining off the superfuous moisture to a sufficient depth to prevent its evil effects on the soil, and thereby supplying the required stratum." It is however well observed, that "in doing this, the artificer must be led by the given properties of the base, and can seldom lower it to any determinate or arbitrary depth. Nevertheless, it will be right, before he proceeds further, to endeavour to form an adequate idea of the medium depth required; in doing which, much, he says, depends on the specific quality of the subfoil. Sand will hold up water that is lodged at its base to a much greater height than gravel. A stratum of gravel of one foot in depth forms a drier subfoil, than a bed of sand of twice or three times that thickness. But clean sand or gravel is rarely found in land; sand and gravelly loams being the more ordinary materials of absorbent subsoils; and these are capable of raising and holding up water to a considerable height. Let us, therefore, admit that effective subsoils may vary from one to two feet, and fix the medium depth at eighteen inches." And "by thus fixing the mean depth of soils at nine inches, and that of subsoils at eighteen inches, place the base or substructure of the land at twenty-four inches beneath its surface; which is a depth of land that is equally conformable with theory and with practice. To this depth drains may be sunk, at a moderate expense; and covered stone drains of this depth may be rendered effectual, yet free from injury by the superficial drainage. In the practice of skilful workmen, the depth of ordinary subsoil-drains varies from eighteen inches to three feet, according to the circumstances of the given case, and the method of draining employed."

After this general view of the component parts of land, and of their due arrangement, the common varieties of it, as they are given by foil, subfoil, and base, may be enumerated and considered. In the execution of which it may be proper to divide lands into classes, and mark the varieties of each.

First Class. — This comprehends, according to the above writer, such lands as are liable to surface water only with their absorbent strata (if any) open, so as freely to discharge the superfuous water they receive upon them: the varieties of
of which are first, where "the soil, the subsoil, and the base are repellent, or in a state of moistness, impermeable by water, as clay and strong deep clayey loam." The second, where "the soil is repellent, the subsoil absorptive, the base repellent." The third, where "the soil is repellent, the subsoil and base absorptive, or in a state of moistness, condensing water; as sand, gravel, open rock, and the lighter more open loams." The fourth, where "the soil, the subsoil, and the base are absorptive." The fifth, where "the soil and the subsoil are absorptive, but the base repellent." And the sixth, where "the soil is absorptive, the subsoil repellent, and the base absorptive or repellent.

2d Clafs.—This includes such lands as are liable to surface-water only, with their absorbent strata closed, or permitting an imperfect discharge, either for want of sufficient deficient, or by reason of impervious strata, or beds of impermeable materials. The varieties of which are, first, where "the soil is repellent, the subsoil absorptive, and the base repellent or absorptive." The second, where "the soil and the subsoil are absorptive, but the base repellent, or absorptive." The third, where "the absorptive and repellent strata, or masses, are thrown together irregularly; or not disposed in regular strata, which correspond with the surface," or upper part.

3d Clafs.—This comprises such lands as are liable, not only to surface-waters, but to those which are subterranean, and which either descend from higher grounds in their respective neighbourhoods, or rise beneath them from subjacent referrers; the absorbent strata of this clafs being closed, and thereby rendered retentive, as in the second clafs, or kind of land. The varieties of which are, first, where "the soil is absorptive or repellent; the sub-strata absorptive and closed, and uniformly charged with descending waters, by an even stratum of gravel, free-fall," or some other similar material. The second, where "the fame soil and sub-strata are partially charged with descending waters, through veins of land or gravel, or fissures of rock, &c." The third, where "the soil is repellent or absorptive, the sub-soil absorptive and closed, and uniformly charged with descending waters; the base repellent, with a sub-base freely absorptive and open." The fourth, where "the soil is absorptive or repellent, the sub-strata uniformly absorptive and closed, and charged with rising waters." And the fifth, where "the soil is repellent or absorptive, the sub-strata complex and closed, and charged with rising and descending waters."

It may be observed, that the nature of these different kinds, or classes of lands and their varieties, with that of their different constructions, the effects to which they are each particularly exposed from a superabundance of water, the methods of removing such wetness, both with the view of ameliorating the lands for the purposes of cultivation, and that of providing supplies of water for economical uses, as the working of light machinery, the consumption of pasturing-flock, and in particular cases, where a sufficient quantity can be procured, for the watering of land, will be fully considered in their proper places; and many useful observations may be found in the work here alluded to, especially in what relates to drainage. The two objects of applying water to the use of live-flock, and that of irrigation, should constantly be kept in the mind of the improver of the soil. See Soil, Watering of Land, and Draining of Land.

It is sufficiently evident, from various circumstances in the management of lands, that some parts are much better calculated for the production of grain crops than those of the grasses kind; while, on the contrary, others are much more suitable and better adapted to the raising of grasses than those of the corn kind; and that there are still others that may be cultivated under a convertible system of corn and grass, with more success than either of the methods separately.

It may be remarked, that all those lands which possess a sufficient degree of dryness, whether they have much depth of mould or not, and which, in their natural state, have but little tendency to produce good herbage, such as those covered with different sorts of coarse plants and vegetable productions, whether in an open or enclosed state, are proper for tillage. And it has been well observed by Mr. Davis, that grounds of this nature are of considerably more value when in a state of tillage than in pasture; as they are particularly adapted to the improved methods of cultivation, and in addition to the quantity of grain to be produced from them, will afford a greater quantity of vegetable food for animal stock, when in a tillage state, than they did when kept entirely in that of pasture or sward. The fame writers, likewise states, that there are various other descriptions of light lands that may be kept in a state of tillage with more advantage than in that of grass, as they are peculiarly suited to those improved modes of cultivation that are necessary for raising large supplies of green-food for the support of live-stock of different kinds. That the poorer sorts of lands, where marl, clay, chalk, or other similar substances, can be readily procured, are much more proper for the purposes of tillage than those of grass, is sufficiently shewn by the improvements that have been made in many of the more southern districts of the kingdom. And that lands of the chalky kind, whether of the more superficial or deep descriptions, are, in most cases, better suited for tillage than grass, is proved from their wetness in the winter season, and their openness and friability in the summer, rendering it almost impossible to establish good herbage upon them. Besides these, there is another sort of land that is better for the purposes of tillage than those of grass, which is that which, in the state of grass, is constantly so disposed to the production of moss, as to afford but a very scanty share of good herbage in any circumstances.

It has been stated by the author of "Practical Agriculture," that "most of the clayey and more heavy descriptions of land, especially when situated in valleys, or other low confined exposures, though they may be capable of affording good crops of particular kinds when under the plough, as those of the wheat and bean kind, are, on account of their retention of moisture, the increased expenses of labour, and the uncertainty of feeon for tilling them, as well as their inaptitude for most other sorts of crops, and their fitness for the production of good herbage, much more beneficial in the state of grass than in that of tillage. When there is an opportunity of procuring sea-fall, and of applying it at an easy expense, they may, however, be observed, be converted to the purposes of tillage in a profitable manner. Most of those strong cold grass-lands which, in a state of tillage, would be improper for the growth of turnips, and other applications of improved cultivation, should also constantly remain in a state of grass. And likewise those lands that are situated near large towns, where manure is plentiful, and, of course, capable of being procured at a reasonable rate; and where the produce of such lands is always in great demand, and therefore capable of being disposed of to great advantage. Such lands as are situated on the banks of large rivers or brooks, which are capable of being improved by means of watering, are likewise more beneficial when kept constantly under the grass system than any other mode of cultivation that can be practised. The lands of a calcareous nature, which are distributed in the valleys of the more mountainous districts, where old grass-land is scarce, and of much importance, and most part of that in the state of tillage incapable of being converted to the condition
of good grass, may also, it is believed, be the most advantageous when continued in a permanent state of herbage.

But that "the forts of lands that are the most adapted to the practice of convertible husbandry are those of the loamy kinds, which are not too strong for the growth of turnips. These, in all their different varieties, are capable of being changed from the state of tillage to that of grass, and the notorious, not only without sustaining any injury, but frequently with the most evident advantage, as the practice of some of the western and midland districts has fully proved." And "the richer kinds of sandy lands are, in most cases, also well suited to this fort of husbandry; especially where marsh is at hand, to be applied at the time of laying them down to grass. Grounds of the peaty fort may likewise, in many cases, be the most beneficially employed in this mode of culture, as from their producing little else than plants of the aquatic kind, it is obvious that they must be absolutely destroyed, and those of the proper grass kind be introduced, before any useful herbage can be produced. And this is capable of being accomplished in by much the most perfect manner under the state of tillage. But as they are, in most instances, much too tender and moist for the purpose of remaining long in the state of tillage, as soon as the above intention has been fully effected, they should be restored to the state of permanent grass," other as meadows or parklands. See Ground and Soil.

Land Carriage, in Rural Economy, that fort of conveyance which is performed on land, which, in many cases, is highly inconvenient, and always greatly expensive and troublesome to the farmer. It should, of course, be as far as possible, in situations that will admit of it, by the facilitating of water-conveyance, by the forming of small narrow canals, which may, in many instances, be done at trifling expense, and thus much lessen the extent or distance of land-carriage. Much has been done in this way, with considerable effect, within the last twenty-five years, in different parts of the country. See Canal and Inland Navigation.

Land-Guard, a fort of fence or embankment constructed of stones, wood, or other materials, on the borders of rivers and brooks, in order to prevent their overflowing and carrying away the land. The cafes in which they become more particularly necessary, are where they are confined in the places where they are required to bend, by rocks or other means, to an unalterable channel; it often takes place in hilly situations, and where deep pools occur in such parts at low water, so as to render it difficult or impossible to provide a good foundation for a pier. The mode of applying and forming these forts of guards, will be explained in considering the nature and manner of guarding river-banks, and confining streams of other kinds. See Embankment, and River-Banks, Guarding of.

Land Mark, in Agriculture, any thing placed as the division of land. These marks were formerly chiefly used for shewing the different lots or divisions in common field-lands, and other forts of commanable land.

Land- Reeve, in Rural Economy, a person whose business it is to overlook certain parts of a farm or estate; to attend, not only to the woods and hedge-timber, but also to the state of the fences, gates, buildings, private roads, drift-ways, and water-courSES: and likewise to the flocking of commons (where there are any), and encroachments of every kind; as well as to prevent, or detect wafte and spoil in general, whether by the tenants of the estate, or others; and to report the same to the manager or land-leeve. It has been observed, that the utility accruing from these inferior officers of an estate occurred to the writer in the Highlands of Scotland; where they have been commonly appointed on every estate, it is believed, from time immemorial, under the name of ground-officers." And he has "seen experienced their utility so fully in England, as to induce him to recommend their appointment on every large estate; not merely as hlep-mates to the acting-manager, but as authentic evidences in matters of dispute, and as intelligent informants to a proprietor in going over, or inquir ing after, the affairs of his estate. Active intelligent tenants, of known integrity, are generally the most suitable persons for having the management of this fort of trust confided in them."

Land Springs, such as tile, or are produced in lands, at some considerable depth, from the water being obstructed in its descent by some fort of impenetrable material, such as clay, &c., and thus forced up to the surface, where it breaks or oozes out, having different appearances, according to the nature of the soil and situation in which it occurs. See Spring, and Draining of Land.

Land Steward, the common name of a person who overlooks, or has the management of a farm or estate. The number, description, and qualities of land stewards must be regulated according to the nature and extent of the property, and the particular circumstances of the proprietor. In order to be fully qualified, according to the author of "The Modern Land Steward," for the proper management of large estates, the stewards should have attained that thorough and correct knowledge of the business of life, that full-tried experience in men and things, which ought not to be expected earlier than the middle age. No material part of their time or attention should be engrossed by their own private concerns, as, in such cases, they must evidently neglect their own, or the business of their employers; and it would be paying human nature too great a compliment to suppose the former. To an ample share of agricultural knowledge, they ought to have a thorough insight into the nature of every improvement of which estates may be capable, whether upon or beneath the surface; or from its local situation, whether inland or upon the sea-coast. Their attention should be also directed to the useful sciences of political economy and political arithmetic, as there is a strict and happy coincidence between public and private wealth. They should be well versed in, and qualified to superintend, the culture of wafle lands, the disposal of timber, the eradication or planting of woods, irrigation and warping, drainage, embankment, and the recovery of land from the sea, the cutting of canals, the laying out and repairing of roads, the construction of bridges, mills, and engines; and be possessed of a con siderable skill in rural architecture of every kind. Nor is it left necessary that they thoroughly comprehend the nature of all the various methods in which money business is transacted; together with the advantage of bargaining in the purchase or sale of estates. Their intelligence ought also to extend to the valuable inventions and improvements of other countries, as well as those of their own; which, whether in the mechanic or agricultural relation, they should use their best means to introduce, and fairly experiment upon the estates under their care, with the honourable and patriotic views both of private and national benefit. In short, with sufficient honesty, a mind amply replenished, a cool, deliberate, and calculating head, a quick discernment, they should lay hold of every occasion, as it springs, to enhance the worth, the reputation, and the embellishment of the property committed to their charge.

For these qualifications and endowments they should have full and adequate allowances, in the way of salaries or wages, according to the service to be performed. Their practical skill in agriculture should particularly extend to the management of cattle, and the common outline, at least, of rural architecture, as far as regards repairs, or ordinary new erections; and they should be thoroughly masters of common accounts,
LAN

It is, on the whole, concluded, that "there is great convenience in land stewardships being surveyors of the highways for the parishes in which they reside; in which case, it lies in their own power to preserve them in a condition creditable to the county and the proprietors for whom they act. Nor ought they ever to be attentive to the conduct of the surveyors of other parishes, in which they are concerned; never permitting the least neglect, nuisance, decayed bridge, or dangerous way; but occasionally, and according to the necessity of the case, making a few examples in a genteel and temperate, but firm tone, always pleading for their punctiliousness, the strict and peremptory orders of their employers, which they dare not disobey." And "the like strictness is, it is supposed, necessary with respect to trespasses from neighbouring cattle; for some farmers are too excessively dilatory in this respect, that they will take no kind of pains either for the security of their own or their neighbour's crops."

It is remarked by the writer of the work on "Landed Property," that on a large estate a resident manager is generally found,—a land steward, a man who has some knowledge of what is termed country business, and who acts under the control of his employer, or of a confidential friend who is more conversant in rural concerns, or perhaps of a law-agent who knows less of them;" and that such residing steward, especially of a detached estate, which lies at some distance from the residence of its proprietor, acts without control. In this case, if he is a man of judgment and integrity, he becomes, at least in the eyes of the tenant, a superior being; frequently, in their minds, a more exalted character than their landlord,—than the proprietor himself, who, perhaps, never deigned to glance his eye upon them or their lands.

But that, "on the contrary, if such postcode manager wants those requisite qualifications, the consequence becomes mischievous to the lands, tenant's, occupier's, their proprietor, and the community. If this unprincipled agent has an interest in the derangement of the estate, and the ruin which will follow, and is suffered to make use of it,—the crime of neglect, on the part of the proprietor, might well be cognizable as a crime against the public." And further, that "similar evils are liable to befal an estate which lies round the residence of its proprietor, if he is equally inattentive" to its proper management and regulation.

Agriculture is considered as the only firm foundation on which the other acquired attainments can be securely reposed. It is not more essentially valuable in the superintendence, than in the improvement of an estate. "It is difficult to become an accurate judge of the value of lands, without a practical knowledge of their uses: nor can any man, without it, properly appreciate the management of occupiers; much less affliah them in correcting their errors, and improving their practice." And that "land surveying is another requisite qualification: not so much, however, for the purpose of mapping and measuring an estate at large, as for checking and correcting the works of professional men; as well as to assist in laying out its lands to the most advantage," and with the greatest propriety. Further: that "some knowledge of mechanics, and the other sciences that are requisite to the business of an engineer, may be highly useful in prosecuting the improvements incidental to landed property, in various ways; as well as a competent knowledge of rural architecture, and the superintendence of artisans, as they may be laid to be of daily use. The nature of planting, and the management of woodlands, are requirements that cannot be dispensed with. Nor should his knowledge and attention be confined to the surface of the estate."
paffage by consequence. The ordinance was, that all houses of husbandry, with twenty acres of ground to them, should be kept up for ever, together with a competent proportion of land to be occupied with them, and in no wise to be levered from them. By these means, the houses being kept up, did, of necessity, enforce a dweller; and the proportion of land for occupation being also kept up, did, of necessity, enforce that dweller not to be a beggar. This statute was renewed in king Henry the Eighth's time; and every person who converted tillage into paffure subjected to a forfeiture of half the land, till the offence was removed. In a law of the 25th of the fame reign, it is set forth, that many farms, and great plenty of cattle, particularly sheep, had been gathered into few lands, whereby the rents of lands had been increafed, and tillage very much decayed; churches and towns pulled down; the price of provifions greatly enhanced, and a marvellous number of people rendered incapable of maintaining themselves and families; and, therefore, it was enacted, that no perfon should keep above two thousand sheep, nor hold more than two farms. In the third of Edw. VI. a bill was brought in for the benefit of the poor, for re-building decayed farm-houses, and maintaining tillage againft too much inclufing. In the year 1698, there was a special commifion from Charles I. for enforcing the statute of the 30th of Elizabeth, by which no cottage was allowed in any county place, without at least four acres of land to it, to prevent the increafe of the poor, by securing to them a maintenance; nor were any inmates allowed in any cottage, to secure the fmal cultivation of the land, by difpacing the people more over it. And by an act in Cromwell's time, no new house was to be built within ten miles of London, unless there were four acres of land occupied by the tenant. Thus did the policy of our ancients discourage inclufing and enclufing, upon the fame general view of their depopulating tendency; and though the increafe of trade and manufactures in more modern times has produced a considerable alteration in the state of our country, and may require fome change in our internal policy, yet it is easy to foresee, because facts justify the apprehenfion, that inclufing and enclufing, to the degree in which they have lately prevailed, will annihilate the fmal occupiers of land, and reduce the inhabitants of the kingdom to two classes, viz. gentry and beggars, or grandees and flates. See this fubjeét more amply difcufsed, and the arguments for and againft inclufions and large farms, flated under Farm, and INCLUFION OF LAND.

As in former times the number of the occupiers of land was greater, and all had more opportunities of working for themselves, it is reafonable to conclude, that the number of people willing to work for others muft have been smaller, and the price of day-labour higher. The nominal price of day-labour, fays an author who wrote a few years ago, is at prent no more than about four times, or at moft five times, higher than it was in the year 1714. But the price of corn is seven times, and of flefh-meat and raiment about fifteen times higher; therefore the price of labour has been fo far from advancing in proportion to the increafe in the expences of living, that it does not appear to bear now halve the proportion to thefe expences that it did formerly. What alternation has taken place since these observations were made, we leave others to determine. See on this fubjeét Price's Observations on Reversionary Payments, Supplement, p. 383, &c. Appeal to the Public on the Subject of the National Debt, p. 93, &c. See Labour, and LABOURERS.

For the different kinds of inclufion, see EARTH-banks, FENCE, HEDGE, and WALL.

LAND, Arable. See ARABLE.
LAN

dana, by the king of Bantam, to whose crown they were appendages.

LANDAFF. See Llandaff.

LANDAFF, a township of America, in Grafton county, New Hampshire; incorporated in 1774, and containing 461 inhabitants.

LANDAU, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the district of Wilmsborg, situated on the river Queich, which runs into the Rhine; containing four churches; formerly imperial. The place contains 5125; and the canton 15246 inhabitants, on a territory of 48736 kilometres, in 18 communes. N. lat. 40° 13' E. long. 9° 15'—Alfo, a town of the county of Waldeck; 12 miles N. of Waldeck.—Alfo, a town of Bavaria, on the Ikr; 32 miles W. of Paffau. N. lat. 48° 36'. E. long. 12° 37'.

LAND-CHAP, an ancient customary fine, paid either in cattle or money, upon the alienating or selling of land in certain manors, or within the liberty of certain boroughs.

At Malden in Essex, a payment is still made of 13d. in every mark of the purchase-money for lands and houses sold in that town, which is called land-cheap.

LANDE, in Geography, a town of Norway; 36 miles N. of Christflund.

LANDECK, a town of the duchy of Warsaw; 48 miles N. of Gnefna.—Alfo, a town of the county of Tyrol, on the Inn; 39 miles W.S.W. of Innsbruck.—Alfo, a town of Prussian Pomerelia; 64 miles S.W. of Dantzig.—Alfo, a town of Silefla, in the county of Glatz, on the Biela; 8 miles S.E. of Glatz. N. lat. 50° 15'. E. long. 16° 40'.

LANDED INTEREST, a term opposed to monied interest, in political considerations; though there is a near connection between them; for the landed interest is affected by foreign trade. See Monied Interest.

The foreign trade of every country must decline, that 1. Lays unequal taxes in general on its people. 2. That cramps its commerce, the fountain of riches, by high duties, and impolitic prohibitions. 3. That fuffers many monopolies. 4. That opprefles its people by prohibiting the importation of viéuals, under the pretence of raising the value of its lands. 5. That encourages idlenefs, by bad laws relating to its poor. 6. That tempts foreigners to carry away its coin for lefs than its intrinsic value. 7. That makes the obtaining justice chargeable. 8. That fuffers a heavy national debt, contracted in time of war, to continue unpaid in time of peace.

The reafon why the decline of foreign trade finks the value of land is, 1. Because it finks the markets at home. For, the produce of land being rendered excufively dear from the caufes above enumerated, foreigners will not take its fuperfluities; and labour being by the fame caufes rendered excufively dear, we cannot manufacture or improve that produce, becaufe nations which can afford cheaper supplies the markets abroad; fo that the produce of the lands, not being carried off as ufual, muft become a dead flock on the farmer's hands, and caufe great quantities to be crowded into markets, where, being encouragement but for few buyers, the price naturally falls; as, for infance, the declining demand of our woolen goods abroad finks the price of wool at home.

2. Because it increases the number of poor, to burden the land.

3. Because it diminishes the number of people; for, as employment lefens, the moft induftrious, rather than idle here, will fly to other countries, where trade can maintain

them. So the consumption of these being taken away, the demand at market must grow lefs, and of course rents must fall, yet the farmer's charges must grow greater; for the fewer the hands, the higher wages are; this muft break him in the end, and produce all the confequences following that misfortune. Besides, men who trade bring in money; therefore the fewer they are, the lefs money will be brought; and the lefs money, the lefs rent can be given for land.

4. Because the decline of trade diminishes our riches. This is a confequence of the above remarks; for having fewer goods capable of being exported by reafon of their dear price, and our manufactures declining, muft in time be loft; therefore the importation of foreign goods muft naturally increase, and more money go out to pay for them.

Nations that have no mines of gold and silver, have no means to get them but by foreign trade; and according to the quantity of the metals they possess, the price of their commodities, and therewith the value of their lands, rise and fall in proportion, which fhall now be proved.

According to Dr. Davenant, the whole rental of England, in 1660, did not exceed six millions per annum, and the price of land was twelve years purchase; in 1688, the rental was fourteen millions, and the price of land was eighteen years purchase: fo that, within this period, the landed interefl rofe from seventy-two to two hundred and fifty-two millions; and this advance was owing to an increafe of trade.

The Britannia Languens, page 12, fays, that if there were but five hundred pounds in England, an ox could hardly be worth a penny; therefore the rent muft bear its proportion to the riches. This appears by Maitland's History of London; for he fays, that, in the year 961, land sold at one shilling per acre. The reafon that land then bore fo low a price, was the low price the produce fold at; for he fays, that, in the year 1000, an ox fold for 2l. 6d., a cow for 2l. a heep for 1l., and a swine for 8d.

In 1445, wheat was at 4l. 6d. per quarter; in 1447, at 5l.; in 1448, at 6l. 8d.; in 1449, at 7l. 5/; a bullock, in 1445, was 5l.; a heep 2l. 5d.; a hog 1l. 14d.; clothing for a year, at the fame period, of a common fervant of hublhandry, 3l. 4d.; of a chief carter, and two falter, 4l.; of a bailiff of hublhandry, 5l.

In 1512, the mean price of wheat in Yorkshire was 6l. 2d.; the price of malt was 4l. and of oats 2l.; fo that the nominal price of grain at this time was about a feventh of its nominal price for the last twenty years; reckoning from the time when the author below cited wrote. The price of a fat ox, at the fame time and in the fame county, was 1l. 4d.; of a lean ox, 8s.; of a wether, 1l. 8d.; of a caif, 1l. 8d.; of a hog, 2s.; fo that the nominal price of meat was no more than about a fifteenth of its presents price, and bore the fame proportion to the price of corn that it would now bear, were it at half its present price. In an act of parliamment of the 29th of Henry VIII. bee, veal, pork, and mutton, are mentioned as the food of the poor, and their price limited to about a halfpenny a pound. Beef and pork in particular were fold in London at 2s. 8d. 1s 3d. for a penny; at the fame time that wheat was at 7s. and 8s. a quarter, and bore the fame proportion to the price of flicb as it would bear now, were it about 4l. a quarter. In 1549, wheat was in London 2s. per quarter, malt 10s., barley 9s., rye 6s. 6d., oats 4s., a middling ox 17s., a wether 3s. 4d. and a penny in pound, and a heep a halfpenny a pound. See the citations in the Supplement to Price's Observations, &c. p. 385, &c. This could be only owing to the little foreign trade the nation had.
had at these respective periods, and consequently, to the little quantity of gold and silver which trade had then brought in.

But if it should be asked, What is the reason that, at present, all things are naturally so much advanced in price, to what they were in those days? the answer is, that the quantities of gold and silver brought to Europe since the progress made by the Spaniards and Portuguese in America, have made those metals more common, and of less value than formerly; so that 20s. will hardly purchase what 1s. would before the difcovery of the West Indies. On this subject, see the article INTEREST. To which may be added, the great increase of our national debt and taxes, together with the circulation of the interest of the principal of the public funds; and likewise that great circulation of paper credit in trade occasioned by notes and bills, which, by promoting an artificial circulation of property, raise the price of commodities, and give the appearance of wealth to the nation; though they are really the characteristics of a declining state. Pol. Dict. Com.

The dearth of commodities and the cheapness of money are the same things.

LANDEGODE, in Geography, a small island in the North sea; in the coast of Norway. N. lat. 69° 25'.

LANDEN, John, in Biography, a celebrated mathematician, was born at Peakirk, near Peterborough, in Northamptonshire, in January 1719. He became an early proficient in mathematical science, was a contributor to the Ladies Diary in the year 1744, and was one of the most ardent friends to that very useful publication. He contributed to this annual work till within a few years of his death. The life of Mr. Landen was far from eventful one. He passed the earlier part of his life, as a farmer, at Walton, near Peterborough, at the same time he gave mathematical instructions to several young persons in the neighbourhood. From Walton, Mr. Landen, in 1752, removed to Milton, the seat of earl Fitzwilliam, to undertake the busines of land steward to his lordship; and in this situation he remained till within a year or two of his death. To return to the mathematical labours of our author.—He published, in the Philosophical Transactions for the year 1754, "An Inveiglement of some Theorems, which suggest several very remarkable Properties of the Circle, &c." and in the following year he published a volume, intitled "Mathematical Recumbents." This title was intended to inform his friends and the public, that the study of mathematics was at that time rather the pursuit of his leisure hours, than his principal employment. They contain a variety of tracts relating to the rectification of curve lines, the summation of series, the finding of fluents, and many other points in the higher parts of mathematics. From this time to the year 1766 he gave the world several valuable works; and on the 10th of January of this year, he was elected a fellow of the Royal Society; five after which he inerred in the Philosophical Transactions. "A Specimen of a new Method of comparing curvilinear Areas," by means of which, many areas are compared, that did not appear to admit of comparison by any other method; a circumstance of considerable importance in that part of natural philosophy which relates to the doctrine of motion. These are but a small part of the works which he produced, and which have given celebrity to his name. In the years 1781, 1782, 1783, he published three small tracts "On the Summation of Converging Series," in which he explained and shewed the extent of some theorems which had been given for that purpose by Dr. Moutre, Sterling, and Thomas Simpson, in answer to what he conceived to have been written in disparagement of those excellent mathematicians. Mr. Landen was author of a work published in two volumes, and at different times, intitled "Memoirs." The second volume contains his last labours on the solution of the general problem concerning rotatory motion. It comprises also a resolution of the problem relating to the motion of a top; with an investigation of the motion of the equinoxes, in which Mr. Landen has, first of any one, pointed out the cause of sir Isaac Newton's mistake in his solution of this celebrated problem. He lived to see the volume completed, and received a copy of it the day before his death, which happened January 17, 1790, at Milton, in the 71st year of his age. Mr. Landen was not only distinguished by his eminent talents as a mathematician, but by the excellence of his moral character. His temper, however, was not a good one; and he was too apt to look with contempt on those whom he deemed his inferiors. His MSS. were sold for waste paper; a circumstance that did not reflect much credit on those persons who came in possession of them.

LANDEN, in Geography, a town of France, in the department of the Oute, and chief place of a canton, in the district of Huy, situated on the river Becke; 17 miles W.S.W. of Liege. The place contains 642, and the canton 9265 inhabitants, on a territory of 824 square miles, in 25 communes.

LANDERNEAU, a town of France, in the department of Finistere, and chief place of a canton, in the district of Brest. The place contains 3575, and the canton 15804 inhabitants, on a territory of 180 square miles, in 9 communes. N. lat. 48° 27'. W. long. 4° 10'.

LANDERON, a town of Switzerland, in the principality of Neuchatel; situated at the S.W. extremity of the lake of Bienne, and inhabited by Roman Catholics; 7 miles N.E. of Neuchatel.

LANDES, in France, formed of Landes and Chalot, districts of Gascogne, in N. lat. 44°, a maritime territory between Lower Pyrenees and Girond; bounded on the N. by the department of the Gironde, on the E. by that of Lot and Garonne, and Gers, on the S. by the Lower Pyrenees, and on the W. by the sea, containing 468 square leagues, and 255,889 inhabitants, and divided into three circles or districts, viz. Mont-de-Marfa, which has 72,068 inhabitants, St. Sever, including 78,125, and Dax, with 77,796 inhabitants, 28 cantons, and 368 communes. Its contributions amount to 145,376 fr. and its expenses charged on the departments are 205,769 fr. 62 cents. The soil of this department is for the most part sandy and unfruitful, the N. and W. parts confining of heath and marshes, and poorly cultivated. Some parts, however, towards the S.E. are more fertile; and this department yields some grain, fruits, and excellent pastures. It has also forests of pines, quaries, and mineral springs. Its chief town is Mont-de-Marfa.

LANDESHUT, a town of Sleia, in the principality of Schweidnitz, on the Bober. The town was founded in 1292, and it has a Latin school, a Roman Catholic church, and by permission and purchase a Lutheran church. Its linen trade is flourishing; 18 miles W.S.W. of Schweidnitz. N. lat. 50° 30'. E. long. 15° 55'.

LAND-FALL, is a sea-term, signifying to fall in with the land, or the first land discovered after a sea-voyage.

LAND-FALL, Good, is when a ship makes or leaves the land, as she expected, according to her reckoning. The contrary is called a bad land-fall.

LAND-GABLE, an ancient term for a tax or rent,

ILLU
LANDGRAVE, formed of the German land, earth, and graff, or grave, judge, or count, a name formerly given to those who executed justice on behalf of the emperors, with regard to the internal policy of the country. The title does not seem to have been used before the eleventh century. These judges were first appointed within a certain district of Germany; in process of time the title became hereditary, and these judges assumed the sovereignty of the several districts or countries over which they presided. Landgrave is now applied, by way of eminence, to those sovereign princes of the empire, who possess or by inheritance certain estates, called landgraviats, and of which they receive the investiture of the emperor. There are four princes who have this title, viz., those of Thuringia, Holstein, Alfac, and Leuchtenberg. There are also other landgraves who are not princes, but counts of the empire. See Count.

LANDGUARD FORT, in Geography, an English fort, situated on point of land at the S.E. extremity of the county of Suffolk, at the mouth of the rivers Orwell and Stour, opposite to Harwich; furnished with a garrison, under the command of a governor, and a platform of guns to defend the coast.

LANDGUARD, a point on lake Erie, in Upper Canada; formerly called Point aux Pins, situated in N. lat. 42° 4' 15". To this place there is a great resort of Indians in the spring, on account of the abundance of fish and fowl, which may be then taken. This point is about twenty miles E. of the South Foreland, and bears the only pine timber on this coast.

LANDI, Ortenso, in Biography, was born at Milan about the middle of the sixteenth century: he was educated at his native place, and at Bologna. Being in necelous circumstances, he attempted to gain a maintenance by the practice of physic, which he exchanged, in a very short time, for theology, and entered into the order of St. Augustine. It has been said by some writers that he apostatized from the church; but others say that in this particular he has been mistaken for a different person. While at Milan, he published two dialogues, entitled "Cicero relegatus," and "Cicero revocatus," which he feigns to have been held by a company of learned men in 1533. His next work was entitled "Testimonia Quaestiones," in which, under the signed name of Philalethes, he treats, in an entertaining manner, on the councils, creeds, diversities, and inhabitants of the different cities of Italy. It was published at Naples in 1536. He then travelled into France, and contracted a close friendship with Stephen Dolet, who was afterwards burnt as an atheist. Upon his return to Italy, he entered lucratively into the service of the bishops of Trent and Catania. In 1540, he published a dialogue against Erazmus, who had been dead four years, and on account of which he was severely handled by an able antagonist. While he was at the court of Francis I. in 1543, he published his two books of "Paraadoxes": these he soon found had been written with too great freedom, and as they began to excite considerable attention, he thought proper to answer them himself anony-
mously, and in his reply he is said to have treated himself with as little ceremony as any real or agent would have done. In 1544, he travelled through Germany, and afterwards through the different provinces of Italy, which he described in a work entitled "Commentario dell' opere noti-
bili et notorifice et d'Italia e altri luoghi." He is sup-
posed to have died soon after the year 1560, leaving behind him many other works besides those which have been enumerated. He lived in friendship with several of the learned men of that age, by whom he has been much praised. Gen. Biog.

LANDINGS, in Architecture, the first part of the floor at the head of a pair of stairs.

LANDINO, Christopher, in Biography, an Italian scholar, was born at Florence in 1434. He studied first at Volterra, under Angiola di Todi, by whom he was so much beloved, that he not only maintained him a long time at his own expense, but at his death bound his heirs to support him three years longer. He was intended by his father for the law, and was by him obliged to pursue it; till he obtained the liberal patronage of Colino and Peter de Medici, by which he was enabled to return to his favourite pursuits, and indulge himself in the study of the Platonic philosophy. He became one of the chief ornaments of the Platonic academy at Florence, and lived in strict friendship with Poliziano, Faenza, and others of its members. In 1457, he gave public lectures on divine literature at Florence, which contributed to the progress of learning in that period. At an advanced age he obtained an office in the state, and was presented with a palace for his residence. He died in 1504, at Prato Vecchio. His "Latin Poems" will bear a comparison with the most able compositions of that age. He wrote commentaries on Virgil and Horace, and Dante, which went through several editions. He translated Pliny's "Natural History" into Italian, and was author of "Dialogues on the Nobility of the Mind," and other pieces connected with moral philosophy. He composed some Latin and Italian orations, which were printed.

LANDIVISIAN, in Geography, a town of France, in the department of Finistere, and chief place of a canton, in the district of Morlaix; 10 miles N.W. of Morlaix. The place contains 2124, and the canton 11,460, on a territory of 150 kilometres, in 7 communes.

LANDIVY, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Mayenne; 18 miles N.W. of Mayenne. The place contains 1872, and the canton 11,223 inhabitants, on a territory of 1874 kilometres, in 8 communes.

LAND-LOCKED: a ship is said to ride land-locked, when she is surrounded with land, that is, at anchor in a place where there is no point open to the sea, so that she is safe from the violence of winds and tides.

LANDO, pope, in Biography, a Sabin by birth, succeed to the pontifical throne on the death of Anastasius III., in the year 913. He was indebted for his elevation to Theodore, and her daughters Marozia and Theodora, all of them no less famous for their beauty, their wit, and address, than infamous for the scandalous lives which they led. Landi died within about six months of the time that he was elevated to the papal see, and during that short reign he did nothing worthy of note, or that need be recorded in this work. Moretti. Bower.

LANDREGIES, in Geography, a town of France, in the department of the North, and chief place of a canton, in the district of Avesnes, seated on the Sambre. It was taken from the Spaniards by the French in 1655, and continued in their possession by the peace of the Pyrenees, when they enlarged its fortifications, and made it one of the strongest places in the country. It has only two gates, one towards the east, called the "Gate of France," and the other towards the west, called the "Gate of Quefnavy." It suffered severely by the siege of 1704, and surrendered to the allies; but in the same year the garrison, consisting of 20,000 men, surrendered to the French. The place contains 8687, and the canton 8865 inhabitants, on a territory of 90 kilometres, in 9 communes. N. lat. 50° 14'. Long. 3° 45'.
LANDRIANO, a town of Italy; 11 miles S.S.E. of Milan.

LANDROAL, a town of Portugal, in Alentejo; 13 miles N. of Mourao. N. lat. 38° 35'. E. long. 7° 12'.

LANDSBERG, a town of Prussia, in the province of Natanger; 26 miles S. of Königsberg. N. lat. 54° 14'. E. long. 20° 30'.—Alto, a town of the duchy of Stiria; 24 miles S.W. of Graz.—Alto, a town of Germany, in the county of Hoya, on the Wefer; 6 miles S.S.W. of Nieu-enburg.—Alto, a town of Silezia, otherwise called Gerseve, in the circle of Oppeln, on the borders of Poland; 30 miles N.E. of Oppeln. N. lat. 51° 3'. E. long. 18° 20'.—Alto, a town of Bavaria, on the Lech; 18 miles S. of Augsburg. N. lat. 48°. E. long. 10° 51'.—Alto, a town of Saxony, in the circle of Leipzig; 14 miles N.W. of Leipzig. N. lat. 51° 34'. E. long. 12° 11'.—Alto, a town of Brandenburg, in the New Mark, on the Warta; containing three churches, a royal magazine, and several manufactories of stuff and cloth, with a considerable trade in wool; 20 miles E.N. of Cuff- tin. N. lat. 52° 48'. E. long. 15° 20'.—Alto, a town of Brandenburg, in the Middle Mark; 14 miles E.N. of Berlin. N. lat. 52° 35'. E. long. 13° 48'.

LANDSCAPE, or LANDSKIP, the view or prospect of a country, extended as far as the eye will reach.

LANDSCAPE Painting, is that peculiar application of the art of painting, which reproduces extended views of whatever is attached to the surface of the earth as mountains, rocks, woods, buildings, &c. It is even applied to views of the sea, particularly when any portion of the land is seen; and, in the general division of the practice of the art into four principal branches, landscape-painting includes all representations of the sea alone; although, in common discourse, they are generally termed according to their character: as a calm at sea, a storm, a sea-fight, &c. &c.

The great points which the artist ought to aim at, who practises landscape-painting, are, to mark just proportion and true perspective; to obtain a free and varying touch, which may fully characterize the various objects he must of necessity call upon to imitate; and to produce the effect of space, or what is technically termed distance.

There are two kinds of proportion which require attention in order to produce a pleasing landscape. One is, between the quantum of the surface of the picture appropriated to the sky, and that allotted to the earth or the figures intended to be introduced, be they mountains, houses, rocks, or trees; and the other is that of the various parts of the picture, reciprocally, according to their various distances in the scene. Of the latter, after the size of the objects on the fore-ground is determined, perspective is the sole regulator: therefore a knowledge of the principal rules of that science is here absolutely requisite.

With regard to the former of these proportions, the subject of the picture will undoubtedly furnish the best means of deciding justly. If the scene be mountainous, viewed from below, and at a short distance, the space allotted to the sky must be small and near the top of the picture. If, on the contrary, the view be of an open champaign country, the reverse will be the just characteristic of the picture; and the sky will occupy by far the larger part. It is by no means affirmed that this will always be the case, as for instance, if the view of a plain be taken from a great height, then of course the horizon will rise very high; but this would have more the character of a plan, than a picturesque or natural view. Common sense points out the rule in the two prefupposed cases; but it is not easy to regulate this matter in ordinary compositions, whereas, to make the work captivating, it is of much more importance than is generally imagined, and a large demand is made upon taste to regulate it. In general, much more grandeur is acquired by a low horizon, and an ample space of sky, than by any other proportion; and next in effect to that, is the direct reverse. In both, it is the quantity doubled that produces the impression; and this principle holds good, not only in landscape, but in all other subjects on which the art is employed. In fact, the general principles of the art of painting are applicable in all its different branches. The same selection in the style of design, or rather choice of nature; the same aims in composition; the same contrasts in arrangements of colour, except that they can never, or very rarely, be so powerful in landscape, as where the picture represents animated or artificial objects. In landscape not only are the objects fit to be introduced, of a class which are not fraught with strong colours, particularly of red or blue, but being surrounded by open air, and receiving reflections of light and colour in every direction, their natural vividness is diminished; and as they recede from the eye, the delicacy of the atmosphere intervening between them and the spectator, envelops them in a mist, and renders them indistinct in various degrees; till in the extreme distance it reduces all colours to one hue of a light greyish blue, almost intermingling them with the sky.

It is by the intervention of this grey hue in the atmosphere, which arises from reflections of light thrown off by particles floating in the vapours which hover upon the surface of the earth, (aided by diminution of form,) that the effect of distance is produced; and to imitate this with truth, and in a tone correspondent to the kind of day or season which is selected for representation, is one of the principal difficulties of landscape painting.

It is vain to attempt to give rules for overcoming this difficulty. Different matters have proceeded by different ways to gain possession of this desideratum. Claude, in one style, and Wilson in another, have both admirably effected it. One by tumbling a grey, or air tint, over the distant parts; the other by working the tints in the body of colours. Observation of their pictures, with taste cultivated by a long continued observance of nature, is the only means of acquiring a just feeling of the simplicity and purity exhibited in her works, and the consequent power of representing them in all the varied effects the exhibits; either in her more gay, or sombrous moments; when the face of the earth is illumined with sunlight, and sparkling with lilute; or when clouds bedim and envelop its beauties in shade; and the forms of distant objects are lost in the whirlwind and the storm.

