1819.
X, a double consonant, and the twenty-second letter in the English alphabet; which, however, begins no English word.

The χ of the Latins, and χ of the Greeks, are compounded of ς and ς; whence, to this day, the letter χ in the English and French has the same found with ς, or χ. Thus we pronounce Alexander exactly as if written Alcander or Alcander.

The Italians have no χ at all in their language, but both speak and write Alcander. The Spaniards pronounce the χ like our c before a; viz. Alcandro, as if it were Alcandro. The Portuguefe pronounce it like fs.

In foreign words, used in English, we sometimes soften the χ into a double s; as Bruxelhs, for Bruxelles, &c.

The letter is not known in the Hebrew, or other oriental languages; but in lieu of it, they write the two simple letters of which it is compounded. And the like do the modern Germans.

Peter Diaconus relates, that the letter X was introduced into the Roman alphabet in the time of Augustus; and that, before his reign, the Romans supplied the want of it by the letters C and S. But Mr. Ayliffe observes, that this is a mistake; the letter X being found in the Duilien pillar, inscribed in the year of Rome 494, and 259 before Christ. Origin and Progress of Writing, p. 78.

X is also a numeral letter, and signifies ten; as representing two V's placed one at top of the other. See V.

X Supra denos numero tibi dat retinendas.

When laid flat, thus X, it signifies a thousand; and when a dash is added over it, X, it signifies ten thousand. I before X denotes the subtraction, and after X the addition of unit; thus, IX = 9, and XI = 11. X before L or C Vol. XXXIX.

X denotes the subtraction of 10 from 50, or 100; thus, XL = 40, and XC = 90.

X on the French coins denotes those struck at Amiens.

We often meet with the Greek letters X and Π joined in this manner Ρ on ancient medals. The first we find are on some large brass coins of the Ptolemies, kings of Egypt, where it was placed on a civil account.

Some writers have taken it for a date, and others for the initials of a proper name; but as no reasons are assigned for either of these conjectures, Mr. Ward rather supposes it an abbreviation of the word XPHMA, money, impressed on those pieces, to denote their currency as money; which might be thought proper, as they have not the heads of kings stamped upon them, like their silver and gold coins; but always that of a Jupiter on the front, and an eagle perched on a thunderbolt on the reverse.

This character was afterwards applied to a very different purpose by Constanine the Great, who made use of it to denote XPICTOC, both in his coins and military ensigns; in which he was followed not only by some succeeding emperors, but also by private persons, who out of devotion put it on their lamps and other utensils.

It afterwards came to be used merely as a critical note, to point out remarkable passages in manuscripts; and then it stood for the initials of XPHICTON, useful; as we learn from Isidore, Orig. lib. i. cap. 20. See Phil. Trans. No 474. feot. 1.

X, with a P, or Greek Ρ, in the middle of it, is also the monogram of the name of CHRIST, which constantly occurs in the catacombs or burial-places of the ancient Christians, and which was the chief ornament of the Labarum or military standard of Constanin, and the succeeding emperors. See Labarum.

B XABEA,
XAM

XABEA, in Geography, a sea-port of Spain, in the province of Valencia, near the coast of the Mediterranean; 38 miles N.N.E. of Alicante.

XABORECTORA, in Ancient Geography, a name given by P. Mela to Aborras, a river of Mesopotamia.

XACA, in Geography. See JACA.

XACRE, a cape on the south-east coast of the island of Cuba, 15 miles S.E. of Settia.

XAGUA BAY, a large bay on the south coast of the island of Cuba. This is one of the best ports in the West Indies, and is 15 miles in circumference, surrounded with mountains, which break off the force of the winds. N. lat. 22° 16'. W. long. 81° 20'.

XAINTES, SANTOS, or All-Saints' Islands, as having been discovered on that holiday by the Spaniards; three small islands in the West Indies, situated to the south-east of Guadaloupe. The most westerly of them is called Terra de Bas, or the Low island, and the most easterly, Terra de Haut, or the High island. The third, which lies exactly in the middle between the other two, seems to be nothing more than a large barren rock, but is of use in affording to form a very good harbour. The island of Terra de Bas is about nine miles in circumference, but the other is larger. These islands have constantly a fresh breeze, let the wind blow from what quarter it may; and on the Terra de Bas is a neat wooden church, with two very convenient creeks both for anchorage and landing. They are about six miles distant from Guadaloupe, and 15 from Marigalanete. N. lat. 15° 56'. W. long. 61° 32'.

XALAPA, a considerable town of Mexico, or New Spain, in the fertile province of Tlaxcalla, formerly famous for the fair held on the arrival of the flatted fleets from Europe; and since the declared freedom of commerce, a considerable mart for European commodities. It is situated on the southern skirts of a mountain, in a beautiful climate, the soil being partly clay and partly stony, while pure waters influe from a white sand, and fertilize the country. The population consists of 243 Spanish families, 182 Mulletoz, and 361 Indians. When north winds prevail at Vera Cruz, it always rains at Xalapa; but the climate is esteemed very healthy. The purging powder of the country is made of the root of a plant, to which the town gives the name of Jalap; 30 miles E. of Puebla de los Angelos. N. lat. 19° 50'. W. long. 98° 26'.

XALISCO, a province of Mexico, in the audience of Guadalajara. It is washed by the South Pacific ocean on the south and west; bounded on the east by Guadalajara, proper and Mecoxcan; and separated from Chianetlan on the north, by a narrow strip of land belonging to Guadalajara, and running out into the sea. It is not above fifty leagues in extent either way. It abounds with Indian wheat and silver mines, but has very few cattle of any sort. From this province is brought the oil of the inferior fig-tree, as the Spaniards call it, much used in medicine.

XALISCO, a town of Mexico, which gives name to a province; 9 miles N.W. of Coacotlana Nueva. N. lat. 21° 25'. W. long. 106° 26'.

XALON, a river of Spain, which rises in a mountain near Medina Celi, and runs into the Ebro, about six miles above Saragossa.

XAMACA, a river of America, which runs into the gulf of Mexico, 13 miles from Vera Cruz.

XAMBRINA, a town of Spain, in the province of Leon; 2 miles S.E. of Tordesillas.

XAMDELLILAH, an Arabian term, used as a grace or thanksgiving after meat.

The greatest men of that nation will often call in the meanest, even the beggars, to eat with them; who, as soon as they have done, always rise and pronounce this word, which signifies, God be praised. Pococke's Egypt, p. 183.

XAMI, a name given by some of the old writers to the coasts of the Greeks, or carob-tree. See Charnoe.

XAN, in Geography, a river of the principality of Georgia, which runs into the Kur, 6 miles E. of Gory.

XANGA, a river of Africa, in the kingdom of Mungallo, which runs into the Indian sea, opposite to the island of the same name. Alto, one of the Querimba islands in the Indian sea, near the coast of Africa. S. lat. 10° 45'.

XANILA, a town of Fezzan, in the road to Egypt; 140 miles E.N.E. of Mourzouk.

XANQUE, or GUAYO, a river of Mexico, which runs into the Spanish Main, 30 miles W. of Cape Camaron.

XANTEN, or SANTEN, a town of France, in the department of the Roper, near the Rhine; 7 miles N.E. of Gueldres.

Gen. Ch. Male, Cal. Perianth of one leaf, in five or fix small, deep, imbricated, roundish, concave, acute segments, with a pair of minute opposite scales at the base. Cor. Petals five, roundish, spreading, larger than the calyx. Stam. Filament one, columnar, erect; anthers five, two-lobed, forming a peltate concave disk, full of gluten, their under fide burbling, and discharging the pollen.

Female, Cal. like that of the male, permanent, inferior. Cor. as in the male. Stam. Filament none; anthers five, prismatic, erect, imperfect. Pfl. German inferior, roundish, with five furrows; stipe none; stigmas five, roundish, thick, emarginate, seated on the germen. Peric. Capsule small, globose or oval, with five furrows, five cells, and five valves, burbling at the furrows, their membranous partitions adhering to the central column. Seeds numerous, oblong, imbedded in the pulp, infected in a double row upon the five-angled columnar receptacle.

Obl. It appears that one-fifth is frequently added to the parts of fructification, in the male as well as female flowers.

Female, Calyx and Corolla like the male. Stigmas five, feffile. Capsule of five cells, with many pulpy seeds.

1. X. sandens. Twining Xantie. Willd. n. 1. (Quapoya scandens; Aubl. Guian. 858. t. 343.)—Leaves obovate, fleshy. Capsule globose. Native of the forests of Guiana, flowering in November. The stem is shrubby, with knotty branches, twining round neighbouring trees. Leaves opposite, on short stalks, simple, entire, thick, and smooth, three or four inches long, with a thick midrib, and a short blunt point, but no branching veins. Flowers small, yellow; their petals filaments longer than the calyx. Petals fleshy. Capsule about the size of a black currant, fleshy, crowned with the black stigmas all meeting in a point. Seeds red. Every part of the plant, when wounded, discharges a transparent, white, viscid, resinous juice. The Indians call this species Quapoy. See Quapoya.

2. X. por-

Gen. Ch. Male flowers compound. \textit{Common Calyx} of many imbricated, slender, equal scales, as long as the numerous florets. \textit{Cor.} compound, uniform, equal, hemispherical, conflititng of numerous, tubular, funnel-shaped, monopetalous, upright, five-cleft florets. \textit{Stam.} Filaments in each floret five, united into a cylinder; anthers erect, parallel, distinct. \textit{Common Receptacle} small, with chaffy scales between the florets.

Female flowers below the male, on the same plant, doubled. \textit{Cal.} involucrum two-flowered, of two opposite, acutely three-lobed leaves, (their middle lobe longest,) betef with hooked prickles, and closely enfolding, as well as united to the, germen, except the lobes, which are free. \textit{Cor.} none. \textit{Petil.} German oval, hifipid; fyles two pair, capillary; \textit{ stigma} simple. \textit{Peric.} Drupari dry, ovate-oblong, cloven at the point, clothed all over with hooked prickles. 

\textit{Seed}. Nut of two cells.

Female, \textit{Calyx} two-leaved, two-flowered. Corolla none. 

Drupari dry, maricatic, cloven. Nut of two cells.

Obs. Linnæus remarks, that the fruit of \textit{Xanthium} could scarcely have been well understood, without a previous knowledge of that of \textit{Ambrofia}. These genera in fact belong to that ambiguous tribe, whose habit, qualities, and in part the structure of their male flowers, all associate them with the compound or fringelous order; while the diffusion of their flowers, and the general nature of their female flowers, and fruit, necessarily refer them to the \textit{Compositæ}, or in the artificial fylenm of Linnæus, the clasf \textit{Monococca}. 

1. \textit{X. strumarium}. Common Burweed, or Small Burdock. Linn. Sp. Pl. 1400. Willd. n. 1. Ait. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 2544. Fl. Dan. t. 975. Bigelow Bot. 221. (Xanthium; Fuch's Hill. 670. Camer. Epit. 926. X. leu Lappa minor; Matth. Vglir. v. 2. 545. Bardana minor; Ger. Em. 809.) — Stem without thorns. Leaves heart-shaped; three-ribbed at the base. — Native of dung-hills, and rich moist ground, in various countries of Europe, as well as North America, flowering towards autumn. In this island it is of very rare occurrence, though occasionally met with about London, and in the west. Dr. Sibthorp noticed the plant in many parts of Greece, where the foil is rich and rather wet, and found it called, by the modern Greeks, \textit{xanthon} a name alluding to its bur-like property, rather than to the quality on which an ancient appellation is founded. The \textit{root} is annual. Herb branched, rough, dark green, rather foppid, of a coarse rank habit, with furrowed, rather hairy, branches. Leaves alternate, flaked, heart-shaped, acutely lobed, and toothed or ferrated; their two lateral ribs marginal, for a small space, at the base, as in the great Burdock, \textit{Arctium Lappa}, and a few other plants. Male flowers globular, green, few together, in axillary or terminal clusters, about the upper part of the branches; female in axillary sebleuf tufts. Fruit elliptical, double-pointed, hard, near an inch long, with soft, prominent, awl-shaped, hooked prickles, which attach themselves to the coats of animals, and thus serve to disperse the seeds.

2. \textit{X. orientale}. Oriental Burweed. Linn. Sp. Pl. 1400. Willd. n. 2. Ait. n. 2. Linn. Fil. Dec. 33. t. 17. "Schulkr Handb. v. 3. 239. t. 297." — Stem without thorns. Leaves ovate, slightly three-lobed, somewhat triple-ribbed; wedge-shaped at the base. — Native of Ceylon, Japan, and China, from which last country it was imported, according to the younger Linnæus, with other seeds for the Upfal garden, in 1761. Sir Hans Sloane is recorded by Ray as having introduced this \textit{Xanthium} into England in 1685; but their plant seems to have been a flight variety of the first, figured by Morison, fept. 15. t. 2. f. 2. found in America, and not answering to the distinctive characters of the present species, though Morison, and others who speak of this variety, are cited by Linnæus and Willdenow. The true \textit{X. orientale} is an annual herb, of a more slender habit than the \textit{Strumarium}, and more harsh, though less hairy. Their essential differences are indicated in our specific characters. The most remarkable seems to be the taper base of the \textit{leaves}, the present species, and the union of their three ribs, at a greater or less distance, above the infertion of the footstalk. The \textit{fruit} is twice as large as the foregoing, with peculiarly strongly hooked thorns.

3. \textit{X. ebinatum}. Compound-thorned Burweed. "Mur- 

ray in Comm. Goett. for 1784, with a figure." Willd. n. 3. — Stem without thorns. Fruit oval; its prickles hooked, coweded, compound at the base. Annual. — Its native country unknown. Willdenow. We have not seen either a specime or figure.

4. \textit{X. spinosum}. Spinos Burweed. Linn. Sp. Pl. 1400. Willd. n. 4. Ait. n. 3. (X. spinosum, atriplicis folio; Moris. fept. 15. t. 2. f. 3. X. lufitanicum spinosum; Herm. Parad. 245, with a figure. Volkm. Noris. 424, with a figure. X. lufitanicum, lacinatum, validiflum acule moniment; Magnol. Hort. 208. t. 20.) — Stipula thorny, three-cleft. Leaves lanceolate, three-lobed; hoary beneath. — Native of the south of France, as well as Italy, Spain, and Portugal. It might be raised here as a tender annual, and planted out in a border, were there sufficient beauty in its copious, long, flame-coloured thorns, to entitle it to a place in the flower-garden. The \textit{leaves} are not inegant. Their upper surface is of a fine green, nearly smooth; the lower downy and white. The \textit{thorns} are in fact \textit{fibulæ}, an inch long, very sharp, standing in pairs at the base of each footstalk, separating just above their origin into three spreading needle-like points. Flowers small and inconsiderable. Fruit oval, covered with copious,
copious, small, hooked prickles. The wild plant makes a conspicuous appearance in winter, on banks about Montpellier.

For X. fruticosum, Linn. Suppl. 418, see Franseria.

Xanthium, in Agriculture, a term under which the lesser burdock is sometimes known by writers, and which is found to be a very troublesome weed. See Weed.

Xanthochymus, in Botany, received that name, either from Dr. Roxburgh or Mr. Dryander, in allusion to the remarkable yellow juice of its fruit; the word being compounded of xanthos, yellow, and \( \chi \alpha \nu \) \( \zeta \) \( \theta \) \( \aupsilon \), juice.—Roxb. Coromand. v. 2. 51. Ait. Hort. Kew. v. 4. 420.—Cliffs and order, Polyadphya Polyandra. Nat. Ord. Guttifera, Joff.

Gen. Ch. Cal. Perithan inferior, of five roundish, unequal, oblong, flattened, spreading, slightly imbricated, permanent leaves. Cor. Petals five, orbicular, nearly sessile, opposite to the calyx-leaves, and twice as long. Nectary of five broad, short, abrupt, porous glands, opposite to the petals, alternate with the flaminis, inserted into the receptacle under the germen. Stam. Filaments twenty united into five oblong, linear, flat bodies, alternate with the stamens, and above twice as long; anthers flaked, roundish, of two lobes and two cells. Pist. Germen superior, globose; style fuscous; stigma fuscous; filaments five, spreading horizontally, obtuse, deciduous. Peric. Berry globose, succulent, with five ovate seeds, immersed in the pulp, some of which are generally abortive.

Eff. Ch. Calyx of five leaves. Petals five. Nectaries five, abrupt. Stamens united into five, opposite with the stigmas. berry with from one to five seeds.

1. X. \( \pi \theta \iota \lambda \iota \iota \iota \) \( \iota \) \( \rho \iota \iota \sigma \), Painter's Golden-apple. Roxb. Coromand. v. 2. 51. 1. B. 196. Ait. n. 1.—Native of moif valleys, among the Cearc mountains of Hindoostan, flowering in the hot seafon, and ripening fruit in November, December, and January. A large tree, whose tall trunk is covered with dark rough bark, and whose numerous, smooth, rather angular branches form an ample evergreen head. Leaves opposite, stalked, about a foot long and two or three inches broad, elliptic-oblong, acute, entire, coriaceous, smooth, and shining, with a strong mid-rib, and many transverse, parallel, fine, interbranching veins. Fruit acaulis an inch in length, angular, channelled, corrugated. Stipulae none. Flowers an inch in diameter, five or six together, in flaked umbels, each umbel opposite to a leaf, or situated nearly where a last-year's leaf has been. Petals white. Stamens and Pistils green. Nectaries and Anthers yellow. Fruit globose, drooping, somewhat pointed, orange-coloured, smooth, two inches or more in diameter. Seeds about the size and shape of almonds.

"The ripe apples," says Dr. Roxburgh, "are eaten by the natives. They are very inviting to the eye, and in taste little inferior to many of our apples in England. I have no doubt, if cultivated by culture, they would prove a delicious fruit." The green, but full-grown, fruit yields a large quantity of a gum, very like Gummi Guttia, Gabambo. The best way to obtain it is by cutting the apples acroa, and to scrape off the juice, as it rapidly issues. When recent, it is of the consistence of very rich cream, bright yellow, considerably acid, and somewhat nauseous to the taste. In a few days it hardens, and becomes less acid. It makes a pretty good water-colour, either by itself, as a yellow, or mixed with other colours, to form green, &c. It has no particular smell when burnt. A milky juice exudes from the bark of this tree when wounded, which soon thickens, and in thickening assumes a yellow tint. It has no smell, and, when first taken into the mouth, little taste; but after a while, a sense of dryness and acrimony extends a little way down the throat. This juice, like that obtained from the fruit, is imperfectly soluble in spirits. Roxb. Prek.

The tree above described is no very remote relation of the Mangofteen, the most delicious fruit of India; so that Dr. Roxburgh's advice of improving it by culture may be well worthy the attention of horticulturists, if any be found in that part of the world where such experiments are practicable. The most obvious would be to obtain pollen of the Mangofteen, which, like that of many other plants, would probably bear carriage, and to impregnate it with some flowers of the Xanthochymus, whose progeny might tincture perhaps be much altered.

Xanthon, a name given by some of the ancients to a species of marble of a yellowish-green colour, much used in ornamenting the inner parts of houses; and from its equal hardness with the Tanarian marble, and the equal high polish it was capable of, supponed by the workmen to be of the same species.

The word xanthon is of very dubious meaning, but is supposed as the name of this marble to have expressed a green colour, as this was otherwise called marmor herbofus. See Tannarium and Herbosum Marmor.

Xanthorrhiza, in Botany, received its name from the late M. L. Heritier; xanthos, yellow, and \( \rho \iota \iota \sigma \), a root, alluding to the colour of that part. We follow Marshall, Schreber, and Martyn, in correcting the original orthography.

Gen. Ch. Cal. none; unleaf, with the French botanists, we take the corolla for such. Cor. Petals five, ovate, acute, spreading, deciduous. Nectaries five, abrupt, two-lobed, spreading, inserted into the receptacle, alternate with the petals, and about half as long. Stam. Filaments five to ten, awl-shaped, very short; anthers roundish. Pist. Germen several, to eleven, superior, oblong; styles awl-shaped, incurved; filaments acute. Peric. Capsules as many, inflated, ovate-oblong, bluntish and compressed at the top, where they burst, terminated obliquely by the styles, each of one cell and two valves. Seeds solitary, oblong, compressed, small, pendulous from the top of the capsule.

Obs. Many of the flowers want either the stamens or pilius.

Eff. Ch. Calyx none. Petals five. Nectaries five, ab

rupt, flaked. Capsules five or more. Seeds solitary, pendulous.

1. X. \( \pi \theta \iota \lambda \iota \iota \iota \) \( \iota \) \( \rho \iota \iota \sigma \) \( \alpha \pi \iota \lambda \iota \iota \iota \iota \), Parley-leaved Yellow-root. (Zanthorhiza apifolia; L. Herit. Strup. Nov. 79. t. 38. Wildl. n. 1. Ait. n. 1. De Cand. n. 1. Pursh n. 1.)—Native of shady banks of rivers, from Virginia to Georgia, flowering in May. Pursh. Mr. Aiton says it was introduced, about the year 1765, by John Buft, eqq. into the English gardens, where it is hardy, flowering in the early spring. Here it flowered unnoticed, or at least undescribed, till M. L. Heritier published his magnificent and learned work. The stem is shrubby, bushy, about a yard high, each branch crowned with a tuft of dark green, smooth, shining, long-flaked, pinnate leaves, whole leaflets, an inch or an inch and half long, are acute, rhomboid-lanceolate, sharply and unequally serrated in their fore-part. Flowers in long panicled thyrsi, from the

Gen. Ch. Cal. none, unless the corolla be taken for such. Cor. inferior, of one petal, in fixed, deep, nearly equal, oblong, permanent segments; the three inner ones concave, converging at the base. Stam. Filaments fix, inserted into the lower part of the corolla, linear, flat, smooth, and naked, longer than the segments; anthers veratilis. Pfit. German superior, ovate, with the rudiments of many heads in each cell; lyle cylindrical, with three furrows; stigma fimple. Peric. Capsule projecting beyond the closed permanent corolla, ovate, with three blunt angles, woody, imlort hornly, polished, acute, of three cells, and three valves, the partitions from the middle of each valve. Seeds one or two in each cell, bordered, compressed, with a hard black shell; the scar at the base, naked; embryo transverse; albumen soft and flabby.

Mr. Brown, from whole examination, of the living plants, we have improved our generic description above, remarks, that the species of this genus have a peculiar habit, so striking, that where they abound, they give a singular character to the face of the country. The body of the root is sometimes elevated into a thick, scarred, black stem, often divided or branched, and several feet in height, exuding a fragrant yellow resin: in other instances it is very short, scarcely rising above the surface of the ground. Leaves very numerous, crowded, narrow, grasy, of great length, linear, somewhat triangular, or two-edged, spreading every way; recurved at the extremity; dilated, and half-thrashing, at the base; rigid and elastic when dry. Flower-flask terminal, quite fimple, round, often many feet in length, smooth, firm, hard, and durable. Spike terminal, solitary, cylindrical, dense, many-flowered, resembling a catkin, sometimes equal in length to the spike itself. Flowers sessile, closely crowded, small, white, each accompanied by numerous, imbricated bracts, tapering at the base into a claw, the innermost gradually smaller. Capsules of a shining chestnut, partly black.

"The structure of the seeds agrees with Boronia, Labill. Nov. Holl. t. 107. Brown Prod. v. 1. 286; nor are these two genera very different in foliage or inflorescence. They are placed at the end of the Asphodes, because of their fleshy alments, and the black crustaceous skin of their seeds." Brown.

1. "X. arbor. Arboreous Yellow-gum. Br. n. 1.—" Stem arborecent. Leaves two-edged; triangular beyond the middle; articulated in front. Stalk barely the length of the very long spike. Bracteas and corolla bearded. — Native of the country near Port Jackson, New South Wales. Each division of the thick stem is crowned with a large tuft of innumerable long, slender, drooping leaves, in the centre of which the flower-flakes stand solitary. See n. 3.

2. "X. australis. Southern Yellow-gum. Br. n. 2.—" Stem arborecent. Leaves comprized longitudinally. Stalk shorter than the elongated spike. Bracteas subtending the tufts of flowers elongated. — Native of the island of Van Diemen, where it was gathered by Mr. Brown. We have seen no specimen.

3. "X. Hafite. Spear Yellow-gum. Br. n. 3. Ait. n. 1. (Yellow resin-tree; White's Voyage, 235 t. p. 249.)— Stem very short. Leaves comprized longitudinally. Stalk many times longer than the eighteen-inch spike. Bracteas, and outer segments of the corolla, downy at the point. — Native of New South Wales, from whence we received specimens in 1795, by favour of Dr. John White. It is said to have been sent, in 1803, to Kew garden, by Philip Gidley King, Esq. A green-bole plant, flowering in April and May. In the description given by Dr. White, at the place above quoted, he evidently confounds this species and the X. arbor; for he says "it is about the size of an English Walnut-tree. The trunk grows pretty straight for about fourteen or sixteen feet, after which it branches out into long spiral leaves, which hang down on all sides, and resemble those of the larger kinds of grass, or fedge. From the centre of the head of leaves arises a single footstalk, eighteen or twenty feet in height, perfect straight and erect, terminating in a spike of a spiral form. This large footstalk is used by the natives for making spears and fish-gigs, being pointed with the teeth of fish, or other animals." The first part of this description appears to belong to the arboreous Xanthorrhiza, the latter, regarding the inflorescence, to the Hafite; which might easily, perhaps, except by a scrutinizing botanist, be supposed different stages of growth, or varieties, of the same plant. Such a mistake may be more easily accounted for than that of the great Linnaeus, in combining nearly the whole genus of Asio into one species. The Yellow Resin is produced by the present, and some other, species of this genus, by spontaneous exudation from the trunk; promoted sometimes, as we judge from the appearance of certain specimens, by fires kindled by the savage natives of the country. The juice, fluid at first, soon hardens in the sun, into a concre, brittle, form, of a dull orange colour. Burnt on hot coals, it emits a fragrant smoke, smelling like a mixture of balm of Toju and Benzoin, approaching in some degree to Storax. This resin is perfectly soluble in spirit of wine, but not in water, nor even in essentinal oil of turpentine, unless digested in a strong heat. The varnish which it makes with either is weak, and of little use. Dr. White found this Yellow Gum a good pectoral medicine, in many cases. If burnt in a room, the fcent, though pleasant to some people, soon proves oppressive, and the smoke irritating to the lungs. Olive gum, used by the Italians, is preferable for fumigation.

Mr. Brown near Port Jackson. He is not quite confident of its being a distinct species from the last.

5. X. minor. Lower Yellow-gum. Br. n. 5.—"Stem none. Leaves triangular; flat in front; rather concave beyond the middle. Stalk many times longer than the spike. Bractæae scarcely longer than the tufts of flowers, all, like the corolla, bearded."—Gathered by Mr. Brown, in New South Wales. The "spike" of this species measures from five to eight inches. Brown.

6. X. braætata. Long-bracted Yellow-gum. Br. n. 6.—"Stem none. Leaves triangular; below the middle somewhat elevated in front; beyond it rather concave. Stalk many times longer than the spike. Bractæae subtending the tufts twice or thrice the length of the flowers, lanceolate and drooping, all, like the corolla, bearded."—From the same country. The "spike" is only from three to six inches in length. Brown.

7. X. Pumila. Dwarf Yellow-gum. Br. n. 7.—"Stem none. Leaves below the middle flat, with a slightly elevated ridge on both sides; beyond it triangular and channelled. Stalk many times longer than the ovate spike. Bractæae nearly equal, bearded as well as the corolla."—Gathered by Mr. Brown, in the tropical part of New Holland. The "flower-stalk" itself is, in this species, only a foot high. Brown.

XANTHOOXYLUM, received its name from governor Cadwallader Colden, because of the yellow hue of the wood, to which ʃə, yellow, and ʃə, wood, alludes. We make no scruple to follow the example of professor Martyn, in restoring the proper orthography; nor is it requisite to burden our readers with a perpetual indication of the original blunder, under every species, though that blunder has the sanction of Linnaeus, and perhaps of all the authors, except Martyn, that we may have to quote. They generally write the word Zanthoxylym, or Zanthoelyx. Linna. Gen. 519. Schreb. 684. Willd. Sp. Pl. v. 4. 753. Mart. Mill. Dict. v. 4. Alt. Hort. Kew. v. 5. 352. Pursh 209. Swartz Ind. Occ. 570. Juff. 374. Lamarck Dict. v. 2. 38. Illust. t. 811. Gærtn. t. 68. (Fagara ; Duham. Arb. v. 1. 229. t. 97. Swartz Prodr. 33.)—Clas and order, Diocæa Pentandria. Nat. Ord. "Hederaces," Linna. rather his Domæae. Terebintaceæ affine, Juff.

Gen. Ch. coréfæct. Male, Cal. Perianth very small, in three or five deep, concave, rather acute segments. Cor. petals three or five, oval, erect, concave, thrice the length of the calyx. Stam. filaments three or five, awl-shaped, erect, longer than the petals; anthers roundish, two-lobed, furrowed.

Female, Cal. like the male, inferior, permanent. Cor. like the male, deciduous. Pist. Gernens from two to five, roundish, each terminating in an awl-shaped style, longer than the petals; stigmas obtuse. Peri. Capsules from one to five, stalked, each in one cell, and two carioceous valves, barbate at the inner margin. Seeds solitary, roundish, polished, pendulous from an upright bristle-shaped stalk.

Eft. Ch. Male, Calyx in three or five small deep segments. Petals three or five.

Female, Calyx like the male, inferior, permanent. Petals three or five. Capsules from one to five, of two valves, and one cell. Seeds solitary, pendulous.

Obs. This genus is distinguished from Fagara, (see that article,) by having separate flowers, either three-cleft, or five-cleft, and pendulous. Botanists appear to have mistaken its real character, taking the corolla for a calyx. To this error Linnaeus and Duhamel led the way, and Jussieu, Willdenow, and others, have followed them.

Yet Linnaeus in his Gen. Pl. subjoins to his generic description a more correct statement, altogether superseding the former; and Willdenow admits species from Swartz, whose petals by their presence contradict his essential character. We have not seen living specimens of Xanthoëlyx, but the descriptions of Browne and Swartz leave little doubt of the correctness of the above characters. We are much tempted to unite the two genera in question, but as they really have not been sufficiently investigated, and Gærtner seems to have discovered a distinctive mark of Xanthoëlyx, in the stalked pendulous seeds, we leave them for future inquiry. The whole genus is shrubby or arborescent, with alternate, pinnate, sometimes only terete, entire, or somewhat crenate leaves, and clustered, or panicled, flowers. The stem is, in most instances, armed with prickles, that are sometimes very formidable. The wood is hard, and serviceable for many purposes.

Sect. 1. Stem without prickles.

1. X. ternatum. Three-leaved Yellow-wood. Swartz Ind. Occ. 570. Willd. n. 1. (Fagara trifoliata ; Swartz Prodr. 33.)—Prickles none. Leaves ternate, ovate, oblong, emarginate, hisping; dotted beneath.—Received by Mr. Joseph Banks from the island of Dominica. A shrub, fix feet high, with roundish, subdivided branches, angular when young. Leaves on short, spreading, channelled peti-foots. Leaflets on small flat leaflets, entire, rigid, veiny; contracted at the base; paler beneath, and minutely dotted with black. Clusters axillary, compound. Flowers small, white. Gernens three, contiguous, like one three-lobed germen. Stigmas three, feefile. Capsules three, each of two hemispherical valves, with two internal, membranous, whitish valves. Seeds solitary, roundish, polished. Swartz.

2. X. emarginatum. Emarginate Yellow-wood. Swartz Ind. Occ. 572. Willd. n. 2. Alt. n. 1. (Fagara emarginata ; Swartz Prodr. 33. Lauro affinis, terebinthi folio alato, ligno odorato candido, flore albo ; Sloane Jam. v. 2. 24. t. 168. f. 4.)—Prickles none. Leaves pinnate, ovate, emarginate, veiny. Flowers triandrous.—Native of mountains in the interior parts of Jamaica, where it is vulgarly called Ligum rurum, a corruption of Ligum Rhodium, the smell of every part of the shrub resembling the latter when rubbed, or held near the fire. The stem is woody, branched, round. Leaflets about three pairs, rarely with an odd one, above an inch long, veiny, rather coriaceous, and hisping. Clusters terminal, somewhat compound, erect. Flowers minute, white. Calyx in five deep, ovate, acute, permanent segments. Petals only three, ovate, concave, spreading; twice the size of the calyx. Stamens three, very short. Gernens three-lobed, with three felifile stigmas. Capsules seldom more than one perfected, with two internal, as well as external, valves, and one orbicular, black, hisping seed. Swartz.

3. X. acuminatum. Pointed-leaved Yellow-wood. Swartz Ind. Occ. 575. Willd. n. 3. (Fagara acuminata ; Swartz Prodr. 33. — Prickles none. Leaves pinnate, elliptical, pointed, coriaceous. Flowers triandrous.—Native of mountainous parts of Jamaica. A shrub, with round spreading branches. Leaflets three or four pair, laurel-like, hisping. Gymnæae terminal, subdivided in a forked manner. Flowers crowded, small, white. Calyx of three minute ovate leaves. Petals three, obtuse, concave, one line and a half long. Stamens three, shorter than the corolla. Fruit globose, the size of a pepper-corn, only one capsule, out of three, coming to perfection.

Sect. 2. Stem prickly.

XANTHOXYLUM.

"Well St. Croix 236."—Stem prickly. Leaves ternate, or pinnate, oblong, finely crenate; dotted beneath.—Native of the island of Santa Cruz. Willdenow.

5. X. spinafum. Prickly Triandrous Yellow-wood. Swartz Ind. Occ. 574. Willd. n. 5. (Fagara spinaf; Swartz Prodr. 33.)—Stem prickly. Leaves pinnate, with many pairs of feflile, ovate, pointed leaflets; prickly beneath, as well as the branches. Flowers triandrous.—Native of dry mountainous situations in Jamaica. A ftrub. about five feet high, with a round, branching, upright stem. Spines (rather we prefume prickle[s]) scattered, prominent, needle-like, as long as the finger-nail; thefe of the main item stronger, and thicker at the bafe. Leaves a foot long, with a comprefled footstalk, round and prickly at its bafe, and, if we understand right, furnifhed with a pair of pricklefs before each pair of leaflets, which are nearly feflile, eight or ten pair in all, ovate, with a short emarginate point, veiny, rigid, fmoother, and thining, very minutely crenate at the edges, their mid-rib occafionally prickly. Cymes terminal, with minute, white, crowded flowefs. Calyx with three ovate acute segments. Petals three, ovate, larger than the calyx. Filaments fcarce any. Anthers ovate, converging. Germin in three diftinft lobes. Stigmas three, feflile, obtufe. Fruit not observed. Swartz.

We have been more full in our defcriptions of Dr. Swartz's four fpecies, that the reader may compare their characters with Fagara. Nothing is faid of their flowefs being feparated, or dioecious.

6. X. Clava Ciculati. Great Prickly Yellow-wood. Linn. Sp. Pl. 1455; excluding the synonym of Duhamel. Amev. Acad. v. 3. 16. Wild. n. 6. Alt. n. 2. Swartz Obs. 725. (X. spinafum, lenticell longiflorus foliis, euonymi frutefculi; Catecb. Carolin. v. 1. t. 26, according to Linneus. X. aculeatum, fraxini ffolis et punctatis foliis; Pluk. Phyt. t. 239. f. 4.)—Stem with broad angular pricklefs. Leaflets ovate, pointed, crenate; nearly equal at the bafe: common footstalk prickly. Flowers terminal, panicked.—Native of woods in the West Indies and Carolina, flowering in March and April. It is marked by Mr. Aiton as a green-house plant, cultivated ever since Miller's time, flowering in April and May. The trunk is woody, often, according to Swartz, 30 or 40 feet high, armed with very powerful pricklefs, which are thick at their bafe, angular and sharp at the point. Leaves a foot long, pinnate, as in all the following fpecies; their common footstalks armed with flattened ftraight pricklefs, one-third of an inch long; leaflets about seven pair, on fhort partial falks, unequally divided by their smooth mid-rib, and fome-

what falcate, an inch and a half or two inches long, bordered with fmal unequal notches, fmoother and rather thining. Clyfters terminal, compound. Flowefs polygamous, there being fome united ones, though not perfecfly feding, on one tree, and others entirely female, on another. The former have a minute five-toothed calyx. Petals five, thirfe as long, ovate, eecf, or a little incurved. Filaments five, twice the length of the petals, and inferted between them. Anthers oblong, cloven at the bafe. German roundish, abortive, with five awl-shaped erect styles, and simple flymgs. The female flowefs have a five-toothed calyx; five concave petals; no fliament. Germin five, united into a roundifh body. Styles none. Stigmata peltate, flightly convex, a little elevated, with five furrows. Capfules five, combined, or one of five lobes, each lobe having two valves, and containing a roundifh, black, thining seed. Our defcription of the fructification is taken from Dr. Swartz. The leaves bear but a flight refemblance to the Maffick-tree, or any other fpecies of Pifacia, being decidedly crenate.

7. X. aromaticum. Aromatic Yellow-wood. Willd. n. 7. (Euonymus adninus aromaticus, five Xanthoxylon spinoifum, fraxinelle folis cheufianicum; Pluk. Amathl. 78. t. 393. f. 2.)—Stem with opposite pricklefs. Leaflets ovato-lanceolate, ferrate; unequal at the bafe: common footstalk prickly. Panicles terminal.—Native of Chufan. "A frub with ftraight pricklefs. Leaflets two, three, or four pair, pointed, one inch and a half long, marked with pel-

fucid dots; rounded near the bafe, at the upper edge; constricted at the lower. Common footstalk befit with strong, nearly opposite, pricklefs." Willdenow, from a dried fpecimem, without flowefs. Pluenken fays, "the fruit is a fingle, round, rough, or warty capfule, frafting strongly of camphor, lined with a white, smooth, infipid membrane, containing a black polished feed, with a hollow whitifh fear, in which lies the thread connecting the feed with its capfule." This very accurate defcription determines the genus. He adds, that the Chinese ufe this fruit instead of pepper.

8. X. rhoeifium. Stomach-leaved Yellow-wood. Lamarrk n. 2. Willd. n. 8. (Euonymus affinis aromaticus, five Xanthoxylon spinoifimum, fraxini anguifolii folio punctatam; Pluk. Amathl. 76. t. 392. f. 1.)—Stem prickly. Leaflets lanceolate, finely ferrate; nearly equal at the bafe: common footstalk downy and prickly. Panicles axillary.—Brought from the iflands of Chufan, like the preceding. The leaves are a foot long. Leaflets nine to eleven pair, with an odd one, each three inches in length, pointed, dotted: flightly downy beneath. Footstalk fometimes without pricklefs. Willdenow. Pluenken's figure reprefents the panicule much like the preceding, but latemal. The capfules feem to be one, two, or three from each flower.

9. X. juglandifolium. Walnut-leaved Yellow-wood. Willd. n. 9. (X. americanum, five Herculis arbor aculeata major, juglandis folis alernis parum finuosi; Pluk. Phyt. t. 239. f. 61) —Stem prickly. Leaflets oblong, pointed, obfcurcly ferrate; unequal at the bafe: common footstalk somewhat prickly. Panicles terminal.—Native of Itipaniola and Nevis. Leaves pinnate, with an odd one; leaflets alternate, coriaceous, two or three inches long, marked with diftant, fcarcely visible, pelucid dots; their edges entire to the naked eye, but under a magnifier appearing furnifhed with close diftant furrows; constricted near the bafe, at the upper edge; rounded at the lower, rather downy beneath. Common footstalk befet with a few short ftraight pricklefs. Panicles terminal, much branched, denfe, downy. Capfules four or five, rather downy, pointed. Seeds black.

10. X. rigidum. Rigid Yellow-wood. Willd. n. 10.—Stem prickly. Leaflets elliptical, entire, emarginate, pointed; their veins hairy beneath; mid-ribs and footstalks prickly."—Native of South America. Humboldt and Bonpland. Leaflets four pair, coriaceous, on very short falks; the upper ones large, two inches long; lower but half an inch; their bafe rather unequal; sometimes having a fhort, obtufe, crenate point; their upper fide pollifhed, reticulated with veins; under paler, with one long, reddifh, awl-shaped prickle on the mid-rib of each, of which there are feveral on the common falk. Flowefs not seen. Willdenow.

XAN

united. — Gathered by Aublet, in the forests of Cayenne, flowering in May, and bearing fruit in August. A tree, whose trunk is 40 or 50 feet high, and two feet and a half in diameter, with a prickly bark. The wood is white, hard, and compact. Leaves about five pairs, nearly sessile, smooth; the largest five inches long, and an inch and a half broad. Panicles large and much branched, composed of numerous, small, white flowers, having stamens and pistils in the same individual. Capsules three, four, or five from each flower, reddish, each containing a black, shining, oily seed. These capsules have a pungent aromatic flavour, and the Creoles call them negro's pepper.

12. X. fraxinum. Ash-leaved Yellow-wood, or Common Tooth-ache Tree. Willd. n. 12. Arb. 412. Ait. n. 2. Pursh n. 1. (X. Clava Herculis 8; Linna. Sp. Pl. 1455. X. ramiforum; Michaux Boreal. Amer. v. 2. 235. Pagara fraxini folia; Duhem. Arb. v. 1. 229. t. 97.)—Stem prickly. Leaves ovate, very minutely serrated; equal at the base. Umbels axillary. — Native of shady woods, near rivers, from Canada to Virginia and Kentucky, flowering in April and May. A tufting of the bark and capsules is recommended in rheumatism and the tooth-ache, whence its English name. Pursh. A large deciduous shrub, whose branches are armed with sharp, conical, comferted, brown prickles, very broad at the base. Leaves four or five pairs, with an odd one, an inch and a half long, on short partial flasks; contracted at each end; more or less dinstinctly crenate, or bluntly serrated; smooth above; soft and downy beneath. Their common footstalk is described without prickles; but in our specimens it is always furnished with some, and occasionally with very numerous ones. The flowers are small, yellowish-green, in little dense umbels, just above the scars of last year's footstalks, accompanied by a tuft of downy young leaves. The mode of inoffencece abundantly distinguishes this species from all the rest. It is hardy in our gardens, flowering in March and April, before the leaves appear. The bark is used in America, as a powerful sudorific and diuretic, whence its use, as above-mentioned, in rheumatic disorders. This is the species most popularly taken for X. Clava Herculis, as appears by the herbarium of Jacquin, purchased formerly by Sir Joseph Banks, and even by that of Linnaeus. The two species, nevertheles, are widely different.

14. X. heterophyllum. Various-leaved Yellow-wood. (Macqueria Commerouni; Jaff. 374, under Xanthoxylum.)—Young branches prickly; their leaves with very numerous serrated leaves, on prickly common flanks: old ones unarmed, their leaves of seven entire leaves, on unarmed common flanks. Panicles axillary. Capsules solitary. — Gathered in the isle of Bourbon, by Commeroun, some of whose specimens are in our possession. Nothing can be more paradoxical than the appearance of this shrub. We must rely on its description for the accuracy of its specimens, as the two branches, so very different in appearance, are not connected together; though we cannot doubt their general identity. The young branch is slender, covered with innumerable, sharp, ascending prickles, of various sizes, a line long at the leaf. Leaves alternate: common footstalk of each five or six inches long, round, straight, channelled, beft with numerous prickles, like those of the branch, but smaller: leaves from 40 to 60, or more, opposite or alternate, ovate, bluntish, smooth, armed or bluntly serrated, one quarter or one-third of an inch in length, of a fine green, paler beneath, marked with pellucid dots; their mid-ribs bearing one or two prickles at the back. The older or flowering branches are stout, rugged, unarmed, leafy at their extremities only. Leaves alternate, rather crowded, altogether defiitute of prickles, each consisting of three pairs of ovate, bluntly pointed, entire, coriaceous, yellow, smooth leaves, with an odd one; the lowermost smile: common footstalk channelled, smooth. Panicles compound, rather shorter than the leaves; their flanks unarmed, comferted, and angular. Capsules only one, perfect in each flower, brown, the size of a pepper-corn, rugged, full of pellucid dots lodging a pungent aromatic camphorated oil, and very bitter. Seed black, polished, with a bivalve elastic tonic, or lining of the capsule.

For X. trifoliatum, Linna, see Panax Aculeatum.

XANTHURUS INDICUS, in Ichthyology, the name of a fish called by the Dutch geel-baard.

It is of the size and shape of the bream; its jaws are armed with straight and very sharp teeth, which slant almost straight out; its back is yellow, and its tail very strongly tinged with that colour; its belly is of a blueish-white; its head brown, and its fins of a fine red. It is caught with hooks among the rocks on the shores of the East Indies, and is a very wholesome and well-flavored fish.

XANTHUS, in the Natural History of the Ancients, the name of an iron-ore of the hematites or blood-flone kind, and usually accounted a species of it, and called by others Elatites.

It was of a pale yellowish-white, or the colour of the French pale yellow ochre, used by our painters; but like all other ferruginous bodies it became red by burning.

Thocphrastus gives us expressly the etymology of the name, observing that it was called fo from its colour; the Dorians calling a yellowish-white Υηςος, xanthus.

XANTHUS, in Ancient Geography, a famous river of Asia Minor, in the Troade. According to Pliny, it had its source in mount Ida, and discharged itself at the port of the Acheans into the Hellespont, after having joined the Sinos.—Alfo, a river of Asia Minor, in Lycia, which had its source in mount Taurus, and watered the towns of Xanthus and Patara, and ran into the Mediterranean, near the laft of these places. This river was anciently called Sirbes, according to Strabo, and he says that the temple of Latona was situated ten stadia above its mouth, and sixty stadia farther was the town of Xanthus.

XANTHUS, or Xanthopolis, a town of Asia Minor, and the largest in Lycia. It was situated seventy stadia from the mouth of the river on its bank. Pliny reckons fifteen miles from this town to the mouth of the river. Under Appian, the inhabitants of Xanthus were such enthusiastic for liberty, that when it was taken by Brutus they burnt it, and preferred death to submission to the conqueror. He adds, that the same circumstance occurred with regard to Harpalus, general of Cyrus the Great, and Alexander the Great. It subsisted in the time of Strabo.—Alfo, a town of the isle of Lefbos.

XANTIPPE, in Biography. See Socrates.

XANTON, in Geography, a town of France, in the department of the Vendee; 5 miles E. of Fontenay-le-Comte.

XANXUS,
XEBEC, in Natural History, a name given by some authors to a large species of sea-shell, somewhat like that with which the Tritons of old were painted. It is found in great abundance near Ceylon, and is used there in medicine as an alkali and absorbent in the same cafes in which we give the tafteaceous powders.

XAPARACO, in Geography, a town of Mexico, in the province of Mechoacan; 85 miles W.N.W. of Mechoacan.

XARAMA, a river of Spain, which runs into the Tagus, a little below Aranjuez.

XARAYES, or ZARAYOS, Laguna de Los, a supposed lake of Brazil, formed by the river Paraguay; about 108 miles in length, and 21 in breadth. This is merely an inundation of the river, and exploded as a lake. S. lat. 17° 45'.

XATHOS, in Ichthyology, a name given by Appian to the fifth called by the generality of authors the erythrinus, or rubellini.

XATIVA, now St. Felipe, in Geography. See St. Felipe.

XAVIER, a town of Spain, in Navarre, the native place of the celebrated missionarv of that name; 3 miles E. of Sangüeza.

XAVIER. See SABI.

XAVIER GOYA, a town of Africa, in the country of Whidah; 12 miles N.N.E. of Sibi.

XAVIER, Saint. See SAINT XAVIER.

XAVIER Zante, a town of Africa, in the country of Whidah; 14 miles N.W. of Sibi.

XAUXA, a town of Peru, in the bishopric of Guamanga, containing two churches; 90 miles E. of Lima. S. lat. 12°. W. long. 75° 30'. See JAUCA.

XAUXA, a river of South America, which rises in the Andes, about 75 miles N. from Atum Xauxa, and uniting with the Apurimac, forms the Ucayale.

XAUXAVA, a town of Morocco, on a river, and at the foot of a mountain, both of the same name; 15 miles N. of Morocco.

XEBEC, in Sea Language, a small three-masted vessel, navigated in the Mediterranean sea, and on the coasts of Spain, Portugal, and Barbery. The fore and main masts are called block-masts, being short, and formed square at the head, to receive threes, to receive the jers, &c. The mizen-mast is fitted with a top-mast, &c., similar to a small English thip, and which has been lately added, to keep them better to the wind. The xebecs have no bowprit, but a sort of boomkin, wound and confined to the prow, nearly horizontal (see GALLEY), to the outer end of which lead the bow-lines. The fore-mast rakes much forward, has no stay, and the shrouds set up, similar to the runners in English cutters or sloops, to toggles fixed in the sides. These shrouds are easily shifted when the xebel go about. The main-mast is nearly upright, and ribs as the fore-mast. Each main carries a latteen-fall, the largest lade of which is bent to a yard that hoists by a purrel round the mast, at about one-third its length; the yards are worked at the lower end by bow-lines, and the fall extended by a fleet at the clue. The upper lee-yard-arm is worked by a brace, and the strain supported by vangs nearer the mast. The main-mast carries a latteen-fall, similar to the main and fore-mast. Vessels with latteen-falls will lie one point nearer the wind than a quare-rigged vessel. Xebecs, particularly in France, have been rigged similar to polacres; but they never fail so well as they did in their primitive situation.

The xebec, generally equipped as a corvair, is constructed with a narrow floor, to be more swift in pursuit of the enemy; and of a great breadth, to enable her to carry a great force of sail for this purpose, without danger of overturning. As these vessels are usually very low built, their decks are formed with a great convexity from the middle of their breadth toward the sides, in order to carry off the water, which falls aboard, more readily by their fenders. But as this extreme convexity would render it difficult to walk thereon at sea, particularly when the vessel rocks by the agitation of the waves, there is a platform of grating along the deck from the sides of the vessel toward the middle, on which the crew may walk dry-footed, whilst the water is conveyed through the grating to the fenders.

When a xebec is equipped for war, she is occasionally navigated in three different methods, according to the force or direction of the wind. Thus, when the wind is fair, and nearly aft, it is usual to extend square sails upon the main-mast, and frequently upon the fore-mast; and as these sails are rarely used in a fresh wind, they are of an extraordinary breadth. When the wind is unfavourable to the course, and yet continues moderate, the square yard and falls are removed from the masts, and laid by; in order to make way for the large latteen yards and falls, which soon after assume their place; but if the foul wind increases to a sturm, these latter are also lowered down and displaced, and small latteen yards, with proportionate falls, are extended on all the masts. The xebecs, which are generally armed as vessels of war by the Algerines, mount from sixteen to twenty-four cannon, and carry from three hundred to four hundred and fifty men, two-thirds of whom are generally soldiers. Falconer.

XEBEROS, in Geography, a town of South America, in the audience of Quito; 40 miles S.W. of La Laguna.

XEUJU, a river of Paraguay, which runs into the Paraguay.

XEKIAS, in Biography, a name given by the Chinefe and Japanee to an Eastern philosopher of mythological origin and character, called also Buddas among the Indians, Sonomacodom in Siam, and after his death Foe or Fotoki, who fascinated the whole northern and eastern region of Asia, as well as part of the southern, with his pantheistic doctrine. It is probable, as some have said, that he lived about 600 years before Christ; and having first appeared in the southern part of India, on the borders of the Indian ocean, disseminated his philosophy by means of his disciples to all India. It is said that he spent twelve years in solitude, when he was instructed by the Tolopoi, called by the ancients "hyloblis," i.e. Sylvan hermits; and that in his 30th year he devoted himself to contemplation, and attained to the intuitive knowledge of the first principles of all things, from which he took the name of Foe, which signifies, "something more than human." His mystical philosophy was delivered to his innumerable disciples under the veil of allegory. The Japanese add, that in his contemplations, during which his body remained unmoved, and his senses unaffected by any external object, he received divine revelations, which he communicated to his disciples.

Buddas, or Xekias, in his esoteric doctrine, taught the difference between good and evil; the immortality of the souls of men and brutes; different degrees of rewards and punishments in a future world; and the final advancement of the soul, after various migrations, to the habitations of the blest. Amidas, who, according to the Chinefe, is Xekias himself, prefigured in these habitations, and is the mediator, through whose intercession had men obtained a mitigation of their punishment. These dogmas are contained in an ancient book, called Kio, which all the Indians beyond the Ganges, who follow the doctrine of Xekias, receive.
receive as sacred, and which is illustrated by innumerable commentaries.

The doctrine which Xekias delivered towards the close of his life to his esoteric disciples was very different. Vacuum, or void, was, according to his instruction, the principle and end of all things, simple, infinite, eternal, but delimited of power, intelligence, or any other familiar attribute; and that to be like this principle, by extinguishing all passion and affection, and remaining absorbed in the most profound contemplation, without any exercise of the reasoning faculty, is the perfection of happiness. The first principle in this system cannot be pure nihility, which admits of no properties; probably, it is First Matter, without variable qualities, whence all things are supposed to arise, which is not to be perceived by the senses, but contemplated as the latent divinity, infinitely distant from the nature of visible things, yet the origin of all substanices. The emanations from this fountain became, in the popular theology, objects of the grossfet superlition and idolatry.

The doctrine of Fœ, or Xekias, was embraced by innumerable disciples. Among these, one of his most eminent succours was Tamo, a Chinefe, who was so entirely devoted to contemplative enthusiasm, that he spent nine whole years in profound meditation, and was on this account defied.

According to the Brahmans, Xekias had neither father nor mother; and as no Indian city claims the honour of his birth, he was probably a foreigner, who migrated to the southern part of India from some neighbouring maritime country, perhaps from Lybia; whither he came with some Egyptian colony, and who had been instructed in the Egyptian mysteries. It is not improbable, that at the time when Cambyses conquered Egypt, and dispersed almost the whole nation, this impostor might have passed over into India, and propagating his doctrine among an ignorant and superstitious people, became an object of universal veneration.

According to the Brahmans, Xekias had neither father nor mother; and as no Indian city claims the honour of his birth, he was probably a foreigner, who migrated to the southern part of India from some neighbouring maritime country, perhaps from Lybia; whither he came with some Egyptian colony, and who had been instructed in the Egyptian mysteries. It is not improbable, that at the time when Cambyses conquered Egypt, and dispersed almost the whole nation, this impostor might have passed over into India, and propagating his doctrine among an ignorant and superstitious people, became an object of universal veneration.

XLE, in the Materia Medica of the Ancients, a name given to the fruit fcl. XELS, in Geography, a town of Spain, anciently a Roman colony, called Julia Celia. XELVA. See Chelva.

XENDAY, a town of Japan, in the island of Niphon; 115 miles N.N.E. of Jedo. N. lat. 39°. E. long. 141° 22′. XENEXTON, a word used by Paracelsus, to express a fort of amulet to be worn about the neck, to preserve people from infection in the plague.

XENIA, σενία, q. d. gifis, in some Ancient Cylians, were gifts, or presents, made to the governors of provinces, by the inhabitants thereof.

The word occurs pretty frequently in charters of privileges; where quieta effe à xenia denotes an exemption from making such presents to kings and queens, upon their travelling through such provinces.

XENIA, in Geography, a township of Ohio, in the county of Greene, with 1429 inhabitants.

XENIL, a river of Spain, which rises in Grenada, and runs into the Guadalquivir, about three miles below Eeja.

XENINEPHIDEI, a word used to express a sort of imaginary spirits, mentioned by the adepts, as delighting to discover the occult qualities of bodies to men.

XENISMI, καινόμηθεις, in Antiquity, sacrifice offered at the Athenian festival Anaea.

XENOCRATES, in Biography, a famous Grecian philosofer, was born at Chalcedon, in the first year of the 96th Olympiad (B.C. 356), and attached himself at first to Echines, but afterwards became a follower of Plato, and succeed Speusippos in the chair of the old academy (B.C. 339). His temper was gloomy, his aspect severe, and his manners were little tinged with urbanity. Plato took pains to correct these obliquities of his disposition and character; and as he highly respected his manner, he probably improved by his instruction, so that he was reckoned as one of his most esteemed disciples. Xenocrates was held in such estimation among the Athenians for his virtues, and especially his integrity, as well as his wisdom, that in a public trial his simple alleviation was accepted instead of an oath, which was usually required; and that even Philip of Macedon found it impossible to corrupt him. Dreading his influence, and the temptation of a bribe, he declined all private intercourse with the Macedonian sovereign, and was honoured by him with this testimonium; that of all persons who had come to him on embassies from foreign states, Xenocrates was the only one whose friendship he was not able to purchase. On occasion of being employed as an ambassador to the court of Antipater, for the redemption of several Athenian captives, he waved the honour of accepting the invitation of this prince to sit down with him at supper, in the words of Ulysses to Circe, cited from Homer's Odyssey. (l. x. v. 383); thus translated—

"What man, whose bosom burns with gen'rous worth, His friends enthral'd, and banish'd from his sight, Would taste a selfish, solitary joy?"

The patriotic spirit expressed in this appropriate passage gratified Antipater so much, that he immediately released the prisoners. As another example of his moderation, it is alleged, that when Alexander, willing to mortify Arisotle, on account of some accidental pique, lent Xenocrates a magnificent present of 50 talents; he accepted only 30 mina, returning the residue to the donor with this message; that the whole sum was more than he should have been able to spend during his whole life. In this instance, he also manifested a superiority to that kind of jealousy and revenge which might have actuated meaner minds, when it is considered that Aristotle had inducted a school in the Lyceum, in opposition to the academy over which Xenocrates prevailed.

In the use of food he was singularly abstemious; his chastity was invincible by the seducing arts of Phryne, a celebrated Athenian courtezan; and his humanity was testified by the shelter which he afforded to a sparrow that was pursued by a hawk, and fled into his bofon, where he allowed it to remain till its enemy was out of sight, alleging that he would never betray a suppliant. In the employment of his time, he allotted a certain portion of each day to its proper busines, one of which he devoted to silent meditation. His high sense of the importance and utility of mathematical studies was sufficiently evinced by his refusing to admit into his academy a young man who was ignorant of geometry and astronomy, because he was deluged of the handles of philosophy. Upon the whole, Xenocrates was eminent, both for his purity of morals, and his acquaintance with science; and he supported the reputation of the Platonic school by his lectures, his writings, and his conduct. His life was prolonged to the third year of the 118th Olympiad (B.C. 314), or the 82d year of his age, when he accidentally fell in the dark into a refervoir of water.

His philosophic tenets were Platonic; but in his lectures he adopted the language of the Pythagoreans. In his system, unity and diversity were principles in nature, or gods; the former being the father, and the latter the mother of the universe.
universe. The heavens he represented as divine, and the
flars as celestial gods; and besides these divinities, he taught
that there are terrestrial demons, of a middle order between
the gods and men, partaking of the nature both of mind and
body, and, like human beings, capable of passions, and
liable to diversity of character. He probably conceived
with Plato, that the superior divinities were ideas, or intel-
ligible forms, proceeding immediately from the Supreme
Deity, and the inferior gods, or demons, to be derived from
the soul of the world, and, like that principle, compounded
of a simple and a divisible substance, or of that which
always remains the same, and that which is liable to change.
by Enfield, vol. i.

XENODOCHUS, formed of ξενο-, stranger, and
δοχειας, I receive, an ecclesiastical officer of the Greek
church, the fame with the hospitalier, or a person who
takes care of the reception and entertainment of strangers.
St. Isidore, a priest and folitary, furnished Xenodochus,
lived in the fourth century. He was thus called, becaule
engaged with that office in the church of Alexandria.

XENOPAROCHUS, formed of ξενο-, stranger, and
παροικος, of παροικος, I furnishe among the Romans, an officer
who provided ambassadors with all kinds of necessaries, at
the public expense.

XENOPHANES, in Biography, the founder of the
Eleatic fect, was born at Colophon, about the 56th Olympi-
ad (B.C. 556); and having left his country, took refuge in
Sicily, where he gained a sublimity by reciting, in the
court of Hiero, elegiac and iambic verses, which he had
written against the theogonies of Hefiod and Homer. From
Sicily he removed to Magna Graecia, where he became a
celebrated professor in the Pythagorean school, without
adhering strictly to the doctrines of Epimenes, Thales, and
Pythagoras. His life was prolonged to the advanced age
of 100 years, that is, till the 81st Olympiad (B.C. 456),
during 70 years of which he occupied the Pythagorean
chair of philosophy. In Enfield's Philosophy of Brucker we have
the following summary of the doctrine of Xenophanes:
In metaphysics, he taught, that if ever there had been a time
when nothing existed, nothing could ever have existed. That
whatever is, has always been from eternity, without deriving
its existence from any prior principle; that nature is one and
without limit; that what is one is similar in all its parts, else
it would be many; that the one infinite, eternal, and ho-
mogeneous universe, is immutable and incapable of change;
that God is one incorporeal eternal being, and, like the uni-
verse, spherical in form; that he is of the same nature with the
universe, comprehending all things within himself; is intel-
ligent, and pervades all things; but bears no resemblance to
human nature either in body or mind.

In physics, he taught, that there are innumerable worlds;
that there is in nature no real production, decay, or change;
that there are four elements, and that the earth is the basis
of all things; that the flars arise from vapours, which are
extinguished by day, and ignited by night; that the fun
confists of fiery particles collected by humid exhalations, and
daily renewed; that the course of the sun is rectilinear, and
only appears curvilinear from its great distance; that there
are as many funs as there are different climates of the earth;
that the moon is an inhabited world; that the earth, as ap-
pears from marine shells, which are found at the tops of
mountains, and in caverns far from the sea, was once a gene-
ral mass of waters; and that it will at length return into the
fame state, and pafs through an endless series of similar
revolutions.

The doctrine of Xenophanes concerning nature is so ob-
scurely expressed by those who have transmitted an imperfect
account of it, that it has been misunderstood and misrepre-
sented. Some have confounded it with the atheistical sys-
tem of Spinoza; by others it has been accommodated to
the ancient doctrine of emanation; and others have main-
tained its similarity to the Pythagorean and Stoical notions
of the soul of the world. The truth seems to have been,
according to Brucker's statement, that he held the univer-
se to be one in nature and substance; distinguishing in his con-
ception between the matter of which all things consist, and
that latent divine force, which he considered as a distinct
substance, but an attribute, and yet necessarily inherent in the
universe, and the cause of all its perfection. This view of
his notion is consistent with the language he used, and with the
account of his doctrine, preferred by Sextus Empiricus, that
God is the same nature with the universe; τον Θεόν ουκ εξαιρετικώς
πᾶν. When he affirmed that there is no motion in nature, it is
probable that he understood the term motion metaphorically,
meaning merely that there is no such thing in nature as passing
from non-entity to entity, or the reverse. Accordingly, the an-
cients more generally applied the term motion to a change
of nature than to change of place. Brucker is of opinion
that the notion ascribed to Xenophanes concerning the na-
ture and origin of the celestial bodies, as meteors daily re-
newed, must have been founded on a misconception and mis-
representation of his opinion on the subject. See Eleatic
Philosophy.

XENOPHILES, an able Greek musician, who pro-
ferred the philosophy of Pythagoras, and who lived at
Athens, where he arrived at the great age of 105. It is
Lucian who gives this account of his extraordinary longevity
from Ariflozenus.

XENOPHON, the son of Gryllus, an Athenian, was
distinguished as a philosopher, commander, and histo-
rian. His engaging appearance whilst he was a youth in-
duced Socrates to admit him into the number of his disci-
iples. Under his tuition he made rapid progress in that kind
of wisdom for which his master was so eminent, and which
qualified him for all the offices of public and private life.
Having accompanied Socrates in the Peloponnesean war,
and manifested his valour in defence of his country, he after-
wards entered into the army of Cyrus as a volunteer; but
his enterprise against his brother proving unfortunate, Xeno-
phon, after the death of Cyrus, advised his fellow-fighters
attempts to retreat into their own country rather than to
surrender themselves to the victor. His advice was regarded,
and he was chosen as their commander. In the exercise of
this duty he acquired by his prudence and firmness a high
degree of honour; and the memorable adventure is re-
lated by himself in his "Retreat of the Ten Thousand."
Having joined Agesilaus, king of Sparta, after his return
into Greece, and fought with him against the Thebans in
the celebrated battle of Cheronea, he displeased the Athe-
niens by this alliance; and he was publicly accused for
his former engagement in the service of Cyrus, and con-
demned to exile. Thus ignominiously treated, the Spartans
took him under their protection, and provided for him a com-
fortable retreat at Scillus, in Elus. In this asylum he
enjoyed the pleasures of domestic life with his wife and two
children for several years, and availed himself of the leisure
that was thus afforded him by writing those historical works
which have rendered his name immortal. On occasion of a
war between the Spartans and Eleans, he was obliged to
abandon this agreeable retreat, and to join his son, who was
settled at Lepreus. From hence he afterwards removed with
his whole family to Corinth, where, in the second year of the

C 2

105th

Gen. Ch. Common Calyx imbricately; scales numerous, elliptic-lanceolate, scarious, permanent, the inner ones much longer than the disk, coloured, forming a radiant crown to the whole compound flower. Cor. compound, somewhat unequal; florets of the disk very numerous, all perfect, tubular, funnel-shaped, much shorter than the calyx, in five equal spreading segments; those of the circumference fewer, female, tubular, somewhat two-lipped, with five unequal segments. Stam. (in the perfect florets) Filaments five, capillary, very short; anthers forming a cylinder rather longer than the corolla. P filament. (in the same florets) German short; style thread-shaped, longer than the stigmas; stigma cloven; in the female florets, Stam. none. Pist. German and style as in the perfect florets; stigma simple, club-shaped. Peric. none, except the calyx scarcely at all altered, except being closed. Seed in both kinds of florets alike, oblong; down a row of taper-pointed narrow scales. Recept. flatish, clothed with linear acute scales, rather longer than the florets.

Obst. Gaertner has long ago observed, what indeed no one could overlook, that the essential character of this genus, as given by Linnaeus, answers to his first species only, X. annuum. This stands in the Syll. Veg. making a fection by itself, characterized by a chaffy receptacle; whereas the other fections, "with a naked receptacle," receive all the numerous species besides, and directly contradict the generic character, "receptaculum palucecum." Gaertner, Jussieu, and Willdenow, have properly corrected this oversight, as we have shown under Elycrium. The true Xeranthemum, therefore, would be left with a solitary species, sufficiently well marked indeed to be distinguished, as far as the Linnaean species go. But our great master is proved to have confounded several together, under his X. annuum. Willdenow distinguishes three species, two of which we cannot separate, but we shall subjoin a fourth. They were all known to Tournefort, who indeed divides them still further, mistaking double or white flowered varieties as species. The root of the whole genus is annual. Herb erect, rigid, alternately branched, clothed with hair, white, clove, cottony down, easily rubbed off. Leaves alternate, sessile, lanceolate, acute, undivided, entire; tapering at the base. Flowers solitary, on long, terminal, slightly scaly, stalks. Outer scales of the calyx roundish, membranous and shining, at least at the edges; inner oblong, spreading while in flower, purple or brownish, occasionally white, very brilliant and ornamental.

2. X. vulgatum. (X. inapertum; Willd. n. 2. Ait. n. 5; excluding the synonym of Moris. X. capiluliflorum, inapertum; Hall. Enum. n. 21. 23. n. 121. Hall. Hift. t. 52. Parn. Imperata; Ger. Em. 666, no figure. Jacc. oleif. flor. minium flore; Bauh. Pin. 272.)

Outer calyx-scales roundish-elliptical, awned, smooth at the
XERANTHEMUM, in Gardening, contains plants of the herbaceous, flowering, annual kinds, in which the species cultivated are, the annual xeranthemum, or common eternal flower (X. anuum); the reflexed-leaved eternal flower (X. retortum); the golden eternal flower (X. speciosissimum); the silvery eternal flower (X. lepidoides); the proliferous eternal flower (X. proliferum); the leafy-flowered eternal flower (X. velutum); and the imbricated eternal flower (X. imbricatum). As to the species of Xeranthemum, see the preceding article.

The first is an herbaceous flowering plant, of which there are varieties with large white flowers, with double white flowers, with double purple flowers, and with double violet-coloured flowers.

Method of Culture.—In the first fort and varieties, the culture is readily effected by fowing the seeds in pots of light fresh mould, in the autumn or spring, or at other seasons for a succession, plunging them in a moderate hot-bed, to bring forward the plants. In the spring they may also be sown in patches where they are to remain, or in beds to be afterwards removed. When the plants have a few inches growth, they should be pricked out in rows a foot apart on beds, or into the borders, clumps, or other places where they are to grow. They should afterwards be kept clean from weeds, and have occasional waterings immediately after prickining out, and afterwards in dry weather.

The other sorts are raised by planting cuttings of the young shoots in the summer, in pots filled with light mould, giving them a little water and shade, or, which is better, plunging them into a hot-bed, and covering them with hand-glasses. When they are become firmly establisht in the autumn, they should be carefully removed into separate pots, being replaced in the hot-bed till re-rooted, after which they should have the management of other shrubby green-house plants.

The first fort produces a fine effect in the borders, clumps, &c. while growing, as well as in pots when the flowers are taken off; and the other sorts afford variety in green-house collections, among other potted plants of the same kind.

XERASIA, in Medicine, the name of a disease, a species of alopecia, in which the hair falls off through a dryness of the part, and want of due nourishment.

XERASIA, in Animals, denotes a certain kind of diseased rate, which confits in a dryness of the hairs, caused by the want of due and sufficient nourishment and support, from which they decay and fall off. It is met with in such animals as have been starved, and kept and fed in a stinted manner only on poor sorts of food. It is to be removed by a better and more full kind of fodder, and other sorts of keep, and by being turned into a good falt-marsh paiture. See SUREITY.

XEREOQUARO, in Geography, a town of Mexico, in the province of Mechoacan; 45 miles N.E. of Mechoacan.

XERES, a town of South America, in Paraguay, now in ruins. S. lat. 20° 5'.

XERES de Badajoz, or Xeres de los Caballeros, a town of Spain, in Extremadura; 72 miles N.N.W. of Seville. N. lat. 38° 17'. W. long. 6° 52'.

XERES de la Frontera, a town of Spain, in the province of Seville, on the Guadate; near which a battle was fought between the Moors and Goths, in the year 712, in which Roderick, the last king of the Goths, lost his life. The environs are celebrated for that excellent wine corruptly called sherry. The best and richest fort of sherry is called "pagarette," from the Spanish word pago, a district, and particularly applied to this vintage. In one aranzado (an acre of vineyard) they plant 1800 vines at regular distances.
XER

tances. It is reckoned a good year if it gives three butts per acre, middling if two, and bad if but one: some years, however, it yields four or five. The number of inhabitants is estimated at 40,000, of whom one-twentiethth, Mr. Swinburne says, are religious; 15 miles N. N. E. of Cadiz. N. lat. 36° 41', W. long. 6° 15'.

Xerex de la Frontera, a town of Mexico, in the province of Zacatecas, with a garrison of Spaniards to protect the mines; 25 miles S. of Zacatecas.

Xerex de Guadalupe, a town of Spain, in the province of Seville, near the frontiers of Portugal; 74 miles W. of Seville.

Xerex Nueva, a town of South America, in the province of Venezuela.

Xeres. Sec Chuluteca.

Xerica, a town of Spain, in the province of Valencia; 7 miles N.W. of Segorbe.

Xeriff, in Commerce, a money of account in Morocco, which is divided into eight paels.

Xerito, in Geography, a small river of Spain, which runs into the Alagon.

Eff. Ch. Calyx two-flowered, of two unequal valves, parallel to the hollow of the receptacle, and half sunk therein; the outer valve smallest. Corolla of both flowers longer than the calyx, of two valves, awl-shaped, membranous, awn-lefs. Stamens in the outermost flower. Styles in the inner one, combined at the base. Nectary none. Seed enclosed in the inner, paper-like, valve of the corolla.

This genus consists of perennial, rough, dry, smooth grases. Leaves awl-shaped, straight and stiff, with a very short rhipula. Stem terminated by alternate sheaths, each containing from two to four short spicatelets, of few flowers. Xerchoila is akin to Apluda, whole character requires correction.

Brown.

Xerodes, in Animals, a term which is applied, and which serves to express any form of tumour that is attended with the property of excision or dryness. See Tumour.

Xeromyron, of εξηρ, dry, and μύρων, ointment, a word used by the ancients to express what they do at other times call in express words a dry ointment. It was a composition of warm aromatic drugs, or of other things fit for external use, but without the fatty ingredients, by which they were usually reduced into the form of ointments.

Xerophagy, εξηρφαγία, formed of εξηρ, dry, and φαγία, I eat, among the Ancients, the feeding only on dry victuals, which was the practice of the athletes.

In the first ages of the church, some, not contented with simple fasting, added the xerophagy thereto; abstaining not only from flesh and wine, but also from all fresh, succulent, and vinous fruits. And some even brought themselves to bare bread and water.

Tertullian, in his book De Abstinentic, cap. 9. speaks of the xerophagy as a thing commendable in time of persecution.

Xerophthalmia, εξηρφαθλήμα, compounded of εξηρ, dry, and οφθαλμος, eye, a kind of ophthalmia, in which the eyes itch, and are red, but without swelling or watering.

Xerophyllum, in Botany, from εξηρ, dry, and φυλλοι, a leaf, a genus founded by Michaux upon Helonias aphyllodeae of Linnaeus.—Michaux Boreal-Amer. v. i. 210. Wildl. Enum. 402. -We confefs ourselves unable to make out any sufficient reason for this measure, either in the author's description, or in the plant itself. Mr. Pursh probably was equally puzzled; for he has not even cited the Xerophyllum of Michaux, as a synonym under the above Helonias. It seems the bases of the flaments are dilated in the aphyllodeae, more than in other species of Helonias. See that article.

Gen. Ch. Cal. none. Cor. of one petal, superior: limb in six deep ovate-oblong, acute, permanent segments; the three outer ones narrowed, spinous-pointed, flouette, externally glandular. Stamina fix, inserted into the lower part of each segment, thread-shaped, very short, equal; anthers erect, linear, half as long as the corolla. Pist. Germin inferior, turbinate; style one, short; stigma tumid, oblong, undivided. Peric. Capsule oval, rough, crowned with the fadex corolla, with three cells, and many seeds.

Eff. Ch. Corolla in six deep segments, permanent; three outermost narrowed, spinous-pointed. Stamens inserted into the base of each segment. Stigma club-shaped. Capsule inferior, of three cells, with many seeds.

1. X. pinifolia. Fir-leaved Xerophyta. Wildl. n. 1. Gathered by Commerson, in Madagascar. A hard rigid shrub, whole stem is round, alternately branched; the wood formed of parallel tubs, as in the generality of the monocotyledonous tribe; branches quarter of an inch in diameter, thickly clothed with the imbricated, deeply furrowed, permanent sheaths of the leaf's foliage, each crowned with the reflexed base of a leaf, by which the whole branch assumes a fagular scaly appearance. Leaves alternate, two inches, or more, in length, linear, rigid, channelled, frayed, with thick entire edges, and a pungent spinous point; their leaf sheathing, fibrous, and somewhat woolly. Flowers terminal, one or two at the end of each branch, on simple flanks, an inch long, rough, like the germin, with minute prominent glands, of which some traces are also found on the backs of the three outward segments of the corolla. The colour, of the inner segments at leaf, appears reddish. Each flower is about half the size of a snowdrop. Nothing is known of the ripe fruit, which in perhaps some better marks, than have hitherto been given, may be found, to distinguish the essential characters of this genus from those of Hypoxis. See that article.

Xeropkin, in Commerce, a silver coin of Goa, in the East Indies, which is worth 3s. 1/2d. being nearly.

Xerotes, in Botany, εξηρ, dry, dryness, a name chosen by Mr. Brown to express the arid roughy habit of this genus, in preference to Lomandra, by which it is designated in the work of M. Labillardiere. This latter appellation, formed of εξηρ, a border, or rather fringes, and αυξ, a male, is designed to indicate the occasionally bordered anthers. It might perhaps have been allowed to remain, as well as many other names which are liable to some exception, though the anthers are not properly fringed. - Brown Prodr. Nov. Holl. v. i. 259. (Lomandra; Labill. Nov. Holl. v. i. 92.) -Clasfs and order, Dioecia Hexandra, Nat.
XEROTES.

Gen. Ch. Male. *Cal*. Perianth of six regular, ovate, co-loured leaves; the three innermost, or perhaps all the six, connected at the base. Cor. none, unless the calyx be so called. Stam. Filaments fix, very short, inserted into the base of each leaf of the calyx; anthers orbicular, peltate. Some rudiments of a pistil.

Female, Calyx of six separate, permanent leaves. Styles three. Capsule superior, coated, of three cells; valves with central partitions. Seeds peltate, solitary.

This New Holland genus consists of perennial herbs, of a dry rigid texture, and a peculiar aspect, resembling the *Junci* and *Calamaria*. Root fibrous. Stem none, or generally very short; sometimes divided, and clothed with sheathing foliage. Leaves linear, either flat or channelled, rarely thread-shaped; their base dilated, membranous, half sheathing; their extremity sometimes toothed. Flowers terminating the stem, or radical spikes, either peltate, racemose, spikoid, or capitate. Inner leaves of the calyx often different from the outer in texture or size. When the flowers are fide, they are inviolate with imbricated membranous bracteas; the male ones are sometimes filiform, with bracteas. Bark of the capsule at length separating, and occasionally a little pulpy. In some species, the skin of the seed adheres to the pelt, as to resemble a distinct tunic. The embryo is longitudinal, slanting, in the bottom of a cartilaginous albumen. Xerotes is allied in many points to the *Palme*. See that article. Brown.

Sec. 1. Female flowers in solitary heads. Leaves entire at the extremity.

1. *X. flexifolia*. Spiral-leaved Xerotes. Br. n. 1. (Dracena of Br. 3. Thum. Dracen. 6. 1. 1. f. 2.)—Stem somewbat branched. Leaves shorter than the branches, two-ranked; twisted; their edges rough with minute teeth; their points withering, acute. Male spikes interrupted, somewhat branched longer than the leaves. — Native of New South Wales, from whence specimens were sent us by Dr. White. The stem is about a foot high; woody at the base; more or less branched above, clothed with numerous, narrow, smooth, deciduous leaves, an inch or an inch and a half long, spreading in two directions; their sheathing bases imbricated, and bordered with a long, thin, torn, filipodiumous membrane at each side. Male flowers small, whitish, in long, mostly branched, rigid, filiform spikes or clusters, separated into little whorl-like tufts, accompanied by brown fleshy bracteas. Female flowers rather larger, in round solitary heads, terminating short leafy branches in the forks of the stem.

2. *X. macrorhiza*. Pointed Xerotes. Br. n. 2.—“Stem somewhat branched. Leaves shorter than the branches, but longer than the male spikes, two-ranked, filiform, or slightly twisted; their points withering, acute; their margins rough, with very minute teeth; dilated and entire at the base.”—Gathered by Mr. Brown, near Port Jackson, New South Wales, as well as the foregoing.

3. *X. colona*. Hill Xerotes. Br. n. 3.—“Leaves taller than the stem, narrow and straight; rough with marginal teeth; withering and very acute at the point; dilated and jagged at the base. Head of female flowers feffile.”—Found by Mr. Brown, on the southern coast of New Holland.

4. *X. glauca*. Glaucous Xerotes. Br. n. 4.—“Leaves taller than the stem, narrow and straight; withering and bluntish at the point; rough with marginal teeth; dilated and jagged at the base. Tufts of flowers in the male spikes feffile.”—Gathered on the south coast of New Holland by Mr. Brown.

Sec. 2. Female flowers racemose or spikoid; male ones racemose or paniced; partial flalks scattered; flowers drooping.

6. *X. paniflora*. Few-flowered Xerotes. Br. n. 6.—“Flowers few in the male cluster, in distal whors. Leaves very narrow, acute and smooth; dilated and entire at the base; shorter than the divided stem.”—Found by Mr. Brown, near Port Jackson, New South Wales.

7. *X. filiformis*. Thread-shaped Xerotes. Br. n. 7. (Dracena filiformis; Thum. Drac. 4. 1. 1. f. 1.)—Leaves thread-shaped, semicylindrical, elongated; flattened in front; rough-edged; finely frayed at the back; round at the point. Male cluster rarely branched. Stem short.—Gathered near Port Jackson, New South Wales, by Dr. White, and Mr. Brown. The root is woody. Stem scarcely any. Leaves several, a span or more in length, erect, rigid, very slender; flattened and whitish in front, with a green, frayed, central flak, convex at the back. We do not find that the point is always, as Mr. Brown says, round or cylindrical. Clusters much shorter than the leaves, branched in our specimens, as in Thunberg’s figure, erect, lax, with rough flaks. Flowers scattered, or in pairs, drooping, whitish, small; the outer segments of the calyx smaller, and more membranous than the inner. Bracteas awl-shaped, acute, at the base of the partial flalks. Mr. Brown notices three varieties: 1. male perianth nearly globular, twice the length of the partial flak; 2. male perianth nearly globular; partial flak longer than that part, or the bracteas: 3. male perianth turbinate; partial flak shorter than it, or the bracteas. The leaves seem variable in breadth and flatness.

10. *X. dentiflora*. Small-toothed Xerotes. Br. n. 10.—“Leaves elongated, thread-shaped, compressed, channelled, with two or three terminal teeth. Male clusters simple or divided. Stem short.”—Gathered by Mr. Brown at Port Jackson. We have some specimens which answer to this description, in the teeth of their leaves, but they seem nearly akin to *X. filiformis* to be separated from that species, and they exactly accord with Thunberg’s fig. 1, drawn from a dried specimen. We are not, however, certain of their being Mr. Brown’s *dentiflora*.

XEROTES.

12. X. rigida. Rigid Xerotes. Br. n. 12. Ait. Epit. 376. (Lomandra rigida; Labill. No. Holl. v. 1. 93. t. 120.)—Stem very short. Stalks and spikes much shorter than the foliage. Leaves two-ranked, cartilaginous; convex beneath; abruptly, with two marginal teeth, at the end; smooth at the edges; dilated and entire at the base.—Gathered by Mr. Brown in the southern part of New Holland. M. Labillardiere found it in Van Lewin's land. Root woody. Leaves a span in length, full a quarter of an inch in breadth, spreading in two directions, thick, rigid, smooth; greatly dilated, and bordered with a membrane, at the base; singularly abrupt, and three-pointed, at the end. Common flower-stalk terminal, thick, sharply two-edged, sometimes triangular, smooth. Tufts of flowers one above another, not numerous, forming an interrupted, branched, upright spike; each tuft accompanied by several unequal, lanceolate, acute bracteae. Three alternate filaments, according to Labillardiere, are longer than the reef, and bear cloven, not bordered, anthers.