Though landscape-painting has not the same powerful means to work with as historic painting, which enjoys the great advantage of animation and expression in its subjects, and likewise presents the greatest difficulty to overcome; yet no true and enthusiastic lover and observer of nature, can avoid acknowledging, that it possesses the power of exciting great interest in the mind. A forest represented by the pen of Gaspard Poussin, or a calm by that of Claude, will not fail to impress the observer with ideas of terror, or gentleness. The one, who skillfully traced the paths of the wind in its ravages, and the deformity produced by the falling shower; and the other, who loved to dwell upon the beauties of the earth, in moments of undisturbed tranquillity, equally interest our feelings, and excite those emotions which such varied circumstances in nature are calculated to inspire. Compared with such views of the higher objects and arts of art, the practician in landscape-portrait painting, or one who paints views in particular spots, sinks into about the same ratio, as the portrait painter of mankind holds to him who engages his talents in the representations of history. Yet still his task is not devoid of pleasure or interest.
The same principles are required for practice, but they are unfortunately often obliged to yield to peculiarities which destroy their simplicity and prevent their effect; unless the artist has obtained that extraordinary talent of introducing casual circumstances, such as ideal shadows, accidental reflections, and agreeable figures, in such a manner as to unite or improve imperfect forms, and guide or attract the eye from disfavourable parts. As is the aim of the improver of grounds, or, as he is now termed, the landscape gardener, such ought to be that of the landscape painter. Wherever blemishes in form occur, they should be hidden, and where natural beauties are bestowed, they should be exhibited to view; and adorned with proper adjuncts of trees, water, clouds, or figures. A person not conversant with the powers of combination and contrast in design, can have no conception of their extraordinary power to heighten the effect of the slight scenes, and the meanest objects. It should therefore be the principal task of the artist to observe those which are constantly occurring among natural objects, their effects, and the different sentiments they excite; so that he may possess a store to recur in, in time of need.

The beauty of landscape-painting depends very much upon simplicity of selection, and clearness and freeness of colour. The former should not only govern the choice of objects or scenery, but also the manner of representing them, i.e., the artist must not attempt to delineate all the forms he sees in a tree or a rock; that would not only be an almost endless labour, but an imperfect one, even when the greatest skill was exhibited: his duty is rather to select those forms which more immediately characterize the object, and mark them only; taking care to avoid heaviness.

Of this kind was the practice of Titian, Claude, Domenicino, Poussin, Mola, and all the best landscape-painters of the Italian school, and Rubens and Rembrandt adopted it; whilst Hobbima, Ruyfelaer, Both, Wynants, and almost all the Flemish school, by attempting too minute an imitation in smaller matters, lost dignity and even interest.

Among those who have practiced with success this delightful branch of the art of painting, the name of Claude Gellée, usually known by that of Claude de Lorraine, deservedly stands pre-eminent. He may have been surpassed by Titian in wild and romantic scenery, and grandeur of style in design, but neither he nor any other has ever equalled Claude's truth and purity of colour and effect. Hitherto the perfection with which he has represented the effect of the atmosphere is unrivalled. Even Corot and our own Wilton, who have arrived the nearest to him, fall short his completion of effect. Their art is more apparent than his in his best works; and great chaliness and sweetness of taste appear generally to have governed his choice of scene and of parts. Nicolo Poussin has left a great number of highly interesting landscapes, in a style peculiarly his own. He appears to have delighted in the hues of the earth and trees after wet, and without sun; and in the tones of twilight; which admirably coincides with his choice of scenery and the classic objects he introduced into it. His nephew Gaspar succeeded in another track, and made pictures from the scenes which the Apennine mountains afforded him; which, while they were wrought with great freedom, still bear too much of the air of porcelainature, and too often lack atmosphere. The same may be said in greater degree of the works of Salvator Rosa, who delighted to represent the most wild and defect scenes of nature; which he executed with a touch in perfect consonance with their character. It was with Wilton, as we have above mentioned, that the taste and talent of Claude for producing the air-tint, (as that which produces the effect of the atmosphere is technically termed,) was most powerfully revived: and of him it may truly be said, that had his patience in completing his pictures been equal to his taste in colour, composition, and effect, the ancient master might have fallen under the modern one; and we should have had to hoist, that the greatest painter of landscapes the world ever produced, was an Englishman.

LANDSCRON, in Geography, a town of Bohemia, in the circle of Chrudim; 27 miles E. of Chrudim. N. lat. 49° 50'; E. long. 16° 23'.

LANDSCRON, a town of Prussia, in Natangen; 18 miles N.E. of Heilperg.

LANDSCRONA, a fortified sea-port town of Sweden, on the W. coast of the province of Skane, on an island near the Sound; a staple town, with a good harbour. The harbour lies between the continent and a small island, and is 20 feet deep; 12 miles S. of Helsingborg. N. lat. 55° 52'; E. long. 12° 36'.

LANDSELE, a small island in the East Indian sea, near the coast of the great Andaman. N. lat. 13° 38'; E. long. 93° 7'.

LAND'S-END. See Cornwall.

LAND'S-END, a cape on the N. coast of the island of Shropsey; 4 miles N. of Sheerness.

LANDSER, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the district of Altkirch. The place contains 6,711 inhabitants, on a territory of 150 kilometres, in 22 communes.

LANDSHAAG, a town of Austria, on the Danube; 19 miles S.W. of Freudlitz.

LAND'S-HEIGHT, or the high ground, in North America, that which lies on the chain of lakes between lake La Pliee and lake Superior, where is a portage of 7 miles; 80 miles E. of the grand portage from the W. end of lake Superior.

LANDSHUT, or LANDSNIT, a town of Moravia, in the circle of Brun; 16 miles S.E. of Auspitz.

LANDSHUT, a town of Bavaria, on the river Ifer; an open well-built town, and the capital of a government; containing two palaces and a college with a church in it, the steeple of which is reckoned the highest in Germany; 32 miles N.E. of Munich. N. lat. 48° 29'; E. long. 12° 5'.—Also, a town of Auerian Poland, in Galicia; 72 miles W. of Lemberg.

LANDSKIP. See Landscape.

LANDSORT, in Geography, a small island in the Baltic, near the coast of Sweden. N. lat. 58° 52'; E. long. 17° 10'.

LANDSTHUL, a town of France, in the department of Mont-Tommerre, and chief place of a canton, in the district of Deux Ponts. The place contains 705, and the canton 7910 inhabitants, in 32 communes.

LANDSTRASS, or LANDSTROS, a town of Carniol, situated on an island in the river Gurek, with a cathedral; 18 miles S. of Celicy.

LAND-TAX, is one of the usual annual taxes, which has superceded all the former methods of rating either property, or portions in respect of their property, whether by tenths, fifteenths, or sixties; land, hydage or hideage, feage or celiage, or cellage. Tenths and fifteenths were temporary aids filling out of personal property, and granted to the king by parliament, being the real tenth or fifteenth part of all the moveables belonging to the subject. We meet with the payment of fifteenths as far back as the statute of Magna Charta; in the conclusion of which, the parliament grants to the king, for the concessions made by him, a full tenth part.
of all their movable goods. This taxation was originally charged upon the several individuals, but in the eighth year of Edward III. a certain sum was rated in every town, &c. In process of time this fifteenth being insufficient for the public exigence, the number of fifteenths was augmented to two or three fifteenths. Whenever, in later years, the commons granted the king a fifteenth, every parish in England knew their proportion of it; i.e. the same identical sum that was assessed by the same aid in the eighth of Edward III., and then raised it by a rate among themselves, and returned it into the royal exchequer. (See Fifteenth. See also Tenth.) The other ancient levies were in the nature of a modern land-tax; for we may trace the original of that charge as high as to the introduction of our military tenures; when every tenant of a knight's fee was bound, if called upon, to attend the king in his army for forty days in every year. In lieu of this personal attendance, a pecuniary satisfaction came to be levied by assessments, at so much for every knight's fee, under the name of feuages. (See Feuage.) Of the same nature with these were the assessments of hydage or hidage upon all other lands, and of tallage upon cities and boroughs. But they all gradually fell into disuse, upon the introduction of subsidies, about the time of king Richard II., and king Henry IV. (See Sunday.) In lieu of subsidies, which were usually raised by commissioners appointed by the crown, or the great officers of state, the parliament, in the beginning of the civil wars, introduced the practice of laying weekly and monthly assessments of a specific sum upon the several counties of the kingdom, to be levied by a pound rate on lands and personal estates; which were occasionally continued during the whole usurpation, sometimes at the rate of 150,000l. a month, sometimes at inferior rates. After the restoration, the ancient method of granting subsidies, instead of these monthly assessments, was twice, and twice only renewed, viz. in 1662, when four subsidies were granted by the laity and four by the clergy; and in 1670, when 800,000l. was raised by way of subsidy, which was the full time of raising supplies in this manner. The monthly assessments being abolished by custom, raised by commissioners named by parliament, and producing a more certain revenue, subsidies were discontinued, and occasional assessments granted as emergencies required. These periodical assessments, the subsidies which preceded them, and the more ancient feuage, hydage, and tallage, says judge Blackstone, were to all intents and purposes a land-tax; and the assessments were sometimes expressly called so. However, in the year 1662, a new assessment or valuation of estates was made throughout the kingdom, which, though by no means a perfect one, had this effect, that a supply of 500,000l. was equal to 1s. in the pound of the value of the estates given in. And, according to this enhanced valuation, from the year 1693 to the present, the land-tax has continued an annual charge upon the subject; above half the time at 4s. in the pound, sometimes at 5s., sometimes at 2s. twice, 4s. in 1732 and 1733; at 1s. but without any total intermission. The medium has been 3s. 3d. in the pound, being equivalent to twenty-three ancient subsidies, and amounting annually to more than a million and a half of money. The method of raising it is by charging a particular sum upon each county, according to the valuation of 1692; and this sum is assessed and raised upon the personal as well as the real estates of individuals by commissioners appointed in the a.i.d., being the principal landholders of the county, and their officers.

It is observed by Dr. Smith, in his "Nature and Causes of the Wealth of Nations," (vol. iii.) that a land-tax, like that of Great Britain, assessed upon each district according to a certain invariable canon, though it should be equal at its first establishment, necessarily becomes unequal in process of time, according to the unequal degrees of improvement, or neglect, in the cultivation of the different parts of the country. In England, the valuation according to which the different counties and parishes were assessed to the land-tax by the 4th of William and Mary, was very unequal even at first establishment. This tax, therefore, offends against the first of those four maxims which this ingenious writer proposes, with regard to taxes in general. (See Tax.) This maxim is, that the subjects of every state ought to contribute towards the support of the government, as nearly as possible, in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state. However, it is perfectly agreeable to the other three. It is perfectly certain, and not arbitrary. The time of payment for the tax, being the same as that for the rent, is as convenient as it can be to the contributor. Although the landlord is in all cases the real contributor, the tax is commonly advanced by the tenant, to whom the landlord is obliged to allow it in the payment of the rent. Moreover, this tax is levied by a much smaller number of officers than any other which affords nearly the same revenue. As the tax upon each district does not rise with the rise of the rent, the sovereign does not share in the profits of the landlord's improvements. It does not therefore obstruct the industry of the people; nor subject the landlord to any other inconvenience besides the unavoidable one of paying the tax. The advantage, however, which the landlord has derived from the invariable constancy of the valuation by which all the lands of Great Britain are rated to the land-tax, has been principally owing to some circumstances altogether extraneous to the nature of the tax. It has been owing in part to the great prosperity of almost every part of the country; the rents of almost all the estates of Great Britain, having, since the time when this valuation was first established, been continually rising, and fearfully any of them having fallen. The landlords, therefore, have almost all gained the difference between the tax which they would have paid, according to the present rent of their estates, and that which they actually pay according to the ancient valuation. But if the state of the country had been different, and rents had been gradually falling in consequence of the declension of cultivation, the landlords would almost all have lost this difference. As the tax is made payable in money, so the valuation of land is expressed in money. Since the establishment of this valuation, the value of silver has been pretty uniform, and there has been no alteration in the standard of the coin, either as to weight or fineness. But if silver had risen considerably in its value, the constancy of the valuation might have proved very oppressive to the landlord. In circumstances, somewhat different from those which have actually taken place, this constancy of valuation might have been a great inconvenience, either to the contributors, or to the commonwealth. A tax upon the rent of land which varies with every variation of the rent, or which rises and falls according to the improvement or neglect of cultivation, has been recommended by those philosophers called economists in France, as the most equitable of all taxes. In the Venetian territory, all the arable lands leased to farmers are taxed at a tenth of the rent. The leases are recorded in a public register, kept by the officers of the revenue in each province or district. A proprietor cultivating his own lands is allowed a deduction of one-fifth of the tax, and pays only 8 instead of 10 per cent. of the supposed rent. A land-tax of this kind, says Dr. Smith, is certainly more equal than
than the land-tax of England, but it might not, perhaps, be altogetherfo certain, and the affixion of the tax might be merely occasion more trouble to the landlord, and the levying of it might be more expensive. In the ancient dominions of the king of Prussia, the land-tax is afixed according to an actual survey and valuation, which is reviewed and altered from time to time. According to that valuation, the key proprietors pay from 20 to 25 per cent. of their revenue. Ecclesiastics from 40 to 45 per cent. In some other countries the same method is pursued. A land-tax affixed according to a general survey and valuation, how equal ever it may be at first, must, in the course of a very moderate period of time, become unequal; and to prevent its becoming so would require the continual and painful attention of government to all the variations in the state and produce of every different farm in the country.

The sum fixed by 38 Geo. III. c. 5. f. 1. to be paid for the land-tax in Great Britain is £607,627l. 50. 4s. 2½d., which is now made perpetual. To this time the land-tax acts had been annual; but by 38 Geo. III. c. 60, after reciting, that it may be notably conducive to strengthening public credit, that the duty now payable for one year on land should be made perpetual, subject to redemption by purchase on conditions herein set forth; it was enacted, that the several sums charged by virtue of an act (38 Geo. III. c. 5.) granting an annuity for the service of the year 1793, on the respective counties, &c., in respect of the manors, meannage, &c., to be raised and paid within one year, from the 25th of March, 1798, shall, after the expiration of the said term (allowing for certain specified exceptions) continue, and be raised and paid after the 25th of March in every year for ever. And all powers and provisions contained in the said act shall be in full force, and be duly executed, subject to the regulations and conditions of redemption or purchase mentioned in it. Provided always, that none of the provisions herein contained shall extend to any sums charged by the said act upon personal estates and perquisites of office; which sums shall, after the 25th of March, 1799, be ascertained, raised, collected, and paid, according to the directions of an act to be passed for that purpose. (39 Geo. III. c. 3.) It is also enacted, that the land-tax not purchased by proprietors shall be fold to other persons, subject to redemption by the person in possession, or having any beneficial or future interest in the lands: provided that in such cases, all such lands where the land-tax is not purchased shall be charged, and shall, until such redemption take place, be subject to a new affixion of the said land-tax from year to year, by an equal rate, according to the value thereof, in common with each other, without any power in such purchaser to exonerate the name from such land-tax, or to fix the rate of land-tax to be charged thereon. Also, where the whole tax in any place shall not be fold, such lands as are not exonerated from this act from such land-tax, shall continue subject to a new affixion yearly, and from year to year, by an equal rate, according to the value thereof, not exceeding in any year 4½, in the pound on such annual value. It is also enacted, that in case persons entering into any contract for the redemption or purchase of any land-tax, shall neglect to complete their contract, such contract shall be void, and the tax be revived, and again affixed and collected; and the persons thus making default shall forfeit not exceeding one-sixteenth part of the consideration. Where land-tax, remaining unfold, shall exceed 4½, in the pound on the annual value, the same shall be subject to an abatement in the manner directed by the said act. (38 Geo. III. c. 60. f. 103. 42 Geo. III. c. 116. f. 181.) By this last act, the provisions of the several acts for the redemption of the land-tax are repealed from the 24th of June, 1824, from which date all contracts are to be entered into and made according to that act, and the 43 Geo. III. c. 51. to render the same more effectual. As the land-tax not purchased will remain to be collected as before, it may not be improper or unuseful to detail the following particulars relating to it. By 38 Geo. III. c. 5, the general qualifications of commissioners in counties, with some few exceptions, is 300l. a year of landed property; these commissioners, before they can act, are required to take the oaths of allegiance, supremacy, and abjuration, under a penalty of £200. to the king; and by 38 Geo. III. c. 5. f. 49, an oath, if required, specifying in writing the parish, situation, quantity of land, whether freehold or copyhold, of the premises which entitle them to act as commissioners. When they first meet, they direct the return and appointment of proper assessors; and by 20 Geo. III. c. 17, they shall cause to be delivered to each assessor a printed form of affidavit, according to which they shall make their affixions. At their second meeting they direct the assessors how to proceed in setting the several rates and charges. By 39 Geo. III. c. 3, the several sums charged upon estates in ready money, debts, goods, wares, merchandises, chattels, or other personal estate, by the act of 38 Geo. III. c. 5., and which were not authorized to be sold by the said act of 38 Geo. III. c. 60; and also the several sums hereby charged in respect of any public office or employment, or any annuity, pension, stipend, or other annual payment, shall be affixed and paid in the following manner. That is to say, the several sums charged by virtue of the said act on personal estates as aforesaid, shall be, and are hereby let and imposed on the respective parishes, censibles, livings, divisions, allotments, and places, wherein the same have been, or shall be so charged by virtue of the said act, and towards raising the several sums hereby charged on the same respectively, all persons, bodies politic and corporate, guilds and fraternities within such places respectively, having any estate in ready money, or in debts owing to them, or having any estate in goods, wares, merchandise, chattels, or other personal estate belonging to, or in trust for them, (except such sums as they may bona fide owe, and such debts owing to them as shall be by the commissioners adjudged disproportionate, and also except those that lie upon lands, and such goods as are used for household stuff; and also except such loans and debts as are owing from his majesty,) shall be charged with as much equality and indifference as is possible by a pound rate, viz. for every 100l. of such ready money and debts, and for every 100l. worth of such goods, wares, and merchandise, or other personal estate, and so in proportion for more or less, towards the said respective sums by this act imposed upon every such parish or place charged therewith as aforesaid, so that by the said rates so to be affixed as aforesaid, upon such personal estates as aforesaid, the full sum hereby set upon the same, shall be completely affixed, collected, and paid. f. 2.

And towards raising the sums charged on persons in respect of public offices, or employments of profit, all persons, having, using, or exercising the same, which are affixed by virtue of the said act of 38 Geo. III. c. 5; and all clerks, agents, subordinates, and other inferior functionaries, whatsoever, (such military officers as are under the command of the king, or in pay of the army or navy in respect of such offices, only excepted,) shall pay any sum not exceeding what such office or employment shall be affixed in the year commencing 25th March, 1798, by virtue of the said act of 38 Geo. III. c. 5. And all persons, guilds, fraternities, bodies politic and corporate, having any annuity,
annuity, pension, or other yearly payment, either out of the 
exchequer, or any branch of the revenue, or payable, or se-
cured to be paid by any person whatsoever, (not insuring 
out of any lands, tenements, or hereditaments, or charged upon 
the same, nor included in any affliement made thereon by 
the said act of 38 Geo. III. c. 5, and not being annuities or yearly 
payments which by any act of parliament shall be exempted 
from the payment of taxes,) shall pay 4s. for every 20s. 
by the year for the same, to be levied and collected in like 
manner, and by the same persons as the land-tax. 3. 4.

It is provided that nothing in this act shall extend to the 
queen or royal family; nor to charge the pensions of 
superannuated sea-officers or their widows, poor knights of 
Windsor, or poor clergy of the Isle of Man, or tolls on turn-
pike roads. 38 Geo. III. c. 5. The charge upon real 
estates shall be as follows: That the entire sum may be 
raised, all manors, messuages, lands, and tenements; all 
quarries, mines of coal, tin and lead, copper, moundick, iron, 
and other mines, iron-mills, furnaces, and other iron-works; 
falk-springs and falk-works; all alum mines and works; all 
parks, chafes, warrens, woods, underwoods, coppices; all 
hills, tithes, tolls, annuities, and all other yearly profits; 
and all hereditaments whatsoever—shall be charged with 
the same equality and indifference as possible, by a pound 
rate, to make up the several sums charged by the act upon 
the several county or place.

A parson who lets to each parishioner his own tithes is 
properly the occupier, and ought to be rated. 16 Viner, 
427.

But if a parson makes a lease of his tithes to one person, 
and that person afterwards lets to each parishioner his own 
tithes, in that case the leesee is the occupier, and ought to 
be rated. 8 Mod. 61.

Colleges and hospitals are exempted, together with the 
buildings that are within the walls or limits of the same. 
The act 38 Geo. III. c. 5. f. 25. also exempts any 
matter, fellow, or scholar, or exhibitor of any such 
college, or hall, or any reader, officer, or master of the said 
universities, colleges, or halls, or any masters or others of 
yep schools; for or in respect of any libations, wages, rents, 
profits, or exhibitions whatsoever, arising, or growing due to 
them in respect to the said several places or employments: or 
any of the lands which before March 25, 1693, did belong 
to the sites of any college or hall, or to Chrift's hopital, 
St. Bartholomew, Bridewell, St. Thomas and Bethlehem 
hospitals in London and Southwark; or any other hopitals 
or almshouses, in respect of any rents, or revenues, which, 
before March 25th, 1693, were payable to them, being to 
be received and disbursed for the immediate use and relief 
of the poor of the said hopitals and almshouses only. Id. 
f. 25.

But this shall not discharge any tenants of any houses or 
lands belonging to the said colleges, halls or hopitals, almsh-
houses, or schools, who, by their leaves, or other contracts, 
are obliged to pay and discharge all rates, taxes, and impoli-
tions. Id. f. 26.

All such lands, revenues, or rents belonging to any hopital 
or almshouse, or settled to any charitable or pious use 
as aforesaid in 4 W. & M. shall be liable; and no other 
lands, revenues, or rents, then belonging to any hopital, or 
alms-house, or settled to any charitable or pious use, shall 
be charged or affessed; but lands given to charities since 
the 4 W. & M. shall not be exempted. No poor person 
shall be charged, whole lands, &c., are not of the full yearly 
value of 20s. in the whole. The affissors themselves are 
affessed by the commissiiners. The land-tax shall be paid 
by the tenant, who shall deduct it out of his rent. Papists 
and reputed papists, being 18 years of age, who shall not 
have taken the oaths of allegiance and supremacy, shall pay 
double land-tax. By 10 Geo. III. c. 6. f. 113. estates 
doubly taxed, coming to Protestant, are to be discharged. 
At the third meeting of the commissiiners, the affissors shall 
deliver duplicates of the affliement in writing, signed by 
them, to the commissiiners, with the names of proper 
collectors, for whom the parish or place shall be answerable. 
One of the duplicates, signed by three or more commissiiners, 
shall be delivered to the collectors, with warrant for collect-
ning; and the time and place of appeals shall then be ap-
pointed. The fourth meeting is that of appeal, notice of 
which shall be given in the church; and every perfon in 
tending to appeal shall give a written notice to one or more 
affissors, that they may attend to justify the affliement. 
The commissiiners are empowered to give relief in case of 
overcharge, and cause the sum abated to be re-affessed:
and when the appeal is determined, it is absolutely final. 
If any perfon refuse or neglect to pay to the collector on demand, 
he may levy the sum affessed by dirrefs and sale of the goods 
of the perfon neglecting or refusing to pay; and for want of 
profit or dirrefs he may be committed by warrant of two com-
missiiners to the common gaol, until payment of the money 
affessed and of the charges. The collector is required to pay 
the money received to the receiver-general, or his deputy 
quarterly, on or before June 24th, Sept. 29th, Dec. 25th, 
and March 25th; who shall give a receipt gratis: the col-
messiiners are allowed 3d. in the pound, which they may retain 
out of the last payment; but if any collector detains the 
money longer than the time appointed, or pays it otherwise 
than directed, he shall forfeit not exceeding 40l. nor less than 
5l. to be levied by dirrefs; and if he refuse to pay it, two 
commisiiiners may imprife him, seize his estates real and 
personal, and sell them for payment. The receiver-general 
is appointed by the king, or in pursuance of his directions, 
and has a salary allowed him by the lords of the treasury, not 
exceeding 2d. a pound; notice of his appointment is to be 
given to the commissiiners, before the time of the first 
quareryl payment. The receiver, within twenty days after the 
receipt, shall pay the money into the exchequer, or forfeit 500l. 
to him who shall sue. The clerks of the commissiiners are 
allowed 1d. in the pound for writing the affliements, dupli-
cates, &c., to be paid by the receiver-general, according to 
the warrant of two commissiiners. Affissors, collectors, 
&c., doing their duty may be fined by three or more 
commissiiners, in any sum not exceeding 40l. 38 Geo. III. 
c. 5. Blackf. Com.” vol. i. Burn's Justice, art. Land-
Taxes.

LANDWELLER, in Geography, a town of Sweden, 
in Webl Gothland; 9 miles E. of Gothenburg.

LAND-WAITER, an officer of the custom-house, 
whole duty is, upon landing any merchandize, to examine, 
take, weigh, measure them, &c. and to take an account 
thereof. In some ports they also execute the office of a 
coast-waiter. They are likewise occasionally flyled 
searchers, and are to attend and join with the patent 
searcher, in the execution of all cokets for the shipping of goods 
to be exported to foreign parts; and in cases where drawbacks 
or bounties are to be paid to the merchant on the exporta-
tion of any goods, they, as well as the patent searchers, 
are to certify the shipping thereof on the debit-books.

LANE, in the Military Art, is used when men are drawn 
up in two ranks facing one another. This is called making 
a lane, and is generally done in the streets through which a 
great person is to pass, as a mark of honour. But soldiers are 
often drawn up in this manner, when an offender is 
to run the gantelope. See Military Execution.
LANE, in Geography, an island in the Atlantic, near the coast of America, a little to the east of Scuticott Point. N. lat. 44° 18'. W. long. 67° 56'.

LANE, a river of Ireland, in the county of Kerry, which rises in Magglecuddy's reeks, and receiving several streams from Mangerton, and other adjoining mountains, and the river Fleek from the westward, flows north-westward to Cahirm oun harbour. The expanse of the waters of this river, confined by a great ledge of rocks, forms the two lakes, so well known and so joyfully celebrated as the upper and lower lakes of Killarney, from the town of that name being near them. See Killarney.

LANEL, a town of Africa, and capital of the kingdom of Galam, on the S. side of the Senegal.

LANERK. See LANARK.

LANES, a town of Sweden, in the province of Angermanland; 30 miles N. of Hembland.

LANESBOROUGH, a post-town of America, in Berkshire county, Massachusetts, N. of Pittsfield six miles. It has two quarries of marble, and contains 1445 inhabitants.

LANESBOROUGH, a small town of Ireland, in the county of Longford, on the bank of the Shannon, over which there is a bridge into the county of Roscommon, in which it has a suburb. This is a borough town, which was disfranchised by the Union, and is 624 miles W.N.W. from Dublin.

LANFRANC, in Biography, archbishop of Canterbury in the eleventh century, was a native of Italy, and born at Pavia, at which place his father was keeper of the public archives; he purfued his academical studies at Bologna, paid particular attention to rhetoric and civil law, and on his return to his native city, he commenced advocate in the courts. He removed to France, under the reign of Henry I., taught publicly in the school of Avranche, and was attended by a crowd of students of high rank. In a journey from that place to Rouen he was beft by robbers, who plundered him, and left him bound in a forest near the abbey of Bec. Here he remained, in a most deplorable state, till next day, when he was released, carried to the abbey, and soon after he took the monk's habit. While he resided in this place, his literary fame and excellent character recommended him to the efeem of William I. duke of Normandy, who made him one of the counsellors of state. Under the pontificate of Leo IX. he went twice to Rome; the principal object of his second journey was to solicit a dispensation for the marriage of William with the daughter of the earl of Flanders, his first cousin, which was granted upon the condition that the duke and his lady should build a monastery. They accordingly gave directions for the building of that named St. Stephen, at Caen, of which Lanfranc was appointed abbot in the year 1065. Soon after William was created on the throne of England, he sent Lanfranc to Rome, to negotiate with Alexander II. about the mission of legates to England, to crown him, and to regulate the affairs of the church. After the coronation of William, he formed the design of depriving many of the English clergy of their dignities, in order that he might bestow them on his countrymen, or on others, on whose attachment he could depend; in conformity with this principle, Stigand, archbishop of Canterbury, was deposed, and Lanfranc raised to the high office in his stead; he would gladly have declined the honour, but an express order from pope Alexander II. obliged him to accept it. He was accordingly consecrated archbishop of Canterbury in 1070, and in the following year he went to Rome, in company with the archbishop of York, and was received with uncommon respect by his holiness, who had formerly been his pupil at the abbey of Bec. Lanfranc defended before the pope the claims of his fee to suzerainty over that of York. Alexander, however, unwilling to offend either of these prelates, or to disoblige the king of England, refused to give judgment in the matter, and declared that it ought to be determined by an English synod. Two councils were held for this purpose in 1072; in which the question was debated with much warmth, in the presence of the king, queen, and the whole court, and at length determined in favour of Canterbury. After this, Lanfranc presided at different councils, in which several ecclesiastical canons were made, by some of which a change was produced in the condition of the clergy, as well as in the creed of the church of England. By one, the secular clergy who had wives were allowed to keep them; but those who had not wives were forbidden to marry, and bishops were prohibited in future to ordain any man who had a wife. By another, the doctrine of transubstantiation was promulgated, which before this period was but little known in our island: Lanfranc was, however, one of its most zealous champions, and employed the weapons of dialectics with great ingenuity and address, in defence of it, both before and after his elevation to the see of Canterbury. Having presided over the diocese nineteen years, he died in 1089, leaving behind him a high character for wisdom, learning, munificence, and other virtues. His munificence in the way of alms-giving has been very highly extolled; he is said to have given away upwards of five hundred pounds a year, a sum which must have been equal to eight or nine thousand pounds at present. As an author, the archbishop maintained a high rank for the age in which he lived, and his works are written in good Latin: there are "Commentaries upon the Epistles of St. Paul;" "A Commentary on the Psalms;" "A Treatise on Confession;" "A Dissertation concerning the Body and Blood of Christ in the Eucharist;" and a collection of letters to pope Alexander II.; to Hildebrand, archbishop of Rome, and to several bishops in England and Normandy. They were collected, and published in 1648, in a folio volume. Morelli Moschei. Henry's Hill.

LANFRANC, a physician and surgeon of Milan in the thirteenth century. He left his native country, in consequence of some perfections that he had suffered during the troubles of the times, and went to France; and in the year 1295, having already obtained considerable reputation, he was invited to Paris by many members of the faculty. His dexterity as an operator, his candour, and the energy with which he communicated his knowledge to others in his lectures, gained him the respect and esteem of his professional brethren; and he certainly contributed to the advancement of surgery, which was at that time at a very low ebb in France. Nevertheless he held some opinions adverse to the progress of the art; he condemned the use of the trepan, and absolutely forbade the operation of lithotomy, alleging that the extraction of a calculus rendered the patient impotent. He pointed out in strong terms the impropriety and danger of tents, which were generally employed at that time; the practice, however, continued to be referred to long after his animadversions were made.

He left two works in MS., which were deposited in the king's library at Paris; the one entitled, "Chirurgia parva," the other, "Ars completa totius Chirurgiae, five Practicae major." They were printed at Venice in 1490, with the title of "Chirurgia magna et parva," in folio; and have undergone several subsequent editions, and have been translated into the French and German languages. Eloy. Dict. Hilt.—Hutchinson Biog. Med.

LANFRANCO, Gio. Maria da Terentio, in 1538 published his Scintille di Musica, or "Sparks of Music," a work...
a work which, notwithstanding its quaint title, is often quoted with great praise by subsequent writers. It is now so scarce, that it would be difficult to find a copy of it throughout Italy.

LANFRANCO GIOVANNI, a painter of history, whose principal merit was the freedom and ease with which he managed large compositions in their colour and execution, but to the great loss of character and expression. He was born at Parma in 1581, and was at first a disciple of Agostino Caracci, but afterwards studied under Annibale, and having obtained a great proficiency of handling, was employed by that master in his great work in the Farnese palace at Rome, part of which he executed so well, that the difference between his painting and that done by Annibale himself is scarcely to be discerned.

Endowed by nature with a lively imagination, and having, after he left the Caracci, (under whom he had learnt the art of composition,) paid great attention to the artificial style of Correggio, particularly in the Duomo at Parma, and in the cupola there, he obtained a fondness for fore-shortening, losing sight of the simplicity of nature, and indulging his fancy in fantastic groups, which, while they exhibit his skill, deprive him of a reputation for judgment or true taste. He was, as M. Fuféli has observed, "a master in art of the first order, and taught his successor the means of filling the eye at a great distance, by partly painting and partly leaving it to the air to paint."

His colour was powerful and rich, but not pure. He most frequently employed very dark shadows, which give his pictures a heavy and sombre appearance; and not being well verified in chiaro-foreno, the lights in them are not unfrequently ill connected, or rather lack connection, and are too much in detached spots. With those who prefer spirit and daft to more studied perfections, Lanfranco will, notwithstanding his deficiencies, be always a favourite.

He was engaged by Urban VIII. to paint the miracle of St. Peter walking on the water for the grand cathedral, dedicated to that saint in Rome, and he afforded his patron so much pleasure by his labour, that his holiness conferred the honour of knighthood upon him.

His pencil being exceedingly rapid, and his life prolonged to the age of 66, his works are by no means scarce, but are to be met with in most collections. He died in 1647.

LANG, JOHN MICHAEL, a German Protestant divine, was born at Ezelwangen, in the duchy of Sulzbach, in the year 1664. Having received a good classical education, he was sent to the university of Altdorf, in 1683, and there applied himself with great ardour to those studies which were to fit him for his future profession. He excelled particularly as an oriental scholar, and was admitted to the degree of M.A. in 1687, and then went to the university of Jena, where he delivered public lectures on ethics and natural theology. He officiated several years as pastor to a country church in the palatinate, but becoming dissatisfied with a country life he removed to Altdorf, where he was created doctor, and admitted into the academical senate in 1677. Here he was elected to the professorship of divinity, and appointed pastor of one of the churches. After some years he was involved in theological disputes, which ended in his quitting Altdorf, and removing to Pretzlow, in the year 1710, where he obtained an appointment, in which he remained till 1737, when he died, at the age of sixty-seven. He was author of the following among other works then held in high estimation: "De Differentia Botanico-Theologicis;" "Physiologia Barbaro-Graeca;" "De Fabulis Mohammadici;" Moretii.

LANG, in Geography, a narrow island of Denmark, some what more than two miles in length, situated in the Baltic, near the S. coast of Lolland. N. lat. 54° 43'. E. long. 11° 20'.

LANGANICO, or Sunni, an anciently a city of Olympe, a town of the Morca, on a small river called Carbon, the ancient Alpheus, once a city of great note, near which were celebrated the "Olympian games," which are. See also OLYMPIA. It is now an inconsiderable place; 60 miles S.W. of Corinth.

LANGAROOD, a town of Perth, in the province of Galloway, near the S. coast of the Clyde, which gives name to a road for ships. It has 10 feet water, but the entrance is narrow. The silk manufacture is here in high estimation; 20 miles S.E. of Refid. N. lat. 57° 27'; E. long. 50° 15'.

LANGASCHANZ, a town of Sweden, in the province of Harjedalen; 110 miles S.W. of Sundsvall.

LANGBAINE, Gerard, in Biography, was born at Barton-kirk, in Welford, about the year 1608. In 1626, he was admitted a fellow of Queen's college, Oxford, of which he became a scholar and afterwards a fellow. He took his degree of M.A. in 1633, and of D.D. in 1646. He had, however, some years previously to his taking the civil degree, made himself known as a man of erudition, by an edition of Longinus, Greek and Latin, with notes, printed at Oxford in 1626. This work was followed by others of an historical and critical kind, displaying much profound learning, and an ardent attachment to the existing order of things in church and state. He was in habits of correspondence with the learned Usher and Selden, and is referred to by bishop Nicholson as a person admirably skilled in the antiquities and laws of England. In 1644, the univrsity, of which he was a member, appointed him keeper of its archives, and in the following year he was made provost of his college. He readily submitted to the changes which took place at this period, and was accordingly allowed to remain in peace, employing his time and talents in the promotion of learning, and the maintenance of academic discipline. He died in the enjoyment of both his offices, in the year 1675. He had a son of the same name, who is known by his "Appendix to a Catalogue of Oxford Graduates;" and "A New Catalogue of English Physic."
LANGEROGE, a town of Germany, in the department of the Upper Loire, and chief place of a canton, in the district of Brioude; 12 miles S. of Brioude. The place contains 1807, and the canton 9753 inhabitants, on a territory of 232.5 square miles, in 16 communes.

LANGEAIS, a town of France, in the department of the Indre and Loire, and chief place of a canton, in the district of Chinon, 12 miles W. of Tours. The place contains 2265, and the canton 6465 inhabitants, on a territory of 332.5 square miles, in 13 communes. N. lat. 47° 18'. W. long. 0° 1'.

LANGEDORF, a town of Germany, in the duchy of Wurzburg; 7 miles S.W. of Kiflingen.

LANGENFORD, a small island near the coast of Lolland. N. lat. 69° 38'.

LANGELAND, a fertile island of Denmark, situated in the south part of the Great Belt, between the islands of Lolland and Funen, about 50 miles in length, and from three to five in breadth. It was formerly a principality, but is now only a county, the best in the kingdom, and under the same government as Funen. The chief town is Rødkoping. N. lat. 55°. W. long. 10° 50'.

LANGELMAKI, a town of Sweden, in the province of Tavastland; 42 miles N. of Tavasthús.

LANGELSH EM, a town of Weilphalia, and principal place of a bailiwick, in the principality of Wolfenbuttel; 6 miles N.W. of Goslar.

LANGENAU, a town of Prussia, in the province of Oberland, the church of which is celebrated for beautiful paintings; 8 miles N. of Bützfrohwerder.-Alto, a town of Prussia, in the province of Ermland; 25 miles N.W. of Hildesberg.—Alto, a town of Bavaria, situated on a small river, which runs into the Danube; 11 miles N.E. of Ulm.

LANGENBERG, a town of the duchy of Berg; 15 miles N.E. of Duffeldorf.

LANGENBURG, a town of Germany, in the principality of Hohenloe, on the Jaxt; 32 miles W. of Anpach.

LANGENES, an island in the North sea, near the coast of Norway, about 24 miles in circumference. N. lat. 59° 20'.

LANGENFELD, a town of Saxony, in the Vogtland; 10 miles S.W. of Zwickau.

LANGEN-SALZA, a town of Saxony, the capital of Thuringia, on the Salza. Its environs are pleasant and manufactures flourishing. It contains about 900 houses, two churches, a college, and a castle; 14 miles W. of Erfurt. N. lat. 51° 4'. E. long. 10° 42'.

LANGENSCHWALBACH, a town of Weilphalia, in the county of Catzenelbogen, celebrated for its mineral waters; 9 miles N.W. of Mentz.

LANGEN-SEE. See LAKE.

LANGENTHAL, a town of Switzerland, in Berne, advantageously situated for commerce with France and Germany; for the convenience of which it has three fairs, at which are annually sold from 10,000 to 11,000 pieces of linen, 8000 of which are whitened; there are exported to Spain, Portugal, America, &c. Cheese is likewise sold here in great quantities, besides horses, cattle, grain, and many other articles, both of agriculture and manufacture.

LAN

In its vicinity are mineral springs; 18 miles N.E. of Berne. N. lat. 47° 18'. E. long. 7° 33'.

LANGENZENN, anciently called Cinnia, or Canna, a town of Germany, on the river Zenn; 12 miles W. of Nuremberg.

LANGERODE, a small island in the German sea, near the coast of East Friesland, with a small town. N. lat. 53° 42'. E. long. 7° 24'.

LANGESHEED, a town of Weilphalia; 25 miles W. of Bremen.

LANGESUND, a sea-port town of Norway, in the diocese of Christianna; 50 miles S.S.W. of Christianna.

LANGEWANG, a town of the duchy of Storia; 16 miles N.E. of Pruck.

LANGFORD, a town of America, in the state of Kentucky; 25 miles E.S.E. of Stanford.

LANGFORD Bay, a bay of the island of Antigua, on the N. coast, W. of Peyerousi's Point.

LANGHOLM, a small island on the E. side of the gulf of Bothnia. N. lat. 68° 45'. E. long. 21° 40'.

LANGHOLM, a market-town and burgh of barony under the duke of Buccleugh, is situated in a parifh of the same name, in the district of Elddale and county of Dumfries, Scotland. The population of this town is stated, in the parliamentary reports of 1801, at 2039 persons, but it is presumed, this number includes the whole parish. A market is held here every week, and four fairs annually; that held on the 25th of July is considered the greatest in Scotland for lambs. At a short distance from the town is the village of New Langholm, which has been erected by the duke of Buccleugh for the establishment of an extensive cotton manufactory. The country along the banks of the Eify is generally flat, well sheltered with woods, and yield luxuriant crops, particularly of oats and barley. The other parts of the parish consist chiefly of small hills, covered with verdure, and affords excellent pasturage for sheep. The duke of Buccleugh has built in this neighbourhood a very handsome mansion called Langholm-lodge, which stands in a delightful valley.