13. X. montana. Mountain Xerotes. Br. n. 13.—"Stem none. Leaves elongated, linear, flat, membranous, smooth-edged; their sharp point with two very short lateral teeth. Female spike undivided, many times shorter than its flower-stalk."—Found by Mr. Brown, near Port Jackson.

14. X. fluvatialis. River Xerotes. Br. n. 14.—"Stem none. Leaves elongated, narrow, channelled, smooth-edged, two or three toothed, with an acute sinus, at the extremity. Female spikes simple or divided. Bracteas rather rigid, twice as long as the tufts of flowers."—Gathered by Mr. Brown in the same country, but, as appears by the name, in the vicinity of rivers.

15. X. longifolia. Long-leaved Xerotes. Br. n. 15. Ait. Epit. 376.—"Stem none. Leaves elongated, linear, coriaceous, erect; irregularly toothed at the point; rough-edged. Panicles lanceolate, rather dense, with opposite branches. Flower-stalk flat-tish. Anthers uniform.—Gathered near Port Jackson, by Mr. Brown; at the Cape of Van Diemen, by M. Labillardiere. The leaves are a foot and a half long, somewhat fritated; dilated at the base, and bordered in that part with a membrane, which at length separates, and becomes torn. Stalk from nine to twelve inches high, two-edged. Flowers more numerous and crowded than in X. rigida, n. 12, with long taper-pointed bracteae. Calyptrum ovate, acute, three as long as the calyx, chesnut-coloured; pale yellow at the base; its coat peeling in irregular fragments.

16. X. Hypoxia. Porcupine Xerotes. Br. n. 16.—"Stem none. Leaves elongated, linear, lax, smooth-edged; somewhat toothed at the extremity. Stalk rather convex on both sides. Male panicles repeatedly compound, with whorled branches. Bracteas leafy, rigid, spinous-pointed.—Sent from the neighbourhood of Port Jackson, among the first botanical communications from thence, by Dr. White. It has also been gathered there by Mr. Brown. We have seen the living plant in tame garden near London, possibly at Kew, and were much struck with the delightful fragrance of its copious panicles of male flowers, resembling the scent of Craulala cumingii, Mischombeanthemum nodiflorum, or a Bergamot Pear. Yet it does not occur in Hort. Kew. The leaves are a foot and a half or two feet long, spreading. Flower-stalks of the male plant numerous, erect, two-edged, though convex at each side, from one to one and a half feet high, somewhat zigzag occasionally, each bearing a flat-tish panicle, from fix to fourteen inches long, composed of numerous triangular branches, from four to eight in a whorl, beset with numerous tufts, or whorls, of sessile flowers, accompanied by several chaffy, inner bracteas, and subtended by about three long, spreading, external ones, with needle-like points. The flowers, and whole panicles, are of a delicate straw-colour, with a tinge of brown about the calyx or anthers. We have not seen the female plant. This species well deserves a place in the green-house, for the singularity of its appearance, as well as for its fine smell.

18. X. dipteras. Distant-flowered Xerotes. Br. n. 18.—"Stem none. Leaves very long, channelled, very rough at the edges. Male panicle with undivided branches, and distant tufts of flowers. Partial stalks shorter than the calyx."—Native of the tropical part of New Holland. The male panicles are a foot long; calyx about a line and a half. Brown.

19. X. media. Intermediate Xerotes. Br. n. 19.—"Stem none. Leaves very long, channelled, smooth-edged. Branches of the male panicle undivided. Flowers five or fix in each tuft; their partial stalks scarcely so long as the very short calyx. Female spike divided in the lower part, each branch bearing one head of flowers."—From the same country as the last. Calyx only one-third of a line in length; male panicle fix inches. Brown.

21. X. multiflora. Many-flowered Xerotes. Br. n. 21.—"Stem none. Leaves very long, channelled; smooth at the back and edges. Male panicle with undivided branches, each bearing from one to three many-flowered tufts. Partial stalks longer than the calyx."—Found by Mr. Brown in the same country as the four preceding species.

22. X. amula. Rough-long-leaved Xerotes. Br. n. 22.—"Stem none. Leaves very long, channelled, erect; rough at the back and edges. Male panicle with undivided branches, each bearing from one to three many-flowered tufts. Partial stalks longer than the calyx."—Found by Mr. Brown, in the country near Port Jackson, New South Wales. The roughness of the leaves seems chiefly to distinguish this species from the last. We have seen no specimens of either.

23. X. Bankjii. Bankian Xerotes. Br. n. 23.—"Caulecent. Leaves two-ranked, flat, rough-edged. Female panicle dense, about the length of its two-edged stalk; branches quadrangular, very short."—Gathered by Mr. Joseph Banks, in the tropical part of New Holland, where it was not found by Mr. Brown.

Sect. 5. Flowers of each sex in a cylindrical, catkin-like spike.
24. X. *b)optii* Spear-flanked Xerotes.—"Stem none, spike very long. Stalk round. Leaves elongated."

Gathered by Mr. Brown, on the southern coast of New Holland. The habit of this species appears by the above characters, to differ widely from the rest of its genus, rather approaching a Xanthorrhoea. See that article.

**XEROTRIBIA**, formed of 25° 25', and 27° 30', *J. rub.,* a term used by authors to express a dry friction, a rubbing of some affected part with the hand or otherwise, to recall the warmth and circulation.

**XERTE**, in Geography, a river of Spain, which passes by Placentia, and runs into the Alagon.

**XERTIGNY**, a town of France, in the department of the Volges; 7 miles E. of Epinal.

**XERUMENHA,** or *JERUMENHA,* or Gerumenha, a town of Portugal, in Alentejo; 10 miles S. of Elvas. N. lat. 38° 35'. W. long. 6° 58'.

**XERXENA,** in Ancient Geography, a country of Asia, on the confines of Lefker Armens, of which it makes a part. Strabo.

**XERXES,** in Biography, was the son of Darius I. by Atossa, the daughter of Cyrus; and on the death of his father, succeeded to the crown of Persia, in the year 485 B.C. Having in the second year of his reign subdued the revolted Egyptians, and committed them to the government of his brother Artaxerxes, he determined to renew the invasion of Greece, in which Darius had been disappointed; and for the success of his expedition, he formed an alliance with the Carthaginians, on condition of their making an attack on the Greek colonies in Italy and Sicily, so that they might not have it in their power to assist the mother-country. His preparations were immense, and occupied several of the first years of his reign. Having provided a large navy, he formed a project of cutting a canal through mountain Athos, of sufficient breadth to admit two galleys abreast; and to this undertaking, which some have regarded as a fiction, he devoted three years. He also constructed a bridge of boats across the Hellepont, in order to convey his army from Asia to Europe; and as the first bridge which had been laid was demolished by a storm, he not only manifested his childish rage by ordering 300 laches to be inflicted on the sea, and a pair of fettlers to be thrown into it, but his tyrannical and cruel disposition by beheading those whom the conduct of the work had been committed. The number of sea and land forces which he employed in this expedition is said to have amounted to two millions and a half, to which we may add as many more attendants. When he ascended a high tower at Abydos, and took a view of the immense number that covered the sea and surrounding plain, his pride and triumph are said to have given way to tears, when the reflection occurred, that the brevity of human life was such as not to allow of one of this sort's half to survive the lapse of 100 years. Without detailing the events of this disastrous expedition, which are the proper subjects of history, we shall merely mention that it terminated in the defeat of Xerxes's navy at Salamis, and the subsquent overthrow and dispersion of Mardonius's army of 300,000 men; and specify some traits of the disposition and character of this ambitious despot. For his ignominious treatment of Leonidas, we refer to his article. Upon his taking possession of Athens, he wreaked his vengeance on the buildings and the temples, and dispatched a special messenger to his uncle Artabanus, to inform him of this inglorious triumph. Having erected a throne on a lofty mountain, in order to view the expected victory at Salamis, the event produced such consternation, that he suddenly left Mardonius and the army, and hastened to the Hellepont, where finding his bridge shattered by storms, but still haunted with terror, he intrusted himself in a fishing-boat, and hastened to Sardes; but when Mardonius was defeated, and all his hopes of conquering Greece were frustrated, he quitted Sardes, after having given orders for the demolition of all the temples in the Greek cities of Asia, and proceeded with all possible expedition to the Persian frontier. The other traces of his disgraceful expedition were the records of the cruelties and debaucheries exercised by himself and his family. So much at length did Xerxes become the object of contempt and hatred, that a conspiracy was formed among his own guards, which terminated in his murder during sleep, in the 21st year after his accession, B.C. 465. Herodotus. Diodorus. Anc. Un. Hist.

**XESTA,** or *xer.* an Attic measure of capacity, answering to the Roman sextary.

**XESTES,** an ancient Greek liquid measure, which is 2 cotyls. See MEASURE.

**XIAMESTL,** in Geography, a town of Mexico, in the province of Xalifico; 30 miles S.E. of Purification.

**XIASSI,** a town of the duchy of warfaw; 20 miles S.S.E. of Posen.

**XIBACA,** a town of Japan, in the island of Niphon; 120 miles S.W. of Mexico.

**XICOCO,** called also Sikoko, and Sikok, an island of Japan, about 90 miles in length, and about half as many in breadth, divided into several provinces, situated near the south-west extremity of Niphon, from which it is separated by a strait, full of small islands, and to the north-east of Ximo. It has several convenient harbours, and towns many within the country. N. lat. 33° 30'. E. long. 132'.

**XICONA.** See XIXONA.

**XILCA.** See CHILCA.

**XILAO.** See QUILO.

**XILOCO,** a river of Spain, which rises in the south part of Aragon, about 7 miles N.E. of Alarbarin, and at Calataiud changes its name to Xalon.

**XILOTEPEC,** a town of Mexico, in the province of Guatleca; 90 miles S.S.W. of Panco.

**XILVAN,** a town of the principality of Georgia; 20 miles N. of Gory.

**XIMABARA,** a town of Japan, on the south coast of the island of Ximo, on a gulf to which it gives name; 33 miles E. of Nangafuki. N. lat. 32° 45'. E. long. 132° 7'.

**XIMAGUINO,** a town of Japan, in the island of Xicoco; 10 miles S. of Awra. N. lat. 33° 50'. E. long. 130° 30'.

**XIMENA,** a town of Spain, in the province of Seville. Near this town Crassus is said to have concealed himself in a cave, till Marius and Cinna were overthrown by Sylla; 24 miles E. of Medina Sidonia.

**XIMENESES, FRANCIS, Cardinal,** in Biography, was born in 1427, in Old Cañizles, and educated at Alcala and Salamanca. Renouncing prelatures which he obtained in his youth, he assumed the habit of St. Francis, in a monastery of the Observantines, one of the most rigid orders of monks in the Romish church. Distinguishing by his austerities and devotional practices, he became confessor to queen Isabella; and still retaining his customary modes of living, he so far engaged her respect and attachment, that he was nominated by her to the archbishopric of Toledo, the richest benefice in Europe next to the papal see; but his real or affected reluctance to accept this high preferment could be overcome only by the authority of the pope. In this elevated station he maintained his strict adherence to the rigours of the order to which he belonged, and so far from relaxing...
in his severities, he indulged them to the extreme of self-mortification and penance. Having thus acquired a complete mastery over his own passions, and possessing political talents in a very high degree, he was thought peculiarly fitted to execute dominion over others; and accordingly Ferdinand and Isabella entrust him with a principal share in the administration. When a long party was formed among the Castilians to deprive Ferdinand of the authority as regent, devoted upon him by the will of the queen, he was defeated by every perfon of distinction except Ximenes and two nobles; and after he had resigned it to the archduke Philip, he again acquired it upon Philip's death in 1506, by the influence of Ximenes. In 1507 Ximenes was created a cardinal by pope Julius II.; and in the following year he undertook the conquest of Oran, and of other places on the coast of Barbary, with an armament, the expense of which he offered to defray out of his own revenues, and he succeed in this enterprise. Such was Ferdinand's confidence in the abilities and integrity of the cardinal, that when he was dying in 1516, he appointed him regent of Castile until the arrival of his grandson Charles. Although he was then in his 70th year, he took an active part in securing the throne to Charles, though in his own judgment he disapproved the king's conduct, who in his assumption of power contended the declared opinion of the Cortes. With no lefs firmness and inflexibility, he prosecuted a plan for extending the royal authority, which the nobility had very much circumvented. The measures which he adopted for this purpose excited violent opposition, but he persevered, and ultimately succeeded. During his administration he was also engaged in two foreign wars; one for the preservation of the kingdom of Navarre, in which he was successful, and another against Horace Barbarossa, who advanced himself from the condition of a corsair to the sovereignty of Algiers and Tunis, in which the Spaniards were totally defeated. When Charles was prevailed upon by Ximenes to visit Spain, the cardinal took a journey towards the coast to meet his majesty; but being disabled to proceed by the attack of a disorder, supposed to be the effect of poison, he requested an interview with the king; but Charles having conceived prejudices against him, returned a cold answer, with permission for his retirement to his diocese, that he might finish his days in tranquillity. In a few hours after the receipt of this letter, he expired November 1517, at the age of 80 years.

Ximenes was held in high estimation by his superstitious countrymen, under a delusive idea that he possessed the gift of prophecy, and a power of working miracles. But his more unequivocal claims to their respect were founded on his extraordinary talents and learning, his liberal patronage of literature, and the munificence of his public charities, to which he devoted the immense revenues of his archbishopric. At Alcalá he built the magnificent college of St. Ildefonso, endowed with forty-six profefhors, and conducted under excellent regulations. Here he printed the Complutæan Polyglott (see Polyglott), the Mozarabic liturgy, and the theological works of Tôtâius. Here he also established a splendid monastery for the education of indigent females of quality, which served as a model for that of St. Cyr, under Lewis IV. The granaries which he constructed remained without decay for centuries; and upon the whole he was justified in declaring on his death-bed, that to the best of his knowledge he had not misapplied a crown of his revenue. Robinson's Charles V. vol. ii.

XIMENES, in Geography, a town of Spain, in the province of Leon; 16 miles S. of Astorga.

XIMENESIA, in Botany, Cavan. Lec. v. 2. 60. Ait. Hort. Kew. v. 5. 85, a genus which can by no means be separated from Pallasia. (See that article, n. 3.) Nothing can be more trifling as a generic, or even specific distinction, than the difference between the fungineous orders of Polygama-superflua, and P. frustrana, of the Linnæan sytem, provided the form of the flores be alike. The fluit, of which rudiments are found in several genera of the latter, may occasionally be perfect, as it does now and then in Melastatus, and this over lies the distinction.

XIMENIA, owes its name to Plumier, who confecrates this genus to the memory of the Rev. Father Francis Ximenes, a Spanish monk, one of the twelve Franciscan friars, who first preached Christianity to the Mexicans. Being well skilful in the language of the country, he collected a great flore of information concerning the properties and medical uses of the plants and animals of New Spain, and especially of Mexico; whence he compos'd a work, printed in four books, at Mexico, in 1615, which is quoted with approbation by De Lact, in many parts of his own publication. It is some confutation to find any of these apolles turning their minds to the study of their Maker's works; as we cannot suppose the fluch to have been contaminated with that infernal spirit, which renders the whole history of the Spaniards in America a foul reproach to humanity, and to Christianity itself, so prostituted or so misunderstood!—Plum. Nov. Gen. 6. t. 21. Linn. Gen. 190. Schreb. 255. Willd. Sp. Pl. v. 2. 338. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 352. Juss. 259. Lamarck Illust. t. 297. Poiret in Lam. Dict. v. 8. 804—Clafs and order, O浦东ria Monogynia. Nat. Ord. Aurantià, Juss.

Obs. Plumier's figure represents but three petals. Linneus has left a note, that his correspondent Allamand found but five flamenta. Swartz and Jacquin describe eight.

1. X. americana. Thoryn Ximenes. Linn. Sp. Pl. 497. Hort. Cliff. 483. Willd. n. 1. Ait. n. 1. Swartz Obf. 149. (X. multiflora; Jacq. Amer. 166. t. 177. f. 31. X. acuta, flore villoso, fructu luto; Plum. Sp. 1. 261. t. 261. f. 1. Heymaëlii spinosa; Aubl. Guian. 324. t. 125?) and H. incermis (ibid. 325?)—Branches spinous. Leaves oblong. Stalks many-flowered.—Native of the neighbourhood of Carthagena, as well as of Hispaniola, flowering in September and October, and ripening fruit in December. Jacquin. Of the rocky flores of Hispaniola, flowering in July. Swartz. We believe Linneus never saw any specimen of this, except in Cliftor's herbarium. That before us was given to the younger Linneus by Dr Joseph Banks. Though Miller might have the plant at Chelsea in 1759, it would now probably be vainly sought for in any collection. The flœm is either shrubby or arborescent. Young branches spinous, round, fruticated. Leaves two or three together, in alternate tufts, from buds of many years' duration, tallaked, elliptic-oblong, obtuse with a minute point, rarely emarginate, entire, single-rilled, smooth on both sides, about two inches long. Footstalks quarter of an inch
inch long, smooth. Thorns lateral, erect, longer than the footstalks, awl-shaped, stout, but sparingly produced. Flower-stalks axillary, or rather from the same bud as the leaves, not half their length, deflexed, round, divided into three to five smooth, single-flowered partial flanks. Galyx spreading quadrangular. Petals four, whitish, faggzy from the base almost to the apex, on the inside; smooth externally. Fruit the size of a small apple, yellow when ripe. Jacquin says the pulp is sweetish, eaten by children and negroes, and that the smell of the flowers is extremely sweet, as well as powerful, something like burnt frankincense. Aublet compares them to cloves. His figure, if it belongs to the same plant as ours, is very faulty; but we rather presume it must be a species nearly akin, whose flowers are really axillary, and, like the fruit, only one-third the size of the Linnean plant; their petals finely downy, not shaggy, all over their inner surface. Still, without seeing a specimen, we dare not describe it as distinct.

2. X. elliptica. Elliptical Ximenia. Forst. Prodr. 27. Willd. n. 2.—"Thorns none. Leaves elliptic-lanceolate. Stalks many-flowered."—Found by Forster in New Caledonia. This is known only by the above characters, which are not so determinable as could be wished, the thorns being variable in the original species, and in the plant of Aublet.

3. X. inornis. Jamaica Ximenia. Linn. Sp. Pl. 497. Willd. n. 3. (Amaryllis arboreae, foliis ovalis glabris, vulturilibros confectis; petolis submarginitatis; floribus foliatis; Browne Jan. 209.)—"Thorns none. Leaves ovate. Stalks single-flowered."—Native of Jamaica. Browne describes it as a bushy tree, not above eight or nine feet high; its trunk about four and a half inches in diameter. Leaves oval, not above an inch long, standing very thick upon the smaller branches. Petals hairy on the inside towards the base. Drupa ovate-oblong.

M. Poirier describes, in Lamarck's Dictionary, a plant by the name of X. ferox, n. 3, which we can scarcely refer to this genus; the flowers being five-cleft; petals linear, smooth on both sides; and filaments prominent. This is a spinous færa, found in Hispaniola, with nearly orbicular, coriaceous leaves, above an inch long, and either solitary or umbellate axillary flowers. The thorns are three or four inches long, very sharp, sometimes leafy.

Jussieu speaks of a X. egypica, as described in the Species Plantarum of Linnaeus, though omitted subfuscely in his Systema. We are unable to discover this, and Jussieu, like Calpurn Buhin, unhappily omits to cite pages. We do, however, find in Linnaeus's copy of Plumier's Genera Plantarum, which once belonged to the French botanist Ifnard, a note of the latter under Ximenia, that "the Agathid of Alpinus, Pl. Ægypt. 38, appears to belong to this genus." The rude wooden cut does indeed countenance such an opinion, especially the flowers; but the author compares the fruit to that of Sambucus Ebulus, describing it moreover as bitterish and astringent. Now Sambucus has nothing in common with Ximenia. The plant of Alpinus, which was brought from Ethiopia, may be a thorny Lythrum, but we cannot refer it to any known species.

XIMO, or Kuroshu, in Geography, an island of Japan, and second in size and eminence, situated to the S.W. of Nippon, from which it is divided by a narrow channel. Its circumference is supposed to be upwards of 300 miles, exclusive of the bays and creeks. It has considerable numbers of cities and towns, with some good harbours. N. lat. 32° 40' to 34° 30'. E. long. 130° 50' to 133° 30'.

XIMONOSEQUII, a sea-port town of Japan, on the S.W. coast of Nippon, with a good harbour, capable of containing 300 vessels. It is a place of trade, and surrounded with walls. N. lat. 33° 50'. E. long. 132° 30'.

XIPHYUS, a river of South America, which rises somewhere near S. lat. 17°, and is first called "Paringa," it afterwards takes a northerly course of about 900 miles, and runs into the Amazonas river, 20 miles E. of Paru, in the government of Para.

XIPHIAS, or sword-fish, the name of the sword-fish; which see. This fish is cut in pieces by the Sicilians, and salted. The procès was annually performed particularly at the town of Thurii, in the bay of Tarantum, and hence the fish was called "Tomus Thurianus." (Plin. l. 32. c. 11.) Besides the Xiphiphas Gladius, described under the article Sword-Fish, Dr. Shaw has enumerated some other species, such as the following:—

PLATYPETERUS, or sword-fish with extremely broad backfin, and very long sharp-pointed thoracic appendages; the Guebeu of Marcgrave, and Staminus gladius of Black. This species, in the appearance of the long and sharp-pointed procès of the upper jaw, is nearly allied to the common sword-fish, but in other respects materially differs from it. It is found twenty feet in length, and sometimes much longer. Its general colour is a silvery blueish-white, except on the back, head, tail, and fins, which in the living animal are of a deep blue. The strength of this fish is such, that it pierced the bottom of an East Indian ship with such force as completely to imbed its finnot into the base; and if it had not been killed by the violence of the effort, but had been able to withdraw its finnot, the ship must have been leaky, and thus have founders. This power of transfixing vessels is mentioned by Pliny. This fish is found not only in the Brazilian and East Indian seas, but also in the Northern ocean; and it is said to be a great enemy to whales, with which it has frequent combats. Dr. Black says, that when this species does not exceed four feet in length, it is considered as an edible fish; but when it exceeds that length, it is too coarce.

MAKAIRA, the blackish sword-fish with finnot of middling length, and two bony tubercles on each side of the tail. This is a species lately discovered, and described by Cepedé under the title of "Makaira." This fish was cast on the island of Rhé, near Rochelle in France. Its length was 330 French centimetres, and its weight 365 kilogrammes; its colour was blackish. It was eaten by many of the inhabitants of Rochelle, and found to be tolerable food, though somewhat dry; the flesh was white. The "round-finned sword-fish" is also described by Cepedé, from the sword or finnot preferred, with the fore-part of the head, in the Paris Museum. Shaw's Zoology, vol iv. part i.

XIPHIAS is also used to express a fiery meteor, in form of a sword. See ACONTIAS.

XIPHIAS, in Astronomy. See DORADO.

XIPHIDIUM, in Botany, from σφεδν, a sword, alluding to the sword-shaped leaves. The name occurs in Pliny, and was adopted by Loebling for the present genus, which Linnaeus, in publishing Loebling's papers, confused with Xiphias (see that article); but subsequent writers have reformed it, the genus being superior, and the corolla of six separate petals.

Filaments three, linear, opposite to the three inner petals; anthers ovate. *Pist. German superior, globose; style thread-shaped; stigma simple.* *Peric. Capsule at first fleshy, then dry, roundish, with three funnels, and three cells. Seed numerous, roundish, pointed, inserted into a fleshy, central, nearly globular, receptacle.* 

Eff. Ch. Corolla regular, of six petals. Capsule superior, of three cells, with many seeds. 

Obf. The regularity of the flower readily distinguishes this genus from *Wachsenburgia.* See that article. 

1. *Xiphionum.* Many-flowered Xiphidium. Swartz Prod. 17. Ind. Occ. 80. Vahl n. 1. (X. albidiurn; Lamarck Illust. v. 1. 131. X. album; Willd. n. 1. Ixia; Linn. in Loebl. it. 179.) 

2. *X. curculium.* Aubl. Guian. 33. t. 11. Willd. n. 2. Ait. n. 1.—Native of South America, as well as of Tobago and St. Kitt's. Mr. Maillon is recorded by Dr. Swartz as having gathered the white-flowered kind, a, at the foot of some hills, near Sandy Point, in the laft-mentioned island: e was found in Guiana, by Aublet. We have a specimen of the latter from Miller's herbarium, gathered in some part of South America. The root is perennial, somewhat creeping, jointed. Stem a foot or more in height, round, simple, as thick as the little finger; leafy in the lower part; more or less minutely hairy. Leaves numerous, alternate, sessile, somewhat sheathing, sword-shaped, pointed, entire, or minutely ferrated, frayed with numerous longitudinal ribs. 

Cluyter compound, terminal, erect, of many spreading, simply racemose, branches, more or less hairy, with a very minute *bractea* under each partial flower-fall. Flowers not half an inch in diameter. Three outer petals green, and often downy at the back; white or blue in front, as the three inner ones are on both sides. 

Swartz and Vahl have united the two supposed species of other authors. The latter affords the blue-flowered variety to be sometimes entirely smooth in its leaves as well as flowers. 

**Xiphionus**, John, in *Biography*, was born at Trebizond, in the 16th century, and having passed the earlier period of his life in a monastery on mount Olympus, was advanced to the patriarchate of Constantinople, which office he held till his death in 1075. Besides a sermon printed in the Bibliotheca Patrum, he is reputed by some to be the author of an “Abridgment of the History of Dion Cassius,” in Greek, written faithfully, which was printed at Paris in 1592, fol. 

**Xiphion**, or *Xiphium*, in *Botany*, *3 of Diosco- 

cides, so called from the sword-shaped leaves, appears evidently, by the account of that ancient writer, to be *Gladiolus commenis*, Linn. Sp. Pl. 52, our Common Cornflag. Xiphium nevertheles is retained by Linnaeus as the specific name of a common, but very elegant and fragrant bulbous *Iris*, with blue and yellow flowers. To this it seems he was led by Tournefort, who applies the name of *Xiphion* to the whole tribe of bulbous-rooted species of *Iris*, of which he makes a separate genus, characterized by the root. This is rather unfortunate, as the Linnaean *Iris* Xiphium has rather awl-shaped than sword-like leaves. 

**Xiphionides**, *3 of Xiphionides*, in *Anatomy*, a cartilage placed at the bottom of the *sternum*, called also *enformis.* 

It is about an inch long, and shaped like the point of a sword. Whence its appellation, from *3 of swords,* and *3 of swords figure.* 

**Xiphionae Promontorium**, in *Ancient Geography*, a promontory of Sicily, near port Xiphionis. 

**Xiphos**, *3 of Xiphos*, among the Athenians, a capital punishment, by beheading with the sword. 

**Xipixapa**, in *Geography*, a town of South America, in the audience of Quito; 80 miles N.W. of Guayaquil. 

**Xiquacan**, a town of Mexico, in the province of Mechoacan; 50 miles S.E. of Zacatula. N. lat. 18° 4'. W. long. 102° 34'. 

**Xiquena**, a town of Spain, in the province of Merida; 15 miles W.N.W. of Lora. 

**Xiquito**, a town of Japan, in the island of Ximo; 16 miles S. of Naka. N. lat. 32° 20'. E. long. 130° 13'. 

**XIR**, a word used by the chemists to express mercury. 

**Xisimum**, a word used by some of the chemical writers to express vinegar. 

**Xivert**, in *Geography*, a town of Spain, in Valencia; 7 miles W.N.W. of Segorbe. 

**Xivry le Franc**, a town of France, in the department of the Moselle; 16 miles S. of Longwy. 

**Xixona**, a town of Spain, in Valencia. In the neighbourhood of this town a great number of perfumes are employed annually to collect the drug called *Kermes*, and a small district, called *de la Grande*, produces some years to the value of $30,000 dollars; 13 miles N. of Alicante. N. lat. 38° 32'. W. long. 6° 42'. 

**Xizabras**, mountains of South America, in the province of Venezuela. 

**Xoana**, in *Ancient Geography*, a town of India, on this side of the Ganges. 

**Xochicocotzo**, in *Botany*, a name used by some authors for the tree which produces the liquid amber, and is called the sweet gum by the inhabitants of the West Indies. 

**Xochitenacatl**, in *Ornithology*, a name given by some to the toucan, or American great-beaked magpie. 

**Xochitenacatl Alia**, the name of a bird described by Nieremberg, of the nature of the toucan, or Brazilian magpie. 

It is of the size of a pigeon; its beak is large and thick, and is black and pointed; its wings and tail are variegated with black and white; it has a large black mark reaching from its back to the breast; the anterior part of the wings is yellow, the rest of its body of a pale colour, and the legs and feet brown. It always is found among the sweet-flowering trees, and is not uncommon in many parts of South America. Ray. 

**Xocotlan**, or *Xocotlan*, in *Geography*, a town of Mexico, in the province of Xalifco; 15 miles S.W. of Purification. 

**Xocoxochitl**, the Indian name of the clove-berry-tree, or the *caffa carapophyllata*, the bark of which is used in medicine. 

**Xodract**, in *Ancient Geography*, a town of India, on this side of the Ganges. Ptolemy. 

**Xoes**, an island of the Mediterranean, on the coast of Egypt, near the mouth of the Nile, called “Xebennictum;” and also a town of the same name. Steph. Byz. 

**Xois**, a town of Egypt, in the Nome, denominated *Xoites Nomos.* Ptolemy. 

**Xola**, in *Geography*. See *Soolo.* 

**Xolo.** See *Gilo.* 

**Xomotl**, in *Ornithology*, the name of an American bird, of which the Indians are very fond, making a part of their garments of its feathers. 

Nieremberg has given a short account of it. It is a web-footed fowl; its back and the upper part of its wings are black, and its breast is brown. When it is angry, it raises up the feathers of its head in form of a crest. Ray. 

**Xorullo,**
XORULLO, or JORULLO, Volcano of, in Geography, a bafaltic cone of New Spain, which appeared above ground on the 15th of September 1759, and which at this day 249 fathoms or 1494 feet above the surrounding plain. It is situated in the province of Mechoacan, at the distance of eight leagues from Pafquaro the capital, towards the S.W.; the volcano of Colima being in the same direction, but at a greater distance. A delicious and fertile vale, eight leagues in length from N. to S., and three in breadth, was called Xorullo by the Indians, a word in their language signifying paradise; but upon the eruption of the volcano, this valley assumed an infernal aspect, blackened with perpetual smoke, covered with deformed rocks and ashes, the trees consumed, the earth full of deep breaks and openings, and now forming a hill of considerable height, crowned with a volcano. A rivulet which fertilized the valley is now so hot as to burn men and animals who attempt to pass it, which is peculiarly inconvenient, as it is in the direct road to the copper-mines in this quarter. Before this catastrophe, there were constantly heard horrible subterranean noises, and earthquakes were felt, which excited contermination in the inhabitants.

XOHOUNHUITICATL, an American name of a stone of the jasper kind, and of a beautiful green, but usually pale, and sometimes with a mixture of grey, and variegated in several places with spots of a deeper green. It is found among the several kinds of lapis nephriticus, with which that country abounds, and most of which the Indians celebrate for their virtues against diseases; they are not, however, acquainted with any medicinal virtues of this species.

XV. VIR, Quindedivir. See Quindedivir. Authors, and especially antiquaries, make use of such abbreviations, which they borrow from medals, and other monuments of antiquity, where those names are so expressed.

XUAREZIA, in Botany, according to De Theis, is a genus dedicated, in the Flora Peruviana, p. 20, to Gaspar Xarez, a Spanish botanist, who has devoted himself to the study of the plants of Italy.

XUCAHA, or Xucahi, the name of a plant much famed for its virtues among the ancient Arabs, but unknown at this time.

XUCAR, in Geography, a river of Spain, which rises in New Castile, and runs into the Mediterranean, 20 miles S. of Valencia.

XUCHES, or Zuchis, in Ancient Geography, a town of Africa, in Libya. Steph. Byz.

XULI, in Geography, a town of Peru, in the diocese of La Paz, near the west coast of lake Titicaca, chiefly inhabited by Indians, and governed by Indian magistrates; 100 miles N.N.W. of La Paz. S. lat. 16° 25'. W. long. 70° 6'.

XULI, a small island in the Pacific ocean, near the coast of Peru. S. lat. 16° 50'.

XULLA, or Xullo, an islet in the East Indian sea, about 42 miles long, and from 10 to 15 broad. The English some years since formed a settlement in this isle, but from the badness of the soil, and some other circumstances, they were induced to abandon it, and remove to Balambangan, on the coast of Borneo. S. lat. 1° 53'. E. long. 125°.

XULLABELLA, an islet in the East Indian sea, about 25 miles long, and 6 broad. S. lat. 2° 15'. E. long. 125° 12'.

XULLAMANGOLA, an islet in the East Indian sea, about 30 miles long, and 10 broad. S. lat. 1° 54'. E. long. 125° 42'.

XUN, a city of China, of the second rank, in Se-tchuen; 150 miles S.W. of Pao-king. N. lat. 36° 18'. E. long. 103° 20'.

XUNDALE, a town of South America, in the province of Popayan; 8 miles S.W. of Sante Fe de Antiquia.

XUQUI, See Jujuy.

XUTHIA, in Ancient Geography, a country of Sicily. Diod. Sic. It is represented as a town by Steph. Byz.

XUXUY, in Geography, a town of La Plata, which chiefly trades in cattle, sold to the miners of Potosí, and brought in considerable number to the great fair of Salta; but now in a declining state. See Jujuy.

XYLAGIUM, a name given by some authors to the lignum fanctum, or guaiacum.

XYLANDER, Wiliam, in Biography, whose family name was Holtzmann, was born in indigent circumstances at Augsburg, in 1532, and enabled by public liberality to study at Tubingen and Balil, in the latter of which places he took the degree of M.A. in 1556. In 1558 he was invited to undertake the Greek professorship at Heidelberg; where, with all the disadvantages of penury, he pursued his literary labours, and acquired an amfluence of erudition, which comprehended the learned languages, history, poetry, music, philosophy, and physics. The works by which he is chiefly known are Latin translations, (with notes,) of Dion Cassius, Plutarch, Strabo, and Cedrenus. His life was prematurely terminated in consequence of hard study, in 1576, at the age of 44 years. Morei.

XYLARIA, in Botany, from ξυλόν, wood, a name given by some cryptogamie botanists to the first section of the genus Sphæria in Perforo. (See that article.) The idea appears to have been suggested by the old name Hypsyxylon, belonging to one of the species. But it may also apply to the woody and durable texture of that and some others of the same section.

XYLENOPOLIS, the Town of the Woods, in Ancient Geography, a town of India, at one of the mouths of the river Indus, according to Pliny, who reports that it was built by Alexander. M. D'Anville thinks that this town is the same with Hyala. It subsisted in the time of Pliny.

XYLINA, Inl, a town of Asia, in the Colchide, and country of the Lazzi. It was situated on the right bank of the Acinatis, near its mouth in the Euxine sea, north of Chordylia.

XYLINE, a town of Cappodocia, in Cappodocian Pontus. Ptol.

XYLINES, a people of Africa, in Libya interior, E. of the Agangines, from the foot of mount Arangas. Ptol.

XYLO-ALOE, compounded of ξυλόν, wood, and αλος, aloe, in Medicin, the lignum aloe; called also agallochum. See Aloe, and Calambac.

XYLO-BALSAMUM, ξυλοβάλσαμον, compounded of ξυλόν, wood, and βάλσαμον, balsam, a name which naturalists, &c. give to the wood of the tree, which yields that precious gum known to the Latins by the name of opobalsamum, and, among us, by the name of balsam, or balm of Gilead.

We have branches of this tree brought from Cairo. They are very straight, brittle, unequal, and full of knots; their bark is reddish without, and greenish within. The wood is whitish, and full of pitch; and, when broken,
broken, yields an agreeable smell, resembling that of the

The xylo-balsamum is reputed good to strengthen
the brain and stomach, and to expel poison.

XYLOCARACTI, or Xylocaracta, in the Materia
Medica, a name by which some authors have called
the carob, or siliqua dulcis, the sweet pipe-tree.

This was called by some of the Greek writers xylocaracta,
the tree bearing pods, and from a corruption of this name
the other has been formed.

XYLOCARPASUM, in Natural History, a name given
by some authors to a poisonous kind of wood.

It was the wood of that tree whose gum was called
carpasum and opocarpasum.

XYLOCARPUS, in Botany, from ξύλον, wood, and
στρώμα, fruit, alluding to the woody texture of the feed-

253.

 XYLODON, in Botany, from ξύλον, wood, and οἶος, a
tooth, an appellation given by Perfon to the third section
of his genus Sistotrema, Syn. Fung. 550. (See that article.)
The lamella of that genus, (which is intermediate, as he justly
fays, between Boletus and Hydnum, though, in our opinion,
mott akin to the latter,) are of a firm, woody, and durable
nature, and divided into many compressed irregular teeth.

XYLOGLYCON, a name given to the carob, or siliqua
dulcis, by some of the old Greek writers.

The word expresses a sweet or sweet-fruited tree.

XYLOIDES, or Hyloides, a term used by many of
the ancient writers to distinguish those plants which had
woody flacks, though they never grew up to any con-
fiderable size; such as the garden-thyme, marjoram, and
the like.

XYLOMA, so called from the firm or woody substance
of the whole fungus, and the jagged or radiating margin
of one of the most common species, X. acerum; the word
being apparently composed of ξύλον, wood, and ακνέ, a
—Clas and order, Cryptogamia Fungi. Nat. Ord. Fungi
Angiocarpi.

Eff. Ch. Flat, nearly orbicular. Receptacle various,
hard, somewhat fleshy internally; either remaining clofed,
or burling unequally.

Sect. 1. Compound. Several receptacles combined. Rather
large.

Meth. 5. t. 2. f. 4."—Thick, tuberculated; internally carti-
laginous, and white at the base.—Frequent on the leaves
of Salsis express. This, according to Perfon, is generally
clofed, but he has found it in the spring, as delineated in
the work quoted, breaking, in the upper part, into several
portions, like the shell of a tortoise, from whole intertices
the fine powdery feeds flew off like smoke. The breadth of
the whole fungus is about half an inch; its colour black.

"Oblong, thickifh, with rib-like elevations, polished."—
Found in summer on the leaves of Andromeda polifolia, which
hence appear as if pitch had been dropped upon them.
Sometimes each fungus is as long as the whole leaf; some-
times only half as long. Its thickness is considerable with
regard to the fize. The lower fparatum is white and firm, as
in the foregoing.

3. X. acerum. Maple Xyloma. Perf. n. 3. (Sphæria
maculiformis; Ehrh. Crypt. n. 219. Beitr. v. 7. 101.)—
Dilated, somewhat orbicular, thin, flat, black, slightly cor-
rugated towards the centre.—Frequent on the leaves of
Acer platanoides, and *A. campbell*, in the autumn. It con-

fects of numerous, black, opaque, inseparable patches, scattered over the upper side of the leaf, each about a quarter or one-third of an inch in diameter; the margin sometimes variably and elegantly notched, or fringed, and always circum-

scribed by a very striking yellow, or tawny, discolora-

tion of the leaf. Persoon says he has observed the surface of this species, though usually almost even and uniform, cracking into wavy bordered fissures. We can see some-

thing of this in a specimen from professor Schrader.

4. *X. punctatum*. Sycamore Xyloxa. Perfor. n. 4. Obs. Mycol. v. 2. 100.—Dilated, thin, imperfectly orbicular, somewhat convex, black. Receptacles unequal, aggregate, parallel, oblong, blunt, superficial.—Frequent on the fading or fallen leaves of *Acer Pseudoplatanus*, which are rarely without this parasite in autumn and winter. The patches are from half an inch to an inch wide, closely united with the leaf, slightly convex above, and rather concave at the under side, which is somewhat blackened by them, e specially at the circumference of each. The wrinkles, or receptacles, are shaped like the clefts of an *Opegrapha* (see that ar-

cicle) but much more shallow, as well as more uniform in colour.

5. *X. stellare*. Starry Xyloxa. Perfor. n. 5. Obs. Mycol. v. 2. 100.—“Thin, pitchy; the margin fringed with radiating fibres.”—Found by Persoon, on the leaves of *Phyto-

tuma spicatum*, though rarely. About half an inch broad, more or less, of a handson appearance, with an uniform smooth dish, very black; the marginal fringe either black, or greyish. No distinct receptacles have yet been noticed.

6. *X. rubrum*. Red Xyloxa. Perfor. n. 6. Obs. Mycol. v. 2. 101.—“Aggregate, orbicular, somewhat confluent, red.”—Generally found in autumn on the leaves of *Prunus domes-

tica*, rarely on *P. spinosa*. At first sight the rich colour of this species, all the others being black, cauces it to be taken for an *Aecidium*, or *Uredo*; but on examination the internal fur-

bivalence proves to be solid, uniform, scarcely containing distinct receptacles, or seed-wuffs; its genus, however, is recog-

nised by Mr. Persoon as very doubtful. The patches are each from two to four lines broad, rather thick, with darker-coloured superficial dish, visible only with a micro-

toscope. Persoon.

Sect. 2. Simple. Receptacles solitary, scattered; generally rounded, as a *Peziza*; or dot-like. Smaller.

7. *X. pseudioideae*. Cup-like Xyloxa. Perfor. n. 7. (Pe-

ziza comitiales; Sowerb. Fung. t. 118. P. viridis; Bolt. Fung. t. 109. f. 1.)—Rather crowded, orbicular, black; opening at length, with an upright, somewhat crenate, border, and a pale olive or greenish dish.—Found on fallen leaves of oak in December; more rarely, and in lesser perfec-

tion, on those of beech. The specimens are very uniform in

form, larger than mustard-feud, closely attached to the surface of the leaf; the border of each sometimes pale, sometimes black, unless Sowerby and Bolton describe two different species.

8. *X. spherioideae*. Dot-like Xyloxa. Perfor. n. 8.—“Scattered, dot-like, softish, with an open dish, and a col-

apped incohered border.”—On the leaves of *Salix caprea*. This at a distance resembles *Spharia punctiformis*; but under a magnifier it looks like some *Peziza*, with a crisped margin. The outside is black; the dish, rarely all displayed, is paler.

at Decri. Fung. t. 10. f. 3, 4.”—“Elliptical, shining, ranged

nearly parallel.”—On the fallen leaves of *Iawthorn*, in the

spring. Each plant is one-third of a line long, ovate, or

elliptical, of a shining black; solid within. A longitudinal

line seems to mark the place where it finally bursts.

10. *X. falicenum*. Willow Xyloxa. Perfor. n. 10. (“Spho-

tia falicha; Ehrh. Crypt. n. 299.”)—“Aggregate and rather crowded, orbicular, thin, with a somewhat convex dish.”—On the leaves of *Salix caprea*, occupying nearly their whole surface. Each individual is from one-third to one-

half a line broad.

11. *X. populorum*. Aspen Xyloxa. Perfor. n. 11.—“Ag-

gregate, flattened, variably shaped, smooth, opaque, black.”

—Found on the old leaves of *Populus tremula*, in the spring.

About a line broad; the disk here and there greyish.

Obs. Mycol. v. 2. 101.—“Simple. Receptacles small, orbicular, depressed, somewhat conical, concentrical, of a footy grey.”—On half-decayed leaves of *Populus tremula*, forming circular patches, near an inch broad. Receptacles like small scattered dots, at first black, afterwards footy or greyish, burfting finally at the sumit.

Meth. Fung. 52.”—“Minute, crowded, of a shining black, 

orbicular, plated, a little depressed.”—Found on the under side of fallen and dried leaves of Beech, in the form of crowded black dots.

14. *X. album*. Alder Xyloxa. Perfor. n. 14.—“Mi-

nine, scattered, roundish, plated.”—This species is met

with in summer, upon Alder-leaves, while they are still green. It consists of a few black distant dots.

These minute productions are neccesarily very obscure in

their charactes and economy. The present genus is marked by its internal solidity, of a corky or woody substance, having nothing of a gelatious nature, nor are there any di-

nict round capular receptacles, as in *Spheria*. See that articlce.

XYLOMELUM, so called by the writer of this, from *Xylem", wood, and "melus", an apple, in allusion to the hardnec

and form of the fruit, which procured it, when firft disco-

vered, the appellation of the wooden pear.—Sm. Tr. of

Alt. Hort. Kew. v. 1. 212.—Class and order, *Tetrandria*

Gen. Ch. Col. non. Car. Petals four, regular, equal, lineal; externally hairy; a little dilated and concave at the tip; revolute soon after expansion. Nectary four glands at the base of the germen. *Stam. Filaments four, very short, inferted rather above the middle of each petal, and becoming prominent by its recurvation; anthers linear, inflexed, of two lateral parallel lobes, with a membraneous edge; im-

perfect in some of the flowers. *Pil. Germin superior, roundish; style erect, rigid, the length of the petals, deci-

duous; stigma vertical, club-shaped, obtuse, often small and abortive. *Petals*. Follicle woody, very thick, ovate, of one

excentric small cell, and burfting into two divided half

valves, at the point. *Seeds* two, roundish, compressed, each with a terminal, oblong, rather oblique, membranous wing, as long as the follicle.

Eff. Ch. Petals four, bearing the petals above the middle, regular, revolute. Nectariferous glands four. Stigma club-

shaped. Style deciduous. Follicle woody, of one excêntric cell, with two winged seeds.

pyriforua; Gaertn. v. 1. 270. t. 47. f. 1. Lamarck Illust.

v. 1. 242. t. 54. f. 4. White's Voyage 224. t. 21. Hakea

pyriforua; Cav., v. 1. 25. t. 536.)—Gathered on the eastern coast of New Holland, near Port Jackson, by the first settlers in that colony. We received specimens from

Dr. White,
Dr. White, in 1780 and 1793. Mr. Brown says it grows on stony hilly ground. This, the only known species is a tree, with opposite branches; downy and rustily when young. Leaves opposite, flaked, five inches long, lanceolate, acute at each end, entire, rather coriaceous, smooth, with one rib, and many prominent reticulate veins; pale and yellowish beneath; clothed, when they first come out, with dense, deciduous, rusty down: those of young plants, according to Mr. Brown, are toothed. Fruit flat, an inch long, smooth. Stipules none. Spikes axillary, opposite, catkin-like, cylindrical, dense, much shorter than the leaves, many-flowered, thready with rusty down. Flowers sessile, hardly an inch long, in pairs, each pair accompanied with one small downy bract; all of them abortive, except the lowermost, so that from specimens seen in fruit only, the flowers were judged to be solitary. The fruit is ovate, or irregularly pear-shaped, very hard, even, downy, two or three inches in length. Seeds and their wings brown. Mr. Brown remarks, that the greater part of the flowers, having a small stigma, and no germs, are necessarily abortive. Many of the anthers too have, as above-mentioned, an imperfect appearance; but having never seen living flowers, we cannot tell whether this be an original defect, or merely owing to their having long ago performed their office. It is possible that the rusty hue of the flowers and young leaves, so rich and beautiful in our specimens, may partly, if not altogether, be owing to drying. This plant, though procured for Kew garden, by sir Joseph Banks, in 1789, appears never yet to have bloomed there.

XYLON, is so well described by Pliny, book 19. chap. 1, as to leave no doubt of its being our Cotton. (See Gossypium.) He says it served to make the chitlons of the Egyptian priests. Dr. J. R. Forster, the famous botanist and circumnavigator, published in 1776 a most learned little volume, to prove Cotton the true Buffs of the ancients. See also Matth. Valgr. v. 1. 376.

XYLON, ἕδαρα, among the Athenians, a punishment inflicted, by putting the offender into the flocks.

Gen. Ch. Male, Cal. Perianth in fix deep regular segments; the three innermost largest. Cor. Petals none, unless the calyx, or its inner segments, be taken for such. Nectary of fix globular glands. Stamin. Filaments united into a very short column; anthers three or fix, roundish; two-lobed.

Female, on the same plant, and in the same situation, as the male. Cal. and Nectary as in the male. Pfl. Gernmen superior, sessile, roundish; styles three, short, spreading; stigmas three-ellipt. Peric. Capsule roundish, with three furrows, three cells, and fix elatic valves. Seeds two in each cell, roundish.

Female, Calyx and Nectary like the male. Styles three.

Stigmas three-ellipt. Capsule of three cells, with fix elatic valves. Seeds two in each cell.

Of. Dr. Sima, in Curt. Mag. 1021, has justly indicated this genus as too near Phyllanthus (see that article) where the seeds are erroneously said to be solitary. Whether the difference between their nectarine be permanent, we have not seen enough to determine. At any rate, these two genera must fland next to each other, in the Linnean artificial system, as well as in every natural one.

1. X. longifolia. Long-leaved Sea-side Laurel. Linn. Mant. 221. Willd. n. 1. Swartz Obs. 112. (Xypophyllas ceramica; Rumph. Amboyn. v. 7. 19. t. 12.—Leaves linear, alternate toothed. Flowers solitary at each tooth.—Found only on the lofty, stony, cold mountains of the island of Ceram. The trunk is thorny, fearfully so thick as a man's arm, dividing above it into many round branches, as thick as the finger. Thee end in numerous, alternate, drooping, long, linear, acute leaves, or perhaps winged branches, with blunt alternate teeth, usually an inch distant from each other. The flowers are solitary, nearly sessile, at each notch. Of their structure nothing is known; nor of the fruit, except what Rumphius relates, and this, as Dr. Swartz observes, does not agree with the genus before us, Linnaeus having merely adopted this remarkable plant as a Xylophylla, on account of its habit, which is striking enough. Rumphius says, "the calyx resembles a small clove, and is red, bearing a round-oblong fruit, resembling a Bay-berry, or the Abris of Alpinus, (and Linneus,) green, hard, with a small point. When opened, a small nucleus is found, resembling a grain of rice, fixed on the stam, and falling sweet, like a Firmber, being enclosed in a white skin." It is very unlikely that the kernel of any species of this genus should be eatable.

2. X. lafifolia. Broad-leaved Sea-side Laurel. Linn. Mant. 221, excluding the synonym. Willd. n. 2. Ait. Swartz Obs. 113. Curt. Mag. t. 1021. (Genethera afrenchilia; L'Her. Sert. Angl. t. 59. Phyllanthus n. 1. Browne Jam. 188.) Hemisodium affinis, americana epiphyllanthos, &c.; Pluk. Phyt. t. 16. f. 7.—Leaves rhomboid, crenate; notches crowded, each bearing one or more staked flowers.—Native of lime-stone rocks, near the sea-fide, in the West Indies. Mr. Waller is recorded in Hort. Kew. as having first sent this elegant and singular shrub to his friends in England, in 1783. If we mistake not, the marquis of Rockingham, who died in 1782, received it from Mr. Waller some time before; the original plant has been lost, one of the dowager marcheshe's finest plants. It flowers in a stuss copiously in August and September. The stam is four or five feet high, with a round bushy head. Leaves a foot long, alternate, staked, alternately pinnate; leaflets twelve or more, nearly sessile, one and a half or two inches long, ovate-rhomboid, acute, hard and rigid, crenat, fruited, smooth, entire towards the base. Flowers copious, small, green, on simple creninous flasks; though of the female flowers much the longest. Both stamens and pistil sometimes occur in the same flower, according to Dr. Swartz.

3. X. Arbustula. Lanceolate-leaved Sea-side Laurel. Swartz Prodr. 22. Willd. n. 3. (Phyllanthus speciosia; Jacq. Coll. v. 2. 360. Lc. Ra. t. 616. Swartz. Ind. Occ. 1107. Scheen. Lc. t. 302.)—Leaves pinnate, lanceolate, pointed, crenate; notches crowded, each bearing one or more staked flowers.—Native of the sloping sides of lofty mountains, in the south part of Jamaica. Swartz. We can discern no real specific difference between this and the last. The leaves indeed are narrower, more elongated, and less falcate, but those characters vary. Dr. Swartz lays...
lays a film on the flowers being polygamous in latifolia, monoeocious in Arbuthuta; but nothing is more variable than this circumstance. It is difficult to say which of the two Schweinheigt's figure represents.

4. X. falcata. Sickle-leaved sea-side laurel. Swartz Prodr. 25. Willd. n. 4. Ait. n. 2. Andr. Repop. t. 351. (Phyllanthus Ephythyllathus; Linn. Sp. Pl. 1932. Ph. americana plat, flores e ungulil foliis crenatis proferent; Comm. Hort. v. i. 199. t. 102.)—Leaves scattered, linear-lanceolate, somewhat falcate, diffusely toothed. Flowers nearly femail, many together at each tooth. Native of the Bahama islands. Cultivated for about 120 years past in the flowers of England and Holland, flowering in July and August. The stem is five or six feet high, shrubby, with round branches. Leaves not pinnate, with a flat stalk, as in the two last, but scattered irregularly over the branches, each proceeding from a scaly bud, fimple, five or six inches long, one-third of an inch wide, rigid, flicated, tapering at each end; entire towards the base; alternately toothed in the upper part, the teeth an inch or more abundant. Flowers crimson, on short stalks, some male and some female in each tuft; the latter fewest.

5. X. angufitifolia. Narrow-leaved sea-side laurel. Swartz Prodr. 28. Willd. n. 5. Ait. n. 3. (X. elongata; Jacq. Hort. Schanbr. v. 3. 53. t. 348. Poir. n. 7. Phyllanthus n. 2; Browne Jam. 188. Ph. americana, anguillarii et longiori folio, ramofo, caulefcens; Pluk. Phyt. t. 247. f. 4. Ph. anguifikolia; Swartz Ind. Occ. 1111.)—Leaves pinnate, linear-lanceolate, rather dis- tandem toothed, scarcely curved. Flowers on short stalks, polygamous, one or more from each tooth.—Native of lofty rocky situations, in the western part of Jamaica. Swartz. Cultivated in the English flowers before 1789, flowering in July and August. Aiton. This agrees with our second and third species, in having several alternate leaves, on a flat or channelled, bordered common stalk; but scarcely half so many on each stalk as in those; and of a longer narrower form, not copiously crenate, but sparingly and rather diffusely toothed, more in the manner of X. falcata. The stem is only two feet high. The flowers are less copious than in the last-mentioned species, and, according to Dr. Swartz, there are some perfect, intermixed with the male and female ones. Their colour is red; the male ones pale. (Jacquin's figure expresses the contrary.) Plutenet's engraving, such as it is, manifestly agrees with this species, and with no other. Linneus, no doubt, confounded this and, at one time, the latifolia also, with the falcata. Browne's synonyms are settled by his own species, though unmarked.

6. X. linearis. Linear sea-side laurel. (X. angufitifolia §; Swartz Prodr. 28. Willd. n. 5. Phyllanthus linearis; Swartz Ind. Occ. 1113.)—4 Leaves pinnate, linear, tapering, pliant, crenate; their common stalk bordered. Flowers several from each notch.1—Native of shady rocky banks of rivers, in the western part of Jamaica. Swartz. The stem is scarcely a foot high, erect, with round branches. Common footstalks four or five inches long, scattered, compressed, (rather depressed) bordered. Leaves linear, rather broadest in the middle; tapering at the base; ending in a very long acute point, fibrated, paler beneath, two inches long, of a thinner subtance than the foregoing species, which circumstance, added to its humbler stature, and different colour, has induced Dr. Swartz to consider it as distinct. The flowers are white, monoeocious, from three to five at each notch of the leaves, on capillary stalks, four lines in length.

7. X. montana. Mountain sea-side laurel. Swartz Vol. XXXIX. Prodr. 28. Willd. n. 6. (Phyllanthus montana; Swartz Ind. Occ. 1117.)—Leaves somewhat two-ranked, elliptic-lanceolate, coriaceous, deeply crenate. Flowers nearly femail, many from each notch. Branches round; two-edged at the extremity.—Found on lime-flone rocks, in the western part of Jamaica. A shrub, six feet high, much and irregularly branched; the branches often forked, round, nearly erect, with annular scars; ultimate ones permanent, glaucous a little coloured, compressed and two-edged at the summit. Leaves alternate, imperfectly two-ranked, nearly femail, either blunter or acute, obliquely flicated, rigid, brownish-green, smooth, with deep many-flowered rosettes. Flowers monoeocious; the males eight or ten, pale red; females solitary among the males, deep purple. Clearly distinguishable from all the species which it otherwise resembles, by the permanency, and woody texture, of the ultimate branches. Swartz.

8. X. ramiflora. Siberian sea-side laurel. Ait. Hort. Kew. ed. 1. v. 1. 376. ed. 2. n. 4. Willd. n. 7. (Pharsaceum? suffruticulm; Pallas It. v. 3. 716. t. E. f. 2.)—Leaves elliptical, fcarce. Flowers axillary.—Native of the defarts of Siberia, from whence it was procured for the English gardens, in 1783, by the late Mr. Bell. It is a hardy shrub, flowering in July and August. Pallas, who never saw the plant alive, merely guessed at its genus. By its figure, its habit is altogether that of a Phyllanthus. The stem is bushy, with many straight, wand-like, leafy branches, each a foot long. Leaves scattered, thin, hardly an inch in length, blunt, crenate, or somewhat wavy. Flowers six or eight together, making a little axillary tuft, accompanied by minute red fipulas, or bractes. Segments of the calyx five, concave, white, with a coloured margin. Anthers five, thick, obtuse, furrowed at the outside. Germin in the same flower, as we preume from Pallas’s description, very small. Styles three, thread-shaped, simple, the length of the flamen. The genus of this species is, at best, very doubtful, as Willdenow has already remarked.

Phyllanthus and Xylophylla are so totally different in habit, and the latter is, in this respect, so very peculiar, that a clear character between them is much to be desired. The true Xylophylla are all of West Indian origin. The tropical Phyllanthi are natives of the East Indies; a few hardy species grow in North America.

Xylophylla, in Gardening, contains plants of the tender exotic kind for the flower, in which the species cultivated are, the long-leaved love flower (X. longifolia), the broad-leaved love flower (X. latifolia), and the falcated love flower (X. falcata).

The first is a branching angular plant, but the second has round branches; and the last is woody in the stems and branches.

Method of Culture.—These plants are increased by sowing the seeds in pots in the early spring, and plunging them in a hot-bed; when the plants are come up two or three inches in growth, they should be pricked out in separate pots, replacing them in the bark-bed; they may afterwards be managed as other flower-plants of a similar growth.

They are also, some of them, capable of being raised by offsets, slips, and cuttings, affixed by a hot-bed in the same manner.

They require the constant protection of the flower in winter, but in the hot summer months may be set out in their pots in a sheltered situation, being taken in on the approach of cold nights.

They afford variety, and are curious in flower collections among other plants of similar growths.

E. Xylophylla.
XYLOPIA.

 XYLOPIA, in Botany, altered by Linnaeus from Xylipheitrum of Browne, a name which the latter took from Plukenet, whose Xylipheitrum, formed from Xylo- and -heitrum, alludes to the bitternels of the wood. M. De Candolle, in following Linnaeus, observes, that this abbreviation entirely destroys the sense. It certainly does to those who do not trace out the source of the word. If the original had been constructured in the most unexceptionable manner, we might have hazarded its restoration; but Xylopia is now too firmly esta-blished to be lightly disturbed, and in found nothing can be better. - Linn. Gen. 469. Schreb. 375; Willd. Sp. Pl. v. 2. 1792. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 336. Juss. 284. De Cand. Syll. v. 1. 499. Poiret in Lamarck Dict. v. 8. 810. Lamarck Illustr. t. 495. Gebrtn. t. 69. (Xylopicterion; Pluk. Almagra. 395. Xylopietrum; Browne Jan. 250.)—Clas and order, Polyandria Polygoenia. (Gynandra Polyandria, Linn.) Nat. Ord. Condateae, Linn. Anone, Jull. Annonaceae, De Candolle. Gen. Ch. Cal. Perianth inferior, of one leaf, in three to five deep, broad, ovate, coriaceous, rather acute, permanent segments. Cor. Petals fix, seelie, linear-lanceolate, coriaceous, much longer than the calyx; the three outermost largest. Stam. Filaments none; antlers numerous, oblong, quadrangular, abrupt, parallel, crowded, seated on the tumid, nearly globose, receptacle, in several rows. Pif. Germs several, on short stalks, compressed; styles tapering, crowded together; stigmas simple. Peric. Capsules several, stalked, coriaceous, compressed, bluntly angular, of one cell and two valves, bursting at the top. Seeds one or two, obovate, polished, tunicrated at the base. Eff. Ch. Calyx lobed, coriaceous. Petals fix; the three outermost largest. Capsules stalked, angular, compressed, of two valves. Seeds one or two, tunicrated.

The plants composing this genus are trees or shrubs, with oblong or lanceolate (entire) leaves, and axillary, bracteated, simple or divided flower-flalks. The wood is bitter; bark and fruit aromatic. De Candolle, who describes eight species, of which the first is still the leaf understood. Linnaeus, by a misapprehension of the true character of his own clafs of Gynandria, (fee that article,) has placed this genus far aunder from Annona, Uvaria, &c., to which it is closely allied, both in natural and artificial distinctions. Few genera have hitherto been less understood.

1. X. muricata. Rough-fruited Bitter-wood. Linn. Sp. Pl. 1567. Willd. n. 1. De Cand. n. 1. Ait. n. 1. (X. fruticosum; Gebrtn. v. 339. 69, excluding the synonym of Aublet. Xylop Fetum; Browne Jan. 250. t. 5. f. 2.)—Leaves ovato-lanceolate, pointed; clothed with close-pressed hairs beneath. Branches zigzag, narrowly smooth. Stalks with several flowers. Fruit mucrinated.—Found by Dr. Patrick Browne, at the foot of the mountains, in Sixteen-mile walk, Jamaica. His specimcn, drawn in the plate above-cited, is in our hands, but stipped of the leaves. This deficiency is supplied by another very large and perfect one, gathered in Jamaica, by Mr. Maffon. The latter M. De Candolle unfortunately did not see, when the writer of this was favoured with too short a visit from this learned and amiable man. It is become necessary to correct some errors in the description, whose fource is unknown to us. The leaves are certainly not "bearded at the point," nor do we perceive in what fume they are termed "fragile beneath." Thafe is Wildenow's expression, adopted by De Candolle. Sir Joseph Banks sent a living plant of this species to Kew garden, in 1793; but if it survies, it has not yet flowered. This is a small tree, fifteen or twenty feet high, with alternate, round branches, zigzag when young, quite smooth, except towards the very extremity, which is slightly milky. Leaves alternate, on short thick flalks, spreading, rather ovate than lanceolate, with a blunt or emarginate, smooth point; their length two inches, or a little more; their margin entire, lightly revolute; their upper surface smooth and shining, reticulated with veins; under paler, more opaque, clothed with fine, scattered, close, milky hairs, after a while deciduous: midrib stout, rough with minute tubercles at the back. Flower-flalks cipious, axillary, solitary, short, knobby, bearing from two to five flowers. Calyx three-lobed, nearly downy. Petals half an inch long, densily milky on both sides; the three innermost very narrow, triangular-awlshaped. Capsules, by Gartner's account, which in the main agrees with that of Linnaeus, nearly ovate, but angular and compressed, sometimes as many as fifteen, coriaceous, covered with little points, of one cell and two valves, containing one or two oval seeds, each with a cup-like tunic at the bottom. Browne made no remarks on the bark or wood of this tree. We perceive little bitterness in either, though some aromatic flavour in the bark. This species being the type of its genus, we have thought a full description requisite.

2. X. fruticosum. Shrubby Silky Bitter-wood. Aubl. Guian. 602. t. 242, excluding the synonyms of Linnaeus and Browne. Willd. n. 2. De Cand. n. 2. — "Dunal Monogr. 120." Lamarck t. 495, copied from Aublet, excluding the fruit, which is Gartner's figure of the foregoing. Poiret n. 2. (X. ietofa; Poiret n. 4, according to De Candolle. Embira feu Pindaiba; Pif. Braf. 71. Ibra; Maregr. Braf. 99.)—Leaves lanceolate, pointed; glaucous and silky beneath. Branches silky. Stalks with few flowers. Capsules smooth.—Found by Maregraf in Brazil, flowering in February; by Aublet in Cayenne and Guiana, bearing flowers and fruit in August. M. De Candolle has examined a specimen, and we, having seen none, are obliged to rely on him and the other authors here cited for the specific distinctions between this and the first species. The smoothness of the fruit, the filikines of the branchies, and narrowness of the leaves, appear sufficient to ascertain the present plant. Maregraf says the bark affords a touch of rich kind of cordage. The fruit, equal in size to hazel-nuts, is aromatic and acrid, fering, when powdered, instead of pepper.

3. X. julifolia. Willow-leaved Bitter-wood. "Humb. and Bonpl. unpublished. Dunal Monogr. 121. t. 17." De Cand. n. 3.—"Leaves oblong, with a blinfth point; silky beneath. Stalks short, single-flowered? with small bracteas."—Found by the celebrated travellers baron Humboldt and M. Bonpland, near Efinail, in South America. A tree with blackish branchies, marked with white dots. Leaves narrow, an inch and a half or two inches long, three or four lines broad, on short flalks, single-ribbed, without veins; smooth and green above; villous beneath, with close-pressed, milky hairs, of a rufous grey. Capsules five to ten, gibbous, slightly pointed, not burbling. Seeds one or two. De Cand.

4. X. liquifera. Privet-leaved Bitter-wood. "Dunal Monogr. 121. t. 18." De Cand. n. 4.—"Leaves oblong, rather acute, smooth on both sides. Stalks short, with few flowers, and small bracteas."—Gathered by Humboldt and Bonpland, at Boga, in South America. The branchies are round, blackish, rugged, rough with whitish points. Leaves an inch and a half long, four lines broad, on very short flalks, single-ribbed, veined; somewhat shining above; paler beneath; the young ones milky at the under side. Stalks axillary, with three or four flowers, and roundish con-

5. X. glabra. Smooth Bitter-wood. Linn. Sp. Pl. 1367. Willd. n. 3. De Cand. n. 4. Dunal Monogr. 121. t. 19." Lunan Hort. Jam. 97. (Xylopiherum n. 2; Browne Jam. 51. Xylopropion arbors, barbadenfibus Bitter-wood; Pluk. Phytl. t. 238. f. 4).—Leaves ovate-oblong, pointed, quite smooth on both sides. Stalks single-flowered, foliary or in pairs. Fruit smooth.—Brought from Barbadoes by Mr. James Reece, who was sent to the West Indies by the earl of Portland, to procure plants for the royal garden at Hampton-Court. Plukent. This species, therefore, may have been alive in England, Dr. Patrick Browne met with it in the mountains, at the back of Bull-bay, in Jamaica, where it grew to a considerable size, being fifty or sixty feet high. He never saw the flowers in perfection. "The wood, bark, and berries," says this author, "have an agreeable bitter taste, not unlike that of the orange-feeding; and would probably prove excellent medicines. Wild pigeons feed much upon the berries, and owe their delicate bittersweet flavour to this food. I have eaten many of the berries jut off the tree, and found them agreeable to the palate, and grateful to the stomach. The bark and wood are agreeably bitter while fresh, but that delicacy diminishes greatly after they are dried. The wood is easly wrought, and good timber, but must not be exposed to the weather." Browne. Mr. Lunan, in his Hortus Jamaicenfis, adds nothing to this account, but carefully distinguishes this Bitter-wood from Quassia, (see that article), with which some persons have confounded it. M. De Candolle observes, that the branches of X. glabra are round, smooth, scarcely dotted; and that even the young leaves are smooth on both sides; the full-grown ones are two inches long, and broad, obtuse with a point. Calyx smooth, with three very obtuse lobes. Unexpanded petals oblone, clothed externally with close-preffed pubescence, their length four lines. Pluknet represent the flower-flanks foliary, opposite to each leaf.

6. X. nitida. Shining-leaved Bitter-wood. "Dunal Monogr. 122. t. 20." De Cand. n. 6.—"Leaves oblong-lanceolate, smooth; polished on the upper side. Stalks branched, many-flowered. Calyx nearly entire."—Found by Joseph Martin, on the Oyac mountains of Cayenne, sloping down to the sea. A tree of a middling size, with straight, round, rugged, not hairy or downy, branches. Leaves somewhat elliptical, two or three inches long, and one or ten lines broad; green, smooth, and very shining above; viscid, pale, and rather silky, with minute close hairs beneath; the margin a little revolute. Clusters small, corimbosely, of four or five flowers, whose flacks are embraced by little roundish bretias. Calyx coriaceous, brown, pitcher-shaped, finely divided. Bed of the petals oblong, triangular, acute. Fruit unknown. De Cand.

7. X. acuminata. Long-pointed Bitter-wood. "Dunal Monogr. 122. t. 16." De Cand. n. 7.—"Leaves oblong-lanceolate, very long-pointed, perfectly smooth. Capsules on long flacks, single-valved, with two seeds."—Native of Cayenne. Branches round, rugged, smooth. Leaves on very short foot flacks, four to six inches long, two inches wide, remarkably pointed, revolute, rather coriaceous; a little shining above. Flowers unknown. Capsules ovate, two or ten lines in length, pointed, each tapering down into a long flack, imperfectly bivalve, smooth and even. Seeds obvolute, black, fatid, convex at the outflde, flat at the inner. De Cand.

8. X. prinodes. Winter-berry Bitter-wood. "Dunal Monogr. 122. t. 15." De Cand. n. 8.—"Leaves oblong-lanceolate, smooth, membranous, pointed; blunth at the extremity. Flowers foliary. Capsules with two valves."—Native of Cayenne. Branches wand-like, slightly rugged. Leaves on short flacks, smooth on both sides, three or four inches, (the author, by mistake as we presume, says three or four lines) in length, and from sixteen to fifteen lines broad; shining above; rather glaucous beneath. Stalks single-flowered, axillary, very short, each bearing an extremely minute bretia. Calyx deeply three-cleft. Petals ovate, acute, fearely two lines long, being the smallest of this genus, or perhaps natural order. Capsules flaked, imperfectly bivalve. Seeds two, flat at the inner side, convex at the outer. De Candolle.

XYLOPORICRUM. See Xyloporia supra.

XYLOPOLIS, in Ancient Geography, a town of Macedonia, in Mydonia. Ptolemy.

Female, Calyx and Neatary as in the male. Style very short. Stigma slightly three-cleft. Berry dry, of two incomplete cells. Seeds two to each cell.

1. X. fulevolens. Serrate-Sweet-wood. Forst. Prodr. n. 380. Willd. n. 1. (Myroxylon fuaveolens; Forst. Gen. 63. n. 1).—Leaves ovate, serrate.—Native of the Society islands of the South seas. The inhabitants employ this wood, to give a fragrant scent to cocoa-nut oil, for anointing their hair. We know not whether this be the precious Red Sanders Wood of the South sea islands, for a specimen of which we are indebted to Sir Joseph Banks, whose scent resembles that of the East Indian wood of the same name. The tree which produced it was, as long as possible, kept from the knowledge of our European voyagers.

2. X. orbicularum. Entire-leaved Sweet-wood. Forst. Prodr. n. 381. Willd. n. 2. (Myroxylon orbicularum; Forst. Gen. 63. n. 2).—Leaves roundish, entire.—Native of Savage island. We have never seen a specimen of either species.

XYLOSTEON, a name by which some authors have called the small red-berried double-fruited chamaeccephus.

XYLOSTEUM, Dod. Pempt. 411. Tourn. 609. t. 379. Juss. 212. Pursh 161. (Chamaeccephus; Tourn. ibid.). A word formed of xylon, wood, and eidos, being synonymous with a Swits name for the same shrubs, which alludes
alludes to the hardnecfs of their wood, and perhaps to its
rubber afiform, filled with pith, as a bone is with marrow.
The authors who retain this genus split the Lonicer of Linnaeus, as (see that article,) into several, without necessity
or utility, offering, in our opinion at leaft, great violence to
nature.

XYLOSTROMA, so called from ἔξω, wood, and κύστις, a flatum, or layer, because this fungus forms indefinite
terminate expansions, like cloth or leather, in the infide of
the trunks or branches of trees.—Tode Fung. Mecklenb.
Fungi angiospermi?

Eff. Ch. Expanded, coriaceous, two-fid, shapefes, concceded; surface smooth and even. Seminal globules very
minute, attached to internal fibres.

f. 51. Sowerb. Fung. t. 358. (Racodium Xylostroma;
Perf. Syn. Fung. 702. Fungus coriaceus quercinus kctam-
todes; Raîi Syn. 25. " F. ampliflimus; Scop. Pl. Subterr.
116. t. 44." Byfus candida ; Lightf. Scot. 1004.)—
This fingular production is found in the centre of the trunks of growing trees, spreading in the form of a piece of
cloth or leather, with numerous ramifications, through some of
the largest trees. But whether it is, like the Boletus lucthymans, or Dry Rot, in wrought timber, the cause of
their decay, or its confequence, we have not sufficient infor-
mation to decide. Tode’s obfervations countenance the
former opinion. He fays the wood of the trees, occupied by
this fungus, becomes rotten and perfectly dry. Its
fhme surfaces are owing to the smoothnefs of the fiffures,
through which it fpreads in a tender flate, and its branching
indeterminate figure arises from the irregularity and subdi-
vifion of those fiffures. The infide is fpongy, or partly
hollow, occupied with branching fibres, bearing numerous
little ovate capsulates, or receptacles, whole apex appeared
in Mr. Sowerby to have an opaque flid. The whole fungus is
very durable, remaining unchanged for many years. Its
lue is generally an uniform buff or pale tan colour; but
Perfons notices a whitifh variety, more compact than the
ufual kind; and a faffron-coloured one, found by Schrafen.
We cannot well reduce the Xylostroma to any other genus
of this natural order. The Racodium, Perf. Syn. 701, de-
fined as “ expanded and soft, refembling cloth in its defibly
interwoven fibres,” feems to us but a vague affimilation;
the firft species being Byfus nigrar, which fome make a
Lichen, others a Conlferva; the fefond a Musor.

XYLOSTROTTON, formed of ἔξω, wood, and κυστις,
lochat, among the Ancients, an appellation given to Mofaic or
chequered work.

XYLUS, in Ancient Geography, a town of Asia Minor,

XYMETHUS, a town of Africa, in the interior of
Cyrenaica. Ptol.

XYMPATHESIS, a word used by fome of the old
medical writers for fympathy.

XYNERESIS, formed of ἔξω, or συς, together, and
αϕης, J feel, a word used by Hippocrates, and others of the
ancients, to express a firm cohesion or connection of any
two things. Some use it to express that firm flitting togethcr,
or clenching of the teeth, which happens in convulsions.

XYNIA, in Ancient Geography, a borough of Thessaly,
on the confines of Phthoebia, near a lake of the fame name.

Linn.

XYNOECA, formed of ἔξω, or συς, with, and αϕης, I
inhabit, a faetl among the ancient Athenians, instituted on
occasion of Thefeus’s uniting all the petty communities of

Attica into one commonwealth; the assemblies of which
were to be held at Athens, in the Pytbanum.

XYPHIOD, in Anatomy, a name given to the cartil-
geage, which forms the inferior extremity of the sternum.
See, the defcription of the fternum, in the article Lungs.

XYRIS, in Botany, an ancient name, of unknown derivation,
ἐξως, or rather ἐξως, of the Greeks, supposed to be
long to our Iris faditifma, transferred by Gronovius to the
present genus, as one of nearly similar habit and characters.
They are not, however, of the fame natural order.—Linn.
v. 8. 818. Lamarck Illuftr. t. 36. Genr. t. 15.—Clafs
rather Tripetaloideae.) Junc. Juff. Refifaces, Brown,
Kunth.

Gen. Ch. (corrected from Brown and Gartner), Cal.
Perianth inferior, of three concave flabby leaves; the outer-
most hooded, deciduous; the two lateral ones keeled, com-
pressed, curved, acute, converging, permanent. Cor. Pet-
tals three, large, spreading, flat, crenate; with narrow
claws, as long as the calyx. Nectaries three, feathery,
alternate with the petals; inferted by Brown and Kunth to
be barren flaments. Stam. Filaments three, inferted into the
clasps of the petals, much shorter than the limb, thread-
shaped, creaf; anthers oblong, incumbent. Pflf. Germs
superior, obovate, three-lobed; ftyle one, thread-shaped,
rather longer than the clasps of the petals, three-celt at the
summit; fflagrs obtufe, entire, or jagged. Peric. Capsu-
le roundifh, of one cell and three valves, with three or
fes prominent receptacles, running down the middle of
each valve. Seeds numerous, minute, roundifh or elliptical,
acute.

Eff. Ch. Calyx of three unequal leaves; the two lateral
ones permanent. Petals three, equal. Nectaries three,
feathery. Capsule superior, of three valves, with central re-
ceptacles. Seeds numerous.

A genus of perennial herbs, with fibrous roots. Leaves
radical, numerous, fword-shaped, or thread-shaped; dilated,
equitant, and membranous at the bafe. Flower-flalk per-
fettly fimple, wrapped in a fheath at the bottom. Head
terminal, solitary, its fcales membranous, fingle-flowered,
clofly imbricated; the outer ones sometimes empty, and
differ from the ref. Anthers pofterior. Brown. flowers
almost invariably yellow.

Linnaeus was acquainted with but one species, X. indica.
Several others have been determined by various authors, in-
formuch that Willdenow defines four, and Vahl ten in all.
Mr. Brown has fifteen from New Holland alone, and there
is a new one from South America. The author juft men-
tioned divides this genus into two fections. Thofe species
which belong to the firft fection have a capule of one cell,
whose receptacles are separate at the bafe; of thofe there
are thirteen found in New Holland. The second fection is
characterized by a capule incompletely divided into three
cells, the receptacles being combined in their lower part.
Of this there are two New Holland species. It is utterly
impossible for us to follow this arrangement, few people
having been half the species in any flate, much lefs their ripe
capules. We are pollefled of ten, which appear to be
different, and which can be referred, with tolerable certainty
in general, to as many defcribed species. For the remainder
we hall cite our authorities.

1. X. indica. East Indian Xyris. Linn. Sp. Pl. 62,
excluding the synonyms of Gronovius, Morehon, and Pifo.
Linn.
Linn. Zeyl. 14. Willd. n. 1. Vahl n. 1. (Gladiolus indicus, flore tripetalá; Rudb. Elsy. v. 2. 127. f. 8. Gladiolus laciniatus ascendas malabaricae, e capitulo botryoidi florifera; Pluk. Almag. 170. t. 416. f. 4. Kotsjelitzi—pulla; Rheede Hort. Malab. v. 9. t. 71. Ramnotta; Hern. Zeyl. 4.)—Stalk furrowed, with many angles. Head ovate.—Native of the East Indies, and perhaps of Sierra Leone. The leaves are described by Vahl as sometimes a foot long, equaling the flower-flasks, lax, acute, almost the breadth of the leaf; but he never saw any so broad as in Rheede's figure. The flower-flasks are several, rather more slender than a pigeon's quill, furnished with six or eight furrows, and twilled in the lower part. Head rather smaller than a Hazel-nut, with roundish scales. Our specimens, gathered by the late Mr. Smithaston at Sierra Leone, have no leaves, but the stalk and head answer exactly to the above description. The scales are from twenty-five to thirty in each head, rounded, or nearly obicular, convex, closely imbricated, obtuse, brown, but little polishes, divided lengthwise into three nearly equal spaces, or regions, (as is the case in most of the species that we have seen); the middle region here is slightly hoary or downy, the fide-ones smooth. The flowers are male. The head in these specimens is nearly globose; not oblong, as in Sertner's figure, marked X. indica. A few of the lowest scales are flatter and rather smaller than the rest, apparently always barren, or unaccompanied by flowers. Whatever Mr. Pursh's X. indica may be, it cannot belong to this species. He describes the leaves very long and graily, twilled as well as the flasks.

2. X. pubescens. Downy-sheathed Xyris. Poiret n. 1.—"Stalk fliered, almost cylindrical, enveloped in a downy sheath. Leaves greatly elongated."—Received by profcorv Desfontaines, from the West Indies. Nearly related to X. indica, but differing in several characters peculiar to itself. The roots are long, as thick as the finger, with foth, rather fleshy, nearly fimple, fibres, thin as a raven's quill; and producing from the crown a great number of foth, fliad, alternate, somewhat imbricated, very smooth leaves, a foot or foot and a half long, half an inch wide, entire, pointed; dilated at the base. Stalks fliad, rather flied, twilled at the lower part, where they are each embraced by a cylindrical, fliered, downy sheath, three or four inches long, terminating in a little short acute leaf. Head of flowers ovate, obtuse, the fize of a large pea, formed of numerous, imbricated, very clove, unequal, whifhit scales; the outer ones a little dilated, ovate, near flat, fcarcely pointed; the inner narrower, obtuse, rather con- cave. Poiret. See our X. anceps, which has also a very long leafy-pointed leaf, but it is quite smooth.

3. X. marcescens. Great-headed Xyris. Vahl n. 2.—"Stalk with one acute angle. Head and fcales ovate; the latter grey at the back."—Native of Cayen. Derived from the herbarium of profcorv Desfontaines. The leaves are eighteen inches long; as broad as the nail, or broader. Stalks taller than the foliage; round in the lower part; somewhat two-edged further up, with one convex and one acute fide. Head when in fruit twice as big as a Hazel-nut, ovate, with obtuse fcales. This differs from the rest in the breadth of its leaves, and the fize of the head. Vahl.

4. X. platycalyx. Broad-flaked Xyris. Poiret n. 4.—Stalk compressed, dilated, fliered, smooth; twilled below; with a lax, cloven, abrupt fheath at the base. Heads glo- bose, abrupt at the summit.—Gathered by Commerfon in Madagascar. Leaves wanting in the specimens. Stalks a foot high; or two or three lines broad. Sheath at leaf three inches long, smooth, fliered, rather lax, cloven lengthwise, obliquely truncated at the fummit. Head hardly so big as a pea, flattish at the top, with broad, obtune, concave, shining, chefnut-coloured fcales, the outer ones keeled towards their point. Poiret. We have enlarged the author's specific orher to his own description, in order the better to contrast this species with the two following, with which it appears to agree in the flatness of the flals.

5. X. aceps. Small-headed Two-edged Xyris. La- marck Illustr. v. 1. 132. Vahl n. 9.—"Stalk two-edged, smooth. Head nearly globose."—Native of Madagascar, and Malabar; perhaps also of Guiana. Leaves rather rigid, narrow, but one-third or one-fourth the height of the flals, which are several, a foot or more in height, twilled, smooth, by no means fliered. Head scarcely so large as a pea, with roundish, convex, hardly emarginate, fcales. Pe- tals yellow, finely toothed. Vahl. A Guiana specimen, communicated by Mr. Rudge, remarkable for the smallness of its head in proportion to the herbage, answers precisely in every point to Vahl's description. Aquatic, or marsh- plants, such as the species of this genus, are known to grow, more than any others, in widely different and dissimilar parts of the world. We have suspected this Guiana specimen might be Poiret's X. pubescens n. 2; but the sheath at the base of the flals is not pubescent.

6. X. complanata. Flat-flaked Xyris. Brown n. 1.—"Stalk compressed flat, dilated, nearly flied; cartilagin- ous and rough at the edges, four times as long as the fword- shaped, flied, bordered, roughish leaves. Spike oblong or cylindrical. Scales orbicular, timid."—Gathered by Mr. Brown, in the tropical part of New Holland. The fals is a line and a half froad. We have seen no specimen.

7. X. fabra. Rough Xyris. Br. n. 2.—"Stalk two- edged, twilled, with rather acute and rough angles. Leaves linear, roughfhit. Head ovate or oblong."—From the same country. The fals is hardly a line in breadth. Brown.

8. X. levis. Smooth Xyris. Br. n. 3.—"Stalk two- edged, smooth, as well as the narrow linear leaves. Head nearly ovate. Scales imbricated every way. Keels of the calyx-leaves fringed."—Gathered by Mr. Brown near Port Jackson, as well as in the tropical part of New Holland. The flals are from fifteen to eighteen inches high.

—Native of moit paitures in Brafil, flowering in the rainy feafon, according to Pito, whole fynonym was verified by Vahl, from an infpefion of Maregraafs herbarium. Aubl found the fame in wet meadows near the river Macouria, in Guiana, flowering in December; but his figure is made up, as Vahl observes, with the leaves of an Ericacol; the fcales of the head, and the flowers, being moreover very ill drawn. We have never met with a specimen anfwering to this species. Vahl fays the leaves are graidly, narrow, and acute, hal the length of the flals, which is a foot or more in height; round in the lower part, with two prominent lines running down it; compressed in the upper part, and a little dilated under the head. The latter is obtufe, rather bigger than a pea. Scales oblong, concave, cloven at the point, with a brownfhit, rather callous point in the notch. Vahl. The corolla is faid to be blue, of which we know no other infance in this genus.

Xyris.

Carolina. *Vahl.* Found in low grassy fields, on a sandy soil, from New Jersey to Florida. Perennial, flowering from June to August. Heads small. Flowers yellow. It is extremely variable. *Pursh.* Vahl thought this species distinct from the last, in having more rigid leaves, and larger heads, which are acute, instead of being remarkably obtuse. The flowers moreover are yellow, not blue. The leaves vary in length. The heads in Lamarck's specimens are longer than those of Richard's. *Vahl.* We have not seen this species, but it seems that more than one may possibly here be confounded.

11. *X. torta.* Twisted-leaved Xyris. (X. indica; Pursh n. 1, excluding the synonomy.)—Leaves linear, spirally twisted, as well as the stalk, which is two-edged below, quadrangular at the upper part. Head globose. Scales polished, rounded, somewhat emarginate, pointless, with a small silky disk.—Gathered in North America by Kalm. Linnaeus confounded his specimens with *X. indica,* which he knew but imperfectly. They appear, however, to answer exactly to the *indica* of Pursh, who very properly gives an original specific character, instead of copying what did not agree with the plant before him. He found it in overflowed meadows, and small ponds, from Pennsylvania to Virginia; perennial, bearing yellow flowers in June and July. He calls the leaves "longissima graminis." In our specimens they are from one to ten inches long, a fine broad, acute, many-ribbed, roughish at the edges, perfectly gramineous; the outermost degenerating into broad, short, chefnut-coloured, pointed, imbricated scales. *Stalks* solitary, about two feet high; nearly round, though two-edged and flattened, at the bottom, as well as very much twisted, even more than the leaves; the upper part is less fo, more evidently two-edged; and towards the top there are four, not always equal, angles. *Head* the size of a large white currant, obtuse, of a shining chefnut-colour. *Scales* almost orbicular, convex; dilated and thin at the edges; marked at the back, just below the notch, with a pale, greenish, silky spot. Two or three of the lowermost of all are smaller, flatter, a little keeled.

12. *X. pufilla.* Dwarf Broad-leaved Xyris. *Brown* n. 4.—Stalk two-edged, smooth, like the short, sword-shaped, two-ranked, equitant leaves. Head orbicular, comprefsed, of a few shining, somewhat keeled and pointed, scales.—Gathered by Mr. Brown, in the tropical part of New Holland. Our specimens, in the herbarium of the younger Linnaeus, were probably given to him when in England, by Sir Joseph Banks and Dr. Solander. The *flanks* are from two to five inches high, pale green, a little zigzag and twisted, somewhat quadrangular; sheathed at the base with one or two *leaves,* which, like those that grow from the root, are about an inch long, and two or three lines broad, slightly incurved at the point, of a pale rather shining green, with several ribs, and a finely dotted, reticulated, surface in the dry state. *Head* the fize of a pea. *Scales* orbicular, convex, of a shining chefnut-brown, pale at the edges; the two lowermost equal, without *flowers,* in an early state covering the whole head, and furnished with a strong, green, pointed keel.

13. *X. dentiflora.* Tooth-leaved Xyris. *Br.* n. 5.—Stalk roundish, smooth. Leaves short, linear-awl-shaped; rough with minute marginal teeth. Head globose. Scales orbicular, shining, keeled at the summit.—Gathered in the tropical part of New Holland, by Sir Joseph Banks and Dr. Solander, who gave specimens to the younger Linnaeus. This is about the fize of the last, or rather taller. The *root* consists of very small fibres. *Leaves* from one to two inches long, not a fine broad, their fine reticulations seeming to form the little teeth, at the margin and keel. *Stalk* slender, fribated or angular towards the top. *Head* twice the fize of the last, of more numerons, bright-chefnut *scales,* with thin, pale, often jagged margins, and a little green short keel, or point, not extending beyond the fcale. The two lowermost *scales* are barren, as in the preceding, and in a young flake enehe the whole head.

14. *X. paludosa.* Bog Xyris. *Brown* n. 6.—"Stalk roundish, smooth; angular at the top. Leaves somewhat tubular; that of the *flalk* longer than the theahe. Head nearly globular. Scales orbicular, shining, imbricated every way."—Found in the tropical part of New Holland, by Sir Joseph Banks and Dr. Solander. We have seen no specimen, nor did Mr. Brown himself meet with this or the last species, any more than with the *pau/iosa* hereafter described.

17. *X. pau/iosa.* Few-flowered Xyris. *Vahl.* n. 2. *Phytogr.* 2. t. 1. f. 1. *Vahl* n. 8. *Br.* n. 7.—Stalk quadrangular. *Leaves* linear; rough with minute marginal teeth. *Head* nearly globular. *Scales* shining, orbicular; spreading at the point, with a short triangular keel.—Gathered by Koenig and Rottler in the East Indies; and by Sir Joseph Banks, in the tropical part of New Holland. The *root* is a small dense tuft of pale fibres. *Stalk* from one to six or eight inches high, erect, straight, slender, fribated, roughish. *Leaves* several, erect, sometimes nearly as tall as the *flalk,* graffy, very narrow, taper-pointed, fribated, roughish, especially at the edges, where they are minutely toothed, or crenate, as in *X. dentiflora,* n. 13. *Head* the fize of a large pea. *Scales* chefnut-coloured, with a membranous, dilated, shining margin of a golden yellow, and each tipped with a green, triangular, projecling keel, or point, originating from the brown disk, but not extending beyond the membranous margin, with which it is incorporated. The prominence of this point, giving the head a squarrose aspect, is well expreffed in Willdenow's, otherwise miserable, figure. The two lowermost *scales* are barren, and closely preffed to the next. *Carrolla* yellow.

18. *X. bracteata.* Bracteated Xyris. *Br.* n. 8.—Stalk triangular. *Leaves* linear; their margins, and base of the keel, rough. *Head* roundish. *Scales* with a hoary disk, and brown membranous margin; the lower ones oblong, empty, with a linear disk.—Sent from Port Jackson, New South Wales, by Dr. White, in 1792. Mr. Brown found it in the same country, and we borrow from him the above characters of the *leaves,* wanting in our specimens. The *flalk* is a foot and a half high, fribed and rough, bluntly triangular, even, smooth to the touch, though Mr. Brown remarks that its moist acute angle is roughish. *Head* rather ovate.
XYRIS.

ovate than perfectly globose, one-third of an inch in length. *Scales* elliptical, abrupt, or partly margined; their disk elliptic-obovate, convex, not keeled, of a hoary or glaucous hue, finely dotted, not downy; their margin, at each side, about half as broad, membranous, of a shining brown, paler outwards. Three, four, or more, *scales*, at the bottom of each head, are di-tilated of flowers, shorter, much narrower, abrupt, oblong, not elliptical, with a peculiarly narrow disk, and have the appearance of *bracteae*. *Corolla* rather large, yellow, turning white in decay.

19. *X. juncea*. Rushy *Xyris*. Brown n. 9.— "Stalk roundish, flatly compressed, rather zigzag, smooth as well as the awl-shaped leaves. Head globose. Scales ovate, undivided, imbricated every way; their disk of the same colour as the margin. *Stigmas* many-cleft."—Gathered by Mr. Brown, in the neighbourhood of Port Jackson, New South Wales. The *flask* is only eight or ten inches high. We have no specimens answering to the above characters.

20. *X. gracilis*. Slender *Xyris*. Brown n. 10?—Stalk thread-shaped, smooth, scarcely twisted. Leaves linear, straight, rather engorged. Head oval, of few flowers. Scales imbricated every way; their disk hoary, margin blackish. *Stigmas* undivided.—Sent from Port Jackson, in 1792, by Dr. White. Mr. Brown mentions only the south part of New Holland, and Van Diemen’s Island, as the native country of this species, and yet we cannot refer our specimens to any other mentioned by him. Our plant is about half the size of *X. bracteata*, with fewer and paler flowers. *Head* small, elliptical, or obovate. *Scales* with a broad, hoary, or glaucous, disk, like that of the *bracteata*; but their membranous margin is of a darker brown, and, at the upper part of each scale, quite black, as if burnt. Several of the lowermost flae are smaller, linear-oblong, and of a more uniform brown. The *flages* are long, and undivided. *Stalk* somewhat compressed, fiddleneck above a foot high; Mr. Brown says a foot and half.

21. *X. filiformis*. Thread-shaped *Xyris*. Lamarck Illust. 132. Vahl n. 9. Poiret n. 9.—Stalk thread-shaped, compressed. Leaves linear-awl-shaped, compressed, two-ranked. Head and scales elliptical; disk and margin uniflorous; with a light trace of a keel.—Gathered by the late Mr. Smeathman, as well as by Dr. Adam Aitzellus, in marly sandy ground at Sierra Leone. The *root* is small and fibrous. *Leaves* four or five, fiddleneck, equitant, erect, linear-awl-shaped, compressed, very narrow, tapering, but rather obtuse at the point; their surface minutely speckled, and more or less evidently reticulated, or dotted; their length, in our specimens, from one to two inches; *Vahl* fidesflectly half an inch. *Stalk* solitary, six or eight inches high, very slender. *Head* the size of hemp-seed, but more oblong, acute at each end, of a copper-brown, not very shining; the two lowest flae are round, neither pale, more oblong, and strongly keeled; the rest elliptical, bluntly pointed, very smooth and even, without any limited disk, but sometimes marked with tenon of beautiful concentric veins; their keel feebly discernible, except in the form of a short pale elevation, near the apex, but not projecting into a point. *Corolla* yellow, small.

22. *X. flexifolia*. Wavy-leaved *Xyris*. Br. n. 11.— "Stalk thread-shaped, twisted, smooth, as well as the zigzag, flender, slightly compressed, leaves. Head oval, with few flowers. *Stigmas* undivided."—Found by Mr. Brown, on the southern coast of New Holland. *Stalk* from six to twelve inches high.

24. *X. lacerata*. Jagged-headed *Xyris*. Br. n. 15.— "Stalk round, smooth. Head nearly globular, many-flowered. Scales imbricated every way, torn into many segments."—Discovered by Mr. Brown, on the south coast of New Holland. We have seen no specimens of this, or the two species immediately preceding.

26. *X. vivipara*. Viviparous *Xyris*. Kuntz n. 2.— "Stalk somewhat compressed; roughish at the top. Leaves linear-awl-shaped; their sheaths fringed. Head globular; at length leafy and viviparous."—Gathered by Humboldt and Bonpland on the banks of the river Oroonoko, between the mouths of Venturius and Guaviare, flowering in May. *Root* fibrous, perennial. *Leaves* all radical, two-ranked, from two to four inches long, erect, bluntish, flatish, smooth, except a little roughness at the back; their *leaves*: keeled, fringed, fringed, roughish also at the back. *Stalks* about a foot high, smooth, except some roughness points towards the summit; enveloped at the base with a fringed, keeled, bluntish, smooth, rough-backed *flabellum*, an inch and a half long. *Head* globose, rather abrupt, the fize of a pepper-corn. *Scales* roundish-ovate, bluntish, brownish, coriaceous, smooth, rather transparent at the margin. After flowering, the head throws out from its centre a leafy crown, which becomes a young plant. *Kuntz*.

We are not told whether this leafy tuft originates in the vegetation of one or two of the seeds; or in the *germen* being inculpated in the flower by a bud; or, which is the leaft likely, in a proliferous elongation of the *flask*, independent of the parts of fructification altogether.

27. *X. operculata*. Imbricated *Xyris*. Labill. Nov. Holl. v. i. 14. t. 10. Brown n. 14. Poiret n. 13. Curt. Mag. t. 1158.—Capsule partly three-celled, *Stalk* round. *Leaves* thread-shaped. *Head* obtuse. *Scales* beardless, imbricated in five rows, with numerous empty ones, gradually smaller at the base.—Sent from Port Jackson, New South Wales, by Dr. White, in 1792. Mr. Brown also observed it there; and Labillardiere in Van Diemen’s Island. Neither the figure of the last-mentioned author, nor that in the Botanical Magazine, by any means represents the remarkable charafter of the five-ranked flae of the *head*, and the numerous, gradually diminishing ones, destitute of flowers, at its base; so that, but for Mr. Brown’s authority, we should have supposed our Port Jackson plant to be essen- tially and widely different. Dr. White’s specimens are without leaves. The *flask* is about eighteen inches high, round, or slightly angular, quite smooth. *Head* obtuse, full half an inch long, with five rows of very numerous obvolute flae, whose broad convex disk is of a bronze-like hue; the margin brown and narrow, more or less jagged, with a deciduous tooth-like fringe. *Flowers* large, bright yellow. *Stigmas* obtuse.

28. *X. lanata*. Woolly *Xyris*. Br. n. 15.— "Stalk round, smooth. Leaves linear, narrow. Head nearly glo- bular. Scales woolly at the extremity, imbricated in five rows, with several empty ones, gradually smaller at the base."—Gathered by Mr. Brown, on the southern coast of New Holland.

The above great accession of new species throws much light
light on this hitherto little-known, and ill-described, genus of plants. Could they all be compared together, even in a dried state, we have no doubt that their specific characters, and the principles on which they are founded, would derive considerable improvement; and that Xyris, whose generic marks are so well established, would afford a beautiful display of clear and specific specific discrimination. Whether the leaves of any of the species be really toothed, in a living state, we have considerable doubt. Their foliage partakes greatly of the cellular texture, so remarkable in the neighbouring genus Ericea;alum; with which also they closely accord in inflorescence, and general habit. Mr. Brown, in his Prodromus, has elucidated both these genera, as far as concerns their numerous New Holland species, with infinitely more success than any other botanist; the one genus having previously been feebly better understood than the other.

XYSMALOBium, from Συμαλαμάν, a shrub, or narrow-bered, and λαμβία, a pod, alluding to the thready coat of the seed-vest, which is very peculiar.—Brown Transf. of the Wernerian Soc. v. 1. 38. Asclepias. 27. Ait. Hort. Kew. v. 2. 79.—Clasf and order, Pentandria Digynia. Nat. Ord. Contorte, Linn. Apocinea, Jaff, Asclepiadse, Brown.

Gen. Ch. Cal. Perianth inferior, of one leaf, in five deep, lanceolate, acute, permanent segments. Cor. of one petal, in five deep, ovate, spreading, rather oblique segments. Crown of the flamin in a single row of ten deep segments; five of them feathery, roundish, opposite to the anthers, simple at the inner side; five intermediate ones smaller. Stam. Filaments scarcely any; anthers five, each tipped with an ovate blinfh membrane; mafles of pollen ten, compressed, smooth, pendulous, with rather broad con-necting procde. Pil. Germens two, ovate, pointed; styles very short; common stigma pointtles. Peric. Folicles two, inlaced, clothed all over with numerou5, long, fonder, tapering, hairy, filamentous proc fuse. Seeds numerous, imbricated, crowned with silky down.

A genus of upright shrubs, with opposite, fometimes alternate, leaves. Umbel lateral, either axillary, or between the ftoofstalks. Flowers rather large; the limb of the corolla sometimes bearded. Only two species are at present known, both natives of Southern Africa.

1. X. undulatum. Waved-leaved Xyismalobium. Dryand. in Ait. n. i. (Asclepias undulata; Linn. Sp. Pl. 312. Willd. Sp. Pl. v. 1. 1262. See Asclepias, n. i. Aponynum africamum, lapathi folio ; Comm. Var. 16. t. 16.)—Leaves undulated, naked. Corolla bearded. Native of the Cape of Good Hope. Sent to Kew garden, in 1763, by Mr. John Grazier. This is a green-houfe plant, flowing in July. Mr. Aiton marks it as a shrub; but Co-melin fays the thick, white, perennial root fends up every year, in the early spring, two or three thick, round, green, leafy stems. All authors fpake of the leaves as opposite; but in our Linnean fpccimen, gathered at the Cape by Thunberg, they are alternate, fefile, three or four inches long, ovato-lanceolate, gradually tapering to a blinfh point, with a thick mid-rib, and numerous interbranching veins; nearly smooth on both fides; undulated and rough breath. Umbels axillary, falked, much shorter than the leaves, with falty falks, and linear hairy branches. Flowers green, their segments densely bearded at the extremity, with white faggy hairs. Follicles covered with fpreadiig hairy filaments, an inch long. Every part of the plant, when wounded, difcharges a copious milky fluid.

2. X. grandiforum. Large-flowered Xyismalobium.
Y

The twenty-third letter in the English alphabet, borrowed, originally, from the Greek ι.

It is occasionally both vowel and consonant. As a vowel some authors have judged it unnecessary in our language, because its sound is precisely the same as that of the i. Accordingly, it is but little used, except in words borrowed from the Greek, to denote their origin, by representing the Greek υ ὑ.

The vowel y, however, has a place even in some words purely English; and that both in the middle of them, as in dying, frying, &c. and at the end, as in lay, &c.

Some ascribe the use of the y, in pure English and French words, and those that have no y in Latin or Greek, to this; that anciently each of those words was written with a double ii; which having something awkward in it, the y was substituted in their place.

Others say, that those words being anciently written, as well as pronounced, with a double ii, as they still are in the Walloon, as paining, painifan, &c. to avoid their being mistaken for an u with two dots over it, they made the second i longer than the first, and so formed the y without defigning it.

Some give a particular reason why words ending in i came to be written with y; viz. that the copysts found the tail of the y very commodious, in adorning the margins and bottoms of pages.

Y was much used by the Saxons; whence it is found for i in the old English writers.

When the y follows a consonant, and at the end of words, it is a vowel, and has the sound of i; and when it precedes a vowel, or diphthong, and at the beginning of words, it is a consonant.

Some have thought that y is in all cases a vowel; but Dr. Johnson observes of y, of as, that it follows a vowel without any hiatus, as it is the Saxons; whence it is found for i in the old English writers.

The Romans used the y for the vowel u, which they had no character for, distinct from the ο consonant; their way being to pronounce the common u, as we do the diphthong eu; and the Greek υ ὑ, as the English and French u.

Peter Diaconus observes, that Augustus first took the letters y and ι from the Greeks, which were not used by the Romans before his time; ι ι being written for ι, and i for ι. But Mr. Jackson shews, that the y was used before the time of Augustus, though probably (says Aristotle, Orig. and Progr. of Writing, p. 78.) it was not much older.

In our own and some other modern tongues, authors begin to dispense more and more with the precise orthography, which requires all words that have an upilon, in the Greek, to be written with a y. And with reason; since our Greek y has lost the sound it had, in the language from which we borrow it. But it is certainly ridiculous to use it, as many do, in words which indeed have a Greek origin, but have no u in the Greek, as in ecclife: yet some affect to do this.

Y is also a numeral letter, signifying 150, or, according to Baronius, 159; as in the verfe—

"Y dat centenos et quinquaginta novens."

When a dash was added at top, Y, it signified 150 thousand.

Pythagoras used the Y as a symbol of human life; the foot representing infancy, and the forked top the two paths of vice and virtue, one or the other of which people are to enter upon, after attaining to the age of discretion.

Y, on the French coins, denotes those struck at Bourges.

Y, in Geography, a city of China, of the second rank, in Chan-tong; 317 miles S.S.E. of Peking. N. lat. 35° 10'. E. long. 118° 19'.

Y, a city of China, of the second rank, in Pe-tche-li; 55 miles S.W. of Peking. N. lat. 39° 25'. E. long. 115° 14'.

Y, or Ey, a river, or broad piece of water, which palls by Amsterdam, exhibiting the appearance of a creek of the sea rather than of a river.

YA, a city of China, of the second rank, in Se-tchuen, on the borders of Thibet; 840 miles S.W. of Peking. N. lat. 36° 35'. E. long. 102° 39'.

YABAQUE, one of the Bahama islands, situated in N. lat. 23° 30'.

YABARGULSKAIA, a town of Russia, in the government of Tobolik, on the Irtsch; 120 miles E. of Tobolik.

YABAY, a town of Burmah; 50 miles S.W. of Ava. YABTONOI, a ridge of the Altai chain in Asiatic Russia, bending in a northerly direction to the vicinity of Ochotk. The name denotes the mountains of Apples.

YACHT. See Ship, and Plate XIII. Ship-Building.

YACHTA, in Geography, a fort of Russia, in the government of Irkutsk, on the borders of China; 48 miles S.S.W. of Selengink.

YACINTE, St. See St. Tainite.

YACONG TALA, a number of small lakes in Thibet, situated near each other. N. lat. 30° 52'. E. long. 78° 39'.

YADAVA, in Hindoo Mythology, a name of the Hindoo Kriithns. It is said to indicate his being of the family or tribe of Yadu.

YAD, in Geography, a river of Russia, which runs into the Obâkaia gulf, N. lat. 68° 25'. E. long. 72° 38'.—

ALSO, a river of Russia, which runs into the Obâkaia gulf, N. lat. 67° 25'. E. long. 72° 18'.

YADKIN, a river of North Carolina, which rises in the F Allegany.
Allegany mountains, and after a course of about 100 miles, changes its name to Pedee, in North Carolina; 9 miles S.W. of Salem.

YADRIN, a town of Ruffia, in the government of Kazan; 122 miles W. of Kazan. N. lat. 55° 34'. E. long. 45° 44'.

YAEGONMEEW, a town of Pegu; 58 miles S. of Prone.

YAFFA. See Jaffa.

YAGARCHOCA, a lake of South America, in the jurisdiction of St. Miguel de Ibarra. It is famous for having been the sepulchre of the inhabitants of Otolcho; upon this place being taken by Huana Capac, the 12th ynea, he, instead of offering any clemency to them on account of their magnanimity, being exasperated at the noble refilance which they made against his army, ordered them all to be beheaded, both those who had quietly surrendered, as well as those taken in arms, and their bodies to be thrown into the lake; so that from the waters of the lake being tinged of a bloody colour, it acquired its present name, which signifies a lake of blood.

YAGATH, in Mythology, a deity adored by the ancient Hindoos, or under the figure of a lion.

YAGO, St. in Geography. See St. Tago.

YAGUACHE, or ST. JACINTO DE YAGUACHE, a town of Peru, and principal place of a lieutenantcy, in the province of Guayaquil; 25 miles N.E. of Guayaquil.

YAGUASH, a town of the island of Cuba; 22 miles S. of Bayamo.

YAGUARIBE, a river of Brazil, which runs into the Atlantic, S. lat. 13° 12'.

YAGUARON, a town of South America, in the province of Paraguay; 10 miles S.E. of Assumption.

YAGUEPIRI, a river of Brazil, which runs into the Negro, 50 miles above Fort Rio Negro.

YAH, in Hindu Mythology, a name of Pavana, the Hindoo god or regent of the wind; another of whose names is Vayu. See PAVANA and VAYU.

YAHANGA, in Geography, a small island in the sea of Japan. N. lat. 43° 8'. E. long. 131° 45'.

YAHEBIRI, a river of South America, which runs into the Parana. S. lat. 24° 42'.

YAIK, a considerable stream of Atavtic Russia, which flows into the Caspian. The name has been recently changed for that of Ural, on account of a daring insurrection of the tribes bordering on the YaiK.

YAITCHNEI, a small island of Russia, in the Penzinsko fea. N. lat. 60° 30'. E. long. 165° 50'.

YAIVA, a river of Russia, which runs into the Kama, 16 miles S. of Solikamsk, in the government of Perm.

YAK, in Zoology, the bar grunniens of the Linnaean syllen, or ox with cylindric horns curving outwards, very long pendant hair, and extremely villous horfe-like tail, the grunting ox of Pennant, and yak of Tartary, has been lately particularly described by Turner, in his "Embassy to Tibet." He calls it the bashly-tailed bull of Tibet; and in Hindooslan it is denominated foora goy. It is about the height of an English bull, which it resembles in the general figure of the body, head, and legs. He could discover no difference between them, except that the yak is wholly covered with a thick coat of long hair. The head is rather short; the horns tapering from the root, upwards, and terminating in sharp points; arched inwards, and bending towards each other, but a little turned backwards near the extremities; the ears small; the forehead prominent; the eyes full and large; the nose small and convex; the nostrils small; the neck short and curved; the withers high and arched; the rump low; over the shoulders rises a thick mufcle, like the protuberance peculiar to the cattle of Hindooslan, covered with a profusion of soft hair; the tail composed of a prodigious quantity of long, flowing, glossy hair; the shoulders, rump, and upper part of the body, clothed with a fort of thick soft wool, the inferior parts having strait pendant hair that descends below the knee, and sometimes trailing on the ground; from the cheek, between the legs, iflies a large pointed tuft of straight hair, somewhat longer than the rest; the legs very short. In all other respects, this animal resembles the ordinary bull. These cattle appear of a large bulk; they have a downcast heavy look, and, as they appear to be, fallen and fupplious, and very impatient at the near approach of strangers. Their lowing is not loud, but a kind of fearfully audibly grunting noise. They are paitured in the coldest parts of Tibet, on the short herbage peculiar to the tops of mountains and bleak plains. Their favourite haunt is the chain of mountains that is situated between the latitudes 27° and 28°, which divides Tibet from Bootan, and whose summits are commonly covered with snow. They are a valuable property to the tribes of itinerant Tartary, called Duckba, who live in tents, and tend them from place to place; they at the same time afford their herdsmen an easy mode of conveyance, a good covering, and wholesome subsistence.

They are never employed in agriculture, but are very useful as beasts of burden; for they are strong, sure-footed, and carry a great weight. Tents and ropes are manufactured of their hair, and caps and jackets are made of their skins. Their tails are much esteemed; and under the denomination of shewnies, they are universally used for driving away winged insects, flies, and mulipquitoes, and are employed as ornamental furniture upon horses and elephants. They supply an abundant quantity of rich milk and excellent butter, which may be kept in skins or bladders through the year, and to the utmost verge of Tartary furnishes a very material article of commercial produce. The orientals highly value a large kind of bezoor that is sometimes found in this animal's stomach. The yak is said to vary in colour, as well as in the length and form of the horns. Those with white tails are most esteemed; and sometimes their horns are as white as ivory.

In India no man of fashion ever goes out or sits in form at home without two "chow badar," or brushes, attired in each furnished with one of these tails, mounted on silver or ivory handles, to brush away the flies. The Chinefe dye them of a beautiful red, and wear them as tufts to theirummer bonnets.

Elhan, according to Pennant, is the only ancient writer who takes notice of this singular species.

YAK, in Geography, a name given by the Okiaks to the Oby; which see.

YAKE DSAKE, a lake of Thibet, about 12 leagues in circumference. N. lat. 34° 40'. E. long. 90° 24'.

YAKSAI. See AKSHA.

YAKSHA, in Hindu Mythology, a race of malignant beings of hideous form, into whom the souls of bad men are said to migrate; particularly the souls of such as in this life are addicted to foridic and base passions, or absorbed too much in worldly prosperity. In the plural, they are termed Yakshas; and are assigned as slaves or servants to Kuvra, the Plutus of the Hindoo Panteon. Another race of beings, of a like description, is called Raksha. (See that article.) Rakshni and Yakshni are the feminines of these races of demons. These names, and some notes of their characters
YAK

characters and attributes, occur in the articles Kuvera, Ravena, and Sitanta.

YAKSHNI-DEVI, a name and an inferior manifestation of the Hindoo goddess Parvati. It means goddesses of malignant beings; one race of whom are in the masculine termed Tafta, which article, and others thence referred to, the reader dehors of information concerning them may consult.

YAKSIMVAR, in Geography, a town of Russia, in the government of Viborg, on the north-west coast of lake Ladoga; 8 miles S. of Serdopol.

YAKUTS, a town of Russia, in the government of Irkutsk, on the Lena, which is here about two leagues in width; but it is greatly impeded with ice, and navigable only by a few small boats, chiefly employed in supplying the town with provisions. This town is the capital of a province, to which it gives name; it contains between 500 and 600 houses, mostly of wood, with stone churches, and is defended by a wooden fort. The best fables are found near this town and Nerchinsk; 960 miles N.E. of Irkutsk. N. lat. 63° 5'. E. long. 129° 14'.

YAKUTS, the Province. The Yakutes, or, as they denominate themselves, Sucho, or natives of this province, are robust, and in general large; they resemble the Tartars in the cast of their features, and there is said also to be a great similarity in the idioms of these two people. Their ancient homestead extended from the Sayane mountains as far as the Angara and the Lena. Persecuted by the Buruts and Mongoles, they removed down the Lena to their present rude and inclement districts, where they are found in the government of Irkutsk on both sides of that river quite to the Frozen ocean. In the year 1620 they submitted to the Russian conquerors, and at the middle of the last century they numbered upwards of 40,000 souls; but since that time they are considerably increased. Their dress is simple, and nearly the same all the year round; the only difference is, that in winter it is made of skins; over their chemise they commonly wear a large striped waistcoat with sleeves; their breeches do not extend below the middle of the thigh, but their long boots, called farri, reach above the knee. In hot weather they wear nothing but the breeches. Polygamy forms a part of the political code of this people; obliged to make frequent journeys, a Yakut has a wife in every place where he stops, but he never affames them together. Notwithstanding this licence, they are jealous to excess, and the sworn enemies of any one who shall dare to violate the rights of hospitality. When summer commences, they leave their winter habitations, and with their families and a small number of horses, make their harvests of fodder for consumption during the frost season. They repair to a considerable distance from their yourt, and to the most fertile cantons. In their absence, the horses are left to the care of the servants, and the neighbouring pastures serve for the maintenance of all their herds. Chamans, or forcerers, are regarded as interpreters of the gods; they grant their intercession to the stupid Yakute, who implores it with trembling, but always pays for it. In the idolatry of the Yakutes, we find all the abfurdities and superlative practices of the ancient Kamtchadales, Corliaks, Tchutchis, and other inhabitants of these countries. The funerals are attended with a kind of pomp more or less magnificent, in proportion to the rank and wealth of the defunct. If a prince, he is arrayed in his finest habits, and most splendid arms. The body, placed in a coffin, is carried by the family to the tomb; deep groans announce the solemn procession; his favourite horse, and another the best in his stud, both richly caparisoned, and led by a valet, or near relation, walk by the side of the corpse. When arrived at the burying-place, they are tied to two stakes, fixed near the grave, and while the matter is interred, their throats are cut over the corpse. This bloody libation is the homage paid to his attachment to these animals, who are suppos'd to follow him into the other world, where it is imagined that he will again be able to enjoy them. They are then flayed; the head and hide, in one entire piece, are fixed horizontally upon the branches of trees at a small distance from the grave; and fuch is the memorial that is erected. A fire is then kindled, and the laft proof of friendship for the deceased confists in roasting and eating upon the fpot their favour'd animals; the tabl being con- cluded the company difperfes. The fame ceremonial is observed for a woman, except that instead of a horse, they sacrifice her favourite cow. Their houfes, like the yorts of the wandering Koriaks, are circular, spacious, and constructed with poles, fewer in number, but ranged in the fame manner, and kept afunder by a fort of hoops at the top, the whole covered with the bark of the birch-tree, formed into pieces eighteen inches wide, placed in a downward direction. These pieces are edged with a kind of ribband, made of bark, and shaped into foetons, and the inside of the yourt is ornamented in the fame manner. The taste of the ornaments is governed by the caprice of the proprietor, and there is in them a fsort of wildnefs that is inefufficiently amusing. The fame decoration is annexed to the chairs and beds of the heads of families. The domestics lie upon the ground on mats or skins, and the fire is lighted in the middle of the houte. See YUHAGHIRS.

YALE, a town of the island of Ceylon; 36 miles S.S.E. of Candi. N. lat. 6° 52'. E. long. 81° 20'.—Allo, a river of Ceylon, which runs into the sea, on the S.E. side of the island, N. lat. 6° 23'. E. long. 81° 41'.

YALE College. See COLLEGE.

YALEPUL, in Geography, a town of Ceylon, at the mouth of the Yale; 30 miles S. of Yale.—Allo, a town of the island of Ceylon, near the E. coast; 96 miles S.E. of Candi.

YALLAH'S BAY, a bay of the island of Jamaica, on the S. coast, situated to the E. of Yallah's Point.

YALLAH'S POINT, a cape on the S. coast of Jamaica; 12 miles S.E. of Kington. N. lat. 17° 53'. W. long. 76° 21'.

YALLAH'S RIVER, a river of Jamaica, which runs into the sea, a little to the east of Yallah's Point.

YALMAL, a cape on the E. coast of Russia, in the Karfkeo sea. N. lat. 72°. E. long. 68° 24'.

YALME, a river of Devonshire, which runs into the English Channel, 7 miles S.E. of Plymouth.

YALLOFFS, YALLOFFS, JALOFFS, or Jaloffs, an active, powerful, and warlike race of negroes, and esteemed the most hardy of all the people, who inhabit a great part of that tract of Africa which lies between the Mandingo states, on the river Gambia to the S., and the Senegal to the N. and E. See JALOFFS.

The Yalloffs differ from the Mandingoos, (see MANDINGO) not only in language, but likewife in complexion and features. Their noses are not so much deformed, nor the lips so protruberant, as among the generality of Africans; and although their skin is of the deepest black, they are considered by the white traders as the most slighty negroes in this part of the continent. They are divided into several independent states or kingdoms; which are frequently at war either with their neighbours, or with one another. In
their manners, superstitions, and government, however, they have a greater resemblance to the Mandingoos than to any other nation; but excel them in the manufacture of cotton cloth, spinning the wool on a finer thread, weaving it in a broader loom, and dyeing it of a better colour. Their language is said to be copious and significant, and is often learnt by Europeans trading to Senegal. Their numerals are as follow:

| Number | Yeen | Yar | Yanet | Judom | Judom Ween | Judom Yar | Judom Yanct | Fook | Fookang Ween, &c. |

Park's Travels, vol. i.

In connection with this brief account of the Yaloffs, we cannot forbear mentioning an anecdote which redounds very much to the honour of Damel, their king. On occasion of a war between Damel and Abdulkader, king of Foota Torra, a country to the W. of Bondon, the latter inflamed with zeal for propagating his religion, sent an ambassador to Damel, accompanied by two of the principal Bahreens, who carried each a knife, fixed on the top of a long pole. When they obtained admittance into the presence of Damel, they announced the object of their embassy in the following singular manner:—"With this knife," said the ambassador, "Abdulkader will consecrate the head of Damel, if Damel will embrace the Mahometan faith; and with this other knife, Abdulkader will cut the throat of Damel, if Damel refuses to embrace it—take your choice." Damel coolly replied, that he had no choice to make; he neither chose to have his head shaved, nor his throat cut: and with this answer the ambassador was civilly dismissed.

Abdulkader with a powerful army invaded Damel's country. The inhabitants of the towns and villages filled up their wells, destroyed their provisions, carried off their effects, and abandoned their dwellings as he approached. Thus he was led on from place to place, until he had advanced three days' journey into the country of the Yaloffs. Several of his men had died with fatigue and hunger by the way. This led him to direct his march to a watering-place in the woods, where his men, having allowed their thirst, lay down, overcome with fatigue, to sleep among the bushes. In this situation, they were attacked by Damel before daybreak, and completely routed. Many were killed, and a greater number taken prisoners. Among the latter was Abdulkader himself, who was led, as a miserable captive, into the presence of Damel. The behaviour of Damel on this occasion is celebrated, in terms and sounds of the highest approbation, by the baying men. When his royal prisoner was brought before him in irons, and thrown upon the ground, the magnificent Damel, instead of setting his foot upon his neck, and stabbing him with his spear, according to the custom in such cases, addressed him in the following manner:—"Abdulkader, answer me this question. If the chance of war had placed me in your situation, and you in mine, how would you have treated me?" "I would have thrice my spear into your heart," returned Abdulkader with great firmness; "and I know that a similar fate awaits me." "Not so," said Damel; "my spear is indeed red with the blood of your subjects killed in battle, and I could now give it a deeper sting by dipping it in your own; but this would not build up my towns, nor bring to life the thousands who fell in the woods. I will not therefore kill you in cold blood; but I will retain you as my slave, until I perceive that your presence in your own kingdom will be no longer dangerous to your neighbours; and then I will consider of the proper way of disposing of you." Abdulkader was accordingly retained, and worked as a slave for three months; at the end of which period, Damel listened to the solicitations of the inhabitants of Fouta Torra, and restored them their king.

YALOVA, a town of Natalia, on the sea of Marmora, once the residence of Dioclesian; 30 miles N. of Brifa.

YALUTOROVSK, a town of Ruffia, in the government of Tobolsk, on the river Tobol; 108 miles S.W. of Tobolsk. N. lat. 56° 8'. E. long. 66° 32'.

YAM, in Botany, a large filthy root, eatable when boiled or roasted, of which there are several species, all natives of tropical climates, and highly useful to voyagers, as they will, like potatoes, keep for a considerable time without spoiling. See Dioscorea.

YAM, in Geography. See JAMEZ.

YAMA, in Hindoo Mythology, is the god of the infernal regions, corresponding with the Pluto of western heathens. Yama is a very important deity; his name is of perpetual recurrence in the sacrificial ceremonies of the Hindoos; obligations and invocations to him forming a portion of many of those ceremonies. The Hindoos, as is explained under our article Marut, have assigned regents or guardian deities to each of the cardinal and intermediate points of the world. Yama is regent of the south, or lower world, in which the Hindoos place the infernal regions; this corresponding with the Grecian Pluto or Minos. Under our article Meni, the great law-giver of this name is supposed to have been the same person as the Minos of antiquity. Yama has many names; and in his character and functions is found related to many important personages of sacred and profane history. Among his names are, Dhrmara, or king of justice; Purjiti, lord of the Purjits, or patriarchs (see Purjit); and Mritu, meaning death; a name also of Kala, or Siva. (See those articles.)

Suan-yama, and Vairavatwa-yama, are others of his names, derived, it is said, the first from a term denoting comeliers or beauty, the other from his solar origin; Yama being of the race of the sun, of which some explanation will be found under our article Suravansa. He is also named Suddha-dhena, or lord of the obsequies, in honour of deceased ancestors, of which a copious account is given under Sraha. As well as the Seventh Meni, Yama bears likewise the name of Satyavrita. He is also named Adhumbara; this name is said to be derived from a species of wood, by the attrition of which fire is produced, wherewith to light the piles on which funeral obsequies are performed to Yama. Every thing connected with the important element of fire is peculiarly mystical with the Hindoos. Touching the sacrificial and other fires, the reader will find many particulars under our articles Pava, Sagnika, Sami, and others: whence referred to. Anbeha is another name of Yama; it means death, or the destroyer: thus the compound Kal-anbeha-yama is Yama, the destroyer of Kal or Time, a peronification of great boldness and extent. Kal is also a name of Yama. (See KAL.) Yama has other compound names, meaning the slayer of all beings, king of deities, reducer of all things to ashes, the dark-blue deity, of wolf-like
like belly, the variegated being, the wonderful inflictor of pain, &c.

His abode is in the infernal city of Yamapur, whither the Hindoos believe that a departed soul immediately Repairing and receiving a just sentence, ascends to Sverga, the first heaven, or descends to Naraka, the naky hell; or is returned to earth, according to its merits or demerits, where it assumes the form of some animal, unless its offences had been such as deserved condemnation to a vegetable or even to a mineral prison. This extensive theory of transmigration is of a very poetical tendency, affording great scope for the imagination, which the mythical and enthusiastic turn of Hindoo metaphysicians or theologians has amply indulged in.

Mr. Wilford believes Yama to be the same with Sersapis; deriving the latter from a Sanskrit term, implying thirst of blood. In the Puranas, Yama is described as attended by two dogs, named Serbura and Syama; the first name signifies raven, and it has other appellations meaning flayed or spitted. When we add that it was also called Tri-siras, or the three-headed, little doubt can be entertained of its being the same as the Cerberus of the Greeks. Syama means black. See SERBURA, SYAMA, and TRI-SIRAS.

As Dharma Raja, or the king of justice, Yama is described in the Puranas as having two countenances. "One, called his divine countenance, is mild and benevolent; and those only see it who abound in virtue. In this form, he is called an emanation of Vishnu. He is attended by a servant named Karmala, who conducts the righteous on self-moving cars into the presence of their judge. His other countenance or form is more terrifically named Yama. He is then depicted with large teeth and a monstrous body, and is thus seen only by the wicked. His attendant is named Kahmala, who drags the wicked with ropes round their necks over rugged paths; and at the command of Yama some are beaten, some cut to pieces, some devoured by monsters, and thrown headlong into hell. He is unmerciful, hard is his heart, and every one trembles at his sight."

"Yama is the name of a celebrated legislator, whose enactments are still venerated by the Hindoos. For his profound knowledge and justice, he is said to have been the judge of departed spirits.

In the feconding of mythologies, Yama is found to be identified, or nearly so, with both Siva and Vishnu, (see those articles,) as well as with Menu, Kala, and others. This may be reconciled, as in the mythology of Greece, by recollecting that almost all the deities met into one. Proserpine or Hecate is given to Pluto as a help-mate, being but another form of Diana. Thus Yama has a form of Parvati asigned him, under the name and character of Pataladevi, or goddess of the infernal regions. (See PATALADEVI.) In heaven Diana is Luna, and Parvati is Svardevi, or queen of heaven. On earth they are distinguished by the names of Diana and Bluddevi, the latter meaning goddess of the earth. These similarities or coincidences could be carried to a great extent.

Some of the ceremonies still in use as propitiating Yama, or his consort Sakti, (which see,) have been found by Sir W. Jones and others, as strikingly resembling those of the Eleusinian goddess; and there can be no doubt but the investigation of the mythological fables of the Hindoos has thrown great light, and may throw still greater, on many obscure and unintelligible passages of our ancient poets of Europe.

We do not find any direct representation of Yama, or any minute description of his person and attributes, in the mythological works before the public; nor many particulars of his family. We have already noticed him as the offering of the fun; this he shares in common with several other of the heroic personages of the Hindoos. Yama is indeed one of the many names of Surya, or the sun. The river Yamuna, or Jumna, or rather perhaps the damsel who here poetically metamorphosed into that interesting stream, is styled the twin sister of Yama. She is poetically called the "blue daughter of the sun." Days are especially kept apart for certain ceremonies to their honour. On one, Yamuna is said to have entertained her brother; and the remembrance of it is preserved in an existing usage of Hindoo young ladies feasting and making their brothers presents on its anniversary. In the Rig-veda (see VEDA), a dialogue is given, in which Yama endeavours to seduce his benevolent father; but his base offers are rejected by her with virtuous expostulation. In some accounts, a divinity named Swadha is described as the goddess of funeral obsequies; and as such we should expect to find her closely allied to Yama, but know little of the relationship. We have noticed her under the article SWADHA. Several other of our articles contain some particulars of Yama. See KASVA, KRITANTA, SARADHADEVA, TAPAS, and VAIVASWAT.

YAMAMAK, in Geography. See JAMA.

YAMANCHALINSKOI, a town of Russia, in the government of Cancaus, on the Ural; 20 miles N. of Guriev.

YAMASCA, a river of Canada, which runs into the St. Laurence, N. lat. 45°. W. long. 72° 45'.

YAMASCO, a town of Canada, at the confluence of the Yama and the St. Laurence.

YAMBLAK, one of the Aleutian islands; which see.

YAMBO. See JAMBO.

YAMBURG, a town of Russia, in the government of Peterburgh, on the Luga. The cloth manufactory at this place was instituted by Catharine II., preferently after her accession to the throne; it contains 36 looms, and employs 600 persons. The cloths are sold at St. Peterburg at a low price; 20 miles E. of Narva. N. lat. 59° 15'; E. long. 28° 40'.

YAMEOS, a town of South America, in the audience of Quito, on the river Amazons; 36 miles W.S.W. of St. Joachim de Omacugai.

YAMIMA, a river of Russia, which rises in the government of Tobol', and runs into the Irtysch, 14 miles S.S.W. of Kozlovo.

YAMINA, a town of Africa, in the kingdom of Bambara, near the Niger. This town, according to Mr. Park, was large, covering the same extent of ground as Sanfanding; but having been invaded and plundered a few years since by the king of Kaarta, it was, when he was there, half in ruins. N. lat. 13° 45'; W. long. 12° 50'.

YAMON BAY, a bay on the coast of the island of Luion. N. lat. 14° 21'; E. long. 123° 37'.

YAMSHEVSKAIA, a fort of Russia, in the government of Kolvian, on the Irtysh. N. lat. 51° 55'; E. long. 77° 50'.

YAMSKA, a gulf of Russia, in the Penzinskoi sea, between Cape Pilatelin and the continent. N. lat. 60° 20'; E. long. 154° 14'.

YAMSKO, a town of Russia, near the gulf of Yamskia; 2500 miles E. of Tobol'. N. lat. 60° 12'; E. long. 155° 34'.

YAMUMINTI, in Hindoo Mythology, the name of one of.
of the wives of the amorous Hindoo deity Krishna. Her name seldom occurs.

YAMUNA, in Geography, a river of India, which takes its rise, as is supposed, in the great range of mountains called Himalaya. Its course has not been accurately explored, but it probably is not more remote than that of the Ganges, which rises in the southern part of that range. The Yamuna flows through the province of Singhara, or Serinagar, in a foitherly course, nearly parallel with the Ganges, approaching its fuller stream to within forty miles, at the village of Garudavara (Gurudwar), in N. lat. 30° 22'; it is then of nearly equal width. The Yamuna enters Hindooout Proper, in the province of Delhi, varying its distance from eighty to fifty miles from the Ganges. The country between them is called Doobab, a word meaning two waters, or watered by two rivers. It is a very fertile district. The rivers approximate and join at Allahabad, an important fortress and military station under the Bengal government, when the Yamuna, little inferior in magnitude, has its name and waters absorbed in the more celebrated stream. Its length, of course under its own name, is estimated at about nine hundred miles.

For many miles of its course, the Yamuna, or Jumna, as it is more properly called, was considered a boundary to the British territories, dividing them from the possession of the Mahrattas. But from its shallowness, being fordable in many places in the dry season, it was not an important military barrier; and for the same reason is of less consequence for the operations of commerce.

The confluence of any two rivers is viewed with holy respect by Hindoos; of these two grand streams more particularly. To heighten the myrificm, (any ternary connection being still more deeply venerated,) it is feigned that a third river, the Sarafwaty, joins the other two by a subterranean communication at Allahabad. Frequent allusion is made to this occult union by mythological poets, who teach that these three rivers are terrene manifestations of the three great deities, Parvati, Lakshmi, and Sarafwati; the Sakti, as they are called, or active energies of their respective lords, Siva, Vishnu, and Brahma, who compose the Hindoo triad of divinity. Of these personages sufficient will be found in the articles given under their several names in this work. The fable of the "three plaited locks," as this supposed union of these rivers is poetically called, often occurs in the writings of the Hindoos: it is noticed in our articles JUNCTIONS, TRIVENI, and ZENNA. Under SUICIDE, an account is given of the supposed proneness of the Hindoos to this crime. At the confluence now under our notice, it not only loses its form, but assumes a meritorious form. Of this, lie more under SUITTEL.

The river deities Yamuna is made by mythologists to be the same with Lakshmi, comfort of Vishnu, and twin sister of Yama, the judge of departed spirits, and ruler of the infernal regions. Of these personages sufficient occurs under their respective names.

YAMUThA, one of the Aleutian islands. N. lat. 53° 40'. E. long. 180° 29'.

YAMYA KONDA, a town of Africa, in the kingdom of Yani.

YAMyAMA KUNDA, a town of Africa, in the kingdom of Toman.

YANA, a river of Russia, which rises in a lake, situated in lat. 62° 14', long. 131° 14', and running due north, being supplied by many small streams, empties itself into the Frozen sea, N. lat. 71° 25'. E. long. 131° 16'. At its discharge it forms five considerable rivers, which issue in a capacious bay.

YANAM, a town of Hindoostan, in the circuit of Rajamundry; 28 miles S.E. of Rajamundry.

YANATONG, a town of Burma; 40 miles S. of Mollone.

YANAVA, a small island at the mouth of the river of the Amazons; 10 miles N. of Caviana.

YANABOO, a town of Birmah, on the Irawaddy, remarkable for its manufacture of earthenware; 70 miles W.S.W. of Ava.

YANDINSKOEI, a town of Russia, in the government of Irikutik, on the Angara; 160 miles N.N.W. of Irikutik. N. lat. 54° 30'. E. long. 103° 20'.

YANFONG, a town of Corea; 40 miles E.S.E. of Outchuen.

YANG, a town of Corea; 13 miles E. of King-ki-tao.

YANGFONRAW, a town of Pegu; 60 miles S. of Lundey.

YANG-CONG, a river of China, which runs into the Kincha river, near Lo-chou-tong.

YANG-FO, a river of China, which joins the Sancambo, N. lat. 40° 23'. E. long. 112° 49'.

YANG-KIN, a town of the kingdom of Corea; 15 miles S.E. of King-ki-tao.

YANG-LI, a city of China, of the second rank; 1157 miles S.S.W. of Peking. N. lat. 22° 54'. E. long. 106° 35'.

YANG-TCHEN, a town of Corea, in Tchufin; 150 miles S.S.W. of King-ki-tao. N. lat. 35° 19'. E. long. 125° 14'.

YANG-TCHEOU, a city of China, of the first rank, in Kiang-nan, situated on the bank of the royal canal, which extends from the Ta-kiang northwards to the river Hoango, or the Yellow river: it carries on a great trade in all manner of Chinefe works, and is rendered extremely populous, chiefly by the sale and distribution of the salt that is made on the sea-coasts of this jurisdiction and parts adjoining, and which is afterwards carried along small canals made for this purpose, which end in communication with the great canal; 485 miles S.S.E. of Peking. N. lat. 32° 30'. E. long. 118° 54'.

YANG-TCHUEN, a town of Corea; 35 miles W.S.W. of King-ki-tao.

YANG-TE', a town of Corea; 84 miles E. of Hanctheon.

YANG-TSE-KIANG, a river of Asia, which rises in the mountains of Tibet, and after crossing the empire of China, from call to call empties itself into the sea, 120 miles E. from Nan-king. This river changes its name almost in every province through which it passes. See KINCHA.

The Yang-te-kiang may be considered as equalling, if not exceeding in size, the Yellow River (which see). The sources of both these rivers are in the same range of mountains, and they approach one another in one part within a few miles. The Yang-te-kiang, according to Mr. Barrow's statement, consists of two distinct branches, which separating from each other about eighty miles, flow in a parallel direction to the southward for the space of 70 miles, and then unite between the 26th and 27th degrees of N. latitude, just at the boundaries of the two provinces of Yunam and Sechuen. Then flanking off to the N.E. directly through the latter of these provinces, collecting the waters of the numerous rivers that descend towards it from that and another province called Quee-choo, it continues in this direction about 600 miles, and then enters the province of Hoo-quang, in the
YAN

31st degree of N. latitude. Through this province it takes a serpentine course, and receives the waters of several lakes, with which this part of the country abounds. Leaving Hoo-quang, it passes between the province of Ho-nan and Kiang-fee, and with a little inclination from the E. towards the N., its copious current glides smoothly through the province of Kiang-nan, and is difembogued into the sea, which bounds China to the E. in the 32d degree of latitude. The distance from thence to Hoo-quang is about 800 miles, which makes the whole length of the river about 2200 miles. The current, where the yachts of lord Macartney’s embassy passed it, did not exceed in the strongest part two miles; but it was much deeper than the Yellow river.

There are two great Chinefe rivers, taking their sources in the fame mountains, falling almost close to each other in a particular spot, separating afterwards from each other to the distance of 15 degrees of latitude, finally discharge themselves into the same sea, within two degrees of each other; comprehending within their grasp a tract of land of above 1000 miles in length, which they contribute greatly to fertilize and enrich, though by extraordinary accidents occurring unequal torrents, they may do injury in particular inferences. This tract includes the principal portion of the Chinefe empire in ancient times; and lies in that part of the temperate zone, which in Europe, as well as in Asia, has been the scene where the most celebrated characters have existed, and the most brilliant actions been performed, which history has transmitted to posterity. When the gentlemen of the embassy had crossed the Yang-tie-kiang, they found that, instead of a flat country, lakes, and swamps, the ground rose gradually from the margin of the river, enriched with various kinds and tints of culture, intermixed with trees, temples, and pagodas. In the river were islands skirted with shrubbery, and rocks rising abruptly from the surface of the water. The waves rolled like thole at sea, and porpoises are said to be sometimes seen leaping amongst them: several junks were lying at anchor.

In the middle of the river is the island called “Chin-fann,” (which fee.) The ground to the southward of the river gradually rises to a height, that it was found necessary to cut down the earth in some parts to the depth of near 80 feet, in order to find a level for the passage of the canal. The land in this neighbourhood is chiefly cultivated with that particular species or variety of the cotton-hrub that produces the cloth usually called Nankeen in Europe. The soil enveloping the seed, or cotton-wool, is whole in the common plant; but in that growing in the province of Kiang-nan, of which the city of Nan-kien is the capital, the down is of the same yellow tinge which it prefers when spun and woven into cloth. The colour, as well as the superior quality of this substance in Kiang-nan, was supposed to be owing to the particular nature of the soil; and it is asserted, that the seeds of the Nankeen cotton degenerate in both particulars when transplanted to another province, however little different in its climate. Lord Macartney’s EmbaHy, vol. ii.

YANG-TSI, a town of Corea; 30 miles S. of King-ki-tao.

YANI, a kingdom of Africa, situated to the east of Burfali, and divided into Upper and Lower, on the north side of the river Gambia. See GISANIA.

YANIMAREW, a town of Africa, in the Lower Yani.

YANIMAZCU, a town of Africa, in the kingdom of Yani. N. lat. 15° 30’. W. long. 1° 14’. YANKEON, a mountain of Thibet; 30 miles N. of Zuenga.

YANKJA, a town of Assyria, near the Tigris, and

not far from Bagdad. This place and also Douelfa are small straggling towns, every house being surrounded by a separate mud-wall.

YANTAC, a town of Thibet; 28 miles S.W. of Harachar.

YAN-TCHIN, or VAN-TCHIN, a city of China, of the second rank, in Guang-fu; 1177 miles S.S.W. of Peking. N. lat. 25° 1’ E. long. 106° 31’.

YAN-TINCOU, a town of Thibet; 75 miles E.N.E. of Pa.

YANTRA, a word denoting a mystical figure among the Hindoos; also a mathematical instrument used in any science or art of an occult nature. An instrument used in astronomical observations, called Golayanta, or the spherical yantra, is described in the ninth volume of the Asiatic Researches, art. 6, as similar to our armillary sphere. The article now referred to by Mr. Colebrooke, president of the Asiatic Society of Calcutta, is very curious and important. The Hindoos, being so prone to mysticism, can fancy various wishes in occult figures and practices. Figures similar to the magic squares, abracadabra, &c. of western wizards, are still used and venerated by the knives and fools of Asia; there are generally called yantra: as are peculiar figures or hieroglyphics, appropriated to certain Hindu deities, whose followers or sectaries mark their foreheads therewith, and deem them of a sanctifying tendency. The nature of these various yantras, with suitable instructions and warnings as to their formation, uses, and purposes, are taught in a Sanskrit book, entitled “Agamasattra, or Occult Science.” It may be noticed in passing, that the word Agama, meaning in the Sanskrit tongue hidden, mysterious, secret, &c. seems to have had in various languages and regions a similar meaning, as to which it may suffice to refer to our articles OGAM, OME, and SHASTAH.

Combined with and related to the yantra, are certain imprecations, incantations, charms, philtres, &c. called Mantra and Tantra, which occur frequently in Hindoo writings, and of which some notice is taken in this work under those words.

YAO, in Geography, a city of China, of the second rank, in Chen-fu; 485 miles S.W. of Peking. N. lat. 31° 54’. E. long. 108° 31’.

YAO-NGAN, or YAO-GAN, a city of China, of the first rank, in Yuen-nan. The territory of this city is considerable, although it contains but two cities, one of the second order, and the other of the third. It is intermixed with mountains, which are covered with fine forests and fruitful valleys, and produces abundance of mufk: near the city there is a well of salt water, from which they make very white salt; 1175 miles S.W. of Peking. N. lat. 25° 33’. E. long. 10° 14’.

YAO-TCHEOU, a town of Chinefe Tartary; 380 miles E.N.E. of Peking. N. lat. 40° 43’. E. long. 122° 14’.

YAO-TCHEOU, or YAO-CHOO-FOO, a city of China, of the first rank, in Kiang-fu, situated on the S.E. bank of the lake Po-yang. It has seven towns of the third rank in its jurisdiction. In this town is a large manufacture of porcelain, from whence, as well as from King-te-ching, it is sent to Nen-chang-fu; 670 miles S. of Peking. N. lat. 29°. E. long. 116° 14’.

YAP, among the Hindoos, is a silent meditation on the names, attributes, and powers of the Deity. Great merit is ascribed to this species of devotion, which is otherwise, though we apprehend its correct, spelle yap; under which article we find we have sufficiently described it, although reference has occasionally been made to this article.
YAPANDAIN, a town of the empire of Birmah, on the Irawaddy; 40 miles W. of Ava.

YAPIZLAGA, or Llanos de Manso, a province of South America, in the vice-royalty of Buenos Ayres, of great extent, situated to the south of the Vermejo river. This country was formerly called Llanos de Manso, or the Plains of Manso, from a captain of that name, who in 1556 undertook to build a town; but when he thought himself in perfect security, he, with all his attendants, was murdered by the Indians; of whom there are several nations. The country is but little known.

YAPON, a river of Surinam, which runs into the Atlantic, near Cape Oranje.

YAPON, in Botany, a species of ilex. See HOLLY.

YARACUI, in Geography, a river of Venezuela, which runs into the Spanish Main, N. lat. 10° 28'. W. long. 68° 40'.

YARANSK, a town of Russia, in the government of Viatka; 72 miles S.W. of Viatka. N. lat. 55° 36'. E. long. 48° 34'.

YARAY, a town of Africa, in the kingdom of Kayor; 80 miles S.E. of Amboul.

YARBA, a town of Africa, and capital of a country, called Yarba; 430 miles S.W. of Tombutóo.

YARD, Virga terre, a long measure, used in England and Spain; chiefly to measure cloth, fluffs, &c.

The English yard contains three feet. It was first settled by Henry I. from the length of his own arm. See Measure.

The English yard is just seven-ninths of the Paris ell; so that nine yards make five ells. To reduce ells, therefore, into yards, say, If seven ells give nine yards, how many yards will the given number of ells give?

Yards are converted into ells Flemish, by adding a third part; into ells English, by subtracting a fifth part; or multiplying by 8, and calling off the right-hand figure. Eells English are converted into yards, by adding a fourth. To turn ells Flemish into yards, subtract one quarter.

The Spanish vara, or yard, chiefly used at Seville, is, in some places, called barra. It contains seven twenty-fourths of the Paris ell; so that nineteen ells make twenty-four Spanish yards.

Yard, in Anatomy, the penis, or virile member; serving for the evacuating of the urine and seed.

It is also the common name for the penis in most animals.

Yard of Land, Virgata terre, or Virga terre, is a certain quantity of land, but that various, according to the place. At Wimbledon, in Surrey, it is only 15 acres; but in most other counties it contains 20, in some 24, in some 30, and in others 40 or 45 acres.

Yard, in Agriculture. See Farm-Yard.
foil must be particularly favourable to the wheat-crop, in preferring a genial temperature beneath the surface late in the autumn and during winter. Moreover, it is a general principle in chemistry, that in all cases of decomposition, substances combine much more readily at the moment or time of their disengagement, than after they have been perfectly formed: and in fermentation beneath the foil the fluid matter produced is applied instantly, even while it is warm, to the organs of the plant, and consequently is more likely to be efficient, than in short dung or manure that has gone through the processes; and of which all the principles have entered into new combinations.

The writings of scientific cultivators allege many arguments and facts which favour the application of yard-dung in a fresh or long flat; and it is suppos'd, that perhaps there is no subject of investigation in which there is such an union of theoretical and practical evidence and proof.

The main objection against the use of slightly fermented or long yard-dung or manure is, that weeds rife more luxuriantly and in greater numbers where it is had recourse to; but though seeds thus carried out will certainly sprout, it is but seldom that this can be the case to any extent; and if the land be not clean of weeds, any kind of manure, long or short, fermented or unfermented, will cause their rapid growth.

The application of yard-dung, or manure in the long flat, is highly advantageous with regard to the quantity or extent of the improvement which may be produced, as nearly four loads of it are mostly required to form one of the short kind.

There are several questions connected with this subject, which is not of less interest or importance to the farmer to have decided, which is that of the superior advantage of containing the straw of the farm by animals, or of having it littered and trodden into dung or manure in the yards. Many of the most enlightened farmers in the first of the above counties, the writer of the account of the agriculture of it says, are against the former of these practices, though a large part of them is in the custom of it: and they have frequently, too, recourse to the method of buying oil-cake, even often at a loss, in order that their straw may be trodden into dung or manure by fattening beasts, which is an excellent management of the yard kind.

Yard-Fallen, a term used among our farriers to express a malady to which horses are sometimes subject, which is the hanging down of the penis from its sheath between the legs, the creature not being able to draw it up again. This is caused by weaknesses of the peculiar muscles which should act in the drawing up; and proceeds sometimes from a violent slip or strain, sometimes from a blow on the back, and sometimes from extreme weariness in long journeys.

The method of curing this is, first to wash it with oil of roes, after this with warm white wine, and finally, to anoint it with a mixture of oil of roes and honey; it is then to be returned into its place, and kept from falling down again by a little canvas bolster. It is to be thus trebled once in twenty-four hours, till the cure is perfect.

There are some other distempers to which this part is subject in a horse, as the being foul at the end, so that the creature voids his urine in the sheath; in this case, the method of cure is to draw out the penis, and cleanse the end of it from any foulness that may be found there; then it is to be washed with butter and white wine vinegar melted together; sometimes there is a discharge of yellow flanking matter from the penis; this is peculiar to flone-horses, and principally affects them after the time of their covering of mares.

This running is attended with a swelling of the penis, and with a pain in voiding the urine; the creature also finds a difficulty in drawing up the penis into the sheath.

The method of cure is, to dissolve in a pint of white wine an ounce of roach-alum by boiling; and four or five times a day this is to be used, injecting it up into the yard with a syringe, blood-warm. This will prove a certain cure.

Yard-Feal, the filthy, furred flat of the yard and sheath in animals of the horse kind, which sometimes produces disease.

It is removed by well washing and cleaning the parts, by the use of soap and water.

Yard, Mattering of, a disease in the yards of horses, produced by different causes, in which matter is formed. It is removed by the use of cooling washes, and keeping the parts clean and perfectly free from dirt and naughtiness.

Yard, Stable. See Stable.

Yard, Straw. See Straw-Yard.

Yards, in a Ship, are long cylindrical pieces of fir-timber, suspended to the masts of ships, &c., to extend the sails to the wind.

All yards are either square or latteen; the former are suspended athwart the masts by the flings, at right angles, and the latter at one-third their length, obliquely.

The proportional lengths of yards are as follow, particularly in the royal navy:—Main-yard, eight-ninths the length of the main-mast; fore-yard, seven-eighths of the main-yard; mizen-yard, fix-fifths of the main-yard; maintopfail-yard, five-sevenths of the main-yard; fore-topfail-yard, seven-eighths of the main-topfail-yard; mizen-topfail-yard, two-thirds of the main-topfail-yard; topfail-yard, to-three-quarters of the main-topfail-yard; topfail-yard, seven-eighths of an inch to every yard in the length; royal-yards, half of the topfail-yards; crofs-jack-yard and spritfail-yard, the same as the fore-topfail-yard; spritfail-topfail-yard and driver-yard, the same as the fore-topfail-yard; and the studding-fail-yards, four-sevenths of their booms.

Proportion of diameters of main and fore yards at the flings is one-quarter of an inch to every foot in their length; mizen-yard, two-thirds the diameter of the main-yard; topfail-yards, five-eighths of an inch to every yard in the length; topfail-yards, three-fifths of an inch to every yard in the length; royal-yards, half the diameter of the topfail-yards; spritfail-yard and crofs-jack-yard, the same diameter as the fore-topfail-yard; spritfail-topfail-yard and driver-yard, the same diameter as the fore-topfail-yard; and the studding-fail-yards, one inch diameter to every five feet in the length.

The square yards are of a cylindrical surface the greater part of their length. They taper from the middle, which are called the flings, towards the extremities, which are termed the yard-arms; and the distance between the flings and the yard-arms on each side is divided into quarters, which are distinguished into the first, second, and third quarters, and yard-arms, which are regularly tapered by the following proportions. The first quarter, or that next the flings or middle, thirty thirty-oners of the given diameter; the second quarter, seven-eighths; the third quarter, seven-tenths; and the arms or ends, three-sevenths. From a middle line struck on the tree or spar the yard is to be made from, half of the several dimensions above is to be set.
set off, and the yard then fawn to its fiding; it is then canted, and a middle line fruck on one of those fides, and the middle and the quarters squared up thereon from the middle line on the frift fide, and the fame diameters set off as before, then lined and fawn square to the upper fide; it is then fawn eight-square the whole length.

The main and fore yards (fig. 17. Rigging, Plate II.) are then trimmed sixteen-square, and rounded from one quarter on each fide the flings to the outer ends, except on the aft-fide, which must remain eight-square two-quarters on each fide the middle. The whole is then planed fair and smooth.

In merchant ships they have a shear-hole in their arms for the topfail-sheets, and are left square the length of the shear-hole; but this method weakens the lower yards.

Topfaff-yard (fig. 18. Rigging, Plate II.) being trimmed sixteen-square, are rounded and planed from the frift quarter on each fide the middle to their outer ends, and a shear-hole cut from their upper fide, its length within each outer end for the reef-tackles. In some merchant ships a hole is cut within the cleats for the top-gallant-sheets, but is better avoided, as it weakens the yard-arms.

Topgallant-yards (fig. 19. Rigging, Plate II.), royal yards, crofs-jack-yards, mizen-yards, sprit and sprit-topfaff-yards, studding-fail and driver yards, are trimmed eight-square, sixteen-square, and then rounded and planed fair and smooth from end to end throughout the length.

Battening of Yards.—Main and fore yards, main, fore, and mizen topfaff-yards, have oak battens nailed on their squares nearly the fame length and breadth, one inch to three-quarters of an inch thick; their ends rounded and fnaed, and the edges chamferred. The fore-fide has no battens.

Clothing of Yards.—The fhing-cleats, a a, (fig. 17. Rigging, Plate II.) nailed on the fore-fide of the main and fore yards, are once and a quarter the given diameter of the yard in length, with a shoulder one-third its length; the breadth one-fourth the length; the thickenfs two-thirds the breadth, made of elm, and nailed once the given diameter on each fide the flings.

Stop-cleats, b, (fig. 17. Rigging, Plate II.) are made of oak, and nailed within the arms, on the fore-fide and aft-fide of the lower yards, one inch and a half to every yard in their length. Their length half the given diameter of the yard; the breadth one-fourth its length; and its thickenfs two-thirds its breadth. Yards for merchant ships have their cleats sometimes raised from the fold.

Topfaff-yards have flop-cleats, nailed on the fore-fide of the yard, once the given diameter on each fide of the flings. Thofe within the arms, on the fore and aft fides of the main and fore topfaff-yards, three inches to every yard in the length; and mizen topfaff-yards, two inches and a quarter.

Topgallant-yards the fame as topfaff-yards.

Royal-yard-cleats are once the diameter on each fide the middle afunder, and twice their length within at the arms.

Crots-jack-yards have flop-cleats, nailed on the fore-fide of the yard, half the diameter on each fide of the flings; thofe at the arms, one inch and a half within their outer ends to every yard in length, and naifed on the fore and after fides.

Mizen-yards have flop-cleats nailed once the diameter afunder on the flarboard-fide, and once and a half the given diameter below the middle of the yard; thofe at the peck or outer end, once the diameter within.

Sprit and sprit-topfaff-yards have flop-cleats nailed on their under fides; the spritfail-yard once the diameter on each fide the flings; the sprit-topfail-yard half the diameter one each fide; thole at the arms one inch and a half within their outer ends to every yard in the length; and they nail on the fore and after fides contrary to thole at the flings.

Studding-fail and driver yards have flop-cleats, nailed on the given diameter afunder, at one-third the length of the yard from the inner end; thole at the arms twice their length within.

Boat-yard-cleats are once the given diameter afunder at the flings; some in the middle, others one-third from the end, fuch as lugs, lateen, and letfes, and the length of the cleats within at the arms.

Yards are fitted at their outer ends for rigging out studding-fails. Main and fore yards have four boom-irons; one on each of their outer ends, c, (fig. 17. Rigging, Plate II.) the others at one-third the length of the boom within, d. The outer boom-iron is composed of a ring, a neck, and flars.

The ring, through which the boom fildes, is of the fame diameter in the clear as its toprail-studding-fail boom; breadth three-eighths the diameter, and from five-eighths to three-quarters of an inch thick. In one fide a ligament vite roller is fitted, one-third in length the diameter of the boom-ring. The neck is fquare, and connects the ring to the flars; each neck one inch longer than the diameter of the ring, and one-fourth its length in fize.

The flars are made one inch and a quarter in length to every three feet of the yard; their breadth once and a half the breadth of the ring; thickenfs at the inner part, three-eighths of an inch: they increafe in fublimen towards the neck, and are made to the fame of and let in their thickenfs into the yard-arm. They are bolted, and have two hoops made to the fize of the yard-arm, one close to the end, and the other near the neck.

Inner boom-irons are made after the fame proportion as the outer ones, but differ in fhape. The flars are made to comfaps the yard at one-third the length of the toprail-studding-fail boom within the end, and the ring is feparated from the flar by a collar; the upper part of the ring opens with a hinge on one fide, and the heel of the boom is clasped therein.

Boom-irons fix on the yards thus: the rings are parallel with the axis of the yard, in a strait line direction, with a line fruck upon the yard, in the middle of the fquare, between the upper and fore fide.

Boom-irons, on the yard-arms of fhips in the merchant service, differ much in fhape. The ring the boom fildes through is connected by a collar to a fquare hoop, that lets on and nails to the yard-arms, they being left fquare; and sometimes a round hoop to the fize of the yard-arms. Others have a strait neck, projecting from flars, with a shoulder in the middle of the neck, and the part without left square. The boom-ring has a fhanl on the under part, with a mortife that fits the neck, and there fattened by a frew-nut, or a fpring-forelock, that goes on the neck next the ring.

Topfaff-yards, main and fore, commonly have boom-irons at their outer ends, like the lower yards in merchant fhips. In the navy they are mostly fitted with a boom-ring, and a fprig-eye-bolt driven in the middle of their ends, parallel to its axis; and an iron hoop let in its thickenfs and breadth, and nailed, to prevent splitting the yard-arm. Yards that have no inner boom-irons have fadders for the heel of the boom.

Topgallant-yards, main and fore, mizen-yards, sprit and sprit-topfail-yards, have their arms fitted with a ferrule-hoop and fprig-eye-bolts, as the topfail-yards.

Mizen-
Mizen-topfall and topgallant yards have hoops like the former let on their outer ends, but no eye-bolts.

Driver-yards have a sheave-hole cut through their outer end, and a hoop and eye-bolt.

The main and fore yards of large ships are sometimes made of two trees; they have each tree lined, long enough to luff four feet beyond the first quarter, next the middle, or slings, which is in all five-eighths the length of the yard, adding four feet. The slings run straight from each quarter next the middle to one-fourth the substance at the quarter next the butt, and three-fourths at the quarter next the middle, and haunches to about three inches at the butt. Each tree is then fawn as before directed, and completed thus: the slings and haunches are trimmed straight, and out of windings on the infide, and a line strung along the middle, and a chain-coak let off, each about two feet four inches long, and one-third the diameter broad; and the slings squared across and down the fides. The coaks are railed one inch and a quarter at the butt, and funk to the fame on the other side of the middle, towards the arm; the other half is then canted thereon, set straight and out of windings, and rayed as the main, (which fee, and the Plate of Main,) and bolted together fore and aft through the middle, in the butt of every coak; the heads are to be driven from the thinneft part of the slings, and clenched on a ring, and the haunches nailed.

The yard is then completed as before directed, and the slings caulked their length and hooped; one hoop over the butt of each slings, one in the middle of each haunch, and one over every bolt: then a filh of fir, two inches thick, and the fame length and breadth as the fquare on the affide, is rayed and nailed clofe over all the hoops.

Another method of treating yards together made of two trees, which is the strongeft, and takes lefs trees than the former, is by providing two trees that will hold the diameter beyond the fijhes, and scanf together similar to the foregoing. Then the deficiency of the diameter towards the middle is made good by long fijhes of fir, from four to fix inches thick, as the fize of the yard may require, extending two feet in length at each end beyond the long fquare on the affide, and each of fufficient breadth to form the eight-square on the outside. The inner surfaces of the fijhes are caoked and rayed clofe upon the yard, the coak extending towards the whole length. The yard is then finifhed as before directed, and hooped and bolted, as in the Plate of Main-making.

Yard-Arm is that half of the yard which is on either fide the main, when it lies athwart the fhip. See the precedig article.

Yards also denote places belonging to the navy, where the ships of war, &c. are laid up in harbour. See Dock-Yards.

YARDLEY, in Geography, a village of Worceftershire, which, according to the population return of the year 1811, contained 1918 inhabitants, including 121 families employed in manufaets, and 453 houses; 7 miles S.E. of Birmingham.

YARE, a river of England, in the county of Norfolk, which rives about five miles N. from New Buckenham, passes by the city of Norwich, and runs into the German ocean near Yarmouth.

YARE. See Segovia Nueva.

YARE, among Sailors, implies as much as, nimble, ready, quick, expeditious. Hence, to be yare at the helm, as some fay, signifies to set a freeth man at the helm.

YARECA, in Geography. See JARECA.

YAREE, a town of Birmah; 40 miles S.W. of Ava.

YARENSK, a town of Russia, in the province of Uliug, on the Vitebsag; 92 miles N.E. of Uliug. N. lat. 62°. E. long. 47° 50'.

YARI, a town of Brafil, in the government of Para; 60 miles N.E. of Paru.

YARIN, a word used by some of the chemical writers to express the floe ari.

YARKAN, Yarkand, Irken, or Yarkien, in Geography, a town of Cashgar, or Little Boccharia, where the grand khan of the Eflh Tartars chiefly resides. The town is large, and well built of bricks dried in the sun. The environs are fertile, and the palace of the khan large, but not handsomely. In 1460 this town was taken and plundered by Timur Beu; 90 miles S.E. of Cashgar. N. lat. 38° 13'; E. long. 78° 49'.

YARKAN, or Yarkand, suggested to be the Oecharides of Ptolemey, a river of Aflia, which passes by the town of Yarkan, and after a considerable course runs into Lake Lop; 100 miles S. of Tourfan.

YARM, or Yarum, a market-town in the W. division of the liberty of Langbargh, in the North Riding of the county of York, England, is situated on the banks of the river Tees, 4 miles S. by W. from Stockton, 44 N.W. from York, and 237 in the fame direction from London. In 1811 the houses in the town and parish were 361, and the inhabitants 1431. Here is a neat modern church. A market is held on Thursday, and fairs on Thursday before the 5th of April, Holy Thursday, 2d of August, and 20th of October. At Yarm was an hospital, founded before 1185; also a house of Black friars, founded about 1271, by the family of Brus or Bruce, both of which were fuppofed by Henry VIII. Over the river Tees at this place is a handsome stone bridge, communicating with the county of Durham. The town, formerly more conliderable than at prezent, flill carries on a good trade by water, particularly in corn and lead for the London market. In 1761 the town suffered feverely by an inundation of the river Tees.—Beauties of England and Wales, Yorkshire, by J. Bigland, 8vo. Lond. 1812.

YARMOUTH, Great, an important fea-port, borough, and market-town, in the hundred of Earl Flegg, and county of Norfolk, England, is situated on the E. coast of England, near the mouth of the river Yare, whence it has its name, 22 miles E. from Norwich, and 124 N.E. from London. The number of houses in the parish, according to the returns of 1811, was 3504, and the inhabitants were 17,977. A market is held here on Saturday, and a fair in Easter week. The town, which sends two members to parliament, was incorporated by James I. It is governed by a mayor, recorder, 7 aldermen, 36 common-council-men, a town-clerk, and other inferior officers. In former times, Yarmouth was a member of the Cinque Ports, and by ancient custom appointed bailiffs, who, in conjunction with the magiftrates of the town, hold a court there during the hering-fair. The corporation poifts also the privileges of courts of admiralty and of record. Yarmouth is finguarly fitioned on a long, narrow, fandy peninfula, having on the E. the German ocean, and on the W., the river Yare, which, after pointing N.E. towards the sea, fuddently bends round to the S. parallel to the shore, and opens into the sea, two miles below the town. The coast near Yarmouth and southward to Lowestoft is the moft eafalter part of Great Britain, Yarmouth church lying in E. long. 1° 45' from Greenwich.

The first mention of this town is in Domeldag-book, which renders it probable, that it had its beginning in the early part of the Anglo-Saxon dynasty. When the land-bank, on which it flands, and which, thrown up by the sea, G 2
unpericed, or at least diverted, the course of the Yare, was sufficiently consolidated, habitations were formed on it by the fishermen who reforted to the coast. By the influx of foreigners for the purchase and sale of fish the town increased, so as to become the most considerable port on the east coast of England. To provide for its security, Henry III. granted to the inhabitants permission to inclose the town with a moat and walls: works which, however, do not appear to have been commenced until 1285, the thirteenth year of his successor, Edward I. But when war with France broke out in 1545, an additional rampart was thrown up towards the sea, and further extended in 1587. In the following year, to guard against the Spanish invasion, outworks were constructed, the south mount was raised and planted with cannon, and a bomb was laid across the entrance of the harbour. Coeval with the first fortification of Yarmouth was probably the caille, in the centre of the town.

It served for some years as a prison; but in 1621 the whole was demolished. In 1642 the inhabitants of Yarmouth declared for the parliament; but it was only after the independent had gained an ascendency in the state that a garrison was admitted here. During the American war, forts and batteries were constructed, and barracks for a considerable body of troops were erected for the defence of the place. Indented for its original excellence, and subsequent increase to the fishery, Yarmouth very early possessed a very numerous shipping. In the summer of 1510, when Edward II. ordered the several ports of England to send ships to Dublin, to convey troops over to Scotland, Yarmouth furnished six, while even Bristol and Gloucester, although so conveniently situate for that object, furnished only two between them. To form a fleet to be employed in the siege of Calais, in 1346, under Edward III., Yarmouth sent out forty-three vessels, carrying 1995 mariners. A number of men far exceeding those furnished by any other port in the kingdom; for London itself was called on for only twenty-five vessels, containing 662 mariners.

In 1797, when men for the navy were required in proportion to the tonnage of each port, Yarmouth was the ninth in order; but according to the Custom-house books of 1800 it had advanced to be the eighth, the ships of the port being 375, the tonnage 32,957, navigated by 2442 men, while Bristol supplied 186 ships, carrying 26,193 tons and 1774 men. Yarmouth was early distinguished, and still remains unrivalled, for the herring-fishery. About 1220 the abbot of St. Alban's purchased a large house in Yarmouth, "in order to lay up fish, especially herrings, which were bought in by his agents at the proper season, for the use of his abbey." Prior to 1238, the people of the opposite coast of Europe were in the habit of returning to Yarmouth for a supply of herrings. These and other recorded facts shew that the method of preserving that fish, probably by salt, must have been known in England more than 200 years before the pretended invention of Beukels in Flanders, from whom pickling is said to have had its name. (See HERRING-FISHERY.) The herrings usually appear on the east coast of England about September, when the grand fishing season commences. The boats fitted out for the fishery are decked, and average from forty to fifty tons burden, with a crew of eleven or twelve men to each. The vessels, with some tons of salt on board, proceed from four to twelve leagues out to sea. Each boat is provided with eighty or a hundred nets, twenty-one yards in length, and eight and a half in depth: all of which, fastened to a long rope, are let down into the sea at dusk, and drawn up at day-light. When salted, the fish are hung up in lofty buildings, and exposed, with small intermissions, for about a month, to the smoke of a wood fire, and thus become red-herrings. Two centuries ago the fishery was also carried on in summer; but in the present times no herrings are found on the coast in that season. In the interval of the fishery, the boats are employed in catching mackerel and cod. Yarmouth trades very largely in the export of corn and malt, and in the woollen stuffs of Norwich. Timber, iron, and hemp, are imported from the Baltic, and ship-building is carried on at this place to a considerable extent.

The formation and the maintenance of the harbour of Yarmouth have required great exertion, ingenuity, and expense; for the present it is the seventh recorded to have been made, and its yearly charge amounts to about 2000l., which sum is defrayed by duties exacted from goods brought in. The new works were executed by Jos. Johnson, a Dutchman, who had been invited from Holland for the purpose. The principal or north pier is in length 275 yards, and the south pier, which is better constructed, 340 yards: the extent of the harbour between these piers is 1111 yards; and the depth of water, in all places of the tide, being now about twenty-four feet, instead of three feet, as was the case before the erection of the piers, vessels can always lie afloat at their moorings. The well-known Yarmouth roads are formed by ranges of sand-banks, lying out parallel to and at no great distance from the shore. The channels between the banks, some of which are dry at low water, and between them and the shore, are in general narrow, but deep enough for ships of any size. The roads conveniently afford most defensible shelter in stormy weather, on a tract of coast projecting a great way into the German ocean, and peculiarly defiitute of accessible harbours. But the concourse of shipping in this station has, on various occasions, produced dreadful disasters, the vessels being frequently driven from their anchors, and wrecked on the banks or on the shore.