LANGHORNE, John, in Biography, an excellent English poet, was born at Kirkby-Stephen, in Westmoreland, in 1733. By the death of his father, the education of John and three other children devolved upon his mother, who fulfilled the task with great assiduity and affection. He received his school-learning at Appleby under Mr. Yates, who joined elegance of style the acquirements of a classical scholar. Langhorne continued under his tuition until the age of eighteen; when the narrowness of his circumstances obliged him to engage himself as a domestic tutor in a family, near Ripon. He made himself known as a poet, by a poem entitled "Audley-park," descriptive, as its title imports, of the beauties of that place. He soon after became an assistant at the free-school of Wakefield, and taking orders, acquired popularity as a preacher. In 1759, he undertook the tuition of the sons of Robert Cracroft, Esq., of Blackthorn, near Lincoln, and while in this situation he made a collection of such miscellaneous poems as he had written, and published them in a volume for the benefit of a friend in distress. In the year 1760, he entered himself at Clare hall, Cambridge, for the purpose of taking a degree, and dated from that place a poem on the king's accession, printed in the University collection of veres on that occasion. In 1761, he officiated as curate to the clergyman of Dagenham, in Essex, and at the same period he published several poems, which made him generally known among the votaries to the Muses, and in 1762, he appeared as a prose writer by his "Letters on religious Retirement, Melancholy, and Enthusiasm,"
sian," and by his eastern tale of "Solomon and Alme-
nax." He was, at this time, likewise a writer in the
Monthly Review. His next work, published in 1753,
etitled "Letters upon two volumes of sermons, which he entitled "Tracts of reli-
gious Philosophy." Dr. Hurd now appointed him cleri-
cian to the college of Lincoln's-Inn, and Mr. Langhorne
soon after gave him the public his "Letters to the
Elloquent of the Pulpit," and "Letters to and from Select Friends, or Effusions
of Friendship and Fancy." He is said to have published a
defence of Lord Bate; but a pastoral poem, entitled "Genius
and Valour," he avowed, the object of which was to vindi-
cate the natives of Scotland from the rancorous abuse
thrown upon them by Churchill. This obtained for the
author a complimentary letter from the university of Edin-
burgh, with a diploma of doctor of divinity. He had,
in the year 1760 or 1761, quitted the family of Hackthorn,
and his son, in account of being refused the hand of one of Mr. Cra-
croft's daughters; in 1767, when he had obtained a station
of much greater respectability, and when he was looked up
to as an author and clergyman, he renewed his fate, and was
successful. The living of Blagdon, in Somersetshire, was
purchased, which afforded the newly-married couple a de-
sirable residence, but this happy union was fatally dissolved
by the death of Mrs. Langhorne in child-bed, in the enfu-
ing year. Life now seemed to have lost its charms on the
survivor, he quitted a place which served only to remind
him of his heavy affliction, and retired to the home of his
brother William, a clergyman at Folkestone, in Kent. In
this retreat, instead of giving himself up to melancholy, he
very wisely occupied his mind with a literary task of some
labour and extent, and the two brothers jointly produced a
new version of Pindar's "Odes," with notes critical and ex-
planatory, and a life of the author, which was published in
1771, and met with a favourable reception. He had pub-
lished, previously to this, "Letters upon two volumes
between St. Evremond and Waller," two vols.; and "Fre-
deric and Pharamond, or the Confessions of Human Life,"
a philosophical discourse. His "Fables of Plato" were
published in 1771, as was another poem, entitled "The Or-
ing of the Veil." In 1772, he paid a visit to his native
country, which produced a fresh matrimonial connection,
and having indulged himself and his lady with a continental
tour, he sat down again at his living of Blagdon. To the
duties of the church he added that of a magistrate, and at
the desire of his friend Dr. Barn, he gave the world accurate
ideas of this important office in a poem, entitled "The Coun-
try JUlice." The first part appeared in 1774, and was
greatly admired for the manly strain of its sentiments, and
the beauty of its descriptions. The two other parts were
of inferior merit, and published at different periods. In
1776, he lost his second wife in child-bed, which muft, to a
man of feeling, have been an unusually severe calamity, and
from the effects of which he probably never wholly re-
covered. His affliction was in a degree alleviated by the
connections that he had acquired in the great world, one of
the fruits of which was, the presentation to a prebend in the
dedical of Wells, in 1777, by the bishop of that see. His
health was, however, declining, yet he continued to
amuse himself and the public with writings of different
kinds, the last of these was a romantic tale, entitled "Owen
of Carron." He died at Blagdon, in April 1779, in the
fourth year of his age. He was amiable in his manners,
but is said to have been rather too much addicted to convivial
indulgences: if this habit was incurred by domestic misfor-
tunes, though not to be justified, it may, in a measure, be
paliated, and the subject of it is to be truly pitied. "His
poetry," says an able critic, "is generally harmonious,
abounding in pleasing imagery, but overloaded with orna-
ment, and not free from obscurity and affectation. His prose
writings are rather light and flowery than solid and natural.
His sermons have been cenfured for the loose soft texture of
their style, and the false pathos of their sentiment. In
religion he was inclined to enthusiasm, but the morality of
all his works is pure and rational.

LANGIN, in Geography, a town of France, in the de-
partments of Mont Blanc; 6 miles N. of Bonne.
LANGINES, a small island of Denmark, in the North
sea, near the west coast of South Jutland; 2 miles N.W.
from the island of Nordstrand.
LANGONE, a town of the kingdom of Laois, con-
formed by a stone as the capital. N. lat. 22° 30'.
LANGLE'S BAY, a bay on the west coast of the
island of Sagarhon, so called by M. La Pourse. N. lat.
47° 49'. E. long. 142° 49'.
LANGLEY, a mountain on the north coast of the
island of Jaffo, said to be more than 1200 toes above
the level of the sea. N. lat. 45° 25'. E. long. 142° 20'.
LANGLEY, a small island, near the south coast of
Newfoundland, about 3 miles S. from the island of Mi-
quelon. N. lat. 46° 42'. W. long. 56° 5'.
LANGOE, a small island of Denmark, near the north
coast of the island of Fynen. N. lat. 55° 35'. E. long.
11°.—Also, an island in the North sea, about 8 miles
in circumference, and 40 from the coast of Norway, cele-
brated for its marble quarries. N. lat. 68° 16'.
LANGOGE, a town of France, in the department of
the Loyer, and chief place of a canton, in the district of
Mende; 21 miles N.E. of Mende. The place contains
2923, and the canton 7450 inhabitants, on a territory of
250 kilometres, in 8 communes. N. lat. 44° 44'. E. long. 3° 54'.
LANGON, a town of France, in the department of the
Gironde, and chief place of a canton, in the district of
Bazas; 9 miles N. of Bazas. The place contains
3208, and the canton 15,602 inhabitants, on a territory of
130 kilometres, in 13 communes. — Also, a small island in
the north part of the gulf of Bothnia. N. lat. 65° 32'. E.
long. 22° 26'.
LANGORAN, a small island on the east side of the
gulf of Botnian. N. lat. 63° 32'. E. long. 22° 18'.
LANGPORT, a market-town and parish in the hundred
of Pinney, and county of Somerset, England, is situated
upon the banks of the river Parrot, near its confluence with the
Irwell. It was formerly a royal borough; and the inhabi-
tants, by immortal custom, still claim several borough-
privileges. This town consists chiefly of two streets, and is
divided into two parts, called Langport-Eastover and Lang-
port-Westover. The government is vested in a portreeve,
a recorder, two capital bailiffs, and nine common-council
men. The river Parrot being navigable by lighters, a con-
siderable trade is carried on, between this place and Bridge-
water, in timber, flax, coal, iron, and salt. The church,
dedicated to All-Saints, is adorned with a very fine tower,
which has several niches on the west side, formerly orna-
ted with handsome statues. Adjoining to the town are
two large commons, called Common-Moor and Rag-Common;
the former consisting of 150, and the latter of 70 acres of
good meadow ground, upon which all the inhabitants not
only assume the right of feeding cattle, but even of building
LAN

as they deem most convenient for themselves. The houses in Langport, according to the parliamentary returns of 1809, amounted to 126 in number, and were occupied by 754 inhabitants. Here are a weekly market and three annual fairs. Collinson's History, &c. of Somersetshire, 3 vols. 4to.

LANGRAVA, a town of Portugal, in the province of Beira, having a medicinal spring; 12 miles N.W. of Pinhel.

LANGREL-SHOT, is a sort of shot sometimes used at sea, made of two bars of iron, with a joint, or flasque, in the middle; by which means it can be shortened, and so put the better into the gun; and at each end there is a half bullet, either of lead or iron.

This shot, when discharged, flies out expanded, and so does more execution among the enemies ringling, &c. It is never used in royal ships, but very often by privateers and merchantmen.

LANGRES, in Geography, a town of France, and chief place of a district, in the department of the Upper Marne. In the time of Julius Caesar, this was the capital of the Lingones. On the irrigation of Attilia, it was taken and burnt; and after having been rebuilt, the Vandals destroyed it. It was, at an early period, erected into a bishopric; and from the reign of Philip Augustus to the revolution, the prelates were peers of France. It afterwards belonged to Burgundy, and fell with the rest of that kingdom to France.

N. lat. 47° 52'. E. long. 4° 25'.

LANGRISH, Brown, in Biography, a physician of the last century, who distinguished himself as an advocate for the mechanical theories of physiognomy and medicine, and by the numerous experiments with which he supported these doctrines. A more accurate investigation of the nature of the animal economy has exploded them; but Dr. Langrish had the merit of ascertaining several interesting facts in respect to the nature of the circulating powers. He died in London, on the 29th of November 1759, and left the following works: "A new Essay on Muscular Motion, founded on Experiments. &c." 1755, 8vo. "Modern Theory of Phlegm," 1738, 8vo. "Physical Experiments upon Brutes," 1745, 8vo. "Croonian Lectures on Muscular Motion," 1747. Eloc. Did. Hift.

LANGSELE, in Geography a town of Sweden, in Angermannland, on a river of the same name; 45 miles N.N.W. of Hernola. N. lat. 63° 14'. E. long. 16° 49'.

LANGSKAR, a small island on the east side of the gulf of Bothnia. N. lat. 63° 11'. E. long. 21° 21'.

LANGTON, Stephen, in Biography, archbishop of Canterbury in the 13th century, was a native of England, but was educated at the university of Paris, where he afterwards taught divinity, and explained the Scriptures with much reputation. His character flowed high, that he was chosen chancellor of that university; rector of Paris, and dean of Rheims. He was afterwards sent for to Rome by pope Innocent III., where he was created a cardinal. In the year 1207, the monks of Canterbury having, upon a vacancy taking place in that see, made a double return, both parties appealed to the pope, and sent agents to Rome to support their respective claims. His holiness not only determined against both the contending candidates, but ordered the monks of Canterbury, then at Rome, immediately to proceed to the election of an archbishop, and, at the same time, commanded them to choose cardinal Stephen Langton. After various excuses, which the pope knew how to get over, by abolishing the agents in the buxiness from all sorts of promies, oaths, &c. and by threatening them with the highest penalties of the church, they complied, and

Langton was consecrated by the pope at Viterbo. As soon as the news arrived in England, king John was incensed in the highest degree both against the pope and monks of Canterbury. The fault being within the reach of his power, experienced the effects of his indignation. He sent two officers with a commission from Canterbury, took possession of the monastery, banished the monks out of the kingdom, and seized all their property. He wrote a spirited letter to the pope, whom he accused of injustice and presumption, in raising a stranger to the highest dignity in his kingdom, without even his knowledge; and he added, that if his holiness did not instantly repair the injury, he would break off all communication with Rome. John, unfortunately for himself and his kingdom, was unit to so arduous a contest; and he, in the end, submitted to the most disgraceful terms. (See John, and Innocent III.) In 1215, cardinal Langton arrived in England, and took possession of the see; and though he owed all his advancement to the pope, yet the moment he became an English baron, he was inspired with a zealous attachment to the liberties and independence of his country. In the very year in which he came over, he and six other bishops joined the party of the barons, who associated to resist the tyranny of the king; and at length they were successful in procuring the great charter. Langton was equally zealous in opposing the claims of the papal agents, particularly of the pope's legate, who assumed the right of regulating all ecclesiastical affairs in the most arbitrary manner. In the grand contest which took place between king John and the barons about the charter, the archbishop's patriotic conduct gave such offence to the pope, that, in 1215, he laid him under a sentence of excommunication. Nevertheless, in the following year, we find Langton aliasing at a general council held at Rome; and during his absence from England at this time, king John died. In 1222, he held a synod at Oxford, in which a remarkable canon was made, prohibiting clergymen from keeping concubines publicly in their houses, or from going to them in other places to openly as to occasion scandal. In the following year, he, at the head of the principal nobility, demanded an audience of king Henry III., and demanded of him a confirmation of the charter of their liberties. Their determined manner convinced the king that their demand was not to be refuted, and he instantly gave orders for the assembling of parliament. The archbishop shewed, in several instances, that he was friendly to the legal prerogatives of the crown; and by a firm and unimpassioned conduct, in a case of great difficulty, he prevented the calamity of a civil war. He died in the year 1238, leaving behind him many works, which prove that he was thedefining the character of being as learned and polite an author as any of the age in which he flourished. He wrote "Commentaries" upon the greatest part of the books of the Old and New Testament. He was deeply versed in Arithmetick, and the application of them to the doctrines of Scripture. The first division of the books of the Bible into chapters is ascribed to this prelate. The history of the translation of the body of Thomas à Becket was printed at the end of this archbishop's letters, at Brussels, 1682. His letter to king John, with the king's answer, may be seen in d'Archery's Spicilegium. Mosheim's Eccl. Hist. Henry's Hist. of Eng.

LANGTON, in Geography, a town of Scotland, in the county of Berwick; 2 miles S.W. of Greenlaw.

LANGUAGE, a set of words which any people have agreed upon, whereby to communicate their thoughts to each other. Or, language, in general, signifies the expression of our ideas by certain articulate sounds, which are used as the signs of these ideas. See Articulation.
Whatever be our opinion respecting the progressive amelioration of brutes, if the capacity of language were communicated to them, there can be no hesitation in admitting the progressive deterioration of the human species, if they were deprived of it. If man had not posited this, or some other extensive power of communication, that amazing faculty, which we call the human mind, would have remained in activity, its faculties torpid, its energies unexcited, and that capacity of progressive improvement, which forms so important a part of the mental constitution of man, would have been given in vain, would have been unknown, except to him who gave it. But in every part of the creation we discern a unity of design, which equally proves the wisdom and benevolence of the great First Cause. The means of bringing his powers into activity are bestowed upon man, as well as the powers themselves; and it is a position which will bear a vigorous examination, that the accuracy of human thought and the extent of human intellect generally proceed in equal steps with the accuracy and extent of language. "This inestimable prerogative," says Smellie, "is perhaps one of the greatest secondary bonds of society, and the greatest improvement to the human intellect. Without artificial language, though nature has bestowed upon every animal a mode of expressing its wants and desires, its pleasures and its pains,—what a humiliating figure would the human species exhibit, even upon the supposition that they did articulate? But when language and society are conjoined, the human intellect, in the progress of time, arrives at a high degree of perfection. Society gives rise to virtue, honour, government, subordination, arts, sciences, order, happiness. All the individuals of a community conduct themselves upon a regulated system. Under the influence of established laws, kings and magistrates, by the exercise of legal authority, encourage virtue, repress vice, and diffuse through the extent of their jurisdiction the happy effects of their administrations. In society, as in a fertile climate, human talents germinate and are expanded; the mechanical and liberal arts flourish; poets, orators, historians, philosophers, lawyers, physicians, and theologians, are produced. These truths are pleasanter, and it were to be wished that no evils accompanied them; but through the whole extent of nature it appears to our limited views, that good and evil, pleasure and pain, are necessary and perpetual concomitants." It will not appear too much to affirm, when we consider the influence of language on the intellect, that if that genius, which has dazzled the world with its splendour and extent, had been originally defective of the power of communication, he would not have risen above the level of the least cultivated of his fellow-mortals. Conceive him (to use the ideas of Cordilac) benefit of the use of visible signs, how much knowledge would be concealed from him, attainable even by an ordinary capacity! Take away from him the use of speech,—the lot of the dumb teaches you in what narrow bounds you enclose him. Finally, deprive him of the use of all kinds of signs; let him not know how to make with propriety any gesture,—you would have in him a mere idiot.

We are far, however, from believing, with lord Monboddo, that the human race have actually risen from the very lowest stage,—that of mere brutality. His lordship's opinion is too singular to be omitted here. He supposes, on the authority of several travellers whom he quotes, (and of whole passion for the marvelous his quotations have no room to doubt,) that there are nations without laws, or any of the arts of civilized life, without even language; and that nine of them, to complete their relationship to the monkey tribe, had actually tails. This, with other opinions, which display rather the credulity of the man of systems than the sober and cool judgment of the philosopher, has been exposed to the lively ridicule of Horne Tooke; and though we will never to counteract the idea, that ridicule is a proper tell of truth,—we are willing to admit, that there are some opinions which it is below the dignity of reason to refute.

We see in language a complicated whole, which we have been accustom to consider as it is, without attempting to ascertain what it has been. We see all regularity and beauty; and we do not ask ourselves the question, has language always been thus regular and beautiful? When we look back into the earlier periods of human nature, we find that which now wears the appearance of art was early the invention of necessity, gradually perfected and brought to a systematic form, by canes which have operated generally, but have received modification from the influence of local or temporary circumstances. A complete system of the origin and progress of language would be a history of the progress of human intellect. This we shall not attempt: perhaps our resources of knowledge are not sufficient to render the attempt in any degree successful; but a short outline of the early history of language, particularly of written language, will be neither uninteresting nor useless.

Our direct evidence is not extensive, and we are too much obliged to have recourse to hypothesis, in tracing the progress of improvement in any department of science. We are unable always to ascertain (as Mr. Stewart observes) how men have actually conducted themselves on particular occasions; and we are then led to inquire in what manner they are likely to have proceeded from the principles of their nature, and the circumstances of their external situation. In such inquiries, the detached facts which the remains of antiquity, or the narration of travellers, afford us, or the actual appearances of language at present, serve as landmarks for our speculations. "In examining the history of the human mind, as well as in examining the phenomena of the natural world, we cannot always trace the progress by which an event has been produced; and it is frequently of importance to discover how it may have been produced: by causes known to exist. The steps in the formation of language cannot probably be determined with certainty; yet if we can shew the known principles of human nature, how the various parts may naturally have arisen, the mind is not only to a certain degree satisfied, but a check is given to that indolent philosophy which refers to a miracle whatever appearances, either in the natural or moral world, it is unable to explain."

Diodorus Siculus (lib. i.) and Vitruvius (Archit. lib. ii. c. 21) supposed that the first men lived for some time in the woods and caves, like the beasts, uttering only confused and inarticulate sounds: till associating for mutual affiance, they came by degrees to use articulate sounds, mutually agreed upon for the arbitrary signs or marks of those ideas in the mind of the speaker, which he wanted to communicate to the hearer. By what degrees they proceeded from inarticulate to articulate sounds, these writers do not attempt to point out; and unless we admit that these articulate sounds were connected with certain feelings, in the same manner as what are called the natural signs, or that they were easily produced, which will not be allowed by those who have attended to the structure of the organs of speech, the account we have received from a better informed historian will not lose ground.

Plato, in Craticl. p. 383. p. 425. ed. Serrani, seems to maintain, that the first language was of divine formation; for he supposes that the names of things had originally some natural connection or congruity with the things themselves,
and that the first names must have been justly imposed, because they were imposed by the gods.

Moses, however, on whole authority we may more confidently depend, gives us to understand that the rudiments of language were begun by man, under the superintendence of his Maker. The Supreme Being caused all the animal creation to pass before his lord, to receive from him their names. If we consider that the numerous varieties which we observe in the subordinate classes of the brute creation probably originated in a comparatively small number or individuals, as the almost equally numerous varieties of men sprang from our great progenitor, this almost endless talk, as it at first sight appears, is very much reduced in its magnitude. Here is the first step. Miracles are never used except when they are necessary, that is, when the same effect cannot be produced by the common laws of nature; and hence we feel inclined to believe, that here the divine communications ceased; and that what man had been instructed to begin, he was left to complete for himself. Indeed, if we suppose that more than the application of names to natural objects had been divinely taught, yet we must admit that these communications would be bounded by the wants of the being to whom they were made. It is not probable that the divine instructor would lead man to fix upon words, to denote things then unknown, or to denote ideas which were not then acquired. “It is not necessary to suppose,” says Kett, “that the Creator inspired the first parents of mankind with any particular original or primitive language; but that he made them fully sensible of the power with which they were endowed of forming articulate sounds, gave them an impulsion to exert it, and left the arbitrary imposition of words to their own choice.” This seems to be intimated Gen. ii. 19. See Shuckford's Connection, vol. i. book ii. p. 111.

Let us then suppose the use of articulation given, and its application in some instances pointed out, in the invention of the names of animals; which, we may observe, is, in fact, the first step that would probably have been taken, presupposing the power of articulation, if no divine direction had been given. Words would originally be simply the signs of things, and farther of individuals. Every new object, for which necessity required a name, would receive a different name from others; but if there were a striking similarity between this new object and one which had already received a name, the old one would be transferred. One of the principles of association is similarity; and this new impression would recall the idea of the former object which it resembled, and consequently the word with which it was connected: and thus what originally was a name only for an individual, would gradually become the name of a multitude. Thus Lee Boo, who had been taught by his fellow-voyagers to call a great Newfoundland dog by the name of Sailor, used to call every dog he saw Sailor. There is little or no difficulty attending the application and classification of sensible objects: it seems to be an operation simple and easy, if we presuppose (as we have done) that some articulate sounds were known.

When several objects had received the same name, it would be sometimes necessary to distinguish them. Our procedure in such cases is to connect with the name of the object, the name of a distinguishing quality, or to specify some relation it has with other objects; but this supposes that to be already done, which we must consider as yet to be done. Now we must bear in mind that similarity, (sensible external similarity,) and local connection, are those principles of association, which are known to be most active at present in the minds of the illiterate and uncultivated: they must also have been most active in the minds of all men in the rude states of society. A peculiar colour, (which would furnish one principle of distinction,) would naturally be denoted by the name of an object remarkable for that colour, and this name, joined with the general term, would connect it to the particular object it was meant to specify. This is a procedure so simple, that one may expect to find some traces of it still remaining, and it is what we actually do in common language. An orange ribbon will precisely explain our meaning. We wish to distinguish a ribbon from others by its colour; in this instance we are able, agreeably to the custom of our language, to employ the name of an object remarkable for that colour, to denote the colour itself; and it is to be observed, that sensible qualities were those, and those only, which would be first noticed, and most requisite to be noticed.

Local situation, or vicinity to some object, would furnish another ground for distinction; the fountain near the cave, for instance. Now in order to express this, the procedure would be simple and intelligible, if immediately preceding or following the term employed to denote fountain, the term denoting cave were added. As we should at present use the expression, the barn-yard, for the yard near to, or adjoining the barn; the hermitage-walk, for the walk leading to the hermitage. This juxtaposition of the signs, to signify the congruity or similarity of the objects they denote, is the most natural, and in a language little extended, sufficiently adequate for all the purposes of common life; but it is obvious that it would allow very great latitude of interpretation; and hence, as language became more copious, contrivances were used to denote the nature of the connection which subsisted between the objects denoted by the signs employed. The chief of these is the employment of prepositions, at first separately, and afterwards, in some cases, coalescing with, and forming a part of the word; and the origin of these furnishes additional proof that the procedures we have spoken of were in reality those of the early framers of language (see Grammar); but these were contrivances of a later date than those of which we have spoken.

By degrees it was found convenient, at least by some tribes, to designate those names which were employed, in connection with other names with a view to point some quality or restricting circumstance of the thing signified, by some note that they were so employed. The speaker might certainly have left the inference to simple juxtaposition; but this appears to have been done in few languages, after improvements began to take place; and to effect such designation words (in some cases denoting add, join, like, &c.) were subjoined to the particularizing names, and they then were used only as adjectives, (or, to use a more general term, as adverbs.) The Chinese, however, still make no distinction in form, between words when employed as nouns and as adverbs; the same word when placed first being an adjective, and when placed last a substantive; thus boa is a good man; and boa is the goodness of a man. We use the same word in many instances both as a noun and an adverb; but a large proportion of our simple adjectives are formed as above, and are never employed as substantives; the Chinese, on the other hand, when a substantive is not to be used as an adjective, adds the designating syllable ざo to it.

As far as the processes we have described regard sensible objects and their connections, all seems very plain; and we find so many traces of similar modes of proceeding in languages at present in use, that we can scarcely doubt that at least it strongly resembles the actual procedure in the early stages of language. And we may remark, as we go on, that,
that every procedure, in order to be probable, should be simple, and such as might easily be adopted. It would not be long before art was applied to perfect and correct that which necessity began; but even this must have had the features of simplicity, must have been directed by circumstances which would not be under the control of man. It is not probable that any variations would be formed by regular analogies, except such as really existed in the situation or connection of the object; nor that they would form any combinations of words, excepting when the objects they signified had some real or apprehended connection.

In order to express objects which were not sensible, so as to convey to others notions or feelings which existed in the mind of the speaker, words would be used which had previously been appropriated to objects to which those objects of the mind's eye appeared to have some resemblance, or other connection. This resemblance or connection was frequently forced, and to those whose situation was different would not be at all striking; in other cases it was correct, and the judgments of application is proved by a similar procedure of unconnected inventors. We may derive great light here from the hieroglyphics; for there cannot be a doubt that where the visible sign which originally represented only a sensible object, was applied to denote some quality discovered by reaoning and observation, or some internal feeling, the audible sign or word was applied in a similar manner. The writing would, of course, as Warburton very justly observes, be that very picture which was before painted by the fancy, and thence delineated in words. Some influences will be added, when we come to consider the hieroglyphical mode of communication; at present we will add one or two as illustrations of the principles we have laid down. The term used to denote the mouth, denoted also speech; this, connected with the dog, signified the dog's voice. They proceeded further, and used this compound, at least the hieroglyphic denoting it, to signify lamentation and the sorrow which produced it. At first view this procedure appears extraordinary; to enter fully into the resemblance, we must remember that in uncultivated minds grief is loud and clamorous; and it is to a similar resemblance, that the same term has, in our own language, been applied to the cry of a dog in pain, and to the expression of lamentation among the lower classes of the Irish. It was a procedure much more natural when the term dog joined with the word denoting a field was made to signify barking. Our readers will be able, even in the present refined period of our language, to trace numerous influences in which the names of intellectual things have been obviously transferred from sensible things; and to those who have attended much to the subject, it will not appear too much to affirm, that in every instance where a word is not the name of a sensible object, it has acquired its present force by a gradual transition from its primary application to sensible objects. Munro Park has furnished us with some good speciments of the commencement of this transition in the Mandingo language; thus telingbadd, literally straight-bodied, signifies proud; saba bata, literally the heart e new out, signifies angry; a toterg, literally is here, signifies after; &c. In every known language the transition has been begun; but it is only among the more refined that it has been complete. In our own, we find abundance of inferences in almost every intermediate stage of the progress, as well as in its termination.

Language would proceed but awkwardly without those wheels which have been gradually made for it; but all which can be thought necessary for communication are the noun and the verb; and even of the latter, as a distinct class of words, the necessity may justly be doubted. We regard it as next to certain that the whole of what is now (by association) implied or denoted by the verb, beyond what is denoted by the acknowledged noun, was originally mere inference from the juxtaposition of the verb-noun with another noun. We cannot indeed advance one step in oral communication, without leading our hearers to the inference that certain ideas are connected in our minds, or that we believe certain objects, properties, or events, to be connected. The connecting link, however, need not always be stated; in the first stage of language it would not exist, because the first words could only be names without the idea of affirmation being appropriated to any of them; and in the language of childhood it does not exist. Words are placed together; and it is easily understood that the corresponding ideas are connected in the mind. "Mamma, milk—good," would commonly be understood by any one; and depending upon the case of inference, the ancient writers (long after words had been appropriated to express affirmation) continually left their readers to make it for themselves. But how slowly, and how ambiguously, communication would, in many cases, proceed, without some appropriated link of connection, any one may be convinced by attempting to express a train of thoughts without those words which have the idea of affirmation associated with them, in the forms so expressing affirmation.

The chief difficulty opposing the admission of the opinion that verbs were originally nouns, arises from the peculiarities existing in the external character of verbs, the notion of time and of modes of existence and action having become associated with them, and the subject in numerous inferences, and occasionally the object, having coalesced with the verb; but these are all accidental circumstances; and the mere English scholar has here advantages which the learned do not possess, because he continually meets with verbs in his own language the same in every external character as the noun, and frequently used as nouns. The point, however, to be carefully kept in view, and which must gradually remove every difficulty, is, that the only essential difference between the noun and the verb is, that the latter (of course by association) expresses affirmation; all the superadded circumstances may be convenient for communication, but are in no way necessary; and in our own language, those superadded circumstances are in most cases expressed by adjuncts and not by the verb itself. If, in any form, a word employed to express affirmation, does not express it, it ceases to be a verb. For grammatical convenience we may arrange such forms with those which express affirmation, but it is merely for convenience: gerund, geribers, geribers, are no more verbs than being, being, being, &c. It would prevent much mistake as to the nature of the verb, if the infinitive and imperative moods were always arranged together under the clas of the non-finite of the verbs. The infinitive is the verb-noun with a termination (originally, without a doubt, expressive by itself, as all terminations must have been,) denoting that it is to be employed with a verb; thus in the Anglo-Saxon verb bean, &c it is the verb-noun, and an is the verbalizing adjectives; whereas, are, are, &c. are the verb-nouns, and are, are, &c. (gradually reduced to be, be, be,) and are, are, &c. have the respective verbalizing adjectives joined to them. In short, in our opinion, the imperative is the verb-noun itself; and the notion of command, entreaty, &c. conveyed by it, is merely the inference of custom; whether we say to a servant bread, or, bring some bread, we merely specify, in the latter case, the action and the object of the action, and, in the former, the object alone; the red is inferred from tone, manner, &c. The fact indubitably is, that in every department of language, fully as much is done by inference as by actual expression; and even
as it is, thought is by far too quick for words. Though we are now encroaching on the department of grammar, we must add as some confirmation of our ideas, that the Hebrew imperative is the same with what is called the radical form of the verbs, in its several conjunctions, except in nippal, where it is the same as the infinitive. But to proceed;

Men, fight, are names, and are still acknowledged as such; when they are placed together, especially if accompanied by distinguishing tones of voice, it would be naturally inferred that the speaker intended to raise in his hearer's mind that belief which exists in his own; or at least, to inform his hearer of a connection which circumstances had formed in his mind. By degrees, at least in most nations, some of those names which were frequently thus employed with the inference of affirmation, became appropriated to convey this inference; and it would then be made whenever the word was employed; but in the more simple languages, a large proportion of those verbs which are employed as verbs, (i.e. conveying the inference of affirmation,) are still immediately recognized as nouns. In the Chinese, very few names are appropriated as verbs, but are used indiscriminately, and without any variation of form, either as nouns or verbs; in the Hebrew, the root, (which does not, like every part of the indicative in the Greek and Latin verbs, include a pronoun,) is a simple name, and is used, in many cases, as a noun; and in our own language, many names are used either as nouns or as verbs. When we have advanced to the frequent use, and gradual appropriation of some names to convey the inference of affirmation, the root is easy and almost certain. With respect to the simple affirmation, the subject of it would, in the case of the first and second persons, always be a pronoun, and, in the same district, the same pronoun. This, where spoken language made material progress, would gradually coalesce with the verb; and the word so formed would be completely inflected with the verbal character, and never be employed but with the inference of affirmation. The Hebrew presents us with this coalescence in its inceptive and obvious state; the Greek and Latin threw it in a much more complete state, and the component parts cannot always be detected; no reasonable doubt can however exist but that the procedure has been the same in all. The same might also be the case respecting the third person, but the coalescence would, in this instance, be more slowly formed; and in some languages where the coalescence took place in the other persons it did not in this; it must, however, be admitted that, in others, the contrary is the fact.

Reflexing the changes of the verb, to make it express other circumstances besides those of affirmation, we must refer to Grammar and the connected articles, and shall content ourselves with the following general remarks. There appears to us to be little or no reason to doubt, but, that all the common changes, which have taken place in the verbs of all languages, to denote the time or mode of existence and action, (as well as those of number and person,) have been formed in consequence of the coalescence of words of appropriate signification; and though the gradual refinement of language may have greatly varied the associations of words, from what they originally polished, yet that those changes were originally found sufficient to answer their respective purposes. In some cases the contrivances adopted can be still traced; and from the new turn which has lately been given to philological speculation, we may expect other discoveries respecting the causes or origin of particular flexions. We shall only mention two instances, which will serve to shew how simple those contrivances originally were. The future of the French verb is nothing more than the infinitive of the verb, with the present tense of avoir; thus aimerai is ai aimer; and s'aimerai, means, I have to love, which mode of expression is, in our own language, used with a future force. This leading distinction between the past and the future tense of the Hebrew verb is, that in the past tense the verb is placed before the fragment of the pronoun forming the person, and in the future after it; to intimate (as may be reasonably supposed) that the action has passed the subject in the first case; in the second, that it is yet to come.

The force of the pronouns (the legitimate subjunctive pronouns,) is very clear. I means the person speaking, thou, the person spoken to; he, his, it, the said person or thing, the person or thing before mentioned or referred to; and so on in the plural. Where the same simple word, taken in one sentence, can be understood as a subject, he, in another case, can feel any mystery in the origin of pronouns. The first plan would undoubtedly be, to use the names themselves; and such is the first procedure in childhood: "Mamma loves Mary, and hopes Mary will be a good girl." Children use pronouns by degrees only; and those of the first and second persons much later than those of the third, for the obvious reason that these latter are the most convenient in their limited intercourse. The pronouns of the third person identify the object now spoken of, with that before spoken of, and save much circumlocution, and still more ambiguity; the pronouns of the first person are of great convenience, in cases where the name of the speaker or hearer is unknown, where there are others of the same name, and in the plural especially where several names must otherwise be often repeated. -The pronoun is then a very valuable, but not a necessary part of speech. How it might be formed, the very probable procedure in a few instances will sufficiently shew. Horne Tooke shews that it, formerly written hit, is the third participle of the verb habere, to name, and therefore means the person or persons, thing or things named or referred to; and accordingly it was applied by all our old writers differently to plural and to singular nouns. We do not know whether a similar opinion as to the origin of pronouns had been previously laid before the public, but the philosophical Greek professor of Glasgow (who in his very interesting and important investigations, has often anticipated Horne Tooke) long ago delivered it as his opinion, that, at least, of the pronouns, are participles, and, if we mistake not, traced the origin of ἑαυτός and ἐμφύς as follows: Eυτός, in one of its earlier forms, was ἵππιος, which is an obvious abbreviation or corruption of λαμψίων, so that ἑαυτός (whence the Latin and other languages have their first pronoun) signifies the person speaking. ἐμφύς is the Latin part participle from ἐμάλωσα; and though this verb is not to be found in Latin writers, those who know how much the Latin is a dialect of the Greek, will not feel this to be a material difficulty: on this derivation ἐμφύς signifies the said person, &c. Whatever be the origin of it, it is obvious that it is in itself merely an adnom, (exactly corresponding to our that,) employed to point out, and probably accompanied in the first instance by the action of pointing out: now from this demonstrative adnom, (a pronoun only by a subauditor, the French have taken not only their demonstrative il, but also their legitimate pronoun e.) Ille is never employed without a subjunctive exprest or understood: it will not admit of a subjunctive, and this fact, among many others which meet us at every step of our investigations, should prevent us from imagining that a procedure cannot have been, because we can now find no traces of it: the origin of it was an adnom, it is itself a pronoun. We shall add one more example of the probable origin of pronouns. Tu is found in the form tute; tute is the vocative of tutus or tusus, from tuci, to see, to observe, and signifies a seen person; we look at the person we...
we speak to, and, by direct inference, *he* denotes the person
spoken to. It may be objected that *tu* is from *ευ*, a form of
cow; it appears to us in no way unreasonable to suppose that
the Latin has preferred a verb from the early Greek dialect
which the common forms of the Greek have lost.

We do not think it necessary to enter any farther into the
subject of the origin of oral language. It can scarcely be
doubted, by those who have studied the nature of the other
parts of speech, by means of the light which the researches
of Horne Tooke and others have afforded, that all have
been derived from the noun and the verb; and, admitting this,
all that is incumbent upon those who profess to draw the
original causes of language, is to present a probable origin of
those classes of words. In those procedures which have been
here stated, there is nothing which supposes metaphysical re-
search, or much observation; and to render any procedure
probable, it must wear the marks of simplicity. In the pre-
sent period of the language, we see the grammarian pointing
out the analogies which are found to exist in language, and
these proceeding to the formation of new words upon
these analogies; this is art; but the early formers of lan-
guage, in their inventions, followed only the dictates of cir-
cumstances; and whatever regularity we may perceive in their
inventions, must be attributed to the similarity of those cir-
cumstances. We see the philosopher inventing a new term,
agreeably to prevailing analogies, to express some power of
the mind, or some emotion which had not received any de-
nomination; but those who originally gave names to mental
feelings, derived them simply from some analogy, fancied or
real, between the internal and an external object, and those
names which now have to fall to their ideas in the most subtle and refi-
fined, were originally only the names of objects obvious to
the senses. The reasoner, when he uses a word whose meaning
has not been accurately ascertained, defines the idea of
which he intends to attach to it, and uses it accordingly; in
the early and even in the more refined periods of language,
the ideas connected with words have been the result of casual
associations, produced by local circumstances, by the customs
of the age, or the appearances of nature in particular situ-
ations.

In languages in which the coalescence between the verb and
its adjuncts has taken place, and also the coalescence between
nouns and their connective words, much greater liberty of
inversion is practicable than in those in which such coales-
ence has not at all occurred, or but incompletely. In
other words, where the noun, adnoun, and verb, admit of
flexion, there the arrangement depends, in many instances,
more upon the found than upon the sense; and nearly in all
cafs may be made subservient to the former. This gives
such languages considerable advantage over those which ad-
im of but few changes, so far as respects their modulation;
and farther, the coalescence renders them much more for-
cible, where emphasis or any of the fractional parts is not
required. Whenever flexion increases peripetity, the ad-
avantage is decisive and obvious; with respect to modulation,
though an object of some consequence (since we may some-
times find the way to the head and heart by pleasing the
ear), yet all cultivated languages will be found to 곧ache
powerful power of pleasing the native ear; and among those
who made found so much an object, the sense was often sacri-
ficed to it; with respect to force it may fairly be doubted
whether the advantage of greater precision by means of
more accurate emphasis, does not counterbalance it. We
are willing to admit, on the whole, that the advantage is
somewhat in favour of those languages in which flexion is
extensively adopted; but we can by no means admit the
opinions of those, who think it needful to a perfect lan-

guage. That language is not the most perfect, which en-
ableus to express our thoughts in a great variety of ways,
but that which enables us to express any thought with pre-
cision and perpsectivity; and contemptible as our own unin-
lected language may appear to those who can think nothing
good, but what accords with the objects of their early tale,
we are disposed to believe that in its real powers, it rises be-
ond all the ancient languages and most of the modern.

Before we leave the subject of oral language, we must
pay some attention to the following inquiries; whether
words are originally imitative; whether they were long;
and of what kind of articulations they were composed.
The latter are of importance in tracing the gradation from
hieroglyphics to alphabetical writing.

Words in their present state are simply arbitrary marks,
used to denote ideas, or combinations of other words;
the found of some appears to be an echo of the sense,
but in the greater number of instances in which there
is supposed to be this resemblance, very much may be
attributed to the fancy of the observer. It is obvious,
however, that there are some words which are formed
upon found, and are truly imitative; such, for instance, as
the various sounds of animals. When we carry our
enquiries further back, we are led to suppose that this
might be the case in the earlier stages of language; that
the original words would be formed from some resemblance, real
or imagined, between the found and the thing signified. What
else, at first, could induce them to fix upon one found rather
than another? We have already seen that sensible objects were
the frst which obtained names; and of sensible objects, the
number is considerable which either emit some imitable
found, or perform such motions as have generally some con-
nection with found. Of these the number is evidently
small; waving and regular, rapid and slow motion, violent
and smooth motion, appear to be all the varieties which
found would denote. With respect to founds, whether pro-
duced by animate or by the motion of inanimate objects,
these might and probably would be imitated; and the names
of those objects which were connected with the founds
would be derived from those imitative founds. The Otshi-
tans give to the gun the appellation of *tick-tick-bow*,
equally imitative of the cocking and report of the gun; and
the Kamatchakans denominated the Russian clergyman *boz-
boz*, because he often repeated the sound *boz*, which in
the Russian language signifies God. With respect to qualities
totally unconnected with found, particularly mental quali-
ties, this principle of imitation is not directly applicable. We
immediately see the incongruity of colour and found, when,
for example, we call to mind the idea of the blind man, that
a scarlet colour was very much like the found of a trumpet.
A circumstance which appears to have misled several gen-
ious writers on this subject, is, that observing certain let-
ters applied to denote a class of ideas which have, among
others, some common features of resemblance, they have
supposed that those letters were signiffcant of that common
feature; for example, *e* denotes cavity or hollowfns.
Now supposing that there is that general idea, variously modi-
fied, in every word in which the *e* forms a principal part, does
it follow from this that the *e* signified by its found cavity or
hollowfns? We can discover no such similarity. We ap-
prehend that the coincidence may be better accounted for
in a different way, that the original word denoting hollowfns,
which has entered, variously modifed, into the words in que-
tion, was *e* with some vocal found. That is the extent of the
inference which may be justly drawn from the coincidence; that
it was so applied, but not that it was signiffcant of the quality.
We have been accustomed to use founds in given connec-

with such regularity and constancy, that they appear to us to have a connection of real signification instead of merely arbitrary institution. Frequently, from our acquaintance with the fene; we read a combination of words as the fene dictates, and suppose that imitation in the words, which in reality exists only in our mode of enunciation; but it is only with words separately, considered from their connection with other words, that we are here concerned; and with respect to them we cannot but confine the resemblance of their sound to their fene, to cases in which they denote either sound, or motion, usually accompanied with sound.

In tracing the transition from hieroglyphics to alphabetical writing, the probability of the theory advanced will much depend upon the shortness of the words of that language in which the transition was made. It is generally supposed that this was the Egyptian; but of the ancient Egyptian we have no remains, excepting some words which the modern Egyptian or Coptic has preferred, many of which, however, are monosyllabic. It will be white, therefore, to state it as a general enquiry, whether the original words of original languages were long or short. Lord Monboddo supposes that all human sounds were originally inarticulate cries; and that the first articulate sounds were imitations of the cries of animals, and consequently were of great length. "For such cries of almost all animals have a certain tract and extension (as his lordship expresses himself) such as the howling of an ox, the neighing of a horse, the braying of an a., the roar of a lion, &c. And that we may not think them an exception to this rule, we need only attend to the dumb perfons among us who utter inarticulate cries, sometimes very loud, but always of a considerable length." There are few looser reasoners than his lordship, at least among those who profess such a fund of information as his lordship certainly did. To produce dumb perfons as an example of what men possessed of the powers of articulation would do when they first began to use those powers, seems a very incorrect mode of argument. We must, however, remember that lord Monboddo supposes men to have arisen from the state of mere brutality. We suppose, and on far better authority than that on which he rests his faith, that man was never a brute, and that the first man was led by divine interposition to use his powers of articulation. We have alreadyseen that it is probable that the sounds to denote objects emitting sounds, would be significant; and the cries of different animals would therefore furnish names for those animals. If we confine imitation to this, great length of words is unnecessary and improbable; unnecessary because one or two distinct articulations would generally be sufficient for distinction; thus, bow-wow would answer the purpose to denote a dog, as well as a continuation of the sound to a hundred syllables. It is improbable, because articulation is at first very difficult, and it is therefore fearedly suppleable that more articulations would be used, than were necessary to express distinctly what object they were intended to denote. If we extend the principle of imitation further, and suppose that man imitated those cries in order to express his feelings merely, his cries would have no claim to the higher title of words, and at any rate would throw no light on our inquiries.

At first sight, the hypothesis that the original words of language were long, appears to draw considerable confirmation from the vocabularies of the North American Indians. Of three that are given us by Mackenzie, two appear to be composed of words, of from two to seven syllables; with scarcely any of one. The third, on the other hand, is composed solely of words of one or two syllables.