The town of Yarmouth is in form an oblong quadrangle, consisting of four principal streets, crossed at right angles by 156 lanes, called rows, so confined in breadth, that for the conveyance of goods through them, the inhabitants have adopted narrow carts, mounted upon low wheels, and drawn by one horse, the driver standing in the front of the cart. The town is inclosed by a wall on the north, east, and south sides, in length 2240 yards, which, with the west side along the river, 2030 yards, make the circuit two miles and 750 yards. Although so populous a town, Yarmouth forms but one parish, and, until a century ago, had but one church, that of St. Nicholas, which was erected by Herbert Lofing, bishop of Norwich, in 1123; but it was greatly enlarged in 1250. It consists of a nave, two aisles, and a transept, and had lately a fire 136 feet high, a distinguished sea-mark in the midst of a long tract of low and dangerous coast; but in 1805 it was taken down. The other public buildings of Yarmouth are, the town-hall, a handsome building, with a Tufcan portico, situated near the centre of the quay; the council-room, which also serves for assemblies; the fisherman's hospital, a quadrangle, containing twenty rooms on a floor, each intended for an old fisherman and his wife; the hospital-school for maintaining and clothing thirty boys and twenty girls, at the expense of the corporation; and the charity-school for seventy boys and thirty girls, who are clothed and educated. The quay of Yarmouth is justly the boast of the town, and is one of the finest and the most extensive in Europe. Its length from the south gate to the bridge is 1014 yards, beyond which it reaches 1016 yards farther, making its whole extent a mile and 370 yards. In many places the breadth is 150 yards, and the southern part
is decorated with a range of handsome buildings. By means
of a bridge across the Yare a communication is main-
tained with the county of Suffolk, which stretches up the
well bank of the river. As a fashionable watering-place, Yar-
mouth is well provided with every accommodation, and
consequently much frequented. On the beach a bathing-hou-
se was erected in 1759, commanding a fine view of the roads
and shipping; and in 1778 a neat theatre was opened. Oppo-
site to Yarmouth, and for about two miles north and
south of the town, the coast is nearly a level common, elevat-
ed only from two to three yards above high-water mark.
From the edge of the common down to the water is a
gentle slope of fine sand, intermixed with coarse pebbles called
flint-ingles; and as the tides rise but about six feet, the space
brought under water is only a few yards. From high-water
mark to the turf of the common the sands abound with
marine plants, some of them rare and curious, of which an
account is given by Mr. Dawson Turner in the Hirtoftic
Guide to Great Yarmouth, 12mo. 1866.—

Beauties of England and Wales, Norfolk, by J. Britton,
F.S.A. 8vo. Lond. 1809.

YARMOUTH, South, a fea-port, borough, and market-
town, in the S.W. half hundred of Wet Meaft liberty, in
the Isle of Wight, and county of Southampton, or Hamp-
shire, England, is situated at the entrance of the little river
Yare, on the N.W. coast of the island, 10 miles W. from
Newport, and 97 S.W. from London. The town, which
was governed by a mayor, twelve burgesses, a reeved, a
town-clerk, &c. was incorporated by James I., and fends
two members to parliament. In 1811 the houses in the
borough and parifh were 88, and the inhabitants 427.
A market is held here on Saturday, and two fairs annually.
Yarmouth is built on a bank floping to the fea, and feems
to have been formerly much larger than it is at present.
The church is situated in the middle of the town. The market-
houfe has over it the town-hall. Here was a castle, built
by Henry VIII. on the feite of an ancient church, which
had been destroyed by the French. This fortrefs is defended
by some pieces of cannon, and a small garrifon. Between
Yarmouth and Lymington a packet falls daily.—Beauties
of England and Wales, Hampshire, by J. Britton and
E.W. Brayley, 8vo. Lond. 1808.

YARMOUTH, a fea-port town of Maffachufetts, in Barn-
stable bay; 50 miles S.E. of Boston. N. lat. 41° 42'.
W. long. 70° 10'.

YARMOUTH, a town on the west coast of Nova Scotia;
35 miles W. of Shelburn.

YARMOUTH, North, a town of America, in the dijtrict
of Maine, and county of Cumberland, with 3295 inhabitants;
9 miles N.E. of Portland. N. lat. 43° 45'. W. long.
76° 8'.

YARMUC, or YARUN, a town of Palestine, in the di-
trict of Saphet, on a river of the fame name, which runs
into the lake of Tiberias, chiefly inhabited by Chriftians;
24 miles S.E. of Saphet.

YARMUC, a river of Syria, anciently called Maria-
thus, which runs into the Orieut, near Apamea. In 636 a
battle was fought on the banks of the river, between the
Chriftians and the Saracens, in which the former were
defeated.

YARN, denotes fpun wool. See Wool, and Woollen
Manufacture.

YARN, Marking. See Marking.

YARN, in Rope-Making, is fpun from hemp, and is called
twenty-five, twenty, and eighteen thread yarn, which differs
only in the finefles; the twenty-five being finer than the
twenty, &c. It is thus distinguished, because either
twenty-five, twenty, or eighteen threads a hook, make
a rope of three inches in circumference, and fo in propor-
tion.

YARN, spun, on board a Ship. See Spun.

YARNALLS, in Geography, a town of Pennsylvania;
20 miles E. of Sunbury.

YAROVOI, a town of Russia, in the government of
Tobolok, on the Irtix; 52 miles N. of Tobolofk.

YARRA. See JARRA.

YARRINGLES, or Yarringle-Blades, a kind of
reel, or instrument, with which hanks of yarn are wound on
to clues, or balls.

YARROW, in Botany. (See Achillea.) Perhaps
this old English name originated in the Spanish Tera, or
Terra, an herb; our Common Achillea Millefolium having
been formerly called, in that language, Milhojas Terra, or
Thousand-leaved Herb, a translation of its Latin appella-
tion.

The leaves and flowers of the common yarrow, or achil-
lea millefolium of Linnum, which is in flower on our ditch-
banks, and in dry purlfures, the greatest part of the summer,
are greatly recommended by some of the German phytifians,
as mild corrodorants, vulneraries, and antipalmodics, in
diarrhoeas, hemorrhages, hypochondriacal, and other dif-
orders. They promise, fays Dr. Lewis, by their fenfible
qualities, to be of no inconfiderable activity. They have
an agreeable, though weak, aromatic smefl, and a bitteriff,
roughif, somewhat pungent taste. The leaves, having the
greatest bitterifnes and aiferity, are chiefly directed for
medicinal ufe; the flowers have the firrongeft and moft
fubtile fmeif, are remarkably acrid, and promise to be of the
greateft efficacy, if the plant has any fuch efficacy, as an
anodyne or antipalmodic. The virtue of both leaves and
flowers is extracted by water and SPIRITuous MENTI-
TRA, the altrirongency most perfectly by the former; their
atromatic warmth and pungency by the latter; and both of
them equally by a mixture of the two. The flowers,
diftilled with water, yield a penetrating effential oil, polleffing
the flavour of the milfoil in perfection; in confequence
fomewhat thick and tenacious; in colour very variable, from
a greenifh-yellow to a deep green and blufh-green, and line
blue, which differences depend in a great meafure on the
foil in which the plant is produced; the flowers gathered
from molt freth grounds yielding generally a blue oil, and
those collected from dry commons a green one, with a
greater or lefs admixture of yellow. The extract obtained
by infipiduating the yellowrifh tincture made in rectified
SPIRIT, is more agreeable in fmeif than the flowers of
a moderately warm penetrating taste, somewhat like that of
camphor, but much milder, accompanied with a flight bit-
erifnes and antifeptic agency. The achillea panicles of
Linnzm, called Jeezewort, or baftard Pellitory, is perennial,
grows wild on heaths, and in moift fandy grounds, and is
found in flower from June to the end of Summer. The
roots of this plant have a fubftantial taste, approaching to
that of Pellitory of Spain, with which they nearly agree in
their pharmacetic properties, and for which they have
been sometimes substituted in the fops. They are by
some recommended internally as a warm fufifuent and
attenuant; but their principal ufe is as a maflicatory and
fermentative. Lewis.

YARROW, in Agriculture, a plant of the herbage kind,
which is common but ufeful in the purlfure-eld in many
cafes. It has long ago been noticed, by the writer of the
"Effays on Rural Affairs," as valuable for cultivation in
grafs-lands in different forts of foil. It fucceeds on moist
loams, but is moft proper for dry burning gravel, sands,
and
and chalks. It is said to polishes the singular quality or property of refuting drought on the moist and dry soils; so that if a green spot appears in a burnt-up cloe-fed pasture ground, it may almost with certainty be concluded to be covered with this plant. In pastures there is not any sort of plant which is eaten down more closely than this, by every kind of browsing domestic animal. It has been remarked with surprize, that spots of rich dry land, which were almost wholly filled with these plants, were eaten down barer than even white clover. It is a strong-rooted perennial plant, which has many fine leaves, of a highly aromatic smell, and which is considered as not only very acceptable, but uncommonly healthy, or even medicinal, both to sheep and black cattle.

It is found in the best bullock pastures and grounds, where it is said to be highly grateful to every sort of live-stock of the cattle kind, and particularly so to sheep, which bite it as fast as it grows or rifes: so that on tolerably well-funded pastures or grounds it is rarely suffered to come into flower. The seeds of it are, therefore, to be obtained from some rich dry spot which is well floored with the plant; and if the soil be well supplied with good mouldy compost, it has been found that the yarrow may be made into a rough hay, from which it is easy to obtain seeds, which are of a peculiar winged form and appearance. It flowers late in the summer, and the seeds may be gathered about the month of October.

It is a plant that has not been observed in abundance in boggy or wet lands; but which, for dry rich soils, deferves the preference to most others for the purpose of being depauperated. It is a plant that on the whole seems to merit the attention of the Stock-farmer, at least in a much greater degree than he has yet bestowed upon it.

Yarrow. Water. See Water Violet.

Yarrow, in Geography, a river of Scotland, which rifes in a mountain called Yarrow Cleugh, in the county of Selkirk, forms two lochs, St. Mary's and Lows, in its course, and runs into the Tweed, about two miles below Selkirk.

YARUM. See Yarm.

YARUQUI, a plain twelve miles north-east from the city of Quito. This spot was pitched upon as the bafe of the whole operations for measuring the length of an arc of the meridian, by Ulloa, &c. Near it is a village of the same name.

YARWHELP, or Yarwip, an English name used in some places for the _agophalus_ of authors. See Godwit.

YASASCHA, in Geography, a town of Ruffia, in the government of Irutik, on the Kitoi; 68 miles N.W. of Irutik.

YASASCHAIA, a river of Ruffia, which runs into the Kolima, at Verchei Kovimiko.

YASCHAMBOUT, a town of Persia, in the province of Adiribitzan; 198 miles S.W. of Taurus.

YASSA, in Modern History, the name given among the Tartars to a body of laws, ascribed to the famous conqueror Gengis-Kan, which are still observed among the Tartars of Crimea, and other parts of Asia. M. de la Croix has given, in his life of Gengis-Kan, an extract of those laws, comprising twenty-one articles: the first of which inculcates the belief of one God, the Creator of heaven and earth, and to whom belong the absolute dominion and dominion of events.

YASUDA, in Hindo Mythology, the name of the fathermother of the Hindoo Krihna: it is said to mean the giver of honour.

YASUDERA, the name of the wife of Bodha, or Boodel, or deity of the Hindoos, and of other people. See Boodel.

YATA, in Geography, a town on the south coast of the island of Catanduanes. N. lat. 13° 52'. E. long. 124° 29'.

YATCHEEVERAM, a town of Hindoostan, in the Carnatic; 25 miles S.W. of Nellore.

YAT, a town of Corea; 25 miles S.W. of Toucheou.

YATCHE, a town of China, in Fo-kien; 15 miles N.E. of Fou-shing.

YATE'S RIVER, a river of Africa, which runs into the Atlantic, N. lat. 8° 8'. W. long. 12° 15'.

YATHKIED, a lake of North America. N. lat. 63° 10'. W. long. 98°.

YATI, the priesthood of the extensive sect of Jainas, in India. (See Jaina.) A yati is sometimes said to be more properly an ascetic, for it doth not appear that he performs any religious rite. It is his duty to read and expound his disciples the scriptures of the Jaina sytem. See under Sects of Hindoos for a general notice of the Jainas.

The yatis are devoted to religion from their infancy; for with the Jainas the priesthood is not hereditary, as with the orthodox Hindoos. A yati never marries, but sometimes purchases a child, adopts it, and instructs it in religious duties. Parents sometimes vow or promise their first-born to the deity, in the hope of obtaining the blessing of fecundity in their family. They serve their noviciate with their guru, or preceptor, and perform for him many domestic offices. After a proper period, when arrived at sufficient age and progress in their studies, they are admitted as yatis. The ceremony on this occasion is simple. The noviate is carried out of the town with music and rejoicing in procession, followed by a crowd of Sravakas, as the laity of the Jainas are called. (See Sravaka.) He is taken beneath a tree with milky juice. The pipala, or Indian fig, is usually preferred. A circle is formed on the ground, within which none but yatis are admitted. The hair, or lock of the noviate is pulled out by the root at five pulls; and camphor, mulk, fandel, fafron, and sugar, are applied to the scalp: he is then shorn, and placed, with joined palms, the poulter of respect and supplication, before his guru, who pronounces a mantra (see MANTRA) in his ear, and invests him with the drell of a yati, which consists of a cloth of three cubits for his loins, another of five cubits for his head, a coarse country blanket, called kamly, for his bed, a water-pot, a plate in his victuals, a cloth to tie up in, a long flicht to defend him, but not to injure others, and lastly, a broom of cotton-threads to sweep the ground where he sits or lies, to avert the destruction of any insect. The Jainas are the sect that so especially avoid shedding blood or destroying life; a tenet that leads them to ridiculous excesses, as will be seen under our article Jaina, in which several particulars of the yati are also given.

YATREB, in Geography, the real name of Medina, in Arabia. It is called Medina, or the city, by way of eminence.

YATTENDON, a village in England, in the county of Berks. Here Alfred overthrew the Danes in 876; 4 miles S.E. of East Ilsley.

YATTONG, a town of Burmah; 15 miles W.N.W. of Ava.

YATTONUR, a town of the island of Ceylon; 10 miles S.W. of Candy.
YAW

YAUACA, a town of Peru, in the diocese of Lima; on the coast: 20 miles S. S. E. of Nafca. S. lat. 15°.

YAGAR, a town of Burmah, on the right bank of the Irawaddy, opposite to Raynangong.

YAGOS, a town of Peru, in the diocese of Lima; 80 miles S. E. of Lima. S. lat. 12° 40'. W. long. 75° 40'.

YAV, a town of Peru, in the diocese of La Plata; 85 miles E. E. of Lipes.

YAW, in Sea Language, denotes the movement by which a ship deviates from the line of her course towards the right or left in steering. See Steady.

Yawl, a small light ship's boat, rowed with four to fix oars, used to convey the officers to and from the ship.

Yawning, Oscillatio, an involuntary opening of the mouth, generally indicating a troublesome weariness, or an inclination to sleep. See Lungs.

YAWS, in Medicine, a severe cutaneous disease, which is indigenous in Africa, and has been thence conveyed to the West Indies and America; so called from the resemblance of its eruptions to a raspberry, the word yaw in some African dialect being the name of that fruit. No folkogists have denominated it Framboesia, from the French Frambois, which has the same signification.

The nature of this disease has been imperfectly investigated by European practitioners; and as it is perhaps never seen in England, a brief account of it will be here sufficient.

It is not easy to discover the precise character of this eruption, from the varying language of authors. An anonymous writer, who gave the first explicit account of the disease, (see Edinb. Med. Essays, vol. v. part 2. art. 76.) says, they are at first "level or smooth with the skin," but soon "become protuberant like pimples." Dr. Hillary, who has copied much from this writer, describes them as "pimples," though smooth and level with the skin, but soon becoming "protuberant pustules." (On the Diff. of Barbadoes, p. 339.) And Dr. Winterbottom, who has given on the whole the most perpicious description of the disease, calls them "pustules," from their first appearance. Again, as to the contents of these eruptions, the anonymous author and Dr. Hillary say, that no pus nor any quantity of ichor is found in them, but speak of a little ichor as drying upon the surface; while Dr. Winterbottom says, they are "filled with an opaque whitish fluid," and when they burst, "a thick viscid matter is discharged." There is also some difference of opinion among the writers on this disease respecting the precursory symptoms, the Former authors asserting, that the general health is not impaired during the first stages; but others, especially Dr. Winterbottom and Dr. Dancer, affirm, that a febrular usually precedes it. On the whole, however, the following appears to be the most correct account of the malady, which is to be collected from the various descriptions which have been published.

The eruption of the yaws sometimes commences without any precursory symptoms of ill health; but it is generally preceded by a slight febrile state, with languor, debility, and pains of the joints, resembling those of rheumatism. After several days, minute protuberances appear on various parts of the skin, at first smaller than the head of a pin, but gradually enlarging, in some cases to the diameter of a line, and in others even to a greater extent: they are most numerous, and of the largest size, in the face, groins, axilla, and about the anus and pudenda. But the crop is not completed at once; new eruptions appear in different places, while some of the earlier ones dry off. When the cuticle is broken, a foul crust is formed on the surface, from under which, on the larger protuberances, red fungous excrescences often spring up, which attain different magnitudes, from that of a small raspberry to that of a large mulberry, which fruit they somewhat resemble from their granulated surfaces. When the eruption is most copious, these tubercles are of the smallest size; and when fewer, they are large. Their duration and progress are various in different constitutions, and at different periods of life. Children suffer less feverously than adults, and are more speedily freed from the disease. In them, according to Dr. Winterbottom, the duration of the yaws is from six to nine months; while in adults it is seldom cured in less than a year, and sometimes continues during two or three. The fungous tubercles attain their acme, according to the anonymous writer already quoted, more rapidly in the well-fed negroes than in those who are ill-fed and thin; and they likewise acquire a larger size in the former than in the latter. They are not posseled of much sensibleness, and are not the seat of any pain, except when they appear upon the soles of the feet, where they are confined and comprised by the hard and thickened cuticle; in that situation they render the act of walking extremely painful, or altogether impracticable. They never suppurate kindly. Dr. Winterbottom says, but gradually discharge a forbid glutinous fluid, which forms an ugly coat round the edges of the excrescence, and covers the upper part of it, when much elevated, with white floughs. When they appear on any part of the body covered with hair, this gradually changes in its colour from black to white, independently of the white incrustation from the discharge. They leave no depreeion of the skin.

The period during which the eruption is in progress varies from a few weeks to several months. "When no more pustules are thrown out," Dr. Winterbottom observes, "and when those already upon the skin no longer increase in size, the disease is supposed to have reached its acme. And, at this time it happens, on some part of the body or other, that one of the pustules becomes much larger than the rest, equaling or surpassing the size of a half-crown piece: it assumes the appearance of an ulcer, and instead of being elevated above the skin like others, it is considerably depressed; the surface is foul and floughy, and pours out an ill-conditioned ichor, which spreads very much, by corroding the surrounding found skin: this is what is called the matter or mother yaw." When arrived at its acme, however, the eruption continues a considerable time without undergoing much alteration, often without very materially injuring the function, and it seldom proves dangerous, except from the mischiefous interference of ill-directed art.

The yaws is propagated solely by the contagion of the matter discharged from the eruption, when it is applied to the wounded or broken skin of another person, who has not previously undergone the disease. For, like the febrile eruptions, the yaws affects the same person only once during life; but, unlike them, it is not propagated by effluvia. The complaint is sometimes inoculated by flies, in those hot countries, when the skin both of the diseased and the healthy remains uncovered. Hence, Dr. Bancroft says, "none ever receive it who's skins are whole; for which reason the whites are rarely infected; but the backs of the negroes being often raw by whipping, and suffered to remain naked, they scarce ever escape it." (Nat. Hist. of Guiana, p. 365. See also Winterbottom, p. 141-3.) In Africa it is usually undergone during childhood. The period which elapses between the reception of the contagion and the commencement of the disease is no where mentioned; but in the case of a Dane, whom Dr. Adams saw at Madeira, the patient had been absent ten months from...
from the West Indies before he felt any indisposition. See Memoirs of the Med. Soc. of London.

With respect to the treatment of yaws, nothing very satisfactory is to be collected from the writings of the practitioners to whom we are indebted for the history of the disease. "The native Africans," according to Dr. Winterbottom, "never attempt to cure it until it has nearly reached its height, when the fungi have acquired their full size, and no more pullules appear." And the practitioners in the West Indies soon learned by experience, that active evacuations retard the natural progress of the disease; and that mercurials, although they induced it, and cleared the skin of the eruption, yet left the patient still susceptible of, or rather still impregnated with, the virus, which deeply evinced its presence by a reappearance of the symptoms more severe and tedious than before. In truth, the disease, it would seem, like the pullular and exanthematous fevers of our own climate, will only leave the constitution after it has completed the various stages of its course, and removed the susceptibility of the individual to future infection; and no medicine yet discovered has had any influence in superseding this action, or in accelerating its progress. Unless, therefore, any urgent symptoms should require alleviation, (which seldom, if ever, happens) it is advisable to dispense with the administration of medicine, and to be content with refticting the patient to a moderate and temperate regimen, during the first stage of the malady. When the eruptions begin to dry, or as soon as they cease to multiply and enlarge, the disease appears to require the same management as other fever and superficial ulcerations, accompanied with a cachectic state of the system; viz. a light but nutritious diet, a dry and wholesome air, warm clothing, moderate exercise, and a course of tonic medicine, especially of farfaparilla, or cinchona, with the mineral acids, or with antimonials and small doses of mercury, according to the circumstances of the individual habit. The effects of mercury, however, exhibited so as to excite salvation, as the early practitioners recommend, seem to be of a very questionable nature, especially when it is unaccompanied by the vegetable decoctions; and it is certain that patients have, in some cases, soon recovered under the use of the latter, when the mercurials were omitted. The mercurial treatment, indeed, is often followed by a train of harassing symptoms, called by the negroes the bone-aque. "The unhappy sufferer is tormented with deep-seated pains in the bones, especially round the joints, which are occasionally aggravated to a violent degree; the perioleum becomes thickened, inflamed, and painful, and nodes are formed on the bones. When these symptoms have continued for some time, the bones are affected with caries, and even become soft and lose their form." The native Africans employ decoctions of the bark of two or three trees, which are generally purgative, as well as tonic, and likewise wash the sores with them, after carefully removing the crusts.

The major-yaw sometimes remains large and troublesome after the rest of the eruption has altogether disappeared. It requires to be treated with gentle echarotics, and soon affumes a healing appearance under these applications. Stronger caustics are requisite after the cure of the crab-yaw, or tedious excrecences, which occur on the soles of the feet.

We may add, that the anonymous writer in the Edin. Med. Essays, and after him Dr. Hillary and others, have deemed the yaws to be the Hebrew leprosy, described by Mozes. (Leviticus, chap. xiii.) In some respects, and especially in the appearance of what is called "raw flesh" in the leprous spots, together with subitenes of the hair, the description of the leprosy of the Jews is applicable to the yaws. But the leprosy is described by the great legislator as beginning in several ways, or appearing under several varieties of form, in only one of which this rising of "raw flesh" is mentioned; and the two circumstances, which all these varieties exhibited in common, were a deprefion of the skin and whitening of the hair. Now this change in the colour of the hair is common to the yaws and to the leprous; and it is conjoined in the latter with cutaneous deprefion. It seems pretty obvious indeed, that the term leprosy was used in the Scriptures to denote several diseases of the skin, against which the law of exclusion was enforced, and others to which it did not apply. An instance of the latter occurs in Gehazi, whom we find full in the employment of Elifha, and even conversing with the king, after the leprosy had been inflicted upon him, and his lefis for ever. (2 Kings, chap. iv. and viii. v. 4.) See Dr. Bateman's Practical Synopsis of Cutan. Disease, and the Works above quoted.

YAXARTES, or YAXARTES, the Syr-Daria, in Geography, a river of Russia, that falls into the Aral. YAXLEY, a small market-town in the hundred of Norman-Crofs, and county of Huntingdon, England, is situated 2 miles N.E. from Stilton, and 73 miles N. by W. from London. It has of late increased in importance from its contiguity to the barracks at Norman-Crofs. The market was for a long time discontinued, but has been recently revived, and is now held on Tuesdays. It was originally granted to the abbots of Thorney, one of whom, named De Yalkesley, who died in 1294, was native of this town. Here is also an annual fair. The church is a handsome fabric, and particularly remarkable for its lofty and well-proportioned spire, which is seen at a considerable distance on all sides. The population of the parish, in the enumeration of the year 1811, was returned at 1391, occupying 171 houses.

YAYACATLAN, a town of Mexico, in the province of Tlafaca; 10 miles E.S.E. of Puebla de los Angélos. YAYAUHQUITOTOL, in Orthoithology, the name of an Indian bird described by Nieremberg, remarkable for having two feathers of its tail much longer than the rest, and naked for a great way, but the end ornamented with black and blue hairs. The bird is of the fize of the flaring, and is beautifully variegated with green, blue, yellow, and grey.

Mr. Ray is of opinion, that this is the bird described by Marcgrave under the name guaira-guainambi.

YAYANGHEOUN, or EARTH OIL CREEK, in Geography, a town of Burmah, on the Irrawaddy, which receives its name from some wells of petroleum, in its neighbourhood. It is chiefly inhabited by potters; 15 miles S. of Pegomgwe.

YAYOS, or YANOS, a town of Peru, and capital of a jurisdiction, in the archiepiscopate of Lima, which begins about 48 miles south-east from Lima, and extends about 75 miles in length along the Andes. It abounds in fruit, maize, wheat, barley, &c. and the pastures feed a great number of cattle for the markets of Lima; 80 miles S.S.E. of Lima.

YAZAMATES, a people who inhabited Kuban, after the Sarmates were for the most part given to Europe, five years before Alexander.

YAZOO, a river of the flate of Georgia, which runs into the Mississiphi, N. lat. 32° 38'. W. long. 91° 10'.

YAZOO, Little, a river of West Florida, which runs into the Mississiphi, N. lat. 32° 13'. W. long. 91° 10'.

YAZVA,
YAZVA, a river of Russia, which runs into the Vishera, 8 miles E. of Gerdin, in the government of Perm.

YBAGUE,  a town of South America, in the kingdom of New Grenada.

YBAICABAL.  See Nervio.

YCA.  See Ica.

YCAJALE.  See Ucayale.

YCHAN, a town of Corea; 13 miles S. of Hetun.

Y-CHI, a town of China, of the third rank, in Chantâ; 12 miles N.N.E. of Kias.

YECONOMUS.  See Oeconomus.

YDALA, in Geography, a town of Sweden, in Blekingen; 10 miles S.S.E. of Kongsback.

YDRIA.  See Hydria.

YDRINUS, or Hydrinus, a name given by some to the ophiur, or serpent-flame.

YDRUS, in Ancient Geography, a mountain of Hilpasia. Jerome.

YE, or Yve, in Geography, a river of Holland, which passes by Amsterdam, and runs into the Zuyder See, about 6 miles below.

YEWA WATER, a river of Scotland, which runs into the Nith, 2 miles E. of Lochmaben.

YEADON, a township of Yorkshire, in the West Riding, with 1695 inhabitants, including 476 employed in trade and manufactures; 3 miles S. of Otley.

YEALME, a river of England, in the county of Devon, which runs into the English Channel, 1 mile N.N.W. of Stoke Point.

YEANGLAW, a town of Birmah; 7 miles S. of Pegomsgow.

YEANLING, among Sheep-Farmers, a term used to signify the act of bringing forth the young animals of the sheep kind. It is said that in the polled breeds of sheep the lambs are reared with the greatest ease and facility, and in the large-horned breeds with the greatest difficulty and inconvenience. See Sheep.

YEANING-Time, the season of yeaning in sheep, which is different in different breeds of them, but probably the most early in the Dorsetshire breed, as they may be managed so as to lamb at a very early period. In general, however, the management is such, that the lambs are yeaned or brought forth from towards the latter end of February to the beginning of the following month, and later in some caels and situations. When yeaned too early there is often great loss, on account of the inclemency of the season, unless the ewes have been kept very well for some time before it takes place. Consequently, in all such caels, they should, for some weeks at least before the yeaning time, be plentifully supplied with proper food, so that the health and strength of them and that of their young may be promoted and preserved against this period. Proper sheltered situations, yards, and spots of ground, should also be provided for this purpose, by which the lives of numbers may be saved. See Sheep.

In all bad caels of yeaning, the ewes should be well supported by good oatmeal gruel and cordial drinks.

YEANLING, a term applied to the young of the sheep kind when newly yeaned. See Lamb.

YEARN, Annuus, in the full extent of the word, is a system or cycle of several months; usually twelve.

Others define year, in the general, a period, or space of time, measured by the revolution of some celestial body in its orbit.

Thus, the time in which the fixed stars make a revolution is called the great year. And the times in which Jupiter, Saturn, the Sun, moon, &c. finish their revolutions, and return to the same point of the zodiac, are respectively called the years of Jupiter and Saturn; and the solar and the lunar years.

As there is no luminary whose changes and revolutions are so frequent and remarkable as those of the moon, some have thought that all nations at first measured and divided time according to the various aspects of this planet. Accordingly the Egyptian year originally consisted of a single lunaion; afterwards it included two or three months, and was defined by the fixed returns of the seafons. It has been also supposed, that several ages must have elapsed before the idea of adjusing the length of the year to the course of the sun became general, though repeated observations were made on his motion in the ecliptic. The Indians, the Chaldeans, and Egyptians, who in a verj early period applied their attention to astronomy, at length found, by comparing the motions of the sun and moon together, that one revolution of the former was equal to about 12 of the latter; and hence was formed a year of 12 lunations, in every one of which were reckoned 30 days: and hence also, it is said, arose the division of the ecliptic into 360 equal parts or degrees.

Year, properly, and by way of eminence so called, is the solar year; or the space of time in which the sun moves through the twelve signs of the ecliptic.

This, by the observations of Caffini, Bianchini, and de la Hire, contains 365 days, 5 hours, and 49 minutes; which is the quantity of the year affirmed by the authors of the Gregorian calendar.

But in the civil or popular account, this year only contains 365 days; except every fourth, which contains 366.

The vicissitude of seasons seems to have given occasion to the first institution of the year. Man, naturally curious to know the cause of that diversity, from found it was the proximity and distance of the sun; and, upon this, gave the name year to the space of time in which that luminary, performing his whole course, returned to the same point of his orbit.

And hence, as it was on account of the seasons, in a great measure, that the year was instituted, their chief regard and attention were, that the same parts of the year should always correspond to the same seasons; i.e. that the beginning of the year should always be when the sun was in the same point of his orbit; and that they should keep pace, come round, and end together.

This, different nations aimed to attain by different ways; making the year to commence from different points of the zodiac, and even making the time of his progress different. So that some of their years were much more perfect than others, but none of them quite just; i.e. none of them whose parts did not shift, with regard to the parts of the sun's course.

We may naturally suppose that the commencement of the year would be determined by the date of some considerable event, such as the creation of the world, the universal deluge, a conjunction of planets, the incarnation of our Saviour, &c.; and of course it has been referred to different points in the ecliptic. The Chaldean and Egyptian years were dated from the autumnal equinox. The ecclesiastical year of the Jews began in the spring; but in civil affairs they retained the epoch of the Egyptian year. The ancient Chinese reckoned from the new moon nearest to the middle of Aquarius; but according to some recent accounts, the beginning of their year was transferred (B.C. 1740) to the new moon nearest to the winter solstice. This likeness is the date of the Japanese year. Dimechfeld,
or Gemelli, king of Peria, observed on the day of his public entry into Persepolis, that the sun entered into Arees; and in commemoration of this fortunate event and coincidence, he ordained the beginning of the year to be removed from the autumnal to the vernal equinox. This epoch was denominated Neurus, viz. New-day, and is still celebrated with great pomp and festivity.

The ancient Scythian year commenced at the winter solstice, or rather at the time of the sun’s appearance in the horizon, after an absence of about 40 days. The feast of this epoch was solemnized on the 20th day after the solstice. Some of the Grecian states computed from the vernal, some from the autumnal equinox, and others from the summer tropic. The year of Romulus commenced in March, and that of Numa in January. The Turks and Arabs date the year from the 16th of July; and the American Indians reckon from the first appearance of the new moon of the vernal equinox. The church of Rome has fixed new-year’s day on the Sunday that corresponds with the full moon of the same season. The Venetians, Florentines, and Pisans in Italy, and the inhabitants of Treves in Germany, begin the year at the vernal equinox. The ancient clergy reckon from the 25th of March; and this method was observed in Britain until the introduction of the New Style, A.D. 1752, after which our year commenced on the first day of January. See EOC libido and CHRONOLOGY.

They were the Egyptians, if we may credit Herodotus, that first formed the year, which was lunisolar, making it to contain 360 days, which they subdivided into 12 months.

This year was corrected by the Thebans, who added to it five intercalary days. The Medes and Persians, who were anciently a part of the Assyrian empire, adopted the old Chaldaean year of 360 days, which they afterwards reformed.

Some millionaries report, that the lunisolar year was corrected in China; the year of the Indians contained 360 days, and was divided into 24 months. But besides this form of the year, the Indians used another, for astronomical purposes, consisting of 365 d. 15 h. 31' 15"; which Indian days and hours are equal to 365 d. 6 h. 12' 30", according to our mode of computation. Or, as this year is sidereal, if you subtract 21' 35" on account of the motion of the stars in longitude, the Indian tropical year will be 365 d. 5 h. 30' 55". The Mexicans received the lunisolar year from the Indians or Chineese, and divided it into 18 months of 20 days; adding five days to the last month, and dating the year from March. That the ancient Grecian year was lunisolar, is evident from many testimonies of Hippocrates, Plato, and Pliny. The Latin year, before Numa’s correction of it, consisted of 360 days, 304 of which were divided into 10 months; and to these were added two private months, not named in the calendar. Plut. in Vit. Numa. Serv. et Virgil Georg. l. i. v. 43.

It has been said that Mercurius Trifmegistus added five days to the Egyptian year of 360 days. And, on this footing, Thales is said to have instituted the year among the Greeks; though that form of the year did not hold throughout all Greece. Add, that the Jewish, Syrian, Roman, Persian, Ethiopick, Arabic, &c. years were all different.

In effect, considering the imperfect state of astronomy in those ages, it is no wonder different people should disagree in the computation of the sun’s course. We are even assailed by Dion. Siculus (lib. i.), Plutarch in Numa, and Pliny (lib. vii. cap. 48.), that the Egyptian year itself was at first very different from that now represented.

The imperfection of the lunisolar year became more and more apparent as the arts and sciences improved; but the necessary correction depended upon a competent knowledge of the solar year. Every nation, by degrees, invented or adopted the method of intercalating a few days at certain intervals. The author of the discovery is not certainly known: the Egyptians have claimed the merit of it; and the Theban priests have attributed it to Hermes or Thoth. It appears that they were acquainted with the year of 365 days in a very remote period. (Herodot. l. iv. c. 4. Strabo Geog. l. xvi. Syncull. Chron. p. 121.) The length of the solar year was represented in a golden circle fixed upon the tomb of Osymandases; and this circle was 365 cubits in circumference, having on each cubit a day of the year inscribed, together with the heliacal risings or settings of the stars. This Osymandases is said to have flourished either in the 13th or 11th century before the Christian era. For perpetuating the memory of this correction, though inaccurate, the first month of the year was distinguished by the title Thoth, or Sothis, which was the Egyptian appellation of the dog-star, the heliacal rising of which announced the inundation of the Nile. Hence, it is said, originated the fable, invented of the priests of Thebes, that Mercury, or Thoth, regulated the civil year by extending it, as we have already observed, to 365 days; and, in return, the first month was called by his name. See Egyptian Year, and CANONICAL YEAR.

The method of correcting the civil year, by the addition of five epagomenae, was communicated by the Chaldaans and Egyptians to other nations; but it has not been ascertained at what epoch the solar year was observed to be almost 6 hours longer than the civil year of 365 days. The priests of Thebes claimed the merit of the discovery (Diod. Sicul. l. i. p. 59. Strabo Geog. l. xvi.); but Herodotus takes no notice of it; nor Thales, who, on his return from Egypt, taught the Greeks to form a solar year of 365 days without any intercalation. Plato and Eudeus are said to have obtained it, as a secret, from the Egyptians, about 80 years after Herodotus, and to have carried it into Greece; which flew that the knowledge of this form of the year was then recent, and confined to a few of the learned, while the old form was still retained, and the Egyptians used no intercalation until the corrected Julian year was received at Alexandria by the order of Augustus; and even at this time the Greeks and Romans, who resided in Egypt, alone obeyed the imperial mandate. The superstitious nations refused to admit any addition to a form of the year which had been so long established among them.

The reformed year of the Chineese consisted of 365 d. 5 h. 20', which were divided into 24 months, each of these equal parts including 15 d. 5 h. 14.31". (Du Halde. Hyd. Relig. Vet. Peri.) The quantity of the Indian year was somewhat different from that of the Chineese: the lunar year contained 364 d. 22 gurris, 1 pul; and the solar year 365 d. 15 gurris, 30 pults, 22½ puds; 60 pults = 1 pul, 60 pullis = 1 gurri, and 60 gurris = 1 day; so that their solar or rather sidereal year consisted of 365.6 d. 12 h. 76". This mode of computation is used by the Brahmins, by the Moguls, and by other Mahometans in India.

YEAR, Solar, is the interval of time in which the sun finishes his course through the zodiac; or in which he returns to the same point of it from whence he had departed.

This, according to our account, is 365 days, 5 hours, 49 minutes; though some astronomers make it a few seconds, and some a whole minute less; as Kepler, for instance, who makes it 365 days, 5 hours, 48 minutes, 57 seconds, 39 thirds. Ricciolus, and Tycho Brahe, 365 days, 5 hours, 48 minutes.

The
The solar year is either astronomical or civil.

The year, **solar astronomical**, is that determined precisely by the observations of astronomy, and is of two kinds, tropical and sidereal or astral.

The year, **tropical or natural**, is the time which the sun employs in paffing through the zodiac, or from one equinox to another, or from one tropic to the same again; which, as before observed, is 365 days, 5 hours, 49 minutes; or, more accurately, 365 days, 6 hours, 9 minutes, 11½ seconds. This is the only proper or natural year, because it always keeps the same feaions to the same months.

In order to find the tropical year, observe the meridian altitude, \(a\), of the sun on the day nearest to the equinox; then the next year take its meridian altitude on two following days, one when its altitude, \(m\), is less than \(a\), and the next when its altitude, \(n\), is greater than \(a\), then \(a - m\) is the increase of the sun’s declination in 24 hours; also, when the declination has increased by the quantity \(a - m\) from the time when the meridian altitude, \(m\), was observed, the declination will then become \(a\); and as we may consider the increase of declination to be uniform for a day, we have \(n - m = a - m : 24\) hours, the interval from the time when the sun was on the meridian of the first of the two days, till the sun has the same declination \(a\), as at the observation the year before; and this time added to the time when the sun’s altitude \(m\) was observed, gives the time when the sun’s place in the ecliptic had the same situation in respect to the equinoctial points, which it had at the time of the observation the preceding year; and the interval of these times is the length of a tropical year.

If, instead of repeating the second observation the next year, there be an interval of several years, and you divide the interval between the times when the declination was found to be the same, by the number of years, you will get the tropical year more exactly.

The year, **sidereal or astral**, is the space of time in which the sun, going from any fixed star, returns to the same place. This consists of 365 days, 6 hours, 6 minutes, 11½ seconds.

To find the length of a sidereal year. On any day when the sun is at \(Z\) on the meridian (Plate XXI. fig. 12), take the difference, \(Zm\), between the sun’s right ascension when it paffes the meridian, and that of a fixed star, \(S\); and when the sun returns to the same part of the heavens the next year, compare its right ascension with that of the same star for two days, one when their difference, \(bm\), of right ascensions is less, and the other when the difference, \(fm\), is greater than the difference, \(Zm\), before observed; then \(bm\) is the increase of the sun’s right ascension in the time, \(t\), and as the increase of right ascension may be considered as uniform for a small time, we have \(bm / \delta Z = t / \delta T\), in which the right ascension is increased from \(b\) to \(Z\), in this time, \(T\), therefore, added to the time of the observed right ascension at \(b\), gives the time when the sun is at the same distance, \(Zm\), from right ascension from the star, which it was when observed at \(Z\) the year before; the interval of these times is therefore the length of the sidereal year. The best time for these observations is about March 25, June 20, September 17, December 20, the sun’s motion in right ascension being then uniform. Instead of observing the difference of the right ascensions, you may observe that of their longitudes.

If, instead of repeating the second observations the year after, there be an interval of several years, and you divide the observed interval of time when the difference of their right ascensions was found to be equal, by the number of years, you will have the length of a sidereal year more exactly.

The precession being given (see Precession), and also the length of a tropical year, the length of a sidereal year may be found by this proportion: 365° = 50°, 25: 360° = 365 d. 5 h. 48' 48": 365 d. 6 h. 9' 11½" the length of the sidereal year.

The year, **anomalialical**, is the time that elapses from the sun’s leaving its apogee till it returns to it; and as the progressive motion of the apogee in a year is 11°, 75', the anomalialical year must be longer than the sidereal year, by the time which the sun takes in moving over 11°, 75' of longitude at its apogee; but when the sun is in its apogee, its motion in longitude is 58° 13' in 24 hours; hence 58° 13' = 11°, 75; = 24 hours; 4' 50"; which added to 365 d. 6 h. 9' 11½", gives 365 d. 6 h. 14' 24"; the length of the anomalialical year. M. de la Lande determined this motion of the apogee from the observations of M. de la Hire, and those of Dr. Maskelyne. Caffini made it the same. This year is sometimes used by astronomers. See Anomalialical Year.

The year, **civil**, is that form of year which each nation has contrived for the computation of time; or the civil is the tropical year, considered as only consisting of a certain number of whole days; the odd hours and minutes being set aside, to render the computation of time in the common occasions of life more easy.

Hence, as the tropical year is 365 days, 5 hours, 48 minutes, 48 seconds, the civil year is 365 days. And hence, also, as it is necessary to keep pace with the heavens, it is required that every fourth year should consist of 366 days.

Hence, lastly, the civil year is either common or bixestile.

The year, **the common civil**, is that consisting of 365 days. This, therefore, has seven months of 31 days each, four of 30 days, and one of 28 days; according to the well-known canon:

Thirty days hath September,
April, June, and November.
February twenty-eight alone,
And all the rest have thirty-one.

The year, **bixistile, or leap**, is that consisting of 366 days; or it has one day extraordinary; which day is called the intercalary, or bixistile day.

This intercalary, or additional day to every fourth year, was first appointed by Julius Caesar; who, to make the civil year keep pace with the tropical ones, contrived that the six hours which the former wanted of being equal to the latter, should, in four years, make a whole day, and be added before the twenty-fourth, or to the twenty-third of February, which was their 6th of the calenders of March. Hence, as in that year, they reckon this day twice over, or add bis sexto calendis, the year itself came to be called bisextus, and Bixistile; which fee.

The intercalary day, however, among us, is not introduced by telling the twenty-third of February twice over, but by adding a day after the twenty-eighth of February; which month, in that year, contains twenty-nine days. See Leap-Year.

A further reformation in this year was made by pope Gregory. See Gregorian Year, and Calendar.

The year, **lunar**, is a system of twelve lunar months. See Lunar.

Hence, from the two kinds of synodical lunar months, there are two kinds of lunar years; the one astronomic, the other civil.

H 2
YEAR.

Year, Lunar Astronomical, consists of twelve lunar synodical months; and therefore contains 354 days, 8 hours, 48 minutes, 36 seconds; and is, therefore, 10 days, 21 hours, 0 minute, 12 seconds, shorter than the solar year. This is the foundation of the Epact; which see.

Year, Lunar Civil, is either common or embolistic.

Year, the Common Lunar, consists of twelve lunar civil months; and therefore contains 354 days.

Year, the Embolistic or Intercalary, consists of thirteen lunar civil months; and therefore contains 384 days. See Embolistic.

Thus far we have considered years and months, with a view to the principles of astronomy, on which the division is founded. By this, the various forms of civil years that have anciently obtained, or still do obtain in divers nations, are to be examined.

Year, Ancient Roman, or Latin, was the lunar year, which, as first settled by Romulus, only consisted of ten months; viz. 1. March, containing 31 days. 2. April, 30. 3. May, 31. 4. June, 30. 5. Quintilis, 31. 6. Sextils, 30. 7. September, 31. 8. October, 31. 9. November, 30. 10. December, 30. In all 304 days, which came short of the true lunar year by 50 days; and of the solar, by 61 days. Hence, the beginning of Romulus's year was vague, and unfixed to any precise season; to remove which inconvenience, that prince ordered so many days to be added yearly as would make the state of the heavens correspond to the first month, without incorporating the additional days, or calling them by the name of any month. Censorinus, Varro, and other Roman authors, agree, that the ancient Latin year was divided into 10 months, which appears from a passage in Plutarch, that two intercalary months were added to every year; which two months were not inserted in the calendar. Romulus retained the former names and number of the months; but adapted their quantity nearly to the course of the sun, affixing, as we have stated, six of them 30 days, and to the remaining four 31 days each, and he transferred the beginning of the year from April to March; December was the 10th month, as its name implies; after which the two intercalary months were inserted, but no names were affixed to them till the succeeding reign.

Numa Pomphilus corrected the irregular constitution of Romulus's year, and composed two new months, January and February, of the days that were used to be added to the former year. Thus, Numa's year consisted of twelve months; viz. 1. January, containing 29 days. 2. February, 28. 3. March, 31. 4. April, 29. 5. May, 31. 6. June, 29. 7. Quintilis, 31. 8. Sextils, 29. 9. September, 29. 10. October, 31. 11. November, 29. 12. December, 29. In all 355 days, which exceeds the quantity of a lunar civil year by one day; and that of a lunar astronomical year by 15 hours, 11 minutes, 24 seconds, but comes short of the common solar year by ten days; so that its beginning also was vague and unfixed.

Numa, however, desiring to have it fixed to the winter solstice, ordered 22 days to be intercalated in February every second year, 23 every fourth, 22 every sixth, and 23 every eighth year, making in all 90 days.

But this rule failing to keep matters even, recourse was had to a new way of intercalating; and, instead of twenty-three days every eighth year, only fifteen were added; and the care of the whole was committed to the pontifex maximus, who neglecting the trifft, let things run to the utmost confusion. And thus the Roman year flood till Julius Caesar made a reformation. See Calendar.

For the manner of reckoning the days of the Roman months, see Calendar, Nones, and Ides.

Year, Julian, is a solar year, containing, commonly, 365 days; though every fourth year, called biferile, it contains 366.

The astronomical quantity, therefore, of the Julian year is 365 days, 6 hours; which exceeds the true solar year by somewhat more than eleven minutes; which excess, in 137 years, amounts to a whole day. So that the times of the equinoxes go backward, and fall earlier by one day in about 131 or 130 years. And thus the Roman year flood, till the reformation made in it by pope Gregory.

For this form of the year, we are indebted to Julius Cæsar; who, in the contrivance of it, was assisted by Sosigenes, a famous mathematician, called over from Egypt for this very purpose; who, to supply the defect of fifty-seven days, which had been lost through the fault of the pontifices, and to fix the beginning of the year to the winter solstice, made that year to consist of 15 months, or 445 days; which, for that reason, is used to be called annus confusionis, the year of confusion. See Julian Calendar.

Year, Gregorius, is the Julian year corrected by this rule, that whereas, on the common footing, every secular or hundredth year is biferile; on the new footing, three of them are common years, and only the fourth is biferile.

The error of eleven minutes in the Julian year, little as it was, yet, by being repeated over and over, at length became considerable; and from the time when Cæsar made his correction, was grown into thirteen days, by which means the equinoxes were greatly disturbed. In the year 1582, the equinoxes were fallen ten days, and the full moons four days, more backwards than they were in the time of the Nicene council; i.e. the equinox, which in the year 325, when that council was held, fell on the twenty-first of March, was in 1582 thrown back to the tenth, and the full moon was removed from the fifth to the first of April. To remedy this irregularity, which was still increasing, pope Gregory XIII., in the year jubilament celebrated, called together the chief almoners of his time, and concerted this correction; and, to restore the equinoxes to their place, threw out the ten days that had been got from the time of the council of Nice, and which had shifted the fifth of October to the fifteenth. He exchanged the lunar cycle for that of the epacts; and in order to restore the spring equinox to the Nicene standard, subtracted ten days out of the month of October, in that year (1582), making the fourth to be the fifteenth; and by this means, the vernal equinox has been restored to the twenty-first of March. Moreover, it was endeavoured, by the omission of three intercalary days in four hundred years, to make the civil year keep pace with the solar for time to come. See Calendar.

In the year 1799, the error of ten days was grown to eleven; upon which the Protestant states of Germany, to prevent further confusion, accepted the Gregorian correction. See Reform Calendar, and Style.

Yet is even the Gregorian year far from being perfect; for we have shown, that in four centuries the Julian year gains three days, one hour, twenty minutes; but it is only the three days that are kept out in the Gregorian year; so that
that there is still an excess of one hour, twenty minutes, in four centuries, which, in seventy-two centuries, amount to a whole day.

The Gregorian year is now used in most countries in Europe. From the difference between this and the Julian year arises the distinction of the old or Julian, and new or Gregorian Style; which see.

Year, Egyptian, called also the year of Nabonassar, on account of the epocha of Nabonassar, is the solar year of 365 days, divided into twelve months, of thirty days each, besides five intercalary days, added at the end.

Hence, as the Egyptian year in every four years loses a whole day of the Julian year, because it neglects the six hours, which make a leap-day once in four years, its beginning, in the space of 1460 years, runs through every part of the Julian year; which space elaps'd, they meet again; and, therefore, it is justly called the erratic year. And because it returns to the same day of the Julian year after 1460 Julian years, this circle is called the Sothic period. See Canicular Year.

This year is used by Ptolemy, in his Almagest; so that the knowledge of it is of great use in alonomy, for comparing the ancient observations with the modern.

This defiratory form was applied by the Egyptians to civil uses, till Antony and Cleopatra were defeated; and the mathematicians and astronomers used it till the time of Ptolemy.

The ancient Egyptians, we are told by Diodorus Siculo (lib. i.), Plutarch (in the Life of Numa), and Pliny (lib. vili. c. 48.), measured their years by the course of the moon. At first, they were only one month, then three, then four, like that of the Arcadians; and then six, like that of the people of Acrania. Those authors add, that it is on this account they reckon such a vast number of years from the beginning of the world; and that, in the history of their kings, we meet with some who lived 1000 or 1200 years.

But Herodotus is silent on this point: he only says, that the Egyptian year consisted of twelve months, as we have above represented it. Besides, we learn from Scripture, that from the times of the flood, the year was composed of twelve months; Cham, consequently, and his son Mifrain, the founder of the Egyptian monarchy, must have had that custom; and it is no way probable his descendants should alter it. Add, that Plutarch speaks of it with great uncertainty, and as no more than a report; and Diod. Siculo, as only a conjecture of authors whom he does not name; and who, in all probability, might have framed this hypothesis to reconcile the Egyptian chronology to that of some other nations.

F. Kircher, however, maintains, that besides the solar year, there were some of the nomes or cantons of Egypt which used a lunar one; and that in the remotest ages there were some who took a revolution of the moon, that is, a month for a year; and others, who finding the year too short, made it two months, three others, and others four, &c. (Oedip. Egypt. tom. ii. p. 252.) A late author observes, that Varro has affirmed of all nations, what we have here quoted of the Egyptians; and adds, that Laclantius takes him to talk on that subject. We do not know in what places of Varro, or Laclantius, he has seen this: all we can say is, that Laclantius (Divin. inlt. lib. iii. c. 13.), where he gives Varro's opinion, only represents him as speaking of the Egyptians. However, St. Augustine (De Civit. Dei, lib. xv. c. 14.) feews, that the years of the patriarchs mentioned in Scripture are like ours, and not one of ours equal to ten of theirs, as, it appears, had been the opinion of some people.

Upon the Egyptians being subdued by the Romans, they received the Julian year, though with some alteration; for they still retained their ancient months, with the five ἐπαρθουμενα, and, every fourth year, intercalated another day between the 28th and 29th of August. Add, that the beginning of their year, or the first day of the month Thoth, answered to the 29th of August of the Julian year, or to the 30th if it happened to be leap-year.

This year, thus reformed, and called the fixed Egyptian year, was called the annus Aegypt., as being instituted soon after the battle of Actium.

Year, Ancient Greek, was lunar, consisting of 12 months, which, at first, had 30 days a-piece, then alternately 30 and 29 days, computed from the first appearance of the new moon; with the addition of an embolismic month of 30 days, every 3d, 5th, 8th, 11th, 14th, 16th, and 19th years of a cycle of 19 years; in order to keep the new and full moons to the same terms or feasons of the years. With this correction, though erroneous, it subsisted until the time of Herodotus and Hippocrates. Solon attempted the reformation of the calendar by the introduction of the complete and defective months; i.e. months of 30 and of 29 days; for two lunations made 59 days, nearly. Thus amended the year became lunar, and was adopted at Athens; but in other states of Greece the ancient form was retained.

Their year commenced with the new moon, the full moon of which comes next after the summer solstice. The order, &c. of their months was thus: 1. ΕΚΑΤΟΔΟΜΟΣ, containing 29 days. 2. ΜΕΣΟΣΤΕΤΗΣ, 30. 3. ΒΕΝΙΣΤΕΤΗΣ, 29. 4. ΜΕΣΟΧΕΡΝΗ, 30. 5. ΠΟΠΟΤΙΤΗΣ, 29. 6. ΠΟΠΟΤΙΤΗΣ, 30. 7. ΤΕΜΕΝΟΣ, 28. 8. ΑΝΠΙΣΤΗΣ, 30. 9. ΕΛΙΦΑΓΟΣ, 30. 10. ΜΕΡΙΩΝ, 30. 11. ΕΥΔΩΡΟΣ, 29. 12. ΕΥΔΩΡΟΣ, 30.

The Macedonians had other names for their months; to the Syro-Macedonians, Smyrneans, Tyrians; to the Cyprians, Paphians; and to the Bithynians, &c.

Year, Ancient Macedonian, is a lunar year, only differing from the Attic, in the names and order of the months; the first Macedonian month agreeing with the Attic Mæcatherion: as the Macedonian year commenced not at the summer solstice, but at the autumnal equinox. The months stand thus: 1. ΑΓΩ, 30 days. 2. ΑΓΩΘΟΝ, 29. 3. ΑΘΟΝ, 30. 4. ΠΕΡΤΙ, 29. 5. ΣΤΡΕΤΟΣ, 30. 6. ΝΑΝΟΣ, 29. 7. ΑΝΠΙΣΤΙΣ, 30. 8. ΝΟΜΙΤΩΣ, 30. 9. ΝΟΜΙΤΩΣ, 30. 10. ΛΟΚΟΣ, 30. 11. ΛΟΚΟΣ, 30. 12. ΤΕΜΕΝΟΣ.

Year, Modern Macedonian, is a solar year, whose beginning is fixed for the first of January of the Julian year, with which it perfectly agrees.

This year was particularly called the ΑΤΙΚΟ, and the intercalary month, after Pothinon, was called ΠΟΘΙΝΟΙ, or ΠΟΘΙΝΟΙ.

Year, Ancient Jews, is a lunar year, consisting commonly, of eleven months, which alternately contain 30 and 29 days.

It was made to agree with the solar year, either by the adding of 11, and sometimes 12 days, at the end of the year, or by an embolismic month.

Tradition reports, that Abraham preferred in his family, and transmitted to posterity, the Chaldaian form of the year, which originally consisted of 360 days (compare Dan. vii. 25. xii. 7. with Rev. xii. to xiv. xi. 2, 3.), and remained without any correction until the date of the Nabonassar era. If any intercalation was used by the Jews, the
Year.

Moles appears to have been unacquainted with it. After the Babylonish captivity, they adopted the solar year. When they were subjected to the Syro-Macedonian yoke (B.C. 312), they were compelled to admit the lunar year into their calendar. To adjust this year to the course of the sun, they added, at certain periods, a month to Adar, and called it Ve-Adar. They composed also a cycle of 19 years; in feven of which they inserted the intercalary month, viz. in the 30th, 6th, 8th, 11th, 14th, 17th, and 19th. The design of this correction was, to bring the 15th day of Nisan to the equinoctial point, and to regulate the course of the feasons, and of the fells, in fuch a manner, as that the corn might be ripe at the paffover, as the law required.

Note.—In the defective year, Cifileu was only 29 days; and in the redundant year, Marchexwan was 30.

Year, Modern Synaeth, is likewise lunar, confiding, in common years, of 12 months, but of 13 in embolimic years; which in a cycle of 19 years are, the 30th, 6th, 8th, 11th, 14th, 17th, and 19th. Its beginning is fixed to the new moon next after the autumnal equinox.

Year, Syriac, is a lunar year, having its beginning fixed to the beginning of October, in the Julian year; from which it only differs in the names of the months, the quantities being the fame, as follows: 1. Tifrin, answering to our October, and containing 31 days. 2. Latter Tifrin, containing, like our November, 30. 3. Canun, 31. 4. Latter Canun, 31. 5. Shabat, 28, or 29 in a leap-year. 6. Adar, 31. 7. Nifan, 30. 8. Aiyar, 31. 9. Haziram, 30. 10. Tamuz, 31. 11. Ab, 31. 12. Elul, 30.

Year, Olympic, was of a singular form, the first month commenced at the new moon, that the full moon might fall on the 15th day. Four years of 360 days contain 1440 days; 48 lunations are equal to 1417 days, 11 hours, 14 minutes; a 49th lunation added to the 4th year makes 1447 days, nearly. By this adjument, the new moon would have happened on the 8th instead of the 1st of the month. To correct this error, two days were added to the last month of every year, the 4th excepted, when one day was added. By these means, the olympic year, which consisted of 362 or 361 days, must have varied 14 days from the course of the fun in the space of an olympiad; and, at the end of 50 years, the games would have been transferred to the winter solstice; but for preventing this deviation, a month was intercalated at certain intervals. Notwithstanding this, a considerable error still remained. The olympic games were regulated by the Cycle of Clostratus; which see. See also Olympiad and Epochia.

Year, Persfan, is a solar year, of 365 days, consisting of 12 months of 30 days each, with five intercalary days added at the end.

This year is called the yezdegardic year, to distinguish it from the fixed solar year, called the gelalcan year, which the Persians began to use in the year 1079, and which was formed by an intercalation made fixe or seven times in four years, and then once every fifth year.

The yezdegardic year, it may be observed, is the same with Nabonassar's year, differing from it only in the names of the months, and the commencement of the epoch; for whereas the Nabonassaran began on February 25, this began on June 16. As to the gelalcan year, it is absolutely the belt and judekt of all the civil years yet invented, as being found, by calculation, to keep the follities and equinoxes precisely to the same days, and answering very accurately to the solar motions; which no other civil year does, not even the Gregorian, for want of so commodious an intercalation. See Persian Calendar.

Year, Arabic, Mahometan, and Turkifh, called also the year of the hegira, which (fee,) is a lunar year, equal to 354 days, 8 hours, and 48 minutes, and consisting of 12 months, which contain alternately 30 and 29 days.

Though sometimes it contains 13 months; the names, &c. of which are as follow: 1. Muharram, containing 30 days. 2. Saphar, 29. 3. Rabia, 30. 4. Latter Rabia, 29. 5. Jamoda, 30. 6. Latter Jamoda, 29. 7. Rajab, 29. 8. Shaaban, 29. 9. Ramudan, 30. 10. Shawal, 29. 11. Dulkadah, 30. 12. Dulheggin, 29; and in the embolimic year, 30. An intercalary day is added every 26th, 5th, 7th, 10th, 13th, 15th, 18th, 21th, 24th, 26th, 29th, in a cycle of 29 years.

The months commence not from the real new moon, but from its first appearance after conjunction.

Year, Ethipic, is a solar year, perfectly agreeing with the AEtis, except in this, that the names of the month are different. It commences with the Egyptian year, on the 29th of August, the Julian year.

Year, Aidian. See Ectian and Egyptian Year.

Year, Attic. See Macedonian Year.

Year, Canicular. See Canicular.

Year, Yezaedg erdic. See Persian Year and Calendar.

Year, Gelali en. See Persian Year and Calendar.

Year, Nabonassar's. See Egyptian Year and Nabo

Year, Sabatic, Anno Sabbatici, among the ancients, was every seventh year; during which the Jews let their lands lie at rest. Levit. xxv. 8.

Every seventh sabbatic year, i.e. every 49th year, was called the year of Jubile (which fee); and held with solemnity extraordinary.

Year, Anomalistical. See Anomalistical and Year supra.

Year, Climacteric. See Climacteric.

Year, Emergent. See Emergent.

Year, Enneatical. See Enneatical.

Year, Holy. See Holy.

Year, Platonick, or Great. See Platic.

Year of the Hegira. See Hegira, and Arabic Year.

Year's Day, New, or the day on which the year commences, has always been very different in different nations; and yet in all has been held in great veneration.

Among the Romans, the first and last day of the year were
were consecrated to Janus; on which account it was that
they represented him with two faces.
To them we owe the ceremony of wishing an happy new
year, which appears to be very ancient. Before the first
day was spent they not only visited and complimented each
other, but also presented freights, and offered vows to the
gods for the preservation of each other.
Lucian represents it as a practice of a very ancient standing,
even in his time, and refers it to Numa.
Ovid intimates the same ceremony in the beginning of
his Fasti;

"Pilora lux auritur, linguisque animisque favete :
Nunc dicenda bono fuit bona verba die."

And Pliny more expressly, lib. xxviii. cap. i. "Primum
anni incipientis diem haecis praeceditionibus invicem faustum
omnianurus."

In Ruffia at the new year is annually held a feast of the
dead, called Raditzli Sabol, on occasion of which every
body visits the grave of his relations, lays some viuals
upon it, and then hears masses, in payment for which the
priests get the viuals. In our own country, the ushering in
of the new year, or "New Year's tide," with rejoicings,
presents, and good wishes, was a custom observed, during
the 16th century, with great regularity and parade, and
was as cordially celebrated in the court of the prince as in
the cottage of the peasant. On the first day of the new
year, presents, called new year's gifts, were given and
received with the mutual expression of good wishes, and par-
ticularly that of a "happy new year." The compliment
was sometimes paid at each other's doors in the form of a
long; but more generally, especially in the north of Eng-
land and in Scotland, the house was entered very early in the
morning by some young men and maidens selected for the
purpose, who presented the spiced bowl, and hailed you with
the gratulations of the season. In the reign of queen Elizabeth,
the chief officers of state, and several of the queen's household
servants, gave new year's gifts to her majesty, conferring, in
general, either of a sum of money, or jewels, trinkets, wearing-
array, &c. The largest sum given by any of the tem-
poral lords was 20l.; but the archbishop of Canterbury gave
40l., the archbishop of York 50l., and the other spi-
ritual lords 20l. and 10l. Many of the temporal lords and
great officers, and most of the peers, gave rich gowns,
petticoats, smocks, kirtles, silk stockings, cuspris garters,
sweet-bags, doublets, mantels, feme embroidered with pears,
garnets, &c., looking-glasses, fans, bracelets, caskets studded
with precious stones, jewels ornamented with spars of diamonds
in various devices, and other costly trinkets. These
presents also consisted of books, and appropriate gifts from
physicians, apothecaries, &c. The queen, though she made
returns in plate and other articles, took sufficient care that
the balance should be in her own favour. In the country,
however, with the exception of the extensive households of
the nobility, this interchange was conducted on the pure
basis of reciprocal kindness and good will, and without any
view of securing patronage or support; it was, indeed, fre-
quently the channel through which charity delighted to ex-
cerce her holy influence, and though originating in the hea-
then world, became sanctified by the Christian virtues.
We shall here add, that the rejoicings on new year's tide
were succeeded by the observance of the "Twelfth-day,"
called, from the idea that the Eastern magi, who are said to
have visited our Saviour on that day, were kings, the "Feast
of the Three Kings." The "Twelfth-cake," distributed on
that occasion, was almost always accompanied by the waifal
bowl; which see. Drake's Shakespear, vol. i.

A year, civil, or legal, in England, formerly commenced
on the day of the Annunciation; i.e. on the 25th day of
March; though the historical year began on the day of the
Circumcision; i.e. the 1st of January, on which day the
German and Italian year also begins.
Stowe observes, that William the Conqueror having been
crowned on the 1st of January, that henceforth became the
first of the year for historians, &c. though, in all civil affairs,
they retained the ancient manner of accounting, which be-
gan the 25th of March.
The part of the year between these two terms was usually
expressed both ways, as 1748-9, or 1749. But by the act
for altering the style, the civil year now commences with
January 1. See New Style.
Since the Conqueror, the king's patents, charters, pro-
clamations, &c. are usually dated by the year of the king's
reign.
The church, as to her solemn service, begins the year on
the 1st Sunday in Advent, which is always that next St.
Andrew's day, or the 30th of November.
The Jews, as most other nations of the East, had a civil
year, which commenced with the new moon in September;
and an ecclesiastical year, which commenced from the new
moon in March.
The month Tifri, which began about the time of the au-
tumnal equinox, was the first month of the Jewish year, till
it was changed at the time of the coming up of the children
of Israel out of Egypt. For that happening in the month
of Abib, afterwards called Nisan, this month was for this
reason reckoned the first month of the year in all ecclesi-
astical matters. Before this period, Tifri was reckoned the
commencement of the year, because it was thought that
the world was created and first began at the time of the autumnal
equinox. And for this reason, the Jews do still in their era of
the creation of the world, as well as in their era of con-
tracts, compute the beginning of the year from the first
of Tifri, and all their bills and bonds, and all other civil acts
and contracts, are still dated among them according to the
fame computation; and from this month also they began all
their jubilees and fribatical years. And therefore, although
their ecclesiastical year began from Nisan, and all their fer-
tivals were computed from it, yet their civil year was still
reckoned from Tifri, and the first day of that month was
their new year's day; and for the more solemn celebration of
it, the feast of trumpets seems to have been appointed.
The French year, during the reigns of the Merovingian
race, began on the day on which the troops were reviewed;
which was the first day of March. Under the Carolingians
it began on Christmas-day; and under the Capetians, on
Easter-day; which, therefore, varied between the 22d of
March and the 25th of April. The ecclesiastical year in
France begins on the first Sunday in Advent. But for the
civil, Charles IX. appointed, in 1564, that for the future it
should commence on the 1st of January.
For an account of the change that took place in France,
see French or Republican Calendar. The French calendar
was of no long duration. It was abolished in the course of thirteen years; and the Gregorian was re-
formed, and ordered to be used in all dates after the 1st of
January, 1806.
The Mahometans begin their year the minute in which
the sun enters Aries. The Persians in the month answering
to our June. The Chinese, and most of the Indians, begin it
with the first moon in March. The Brachmans begin it
with the new moon in April, on which day they hold a feast
called samwai faradi paudoga, q. d. feast of New-year's day.
The Mexicans, according to D'Acolata, begin the year on
our
our 23d of February, when the leaves begin to grow green: their year consists of eighteen months, having twenty days each, which make three hundred and sixty; the remaining five days are spent in mirth, and no business is suffered to be done, nor even any service at the temples. Alvarez relates much the fame of the Abyssinians; who begin their year on the 26th of August, and have five idle days at the end, which they call pagomen. At Rome there are two ways of computing the year; the one beginning at the Nativity of our Lord; this the notaries use, dating a Nativitate. The other on the 25th of March, on occasion of the Incarnation; and it is by this the bulls are dated, anno Incarnationis. The Greeks begin their year of the world from the first of September. See Year supra.

Years are also distinguished with regard to the epochas whence they are numbered: thus, years of our Lord, are those reckoned from the birth of Jesus Christ. Years of the world, are those elapsed since the Creation. Years of Rome, of the Hegira, of Nabonassar, &c. See the difference between these years, under the article EPOCHA.

Year is also a word used by some of the chemical writers to express any product of their operations, which may serve as a medicine, whether internally or externally.

Year and day, in Law, &c. is a time that determines a right in many cases, and is in some an usufruct, and in others a prerogation.

Thus, in the case of an estray, if the owner, proclamation being made, challenge it not within a year and day, it is forfeit. In like manner is the year and day given in cases of appeal, of defendant, of entry or claim, of non-claim upon a fine, or writ of right, of the death of a man, a freehold, or wound of, protections, effuins in respect of the king's service, of a wreck, and on many other occasions.

Year, Days, and Wages, Annu, Diet, or Vafum, is a part of the king's prerogative, by which he challenges the profits of the lands and tenements of persons attainted for petty treason, or felony, for the space of a year and a day, whoever is lord of the manor to which they belong.

Formerly the king had only a liberty of committing waste on the lands of felons, by pulling down their houses, extirpating their gardens, ploughing their meadows, and cutting down their woods. But this tending greatly to the prejudice of the public, it was agreed in the reign of Henry I., that the king should have the profits of the land for one year and a day in lieu of the delCTION he was otherwise at liberty to commit: and, therefore, Magna Charta provides, that the king shall only hold such lands for a year and a day, and then restore them to the lord of the fee; without any mention made of waste. But the statute 17 Edward II. de prerogativa regis, seems to supposit, that the king shall have his year, day, and wages, and not the year and day instead of waste; which fits Edward Coke, and the author of the Mirror, before him, very jutly look upon as an encroachment, though a very ancient one, of the royal prerogative.

This year, day, and wages, are now usually compounded for; but otherwise they regularly belong to the crown: and, after their expiration, the land would naturally have descended to the heir (as in gavel-kind tenure it still does), did not its feudal quality intercept such descent, and give it by way of escheat to the lord. Black. Com. book iv.

Year-Books, in Law. See Reports.

Years, Elys, or Law, is a contract for the possession of lands or tenements for some determinate period; and it happens when a man letteth them to another for the term of a certain number of years, agreed upon between the lessor and the lessee, and the lessee enters thereon.

If the lease be but for half a year, or a quarter, or any lesser time, this leys is reputed as a lease or tenant for years, and is fo edied in some legal proceedings; a year being the shortest term which the law in this case takes notice of. An estate of this kind, even for a thousand years, is only a chattel, and reckoned part of the personal estate; and, therefore, a least for years may be made to commence in futuro, though a lease for life cannot.

With regard to emblements, or profits of land fowed by tenant for years, there is this difference between him and tenant for life: that where the term of tenant for years depends upon a certainty, as if he holds from Midsummer for ten years, and in the last year fows a crop of corn, and if it is not ripe and cut before Midsummer, the end of his term, the landlord shall have it; for the tenant knew the expiration of his term, and therefore it was his own folly to low what he never could reap the profits of. But where the lease for years depends upon an uncertainty; as, upon the death of the leysor, being himself only tenant for life, or being a husband fedeled in right of his wife; or if the term of years be determinable upon a life or lives; in all these cases, the estate for years not being certainly to expire at a time foreknown, but merely by the act of God, the tenant or his executors shall have the emblements in the same manner as a tenant for life, or his executors shall be intitled to it. But not so, if it determine by the act of the party himself; as if tenant for years does any thing that amounts to a forfeiture; in which case the emblements shall go to the leysor, and not to the leysor, who hath determined his estate by his own default. Blackl. Com. vol. ii.

YEARLINGS, in Rural Economy, a term applied to young neat cattle of the heifer kind in the second year. It is observed in the Gloucefheri Report on Agriculture, that until within these few years, it was there esteemed a bad practice to let them be put fo early to the bull, but that now it is even thought that this method improves them as milkers; and that from the increased value of flock, it is advantageous to anticipate a year, as a heifer in calf, at two years old, will be worth nearly as much as it would be if kept three. See Live-Stock.

YEAR, in Hunting, signifies to bark, as beagles properly do, at their prey.

YEARING, in Rural Economy, a term applied to runnet, used for curdling milk in some places. See Dairying and Runnet.

YEAST, Yest, or Barm, the foam or flower of beer, or other liquor in fermentation.

The yeat of beer is used for a leaven or ferment in the making of bread: as serving to swell or puff up very considerably in a little time, and to make it much lighter, softer, and more delicate. But when there is too much of it, it renders the bread bitter.

The use of yeat in bread is but of late standing among us: it is not above a century since the avarice of the bakers first introduced it; and then it was only done by stealth. Though Pliny witnessed it to have been used by the ancient Gauls.

The faculty of medicine of Paris, by a decree of the 24th of March, 1688, solemnly maintained it noxious to the health of the people; yet even that censure could not prevent its progress.

Common ale-yeat may be kept fresh and fit for use several months by the following method: Put a quantity of it into a cloth bag, and gently squeeze out the moisture in a fore-pref, till the remaining matter be as firm and stiff as clay.

In this state it may be close packed up in a tight cask, for securing
securing it from the air; and will keep fresh, sound, and fit for use for a long time.

This is a secret that might be of great use to the brewers and distillers here, who, though they employ very large quantities of yeast, seem to know no method of preparing it, or raising nurseries of it; for want of which they fullain a very considerable loss; whereas the brewers in Flanders make a very great advantage of supplying the malt-distillers of Holland with yeast, which is rendered laking; and fit for carriage, by this easy expediten. Shaw's Lectures.

Mr. Henry has repeatedly prepared an artificial yeast, by impregnating flour and water with fixed air, with which he has made very good bread, without the assistance of any other ferment; and he propofes this method of procuring fresh fermented bread at fea.

The proces is as follows: Boil flour and water together to the confidence of treacle; when the mixture is become cold, fill a small cask with it. This cask is to be filled up in the manner represented in Plate XV. fig. 7. Pneumatics, and defcribed under Pyrnnont Water, for the impregnation of water with fixed air; and the proces is to be conducten in a fimilar way, except that the cask is to be agitated as often as the mixture rises to about two-thirds of the capacity of the funnel $k$; and after each agitation, which should con- tinue during several minutes, the unabforbed air is to be let out, by withdrawing the plug from the orifice $m$, till that part of the mixture which remained in the funnel has returned into the cafl. The orifice at $i$ should also be larger than is necelfary in the other operations, on account of the superior visibility of the mixture. When, after repeated agitation, the mixture which has ascended into the funnel does not subfide into the cask, it may be suppoled incapable of abforbing more air.

Pour the mixture, thus saturated, into one or more large bottles, or narrow-mouthed jars; cover it over loofely with paper, and upon that lay a flate or board with a weight to keep it feady. Place the vefsel in a litation where the thermometer will fland from 70° to 80°, and flir up the mixture two or three times in twenty-four hours. In about two days, such a degree of fermentation will have taken place, as to give the mixture the appearance of yeast.

With the yeast in this flate, and before it has acquired a thoroughly vinous smell, mix the quantity of flour intended for bread, in the proportion of fix pounds of flour to a quart of the yeast, and a sufficient portion of warm water. Knead them well together in a proper vefsel, and covering it with a cloth, let the dough fland for twelve hours, or till it appears to be sufficiently fermented, in the above-mentioned degree of warmth. It is then to be formed into loaves and baked.

Mr. Henry adds, that perhaps the yeast would be more perfect, if a decoction of malt were used instead of flimple water.

When the operation is finished, the cask, in order to pre- vent its contracting a disagreeable taint, should be well washed. Henry's Account of a Method of preferring Water at Sea, &c. p. 26. 1784.

YEAST. Chemical Properties of. The nature of yeast has been briefly discussed under the head of fermentation. Since that article was written, however, some additional experiments have been published on the subject, which deserve to be noticed here.

The active and essential principle of yeast, as observed under the article Fermentation above alluded to, appears to be a species of gluten. When yeast is kept for some time in cylindrical glass vefsels, a white substance, not unlike curd, separates and swins upon the surface. If this substance be removed, the yeast lofes the property of exciting fermentation. This subfstance poiplies many of the properties of gluten, though it differs from it in others. Its colour is much whiter. It has not the fame elasticity, and its particles do not adhere with the fame force. It diffolves more readily in acids. Dr. Thomson confiders this as the real fermentative principle, and thinks it may be confidered as gluten somewhat altered, and rendered more much capable of decomposition. He thinks also that it exilited in the raw grain originally, but underwent considerable modifications by the malting proces, and perhaps others during the fermentation of the beer from which it separated.

The fame distinguifhed chemifl flates, in support of this opinion, the experiments of Fabroni and Thenard. Fabroni, by heating the juice of grapes, and pafling it through a filtre, separated an adhesive matter, which poiplies the properties of gluten, and deprived of which the juice refused to ferment, though it fermented as well as usual when this principle was again added. Thenard likewife found in the juices of all the fruits he examined a subfstance similar to that de- scribed by Fabroni, and which, according to him, is abso- lutely the fame with pure yeast. This subfstance is impipid, does not change vegetable blues, is infoluble in water, lofes three-fourths of its weight when dried, and is decomposed like animal subfstances. When eight parts of it were dif- tilled, they left 2.83 of charcoal, and yielded 1.61 of water, 1.81 of oil, and a quantity of ammonia, which, when satu- rated with mariatic acid, formed 1.46 of muriate of ammonia. The gas obtained weighed 0.53, and confiited of one- fifth of carbonic acid, and four-fifths of carbutted hydro- gen, requiring $\frac{1}{2}$ times its bulk of oxygen to confume it. Nitric acid, even when much diluted, converts it into a species of tallow. With potash it forms a foap, while ammonia is difengaged. When mixed with fugar and a fufficient quantity of water, fermentation takes place, carbonic acid is dif- engaged, and a vinous liquor formed. By this action, the ferment lofes the whole of its azote, and becomes incapable of exciting fermentation when mixed with a new portion of fugar. In farther corroboration of this opinion, Dr. Thomson adjoins an experiment of Kirchhoff, which he thins throws confiderable light on the nature of yeast. Barley-meal contains both gluten and flarch. Pure flarch infuded in hot water is not converted into fugar; nor does gluten become faccharine matter when heated in the fame manner. But if a mixture of pure dried pulverized wheat-gluten and potato-flarch be infuded in hot water, the flarch is converted into fugar. During the proces an acid is faid to be evolved. The gluten is little changed in appearance or quantity, and may molt of it be separated by filtration. What is singular, however, is it incapable of inducing the fame change upon flarch a second time.

The following are the constituents of yeast, according to Weltrumb, as quoted by Dr. Thomson. From 15.360 parts he obtained,

Belfides
Besides some traces of phosphoric acid and silica. But it is evident, as Dr. Thomfon observes, that all these ingredients are not essentiel, and he considers the gluten only as deferving that appellation.

Some of the French chemiffs have confidered the principle of fermentation to refide in an imperfect species of fugar, which they have denominnated the sweet principle, and which they flate to exist in combination with real fugar in all fruits containing that principle. This sweet principle they suppose to differ from pure fugar, in being incapable of crytalizing. A familiar example of it we have in treacle or molasses, which, according to them, is the sweet principle of the fugar-cane. This doctrine, however, has not met with many adherents; for, as Dr. Macculloch observes, although chemiffy has not hitherto discovered the means of separating the fugar from the sweet principle, the refults of fermentation leave no doubt that the latter confifts of fugar combined with the vegetable extractive matter, or gluten, as it is denominated by moliff chemiffs. Thus molafiess confifts of a certain portion of real fugar, in such a flate of combination with a variety of subflances, and the fermentative principle among the rest, that it cannot be made to crytalize or be otherwise obtained in a separate flate. This is demonstrat led by the well-known fact, that molaffes may be made to undergo the fermentative process, and to yield alcohol, in precisely the fame manner as a simple mixture of fugar and yeast. The sweet principle of molaffes, therefore, must be in fact nothing elfe than fugar, unlefs we fuppofe two different subflances capable, by the fame means, of producing the fame refult, which is totally unprecedented in chemiffy, besides being in itelf extremely improbable.

Upon the whole then, in the prefent flate of our knowledge, we are obliged to conclude that the effential principle of yeafht, or the real fermentative principle, is either identical with gluten, or clofely allied to it. Of its real nature, however, and modus operandi, we are totally ignorant, and shall probably long remain fo.

The yeafht of beer is most generally employed, and is of the utmost importance in the manufacture of bread, and of fermented liquors from malt. If carefully dried and preserved from moisiture, it retains its properties for a long time, and it is a pity this practice is not more generally re ferred to, as fluid yeafht in warm weather soon becomes acceff and purid, and not only lofes its properties, but imparts a moft disagreeable flavour to the bread, &c. with which it is mixed. Yeafht may be readily dried by firll separating its watery parts as much as possible, and afterwards exfoping it in shallow vefsells to the air, or to a gentle heat in a flove. In this way, it may be obtained in thin lamming, and requires only to be preferved in clofe vefsells in a dry place, when it will be always ready for ufe, by diffufing it in a little warm water. A popular method of preferring yeafht is by drying it upon bunches of twigs. See Bread, Brewing, Fermentation, and Wine.

Yeafht, Medicinal Properties of. Yeafht has been highly extolled as an antifeptic remedy in difeafes, when a putrid diathesis was fuppofed to prevail; as in low typhus fevers, gangrene, &c. A good method of exhibiting it is, to mix one or two table-foopfuls of it with a quart of infusion of malt or mild porter, and to take a wine-glaflful of this mixture frequently. Many pratiffes have alfo fpoken highly of the good effects of a fomenting poultice composed partly of yeafht, when applied to foul and gangrenous ulcers. The good effects of this remedy, if in reality it poifonies any, may probably be attributed to the carbonic acid gas generated by its agency. See Fever.

Yeats, Mrs., in Biography, the celebrated tragic actres, who, in conjunction with Mrs. Brooke, the novelist, a lady of confiderable literary merit, undertook, in 1773, at all risks, the conduct and government of the opera, and all its dependencies; an enterprife for which they were but sparingly qualified. In the firft place, Mrs. Yeats, though poffefled of strong natural parts, and an inherent spirit of government, knew no language but English, was ignorant and indifferent about music, dancing, painting, machinery, and decorations. She and her husband had faved a confiderable sum by their haracies and benefits at our national theatres, and in hopes of accumulation previous to retirement, they quitted employments for which they were extremely well fitted, and in which their facces was certain, to govern a molt froward family by deputation, at the extreme hazard of being ruined.

Mrs. Brooke, who had refided some time at Quebec, after its conquest, with her husband, the Rev. Dr. Brooke, chap lain to the army in that colony, indeed knew French, had a good tarde in books, and wrote in a good fyle; but was ignorant of music, and totally unacquainted with all opera concerns. Yet it was during this female regency, that the fleft composers, the greateft fingers, and the moft capital and renowned dancers, were engaged; for during nine years, from 1773 to 1782, we had Sacchini, Truetta, and Anfolfi, to compute; Pacchierotti, Anfani, and the Gabrielli, to fing; and Madlle. Heynel, the Veefris, and Le Picq, to dance.

Mrs. Yeats did not enrich herfelf by her opera fovereignty; but she had the adresses to effcape ruin. And Mrs. Brooke, who rifked no property, loft no reputation by imprudence, or the want of talents in the persons he engaged.

**YELANG**, a town of Burmah; 14 miles S. of Mollone.

**YELLOOR**, a town of Hindooftan, in Baramaul; 6 miles N.N.W. of Namcul.

**YELLOW**, a bright colour, reflecting the most light of any after white. See Colour.

The word is formed from the Italian *giello*, or the German *gel*, which signifies the same; or from the Latin *galbans*, bright, gay.

There are divers yellow substances that become white, upon wetting and drying them again several times in the sun: such as wax, linen cloth, &c. (See Bleaching.) And the same bodies, if they be already white, and continue a long time in the air without being wetted, turn yellow.

Paper and ivory, applied near the fire, become successively yellow, red, and black. Silk, when turned yellow, is whitened again with the fumes of sulphur.

**YELLOW**, in Dyeing, is one of the five simple and mother colours. See Colour.

The only materials used by the calico-printers for the production of fine yellows are the quercitrin-corn (see Quercus), and the *Weld*, or *Rooda Luteola*, which fee. In order to obtain calicos of the finest yellow or more delicate lemon colour, it is necessary to dry the pieces in the open air, as the flow would not fail to injure such colours; flow-drying having a tendency to change a yellow into an orange.

In the operation of dunging the mordants for these pale yellows, care should be taken that it be not done at a higher temperature than 96° or 100°, as such a high temperature would impair their beauty. But besides, by dunging at this low temperature, the dyeing may be completed at about 110°, which will give a much livelier colour than if a higher temperature had been employed. For all the different shades of reds and yellows, the mordant employed by calico-printers is the acetate of alum; which is prepared by a mixture of the sulphate of alumine with acetate of lead, both in a state of solution; so that, on the theory of double decomposition, sulphate of lead is formed, which precipitates while the acetate of alumine remains in solution. Of late this article has been prepared from the pyrogallous acid, by means of lime and alum, in the following manner:—

The pyrogallic acid is first passed through a still, to distil it of a portion of the tar which is always divorced in it: it is then saturated with lime or whiting; and the acetate of lime thus formed is decomposed by a heated solution of sulphate of alumine. The result of this double decomposition is sulphate of lime, which precipitates, and acetate of alumine, which is drawn from the sediment of the calcareous sulphate, and preferred for use. Mr. Parkes cautions the manufacturer against the use of lime in the process for making acetate of alumine; and he says that the true mode of making it, though more expensive, is that recommended by Berthollet; which consists in decomposing sulphate of alumine by means of saccharum saturni, or acetate of lead. Mr. Parkes mentions a method of producing yellows on calico, which, though not often practised, has nevertheless a very good effect. The process is as follows:—A strong decoction of bark, thickened with gum tragacanth, is to be mixed with a portion of very pure muriate of tin; and this, when printed with the usual management, will produce a colour of great brightness and durability. This mode possettes one very important advantage; viz., that if it should be necessary to pad a piece in diluted acetate of alumine to obtain a pale lemon ground, the yellow figures previously done by the above process will not give out any part of their colour to the second mordant; whereas, whenever a strong yellow has been produced in the common way, the pattern is very apt to spread, and to become irregular, and often to stain the ground, when the piece comes a second time into the acetate of alumine. Parkes's Eff. vol. ii.

Turmeric likewise gives a good yellow, though not the best.

Woollen cloth, impregnated with a solution of alum and tartar, acquires on being boiled with the watery decoction, an elegant, but not very durable orange-yellow or gold-coloured dye. It is rarely made use of by the dyers, on account of its price, and the perishableness of its colour.

There is also an Indian wood that gives a yellow colour bordering on gold. This wood, called *fullick*, is a species of mulberry-tree, of a deep sulphur-yellow colour, which it readily gives out both to water and spirit. The watery decoction of yellow dye prepared woollen of a very durable orange-yellow: the colour is imbibed by the cloth in a moderate warmth, without boiling.

The *fullet* or *fullet* of the French is a yellow wood or root, very different from our *fullick*: it gives a fine orange dye to woollen, but the colour is extremely perishable in the air. This is called *colinus cortaria*, or *Ponce fumac*.

The leaves of many kinds of herbs and trees give a yellow dye to wool or woollen cloth that has been previously boiled with a solution of alum and tartar. There is, indeed, no colour for which we have such plenty of materials as for yellow.

Mr. Hollot observes, in his Art de Teindre, that all leaves, barks, and roots, which on being chewed discover a flight altrignancy, as the leaves of the almond, peach, and pear trees, ash-bark (especially that taken off after the first rising of the sap in spring), the roots of wild patience, &c. (see Leaf), yield durable yellows, more or less beautiful, according to the length of time that the boiling is continued, and the proportions of alum and tartar in the preparatory liquor: that a large quantity of alum makes these yellows approach to the elegant yellow of weld; that if the tartar is made to prevail, it inclines them to an orange; and that if the roots, barks, or leaves, be too long boiled, the yellow proves tarnished, and acquires shades of brown.

Neumann's Chemical Works, by Lewis, p. 384. 434.

The Chinese are famous for their yellows in dyeing, which neither change with washing. They make this dye of the flowers of the acacia, in a manner in which we might use several of our productions to a great advantage.

It is thus: they gather the flowers before they are perfectly ripe, and dry them in an earthen vessel over a gentle heat, till they crisp up in the manner of tea-leaves: they then add to them the ripe seeds of the same tree in different proportions; and then boiling them in river water with alum, they give the yellow in any degree that they please.

They have three kinds of yellow, which they distinguish by the names of *Ngoo-loang*, *king-beang*, and *beang* alone.

The first of these is the brightest yellow: to dye five or
fix ells ofilk ofthis colour, they use a pound of the flowers of the acacia, about two ounces of the seeds, and four ounces of alumin.

The king-baang is a somewhat deeper yellow: to dye this, they use the same ingredients in the same proportion as in the former cafe; and when the silk is dry from the dipping in this, they give it a second dipping in a flight tincture of Brasil wood: this brings it to the fine strong yellow we see.

The baang, or pale yellow, is made of the same ingredients as the first only, instead of four ounces of alumin they put in but three ounces: river water is found to be greatly preferable to any other for the extracting of these colours; but even in that there is great difference, some doing the business much better than others.

The Chince are so expert in judging on this occasion, that they can tell by the taste of water whether it will or will not do; and if it taste faint they know it is faulty; but they dip the pieces twice into it instead of once, and the colour succeeds well.

The flowers of the acacia, when they have been prepared by roasting in this manner, may be kept all the year round, and employed in dyeing as occasion requires, only there is to be longer boiling for the dried flowers than the fresh ones; and it is always found that the fresh flowers give the brightest colour. Obs. fur les Coutum. de l’Abe, p. 254.

Greens are usually made of yellow and blue mixed. With yellow, madder red, and goat’s hair-prepared with madder, are made the golden yellow, Auraora, panly, nacreate, Isabella, and chamois colour, which are all cafts or shades of yellow.

Mr. Peter Woulfe has given the following receipt for making the yellow dye:— Take half an ounce of powdered indigo, and mix it in a high glass vessel, with two ounces of strong spirit of nitre, which should be previously diluted with eight ounces of water, for preventing the indigo’s being set on fire by the spirit; because two ounces and a half of strong spirit of nitre will set fire to half an ounce of indigo: let the mixture stand for a week, and then digest it in a land-heat for an hour or more, and add four ounces more of water to it; filter the solution, which will be of a fine yellow colour. If the indigo be digested twenty-four hours after the spirit of nitre is poured upon it, it will froth and boil over; but after standing about a week, it has not that property.

One part of the solution of indigo in the acid of nitre, mixed with four or five parts of water, will dye silk or cloth of the palest yellow colour, or of any shade to the deepest, and that by letting them boil more or less in the colour. The addition of alumin is useful, as it makes the colour more lasting: according as the solution boils away, more water must be added. None of the colour in the operation separates from the water, but what adheres to the silk or cloth; and consequently this colour goes far in dyeing.

Cochineal, Dutch litmus, orchil, cudbear, and many other colouring substances treated in this manner, will all dye silk and wool of a yellow colour.

The indigo which remains undissolved in making Saxon blue, and collected by filtration, if digested with spirit of nitre, dyes silk and wool of all shades of brown, inclining to a yellow.

Cloth and silk may be dyed green with indigo; but they must first be boiled in the yellow dye, and then in the blue. Phil. Trans. vol. lxi. part i. p. 129, &c. See Dyeing.

Painters and enamellers make their yellow of mafficot, or as some write it, malicoot, which is croule raised to a yellow colour by the fire; or with yellow ochre. Limners and illuminers make it with saffron, French berries, orzette, &c.

Mr. Boyle tells us a moft beautiful yellow may be procured by taking good quicksilver, and three or four times its weight of oil of vitriol, drawing off, in a glass retort, the false meniftrum from the metaline liquor, till there remains a dry low-white cake at the bottom: on pouring a large quantity of fair water on this, the colour changes to an excellent light yellow.

He says he fears this colour is too costly to be used by painters, and he does not know how it would agree with every pigment, especially oil colours. Works abr. vol. ii. p. 91. See Vitriol.

Branton observes, that it was anciently the custom to paint a man’s door yellow, and threw his house with falt, to declare him a traitor to his king.

Yellow and other Colouring Matters of Flowers, in Rural Economy, the different colouring matters thus produced. The nature of the colouring matters of flowers has not yet been much examined into. Such colouring matters are in general very transient, especially those of the blue and red kinds. The yellow colouring matters of this fort are said to be the most permanent. It is noticed by a late writer, that the carthamus contains a red and a yellow colouring matter; that the yellow is easily diffolved by water; that from the red, rouge is produced by a process which is kept secret; that the colours of most flowers are changed by alcalies to green, and by acids to red; that an imitation of the colouring matter may be made by digesting solutions of gall-nuts with chalk; a green fluid is produced, which becomes red by the action of an acid; and that has its green colour refored by means of alcalies.

Yellow Copper, in Mineralogy, copper pyrites. See Copper Ore.

Yellow Earth, a soft yellow mineral substance, found at Weiraw, in Upper Lufalia, associated with clay and argillaceous iron-oxide: it is sometimes used as a yellow pigment. The characters given of this substance do not seem to entitle it to be regarded as a different species from some of the ochreous clays which occur in the coal-strata in England. It is classed by professor Jameson with the lithomarge family, and is thus described by him. Its colour is ochre-yellow, of different degrees of intensity; its texture friable; it is dull in the crofs fracture, but glittering in the parallel fracture. In the large, the fracture inclines to flat; in the small, the fracture is earthy. The fragments are tubular, or indestructively angular. It becomes shining in the fire: it is opaque and very soft, passing into friable; it foils the fingers slightly, and adheres to the tongue; its feel is rather gritty; it is rather light, but the specific gravity is not given. Before the blow-pipe, yellow earth is converted into a black and shining enamel. We have no analysis of this earth.

Yellow Tellurium Ore, an ore of tellurium, hitherto found only at Nagyag, in Transylvania. See Tellurium.

Yellow Cow-Wheat, in Agriculture. See Weed.

Yellow Dead Nettle. See Weed.

Yellow Devil’s Bit. See Weed.

Yellow or French Berries. See Avignon, and Lycium.

Yellow Fever, an epidemic disease of frequent occurrence in America and the West Indies. See Fever, Yellow.

Vegeta arriving in Great Britain or Ireland, or the islands of Guernsey, Jersey, Alderney, Sark, or Man, from places where the yellow fever is known to exist, or where it is deemed likely to break out, are subjected by various laws and orders of his majesty in council to the restraint of quarantine; the same as ships arriving from countries subjected
to the Phuge, for the details of which, see that article in the Addenda.

**YELLOW-Hammer**, in Ornithology, the name of a very common English bird, called by authors *emberiza lutus*; and by Linnaeus *emberiza citrinella*; and by some *hortulanus*; by others *lutes*; and by others *chlorus*.

The bill is of a duffey hue; the crown of the head is of a pleasant pale yellow; in some almost plain, in others spotted with brown; the hind-part of the neck is tinged with green; the chin and throat are yellow; the breast is marked with an orange-red; the belly yellow; the latter coverts of the wings are green; the others dufky, edged with rust colour; the back of the face colours; the rump of a rufly red; the quill-feathers dufky, edged on their exterior sides with yellowish-green; the tail is a little forked; the middle feathers are brown; the two middlemoft edged on both sides with green, the others on their exterior sides only; the interior sides of the two outermost feathers are marked obliquely near their ends with white.

This species makes a large flat nest on the ground, near a bush or hedge, of mosses, yellow roots, and horfe-hair; it lays six eggs, of a white colour, with dark purple veins; and in winter frequents our farm-yards with other small birds. Pennant.

There is besides this another kind, which is much smaller, and of a browner colour on the back; this is called by some authors *rivo*.  

**YELLOW Hawkweed**, in Agriculture. See Weed.

**YELLOW Jaundice**, in Medicine. See Jaundice.

**YELLOW King's**, is a pure orpiment, or arsenic coloured with sulphur, used for painting in oil and varnish; of an extreme bright colour, and when good a true yellow: when used alone, it will fand well; but mixed with white lead, and several other pigments, its colour fifies or changes. It is sometimes mixed with blue pigments, to form a green colour. This pigment may be prepared by mixing sulphur and arsenic by sublimation: taking of arsenic powdered, and flowers of sulphur, in the proportion of twenty parts of the fift to one of the second, and putting them into a fublimer, and subliming them in a land-heat by means of a furnace particularly adapted to the purpohe. When the operation is completed, the king's yellow will be found in the upper part of the glafs, which must be separated with care from any foul parts adhering to it in the glafs, and levigated into an uniform powder. It may be alfo obtained from common orpiment by subliming it in the fame manner. This pigment may be rendered warmer, or more inclined to orange, by increasing the proportion of the sulphur, and vice verfa. Handmaid to the Arts, vol. i. p. 17.

**YELLOW Ladies' Bed Straw.** See Weed.

**YELLOW Meat**, in Rural Economy, that which is much tinged with a yellow colour. It is faid to be a pedicular property in fome forts of animals, of both the sheep and cattle kinds, to afford meat which has a yellow caff or appearance.

It is fuppofed that this defect must be hereditary, as no pafture or particular food can either produce or remove it, as sheep which have been tried in the manner here defcribed and found yellow have been fent to the Thames marfes, kept there a year, and when flainted have proved as yellow as gold. It may probably depend upon some phyfiological principle, which mere examination after death has not yet fhewn. These remarks are equally applicable to beef as mutton, and are the refult of information on the subject derived from a well-experienced Smithfield faffman.

**YELLOW, Naples.** See Giallolina.

**YELLOW Out-Gras**, in Agriculture, a fort of gras which thrives well in meadows and paftures, as well as upon hills where the foil is of a calcareous nature, flowering in the middle of fummer. It is a rather coarse gras, which, though tolerably fweet, is thought by many to be much inferior to the meadow and fuce grasfes; and which Withering has fett out not to be relifted by cattle; but which Swayne thinks one of the beft grasfes of this kind for the use of the farmer.

The proportional value which the grasf, at the time the feed is ripe, bears to that at the time of flowering, is as 9 to 15.

The proportional value which the grasf of the latter-math bears to that at the time of flowering, is as 5 to 15; and to that at the time the feed is ripe, as 5 to 9.

It is remarke that this species of gras is pretty gene rally cultivated in many districts and parts of this country; and that it would appear from the above details to be a valuable grasf, though inferior to many others. See Avena Flavefcenta, Grass, and Grass-Land.

**YELLOW Ochre.** See Ochre.

**YELLOW Rattle.** See Weed.

**YELLOW Scour or Milk**, a disease in lambs, which takes place while they are young, and in which they appear quite dull and spiritless; their ears instead of being upright lie flat and afunder on their heads; they are very lank in the fides and bellies, and their breathing is very short and unequal. Thefe appearances are proceeded by a purging of a yellowish milky coloured matter, which, in fome cafes, has come on before the disease is noticed; but at other times, the lambs die without having had any or only a flight discharge of excrement. The body or carcase appears well fed; the excrement in the intestines, which laft are sometime in some degree fwell, refembles in colour that paffed at the anus, while the fomach is particularly full of coagulated milk.

It is a disease which never appears or fhews itself in hard feafons, but only when the weather is warm, growing, and genial, and there is great plenty of new gras. In general it does not affect them after they are three weeks old. It is mollly ascribed to their fucking more milk than they can digef; and it is even faid, that they not unfrequently fuff until their stomachs burft.

The lambs being young, and of little value, remedies to prevent or remove the disease are feldom tried; but thofe of the aromatic cretatious kind, with a little opium, may often be used with much advantage in preventing and curing the complaint.

**YELLOW Vetchling**, in Agriculture, a plant of the tare kind, that may be cultivated by the farmer in many cafes with profit. The writer of the Essays on Rural Affairs flates, that it grows with great luxuriance on iffic clayey foils; that it continues annually, for any length of time, to afford a great weight of produce, which is of the very beft quality; that it is equally fit for pafture herbage or for lay; and that it may be applied to one or other of these purpofes at any period as convenient; that it has likewife this advantage, that as it continues to grow with equal strength in the end as in the beginning of the fummer feafon, it may admit of being paftured upon in the early fpring, when neceffary, without endangering the loss of the hay-crop, which cannot be the cafe with any other plant usually cultivated, except clover, which is unfit both for early pafture and for hay; and that it is fit more valuable, as growing to the greatest perfection on fuch foils as are wholly unfit for producing fain-foin, the only fort of plant yet cultivated in the
the field, which seems to have qualities approaching to those of this plant.

The principal objection to its cultivation is the difficulty of procuring the seeds of it in plenty, which may probably be obviated by proper management. It is, however, an abiding plant, and one which increases fast by its running roots, and which may readily be propagated in this way in the field. See Lathyrus pratensis.

Yellow-Berry Waft, is a solution of the gum of the French berries in water; and may be prepared by boiling a pound of the berries in a gallon of water with half an ounce of alum, in a pewter vessel, and filtering the fluid; and by evaporating the fluid in the boiler till the colour appears to be of the requisite degree of strength.

This is used as a washing colour in water-painting; it will stand extremely well, and being more diluted, or laid on thicker, will, in consequence of its transparence, give a variety of shades.

Yellow Waft of Saffron. See TinTue of Saffron.

Yellow Waft of Turmeric. See Turmeric.

Yellow Breecher Creek, in Geography, a river of Pennsylvania, which runs into the Susquehanna, N. lat. 40° 13', W. long. 76° 52'.

Yellow Creek, a township of Ohio, in the county of Columbiana, with 491 inhabitants.—Also, a river of America, which runs into the Ohio, N. lat. 40° 34', W. long. 80° 44'.

Yellow River, a small river of Ireland, in the King's county, which joins the river Boyne.

Yellow River. (See Hoang.) Mr. Barrow, supposing, without the possibility of exaggeration, that the breadth of the Yellow river, where Macarney's embassy passed it, about 70 miles from the sea, was only three-fourths of a mile, the mean depth five feet, and the velocity of its course four miles an hour, concludes, from these data, that the river discharges into the Yellow sea, in every hour, a volume of water equal to 418,176,000 solid feet, or 2,563,000,000 gallons of water, or 1100 times as much as appears to be given by the Ganges. By another computation, he estimates the quantity of mud wafted into the sea by this river in every hour to be equal to 2,000,000 solid feet, or 48,000,000 in every day, or 17,520,000 in every year. Supposing the mean depth of the Yellow sea to be 20 fathoms, or 120 feet, the quantity of earth brought down by the Yellow river would, if accumulated together, be sufficient to fill up, even to the surface of the sea, an island one mile square in 70 days. By extending the calculation, a curious inquirer may find in what space of time the Yellow sea itself might be filled up by the successive depozitions from the Yellow river alone; for supposing that sea to extend northward from that river, and to include the gulfs of Pe-che-lee and Lea-tong, the number of square miles on the surface of this extent would be about 125,000, which, multiplied by the number (70) of days necessary for consolidating one mile square, would make 8,750,000 days, or 24,000 years.

The velocity of the Yellow river at the place where the embraffed it was so great, as to require, agreeably to the superfluous notions of the Chinee crews, a sacrifice to the Spirit of the river, in order to ensure a safe passage over it. With this view, the master presented a cock, and having wrung off his head, which he threw into the sea, consecrated the vessel with the blood spouting from the body, by sprinkling it upon the deck, the masts, the anchor, and the doors of the apartments, and stuck upon them a few of the feathers of the bird. Various kinds of provisions were then ranged across the deck; and when the captain had made three profound inclinations of the body with his hands uplifted, he muttered a few words, as if of solicitation to the Deity. The loo, or brazen drum, was in the mean time beaten forcibly; lighted matches were held towards heaven; papers, covered with tin or silver-leaf, were burnt; and crackers fired off in great abundance by the crew. The captain afterwards made libations to the river, by emptying it into the vessel's prow the several cups of liquors which he had provided, and concluded with throwing in also that which held the falt. All the ceremonies being finished, and the bowls of meat removed, the people feak'd on it; and afterwards launched with confidence the yacht into the current. As soon as she had reached the opposite shore, the captain returned thanks to heaven, with three inclinations of the body. Sacrifices are also offered to obtain a fair wind, and to avert any impending danger.

Besides these offerings, great exertions were necessary to overcome the violence of the Yellow river, and to transport large yachts in safety to the opposite shore. Embaffy to China, vol. ii.

Yellow Sea, an extensive but shallow inland sea between Corea and China, hardly any where exceeding forty-five fathoms in depth, and often not more than twenty; with a bottom of clay or mud: the alluvion, without doubt, of the rivers that are poured into it from the mountains and plains of China. See Leao-tong.

YELLOWs, in Animals, is a disease which is incident to horses, neat-cattle, and sheep, in which there is a yellow jaundice-like appearance, especially in the eyes.

It is a disease that takes place in horses in all states of them, but which in those of the young kind is often unaccompanied with fever, or any sort of irritation. It shews itself by a particular yellowness in the eyes and the inoff of the mouth, with a considerable degree of congestion of the bowels in some cases.

The complaint is frequently much relieved by the use of a ball composed of one ounce of aloes in powder, with one drachm of calomel, and half an ounce of Caffle soap, made up with a sufficient quantity of treacle; and the second morning afterwards giving one constituted of half an ounce each of nitre, reinf, and Caffle soap, made up with honey; and if the yellowness should continue in the eyes and mouth, repeating the latter after an interval of four days.

Some, however, advise to have first recourse to bleeding, clysters, and purges; in the last of which intentions the composition directed below may be found useful: One ounce and a half of Indian rhubarb, two drachms of saffron, and six drachms of socotrine aloes, formed into a ball with syrup of buckthorn. But if the rhubarb should be thought too expensive, it may be omitted, and the fame quantity of cream of tartar, and half an ounce of Caffle soap, with four drachms more of aloes, be added. This may be repeated two or three times, giving immediately the remedies directed below: Half an ounce of Ethiopis' mineral, and one ounce of Caffle soap, formed into a ball, and one of them given every day, washing it down with a pint of the following decoction: Madder and turmeric-root, each four ounces; burdock-root sliced, half a pound; monk's rhubarb, four ounces; and liquorice sliced, two ounces; boiled in one gallon of forc'e-water to three quarts; the liquor then strained off, and sweetened with honey.

In this disease, balls of Caffle soap and turmeric alone are likewise often had recourse to, even to the quantity of three or four ounces or more in the day; and not unfrequently succeed in recent cases.

By means of this fort, the disease for the most part abates
Y E L

abates in the course of a week or ten days, which may be
known by the alteration in the eyes and mouth of the horse;
but the remedies are to be continued until the yellowness
is wholly removed. Should, however, the disease prove
obstinate, and not give way to such modes of treatment,
it will be necessary to have recourse to more powerful remedies,
such as those of the mercurial purging kind, repeated two
or three times at proper intervals, and then to give the balls
composed of the substances directed below: Two ounces
of salt of tartar, four ounces of cinnabar or antimony, three
ounces of filings of steel, and soap half a pound, formed
with honey into balls the size of a pullet’s egg, giving one
night and morning in a pint of the above decoction drink.

On the recovery of the horse, some advise two or three
mild purges; and if he be strong and fat, to put in a
towel.

He should have mashes and warm water frequently, and
be exercised daily, and warmly covered with cloths.

In order to prevent a relapse, the first purging-ball may
sometimes be used with great advantage; and a powder
formed of the following ingredients be mixed, with the seeds
of corn every night for a fortnight: 'Ethiops’ mineral, nitre,
and aniseeds, each half an ounce, mixed together.

Salt-mashes, too, have often been found very useful in
the cure of this disorder, and when taken in time rarely fail
in restoring the animal.

The yellows in neat-cattle is a common disease, arising
from obstruction in the gall-ducks, and consists in a diffusion
of the obstructed bile through the whole body of the animal.
It is first distinguished in the white of the eyes, which has
a particular yellow appearance; and as it increases, the
whole of the skin becomes tinged with the same yellow
colour: but the ears, tail, eyes, and mouth, are the parts in
which it is the most conspicuous. The animals are affected
with great weakness and debility in every fringe of the
disease, and there is a little discernible, with indisposition to
move, and a want of appetite for their food. When in the pastures, they
most often wander about by the sides of the hedges, or other
fences, in a lonely manner. Milch cows are particularly
subject to the disease in the spring and at the fall of the
year; though they are not exempt from having it at all
other seasons. The most unfavourable state of the disease
is when it proceeds from an induration of some part of the
liver, as there is then but little hope of the disease being perma-
nently removed. As the changing state of the weather
has often a great effect in retarding or halting the re-
move of the disease, care should be taken to house the
animals in all unfavourable seasons.

On the first appearance of the disease, it may often be
removed by the composition directed below: Salt of tartar,
Caffile soap, and grains of Paradise, each one ounce;
turmeric-root, and coriander-seeds, in powder, each two
ounces; the whole being made into a drink, by pouring
three pints of hot ale upon the ingredients in a proper clo-
celestial, firstrones and then in a thin manner, and covering
them well up until they become about new milk warm,
when two ounces of honey or treacle may be added, and
the whole given as a drink. It must be repeated at the
distance of every day or two, for two or three times, or as
there may be occasion.

Where the beast is strong, a little blood may sometimes
be taken away with advantage; but it should not be turned
out into the pasturage the same day.

When the disease does not give way to these remedies, it
may be necessary to have recourse to a strong purge or two.
After which a drink composed as below may be given:
Salt of tartar, one ounce; Caffile soap sliced, two ounces;
well rubbed down with an ounce of balm of copaiva, and
then two ounces each of valerian-root, ginger-root, and
Peruvian bark in powder added, and the whole given in ale
or gruel as above, repeating it every other day.

It is necessary to keep the bodies of the animals well
open through the whole of the disease; in which intention
a drink composed as below may often be useful: Barba-
does aloe, in powder, one ounce; caffor-oil, four ounces;
lyrup of buckthorn, two ounces; mixed and given in a quart
of oatmeal-gruel when about new milk warm, and repeated
until the proper effect be produced, using the first fapon-
aceous drink at the same time.

When this complaint is removed, the general health of the
animals may soon be restored by the proper use of cor-
dial strengthening drinks, formed of the different aromatic
pectoral feeds in the powdered state.

The yellows is not a very common disease among theep,
and consequently has not been very accurately described;
but probably confounded with many other affections to
which they are subject. It is supposed by some to be in
general confined to the South-Down and new Leiceste
breeds, which, from their more tender constitutions, are
more liable to complaints.

The appearances of the disease are a yellowness over
the whole body, but particularly discernible in the white
of the eye. The wool, too, has a little of the tinged, and
is slightly hard. The pallidess of the belly are of a white
colour, and the urine is found to tinge any thing immersed
in it of a yellow hue. Sometimes there is a degree of full-
ness and hardnees in the right-side, about the seat of the
liver. The caules are any thing which has a tendency to
obstruct the gall-ducks, but they are by no means evident;
their effect, however, seems generally to harden the liver,
and invariably to impede the passage of the bile from it into
the bowels. In some cases, small fomes, formed in the gall-
bladder, produce it; and at other times, it is caused, as in
the rot, by the swelling of the glands impeding the flow
of the bile in the duets, in which case it is mostly incurable.

The removal of the disease is to be attempted by the
use of strong purgatives, and such remedies as act strongly
on the bowels. A strong solution of purging salts will
partly tend to produce this effect; and ten grains of
ipeacuana, given every three hours in a little watered
strong beer, is said to be attended with the most beneficial
effects, when continued for five or six days together, and a
dose of purging salts given after it, so as to clear the bowels.
Calomel and soap may likewise be often given with great
benefit, as well as some of the above faponaceous remedies.

Y E M

YEMANA, or JEMAMIA, in Geography, a country and
city of Arabia, which M. D’Anville, probably misled by
some map and uncertain accounts, places on a river called
Altan, and which he represents as a stream in Negeb,
though Niebuhr mentions it merely as a wall or brook, which
runs after rains. D’Anville says, that Jemama is in Al
Kardje, which is the grand province of Kerje of Niebuhr,
on the E. of Hedjaz and Yemen; and in this province,
according to the Danish geographer, is the city of Amam
or Iumama, renowned for the prophet Moeflama, whom
the historian Gibbon ascribes to Yemama, and which town is
in the district of Surfa. But this cannot correspond with
D’Anville’s Jemama, which is in the province of Ared,
bounded only by that of Lahia on the E. Niebuhr also
informs us, that Aijana, a town of Ared, is remarkable for
the new prophet Wahlab; and therefore Gibbon feems
to have erred by supposing it to be the same with Yemama,
the latter being probably a town of Kerje, not far to the
E. of Hedjaz. After all, the province and city of Jemama
are
are probably mere fictions, which should be excluded from the maps, together with the river of Aftan, which, if it exited, would certainly be followed by the caravans from Lahfa to Mecca, while they seem to prefer a sandy desert.

Pinkerton's Geography.

YEMBA. See Emba.

YEMELLA, a town of Hindooftan, in Golconda; 24 miles E.N.E. of Rachore.

YEMEN, a province of Arabia, comprehending the finest and most fertile part of Arabia, representing, as Gibbon has observed, the Arabia Felix of antiquity, surrounded by the Red sea, or Arabic gulf, and by the province of Hadramout, Nedsjed, and Hedsjas. Yemen is naturally divided into two parts, differing greatly in soil and climate: that bordering on the Red sea is a dry and sandy plain, nearly two days' journey in breadth, and is harassed by the moist torrent heats; the other, extending immediately beyond this, is a high-lying country, full of precipitous yet fertile hills, and enjoying a much more temperate air. Yemen is, like the rest of Arabia, parcelled out among a number of different sovereigns in unequal portions. Some of them are princes of considerable power; but many are petty chieftains, who are, however, perfectly independent: the most considerable of these princes is the imam, who resides at Sana. There are several other independent states, as Aden, Kaukeban, Kobaib or Hafchid-u-Bekil, Abu-Arifch, a large district between Abu-Arifch and Hedsjas, inhabited by free Bedouins; Khaulan, Sahban, comprehending the principality of Saade; Nedsjeran, Kachtan, Nehmm, Eaff Khaufan, Dsjoj or Mareb, Jafa, and several others. The fame mixture of fertile and barren territory, and the fame productions, appear every where through the whole province: the imam, however, seems to be master of the richest, the most agreeable, and the most interesting part of this tract of country. It would not be easy to explain distinctly the extents and limits of this sovereign's territories, as they are so intermixed by the domains of a number of petty princes. The general division of Yemen into Tehama the Lowlands, and Djebal the Highlands, obtains in the imam's dominion as well as elsewhere. Upon this grand division depends the subdivision of the kingdom of Sana into thirty governments or counties. Tehama contains six of these governments, and the Highland country twenty-four; the small governments are not all alike populous or remarkable. There are in the territory of the imam many chieftains dispersed among the mountains, who acknowledge not his authority, and are but in a very slight degree dependent upon him. From the expulsion of the Turks in the year 1630, the reign of the imams began; their great ancestor Khallam Abu Mahomed was the chief author of that revolution. The throne of Yemen is hereditary; if generally approved of by the subjects, the eldest legitimate son of an imam is his rightful successor. But in the despotic governments of the East, indeed, no order can be closely observed, because there are no fundamental laws. The imam is an absolute prince, and the more so by uniting in his own person supreme authority, both spiritual and temporal, over his subjects. His jurisdiction in ecclesiastical matters, however, extends not over the dominions of other sovereigns of the same sect: these states have each a mutri, or cadi, for its spiritual use. Although the imam be absolute, he is checked in the exercise of his authority by the supreme tribunal of Sana, of which he is only president: this tribunal, consisting of a certain number of cadis, possesseth the sole power of life and death. The imam may not order any of his subjects for execution, but such as have been condemned in consequence of a criminal prosecution before this court.

The cadis are generally esteemed to be persons of incorruptible integrity, of blameless lives, and devoted to the faithful discharge of their duties: they are not changed here so often as in Turkey, but hold their offices usually for life. Every petty district in the dominions of the imam has its governor: if not a prince, or one of the highest nobility, this governor is called wali and dola, or sometimes emir, when he happens to be a person of low birth. In every little town, a sub-dola, with a small garrison, confining sometimes of five or six soldiers, refides to maintain order. The chief of a large village is a schieck; he of a small one a hakin. Every city in which a dola refides has also a cadi, dependent on the chief cadi of Sana; the cadi is sole judge in civil and ecclesiastical affairs, nor may the dola interfere to contradict his sentences, or render them inefficacious. The cadis in the provinces, no less than in the capital, are in high reputation for wisdom and integrity. The revenue of the imam is fluctuating and precarious; Niebuhr states it at about 500,000 crowns a month. This revenue arises from a land and poll tax, and from duties payable upon articles of merchandise. The military force consists ordinarily of 4000 infantry and 1000 cavalry. These armies use no artillery, nor do the Arabs know how to manage cannon. As the imam has no dread of enemies or corsairs upon the Arabic gulf, he has no occasion for a naval force; and his subjects are therefore generally unskilled in navigation. The fishermen venture far to sea in small canoes scarcely furnished with oars. The manufactories of a people of so little industry cannot but be very trifling: no fabrics are manufactured in Yemen, nor any edged weapon, except a kind of crooked knives, called jembea. The making of match fire-locks has been attempted here within these few years: it succeeds but indifferently. It is only of late that glass works have been established at Mocha; some coarse cloth is manufactured here, but not so much as is required for the use of the country: broad cloths are neither made nor worn here. The English brought some goods of this sort to Mocha, but were obliged to carry them back to India unfold. A country which affords so few articles for sale cannot have a great trade. Coffee is almost the sole article exported from Yemen; a valuable commodity, in exchange for which many of those things which this country needs from abroad may well be obtained. All the commerce of Yemen is carried on by Mocha, except only that some small quantities of coffee are exported by Loheia and Hodeida. Agriculture seems to be farther advanced in Yemen than in the other parts of the East. Wheat, in the belt cultivated districts, is sown to yield an increase of fifty-fold; durra, in the Highlands, 140; and in the Tehama from 200 to 400: and the inhabitants of Tehama reap three successive crops from the same field in the same year. In many parts of Yemen, whole fields are cultivated like a garden, and watered in the rainy season by canals from the hills. The inhabitants of the plain are obliged to encompass their fields with dykes, that the water may remain for some time upon the surface of the ground. In the upper parts of Yemen, the inhabitants collect the water necessary for their fields in dams formed at the foot of the hills. In some districts of Yemen, maize and durra are planted with the hand. The husbandry of Tull and Du Hamel, says Niebuhr, although novel in Europe, is very old in Arabia. In order to guard their fields from depredation of birds and other destructive animals, the peasants watch them by turns. In the Highlands, he who watches feeds himself on a tree; in the Tehama, on a fort of scaffold, with a roof raised over it. Niebuhr's Travels.
YEN, a river of China, which runs into the Hoang, 17 miles S.E. of Yen-tchang.

YEN-CHIN-TCHING, a town of China, in Canton; 45 miles E.S.E. of Tei-naan.

YENDON, a river of England, in the county of Stafford, which runs into the Churnet.

YENGLI IMAN, a town of Curditian; 70 miles S.E. of Kerkuk.

YENGE, a town of Corea; 25 miles N.E. of Kang.

YENISSEI, or YENISEI, or ENISEI, a river of Russia, which the Tartars and Mongoles, who inhabit the superior regions of it, above the Tunguika, call Kem, and the Oliftaks, Gub or Khefes, figuring the Great River, and which is at first composed of two rivers, the Kambara and the Veikerm, originating in the Chinefe Songaaria, or Bucharia, and forming a conjunction in N. lat. 51° 32', and E. long. 111°. About the mouth of the Bom-Kemféryeg it enters on Russian ground, and hence first takes the name of Yenisfély. After various windings it turns northward, and in N. lat. 70°, and E. long. 103° 30', forms a bay containing several islands; and at last, in 3° 30' of length, falls into the Frozen ocean. In autumn, when its water is at the lowest, its breadth, 5 gr. at the town of Yenifesfe, is about 570 fathom, whereas in the spring it is 750 fathom and upwards. The coasts of the Frozen ocean, between the mouths of the Yenisfély and Oby, are called the Yuratzkoi shore. The more considerable streams taken up by the Yenisfély are the following: on the right, the Ufs, the Tüban, the Kan, and the three Tunguikis, &c. the Upper, the Middle, and Podkamenaia, and the Lower Tunguika; on the left, the Abakan, the Velovi, and the Turukhan. In its superior regions, the Yenisfély flows over a very flabby bed; and its shores, particularly the eastern, are mostly befted with lofty mountains and rocks. Its course is in general very rapid, though near its mouth it flows so gently, that the current is hardly perceptible. In the neighbourhood of Turukhana and elsewhere it forms some considerable islands; and between the cities of Yenifesfe and Krafnoyarska, several cataracts are to be seen. The Yenisfély is navigable from its mouth as far as Abakan, and affords abundance of the best fish. Near this river, as well as in some other parts of Russia, are ftones, which represent in rude sculpture human faces, camels, horfemen, with lances, and other objects. Between this river and the Oby, or Ob, is a vast space extending from the north of Tomik to the Arctic ocean, which is regarded as a tepee, being a prodigious level with no appearance of a mountain, and scarcely of a hill. The fame term is applied to the wider space betwixt the Yenisfély and the Lena, between the Arctic ocean in the N., and the river Tunguika, or Angara, in lat. 65°; and to the parts beyond the Lena as far as the river Kolyma or Covina. Tocke's Ruil, vol. i.

YENISSEISK, or ENISSEIK, a small town of Russia, in the government of Toboliik, situated on the above described river, the forges of which yield a considerable tax to the Russian revenue. Its jurisdiction is extensive, and it pays annually a tribute in skins to the crown of Russia; 400 miles E.N.E. of Kolvan. N. lat. 56° 16'. E. long. 91° 50'.

YENITE, in Mineralogy, Livicite, Werner, a mineral found in the island of Corflca, which from the great quantity of iron that it contains might properly be classed with the ores of iron. It is arranged by professor Jamefon with the chryfoite family, but it differs greatly in the proportions of its constituent parts from all the other species which he has claffed with this family. The appearance of this mineral resembles hornblende, or rather black epidote:

it occurs both cryftallized and massive. The form of the cryftals is that of a rhomboidal prism, the alternate angles of which measure about 113 and 67 degrees; the prisms are terminated by low four-fided pyramids, the faces of which are set on the lateral plane of the prism. It is also cryftallized in rectagular prisms, bevelled on the extremities, and the bevelling planes set on the obtuse edges. These figures are also variously modified by the edges or angles being bevelled. The cryftals are sometimes very minute or acicular, and sometimes half an inch in thicknefs; they are frequently aggregated in diverging radii, and sometimes imbedded. The prisms are inserted longitudinally. The structure is imperfectly lamellar, with joints parallel to the sides, and to the short diagonal of the rhomboidal prism. The fracture of yenite is uneven, and imperfectly conchoidal, with a luftre between vitreous and resinous. The colour is black passing into brown; it does not change its colour in the firebox. The hardnefs of yenite is about equal to that of common felpar; it is easily flangible. The specific gravity of yenite varies from 3.62 to 4.061.

It is flamble with ease by the blow-pipe into a black glafs, which has a metallic aspæct, and is attracted by the magnet, but does not possess polarity; it diffolves with bafax with a flight ebullition. It is acted upon by the mineral acids, but does not gelatinize with them. When exposed to heat it becomes magnetic. Its colour is changed by heat from black into dark reddish-brown, and it lofes about two per cent. of its weight.

The conflituent parts of yenite are,

Yenite decomposes gradually on exposure to the air, and is reduced to a yellowish-brown ochre. According to Brongniart, yenite occurs in diipersed cryftals and groups, and in compact kidney-shaped masses, in a thick bed of a greenish fulidence nearly resembing yenite, but which has not been accurately examined. It is accompanied with epidote, quartz, and arsenical pyrites. This bed at Rio la Marino, in Corflca, covers a rock of primitive marble mixed with tate. At the Cap de Calamite, it is accompanied with magnetic iron-stone, garnets, and quartz.

YEN-KING, in Geography, a city of China, of the second rank, in Pe-tche-li; 82 miles N.N.W. of Peking. N. lat. 40° 30'. E. long. 125° 30'.

YENLADIE, or STAY, a channel between the Thames and Medway, which separates the island of Grane from the coast of Kent. It was formerly the usual passage for vessels to and from London.

YENNE, a town of France, in the department of Mont Blanc, near the Rhone, supposed to be the ancient Epamna, where Sigismund, king of Burgundy, assembled a council at the end of the fifth century; 14 miles N.W. of Chambery.

YEN-NGAN, a city of China, of the first rank, in Chen-fê, on the river Yen; 390 miles S.W. of Peking. N. lat. 26° 44'. E. long. 108° 49'.

YEN-PING, a city of China, of the first rank, in Fokien; 820 miles S. of Peking. N. lat. 26° 40'. E. long. 117° 44'.

YEN-TCHOU, a city of China, of the first rank, in Tche-kiang. Near this town are mines of copper, and trees that yield varnish, which give a value to the cabinet-work so much esteemed in Europe; when this varnish is once dry, it never melts again, and will bear boiling water.

The
The paper manufacture of this place is in equal esteem, and for which they have a great demand. Six towns of the third order are under its jurisdiction; 650 miles S.S.E. of Peking. N. lat. 29° 53'. E. long. 116° 14'.—Alto, a city of China, of the first rank, in Chantong. The territory depending upon this capital is interposed between two considerable rivers, which abound with fish, and make the soil very fruitful. The country is very well cultivated, the mountains are covered with woods, and the air is mild and temperate. There are twenty-seven towns within the jurisdiction of this capital; four of the second order, and twenty-three of the third; 267 miles S. of Peking. N. lat. 35° 44'. E. long. 116° 36'.

YENTCHERU, a town of Hindoostan, in the circuit of Cuddapa: 20 miles N.N.E. of Combam.

YENTCHING, a town of China, in Chantong, where a peculiar species of glass is manufactured, of so delicate a nature, that it will not endure the inclemency of the air; 45 miles S.E. of Tien-nan.

YEOMAN. See Yeovil.

YEOMAN, the first or highest degree among the plebeians of England; next in order to the gentry. The yeomen are properly the freeholders, who have land of their own; so called from the Saxon geman, or geman, common.

The word yeoman is used for yeoman in the statute 33 Hen. VIII., and in old deeds it is sometimes also written geman, which, in the German, signifies anybody.

According to Sir Thomas Smith, a yeoman is a free-born Englishman, who can lay out of his own free land in yearly revenue to the sum of forty shillings sterling.

The yeomantry of England are capable of holding lands of their own to a good value; are adjudged capable of certain offices, as constables, churchwardens, jurymen; and are also to vote in elections to parliament, and to serve in the army, and to do any other act where the law requires one that is produs et legalis homo.

The yeomen were famous, in ancient times, for military valour, being particularly expert at the management of the bow; whence the infantry was composed chiefly of them.

They frequently constituted the body-guard of our kings; and in process of time gave rise to the institution of yeomen of the guard.

In many cafes, the law conceives a better opinion of the yeomantry than occupant lands, than of tradesmen, artisans, &c.

By a statute, 2 Hen. IV., it is enacted, that no yeoman shall take or wear a livery of any lord, upon pain of imprisonment, and a fine at the king's pleasure.

Yeoman is also a title of office in the king's household, of a middle place or rank between a gentleman and a groom. Such are the yeoman of the buttery; yeoman of the feuilly; yeoman of the wine-cellars, ewry, wood-yard, &c.

There are also the yeoman of the mouth, yeoman of the kitchen, yeomen-porters, &c.

Yeoman, in Sea Language, an officer under the boatswain or gunner of a ship of war, usually charged with the1 flowage, account, and distribution of their respective stores.

Yeomen—Warders. See Warders of the Tower.

Yeomen of the Guard, properly called yeomen of the guard of the king's body, were anciently a body of men of the best rank under gentry, and of larger stature than ordinary; every one being required to be six feet high.

Their number has varied in almost every reign, and formerly consisted of a certain number in ordinary, and an indefinite number extraordinary; and in case of a vacancy in the former, it was supplied out of the latter number. In the reign of king Edward VI. this corps was very numerous. In the reign of queen Elizabeth, the yeomen attending her in her different progresses were occasionally mounted. In the reign of queen Anne, the arms of half this band were arquebuses, which are paid by Chamberlain to have been diffused ever since the reign of king William; the other half had partisans, and those of both classes had swords. They had their wages and diet allowed them; so that in a MS. of the expenses of the royal establishment for the year 1727, the charges of the table of the yeomen of the guard were 273l. 15s. But their diet has been discontinued since that reign. Their duty was to wait upon the queen in her flaming-houses; forty by day, and twenty by night. At St. James's, they waited in the first room above stairs, called the guard-chamber. It is also their duty to attend the foreigner abroad by land or water.

At present there are but one hundred yeomen in constant duty, at 39l. 11s. 3d. per annum each; eight of whom are called ushers, who have 10l. per annum each more than the other yeomen; six are called yeomen hangers, and two, yeomen bed-guards, who have the same pay as the ushers; and seventy more not on duty; and as one of the hundred dies, his place is supplied out of the seventy.

The officers are a captain, who has 100l. per annum; a lieutenant, at 500l. per annum; an ensign, at 300l.; and four ensigns, at 150l. per annum each; and a clerk of the cheque at the same salary.

Their origin is traced to the year 1485, when king Henry VII. ascending the throne, immediately after his coronation, instituted a guard of fifty archers to attend him and his successors. They were probably then, as they are now, called the yeomen of the guard.

It is observed, that this is the first instance of any established or permanent military guard in England: its kings, till that time, except in times of war and insurrection, contenting themselves with the guard of their proper domestics and retainers. And Hist. Com. vol. i. p. 302.

Most of the writers, however, against standing armies commence that establishment with the jerjeans at arms, who were first instituted by king Richard I. Their drefs is that which was worn in the reign of king Henry VIII., and which on many occasions was put on by that king: it consists of a scarlet coat reaching down to the knees, guarded with garter blue velvet, and with badges of the rose and crown on their breasts and backs; their breeches also are scarlet, guarded with blue velvet; their caps are of black velvet, with broad round crowns, adorned with ribbons of the royal colours, viz. red, white, and blue.

The officers and yeomen are at the disposal of the captain; but the captain is at the appointment of the king.

Yeoman of the Salt Stores. See A catalogue.

Yeomanry Cavalry, a denomination given to those troops of horse which were levied in the late war among the gentlemen and yeomen of the country, upon the same principle with the volunteer companies. The yeomanry cavalry were to be allowed pay when called out on actual service, and each corps was liable to be put upon duty within its district: all contingent expenses, properly and unavoidably incurred, were to be reimbursed after an investigation at the war-office. One jerjeant and a trumpeter per troop were to have constant pay, with the same allowances as jerjeans and trumpeters of regular cavalry. Some accoutrements were to be furnished by the ordinance, or an equivalent
YERIL, in Geography, a large and populous market-town in the hundred of Stone, county of Somerfield, England, is situated on the confines of the county, at the distance of 9 miles S.E. from Somerton, and 122 miles W.S.W. from London. It derives its name from the river Yeo, which rises near Sherborne, and passes this place under a stone bridge of three arches, separating the counties of Somerfield and Dorset. The town of Yevil consists of upwards of twenty streets and lanes; many of the former are of considerable width: the houses in general are respectable, and many of them are built of stone. Part of the town is called the Borough, and is governed by a port-reeve and eleven burgesses, out of whom the portreeve is annually chosen. Here is a spacious market-house, seventy feet in length, and twenty in breadth, supported by stone pillars, in the centre of which are the remains of an ancient crofs. A considerable market is held on Fridays for corn, cattle, pigs, butter, cheese, and flax: here are also two annual fairs. The woollen trade was formerly extensive here, but has decreased: the chief business of the town is the manufacture of leather gloves. In the return of the year 1811, the population of this parish was estimated at 4118; the number of houses at 459. The church, a large ancient structure, consists of a nave, chancel, two aisles, and transept: the length of the whole is 146 feet; the breadth 90. At the west end is a plain tower, ninety feet high, with a stone balustrade at the top. Dillentors have several meeting-houses in the town. Here is an almshouse, founded in the year 1476, by the Rev. Mr. Woburne, minor canon of St. Paul's, London, and by him endowed with considerable landed property for the maintenance of a master, two wardens, and twelve poor persons of either sex. He also built a chapel for the use of his poor, and ordained divine service to be performed in it every day.—Collinson's History of Somerfield, vol. iii. Beauties of England and Wales, vol. xiii. Somerfield.

YEOUNGBENZAHA, a town of Birmah, on the Irrawaddy; 36 miles N.N.W. of Rangoon. N. lat. 17° 30'.

YEOUN TUN OUEI, a town of Chinese Tartary. N. lat. 47° 8'. E. long. 121° 9'.

YEOUN YU, one of the small islands in the Chinese Archipelago; 62 miles S.W. of Macao.

YEOWAH, a town of Birmah; 15 miles S. of Penangmew.

YEPES, a town of Spain, in New Castile; 17 miles E. of Toledo.

YERAPATTA, a town of Hindoostan, in Myerox; 8 miles S. of Dalmacherry.

YERCO, a town of Thibet; 90 miles S.E. of Lassa.

YERE, a river of France, in the department of the Lower Seine, which runs into the English Channel, at Eu.

YERCHEN. See Yarkan.

YERK, in Horser, a term signifying to strike out backwards. A horse is said to yerk, or strike with the hind legs, when he flings and kicks with his whole hind quarters, striking out the two hinder legs near together, and even to their full extent. Horses of this fort are very dangerous, and should be parted with as soon as possible, whether they are of the farm or the faddle kind.

YERKIE, in Geography, a town of Russia, on an island at the mouth of the Volga, where vessels take their departure for the Caspian sea. Here ships formerly entered and cleared, but the island is now almost overflowed, and the trade of the place much decayed since 1747; 60 miles S. of Astrachan.

YERMA. See Jermai.

YERMUK. See Yarmuck.

YERTNAGOODAM, a town of Hindoostan, in the circar of Rajamundry; 17 miles S.W. of Rajamundry.

YERVAMAORA, in Botany. See Bosea.

YERVILLE, in Geography, a town of France, in the department of the Lower Seine; 12 miles N.E. of Caudebec.

YESCOKING CREEK, a river of North Carolina, which runs into Pamlico sound, N. lat. 35° 29'. W. long. 76° 14'.

YERG. See Yezd.

YERD, a town of Peria, in the province of Lar, 40 miles N. of Lar.

YERDCAST. See Jezzkast.

YERID, a town of Peria, in the province of Chufitan, or Kuzifan; 18 miles N. of Toftar.

YEST. See Yeast.

YETCHERADAW, in Geography, a town of Hindoostan, in Myerox; 9 miles E. of Rydroog.

YTEOPAUK, a town of Hindoostan, in the circar of Celeccole; 15 miles S.W. of Coflincoita.

YETHAN, a river of Scotland, which runs into the German sea, 10 miles N. of Aberdeen.

YETHOLM, or ZET-HAM, a market-town in the district of Kello, and shire of Roxburgh, Scotland, is situated nine miles S.E. from Kello, on the small river Bowmont, which divides it into two parts, respectively named Town Yetholm and Kirk Yetholm. A weekly market is held on Wednesdays; and two fairs annually. Many tinkers and gypseys reside in this town. The parish extends about four miles in length, and two in breadth; and is bounded on the east and south by the English border. The surface is hilly, but the hills are covered with verdure, and pattered by a very considerable number of sheep. In the population return of the year 1811, this parish is rated to contain 273 houses, and 1138 inhabitants. King Robert III. granted the barony of Yetholm in the fourteenth century to Archibald Mac Douglas, whose descendant still enjoys it.—Carllie's Topographical Dictionary of Scotland, 1813.

YETTUS, in Natural History, a name given by the writers of the middle ages to a species of marble of a deep red, which was used by fome as a touch-floe.

YEU, in Geography, a small and insignificant isle, situated on the W. coast of France.

YEVA CHARRUM, in Natural History, a name given by the people of the East Indies to a kind of litharge, which is very common in that part of the world, and is said to be made partly from lead and partly from zinc. It is less heavy than our yellow litharge, and of a paler colour. It is used as a cautery in all the occasions of surgery there.

YEVERING, in Geography, a village of England, in the county of Northumberland, where the Scots were defeated in 1415, by Sir Robert Humphrevel and the earl of Wiltmoreland. Near it is a mountain called Yevering Bell, belonging to thefe called Cheviot; 6 miles W.N.W. of Wooler.

YEULA, a town of Hindoostan, in Baglan; 5 miles E. of Bahbelgong.

YEVRE LE CHATEAU, a town of France, in the department of the Loiret; 6 miles S.E. of Pithiviers.

YEW, or EUGUS, in Botany. (See Taxus.) De Thris traces thefè English words, whose antiquity cannot be doubted,
doubted, to the Celtic *if* or *law*, green, alluding to the
evergreen foliage of this tree. The French have retained
*if* unaltered to the present day.

*Tree*, as some say, may be derived from the Greek *teza*,
to hurt; and probably became before the invention of guns
our ancestors made their bows of this wood: they therefore
took care to plant the trees in the church-yards, where they
might be often seen and preferred by the people.

*Yew* is also a term used by the salt-workers of Lymington,
and some other parts of England, to express the first
rising of a scum upon the brine in boiling.

In the places where they use this term, they add no
clarifying mixtures to the brine, for it ferments in the cist-
terns; and all the founkleaks to the bottom in form of a
thin mud; they admit only the clear liquor into the pan,
and boil this briskly till it yews, that is, till a thin skin of
salt appears upon its surface; they then damp the fire, and
carefully skim off this film, and clear only the feratch or
calcareous earth, which separates to the bottom.

They do not collect this into feratch-panes, as at many of
the other works, but they rake it up to one side of the pan,
and take it out; they there add a piece of butter, and con-
tinue the fire moderately strong till the salt is granulated.
They keep a brisker fire on this occasion at Lymington
than in most of the other works; so that they will work three
pans in twenty-four hours. See **SALT**.

*yew-tree*, in **Agriculture and Rural Economy**, a well-
known evergreen tree, the timber of which is much esteemed
for different uses and purposes in husbandry, and where
toughness, elasticity, and durability are required.

Trees of this sort may be easily propagated, in moss cates,
by fowring their berries when divested of the pulp in au-

tumn, as soon as they are ripe, upon a bed of fresh un-
duged foil, either over the whole or in droils, covering them
over about half an inch thick with the same earth: but
the latter is the better mode. In the spring, the bed must
be carefully cleared from weeds, and if the fowen prove
dry, it will be proper to refreh it with water now and
then, which will promote the growth of the seeds; many
of which will come up the same spring, but others will re-
main in the ground until autumn or spring following; but
when the seeds are preferred above ground till spring before
they are sown, the plants never come up till the year after,
so that by fowring the seeds as soon as they are ripe there
is often a whole year faved.

The plants, when they come up, should be kept con-
stantly well cleared from weeds, which, if permitted to
grow amongst them, would cause their bottoms to be
naked, and frequently destroy the plants when they con-
tinue long undisturbed.

In this bed, the plants may remain two years; after
which, in autumn, there should be a foot of fresh unduged
foil prepared, into which they should be removed about the
beginning of October, planting them in beds about four or
five feet wide, in rows about a foot and half, and six inches
distant from each other in the rows, observing to lay a little
litter or mulch upon the surface of the ground about their
roots, as also to water them in dry weather until they have
taken root; after which they will require no farther care,
but to keep them clear from weeds in summer, and to train
them according to the purpose for which they are designed,
—for timber in a straight manner.

In these beds they may remain two or three years, ac-
cording as they have grown, when they should again be re-
moved into a nursery, placing them in rows at three feet
distance, and the plants eighteen inches asunder in the rows,
observing to do it in the autumn, as before directed, and
continue to trim them in the summer for what they are in-
tended; after they have continued three or four years in
this nursery, they may be transplanted where they are to
remain, always observing to remove them in autumn when
the ground is very dry; but on cold moils land it is better
in the spring.

These trees are very flow in growing, but there are many
very large trees upon some barren cold foils.

It is observed in the Gloucestershire Report on Agri-
culture, that the yew-tree should not be suffered to grow in
or near cow-pastures. The leaves are poisonous to horned
cattle and horses, though the berries are esteemed inoffen-
sive. In January 1805, in consequence of some fences
being broken down by a violent wind during the night, a
number of cows belonging to a farmer in Sandhurst entered
an inclosed shrubbery, where there were many yew-trees

growing, and continued in it till the morning. Soon
after they were driven out, all of them were seized more
or less with a kind of madness, or such acute pains as made
them run about in a very furious manner, sometimes leaping

to a considerable height, then beating their heads against
whatever opposed them, and at last falling instantly dead.
Oils of different forts were poured down their throats, as
there was an opportunity of securing them, which seemed to
produce a good effect on some; but notwithstanding
every effort, nine out of thirty died in a few hours after
they were discovered. On their being opened, it appeared
that the whole quantity they had eaten, put together, would
not have filled a peck.

An opinion prevails, that the leaves are not poisonous in
the summer; this, however, is probably erroneous, at least
it is not confirmed sufficiently by fact to justify the farmer
in subjecting his cattle to the experiment. If cattle come
within reach of the yew-tree at that time of the year, they
may perhaps reject it altogether, giving the preference to
other green food, more palatable, and in plenty around
them.

These trees should therefore in all cases be carefully kept
out of the hedge-rows and all other parts of fields, where
cattle are suffered to feed and pasture.

**YEYEAPOUR**, in **Geography**, a town of Hindooftan,
in Lahore; 16 miles S. of Nagorco.

**YEZD**, or **Yezd**, a large and populous city of Per-
fsia, situated in a sandy desert, contiguous to a high range
of mountains running nearly E. and W. This is the grand
mart between Hindooftan, Bucharia, and Perfsia, and is,
therefore, a place of considerable trade. The bazaar is
well supplied, and the city contains 20,000 houses; besides
those of the Guebres, or worshippers of fire, which are esti-

*ated at 4000. The Guebres were an indolent people, but
are greatly oppressed, being taxed at twenty puliaires a-
head, in addition to the various other exactions of the Per-
fsian government. Many opulent Hindoos formerly resided
*here; but the late governor, wishing to enrich himself by
plundering their property, they all fled in one night to-
wards Candahar, where they have since established them-

*elves. The present khan has, in vain, endeavored to re-
*call them, and there are now only nine Hindoos in Yezd.
The city imports the greatest part of its corn from the
*neighbourhood of Ifpanh. Cattle are also scarce, and an
*ars will sometimes fall as high as fifty taunos. The ma-
*nufacture of silk stuffs is superior to any in Perfsia; and
*the muslins or thick felts of Tuft, a small village, distant eight
*miles, are equally famous. The fort of Yezd has but a
*mean appearance; and the town is destitute of a wall.

That
That territory which lies between Yezd and Isphahan is the most arid part of Irak. The soil is poor, light, and sandy; and here is a general scarcity of water and wood; the climate also is hot, though not unhealthy. The small towns of Ardistan, Nain, Aujdah, Myboosh, and Sezabad, are badly built, and contain from 100 to 200 houses each. McKenzie’s Persia.

YEZDEGERDIC Year, in Chronology. See Persian Year.

YEZDICAN, in Geography, a river of the Persian empire, in the province of Azerbaijan, which has its source about 60 miles to the E. of the lake of Van, and which, pursuivit a N.E. course, passes under the walls of Yezdican and Kurs, and meets the Araxes a little to the N. of Nuch-ihvan.

YEZEDI, the name of a Persian sect, of which several tribes inhabit the mountains of Sinjar, about eight or ten miles from Nisibis. They are numerous in the vicinity of Moful, and are said to worship, or rather to adore, the devil, entertaining an idea that he possesseth an unlimited power over mankind. They even dislike to hear the name of the evil spirit mentioned in their presence. They are the descendants of those Arabs who followed the banners of Yezid, and fought against Houssein, in the battle of Kerbel; and sheikh Ade, the founder of the sect, is interred near Moful. They adore one Supreme Being as the creator and benefactor of the human race, drink wine and other strong liquors, and circumeice like the Mahometans. The Yezedi are hated by the Turks, to whom they are mortal enemies, and who have never been able to subdue them. They lie in ambush behind the rising grounds which skirt the road between Moful and Merv; and as travellers are obliged to pass a lonely wild, twenty furlongs in length, they are liable, if not numerously attended, to be murdered by these miscreants. Sinjar affords abundance of pasture, and also yields a sufficient quantity of grain for the consumption of its savage inhabitants. McKenzie’s Persia.

YFFINIA, a town of France, in the department of the North Coasts; 6 miles S.E. of St. Brieuc.

YGERA, a town of Spain, in Old Caftile; 12 miles S. of Calahorra.

YGGEDE, or Uggade, in Ancient Geography, a place of Gallia Lyonnensis. Anton. Itin.

YGIN, in Geography, a town of Corea; 28 miles S.S.W. of Hamen.

YGROMETER. See Hygrometer.

YGUALADA, in Geography, a town of Spain, in Catalonia; 28 miles N.W. of Barcelona.

YGUISET, a small island among the Philippines, near the north coast of Panay. N. lat. 11° 35'. E. long. 122° 32'.

Y-HO, a river of China, which rises in Shan-tong, and runs into the Hoang, near Sou-tcheou, in the province of Kiang-nan.

YIAN-KANTH, a town of Corea; 28 miles E. of Hetfian, or Efian.

YICHKENISH, one of the smaller Western islands of Scotland; 1 mile N. of Benbecula.

YIELD or Slack the Hand, in the Manege. See Slack.

YIELDING and Paying, a law phrase, formed by corruption from the Saxon geldan, or gildan, to pay. Hence, in Domclday, gildare is frequently used for solvere, reddere; the Saxon g being easily converted into y. See GELD, and GILD.

YIETI, in Geography, a town of South America, in the province of Paraguay; 120 miles S.E. of Asuncion.

YIN, a word used by some of the chemical writers to express verdigrife.

YISSER, in Geography, a river of Algiers, anciently called Serbetis, which runs into the sea at Jinnett.

YKINA, a town of Sweden, in the province of Finland; 45 miles N. of Bironenborg.

YLACE, a town of Sweden, in the government of Abo; 27 miles N. of Abo.

YLAY. See I.JA.

YLIGAN, a town on the north coast of Mindanao.

YLKANNUS, a town of Sweden, in the government of Wahf; 24 miles E.N.E. of Gamla Karleby.

Y-LIN, a city of China, of the second rank, in Hou-kuang; 617 miles S.S.W. of Peking. N. lat. 30° 52'. E. long. 110° 44'.

YLISTARO, a town of Sweden, in the government of Wahf; 24 miles E.N.E. of Wahf.

YLIVIESKA, a town of Sweden, in the government of Uleca; 38 miles S. of Uleca.

YLO, or ILO, a sea-port town of Peru, in the diocese of Arequipa, situated near the mouth of a fresh-water river of the same name, which is dry from the beginning of October to January; 25 miles W. of Moquegua. S. lat. 17° 38'.

YLST. See Ist.

YLUM OF, a small island of Denmark, in the Little Belt. N. lat. 55° 8'. E. long. 10° 7'.

YLWISKA, a town of Sweden, in East Bothnia; 28 miles S. of Brahefjord.

YNATILAN, a town on the west coast of the island of Suma. N. lat. 10° 21'. E. long. 121° 22'.

YNCA, YNCAH, or INCA, an appellation anciently given to the kings of Peru, and the princes of their blood; the word signifying literally, lord, king, emperor, and royal blood.

The king himself was particularly called capas yncas, i.e. great lord; his wife, pallas; and the princes simply yncas. These yncas, before the arrival of the Spaniards, were exceeding powerful. Their people revered them to excesses, as believing them to be sons of the sun, and never to have committed any fault. If any person offended the royal majesty in the smallest matter, the city he belonged to was totally demolished.

When they travelled, whatever chamber they lay in on the road was walled up as soon as they departed, that nobody might ever enter in after them. The like was done to the room in which the king died; in which, likewise, all the gold, silver, and precious furniture, were always immured, and a new apartment was built for his successor.

His loved wives, domestics, &c. likewise sacrificed themselves, and were buried alive in the same tomb along with him. See the History of the Yncas, by Garcilaso de la Vefia. See also INCA.

YN, or YN, in Geography, a city of China, of the second rank, in Chan-fu. N. lat. 39° 40'. E. long. 112° 49'.

YNIESTA, a town of Spain, in New Caftile; 20 miles S.E. of Alarcon.

Y-NING, a town of Corea; 33 miles E.N.E. of Tin- tcheou.

Y-PING, a town of Corea; 38 miles S.W. of Kiang- tcheou.

Y-TCHENG, a town of Corea; 25 miles E. of Outchuen.

YN-YUEI,
YN-YUEI, a city of China, of the second rank, in Yuen-nan; 1300 miles S.W. of Peking. N. lat. 25° 58'. E. long. 98° 24'.

YOAK, in Agriculture. See Yok, and Yoking.

YOAK, Jugum, in Antiquity. The Romans made the enemies they subdued pas under the yoke, which they called sub jugum mitter; that is, they made them pas under a fort of force patibulares, or galbous, confining of a pike, or other weapon, laid across two others planted upright in the ground. This done they treated them with humanity enough, and sent them home again. See Furca.

The fame meafure was sometimes dealt them by their enemies upon the fame occasion. Thus Caesar (lib. ii.) observes, that the conful L. Caflius had been killed by the Swifs, and his army defeated, and made to pas under the yoke.

YOAK of Land, jugata terre, in our Ancient Cufomus, was the space which a yoke of oxen, that is, two oxen, may plough in one day. See Hide, Yard-Land, &c.

YO-Chin, in Geography, a town of Corea; 10 miles N.E. of Han-techou.

Yocket. See Jocket.

Yocom Creek, in Geography, a river of Virginia, which runs into the Potomack, N. lat. 38° 6'. W. long. 76° 30'.

Yocote, a town of Hindooftan, in Dowlatabad; 27 miles S.S.W. of Mahur.

Yogeswar, in Hindoo Mythology, a name of the Hindoo god Siva; which fee. It means lord of ages, or of time; yug, or yog, being vast periods of time into which Hindoo chronologifts arrange the past. The addition of Ifwara, the powerful, a name of Siva, seems to give a satisfactory derivation. (See Iswara.) For an account of those periods, fee Jogues. Some have derived the name of Yogefwara from lord of Yogis, supposing the feft of fanctifie Beggars fo designated as being more immediately under the protection of Siva; but this is in fact nearly the fame thing, for yog signifies union or junction, and these periods of time re-unite all things in the Deity; and the Yogi by intenfe contemplation effects a fimilar union. But this metaphysical dogma cannot be explained here. See Kalpa, Yogi, and Yug.

Yogi, a description of wandering faints, much re-

spected by many of the natives of India, though by others they are strongly suspected to partake more of the impolter than the enthufta. There are many defcriptions of these itinerants among the Hindoos; and we are not aware that the diftinctions between them have been accurately pointed out. The appellation Yogi means a devout man, devoted to spiritual things, especially to the contemplation of the attributes of the Deity. It is derived from yog or yug, which, among very many significations, means primarily union or junction, and is applied in this fenfe to one who by intenfe meditation is united to the divine nature; a mysticifc easily understood by the initiated and enthusiastic Hindoos, though not recognizable by others. There is a defire, we believe, between the Yogi and Saniaffy, but we cannot exactly fay in what it conffits. In the latter part of the article Sects of Hindoos, some particulars of these two will be found. Perhaps the Yogi may be the defignation of the Vaihnnava, and Saniaffy of the Saiva feft. (See Saiwa, Vaisinawa, and Yogeswar.) Both proffefs poverty, purity, and auffection. When the latter are carried to any extent, the zealot is honoured with the title of Tapawi, of whatever feft he be. Of fuch, and their affections, fee under Tapas. We fometimes read of female anchorets denominated Yogni; but they are, we believe, merely enthusiatic females, who become afceftics and not

the wives of the fanctifie males. Among the oriental manuscripts preffented to the Royal Society by fr W. Jones, is one entitled "Hatha Prapidaca, or Inftruclions for the Performance of the religious Discipline called Yaga."

In the Gita, Krishna defcribes the Yogi as being "more exalted than the Tapawi, the zealot who harraffes himfelf in performing penances: he is refefted above the learned in science, and superior to thofe attached to moral works."

This paflage is quoted in the latter part of our article Sects of Hindoos, but being erroneoufly pointed is fearcely intelligible. This article being thence referred to, we take the opportunity of correfting another error or two in it:—In the fecond column, the name of the Maharatta Brahman general, Purferam Bhow, is twice spellfed Bbon; in the fifth column, the name of Vopadeva, the author of the Sri Bhagavata, is spellfed Vapadeva; in the next column, line 21 from the bottom, a comma is wanted after Krishna. Having referred above to the article Tapas, we will here correct an error in that alfo:—In fecond column, line 11, for infexions read infickions.

Yohogany, in Geography. See Youghiogeny.

Yoides, in Anatomy, the bone of the tongue, commonly called hyoides. See Hyoides.

Yoinit, or Joingt, in Geography, a town of France, in the department of the Rhone and Loire; 7 miles E. of Roanne.

Yaitsbach, a river of Silesia, which runs into the Ouis, near Friedberg.

Yoke, in Agriculture, a fame of wood hellowed out and lined for receiving the neck part of the ox or other cattle in working. Yokes are confructed in different manners, as single and double, in order to be used differently. They are fixed with bows over the necks of the oxen or other cattle when in use; by which means, in the latter fort, the two animals are coupled together, and attached to the plough or other vehicle. See Yoking.

Yoke, in Sea Language, a name formerly given to the tiller, when communicating with two blocks or fheaves affixed to the inner end of the tiller. It is now applied to a caif board or bar which fits on the upper end of a boat's rudder at right angles, and having two small cords extending from its opposite extremities to the ftern-forets of the boat, by which thefe is feered as with a tiller.

Yoked Leaf, in Botany, folium conjugatum, or bina-

tum. See Leaf.

Yo-Keou, in Geography, a town of Corea; 38 miles S. of Haimen.

Yoking, in Agriculture, the practice of putting the animals into the yoke or other fort of team.

In the bufines of yoking or harnecfing oxen for the purpofe of draught, different methods have been followed by different farmers. And the modes of harnecfing and yoking oxen are even different in different counties, and districts of the fame county. The moft common practice in the southern parts of this kingdom, is that of working them in harnes in the manner of horses; while in the northern counties, the yoke and bows are ftil much employed. On the continent, as in France, Portugal, &c. the head is the part to which the draught is chiefly attached.

In the firft cafe, the fhoolder is made the principal point of draught; but in the fcond method, the neck and fhoolder conjointly have the weight of the draught; and in the laft mode, the principle of draught is, in one cafe the head, and in the other the joint power of the neck and bafe of the horn, which lord Somerville has confidered a purchase as great perhaps as can be given to the animal.

It is "effected by a long leathern strap, wrapped round the
YOKING.

the bafe or bottom of the horns, and again fastened to the yoke." It has been observed by a writer in the ninth volume of the Agricultural Magazine, that with respect to the second method which has been noticed above, the "usual form of the yoke is a frame of wood fittet over the necks of the oxen, by which they are coupled, and harnessed to the plough. It consists of several parts, as the yoke properly so called, which is a thick piece of wood, lying over the neck; the bow, which compasses the neck about; the fitchings and wreathings, which hold the bow flat in the yoke, and the yoke-ring and ox-chain," which is sup- posed "a method which is evidently founded on a total mistake in the anatomy of the ox."

And that in the first we have "imitated the gear used with the horse, without considering that the strength and agility of the ox are placed by nature in a different situation. The neck of the ox is a tower of strength; if the foil reftit, he projects this part of his form with that prodigious muscular force with which nature has provided him for his own defence; but without attending to her operations, we impose a load of timber on his withers, we lacerate his flesh, and prefs him down to the earth."

The third or French mode of yoking is thus described in the words of Mr. Hughes. "The labourer passes a piece of wood, of about one-sixth of the weight of the English yoke, across the forehead of his cattle, having previously neatly hollowed out the extremities of it to fit the mould of the head, and lined tho' hollows with a piece of woolly sheep-skin, to answer the purpose of a soft pad or cushion. This light and easy yoke he braccs to the horns with a small thong of leather, attaches the beam of his plough to the middle part of it, and the animal is completely equipped for his labour."

It has been obsered by lord Somerville, in his System of the Board of Agriculture, that oxen, "whether worked in harness, or in the yoke and bow, as in England, by the joint power of the yoke and horn, as in Portugal, or by the head, as in France, they cannot fail to benefit their employer. As, however, the yoke and bow have prevailed for a con- siderable length of time, it is probable that the practice may still prevail, in which case the Portuguese mode of draught will apply with the utmost ease and success to our yoke and bow, fo as gradually and imperceptibly to cheat the ox into its use. This in itself is an obvious advantage, because it gives two points of draught instead of one, and thereby relieving each admits of a lighter yoke, which in this country has ever been far too heavy and oppressive; and if hereafter the French method should be preferred, for which there are not wanting advocates, it is the belt preparatory step to its introduction. It would be almost superfluous to remark that the strong points of an ox are in his head and neck. It is ordained by nature, that where the strength of an animal lies, there he will resort for defence; the horse to his heels, the man to his arms, and the ox to his head; and in cafes of the greatest exertion, the beast ever puts his nose close to the ground."

In objection to the harnessing of oxen, it has been obsered in the paper noticed above, that "the article of gear is an oppressive annual charge, from the pernicious nature of the commodity employed." The tackle there recommended for twelve oxen would not amount to fix-and-thirty shillings, whereas the leathern harness for the fame number of animals, according to the new method, would cost fix-and-thirty pounds, and the annual expense of repairs would exceed thrice the original cost of the former."

And that "by the French mode of yoking, at least one-third more of the power of the animal is obtained. In the common way, the shouder being bruised by the unyielding bow, no vigour is exerted, excepting what is imparted by the goad; and the fineews of the neck are not brought into employment: hence the sublime and gigantic force with which he is endowed is not rendered subservient in the important duties he has to perform for the supply of human subsistence. The cattle proceed in the French team bold and erect: no pain opprefis them, and they chew the cud cheerfully as they pace along the furrow. On the contrary, in this country the painful prefecture obstructs the progress of the animals, they lean against each other, fearcely capable of supporting their own weight, and the fine intelligent eye which nature has given them to express the generosity of their temper is clouded with anxiety." That "the trial of this method has at least two recommendations; it may be made at very little expense, and under the fair expectation of succees."

See TEAM.

The methods of yoking cattle in ploughs are also dif- ferent in different places; but the only circumstance worthy of being considered is, whether the cattle should be yoked in pairs, or in a line before each other. It may, therefore, be useful to consider the advantages and disadvantages attending each mode, and to compare them.

The moft common way of yoking cattle in ploughs is in pairs. There are fome disadvantages attending this way that are obvious. In ploughing the furrows betwixt ridges, the land-cattle go upon the ploughed land, and tread it down with their feet: this, especially if the land be wet, poaches and hurts it very much. And there is another disadvantage which is very obvious. When there is but as much of the ridge unploughed as to allow the land-cattle to go upon it with difficulty, they are frequently either going into the opposite furrow, and thereby giving the plough too much land, or, which is worse, they are jolting the furrow-cattle upon the ploughed land.

In order to remove the inconveniences which attend the ploughing with cattle yoked in pairs, some yoke them in a line before each other. It is obvious, that cattle yoked in this manner, going always in the furrow, neither tread upon the ploughed land nor jolte one another. In these repects, the yoking the cattle in a line before each other seems to have the advantage. It is to be observed, however, that this method is not quite free from inconveniences. When examined, it may, perhaps, be found attended with as great inconvenience as the other. Where cattle are yoked in a line, they go all in the furrow. This makes it necefly to give the plough more land than ordinary, either by the fock or the muzzle; for if this be not done, the head and fock being in the fame direction with the beam, and the cattle yoked to the middle of it, the plough will direcly follow the cattle without taking any thing off from the land. Now it is inconvenient to be obliged to give the plough land either by the fock or muzzle; for when the fock is turned out of the plane of the beam, it makes the plough heavy to draw; and when the muzzle puts the draught too much to one side of the beam, it prevents the plough from going upright. The yoking of the cattle in pairs is attended with none of these inconveniences; for in this case, the quantity of land which the plough has naturally, when right made, is sufficient to make it take off a proper furrow.

There is another inconvenience that attends yoking cattle in a line, arising from the nature of the animals, which is, that as they like their cafe, they are disposed to throw the burden upon their fellows. This they have a better opportunity of doing when yoked in a line before each other than when yoked in pairs. When yoked in a line,
line, each pull by the traces of the one behind him; and therefore, though it may be known when the foremost neglects his work, by the slackening of his traces, it cannot be known when any of the rest neglect their work; for though one of them does this, yet by the pulling of the one before him his traces may be fully stretched. But this is easily discovered when the cattle are yoked in pairs; for then every one of them has a separate draught.

There is still another inconvenience that attends the common way of yoking cattle in a line before each other. When the fore cattle are all yoked to the traces of the hindmoist, it is obvious, that as the beam to which the draught is fixed is much lower than his shoulders, by which the rest pull, such a weight must be laid upon his back or shoulder, as must render him incapable of giving any assistance. Besides, as the whole force is applied in the direction of the traces of the hindmoist, it cannot have such influence on the plough, as when a part of it is in a direction more horizontal. When a body is to be moved forward in any direction, the nearer that the direction of the force applied approaches to the direction of the body, it acts with greater influence; and, therefore, as the plough moves horizontally, and as the direction of the united draught of a plough with the cattle yoked two abreast is more horizontal than the direction of the draught in a plough with cattle yoked in a line, the force applied will have greater influence.

When these two different ways of yoking cattle in ploughs are thus considered and compared together, it is difficult to determine which ought to be preferred. Each of the two seems preferable to the other in a certain situation. When the land is stiff, and the labour severe, the yoking the cattle in pairs seems preferable, as it is certainly the strongest draught; and when the land is wet, and in danger of being much hurt by the treading of the cattle, the yoking them in a line before each other seems preferable; as thereby they are confined to the bottom of the furrow, which is the firmer part of the land, and prevented from doing harm.

In wet lands and seafolds, as long teams answer best, for the moat part, collars and trace-chains become of considerable utility in most cafes in yoking of cattle; and in whichever way neat cattle are geared for work, they should constantly have bridles or bit-halters, with blinders, as by such means they are rendered docile, tractable, and easy to manage in the bufnife of team labour. Much information on this subject may be seen in the Corrected Report on Agriculture for the County of Suffolk.

YOKULS, in Geography, the highest mountains in Iceland, perpetually clothed with snow. Of these, Snoefal, hanging over the sea on the S.W. part of the island, is said to be the highest, its height being computed at 6860 feet. The mountains are said to be chiefly sandstone, pudding-stone, with porosilix, flextite, and argillaceous schistus.

YOLK, or YEIK, in Natural History, the yellow part in the middle of an egg. See Egg.

The chicken is formed out of and nourished by the white alone, till it be grown to some bulk: after which the yolk serves it for nourishment; which it likewise does, in part, after it is hatched. For a good part of the yolk remains after exclusion; being received into the chicken's belly: and being there revered, as in a flore-houte, is by the ductus intestinius, as by a funnel, conveyed into the guts, and serves instead of milk. Willughby's Ornithol. lib. i. cap. 3.

This was even known to Pliny:—"Ipsum animal ex albo liquore ovi corporatur: cibus ejus in luteo eft." Lib. x. cap. 53.

Yolk, in Rural Economy, the peculiar munificent secretion which exudes through the skins of sheep, and which by intermingling with the pile of the wool renders it soft, pliable, and in proper condition. It has somewhat the same effect on it which oil has upon a thong of leather, when kept in and perfectly faturated with it. The disposition to the production of this subtile in sheep is favourable to the valuable properties of the wool, and should be attended to by the shepherds in fixing and regulating his flock. It is noticed by a late writer on Agricultural Chemistry, that wool often washed in calcareous water becomes rough and more brittle than usual, as the carbonate of lime has the power of diffusing or decomposing the yolk of it, which is an animal sap that naturally defends it; that the finest wool, such as that of the Spanish and Saxen sheep, is most abundant in yolk; that M. Vanquelin has analysed several different species of yolk, and has found the principal part of all of them a sap, with a basis of potassa, that is, a compound of oily matter and potassa, with a little oily subtile in excess; and that he has likewise found in them a notable quantity of acetate of potassa, and minute quantities of carbonate of potassa and murate of potassa, and a peculiar odorous animal matter.

The fame chemical writer has stated, that he found some specimens of wool lofe as much as forty-five per cent. in being deprived of their yolk; and that the smallest los in his trials was thirty-five per cent.

It is suggetted above, that the yolk is the most useful to the wool on the back of the sheep in cold and wet seafolds; and that probably the application of a little sap of potassa, with excess of grease, to the sheep brought from warmer climates in our winter, that is, increasing their yolk artificially, might be useful in oases where the fineness of the wool is of great importance. A mixture of this sort is more conformable to nature, it is thought, than that ingeniously adopted by the late Mr. Bakewell; but that at the time his labours began, the chemical nature of the yolk of wool was not known. See Wool, Washing Sheep.