With respect to the former, even where words actually denote objects of sense, our inferences that they are uncompounded should be carefully drawn. The moon is expressed by two words, Tliis, pejam, signifying the night; and several others appear clearly to be circumlocutions. In like manner the lavages on the river St. Lawrence, near Montreal (who are Catholics) give the French equivalents to the peripetia of the matter of life's man; and it is by far the most probable supposition, that, in uncultivated nations, names of new objects would, when possible, be formed rather by significant combination of words in use, than by the formation of new words. Thus, as we learn from Mr. Park, the Mandingo nation use the following (among many) circumlocutions: fruit is eree-ding, child of the trees: noon, teeleckoniata, the fun over head; finger, boullakonding, child of the hand or arm; brother, ba-ding-keela, mother's male child: fyller, ba-ding-moos, mother's female child. Some others we have already noticed.

Lord Monboddo is very unfortunate in the choice of examples of his theory; for not one is of that class of names, which, in all probability, were the original ones, names of sensible objects. They are the following: wonna, wuick-bouli, signifies much, and mikkeaw, rootk, little, in the Elikmu language; and poellarrarorar, the name for three among some South American Indians. With respect to the former, the examples above added, authorize us to conclude that they are circumlocutions, descriptive of the signification. With respect to the last, when we observe, that the names of numbers were, probably, originally significant in all languages; and that the length of those names would depend upon the length of the original words, and the manner adopted in combining them. Thus, a, is, by the Kintichakans, denoted by inen-michin, i.e. one and five. Numbers are so familiar to us, and so distinctly arranged in groups, that perhaps in no instance are our ideas more clear. Yet this clearness entirely depends upon the distinctness of the signs we use to denote them. We speak of ten and twenty, &c. and all seems very clear; but it is evident that if we attempt to form a conception of ten, twenty, &c. we must pause over every one finely, and endeavour to combine them together by processes which will be varied by the habits of the individual. If we give a fresh name to every group of objects, and then consider those groups as units, and so on, we are capable of extending our ideas of number indefinitely, and of speaking and thinking of them with accuracy; but if the small extent of our intellect, or the circumstances of our situation, prevents this grouping, and we confine our attention to individuals, our arithmetic must be very confined. Those nations which reckon only by a computation with their fingers, carry their ideas of numbers no farther than ten; those who with the Kintichakans take in the toes, go as far as twenty; these people can reckon no farther, and when they have advanced to this limit, they say, "where shall we go now?" It is difficult to conceive what "circumstances could bound the arithmetic of lord Monboddo's Indians to three, or rather what should induce them to choose to troublesome a mode of procedure; but it appears probable that they joined the names of three different men or other animals; and if they had proceeded further, would have joined four together, &c. Why they did not use shorter words to form the combination, we cannot conjecture, unless it were that their tribe was originally very small, and that they mentioned the names of one, two, or three in order to denote those one, two, or three; and that these names, being proper names of persons, would be somewhat long. But this is entirely hypothetical. It seems a more natural
natural procedure to repeat the word as often as there were numbers to be denoted, but the ear would not readily follow this repetition.

If lord Monboddo had looked into the vocabulary of the Mexicans, he would have thought that his theory derived great confirmation from their words. Clavigero informs us, that they had words of fifteen or sixteen syllables; but he expressly says that they are compounds. He gives us one specimen of their mode of combination. It is a title of address, Nellasonahuitztopicatzin, and signifies my very worthy father, or, revered priest. It is compounded of five words (taking away eight consonants and four vowels), pre-fixing no, which corresponds to my, and adding twin, which is a particle expressive of reverence; so that there are no fewer than seven words compounded together. Their language is very copious; and one cause of the length of their words is probably the deficiency of consonants, which would render a combination of sounds necessary for distinction. It is entirely delinete of the b, d, j, g, r, s, but abunds with l, v, w, z, th, etc.

We have before remarked, that the importance of the enquiry to us results principally from its connection with the origin of alphabetical writing. Now we may admit that the languages of these North American Indians favors the hypotheses of long words without any injury, for among them alphabetical writing never existed; and we should have enlarged less on this point, if it had not led us to notice some curious procedures of language. Yet it seems reasonable to admit, as an inference, that the original, or rather secondary words of language, would have been long (though not to the degree lord Monboddo supposes), if the circumstances of man had not required a varied vocabulary; for the more confined the number of articulations, the more extent must be given to some words to distinguish them from others. But when we advance further, and inquire of what kind the original words of man really were, we shall see sufficient reason to conclude them to be short. Language was first used in the East, and there, too, writing was first invented. We have already mentioned, that of the ancient Egyptian words which are preferred in the Coptic, a considerable number are monosyllabic. The Chinefe, which, as far as original language is considered, appears to have undergone little alteration, or combination, and is probably nearly an original language, is composed entirely of monosyllables. Probably, indeed, this was the very cause that the Chinefe never advanced into the alphabetical mode of writing. They had no compounds of sounds; and they varied their words by inflection of voice instead of additions of articulations. The original words of the Hebrew, Greek, &c., that is, those which are not varied by the addition of other words, are short, frequently only of one syllable, seldom of more than two. And of the vocabularies which we have had an opportunity of consulting, of the uncivilized nations of the East, the words are generally monosyllabic or disyllabic.

Having now attended to the two former of the inquiries with which we proposed to finish the subject of oral language, we shall proceed to the last.—Of what kind of articulations the early languages were composed. It appears that in the early languages consonant sounds were at least generally accompanied by vowel sounds; but though this is a material point in tracing the transition from hieroglyphic to alphabetical writing, it will not be necessary to enlarge much upon it. We think this position proved, by the following, in some measure unconnected, considerations. 1. Vowel sounds are by far the most easy; and consequently they constitute the earliest vocal sounds of children, and a large portion of the vocal sounds of uncivilized nations. Several words among the South Sea illanders are composed entirely of vowel sounds; and so great is the difficulty which these people find in pronouncing consonants together, that they call it Joseph Banks, Opano. From this consideration we may fairly infer, that vowel sounds would be frequent in the original words of the early languages, which were formed before articulation was become easy. 2. Yet as the shades of distinction between them, when employed alone or together, are too nice to furnish, at least to the unpracticed ear, many obviously different words; and as man was not at first in that low state of intellect in which he has sometimes appeared, a vocabulary formed of such sounds would be very inadequate to his wants; and, therefore, we must suppose that in the early languages there would be very few words without consonant sounds. 3. Some of the first articulations of man were without doubt employed in naming those of the inferior animals with which he was concerned. Now their names would almost certainly be given from their distinguishing cries, and the cries of such animals consist of consonant sounds, each followed by a vowel sound. The articulation would at first be nearly as difficult as we now perceive it to be in children, the first words would be compos of simple articulations, that is, of consonant sounds, each followed by a vowel; and new words would be formed by the combination of such; so that in the early languages all compounds would be formed by the combination of simple articulations. 4. The greater part of consonant sounds, cannot be founded singly without vowels, nor together without vowels intervening. In many cases this is evident to the ear; and when it is not perceived, it often is the fact, though the acquired rapidity of utterance may render it very little perceptible. 5. Some languages do not admit of any two consonant sounds together. The Tartar language always requires a vowel between two consonants. The Ruffians, we believe, does the same. The Chinefe never join two consonants, unless we must except ng; but this appears to be only a simple sound, though represented by two of our letters. With respect to the Chinefe the point is of consequence, because there is great reason to believe that they came from the stock of the Egyptians, before there had been any considerable addition to their vocabulary by combinations of sounds, and before the transition had been made from hieroglyphical to alphabetical writing. It is true many of the Chinefe words end in consonants, which seems to render improbable the position advanced; but it is to be observed, that in such cases the words should be considered as of two syllables; for it is impossible, in continuous speaking, to utter a complete consonant found at the end of a word, without emitting a vowel sound. 7. That the Hebrew (which is to be considered as a representative of all the cognate eastern languages) never found a consonant without a vowel, may be inferred from this circumstance, that those who invented the denotements of vowel sounds, while at least the leading features of the pronunciation remained, thought it necessary to add or suppoce underlaid a vowel sound after every consonant.

Having gone over the principal topics relative to oral language, we proceed to written language. Writing has been truly considered as one of the most noble and beneficial inventions which human ingenuity can boast. We shall not expatiante upon its advantages in embodying and perpetuating our thoughts, but shall proceed to give a history less enveloped in obscurity in most of its stages than that of oral language. Difficulties indeed attend it, as must occur in every investigation into antiquity; but we have here data
which to found our conclusions, which the fleeting nature of oral language would not permit.

Visible language first used marks as the signs of things; and we can trace it through its various stages from the simple picture to the arbitrary mark. The rudest species of visible communication with which we are acquainted, is that of the Peruvians; it was by means of knotted cords of various colours. We have reason to believe, however, that this was not the only species of visible communication among them; and it was evidently very defective. The Quipos, as they are called, have been celebrated by authors fond of the marvellous, as if they had possessed regular annals of the empire; but it seems reasonable to infer from here. They might have some significance by inference, but without oral interpretation they could denote little more than that something was to be remembered, in the same manner as perfoms of weak memories sometimes adopt the contrivance of tying a piece of string round their finger to remind them that recollection is necessary. According to the opinion of the best informed judges, they seem to have been a device for rendering calculation more expeditious and accurate. By various colours, different objects were denoted, and by each knot a distinct number; so that they might serve as a kind of register of the number of inhabitants in each province, or of the quota they furnished to the general treasury of the nation. As they had picture-writing, though to no great extent, and numbers must be denoted by arbitrary signs to render calculation at all extensive, this account is far more probable than that of those who suppose them designed for historical purposes. In this view they could answer no farther purpose than the twelve fomes which Joshua set up after the passage of the Israelites over the Jordan.

The Mexican picture-writing was the first step in the progress towards alphabetical writing. The essential difference which it will be desirable to keep in mind between the latter and all the intermediate steps, is, that in alphabetical writing we use signs for sounds only; except with the deaf, they are in the first instance significant of things or ideas only by an intermediate step: picture-writing, in all its various stages, presents signs for things or ideas directly, and only for sounds as being the denotement of them.

The simplest species of picture-writing was that in which a mere delineation of the thing to be denoted was employed; thus, to express man or dog, &c. a drawing of the animal would be given. This we learn from Sir William Johnson is the procedure of the North American Indians: when they go to war they paint some trees with the figures of warriors, often the exact number of the party, and if they go by water they delineate a canoe. When they gain a victory, they mark the handle of their tomahawks with human figures, to signify prisoners; and draw the bodies without heads to express the scalps they have taken. To these simple annals the warrior tills for renown; and pleads himself with the belief, that by their means he shall receive praise from the warriors of other times. Thus, too, the Mexicans, when the Spanish invaders first arrived on their coasts, lent large paintings on cloth as expreses to their emperor Montezuma. But the Mexicans had made much greater advances than their savage countrymen; except in some few instances they did not indeed go further than simple delineation, but by a proper disposition of their figures they could exhibit a more complex series of events in historical order. They could describe, for instance, the occurrences of a king's reign from his accession to his death; the progress of an infant's education from its birth to the years of maturity; the different recom pense and marks of distinction conferred upon war-riors, in proportion to the exploits they had performed. Some very curious specimens of this picture-writing are preserved; the most valuable one has been published, and may be found in Purchas's Pilgrim. It is divided into three parts. The first contains a history of the Mexican empire under its ten monarchs; the second is a tribute roll, representing what each conquered town paid into the royal treasury; the third is a code of their institutions, domestic, political, and literary.

We have reason to believe, however, that this was not the only species of visible communication among them; and it was evidently very defective. The Quipos, as they are called, have been celebrated by authors fond of the marvellous, as if they had possessed regular annals of the empire; but it seems reasonable to infer from here. They might have some significance by inference, but without oral interpretation they could denote little more than that something was to be remembered, in the same manner as persons of weak memories sometimes adopt the contrivance of tying a piece of string round their finger to remind them that recollection is necessary. According to the opinion of the best informed judges, they seem to have been a device for rendering calculation more expeditious and accurate. By various colours, different objects were denoted, and by each knot a distinct number; so that they might serve as a kind of register of the number of inhabitants in each province, or of the quota they furnished to the general treasury of the nation. As they had picture-writing, though to no great extent, and numbers must be denoted by arbitrary signs to render calculation at all extensive, this account is far more probable than that of those who suppose them designed for historical purposes. In this view they could answer no farther purpose than the twelve fomes which Joshua set up after the passage of the Israelites over the Jordan.

The Mexican picture-writing was the first step in the progress towards alphabetical writing. The essential difference which it will be desirable to keep in mind between the latter and all the intermediate steps, is, that in alphabetical writing we use signs for sounds only; except with the deaf, they are in the first instance significant of things or ideas only by an intermediate step: picture-writing, in all its various stages, presents signs for things or ideas directly, and only for sounds as being the denotement of them.

The simplest species of picture-writing was that in which a mere delineation of the thing to be denoted was employed; thus, to express man or dog, &c. a drawing of the animal would be given. This we learn from Sir William Johnson is the procedure of the North American Indians: when they go to war they paint some trees with the figures of warriors, often the exact number of the party, and if they go by water they delineate a canoe. When they gain a victory, they mark the handle of their tomahawks with human figures, to signify prisoners; and draw the bodies without heads to express the scalps they have taken. To these simple annals the warrior tills for renown; and pleads himself with the belief, that by their means he shall receive praise from the warriors of other times. Thus, too, the Mexicans, when the Spanish invaders first arrived on their coasts, lent large paintings on cloth as expreses to their emperor Montezuma. But the Mexicans had made much greater advances than their savage countrymen; except in some few instances they did not indeed go further than simple delineation, but by a proper disposition of their figures they could exhibit a more complex series of events in historical order. They could describe, for instance, the occurrences of a king's reign from his accession to his death; the progress of an infant's education from its birth to the years of maturity; the different recom pense and marks of distinction conferred upon war-
monuments perpetuated the memory of their heroes, their mythology, their laws, and their customs. See Robertson's America, vol. iii. p. 173—180, and Clavigero, vol. i. P. 499—11.

This simple picture-writing would soon be contracted by necessity; parts of the object, or the principal circumstances of the action, would be delineated to denote the whole of the object or action which it was intended to represent. This would correspond to what we should call in writing a plain style; but it is obvious that language, whether written or spoken, if confined to words denoting objects of sense merely, would be very meagre and imperfect. To enlarge the powers of visible communication, the real or supposed instrument of a thing was placed for the thing itself. And a still more refined species of hieroglyphics, where qualities, &c, were represented by objects which had some real or supposed analogy to them; this corresponds to a figurative style. We here speak of hieroglyphics as intended for the purpose of communicating, not concealing knowledge. It was long supposed that the latter was their first and only purpose; but bishop Warburton has satisfactorily proved that this use was not made of them after the other was rendered unnecessary by the invention of alphabetical writing. It is for the purpose of communication that we wish to consider them. Warburton seems to consider these three kinds of hieroglyphics as in reality three distinct species of communication; but as De Guignes juftly observes, this difference regards the style alone. And though probably in the most simple hieroglyphics were those first used, yet as language must have made some progress by the use of permanent visible communication, it was found necessary, and consequently must have given metaphorical meanings to the names of many sensible objects, it is not to be supposed that the hieroglyphics would be confined thus even in their very earliest stages. We must remember, too, that even the rudest kind is an improvement upon the picture-writing; so that we are not to consider them as the first attempts of men to embody their thoughts.

The most simple species of hieroglyphics was when the delineation of part of the object or action represented the whole; thus the ancient Egyptians painted a man's two feet in water to represent a fuller; smoke ascending to denote fire; two hands, one of which held a buckler, the other a bow, to denote a battle, &c. Now if we direct our attention to oral language, we shall perceive that it still retains many of these contractions, particularly in poetry. The fail, for instance, to denote the whole ship; the hand, to denote the whole man, &c; where, however, it must be remarked, that these contractions are for the purpose of denoting the part of the object, &c, which is most to be attended to in the given circumstances, and therefore come under the second kind of hieroglyphics, where the real or supposed instrument is used to denote the performer or the thing performed. And indeed so long as oral language denotes sensible objects, there is no advantage with respect to brevity in placing the name of a part to denote the whole, since, except in peculiar cases, the name of the whole may be pronounced with as great facility as of the part. Examples of this second class of hieroglyphics, are the eye and the sceptre to denote a king; a sword to denote a bloody tyrant; the mouth for speech and voice; an eye placed in an eminent position, to denote the presence of God; and the sun and moon in like manner were used to denote the succession of time. Initiates of similar metaphors in common language are very numerous; to take the last two instances, we say the eye of God is upon us, meaning that the omnipotence of the Supreme Being extends to us; and though perhaps it would be too bold even for our poetry to use the expression of fear for the time of his apparent revolution; yet we might employ moon to denote the time of a lunation. The last kind we mentioned, was that which employed, to represent one thing, another which had some resemblance or analogy to it. Hence was the last procures in the invention of oral as well as pictured language, and it is perfectly similar to what we at present consider to be an ornament, figurative language. For it must be observed, that what we consider as a beauty, was originally the invention of necessity. For instance, among the Egyptians the dog's head, (as among the Chinese the dog's voice,) was the symbol for sorrow; science was denoted by a dew falling from heaven. This very metaphor is expressed in the form of a simile, in Deut. xxxii. 2. "My doctrine shall drop as the rain, my speech shall distil as the dew, as the small rain upon the tender herb, as the showers upon the grass." These symbolical hieroglyphics would be very frequently derived from very fanciful analogies, founded frequently on the popular prejudices of the time. As an instance, may be mentioned the figure of an hyena, which was used to denote a man who supported his misfortunes with courage, and rode superior to them. This took its rise in the opinion that the skin of the hyena rendered the wearer fearless and invincible. The last we shall mention, is the famous inscription at the temple of Minerva at Sais, where we find the figures of an infant, an old man, a hawk, a fish, and a river horse. The hawk and fish were one character; this kind destroys fish, and is therefore the symbol for hatred. The river horse was the symbol for impudence, and the infant and the old man were intended to denote all men. The hieroglyphic therefore means "young and old hate impudence," or, more literally, "old man, infant, hatred, impudence." It has been more diffusely rendered: "all ye who enter into the world, and who go out of it, know that the gods hate impudence." We may remark, as we proceed, that this tends to confirm the hypothesis, that originally all words, even verbs, were nouns. This hieroglyphic was a plain admonition, designed for the instruction of the people; for it was engraved on the vestibule of a public temple; and is therefore juftly considered by Warburton, as one proof that the original hieroglyphics were for the purpose of communication, not of concealment. If the Scythian king had been able to delineate objects, he would perhaps have lent to Darius instead of the real objects. The picture of a mouse, a frog, a bird, a dart, and a plough would have answered the same purpose as the things themselves, and have been less inconvenient. They would then have been real hieroglyphics.

The first object of those who invented hieroglyphics, was to preserve the memory of events, and to make known laws and regulations for the conduct of the citizen and the man. Such symbols therefore would first be employed as were of obvious interpretations. Figures founded on their language (which, as we have already observed, must have made considerable advances towards improvement,) would be readily understood, even if the analogies which gave birth to the words were forgotten. By degrees they were employed for the more refined purposes of philosophy; and analogies and resemblances were the foundation of hieroglyphics, which would be intelligible only to those who were acquainted with the sciences from which those analogies were deduced.

This progress, as we shall afterwards see, is the same with that of the Chinese language, which in all its stages is an object worthy of our curiosity. Still, however, there was nothing done for concealment. The purpose of communication was still kept in view, and knowledge of the theories of the times alone was sufficient for their interpretation. But by degrees superstition appropriated them for the purpose of concealment.
ereals, and those whose whole dominion over the vulgar con-
visited in the pi-llection of mysteries, after the invention of
alphabetical writing, which would otherwise have annihilated
the use of hieroglyphics, still employed them to keep the
secrets of the priesthood from the eyes of the profane vulgar.
Their symbols, which for the purposes of communication
should have had an obvious analogy, were introduced from
far-fetched resemblances. A cat was used to denote the
moon, because they perceived a difference in the size of its
pupil at the full moon, and in different periods of its ap-
parent magnitude. Egypt (which in the common hierogly-
phic was denoted by a crocodile,) was in the sacred hier-
oglyphic denoted by a burning center with a heart upon it.
In the natural progress of hieroglyphics, qualities would be
denoted by the objects which would be considered as pos-
sessing them in a great degree; as we have seen in the inscrip-
tion at Sais. But to make the hieroglyphic a real mystery,
one animal or inanimate object was made to denote a variety of
contrary qualities; thus the hawk denoted sublimity, humi-
lity, victory, excellence, &c. And on the other hand, the
same idea was denoted by various hieroglyphics. It was
this use, which was probably posterior to the invention of
alphabetical writing, that has attached to the hieroglyphic
system the character of mystery.

It is obvious that the exact manner of delineation would
be tedious, as well as voluminous. The more use was made
of visible communication, the more we may expect to find
the written characters depart from the simple picture, and
become arbitrary marks. Not, indeed, arbitrary in their
original invention, but perfectly arbitrary to those who after-
wards used them. We see, from the remains of the Egyp-
tian hieroglyphics in their early stages, that they paid con-
siderable attention to the delineation of their figures: they
filled up the outline of their pictures; in process of time they
used only the outline; and these, again, they changed, as the
convenience of the writer dictated, till at last it lost every
resemblance to the object which it originally represented.
The changes that our written characters have undergone,
and are continually undergoing, might be adduced as an
exemplification of this procedure, from delineation to the
cursive hieroglyphic. The mark for and, for example, was
originally significant; it did not, indeed, represent an object,
but it was a correct picture of a word. Some of the forms
yet shew its derivation; and is obviously at; but continual
changes have been made upon it, till the & of the writer no
longer bears marks of its origin. We cease now to confi-
der the letters of which it is composed; it is the represen-
tative of an idea; and, consequently, of the word denoting it
in the respective nations that use it. We use it for and
without considering at all the meaning it originally had.
The use of the cursive hieroglyphics would, in like manner,
take off the attention from the symbol, and fix it upon the
thing signified; a progress which we equally observe in oral
language, where the words employed to denote mental affec-
tions were originally denotements of inanimate objects; then
of mental affections bearing some resemblance to them; and,
finally, in many instances, of those mental objects, without
any reference to their original meaning.

We have now advanced to the verge of alphabetical
writing. So far has generally been regarded as simple,
and as the actual procedure; but it is imagined that till
there is a great gulf, whose depth is unfathomable. Many
of the preceding observations have been made with a view
to this discussion; and by their means it does not appear
difficult to ascertain the exact procedure. Perhaps we shall
not be able to trace all the minute steps of the mind's march;
but the general track we shall find so difficult in pursuing,

Truth, Horne Tooke observes, has generally been suppos-
ed to be at the bottom of a well; he thinks it lies much nearer
the surface. More has been supposed necessary than could
have been done, at least than is probable, at the periods of
which we speak; and this has deterred those who saw the
necessity of simplicity from attempting anything. We shall
see that much was not necessary; certainly, we can do so much
as to render requisite the exertions of genius, aided by the light
of philosophical research. Signs, we have seen, become at last
arbitrary marks for ideas or words. From this stage we
may consider written language as taking two different
courses; in one the sign became merely the sign of the
found, and its combinations the signs of those of found; in
the other the sign was considered as the sign of the idea, and
its combinations did not correspond with any combinations
in oral language, but were representative of combinations of
ideas. The former we may expect to occur where oral
language was copious, the latter where it was scanty; the
former where learning was considerably diffused, the latter
where it was confined to a small proportion of the persons
using the language. Where the visible signs became merely
signs for sounds, alphabetical writing, as we shall hereafter
see, easily followed; where they were arbitrary signs for
ideas, every new combination not attended by a correspondent
combination in oral language, placed the introduction of
alphabetical writing at a greater distance than ever. This
latter we shall find to be the case with the Chinese language,
to which, as far as respects the objects of the present dis-
cussion, we wish now to call the attention of our readers; as
presenting some most important features in the history of
language.

We have seen that written language originally consisted
of pictures of the things to be denoted; then of abbreviated
forms of the same; that these pictures and abbreviations
were employed to denote, not only the objects they repre-
sented, but others which had some real or suppoled resem-
bance to them; and finally, that through gradual changes
and abbreviations of the written character, it became at last,
instead of a picture, a mere arbitrary character. Through
all these stages has the written language of China passed:
from caules, some of which we can trace, they here stopped.
Other nations proceeded further, and used these marks as
the signs of sounds and of ideas through their intervention;
the Chinese employ them as the signs of ideas, without the
intervention of sounds, and their combinations and changes
have no corresponding combinations and changes in their
spoken language.

Before the time of Fohi, the first Chinefe emperor, the
Chinese used knotted cords, similar to those of the Peruvians. Fohi, in the place of these knots, employed
two horizontal lines, the one whole, the other divided,
and by their various combinations in threes, formed the
text of the most ancient work among the Chinefe, known
under the name of Ye King, or the book of predictions.
The Chinefe regard this work as a precious monument of
the most ancient philosophy; but, notwithstanding the nu-
umerous commentators which have been published upon it,
none so early as 1600 years before Christ, it is still unintel-
ligible. They are, however, supposfed to contain, in a few
lines, the most sublime truths, and are still employed for
the purposes of divination. Subsequent to the trigrams of
Fohi, Xinquang, the next in succession, is said to have invented
sixty-four hexagrams, which are supposfed to express the
whole circle of human knowledge, and, together with the
trigrams, are to be considered as the most ancient written
characters of the Chinefe. It is supposfed that these char-
acters were taken from the knotted cords; and it appears,
to us highly probable that they expressed no more. It does not appear at all likely that these marks should be intended to denote the mysteries of philosophy, whether we consider the time of their invention, which is carried back to the age of Noah, or their inadequacy to express anything but numbers. It is allowed that the earliest writing of the Chineses was the result of the rotation of numbers by the knotted cords. In fact, the present numerals of the Chinefes appear to have an equal right to be considered as the mysterious denominations of mysteries. The present Chinefes characters are not to be deduced from these combinations of lines, but from pictures and symbols. Their present form does not present any objection to this supposition. Many of them, indeed most of them, bear little or no resemblance to their original form; but the progress can be traced in very many cases, and hence it is a fair inference that they were deduced from pictures and symbols, even where the connecting steps are lost. Several examples of this are given in the Philosophical Transactions for 1769, vol. lix.

Before we proceed further in the consideration of the written character of the Chinefes, we shall find it expedient briefly to consider the singular structure of their oral language. This, as we have before observed, is entirely monosyllabic; and every word may be expressed by an European consonant and a vowel, and about one-third of the words end with $n$, or the nasal sound of $n$. We must not expect to find a monosyllabic language very copious in sounds; and we shall expect a full smaller variety of words when we find that their consonant sounds are less numerous than our $s$, as they are destitute of the $b$, $d$, $r$, and $x$; in fact, the number of their words is not more than 330. This number is so small, that we should suppose it inadequate to the purposes of life, much more so to those of science. The capabilities of their oral language are, however, very much increased by the variation their words undergo by means of tones, or other inflections of the voice. For instance, the word $Fu$, differently pronounced, denotes a husband, to help, a town, a father, and to conceal. There are other modifications of sound which the same word undergoes, which enables them to extend its meaning without confusion, and this to things very opposite, or at least very different in their nature. These nice distinctions certainly require a very discriminating eye to perceive them, and very flexible organs to express them; but we know the power of habit. We have in our own language inflections of words approaching so nearly in found, that many never pronounce them correctly, yet seldom leave any room for ambiguity; for instance, $hair$, $air$, $beir$, $are$, $bare$; are all different sounds, but their similarity is so great, that many confound them in pronunciation. Stanton observes, that synonymous words are very much used in conversation; and this mutual facility lessens the ambiguity. This, however, must only be for the sake of those who have any difficulty; for it seems to be the genius of the Chinefes language to express the ideas of the speaker in as few words as possible. “The Chinefes,” says a writer in the Philosophical Transactions, vol. lix. p. 495: “speak as fast as we do, say more things in fewer words, and understand each other.” The last refers to diminish the occasional difficulty in conveying their ideas by oral language as to trace the written sign in the air, or in a more permanent manner.

A language in which we find not more than 1500 distinct sounds cannot be considered as copious. It is probably sufficient for all the purposes of life, but for the purposes of science very inadequate. Most nations have improved their oral language; the Chinefes have directed all their attention to the improvement of their written language. They have refrained from combinations of words to express combinations of ideas; and what appears still more singular, the combinations which have been formed in their visible, have not been carried into their oral language. In fact, the Chinefes writing may be considered as totally distinct from their oral language. One might have supposed, as Ferret says, that it was invented for those who do not possess the capacity of speech. The written not having been founded on the spoken language, the improvements and changes of each are independent of the other. Their characters were originally signs of ideas; and as it is much more easy to introduce changes in the language of science, than of the vulgar, the philosophers combined, and combined their combinations of characters, but did not, perhaps could not, carry their combinations into oral language. Thus, for instance, the character for $ho$je named $mien$, and that for $fire$ named $bo$, when combined denote $calamity$, expressed in oral language not by $mien-bo$, but by $bfai$. On the other hand, as our writing is a denotation of sound, every combination of written words will have a correspondent combination of sound, and no combinations will be formed except such as can be spoken. We may compare the Chinefes characters to the arithmetical cypher, or to algebraic or astronomical characters, which may be understood by those who are acquainted with the words we express to denote them. Present an arithmetical calculation, or algebraic demonstration, to ten mathematicians of ten different countries, every one understands it immediately. In the same manner the Chinefes characters are intelligible not only in all the provinces of this vast empire, but farther in Japan and Cochinchina, whose spoken languages are totally different from that of the Chinefes. If these nations converse they employ an interpreter, but the obstacles to communication vanish, as soon as they trace their written character. There appears, however, a considerable difference between the common use of the arithmetical cypher, and the use the Chinefes philosophers make of their characters. We always think of one, two, &c. if we use 1, 2, &c.; at least this must be the case with all who are not in the habit of calculation; and the visible sign is so strongly associated with the audible, that we apprehend few persons read to themselves without the intervention of found, real or conceived. When we think in words (as we always do when we reason, and frequently when we feel), it is to the audible and not to the visible sign that we attend; and we apprehend that it is generally the case where the habit of solitary study and seclusion from the world has not been formed. Our written words are more or less exact representatives of the sound, and it is therefore difficult to separate them even in imagination; but the Chinefes characters have no connection with found, except by their common connection with ideas. And as they have no visible representation of the found, its intermediate association cannot be sufficiently strong in the minds of their literati to render it necessary in the train of reasoning to use the found at all.

All the Chinefes characters are composed of 214 clefts, keys, or tribunals (as the Chinefes themselves call them). These represent the most simple ideas, and by their combinations are produced, expressions for the more complex ideas. In fact, these keys express fire, water, earth, air, wood (which are the first elements of the Chinefes), the sun, the moon, bird, man, different kinds of animals, mountains, valleys, &c. fisher, mother, son, life, death, the body, and different parts of it, and some vessels and instruments, and many other things similarly simple. All these can be traced to simple paintings or symbols; and hence the whole written language may be truly considered as deducible from the more
more simple writing of the Mexicans and the Egyptians. Indeed, the resemblance between the ancient Chinese character and the Egyptian hieroglyphics is so striking, and this in cases where the analogy on which both are founded is not an obvious one, that De Guignes considers them as derived from the same source. The actual number of the keys at present is 214; anciently they were more or less numerous, but this has been owing rather to the different opinions of the philologists of the time, than to any real change in their number. These keys are formed at present from six simple strokes, a horizontal line, two perpendicular lines, the one pointed at the bottom, the other blunt, a point, a line curved to the right, and another to the left. We are not, however, to suppute, that the inventors of the Chinese characters fixed upon these six elements, and composed all the characters from them methodically: this is the procedure of art. But as writing gradually paffed from painting, it lost its correctness of delineation, and the object was to facilitate, as much as possible, the labour of writing. It reduced all the characters by degrees; the more compounded, to others less so; and these again to simple strokes, such as have been mentioned. These 214 keys are each employed alone, as a character serving to express an idea, or differently combined one with another when they are considered only as parts of a group. The several parts of this group, or combination, form a kind of pharse expressive of the idea it is intended to communicate. Thus, the Chinese character for night, is composed of three characters, signifying darkness, the action of covering, and man, which rendered literally, signifies darkness covering man; a pharse which perfectly expresses the idea of night, and which is similar to the language of poetry. Both, in fact, issue from the cradle of the human race. This figurative kind of language (the offspring of necessity) is what we admire so much in the sacred writings: it comes home to our feelings and our bosom; it points to our minds, and calls up their conception forcibly and correctly. Hence it justly deemed a beauty, and whenever the language of feeling is necessary to excite the mind to activity, will generally be found a prevailing trait.

We might suppose that all the Chinese characters, being composed of simple characters, might be easily understood, when the meaning of the keys composing them is known: as is the case in the two examples which have been given. If it were actually so, the Chinese would be the most easy of all languages, and might be adapted as a general or philosophical language; but the analogies and metaphors on which the composition is founded, are often forced and often erroneous. Their principles of philosophy furnished a wide field for combination but frequently these are absolutely false: their ancient customs and their popular superstitions all afforded scope for the invention of new characters; and to understand the compound characters of the Chinese, without the aid of oral instruction, we must understand their ancient physical and religious dogmata, and join to this an acquaintance with the fleeting customs and opinions of the times in which they were formed. This is not peculiar to the Chinese language: in order to trace the origin of words, the same references are often necessary, but we have more frequently the data requisite to enter into them. For instance, candidus in Latin signifies white, candidatus, a candidate (a person who offers himself to fill a lucrative or honourable situation), a perfone drossed in white. We should have been unable to follow this analogy if we had not been informed by history, that among the Romans all candidates for places wore white robes. In a similar manner the Chinese character, pao, to run, is composed of two, that of wrapping, and that of feet; this is not an obvious procedure, and the Chinese do not retain any explanation of it; but we know that the savages of Louisiana, when about to undertake a long march, wrap up their feet in cloth to prevent their being torn; and it is highly probable that the combination of pao must refer to a similar custom.

We have now traced the various procedures which have been adopted to perpetuate the remembrance of actions or opinions. We have seen the artless contrivances of men in early stages of cultivation; we have observed the progress of the art of visible communication from the rudequips of the Peruvians to the curving hieroglyphics of the philological Egyptians. We have found that when the visible marks lost their original correctness of delineation, they became mere arbitrary characters. From this stage two procedures have been pursued; some nations have ceased to consider them as signs for things, and have retained them as signs for sounds; others have continued to use them as signs for things without any immediate connection with sound. The latter have combined, and combined these combinations to form expressions for ideas without any regard to analogous combinations of sound; the former have combined them to express combinations of sound, and of ideas only by their intervention. In the one the written language is a picture of the spoken, in the other it is a picture of thought. We now proceed to the object we have all along had in view—the investigation of the other procedure, where visible marks became signs for elementary sounds.

In tracing the origin of oral language, we derive some assistance from the Mosaic records; we ascertain the degree of divine interference. In tracing the origin of alphabetical writing we must expect no such assistance; the art of writing is no where referred to a divine original, and while revelation is thus silent it becomes us to be silent too. Upon the principle that we ought not to suppute miraculous interposition merely from the difficulty of accounting for a phenomenon, we should argue a priori, that no miraculous interposition took place in the present instance. This would not weigh in the least if we were assured by the scriptures of the reality of that interposition; but it weighs very much against all presumptive arguments for it. However, though revelation is silent on this head, yet there are some arguments in favour of the theory of the divine origin of alphabetical writing, which it will be desirable to consider. After stating these and the answers which occur to obviate or refute the difficulties they present, we shall point out what appears the most probable account of the transition of hieroglyphics to letters.

11th. Alphabeticall writing may be traced to one source. Now if it were an invention of man, especially if it be a simple invention (as it must be shown to have been, in order to give any plausibility to the hypothesis), there is no reason why it should not have been an independent invention.

Two answers may be given to this argument. 1. If we examine the alphabets of Asia, we shall find it difficult to admit that they may be traced to one source; there is so great a degree of diffimilarity among them, that it requires stronger evidence than any we have yet seen to prove it. When, however, we consider the changes that we know have actually taken place in the same character, we may admit the possibility of the original identity, and perhaps other circumstances may induce us to admit its probability; but this probability cannot, we apprehend, become so great as to give any force to the argument in question. But even admitting its certainty, we observe, (2) that this can only prove the high antiquity of the invention. That it originated before mankind were much separated from each other;
other; and that the groundwork being laid by those who
had made the greatest advances in cultivation, was built upon
by those people who afterwards penetrated to a distant part
of the continent.

But when we come to the second place, that we have not only
no instance of independent discovery, but have even an ex-
ample of a nation, which had no communication with the
original inventors, remaining in total ignorance of it, and
employing a procedure which now incapacitates them for
the reception of alphabetical writing: and the force of this
objection is materially increased by the circumstance, that
their writing, equally with the alphabetical, originated in
hieroglyphics, and actually went through the same stages,
even from the simple picture to the arbitrary mark.

This singular procedure of the Chineese, which certainly
presents a difficulty against the theory of the human origin
of alphabetical writing, may probably be obviated by the
four following considerations: (1) The written language
of China was cultivated more for the purposes of philosophy
than of common life. Their combinations were founded on
their philosophy; and it probably would not have been in
their power to have carried these combinations into the oral
language of the vulgar. A complete nomenclature of che-
my has been introduced, founded on the prevailing theory
of chemistry. This is universally received, wherever the
new system is embraced; but it would have been impossible
for the philosophers, who invented this beautiful specimen
of philosophical language, to have induced the illiterate
of a whole nation to change their language, or adopt a new
one, however expressive and correct. The philosophers
of China might indeed have formed an oral language upon
their characters; but the genius of the Chineese seems rather
to direct them to study than to conversation, and abstract
philosophy is better taught to the studious by written than
by oral communication. Besides, (2) the spoken language
of China did not favour the plan of making their writing
representatives of found; for their words being all mono-
ylabic, and not very numerous, there would not be the same
necessity for attention to elementary sounds; and what is
more important, they did not vary the articulation, but the
tone, in order to express a variation of meaning. It appears
to us, that alphabetical writing could not, from the very
nature of their spoken language, have originated among the
Chineese; and to these considerations we may add, (3) that
the empire of China, with its dependencies, was so extensive,
that there must be a very great variety in the Chineese
dialects; and this would contribute to increase the attention
of their literati to the written language, since this (as we have
seen it actually) is most evidently independent of their
spoken words. (4) If we admit the very probable hypothesis
of De Guignes, that the Chineese characters were
brought from Egypt, and that they had originally no con-
nection whatever with the spoken language of the country
into which they were introduced,—that, in fact, they were
applied to denote names different from those with which they
had before been connected,—we shall perceive at once the
reason why, originally, the combinations of the characters
were not attended with similar combinations of sounds.
After this, there is no difficulty in admitting that the written
must continue independent of the spoken language, especially
among people so little addicted to innovation as the Chineese
appear to be.

It is urged, in the third place, that the invention of writ-
ing is, by many of the ancients, ascribed to the gods; and
that Pliny, in particular, expressly says that the use of let-
ters was eternal.

To this it is replied, that the ancients universally ascribed
to the gods all inventions of which they knew not the origin;
and that as for Pliny, he expressly says elsewhere, that the
Phocicians were famed for the invention of letters. The
reason that this argument can prove is the antiquity, but not
the divine origin of this invention.

Such appear to be the principal arguments from fact, in
favour of the divine origin of alphabetical writing. There
are some arguments a priori, which remain to be considered;
these are, first, the difficulty of the invention in any stage
of human progress; and, secondly, its antiquity, which very
much increases the improbability of its human origin.

First, With respect to the difficulty of the invention, it
is observed, that we are to suppose that the inventors de-
composed the sounds of words, not only into syllables, but
into letters; observing the component parts of syllables, and
denoting these parts by appropriate marks; and using marks
for these elementary sounds in the visible representation of
other words, into which these sounds were found to enter.
This dillicult of the articulate sounds of man, tracing
them through all their various combinations, and expressing
them by a few simple marks, whose combinations may ex-
press every possible combination of sound, appears to sup-
poke a habit of patient experiment, of discriminating ex-
amination, and of generalization, which all accords with the
uncultivated state of the human intellect in the early periods
of society. But, secondly, when we consider the antiquity
of the invention, when we are forced to carry it so far back
as to have been in a state of perfection as early as the time
of Moses, this difficulty appears insuperable. We must admit,
it is urged, that men, in the earliest ages, flapped at once
from a tedious and awkward, frequently unintelligible,
method of communication, to a method which answers every
purpose of communication, in the shortest way; and that,
unlike all other inventions, it was brought at once to such
a state of perfection, that no succeeding alphabet has any real
superiority over the ancient Hebrew.

This objection against the human origin of letters is more
weighty in appearance than in reality. With respect to the
difficulty of the invention, the objection loses all its force, as
soon as a simple and easy procedure, such as might be
adopted in the circumstances of the case, can be pointed
out. To obviate the difficulty arising from the apparent per-
fection of the original invention, we may observe, (1) that
if the perfection of an alphabet conflicts in its capability of
expressing all the sounds of spoken language, there is no
known alphabet which is perfect. Every letter should ex-
press only one definite sound, and every known sound should
have a corresponding letter. We do not mean that it is
necessary that the alphabet of one language should be capable
of expressing all the sounds of another, but of its own.
Now we have no instance of this among living languages;
and we cannot, therefore, suppose that it was the case in any
former language. But even admitting this, we may ob-
serve, (2) that no known alphabet, however ancient, is in
the state of its original invention. Cadmus, who was born
in the East, carried with him into Greece only sixteen let-
ters; the least copious alphabets we are acquainted with
have twenty-two. It is not in the least probable that Cad-
mus would introduce fewer than he possessed: it is more
probable that he introduced more, to express sounds of
which he had no representation, but which were found among
the Aborigines of Greece.

We have said, that if a procedure can be pointed out,
simple as the intellect of the inventors of language, and ca-
}pable of easy introduction in the early periods of mental cul-
ture, all arguments a priori fall to the ground. It has gene-
}rally been supposed of late that alphabetical writing was
}formed
formed from hieroglyphics: it appears nearly certain that it was so; but the reason was never, we apprehend, explained with probability before the time of De Guignes. His hypothesis appears to have been unobserved by subsequent writers, who have attempted to trace the transition; and the only satisfactory statement which we have noticed in our own language is in a paper in the Irish Philosophical Transactions, by Dr. Hearneey, who advances one important step, by supposing that letters originally represented syllables. Dr. Hearneey, however, speaks of the human mind as accustomed to analysis, when the transition took place; and supports his hypothesis on the subject with arguments which appear little conclusive.

"Perhaps," says De Guignes, "we have done too much honour to the inventor of letters (whoever he was), in supposing that he divided the voice into two parts, and invented marks of two kinds, some to express consonants, the other vowels. It is more natural to suppose that the hieroglyphical writing was abridged by little and little, by suppressing a great number of figures; and that those which they adopted preferred always the sounds which they had before; that they read them as they had read hieroglyphics; that they were always words, but very simple, and words whose shape was a single consonant; that finally reduced into a regular order, (which we call the alphabetical,) they were regarded as consonants, capable of being differently modified by a simple vowel found."

Our ideas on the transition from hieroglyphics to letters, (derived in a great degree from De Guignes,) may be thus stated:--The hieroglyphics, with their exactness of delineation, lost their original signification, independent of spoken language. This must first be the case with words of the most frequent recurrence, and which entered most into combination with other words. Having become simple denotations of sound, they were employed to express their respective sounds in combination of other monosyllabic words, which in like manner had lost their original signification. Hence, by degrees, they would become representative of the component parts of all words into which their respective sounds entered. They were always words, but very simple, consisting only of a consonant and a vowel. Variation in the pronunciation of the vowel would occur in different dialects; and hence these marks would gradually be regarded as consonants, capable of being differently modified by simple vocal sounds. Letters, at first monosyllabic words, then became marks for the component parts, or syllables of disyllabic or polysyllabic words; and then for the unchangeable part of those syllables, that is, for consonants. In the most ancient state of the oriental languages, vowel sounds had no distinct marks; in the latter, marks were joined to the consonants, to express the different sounds with which the radical consonant was invested. Among the western nations, a different procedure was adopted. In some cases, they used the marks which they had received from the oriental nations, for an aspirate and vowel, to denote the sound itself; and having once commenced the use of distinct marks for vowels, the procedure was continued, and new marks adapted to express noticed variations of vocal sounds.

In support of this hypothesis, may be adduced the following observations:

1st. We have seen that hieroglyphics did become significant of sounds; and that words originally significant of one class of ideas being applied to a second, lost their connection with the former, and became directly significant of the latter.

2. We have reason to believe that words were originally monosyllabic in those nations where alphabetical writing was invented, and that the combination of old sounds, or the use of them uncompounded, to express new ideas, was the mode employed to extend the capabilities of their language. Hence the same word would frequently occur in combination, and though its different significations must originally have been represented by different hieroglyphics, yet as these lost their signification, they would easily become as extensive in their meaning as the sounds themselves. And it is obvious that the most simple of those hieroglyphics which were used for the same sound, would be employed to represent the sound.

3. It has been shown to be highly probable that originally every consonant had its vowel found. Hence all syllables might be represented by two, or at most, three European letters. This circumstance would materially diminish the varieties of syllabic sounds.

4. The probability of the theory advanced depends greatly upon the hypothesis that originally letters were syllabic. The following facts appear to prove this. The ancient oriental alphabets had no denotations for vowels; and even if this be disputed, it must be admitted that they had many words into which none of the suppos'd vowel marks entered. The Ethiopic alphabet is entirely syllabic. The simple letters denote a consonant and a short a, and marks were added to them to denote other vowels, where used. What is doubly singular and important, they have in many cases added marks to these syllabic characters, to denote that they have no vowel belonging to them. In the Coptic and Arabic, there are syllabic characters. The alphabets of the eastern Ethiopians are principally syllabic, some with a, others with e joined to a consonant. These circumstances render very probable the account here given of the transition from hieroglyphics to letters. The following observations more directly tend to ascertain its high probability.

5. The letters of some of the ancient alphabets have a great resemblance to the hieroglyphical characters, indeed are such exact transcripts of them, that a simple inspection is sufficient to convince us that hieroglyphics were the origin of letters, and this point is almost universally admitted. This however proves little as to the nature of the invention of alphabetical writing, except that it was subantial to the use of hieroglyphics. But,

6. These characters in many instances retained their original signification, which proves them to have been, as De Guignes supposes, denotements for words. We must not expect to find this signification in all words of which they form component parts; but if in such only in whose visible representation the original hieroglyphic formed a component part. Now we must observe, first, that the names of several of the oriental letters are still by themselves significant, and that some of these letters are similar to the Chinese characters which have the same signification. Thus the Hebrew א, god, signifies the band. Its form in some alphabets resembles the Chinese character for band. The ק, daleth, of the Hebrews, Phcenicians, and Ethiopians, signifies a gate or the action of opening. The hieroglyphic which among the ancient Chinese represented a gate, is exactly similar to this letter. The נ, phi, of the Hebrews, and of the Ethiopians, signifies the mouth. The Chinefe characters for the mouth all resemble it. The ח, aim, signifies the eye. The Phcenicians and Chinese employed the outline of the eye as a denotement of the object. The י, join, in Hebrew signifies the teeth, and its figure is still found among the Chinese, with the same signification. The י, mem, signifies water. The corresponding Samaritan and Ethiopian characters have a clear resemblance to the Chinese hieroglyphic for water.
ties unity, the action of concluding, pre-eminent. The Phæri-
nian form of this letter exactly represents the Chinefe char-
acter for one, and every action by which we are at the head of
others. But these letters are not only signifying by them-
elves, but secondly in combinations. Thus was expanded by
the monosyllable χ, χι, or χι; to this another monosyl-
labic, χί, which had equally a signification relative to the figure
being added, formed a word of two syllables. For instance,
instead of the present denomination of χι, δαλβτ, we may rea-
sonably suppose its original found to have been δαλβτ.
The word χι, δαλβτ, hieroglyphically represented by a gate and a
band, is found in the Hebrew with a signification derived
from that of the letters composing it; to call out, (as we
might say, brand him to the door,) to extend. Add to this
the word χι, αίν, (originally, probably, founded bo,) which
signifies the eye, and we have χαλβτοκ, which should dignify to
be on the eyes, to extend the view, &c. and metaphorically, to know,
to understand; and in fact this is the signification of χι, δαλβτ
in Hebrew. But this is not all, for exactly the same pro-
cedure has been adopted by the Chinese. 苾, which signi-
fies examine, is composed of three radical characters, of
which the first signifies the band, the second a gate, the third
the eye. So also苾 is composed of three characters, one
signifying the teeth, the other two, gate or opening, which
signifies to break through, to make a great opening. In Hebrew,
苾 is similarly composed, and signifies to plunder, to
lay waste.苾 is a large collection of water. It was
composed of the characters for hand and water. The
same compound was formed among the Hebrews, and
苾, γιαν, signifies a great collection of water, or the sea.
In Arabic the letters بئئئ, i.e. earth, and يم, i.e. water,
form the word بئئئ, and signify a flood. The Hebrew
GreaterThan is composed of the بئئئ or earth, and the يم, which
signifies يم, i.e. man of the earth, and further, to form, to
create. In both these inferences the Chinefe correspond in
their combinations with the alphabetical writing.—Many
other inferences might be brought. We will adduce one,
to which there is no corresponding combination in the
Chinese language. .logo or 4βa signifies father; the compo-
nent parts of it signify principal of the boy.

The papers of De Guignes, to which we are very greatly
indebted on this subject, are to be found in Memoires de
l'Academie des Inscriptions et des Belles Lettres, vol. 34,
&c. See Alphabet, Hieroglyphics, Letters, Words,
and Writing.

LANGUAGE. Structure of, comprehends the nature and ar-
range ment of the different parts of speech. See each under
its proper head. (See also Grammar.) No grammatical
rules, however, have sufficient authority to control the aim
and established usage of language. Established custom,
says Blair (Lectures, vol. 1.), both in speaking and writing,
is the standard to which we must all fall short, for deter-
mining every controverted point in language and style. But
it will not follow from this, that grammatical rules are super-
ceded as useless. In every language, which has been in any
degree cultivated, there prevails a certain structure and ana-
logy of parts which is understood to give foundation to the
most reputable usage of speech; and which, in all cases,
where usage is loose or dubious, poiffesses considerable au-
thority. In every language, there are rules of syntax which
must be invariably observed by all who would either write or
speak with any propriety. For syntax is no other than that
arrangement of words in a sentence, which renders the mean-
ing of each word, and the relation of all the words to one
another, most clear and intelligible. See Syntax.

Usage and custom, says F. Buffle, are the rule of a lan-
guage; and these hold their empire independent of reason,
or any other cause: nor has reason any thing to do in lan-
guage, unless to furnish or teach it, such as it is. Here
then commences grammar; a juj plan of which supposes a
language already introduced by life, and, without pretending
to alter or amend a tittle, only furnishes reflections, called
rules, to which the manner of speaking used in that lan-
guage may be reduced; which assemblage of reflections is
what we call the grammar of that language. This remark
may obviate an abufe introduced among grammarians, who are
ever crying out, "Usage is, in this point, opposite to gra-
m and; or the language here frees itself from the rules of
grammar, &c."

It is choice then to which we owe usage, and usage that
makes the rules and measures of language. Usage, indeed,
is somewhat dubious, and may be divided into good and bad.
If it be asked, wherein the difference between these lies?
it is in this: that the one is better established, or authorized,
the other; and if it be asked, wherein that difference of
authority confits? it is answered, that in dead languages,
that which makes the good usage ts the writings of the best
authors in that language: and if it be farther questioned,
which are the best? those are allowed such, who wrote when
the state was in its greatest glory. Thus the age of
Augustus, being the most distiguished by great men, who then
flourished, we call that good Latin which is conformable to
the manners of speaking used by authors, who wrote within
fifty years before, and fifty after, the reign of that emperor.
As to living languages, the good usage, or mode, is that
which obtains among the most eminent persons, whether as
to quality and authority, or as to learning and the reputation
of writing well.

With this view it is, that M. Vauclus defines usage of a
language, the manner of speaking used by the founder or
chief part of the court, conformable to the manner of writing
among the best part of the authors of the time. But this
definition, how judicious soever, may occasion infinite doubt;
for which is to be deemed the best part of the court; and of
the writers? Each party, doubtless, thinks itself the best.
F. Buffier, therefore, very justly, instead of the best part,
subsitutes the greatest part, which brings the matter nearer
to a certainty: the most numerous part being something
fixed and palpable; whereas the most found part may be in-
feasible or arbitrary. There is found a constant resemb-
ance between the genius or natural complexion of each person,
and the language they speak. Thus the Greeks, a polite,
but voluptuous nation, had a language perfectly suitable,
full of delicacy and softnefs. The Romans, who seemed
only born to command, had a language noble, nervous, and
august: and their descendants, the Italians, are sunk into
softnefs and effeminacy, which is as visible in their language
as in their manners. The language of the Spaniards is full
of that gravity and laungtnefs of air which make the dif-
cussing character of that people.
The French, who have great vivacity, have a language
that runs extremely brisk and lively. And the English, who
are naturally thoughtful, and use few words, have a language
more concise and lenientious, though far from being de-
icent in respect of copiousnefs.

LANGUAGES, the Diversity of, is generally allowed to
have taken its rise from the confusion at the building of the
tower of Babel. See Confusion of Tongues, and Dispersion
of Mankind.

As to the point of antiquity and priority among languages,
that has been extremely controverted. Herodotus tells us,
that in the dispute between the Egyptians and Phrygians
about the antiquity of their languages, Pammnestichus, king
of Egypt, ordered two children to be brought up, with
expressa
LANGUAGE.

express prohibition not to have one word pronounced before
them, but to leave nature to speak of herself; and the first
word they spake happened to be cucceus, which, in the Phyr-
gian language, signifies bread. The Egyptians, however,
were not convinced with this proof. The Arabs dispute
the point of antiquity with the Hebrews; but the Jews, jea-
ious, even to excess, of the honour of their nation, po- 
tively insist on it, that the Hebrew tongue, such as it is
found in the Holy Scriptures, is the primitive language, and
that spoken by the first man. For the arguments alleged in
favour of this opinion, see Hebrew Language.

Of all the oriental languages, except the Hebrew, the
Syriac has had the greater number of advocates, especially
among the eastern authors. They have alleged, that a dial-
lect of this language was spoken in Mesopotamia, Chaldea,
and Assyria, where mankind first settled after the flood, and
where, it is presumed, the language of Noah and his sons
remained: to which argument they add, that the names of
persons and places mentioned by Moses are easily derived
from that language. Besides these kindred languages, which
are commonly called the oriental tongues, the Ar-
menian, the Celtic, and the Coptic, pleading the antici-
quity of their nations; and the Armenians, that their
ancestors were the first settled in their country; the Greek, on account of its
pointed dialects and conjugations, the Talmudic, from which
some have pretended to derive even the Hebrew itself, and
the Chinese, have aspired to preference, in point of an-
tiquity.

The pretensions of the Chinese, in particular, have been
supported not only from the great antiquity of that nation,
their early acquaintance with arts and sciences, and their
having preserved themselves so many ages from any con-
derable mixture or intercourse with other nations; but also
from the singularity of the tongue itself, which consists of
few words, all monosyllables, and is most simple in its con-
struction, having no variety of declensions, conjugations, or
grammatical rules. Besides, it is urged, that the Chinese
are the posterity of Noah, and that Fohi, the first king of
China, was Noah.

Mr. Webb, an ingenious writer in the reign of Charles
II., strenuously maintains that this is the only original lan-
guage, and that they now talk in China the language of
Paradise.

Others maintain, that the language spoken by Adam is
lost; and that the Hebrew, Chaldean, and Arabic, are
only dialects of the original tongue. So far are they from
giving the priority to the Hebrew, that they maintain
Abraham spoke Chaldean before he passed the Euphrates;
and that he first learned the Hebrew in the land of Ca-
naan; so that this was not a special language consecrated to
the people of God, but was originally the language of the
Cananites.

M. Le Clerc is of opinion, the Hebrew is far inferior
to the Greek, both in copiousness, elegance, and perfc-
pitude; it is dry, and delusive of ornaments, incomprehensible,
that wanting expressions to vary the phrasing, the fame pe-
riods are perpetually returning. The rabbins, converting
its poverty into an excellence, say, it is so pure and chaste,
that it has no proper names for the parts of generation, nor
for those by which the excrements are discharged. See
Hebrew.

The Arabic is held the most copious of all languages.
See the Preliminary Discourse to Sale's Koran.

LANGUAGE. Explication of, for Singing. It seems as if the
vocal music of every country depended on the purity of the
vowels, neat articulation of the consonants, and easy utter-
ance of the words of which a language is composed; and
there can be no doubt that the dialect which has the greatest
number of open vowels mixed with its consonants, is the
most true for vocal purposes. The tones of voice can only
be heard with purity and clearness by the afflication of
vowels; as the words, voices and voice, are equally derived
from voices, which implies a sound, a musical tone, vocal
modulation, or modulation. And it is not only from the general
facility with which the syllables of a language can be
uttered with neatness and articulation that it is rendered
favourable to the finger, but from the number of vocal ter-
iminations, or words ending with vowels, which allow the
voice to expand, and finish a musical phrase with grace and
purity.

It is generally allowed that the French language is nasal,
the German guttural, and the English folksy, and loaded
with consonants, nasal syllables ending with n, and other
harsh and mute terminations. We have, indeed, filed off
the Saxon roughness in words where gh occurs: asough,
rough, laugh, plough, through, right, freight, enough, &c.
which used to be pronounced in the Teutonic manner, and
which are still guttural words in Scotland, and some parts
of England.

But besides the obscurities which the voice meets with in
its passage, from clashing consonants in the middle of
words, we have a greater number of terms that end with
absolute mute and abrupt consonants, than either the French
or Germans: such are those which terminate in b, d, g, f,
or hard s, p, and t. And it is not easy to defend our lan-
guage from the biffing of which it is accused by foreigners,
on account of the frequent use of the letter s at the end of
words, and the great number of words which terminate
with a double s. For though the plural number of French
nouns is distinguished in writing by an s, as well as the
English, yet the final s is never pronounced. The German
plurals too are terminated by the letter n: as haus, haufen;
thrust, struhen; pferd, pferden; &c. in the same manner as
house used to be haus in the plural, house, bozen; and as the
infinitive or full has xaven in the plural. And the letter n
being a liquid, renders the words which it terminates less
difficult to utter, as well as less offensive to the ear, than
the letter s, with which we have more words begin and end than
with any other letter in the alphabet. Indeed, modern ref-
nimentures or corruptions in pronouncing our language have
greatly augmented the fission of which we are unjustly
charged, by changing the eth and ath of verbs into is and
as; and saying gives for gives, bath for bath, &c.

The learned Dr. Wallis, a profound musician, in his trea-
tise "De Loquela," prefixed to his Grammar of the Englih
Tongue, has confided with great exactness the accurate
formation of all founds in speaking, to which few have at-
tended before; but with respect to singing, the work is full
of to be done.

Dr. Holder, who was a very learned musician and a com-
poser, though he has admirably analyzed the principles of
pronunciation, and described the organs of utterance, with
respect to colloquial language (Elements of Speech; an
Ecy of Inquiry into the natural Production of Letters,
1669), has not pointed out the means by which the mu-
ical voice in articulating words is aspired or impeded in its
formation and delivery, or the canes of its arriving at the
ear with more or less clean effects and purity. It was a sub-
ject that did not immediately concern the purport of this
excellent essay, which was written with the benevolent in-
tention of relieving persons born deaf and dumb to compre-
hend the speech of others by the eye, from its effect on the
external organs; and, therefore, the omission of such en-
quiries.
queries as seem necessary in this place cannot be termed a

defect.

Roufleau, in his ingenious and spirited "Lettre de la
Musique Françoise," has confined his remarks chiefly to the
vices of the French language; but to all, except the na-
tives of France, a lefs eloquent and forcible writer might
easily have proved it unsuit for every kind of vocal mu-
cine, superior to a "Vaudeville," or "Chanson à table:" for
the words of these compositions being their principal merit, the
hearer is the less inclined to judge severely of the music, or
the singer, provided he allot none of the wit or ingenuity of
the poem. And, indeed, it is at the serious French opera,
and by the performance of flow music, and airs tendres, that
these accustomed to good singing are most offended. However,
in the parallel which Roufleau has drawn between the lan-
guages of France and Italy, after describing all the incon-
veniences arising to a singer from the compound, mute, m-
fal, and dead syllables, of the French language; he affirms,
that the paucity of sonorous vowels, and abundance of con-
sonants and articulations, force the lyric poet to exclude many
words, and allow the musical composer to give only elementary,
or short and simple, founds to the others. There is no language
in which all the words of its vocabulary are equally fit for mu-
ic, or lyric poetry; according to Salvini, out of forty thousand
words in the Italian language, only six or seven thousand can be adopted
by the writers of serious musical dramas. Indeed, some of
these rejected words, by their want of dignity, as well as
softness, may be unfit for lyric compositions. Hence, the
melody ncecellarily becomes infipid and monotonous, and its
movement slow and tiresome; for if the time of such music
be at all accelerated, its velocity resembles that of an angular
body rumbling on a pavement. He goes on with his struc-
tures, and supposes, that "such a language as he hath been
deferring, has a bad proody, unmarked, without exactitude
and precision; that the long and short syllables have no
feminle and determinate proportion between them in dura-
tion, or numbers, by which the rhythm can be rendered
agreeable, exact, and regular; that it has both long and
short syllables of an uncertain duration, with others that
are neither long nor short; and that the difference between
them is wholly incommensurable."

"These vices and inconveniences," he adds, "have such
an effect upon the time or measure of music, when applied to
such words, as to render it wholly unmarked, irregular,
and disjointed.

His character of the Italian language, and description of
its beauxies, and advantage over all others, for vocal pur-
pofes, are so apposite to the present enquiries, that we shall
faithfully translate the whole passage.

"If it should be asked what language is the most gram-
matical, I should answer, that of the people who reafen the
belt; and if it should be asked what people are likely to
have the belt music, I should say, those that have the belt
language for it. Now if there is in Europe one language
more favourable to music than another, it is certainly the
Italian: for this language is soft, sonorous, melodiou, and
more accentuated than any other; four qualities peculiarly
important to vocal music. It is soft from its articulations
being unpointed; from the irregularity of claffing con-
sonants; and from every word in the language being ter-
ninated by a vowel. It is sonorous from most of its vowels
being open; its diphthongs uncompounded; from having no
metal vowels; and from its articulations being few and easy,
which render the sound of each neat and full. It is melo-
dious from its own native sweetnefs, which renders it vocal
eyes in declamation and common speech, without the affil-
ance of musical notes. But what renders the Italian lan-
guage more peculiarly mellifluous, as well as more expres-
sive of sentiment, than any other, is the great compass and va-
"riety of its tones, and the choice it allows in painting the
affections. To prove this, let any one who imagines it to be
only the language of love and tenderness, take the trouble
of comparing the two following stanza of Tasso."

"Teneri d'e i e placide è tranquille
Repolle e cari vevi e liete pace,
Sorridi, pafcolte, e dolce fulle
Di pianto e foppir, tronchi e molli bacce
Fude tai cote tutte, e polca unille,
Et al foce tempi de leute fuci;
E ne’ formo quel fi mirabil cinto
Di ch’ ella avenal bel fancio foceinto."

Canto IV. Stanza xxxii.

"Chiama gl’ abitator de l’ombre eterne
Il rauco fono de la tartarea trambula;
Tremen le spaziofe atrre carverne,
E l’ar eieco a quel romor rimbonba;
Ne f’i frideni mo de lauperue
Regione del cielo il folgor plumba,
Ne f’i scoffa giammi trema la terra
Quando i vapori in fen gravi serra.”

Canto XVI. Stanza xxxv.

It will be found, perhaps, equally difficult to express in
any other language the sweetnefs of the one or the vigour
of the other of these flanzas. But the roughnefs of the last
flanza does not confit in hard and uncouth words; they are
all sonorous, and, though rough to the ear, easy of ut-
terance.

These flanzas, however, which Roufleau, and, after him,
almost all musical writers have inflamed as of remarkably
easy utterance, should have been confined to reading and
declamation; for better lyrical or vocal verfs may be found
in Metaftafio, and, indeed, in almost all Italian lyric poets,
since it has been found that the vowel a is the best for di-

tions, and all the other vowels have been long in difufe for
such purpofes, by the best Italian composers for the flage.
In the flanza cited as a model of softnefs, in vocal verfs,
there are but two words, to which, in a lively, divisions
would be given: Caris pace. But even thefe, in which the
vowel a occurs in the soft syllable, would have no long divi-

tsions affigned them, if there was a fefd syllable terminated
by that letter, as in the third perfon singular of the future tenfe
of verbs, vedrai, ucciderai, farai, darai, parlerai, cantarai, fugirai; in the elision of the infinitive mood, trionfar,
ripofar, scordar, levigar, ravagnar; and in the subli-
matives, fedeltà, pietà, felicità, libertà, crudeltà, and Mais.

In letting Metaftafio’s early opus, till about the middle
of the present century, we find the best composers giving
divisions to the verbs o and e; as in movrò, dovèrò, fugirò,
re, te, fe, fremo, fiemo, vender, voler, è, mercè, &c. but
ever to i or u.

Roufleau declined discerning the accents of the Italian
tongue; but if, as has been imagined, the Greek accents
were used as a notation of the tone or tone of voice in
reading or speaking; the acute accent raisng the voice, the
grave depreffing it, and the circumflex keeping it at a mid-
dle pitch or tone, the Italian would afford a more varied
and pleasing melody than any of the other European dia-
lects.

All tunable founds, says Dr. Holder, of which the human
voice is one, are produced by a regular and equal vibration
of the sonorous body and undulation of the air, proportioned
to the acuteness or gravity of the tone. And, according to Dr. Wallis, this gravity, or acuteness of tones in speech, depends on the openness of the aperture in the larynx, which is the seat of the voice; and roughness and smoothness of vocal tones, he refers to the state of this organ.

But as these learned philologers have only dissected our alphabet, and analyzed the pronunciation of our language, as far as concerns its articulation in speech, we shall examine it with respect to lyric poetry and singing, to which our remarks will be strictly confined.

If it be considered that of the five vowels in European alphabets, only two, a and e, are favourable to the clear emission of vocal sound; that of the nineteen consonants eight are absolutely mute, as b, h, e, h, f, s, g, t; seven semi-mute, as d, m, n, f, w, v, x, z, that the soft g and consonant j are likewise of this kind; and that r, though accounted a liquid, only admits of a snarling, canine kind of a noise; t, indeed, is a true liquid, allowing a continuation of sound after it is formed; and z and y may be accounted semi-vowels, yet so numerous are the impediments to a neat, clean articulation, as well as softness and purity of mucosal tones, that some care should at least be used by the lyric poet in the selection of words, as well as great precaution by the composer, who gives them a melody.

If our alphabet be critically examined, in order to discover the effect which each letter has upon the voice in singing; it will be found that peculiar letters, as well as combinations of letters, have peculiar vices and tendencies to impede or corrupt mucosal sounds, both in their formation and passage; that d admits only of a whisper; for though regarded as a semi-vowel on account of its allowing us to breathe after it has been pronounced, without altering the form of the mouth; yet, as Dr. Holder has well observed, "it is one thing to breathe, and another to vocalise that breath." A, n, and ng, likewise allow us to breathe; but as it is only nasal breath, the sound we are able to emit isассив, and impure. s, and its substitutive, soft e, are kipping; and s and z afford only a jarring buzz, by the vibration of the teeth and under lip, like that of a walf or bee; th cannot be uttered without a ʃ ʃ , and the Saxo-Norman syllables ble, cte, fle, gle, gle, ale, ple, tle, are all unmusical, and of difficult utterance.

The vowel a, according to our manner of founding it in the words all, ball, calt, &c. affords the purest and most open passage to the voice through the mouth; and long divisions and vocal effusions should be appropriated as much as possible to this vowel, which is still more convenient to the finger when combined with no other letter, which alters the form of the organ. O, a lows a free passage to sound; yet, as it separates the lips and teeth less than the letter a, it is in less favour with fingers: however, the English words blow, flow, glow, blow, howe, &c. are well calculated for musical divisions. E, i, and u, partake of the nature of consonants, by putting the organs of speech in motion when they are first sounded; and in dwelling upon these vowels no voice di positio, no voice can be produced from the chief, as they confine it to a small part of the mouth, or render it nasal. Indeed, the u, by almost closing the lips, allows but a very narrow and inconvenient passage to the voice; the i and the e are more favourable to a falset, a voce di ʃ ʃ , or feigned voice, than to a true portamento, or conduct of the voice.

Tofi, in his "Opinioni dei' cantori antichi e moderni, o foien osservazioni fo pera il canto figurato," or florid song, fourscore years ago, recommended the exercising of the voice upon the three open vowels, which, with the Italians, are a, e, o, equivalent to our aw, ao, o. The Italian i, found like our double e, and u as our double o, are never honoured with divisions or long sounds by the best composers or singing masters of Italy.

As open vowels are the most desirable to fingers; to distinct, determinate, and uncompounded consonants, are the best crutches for the voice to lean on; for a neat, clear, and articulate pronunciation of consonants is as necessary to the intelligence of what is singing, as open vowels are to its being well sung. The letters p, t, k, for instance, are such clear and distinct articulations, that the voice, after any one of them, is delivered with a gentle kind of explosion, which conferably augments its force.

The i, in English, as it is found in the word smile, and which is fo peculiar to English mouths, seems a diphthong, compounded of e feminine, and y, or the Greek diphthong tau, or rather the German ei, as found in eifene, eicher, &c. and not a simple, or original vowel. Indeed, most of the diphthongs in our language require action in the organ, and spring in the muscles, as ay, oy, eu, ow, in the words boy, boy, Europe, our.

As accent and emphasis have great influence in varying the found of oral language, they are not indifferent to vocal melody: the Italian tongue, though it is easy to pronounce, and soft and mellifluous to the ear, from the openers and frequency of its vowels; yet the articulations of its consonants are more firm, vigorous, and poignant, than in any other language; and as every dialect has peculiar inflections of voice which form a kind of tone in its utterance, the Italian seems to have a greater compass and variety of intervals in this colloquial tone, or cantilena, than any other with which we are acquainted.

Diomedes calls accent the soul of speech, anima vocis. And every word of more than one syllable in prose, must have one emphatic or accented syllable among the rest. However, in verse, this rule cannot be observed without abridgment.

"Of man's first disobedience, and the fruit Of that forbidden tree," &c.

"Awake my Saint John, leave all manner things To low ambition, and the pride of kings."

In each of these two last verses, they set in recitative, which is the best musical criterion of accenting any language, there can only be two emphatic, accented syllables: as in Handel's opening of "Alexander's Feast;"

"Twas at the royal feast, for Peri was."

A syllable in English, as well as Latin, which has two consonants after a vowel, is long, except one of these consonants be mute, and the other a liquid, as in regus, regere. Indeed, the accented syllable in our words which have double consonants, is short: so that accent and long do not always imply the same thing. In the case of double rhymes this rule should be observed: as pleurare, mearare, manner, manner; which should all have short notes. Here accent and quantity certainly differ. By applying Italian melody to English words, we seem to lose in sense what we gain in sound. The universality of double rhymes in Italian poetry must have an influence upon vocal melody, which our single rhymes but awkwardly imitate.

Dacier, in a note to his translation of Plutarch's Life of Lycurgus, says, that "the progress of the arts, in all times, has ever been proportioned to the genius and language of the people." The ancient Romans, though great in arms, agriculture, and literature, were not successful cultivators of
of the fine arts; and nothing was achieved in them, throughout their empire, but by Grecian artists. For this we may, however, account, by the slaves only being allowed to cultivate the polite arts, among the Romans; whereas, in Greece, on the contrary, they were wholly prohibited their life.

No visionary innovation, or fantástical change, is here intended, in a language so excellent as our own for every purpose of reason, science, philosophy, and poetry; all we would recommend, is care to our lyric poets in the selection and arrangement of syllables, as well as unity of subject (see Italian Tour, p. 28, and our articles Song, Symmetry, and Unity of Motion), and attentive observation to the composers who set them to music, not to dwell on harsh, mute, nasal, or guttural words, which either preclude or vitiate all musical sound.

Song and singing, unfortunately, the two most common words in our lyric poetry, begin by a life, and end with a bound entirely nasal; and if we examine the syllables which terminate each line in Dryden's Ode on St. Cecilia's Day, the bell of our lyric poems, and perhaps the most noble produc'tion, to read, of modern languages, we shall find that the dead letter d predominates; terminating in the course of the poem more than half of it, this solid and dumb letter is preceded by n, which, though it does not wholly silence the voice, yet allows it no passage, but through the nose. However, this junction is not so injurious to vocalised sound, as ng in the words sung, young, beginning, beginning, destroying, enjoying; or s and s in ears, hearts, spheres, comets, drums, prizes, filings, &c. which terminate each musical phrase or period with a life. The impervious consonant t, in states, states, fits, &c. preceded by a vowel, is less difficult to pronounce, and less offensive to hear, than the fibulation in bros, opply, &c.

Admirable and sublime as this ode is in the perusal, some of the lines are extremely difficult to sing, without injuring either the poet or musician; the first, by a languid and inarticulate utterance, or the latter by a pronunciation too rough and violent. The recitative may, with propriety, admit of strong accentuation, as such a portion of sound is wanting as will render the words more audible, and nearer singing, than mere speech; but as recitative is the medium between declamation and musical air, some attention seems necessary in selecting the words, and polishing the verses, even for this narrative melody; in spinning harsh alliterations, such as in the lines, three he flew the sleaf—

the sweet enthu§iasm from her sacred flowe, &c. where there is a constant and unavoidable hushing upon all the accents; and in placing such words at the pause, or hiatus, in the middle as well as at the end of each line or verse, where the punctuation requires a repose, or long note, as will neither wholly silence the voice, nor impede its expansion. If such precautions should be thought necessary for words of quick utterance in recitative, fill more fictitious to the lyric poet be in the choice and arrangement when he writes an air, where every syllable is lengthened and vocalized, and where the vowel in each is all that the composer can tune, or the finger sweeten and refine.

It is very natural for poets to wish that the language, in setting it to music, should be more respected than it has generally been, particularly in our church compositions, by old masters, which the late Mr. Mason, in his "Anthem Book for York Cathedral," has very justly censured, but he commends Ticker, who was gentleman of Charles II's chapel, for his very accurate attention to accent and length of syllables; and sums up the excellencies and defects of our ecclesiastical composers brought up in the King's chapel, after the Reformation, by speaking with exact discrimination of "the pleasing melodies of Will; pathetic airs of Clarke; majestic movements of Blow; and sublime strains of Purcell."

But Purcell, the pride of every Englishman who loves music, was, in general, not only accurate, but happy and touching in the expression of words. Many of his melodies are, however, now become wholly obsolete and unseemly, from the temporary graces, with which he overloaded them, for the sake of ignorant singers; and, indeed, he wrote for no other. But these being the forbearances and follies of a particular period, are very short-lived, and soon disgrace the melody which they were intended to embellish.

LANGUAGES are in general divided into original or mother-tongues, as the Hebrew and Arabic, in the East; the Teutonic and Slavonic, in the west.

LANGUAGES, Secondary, or derivative, which are those formed out of a mixture of several others, as Latin, French, &c.

Kircher will have the Coptic a mother-tongue independent of all others. See Coptic.

Du Jemon maintains the Gothic a primitive language, and the mother of all the Teutonic tongues; that is, of all those spoken in the north. See Gothic.

Some add the Basque, or Biscayan, and Bas Briton, to the number of mother-tongues, imagining them to have been those of the ancient Celt, or Gauls.

LANGUAGES, Learned, or Dead, are those which only subsist in books, and which must be learned by the rules of grammar; as the Greek, Hebrew, Syriac, and Chaldee.

Raimond Lully solicited the establishment of the study of the learned languages a long time, in the thirteenth and fourteenth centuries. At length, in the year 1312, pope Clement, and the council of Vienne, appointed, that in the court of Rome, and in the universities of Paris, Oxford, Bologna, and Salamanca, there should be instituted professors of each, who should have salaries from the respective courts. The monks, however, vigorously opposed the spreading of these studies; and with so much success, that Erasmus tells us, in his time, "Graece nosse fluepectum, Hebraice prope horacitium."

LANGUAGES, Living, are those still spoken in some country or other; and which may be learned by conversation. The most popular among these are the French, Italian, Spanish, and English.

The Spaniards seem to place the noblest art of their language in the number of syllables, and the swelling of words; and speak less to be understood, than to be admired. Their terms are honoros; their expressions haughty; pomp and ostentation run through all they say; their language cannot paint a thought to the life; it always magnifies it; frequently distorts it; and does nothing, if it does not exceed nature.

The Italian tongue does not swell up things to that degree, but it adorns and embellishes them more; yet these ornaments and embellishments are not real beauties. The Italian expressions, thus rich and brilliant, are like those faces covered with paint and patch, which make a fine flow; but the finery is all deceit.

The French language (as some of their authors express themselves) is simple, without lowness; bold, without indelicacy; elegant and florid, without ascription; harmonious, without swelling; majestic, without pride; delicate, without softness; and strong, without roughness. Though, as to the points of strength and majesty, the French might give
give way to the English; which in these, as well as in co-
pienues, exceeds most of the living languages; as far as
it is inferior to some of them in smoothness and delicacy.

Of all the modern languages, the French is generally al-
lowed to be the most clear, and fit for philosophical and cri-
tical subjects; the chaste and most refined in its diction;
the most judicious and severe in its ornaments.

The language of France, for vocal appearances, may be com-
pared with that of Italy. That the Italian language is favour-
able to the pure omission of sound, and consequently to sing-
ing, and the French the contrary, none but a native of France
will dispute. Yet M. Frameray, a man of taste and know-
ledge of music, and who sometimes seems to feel and ac-
knowledge the defects of French music and its language for
vocal purposes, says in the Encyclopédie Methodique, p. 235; "de celebres compositeurs, Medra. Duni, Gluck,
Picieni, Sacchini, ont dit. ou écrit, qu’ils aient mieux
composer sur la langue Francoise que sur la langue Ital-
ienne!:" credit Jaufray. M. Frameray never surprised us
more, or convinced us less. Those composers may have
said something flattering to the French, in public about
their language, while at Paris; but in private, Gluck and
Sacchini, to our knowledge, spoke of French as a musical
language with no great respect. The Italians have often
pretended, in Scotland, to prefer Scots tunes; and in Ire-
land, Irish, to Italian music. Gemurrani and Teducci did
this in both countries; but in England, and among their own
countrymen, they turned to ridicule both these national
music, more than they deserved; for though, when sung
by fine fingers, they lose their chief merit of originality
and simplicity, when sung by the natives, they are extremely
pleasing, and often truly touching.

Of all others, the English is said to be the most honest, open,
and underfigning language. With all its fublimity, it is gay
and pleasant on occasion; but its gaiety is still moderated
and restrained by good fene; it hates excessive ornaments;
and, for the greater simplicity, would almost choose, as
foe of the French, to go naked; it never dreads more
than decorum and neceflity require.

The English language is derived from so many and such
different sources, that, on this account, it is deficient in
regularity and analogy. Yet we have this advantage to
compensate the defect, that what we want in elegance, we
gain in copiousnefs, in which haff respect few languages will
be found inferior to our own. See English.

Ennis and Cercops are celebrated for their knowledge of
many languages. Mitridates, king of Pontus, it is laid,
understood twenty-two tongues, which was the number of
different people over whom he commanded; and those
languages he knew so well, that he was able to harangue each
of his people in their own tongue. It was a faying of
Charles V. "That so many languages as a man under
stands, so many times he is a man." Sultan Soliman's in-
terpreter spoke perfectly well seventeen different languages.
But among the moderns, none has been more remarkable in
this way than Potellius; who, besides a perfect knowledge
of all the dead languages, was so well acquainted with the
living, that it is said he could have made the tour of the
globe, without the use of an interpreter. See our article
Jones, Sir William.

Bibilander has written of the analogy and proportion of
languages and letters, De Ratione Commune Linguarum,
in 1518. Gefner, of the Difference of Languages, in 1572.
Lazius published an Introduction to the Learning of the
politer Languages, in a common Method, in 1548. Me-
philer, a scheme of forty different languages, and different
dialects, specimens of each whereof he gives in the Lord's
prayer, in 1593. De Recoles, in his Addition to the
World of Davit, has published the Pater-noster in all
the languages spoken among Christians; and Mr. chamberlay
prepared to do the same in a hundred languages, a spe-
cimen of which has been published. Alberthi Gentils
brevore of the mixture of languages, in 1633. And
father Reinger's Discourse of ETymologies, is a work of
the fame kind. In 1644, Durer published a tafmate of the
hitory of all the languages in the universe. Guichart has
a treatise of the etymological harmony of languages, pub-
lished in 1619. Drewswood has given us curious inquiries into
the diversities of languages and religions, published in 1635.

Language, Philosophical. See Character, Universal.

Language is also used, in the order of Malta, for nation.
The knights of Malta are divided into eight languages; three
whereof are for France; viz. the languages of Pro-
ence, of Avenger, and of France; two for Spain, those
of Cadiz and Arragon; the other three are the languages
of Italy, England, and Germany.

Each of these languages has its chief, who presides in assem-
blies of the language to which he belongs. See Malta.

Language, French. See Frank.

Language Helvetique. See Helvetic.

Language, Latin. See Law Language.

LANGUED, Language, in Heraldry, is applied to such
animals whose tongues appear out of their mouths; being
of a colour different from that of the body of the animal.

LANGUEDOC, Occitan, in Geography, a portion of
Gallia Braccata, a maritime province (as it was denominated
before the revolution,) bounded on the N. by Guiene, Au-
vergne, and Languedoc, on the E. by the Rhone, on the S.
by Fox, Rouillon, and the Mediterranean, and on the W.
by the Garonne. It lies between 42° 40', and 45° 20' N.
lat., and between 1° 20', and 4° 20' E. long. In 43° 50',
the parallel of Touloufe nearly, it extends 52 leagues from
W. to E.; but towards either extremity, it does not exceed
33. Its breadth, for the greatest part, is 33 to 38 leagues,
except towards the middle, where it scarcely amounts to 40
miles. The coast from Agde eastward is considerably aug-
mented, the sea having retired, as appears by comparing
the situation of the maritime places in ancient and modern
times. The surface of this province consists of mountains and
vallies, hills and plains. In the mountains, called the Cevennes
and its branches, which are partly covered with forests, there
are lead and iron mines. The lower tracts are fertile, and well
watered, yielding grain, wine, and fruit; but one-half of
the province is of an ungrateful and unproductive soil.
The principal rivers are the Rhone, Garonne, Loire, Garden,
Vilte, Erault, Orbe, Ade, Arricige, Allher, Tarn, and
Lot. In this province many canals have been formed for
commercial purposes.

Languedoc has been sometimes divided into Upper,
Lower, and the Cevennes; the Upper, including nine dioc-
ese, the Lower, containing 11 bishoprics, and the Ceve-
nnes, comprehending three. Geographers have divided
this province into Upper and Lower; containing three arch-
bishoprics, 25 bishoprics, 61 abbeys, 637 priories, 353 reli-
gious houses, 60 commandaries, 250 towns and villages,
2 universities, 6 academies, 1000 ecclesiastics, 342,758 fami-
lies, and 1,560,000 inhabitants. The ecclesiastical division
has been differently arranged since the revolution.

The capital of Upper Languedoc was Touloufe, and of Lower
Languedoc, Montpellier. It is now divided into seven
departments, viz. the Ardeche, Lozere, Gard, Hérault,
Tarn, Upper Garonne, and Aude.

LANGUENBRUCK, a town of Switzerland, in the
canton of Soleure; 14 miles N.E. of Soleure.
LANGUEPÔUR, a town of Hindooistan, in Bahar; 43 miles S.S.W. of Bahar.