Yolk of the Seed, Vitellus, in Botany and Vegetable Physiology, a part first described by Gærtner, and thus named by him, from its supposed analogy with the yolk of an egg. This analogy, and even the existence of the part in question, have been disputed, as Mr. Brown hints, in Prodr. Nov. Holl. v. 1. 306, by M. Correa de Serra, and by the writer of the present article. We have never at any time communicated on this subject with our learned and sagacious friend, now the Portuguese minister at New York; to that we are ignorant how far his objections extend, or on what they are founded. Nor does Mr. Brown know more of this matter, than a simple record of M. Correa's opinion, in De Candolle's Flore Francaise, v. 1. 157. This coincidence, however, from such a quarter, gives us great confidence in our own opinion, which was first offered to the public in Introd. to Botany, chap. 19, published in 1807. On a more attentive and full consideration of the question, the same sentiments were more explicitly detailed and defended in a paper read before the Linnean Soc. Nov. 3. 1807, and printed in that Society's Transactions, v. 9. 204.

Gærtner states the Vitellus, or Yolk of the Seed, to be "difficult from the Coatledons, as well as from the Albumen, and for the most part situated between the latter and the Embryo." (See Seed, where a reference is made to Vitellus, under which head the subtiltude of the present article..."
was designed to have been infected.) Gærtner considers
the part of which we are about to treat, as "of all the in-
ternal parts of a feed the most singular, and by far the most
unfrequent." Its importance therefore cannot be very
considerable. The principal diagnostics of the Vitellus,
according to this eminent carpologist, are the following:
1st, "It is most closely connected with the Embryo, so as
to be inseparable therefrom, without injury to its own
substance. 2dly, Notwithstanding this intimate connection,
never rises out of the integuments of the feed, as the
Cotyledons usually do, in germination, so as to become a
fecial leaf; but, rather like the Albumen, its whole sub-
stance is destroyed by the feeding plant, and converted
into its nourishment. And 3dly, If the Albumen be likewise
present, the Vitellus is always situated between that and the
Embryo, in such a manner, however, that it may be separated
from the Albumen with great ease, and without injury." For
these reasons, Gærtner considers the organ in question
as "allied on the one hand to the Albumen, on the other to
the Cotyledons," but truly distinct in nature from both.

We premise to divert from this decision of the great
writer, whose words have just been quoted, for the follow-
ing reasons: 1st, The Vitellus is certainly not more closely
connected with the Embryo than the greater number of
Cotyledons are, as any person may find by examining feeds
in the first stage of their germination, and as the faithful
delineations of Gærtner himself everywhere shew. 2dly,
That the Vitellus never rises out of the ground, is a circum-
stance likewise common to many Cotyledons, allowed by
Gærtner to be "such, as in various leguminous plants, as
well in Aesculus, Cyanus, Trapa polum, and many others.
The difference between Cotyledons which grow up into
feminal leaves, and those which remain and decay under
ground, is of so little importance as to the classification
of plants, that the most natural order of Papilionaceæ, or Legu-
minosæ, contains decided instances of both; Lupinus and
Vicia affording examples of the former mode of growth, La-
thyrus of the latter. And 3dly, The situation of the Vitellus,
between the Albumen, if the latter be present as a separate
organ, and the Embryo, is only a necessary consequence of
the more intimate connection between the Vitellus and the
Embryo, than either of them has with any other part, ex-
cept that of the Cotyledons and Embryo, which is as strict as
it can possibly be. Hence we cannot consider the Vitellus of
Gærtner to differ from the subterraneous Cotyledons above
mentioned. We" premise their offices must be exactly
similar, to perform the necessary functions relative to air or
oxygen, till the leaves come forth, and assume those func-
tions in greater perfection, with the co-operation of light.
This appears to us more satisfactory than the hypothesis of
Gærtner, that the organ of which we are treating affords
nourishment to the Embryo; because this is abundantly
supplied by the copious Albumen of a multitude of feeds,
while Vitellus is very inconsiderable, such as grasses; and
it is recurring to two canes to explain what is evidently ac-
counted for by one alone. If the vegetation of corn be
observed, the Vitellus will be found to dwindle away, with
fearcely any change in its very inconsiderable bulk, when
the first leaves are unfolded, exactly as happens to the sub-
terraneous Cotyledons of Lathyris odoratus, &c. The same
thing very often takes place as speedily in Cotyledons which
rise out of the ground. Some which are more permanent,
as in cruciferae and umbelliferous plants, being only more
of the nature of leaves. In grasses, the calæ taken by
Gærtner for a Vitellus is most slippery and uninfusíngual,
as not possibly to contain any material portion of nourish-
ment; ample supplies of which are furnished by the plen-

YOLK.

The Albumen of those plants. But its expanded figure
is very well calculated, like that of the leaves, for functions
analogous to vegetable respiration; and it has the evident
aspect of a subterraneous leaf, quickly rendered superfluous
by the production of real leaves, and withering away, as
the first of those leaves themselves do, when more vigorous
ones come forth. It is remarkable, that the pretended Vi-
tellus appears not to be necessary to all plants furnished
with this distinct kind of Albumen, as Palms and Orchideæ
have it not; while, on the other hand, no instance presents
itself of a supposed Vitellus, and a real Cotyledon, or Cotyle-
dons, in the same plant. Gærtner takes the Plumula for
Cotyledons in Rbizophora (see his t. 45.), as well as in some
of the Scitamineæ; for we cannot conceive the tubular
part, embracing the Embryo, in Amomum, (see Gært. t. 12,
which he erroneously calls Zingiber,) to be any thing but a
Cotyledon, notwithstanding the opinion of our learned friend Mr. Brown, who, like Gærtner, terms it a Vitellus.
The name would be of little importance, if the supposed
use of it did not convey, as we presume to think, an erro-
neous idea; in attributing to these seeds two distinct and
separate sources of nourishment. That such distinct parts exist in this natural order, and perhaps, as Mr. Brown
observes, in Nympheæ and Nuphar likewise, we are ready to
admit; and we are therefore more satisfied to attribute to
each a separate and appropriate office. We have had no
opportunity of observing the germination of Amomum, or
any true feminates plant; but as far as we have been
able to judge, it appears that the Albumen of every feed,
when separate from the other parts, is always totally ab-
sorbed, or removed, leaving its skin empty; whereas a
Cotyledon withers and shrinks in its whole substance, like a
decaying leaf. If the albuminous matter, necessary for the
temporary nourishment of perhaps every feed, in one form
or other, be lodged in the substance of the Cotyledons, as
in Zania, the leguminous and curcurbitaceous tribes, and
many others, such parts shrink the more, but do not lose
any particular portion of their substance, so as to have
only a skin left behind. Perhaps a confusion of ideas has
arisen, from the first consideration of this subject, in con-
sequence of the term monocotyledonous as contrasted with
dicotyledonous. The first had an evident reference to the
Albumen, in corn, palms, &c.; and when Gærtner had emancipated himself from this error, he seems to have trans-
furred the idea to the Embryo, which he calls monocoty-
ledonous, as if he meant by that word to express its own simple
form. Prepossessed with this idea, when a separate organ
manifested itself, as in the Scitamineæ, he thought a new
appellation requisite. Mr. Brown objects to the term Coty-
ledon in this cafe, because he says there is no point of union
between the part in question and the Embryo. If such be
the case, which we cannot understand, it would be not at all
less difficult to conceive how this part could, as a Vitellus,
supply the Embryo with nourishment, than it would be to
imagine how it could perform any services towards that
organ with respect to air, in its capacity of a Cotyledon.

It seems to us, that by considering the Vitellus of Gærtner
as a Cotyledon, all ambiguity respecting the anatomy or
component parts of any feed is removed. When the Cotyl-
edons are two or more, the albuminous matter is either
lodged in their substance, or forms a separate part. In the
latter case, it has no more connection with the Embryo than
is absolutely necessary, being in fact not an organic part, but
merely a reservoir of food or nourishment, immediately under-
going a chemical change, after which its whole substance is
speedily absorbed. Such is the economy of corn and
palms; even the large Albumen of the cocoa-nut soon dis-
Vol. XXXIX.
appearing, for the evolution and sustenance of the little Embryo, lodged in a cavity of its bale; while the Cotyledon of the not very dainty genus Zania shrinks indeed considerably, from losing the albuminous part of its substance, but does not disappear; because the remaining part defined to perform the essential office of a Cotyledon, respecting air, merely decays when its purpose is answered, and sloughs off, like any other dead portion of the vegetable body.

We have already (see Germination) adverted to these two different situations of the albuminous matter. That substance must be present, in some shape or other, for the nourishment of the young Embryo, at the first period of its evolution, when so great an alteration of bulk takes place, till it can supply itself from the earth. The idea of this nutritious substance, whether of an oily, mucilaginous, or farinaceous nature, being always, when not a distinct body, lodged in the Cotyledons, throws additional light on the nature and physiology of these last-mentioned parts, and in a very beautiful manner confirms their analogy with leaves. The sap of plants (see Circulation of the Sap) being carried into the leaves, and there acted upon by air, light, heat, and moisture, is returned in the form of various secretions, into the different parts of the vegetable body. Under the influence of light, the upper surface of their leaves absorbs carbonic acid gas, and the under gives out pure oxygen. But in the dark, leaves absorb oxygen. So the Cotyledons of seeds, in their dark subterraneous situation, being moreover often guarded expressly from light by a brown or even black skin, absorb oxygen, which, as we have said in the article above cited, is known to be necessary to germination. They are already flored with albuminous matter, abounding with the carbonic principle. This, by the action of oxygen, becomes saccharine and milky, fit to be transmitted, through the returning vesseis, which the Cotyledons, in common with leaves, poulpe, into the stem of the Embryo; all these important parts having already begun to swell, from the absorption of moisture, and the tumultuous effects of heat. Hence we see why light proves harmful to incipient germination, and why carbonic acid gas may be given out by seeds during that process. It is evident that the proper functions of the Cotyledons are best performed under ground, and that when they rise into the air and light, it is not till after their primary definition is fulfilled, and then only because, being fundamentally of the nature of leaves, they are more capable of affording a series of those organs, with respect to light. Cotyledons of seeds are subterraneous leaves, just like the scales of a bulbous root. Both are flored with albuminous or nutritious matter, and when acted upon by oxygen perform under ground those functions, which leaves perform in the open air, with the assistance of light. It is worthy of notice that the Cotyledons are so placed, in all seeds, that the oxygen gas must be imbied by their under surface only, that very same part which, in leaves, gives out this kind of gas during the day, and probably absorbs it at night. "It would," as we have elsewhere observed, Tr. of Linn. Soc. v. 9. 213, "have evinced a strange contrariety in the constitutions of two organs otherwise so analogous, the Leaves and Cotyledons, if the upper surface of the latter, while in the unexpanded seed, had been preferred to receive the oxygen gas."

By taking the Vitellus of Gartner for a Cotyledon, we throw no new difficulties in the way of the classification of plants by this organ. Its form is always, as far as we know, simple and indivisive, so that the plants in which it occurs remain only the more steadily fixed in their place of Monocotyledons, as opposed to the Dicotyledons; witness Gramina, Sittainima, &c. thus indeed acquiring a right to such an appellation, which they could otherwise scarcely claim, having, according to Gartner's principle, no Cotyledon at all.

YOLOTOU, or YULUZ, or Cyalis, or Chialis, in Geography, called by the Turks Kerathir, or the Black City, a town of Little Bucharia, situated in a country abounding with springs and fine meadows; 85 miles N. N. W. of Hami.

YOM-NIM-KIEN HOTUN, a town of Chinae Tartary, on the E. coast of the gulf of Leao-tong; 263 miles E. of Peking. N. lat. 40°. E. long. 121° 34'.

YOM-TA-HOTUN, a town of Corea; 648 miles E. N. E. of Peking. N. lat. 42° 55'. E. long. 129° 37'.

YON, a river of France, in the department of the Vendée, which falls by La Roche fur Yon.

YONGHELAHE, a river of the island of Madagascar, which runs into the sea on the west side of the island, S. lat. 23° 20'. E. long. 42° 4'.

YONG-LI, a town of Corea; 30 miles S. E. of Koang-tehou.

YONG-NGAO, a small island near the coast of China, in Quang-tong; 20 miles S. S. E. of Macao.

YONG-NING, a city of China, of the first rank, in Yun-nan, on the borders of Thibet. A little to the E. of this town is a lake; 1095 miles S. W. of Peking. N. lat. 27° 50'. E. long. 106° 24'.—Also, a city of China, of the second rank, in Quang-fi; 977 miles S. S. W. of Peking. N. lat. 23° 36'. E. long. 104° 14'.

YONG-NING, or Yung-ning, a city of China, of the second rank, in Koei-tehou; 1027 miles S. S. W. of Peking. N. lat. 25° 55'. E. long. 104° 57'.

YONG-PE, a city of China, of the first rank, in Yun-nan; 1150 miles S. W. of Peking. N. lat. 26° 42'. E. long. 100° 34'.

YONG-PING, a city of China, of the first rank, in Pe-tche-li, on a river which runs into the gulf of Leao-tong. This city is advantageously situated, but its jurisdiction is not very extensive; it contains but one city of the second order, and five of the third. It is environed by the sea, by rivers, and by mountains, covered for the most part with forests; this makes the country less fertile, but the neighbouring bay favours its want with great plenty of all the necessaries of life. Not far from this city stands a fort named Chun-bai, which is the key of the province of Leao-tong. This fort is near the beginning of the great wall, which is built, for a league together, in a hilly marsh, from the bulwark in the sea; 115 miles E. of Peking. N. lat. 35° 55'. E. long. 118° 34'.

YONG-SIN, a town of Corea; 113 miles E. of Han-tehou.

YONG-TCHANG, or Yung-tchang, a city of China, of the first rank, in Yun-nan. This city is large and populous, and is built in the midst of high mountains, on the borders of the province, in the neighbourhood of a savage people, whose genius and manners the inhabitants of this country partake of. The country produces gold, honey, wax, amber, and a vast quantity of fine silk. It has within its districts one town of the second order, and two of the third; 270 miles S. W. of Peking. N. lat. 25° 6'. E. long. 99°.

YONG-TCHEOU, a city of China, of the first rank, in Hon-quang; 882 miles S. S. W. of Peking. N. lat. 26° 10'. E. long. 111° 15'.
YONG-TONG, a town of Corea; 40 miles E. of Het-fin.

YONI, in Metaphysics, the name of a mysterious symbol among the Hindoos; which, although contemplated with respect and awe by that superstitious race, is yet of such a nature as not to be divulged without difficulty in the living language of a country which has happily shaken off the trammels of priestcraft; and views with pity, mixed with just abhorrence, the idolatrous propensities of those still retained in mental bondage; accompanied, as we find they were, among many ancient peoples, by the indecencies of impure rites, scarcely yet diffused, even in Europe, and existing in almost undiminished grossness in the still unenlightened regions of Asia.

The reader is supposed to be more or less aware of the nature of the orgia incident to the worship of such deities as Pan, Priapus, Bacchus, Venus, &c. We do not here inquire particularly into the origin of such rites. In their earlier stages, they were probably an innocent ebullition of gratitude for the experienced bounties of nature. In the lapse of time, a concourse of people of both sexes, warmed by exercise and beneficent feelings, at a genial season most likely of the year, found, as is ever the case, their unrestrained devotion sublimed into enthusiasm; and hurried by such feelings beyond the scope of unaffiffed reason, gave themselves up to the extravagances of mysticism, and in the end to excesses which not only Christians, but the decent of every sect and country must unite in reproving. These Bacchic phrenzies were accordingly suppressed or mitigated as to their offenfive usages and tangible abominations. Nature, in the pharaeology of certain sects, was no longer propitiated through the indulgence of feelings of her own prompting, excited farther by the presence of unequivocal exhibitions. She, still perfomined, was more decently represented by certain symbols substituted for the earlier types. The cunning priest no longer daring to exhibit their obscenities in shameless nudity, permitted only a portion of indecency to remain in the hands and eyes of their deluded votaries, and concealed their origin and meaning in the various mysteries and hieroglyphics designated Bacchic, Eleusinian, Phallas, Linga, Yoni, Cone, &c. &c. Some notice of these things, and of the ordinary course and consequences, will be found under the appropriate articles of our work; also in Mystery, Mystics, and others whence referred to.

By such people Nature was contemplated chiefly under her attribute or property of fecundity; and symbols of generative allusion were those under which her prolific potencies were exhibited. These prone, like the Hindoos, to resolve all things into sexual allegory, of course fancied the male and female pudenda omni-archetypal. These, in the early days of such perverted devotion, were probably portrayed in India, as elsewhere, without reserve; but were, in most cafes, soon corrected into the comparative decency of the hieroglyphics; and the deluded people were cajoled by mummery and mystery, that became less and less understood, and therefore, perhaps, the more reverence. We have said in most cafes; for in Egypt and Greece the grotesqueness of Phallism is known only in the remains of antiquity; in India it doubtless exists, but divested of obtrusive or conspicuous indecency; and too true it is that among Christians was the primal infamy of the symbol and usage most tenaciously retained. We can but just allude to the discovery of this curious though lamentable fact, by Sir William Hamilton, in the neighbourhood of Naples. His communication, with ample commentary and illustration, has been printed, but very properly not published; concealed, though not supressed; and we therefore make no direct reference to the sufficiently instructive, though too disgraceful volume, in which this disgusting worship is proved to exist in Christian Europe, and is traced almost all the world over.

Among the Egyptians, Greeks, and Romans, the Phallus and the Cone seem to have been the earliest of the grocer and corrected emblems; the latter contained both the Linga and Yoni, nature active and passive; and familiar, or recondite meanings and allusions were thus readily revived in the minds of the vulgar and the initiated, suitable to the eteric or isoteric nature of their capacities and feelings. These foolishers, to give them no harsher name, thus found to have existed among the people just mentioned, and others, have, with great appearance of reason, been supposituously derived from the still more ancient usages of India. Much might be said in support of this, were it worth while; and thus far the inquiry will probably be repaid, that it may bring to light many strange coincidences. If such writers as Colebrooke, Wilford, Faber, and others, who bend their minds to the development and elucidation of Eastern literature and mysteries, continue for a while in the same line of research, we anticipate a confirmation of the surmises long entertained, that nearly all the learning, science, and art, as well as the religion of Egypt and Greece, originated in India, or at least with the Bramhans; however much they may have been improved or embellished by the hands through which they reached us.

India then, or the country of the Bramhans, wherever that was, being in our judgment the region where the superstitious practices now under our consideration originated, we may expect to find its early history teeming with allusions to it. This is indeed the case; though such allusions are not, perhaps, found in its earliest works on theology. But as no people have changed so little as the Bramhans and their flock by the innovations of strangers, or the lapse of time, (for frequent subjugations by conquests seem to affect them but little, and perfections serve only to confirm their prejudices,) we may expect to find their religious institutions and practices more in accordance with those of their early days than the usages of other people who have not disdained to become wiser by the operation of reason and philosophy; and who have been taught to look on the follies of their ancestors with the pity they deserve. In India, we thus find certain hieroglyphics still receiving the external adoration so little their due. There we find the infidious Brahman still teaching his ignorant supplicant to fall down and worship the Linga and Yoni; symbols, in whatever shape exhibited to the public eye, no doubt fitter for the brothel than the temple. The former of these is the attribute of Siva, the Maha-deva, or great divinity presiding over reproduction, or regeneration in the abstract; and the other of his confort Devi, or Parvati, the Magna-Mater, the Bona Dea of the East.

In preceding articles, we have necessarily touched on the character and attributes of the two just mentioned grand divinities of the Hindoos; and refer our readers to Parvati and Siva for our remarks thereon, and to Linga for a brief notice of the Phallic worship of India. In this article, we propose to discuss that still offered to the Juno, the Venus, the Isis, the many-named all-absorbing goddess of the Hindoos, whose emblem is the Yoni.

Writers on this subject generally, perhaps unavoidably, commix their speculations on the Linga and Yoni. Crude nature
YONI.

nature is personified, and called Prakriti; she is declared to be nature, or the earth, the womb of nature; she is thence any thing conceiving or containing, or the power or fakti of such faculties. In its first state that power was rather a tendency, an aptitude, and laid dormant until excited by the bija, or vivifying principle, the aura of nature personified in Siva, who in this character is called Parvathi, or the primeval male. Here we find nature passive and active: the power or aptitude of nature is symbolized by the Yoni; the vivifying principle by the Linga. Prakriti is found to be one of the names and forms of Par- vathi, as Parvathi is of Siva. Under these names we have seen some notice of their character; but it is not easy, in the short articles to which, in these matters, we must refer, ourselves, to explain fully, were we able, the nature and allusions of these abstract personifications.

The faculty or power of containing, of which the Yoni is the type, is also called Argha by Hindu mystics. The name is given to a cup or dish, or vessel, in which fruits and flowers are offered in oblation. These vessels, they say, ought always to be boat-shaped; and so they frequently are, but sometimes round, oval, or square; mostly, however, circular. All this is mysterious and profound. The rim of the Argha is more especially the Yoni, while the contents of the vessel represent the Linga, which is sometimes more unequivocally figured by an image of Siva standing erect in the centre of the Argha. Hence one of his names is Arghanatha, or lord of the boat-shaped vessel. We may stop a moment here to remark how readily Bryant, Faber, and the race of Noetics, would have recognized the ark, in the arga or arka, or ark, as it may without much licence be written, of the Hindoos. We do not hesitate to hint our belief that many of the fables connected with Calchas, Juno, Io, Ionia, Jonah, &c. are traceable upwards to Hindu words: many also connected with the names of places or persons, beginning with Col or Kal, or containing its root, that are scattered in unmeaning profusion throughout the geography and early biography of Europe. But this is not the place to enlarge on this subject.

The Argha, as a type of the power of conception, excited and vivified by the Linga or Phallus, Mr. Wilford (Af. Ref. vol. iii.) supposes to be one and the same with the ship Argo, which, according to Orpheus (Argon. v. lxvi.), was built by Juno and Pallas, or, according to Apollo, (b. ii.), by Pallas and Arga, at the instance of Juno. The word Yoni, as it is usually pronounced, nearly resembles the name of the principal Etruscan goddes; and the Sanskrit pharse Arghanatha Isvara seems accurately rendered by Plutarch (on Isis and Ophis), when he affirms that Ophis was command-er of the Argo. That the Sanskrit words p'aka, meaning fruit, and p'bullet, a flower, had ever the sense of phallus, is not affirmed; but as these are the chief oblivions in the Argha, and are confessed to be a representation of the Linga, their founds may easily have been transferred. We have seen, too, that Mahadeva himself, the prototype of the Linga, is sometimes placed erect in the Argha: this is to complete a mythical trinomin of powers; for Vifhnu, the principle of humidity and of conservation, is symbolized by a convexity or embolon in the centre of the Argha, over which the image of Mahadeva, or the p'aka and p'phulla, as representing the Linga or Phallus, are placed. The idea that the Sanskrit p'pha or p'phulla may in feme as well as found be cognate with and the source of the Greek phal- lus, derives strength from the fact that Mahadeva, in his character corresponding with that of Jupiter, or Neptune, bears, like his Roman kinman, a trident, called Triflula, and sometimes Triphala, denoting trification and triflorence. Jupiter Triphylus is thus identified with the three-eyed Siva, who in this form is named Trilokin and Triflula.

That the Sanskrit language is very widely spread, and is traceable in various dialects, we have the authority of Mr. Colebrooke for believing. In the names of places, we are inclined to think its extension is proved as much as in any point: and we do not deem the idea very extravagant (fays our correspondent) that derives the name of Trafalgar, the scene of the last grand triumph of the British Neptune, from the mythological language of our fellow-subjects of India.

To return to the Yoni or Argha, we have seen that the vessel under the latter denomination is boat-shaped, and a type of the world. In the general Deluge, the generative powers of nature, male and female, reduced to their simplest elements, the Linga and Yoni, assumed this shape for the preservation of mankind. Brahma, the creative power, is represented to have been asleep at the bottom of the abyss. This alludes, we fuppofe, to the destruction of mankind; man being represented in the abtracif by Brahma. The Yoni becoming boat-shaped, the Linga was the mast, and protected by Vifhnu rode upon the waters. This, though sufficiently gros, is doubtles an arkte allegory. Every thing hollow or concave having the property of containing, remind mystics of their type the Argha or Yoni, as aspir- ing objects do of the Linga. Enthusiasts fee thefe two principles; that is, they fay, nature passive and active, dormant and redivivified, every where and in every thing,—the earth, the sea, a boat, a well, a pond, the hollow of the hand, clefts in rocks, excavations, caves, commiffures of branches, &c. partake of relationship with the one,—mountains, especially if inflated and conical, pyramids, cones of any fort, fire, a mast, a tree, especially if denuded of branches, obelisks, &c.—all these connect themselves with ideas of Mahadeva and the Linga. The earth is tipified by a boat; the Argha of the Hindoos, and the Cibium of the Egyptians. Ophis is represented in a boat carried by men: in India, Mahadeva erect in the Argha refers to the same allegory. All over India, the Argha, and Linga of stone inferted in it, is found an object of worship. It is fmeared with flowers, and water is poured on the Linga, and conveyed off by the rim or Yoni; the yofa navicularis or mystical boat of Ifes.

Caves we have noticed as types of the Yoni, from their property of hollownefs or containing, and also from the shape of their mouth. It will be recollected, that the most ancient oracle and place of worship at Delphos was that of the earth in a cave, which was called Delphi; an obsolete Greek word, synonymous, according to Mr. Wilford (Af. Ref. vol. vi.), with Yoni in Sanskrit. Similar superitions have prevailed farther westward. Perforations and clefts in bones and rocks were called Cumi Diaboli by early Chris- tians, who usually believed the appellation of devils on the deities of the heathens. One of the wonders of the peak in Derbyshire retains an appellation still coarser: but Mr. Wilford thinks improperly; for this wonderful cave, or one he fays very like it, particularly noticed in the Puranas, is declared to be the sacred Yoni. The cleft called Gulya- thi, in Nepal, answers fully and literally to the curious appellation of its relative in Derbyshire, (Guhya, or Podex,) and is devoutly worshipped by numerous pilgrims from all parts of India. Perforated rocks or bones, as well as the mouths of caves, are mystically contemplated in India. A regeneration is effected by pelfing through them; or, if the hole be too small, a hand or a foot thrust through, with a sufficient faith, will nearly answer the fame purpoze.
It is difficult to discuss such subjects as these, without feeling a certain degree of contempt, pity, and wonder, at the foolishness of creatures called rational. But when we recollect that many millions, hundreds of millions probably, of our fellow mortals are, or have been, thus misled, and have been similarly misled in all parts of the world, the origin and spread of such fables become a subject not unworthy the inquiry of the philosopher: as connected probably with the history of fabulous events in sacred history, it claims also the attention of the theologian; and the total diversity of all such irrational superstition among ourselves is a matter of gratulation to us as reformed Christians. We are dispofed, however, to view it in all cases as an invention and engine of priesthood, and not much more to be charged on the religion of the Hindus and others, than the mummeries practiced at Loretto, Naples, and elsewhere, are justly chargeable on Christianity.

Connected with the symbols and rites of the Yoni, we had prepared to offer some remarks shewing the spread of similar superfluities almost all over Europe, as well as in other regions. And, indeed, although their origin and allusion are now wholly forgotten, curious observers may discern in still existing usages occasional relics of this species of devotion even in England. It is inexpedient, however, to indulge in this extended view.

Adoration of stones is found similarly spread through the superfluous ages of all nations. The Hindoos retain it with undiminished bigotry; and will affirm, and indeed go nigh to prove, that such objects, from the sacred monolithic subject of the Kaaba at Mecca, or the obelisks of Egypt, to the trilithic temple at Stonehenge, with many intermediate, are no other than their Linga, under various forms and denominations. The Battista of antiquity are nearly related to it. Under Baetilos, Croniche, Kissvaen, Stonehenge, and other articles of this work thence referred to, the reader may, if disposed, see the extent of speculation to which the superflition connected with Lithism, if such a term may be allowed, has given rise.

Clefts in rocks, rent by the hand of nature, may therefore be supposed to be profoundly venerated by such enthusiasts as are Hindoo mystics. One of the most celebrated in India, as far as we have heard, is at the promontory on the island of Bombay, called by the English Malabar point. The promontory itself, thrusting its apex into the sea, which there forms a fandya, or junction, (see Junctions,) is Lingat. It used to be much referred to, and its sin-expelling potency much relied on, before its purity and privacy were polluted and interrupted by the presence of strangers, and the increasing population of the island. The unequal density of its present population, and the extending prevalence of foreign manners, have heaved the sanctity of this spot, now the constant resort and abode of persons who look on the local superfluities with an eye too rational or curious—or severe—shall we say?—to encourage their continuance. Like the Lithic Linga temple of its neighbouring island of Elephanta, as the English call it, the Yoni of Malabar point will soon cease to be referred to. Its fine temple is levelled to the rock whence it arose, and some of its spoils adorn the Museum at the India House. The neighbourhood of Bombay was in former times a grand assembly of Hindoo temples. The great beauty and fulness of the situation, the forms of the hills and islands, and other real and fanciful advantages, combined to give it high charms to the tasteful and cunning Brahman. An island rising conically is, we have seen, itself a Linga, its shores a Yoni, the ocean an Argha. The de-moralizing effect of this perverted philosophy on the mind of the simple Hindoo might be exemplified by a citation from our great dramatic poet, slightly altered:

—And this their life, exempt from public haunt,
    Found Lingas in stones, Arghas in running brooks,
    Yonis in rocks, and gods in everything.

Passing through such clefts as we have just noticed with a peculiar or expiatory view is, or rather has been, of extensive prevalence. We could shew it to have existed in many parts of Europe. Relics of it still exist in England. And indeed such is the recent rage of theological innovation, and the amazing increase of credulity, that a zealous sectarian need not diphair of feeling the same, or usages equally ridiculous, revived among us. But it would not suit the crafty Brahmans to allow rich delinquents to empty an expiation as the passage through a cleft or Yoni of rock. In certain cases of defilement, it is required that an image of pure gold be made of the female power of nature, either in the form of a woman or of a cow: in this statue, the person to be regenerated is enclosed, and is protruded through the usual channel. As this evidently must be enormously expensive, it is of course rarely referred to. An instance is given in the Hindoo Pantheon, p. 398, of a recent case where a Yoni of gold was the medium of regeneration to two Brahmans, who had suffered pollution by coming to England. The defilement of a natural birth is done away by the protraction of the person or head through a facred thread called Zennar. (See that article.) This regeneration is essential to Brahmanical purity, and is also required of the two next tribes. The individuals thereafter are denominated twice-born. The fourth tribe is not allowed to be thus purified, and is therefore considered as base and unclean. See Sects of Hindoes.

Enough has been said under this article to shew the mysterious bearing of its title. It is a subject which, connected with the Linga, meets the observer or inquirer directly or allu-tively, though not oftentimes, or very often in an offensive form, at every step he takes in the investigation of Hindoo literature or antiquities. Respectful the non-offensive views of their appearances, we refer to our article Linga; of which indeed this may be considered as a continuation. The subject is inexhaustible, but to us not inviting, though it must have been so to others. It might not be exaggeration, if it appear so, to say, that more speculation exists hereon in the languages of India than would fill a volume equal to our whole Cyclopedia! Reference to earlier articles descriptive of the Yoni and its attributes and allusions enables us to abide this, which is, however, even combined with what is said in those articles, still and necessarily incomplete. See Kamalayoni, Lieswara, Lotos, Meru, Patra, Radha, Saiya, Sami, Sami-devi, and Sects of Hindoes. From the article Sami reference is made to this, and we take this occasion to correct an error in the former: in col. 2, line 24 from bottom, for fiction read friction.

Individuals, chiefly of the sect called Sakti, meaning worshippers of the Sakti, or female energy of Mahadeva, the deity of reproduction, propitiate the gods under the form of the Yoni, the mystical matrix of nature. Of this, see under Sakt and Sakti. Such individuals have the fraternal appallation of Yonja. In what they differ from the Sakti, if they differ at all, we are not informed. These sects may be supposed to comprise but few persons; but this is a point on which information is obtained with difficulty. Respectable individuals, if there be any such belonging to it, are ashamed to avow being Saktas; and from persons of a different fort information is not to be relied on.
Writings, too, on these subjects, are very obscure; their endless Scholia equally so, and can be critically understood by very few Europeans, even with the assistance of a learned native, who, admitted probably of what he is desired to explain, will, with almost laudable delicacy or decept, gloss over the half-revealed obscurities of his brethren.

The common tendency in the nature of the adoration of the Linga and of the Yoni might, one would think, have united their worshippers in a community of object and view. But such are the anomalies and perversities of the human mind, that it appears to be an historical fact, that the Lingajas and Yonijas have actually not only disputed and quarrelled respecting the comparative merits of their respective hieroglyphics, or, in other terms, the paramount potentiality of the archetypo; but that bloody wars have arisen between them on the question, which, as far as now appears, seems really to have been one of physiology: the only influence, probably, in which such a question hath ever operated as a cause of holy war, manifold as those causes unhappily have been. The Yonijas infisted, it seems, on a superior influence in the female over the male nature in the production of a perfect offspring. The consequent disputes and warfare the Hindu writers have, as usual, recited in extravagant allegories, which we should call obscene, but which they consider as awfully facred.

"This diversity of opinion," says Wilford, "seems to have occasioned the general war which is often mentioned in the Puranas (see Purana), and was celebrated by the poets of the West as the basis of the Grecian mythology: I mean that between the gods led by Jupiter, and the giants, or gods of the earth, or, in other words, between the followers of Vishnu (see Iswara) and the Yonijas, or men produced, as they affected, by Prithu, a form of Vishnu (see Prithu and Yonijas); for Nonnus (Dionys. b. xxxiv. v. 241.) expressly declares, that the war in question arose between the partisans of Jupiter and those who acknowledged no other deities than water and earth. According to both Nonnus and the Hindu mythologists, it began in India, whence it was spread over the whole globe, and all mankind appear to have borne a part in it.

"These religious and physiological contests were disguised in Egypt and India under a veil of the wilderde allegories and emblems. On the banks of the Nile, Osiris was born in pieces; and on those of the Ganges, the limbs of his consort Ivi, or Sat, (see Osiris, Isis, 1st, and Sati,) were scattered over the world, giving names to the places where they fell, and where they are still superstitiously worshipped. In Sanskrit books, we find the Grecian story concerning the wanderings of Bacchus; for Iswara, having been mutilated through the imprecation of some offended Munis, (see Muni and Sama-dev,) rambled over the whole earth, bewailing his misfortune; while Iswara also through the world king mournful ditties in a state of distraction. There is a legend in another book, of which the figurative meaning is more obvious. When Sat, after the close of her existence as the daughter of Dakha, sprang again to life in the character of Parvati, or mountain-born, (see Mera and Mena,) she was re-united in marriage to Mahadeva. This divine pair had once a dispute on the comparative influence of sexes in producing animated beings, and each resolved, by mutual agreement, to create apart a new race of men. The race produced by Mahadeva was very numerous, and devoted themselves exclusively to the worship of the male deity; but their intellects were dull, their bodies feeble, and their compositions of different hues. Parvati had at the same time created a multitude of human beings, who adored the female power only. These were well-shaped, with sweet aspects, and fine complexions. A furious contest ensued between these Lingancias and Yonijas: the former fought their ground pretty well at first, but were in the end defeated, and shamefully routed in the battle, through the potency of the sacred Yoni. Mahadeva enraged was about to deliver them by the fire of his eye; but Parvati interposed; and appeased him, made use of the same artifice that Bahu did to put Ceres into good humour, and showed him the prototype of the Lotos. Mahadeva smiled, and relented on condition that the Yonijas should instantly leave the country.

"It is evident that this strange tale was invented to establish the opinion of the Yonijas, or votaries of Parvati or the Yoni, that the good shape, strength, and courage of animals depend on the superior influence of the female parent, whose powers are only excited and put into action by the male aura. But the Lingancias maintain an opposite doctrine. There is also a sect of Hindoos, by far the most numerous of any, who, attempting to reconcile the two systmes, tells us, in their allegorical style, that Parvati and Mahadeva found their concurrence essential to the perfection of their offspring; and that Vishnu, at the request of the goddess, effected a reconciliation between them: hence the name of Vishnu, by which they mean the as tinea, is worshipped as one and the same with the sacred Yoni." Wilford, in At. Ref. vol. iii.

YONIIA, the name of a sect of Hindoos, who worship the hieroglyphic of Parvati, called Yoni; which see.

YONKERS, in Geography, a post-township of the rate of New York, in Westchester county, on the E. bank of the Hudson, above New York island, 20 miles N. of New York, extending near eight miles along the Hudson, and having a medial breadth of near three miles. The surface is broken, but the lands are cultivated and productive. In 1810 the whole population consisted of 965 persons, with 93 electors, and 204 taxable inhabitants.

YONNE, a river of France, which rises about four miles S. from Chateau-Chinon, in the department of the Nyevre, pafles by or near to Monceaux, Clamency, Coulanges, Cravan, Auxerre, Joigny, Villeneuve, Sens, Pont fur Yonne, &c. and joins the Seine at Montoire.

YONNE, one of the nine departments of the central region of France, formerly Yonne, E. of Loiret, in N. lat. 47° 30', about 70 miles long, and from 30 to 40 broad, containing 7740 kilometres, or 372 square leagues, and 333,278 inhabitants; bounded on the N. by the department of the Aube, and on the S.E. by the department of the Cote d'Or, on the S. by that of the Nyevre, on the W. by that of the Loiret, and on the N.W. by that of the Seine and Marne. The river Yonne, from which it receives its name, crocetis from S.E. to N.W. It is formed of the Auxerrois, formerly reckoned a part of Burgundy. Its capital is Auxerre. It is divided into five circles, or districts, 34 cantons, and 484 communes. The circles are, Sens, comprehending 57,285 inhabitants; Joigny, 81,933; Auxerre, 103,882; Tonnerre, 47,394; and Avalon, 42,784. According to Hasselrat, its extent in French leagues is 29 in length, and 25 in breadth: its circles are 7, its cantons 69, and its population consists of 364,969 persons. In the 11th year of the French era, the total of its contributions was 3,093,023 fr.; and its expenses, administration, judiciary, and for public instruction, were 297,935 fr. 66 cents. The soil is various; it has some dry and indifferently fertile tracts, diversified with little hills; the western part is of a clayey soil, covered with woods and pools:

YON
poles: the cantons to the S. and E. are planted with vineyards; and the northern district is tolerably cultivated. The department, in general, is fertile, producing grain in abundance, with wine, fruits, and excellent pastures.

Yool Islands, a cluster of small islands in the Pacific ocean, so called by captain Forrest, in the year 1774. In 1788 they were by Mr. Meers called Tattea islands.

Yoo-Miou, a large town of the Birman empire, situated on a small river, which enters the Irrawaddy at a place called Yoo-va. An extensive tract of country is inhabited by a people called Yoo, who are said to be exceedingly ugly, having protuberant bellies, and white teeth. These Yos are subjects of the Birman state, and observe the same religious worship. They speak the language of Tayy, which is merely a provincial dialect of the Birman tongue. Symes's Embassy to Ava, vol. ii.

Yopa, a town of Mexico, in the province of Culiacan; 150 miles E.N.W. of Culiacan.

Yopas, Las, or Topes, a river of Mexico, which rises in Tlaicala, and runs into the Pacific ocean, N. lat. 1° 10'.

Yo-Ping, a town of Corea; 33 miles S.W. of King-ki-tao.—Also, a town of Corea; 28 miles S.S.E. of Tsin.

York, the Eboracum of the Romans, is the capital of the great county to which it gives name, the see of an archbishop, who is primatial and metropolitan of England, and the second city in rank in the kingdom. It is of unquestionable antiquity, and notoriously distinguished in English history by the important political, ecclesiastical, and military transactions which have occurred within its walls, or with which it has been in other ways intimately connected. Seated in the midst of a vast plain, by the side of a river which was navigable for the largest ships of ancient times, and too remote from the open sea to be immediately exposed to predatory invasion, York must have early attracted the attention and become the favourite abode of the chiefs of the northern tribes, and of their successful invaders from foreign lands. Eboracum was accordingly selected by Roman emperors and commanders as a principal refuge during their protracted contests with the ungovernable inhabitants of the northern parts of Britain. The metropolis of a shire unparalleled in the kingdom for extent, population, and productions, York is placed at the point of junction, although independent of them all, of the three ridings or districts into which the shire is subdivided. The cathedral is situated in N. lat. 53° 58', and in W. long. from Greenwich 1° 7'. The city is distant, by the shortest roads, from London, N. by W. 198 miles; from Edinburgh, S.S.E. 201 miles; from Durham, S. by E. 67 miles; from Hull, N.N.W. 38 miles; and from Liverpool, E.N.E. 100 miles. The nearest point of the sea-coast on the E. is at Bridlington bay, distant 33 miles, and on the W. at Lancaster 200 miles. The position of the city is central, with respect to both the limits of the county, and the great body of the population, industry, and commerce, by which it is distinguished. The ancient station of Eboracum was confined between the river Ouse on the W. and the collared stream, the Fos, on the E., which falls into the Ouse at the southern extremity of the old city. In later times, however, the limits were extended considerably on the opposite sides of both rivers. Such a position, defended on three sides by rivers and marlhes, and accessible by an enemy on the N. side alone, although in the midst of a plain, but consequently overlooked by no neighbouring eminence, would, even in the modern art of war, be susceptible of powerful defence: in ancient times it might have been rendered nearly impregnable. In constructing the walls, and laying down the streets, on ground previously occupied by their camps, it was the practice of the Romans to preserve as much as possible the form and distribution of the prior intrenchment. Of this practice frequent instances are found in Britain, as well as in Gaul, and other parts of the continent. The fame, notwithstanding the many changes to which the city has been subjected, may still be traced in York, where evident remains of Roman architecture are yet preferred, and where monuments of antiquity of various clavses have often been discovered.

In its present state, the plan of York forms an irregular pentagon, extending from S. to N. about 1340 yards, and from W. to E. about 1360 yards: the area within the walls is therefore about 300 acres. It is divided into four wards, which take their names from the four gates. Boothamgate-ward, in the N.W., contains three parishes; Micklegate-ward, on the W. side of the Ouse, contains six parishes; Monk-ward, in the N.E., five parishes; and Walmgate-ward, on the S.E., seven parishes. But the close of the cathedral is not included in any ward. Some of these parishes extend beyond the walls; and the two churches of St. Lawrence and St. Maurice, situated on the outside of the city, are still commonly reckoned to belong to it. The number of churches, exclusive of the cathedral, is therefore twenty-three. In former times they amounted to forty-five. Although no regular plan can now be traced in the distribution of the streets, yet some of them are of respectable appearance, having of late years been much improved by widening and paving; and new and handsome buildings, public and private, have been erected. The river Fos, long a piece of flagnated water, has again been rendered navigable, and now materially contributes to the ornament of the city as well as to the health of the inhabitants.

York, still inhabited by many genteel families, maintains its importance in no inconsiderable degree; but in point of population and wealth, it has been far excelled by many manufacturing and trading towns in the county, of comparatively modern foundation. According to the reports of the population of the kingdom in 1811, the inhabitants of York were then only 18,217, and the houses 7437.

Civil History.—York, under its romanized name, Eboracum, early appears in British history. In the year 208, the emperor Severus, with his sons Caracalla and Geta, visited Britain; and returning from an expedition against the northern insurgents in the following year, Severus resided at Eboracum, while his troops were employed in constructing across the isthmus, between the mouths of the Eden and the Tyne, the great wall of defence still known by his name. In this enterprise, he followed the example and completed the fortification of his predecessor Hadrian, which had been formed in the year 121. While Severus's great work was in progress, the emperor died at York in 210; and his successor Caracalla, more intent on the destruction of his envious brother Geta than on the enlargement of the pretensions of the Roman dominion in Britain, soon afterwards returned to the continent. During his residence in York, Severus struck money, on which he styled himself Britannicus; and also issued a decree respecting the recovery of slaves, which decree is still preserved in the Roman code, dated at Eboracum, on the 31 of the nones of May, in the consulate of Paulinus and Rufus, corresponding to the year A.D. 209.

Turning his arms against the Caledonians, and other Britons, who struggled for freedom in the north, Constantius fixed his head-quarters in York, and there ended his life in 306. York was also the scene of the inauguration of his son
ton and successor Constantine, who, learning in Asia the indisposition of his father, hastened to York, where he arrived in time to receive his last instructions; and was there proclaimed emperor by the army.

Among the towns specified in the geography of Ptolemy, the Itinerary of Antoninus, and the much later work of Richard of Cirencester, Eboracum is ranked first as a colony, and afterwards as a municipal town. As a colony, or settlement of veteran troops, the inhabitants were citizens of Rome, and governed by the laws of the State. When advanced to the highest station, that of municipium, the inhabitants retaining the privileges of Roman citizens were no longer under those particular laws, but invested with the power of self-government, under magistrates of their own appointment. Besides Eboracum, Britain contained but one other municipal town, Verulamium. In the list of Roman troops stationed in York, the fifth legion, called the victorious, appears to have been there for three successive centuries, down to 446, when the Romans finally renounced all dominion in Britain. The British name of York is Iulii; but although softened into Eboracum by the Romans, and by their colonists, who copied from them, traces of the original may still be perceived in the Kair-Ebrac of Nennius and Henry of Huntington, and in the Cair-Efric, or Erfric, of the Welsh. In British compounds appellations of places, the descriptive part precedes the proper name; in the language of the Saxons a contrary mode prevailed. Hence Cair-Efric was by them converted into Erfric-wyc, and Yevor-wyc, from which the present name of York seems to be derived.

York was the capital of Deira, one of the districts into which the Provincia Maxima of the Romans, or the county of Northumberland, was divided; and there, in the beginning of the seventh century, reigned Edwin, who united those kingdoms, and acquired the principal ascendency over Saxon-England. To this prince are ascribed the construction of the castle, and the foundation of the city of Edinburgh (Edwyru’s burgh), now the capital of Scotland. He also founded a cathedral in York; but in 633 he fell in the defence of his dominions, against the combined attack of the Saxons of Mercia and the Britons of Wales. Under Oswald, who came to the crown in the following year, Northumberland was again united into one kingdom; and afterwards governed by the celebrated Egbert, who, in 827, out of the Saxon heptarchy, formed the great kingdom of England. After a long series of disasters from Danish invasion, and the internal disorders of the kingdom, York was exposed to utter destruction from the memorable expedition of Harold Hardrada, king of Norway. On the death of Harold of England, an unsuccessful attempt was made by the people of York to place Edgar Atheling on the throne. For this step, William of Normandy besieged the city in 1070, which, after many months, was compelled by famine to surrender. The conqueror inflicted the most horrible vengeance on the inhabitants, the surrounding country was laid waste, and cattle were erected within the walls, to keep the conquered citizens in subjection. With the exception of the contests between the metropolitans of York and Canterbury, little is recorded of the former city until 1137, when the cathedral church, thirty-nine parish-churches, and the greater part of the houses, were accidentally burnt down. About 1160, one of the first parliaments of England was held there by Henry II.; and in the reign of his successor, Richard I., in 1190, occurred the horrible massacre of the Jews, which was perpetrated and accompanied with circumstances of peculiar atrocity. In 1290, the courts of justice were removed from London to York by Edward I. during his expeditions against Scotland. In his reign this city was cladded among the sea-ports of England, and required to furnish one ship for his use. In the languidary contests between the houses of York and Lancaster, the former city naturally espoused the cause of the white rose; and in 1483, Richard III. was a second time crowned in the cathedral. The year 1529 was distinguished by the establishment of a printing press in the Minster-yard of York, near the place where the royal privileges were afterwards erected in 1642, while King Charles resided in the city. Nothing of moment relative to York is afterwards recorded until the 31st year of Henry VIII., when commissioners were appointed there to conduct the suppression of the northern monasteries. Adhering to the royal cause, the city was, in 1544, beleaguered by the parliamentary forces under Sir Thomas Fairfax. But on the approach of Prince Rupert, the siege was raised; and on the 23d of July, the important battle of Marston-moor, about five miles off, was fought, in which the royal party was completely defeated. Returning to the siege, Fairfax, at the end of six weeks, obtained possession of the city, on most honourable terms for the garrison and inhabitants. Notwithstanding the zeal for the royal cause manifested by the citizens of York, their charter was suppressed by Charles II., and never restored. A new charter, however, confirming all the former rights of the city, was granted by his successor James II. in 1685. Down to the 30th of July, 1688, the inhabitants of York continued to express their determined attachment to James; and on that day, the mayor, aldermen, and commons, congratulated him, in the most energetic terms, on the birth of a young prince.

Civil Government.—The government of York is vested in a mayor, who, like the mayors of London and Dublin, and the provost of Edinburgh, is authorized by the act of Richard II. to assume the title of lord; a recorder, a city-council, twelve aldermen, two sheriffs, seventy-two common-council-men, and six chamberlains. What is styled the privy-council, or the upper house, consists of the lord-mayor, aldermen, and sheriffs, together with those citizens who have puffed the office of sheriff. This body, whatever may be its number, is usually called the twenty-four. The mayor, whose office ceases on the 3d of February, is chosen annually from those aldermen who have not borne that office twice, nor within the six preceding years; and during his mayoralty takes precedence of all persons within his jurisdiction. York was early distinguished among the cities of England: in the Domesday-book it appears to be exempted from the payment of geld, except when the same is paid by London and Winchester, and from paying relief. In 1396 King Richard appointed two sheriffs, instead of three bailiffs, for the government of the city, which was then constituted a county within itself. The earliest charters of York now preferred are, one granted in 1199, and another by Henry III., who died in 1272; but both recite preceding charters of Richard I., Henry I., and Henry II. Representatives in parliament for the city of York appear in the summons and returns of the 23rd of Edward I. For the parliament called to assemble at Shrewsbury, on the 30th of September 1283, which was but the 11th year of Edward, two representatives were summoned from a number of cities and towns, among which York stands the fourth in order; those before it being London, Winchester, and Newcastle-upon-Tyne. Under the jurisdiction of the lord-mayor, aldermen, and sheriffs, besides the city, is a considerable district on the W. of the river Ouse, called the Ainstey, in ancient writings, Ancility; but its origin and import are now unknown. This tract was once a hundred or wapentake of the Welf Riding of Yorkshire; but in the 27th year
year of Henry VI. it was annexed to the jurisdiction of the
magnates of York, and has ever since been comprehended
in the county of the city of York. The whole district was
anciently a forest, but laid open in the reigns of Richard I.
and John: it contains 22 parishes subdivided into a number
of townships; the inhabitants of the whole amounting, in
1811, to 8205 persons. In all parliamentary affluences the
city is called on for three-fifths of the amount, and the
Ainfley for two-fifths. Doubts having long been entertained
whether the inhabitants of this district could vote for the
representatives of Yorkshire in parliament, a decision was
obtained in the house of commons in 1735, declaring, "that
the persons whose freeholds lie within that part of the
county of the city of York, which is commonly called the Ainfley,
have a right to vote for knights of the shire for the county
of York."

Ecclesiastical History.—The earliest notice respecting
the recognised establishment of Christianity in Eboracum, or
York, exists in the list of bishops, or patres, who composed
the synod or council of Arletace, now Arles, in the fourth
of France, about A.D. 314. The bishops who then appeared
on the part of the British church were, Eborius de civitate
Eboracenei, Restitutus de civitate Londinensii, and Adel-
fius de civitate Colonia Londinium. By the retreat
of the Romans in the middle of the 5th century, and the
subsequent overwhelming invasions of the Saxons, Christianity
was almost entirely suppressed in the northern parts of
the kingdom. At last, about 628, Edwin, king of Northumbria,
having married Ethelburga, the sister of Eobald, the converted
king of Kent, was, by her persuasion, aided by Paulinus, who
attended her to York, induced also to embrace the Christian
religion. Paulinus was consequently publicly appointed
bishop, or, as some say, archbishop of the renovated church
of York. The appointment was confirmed, and the new
prelate formally invested with the ensigns of his office, by
pope Honorius. In former times, jealousies and contentions
occasionally took place between the metropolitans of York
and Canterbury; to appease which it was often necessary to
appeal to the pope. Under the archbishop of York are
placed the bishops of Durham, Chelmer, Carlisle, and the Isle
of Mann; and he is styled in general primate and metropo-
latin of England; but the archbishop of Canterbury
assumes the same titles over all England. At the coronation
the latter crowns the king; but the queen has that ceremony
performed on her by the archbishop of York. By the re-
moval of the seat of government to the southern parts of
the kingdom, and particularly after the Norman Conquest,
the prelates of Canterbury and Winchester, situated near
the throne, soon acquired an ascendancy over their brothers
of York in political favour and power. Among the latter,
however, were many men of eminence in the history of the
church and of the State. Wilfrid, appointed in 669, founded
the celebrated monastery of Ripon. Egbert, the brother of
Eadbert, king of Northumberland, was the patron of Al-
cuin, the enlightened secretary of Charlemagne. In 930
Wulstan was deprived for aiding Anlchof, the Danish king
of Northumberland, against Edred of England. Aldred,
who succeeded in 960, was the last primate of the Saxon
race; for dying in 1079, he was succeeded by Thomas, a
Norman. Gerard, appointed in 1100, as well as his pre-
decessor, refused obedience to the fee of Canterbury; but
pontifical authority compelled him to submit. Obedience
was again denied by Thurstan, who had been appointed
in 1114; but at last he retired to a monastery. In 1153
succeeded William, afterwards canonized. Roger, suspec-
ted of being privy to the death of Becket, was acquitted on his
oath of purgation. In 1190 the fee was filled by Geoffrey

Plantagenet, son of Henry II. and the Fair Rosamond. His
successor, Walter de Grey, is said to have transmitted a pro-
digious sum to Rome for his installation; but for this apparent
finesse he stoned by purchasing the manor of Thorpe for
the country-residence of the archbishops of York, and by
contributing materially to the erection of the cathedral.
While the fee was occupied by John Thoresby, appointed
in 1352, in order to remove the contentions between the two
archbishops, pope Innocent VI. established the distinction
before-mentioned in the metropolitan dignity. Richard
Scorpe, who succeeded to the fee in 1398, was, in 1405,
behindhand for the active part he took in opposition to
Henry IV. after the murder of Richard II., who, on var-
ious occasions, had flown a particular favour for York.
The fifty-second prelate, appointed in 1464, was George
Neville, brother of the famous earl of Warwick, and dis-
tinguished by the misfortunes of his latter years, no less
than by the unbounded magnificence of his installation.
Christopher Bainbridge, appointed in 1508, and ambas-
dador to Rome, was created a cardinal; but was soon after poisoned
by an Italian priest, his steward. His successor, in 1514, was
the celebrated cardinal Wolsey. By the exertions of arch-
bishop Heath, appointed in 1555, the fee recovered a great
part of the revenues it now enjoys, which had been alienated
by the arbitrary and avaricious measures of Henry VIII.
As a Roman Catholic, he was deprived of his dignities by
Elizabeth, who, however, respected his merits, and allowed
him to retire to his estate at Cobham. In 1541 the fee was
filled by John Williams, who, after warmly expounding the
royal cause, openly joined the parliament. After him the fee
remained vacant for ten years until 1665, when, on the
restoration of Charles II., it was conferred on archbishop
Frewen. Archbishop Dolben, who succeeded Richard
Sterne, was an enigma in the army in his youth, and bled in
the royal cause at Marlton-moor: he died in 1688. The
latest primate was Dr. Markham, who had been head-master
of Westminster-school, and preceptor to the prince of Wales.
Dying in 1808, he was succeeded by the present archbishop,
the honourable Edward Vernon.

Antiquities.—That Eboracum possessed temples, palaces,
threries, and the other public edifices with which the politic
Romans were in the habit of adorning the principal, and
even in some cases the minor cities within their dominions,
cannot be doubted; but all such structures have long dis-
appeared. The most remarkable monument of Roman oc-
cupation now to be seen is what is called the multangular
tower, being a polygon forming the N.W. angle of the Ro-
man wall, near the N.E. bank of the Ouse. The lower
part of this tower is faced with rows of regularly squared
stones, separated at broad intervals by layers of flat bricks.
The upper part of the tower, pierced with loopholes, is of
much later date. Various Roman inscriptions have been and
continue to be discovered in York: some are mentioned by
Camden, who was the first to record them. In digging for
a cellar, in the beginning of the last century, in a place
called the maron, or the ruins of St. Mary's abbey, on the
outside of Bootham-bar, was found a small bush in bronze.
In the environs of the city, particularly on the London
road, which follows the course of the ancient Roman way,
feveral urns of various kinds have been discovered. Coins,
seals, fibulae, and many other relics of Roman antiquity, are
abundantly found within and around the city. The coins
bear the names of all the emperors, from Augustus to Gra-
tian. In 1807 a small vault of Roman construction was
discovered, four feet below the surface, on the outside of
Micklelegate-bar, containing a stone coffin, with a human
skeleton entire, a lacrymatory, &c. In 1813 two large
M

Vol. XXXIX.
...and coffin was found without Bootham-bar; and are now preferred in the cathedral. In 1814 was laid open a beautiful tessellated pavement, within Micklegate-bar, but without the Roman town; but unfortunately a part of it only was preserved: this was the first ever found in York. The walls of the city, which probably succeeded to the Roman fortifications, and which are now in rapid and disgraceful decay, still retain sufficient evidences of their ancient strength and importance. When they were erected is now unknown; but their construction on the Roman foundations is generally ascribed to Edward I., about 1280: in the time of Henry VIII. they were in complete repair. The eldest part of the present walls appears to be that adjoining to Walmgate-bar, at the S.E. corner of the city, on the road to Hull, where the remains of the Red tower are still visible. During the last siege of York, in the civil wars, by Sir Thomas Fairfax, in 1644, these walls were so shattered as to require three years to repair them; but since that period they have been shamefully neglected by those whose duty it is to preserve them.

York is distinguished among the cities of England for its ancient gates, or bars, as they are termed. Of these, Micklegate-bar, on the S.W. side of the present city, under which is the road from London, is the most remarkable. It consists of a lofty square embattled tower, with loop-holes, &c. and guarded by an adored work, with battison-turrets, &c. Bootham-bar, at the N. entrance of the city, not far from the Roman tower, is almost wholly constructed of materials formerly employed in Roman buildings. Monk-bar, on the N.E., and the Walmgate-bar on the S.E., seem to be of equal date, and were probably erected by Edward III. The whole circuit of the ancient walls is nearly two miles and three-quarters.

Castle: Clifford’s Tower.—Nearly at the junction of the Ouse and the Foss, on an eminence, is the site of the ancient castle, accessible only from the city on the N., and strengthened on the other sides by the Foss, carried round it in a deep moat. Prior to the Norman Conquest, York possessed a castle, by some supposed to have stood on the W. side of the Ouse. It is, however, much more probable, that the principal fortresses occupied the position here described, on which William of Normandy erected his castle, which was restored by Richard III. Ceasing to be regarded as a place of strength, it was converted into the prison for the county of York; but becoming ruinous, the whole was, in 1701, taken down, and the present grand structures, still retaining, although very incongruously, the original name, were erected. Within the inclosure of the ancient castle on the N.W. is a high mount, surrounded by a deep ditch, rising 90 feet above the river Ouse, and 50 above the feite of the castle. On the summit stands Clifford’s tower, consisting of four segments of circles joined together, and so called, it is said, from the first governor, after its erection by William the Conqueror, to whose castle it served as the keep. In the time of Henry VIII. this tower was in a ruinous state: but on the commencement of the disorders in the reign of Charles I., it was repaired and fortified by the earl of Cumberland, who mounted some pieces of artillery on the platform. In the year 1684, the powder-magazine within the tower exploded, and the building was reduced to its external walls, as now existing. Corresponding to Clifford’s tower, on the W. side of the Ouse, is another mount, called the Old Bailey, or Vetus Ballium; also the site of an ancient fortres.

Public Buildings.—At the head of the public edifices of York is necessarily placed the venerable minster, or cathedral, which, considered in its totality, is unparalleled in England. The earliest erection of a stone edifice for the service of the Christian religion in York was always ascribed to Edwin, king of the Northumbrians. This church was founded about A.D. 628; but it was completed by Bishop Wilfrid, after 669, who covered the roof with lead, and filled the windows with glass. This last invaluable substance must have been imported from the continent; for it was not till 674 that glaziers-makers were first introduced into England by Benedict Biscop, to glaze the windows of his new monastery at Bishops-Wearmouth. That the cathedral of York suffered with the other parts of the city by the ravages of the Danes in 867 is most probable: but it is not noticed until 1069, when it was destroyed, with a great part of the city, in a conflagration occasioned by the Norman garrison, when attacked by the united Danes and Northumbrians. To punish the refractory people of the city and vicinity, William of Normandy expelled the ecclesiastics, and feized the revenues of the fee: but these were restored to their chaplain and treasurer, Thomas, a Norman, was promoted to the archbishopric. By this prelate the cathedral was rebuilt in a magnificent style; but in 1137 it was again destroyed by fire, together with the abbey of St. Mary, and 39 parish-churches. Having for a number of years lain in ruins, archbishop Roger, the fiery opponent of Becket of Canterbury, began in 1171 to rebuild the choir with its crypt, which he lived to finish. In 1227, his successor, Walter de Grey, erected the transept, with the exception of the N. part, which was the work of John le Romaine, the treasurer, who also raised a central steeple in 1260. In 1291, the friars of the preceding being advanced to the fee, commenced the nave, which, together with the two noble west-end towers, was completed by archbishop William le Melton. In 1361, the present beautiful choir was commenced by archbishop Thoreby, who contributed largely to defray the charges of the work. More money having been collected than was required, the surplus was, in 1370, employed to construct the present noble central tower, in the place of one erected by John le Romaine. Thus, in the course of 150 years, the cathedral of York was brought into a form nearly as it now appears. It is a grand and interesting edifice; and consists of a nave with side aisles, a large and lofty transept with aisles, a choir with aisles, and a large space east of the choir, called the lady-chapel, with aisles. Beneath the altar is a crypt; on the south side are three apartments called vestries and treasury; and at the end of the north transept is a fine chapter-house, with a corresponding vault. The west end is adorned by two elegantly ornamented towers, whilst another, of larger dimensions, rises at the centre of the transept. All these parts of the church are on a large and magnificent scale; and though not in an uniform style, yet the nave and choir are of corresponding height and width, and very similar in their windows, columns, and other members. The W. front is more richly adorned than any other part of the edifice. Its two towers diminish in dimensions as they ascend, and have been ornamented with several statues, of which now only very few remain. Each tower is surmounted by eight pinnacles; and in the south tower is a set of celebrated bells. In the front are three entrances; that in the centre is divided into two by a pillar. The entire length of the cathedral is above 524 feet; that of the nave, from the west end to the sjeer at the entrance of the choir, is 250 feet; the length of the choir to the altar-screen is 150 feet; and that of the lady-chapel, at the east end, 65 feet. The transept is in length 222 feet. The breadth of the nave, with its side aisles, is 103 feet; that of the nave itself being 63. In the centre of the nave the height to the roof...
is 91½ feet; in the transept 103 feet; and in the choir 101 feet. The elevation of the central tower or lantern is 213 feet; that of the towers at the W. end 196 feet. The great windows which occupy the principal part of the W. and E. ends of the church are particularly beautiful. The great E. window, especially, is of uncommon dimensions and richness. It was executed about 1405, at the expense of the dean and chapter; and the glais painted, &c. by John Thornton, of Coventry, glazier, who engaged to finish it in three years, and for which he was paid four fillings per week. Spacious, lofty, and light, the interior of this cathedral has a most imposing effect. For although the choir be separated from the body of the building by a screen surmounted by the organ, fill from the W. end the eye ranges over all, quite to the great terminating window in the E. The nave consists of a double range of eight lofty pointed arches, supported by slender clustered columns. A similar arrangement prevails in the choir; but the transept is of a different age, style, and character, to all the other parts of the church.

Great labour has been bestowed on the carving of the stalls of the choir, which are of oak. The screen behind the altar is stone, divided into eight pointed arches, the upper parts of which are perforated and glazed. At the entrance of the choir is a very elaborate screen of tabernacle work, perhaps of the time of Henry VI. It is covered with niches, canopies, pediments, pinnacles, &c. and contains statues of fifteen English monarchs; i.e. eight on one side of the entrance, and seven on the other side. The whole has been of late years suitably repaired. The central tower, or lantern, as it is usually called, is supported by four lofty arches resting on strong massive clustered piers.

Among the monuments of prelates and other eminent persons preferred within the cathedral of York, is distinguished that of archbishop Walter Grey in the south transept. It exhibits his effigy in his pontificals, covered by a magnificent canopy, supported by slender pillars. The whole was enclosed with a handfome railing by the late Dr. Markham. But the most elegant of all is the monument of archbishop Bowet, appointed in 1423, of great height, and in the most florid style of the pointed architecture. A full-length statue, with emblems and an inscription, commemorates the late Sir George Saville. Attached to the south side of the choir is a range of low buildings, styled the vestries; in one of which are preferred fundry emblems of the ancient metropolitan dignity of York cathedral. Among these is a famous antique horn, as it is termed, although formed out of an elephant's tooth, by the presentation of which the church holds lands of great value, said to have been granted by Ulphus, a Saxon prince of Deira. In the same place is preferred the silver pastoral staff, presented by Catharine of Portugal, dowager of Charles II.; to her confessor, who had been appointed popish archbishop by James II. in 1697. Adjoining to the S.W. angle of the transept was a small building, formerly used as a library. A library for the use of the ecclesiastics of the cathedral is believed to have been founded by Egbert the archbishop in 740, and his successor Albert; but the whole was consumed by fire in 1609. By this misfortune no small loss was sustained by the lovers of learning; for according to certain writings of Alcuin, the secretary of Charlemagne, many valuable classical and other works were contained in it. To supply in some measure its place, another library was collected by archbishop Thomas, the Norman; but that also was destroyed by the flames in 1137. From this period, the cathedral is not known to have been furnished with many books until the private collection, consisting of upwards of 3000 volumes, of archbishop Matthew, was bestowed on it by his relish in the beginning of the 17th century. By various subsequent bequests, presents, and purchases, a large collection of valuable books and manuscripts has been formed, and placed in what was formerly the chapel of the archiepiscopal palace, on the north side of the cathedral. This building has been lately repaired in a style suitable to that of the church, and commodiously adapted to its present destination. Connected by a short passage or vestibule with the N.E. angle of the transept of the cathedral is the chapter-house, an octagon room, 63 feet in diameter, and nearly 68 in height. This building differs from many others of the same kind, in having no central pillar to support the roof; but the prelure of the arched roof upon the walls is effectually counteracted by buttresses at each external angle. From the similarity of the style of building with that of the nave of the cathedral, founded in 1291, the chapter-house is supposed to have been erected about that time. The buildings belonging to the cathedral were formerly separated from the city by walls; and some remains of the gates of communication may still be discovered. Of those buildings, the principal was the archiepiscopal palace, situated on the north of the church. It was erected by the first Norman prelate appointed in 1070; but after a lapse of about 500 years, the great hall was taken down by the Protestant archbishop Young, for the fake, it is said, of the lead on the roof. Since that time other parts of the palace have been leaved out. In former times to the fee of York belonged various places of residence; but now that of Bishopthorpe alone is occupied. This is agreeably situated on the site of the river Ouse, about three miles south-west from the city. It was purchased and appropriated to the fee by archbishop Walter de Grey, in the early part of the 13th century; since whose time it has undergone many important alterations and improvements. The principal front and the vestibule are in the pointed style of architecture, and in the interior are several spacious and elegant apartments, besides the chapel and library. In the minster-yard still remains the residence of the dean of the cathedral, a spacious and convenient edifice of respectable appearance.

Of the parish-churches in York, that of St. Margaret in the south-east quarter of the city is remarkable for the porch attached to it, but which is of much higher antiquity than any other part of the edifice. It was removed from the church of St. Nicholas, formerly situated without Walmgate-bar, but ruined during the siege of York in 1644. The arch of the porch is lenticular, and exhibits alternately the signs of the zodiac and the emblems of the months. The churches of St. Denys and St. Lawrence have also an appearance of considerable antiquity. Next to the cathedral, the church of St. Michael-le-Belfrey is the largest and the most regular in the city, supported by light pillars and pointed arches. The present building was erected on the removal of the former in 1235. The church of All Saints, on the pavement, is distinguished by its open octagonal turret, erected on a square tower, in which, according to tradition, a large lamp was suspended in the night, to guide travellers over the broad forest of Galtres, which extended on the north and east of the city. York contains places of meeting for various classes of dissenters from the established church; that for the Society of Friends, lately erected, is large and commodious. A handfome chapel for the use of the Roman Catholics was built in 1782.

Of the numerous religious establishments formerly existing in and near York many vestiges still remain. Of these,
the principal was St. Mary's abbey, situated on the bank of the river Ouse, on the outside of the city wall. The foundation of the monastery is of uncertain date; but the church, of which some considerable ruins still remain, was rebuilt in 1270. Having fallen to decay after the general suppreffion of religious houses, Henry VIII. ordered a palace to be erected out of the ruins, for the residence of the lord-president of the north of England, to be designated the 'king's manor.' This was enlarged by James I. Previously to the Revolution it became an object of popular outrage: but some years afterwards the king's Mint was established in it, and much gold and silver, distinguised by the initial letter V, was struck there for William III. The site of the abbey and the manor have long been leased from the crown by lord Grantham and his predeceffors. Connected with the religious system of former times, it may be noticed, that adjoining to the walls of York, immediately without Micklegate-bar on the London road, is an establishment called the Nunnery. The building was originally acquired in 1686, as a place of education and living for young ladies of Roman Catholic families. The establishment at present consists of the superior and twenty affilnants, who wear the dresses and conform to the regulations of nuns in Catholic countries, with twelve lay-sisters, and a chaplain. From sixty to seventy boarders are usually accommodated in the institution.

The Guild-hall and the Manfon-houfe are situated near the river Ouse, in the north-west quarter of the city. The hall, built in 1446, is a noble room, ninety-five feet long, forty-five broad, and twenty-nine feet six inches high. In it are held the laws-courts and the courts of municipal justice. The Manfon-houfe was erected in 1725, and contains every necessary accommodation for the lord-mayor. In the same quarter of the city are the assembly-rooms, the theatre, the subscription library, the principal hotels, &c. As a fortress, York castle has long ceased to be of importance; it is now occupied by several structures. That on the W. side of the area is the county-hall, rebuilt in 1777, in which the alhizes are held, and other county business is transacted. The central building is the prison for debtors and criminals; the third building on the E. contains the record-office, and various apartments necessary for the transacting of the buifiness of the county. Of all these buildings it is but justice to say, that in their construction external elegance and taste have been properly combined with a due attention to their several definations. The arrangement and management of the prisons have been frequently the subject of commendation. The new city-gate, an extenfive stone structure near the Old Bailey, on the west side of the river Ouse, and the house of correction, are also deserving of attention.

The charitable establishments for the poor and the sick in York are very numerous, and well conducted. Among these, the county-hospital and the city-dispenfary are highly commendable. Schools for the education of youth of both sexes are not wanting in York. In 1647 a petition was presented to the crown from the inhabitants of the city and the county, and from other parts of the north, for the establishment of an university in York: but the unsettled state of the affairs of the kingdom then prevented due consideration of the request; nor has it since been renewed; although, for various important reasons, York seems peculiarly adapted for a place of literary and fcientific retirement and study. A feinary or college for the education of minifters and lay-gentlemen among Protestant diviners, which formerly subsisted at Manchester under the successive care of the Rev. Dr. Barnes and Mr. Walker, and was liberally supported by voluntary subscription, was, on the death of the latter professor removed to York, where it is conducted with great reputation by the Rev. Meffrs. Wellbeloved, Kenrick, and Turner.

Bridge.—Communication between the original city of York, and the suburb styled Micklegate-bar on the south-west side of the river Ouse, is maintained by a handfome stone bridge, which has lately been erected from the designs and under the direction of Peter Atkinson, eqq. of York. In 1154 the bridge was wood: but in 1268 it was probably of stone, for then was founded on it St. William's chapel, in atonement for the death of several perfons on the spot in a fray with the people of the town. In 1564 a flood following an intense frot swept away two arches of the bridge, with the houses built on them.

On the south-east fide of York, going out by Walmgate-bar, near the village of Hellington, is an establishment for the reception and relief of perfons disordered in mind; which has, for some time, been the fubjeft of general approbation. This was called the Retreat, founded by the repectable Society of Friends, and originally intended for members of their class alone. The firit idea of this admirable infitution was fuggelted in 1791, by the unfortunate death of one of their fociety, at a common receptacle for the infane. In 1794 land was purchased, and the building commenced, on a commanding eminence. The general arrangement, management, and fystem of treatment of the unfortunate patients, have been imitated, as the moft perfect of their kind, in various parts of the kingdom and America. See an "Account of the Retreat," 8vo.—Eboracum, or History and Antiquities of York, by Francis Drake, F.R.S. folio. 1736. Description and History of the City and Cathedral of York, 12mo. 3d ed. 1790. Description of York, 12mo. 1816. A Guide to the Cathedral of York, 12mo. 1815, is a rational and judicious vade mecum.

York, Cuffum of: See Rationebilf parti bonorum.

York, in Geography, a county of the United States, in the district of Maine, containing 23 towns, and 41,877 inhabitants.

York, a district of South Carolina, containing 10,032 inhabitants, including 5164 slaves.

York, a county of Pennsylvania, south-west of Susquehanna. It contains 22 townships, and 31,958 inhabitants.

York Borough, a town of Pennsylvania, in York county, containing 2847 inhabitants.

York, a township of Pennsylvania, in York county, containing 1649 inhabitants.

York, a county of Virginia, with 5187 inhabitants, including 2931 slaves.

York, a town of United America, in the district of Maine, and county of York, containing 3246 inhabitants; 50 miles N.N.E. of Boston. N. lat. 43° 7'. W. long. 70° 41'.

York, a township of Ohio, in the county of Belmont, containing 1340 inhabitants.

York, the capital of Upper Canada, situated on the lake Ontario. It is likely to become a city of great importance, as it possefses great facilities for commerce and navigation. It lies in about 43° 35' N. lat., within an excellent harbour of the same name, made by a long peninsula, which embraces a bay of water sufficiently large for containing a considerable fleet. Vessels may ride safely at its entrance during the winter. On the extreme of the peninsula, which is called Gibraltar Point, are erected commodious block-houses and frienders commanding the entrance into the harbour. On the main land

Opposite
York.

York, New, one of the United States of America, situated, according to the statement of Melish, between 40° 33' and 45° N. lat., and 3° 43' E. and 2° 43' W. long. from Washington; extending from N. to S. 198 miles, and from E. to W. 256; and comprehending an area of 46,085 square miles, or 28,440,000 acres. This state is bounded on the N. by lake Ontario and Canada; on the S. by Pennsylvania, New Jersey, and the Atlantic ocean; on the E. by Vermont, Massachusetts, and Connecticut; and on the W. by Upper Canada, lake Erie, Pennsylvania, and New Jersey. This territory, according to Spafford's "Gazetteer of New York," comprises an area of 46,085 square miles, equal to 29,494,720 acres; but this computation includes all the inland rivers and lakes, one half of lake Champlain, and the St. Lawrence; excluding only all the waters below New York island, and that part of the lakes Ontario and Erie which belong to this state. This statement gives 20.8 per sons to a square mile. New York is at present divided into 45 counties, and 452 townships, including four incorporated cities: viz. New York, Albany, Hudson, and Schenectady, as exhibited in the following.

Suffolk
Warren county was erected from the N. W. extremity of Washington, March 12, 1813. It comprises the towns of Bolton, Caldwell, Chester, Hague, Johnburgh, Luzerne, Queenbury, and Thurman, the last of which is divided into two towns, called Athol and Warrenburgh. The chief town is Caldwell, with a population of 560 persons, and 60 electors; Athol has 443 inhabitants, and its electors are 20; Bolton has 726, and 30 electors; Chester 937, and 120 electors; Hague 398, and 27 electors; Johnburgh 651, and 82 electors; Luzerne 1015, and 83 electors; Queenbury 1948, and 197 electors; and Warrenburgh 887, with 41 electors.

The face of this state exhibits a great variety. To the S.E. its surface is agreeably uneven; in the middle, mountainous; to the N.W. undulating; flat toward the lakes; and hilly toward the southern extremity.

Of the mountains in this state, the chain called Catskill, or Catskill, is the largest and most extensive, and this presents a bifurcation of the Appalachian ridge, which at the Highlands occupy a tract of about 16 miles in width, lying obliquely across the Hudson, and penetrating by that river. These ridges preserving their general direction stretch across Dutchess county, the eastern parts of Columbia and Renfilleaer counties, and exhibit some lofty summits. The Taconic mountains are lofty and very rugged, and Hoofack and Williamstown are mountains which deserve the appellation. But the Catskill or Catskill mountains present some summits that are higher than any others of the Appalachian chain, if we except the White-hills in New Hampshire. At the Highlands, the summit of Butter-hill is 1432 feet above the level of the river; that called the Crow's-nest 1330; Bell-hill 1391. About six miles N., the Round-top is elevated 3655 feet above the level of the river; the High-peak 3487. These summits are in Windham, Greene county, about 20 miles W. of Hudson, and in full view from that city. A turnpike-road which crosses this range of mountains near those summits, winds up till it reaches the alloning altitude of 2274 feet. Upon this spot the view is inexplicably grand. The general altitude of the Catskill mountains may be estimated at about 2000 to 3000 feet across Greene county. From Greene they pass into Schoharie county with ridges less rugged; and towards the southern part, their continuity is less distinctly defined. Until after forming the falls of the Mohawk, this range traverses Herkimer county, forming a rugged tract, and diminishing in altitude till they cross the St. Lawrence into Canada, at the Thousand islands. These mountains have obtained from the early Dutch inhabitants the name of Helderberg, or clear mountain, presenting, instead of lofty summits of granite and schistous mountains, an elevated plain of considerable and very uniform altitudes. About lake George, and to the W. of lake Champlain, we find the Peruvian mountains, which furnish the northern forces of the Hudson, and form the height of land that separates the waters of the Hudson and St. Lawrence. The highest of thee is probably that called White-face, which commands a view of Montreal, at the distance of near 80 miles. The altitude of this summit is little short of 3000 feet from the level of lake Champlain. These mountains obtained the name of Peru from the French inhabitants, in allusion to their supposed mineral treasures. With some few exceptions, the whole county S. of the Highlands is underlaid by rocks of granite, with superflata of other rocks, which appear in the elevated tracts. There are some tracts of lime-flone and some of sand-flone, but these are so inconsiderable in extent as to furnish no objection against deno- minating this the granite region. Some ranges of hills on the W. of the Hudson, composed of sand-flone, are underlaid by granite; and the Catskill mountains are a mass of sand-flone, similar to the Alleghany mountains in Pennsylvania, intermixed with lime; the Helderberg, with some particles of sand-flone, occasionally interperfered. N. and E. of the Highlands the rocks are chiefly schistous that form the subfratum, while calcareous ridges of great extent occupy the surface. The hills on the eastern border of Columbia and Rensalleer counties are formed chiefly of schistus, intermixed with quartz, and occasional superflata of lime-flone. On the eastern declivities of these hills lime-flone predominates, forming the marble quarries of Stockbridge, Lenosborough, &c. in Massachusetts. The northwestern continuation of the Catskill or Catskill presents a kind of calcareous granite, in which the absence of felspar is supplied by primate lime-flone. The Peruvian mountains are principally granite, though ridges of lime-flone, flate, flint, and sand-flone, appear in conglomerate masses, and these are most abundant in mineral treasures. The whole level county of the small western lakes is calcareous. The Taconic hills that border the fourth-eastern part of Columbia county are to the Hudson and the Mohawk are the most considerable rivers, to which we may add the Susquehanna, a branch of the Hudson and Saco rivers, connected with Saco and Brant lakes. The creeks of the Hudson and Mohawk are numerous. The Susquehanna rises in this state; and its western branch, the Tioga, is a river of some note, and claims distinction from several creeks belonging to the former river. The Delaware, which receives several rivers and creeks, forms a part of the western boundary of New York; and the Alleghany, a principal branch of the Ohio, has its origin in this state, and its creeks, large and small, are too numerous for our re- cital. The Chataqua lake discharges itself into Connewango creek. The Catarans and Buffalo creeks run into lake Erie; Tonawanda and Ellicott's creeks into Niagara river, forming a part of the western boundary of the state. Lake Ontario, half of which is in this state, receives the Genesee, the Oswego, and Black rivers, which convey into this lake the
the waters of several other rivers and creeks. The St. Lawrence washes more than 100 miles of the north-western boundary, and it receives a number of rivers and creeks. Half of lake Champlain also belongs to this part, and it is supplied by several streams. Each river also belongs to this part.

The climate and seasons must in such an extent of country be very various, so that it is difficult to accommodate any general observation to the whole State. In the eastern territory, or wholly of the Highlands, where the prevailing winds are south-eastly, the weather is generally very variable; and the changes of temperature governed by the winds, frequent and sudden. In the northern part of the State, the weather is less variable; but the winters are long and severe, with a clear and settled sky. This region, extending from the southern extremity of Lake George, and westward to near Lake Ontario and the St. Lawrence, may be distinguished as the region of the "northern climate." That of the "western climate" comprises the great western territory of this State, extending from the Catskill or Catskill mountains to the great lakes. Here south-westerly winds prevail in a considerable proportion throughout the year. A gentle current of air, that may be traced from the gulf of Mexico, and reaching to a distance of more than 1000 miles, prevails almost constantly from the S.W.; and northerly and easterly winds are almost wholly unknown. In this district, the average temperatures are about three degrees higher than in similar latitudes in the eastern climate. Such is the general character of the western climate of the United States, and the distinction is said to terminate, or nearly so, with the region about Lake Ontario. The western climate of this State is therefore warmer than the eastern by about 3° of Fahrenheit; and this is attributed to the greater prevalence of warmer currents of air from the S.W. In the region about Albany, the rigours of winter commence about the 20th of December, and end with February, or about the 10th of March, when the ice usually breaks up in the Hudson. From the middle of March to the end of April, the weather is very variable; the changes of temperature great and sudden, though it be generally rainy, with long-continued storms of easterly winds. May is also a variable month; June assumes a summer character; in July, southerly winds are diminished, and drought prevails; August is more showery, and more uniformly temperate, than any month of the year, and affording health and plenty. The former part of September resembles August, and terminating with mild and pleasant weather, October is an agreeable month; early frosts occur about the 26th of September, though corn ripens till the middle of October; and from the 15th to the 25th of this month the foliage of the forest-trees is destroyed, and early falls of snow commence about this time. December is usually cold and showery, and storms from the N. and E. are frequent, and of long continuance. It is observed, that a general modification of temperature, favourable to agricultural interests, has occurred within the last 10 or 15 years.