LANGUET, John Baptist Joseph, in *Biography*, son of Denis Languet, attorney-general to the parliament of Dijon, in which city he was born in the year 1675. He received the elementary parts of his education in his native place, and then went to pursue his studies at Paris, where he resided at the seminary at St. Sulpice. In the year 1698, he was admitted a licentiate of the faculty of the Sorbonne, and was ordained, soon after, a priest at Vienne, in Dauphiné. He returned to Paris, took the degree of doctor in 1703, and attached himself to the community of St. Sulpice, where, by the exertions of his benevolent labours, he rendered himself so useful that he was chosen curator to M. de la Chétardie. The duties of this appointment he discharged ten years, and fold his estate, that he might have it in his power to relieve the necessities of the poor. In the year 1714, he succeeded to the living of St. Sulpice, and finding the church much too small for the number of his parishioners, he conceived the design of building a place that should excel every other church in the world in magnificence, and architectural decorations. This great work he accomplished by means of donations, which poured in from all quarters the moment his intentions were made known. It was consecrated, in the year 1745, with so much splendour, that Frederic II., king of Prufia, was induced, from an account which he read of the proceedings on that occasion, to send a polite complimentary letter to M. Languet. He established likewise ”La Maison de l’Infant Jésus,” intended for the accommodation of 30 or 40 poor ladies of noble descent. Here they were boarded and educated in a manner suitable to them, but at the same time were taught to be useful. They were employed, by turns, in attending to domestic concerns, and in other offices that would render them serviceable to their relations in the country. Another object of this establishment, was to afford an asylum to more than eight hundred poor women and girls delinquent of the means of support, belonging either to the city or country. They were provided with daily food, and were made to earn their support, chiefly by spinning cotton and linen. Without entering into the minutiae of the regulations of the place, it is sufficient to say, that this establishment has proved a most happy retreat for numerous unfortunate females, who had been abandoned, by infamous betrayers, to disease and wretchedness. Here, by good example and excellent moral instruction, they have been recalled to virtue, and habituated to industry, and many of them have proved useful and honourable members of the society. For their encouragement when they quitted the house, they were paid in money the amount of what they had earned by their labour. Though the land attached to the house consisted of only fourteen French acres, yet it fed a sufficient number of cows to give milk for upwards of two thousand children in the parish: it also contained conveniences for pigs and all kinds of poultry, which were sold for the benefit of the institution; a bakehouse, furnishing more than a hundred thousand pounds of bread monthly, which was distributed among the poor of the parish; spinning-rooms, an excellent and well cultivated garden, a noble dispensary, &c. The management and regularity with which every department in this house was conducted, either for the instruction, employment, or support of such a number of persons, was so admirable, and gave so high an idea of the great directing hand, that cardinal Fleury prophesied that Languet should be appointed superintendent of all the hospitals in the kingdom; to whom he answered with a smile, “I have always said, my lord, that the bounty of your eminence led me to the hospital.” M. Languet’s benevolent exertions were not confined to the objects already mentioned, but extended to the poor and wretched of every description. No person was ever more active and successful than himself in obtaining large alms and considerable legacies, which he distributed with admirable prudence and discretion. It is said, on good authority, that he disbursed about a million of livres in charity every year. Noble families reduced to poverty, were among the prime objects of his benevolent attention. At the time of the great dearth in 1725, in order that he might relieve the poor, he sold his household furniture, his pictures, and curious and rare pieces of workmanship, and, in short, scarcely left himself the bare necessaries of life. He was among the first to be present at fires, or any other scene of public calamity, where his prudence, self-possession, and universally respected character, rendered his advice and exertions essentially serviceable. He had a wonderful talent in discovering the different dispositions of mankind, and he knew how to employ every person according to his capacity. This excellent man declined the offers made of several bishoprics; his great ambition was to do good, and he had ample means for this as a parish priest. He died in the year 1750 at the age of seventy-five. His piety and application to works of benevolence did not prevent him from being a lively and cheerful companion. He possessed a fine genius, and was highly delighted with cheerful and amusing society. His younger brother, named Joseph, born at Dijon in 1667, refers to considerable eminence in the church, and was 40 years archbishop of Sens. He died in 1753. He took a very distinguished part as a controversialist, in defence of the bull “Unigenitus,” and displayed much learning and acuteness in his polemical pieces, which were translated into Latin, and printed in 1733, in two volumes folio. He was author of ”A Translation of the Book of Psalms,” and of other works published in the collections of the French academy. Moreri.

LANGUET, Hubert, was born at Viteaux, in Burgundy, in 1518; after a preliminary course of instruction in his own country, he went to Italy for the study of the civil law, and took a doctor’s degree at Pavia. Having met before the death of Melchior, he felt a great desire of seeing the author, and, in 1549, procured an interview with him at Wittenberg, which terminated in his conversion to the Protestant faith. After this he spent several years in travelling over different countries in the North of Europe; in his tour he became acquainted with Gullanus, king of Sweden, who gave him a commission to invite persons skilful in the arts and sciences from France to his dominions. In 1559, he accompanied Adolphus of Nassau, prince of Orange, into Italy; after this he was nominated by the elector of Saxony to be his envoy to the court of France. He was deputed by that prince to the assembly of the estates of Augsburg in 1568, and was employed by him in other important negociations. He was again sent to France in 1570, when he pronounced a bold and eloquent harangue in the name of the Protestant princes of Germany before Charles IX. He resided at Paris during the bloody massacre of St. Bartholomew, and exposed his own life to danger by his efforts in saving his host, Andrew Wechel, the famous printer, and his friend, Duplessis Mornai. After accomplishing various other missions to the satisfaction of his employers, he died at Antwerp in September, 1581, at the age of 63, greatly regretted by all who knew him. The prince of Orange, in whose service he had been employed, walked as chief mourner at his funeral. He was a man of pure virtue in corrupt and difficult times: “He was,” says one of his biographers, “such as many would wish to appear;
LAN

he lived as good men would wish to die." His works are "Collections of Latin Letters to the Elector of Saxony, to Camerarius, Father and Son, and to Philip Sidney:" A Relation of the Expedition of the Elector Augustus against the Revolters of Saxony; with the History of the Proceedings of the Emperor against that Prince: "Vindiciae contra Tyrannos," which is a spirited attack upon tyranny, and a defence of the rights of the people. This appeared soon after Langue's death, and coming out with the name of Stephanus Junius Brutus, was attributed to various persons, but has been ascertained to have been the production of Langue. Bayle. Moreri.

LANGUETTE, Fr. the tongue of a jack in a harp-fish or spinet; the valve which opens and shuts the wind chisel in an organ to let the wind into the pipes, when a key is pressed down.

LANGUIDO and LANGUENTE, Ital. musical terms for a languid or languishing air.

LANGUOR, a faintness and indisposition to exertion, commonly accompanied with a latitude or weariness, and arising from a feverish state, or from a general debility of the nervous and circulating systems.

LANGUR, in Geography, a mountain of Thibet; 40 miles E. of Tankia.—Aflo, a river of Mingrelia, anciently Adolphus, which runs into the Black sea, about two miles from Anarghia.

LANGUT, a town of Prussia, in the province of Oberland; 10 miles S.E. of Morangel.

LANGWIESE, a town of Bohemia, in the circle of Leitmeritz; 20 miles W.N.W. of Leitmeritz.

LANJAN, LANJAN, or Lanjang, a city of Laos, and capital of the kingdom, or at least of the southern division, to which it gives name, and the usual residence of the king; situated on the W. side of the river Mecon, and defended on the land side by stiles and high walls. The palace is of wide extent, and appears like a city, from its size and the number of people who inhabit it. The houfes of the principal persons are high, elegant, and richly ornamented; those of the lower people are mere huts. The priests alone have the privilege of building their houses of brick or stone.

N. lat. 18° 39'. E. long. 101° 38'.

LANIARDS. See LANNIERS.

LANIARON, in Geography, a town of Spain, in the province of Granada; 15 miles S. of Granada.

LANIERE, Nicole, in Biography, was an Italian, who came into England early in the last century; there is a fine portrait of him at the Grange, in Hampshire, by Van-dyke. It was the sight of this portrait that determined Charles I. to employ that excellent painter. Lanière profecionally practised music, painting, and engraving; but his greatest excellence was in music. His own portrait, painted by himself, is in the music school at Oxford. He etched a considerable number of plates for a drawing-book; was an able connoisseur in pictures; and had the art of giving modern paintings an air of antiquity, and putting off copies for originals. Granger's Biog. Hist. of Engl. vol. i. P. 539.

It is recorded in the folio edition of Ben Jonson's works, printed 1640, that, in 1617, his whole maque, which was performed at the house of lord Hay, for the entertainment of the French ambaffador, was set to music after the Italian manner, fillo recitative, by Nic. Laniere, who was not only ordered to set the music, but to paint the scenes.

This short piece being wholly in rhyme, though without variation in the measure, to distinffish airs from recitation, as it was all in musical declamation, may be safely pro-

nounced the first attempt at an opera in the Italian manner, after the invention of recitative.

But in the same year, in the masque, by the fame author, called "The Vision of Delight," presented at court during Christmas, there is a manifest distinction of air from recitative; in both which syllables the whole piece, in verses of different measures, was performed. It is opened by Delight, personified, who, fillo recitative, "spake in long." Then Night, likewise personified, sung, "Break Fancy thy cave of cloud, &c." This air ends in a chorus or quire. After which Fancy spake, in fillo recitative. Then Peace sung, "Why, bank, you, &c." After which an air that terminates in a quire. The song ended, "Wonder spake," in recitative. Then dancing, singing, and chorus.

Here we have all the characteristics of a genuine opera, or musical drama of modern times, complete: splendid scenes and machinery; poetry; musical recitation; air; chorus; and dancing.

Though the music of this masque is not to be found, yet of Laniere's "Mufca narativa" we have several examples, printed by Playford in the collections of the time, particularly the "Ayres and Dialogues," 1653, and the second part of the "Musical Companion," which appeared in 1665; and in which his music to the dialogues is infinitely superior to the rest: there is melody, measure, and meaning in it. His recitative is more like that of his countrymen at present, than any contemporary Englishman's. However, these dialogues were composed before the laws and phræasology of recitative were settled, even in Italy. His cantata of "Hero and Leander" was much celebrated during these times, and the recitative regarded as a model of true Italian musical declamation.

LANIGEROUS, any thing that bears wool. Hence, LANIGEROUS, or Langinosus Trea, among Herbiftus, are those trees that bear a woolly downy substance; as, the black, white, and trembling poplars, ojers, and willows of all sorts.

LANINA, in Geography, a town of Russia, in the government of Irkutsk, near the Baikal lake; 80 miles N.E. of Irkutsk.

LANINI, Bernardino, in Biography, an historical painter, native of Vercelli, and a pupil of Gaudenzio Ferrari. He imitated the style of that master, in his first works, to a degree of illusion. As he advanced in practice he cast a bolder eye on nature, and, by equal vigour of conception and execution, proved to the first artists of Milano, that, like Ferrari, he was born for grand subjects: such is that of St. Catarina, near S. Celso; the face and attitude of the heroine anticipate the graces of Guido; the colour of the whole approaches the tones of Tiziano; the glory of the angels rivals Gaudenzio; a left neglected style of drapery would have left little to wish for. Among his copious works at Milano, and in its district, the dome of Novara claims distinguished notice. There he painted those Sybils, and that semblance of the eternal Father, so much admired by Lomazzo, and near them certain subjects from the life of the Virgin, which even now in a ruined state of colour enchant by spirit and evidence of design. His veritable talent indulged sometimes in imitations of Leonardo da Vinci; and at the Basilica of St. Ambrogio, the figure of Christ between two angels, in form, expression, and effect, fully proves with what felicity he penetrated the principles of that genius. Fuselli's Pilkington.

LANIS de cressentia Wallis traducta, ab ejus auctore, &c. an ancient writ that lies to the custome of a port, to permit
permit one to pass wool without paying custom, he having paid it before in Wales.

LANISCHL. in Geography, a town of Iliria; 16 miles S.E. of Capo d'Iliria.

LANISTA. in Antiquity, is sometimes used to signify an executioner, but more frequently for a matter gladiator, who taught the use of arms, and had always people under them, ready to exhibit shows of that kind. For which purpose they either purchased gladiators, or educated children, that had been exposed in that art.

LANISTA was also used to denote one who taught game-cocks to fight.

LANIUS, in Ornithology, a genus of the rapacious tribe, having the bill rather straight, with a tooth, or notch, on each mandible near the end; the base naked; and the tongue jagged at the tip. To this character, assigned by Gmelin after Linnaeus, may be added, that the noddles are generally round, and covered with stiff bristles. Dr. Latham observes still further, that the birds of this genus are not furnished with a cere at the base of the bill, and that the middle toe is connected to the next as far as the first joint. Lastly, according to Scopoli, the segments of the skins are seven in number.

Linnaeus, in the various editions of his Syllena Nature and other works, has referred this genus of birds to several distinct families, having sometimes placed it with the chatterers, sometimes with the titmice, and then again, from its habits of rapacity, with the accipitres, in which last-mentioned order it stands in the Genera edition of that author's publication. Before the time of Linnaeus, our countryman, Ray, had classed this tribe among the short-winged hawks: Buffon also had arranged it after the falcons; but Buffon, on the contrary, includes them with the thrushes and the chatterers, two analogous genera, which obviously belong to the order pafseres. Kramer introduces it under the pafserine order; Scopoli under the pies; and Pennant, in his "Genera of Birds," with the accipitres; from which, however, the latter writer removes it to the order pies, in a subsequent edition. Gmelin retains it still in the accipitrine order. In Latham's "Synopicts," and also in his "Index Ornithologicus," the example of Scopoli is followed; the thrakes are dispersed at the head of the order pies, and this arrangement has obtained the sanction of the French ornithologists. We are far from willing to intrude a solitary figuration against established opinions, and those too of acknowledged merit; yet, on a point in which so much difference has prevailed, a figuration may be allowed. The thrakes then appear to us, at least in a general view, less intimately connected with the pies than the falcon tribe, though confessedly allied to both; and in defining the precise line between it is not impossible that a future era will concur in the accuracy of Gmelin, who incorporates them with the accipitres; or, in reverting still farther back to the example of Ray, our enlightened countryman, place them as the shaft of the falcon tribe.

The birds of this genus are dispersed throughout most parts of the globe; they are generally of a noisy, refractory, quarrelsome, and ferocious disposition; prey on all the smaller kinds of birds as well as insects. The manner in which they destroy their prey is almost, if not entirely, peculiar to themselves, and evinces a degree of address and cruelty that has not inaptly obtained them the name of butcher-birds. After yowling upon their defined victim, which they usually seize upon in a defenceless state, while young, and in the nest, they bear it away to some thorny bush, and by the dint of dexterity force it upon one of the floutteit and sharpest spines; after which they proceed to tear the yet living creature into pieces, separating its mangled remains by the assistance of their bill and talons, and dispersing on different spines of the bush such remants of the flesh, after being for the present satisfied, as are reserved for future meals. In this manner, the shrike tribe also treat the larger kinds of insects, as well as birds.

Species.

Length ten inches; size of a black-bird; tail long, and much furcated; crest sometimes wanting. Inhabits the Cape of Good Hope, Madagascar, and China.

CARULESCENS. Tail forked; body blueish-black; belly white. Linn. La pie-grisette a queue fourchue de Bengal, Briif. Le fangab, Buff. Fork-tailed Indian butcher-bird; Edwards.

Inhabits Bengal, where it is called fangah: The English settlers call it also the king of the crows, from the hoftiles disposition they constantly evince against those birds. Its length is seven inches and a half; the tail much forked, the outer feather spotted with dirty white.

Length seventeen inches and a half. This species inhabits Malabar.

CASTANEUS. Tail cuneated; body above cinereous, beneath white; crown, rump, and hind-head cerineous. Lath. Lanius caffianus, Gmel. Chef-on-barked fork-rikke.

Country unknown. The bill, wings, and legs black; front black. Length ten inches.

LUCIONENSIS. Tail cuneated; body reddish-grey; tail-feathers banded with brown at the ends; a black spot on the head, behind the eye. Lanius lucionensis, Linn. La pie-grisette de Luzon, Briif. Luzonian fork-rikke.

Length seven inches and a half; bill and body above grey-brown; beneath, and on the sides, reddish, with white lines; tail russet-grey; the tip of each feather, except the two middle ones, russet white; legs and claws brown. According to Buffon, the inhabitants of the island of Luzon, which it inhabits, call this bird cabezote.

Length six inches and a half; the bill and claws black; crest reddish; cheeks dusky, with white spots; throat and breast yellowish-red; belly cinereous; wing-covers black, edged with white; tail black, with white dots. This species inhabits Canada.

LUDOVICIANUS. Tail cuneated and cinereous; body above cinereous, beneath whitish. Gmel. Pie grigrette de la Louisiane, Buff. Louisiane fork-rikke.

Inhabitants Loufiane. Length eight inches; beneath the eyes a black band; six middle tail-feathers black, the rest white at the base and tip.

NEGETA. Tail cuneated, white at the tip; body cinereous, beneath whitish. Linn. Cotunga cinereus, Briif. Guinaru
Lanius.

Inhabits northern Europe, Brazil, Surinam, and other parts of South America, frequenting marshy places.

Length nine inches. In this species the wings and tail are blackish; wing-coverts black, with the tips dull white; primary quill-feathers black, outer tail-feathers at the tip white.

Both mandibles reflected at the tips; hind-head greenish-black; greater tail-coverts obliquely spotted with white; tail-feathers in the middle, within cinereous, without black, tip white; legs lead colour, claws blackish. A native of Madagascar, where the inhabitants distinguish it by the name of vanga. It feeds on fruits, and is said to flit well.

Native of the Cape of Good Hope. Length twelve inches.

This species inhabits many parts of North America and Europe, and is the largest of its tribe found in Britain, where, however, it is extremely rare. The length is ten inches. The male differs very little from the female, except that the parts beneath in the former are entirely white, while those in the female are marked with fine fémicircular brownish lines. The female makes her nest of heath and moss, lined with wool and other soft substances. The species chiefily inhabits woods; it feeds on insects and small birds, the latter of which it feeds by the throat, then fixes them on a sharp thorn, and tears them to pieces. When confined in a cage, it will often, if possible, contrive to affix its food against the wires, that in like manner it may pull it afiend with its claws and bill. In countries where these birds are abundant, the husbandmen treat them with regard, being especially useful in the destruction of rats, mice, and other vermin. There are some distinct varieties of this bird; in one the body is white, the legs yellowish, and the bill and claws blackish; and another in which the latter wing-coverts and shoulders are reddish.

Length seven inches and a half; the head and lower parts of the back light grey; upper part of the back, with the wing-coverts, ferruginous; the tail black, with all the feathers, except the two middle ones, more or less white at the base; the outer web of the outer feather white; breast, belly, and sides globb-colour; legs black. In the female, the head is dull ferruginous, mixed with grey; breast, belly, and sides dirty white, with fémicircular dusky lines; tail deep brown, the outer feather only white on the outer web. This species is not very uncommon in Britain, where it is considered as a bird of paffage. It lays six white eggs, marked with a rufous brown circle towards the large end.

The neck is generally placed in a hedge or low hush, near which, it is affected, no small birds have the temerity to build, as it not only feeds on insects, but also on the young of other birds, which it seizes in the neck by the neck, and kills by piercing the skull with its bill, the brain and eyes being the parts it first devours. It is remarkably fond of grass-hoppers and beetles, which it eats by morfels; and when fatined, transfixes the remains on a thorn, to be eaten at another opportunity. This, like the grey frirle, has no note peculiar to itself; it is merely an adept in the imitative art, as its note is varied to that of any other birds it wishes to decoy within its power. Writers describe two or three varieties of this species, the most probable of which is the variegated frirle, l'Ecorcheur varie of Bridfou. This is grey on the upper part of the body, and rufous-white beneath, the whole marked with transverse brown frirles; the feaucules rufous-white, bounded by a parallel black stripe; the tail black, the three outer feathers rufous-white at the base and tips, the outer one wholly rufous-white on the outer edge. It is the leffer variegated butcher bird of Willughby, and is admitted as a variety by Gmelin and Latham. Gmelin is, however, mistaken in placing the following bird as another variety of the species collurio.

Extremely rare in Britain. Its size is equal to that of the common or red-backed frirle, and its manners, so far as we are acquainted with the species, are nearly the same, except that it never frequents woods, keeping constantly on the elevations or among the low bulhes in the open plains; it inhabits Africa and Southern Europe chiefly. There is an apparent error among writers in considering the bird called by Buffon la pie-grische rouffe à tete noire du Senegal, as a variety of Lanius rufus. Levallant describes it as a British bird under the name of Thagra, from the peculiar sound of its note, which resembles the repeated repetition of the words tchack-tchack; it enriches us it is no other than a variety of the following species.

Senegalus. Grey, beneath whitish; crown, band through the eyes, and tail-feathers black; the left, except the two middle feathers, white at the tips. Lanius Senegalus, Linn. Lanius Senegalensis cinereus, Griff. Senegal frirle.

Length nine inches. Very common in Senegal.

Inhabitats the Philippines and Panay isles.

Native of Jamaica. Length seven inches.

Levantarius. Tail long, cuneated, black at the tip; bill, head, neck, middle of the breast, and legs black, the rest white. Gmel. Lanius pictus, Lath. Magpie frirle.

Inhabitats South America; length ten inches; greater wing-coverts and seconday quill-feathers white at the edge; two middle tail-feathers as long again as the rest, the whole black with white tips.

Rufus. Rufous, beneath white; head greenish-black.

O 0 2

Linn.
Lanius.

Length eight inches, the bill, legs, and claws lead-colour.

Size of the half, and inhabits the same country.

Atricapillus. Tail cutaneous, and with the neck, crown, shoulders, and wings black; body above mouline-colour, beneath blue-ath. Merrem.

Native of Surinam. The length five inches; wings short; wing-coverts and secondary quill-feathers edged with white; tail-feathers, except the two middle ones, tipped with white.

Pomeranian. Body above black, beneath white, hind head and back of the neck dark rusty, surrounnded with black; two spots on each side the wings and rump white. Sparmann.

Inhabits Pomerania; bill, legs, and wings black.

Tyrannus. Body cincereus, beneath white; crown black, with a longitudinal tawny streak. Gmel. Myiaca tyran-

us, Briff. Tyrann, Buff. Tyrant foriske.

Native of America. Length eight inches. Builds in hollow trees, is fierce and audacious, and will even attack the eagle, filling upon its back, and continuing to scream and peck with its beak till it forces the eagle to retreat. There are several varieties of this bird.

Major. Grey; each side the head reddish; tail longer than the body, and pointed. La grande pie-grièche, Sonnini.

Size of the black-bird, the plumage greyish-ath; bill citron-yellow; legs brownish, claws black.

Aficanus. Body above black, beneath white, and a band of the fame on the wings. La pie-grièche silencieuse, Sonnini.

Size of the common red butcher-bird of Europe, the bill horn-colour; iris and legs brown, and claws black. The female is rather smaller than the male, and the colours more obscure. The neck, which is contracted with much art, is placed among trees, and commonly contains from three to four eggs of a pale green colour. The young in plumage resemble the female. Inhabits Africa.

Native of Chi-a, in fize resembling the species tyrannus. Head and neck on the upper part grey; neck beneath dull reddish-white; back and belly reddish.

Pitangiu. Body black, beneath yellow; crowned with a tawny streak; band over the eyes white. Gmel. Lanius pitangiu, Linn. Pitangiu guaca, Ray. Tyrannus Braifeliensi,

Length nine inches; bill thick, throat white; wings be-

neath yellow. Native of South America.

Length nine inches; the bill, wings, tail, feet, and claws black, head, neck, vent, and lower wing-coverts yellow. Inhabits Barbary.

Sulphuratus. Fuscous, beneath yellow, head blackish, surrounnded by a whitish band. Gmel. Lanius Caya-

Native of Cayenne, the length nine inches; chin and throat white; legs grey; bill and claws blackish; wings and tail brown, edged with rufous.

Cayanus. Cincereus; head, tail, and primary quill-feathers black. Linn. Lanius Cayennensis, Briff. Pie-

grièche grise de Cayenne, Buff. Cayenne foriske.

Size of a black-bird, the length eight inches and a half, bill at the base red, at the tip black; legs cincereus, claws black. Buffon describes a supposed variety, about the same size, that differs in having a longitudinal black streak down each feather. This is from Cayenne, as is likewise another variety of smaller size, with the front yellowish.

Madagascariensis. Cincereus, beneath whitish; lores black; tail-feathers reddish. Gmel. Lanius Madagascariensi

Length scarcely five inches, and inhabits Madagascar. In the male, the chin and throat is black; in the female, white mixed with rufous.

Aurantius. Tawny yellow; chin, throat, and breast reddish; head, above the eyes, and nape black; wings and tail brown. Lath. Ind. Ori. Orange foriske.

Native of Cayenne. Length seven inches.

Nootka. Tail rounded; body above black, beneath white; crown black; collar white. Gmel. Nootka foriske, Lath.

Length seven inches; bill and legs black; above the eyes a white line reaching to the nape, and a black one beneath the nape; lesser wing-coverts black, greater white; tail-feathers black, the four outer white at the tips. Native of New Zealand.

Length five inches and a half; the bill greyish-brown; crown and hind head black; abdomen and upper tail-coverts red; each side the neck four black curved spots. Native of Bengal.

Size of a lark; length seven inches and a half, and inhabits China, where it is called Kowkai-son.

Length five inches and a half; the bill, head, margin of the quill-feathers, two middle tail-feathers, and outer mar-
gin of the four next blue; the feathers surrounding the bill, the quill-feathers, except at the base, outer tail-feathers, legs, and claws black; female beneath dirty white; tail slightly cuneate. Native of Madagascar.

Leucorrhinca. Body above blackish, beneath white; bill, breast, belly, and rump white. Gmel. Lanius Mani-

Inhabits Manilla; length seven inches; wings, tail, legs, and claws black; tail equal.

A native of the Cape of Good Hope; size the same as the cinereus foriske; the bill lead colour; tail dusky brown; legs black.

Tabuenus. Body above olive; chin and breast cinereous; belly yellowish-brown; tail and legs brown. Gmel. Ta-

buan foriske.

Length eight inches; the bill brown; crown greenish; wings black on the outer edge. First described by Dr. La-
tham,
LAN

tham, from a specimen in the Leverian Museum. It inhabits the Friendly isles.

Described from an example of the species in the Bankian collection, found in one of the islands of the South seas. The bill is dusky; feathers of the head and neck very narrow; tail three inches long, dusky and even to the end; toes divided to the base, the middle one very long.

Septentrionalis. Bill black; legs lead colour; body above brown; chin and breast cinereous; belly and vent brownish. Gmel. Northern Black, Lath.

Length eight inches; four middle tail-fathers brown, the rest within white at the tip, and each two inches long; legs short; claws stout and brown. Native of North America.

Pileatus. Head black and crested; body cinereous; throat and breast black; wing-coverts barred with white; tail black at the tip. Lath. Ind. Orn. Black cooped

Native of Cayenne. Length six inches. Female without crest; throat and breast cinereous.

Size of the last; the wings long; two middle tail-feathers dully green, the rest black at the outer edge; legs and claws black.

Varius. Body above cinereous brown; chin and breast yellow-buff; belly, rump, and vent dirty brownish-white; intercapillaries white; tail and wings brown. Gmel. White Shouldered Black, Lath.

Described by Pennant as a native of Brazil; the legs and bill are black; front and cheeks with paler spots.

Leucocephalus. White; body above greenish-black; head, neck, and under parts of the body white. Lath. &c. Tela-chert, Buff. White-headed Black.

Length eight inches. This species inhabits Madagascar.

Inhabits the Philippine islands; exceeds the sparrow in size; flies swift, is bold and troublesome to crows. Is by some presumed to be a variety of the preceding species.

Panayensis. Bill and legs black; head, throat, breast, and belly red; crown, wings, and tail brown. Gmel. Panay Black.

Seven inches in length, and inhabits the island Panay.

Albus. White; bill, tail, legs, and greater part of the wings, black. Gmel. White Black.

Inhabits same place as the former.

Native of Cayenne; the bill and legs black; tail-feathers white at the tip.

Supposed to inhabit America; in size corresponds with L. naevius; the bill is horn-colour; wings and tail more dusky than the body, and the legs brown.

Bill at the tip, and legs black.

Native of Surinam.

Minor. Cinereous; chin white; breast and belly rosy; front, line over the eyes, and tail black. Gmel. Pie-grisiche d'Italie, Buff.

Native of Italy, Spain, and Russia, and resembles the grey Black.

Melanocephalus. Bill, head, and chin black; body olive above, beneath paler; tail with a broad black band, at the tip yellow. Gmel. Black-headed Black, Lath.

Length six inches, the legs dusky; and inhabits the South Sea islands.

Brachyurus. Head above rufly grey; eye-brows white; a black band from between the eyes to the ears; body above cinereous, grey, beneath yellowish-white; tail rounded. Pallas. Short-tailed Black.

Size of the red-backed Black; wings blackish; tail-feathers ten, brown-grey, and, except the middle ones, white at the tip. Native of Hungary.

Size of the field-fare; bill and legs yellow. Inhabits India.

Pheonicus. Body above reddish-grey, beneath yellowish-white, tail long, rounded, and with the rump bright red; orbits crossed by a black band. Pallas. Inhabitats rocky places on the river Onon; size of the last.

Doliatus. Tail rounded; body closely varied with black and white lines. Linn. Pictus Black.

Native of Cayenne; the length six inches and a half; bill dusky, claws and legs brown; feather on the hind head long, and when erected form a crest; wings and tail with transverse white spots.

Faustus. Grey, beneath ferruginous; a white line between the eyes; tail rounded. Linn. Amoen. Acad.

Size of the field-fare; bill and legs pale; wings rounded; quill-feathers brownish, grey at the edges, tail brown, and all marked with light brown decussating lines.

Lanka, in Geography, a position of some importance, referring both to the science and history of the Hindoos. It is the generally received opinion, that Lanka is Ceylon; but in a note of the Ayin Acharivar (vol iii. p. 36, Calcutta ed.) it is alleged, that Lanka is not Ceylon, but a place determined by the interjection of the equator and the meridian of Delhi, anfwering to the southern extremity of the Maldevy islands. “Indeed,” the note continues, “there are many reasons for concluding Lanka to have been part of the Taprobane of the ancients, and that Taprobane, or more properly Tapobon, which in Sanscrit means the wildernef of prayer, was a very large island, including the whole, or the greater part, of the Maldevy islands, which have since been destroyed by inundations. This agrees very well with Ptolemay’s description, and his island of monkyes seems to relate to thefe of the Ramayana.” See Ramayana and Taprobana.

On this note it is observed, in the Hindoo Pantheon, p. 328, whence this article is chiefly taken, that therem is an avowed obscurity, and an excelling error somewhere; for that many arguments, if not proofs, may be adduced in support of the identity of Lanka and Ceylon, and perhaps Taprobane. Lanka was the theatre of Rama’s exploits against its tyrannical king Ravana, whose name is indifferently pronounced Ravan, Raban, Raban, &c. nor can there be much
much doubt of the island, that we now call Ceylon having formed a part, at any rate, of that theatre, which might in former times have been of greater extent than that island is at present.

It is said, that in Sanscrit books Ceylon is called Taprobane, Taparawna, Tapua or Taprwa, in that language, meaning an island, and it may be indirectly pronounced Taparaban, or, indeed, in common discourse, Taprobana, or Tapprobane. Much stress is not perhaps to be laid on conjectural etymology, but it may be observed, that many names of places and things on Ceylon, and in its neighbourhood, correspond with the nomenclature of the Ramayan. In the fifth volume of the Atlantic Researches is an interesting account by the Hon. Mr. Duncan, of that extraordinary traveller Purana-Purja, who notices on Ceylon a lake called the "tank of Ravan or Raban (the s and b being pronounced indifferently in various parts of India), from whom this tapu, or island, may probably have received its ancient appellation of Taprobane (i.e., the isle of Raban); here also is a place called Sita Koond, or the pool of Sita, where Rama is related to have left his wife Sita, on the occasion of the war with the ravighi Ravan." (See Sita.) In the Indian hyperbolas of the Hindoos, the tears shed by Sita, in her lamentation for her lord's absence and her own captivity, are said to form this koond, or pool, still called by her name.

Between Ceylon and the continent is a series of rocks, some of which appear above water, admitting a passage only in fine weather to vessels of small burden. This in our maps is called Adam's bridge, the Romish missionaries having placed the garden of Eden in Ceylon, and fancied this bridge his only mode of exit. In Hindoo writings this is called Rama's bridge, and in the Hindoo Pantheon a planet is given of the building of it by Rama's monkey-general Hanuman, and his Simian associates. The conspicuous part acted by those animals, in the wars of the Ramayan, reminds us strongly of Potemkin's island of monkees, and offers another mark of identity. On the continent of India, Ceylon is to this day popularly believed to be inhabited principally by monksies, lions, and monkeys; one of its names, Singala dwipa, whence Sellan diva, Schendeb, Ceylon, &c. means the country of lions. See Ceylon.

In Hamilton's account of the East Indies (vol. i. p. 142.) a map of the peninsula has one of the Maldey islands marked Hannamandon, evidently the same with Hanuman devy, as it would be more correctly pronounced, meaning the isle of Hanuman; and this name occurring consecutively on those islands gives room for imagining a connection between them and the history of Rama, Ravan, Lanka, &c. that would be farther developed if we had more knowledge of the islands in question; a knowledge that might be abundantly obtained by a permitted admission to the records at the India House. Hamilton calls the southern extremity of the peninsula Ram's point; this, in our more modern maps, is named Cape Comorin, and it has derived this name, which is cited by Potemkin, from a celebrated temple of the goddess Is, or Devi, in her character of Kumari, or the Virgin. These are names of Paradis, which fece. Rami is another of her names, and the temple, which is generally imagined to be in honour of Rama, the avatara or incarnation of Vishnu, may perhaps originally have been dedicated to Rami, whatever rites may now obtain there; a point that we are uninformed on; and shall offer no more there-on in this place than the remark that the rites of the virgin goddess Kumari, (whose magnificent temple under the name of Ramitiwara, or Ramiferam, at the southern extremity of the promontory of India, is still a much venerated shrine, and of great resort by pilgrims,) have a striking analogy with those of the Taurian Diana, a virgin goddess also, whole temple similarly occupied the southern promontory of the Taurian Cheremonus. See Ram and Ramiswara.

The first meridian of the Hindoo astronomers passed through Orjiny (Oojein, which fece) and Lanka; the latter cannot therefore be Ceylon if confined to its present extent, for Oojein lies in about 56', and the westernmost part of Ceylon in 80' of Greenwich. This difficulty seems reconcileable only by allowing what is affected in India, that Ceylon was formerly of greater extent than at present, and it is said, that appearances between that island and the Maldives, or Maldives, as well as between it and the continent, justify the belief of their having once joined. See As. Ref. vol. ii. p. 44. also Ceylon and Maldives in this work.

LANKAYT, a small island near the W. coast of Ceylon.

LANKE, a lake of Tibet, about 45 miles in circumference; 45 miles N. of Darmadjiara.

LANMEUR, a town of France, in the department of Finisterre, and chief place of a canton, in the district of Morlaix; 6 miles N. E. of Morlaix. The place contains 2389, and the canton 13,170 inhabitants, on a territory of 1824 kilometres, in 8 communes.

LANNARIUS, in Ornithology, the name of a bird of the long-winged hawk kind; the Falco lannarius of Linneus, called in English the lanner, and the male lannaret. See Falco lannarius.

LANNAS, in Geography, a town of Sweden, in the province of Angermanland; 35 miles N.W. of Herno-fand.

LANNIERS, or LA NIARDES, in a Ship, are small ropes reeved into the dead-men's-eyes of all the shrouds and chains. Their use is to slacken or set taught the throuds. The flays also of all masts are set taught by lanners. That rope, which fastens the stopper of the halliards to them, is called also a lanner; and the term is generally applied to any short piece of cord or line, fastened to several machines in a ship, and serving to secure them in a particular place, or to manage them more conveniently; such are the lanniards of the gun-ports, the laniard of the buoy, of the cat-hook, &c.

LANNION, in Geography, a town of France, and chief place of a district, in the department of the Northern Coasts. The place contains 3132, and the canton 14,988 inhabitants, on a territory of 105 kilometres, in 9 communes. N. lat. 48° 44'. W. long. 3° 22'.

LANNOY, a town of France, in the department of the North, and chief place of a canton, in the district of Lille; 6 miles E. N. E. of Lille. The place contains 923, and the canton 13,033 inhabitants, on a territory of 97 kilomètres, in 16 communes.

LANNSTROFF, a town of France, in the department of the Moselle, and chief place of a canton, in the district of Thionville. The place contains 338, and the canton 13,615 inhabitants, on a territory of 357½ kilometries, in 44 communes.

LANO, a lake of the island Mindanao, from 15 to 20 miles broad, and about 60 miles round. See Mindanao.

LANOUAILLE, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Nontron. The place contains 458, and the canton 9581 inhabitants, on a territory of 235 kilometres, in 10 communes.

LANPENKEN, a town of Prussia, in the province of Mazarlen, 14 miles N. of Strasburg.

LANSARD, a town of Perus, in the province of Mazarlen,
Dordrecht, on the coast of the Caspian Sea; 10 miles W. of
Icorabad.

LANSBurg, New City, a town of America,
in the township of Troy, county of Rensselaer, New
York, pleasantly situated on the E. bank of Hudson's river,
opposite to one of the mouths of the Mohawk; containing
about 350 houses, a brick church for the joint use of the
Dutch and Presbyterians, a court-house, jail, and an aca-
demy, incorporated in 1796. The library of this town was
incorporated in 1775; 9 miles N. of Albany. N. lat. 43°
46'. W. long 73° 34'.

LANS-LE-BOURG, a town of France, in the depart-
ment of Mont Blanc, and chief place of a canton, in the
district of St. Jean-de-Maurienne. The place contains 874,
and the canton 4675 inhabitants, on a territory of 742½ kilo-
metres, in 7 communes.

LANSMANs, a town of Norway; 116 miles N. of
Bergen.

LANSPESSADE, in Military Affairs. See ANSPE-
SADE.

LANSQUENET is the name of a game at cards.

LANTA, in Geography, a town of France, in the depart-
ment of the Upper Garonne, and chief place of a canton, in
the district of Villefranche, 9 miles E. of Toulouse.
The place contains 1455, and the canton 5669 inhabitants, on
a territory of 119½ kilometres, in 16 communes.

LANTAB-LEPTEN, a small island on the coast
of China, near the harbour of Macao.

LANTANA, in Botany, supposed to be derived from
lentus, flexible, was in that sense originally applied to the
Plant Mealy Tree, Viburnum Lantana. It is now used
generically for a set of plants, rather agreeing with that in
general aspect, than in this peculiar quality.—Linn. Gen.
Lamarck Illnfr. t. 310. Gen. t. 56. (Camaro; Plum.
Gen. 31. t. 2.):—Clas and order, Didynamia Angiofoemia.

Gen. Ch. Cal. Perianth inferior, of one leaf, very short,
cohering, tubular, with four flight teeth. Cor. of one petal,
nearly regular; tube cylindrical, flender, longer than the
calyx, somewhat oblique; limb flat, unequally and bluntly
four-creft. Stam. Filaments four, extremely minute, situated
in the middle of the tube, flender, two of them a little above
the root; anthers roundish. Pfi. Germen superior, roundish,
yell thread-shaped, short; stigma bent backward like a hook,
pointed downwards, and attached obliquely, as it were,
to the top of the style. Peric. Drupa roundish, of
one cell. Seed. Nut roundish, somewhat pyramidal, of three
cells, the lowermost of which is barren; kernels foliary,
oblung.

Obf. Linnæus observes that the essential character con-
fits in the figure of the stigma. His L. Africana is now
separated from the root; and called Spinhinnia. In the
genuine Lantana there is a many-leaved involucrum, accord-
ing to Linnæus, (rather to be termed a number of bracteas;
and the common receptacle of the fruitification is oblong,
bearing many crowded feather flowers, mostly very unequal.
Efl. Ch. Calyx obscurely four-toothed. Limb of the
corolla unequally four-creft, flat, with an open mouth.
Stigma bent back like a hook. Drupa with a smooth nut
of two cells.

The species in Wildenow are 15, but professor Martyn
reckons up 19. Some uncertainty attends a few, even of
those defined by Linnæus, at least he suspected his trifolia
might not be distinct from annua, but in this he seems to
have been mistaken. Medicus, indeed, who took some pains
with this genus, appears to have described annua for trifoli,
which Reichard corrected. The L. trifolia of Linnæus is
properly referred in Hort. Kew. to Budd."

Good examples of the genus are,

874. Curt. Mag. t. 96.—Leaves ovate, somewhat heart-
shaped, downy underneath. Stem prickly. Bracteas
chordate, with a broad bale.—Native of the West Indies,
in which it is variegated as Wild Sage. It is one of
the most commonly cultivated in our gardens, being readily
propagated by cuttings, and flowering all through the year.
The stem is shrubby, more or less rough, with projecting prickles.
Leaves flaked, serrated, pointed, roughish, about two inches long.
Flowers bright yellow at first, then orange, numerous,
in flattened heads, in simple, foliitary, axillary flanks.

874. (Camara melisso-folio, flore variabilis; Dill. Eth. 65.
t. 56. f. 65.):—Leaves ovate, rough on both sides. Stem
unarmed. Bracteas ovate, small, downy.—Native of South
America; an old inhabitant of our gardens. The flowers
are changeable in colour, being, at first opening, yellow, then
orange, finally scarlet; which becomes dull or brownish as
they fade, not purple, as in some other species.—Several of
this genus are described under the Brazilian name of Camara,
in Pifio and Maregraves. The word is now adopted by
the Portuguese, as it seems, in a medical sense, suggested by
the colour of the flowers, for the dyestuff.

Mag. t. 1022.—Leaves ovate, downy beneath. Stem
unarmed, hairy. Spikes oblong. Bracteas oval, pointed.—
Native of the West Indies, as well as of the Spanish
Main; rarely preferred long in our gardens, to which it has
from time to time been introduced, because the seeds do
not ripen well here, and the plant, though shrubby in habit,
is properly annual. The leaves are broad, almost heart-shaped.
Flowers in oblong, stalked, axillary spikes, very beautiful.
When cultivated in an airy light loam, being bright reddish-
purple, or pink, with a white ring and yellow eye.

L. trifolia of Linnæus differs from the last very widely in
appearance, and has the leaves growing three or four toget-
er, ovate, much more finely crenate; the heads of flowers
rounder; bracteas larger, and more obtuse.—Plumier's Icons,
t. 70, quoted for this, is not at all like the Linnaean
specimen, but appears to be merely a three-leaved variety of
the annua.

L. nivea. Venten. Malmaison. t. 8, appears to us a white-
flowered variety of L. aculeata; at least we can discover no
specific distinction, unless the flower-flakes, growing in pairs
at each leaf, should prove to be fuch. This is a native of
the West Indies, and was sent to the garden of Malmaison by
Meffins. Lee and Kennedy. The leaves are of a full bright
green; flowers snow-white, copious about the ends of the
branches.

Jacquin has a few new or doubtful species in his Hortus
Schoenbrunnensis; amongst others

L. hawaiolacca. Willd. n. 11. White small-
flowered Lantana.—Leaves elliptic-lanceolate, serrated,
downy beneath. Stem roundish. Heads of flowers cylin-
drical, shorter than the leaves. Bracteas nearly orbicular.
—Wildenow, who first described this, and Jacquin, had it
in their gardens, without knowing whence it came. We have
a native specimen gathered by Dombey, in moist situations
at Lima. It is shrubby, with round, flender, roughish
branches. Leaves opposite, flaked, an inch long or more,
rugose; rough above; downy, with numerous, branching,
prudent ribs and veins beneath; the margin sharply ferr-
ated. Flower-flakes axillary, various in length, but always
much
much shorter than the leaves. *Stylos* oblong, with broad, roundish, pointed bracteas; the flowers white, unequally five-lobed, turning reddish-brown in decay. The dried leaves are aromatic, with somewhat of the flavour of fage.

—This species is properly placed next to *L. odorata*.

**Lantana.** in Gardening, comprehends plants of the shrubby, exotic, green-house, and flower kinds, of which the species cultivated are the various-flowered lantana. *L. miilia*; the various-coloured lantana, *L. camara*; the round-leaved lantana, *L. involucrata*; baun-leaved lantana, *L. melifolia*; the prickly lantana, *L. aculeata*; the golden-flowered lantana, *L. aurea*.

**Method of Culture.**—These plants are capable of being raised by seeds and cuttings of the young branches.

With regard to the seeds, they should be sown in pots of light mould in the early spring, plungeing them in a bark hot-bed. When the plants have attained some inches growth, they should be removed into separate pots of a small size, and be replunged in the bark-bed, due shade and air being given. The plants should afterwards, when they have acquired strength, be removed into an airy glass-case, or dry stove, where they may have a large share of air in warm weather, but be protected from the cold. This is necessary for the young plants, which should not the first year be expoed to the open air, but afterwards they may be placed abroad in the warmest part of the summer, and in winter be placed upon flats in the dry stove, where they will continue long in flower, and many of the roots ripen their seeds.

In winter they should be sparingly watered, as much moisture rots their roots.

And the cuttings should be planted in pots in the spring and summer month, as in May and July, and be plunged in a moderate hot-bed, due shade being given. They soon take root, and should afterwards be removed into separate pots filled with light earth, and managed in the same manner as those raised from seed.

These plants afford ornament and variety among collections of stove and greenhouse plants.

**LANTGUR, in Geography,** a town of Lamjungh; 42 miles N. of Gorkah. N. lat. 29°. E. long. 84° 18'.

**LANTCHANG.** See LANJAN.

**LANTER-LOO, or Loo,** is the name of a common game at cards.

**LANTERN, or LANTHORN,** a cover for a luminary, made of some transparent matter; serving to transmit the light; and, at the same time, to screen it from the wind and rain.

The word is derived from the French *lanterne*; and from the Latin *laterna,* of later, I am hidden; *ex quid lacet habet iterius clausam,* because the light is hidden within, by Suidore and Lambin. But according to Pezron, *laterna* comes from the Celtic *later,* and according to Salmasius *laterna* comes from *lato,* of fare, because it bears a lamp or a light.

Epictetus's lantern is said to have been sold for three thousand drachmas; that of Diogenes was held in great veneration among the ancients; and that of Judas is still preserved in the treasury of St. Denys, as a very curious piece of antiquity.

Lanterns are made of glas, horn, paper, &c. Formerly they were made of the horn of a wild bull, called *uru*; which, when cut into thin lamine, Phiny tells us, was very transparent. Thoese of horn were first introduced into England by king Alfred, about the year 887, in order to preserve his candle time-measurers from the wind. See LENS.

And Hist. Com. vol. i. p. 45.

**LANTERN, Dark,** is a lantern with only one opening or light, which, too, may be closed up when the light is to be entirely hid; and may be presented to the person one would see without being perceived one's self.

The ancients had their dark lanterns, but they differed from ours; they were covered with four lakens, one on each side, or light, three of which were black, and only the fourth transparent. Cafaubon, who gives us the description, took it from a manuscript of Julius Frontinus. These were principally used in their armies, when they were to march privately off from their enemies in the night-time.

**LANTERNS are used at feizes in the night-time, upon the batteries; but these must be blind or dark lanterns. There is always great provision of them in all those-houses.**

**LANTERNs, Foglt of,** in China, is a celebrated feast held on the thirtieth day of the first month; and is so called from the great number of lanterns hung out of the houses and in the streets; infomuch that it rather appears a fit of madness than of feasting. On this day are exposed lanterns of all prices, some of which are said to cost two thousand crowns. Some of their grandees retrench somewhat every day out of their table, out of their drefses, equipage, &c. to appear the more magnificent in lanterns. They are adorned with gilding, sculpture, painting, japanning, &c. and as to their size, it is extravagant; some are from twenty-five to thirty feet diameter; they represent halls and chambers, and two or three such machines together would make handsome houses; so that in China they are able to eat, lodge, receive visits, have balls, and act plays, in a lantern.

To illuminate them, they should have bonfires; but as that would be inconvenient, they content themselves with lighting up in them a great number of torches or lamps, which at a distance have a beautiful effect. In these they exhibit various kinds of shows to divert the people.

Besides these enormous lanterns, there is a multitude of other smaller: these usually consist of six faces or lights, each about four feet high and one and a half broad, framed in wood finely girt and adorned; over these they stretch a fine transparent silk, curiously painted with flowers, trees, and sometimes human figures: the painting is very extraordinary, and the colours extremely bright; and when their torches are lighted, they appear highly beautiful and surprizing.

**LANTERN, or Lanterns,** in Architecture, a turret raised above the roof with windows round the sides, in order to light the apartment below. Lanterns are much more convenient than skylights; as the surface of the glass stands vertical, they are not so liable to be broken, nor so subject to the rattling noise of heavy rains and hail.

Lanterns are also used for a square cage of timber, with glass in it, placed over the ridge of a corridor, or a gallery between two rows of shops to illuminate them.

**LANTERN, Magic,** in Optics, the name of a machine, which, in the dark, represents various images and spectres on a wall, or other white surface, so odd and surprizing, that those who are not in the secret think them the effect of magic. See MAGIC.

**LANTERN-Fish,** in Ichthyology, the English name of a fish of the sole-kind, but smaller and smoother to the touch, called in Latin anguiflaits.

**LANTERN-Fly,** in Natural History, the name of a very singular kind of insect produced in the West Indies, and carrying

the
in running which deep,
Merian,
dilTufe prodau/a.
The animal the fe spots.
The colour is an olive brown, and underneath it has one large rib running all the way along it, from end to end, and dividing it into two, and by the fides of that there are some others. These are all reddish, and those nearest the edges have small rows of spines running along them. Over each of the eyes there is a round granulated prominence, which seems to have been a collection of smaller eyes: and if so, the animal is supplied with the organs of vision in a different manner from all other known creatures. But there requires an examination of the creature on the spot, and while alive, in order to find out this. The upper pair of wings are not perfectly transparent, they are dotted with white in some places, and are variegated near their origin with several blackish spots. The under pair are more transparent than the upper; they are much shorter, and are broader than the others: these have each a large and beautiful round spot near the extremity, reflecting that on the wing of the peacock-butterfly. The colours of the circles of these eyes are brown and olive; the last colour very bright and clear, the others very dusky and obscure. The spots are so large, that they appear very beautiful. Reaumur's Hift. Inf. vol. ix. P. 247.

LANTERNISTS, a name assumed by the academicians of Thoufouf.

LANTHONY, in Geography, a hamlet in the parish of Cwmyoy, and hundred of Abergavenny, county of Monmouth, England, is noted for the fine and picturesque ruins of its abbey-church. These are seated in a narrow, deep valley, called "The Vale of Eurs." The surrounding hills, called Hatteral, are lofty and grand, and from their steep acclivities are almost impassable for travellers. In a fcelestial dale among these hills or mountains, Hugh Lacy founded a priory of canons-regular of the order of St. Augustine, about the year 1168. A very particular history and description of this abbey, and the surrounding country, with several prints, are to be found in Cosse's "Historical Tour in Monmouthshire," 4to. 1801.

LANTIGNANO, a town of Etruria; 13 miles S. of Pisa.

LANTO, a small island in the Baltic, between the island of Aland and the coast of Finland. N lat. 60° 25'. E. long. 26° 36'.

Vol. XX.

LANTOOR, or BANDA, the chief island among those called Banda islands in the East Indian sea. See BANDA.

LAN-TSIO, a river of Asia, which rises in the N. part of the Chinese province of Yunnan, on the borders of Tibet, traverses the province from N. to S., changing its name to Kou-long; enters the kingdom of Laos, affuming the name of Mecon, and afterwards discharges itself into the East Indian sea.

LANUGINOUS. See LANIGEROUS.

LANUGO, in Botany, down; that soft, hairy woollen covering, which grows on leaves, italiks, or fruits, of divers plants.

Such is that found on the leaves of the rofe-campion, and on the fruit of the peach-tree.

LANVOLLON, in Geography, a town of France, in the department of the North Coasts, and chief place of a canton, in the district of St. Brienc; 11 miles N.W. of St. Brienc. The place contains 1123, and the canton 15,206 inhabitants, on a territory of 147½ kilometres, in 12 communes.

LANUVIUM, in Ancient Geography, a town of Latium, in Italy, S.E. of Rome, and S.E. of Abba, situated on the brow of a mountain near the Appian way. Milo, who killed Clodius, was born in this town. Here was a temple of Juno, worshipped under the three names of Sophita, Moneta, and Regina.

LANYARDS, or LANNIARDS, on Ship-board. See LANNIERS.

LANZA, in Geography, a town of Spain, in Navarre; 8 miles N. of Pamplona.

LANZETTI, in Biography, an eminent performer on the violincello, during the early part of the last century. He was in England about the year 1740; but returned to Bologna, the place of his nativity, where he ended his days.

LANZO, in Geography, a town of France, in the department of the Fo, on the Stura; 11 miles N.W. of Turin.

LANZONI, Joseph, in Biography, a physician, was born at Ferrara on the 26th of October 1663. From his early childhood he exhibited a strong inclination for literature, which his parents indulged, by obtaining for him the best masters. He distinguished himself particularly in the schools of philosophy and of medicine, and graduated in both thesc sciences in the year 1685. In the following year, at the age of 21, he was appointed ordinary professor, and displayed talents which did honour to the university of Ferrara, during the long period in which he filled that office. He died in February 1730, at the age of 66.

Lanzoni acquired a high reputation by the success of his practice, and obtained the confidence and esteem of many illustrious personages. His attachment to study increased with his years; and every moment, in which he was not employed in the duties of his profession, was devoted to literature, philosophy, or antiquarian research. His character as a physician and philosopher, indeed, ranked so high, that if any question upon these subjects was agitated in Italy, the decision was commonly referred to him. He was distinguished likewise by his genius in Latin and Italian poetry; and he was the refector and secretary of the academy of Ferrara, and a member of many of the learned societies of his time. He left a considerable number of works, both published and in manuscript, in the execution of which he has been reproached with carelessness and inaccuracies. It will be sufficient to state, that a collection of his works, as well of those published by himself as of his manuscripts, was printed

LAO, in Geography, a town of the island of Cuba; 25 miles W. of Havana.

LAOCOON, in the History of the Arts, is a celebrated monument of Greek sculpture, executed in marble by Poly- doros, Athenodorus, and Agefander, the three famous artists of Rhodes. This remains of antiquity was found at Rome, in the ruins of the palace of Titus, in the beginning of the sixteenth century, under the pontificate of Julius II, and since deposited in the Farnese palace. Laocoon, the priest of Apollo and Neptune, is here represented with his two sons, with two hideous serpents clinging round his body, gnawing it, and inflicting their poison. Virgil has given us the following description of the fact:

"Serpens amplexus uteque
Implicat & miteros morfi depaecitur artus:
Corripit, spiraque ligant ingentibus, & jam
Bis medium amplexis, bis collo squalent circum
Terga datur, superant capite, & cervicibus altis."

This statue exhibits the most astonishing dignity and tranquility of mind; in the midst of the most excruciating torments. Phily says of it, that it is "opus omnibus, pictura & Natuearum artis, preferendum." Lib. xxxvi. c. 5.

LAODICEA, in Ancient Geography, a town of Asia, in Caria, called "Laodicea ad Lycum," not that it was near this river, which passed to the west of it, and received, to the north of Laodicea, the river Caprus, which traversed the town, and the Aepis, which was east of it. A little to the south of Laodicea was Hierapolis. This town was more anciently called Dispolis, and afterwards Rhenea. It was re-established by Antiochus, who gave it the name of his wife; and it became one of the most considerable and rich towns of Asia Minor.

LAODICEA Cappadocia, a town of Asia, in Syria, situated eastward near mountains, well of Eunea and the river Oronites. It was favoured by the emperor Severus, on account of its attachment to the interests of the empire. By way of distinction, it was called "Laodicea ad Libanum."

LAODICEA ad Mare, Latikia, a maritime town of Syria, situated on an eminence, near the sea-coast. Strabo says, that its environs furnished abundance of wine. In its present ruins may be seen columns of porphyry and granite, an aqueduct, and a triumphal arch, supported by columns of the Corinthian order. About a staidum west of this town are the ruins of a fine port, artificially constructed in the form of an amphitheatre, and capable of containing a considerable fleet.

LAODICEA Comitias, a town of Asia, in Lycocenia, east of Philomelum; supposed to have derived its name from traces of ancient volcanoes.

LAODICEA, a town of Asia, on the confines of Media and Persea Propria. Allo, a town of Melopotamia, according to Pliny; being one of the six towns built by Seleucus under this name.-Allo, a town of the Peloponnesus, in the Megacotla, according to Polybius and Thucydides; the same with the Laudonia of Pausanias.

LAI-KUN-TIM, in Geography, a town of Chinefe Tartary; 50 miles S.W. of Ning-yuen-techeu.

LAON, a town of France, and chief place of a district, in the department of the Aisne; and before the revolution, the capital of a small country called Laonnois, and the see of a bishop, who was a duke, and the second peer of France. The place contains 6691, and the canton 14,558 inhabitants, on a territory of 215 square miles, in 27 communes. N. lat. 49° 34', E. long. 3° 42'.

LAOS, in Ancient Geography, a town of Italy, in Lucania, part of the Bruttium, and near it. It was situated on a small gulf, distant 400 stadia from the town of Hyde. It was founded by a colony of Serbites.

LAOS, in Geography, a country of Asia, bounded on the north by the Chinese province of Yunnan, on the east by Tonquin, on the south by Cambodia, and on the west by Siam and Ava. Kempter represents it as a powerful state, surrounded by forests and deserts, and of difficult access by water, because the river is full of rocks and cataracts. The soil is represented as fertile in rice, and the merchants of Cambodia were furnished with rice with the belt benjoin and laica. Exquisite musk is also obtained from Laos, with some gold and rubies; and the rivers supply the fresh water mya, which yields pearls. The religion and manners of the people resemble those of Siam; but in personal appearance they are like the southern Chinese. In Kempfer's time, the chief towns were Landian, or Lantchung, and Tiamaja, the people take the name of Landianfe, to which, in modern maps, is added Sandepora. Duhalde has given some account of this country, the capital of which is denominated Mohang-Lang by the Chinese. (See MO-HANG-LANG.) Laos, in his time, was tributary to Ava; but its chief trade was with the Chinese. It is said to have mines of gold, silver, and copper; near the capital is one mine of rubies; and its emeralds are of large size. The articles exported are tin and sulphur, (perhaps cinnabar or realgar,) cotton, tea, and Japan or Brazil wood. The chief river is denominated Meinam Kong, which passes through Cambodia, and some of these branches bear different appellations. This grand stream, in Mr. Dalrymple's map of exterior India, is called the Kion-Long, or Maykaung. Mr. Arrowmith derives it from the Tibetan Alps, where it is called the Satchou, and by D'Anville the Lantshang. Of this country Turpin, cited by Pinkerton, (Geog. vol. ii.) has given the most recent account. The name Laos, he says, denotes 10,000 elephants, with which animals the country abounds. The climate is warm and temperate, and the air so pure, that men are said to retain their health and vigour, in some instances, to the age of 100 years. The chief part of the country resembles Siam, but the soil on the east bank of the river is more fertile than that on the west. The rice is preferred to that of other oriental countries. The ivory is beautiful, but the horn of the rhinoceros is particularly esteemed from a superstitious notion, that the posseor, who keeps it, infuses his felicity. The fields, abounding with flowers, afford food for numerous swarms of bees, which supply excellent wax and honey. In the mountains are found rich mines of tin, iron, and lead; but gold and silver are explored in the lands of the rivers. Musk, says this author, is not a product of the country. Before the irruption of the Tartars, the Chinese carried on a considerable commerce with Laos, exchanging their velvets, silks, cottons, and porcelain, for ivory, opium, and medicinal plants. In the province of Laos, whence the kingdom derives its name, is a deep mine, which furnishes rubies and beautiful emeralds, one of which, in the royal treasury, is said to be as large as a common orange. The inhabitants of this kingdom are celebrated for their honesty and fidelity; and so anxious are they to maintain their reputation in this respect, that if a traveller be robbed, the nearest town or village is obliged to indemnify him. At the fame
same time, they are indolent and luxurious, and addicted to
the study and practice of magic. The army of Laos is es-
estimated by Tarpin at 500,000 combatants; but he adds a
circumstance which somewhat affects his credibility, that a
numerous army might be raised of men who have lived a
century. The people of this country are not very disfig-
"ured for their obstinacy and temperance, as they eat daily
four repasts of rice, fish, and the flesh of the buffalo; the
buffalo and venison being common in their markets. Mar-
rriages are easily contracted, and no fees easily diffused;
and the rich entertain many concubines. A funeral resem-
bles a festival; and a sum of money is deposited in the tomb, which
is circulated, after a certain period, by the priests. The
commerce of this country was chiefly carried on in former
times with Siam; but after the rupture of the Burmas, it
passed to Pegu; at a later period, the trade of Laos has
been transferred to Cambodia. The inhabitants of Laos
boast that the Siamese borrowed the art of writing on palm-
tree leaves from them. The tongue and characters are the
same; but it is said, that the Laotian cannot pronounce the
letters L and R.

The ancient worship of these people is said to have been
directed to one God, the creator of all, who was only to be
pleased by the exercise of virtue, and not by sacrifice, cere-
monies, or the observance of certain days. But the pu-
ri ty of their faith has been corrupted by their intercourse
with the Chinese. They believe in regular renovations of
the universe; and that our earth has attained the age of
18,000 years. Polygamy is one of the promised joys of
paradise, and the women are affured, that if they lead a vir-
tuous life, they shall be changed into men. The priests take
comfort under the privations of celibacy, from a perfusion
which they indulge, that in another world they shall be able,
by the privilege of their order, to create females at their
pleasure. Some of their ceremonies, like those of Thibet,
seem to have been derived from the Nestorian Christians. To
the rich they fell dispensations and pardons; while the poor
alone are condemned to perpetual misery.

The king of Laos is said to be an absolute, independent
prince, and to acknowledge no superior, either in temporal
or spiritual concerns. In him is vested the whole property of
lands, and he dispenses at pleasure the effects of his sub-
jects; nor can any family in the kingdom inherit or possess
any thing left them by will.

LAOUR, a town of Hindoostan, in Bengal; 40 miles
N.W. of Silhet. N. lat. 25° 7'. E. long. 91° 20'.

LAPA, one of the Sooloo islands. N. lat. 5° 25'.
E. long. 120° 42'.—Alto, a town of Circassia, on the Cu-
ban. N. lat. 44° 30'. E. long. 58° 34'.

LAPACTICS, from κατοκτίνα, to evacuate, a term used by
the old writers in medicine to express such things as purged
by foal, or at least gently loosed the belly. It was some-
times applied to the cathartic medicines, and sometimes to
those foods which were of this tendency.

LA PALISSE, in Geography. See La Palisse.

LAPAROCELE, from lapara, the flanks, and νοση
a tumours, a term in Surgery, denoting a swelling, or
hernia, at the side of the belly.

LAPARY, in Geography, a town of Hindoostan, in
Allahabad; 7 miles N. of Jipaurus.

LAPATA, a chain of mountains in Africa, called the
" Backbone of the World," extending from N. to S. about
600 miles. S. lat. 12° 30' to 20'. E. long. 27° to 33°.

LAPATHIUS, in Ancient Geography, a town of the
island of Crete, on the northern coast.

LAPAVUM, in Botany, λαπσαίον of the Greeks, from
λαπά, or λαπάνο, to evacuate, alluding to its medical
qualities; a general name for various plants, mostly of the
Dock kind, belonging to the Rumex, Rheum, Chenopodium,
or Spinacia of Linnaeus.

LAPATHIUS, LAMITO, in Ancient Geography, a town
on the N. coast of the island of Cyprus, at the bottom of
a small gulf, formed to the N.W. by the promontory called
Cronianon. It was founded by the Lacedemonians as a
place of arms, and a port.

LA PAZ, in Geography. See La Paz.

LAP-Dog, called also melites, or foro, and by Dr.
Caius, in his Syllen of British Dogs, the spaniel gentle or
comforter, is a species of the most generous kind of dogs.
See Dog.

Mr. Pennant observes, that the Maltese little dogs were
as much esteemed by the fine ladies of past times as those of
Bologna are among the moderns. Old Hollinghed is ri-
diculously fevere on the fair of his days for their execlive
passion for these little animals; which is sufficient to prove
it was in his time, and is in the reign of queen Elizabeth, a
notably.

LAPEYROUSIA, in Botany, received its name from
the abbé Pourret of Narborne, in honour of M. Picot
Lapeyrrouse, author of a splendid botanical book on the
geu Saxifraga, and who has paid great attention to the natu-
ral history of the Pyrenees. Thunberg has applied the
same name to a Cape plant, Ofisites calicina, Linn. Suppl.
386, which he separates in his Prodromus, p. 163, from Ofis-
ites, saying the receptacle is naked, and the corolla difcoid.
In this Wildenow follows him, Sp. Pl. v. 2. 2260. On ex-
amining the original Linnean specimen, marked as commu-
nicated by Thunberg himself, we find ourselves obliged to
declare that neither of these characters holds good. The
 lanceolate scales of the receptacle are numerous and ap-
parent between the florets of the disk, and the ligulate florets
of the radius are not visible within the calyx; though in
deed the large membranous inner scales of the latter equal
them in length. The habit of the shrub, too, is sufficiently like
other species of Ofisites. Such being the state of the cafe,
and the right of priority moreover in favour of Pourret, we
adopt his Lapeyroousia in preference. — Ker (Gawler) in
237. Dryandr. in Ait. Hort. Kew. ed. 2. v. 1. 110.—Clas-
Iririt, Juff.

Gen. Ch. Cal. Spata inferior, shorter than the corolla,
of two, rarely but one, folded valves. Cor. of one petal,
superior, valver-shaped, nearly or quite equal; tube long,
slender, triangular, its throat a little enlarged; limb in fix
depend segments, shorter than the tube, either quite equal
and regular, or slightly irregular, in the former cafe horizontal,
in the latter inclining. Stam. Filaments three, inserted into
the mouth of the tube, rather shorter than the limb, various
in direction; anthers oblong, incumbent. Fij/. Germen in-
fier, roundish; style capillary, as long as the flamen; stigmas
three, linear, deeply divided, spreading and recurved,
downy. Peric. Capsule membranous, three-lobed, or with
three compressed dilated angles, of three cells and three
valves, with very short partitions. Seeds numerous, in tw
rows, nearly globose, or slightly angular from pressure.

Eff. Ch. Spatha of one or two folded valves. Corolla fal-
ver-shaped; limb in five deep segments, shorter than the tube.
Stigmas three, deeply divided. Capsule membranous,
triangular, with many globular seeds.

The most correct enumeration of the species of this genus,
previously, by other writers, confounded with Asia, Gladi-
ata, or Galasia, is given by Mr. Ker, in Curt. Mag. v. 31
above quoted as follows.

P 2 1. L.
1. *L. corymbosa*. Level-topped Lapeyrou sia. Curt. Mag. t. 395. (Ixia corymbosa; Linn. Sp. Pl. 51. Willd. Sp. Pl. v. 1. 199. Jacq. Ic. Rar. t. 288. L. crispifolia; Andr. Repof. t. 33.)—Flowers regular, corymbose; tube fearfully longer than the limb. Stamens widely spreading. Stem two-edged, somewhat branched.—Native of the Cape of Good Hope, from whence it was introduced by Mr. Maffon, in 1791. It flowers in the green-house in May and June, and requires to be kept dry when out of bloom. The bulb is conical, with a broad base. Stem about a foot high, zig-zag, somewhat branched, leafy, corymbose. Leaves vertical, clasping the stem with their broad sheathing base. Flowers numerous, not an inch wide, blue, generally with a white starry central mark, bordered with darker blue, not very unlike another beautiful Cape plant, *Rodda chiliosa*, however different in botanical affinity. Sometimes they vary to white.

Mr. Ker is now convinced that *Ixia flabelligera*, Lamark, Dict. v. 3. 317, is not specifically distinct from the above.

2. *L. falcatata*. Falcatate Lapeyrou sia.—(Gladiolus falcatus; Thunb. Gladiol. n. 4. t. 1. f. 3.)—Flowers slightly irregular, racemose; tube twice as long as the limb. Stem compressed. Leaves nearly radical, falcate, obovate-lanceolate. From the same country; discovered by Thunberg. The stem is but five or six inches high. Leaves one or two.

*Flowers five or six, blue*. *Spathe of two valves.*

3. *L. falcatulata*. Falcate Lapeyrou sia. (Ixia heterophylla; Vahl. Enum. v. 2. 57. Galaxia pica; Jacq. Ic. Rar. t. 292.)—Radical leaves sword-shaped, erect; floral ones crowded, recurved, undulated, obtuse, longer than the clustered flowers. Corolla regular; tube above twice as long as the limb. Spathe of one valve.—Native of the Cape of Good Hope. The stem is very short. The flowers are clustered at its summit, white, with narrow equal segments, and remarkable for being encompasped with crowded floral leaves, which are longer than themselves, recurved, undulated and obtuse. The foliage is glaucous. Radial leaves few, long, erect, sword-shaped and acute.

Vahl and Ker appear to have adopted this species from Jacquin, and they both cite his t. 291, and instead of 292, apparently after Willdenow in Sp. Pl. v. 1. 199, quoted by Ker 159. Thus erroneous references accumulate, for want of turning to the original authorities.

4. *L. fililoilus*. Split-leafed Lapeyrou sia.—(Gladiolus fililolus; Jacq. Ic. Rar. t. 266. Vahl. Enum. v. 2. 197.)—Leaves deeply split, and clasping the stem at their base; with a short sword-shaped point; floral ones rounded. Spike leaffy. Corolla somewhat irregular, drooping; tube thrice as long as the limb. Received from the Cape of Good Hope by Meffrs. Lee and Kennedy, with whom it flowered in Sept. 1809. Mr. Maffon, however, is recorded as having sent the same to Kew in 1791. The leafy spike is peculiar, as well as the long deep suffure of the *flom leaves*. The flowers are purplish, fragrant, varying in the size and colours of their limb.

5. *L. anceps*. Sword-leaved Lapeyrou sia.—(Gladiolus anceps; Linn. Suppl. 94. Jacq Ic. Rar. t. 269.)—Leaves sword-shaped, decurrent, toothed at the outer edge. Stem corymbose, spreading. Corolla irregular; tube thrice as long as the limb.—Native of the Cape. This appears to be the original species on which Pourret founded the genus, in the Memoirs of the Society of Thouleve, vol. 3. It differs from the last in its branching corymbose *flom*, winged with the narrow, decurrent, toothed bases of the perfectly sword-shaped and vertical leaves. The flowers vary with different shades of blue, and have a very long tube. The *floral leaves* are either large, with toothed or crisped edges, as Jacquin represents them; or small and nearly smooth or even.

6. *L. fililoilus*. Campion-flowered Lapeyrou sia.—(Gladiolus filileolus; Jacq. Ic. Rar. t. 270. Vahl. Enum. v. 2. 106. Willd. n. 33.)—Leaves linear-sword-shaped, entire; floral ones as long as the stem. Corolla irregular; tube five times as long as the limb, erect.—Native of the Cape, and, as it seems, known only to Jacquin, who has named it very happily from the aspect of the flower, which is red, with a spot of yellow at the base of three of the segments, all on one side. The *flom* is about an inch high, branched from the bottom, and clothed with linear, glaucous, hairy leaves, from several of the uppermost of which the *flom* proceed, and their white tube is about as long as the corresponding leaf, straight and rather tumid in its upper part.

Two other species are indicated as doubtful by Mr. Ker, *Gladiolus bra'tisatus* and *G. Fabricii* of Thunberg and Vahl, which are fuppofed to be possibly not distinct from *L. filileo'-
ilus*, or from *anceps*.

LAPFORD, in Geography, a town of Sweden, in a bay of the gulf of Bothnia; eight miles S. of Christianfand.

LAPHAO, a town on the N. coast of the island of Timor, inhabited by Portuguese or their descendants, situated at the bottom of a bay, and containing a church and about 60 houses; the inhabitants are of a copper colour, with black hair, they carry on some trade with Betania; and this port is visited by some Chinese junks and vessels from Goa, but the port is false only from March till August; at other times the hurricanes render it insecure.

LAPHIAti, in Zoology, the name by which the people of Lemnos call a species of ferpent, suppos'd by Bellonius to be the same with the chaps, or elaphis, of the ancients.

LAPHYSIUS, in Ancient Geography, a mountain of Boetia, 20 stadia from Coronna. It had a certain district consecrated to Jupiter Laphysius, in which there was a marble statue of this deity. Hercules Charops had a temple at a little distance from it. Paulianus, l. ix. Boetia. c. 34.

LAPIDARY, LAPIsARIUS, an artificer, who cuts precious stones. See GEMS.

The art of cutting precious stones is very ancient; but, like other arts, its original was very imperfect. The French have succeeded in it the best; and the lapidaries of Paris, who have been a corporation since the year 1290, have carried it, especially in cutting of diamonds called brilliants, to a very great perfection, not but superior to that of the English.

There are various machines used in the cutting of precious stones, according to the quality of the matter to be cut: the diamond, which is extremely hard, is cut and formed on a wheel of soft steel, turned by a kind of mill, with diamond dust tempered in oil of olives; and this leaves to polish them as well as to cut them.

Oriental rubies, sapphires, and topazes, are cut and formed on a copper wheel, with oil of olives, and diamond dust: they are afterwards polished on another copper wheel with tripoli and water.

Emeralds, hyacinths, amethysts, garnets, agates, and other stones less hard, are cut on a leaden wheel, with smalt and water, and polished on a tin wheel with tripoli.

Lapidary is also used for a virtuoso skilled in the nature, kinds, &c. of precious stones; or a merchant who deals in them. See GEMS.
LAPIDARY Style, denotes the style proper for monumental or other inscriptions.

This is a kind of medium between prose and verse; the jejune and the brilliant are here equally to be avoided. Cicero has preferred the rules of it: "Accedit oratione oratio variarum, velorum, plena spiritus. Omnium sententiarum gravitate, omnium verborum ponderibus, est utendum."

The lapidary style, which was lost with the ancient monuments, has been retrieved, at the beginning of this age, by count Emanuel Teforo: it is now used various ways at the beginning of books; and even epistles dedicatory are composed in it, of which we have no example among the ancients.

LAPIDES Picti, in Natural History, a term used by Languis, to express such stones as are found with the delineations of fishes, trees, and shells, as well as leaves of ferns and other plants, very perfectly representing the things themselves, but fearfully at all standing out above the surface of the stone, and having in themselves fearfully any thickness. It is very evident, that the bodies represented are not here, in reality, but the whole configuration is owing to the natural veins of the stone, and the coalescence of the several small mafles of which each large stone is composed, and to the vapours from within the earth, getting into the natural fine cracks in the stones, and tinging their sides with blackness.

LAPIDESCENT, anything which has the faculty of petrifying, or turning bodies to a stone-like nature.

Naturalists speak of a lapidescent principle, a lapidescat spirit, a lapidescat juice, &c.

LAPIDESCENT Waters, or Springs, are such as, having stony particles dissolved and swimming in them, do deposit the same on wood, leaves, and other bodies immersed therein; which, being incrusted herewith, are commonly mistaken for petrifications.

LAPIDIFICATION, in Chemistry, an operation whereby any substance is converted into a stone.

Lapidification is practiced in metals, fixed salts, and fallts of plants.

The term is also used for the making of artificial stones.

LAPIN, in Zoology, the Rabbit. See LEPUS Curtus.

LAPIS, in the general sense. See STONE.

LAPIS Arabicus, in the Natural History of the Ancients, the name of a stone of a fine white colour, resembling the purest ivory; and which, though naturally of a firm, solid, and compact texture, yet, when burnt, became light, porous, and spungy, and assumed the figure and appearance of a pumice; and was used like it in the compositions of the ancient physicians for cleaning the teeth.

LAPIS Leporus, in Natural History, a name given to several sorts of stones, and other fossils, which had lain in the neighbourhood of copper-mines, and been impregnated with particles of copper, though not in a sufficient degree to be thought worthy the name of copper ores. See PYRITES.

The same sort of stones were also sometimes called chariotes, which made stone confusion, as it gave occasion to confound them with the true chariotes.

LAPIS Aesfor. See ASBESTOS.

LAPIS Rutilis. See RUTILES.

LAPIS Armenus. See ARMENIAN STONE.

LAPIS Affinis, in the Natural History of the Ancients, the name of a stone, called also carphoagus, from its power of consuming flesh.

It was a stone much used among the Greeks in their sepulchres, and is recorded to have always perfectly consumed the flesh of human bodies, buried in it, in forty days. This property it was much famed for, and all the ancient naturalists mention it. There was another very singular quality also in it, but whether in all, or only in some peculiar pieces in it, is not known: that is, its turning into stone anything that was put into vessels made of it. This is recorded only by Musienus and Theophrastus, except that Pliny has copied it from these authors; and some of the later writers on the subjects from him.

This effect might probably be a kind of incrustation, formed on substances included in vessels made of this stone, by water passing through its pores, discharging from the common mass of the stone, and carrying with it particles of such spar as it contained; and afterwards falling in repeated drops on whatever lay in its way, it might again deposit in such substances, in form of incrustations.

The place from whence the ancients tell us they had this stone was Alos, a city in Lycia, in the neighbourhood of which it was dug: and De Boor informs us, that in that country, and in some parts of the East, there are also stones of this kind, which, if tied to the bodies of living persons, would, in the same manner, consume their flesh. Hul's Notes on Theophrastus, p. 1.

LAPIS ALBOMARTIANUS, the copper-flake. See Pyrites.

LAPIS BURNOSUS. See BUMBLUS.

LAPIS BONONIENSIS, the Bolonian stone, a peculiar species of stone found in Bolonia. See BONONIUS.

LAPIS Calaminarius. See CALAMINE and ZINC.

LAPIS Calcarius. See LIME and LIME-STONE.

LAPIS Cauda corvari, in Natural History, a name given by Gesner, and some other writers, to the fossil shells, since called tubuli marini cacamari, and by some polythalia, in ortho-ceratites. See TUBULI CONCUMERAT.

LAPIS Ceratitius. See UNICORNIS.

LAPIS Calcites. See COLICSTONE.

LAPIS Corneus, born-flake, a name given by many of the German authors to flint, which some of them have also very improperly called pyrites, or the fire-flake, because it is used to strike fire with. See HORNSTEIN and PETROSIEX.

LAPIS Divinus. See NEPHRITES.

LAPIS HAMATITIS. See HAMATITE, and ORES of IRON.

LAPIS HEPATITUS, tert-flake, or lilke-flake, a species of the barytic genus of earths or stones, colour grey, greyish, or yellow-grey, or brown, or greyish-black: lute, 2:1; transparency, 1; fracture, foliated and partly friable: hardness, from five to six; fp. grav. 2.666; emitting a smell of liver of sulphur when rubbed or heated to redness; not effervescing with acids. According to the analysis of Bergman, a specimen from Andranor in Scania contains 0.38 of barolenite, 0.43 of silex, 0.22 of alum, 0.07 of gypsum, and 0.5 of mineral oil. Kirwan.

LAPIS HIBERDICUS. See TRIB Slate.

LAPIS HYACINTUS. See HYACINTUS lapid.

LAPIS INFERNALIS. See LUMP CAUSTIC.

LAPIS Iridescentius. See LEIEIUS lapis.

LAPIS JUDAICUS. See JUDAICUS.

LAPIS Lazuli. See LAZULITE.

LAPIS LUCET, the stone of light, in the Materia Medica of the Arabs, a name given to the brassy mandle or pyrites. The Arabs have adopted this. Avicenna supposes this substance to be called so, because it was used, after calcination, for diseases of the eyes. It is very probable, that this where vitriolic medicines take place, the caput mortuus of this fossil, which is only a colorant of vitriol, may be of use. But its virtues in this respect can never be supposed to ensue, as to have inspired it to the pompous name it bears. It seems more probable, that it was called the stone of light, either from its glittering appearance when fresh broken, or from its giving large sparks of fire, when struck against a flint.
norway from Sweden. It is divided into six districts, denominated marts, or territories, which are distinguished by the names of rivers, as Angunerland, Eina, Peta, Lula, Torra, and Kini. 3. The eastern part is subject to the czar of Muscovy, situated between the lake Enarak and the White sea: this part of Lapland is divided into three prefectures; namely, that of the sea-coast to the north, called "Mournamkoi Leporie:" that upon the coast of the White sea, denominated "Jerkoi Leporie:" and the inland part, known by the name of "Bellamcrefki Leporie." In Swedish Lapland, the provinces or marks are subdivided into smaller districts called biers, consisting each of a number of families, among which the land is parcellled out by government. The whole country consists of huge congeries of frightful rocks and stupendous mountains, interpered, however, with many pleasant valleys, watered by an infinite number of rivulets that fall into the rivers and lakes, which discharge themselves into the gulf of Bothnia. The chief towns are Kola and Tornea. There are many considerable lakes, as the Great Uma; the Great Windel; the Stor-avan, &c. Some of them are said to extend 60 leagues in length, and contain a great number of islands. Stor-avan is computed to contain 355; and Enara contains so many, that it has been affirmed, that no Laplander has lived long enough to visit each particular island. For the history of this country, we must refer to that of those countries to which it is subject, and also to the article Finns. The climate is exceedingly cold during the winter months; the lakes and rivers are at that season completely frozen over, and to a great thickness: the whole face of the country is covered with snow to the depth of four or five feet. While this continues, it is impossible to travel, but if a partial thaw takes place, the surface of the snow is formed by a succeeding frost into a hard impenetrable crust, over which the inhabitants, by means of snowshoes, can cross, and travel with the utmost celerity. While the thaw continues, the air is for a time charged with vapours, and the climate is rainy, so that the snow, as the north wind blows, the sky is beautifully serene, and the air is clear. The heat of summer is almost as intolerable in Lapland as the cold of winter. In the more northerly parts of the country, the sun never sets for three months in the summer, and in the winter there is an uninterrupted night of the same duration, but this is qualified by a constant revolution of dawn and twilight, by a serene sky, moon-light, and aurora borealis, so that the inhabitants are enabled to fish and hunt, and to proceed with their ordinary occupations. During the summer season nothing can be more enchanting in many parts, than the vast prospects of mountains, forests, lakes, and rivers. At this season, notwithstanding the climate, the rooks are seen in full flower on the banks of the lakes and rivers, with all the beauties of nature which appear in those cultivated in our gardens. In the intervals between the mountains, great part of the country is flat, covered with brown dusty forest of fir and pine trees, and there are often skirted by wide extended morasses, the stagnating waters of which in summer produce multitudes of minute insects, that are more intolerable than even the cold of winter. The soil of Lapland is very barren, owing chiefly to the want of cultivation. In some divisions the land will bear large crops of rye; there are many varieties of berries; currants, Norwegian mulberries, that grow on a creeping plant; rasperries, cranberries, juniper berries, and bilberries. There are very fine woods of birch, pine, and fir, which are oftentimes defaced by nature, as if they had been planted in regular rows by the hand of art. The service-tree, the willow, the poplar, the elder, and the cornel are found here. Among plants, the angela
anglica is most cultivated, and highly esteemed: the orrel is used as an antiscorbutic. They have likewise other kinds of herbs, different species of grafs, beath, fern and mosses, but the vegetable which is in the greatest plenty is the lichen. This moss covers the whole ground; its colour is a pale yellow, which when dry changes to white; the regularity of its shape, and the uniform manner in which the surface of the ground is decked with it, appears singular and striking; it has the semblance of a beautiful carpet. These plants grow in a shape nearly octagonal, and approaching to a circle, and as they join each other, they form a kind of Mosaic work, or embroidery. As this moss is very dry, nothing can be more pleasant to tread upon, nor can there be any thing softer for a bed: Acerbi, and his companions, in their journey frequently slept upon it. In some places it seems to be the only herb that will grow; the neighbouring birches and firs appear to vegetate with difficulty, as if deprived of their nourishment by the moss; in short, says the writer, "this moss appeared to be a royal plant, which ruled absolute over the vegetable kingdom of the country, and distributed its bounty and influence among a particular race of men and animals." With respect to the mineralogy of the country; silver and lead have been discovered in the provinces of Pitha and Lula; in the district of Torna there are two copper mines, and some excellent veins of iron. Here are found crystals of a very large size, and so hard and fine, that when polished they resemble real diamonds. In some parts amethysts and topazes are found: also curious flones too hard to be worked by the common tools of the mason. In a few of their rivers they fish for pearls, which are generally pale; but some of them are as bright as the oriental pearls, though larger and more round. Lapland is infested with a great number of grey wolves and bears, with which the natives are perpetually at war. The country likewise abounds with elk, beavers, and otters, which live here un molested, and find plenty of fish for their subsistence. The forests of this country furnish habitation to a great number of beautiful martens and squirrels, which change their colour every winter from brown to grey. Here are also ermines, weasels, hares, large black cats which attend the Laplanders in hunting, and little dogs trained to the pursuit of game. But the most remarkable animal of Lapland is the rein-deer. The woods, mountains, and rivers, are well stocked with wild fowl, and all sorts of aquatic birds that build and breed in northern climates. Early in every spring the swans go thither in numerous flights from the German ocean; the lapwings follow in such fwarms that they darken the sky. The rocks and mountains are frequented with eagles, hawks, kites, falcons, and other birds of prey. The rivers abound with salmon, which ascend from the gulf of Bothnia, trout, bream, and perch of excellent flavour, and amazing magnitude. The insects are extremely numerous; they often obscure the face of day, and are so venomous that the reindeer, to avoid them, fly to the tops of the highest mountains for shelter, and the inhabitants betake themselves to the seaside, which is left infested than other parts by these pestilential vermin.