This State affords facilities for inland navigation superior to any other, combining both the objects and the means of intercourse. The connections of the rivers Hudson, Mohawk, Otsego, Delaware, Ohio, Susquehanna, Alleghany, Mississippi, and St. Lawrence, by creeks and streams, and canals with the lakes Oneida, Erie, George, Champlain, Ontario, &c. are peculiarly favourable to internal navigation and commerce. The canal at Rome, which connects the waters of the Mohawk and lake Ontario, and which was completed in 1797, deserves particular mention; and it should be noticed to the honour of this State, that the western inland lake navigation company is formed for the direct purpose of improving the navigation of the western waters; and that the project of a great western canal for connecting lake Erie and the Hudson by a boat navigation is a very important object.

The State of New York has few bays, exclusively of those of Long Island, which are very numerous. It has many islands, among which Naffau, or Long Island, claims the first place, as it affords more than 100 miles of sea-coast, many excellent harbours, and many advantages for commerce. Its bays are both numerous and large, and it has immediately dependent upon it many subordinate islands. The islands in the bay of New York, as well as that upon which New York itself is situated, and Staten Island, and those belonging to the Hudson, Mohawk, Niagara, and St. Lawrence rivers, to lake Ontario, Champlain, George, &c. might be enumerated if our limits would allow. In this connection we might also mention a variety of bridges that enable to facilitate communication and intercourse between the various parts of this State.

The soil and agriculture of New York deserve particular attention. The soil is of various characters in different parts of the State. In some districts it is deep and warm, and well adapted to grain or grass; in other parts it is of a looser texture, and is found in various proportions by the admixture of vegetable remains; forming a thick vegetable mould, with a small proportion of earth, and called by the farmers in that country "black muck." This is soon exhausted, and as it refits on a substratum, called "hard-pan" by the farmers, that is cold and stony, it is incapable of being refertilized or reclaimed by any manure or art of husbandry. The west end of Long Island is rich, fertile, and highly cultivated; but the eastern part has a large proportion of sandy barren plains. Below the Highlands, the soil is principally dry and warm, having a gravelly or sandy substratum, or granitic rock. North of the Highlands to the Mohawk, the soil is dry and warm, being either a gravelly or sandy loam in general; and both those which we have mentioned are slated to be a medium soil. But on the eastern border of the State, the rocks are principally schistose, and a schistose gravel forms most of the soil, which is warm and productive, though not deep. The alluvial plains of Columbia and some part of Rensselaer counties are very extensive and rich; and the valleys, presenting a warm gravelly soil, are also extensive, and furnish much good medium soil. West of Albany are extensive sandy plains, interperfed with marshes, and rather cold and wet till we approach the Helderberg hills. This plain is generally underlaid by clay; but the Helderberg hills are calcareous, and present a better foil, though broken and much diversified.

The agricultural products of this division of the whole territory of the State consists of all the various productions of this country. The west part of Long Island, and the counties of Westchester and Dutchess, are well cultivated. The latter is one of the best farming counties in the State. The introduction of gypsum as a manure has marked a new era in the agriculture and rural economy of this region. The west side of the Hudson is considerably behind the eastern. The southern part of Washington county has a warm gravelly medium soil, and abundant crops. Saratoga has much good but more wafe land. Its general character is more sandy, and, like that of Albany, rests on clay. Around Lake Champlain there is a large extent of clayey soil, extending to the hills that skirt the Peru mountains. With the exception of the alluvial flats, which are extensive and rich, the soil of the country of the Mohawk may be generally
generally denominated a flint loam, till we go west of the Catskill hills at the Little Falls. Here it assumes a new character. The soil of the mountainous tract of the western region is much diversified: the hills are rocky; the valleys deep and narrow, or spacious and rich. This soil furnishes considerable black muck, or deep vegetable mould, in the valleys. A very large proportion of the soil of this country may be denominated a rich mould, variously intermixed with earth of different kinds; and much of the soil is well adapted for grain and grapes. No part of the slate is more rapidly advancing in agricultural improvements than this western region. The soil of the level country east of lake Ontario, and along the St. Lawrence, is a warm sandy loam, with a large proportion of the flint rate of medium for agriculture.

The rotation of crops lately introduced into this country marks a new era in its agriculture. We shall clothe this detail with remarking, that the exertions of the agricultural society of this state have been very beneficial, though its publications need more general circulation.

The botanical productions of this state are numerous and various. Its forest-trees are luxuriant. The region of the western climate is principally wooded with deciduous trees, and of the loftiest growth. Those of the eastern or Atlantic climate are generally deciduous, but less lofty. The most common forest-trees are, oak, maple, beech, walnut, butternut, chestnut, birch, tilia or bals-wood, poplar, cherry, fycamore or button-wood, ash, elm, sassafras, hornbeam, sumach, elder, pine, spruce, larch, fir, hemlock, cedar, and in some parts, locust laurel, mulberry, black-walnut, cucumber-tree, crab-apple, and common thorn, of many varieties. The state of New York is efficiently agricultural. Wheat is the first object of the farmers; and they also cultivate rye, maize, oats, flax, hemp, peas, beans, &c. and most of the domestic grasses are cultivated with success. Fruits are abundant and various; such as apples, affording cyder of the best quality, peaches, pears, plums, cherries, &c. The garden-fruit is as various as those of any state in the Union.

The domestic zoology of the state presents the horse, the cow kind, the merino and other kinds of sheep, which furnish good wool, and swine. The wild animals, not to mention the mammoth, the moose, and the bisons, now extinct in this state, are, the deer, bear, wolf, and fox; and more rarely, the otter, the wolverene, the wild-cat, racoon, marton, the weasel, hare and rabbit, squirrel and mouse, &c. The lakes and rivers supply abundance of fish, such as the salmon-trout, trout, flurgeon, chad, herring, pike, and many others. The oysters are in high repute. The number of birds stationary and migratory is very great. Serpents are found in small numbers, and the rattlle-snake does not frequently occur; other snakes are numerous. It is needful to mention the insects, of which the number and variety are considerable.

The mineralogy comprehends iron-ore, slate, gyphsum, lime-flint, marble, flake, native brimstone, coal, ores of lead, copper, zinc, tin, albotellis, mill-flones, marble and peat, clays, alun, flwine-flone, &c. Calcaryeous petrifications are very common in the calcareous regions. Siliceous sand for the manufacture of glafs, hamboro, a variety of ochres, mica, flingflas, magnesian flones, amanthes, black flints for mufkets, molybdena, iron and copper pyrites, emery, magnetic ores of iron, ores of zinc, ores containing silver and antimony, and rock crysflals, are severally found in various parts of this state. Its mineral waters are held in high estimation.

The constitution of this state was adopted by a convention of delegates April 20, 1777, and revised in 1801; and its character is republican. The constitution of the United States was adopted in this state in 1788. The supreme executive power is vested in a governor and lieutenant-governor, elected every three years by free-holders pollfing a clear fiate of 250 dollars; as are the senators also. The supreme legislative powers are vested in a senate and house of assembly, which meet at least once in each year. The senators are elected for four years; the members, or representatives, as they are called, who compose the house of assembly, are elected annually. The number of senators is limited to thirty-two; that of members is not to exceed 150.

For the convenience of electing senators, the state is divided into four great districts: the southern, which elects five senators, and comprehends six counties; the middle, eight; the eastern, nine; and the western, twenty-two. The general election is held annually. A census of the electors is taken every seven years, and the representation apportioned according to the numbers in the respective counties, increasing the number of representatives each year by the addition of two, until they amount to 150. The senators are divided into four classes, elected at different periods, so that some new senators are chosen annually. The governor is commander-in-chief of the militia, and admiral of the navy, of this state: he has power to convene the legislature; to grant pardons and reprieves for crimes, except treason and murder; and can suspend the execution of sentences in those cases till the sitting of the legislature, which alone has a right to pardon. A council of revision consists of the governor, the chancellor, the judges of the supreme court, or any two of them, whose duty it is to revile all bills about to be passed into laws; and if they object in writing to a bill, a re-consideration takes place, and the same must be amended or approved by two-thirds of both houses before it can then become a law: and this is the negative of the executive power. If the council neglect to return a bill, in ten days it becomes a law, unless the legislature has previously adjourned. A council of appointment consists of the governor, and a senator from each of the four great districts, chosen annually by the legislature. In this council, the governor presides, with only a casting vote. The right to nominate is vested concurrently in the governor and the other members of the council. The lift of officers annually appointed by this council is enormous, and consilts of most of the subordinate officers of the state.

The chancellor holds courts of equity, and appoints the officers of his court. The supreme court is a court of law. It consists of a chief-justice and four associate judges. County courts consist of a first judge and a number of associate justices. Circuit courts are held in the respective counties by a judge or justice of the supreme court, and the judge and justices of the county. Justices of the peace have cognizance of trials for the recovery of debts to the value of twenty-five dollars; and in New York to the value of fifty dollars. The right of habeas corpus is preferred, and the trial by jury.

The great officers of state are, the governor, lieutenant-governor, a secretary of state, comptroller, treasurer, surveyor-general, attorney-general, council of appointment, commissi®neer of the land-office, the regents of the university, &c. for the department of state.

Judiciary officers of state, a chancellor, five judges of the supreme court, and a judge of probates.

For the general convenience and the better administration of justice, the whole territory of this state is subdivided into counties, and these into towns.

From the report of the comptroller to the legislature of this state in 1811, the productive funds of this state, invested
York.

vested in rock of banks, United States stock, &c. securities on lands, &c. &c. amounted to 4,101,823 dollars 25 cents, producing an annual revenue of 278,489 doll. 96 cents. To this amount of funds should be added the school fund, amounting to 483,262 doll. 29 cents, producing an annual income of 36,427 doll. 64 cents. The state also owns about 1,000,000 acres of land, which, valued at two dollars per acre, amount to 6,675,129 doll. 54 cents. The expenses of government for the year 1811 amounted to 268,160 doll. 22 cents. This estimate draws an excess of revenue amounting to 10,123 doll. 74 cents, and including the balance in the treasury, Feb. 16, 1811, of ready funds, to the amount of 34,129 doll. 86 cents.

The militia of this state consists of every able-bodied male inhabitant between eighteen and forty-five years of age; and the laws have made an honourable exception in favour of those whose religious opinions are averse to war. Agreeably to the annual return of the adjutant-general for 1809, the enrolled infantry amounted to 95,324; the artillery, 3102; the cavalry, 3642; giving a total of 102,068.

The constitution provides for the free exercise of religion in this state in the following terms: “And whereas we are required by the benevolent principles of rational liberty not only to expel civil tyranny, but also to guard against that spiritual oppression and intolerance, wherewith the bigotry and ambition of weak and wicked priests and princes have engrossed mankind: This convention doth further, in the name and by the authority of the good people of this state, ordain, determine, and declare, that the free exercise and enjoyment of religious profession and worship, without discrimination or preference, shall for ever hereafter be allowed within this state to all mankind. Provided, that the liberty of conscience hereby granted shall not be so construed as to exclude acts of licentiousness, or justify practices inconsistent with the peace or safety of this state. That no minister of the gospel, or priest of any denomination, shall ever hold any civil or military office or place within this state.” In April, 1806, a law was passed authorizing all religious denominations to appoint trustees, for the purpose of superintending the temporal concerns of their respective congregations. And these trustees become a body corporate by that general act, capable of all legal transactions in behalf of the congregation.

All denominations, therefore, are left at liberty to support their own ministrv, and maintain the order of their worship, in such way as is most agreeable; and every congregation may designate from three to nine of its members as trustees, who are, with little trouble, invested with corporate powers in behalf of the whole, and authorized to hold estates producing an annual revenue of 30,000 dollars. This free toleration has not produced more facts in this than in other states left tolerant of religious opinions. There are many facts however; and in the enumeration of those, no regard is paid to comparative numbers. There are, English Presbyterians, Dutch Reformed, Congregationalists, Episcopanians, Quakers, Baptists, Methodists, German Lutherans, Moravians, Roman Catholics, Shakers, Jews, and a few of the Universal Friends, or the followers of Jemima Wilkinson, Scotch Cameronsians, Anabaptists; and Christian charity would include all the others, because those who profess Christianitv. But it is worthy of remark, that many of the above sectarian distinctions exist merely in name, while their tenets differ less, perhaps, than those of the same religious society, in the individual opinions.

The manners and customs of this state have undergone a considerable variation during the period that has elapsed from its first settlement to the present day. Among those who planted the colony of New York, and who for many years afterwards settled in it, a large proportion consisted of Dutch families, who migrated hither from the Dutch Netherlands, and transferred to the societies which they established here, the rural economy of the population of the Netherlands, of Holland, and of the banks of the Rhine. Soon after their arrival, various parts of this state presented buildings resembling those of their native country, and habits of manners, order, industry, and frugality, which they had practiced from their youth. After the conquest of the English in 1664, multitudes flocked hither from various nations of Europe, and produced a considerable change in the original and discriminating character and customs of this colony. In 1685 it had a numerous accession of French Protestant. In 1710 it was augmented by about one hundred families of poor Poles from Germany; fifty or seventy of which settled German-town on the east bank of the Hudon, and some at Epus, now Kingston. Other early German emigrants settled on the Mohawk, in Orange county, on Long island, and in many other parts where their descendants are now found. The early English settled principally at New York and in Long island. The French, at New Rochelle, in Westchester county, and on Staten island. The Scotch fixed themselves, during the more early periods, about Albany, and in Washington county. Massachusetts supplied also the east part of Long island with inhabitants, whose politeness form a large share of the present population. But the Dutch were the original proprietors and first colonists, and therefore their possessions were the greatest and the most valuable: nor did they, or the Germans, next to them in number and importance, altogether abandon their discriminating manners and habits. The Revolution, however, produced a material change in this state, and the change, though effected by fanguinary conflicts, was not unfavourable to its general character. The prosperity that succeeded the peace widely diffused a spirit of enterprise and of emigration; and was followed by a surprising increase of population and wealth. Hence arose those various traits of national character, and those diversified habits, manners, and customs, which have distinguished this state. It is observed, that the new character imparted by the influx of emigrants is beneficial to the state; more especially as the New England people have introduced their improved agriculture, their spirit of enterprise, their megreuty in the arts, and their social habits. In this state, it is said, there are about 100,000 freeholders; and freehold estates are known to produce for their proprietors from 30,000 down to 50 dollars per annum; and this fact is alleged as forming a peculiar feature of the civil habits, manners, and customs of the population of this state.

The English language is chiefly prevalent in this state; though the Dutch and German are in use among people of Dutch and German descent; but these and other dialects are declining, in consequence of the intercourse and influence of a large majority of those who speak English. Some few influences, however, occur, in which public worship is performed in the Dutch, German, and Welsh dialects.

The tale for literature and science is gradually increasing, and is promoted by a variety of publications; and by the progressive improvement of school education, by which a liberal fund is provided, which has been already mentioned. We are informed by the writer of communications, of which we avail ourselves in the compilation of this article, that there are about a hundred printing establishments in this state, and fifty-nine gazettes, besides a very considerable number of other public journals, which contribute to diffuse various kinds of knowledge. The advancement of literature is promoted by
an institution established in 1787, intitled "Regents of the University of the State of New York;" being a society of twenty-one gentlemen, possessing adequate powers derived from the legislature for superintending colleges, academies, and schools. The university of New York is acquiring distinction, and the Columbia college claims high reputation. See COLLEGE.

In this state there are fifteen banking companies, with a very considerable sum of capital stock, which is said to have amounted in 1811 to 12,382,000 dollars; and 11 incorporated assurance companies. The manufactures of this state, consisting of woollen, linen, and cotton cloths, leather, paper, hats, iron, &c. are in an improving condition, and are said to have amounted, in 1811, to 30,000,000 dollars, of which 12,000,000 were produced by household industry and enterprise. If we judge of the commerce of this state by the returns of 1810, it must appear to be very considerable. The domestic exports of that year amounted to 10,925,573 dollars, and the foreign to 6,315,757, making a total of 17,241,330 dollars; and it is said that the port of New York yields about one-fourth of the revenue of the United States, arising from commerce. The exports, exclusive of articles from foreign countries, consist principally of beef, tallow, pork, hams, lard, wheat, maize, rye, butter, cheese, pot and pearl ashes, flax-feed, peas, beans, hogs, cattle, lumber, flour and meal, bread and biscuit. The foreign exports are composed of important articles. Wheat, which is the national flax, is exported annually to a very great amount; and about 6,000,000 bushels on an average, after deducting the supplies for the country, are sent to market from the surplus product of this state. The average annual payments into the treasury of the United States, for duties on imports, tonnage, &c. exceed 4,000,000 dollars from the district of New York.

The Societies for promoting Agriculture and the Arts in this state are numerous. It has also several Medical Societies; an Historical Society; and also an Academy of Arts lately established at New York. Bible and Missionary Societies are instituted in New York, Albany, and some other counties; and the Charitable and Humane Societies abound. In the city of New York alone there are about forty benevolent institutions; and there are societies of the same kind, as well as those of a literary nature, in Albany, Hudson, Schenectady, Troy, Poughkeepsie, Kingstown, Newburgh, Utica, and most of the large towns.

The State-Prison, or Penitentiary, is about two miles from the city-hall, in the city of New York, on the E. bank of the Hudson; it was built in 1796-7, and together with its buildings and courts comprises four acres of ground. The immediate government of the prison is committed to seven inspectors. The convicts are all dressed in uniform, the sexes kept separate, and all are comfortably clothed and fed. Great care is taken of their morals, in the benevolent hope of a reformation.

The Natural Curiosities of this state comprehend the cataracts or falls of Niagara, of the Mohawk, of the Hudson, of Well Canada creek, of Black river, Seneca river, Genesee river, and some others of lefs note. It is probable, that the southern and western parts of this state were occupied by a considerable proportion of Indians at a remote period. So long ago as the year 1655, the country about the lake Onondaga was considered as a favourite station by the wandering tribes; but their condition was not much known till about the year 1635. At that time, the Iroquois, or Five Nations, occupied the countries from lake Erie to Ontario, the St. Lawrence, around lake Champlain, and the whole of that watered by the Hudson down to the Highlands, were very numerous and warlike. Such was their ascendency, that the Indians of the lower country of the Hudson, on the Connecticut, the Delaware, and Susquehanna rivers, were in a kind of subjection to them. Onondaga was the principal settlement, and the seat of Indian power. Their combination confounded of Onondaga, Oneidas, Mohawks, Cayugas, and Senecas; and it was then so powerful as to be able to send several thousand warriors on distant expeditions. The first Christian colonists, availing themselves of Indian wars, which they promoted, taught the Indians to despoil and abhor those for their hypocrisy and perfidy whom they had first considered as beings of a superior order; and thus originated the intractable enmities which not only continued but increased when the French and British became rival nations. About the year 1690, the English erected a strong fort at Onondaga; and in 1696, the French sent a considerable force against the Indian settlement, and succeeded in destroying it. From this time, colonies of each of these nations were planted there at different periods. But we forbear, to pursue their histories, and to trace the fanatical confusions that have mutually concurred and confounded Indians and professéd Christians. At this time, the principal settlements of the Indians are at Onondaga and Oneida, on the Geneve and Alleghany rivers, Buffalo creek, and Tuscarora, besides other places which we have not room to enumerate in detail. But we must hasten to finish this sketch of the New York state by a brief abstract of its history.

Soon after the discovery of America, towards the commencement of the 16th century, the present state of New York was possessed by the Iroquois, and Canada by the Algonquins, two rival nations of Indians. About the year 1608, the French planted colonies in Canada, which they had laid claim to having first sailed up the St. Lawrence as far as the present Montreal. In 1609 Champlain, the founder, discovered lakes Champlain and George, when he defeated a small party of the Iroquois. In 1628 Hudson, an Englishman, discovered the East and North rivers, ascending up the latter as far as the present Albany; and soon after he sold his right to the Dutch. In 1644 the States General of Holland erected a fort at Albany, and granted an exclusive trade on Hudson river to the Dutch West India company; and in 1629, Wouter van Twiller, the first governor, arrived, and took the command of New Netherland, as it was then called. The English, who still laid claim to this country, objected to the sale of Hudson; and in 1663-4, the English king granted the whole to his brother James, duke of York and Albany, afterwards James II. A small armament subdued the colony for England, which then took the name of New York, as did the city also. In 1673 New York was conquered by the Dutch, but restored in 1674. The duke's grant was confirmed, and the colony alligned to the English by treaty; and this right they held till the Revolution. From the surrender of the province in 1664 to 1683, the duke of York possessed full sovereignty. He appointed the governor and the council, who made rules and orders that were acknowledged as laws. These were called the duke's laws; they were collected and arranged about 1674, and a copy of them is deposited among the records of the state. Thence, it is said, which were made in 1683, and after the duke's accession to the throne of England, when the people were admitted to a participation of the legislative power, are defaced or lost. No regard is now paid to any laws made here antecedently to 1691, when the first legislative assembly was organized. New York was then divided into nine counties, and the house consisted of seventeen delegates. The second legislative assembly was convened in 1708. We shall not minutely trace
The whole number of the churches, or houses for Christian worship, is 37; besides a Jewish synagogue. Of these, eight are Presbyterian, eight Episcopal, four Dutch Reformed, three Scots Presbyterian, three Methodist, two for Friends, or Quakers, two Baptist, two German Lutheran, one French Protestant, one Moravian, one Roman Catholic, two African. The New York hospital is an extensive establishment; the custom-house adjoins the battery at the S.W. angle of the city; the gaol and bridewell are opposite to the Park, and the Custom-house is on the same square with the gaol, bridewell, and city-hall. The college is about midway between the Park and the river Hudson; and St. John's church, reckoned the most elegant in the city, is in Hudson-square, farther north. The State-prison is two miles N. of the battery, on the bank of the Hudson. Here are also a library and theatre, fix market-houses, and many other buildings that might, if space were allowable, be enumerated. There are eight banking-companies in this city; and their houses and offices, together with those of the insurance, manufacturing, and other companies, and those of various societies, add to the number of edifices that adorn the metropolis. The population, which by the census of 1810 was estimated at 96,373, is supposed to amount to more than 100,000. The city and harbour of New York have been lately fortified against naval assaults at a very great expense; but we should be tedious in minutely describing the works which have been constructed for this purpose. The number of charitable establishments, and of schools for education in this city, is very great, and does honour to the disposition and liberality of its inhabitants. The markets, which are kept every day, are well supplied with the productions both of land and water. The public walks and amusements in the vicinity of this city afford attraction to its flated inhabitants, and to those who occasionally resort hither. The theatre, reading-rooms, public-gardens, park, and walks on the battery, afford amusement, and contribute to activity and health.

The city of New York is governed by a mayor, recorder, aldermen, and assessors, who constitute the common council. Each ward chooses an alderman and assessor. The mayor, deputy-mayor, recorder, and aldermen, are ex-officio justices of the peace, and justices of oyer and terminer; and the mayor, aldermen, and commonalty, are authorized to hold a court of record or of common pleas; and this is called the mayor's court, and deemed of great importance. For the manufactures, commerce, literature, institutions, &c. &c. of the city of New York, we refer to the account already given of the state of New York. Melish. Morde. Spafford's Gazetteer of New York, 1813.

York, New, a poll-town of Virginia; 167 miles S.W. of Washington.

York Town, or York, a township of West Cheltenham county, in the state of New York, 45 miles N. of New York, bounded by Duchess county, E. by Somers and New-castle, S. by New-castle, W. by Cortland; in length N. and S. 10 miles, and nearly 4 miles wide. The general surface is hilly, but productive, and well distributed into arable, pasture, and meadow lands. In 1810, there were 269 taxable inhabitants, 142 electors, and in all 1974 inhabitants.

York Town, a town of the state of Virginia, capital of the county of York, on the right bank of York river, about 10 miles from its mouth, containing about 800 inhabitants. In the year 1781, the British army under lord Cornwallis surrendered themselves prisoners of war to the united forces of America and France near this town, and was the occasion of a peace which followed soon after. A marble column,
YORKSHIRE.

column, with a suitable inscription and trophies, was ordered by Congress to be erected on the spot in commemoration of the event; 8 miles E. of Williamshurgh.

YORKSHIRE, a county in the northern part of England, which, for extent, for its number of inhabitants, and for its natural and artificial productions, is by far the most considerable in the kingdom. In its general form the county is an irregular quadrangle; the longest diagonal extends from N.W. to S.E. about 130 miles, and the shortest from S.W. to N.E. about 90 miles. The area of the county comprehends about 5,960 square miles, or above 3,814,000 statute acres. Yorkshire, taken at its extreme points, is situated between the parallels of 53° 18', and 54° 40' N. latitude, and between 2° 40' of W. and 0° 10' of E. longitude from Greenwich. On the N., the E., and part of the S. sides, it is distinctly defined by rivers and by the sea. On the N. it is separated in its whole extent, from the county of Durham, by the river Tees. From the mouth of this river to the entrance of the Humber, the whole E. side is washed by the German ocean. By the estuary of the Humber and the river Trent, it is divided from Lincolnshire on the N. The limits between Yorkshire, and the counties of Nottingham, Derby, and Chester on the S., and those separating it from Lancashire and Westmorland on the W., are merely conventional, being indicated by no natural feature of the country; the latter, however, in a general, coincide with the mountainous range which distinguishes the northern from the southern provinces of England. At a very early period of the Saxon dominion, the great county of York was subdivided into three districts, still recognized, and still under the corrupt name of ridings. These are termed north, east, and west, in reference to their relative positions with respect to each other, and to the capital city of the county. The North Riding is subdivided into 12 wapentakes, the East into 7, and the West into 11 wapentakes; the whole county thus containing 38 wapentakes and 569 parishes. The wapentake, a division adopted in certain northern counties of England, corresponds generally to the cantred or hundred of the southern provinces. The whole county comprehends one archiepiscopal city, York, and 59 market-towns, of which 13 are parliamentary boroughs. Of those last in the North Riding are 5, viz. Malton, Northallerton, Richmond, Scarborough, and Thirsk; in the East Riding contains three boroughs, Beverley, Heydon, and Hull; in the West Riding the five boroughs are, Aldborough, Boroughbridge, Knaresborough, Pontefract, and Ripon. Yorkshire sends thirteen members to parliament; viz. two for the county, two for the city, and two for each of the boroughs just named. According to the official reports made in 1811, the number of houses and inhabitants in the county was the following:—In the North Riding 33,567 houses, and 152,445 inhabitants; in the East Riding (York city included) 31,420 houses, and 167,155 inhabitants; and in the West Riding, 129,575 houses, and 653,315 inhabitants. From this statement, Yorkshire, at that period, contained altogether 194,562 houses, and 973,113 inhabitants, or on an average 163 persons for each square statute mile.

General Appearance, Soil, and Climate.—Yorkshire is an extensive and interesting county; in its geographical features, and geological characteristics, it presents important themes for inquiry and disquisition. Its ancient history, and the numerous antiquities with which it abounds, afford other and not less interesting topics for investigation and comment. The manufactures, commerce, and trade of the county; its mineral productions, and agricultural practices, are also entitled to the most careful and critical develope-

ment of the topographer. It is, however, to be regretted, that neither of these subjects has hitherto been satisfactorily elucidated by a local historian: whence we shall be necessitated to refer to and cautiously analyse several detached and imperfect works, to render a short topographical account of this widely-extended county in any degree useful to the general reader. In the sequel these works will be referred to. Yorkshire presents a great variety of surface: mountains, hills, vales, moors, fens, rocks, coasts, and rivers, are its component parts; but these are greatly diversified. The North Riding consists principally of two hilly regions, separated by a comparatively low tract, which opens on the S. into the spacious plain of York. The hill parts are commonly termed, from their position and their nature, the E. and the W. moorlands. Tho the E. bounded by the valley of the river Tees on the N., and by the sea on the N.E., occupy a space of 30 miles from W. to E. by about half as much from N. to S. They consist in general of bleak heath, interspersed with loose blocks of stone, or with peat-mofs and bog. The whole is defitute of wood, excepting in a few interfingering dales or valleys, where cultivation is practicable. Of these dales a few are of moderate extent, particularly Eildale and B'ldale, in the eastern parts toward the sea. The western extremity of these moorlands, in the district of Hamilton, produces heath intermingled with large quantities of coarse grass. Between the N. edge of the moorlands and the river Tees is the fertile district of Cleveland. Several productive valleys intersect the W. moorlands, of which Wentleydale is the most considerable. Watered by the river Ure, the bottom of the valley furnishes rich grazing grounds, bordered on each side by sloping inclosed fields, which reach up the hills for more than a mile from the river. In the Eall Riding the face of the country, although varied, is less boldly characterized than that in the N. It is divided in the middle into two extensive plains, by the Wolds, a range of hills stretching N. and S. Towards the sea the coast of this Riding is in general low when compared with that of the North Riding; but in several places it rises to cliffs of considerable height, as at and in the vicinity of Flamborough-head. The S.E. part of this Riding consists chiefly of a tract of fen and marsh, about 20 miles in length, and four in breadth, which spreads from the sea to the Humber. This part of the Riding, forming the wapentake of Holderness, runs out to the S.E. and S., and terminates its course at the Spurn, a well-known point on the N. shore of the Humber. A succession of rocky ridings forms the eastern acient of the range of the Wolds; but on other sides they are steep; and the whole have an agreeable and peculiar appearance. Considered with respect to extent and population, to manufactures and trade, the West Riding is by far the most important division of Yorkshire. Its surface is very irregular, varying from the low marshy tracts in the E. to the rocky mountainous country in the W. The level marshes are the continuation of those already mentioned in the Eall Riding, and extend westward nearly to the great N. road through Doncaster. Still farther westward lies the middle division of the West Riding, gradually and beautifully swelling into hills, and extending to Sheffield, Bradford, and Otley. Beyond these towns, the country becomes rugged and mountainous, and is composed chiefly of black moors, which terminate in the lofty range of hills bordering on Lancashire. These hilly and mountainous tracts are not, however, without many beautiful and romantic valleys, among which are those watered by the rivers Aire, Nid, and Wharfe. Several of the smaller dales are
well-wooded and inclosed, and have numerous villages interpersed.

The soil of Yorkshire is not less variegated than the surface. In the E. moorlands of the North Riding, wherever the ground is covered with ling or heath, the upper soil is invariably black moor or peat; but the subsoil is various, and consists of clay, free-flone, and hardened sand. In that part of the moors called Hamilton, the soil consists generally of fine loam on lime-flone rock. In the interfing daleys, black moory earth, sand, and grit-rock, more or less, prevail; but the vale of Cleveland, along the river Tees, is composed chiefly of strong tenacious clay. Lime-flone, or a calcareous rock, is the general basis of the W. moorlands; and the beneficial effects of this subsoil are evident in the grasses and other useful productions with which the surface is generally covered. In the extensive tract of plain styled the Vale of York, which occupies the interior parts of the county, and comprehends portions of all the three Ridings, considerable changes of soil are found. In the N. part towards the river Tees, a rich gravelly loam prevails. The slopes of the high grounds on the E. and W. are in some places cold, and abound in springs; but in the greatest part the soil is strong and fertile. Of the East Riding, the most striking feature is the range of hills called the Wolds, composed of chalk; but the surface is in general a light free loam, interfinged with chalky gravel, often very shallow. The great plain between the Wolds, the sea, and the lower part of the Humber, contains many extensive tracts of fertile cultivable land, especially in the N. and E. quarters; but the southern districts, towards the river, are covered with marshes and fens, insupportable, where draining can be practised, of material improvement. In the continuation of these sens, situated on the W. of the Wolds, called the Levels, the soil is either clay or sand, with moorish tracts interfinged; but on the banks of the Darwent and the Ouse strong clay and loam prevail. In the extensive West Riding soils of every kind are to be found, from deep strong clay and rich loam to the poorest peat-earth. Clay and loam, but mingled with some sand and moor, prevail in the E. district of this Riding, while the middle division consists chiefly of loam on a lime-flone base. Similar soils extend through the W. parts, but are frequently interrupted by tracts of moor of different kinds.

In a country of such extent, and of such variety of soil, elevation, and exposure, as Yorkshire, an accordant variety of climate, with regard to temperature, humidity, and salubrity, must naturally be experienced. The E. moorlands, advancing high and bold into the German ocean, are necessarily exposed to the cold, moist, and impetuous winds from the N. and E. The climate there, however, is rather disagreeable than unhealthy; for the high grounds are frequently involved in mists and vapours from the sea. Among the W. moorlands the climate is still more severe; but its effects on the productions of the surface are powerfully counteracted by the calcareous rock of which those mountainous tracts consist. By their distance from the sea, combined with their much greater elevation, the snow remains on them considerably longer than on the E. moorlands. But the greatest obstacle to agricultural labours in the W. parts of the county is the almost incessant rain which falls among the mountains. On them are accumulated and condensed the vapours collected by the opposite winds, which prevail on the contrary sides of the island. By the humidity thus produced, no attempt to raise corn-crops among those high lands can succeed. In the intermediate plains and gently-swalling tracts of the centre of the county, the climate is, on the contrary, in general mild and temperate, in proportion to the remoteness from the mountainous quarters. The low grounds on the banks of the Darwent, are, however, so moist, although warm, as to be much better adapted to pasturage than to corn-land. What is said of the climate of the W. parts of the North Riding is equally applicable to the corresponding portion of the W.; for there the climate is also rainy, cold, and stormy. At Sheffield, although on the S. border of the county, the quantity of rain which falls in a year is about 33 inches. It is, indeed, found by experience, that the lofty tracts which separate Yorkshire from Lancashire and Cheshire are fully as subject to fog, rain, and storms, as any other portion of England. But notwithstanding these circumstances, the air is pure and healthy. The middle and lofty elevated tracts of the West Riding are equally healthy, milder, and less humid; holding a defirable medium between the tempestuous blasts of the mountains in the W., and the dull fogs and damps which usually befet the lower country in the E. On the opposite sides of the Wolds, in the East Riding, a different temperature is experienced; for by those hills the W. division is in general sheltered from the cold damp winds from the sea and the entrance of the Humber, which prevail over the E. division. On the Wolds themselves the air is sharp, and the snow remains for a considerably time on the ground. But the mildness of the climate in the W. Levels is abundantly compensated, in regard to salubrity, by the vapours of the marshes.

Mountains.—The E. moorlands of the North Riding form a peculiar feature in the county; for they are wholly detached by their position, and by their sublimity, from the mountains in the W. Some points of the E. moorlands rise nearly 900 feet above the level of the sea; but the most remarkable summit of the whole is Rosbrough Topping. This singular hill, situated midway between Stokelsey and Guisborough, towards the N. edge of the moors, shoots up in a conical form, to the height of 1488 feet above the sea. By its detached position and superior elevation, it commands, in all directions, a prospect at once extensive and interesting. The hill seems to rest on a basis of alum-iron, interfinged with iron flone; and its pinnacled summit indicates to the surrounding country the approaching changes in the weather; for when the summit is involved in clouds, rains seldom fail to descend on the neighbouring low grounds. It is, however, on the W. borders of the county, that the most elevated mountains are found. These are a portion of the chain, which, commencing in the S. in Staffordshire, extend northward, with increasing elevation, through Derbyshire, Lancashire, Westmoreland, Cumberland, and Northumberland, into Scotland. In that portion of this range which belongs to Yorkshire are several summits of very considerable elevation above the sea. Of these, the most remarkable are, Penningt, which rises, according to barometrical measurement, to the height of 3930 feet; Ingleborough, 3987 feet; and Whernside, 4052 feet. The last mountain is the highest in England; for Crofsell on the borders of Cumberland is in height only 3839 feet; Skiddaw, 3530; and Snowden, the highest in Wales, 3568. Benennie, a detached mountain in the N. of Scotland, and the most elevated in Britain, rises to the height of 4387 feet. Penningt, situated about 7 miles N. from Settle, is steep and towering. Ingleborough consists of a basis of lime-flone, but towards the summit the grit-rock appears. The E. and S. sides of this mountain are very steep, and of difficult access, on account of a deep morass at the bottom; but the W. and N. sides, particularly the former, may be
afecended with ease. Continually receiving vapours from the Irish sea on the W., Ingleborough is seldom free from
clouds, and the whole mountain abounds with springs: whence it is covered with verdure, and sheep graze on
the most elevated parts. In the vicinity appear Penyghent, distant 6 miles to the E., and Whernside 5 miles to the N.
On the N.W. are the mountains of Wensmoorland, and on the W. spreads out the low land of Lancashire, bounded at
the distance of 24 miles by the Irish sea, of which a great
portion may, in clear weather, be detected. In the midst
of a circle of hills rifes Whernside, on which account,
although more elevated, the views from it are not equally
interesting with those from Ingleborough. Near the
summit are several small lakes or pools, there called tarns,
one of which is about 180 yards in length by nearly an
equal breadth. In the East Riding, the only hills of note
are the Wolds, which exhibit themselves to advantage, in
rising out of the low country around them; but at no point
are they supposed to exceed 600 feet in height.

Rivers.—Along the whole length of the North Riding,
from W. to E., the county is bounded by the river Tees.
Rising in the mountains of Wensmoorland and Cumbland,
it pursues a very indirect course to the German ocean
below Stockton, where it spreads out into an estuary three
miles in breadth. The river Tees is navigable for ships of
considerable burthen up to Stockton; but the channel
is serpentine and intricate, and the current is rapid.

Commounous anchorage is, however, found at the entrance, in
winds from the W. and S. A few inaccessible streams from the
W. moorlands fall into the river Tees; but the great
body of the waters of Yorkshire take their course in the
opposite direction, and unite with the Humber. Of these
rivers, the most northern is the Swale, which, rising in the
W. moorlands, enlivens the romantic Swale dale, and, and,
afte r visiting Richmond, bends S.E. until it reaches Bo-
roughbridge, where it unites with the Ure. The latter
river, proceeding from the same moors, passes near to
Ripon, and in some part of its course separates the North
and West Ridings. Having received the Swale, about
six miles below Boroughbridge, the Ure takes the name of
Oufe, from an insignificant rivulet which joins it on the W.
side. Under this last appellation the combined stream, still
farther augmented by the waters of the Nid, traverses the
city of York, where it becomes the limit between the West
and the East Ridings; and being navigable for large barges
up to that city, it receives on its W. side the rivers Wharfl
and Aire: at last, after a very wandering course to the
southward, in conjunction with the Trent, it disappears in
the estuary of the Humber. The Aire, already mentioned,
a very considerable stream, issuing from the mountains of
Craven, facilitates by its waters the important manufactur-
ing commerce of Leeds. Receiving on the W. side the current of
the Calder, which performs the same service to Wake-
field, the joint stream conveys an important accession to the
Oufe. Still farther to the S. the Don pursues its course to the
W. mountains to Sheffield, where it bends to the N.E. by Rotheram and Doncaster, to its influx into the
Aire. Before it be lost in the Humber, the Oufe receives on the E. the Darwent, which, having its sources in the
E. moorlands, flows in general S.W. by Malton, across the
western parts of the E. district. Two small streams still
deferve notice in Yorkshire, not too much for their length of
course, or volume of water, as for their great utility in
forming the principal ports of the county. In the E.
moorlands of the North Riding rifes the Eke, which after
watering Elfdale opens into the German ocean through the

YORKSHIRE.

harbour of Whitby. The river Hull traverses the East Riding
from N. to S. palling near to Beverley, and, at its influx into the
Humber, forms the creek though not capacious harbour of
Kingston, which, from the river, is generally also called Hull.

Canals of Yorkshire. See Canal.

Coast and Harbours.—The sea-coast of Yorkshire, though
very extensive, affords but very few harbours of any impor-
tance. The mouth of the river Tees, as already stated, is
frequented as a place of anchorage in winds from the south
and the west. Vessels also often resort to other spots on the
coast when the wind blows off the land, such as to Ro-
binhood's bay to the southward of Whitby, to Filey bay on the
north-west, and Bridlington bay on the south-west of Flamborough-head.

The principal harbour on this coast is that of Whitby.
(See Whitby.) Scarborough bay is serviceable in westly
winds; and the pier, a noble stone structure, furnishes easy
access and safe protection for ships of considerable burthen;
for at spring-tides, the depth of water at the entrance is
from twenty to twenty-four feet: for want of a back-stream,
however, the harbour is in danger of being filled with sand.
The entrance of the Humber affords to shipping less protec-
tion than from its locality might be expected; for the
hores on both sides of Hull, from the N.E. and of Lincoln-
shire on the S.W. are low, and the channel is much
incumbered with sand-banks and shallows. Notwithstanding
these disadvantages on its north bank, just at the point
where the estuary turns its direction from E. to S.E., is
situated the much-frequented and important harbour of
Kingston-upon-Hull. The natural accommodation of the
river has proved very insufficient for the increased shipping
belonging and trading to the port, which ranks as the fifth
in the kingdom. Docks of great capacity have therefore
been excavated, in which vessels lie afloat or dry, as may be
required. From this port, the produce of the great manufac-
turing districts in the interior of the country are ex-
ported to foreign parts; and there foreign commodities are
transferred to smaller vessels, to be in their turn distributed
over the interior of the kingdom. The most remarkable
projection of the coast of Yorkshire is the bold and lofty
promontory, called Flamborough-head. The cliffs rise
perpendicularly over the sea to the height of 150 and 150 yards.

They are composed of a mouldering lime-stone rock, of un-
common whiteness; and at the bottom are pierced by a
number of caverns, some of them entering a great way into the
rock. A new light-house is placed about 300 yards west
from the extremity of the promontory. About four by east
eleven leagues from Flamborough-head is another point
of great confluence to mariners. This is the Spurn-point,
which, running out southwards, low and narrow, forms the
north limit of the mouth of the Humber. The light-house
is situated in N. lat. 53° 41', and E. long. 8° 17'.

Agriculture.—From what has been already noticed re-
specting the mountainous and the marshy tracts compre-
ended within the capacious limits of Yorkshire, agricul-
tural improvements in them must be comparatively very
limited. In other districts, however, particularly in the
spacious plains forming the central parts of the county,
every species of amelioration of the soil which the in-
dustry of the inhabitants, availing themselves of the natural
means within their command, could apply, has been
generally brought into action. The farms are of very
unequal extent and rental, conformably to the nature of the
soil and to the situation of the farmer with respect to a mar-
ket. It is remarkable, that in the North Riding leaves are

unusual; but although the husbandman labours on so preca-
rious
tious a possession, changes of occupants of farms are by no means common. In the vale of York one-third of the land is comprised in tillage, and two-thirds in grass; but in Cleveland, along the south bank of the river Tees, the country is equally divided between corn and pasture. In the environs of Thirsk, where the dairy is the chief object of pursuit, fully three-quarters of the land are devoted to it. In the valleys or dales which intersect the East moorlands, about one-fifth of the surface is for tillage; but in those of the west, a much smaller quantity is usually ploughed: those parts although included are generally in pasture. In few districts of England have improvements in agriculture been more generally or skillfully introduced than of late years in the East Riding. The farms are comparatively large, and vary in annual rental from two or three hundred pounds to a thousand; but in the marily tracts, called the levels, they are mostly small. By drainage there, and in the flat country, in the vicinity of Hull, large tracts, formerly flooded, now produce plentiful crops of corn; the value of the land being thus increased to ten times its former worth. In the hilly ranges of the Wolds, barley and oats have in many places been superceded by wheat. In the West Riding the farms are generally small, but in the environs of the manufacturing towns a great portion of the ground is occupied by the inhabitants for the use of their families. To the eastward of Leeds, Wakefield, and Rotherham, the greatest part of the Riding is cornland; but this tract contains no small proportion of common fields. The soil, however, is good, and improvement may be easily introduced. In addition to grain of all sorts, flax is cultivated in the marshlands to considerable extent; and in the environs of York mustard is now a valuable article of cultivation; though it is still considered as the produce of Durham. The horsey of Yorkshire, and in particular those of the North Riding, have long and universally been famed. Cleveland furnishes an excellent breed for the coach and the plough; the northern parts of the vale of York others for the coach and saddle; and many of both kinds are bred in the southern parts and the marshes. The East Riding also bears horsey of peculiar value. A smaller but hardy and useful kind is bred in the dales of the east moorlands; many of an equally serviceable description are also produced in the moorlands on the west. The horned cattle of Yorkshire are of various kinds, adapted to the nature of their pastures, and to the ufs for which they are employed. The north parts of the vale of York and the district of Cleveland produce the Tees-water breed, which is ranked among the largest in the kingdom. In the plains where cattle are chiefly kept for the purposes of the dairy, the milk, and not the form or strength of the race, is the main object of attention with the farmer. The sheep in the various parts of the county are also extremely different in their nature and properties. In the North Riding, the flock has of late years been considerably improved by the introduction of the Northumberland and other breeds. The sheep of the west moorlands are small; but the wool is tolerably fine: those of the east moorlands are still smaller, but with a very coarse wool. Many of the old sheep-walks on the Wolds, in the East Riding, are now broken up, and converted into corn-land. In the West Riding, by the introduction of the Leicestershire breed, the sheep have in many places been highly improved. Those bred on the well moors and hills of this Riding, when brought down early to pasture in the low grounds, become very valuable for food.

In many parts of Yorkshire, great improvement of the soil has been produced by hollow-draining; irrigation, paring, and burning the surface, have also been advantageously adopted. In certain tracts, bones bruised in a mill are usefully employed in composts for manure. Considering its great extent, the North Riding of Yorkshire contains a small proportion of woodlands; the whole having been estimated at about 25,000 acres, of which the vale of York, with its boundary hills to the north, contains about 11,000. Large full-grown timber is accordingly very scarce, excepting on the estates of the earl of Carliole, C. S. Duncombe, &q; and some other land proprietors. But the oak, timber of this Riding, produced on hard rocky ground, if not of great size, is fold and durable; and hence the valuable qualities of the slipping built at Whitby and Scarborough. The planting of the Wolds in the East Riding has been successfully begun by several proprietors. In the West Riding, the quantity of oak and ash is very considerable; and both are much used for ship-building, and for the various demands of the manufacturers: much is also consumed in the coal and other mines. In the vicinity of Sheffield, the duke of Norfolk poleties above 1500 acres of woodland.

According to a calculation made in 1799, the waste lands in this Riding amounted to upwards of 400,000 acres, of which one-third seemed to be proper only for planting. No great progress in that operation has, however, yet been made.

**Manufactures.**—The manufactured productions of Yorkshire, especially of the West Riding, are of the very first importance to the county and to the kingdom, as well as to the multitudes to whom they furnish employment and wealth. The principal inducement for the establishment of these great works in the interior of the country was the plentiful supply of water and fuel for giving motion to machinery, and for the various other operations of the several branches of industry. Leeds, situated on the north bank of the river Aire, has long been celebrated as the centre of the manufacture of woollen cloth; and it is still the great mart for that staple article of the commerce of Yorkshire. (See Leeds, and Woollen Manufacture.) The white cloth is chiefly made at and about Dewsbury, among the hills which separate the valleys of the Aire and Calder, and in the vicinity of Wakefield. The mixed cloth is principally made in the villages comprehended in the district of Leeds to the westward of the town; in the vale of Calder west from Wakefield; and also in the environs of Dewsbury. In the year 1806, the number of yards of broad cloth manufactured in the West Riding of Yorkshire is stated at 10,795,256, and of narrow cloth at 6,193,517. But in 1810 the broad cloth was only 9,826,248 yards, and the narrow cloth had increased to 6,951,762 yards. In 1811, however, the quantity of both sorts of cloth had sensibly diminished; for the yards of broad cloth were only 8,671,422, and those of narrow cloth 6,180,181; one of the many effects produced on the industry, and consequently on the well-being of the county and of the kingdom at large, by the hostilities in which Britain was then deeply involved on both sides of the Atlantic. The cutlery and plated goods of Sheffield are in all their branches carried to a perfection and an extent of which it is not easy to furnish a satisfactory account. The cutlery, consisting of edge-tools of every description, files, anvils, faws, &c. is not confined to that town, but manufactured in all the neighbouring villages. The plated goods, consisting of teapots, coffee-pots, tankards, candlesticks, and many other articles of household use, are all prepared within the town. In it are also several founderies for iron, brass, and white metal.

**Minerals.**—Excepting the alun on the borders of the east moorlands, and the lead of the vicinity of Richmond towards
wards the opposite quarter, the North Riding of Yorkshire furnishes but few mineral substances of peculiar value. Copper of good quality, it is true, was wrought about the middle of the last century near Middleton-Tyas; but the works have for some time been discontinued. Copper was also discovered about twenty years ago at Richmond. In the vale of the river Swale, twelve miles above that town, are several very profitable lead-mines. The iron- lone of the east moorlands has not hitherto been applied to any useful purpose. It appears, however, from ancient records, that as early as the beginning of the thirteenth century, iron was wrought and forged in Rofedale. Ayton, a few miles S.W. from Scarborough, is the only place where forges are now established, and those are but incon siderable. The great alum works are principally situated on the sea-coast on both sides of Whitby, and in the vicinity of Guiborough. See WHITEBY and ALUM.

Various parts of the North Riding produce coal, particularly in the plain between Easingwold and Thirsk; and in the well moors, the coal hitherto discovered seems adapted only to the burning of lime; the north part of the Riding is consequently furnished with that mineral from the adjoining county of Durham. Good free-lone for building appears in many parts of the Riding; a few miles west from Whitby is a quarry from which have been drawn the blocks employed in constructing the new pier of that town. Lime-lone, and a species of marble not inferior to the Derbyshire, are found in different places; and loose blocks of red granite are seen on the surface in certain parts of the west moorlands.

In the East Riding, the chalk of the Wolds is the only mineral substance of importance hitherto discovered or brought into use; but the mineral productions of the West Riding are of peculiar value; for it contains lime, coal, iron, and lead, in great abundance. None of them, however, are found in the low level tracts in the east division of the Riding. The lime-lone extends all to the westward of a line running northward from Doncaster to Tadcaster. The tracts situated between the rivers Aire at Leeds and Calder at Wakefield are the principal seats of the coal-mines, which abound likewise in the neighbourhood of Bradford, Barnsley, and Sheffield. Near Bradford also there are very considerable iron-mines. Lead is principally extracted from the mines of Grassington, the property of the duke of Devonshire.

Yorkshire contains several mineral waters of great virtue and celebrity. The chalybeate and sulphuriferous springs of Harrogate have long been in high repute. See HARROWGATE.

Scarborough, on the sea-coast of the East Riding, has long been celebrated for its mineral springs, which issue from the foot of a lofty cliff on the shore, a little way to the southward of the town. See SCARBOROUGH.

Ancient History, Remains, &c.—The great county of York was but a part of the territory of the Britih tribe, called in Roman history the Brigantes: they are not however mentioned by Caesar. It appears that they were first overpowered by Cerialis, in the reign of Vespasian, in the year 71 of the Christian era. In 78, the Roman arms were carried beyond the river Tay in Scotland, where Agricola encountered the Caledonians, under Galgacus: but, contrary to the usual practice of the Romans, after a signal victory over the natives, as it is reprefented by Tacitus, his fon-in-law and professed panegyrist, the Roman commander, retreated into the southern part of the country previously subdued. Having established a chain of forts across the narrow islethmus, between the firths of Forth and Clyde, Agricola was in the year 85 recalled by Domitian. From that period, until the arrival of the emperor Adrian himself in Britain in 120, little is known of the transactions in the northern parts of the island. That Adrian should deem it necessary to repair in perfon to fo remote a portion of the empire, which then comprehended the richest provinces of the world, is however a proof that the Britons, although overpowered, were by no means reduced to patient subjection. Renouncing, therefore, a great part of the country included within the chain of forts of Agricola, Adrian constructed an earthen rampart across the island, between the mouths of the rivers Tyne and Eden. While these operations were in progress, the emperor fixed his residence in Eboracum, or York; but fearlessly had he returned to the continent when the northern Britons, breaking through the second rampart thrown up against them, joined with the Brigantes in an endeavour to regain their independence. To repel these attempts, Lollius Urbicus was sent into Britain, who, repelling the natives beyond the Roman bounds, constructed a wall and towers on the line between the Forth and the Clyde, first fortified by Agricola. From this event, which happened about 140 until 183, Britain seemed to be tranquil; but then, while the empire was subject to the monitor Commodus by the exertions of the natives, and the discontented spirit of the legions themselves, the power of the Romans in Britain was reduced to a very precarious situation. Pertinax, who had served in the island, and who, by his military talents, was fully qualified to restore the discipline and spirit of former times, was soon cut off by the licentious and disorderly Pretorian guards of Rome; and in 196; Septimius Severus became sole master of the empire. The Caledonians still continuing their efforts to rid themselves of the Roman yoke, Severus, although thus far advanced in life, and very unfit for the service of the field, found it necessary to repair to Britain. (See YORK.) In 207 he arrived at Eboracum, in the full determination to quell the reliefs spirit of the natives. After an expedition into the northern parts of the island, in which the Iofs of the Romans is admitted by their own historians to have been prodigious, he fixed his head-quarters in Eboracum; and commanded the rampart thrown up by Adrian between the Eden and the Tyne, to be powerfully strengthened, as Urbicus had done on the northern rampart with a continued wall and forts of flone. Taking advantage of his absence from the frontiers, the Caledonians again had recourse to arms; but in 211, while Severus was preparing in Eboracum to repel their affaits, he died, and his sons and succeffors Caracalla and Geta soon afterwards returned to Rome. Whatever might have been the inclinations of the Brigantes, however gladly they would have combined with their countrymen of the north, yet by the presence of the imperial court, officers, and troops, every effort on their part must have been instantly discovered and repelled. Under Carausius, Britain enjoyed some semblance of independence; but his affiliation in the midft of his spirited projects enabled Constantius to subject Britain again to the Roman arms. Dying in Eboracum in 307, Constantius was succeeded in the western portion of the empire by his fon Constantine, who was present at his death, and was immediately proclaimed emperor by the legions. For many years, the Brigantes with the other southern provinces of Britain seem to have been submissive to their masters; but in 364, the northern nations renewed their incursions, while the opposite part of the illand was harassed by the predatory defecents
Yorkshire.

Thefts of the Saxons. Tranquillity was at first restored by Theodoricus, whose son of the same name obtained the purple, and after a short reign died in 393. Diffusion within and around from without were now fast hastening on the overthrow of the mighty empire of Rome; and in the middle of the fifth century of our era, the Romans finally relinquished all possession, power, and authority in Britain. Of their long protracted residence in Yorkshire, many unquestionable evidences are found in the capital, and in other parts of the county. The roads established by that extraordinary people may yet be traced, traversing the county in various directions. The whole system of the Roman policy and discipline was certainly directed to the perfection of their military power.

One great line of probably Roman road, which traverses the county of York from S. to N., is now called the Watling-street, (a name apparently Saxon,) which was opened from the Rutupian port, in the neighbourhood of Sandwich, in Kent, in various directions, all the way to the wall of Severus. Entering Yorkshire near Bawtry, it has been traced by Doncaster, (Danum, or the station on the river Don,) over Scawby and Pigburn Leas, to Barnsdale, through Pontefract to Catterickford, supposed to be the position of the ancient Legion, a little below the junction of the river Aire and Calder. From this point, the road was conducted by Calcaria, now Tadcaster, to Eboracum, or York. From this city it probably followed the N.E. fide of the river Ouse, crossing it near to Ifurium, now Aldborough, below Boroughbridge, and thence by Leeming-lane to Catterickbridge, adjoining to which vestiges of Cataractonium are to be seen; there turning more to the northward, it passed over the Tees at Piercebridge into the county of Durham. Another military road is supposed to have been laid out from Mancunium, now Manchester, in a N.E. direction, by Wakefield, to join the former line between Doncaster and York. North-easterly from York a road seems to have been formed by or near Malton, terminating on the sea-coast at Dunleaty bay, the Danus bay of Utem. This road is still called Wades' causeway, from the Saxon chief Wada, as Camden thinks, who resided on the coast in a castle, perhaps originally erected by the Romans. A branch of this road is supposed to have led to Scarborough, when the sheltered beach furnished a convenient place for Roman shipping. The straight course of an ancient road may be traced, although over the high grounds of the Wolds pointing from York towards Bridlington bay, corresponding probably to the Sinus Gabranovicorum of the Romans; a branch has also been observed tending towards Hunmanby and Filey bay. Another line may also be followed in a direction to Patrington (Praetorium) and the Spurn-point, which seems to correspond with the Ocellum Promontorium of Utem. From Lincoln (Linodium colonia) a Roman road may be traced running N. to the S. bank of the Humber near Winningham, where are still seen vestiges of the station, ad Abum. On the N. bank, Brugh indicates the position of another ancient station, from which a branch of road probably communicated with York. This, however, is not the course indicated in the itineraries, which point out a much more convenient course from Lincoln to York, across the river Trent at Littleborough, the ancient Segelocum.

The vestiges of Roman works and occupation distributed over various parts of Yorkshire are by far too numerous to be mentioned in this place; it must therefore be sufficient to point out two, Cataractonium and Ifurium. About five miles below Richmond in Swaledale is the present village of Catterick, so named from the Cataractonium of the Romans, of which the vestiges are visible on the S. bank of the river, a little lower down the valley. Ifurium exhibits the most remarkable proofs of Roman habitation. Sixteen miles above York, and nearly one mile below Boroughbridge, on the S. bank of the river Ure, is Aldborough, so called in allusion to the old town, to which it has succeeded, named by the Romans Ifurium.

Caflie.—Of these many still remain in Yorkshire, although in several cases they are either nearly demolished, or by later alterations, bear but little resemblance to their original form and structure: in some, indeed, the name alone is preferred. Of York castle, the keep, or Clifford's tower, is almost all that is to be seen above the surface of the ground. Scarborough castle is situated on a projecting precipitous cliff, 300 feet above the sea, and cut off by a deep natural hollow from the high ground behind it. Richmond has long been distinguished by its extensive castle, which was erected soon after the Norman Conquest by Alan, a kinsman of William the Conqueror, on receiving the vatt possessions of the Saxon, Edwin, earl of Chester. Craik or Creyke castle, although belonging to the county of Durham, is situated only twelve miles N. from York, is of great antiquity; for so early as in 685, it was beseamed on St. Cuthberth by Egfrid, king of Northumberland. Six miles W. from Doncaster, are the castle and village of Conisburgh, or more properly Coningsborough. The castle, one of the most interesting edifices of the kind in the N. of England, a building of great extent and strength, is commanded by the high ground on which the village is placed. The area of the castle is in circuit about 700 feet, encompassed by a very deep ditch, now filled with trees. Of Knareburgh castle, once a fortres of importance, but few remains are now to be seen. It is believed to have been erected by Serlo de Burgh, who received the manor as a reward for his services at the Conquest. Pontefract castle, the scene of many transactions of note in English history, in particular of the murder of Richard II., is built on a lofty rock. Sheffield castle, formerly of great strength from its situation, between and at the meeting of the rivers Don and Sheaf, was levelled to the ground by the parliament in the civil wars. The ancient castle of Skipton, in the W. part of the county, is still in a habitable state. It now belongs to the earl of Thetford; but was formerly the residence of the powerful family of Clifford, of which Henry, the fourteenth lord, was, in 1525, created Earl of Cumberland. Near the E. bank of the Darwent, S.E. from York, are the remains of the magnificent castle of Wresley, supposed to have been erected by Percy, earl of Worcester, in the reign of Richard II., towards the end of the 14th century. Originally the castle formed a quadrangle, having a tower at each corner, and a fifth over the entrance. Wresley was one of the places of residence of the great earls of Northumberland, where they lived in a style of splendour and magnificence, formed on the model and with the flate of the royal household. Notwithstanding the zeal evinced by the earl of Northumberland in the cause of the parliament, the castle was, in 1650, dismantled. Three sides of the quadrangle were demolished, and an accidental fire in 1796 completed its destruction. The site belongs to the castle of Egremont.

Seats.—To describe the number of admirable structures of modern times, with which the county of York is adorned, would require a volume. In this place merely to notice some of the most eminent seats is all that can be attempted. About 13 miles N.N.E. from York is situated Castle Howard, the princely mansion of the earl of Carlisle, of the illustrious house of Howard. On the site of the ancient castle of Hinderkelf the present building was erected, about a century ago, by Sir John Vanbrugh, the celebrated architect.
architect of Blenheim. Castle-Howard, in its general arrangement and appearance, bears an evident resemblance to that superb structure, and indicates the genius of that distinguished artiff. In extent of front it exceeds Blenheim, and in exterior display of magnificence it is, perhaps, superior. The interior, spacious and lofty, is enriched with a very valuable assemblage of paintings by masters of the greatest celebrity; and the collection of antique statues, busts, &c., is particularly interesting. The surrounding park and grounds are distributed and ornamented in a way suitable to the grandeur of the structure they inclose. Duncombe-park, the feat of Charles Slingby Duncombe, eq., 22 miles N. from York, also erected by Vanbrugh, is splendid in itself, and splendidly adorned with paintings of the most eminent artists. Harewood-houfe, the residence of the earl of Harewood, six miles N. from Leeds, is a magnificent structure, commenced in 1760, in which are combined grandeur of design and ornament, with convenience and accommodation of arrangement. One of the greatest ornaments, not of Yorkshire only, but of the kingdom, is Wentworth-houfe, once the habitation of the distinguished patriot Charles marquis of Rockingham, from whom it descended to his nephew and heir the present earl Fitzwilliam. It is situated in a spacious park, four miles N.W. from Rotherham, and seven N.N.E. from Sheffield. The mansion extends in front about 600 feet, forming altogether a structure of uncommon magnificence. Nor is the interior deficient in appropriate arrangement and splendour. In approaching the houfe, the attention of the visitor is arrested by a noble maufleum, raised in 1788, by the present earl, to the memory of his uncle, the marquis. This monument is placed on an eminence, and is in itself 90 feet in height, divided into three parts. The circular Doric basement supports a similar structure of the Ionic order, with open arches on the sides exhibiting a farscopus; the whole surmounted by a cupola. Within the basement is a chamber containing a statue of the marquis, by Nollekens. Around the walls are bufls of eight of his principal political friends, C. J. Fof, Sir G. Saville, &c. Wentworth-houfe, erected by the earl of Strafford in 1730, but now the seat of Henry Vernon, eq., is a noble fabric. Towards the southern border of the county, midway between Doncaster and Wolkop, is Sandbeck, the superb mansion of the earl of Scarborough, erected nearly fifty years ago.

Ecclefiafical State.—A very important change in the condition of the ecclefiafical establishments in Yorkshire, and over England in general, was introduced by William I. Prior to the Conquest the Saxon prelates, with their archdeacons and other delegates, fat in the courts with the eufs and thiriffs for the administration of justice; receiving with the lay-judges a share of the fines imposed on offenders. According to the original charter, however, still preferred among the records of the cathedral of Lincoln, the Conqueror declared, that no bishop or archdeacon should, in future, hold ecclefiafical pleas in the hundred-court, nor suffer any cause of a spiritual nature to come under the cognizance of secular perffons. Whoever, therefore, offended against the canons of the church was to be tried by a tribunal, to be appointed by the bishop of each diocese. It was also strictly enjoined on all thiriffs, royal officers, or other lay perffons, not to encroach on the episcopal jurisdiction. These regulations were afterwards confirmed, in a general council of the nation, by the bishops, abbots, and all the principal nobility; but those nobles and prelates were then almost all Normans or other foreigners. To this artifical separation of the ecclefiafical from the civil jurisprudence, the jealousies, contrarieties, contefts, and open ruptures, by which the kingdom was, on various occasions, brought almost to its ruin, must be ascribed. In addition to the diffentions occasioned in this way, the dispute respecting the superiority of the fee of Canterbury over that of York was conducted with peculiar animosity, between the Norman prelates of both. In 1270, Thomas, a canon of Bayeux in Normandy, appointed to York, repaired to Canterbury for confirmation from the hands of archbishop Lanfranc, who had been previously installe, but refusing to swear obedience to the fee of Canterbury, the confirmation did not take place. The famous Gregory VII. making it now a rule to confer the pall on no prelate who did not appear in person before him, the two contending English archbishops were required to present themselves in the court of Rome, where the dispute was referred for decision to a synod of the clergy of England. By this council, assembled at Windlor in 1072, a sentence amounting to a compromise was pronounced. The rights claimed by Canterbury were confirmed; but Lanfranc defiended with the oath of obedience from Thomas of York. In his profession of obedience, however, Thomas acknowledged that the archbishops of York and their suffragans were bound to obey the mandate of the primate of Canterbury, when required to attend him in council, wherever it should be held. On the appointment to York of Thurlian, chaplain and secretary of Henry I. in 1115, the dispute was again revived; but in 1121, Thurlian, who had obtained favour at Rome, was permitted by Henry, whom his pertinacity had irritated, to return to York. It does not, however, appear that he ever made any satisfaction for his refiftance to the claims of Canterbury; or that a profession of obedience to that fee was ever made by any of his successors. From this time, therefore, York maintained its independence, and, a few years afterwards, had certain suffragan bishops placed under its authority. Roger of York, in 1162, procured a bull from Rome, granting him the privilege of crowning the kings of England, prolonged by some of his predecessors, and of having his crofs carried erect before him throughout the whole kingdom. But in 1163, in the reign of Henry II., the latter privilege was by pope Alexander III. restricted to Roger's peculiar province. Opposing claims were nevertheless advanced on both sides, until Edward III. by influence and management procured from Rome a confirmation of the arrangement he had accomplished between the contending prelates. Then was introduced the caufialitical and filthy diftinction, still preferred, in the titles of the two metropolitans, by which the archbishop of York is stile d primate of England, and his brother of Canterbury primate of all England.

The county of York is wholly and immediately under the superintendence of the archbishop, whose suffragans are the bishops of Carlile, Chefter, Durham, and the Isle of Man. The latter, stiled bishop of Sodor (the southern isles of Scotland) and Man, prefiging over a diocese not formerly pertaining to England, has no feast in the houfe of peers. Under the archbishop, ecclefiafical affairs are conducted by archdeacons; an office first introduced into the diocese, as it is said, by Thomas the Norman, appointed in 1270.

Fertile and extensive as is the county of York, the number of religious houses erected within its bounds, in former times, was prodigious. "These were in all," according to Burton, (Monasticon Eboracense,) "106; or. abbeys 14, priories 44; alien priories 7, cells 13, and houses of friars of various orders 28." Of those establishments the ruins of many houses still exist; some of them exhibiting very picturesque and attractive monuments of ancient devotion and liberality. St. Mary's abbey adjoining to York gives sufficient indications.
tions of its original grandeur. The abbots of St. Mary's and of Selby, both of the Benedictine order, were alone entitled to wear the mitre on the N. side of Trent. But for an account of those abbeys, and that of Whithby, the reader is referred to the description of the several towns in which they are situated. Of some others, erected in detached situations, a few may be here noticed. About three miles S.W. from Ripon are the magnificent and picturesque ruins of Fountain's abbey, of the Cistercian order, founded in 1142; and so named, not from any abundance of springs of water at the place, but from the village of Fontaine in Burgundy, where St. Bernard, the great patron of the order, was born. But the structure, of which the remains are so great an ornament to the country, was commenced in 1204. Built in the most elegant style of the ancient pointed architecture, the tower and the walls of the church still remain; the roof only being ruined. The length of the church was 351 feet, and that of the transept 186. The great tower, singularly situated at the N. end of the transept, is in height 166 feet. The whole edifice may be considered as one of the finest specimens of the simple but majestic style of the time of Henry III. and his successor Edward I. The abbey now forms a peculiar ornament to the celebrated grounds of Studley-Royal. On the N. bank of the river Aire, three miles to the westward of Leeds, are the remains of Kirkstall abbey, founded in 1147, by a colony of Cistercian monks from Fountain's abbey. The venerable remains of the Cistercian abbey of Rievaulx, or Rievaulx, are situated in a valley, about three miles northwards from Duncombe-park, from which they appear with peculiar advantage. Of the very ancient monastery of Ripon no part now exists. The collegiate church, or minster, still an interesting edifice, was partly rebuilt in the middle of the 14th century. Roche abbey, situated near lord Scarbrough's seat of Sandbeck, in a deep narrow vale, is now reduced to a few arches, and a portion of the nave.

Yorkshire Cows, in Rural Economy, a term sometimes applied to a large short-horned breed of thefe cattle, which afford much milk, but which is not of the most rich kind, and which are much produced on the fine pastures in that district. See Cow and Live-Stock.

Yorkshire White, in Agriculture, a perennial grass that thrives well in most situations, and which grows very generally on all soils, except those that are of the most barren and dry qualities. It flowers in the middle of the summer, and is well calculated for sheep, as it answers uncommonly well when closely fed down. It is said not to be much relished by neat cattle, and confirmed injurious to horeses, which, in some cases, are supposed to become affected with a profuse discharge of urine and general weakness in consequence of the use of it. But should any hay, made from this grass, be accidentally given to these animals, and produce these effects, an immediate change of the fodder will prevent any further bad consequences. Its foliage is rather soft and woolly.

The proportional value which the grass at the time the feed is ripe bears to that at the time of flowering, is as 11 to 12.

It is an useful sort of grass in many cafes of laying land down to pasture and other such purposes. See HOLCUS Lonicatus.

YO-SANPOO, in Geography. See Sanpoo.

YO-TCHEOU, a city of China, of the first rank, in the province of Hon-guang, situated on the Yang-tze river, and on the Tong-ting lake. This lake, which resembles a sea, is remarkable for the greatness of its circuit, which is more than 210 miles; for the quantity of its water, especially in certain seasons, in which the two great rivers of the provinces swell with rains, discharge themselves into it, paffing out on the other side sensibly diminished; and for its astonishing quantity of fine fish which are caught therein. The great number of banks and merchandizes which are brought thither render it one of the richest cities in the empire; its district contains one town of the second order, and seven of the third; some on the east side of the lake, and others on the west. The country round is everywhere extremely fruitful, and full of different kinds of orange and lemon trees; 675 miles S. of Peking. N. lat. 29° 23'. E. long. 112° 35'.

YOUB, EL, a town of Algiers; 50 miles S.W. of Tremercen.

YOUGLIADGES, a post-town of Maryland; 173 miles N.W. of Washington.

YOUHAL, a sea-port, borough, and post-town of the county of Cork, Ireland, situated at the mouth of the river Blackwater, in the eastern part of the county. Youghal is an ancient corporation, and sends a member to the united parliament. It is one of the towns belonging to the duke of Devonshire, as heir of the eldest branch of the Boyle family. It has a considerable corn trade, and is much frequented for bathing. There is a collegiate church, the wardenship of which is united to the fee of Cloony. Youghal is 115 miles S.W. from Dublin, and 25 E. from Cork.

YOUHIOGENY, a river of America, which rises in the north part of Virginia, and runs into the Alleghany, at Pittsburgh.

YOUIS, a town of Africa, in the county of Whidah; 9 miles E.N.E. of Sabi.

YOULE, a river of Madagascar, which runs into the sea on the west coast, S. lat. 20° 20'. E. long. 44° 40'.

YOUW, a river of China, which runs into the sea on the west coast, S. lat. 20° 20'. E. long. 44° 40'.

YOUUNG, Edward, in Biography, a celebrated poet and clergyman of the established church, was born at his father's living of Upham, in Hampshire, in 1684, and removed from Winchester school to New college, in the university of Oxford in 1703, and afterwards to Corpus Christi college. In 1708 he obtained a law-fellowship at All Souls by the patronage of archbishop Tenison, and at this time poetry was the chief object of his pursuit. His first performance in this department was "An Epistle to Lord Lovelawn," one of the twelve peers created at the same time in 1712; and this was followed in the next year by his "Last Day," to which he prefixed a dedication to queen Anne, extolling the peace of Utrecht. From this circumstance he was regarded as a court-writer with a fixed stipend, under which character Swift alludes to him in his "Rhapsody on Poetry":

"Where Y must torture his invention
To flatter knaves, or lose his pension."

O 2
His next production was "The Force of Religion, or Vanquished Love," founded on the story of lady Jane Gray; and in 1714 he inscribed a poem on the death of the queen and the accession of George I. to Additon, who was then secretary to the lords justices. In 1719 he became tutor to the elder son of the earl of Exeter; but soon abandoning that connexion by the solicitations of the duke of Wharton, he graduated doctor of civil laws in this year, and wrote his tragedy of "Bubris, King of Egypt," which was dedicated to the duke of Newcastle, and favourably received; and in the same year he dedicated in a very complimentary strain to lord chancellor Parker, his poetical "Paraphrase on Part of the Book of Job." In the year 1721 his tragedy, "The Revenge," was exhibited with great applause, and dedicated to the duke of Wharton, whom he avows as his peculiar patron, and from whom he received some pecuniary favours. His satires, entitled "The Love of Fame, or the Universal Panion," were separately published, from 1725 to 1728, and as they became popular, he derived from them considerable profit. In 1726 he addressed his poem, entitled "The Inflation," to sir Robert Walpole, on his receiving the honour of the Garter; and he availed himself, on the accession of king George II., of his recommending an attention to the navy, to compose two odes, one inscribed "To the King, Pater Patriae," introducing another under the title of "Ocean." Having attained his 44th year, he took orders, and in 1728 was nominated one of the royal chaplains; and this change of his views and pursuits induced him to withdraw from the flage his tragedy of "The Brothers," which was under rehearsal. His next publications were adapted to his new profession; and among these were his "True Estimable of Human Life," exhibiting the dark side of the picture; and a sermon preached before the house of commons on the 30th of January, entitled "An Apology for Princes, or the Reverence due to Government," a subject not unappropriate to his situation as royal chaplain. In 1730, Dr. Young was presented by his college to the rectory of Welwyn, in Hertfordshire; and in the following year he married lady Elizabeth Lee, widow of colonel Lee, and daughter of the earl of Lichfield. Before this time he had refumed his poetical pen, and written "Imperium Pelagi, a Naval Lyric;" "Two Epitaphs to Mr. Pope, concerning the Authors of the Age;" and "The Sea-Piece," in two odes, dedicated to Voltaire. By his wife, who died in 1741, he had one son; and this circumstance, together with some other domestic losses that occurred about the same period, increased that melancholy and depression of mind to which he was constitutionally inclined. When he married lady Lee, she had a son, and also two daughters, the eldest of whom, denominated by him Narcissa, falling into a decline, went to the south of France, and died at Lyons in 1736. Her husband, Mr. Temple, suppofed to be the poet's Philander, died in 1740; and his own lady died in 1741. If he referred to these events in the annexed lines, he must have taken a chronological licence hardly allowable even to a poet:

"Infatiate archer! could not one suffice?
Thy shaft flew thrice, and thrice my peace was slain; And thrice, ere thrice, my son had filled her horn."

It is certain that he began to write his "Night Thoughts" in the year 1741; and the occasion, as he declares, was real, and not fictitious. The seventh of these poems is dated in 1744; and the interval must have been occupied in the composition of them. Notwithstanding the sublime strains in which the author expresses his pious feeling, he is not regardless of the patronage of distinguished persons, for to such he inscribes them. On this work Dr. Young bestowed much attention and labour, and he valued it as the chief of his productions. Among his other works, we may mention a poem written as an expression of his loyalty in 1745, and entitled "Some Thoughts occasioned by the present Juncture, inscribed to the Duke of Newcastle;" "The Cautous not fabulous, in Six Letters to a Friend, on the Life in Vogue," an overcharged picture of the existing manners; and "A Sermon preached before their Majesties," with a dedication to the king, 1758.

Dr. Young, notwithstanding his genius and piety, and his solicitude to obtain preferment, seems to have been disregarded; and though archbishop Seeker expresses his surprise that he had been overlooked by persons in power, he declines any interference in his favour. It should be recollected, however, that the attention which he paid to Frederick, prince of Wales, during his variance with his father, was not forgotten; nor indeed would his junction of the poetical and clerical character be any recommendation to George II. But the reason of his name's being stuck out of the list of court-chaplains on the accession of his present majesty is not known; it is the more unaccountable, as he was soon after appointed clerk of the clofet to the prince's dowager of Wales.

In his retreat at Welwyn he maintained a respectable and dignified character; and though the cast of his mind seems to have been gloomy, he was an agreeable and lively companion. The close of his life, however, was rather difconsolate than cheerful. The conduct of his only son, supposed to be the Lorenzo of the Night Thoughts, who is said to have been a rake and free-thinker, afforded him renewed opportunities for reproof and sarcasm, and must have been the occasion of poignant grief; though Mr. H. Croft vindicates his character, alleging that he was only eight years old when his father began that poem. But others have asserted that he was alarmed and grieved on his account; and that, notwithstanding the favourable change which took place in his sentiments and character, his father would not admit him to any interview in his latter years: and even on his death-bed he refused to see him, though he adored him of his forfiveness, and made him his heir. Towards the close of his life, he surrendered himself to the influence of a housekeeper, and from some mismanagement in his concerns, and a growing disposition to avarice, he became irritable in temper and depressed in spirits. His last production was a poem, entitled "Reparation," printed in 1762, which indicated the decline of his mental powers. His life was prolonged to the year 1765, and he then died in his 84th year. He was interred in the church of Welwyn, and his son erected a monument near the remains of both his parents.

Dr. Young is known principally, if not wholly, as a poet; and his compositions in this department are distributed into satires, tragedies, and night thoughts. His satires are founded on the questionable principle, that the love of fame is the universal passion of mankind; and as he did not excel in judgment, they are exercises of wit and invention rather than grave exposures of vice and folly. As a dramatic writer, he is charged with not understanding or not adhering to nature, and with indulging his imagination and feeling, and running into exaggeration of character and bombast of expression. The only tragedy that has kept possession of the stage is his "Revenge," the Zanga of which is said to have no competitor for theatrical effect.
effect among the personages of modern tragedies. His "Night Thoughts" are deemed original in design and execution. Whatever were the causes that produced them, they are adapted to excite devout feeling, and to produce moral effect, though they are justly complained of as in some places unintelligible, and as affording too much scope for criticism. To many readers, the theology on which they are founded and which they express is too awful and severe, and not so well calculated to soothe and pacify the human mind under trouble as the gentler and more contemplative dictates of Chriftianity. They are sometimes tedious and prolix. They will never be neglected as long as taste and fanciopetity of virtuous and religious impressions remain. The lyric attempts of Dr. Young are said to have been singularly unfortunate. From the edition of his works published in his life-time in 4 vols. 8vo., he himself excluded several compositions which he thought of inferior merit. Biog. Brit. Croft's Life of Young in Johnson's English Poets. Gen. Bio.

You, young, (Patricius Junius, Lat.), an eminent scholar, was born in 1584, at the seat of his father, Sir Peter Young, who had been co-tutor with Buchanan to James VI. of Scotland, at Seaton in Lothian. Educated in the university of St. Andrew's, and accompanying his father in the suite of king James, he was employed for some time as librarian and secretary, by Dr. Lloyd, bishop of Chester. In 1625 he assumed the degree of M.A. which he had before taken at St. Andrew's, and entering into orders, became chaplain at All Souls' college. During his residence at Oxford he occupied himself in the study of ecclesiastical history and antiquities, and also the Greek language; and upon his removal to London, he obtained a pension of 50/. a year, and was occasionally employed by the king and persons in power in writing Latin letters. His patron was Montagu, bishop of Bath and Wells, who procured for him the appointment of librarian to the king. In 1617 he was introduced at Paris, by the recommendation of Camden, to the learned men of that city; and upon his return, he assisted Thomas Rhead in making a Latin version of the works of king James. In 1620 he married, and afterwards was advanced to several preferments in the church; and succeeded Rhead in 1624 as Latin secretary. Unknown by any publication, he was nevertheless honoured as a person of distinguished literature, who rendered acceptable and useful services to learned men. In this way, he was the coadjutor of Selden in the examination of the Arundelian marbles, and when they were published by this celebrated antiquary, he dedicated the work to Young. He was also employed in collating the Alexandrian MS. of the Bible with other copies; and as the result of his labours, he communicated many various readings to Grotius, Ussher, and other persons. It was his intention to have edited a fac-simile of this MS., but his design was never executed. He published, however, in 1633, from this MS. the "Epistles of Clemens Romanus," and he proposed editing the curious MSS. from the king's library; but the civil wars, and the seizure of the royal library, prevented the accomplishment of his purpose. During the troubles of this period, he fought an affray with a fons-in-law, at Bromfield in Essex, where he died in 1652.

Young is said to have indulged to excess a disposition to oblivion, which led him to lend valuable MSS. belonging to the royal library to foreigners and others; and he has been charged with betraying his trust, by not returning MSS. which he removed to his own house in contemplation of the pilage of the library, and these were sold among his other effects. To obviate this imputation, it has been alleged that he purchased for himself many MSS. from Greeks who visited this country. Smith's Vit. Erud. Viro. Gen. Bio.

Young is a name borne by many persons connected with and remarkable in some way or other for useful talents in the arts. Charles Young, organist of Catharine-cren church, near the Tower, father of three daughters, who were all public singers: Cuccilia, the eldest, was an effective of Geminian, spoke Italian well, sung in many of Handel's later operas, and was afterwards married to Dr. Arne; the second Mifs Young, Isabella, was married to the ingenious and excellent composer Mr. Lampe, who set the Dragon of Wantley; and the third Mifs Young, Effie, afterwards Mrs. Jobes, sung on the stage at Covent-Garden theatre as the time of their deaths. Charles, the father of these ladies, was, we believe, the son of Anthony Young, a musician and musician in St. Paul's church-yard, commonly called Tony Young, who has been paid by some of the family to have set "God save great George our King." But at the time of the rebellion of 1745, when this air was revived, which Dr. Arne's mother allowed us was written and set for king James II., when the prince of Orange was hovering over the coast previous to the Revolution; no claim was then made by the descendants of Anthony Young, or of any other composer of this air, which no one durt sing or own after the abdication of king James, without incurring the penalty of treason to king William; so that the song or hymn lay dormant, and the author concealed for near sixty years, before it was applied to king George II.

There is a quibbling glee in the first volume of Purcell's catches on two persons of the name of Young, father and son, who lived in St. Paul's church-yard; the one was an instrument-maker, and the other an excellent performer on the violin:

"You scapen that want a good fiddle well strung, You must go to the man that is old while he's Young, But if this fame fiddle you fain would play hold, You must go to his foon, who'll be Young when he's old. There's old Young and young Young, both men of renown, Old falls, and young plays, the best fiddle in town; Young and old live together, and may they live long, Young to play an old fiddle, old to fell a new song."

Another Young, of the same family, the proprietor of a music-shop in St. Paul's church-yard till the middle of the last century, had a relation, an excellent performer on the violin, known by the name of Chin-Young, from the length of that feature, who led at almost all the concerts within Temple-bar, particularly at the Blue-coat school chapel, Chrift's hospital, on a Sunday evening, where there used to be a performance of sacred music.

Mifs Young, afterwards the hon. Mrs. Scot, and her sister Mrs. Bartleman, both public singers, seem to have been the last remains of the musical family of Young.

Young. See Generation, Conception, Gestation, Embryo, Fetus, Delivery, Child, &c.

In the army, that regiment, or officer, is said to be the younger, junior, which was last raised, or whose commission is of late date, whatever be the age of the man, or however long he may have served in other capacities.