The commerce carried on by the Laplanders is more considerable than one would expect in a desert country, inhabited by a savage and ignorant people. They export large quantities of fish to Bothnia and White Russia. They trade with the neighbouring countries of Norway, Sweden, Muscovy, and Finland, by the sale of rein-deer, fine furs, bakets, toys of their own manufacture, and cheeke made of the reindeer's milk. They receive in return rix-dollars, woollen cloths, linen, copper, tin, flour, oil, hides, cutlery, spirits, and tobacco. The Laplanders march in caravans to the fairs in Finland and Norway; these are composed of a long string of 30 or 40 rein-deer tied to one another, the foremost being led by a Laplander who walks in front. At night, when they have fixed upon a spot to rest on, they form a large circle of their rein-deer and poulkas or fedges, ready yoked, and the animals lying down quietly on the snow, are fed with moss by their masters. The people kindle great fires, around which they sit and fup, and smoke and feep. The revenue arising from this country is not of much consequence; it is partly paid in rix-dollars, but chiefly in furs, and the tribute from the poorer classes is taken in dried fish. Part of the taxes is allotted for the maintenance of the clergy. The Laplanders are short, few of them being five feet high; in their drefs they use no kind of linen; the men wear a fort of pantaloons reaching to their shoes, and their doubtful is made to fit the shape; over this is a clofe coat with narrow fleeves, which is fastened round them with a leathern girdle. To the girde are attached their knives, their pipes, and their instruments for striking fire. The drefs of the women is very much like that of the men, but in addition to it they wear handkerchiefs, short aprons, rings on their fingers, and in their ears, from which among the rich are fupended chains of silver, which pass twice or thrice round the neck. They are much addicted to finery, and to the use of embroidery manufactured from brafs wire. They change their habitations according to the feast, living in houfes in the winter, and in summer they make use of tents. Their houfhold furniture consists of iron or copper kettles, wooden cups, bowls, spoons, and sometimes tin or even silver fafons, to which must be added the implements of fishing and hunting. The inhabitants are chiefly divided into fhillers and mountaineers. The former build their habitations near some lake, from which they derive their fubfintence. The others seek their support on the mountains, poiffcning herds of rein-deer more or lefs numerous; they are very rich in fpanifh of the fiflersmen. It is ufual to affign to every child at its birth a number of these animals, which, with their produce and income are to belong to it, fo that when he arrives at man's eflate, he finds himself master of several hundred rein-deer. The following defcription of a Lapland family was given from the life by an intelligent traveller: "it confin'd of an old man and his wife, with a child about two or three months old. The infant was truff'd up in a kind of cradle, reembling, in fhape, a fiddle cafe, made of the thick bark of a tree, fo formed that it exaftly contained the child, which was fix'd in it with a kind of brafs-chain. It was covered with fine and soft fofs, over which was spread the skin of a young rein-deer. The cradle was fix'd on a rope, which was faftened to the top of the hut." The Laplanders are afeve from war, and will forfake their homes, to which they are much attached, rather than engage in it. Their manners and habits are finely defcribed by Thomson, who, in comparing them with the martial hordes of the north, fays, "Not fuch the fons of Lapland: wifely they Defpite th' infenfate barbarous trade of war: They ask no more than fimple nature gives; They love their mountains, and enjoy their florms. No falfe defires, no pride-created wants Difurb the peaceful current of their time; And through the reflrefs ever-tortured maze: Of pleafure or ambition bid it rage. Their rein-deer form their riches. These their tents, Their robes, their beds, and all their homely wealths Supply: their wholesome fare and cheerful cups." Great pains have been taken by the Danes and Swedes to in-
form the minds of the Laplanders on the subject of religion, but the majority of them continue to practice superstitious and idolatries, as gras as any that are to be met with among the most uninstructed Pagans. They rely on augury and witchcraft, and have been considered by many of our con-

trymen, who have visited those parts, as skilful in magic and divination. Their magicians make use of what they call a drum, an instrument like the tambourine. On this, those who profess to be Christians draw the figures of their own gods, as well as those of Jesus Christ, the apostles, the sun, moon, stars, rivers, &c.: on different parts of this instru-

cment and its ornaments are placed small brass rings, which, when the drum is beaten with a little hammer, dance over the figures, and according to their progress the forcerer prognosticates. They retain the worship of many Teutonic gods, and have among them considerable remains of Druidical institutions. They believe in the transmigration of the soul, and have festivals set apart for the worship of certain genii, who, they imagine, inhabit the air, and have the direction and superintendence of human actions. A black cat is reckoned one of the most valuable appendages in each houfe: they talk to it as to a rational creature, and in their hunting and fishing parties it is their usual attendant. To this animal the Danish Laplanders communicate their se-
crets; they consult it on all important occasions; and among the Swedish Laplanders, the drum is kept in every family for the purpose of consulting the devil.

The account given by M. Maupertuis of the rigour of this climate, when he went to the polar circle to ascertain the real figure of the earth, deserves to be noticed in this article. He observes, that in the month of December spirits froze within their houses; and if the door of a warm room were opened only for a moment, the external air instantly converted all the vapour within into a kind of snow, whirl-

ing it round in vortices. When they went abroad, they felt as if the air was tearing their breasts to pieces, and within doors, the cracking of the wood, of which the houses were built, continually warn them by its contraction of an increase of cold. In speaking of the atmospheric ap-
pearances, and of the heavenly bodies; he says, the bright-

ness of the moonlight, the twinkling of the stars, and the effulgent coruscations of the aurora borealis, afford a light sufficient for most of the occasions of life. No sooner, says he, are the short days closed, than fires of thousands glows and colours light the sky, as if they intended to make up for the absence of the sun. These ligles are perpetually variable. Sometimes they begin in the form of a great carpet of bright light, with its extremities upon the horizon, which, with the motion resembling that of a fishing-net, glides softly up the sky, preferring a direction nearly perpendicular to the meri-
dian, and commonly after these precedes all the lights unite at the zenith, and form the top of the crown. It would be difficult to enumerate the different figures which these meteors assume, and the various motions with which they are agitated. Their motion is most commonly like that of a pair of colours waving in the air, and the different tints of their light give them the appearance of so many dreamers of changeable film. "I saw," says the philosopher, "a phenomenon of this kind, that in the midst of all the wonders to which I was now every day accustomed, excited my admiration. To the south a great space of sky appeared tinged with so lively a red, that the constellation of Orion looked as if it had been dipped in blood. This light, which was at first fixed, soon moved, and changing into other colours, violet and blue, settled into a dome, the top of which stood a little to the south-west of the zenith. In this country, where there are lights of so many different colours, I never saw but two that were red, and such are always taken for pre-
fuges of some great misfortune. It is not at all surprising, if people, with an unphilosophic eye, discover in these phenome-

nons armies engaged, fiery chariots, and a thousand other prodigies. To the enlightened and rational philosopher, Lapland every where presents subjects of reflection and contemplation: no arts flourish here; we no where meet with temples, houses, wrecks of columns, or other monuments, but a fine opportunity is afforded of studying among the wandering tribes the first elements of social life; of society in its most ancient form." Acerbi's Travels into Sweden, Lapland, &c. Confid's Tour to Lapland.

LA PLATA. See La Plata.

LAPMARK. See FINMARK.

LAPOUTI, a mountain of Asia, between Cashgar and Little Thibet.

LAPPA, in Botany, the Latin name for any kind of Bur, or seed that sticks to the coats of animals. See ARCTI-

UM, APARINE, and XANTHUM.

LAPPAGO, a name for the Gallium Aparine, or Goose-graft, alluding to the bur-like nature of its seeds. (See LAPP.) It is now appropriated by Schreber to a partic-

ular genus of graftes; see the next article.

LAPPAGO, so named by Schreber, on account of the bur-like aspect of the seed invested with its muricated hulls.

Geo. Ch. Cal. aggregate, each glume of one valve, single-flowered, lanceolate, pointed, ventricose, angular, furrowed, permanent, muricated at the back with a triple row of cartilaginous prickles, hooked upwards. Flore foli-

dary, feble. Cor. of two valves, smaller than the calyx, awnless, smooth, membraneous and whitish; its glumes lan-

celate, acute, conceave; the outermost opposite to the caly-

x, ribbed, inner more delicate and but half the size of the outer, embraced by the calyx. Nectar of two lanceo-

late acute leaflets. Stam. Filaments three, capillary, the length of the glumes; anthers short, deeply divided. Pfl. Ger. Canis superior, ovate; lyles two, capillary, rather short; lifulum, trinervigranulose, feathery. Pet. stone, except the perma-
nent corolla. Seed unconnected, elliptic-oblong, with a longitudinal furrow.

The only known species is

1. L. racemosa. Branching Bur-graft.—Sm. Fl. Grac. Sibith. v. 2. t. 101. Hoff. Gram. Aulfr. v. 1. 28. t. 36. (Cenchra racemosa; Linn. Sp. Pl. 1487. Schreb. Gram. v. 1. 147. t. 43. Gramen canarium maritimum alperrum; Buch. Prodr. 2. Theatr. 16.)—Native of the sandy sea-thores of the Fouth of Europe, as well as of Arabia and India. It is a hardy annual with us, flowering in the warmest part of the summer. The root confids of downy fibres. Stems numerous, a span high, jointed, unbranched, leafy, round, smooth, decumbent and taking root at the bottom. Leaves spreading, lanceolate, very acute, flat, fringed, smooth, except the edge, which is fringed as well as toothed; the base is heart-shaped; the upper leaves are very short; theaths rather twelling, fringed, smooth, the upper ones longest. Stipula short, fringed. Spike terminal, solitary, two or three inches long, erect, cylindrical, obtuse, many-flowered, generally purplish and of an unusual aspect on account of the prickly hulks. Their common Salk is hairy. Flowers three or four on each little zig-zag partial Salk, alternate, rather
rather dilated, erect. the uppermost generally abortive. The lower part of the spike is thin and drooping.

**LAPPANO**, in Geography, a town of Naples, in Calabria Città; four miles N. of Cofenza.

**L. APPO**, a small island in the Baltic, between the coast of Finland and the island of Aland. N. lat. 60° 20'. E. long. 26° 48'.—Also, a town of Sweden, in the government of Abo; 23 miles S. of Abo.—Also, a town of Sweden, in East Bothnia, and government of Vasa; 37 miles N.E. of Vasa.

**L. APPERS**, a town of Sweden, in East Bothnia; 40 miles S.E. of Vasa.

**L. APPEROCK**, a river of East Bothnia, which runs into the sea, five miles below Ny-Karleby.

**LAPPORN**, a small island on the E. side of the gulf of Bothnia. N. lat. 63° 23'. E. long. 20° 59'.

**LAPTRASK**, a town of Sweden, in the province of Nyland; 21 miles N.E. of Borgo. N. lat. 60° 37'. E. long. 20° 12'.

**LAPPULA**, in Botany, a name given by some to the great caesalpin, or rough-fruited stone-parley, or bald-fruited parley.

Gen. Ch. Common Calyx ovate, somewhat cylindrical, angular, of about eight equal, linear, keeled, channelled, acute scales, with a few small imbricated ones at the base, all permanent. Cor. compound, imbricated, uniform; the florets hermaphrodite, about 16, more or less, equal, each one of one petal, ligulate, abrupt, with five teeth. Stam. Filaments five, capillary, very short; anthers united into a cylindrical tube. Pist. German rather oblong; style thread-shaped, as long as the stamnes; stigma cloven, reflexed. Peric. none, except the permanent scales of the calyx. Seeds solitary, oblong, angular, contracted at the top, upright or spreading, delinicate of wing or down. Recept. naked.

Eff. Ch. Receptacle naked. Calyx x scales at the base, its inner scales equal, channelled. Seeds without down, contracted at the top.

1. L. communis. Common Nipple-wort.—Linn. Sp. Pl. 114. Engl. Bot. t. 843. Curt. Lond. fere. t. 59. Fl. Dan. t. 560. Calyx of the fruit closed, unchanging, smooth. Seeds loose. Stem panicked.—Frequent in waste or cultivated ground throughout most parts of Europe, flowering in summer. The root is annual. Stem erect, two or three feet high, roundish, nearly smooth, much branched in a panicked manner, leafy in the lower part. Leaves soft and rather hairy, toothed; the radical ones lyrate, the others ovate, acute, alternate. Flowers small, yellow, on long, slender, alternate filaments. Seeds nearly straight and erect, angular and frayed, surrounded by the dried, smooth, permanent, scarcely changed calyx, but unconnected with it, and at length falling out, leaving it empty. This plant is said to be called *Papulartia*, in Prussia, a name synonymous with *Nipple-wort*; because it is said to cure ulcerated breasts.

A variety of this, with the margins of its leaves curled, and more deeply as unequally toothed, is *L. cripta* of Willdenow, laid by him to continue constant from light. Linnaeus considered it a variety, nor do we find reason to venerate from that opinion.

2. L. *flamia*. Starry Nipple-wort.—Linn. Sp. Pl. 114. Curt. Lond. fere. t. 59. Fl. Dan. t. 560. Calyx of the fruit closed, unchanging, smooth. Seeds loose. Stem panicked.—Frequent in waste or cultivated ground throughout most parts of Europe, flowering in summer. The root is annual. Stem erect, two or three feet high, roundish, nearly smooth, much branched in a panicked manner, leafy in the lower part. Leaves soft and rather hairy, toothed; the radical ones lyrate, the others ovate, acute, alternate. Flowers small, yellow, on long, slender, alternate filaments. Seeds nearly straight and erect, angular and frayed, surrounded by the dried, smooth, permanent, scarcely changed calyx, but unconnected with it, and at length falling out, leaving it empty. This plant is said to be called *Papulartia*, in Prussia, a name synonymous with *Nipple-wort*; because it is said to cure ulcerated breasts.

Vol. XX.
synonym of Tournefort's Corolla, though with a mark of doubt.

4. L. Koelpinia. Linear-leaved Nipple-wort.—Linn. Suppl. 348. (Koelpinia linearis; Pallas It. v. 3. 755. L. l, f. 2. Rhagadiolus Koelpinia; Willd. n. 3.)—Seeds numerous, awl-shaped, spreading, incurved, embraced by the maricated calyx-leaf. Leaves all linear-lanceolate, entire.—Found by Pallas in only one moist valley, by Mount Bogden, in the desert of Astrahan. We have a wild specimen from Aleppo, given by Sir Joseph Banks. It flowers in the middle of May, ripening feed by the end of the month. The yellow blossoms open to the morning sun, and close at noon. This is a very slender plant, with a small annual root. The stems are from ten to eighteen inches long, feecely branched, loosely spreading, smooth; square and furrowed towards the top. Leavers diffuse, all linear lanceolate, acute, entire, plicate, smooth, obscurely three-ribbed. Flowers solitary, on short stalked stalks, from the very root to the extremity of each stem. Calyx clothed with incurved prickles. Ripe feeds numerous, about twelve or fourteen, spreading from their base, but strongly incurved, each invaginated with one of the calyx-leaves, whole numerous, incurved, hooked prickles are much more remarkable than in either of the two last, some of them forming a recurved flat at the top of each feed. This species is more akin to L. filifolia perhaps than any other, but the characters given above seem sufficient to keep them distinct. Pallas suggested the propriety of separating these last described species from Lapfana, by the name of Koelpinia; see that article. Whether they ought to form a genus, is, to us at least, doubtful. Schreber has agreed with Pallas if this point, only properly preferring the name of Rhagadiolus for the genus, as given by Cefalopins and Tournefort, and correctly derived from ῥάγας ἕρμας, a crest or crest, that it alludes to the reputed virtues of these plants in healing cracks of the skin, or to the cut (or flar-like) aspect of the feeds. In habit they sufficiently accord with the original Lapfana, and the difference in the position of the ripening feed's is their only distinction. We ought rather perhaps to admire the sagacity of Linnaeus in perceiving their agreement, than the ingenuity of those who have distinguished them. Pallas himself, with great modestly, merely submits his opinion to the decision of those who take the lead in botany. In the same uncertainty we with now to leave it.—L. Zacyntha seems to be separated from the rest with more propriety, as its feeds have a feathery crown, and the nature of the torose calyx is more like that of Crepis. Juiffue includes in this genus Hedyphorus; see that article.

Three much more diminutive plants are ranged under Lapfana by Willdenow. These are Hypoferis fatid and minima of Linnaeus, with L. virgata of Desfontaines, Pl. Atlant. v. 2. t. 215.—The first is on the authority of Haller and Scalopi, who say the feeds are without down. We have never seen them, but the items habi of the plant, and its whole aspect, exactly like a Leonotis, are fo foreign to Lapfana, that the natural characters of the genus would be overtop by its admission.—Hypoferis minima, Gærtner's Arnoferis, t. 157, is indeed less unlike in habit, though items, the feeds have an elevated border, and do not agree with Lapfana.

The third, virgata, has to great a number of florets as to take off an important part of its generic affinity, and its habit is more like an Hedyphorus. Having seen no specimen, we can decide nothing as to this species. It is necessary to know whether the feeds have an elevated border, in which case it might very well be placed along with Hypoferis minima, wherever that remains; or whether they be truly all without a crown, and contradicted at the summit, as in the true species of Lapfana.

LAPSARI. See Inferalapsani, Sublapsani, and Supralapsari.

LAPSE, in Law, a slip or omission of a patron to present a clerk to a benefice within six months of its being void; in which case, the benefice is said to be in lapse, or lapsed, and the right of presentation devolved to the ordinary.

And if the ordinary neglect to present during the same time, the right of presentation accrues to the metropolitan, and to the king by neglect of the metropolitan. This right of lapse was first established in the reign of Henry II., when the bishops first began to exercise universally the right of presentation to churches (Bract. l. 4. tr. 2. c. 3); and therefore, when there is no right of presentation, there is no right of lapse; so that no donative can lapse to the ordinary, unless it hath been augmented by the king's bounty; (l. 1 Geo. I. c. 2. c. 10.) but no right of lapse can accrue when the original presentation is in the crown. (St. Tr. 1 Edw. II. c. 8. 2 Edw. II. 1. 273.) In case the benefice becomes void by death, or cession through plurality of benefices, there the patron is bound to take notice of the vacancy at his own peril; but in case of a vacancy by relinquishment, or casuall deprivation, or if a clerk presented be refused for insufficiency, these being matters of which the bishop alone is presumed to be cognizant, here the law requires him to give notice thereof to the patron; otherwise he can take no advantage by way of lapse. (4 Rep. 77. 2 Inst. 632.) Neither shall any lapse accrue thereby to the metropolitan or the king. If the bishop refuse or neglect to examine and admit the patron's clerk, without good reason signed or notice given, he shall have no title to present by lapse (2 Roll Abr. 639); and if the right of presentation be litigated or contended, and an action be brought against the bishop to try the title, no lapse shall occur till the question of right be decided. (Co. Litt. 344.) If the bishop be both patron and ordinary, he shall not have a double time allowed him to collate in (Gib. Cod. 769.); and if the bishop doth not collate his own clerk immediately to the living, and the patron presents, though after the six months are lapsed, yet the presentation is good, and the bishop is bound to institute the patron's clerk. (2 Inst. 273.) If the bishop suffer the presentation to lapse to the metropolitian, the patron also has the same advantage if he presents before the archbishop has filled up the benefice: yet the ordinary cannot after lapse to the metropolitan, collate his own clerk to the prejudice of the archbishop. (2 Roll Abr. 368.) But if the presentation lapsed to the king, the patron shall never recover his right, till the king has ratified his claim by presentation; for nullum tempus occurrat regi. But to prevent the inconvenience of the church's continuing void for ever, unless the king shall be pleased to present, the law has lodged a power in the patron's hands of, as it were, compelling the king to present. For, if during the delay of the crown to present, the patron himself presents, and his clerk is instituted, the king indeed, by presenting another, may turn out the patron's clerk; or, after induction, may remove him by nuncupation: but if he does not, and the patron's clerk dies incumbent, or is canonically deprived, the king hath left his right, which was only to the next or first presentation. 7 Rep. 28. Cro. Eliz. 44. Blacklt. Com. vol. ii.

LAPSED LEGACY. See Legacy.

LAP-SIDED, in Sea Language, denotes the state of a ship, which is built in such a manner as to have one side heavier than the other, and consequently to retain a constant
heel or tendency toward the heavier side, unless when she is brought upright by placing a greater quantity of the cargo or ballast on the other side.

LAPTANA, in Geography, a town of Prussia, in the province of Samland; 10 miles N. of Königsberg.

LAPITCHOUT-HOTUN, a town of Asia, in the country of Hami; 30 miles W. of Hami-Hotun. N. lat. 43°. E. long. 92° 48'.

LAPUSZNA, a town of European Turkey, in Moldavia, near a river of the same name; 50 miles E.S.E. of Jaffa.

LAPWING, Capella, in Ornithology, the black-breasted tragula, with a hanging crest, or Tringa vanellus of Linnaeus, commonly known in England by the name of lapwing or bastard plover, and called by some, in Latin, vanellus. See Tringa.

Were the lapwing less common, it would be highly esteemed for its beauty. It is very frequent in our fancy countries, and in the wet places of most other parts of Europe.

It lays four eggs, of an olive cast, spotted with black, in a slight nest made with a few bents. The young, as soon as hatched, run like chickens, and are preferred with great anxiety and clamour by their parents from apprehended danger; which are laid to flutter along the ground to a considerable distance from their nest, to elude pursuers, and become more clamorous when most remote from it. The eggs are much valued for their delicacy, and are sold by the London pullerers for three shillings per dozen. In winter, lapwings join in large flocks, and are very wild; their flesh is very good, their blood being infects and worms. During October and November, they are taken in the fens in nets, in the same manner as ruffs are, but are not preferred for fattening, being killed as soon as caught. Ray and Pennant.

LAQUEUS, a kind of athlete among the ancients, who in one hand held a laqueus, i.e. a fort of fire, where-with to embarrass and entangle his antagonist, and in the other a poignard to stab him.

LAQUEUR. See LACQUER.

LAQUEUS, in Surgery, a noose or snare; or a kind of ligature, so contrived, that when stretched, by any weight, or the like, it draws up close.

It is used to extend broken or disjointed bones, to keep them in their places, when they are set, and to bind the parts close together.

LAQUÍLO, in Geography, a small island in the Mediterranean, near the coast of Murcia, about 3 miles S.E. of Almeria.

LÁR, or LAAR, a city of Perú, and capital of Larián, situated on a sandy soil, amidst barren mountains; but the gardens, of which each house has one, abound with dates, an excellent fruit, which particularly prospers in this part of Perú. The housetops are low, and in the time of Chardin were about 200. The city also contains bazars, mosques, a castle on a rock, and a palace, in which the governor resides. The Jews reside in a quarter by themselves, and carry on a silk manufacture; and the Dutch have a factory here. In the vicinity are plantations of oranges and tamarinds, as well as dates; and at the foot of a mountain, at a small distance from the city, is found the sulphur called "Mummy." 120 miles W. of Oermus. N. lat. 27° 20'. E. long. 54° 12'.

LARA, a town of Spain, in Old Castile, on the Arlenza; 23 miles S.E.E. of Burgos.

LARACHA, or LARACH, a sea-port town of Africa, in the empire of Morocco, on the river Luçeos, near the Atlantic ocean. The environs are intersected by woods and marshes. A fort, built by the Spaniards, on the land side, fills remains, and the castle on the side of the road is defended by batteries, which lie close to the water's edge. The river is of good depth; and some commerce was formerly carried on in this place by the Europeans; but in the year 1783, the emperor compelled the merchants to retire. The large vellis of the emperor usually winter here; but there are no docks for ship-building. The road of this harbour is incomparably fine in winter, but it is free from danger between the beginning of April and the end of September; 33 miles S. of Tangiers. N. lat. 34° 52'. W. long. 6° 2'. Chérier's Morocco, vol. i.

LARADA, a town of Tripoli; 30 miles S.E. of Misurata.

LARAGNE, a town of France, in the department of the Higher Alps, and chief place of a canton, in the district of Gap; 9 miles S.S.E. of Serrès. The space contains 664, and the canton 2673 inhabitants, on a territory of 1925 kilometres, in 8 communes.

LARANDA, in Ancient Geography, a town of Asia, in Cappadocia, belonging to Antiochiana, according to Ptolemy, who joins this canton to Lycaonia, but by other authors it is united with Pifidia and Iphoria.

LARASSA, a town of Asia, in Media, not far from Ecbatana. Ptol.

LARBOARD, in Sea Language, the left-hand side of the ship, looking forward from the stern.

LARBORUM, in Ancient Geography, an episcopal town of Asia, in Caria.

LARSEN, or LARSSY, in Law, is a theft of personal goods or chattels, in the owner's absence. See Theft.

The word comes from the French larcin; and that from the Latin larcinum, theft.

Larsen is distinguished by the law into two sorts; the one called simple larceny, or plain theft, unaccompanied with any other atrocious circumstance; and mixed or compound larceny, which includes in it the aggravation of taking from one's house or person.

In respect of the things stolen, simple larceny is either great or small.

Larsen, Great, is, when the things stolen, though severally, exceed the value of 12l.

Larsen, Petty, or Petit, is when the goods stolen exceed not the value of 12l.

Simple larceny is defined the felonious taking, and carrying away, the personal goods of another: so that in order to constitute this crime, there must be a taking, which implies the content of the owner to be wanting; and therefore no delivery of the goods from the owner to the offender, upon truth, can ground a larceny. By the common law it was no larceny in a servant to run away with the goods committed to him to keep, but only a breach of trust: but by statute 21 Hen. VIII. c. 7, if any servant embezzles his master's goods to the value of 40l, it is made felony, except in an apprentice and servants under eighteen years old. But if he had not the possession, but only the care and oversight of the goods, as the butter of plate, the sheep and oxen, and the like; the embezzling of them is felony at common law. (1 Hal. P. C. 506.) By the declaratory act of 39 Geo. III. c. 87, entitled "An act to protect masters against embezzlements by their clerks or servants," it is enacted and declared, that if any servant or clerk, or any person employed for the purpose in the capacity of a servant or clerk, to any person or persons whomsoever, or to any body corporate or politic, shall, by virtue of such employment,
LARCENY.

employment, receive or take into his possession any money, goods, bond, bill, note, banker's draft, or other valuable security, or effects, for, or in the name, or on the account of his master or masters, or employer or employers, and shall fraudulently embezze, secrete, or make away with the same, or any part thereof; every such offender shall be deemed to have feloniously stolen the same; although such money, goods, &c. was or were not otherwise received into the possession of such master or masters, &c. than by the actual possession of his or their servant, clerk, or other person so employed. And every such offender, his adviser, procurer, aider, or abettor, being thereby lawfully convicted or attainted, shall be liable to be transported to such parts &c. for any term not exceeding fourteen years, in the discretion of the court before whom he shall be convicted or adjudged. Several statutes have also, at various times, failed to protect public companies from depredations by their officers and servants; as 15 Geo. II. c. 13. f. 12. with respect to theohe of the bank of England, rendering embezzelement a capital felony; 35 Geo. III. c. 66. f. 6. and 37 Geo. III. c. 45. touching certain annuities payable at the bank of England, and containing the same provisions as the 15 Geo. II. c. 13. f. 12. The 24 Geo. II. c. 11. f. 2. contains the same provisions respecting the officers and servants of the South Sea house. So if a gent. robs his inn or tavern of a piece of plate, it is larceny (1 Hawk. P. C. c. 5.) and so it is declared to be by 5 & 6 W. & M. c. 2. if a lodger runs away with the goods from his ready furnished lodgings. There must also be a carrying away; and a bare removal from the place in which he found the goods, though the thief does not quite make off with them, is sufficient. But this must be felonius, i.e. done animo furandi, or, as the civil law expresst it, lucr. cunfa. (Inf. 4. f. 1.) The ordinary discovery of a felonious intent, is where the party doth it clandestinely, or, being charged with the fact, denies it; besides which, there are other circumstances that evince a felonious intent, which are left to the consideration of the court and jury. Moreover, this felonious taking and carrying away must be of the personal goods of another. Of things that adhere to a freehold, as corn, grafs, trees, and the like, or lead upon a house, no larceny could be committed by common law; but the severance of them was, and in many things is still, merely a trespas; however, if the thief severs them at one time, whereby the trespas is completed, and they are converted into personal chattels, in the constructive possession of him on whose foil they are left or laid, and comes again at another time, when they are so turned into personality, and takes them away, it is larceny; and alfo if the owner, or any one else, has fevered them. (3 Inf. 109. 1 Hal. P. C. 510.) And by 4 Geo. II. c. 32. to steal, or with intent to steal any lead or iron fixed to a dwelling-house, or out-house, or in any court or garden belonging to it, is made felony, liable to transportation for seven years. And by 21 Geo. III. c. 68. he who shall steal, rip, cut, break, or remove, with intent to steal any copper, brass, bell-metal, utensil, or fixture, fixed to any building, or in any garden, orchard, court-yard, fence, or outlet, belonging to any building, or iron-rolls, or fencing, &c. and alfo his aider and abettors, and all who shall knowingly buy or receive the same, shall be guilty of felony, and transported for seven years, or detained in prison and kept to hard labour, not exceeding three years, nor less than one, and within that time, if the court shall think fit, shall be once or oftener, but not more than thrice, publicly whipped. Moreover, to steal underwood or hedges, and the like, to rob orchards or gardens of fruit growing therein, to steal or otherwise destroy any turnip, or the roots of madder when growing, are, by 43 Eliz. c. 7. 15 Car. II. c. 29. 31 Geo. II. c. 25. 6 Geo. III. c. 48. 9 Geo. III. c. 41. 13 Geo. III. c. 32. punishable criminally by whipping, small fines, imprisonment, and satisfaction to the party wronged, according to the nature of the offence. Moreover, the stealing by night of any trees, roots, shrubs, or plants, to the value of £5. is by 6 Geo. III. c. 36. made felony in the principals, aiders, and abettors, and in the purchasers knowing the same to be stolen: and by 6 Geo. III. c. 48. and 13 Geo. III. c. 13. the stealing of any timber-trees, as oak, beech, chestnut, walnut, ash, elm, cedar, fir, holly, lime, fycamore, birch, poplar, alder, harch, maple, and hornbeam, and of any root, shrub, or plant, by day or night, is liable to pecuniary penalties for the first two offences, and for the third is constituted a felony, liable to transportation for seven years. Stealing ore out of mines is no larceny, except the stealing ore out of mines of black lead, which is felony without benefit of the clergy by 25 Geo. II. c. 10. Stealing of writings relating to a real estate is no felony, but a trespass (11 Hal. P. C. 516. Stra. 1137.) bonds, bills, and notes are goads of which larceny cannot be committed by common law (8 Rep. 33.) but by 2 Geo. II. c. 25. they are put upon the same footing with respect to thearies, as the money they were designed to secure. And by 7 Geo. III. c. 50. if any officer or servant of the post-office shall secrete, embezze, or destroy any letter or packet, containing any bank-note, or other valuable paper, specified in the act; shall steal the same out of any letter or packet, he shall be guilty of felony without benefit of clergy. Or if he shall destroy any letter or packet with which he has received money for the postage, or advance the rate of postage, and secrete the money, he shall be guilty of single felony. By 26 Geo. II. c. 19. plundering or stealing from any ship in ditches, whether wreck or no wreck, is felony, without benefit of clergy. For the laws relating to fish and game, see Stealing of Fish and Game.

Of all valuable domastic animals, as horses, and of all animals, domes nature, which serve for food, as swine, sheep, poultry, and the like, larceny may be committed; and also of the flesh of such as are faera nature, when killed. 1 Hal. P. C. 511.

Although no larceny can be committed, unless there be some property in the thing taken, and an owner; yet, if the owner be unknown, provided there be a property, it is larceny to steal it; and an indictment will lie, for the goods of a person unknown. (1 Hal P. C. 512.) This is the case of stealing a throned out of a grave, which is the property of those, whoever they were, that buried the dead; but stealing the corpse itself, which has no owner, (though a matter of great indecency,) is no felony, unleas some of the grave clothes be stolen with it.

By the Roman law, the penalty of simple and secret larceny was the returning it two-fold; and of manifest larceny four-fold; manifest larceny was, where the criminal was taken in the fact; simple, where he was not. The Lacedemonians never punished larceny provided the perfon was not caught in the fact; but, on the contrary, it was applauded as a mark of dexterity and address. See Lacedemonians.

The laws of Draco at Athens, which are laid to be written in blood, punished it with death; but Solon afterwards changed the penalty into a pecuniary mult; and so the Attic laws in general continued. By the Jewish law, theft was only punished with a pecuniary fine, and satisfaction to the party injured. (Exod. chap. xxii.) From these examples, as well as the reason of the thing, many learned and scrupulous men have questioned the propriety, if not lawfulness.
Larceny.

falseh, of inflicting capital punishment for simple theft; and proposed either a pecuniary or a corporal punishment. Sir Thomas More in his Utopia, p. 42, and more lately the marquis Becarria, Eff. on Crimes and Punishments, chap. xxiv. have proposed that kind of corporal punishment, which approaches nearest to a pecuniary satisfaction, viz. a temporary imprisonment, with an obligation to labour, first for the party robbed, and afterwards for the public, in works of the most deplorable kind; nevertheless the punishment of theft still continues, through the greatest part of Europe, to be capital. Puffendorf (Law of Nat. l. 8. c. 3) and Sir Matthew Hale (1 Hal. P. C. 13.) are of opinion, that this must be always referred to the prudence of the legislature; yet both writers agree, that such punishment should be cautious and moderate, and never without the utmost necessity. It is observed, that our ancient Saxon laws nominally punished theft with death; but the criminal was permitted to redeem his life by a pecuniary ransom: as, among their ancestors the Germans, by a falted number of cattle. (Tactis. de Mor. Germ. c. 12.) But in the ninth year of Henry I. this power of redemption was taken away, and persons guilty of great larceny directed to be hanged, which law continues in force to this day. (1 Hal. P. C. 12. 3 Init. 53.) See Felony. Petit larceny by common law is only punishable by whipping or imprisonment. (3 Init. 218.) Or, by 3 Geo. l. c. 11. the punishment may be extended to transportation for seven years; but the punishment of grand larceny, or stealing above the value of 12d., which sum was the standard in the time of King Athelstan, eight hundred years ago, is at common law, regularly death: upon which Sir Henry Spelman observed, above a century since, when money was at twice its present rate, that while every thing else was risen in its nominal value, and become dearer, the life of man had continually grown cheaper. And though the jury may exercise a kind of unwarrantable clemency, by bringing in larceny under the value of 12d. and the benefit of clergy is allowed for the first offence; yet in many cases of simple larceny this is taken away by the statute; as from house-breaking (1 Edw. VI. c. 12. 6 & 3 Edw. VI. l. c. 33. 31 Eliz. c. 12,) taking woolen-cloth from off the tenders (Hatt. 22 Car. II. c. 5,) or linen, fustians, calicos, or cotton goods from the place of manufacture (14 Geo. II. c. 27.) stealing sheep or other cattle specified in the acts (14 Geo. II. c. 6. 15 Geo. II. c. 34.) thefts on navigable rivers above the value of 50l. (24 Geo. II. c. 45.) plundering vessels in rivers, or that have suffered shipwreck (12 Ann. Stat. 2. c. 18. 26 Geo. II. c. 19.) stealing letters sent by the post (7 Geo. III. c. 50.) and stealing deer, hares, and conies under the circumstances recited in the Waltham Black act, (26 Geo. I. c. 25.)

The Circassians are said to honour theft at this day; infomuch that at their public feasts, their youth are not suffered to drink, if they have not performed something remarkable in that way. Solinus tells us, that in Sarathmore there was a fountain that had the virtue of discovering a person that had committed larceny. Compound or mixed larceny is that, which besides all the properties of the former, has the aggravation of taking from one's house or person. With respect to larceny from the house, see Burglary and House-breaking.

It may be here observed, that the benefit of clergy is denied: 1. In all larcenies above the value of 12d. from a church, or from a dwelling-house, or both, any person being therein. 2. In all larcenies to the value of 5s. committed by breaking the dwelling house, though no person be therein. 3. In all larcenies to the value of 40s. from a dwelling-house, or its out-houses, without breaking in, and whether any person be therein or no. 4. In all larcenies to the value of 5s. from any shop, warehouse, coach-house, or stable, whether the same be broke open or not, and whether any person be therein or no: whether these offences are committed by day or by night.

Larceny from the person is either by private breaking; or by open and violent assault, usually called robbery. The offence of privately breaking from a man's person above the value of 12d. as by privately picking his pocket or the like, without his knowledge, was deemed of felony, so early as by the statute 8 Eliz. c. 14. For the other kind of larceny from the person, see ROBBERY. See also FELONY.

Persons who buy or receive any stolen goods, knowing the fame to be stolen, shall be deemed accessories after the fact: 3 W. c. 5; and by 4 Geo. l. c. 11. they may be transported for fourteen years; and by 5 Anne, c. 31. such persons, and those who conceal any felons or thieves, shall be deemed accessory to the felony, and being convicted on the testimony of one witness shall suffer death as a felon convict: but within clergy. If the principal felon cannot be taken, so as to be prosecuted and convicted, yet the buyer and receiver of stolen goods may be prosecuted for a misdemeanor, and punished by fine and imprisonment, or other such corporal punishment as the court shall think fit; which shall exempt him from being punished as accessory, if the principal shall be afterwards taken and convicted. Receivers of stolen lead, iron, copper, brass, bell-metal, and solder, fixed to or being in any houses, out-houses, mills, &c. shall, on conviction by due course of law, although the principal hath not been convicted, be transported for fourteen years. Suspected places may be searched, and suspected persons may be apprehended, and carried before two Justices, and if the person from whom the goods were received be not produced, or some credible witnesses do not depose upon oath the sale or delivery of them, or no satisfactory account of them be given, they shall be adjudged guilty of a misdemeanour. Every person, to whom such goods shall be offered for sale, or to be pawned, shall apprehend the person offering them; and if it shall appear, to the satisfaction of two Justices, that such person did not apprehend, &c. the person who brought or offered the same, then he shall be adjudged guilty of a misdemeanour. And persons for the two former misdemeanours, in having or carrying any of the said goods, shall forfeit for the first offence 40l., for the second 47., and for every subsequent offence 6l.; and for not carrying or a suspected person before a justice, he shall forfeit for the first offence 20l., for the second 42l., and for every subsequent offence 42l. (20 Geo. II. c. 30.) By 21 Geo. l. c. 67 every person who shall buy or receive any pewter, or other metal, or paper, knowing the same to be stolen or unlawfully come by, shall be convicted, and brought before a surveyor or other officer before a justice, who may commit them for trial, not exceeding seven years, or detained in prison and kept to hard labour not more than three years nor less than one; and within that time be once or oftener, but not more than thrice, publicly whipped. Persons offering for pawn or sale goods suspected to be stolen, may be seized and conveyed by a constable or other peace officer before a justice, who may commit them for trial not exceeding six days for examination, and afterwards, if the goods were stolen or clandestinely obtained, to the common gaol or house of correction. (30 Geo. II. c. 24.) Persons advertising a reward for helping to obtain stolen goods, and also the printer and publisher of such advertisement, shall respectively forfeit 50l. with costs. (25 Geo. II. c. 36.) And by 4 Geo. l. 11. those who receive such reward, without apprehending the felon and bringing him.
him to trial, shall be guilty of felony in the same manner as if they had stolen the same. The charges of prosecution and conviction, in respect of any grand or petit larceny, may, by order of court, and at the prayer of the prosecutor, be paid by the county treasurer, with a reasonable allowance for his time and trouble. (25 Geo. II. c. 36.) And by 18 Geo. III. c. 19. the same charges shall be allowed to the prosecutor, whether the person tried be convicted or acquitted, provided that in this latter case it shall appear to the court that there was reasonable ground of prosecution, and that the prosecutor had bond filed prosecuted. And by 27 Geo. III. c. 3. 18 Geo. III. c. 19. reasonable charges may be allowed and paid in the same manner, to a poor person who is required to give evidence in Middlesex; these charges shall be paid by the overseers of the poor where the person was apprehended. It is provided by statute, that every person who shall apprehend any one guilty of housebreaking or private stealing, to the value of 5l. and prosecute him to conviction, and all the executors or administrators of a person slain in endeavouring to apprehend a housebreaker or felon, shall have a certificate without fee, under the hand of the judge, certifying such conviction, &c., which certificate shall be inrolled by the clerk of the peace of the county where it is granted, and may be once affixed over and over no more. By virtue of this certificate the original proprietor, or alligees of the same, shall be discharged from all parish and poor offices, within the parish or ward where the felony was committed. (10 & 11 W. c. 23.) Every such person, and also the executors and administrators of a person killed as before, shall also have another certificate, which, on being tendered to the sheriff, and demand made, shall entitle him to the sum of 40l. without fee, in one month after the tender and demand; on pain of forfeiting double with treble costs. (5 Anne, c. 31.) See DISCOVERY of ACCOMPLICES.

The sheriff, on producing the certificates and the receipts for the said rewards, may deduct the same from his accounts; and if he have not money in his hands, he shall be repaid out of the treasurers, on certificate from the clerk of the pipe; or he may immediately apply to the commissioners of the treasury, who shall pay the same without fee. 3 Geo. c. 15.

LARCH-TREE, Larix, in Botany. Linnaeus refers this to the genus of pine. See PINUS Larix.

It is the common name of a kind of pine or fir tree, the leaves of which are long and narrow, and are produced out of little knots or tubercles, in the form of a painter's pencil; the cones are produced at remote distances from the male flowers on the same tree; the flowers are very like small cones at their first appearance, but afterwards stretched out in length. These trees are propagated by seeds, which should be sown in the beginning of March, upon a bed of light soil, exposed to the morning sun only; or they may be sown in pots or boxes of light earth, and placed near a hedge, where they may be exposed to it. The seed should be covered about half an inch thick with fine light earth, and in very dry weather should be gently refreshed with water. In about six weeks, if the seeds be good, the plants will come up, at which time they should be carefully guarded against rapacious birds, which would otherwise pull off the heads of the plants, as they thrust themselves out of the ground with their covers on them; and refresh them with water in dry weather, especially if they are sown in pots or boxes; also keep them clear from weeds, which, if suffering to grow among the young plants, will soon destroy them. In October, if they are in boxes or pots, remove them into a situation where they may be defended from sharp winds, which are sometimes hurtful to them, while young; but afterwards they will endure the severest weather of our climate. These trees are very proper for the sides of barren hills, where few other forests will thrive so well; nor are they very delicate in regard to soil, but will grow much better on poor, strong, stony land, than in rich ground; during the summer, they appear very beautiful; but in autumn they cast their leaves, and are not evergreen like the fir.