Young Frederick's Island, in Geography, a small island among Queen Charlotte's islands, in Port Ingham.

Young Nick's Head, a capo on the eft coast of New Zealand, so called from Nicholas Young, a boy on board the
the Endeavour, who discovered it in 1769. It forms the south-west point of Poverty bay.

Young Point, a cape on the east coast of St. Vincent. N. lat. 13° 14'. W. long. 61° 9'.

Young's Island, a small island near the south coast of the island of St. Vincent; 2 miles S.E. of Kingston bay.

YOUNGE, NICOLAS, in Musick History, an Italian merchant, the editor of "Musica Transalpina," 1588; Madrigales of four, five, and fixe parts, chosen out of divers excellent Anlhours; with the first and second part of La Virginella, made by Maifer Bird upon two Stanzas of Arioflo, and brought to speak English with the rest. The editor having opportunities of obtaining from his correspondents the newest and best compositions from the continent, had them frequently performed at his house, for the entertainment of his musical friends.

The second collection of the same kind was published by the same editor in 1597; in which, among others, there are three madrigals by Crouse, three by Luca Marenzio, and six by the elder Ferrabosco. These three collections being selected from the works of Palestrina, Luca Marenzio, and other celebrated masters on the continent, seem to have given birth to that passion for madrigals which became so prevalent among us afterwards, and which the composers of our own country endeavoured with such zeal to gratify.

If allowance be made for the wretched state of lyric poetry in England at the time the madrigals published in Younge's two collections were translated, which was long before the publication of the sonnets of Spenfer or Shakespeare, the undertaking seems to have been tolerably executed. Indeed, sometimes with such care and felicity as to transmute the expression of the original words into that of the version. The Italians themselves, at this time, had but little melody or rhyme in their music; but their poetry having been long cultivated, and brought to a much greater degree of perfection than ours could then boast, it indicated to the musical composer traits of melody, more airy and marked, perhaps, than we could derive from the prosody or phræology of our own language. The translator of these madrigals, however, he was, for the editor does not tell us, feems in general to have imitated the original Italian measure and structure of verse, as well as ideas; and though they abound with concetti, to which not only Italian poets, but those of all the rest of Europe were then so much addicted, the general taste of the times was indulged in poetry as well as music, and metre and melody were at once furnisht with new models.

However, the perpetual double rhymes in Italian madrigals and sonnets, and, further, the transmutation of the original music obliged him to render his version tidusy syllable, his embarrasments on this account are sometimes truly ridiculous. It seems as if the constant double rhymes in Italian poetry, which throw the accent on the penultima, instead of the final syllable of a verse, gave a peculiar cast to the melody in which it is clothed, and rendered it specifically different from that of English songs, in which but few double rhymes occur. The constant and regular mixture of masculine and feminine rhymes in French poetry may likewise have had a latent effect on the vocal melody of France, different from that of the other two neighbouring nations. But, after mentioning these difficulties, we shall leave the further investigation of so subtle a subject to philosphers, not only possessed of the necessary knowledge, but an equal zeal for the cultivation of philology, poetry, and music.

No. 7 in Younge's second publication of Italian madrigals Englished, in which the old Saxon termination of the present tense of the indicative mood of our verbs is conveniently preserved, was doubtless not thought the worst, as it is applied to several compositions in the collection.

"In wayne he seekes for beauty that excelleth,
That hath not even his eyes where love feigneth,
How sweetly here and there the music she turneth.

He knows not how love heareth, and he quetheth
That knows not how the fighes, and sweet beguilith,
And how the sweetly speakes, and sweetly smilith."

These madrigals were celebrated, nearly forty years after their publication, by Peaches, who has pointed out the peculiar excellence of several, particularly those of Luca Marenzio, which, he says, "are songs the muses themselves might not have been ashamed to have composed;" and of those by Alfonso Ferrabosco, the father, he says, "they cannot be bettered for sweetness of ayre and depth of judgment." Upon the ditty (words) of one of thefe, "I saw my Lady weeping," (he says) Master Byrd and Alfonso, in a friendly emulation, exercised their invention. The words of the Nightingale, and Payre Susanna, were so much admired, that they seem to have been set by all the best composers of the times. A few lines of each will perhaps convey to the reader an adequate idea of the poetical beauty of thefe favourite songs.

The Nightingale.

"But my poore hart with sorrowes over-fwalling,
Through bondage yyle, binding my freedom short,
No pleasure takes in these his sports excelling,
Nor of his song receiveth no comfort."

Payre Susanna.

"To them the fayd, if I, by craft procur'd,
Do yeld to you my body to abuse it,
I lofe my soule; and if I shall refuse it,
You will me judge to death reproachfully.
But better it is in innocence to chuse it,
Then by my fault t'offend my God on hye."

Indeed, in more than twenty sets, published between the years 1588 and 1624, during a period of near forty years, including almost four hundred and fifty madrigals and songs in parts, it would be difficult to find any one of which the words can be perused with pleasure. The sonnets of Spenfer and Shakespare, many of which are worthy of their authors, were indeed not published till about the end of the sixteenth century; but afterwards, it is wonderful, that, except one by Shakespare, none of them were set by our best musical composers of their time.

YOUNGOULE, in Geography, a sea-port town, on the west coast of the island of Madagascar. S. lat. 23° 30'. E. long. 47° 4'.

YOUNGSTOWN, a townhip in the State of Ohio, in the county of Trumbull, with 773 inhabitants; 66 miles N. of Pittsburgh.

YOUNGSTOWN, an inconsiderable settlement called a village in Cambria, Niagara county, and State of New York, 1 mile from Fort Niagara, and 6 from Lewiston, containing about six or eight houses.

YOUNKERS, among SAILORS, are the younger sailors, other wise called fore-mast-men; whose business is to take in the top-fails, furl the sails, fling the yards, &c.

YOUNE, in Geography. See URE.

YOURS, a town in Africa, in the kingdom of Cashna. N. lat. 16° 15'. E. long. 11° 2'.

YOUTH.
YOUTH, Adolescence. See Age and Adolescence.

The renovation of youth has been much fought after by chemical adepts; and many of them pretended to various secrets for this purpose; but unluckily the death of the pretenders proved a sufficient refutation of their doctrine. Paracelsus tells of the mighty things he could do with his ens primum; and even Mr. Boyle tells us some strange things about the ens primum of balm. (Boyle’s Works abr. vol. 1. p. 73.) But Mr. Boyle gives these wonderful flories on the credit of a French chemist, and not on his own.

Youth, Juvenitum, or Juvenitas, in the Pagan Theology, a goddes worshipped among the Romans, who, together with the gods Mars and Terminus, kept her place in the Capitol along with Jupiter, when the other deities were turned out: whence the Romans drew a lucky omen for the durability of their empire. Mem. Acad. Infrerp. vol. i. p. 17. seq.

This rate of life was, by the ancients, compared to autumn. In which sense, Horace speaking of one approaching to puberty, says,

"Jam tibi lilibidos
Diftinguet autumnus racemos,
Purpureo varius color." The moderns, on the contrary, when they speak of one in the autumn of his age, mean one that is upon the decline; and choose rather to use the comparison of the spring, to denote youth.

YOWRY, in Geography, a small island in the East Indian sea, near the north coast of New Guinea, on which a nutmeg-tree was found growing by captain Forrest. S. lat. 15°; E. long. 130° 45'.

YPAPA, a river of Bohemia, which runs into the Elbe, near its source.

YPERLEE, a river of France, which rises near Ypres, and runs into the canal of Nieuport.

YPOLOTE, a town on the E. coast of the island of Paraguay. N. lat. 8° 46'. E. long. 118° 21'.

YPRES, or Ipres, a city of France, in the department of the Ly's, situated on the river Yperlee, from whence it takes its name. Before the year 1000, it was only a chateau, which was sacked and ruined by the Normans. Baldwin III. comte of Flanders, repaired the chateau, and built a town about the year 960, which was afterwards enlarged by Thierry, comte of Flanders, and Ferrand, the son of Sanchez, king of Portugal. In the year 1325, the inhabitants revolted with most part of the neighbouring towns against Louis de Nevers, comte of Flanders, and pulled down the old wall to build a new one, in which they included the Fauquibourgs, which had become so extremely populous, from weavers and other tradepeople, that in the year 1242, the number of persons amounted to 200,000. In the 14th century, the inhabitants of Ypres, for the most part weavers, were exceedingly troublesome to their neighbours, being unwilling that any people should carry on trade besides themselves. In the year 1383, the rebels of Ghent, allied by the English, under the command of the bishop of Norwich, besieged this town with great vigour for six weeks, but were compelled to retire; and the English being obliged to quit Flanders, Philip the Hardy, duke of Burgundy, having become master by a marriage with the heiress of the late comte Louis, enlarged it, and surrounded it with walls. It was erected into a bishopric under the archbishop of Malines, by pope Paul IV. in the year 1559. The town-house is a very large building, forming a square, and is said to have been built by the English, 600 feet in front; it has a very handsome tower, in which were kept their public archives from the year 1342. Besides the cathedral, it has several other churches, and some religious houses. The inhabitants carried on formerly a great trade in woollen cloth, but by the severity of the duke of Alva, the principal manufacturers were driven to England, from which time that branch of trade declined. At this time they carry on a considerable manufacture of linen of excellent fabric; 4 miles N.W. of Lille. N. lat. 50° 48'. E. long. 2° 53'.

YSILOIDES, Or Dodenhof, in Anatomy, the third genuine future of the cranium; thus called from its resembling a Greek y, or upilon.

Some also call it흡고유나, lambdoiodes. There is also a bone at the root of the tongue, called phyloides, and byades. See Hyoides.

YQUETAYA, in Natural History, a plant growing in Brazil, long used as a medicine in that country; and lately discovered to the Europeans by a French surgeon.

It has been since found in France; where, being cultivated and examined by Marchant, it appears to be not other than the common water-betony, or fcrphularia aquatica.

It has this remarkable property, that it takes away from fena all its ill taste and smell; which property of correcting the infusion of fena was before wholly unknown.

To use this plant, it must be dried ten or twelve days in the shade, and afterwards exposed to the sun, till quite dry.

YRAME, in Geography, a town of Arabia, in the province of Yemen; 100 miles N.N.E. of Aden.

YROUER, in Geography, a town of France, in the department of the Yonne; 5 miles S. of Tonnerre.

YRSEE ABBEY, a princely abbey of Germany, in the circle of Swabia, founded in the year 1182. The territory includes the village of Yrsee, and seven others. In 1800, this abbey was given among the indemnities to the elector of Bavaria; 3 miles N.W. of Kaufbeuren.

YRILLAC, a town of France, in the department of the Finisterre; 3 miles S. of Landerneau.

YRUN, a town of Spain, in Guipucos; 2 miles S. of Pontarabia.

YRVON, a river of Wales, in the county of Brecknock, which runs into the Wye, at Builth.

YS, in Ichthyology, a name given by Athenæus, and some other of the Greek writers, to the fish called mus and sus by others. It is the capricus of later writers. See Goat-Fish.

YSABRA, a word used by some as a name for hellebore, and by others to express a species of poifon prepared in Spain, of which hellebore is an ingredient.

YSARD, in Zoology, a name given to the chamois.

YSCH, in Geography, a river of France, which runs into the Dyle, 6 miles S. of Louvain.

YSENDYCK, or ISENDYCK, a town and fortress of Flanders, situated on the side or arm of the Scheldt, called
The Blie; it was built near a town called Galtersne, swallowed up by an inundation of the tea some centuries ago, whose inhabitants came to establish themselves at this place. The Dutch made themselves masters of it in the year 1634, and since that time it has been strongly fortified, which is much as if by its situation, being surrounded by marshes, which they can lay under water at pleasure; 8 miles E. of Sulys. N. lat. 51° 24'. E. long. 3° 29'.

YSIORTAM, in Ancient Geography, a place of Aria, in Armenia, which had a Roman garrison.

YSNL, in Geography. See ISNL.

YSOPUS, a term used by fome to express the chemical art of separation.

YSBR, a name by which fome of the chemical writers call iron.

YSANDON, JEAN, in Musical Biography, born at Leffart, in the Comte de Poix, wrote "A Treatise on Practical Music, divided in Two Parts." This book was become very fcarce, and deferves to be reprinted. It was first printed by Ballard in 1582. Laborde.

YSSEL, in Geography. See ISEL.

YSSENGEAUX. See ISENGEAUX.

YSTAD, or YSTAD, a fea-port town of Sweden, on the south coast of the province of Schonen, from whence a packet fails to Stralfund. It was formerly well fortified, and contained two churches. The harbour is neither large nor safe; 26 miles S.E. of Lund. N. lat. 55° 22'. E. long. 13° 44'.

YSTSA, a town of North America, in the province of Mexico.

YSTWTH. See ISTWITH.

Y-TCHANG, a town of Corea; 35 miles W.N.W. of Kang-tcheou.

Y-TCHUUN, a town of Corea; 15 miles S.S.W. of Ou-tcheou.—Alfo, a town of Corea; 55 miles N. of King-kitao.

YTHAN, a river of Scotland, a few miles N. of the Don, that joins the fes, about two miles from Aberdeen, which falls into the German ocean. The Ythan is a frem formerly celebrated for its pearl fisheries, of which fome relics are now found.

Yther, a river of Wales, which runs into the Wye, 3 miles N. of Buith.

YTERON, a small island in the gulf of Bothnia. N. lat. 69° 4'.

YTRYRA BERGON, a small island on the W. side of the gulf of Bothnia. N. lat. 61° 48'. E. long. 17° 13'.

YTRRA, or YTRIA, in Chemistry, is a peculiar elementary substance usually considered as an earth.

Ytria has been hitherto met with in a peculiar mineral named GADOLINITE, so named from professor Gadolin, who first analysed it, and in YTTRO-TANTALITE, both minerals found only in Sweden. See those articles.

Ytria has the appearance of a fine white powder, without taste or smell. It does not affect vegetable blues. Its specific gravity is considerably higher than that of the other earths, being no less, according to Ekeberg, than 4.842.

Ytria is insoluble in water, yet, like alumina, it is capable, according to Klaproth, of combining with nearly one-third of its weight of that fluid when precipitated from a folution by the muriatic acid. In solutions of the pure alkalies it is likewise insoluble; but in the carbonate of ammonia, and indeed in all the alkaline carbonates, it dissolves readily. It combines with acids, and forms with them salts, which, as far as they are known, are described below.

Ytria is not affected by light, and probably does not combine with oxygen. According to the experiments of Klaproth, it does not combine readily with sulphur.

Sir Humphrey Davy found, that when potafh was passed through red hot yttria, it was converted into potafh, while grey metallic particles were perceived mixed with the alkali, which were considered to be the metallic basis of the earth or yttrium. Nothing further, however, is known respecting this metallic basis.

The Salts of Ytria are but little known. The following only have been examined.

Nitrate of Ytria.—This salt was frift formed by Ekeberg, and has been more lately examined by Vauquelin. It may be prepared by dissolving yttria in nitric acid. The folution has a fweet astringent taste, and can scarcely be made to crystallize. Expofed to the air, it deliquesces. When fulpuric acid is poured into the folution, crystals of fulpurate of yttria are instantly precipitated.

Carbonate of Ytria.—This falt may be formed by precipitating yttria from its folution in acids by means of an alkaline carbonate. It is white tafteless infuble powder, composed, according to Klaproth, of

</tbody>
</table>

According to Vauquelin, however, it loses only 32 per cent. when calcined.

Phosphate of Ytria.—Vauquelin formed this falt by mixing a folution of the phosphate of foda with the sulphate, nitrate, or muriate of yttria. The phosphate of yttria precipitated in the form of gelatinous flakes.

Sulphate of Ytria.—Sulphuric acid dissolves yttria readily. As the folution proceeds, the sulphate crystallizes in small brilliant grains. Ekeberg flates these crystals to be flat fided prisms, terminated by four-fided fummits. Dr. Thomson obtained thefe in the form of long fendid rhomboidal prisms. Their colour is amethyst-red. Their specific gravity 2.791. They are foble in about 30 parts of water at 60°. A red heat partly decomposes them. Oxalic acid, prufiate of potafh, and infusion of nutgalls, occasion a precipitate in the aqueous folution of this falt. It is decomposed by the phosphate of foda. The folution of Glucina is readily diftinguished from this falt by its being colourfes, lighter, and more soluble in water. According to Berzelius, the sulphate of yttria is composed of

Arseniate of Ytria.—When yttria is dissolved in arfenc acid, and the folution boiled, arseniate of yttria precipitates in the form of a white powder. Arfenate of potafh also precipitates yttria from acids.

Chromate of Ytria.—Chromic acid dissolves yttria cold in considerable quantity, and with effervescence. The folution has an astringent and pungent taste, and, like moft of the chromates, has an orange-red colour, passing into yellow. The folution is fweet neutral. When evaporated, it forms minute prismatic and cubic crystals. It is very foble in water.

Acetate of Ytria.—Yttria dissolves readily in acetic acid, and the folution on evaporation yields crystals of the acetate of yttria, the form of which is usually that of thick fixed plates.
plates, obliquely truncated. Their colour is amethyst-red, and they are not altered by exposure to the air.

*Succinate of yttria.*—Yttria is not precipitated from its solution in acids by the succinates, unless the two salts be concentrated, in which case small cubic crystals fall, which are the succinate of yttria.

*Oxalate of yttria.*—When oxalic acid, or the oxalate of ammonia, is dropped into a solution of yttria in an acid, a white insoluble powder falls, which is the oxalate of yttria. According to Vaquelin, this salt is composed of

<td><strong>Total</strong></td>
<td><strong>100</strong></td>
</tr>
</tbody>
</table>

*Tartrate of yttria.*—Yttria is precipitated from its solution in acids by the tartrate of potash, but the precipitate is dissolved by the addition of water.

Dr. Thomson infers, from the analyses above-mentioned, and more especially from the analysis of the sulphate and carbonate by Berzelius and Vaquelin, that the combining weight or weight of the atom of yttria is 50, oxygen by 10, and consequently that it is composed of

and the weight of the atom of yttrium will be 40.

With respect to the salts of yttria in general, it may be said, that many of them are little soluble; that they are capable of being precipitated from acids by the phosphates of soda, the carbonate of soda, the oxalate of ammonia, the tartrate of potash, and the prussiate of potash; and lastly, that the sulphate of yttria may be distinguished from the sulphate of lime by its greater solubility, and by its sweet taste.

**YTTRIUM**, the metallic basis of yttria. See *Yttria supra.*

**YTTRIO-TANTALITE**, in Mineralogy, Tantale yttrii, Tantale yttrithan, Brougniart, an ore of tantalum, combined with the newly-discovered earth called yttria, and found at Ytterby, near Koflagen, in Sweden. The colour of yttrio-tantalite is a dark iron-black; when pulverized it is greyish; it occurs in nodules, about the size of a hazel-nut, and also crystallized in oblique six-sided and four-sided prisms. It occurs also in granular distinct concretions. Its fracture is compact or finely granular, and it has a shining metallic lustre. Yttrio-tantalite scratches glass, but yields with difficulty to the knife. The specific gravity of this mineral is 5.13. It decomposes with the blow-pipe, but at length melts into a greenish-yellow flag. According to Vaquelin, the constituent parts are,

| Oxyl of tantalum | 45   |
| Oxyl of iron and yttria | 55   |
| **Total**        | **100** |

Yttrio-tantalite is nearly allied to gadolinite, the other mineral in which yttria is found, and occurs with it at Ytterby, in a bed of flesh-red felspar in gneifs.

**YTZAIMPATLI,** in the *Materia Medica*, a name given by some to the cedavilla, or hordeum caucicum, the caucic Indian barley.

**YU,** in Geography, a city of China, of the second rank, Vol. XXXIX.

in Pe-chie-li; 87 miles W. of Peking. N. lat. 39° 52'. E. long. 114° 14'.—Alfo, a city of China, of the second rank, in Ho-nan; 443 miles S.S.W. of Peking. N. lat. 39° 22'. E. long. 112° 38'.—Alfo, a city of China, of the second rank, in Ho-nan; 377 miles S.S.W. of Peking. N. lat. 34° 16'. E. long. 113° 14'.—Alfo, a river of China, which rises in Ho-nan, 12 miles N. of Pi-yang, and joins the Hoai, 20 miles E.S.E. of Sin-tai.—Alfo, a river of China, which rises about 26 miles W. from Ngan-fou, in Kiang-fu, and runs into the Kan-kiang, 7 miles N.N.E. of Lin-kiang.

**YUCATAN,** a province of Mexico: it is a peninsula, surrounded on the W. and N. by the gulf of Mexico, between the bay of Campeachy on the S.W., and that of Honduras on the S.E., having the little province of Tabasco on the S.W., and that of Vera Paz, in the audience of Guatemala on the S., where it is joined on the continent by an isthmus not 120 miles broad. The climate is pretty warm in summer, which begins about April, and ends in September. It rarely rains here during the winter season, though the weather is tolerably cool, except in January and February, which are almost as hot as in the middle of summer. It is, however, very healthy, especially a large mountainous tracts, extending from Salamanca on the W., to the eastern boundary, and where the natives live to a great age. The south side of this ridge is ill-peopled, and worse cultivated, for want of water; but the north part is very populous, being rendered pleasant by gentle breezes, though the sun is very hot. The days and nights are nearly equal all the year. The soil when properly cultivated produces great quantities of corn, cotton, and indigo. All sorts of cattle, wild-beasts, honey, wax, and fowls, are here in great plenty; and on the coasts are found large pieces of amber; but as no mines were ever discovered in this country, the Spaniards are not fond of making settlements here, so that it abounds mostly with Indians, subject to the Spaniards, who employ them in making salt, in the bay of Campeachy. This peninsula has very few rivers, but wells without number, and considerable lakes; and wherever they dig up the land, abundance of shells are found, which with the lownefs of the country, and shallownefs of the sea about it, has induced many to think that the greatest part of it was once under water. The capital of Yucatan is Campeachy, in the bay of which, and of Honduras, the former lying on the west, and the latter on the east side of this province, the English cut their logwood.

Gen. Ch. Cal. none. Cor. bell-shaped, in six deep, ovate, very large, equal, moderately spreading segments, connected by their claws. Nectaries none. Stam. Filaments fixed, inserted into the base of the corolla, very short, swelling upwards, reflexed; anthers minute, roundish. *Pyf.* P German
YUCCA.

Germn superior, oblong, bluntly triangular, with six furrows, rather longer than the stamens; stamens five; stigmas obtuse, with three furrows, its lobes cloven, the centre pennis. *Pursh.* Berry oblong, bluntly hexagonal, fleshy, perforated at the summit, of six cells; three of the partitions thicker than the three intermediate ones. *Seeds* very numerous, in a single row, separated from each other by transverse membranes, roundish-obovate, flat, depressed, attached, by their pointed base, to the inner angle of the cell.

Ob. We have, like Schreber, adopted Gartner's idea of the fruit, which Linnaeus does not appear to have seen in perfection, and which Dillenius confesses himself to have judged from the unenlarged *germen* only. Analogy might well lead these authors to presume it a *capsule,* which, from the structure of the *germen,* might be judged to consist of three cells. This idea was moreover supported by an account which Ray had somehow obtained from the East Indies; where indeed no *Yucca* grows wild, and therefore this account cannot implicitly be trusted. Gartner received, from professor Hermann of Strauburg, the ripe fruit of *Yucca dracaonis*; and this being the only authentic instance of the seed-veget of any one of the genus paffing under the investigation of a critical botanist, we must rely on it as affording the only certain type of the genus in this particular. Jullifc appears to have followed Linnaeus; but the discovery of the true nature of the fruit, rather favours his opinion above-mentioned, of the affinity of *Yucca* to his *Bromelie.* This is a handsome perennial genus, more or less caespitose, with numerous, long, simple, rigid or coriaceous, pungent leaves; and copious, panicled, white, lilaceous, very elegant though generally inodorous flowers. Some of the species are tolerably hardy in our gardens, but they do not very readily or constantly bloom.

1. *Y. gloriosa.* Common Adam's-needle. Linn. Sp. Pl. 456. Willd. n. 1. Ait. n. 1. Pursh n. 4. Curt. Mag. t. 1260. Andr. Repof. t. 473. (Y. five Jucca, perumum; Ger. Em. 1543. Yucca indica, folis aequos, flore albo; Barrel. Lc. t. 1194.)-Caulecente. Leaves lanceolate, straight, furrowed; their edges smooth and entire.—Native of Peru and North America. On the sea shore of Carolina, flowering in July and August; the whole plant about ten feet high. Flowers white. *Pursh.* The *film* in our gardens is seldom two feet in height, somewhat branched, thick, tough, crowned at the summit of each branch, if divided, with a profusion of crowded leaves, spreading in every direction, each a foot and a half or two feet long, tapering to a hard spiny point; contracted in the lower part, but dilated at the very base, where they half clasp the *film;* their upper surface is of a fine green, smooth, furrowed longitudinally, especially toward the end; the under paler, and more even; the edges quite even and smooth. *Panicule* terminal, compound, erect, composed of perhaps an hundred drooping flowers, not much inferior in size and beauty to those of the White Water-Lily, but more cream-coloured, tinged at the base and points with crimson, destitute of fecent. Partial *flakas* about an inch long, round, smooth, with a pair of membranous bracteas at the base. *Stigma* in three distinct spreading, cloven lobes. We cannot but think, notwithstanding Mr. Ker's opinion, that Andrews's figure belongs to this species, and not to alafoja. This is evinced by the furrows and margin of the leaves, as well as by the structure of the stigma; though we must allow the whole representation to be less happy and characteristic than that in the Magazine.

2. *Y. recurvifolia.* Drooping-leaved Adam's-needle. Saliib. Parad. t. 31. Pursh n. 3.—Caulecent. Leaves linear-lanceolate, furrowed, recurved and drooping; their edges at length somewhat filamentous.—Native of the sandy shores of Georgia, where it was found by M. Leconte, flowering in July and August. The *flowers* are of a greenish-yellow, with a tinge of purple. *Stern* about three feet high. *Pursh.* This species is recorded in the *Paradisus Londinensis,* as having flowered, in the late Mr. Swainson's garden at Twickenham, in 1805; yet it is not admitted by Mr. Dryander, or Mr. Aiton, into the *Hortus Kewensis,* or its *Epitome.* The flowers are said by Mr. Salibury to have a strong smell, mixed with something like a citron flavour. The three inner segments of the corolla are a little the broadest. *Stigma* most like the last. The edges of the leaves split off in a few disjointed filaments, in the manner of *F. filamentofa,* though far less remarkably. We have seen no specimen. Mr. Pursh having observed this, as well as the gloriosa, in a living state, in North America, chiefly induces us to admit it into our list of species; garden plants being always left to be trusted in any doubtful question.

3. *Y. alafoja.* Aloe-leaved Adam's-needle. Linn. Sp. Pl. 457. Willd. n. 2. Ait. n. 2. Pursh n. 5. Curt. Mag. t. 1700. (Y. aborecens, folis rigidioribus rectis ferratis; Dill. Elth. 435; t. 323.)—Caulecente. Leaves linear-lanceolate, even, straight; their edges bordered with fine ciliate notches.—Native of South America, according to most authors; of the coast of Carolina and Florida, flowering in August. *Pursh.* It was introduced, more than a hundred years ago, into the English and Dutch gardens, and is generally treated as a green-house shrub, though said to succeed and flower better, in mild seasons, in the open ground. The *filum* is generally simple, and rises to the height of fifteen to eighteen feet, even in our conservatories, being for the most part naked, round, three or four inches in diameter, marked with scars where leaves have been. The upper part, for the space of a foot or more, is thickly becket with leaves, spreading in every direction, the lower ones pointing downwards, the upper ones nearly upwards, a few in the middle only being horizontal. The *leaves* are all straight, narrower and rifer than in *Y. gloriosa,* and distinguished by their entire edges, as well as even surface. The *panicule* also is more dense and cylindrical, from two to three feet high. *Flowers* white, externally tinged with purple. *Stigma* abruptly of three shorter, less dilated and spreading, lobes. Mr. Ker truly remarks, in the Botanical Magazine, that this species will thrive for many years with very little earth, in pots not more than a foot deep. Its flowering is a rare occurrence, and after that event, the head decays at the top, throwing out lateral shoots, and the plant becomes branched; but its elegant simplicity is destroyed, and we believe no more flowers, at least in our gardens, are ever produced.

4. *Y. dracaonis.* Drooping-leaved Adam's-needle. Linn. Sp. Pl. 457. Willd. n. 3. Ait. n. 3. (Y. dracoenis folio, ferrato reflexo; Dill. Elth. 437; t. 324. Tacoroi; Clus. Exot. 48.)—Caulecente. Leaves linear-lanceolate, even, reflexed, crenate. Segments of the corolla spreading, somewhat recurved.—Native of South Carolina, according to Mr. Aiton, who marks this species as a hardy shrub, flowering in October and November. We have never seen an authentic specimen of the flowers, but in the very admirable plate, communicated to Dillenius by his friend Spreckelon of Hamburg, and published in the Hort. Elth. as above, the _corolla_ is represented with more lanceolate, flat, spreading,
YUCA, in Gardening, contains plants of the succulent, evergreen, shrubby, hardy, and tender kinds, in which the species cultivated are, the common Adam's-needle (Y. filamentosae), the thready Virginian yucca (Y. filamentosa), the aloe-leaved yucca (Y. aloifolifla), and the dragon-tree-leaved yucca (Y. dracena).

There are all succulent evergreen shrubby plants, some of them having a flabby nature and great regularity of growth.

Method of Culture.—These plants are all capable of being raised by offsets or suckers, from the roots and heads of the old plants, as well as by seed.

The offsets and suckers may be taken off any time in the spring or summer, being laid in some dry place for a few days, until the wounded part caused by the separation from the plant is dried and healed over; when they may be planted out separately in pots of light sandy compost, and be placed in a shady situation till they have taken root in a perfect manner. When lifted by a hot-bed, they often succed better.

The seed obtained from abroad should be sown in the spring in pots of light earth,. putting them in a hot-bed, in which the plants soon come up; and when they are two or three inches high, they should be pricked out separately in small pots of light sandy mould, replacing them in the hot-bed to forward their growth, affording them with moderate waterings and fresh air daily, and hardening them by degrees to the full air, so as to be set out in June to remain till October, when they should be removed into the green-house for the winter.

Some plants of all the sorts should constantly be preferred in pots.

They are all very ornamental; the two first after they have been hardened, in the dry borders, where the soil is light, and where the situation is warm and sheltered; and the others in green-house collections, among other potted plants.

YUE, in Geography, a city of China, of the second rank, in Yunnan; 1105 miles S.S.W. of Peking. N. lat. 25° 22'. E. long. 109° 22'.

YUEN, a river of China, which runs into the lake Tong-ting, 17 miles E. of Tchang-te.—Alfo, a city of China, of the second rank, in Hou-ouang; 850 miles S.S.W. of Peking. N. lat. 27° 23'. E. long. 105°.

YUEN-KIANG, a city of China, of the first rank, in Yunnan, on the Ho-ti river; 1250 miles S.W. of Peking. N. lat. 23° 37'. E. long. 104° 44'.

YUEN-TCHEOU, a city of China, of the first rank, in Kiang-fi; 750 miles S. of Peking. N. lat. 27° 50'. E. long. 114°.

YUEN-YANG, a city of China, of the first rank, in Hou-ouang, on the river Han; 517 miles S.S.W. of Peking. N. lat. 32° 50'. E. long. 110° 29'.

YVERDUN, or IFFERTEN, a town of Switzerland, in the Vaudois, and capital of a bailiwick, in the canton of Berne, situated on the lake of Neufchatel, otherwise called the lake of Yverdun, at the mouth of the river Ord, which divides into two branches, forming a good port, and an island, on which the town is situated. The two f luxbours communicate with the town by bridges. It is ancient, and in the Thedofian table called "Cafrum Ebredunenfis," and "Ebredunenfis," by which it is understood to have been a place of strength. The Romans maintained here a praefetus barcariorum, and there yet exist a society of boatmen, of ancient standing, and numerous, who have a particular police, privileges, and laws of navigation. From the Romans it passed to the kings of Burgundy, and afterwards to the dukes of Zahringen. In the year 1259, it was taken by Peter of Savoy, who reduced it by famine, and it continued
in that family till the year 1536. In this year, the troops of Berne, when they had reduced the rest of the Vaudois, laid siege to this town, and after a few days, became masters, since which Yverdon has been subject to Berne. The police is administered by a great and little council, composed of thirty-six members, the president of whom has the title of banniert. It has a large and strong castle, flanked with four towers, built in the 12th century, by Conrad, duke of Zähringen: other public buildings are, a college for the instruction of youth, an hospital, divers magazines, &c. and in the town-house is a library, formed not long since by contribution. The environs were formerly a morass, which has been drained, and is now become good and fertile land. Near the town is a sulphurous medicinal spring, and in the year 1736, a building, for the purpose of bathing, was erected by the magistrates. In the middle of the last century, a company was formed, for the purpose of making a navigable canal from the lake of Yverdon to the lake of Geneva, but it was never finished. The bailiwick is one of the most considerable in the canton of Berne, containing about 25 parishes and 20 lordships, and is about 15 miles in length. The fertility is moderate: the wine is not of the best quality; 34 miles S.W. of Berne. N. lat. 46° 48'. E. long. 6° 14'.

YVES, or Ivo, in Biography, bishop of Chartres, was born in the 11th century, of a noble family, in the territory of Beauvais, and studied theology under Lanfranc, prior of Bec. Being made abbot of St. Quentin, he opened a theological school, which became famous; and having superintended this institution for fourteen or fifteen years, and maintained a regularity among those who attended it conformable to the ancient canons, he was justly regarded as one of the chief founders of the order of canons-regular. Upon the death of Geoffrey, bishop of Chartres, he was chosen as his successor, and the election was confirmed by Urban II. in 1091. The discipline he maintained in his see was exemplary, and in the duties of it he was employed for 25 years, his episcopate and his life terminating in 1116. Besides sermons, a brief chronicle of the kings of France, and two collections of ecclesiastical decrees, he has left 287 epistles, from which may be learned the manners of the times in which he lived. Of these we have a summary by Dupin. A collection of his works was printed at Paris in 1647. His name is highly respected in the church of Rome, and pope Pius V. sufficed a bull in 1570, empowering the canons-regular of Latran to celebrate an anniversary for "the blessed Yves." Dupin. Moreri.

YVETOT, in Geography, a town of France, in the department of the Lower Seine. This was once a place of consequence, and the capital of a kingdom; 18 miles N.W. of Rouen.

YUFTS, or Russian Leather, as it is called in England, are the chief products of the tanneries in Russia; and the principal places in which they are prepared, next to Moscow and Peterburg, are, Arkamas, Kotroma, Yarolla, Pfcove, Kazan, Vologda, Nilhen-Nogorod, Vladimir, Ekatarinenburg, &c. Mr. Tooke has described the processes by which they are prepared:—The raw ox-hides are first laid in running water, or in large tannpits full of water dug in the earth for that purpose, to soak for a whole week; but in summer not so long. During this time they are daily taken out of the water, and scraped at a scraping-bench, or wooden horse. Having now been duly steeped, they are put into a leat, thus prepared: In other words, likewise dug in the ground, and under cover, they mix two parts of good ashes with one part of unblacked lime, in boiling water, and flink the wet hides in this leat on a grating, which being suspended by cords, can be railed or let down at pleasure. In this vat the hides are laid again for about a week, though in warm weather less, in cold perhaps even longer. The sign that they have lain long enough in the leat is, that the hair can without difficulty be rubbed off with the hand, so that none remains. If the hides, after the expiration of a week, are not in that condition, fresh ashes are put into the leat, and the skin funk in it. But if at length the hair be sufficiently loose, the hides are entirely taken out of the leat, and all the hair scraped off on a scraping-block, by means of blunt iron scrapers with two handles. The hair is washed clean, and folded for domestic uses. The hides, thoroughly cleansed from hair, are suspended in vats of clean water on a running stream, where they remain three days, diligently turned towards to and fro, in order to purge them from the ashes and leat; afterwards they are hung up, and left to drain. The hides must now be scraped on the flesh side. To this end they employ either the aforesaid scraping-iron, or others sharper in various degrees. After this treatment, the hides are trampled. But calves-hides have another sort of preparation, which the yuf-tanners, in the interior towns of the empire, who mostly practice it, call rakfisht. This preparation is performed with the white excrement of dogs dried, which is dissolved in boiling water, and to a hundred hides about four vedros full of excrement is the rule. If here the right proportion with the water be not found, the hides corrupt in this steame, the object whereof seems to be the complete freeing of the skin from the salts that adhere to it from the leat. The hides are left to lie twice twenty-four hours. With this is mixed a great quantitv of oatmeal with warm water, and to three ofnicks, or eighthts of a chetverik, three or four vedros of dreggs of the common quas, which the people make of meal and a small portion of malt, put in the thin gruel, that it may quickly four with the hides. To ten hides, the tanners usually reckon forty pounds of meal.

After the hides have foured, which is done in large vats, they are laid in other vats, and well steeped for two or three days in a strong tan-juice, fok, thoroughly boiled from good bark. When this is done they are brought straight to the tan. In the tan-pits, in which often some hundreds of hides are lying, is poured half water and half tan, or water boiled with tan, and a grating is hung in with cords, having one hide after the other spread upon it; thick itrewed with good fince-pounded tan, and the grating constantly let deeper into the pit, till it be nearly full; yet so that the tan-liquor is always above the hides, which are then again sprinkled over with tan. In this tan the hides continue to lie a week; though of full-grown animals longer. On being taken out, they are washed and trampled on, which two workmen in a summer's day can perform with three hundred hides. The next day they are laid, in the manner above-described, in fresh tan. Thus they generally get four times successevly fresh tan, and are every time rinsed clean. In the last tan they lie three weeks, or longer, are then finally washed, hung up, and, when they have tolerably drained, delivered to these workmen whole bufines it is, in particular workshops, to dye, drefs, and wash the yufts, and to deliver the goods finished. It is to be observed, that the Russian yuf-tanners seldom use oak-tan, and never willingly. The choiceest and best tan is that of the tschernotal, as they call it, or the black willow; and also the young bark peeled off from other shrubbery willows, which are collected by the boors, dried in bundles, and brought in cart-loads to market. To ten hides, the tanners compute one and a half fathom of these bundles of yellow-bark,
bark, as they are laid one upon another for sale, through all the seven. It must not, however, be imagined that the excellence of the Russian yuffs depends on this; for in Siberia, where there are no oaks, and but few willows of any size, they tan yuffs with only birch-bark, which are not much worse than the Russian. The bark is made small by either ordinary tan-mills, turned by horses or by water; or the tanner himself, in many towns where there are no mills, causes it, at unnecessary expense and labour, to be pounded in wooden mortars, or excavated blocks, with pestles, almost like those in the tan-mills, by day-labourers.

The dyeing of the yuffs is performed in two ways, and over two colours. The commonest and most natural custom of giving the colour to the hides is, by feeding them together in pairs, the hair side inwards, while they are yet moist, round the edges, with rufhes or stripes of bark, thus forming them into a bag or sack; into this sack the colour is put, the sack well shook, and the superfuous dye let to run out, whereupon the skins are dried. From this method of dyeing them, it seems to proceed that the yuffs are called and taken by pairs. The other process, whereby much trouble, time, and colour are saved, and the edges of the skin entirely preferred, is the following: Each skin is hung upon a horse over a long trough, so that the hair side, which must be stained, appears outwards, pounding the dye upon it out of the dye-kettle, till the whole skin is dyed. The two colours given to the yuffs are red and black. The red dye is thus prepared: Pound braflf wood (fandal) in the pounding-mill, or with hand-pestles, as fine as the tan, and boil in kettles. Previous to the dyeing, steep the skins in alum and water. It is calculated, that to each small yuff skin a half, and to a large one a whole pound of logwood is put. But the latter are mostly coloured black. To a hundred yuffs to be dyed red, four pounds of alum is sufficient. For dyeing black the braflf wood is likewise used; but in the red dye, to a hundred skins three pounds of good iron vitriol is dissolved. After the first tincture the skins are dried, and afterwards on tables done over again with the same dye and rolled up, that they may thoroughly imbibe the dye. For heightening the colour this tincture is sometimes thrice repeated. When the skins are now tolerably dried, by hanging, that the colour may not fade, with the flesh side outwards, the yuffs, still somewhat moist, are smeared over on tables that have ledges. There was a time when it was commanded by authority to use nothing but dolphin and seal-blobber for tinning them; but by that the yuffs are harbier, and have not that yuffs smell, which foreigner prize so much, unless the birch-tar, deggot, prepared in Russia, at least be mixed with it. At present this birch-tar alone is used for tinning. These skins are cleaned from any impurities that may remain, and are sent to the dressing-house, where skillful workmen scrape them first with slitting-irons, having two handles, with the edge crofs-wise on a stretching-bench, that a soft thin leather remains with a clear glossy surface, free from all impurities. Other workmen then take the clean-scraped yuffs on large clean tables, sprinkle them on the flesh side with a gentle flower of fresh water from their mouths, and lay them slightly rolled up to moisten. This done, the skins are taken separately one after another, folded together, and worked and calendered in all directions, to make them soft and pliant. They are then curried with a kind of wooden curry-comb, with sharp irons fixed in leathers, like a card for carding wool, the skin being folded with the hair side outwards, by which the whole surface of the yuffs acquire the cross-strokes or trellis-like marks they are always seen to have. Some work the skins with the hands first dry, not sprinkling them till they are mangled with the card. Lastly, thele skins which are too hard and stiff to the feeling, are more or less sprinkled with linseed-oil, and thus are ready for the merchant.

In this connection we shall introduce from the same account an account of the Russian method of preparing and dyeing their ollafian, maroquin, or Morocco leather, which are dyed at Astrachan of three colours, red, yellow, and black. The treatment of the red taffians, which are the most famous, is as follows:—The raw hides are first laid in large vats, and have river water poured upon them, in which they are left to soak for three or four times twenty-four hours. They are then taken out, the water is drained and fqueezed from each skin, and are scraped one by one on the stretching-bank with scraping-irons, uraki, quite gently on the flesh side, in order to take away the greater impurities, but principally for opening the skin, and to qualify it for the ensuing operation.

They now proceed to make the hair fall clean off, chiefly by the application of lime. To a hundred hides is stirred in about half a bushel of unflaked lime in vats with river water, and the hides are laid in fo as that the lime may as much as possible be equally distributed over all of them. The Astrachan Tartars let the hides lie in this lime-pit frequently three weeks; but it is well known, that their taffians are so harsh and liable to crack, and even certified by it, that they are fit for nothing, and can only impose upon an inexperienced purchaser. They then take out skins, wash them, and carefully scrape off the hair, now become loose, with wooden scrapers. It often happens, that the hair is not perfectly loosen'd by the first lime-ley, but that many tender fubs and few small hairs are left remaining. In this case, the hides must be put into fresh lime-ley, and be left perhaps two weeks in it; the hair then proves off, and the hair side of the skin gets a green and very white appearance, but the substance is then also very soft, and the taffians, by this corruption of the lime, are very little durable in comparison of other kinds of leather.

The method now for taking the lime again out of the hides, is the second treatment with dog-excrement, or white gentian, which is carefully collected for this purpose. This excrement, which is indescribably necessary, is poured into a narrow not very large vat, warm water poured upon it, the mafs thoroughly stirred, and the cleaned hides are put with it into another vat, so that the dissolved album gum is spread and infiltrated over and between every skin. In these ingredients, the skins must lie only twenty-four hours, or if the quantity of album gum prove not rich, somewhat longer. The proportion here to be observed cannot be accurately ascertained; for the taffian-makers are guided generally by eye-measure, and observe only that the water be very thick and turbid, and consequently acid enough. The hides come out of this corrosive much softer and thinner than they were, and are now freed from the force of the lime; but no time must be lost in endeavouring to extract the corrosive like-wise, that the hide may not be even more ruined by it than by the lime. They are generally very careful that the hides lie not too long in this corrosive, which they judge of by their eye from the pliancy and suppleness of them. As soon as the skins are lifted out, the unclean mois-
skin is softer and mellow. All these particulars are in some measure of no other service than to bring off the hair thoroughly clean from the skin.

Now follows the proper preparation of the skins taken out of the wheat-bran. This is done chiefly by heat. To eighty hides they take about twenty-five pounds of raw stone, boil it in a kettle, pour as much water to it as is necessary for giving it a due consistance, and stir it for a pretty long time boiling on the fire. They then let the kettle cool, till they can but just bear the hand in it, and then pour the still hot honey-water on the hides lying singly in little trays, by ladle-fulls, till they have thoroughly imbibed the honey-water. When all the skins are duly drenched, they are thrown into a dry vat all together, laying at top a board with weights upon it, and covering the whole vat with felt, carpets, or furs, that the vapour during the fermentation may not escape; and in this manner, the skins must ferment once more thrice twenty-four hours. By this means they acquire the grain. From the honey-vat they are rinsed clean in luke-warm water, wrung as dry as possibly, steeped immediately in a moderately strong pickle or brine made of common salt, in which they must be left five or six days. This time being elapsed, the skins are taken out of the pickle, and hung upon clean poles, that the brine may drain out, as it would be thought injurious to squeeze it out with the hands. This done, the skins have received their whole preparation, and may now be dyed red, but not yellow; because for the yellow faffians, as was said before, the preparation is of another kind.

For giving the red faffians the colour, nothing is used but cochineal, or, as the Tartars call it, kirmefs, and that in the following method: First, they boil a quantity of the herb falkola ericoide, by the Tartars called tchagan, plentifully growing on the arid Affercan salt-plateaus. To about four Russian quarts of water is put of this dried herb somewhat less than a pound, and it is set to boil for a whole hour, whereby the water acquires a dark greenish colour, but betrays no acrimony to the taste. The faffian-maker only takes care that the water be not too deeply tinted, and that when dropped on the thumb-nail shews only a scarce perceptible green; and in case it have adopted too many particles of the colour, it is drawn off, and fresh water put, in which the herb must boil again, till the decoction has received the due degree of saturation. The herb is then with a scoop taken clean out of the kettle, and then the previously nicely powdered cochineal thrown into a kettle of four Russian quarts to about half a pound, well stirred, and fresh fire added, in which great attention must be paid, that the red colour, which arises from boiling, does not boil over, therefore cautiously some is taken and again poured in, in order by this refrigeration to prevent the over-boiling, and to allow the foam. After boiling for about an hour and a half, the water has obtained a strong tinture; but as much of it is boiled away, the kettle is filled up again with the remaining decoction of the herb tchagan, and the thus attenuated colour boiled afresh, till it is seen that the cochineal is perfectly dissolved, and the colour become thoroughly bright. Upon this, to the whole kettle is put about two lote of pounded and burnt alum into the dye, with which it is to boil about a quarter of an hour, and then the fire is taken from under the kettle, leaving only some hot embers, that the dye may retain as much heat as the hand can but just bear. This done, the skins prepared for dyeing are taken in hand, the dye poured by ladles into trays, one skin folded together after another, with the hair side, outwards, and then are worked in their portion of dye for long, till they have unitedly absorbed all the dyeing particles, and only somewhat of a pale moisture remains. The leathers being thus for the first time flaimed are quickly squeezed out, hung up flings across poles, and when they are all done, they are directly taken for the second time, and imbued in the same manner with dye, and this treatment is repeated for the third and the fourth time, so that each skin gets four ladles of the dye. From the fourth dye the skins are no more prefixed, but hung up entirely wet, to be ventilated, upon poles.

After the dye, the skins are once more curried with the leaves of the tan-tree, which the Armenians call belge. The crushed or pounded dry leaves, which the Affercan faffian-makers get from the Terek, are stirred in broad troughs to a thick gruel with river water, and the coloured skins laid in it, between each of them, leaving a sufficiency of the leaf-ooze; the Tanner then goes barefoot into the troughs upon the skins lying on one another. In this tan, or quas, as the workmen call it, the faffians lie eight days and nights, adding fresh tan every other day; so that four tans are necessary.

Here it must be observed, that some Armenians who prepare faffians, for enhancing the quality of the red colour of their faffians, to half a pound of cochineal add two lote, or rather more of forrell, or the like, as they call it, in the dye-kettle, but it is usually omitted in Affercan, on account of its high price; for which reason the Affercan faffians are excelled by the Turcesh in beauty of colour. Secondly, it is to be known, that instead of the leaves of the tan-tree, bruised nut-galls are held to be still more efficacious for giving the faffians the tan. By this means, the colour is durable as never to pass away but with the leather; whereas the faffians prepared with the tan-tree begin soon to be discoloured. But the nut-galls are likewise too dear in Affercan to be curiously used by the fassian-makers. The Kazan Tartars colour their faffians with red wood, and tan them with the shrub uva urbi, but it makes the worst faffians of all, as they presently fade.

When the faffians are lifted out of the tan, still the hair work remains. They are first left some time in the air to dry, they are afterwards scraped on the fretch-bank with sharp scrapers on the flesh side, quite smooth and clean, then washed in running water, each skin duly stretched with pegs all round the edges, and thus left till they are dry.

The skins must now be smoothed on the hair side with a wooden instrument for that purpose; and lastly, they are laid on a thick felt, where, with an iron heckle that has blunt points, the little pickings, which the faffians are generally keen to have, are imprefsed on the same side. And thus they are ready for sale, without being finedit with linseed-oil, as is mentioned in Gmelin's travels, which would infallibly spoil them.

The yellow fassians are little made in Affercan, as the demand for them is much less, and there are but few fassian-makers who know much of the matter. The dye which they make use of for this purpose is of the berries of a sort of rhammus (perhaps lycioides), which are brought from Perita under the name of ulofherr, and usually bought for fixed nine rubles the pod. The Kazan Tartars colour their ordinary yellow fassians with the flowers of the yellow camomile, which they gather under the name tchechichak, i.e. yellow-flower.

In preparing the yellow fassians, they observe in Affercan the following difference of treatment: 1. They make no use whatever of honey in the preparation. 2. They never
YUM

ever at all put the hides into the salt brine. 4. Instead of the honey-preparation and the pickling, they lay the hides before the dyeing, in the foregoing manner, in the tan of the leaves of the kitul tree, leaving them in it eight days.

4. For preparing the dye, they have no need of the herb fshagan, but the berries alone are boiled in clear water, of which to four Russian yards of water about ten pounds are requisite, and heighten the color afterwards with three lots of alum to every pound of berries. The dyeing is performed in the same manner as has been related with the red, and after the dyeing there is no need to lay the saffins in the tan, as having before received it. Nothing more is necessary than to scrape them clean, to work them thoroughly, to polish and to ornament them. The yellow saffins usually are fold at one hundred twenty kopeks; but the red at somewhat, on account of the dearness of the dye, generally one ruble eighty kopeks.

YUG, or Yoo, the more correct mode of writing the word joyas, by which the Hindoos distinguish the poetic or mythological ages of the world. We have noticed the wild speculations under the more popular word joyas; to which, to Gentoo, Calcut, Kalpa, and Yogeswaru, we refer those defirous of further information hereon.

YUGASIRI, in Hindu Mythology, is the name of the wife of Vairava, an incarnation of Siva. See those articles.

YUHAGHIRS, in Geography, a Russian tribe, which occupies the northernmost parts of the territory of the Yakutes, bordering on the Frozen ocean, from the Yama to the Kolyma. They were known to the Russian conquerors as early as the Yakutes; but on account of their wild and impassable deferts, could not be brought into entire subjection until the year 1639. They had never seen a horse, though that species of animals was found among the Yakutes; and therefore they appear to have been for a long time confined to their cold, fenny, and mountainous districts. The whole people, at the revision before the law, pays Mr. Tooke, paid taxes only for about 1000 heads; but it was so easy for them in their deferts to evade the payment, that their entire population may be computed at a much higher number. See Yakutsk.

YVIAS, a town of France, in the department of the North coasts; 4 miles E.N.E. of Pontrien.

YVICA. See Ivica.

YUKANLOOT, a town of Candahar; 10 miles E.N.E. of Sufa.

YULDUZ. See Yolotou.

YUMA, or Yumba, or Long Island, one of the Bahama islands: about 50 miles in length, of very unequal breadth.

N. lat. 23°. W. long. 74°. 50'.

YUMA, in Mythology. See Tscheremisses.

YUMAR, the name of the object of worship among the Votians; similar probably to Yuma, Yummel, and Yummal, among other tribes of the ancient Finns.

YUMBA BAY, in Geography, a bay on the E. coast of the island of Hispaniola, S. of Cape Spada.

YUMETOS, a cluster of small islands, among the Bahama islands, about 20 miles S.W. from Yuma.

YUMFONG, a small island, near the coast of China, about three miles from the island of Tieng-ming. N. lat. 31°. 42'. W. long. 121°. 17'.

YUMMALA, in Mythology, an idol deity of the Finns, who had a rich temple in Permia, or Biroria, supposed to have extended from the White sea to the mountains of Urals. This temple was decorated with a profusion of gold and jewels. See Persians.

YUMMEL, an appellation by which the Lieflanders and Ethionians worshipped the true God; in subordination to whom they only admitted inferior deities as beneficent and malicious spirits.

YUN, in Geography, a city of China, of the second rank, in Yun-nan; 1262 miles S.W. of Peking. N. lat. 24°. 32'. E. long. 99°. 35'.

YUN, or Tong-pe, a city of China, of the first rank, in Yun-nan; 1315 miles S.W. of Peking. N. lat. 26°. 44'. E. long. 100°. 34'.

YUNA, a river of Hispaniola, which runs into the somana bay.

YUNCHA, a town of South America, in the province of Tucuman; 60 miles S. of St. Jago del Eilero.

YUNG-KANG, a city of China, of the second rank, in Quang-fi; 1190 miles S.S.W. of Peking. N. lat. 22°. 56'. E. long. 107°. 26'.

YUNG-NGAN-POU, a fortress of China, in Chen-fi, on the borders of Tartary; 110 miles N. of Ling-tao.

YUNG-NING, a city of China, of the second rank, in Chan-fi; 300 miles S.W. of Peking. N. lat. 37°. 35'. E. long. 110°. 39'.

YUNGUS, or Yungus Vicus, in Ancient Geography, a place of Gaul, on the route from Reims to Treves. Anton. Itin.

YUNG-HING, in Geography, a city of China, of the first rank, in Ho-nan. The country within its district is very large, and is partly flat, and partly mountainous, especially to the north and south; it is watered by several rivers, which render the soil very fruitful. There are two towns of the second rank, and twelve of the third under its jurisdiction; 430 miles S. of Peking. N. lat. 33°. E. long. 113°. 2'.

YUNG-LEAN-HO, a canal of China, formed of the river Pay-bo, or rather the river itself made navigable from Hiam-ho to Tien-thin, in the province of Pe-tche-li, for the purpose of conveying corn towards Tong-techeou and Peking. The name in the Chinese language is said to mean corn bearing.

YUN-NAN, a province of China, bounded on the N. by Se-etchen and Thibet, on the E. by Quang-fi and Koei-techeou, on the S. by Laos, and on the W. by Ava and Pegu; about 300 miles in length, and 250 in breadth. This province is reckoned one of the most fertile and opulent in China. Its inhabitants are brave, robust, affable, and fond of the sciences, which they cultivate with success; its rivers, gold, copper, and tin-mines; its amber, rubies, lapphires, agates, pearls, precious stones, its marble, musk, silk, elephants, horses, gums, medicinal plants, and linen, have procured it a reputation which renders it respectable to the Chinese. Its commerce is immense, as well as its riches, which are said to be inexhaustible. This province contains 21 cities of the first class, and 55 of the second and third. Sir George Staunton estimates the population at eight millions.

YUN-nan, a city of China, of the first rank, and capital of Yun-nan, situated at the north extremity of a lake. It was formerly celebrated for its extent, and the beauty of its public edifices. Here were seen magnificent buildings, vast gardens, tombs, triumphal arches, and elegant fountains; but the Tartars, in their different invasions, destroyed all these monuments; and the city at present contains nothing remarkable; it is, however, the residence of the governor of the province. It comprehends in its district four towns of the second class, and seven of the third; 1152 miles S.S.W. of Peking. N. lat. 25°. 6'. E. long. 102°. 28'.

YUNTAI, an island near the coast of China, in the Eastern
YUT

Eastern sea, 30 miles in circumference; about two miles and a half from the continent. N. lat. 34° 35’. E. long. 119° 19’.

YVOY. See Carignan.

YUPURA, a river of Peru, which branches off from the Caqueta, about N. lat. 1°, and after an easterly course of about 500 miles, runs into the river of the Amazons by many mouths, 100 miles W. of Fort Rio Negro. S. lat. 4°.

YURATZKOI, the denomination of the shore that lay between the rivers Yeniffey and Obi.

YUR Cup. See urecup.

YURE L’Eveque, a town of France, in the department of the Sartre, on the Huife; 3 miles E. of Le Mans.

YURIEF, a name given by the Russians to Dorpat, built by order of Yaroslaf in the year 1030.

YURIMAGUAS, a town of South America, in the audience of Quito, on the Guallaga; 60 miles S. of La Laguna.

YURNA, a small island on the coast of Brazil, at the mouth of the river Amazons, near the equinoctial line. W. long. 50° 40’.

YVRY, a town of France, in the department of the Eure; 11 miles N. of Dreux.

YUSDROME, in Commerce, a weight of Turkey, the ounce being the 44th part of the cantaro, quintal, or kintel, containing four yufidromes, or cheques, or 400 drums; the chequee of cotton yarn being = 11 1/2 ounces avoirdupois; the chequee of goat’s wool = 5 lbs. 10 oz. avoirdupois; and the chequee of opium = 270 oz. 10 dr. avoirdupois.

YUTHIA, in Geography, the capital city of Siam, situated on an island formed by the river Meinam. See Siam.

YZQ

YUTI, a town of Paraguay, on a river of the same name, which runs into the Paraguay, 115 miles S.E. of Assumption.

YU-YANG, a town of Corea; 15 miles S. of Kang.

YXIR, a word used by some of the old chemists to express any thing good in medicine.

YZQUAUHTLI, in Ornithology, the Indian name for a bird described by Nieremberg, and called the crested eagle.

YZQUIEPATL, in Zoology, the name of an American animal of the weasel kind, with a short slender nose; short ears and legs; black body, full of hair; long tail, of a black and white colour; its length from nose to tail is about eighteen inches. It inhabits Mexico, and perhaps other parts of America. It lives in the caves and in the hollows of rocks, where it breeds, and brings up its offspring. It feeds on worms, beetles, and other insects, and small animals: when pursued, it breaks wind backward with an inoffensive stench. See Conepatl.

Professor Kalm was one night in danger of being suffocated by one that was pursued into a house where he slept; and it affected the cattle so that they bellowed through pain.

Another, which was killed by a maid-servant in a cellar, so affected her with its stench, that she lay ill for several days; and all the provisions in the place were tainted to such a degree, that the owner was obliged to throw them away.

Nevertheless, the flesh is reckoned good meat, and not unlike that of a pig; but it must be skinned as soon as killed, and the bladder taken carefully out. Pennant.

Z.

Z, The last letter in the alphabet, and one of the double consonants, both among the Latins and Greeks.

Its pronunciation is much more soft and obtuse than that of the x; which makes Quintilian call it jucundifima, and dulceffima. Nevertheless, the sound was not always the same as it is now; which is but, as it were, half that of an s; or, that, expressed by its name iizzard or iizzard, of an s uttered with a clover compression of the palate by the tongue, as friez, froze.

It had something originally in it of the d; but only what founded very smoothly: thus, Messerinius was pronounced as if it had been Medsenius, &c.

The Z had also an affinity with the g; thus Capella,
the eighth part of an ounce, that is, a drachm Troy-weight; and it has in earlier times been used to express the third part of an ounce, or eight scruples.

On French coins, Z denotes those struck at Grenoble.

ZZ, these letters were used by some of the ancient physicians to express myrrh. At present they are often used to signify zinsiber, or ginger.

ZAAB, or Zeb, in Geography, a district of Africa, in the country of Sahara, belonging to the Algerines. It was anciently a part of the Mauritania Sittifenis, and is a narrow tract of land lying immediately under the Atlas. N. lat. between 34° 30' and 35°.

ZAARA. See Sahara.

ZAARA, a word used by the Arabian physicians, to express the *vittia morsis*, or continual watchings of persons in many illnesses.

ZAARAM, in Ancient Geography, a town of Arabia Felix, which, according to Ptolemy, was the residence of the king of the Cinaedolitcs.

ZAARON, in Geography, a mountain of Africa, on the western side of the plain of Fez, in sight of Mequinez, on which is a village consecrated to Mahometan devotion. It contains the sanctuary of Sidi Edris, who came from Medina at the end of the 8th century, introduced Mahometanism, and was the first sovereign of his race in this part of Africa. This sanctuary is an asylum for malefactors, and never violated by the emperor of Morocco.

ZAB, a town of the Arabian Itrak, on the Euphrates; 65 miles W.S.W. of Bagdad.

ZAB, Great, the Zabatus of Xenophon, and Lucius of Ptolemy, a river of the Lower Kordiulan, in the pachalic of Bagdad, which rises in the same range of hills, and contiguous to those of the Diah, mentioned in history by the names of Delos and Arba; this latter river, increased by several streams, continues its course to the south, and enters the Tigris, about 5 miles above Taouke Kofra. During the summer it is fordable at Bskooba, 9 leagues from Bagdad, on the road to Kermanshaw, and is near 150 yards wide, at the place where a bridge of boats is thrown across it, for the convenience of travellers, just before it approaches the Tigris. The Great Zab at first pursues a northerly course, when meeting with a small stream, which comes from the district of Alhak, it proceeds to the westward, unites with the Hakkar, or river of Julamerick, and then flowing in a S.W. direction, forms a junction with the Hazir fu (anciently Bumadus), and dilesembogues into the Tigris at Toprukula, 14 furfungs (or about 42 miles) below Mosul. Between Mosul and Erbille, this river can only be forded in the summer, and when low, it is so deep and so rapid that it is difficult of passage. The 10,000 Greeks commenced their retreat by crossing this river in the face of the Perivan army. Xenophon reckons it 400 feet wide; but when the Greeks passed it, it must have been fordable.

ZAB, Little, the Zabus Minor and Caprus of the Macedonians, a river of Kordiulan, formed by the junction of a great number of little brooks, which originate in the hilly country to the E. of Khoi Sindjack. At Altun Kupri, 68 furfungs from Bagdad, on the route to Mosul, it joins the Altun fu, or golden water, and terminates in the Tigris, opposite to the large and rich city of Cane, or the present village of Senn, 30 miles below Haditha. This river is narrow, winds very deep, and very rapid. That part of the Lower Kordiulan that lies N. of the Little Zab, has in every age been a rich and productive province; and it still continues to supply Bagdad, Mosul, and the other cities, with corn, cattle, cheese, butter, dried fruits, and almost every other kind of provision. Another river, the Odorneh, supposed by some authors to be the Physius of Xenophon, is also formed by the junction of many streams, which arise in the hills between Kerkuk, the largest town in the Lower Kordiulan, (N. lat. 35° 29') and Salamania (which see). Kerkuk or Kerkuk, (which see,) entitled Demetricus by Strabo, and Porca by Ptolemy, lies in the direct road from Bagdad to Mosul, 59 furfungs from the former, and 41 from the latter, on a commanding eminence, but with narrow and filthy streets and mean houses. The population is estimated at 18,000 souls, Turks, Armenians, Nestorians, and Kurds; but this estimate is supposed to exceed the truth by 5000. It is defended by a mud wall, has 2 gates, 7 mosques, 13 coffee-houses, one harem, one caravansera, one Armenian church, and 12 pieces of useful artillery. The suburbs contain 5 mosques, 9 small caravanseras, 13 coffee-houses, 3 convents, and 3 catholic churches. Around the town the country is hilly, and on the N. side a low range of barren and rocky mountains separates the district of Kerkook from the fine plain of Altun Kupri. At a short distance there is a number of naphtha pits, which supply the neighbouring country with the naphtha, which in a liquid state is raised in leather buckets, and deposited in earthen jars. The river Odorn, after pursuing a S.W. course, falls into the Tigris, 20 furfungs above Bagdad. Its bed is about 60 yards broad, and its springs contain a large body of water. Kimeir's Periva.

ZABA, or SABA manifold, (Batu-Saker,) in Ancient Geography, a considerable place, and one of the principal trading towns of India, in the peninsula beyond the Ganges; marked in the map of D'Anville, a little W. of the S.E. point of this peninsula.

ZABACHA, in Geography. See Azor.

ZABADANS, in Ancient Geography, Arabs who lived to the east of the mountains of Galaad. In the Maccabees we learn that Jonathan marched against them, and defeated them.

ZABATRA, in Geography, a town of African Turkey, in the government of Marafch; 48 miles N.E. of Marafch.

ZABDA, a large and pleasant town of Syria, situated among the mountains, and chiefly, if not solely inhabited by Christians, which furnishes 700 men fit for war. The town is divided into five districts, each having its separate schiefeck, who pays tribute to the emir of the Drufes; they complain of oppression; and the state of the place and the adjacent country show that their complaints are not unfounded. The town is sheltered by mountains, but the locusts are very destructive. Tobacco is one of the chief articles of cultivation. A rivulet, rolling from the rocks, turns the mills, and waters the ground. The air is salubrious, unmoisted with excessive heat. Near it is a long structure, apparently part of an aqueduct, called “the tomb of Noah.” It extends about 60 feet, being the nature of Noah, according to oriental tradition. The pilgrims who formerly came to worship in an adjacent mosque were very numerous; and the religious revenue is paid to amount to 300 purses annually. Browne's Travels.

ZABDICENA, in Ancient Geography, a country of Asia and one of those called by Ammianus Marcellinus Trans- tigritanae, because they lay beyond the Tigris, with respect to Periva. It was extended along the Tigris.

ZABECES, a people of Africa, in Libya, neighbours of the Marges and Zygautes, according to Herodotus.

ZABELTZITZ, in Geography, a town of Saxony, in the margrave of Meissen; 4 miles N. of Groffen Hayn.

ZABER, a river of Wurtemberg, which runs into the Neckar, near Lauffen.
ZACATECAS, a province of Mexico, bounded on the north by New Bécary, on the east by Guadalupe, on the south by the provinces of Mechoacan, Guadalajara, and樟maten, and on the west by Chametlan and Culiacan. It is well inhabited, and abounds with large villages. Part of it lies in the temperate and part in the torrid zone: it is about 100 leagues in length, and 45 in breadth. The western part of it is an arid tract, and would not be inhabited were it not for the mines, which were formerly reckoned the richest in America; but the eastern part abounds with corn, and fruits of various kinds, and its forests are full of deer.

ZACATECAS, the capital of the afore-mentioned district, the importance of which has declined with the mines. It formerly contained about 12,000 families of Spaniards and mixed breeds, though consisting chiefly of one street, in a deep passage between high rocks, crowned with cottages. Luis de Potoño on the S.E. is said by Alcedo to contain only 1600 families of Spaniards, Mulattoes, and Indians, though it has magnificent churches. The ridge of St. Peter, five leagues from the city, contained rich mines of gold and silver; but they are now in part exhausted, and the fuel has become scarce. The opulence of this city has in course declined, and the chief trade is in goatskins and tanned leather.

ZACATELAN, a town of Mexico, in the province of Tlascalá; 30 miles N. of Puebla de los Ángeles.

ZACATULA, or Zacatula, a town of Mexico, in the province of Mechoacan, on a river of the same name, near the Pacific Ocean; 95 miles S. of Mechoacan. N. lat. 18° 35'. W. long. 103°.

ZICANZA, a small but fertile province in the dominion of Mexico.—Alfo, a river of Mexico, which runs into the Pacific ocean, near the town of Zacatula.

ZACCARIA. See Tevo.

ZACCHIA, Paolo, in Biography, an eminent physician, was born at Rome in 1585, and in the progress of life was distinguished by his learning, and by his skill in music, painting, poetry, and eloquence, as well as in the more appropriate sciences relating to his own profession. He was physician to pope Innocent X., and celebrated among his contemporaries by various publications; of which the principal is intitled "Questiones Medicæ legales, in quibus omnes materiae medicae quaad legales facultates videtur pertinere, proponuntur, pertraueruntur, revolvuntur," a work which has been often reprinted. He was also the author, in Italian, of two celebrated works, "Del Vito Quadrigeniarum," 1637, the subject of which is the regimen of diet in Lent; and "De' Mal Ipocodriachi," 1639, a diffuse treatise on hypochondriacal affections. He died in 1659, aged 75. Haller. Ely. Gen. Biog.

ZACCHI, P. Lodovico, of Pæsaro, author of an ample treatise of music, entitled "Prattica di Musica," the first part of which was printed at Venice, 1592, and the second in 1596; a publication in which the author not only proposes to give instructions for the regular composition, but the accurate performance of every species of music. The idea is splendid; but the world has so frequently deceived by the titles of books, that authors are obliged to abate in their promises, in proportion as the expectations of the public are diminished. If arts and sciences could be acquired by the dead letter of silent instruction, every one who could read, in Italy, might, during the times under consideration, have been a musician. But though no ingenious occupation was perhaps ever yet completely taught by books, without a master, or by a master, without books, yet they are excellent helps to each other. It is hardly possible for a didactic work to satisfy all the doubts that arise in an inquiring mind during solitary meditation; particularly in the first stages of a student's journey through the rugged roads of science. But when he has made some progress, if he should be separated from his guide, the way becomes daily so much more straight and smooth, that by
the help of these kinds of charts, he will be enabled to advance with tolerable speed and facility by himself.

Zacconi’s work, though sometimes dry and tedious, contains much useful and practical knowledge. And as he is almost the only Italian writer on the subject of music who has not bewildered himself in inquiries concerning the system of the ancient Greeks, or the philosophy of found, he has had the more leisure for analysing the art, and facilitating the student’s progress. This author regarded Okenheim, Josquin, Hass, Jemmel, Mouton, and Seldenio, as ancients compared with Willaert, Morales, Cipriano, Zarlini, and Palestrina; and these last, ancient with respect to himself and contemporaries; and says (lib. i. cap. x.), that as the ancient Greeks and Romans produced their musical effects by mere melody, united with poetry, and Josquin and other early contrapuntists, by notes of different lengths, harmonized and worked into perpetual fugue; so the more modern, though the rules of harmony are the same, by a different disposition of concords, inversions, and other contrivances, produce a greater variety of effects.

He likewise observes (cap. xxviii.), that “every age has vainly thought its music brought to as great a degree of perfection as was possible; but it was always found that the next age continues to change, and still to think the same. Okenheim, the master of Josquin, and even in the days of Josquin, John Mouton, his scholar, had the fame ideas of their own improvements; yet, since their time, music has not flood still, but made great advances towards perfection, being more light and pleasing.”

The change in musical modes has continued to our own time, and will doubtless continue to the end of all time; for melody, being a child of fancy and imagination, will submit to no theory or laws of reason and philosophy; and therefore, like love, will always continue in childhood.

Zacconi’s chief labour and merit in the third book have been the explanation of the moods, and correction of errors in the notation of old composers, to which his work will serve as a useful collection of errata. In Book I. he dwells much on the superiority of the finging and fingers of his own time, over all that preceded them; and has a long chapter upon the manner of gracing and embellishing a melody, where he tells us, “Che file ti tenghii nel far di gorgia; dell’ufo de i moderni paffagi, come il forfchheno le cantillene; e speaks of accordanza, as the modern Italians do of ristornamenti, or graces. The divisions, however, into which he breaks paffages, in order to embellish them, if adopted by an operator of the present times, would be like a modern fine lady appearing at court in the furbelows and flounces of queen Elizabeth, or a fine gentleman in the peruke of sir Cloudesley Shovel.

ZACHAN, or Socian, in Geography, a town of Hinder Pomernania; 14 miles E. of Stargard. N. lat. 53° 13”. E. long. 15° 28’.

ZACHAREVSKAIA, a fort of Russia, in the government of Ekaterinoslav, on the Konka; 26 miles W. of Mariupol.

ZACHARIAS, Justus Frederick William, in Biography, was born at Frankenhauen in Thuringia, in 1726; and during the course of his elementary education at his native place, he distinguished himself by various poetical pieces. In 1743 he went to Leipsic to study jurisprudence, but directing his chief attention to the belles lettres, he produced his mock-heroic poem, entitled “Renommien,” which Eichorn, in his History of Literature, says, was the commencement of hero-comic poetry among the Germans. In the following year, he was admitted as an associate by the young men who contributed to the work published under the title of “Amusements of Reason and Wit.” From Leipsic, where he remained about three years, he removed to Gottingen, where, attracting the notice of professor Klapproth, he was recommended by him to be a member of the German society. In 1748 he was appointed tutor at the Caroline college at Brunswick, and in 1761 he became professor of poetry in that institution; to which, in the succeeding year, were annexed the offices of inspector of the typographic and book-selling establishment belonging to the Orphan House, and director of the Brunswick Intelligencer. From 1768 to 1774, he was editor of the New Brunswick Gazette; in 1775 he was appointed to the diocese of St. Syriac, at Brunswick; and he died in the month of June, 1777, in the 51st year of his age. His biographer states, that “he possessed a very fertile and vivid imagination, with a fine taste, improved by observation and acquaintance with the world. As a poet, he composed with uncommon facility, and tried his talents in almost every species, but was the most successful in the descriptive and hero-comic. His burlesque poems were distinguished from every thing of the kind that had before appeared in Germany.” A collection of Zacharias’s poetical works was published at Brunswick in 1763–1765, 9 vols. 8vo. Gen. Biog.

ZACHARIAH, or Zachariah, one of the minor prophets, who commenced the exercise of his gift in the 8th month of the 20th year of Darius, the son of Hystaspes; and on account of the precision and clearness of his predictions, he has been entitled “the fun among the minor prophets.” The most remarkable of his prophecies are those that relate to the advent of the Messiah, and to the destruction of Jerusalem. Dupin.

ZACHARIAS, Pope, a native of Greece, succeeded Gregory III. in 741; at a time when the Roman territory was threatened with an invasion by Luitprand, king of the Lombards, and when the sons of Charles Martel were too much engaged by domestic broils to undertake its defence. The pope, therefore, tried how far he might avail himself of the authority of religion in averting the storm; and by a solemn embassy and personal visit, he not only obtained peace, but induced Luitprand to restore to the Roman see four cities which he had taken from it. He also interposed, in 743, with Luitprand on behalf of the exarch of Ravenna, and prevailed with him to desist from an invasion of the exarchate, and to grant peace, as well as to give back the fortresses of Cesena to the exarch; and in the same year he held a council at Rome to settle some matters of discipline, particularly such as related to the clergy. During the pontificate of Zacharias in the year 746, Carloman, the eldest son of Charles Martel, who had surrendered his dominions to his brother Pepin, went to Rome, and assumed the monastic habit, with which he was feemingly invested by the pope. Rachis, the successor of Luitprand, who, upon his accession to the throne in 747, was peaceable disposed towards the pope and the Romans, took up arms against them; but his hostile purposes were averted by the remonstrances of Zacharias, and those of some of his principal clergy and nobility, who visited his camp, in order to obtain peace; nor were they successful merely in this object; but the refusal of their interview was Rachis’s renunciation of his crown, the assumption of the monastic habit conferred upon him by the pope, and retirement to the monastery of Monte Cassino, where Carloman refided. In 752 Pepin applied to the pope for permission to seize the crown of France, and to set aside Childerich III.; the pope consented, and Childeric was provided for in a monastery. Zacharias, having displayed talents in the exercise of his office, which gave him...
ZAC

him rank among the greatest of the popes, and having esta-
blished an estimable character by his liberality to the poor,
and by his munificence in public works, died in 752, in the
11th year of his pontificate. Some of his decrees and
epistles, and also his translation of the dialogues of St. Gre-
gory from Latin into Greek, are extant. Bower.
ZACHAROVA, in Geography, a fort of Russia, in the
government of Irkutsk; 32 miles N.N.E. of Kirendle.
ZACHAU, a town of Brandenburg, in the Middle
Mark; 10 miles E. of Brandenburg.
ZACHA, Freidick William, in Biography, an
able musician and organist at Halle, in Saxony, was born at
Leipzig in 1665. He had the honour and good fortune to
have Handel for his scholar. He is still celebrated by the
Germans as a master, who had established an admirable
school of music at Halle, and as one who was deeply skilled
in all the areana of composition and performance.
ZACHEO, or Descechio, in Geography, a small island in
the West Indies, between Hifapanola and Porto Rico; about
27 miles N.E. of Mona.
ZACHTLEVEN, Cornelius, in Biography, was born
at Rotterdam in 1606, and became an admirable painter of
scenes of humour, imitating the style of Bronower; but in
subjects of a more sober description, which he also painted,
such as farm-houses, kitchens, and the recreations of vil-
lagers, &c. he chose the more light and agreeable style of
Teniers for his model; and in that style attempted to
embody the same design of perions and compositions. In
neither, however, of his imitations did he attain an equal
degree of spirit or of truth with his prototypes. His
works are well composed, and the touch with which they
are executed is bold and free; they are not often met with,
but are thought deserving of a place in the best collections.
ZACHTLEVEN, Herman, was the younger brother of
Cornelius, and was born at Rotterdam in 1609. He is
said to have been the pupil of Van Goyen, but did not
follow the style of that master. His principal occupation
appears to have been in painting views of the banks of the
Rhine and the Meuse. These he executed in a very neat
manner, but with a mean and common-place style of selec-
tion and imitation. The tones and hues of his pictures are
generally cold, but fresh; and as he appears to have had
great knowledge of aerial perspective, his distances are well
preferred; and the forms drawn with great care and minute-
ness. He never left Flanders, though it has been ascertained
that he went to Italy. His drawings are numerous, and
are carefully preferred in the best collections. He died in
1683; aged 76. Both he and his brother Cornelius em-
ployed the etching-needle, and left several neatly executed
plates, from designs of their own.
ZACINTHA, in Botany, whether so called by Mat-
thiolius, the author of the name, because this plant was
originally found in the island of Zante, or for what other rea-
t. 269. Poiret in Lamarck v. 8. 851. Gærtn. t. 157.—
Gen. Ch. Common Calyx double; the outermost flord,
crec, of several lanceolate leaves, membraneous at the edges;
innermost larger, simple, furrowed, of eight permanent, li-
near, acute, converging leaves; at length swelling and very
prominent at the base. Cor. compound, imbricated, uni-
form: florets equal, perfect, of one petal, ligulate, linear,
abrupt, with five teeth. Stam. Filaments five, capillaries,
very short; anthers united into a cylindrical tube. Pef.
ZAC

GERMEN ovate-oblong; style thread-shaped, the length of
the flaments; stigma two, reflexed. Petio. none, except
the interior calyx, which becomes woody, clofed, depressed,
with a point, having eight rounded protuberant angles,
each scale enveloping one of the marginal seeds. Steels li-
tary to each floret; the marginal ones ovate-oblong, in-
curved, compressed at the fides, gibbous at the back, taper-
ing below, iliiated; longitudinally channelled, and villous,
in front; central ones oblong, slightly incurved, quadran-
gear, compressed at the back, iliiated, smooth. Down
fiddle, somewhat feathery. Recept. naked.
Eff. Ch. Receptacle naked. Seeds of the circumference
incurved; of the centre straight. Down very short, finely
feathery. Outer calyx membraneous; inner with eight pro-
tubercles.

Wild. n. 1. Ait. n. 1. Sm. Fl. Græc. Sibth. t. 820,
unpublished. (Lapsana Zacinta; Linn. Sp. Pl. 1141.
Cichorium verrucatum; Zacinta; Clin. Hift. v. 2. 144.
C. verrucarum; Gært. Ec. 398.)—Native of Italy, Crete,
Lemnos, and Zante, as well as of mount Athos. Subpref.
The root of this, the only known species, is annual. Stem
somewhat leafy, round, smooth, branched and forked,
spreading, from a span to eighteen inches high. Leaves
runcinate, smooth; the radical ones largest and mott
numerous. Flowers yellow, small. The swelling part of the
calyx, after flowering, assumes a purple colour. See Laps
ana and Rhagadiolus.
ZACO, in Geography, a territory which probably be-
longed to the province of Adiabene, and was generally
comprehended between the Tigris and the Cappad, or
Little Zab. The ridges or mountains of Zaco are a part
of the Kuridih region, on which was the road along the
Tigris, between Moful and Jezirah. Thee ridges were
lofty, steep, and rocky, and the path rugged and difficult.
of ascent. It was part of the road of the 10,000 Greeks
in their retreat. The present town of Zaco stands near
the northern part of the ridge, denominated from it; and
it is the most considerable place that occurs between Moful
and Jezirah; and is surrounded by a fertile district, which
produces a great variety of excellent fruits. Zaco stands
in an island of the river Kurnib, which descends from the
Kuridih or Carduchian mountains, and falls into the
Tigris, a few miles below the town.
ZACONDA, a town of Africa, in the country of Ante,
where the Dutch built a fort. It was a considerable town
at one time, till in a war between the people of Ante and
Adom, it was burnt down by the latter; since which it has
never been thoroughly repaired.
ZACUTO, or Zacetus Lusitanus, in Biography, a
physician, was born at Lisbon in 1557, and educated at
Salamanca and Coimbra. In his 24th year he took the degree
of doctor, and settling in his native city, practised with
reputation for thirty years. As he was a descendant of
jewish parents, his dread of the Inquisition, after the edit
of Philip IV. against the Jews was issued in 1625, induced
him to retire to Holland, where he openly professed the
religion of his family, and maintained a character highly
respectable, both in his profession as a physician, and in his
moral conduct. He died at Amsterdam in the year 1642;
and left behind him a collection of works, amounting to
2 vols. fol. The principal of his works are, "De Medi-
corum Principum Historia," lib. vi. in which he approves
himself a strenuous advocate of Galen and the Greek phy-
sicians; "Praxis Historiarum Mororum," lib. v.; and
"Praxis Medica admiranda," lib. iii. In all his works he
blends acuteness of observation with a certain degree of
superfious
superstitious credalit; but they are nevertheless consulted and quoted. Haller. Elv.

ZACYNTHUS, in Ancient Geography, an island of the Ionian sea, W. of that part of the Peloponnesus on which is the Sinus Cheloniis. It is now called Zante. Strabo makes its compass 160 stadia. It had many forts, and was very fertile. In this isle was a town of the same name, situated in the eastern part, with a citadel. According to Dionysius of Halicarnassus, it derived its name from Zacynthus, son of Dardanus, who, accompanied by a number of Phrygians, settled here. According to Thucydides, the first Greeks known in this island were Achaeans, who came hither from Achaia. It passed under the dominion of Philip, king of Macedon, who rendered it to Amyander, king of the Athamanes, who confided the government of it to Philip of Megalopolis, by whom it was transferred to Hierocles of Sicily. After the defeat of Antiochus at Thermopylae, Hierocles sold it to the Achaeans. Livy says, that the town and citadel were assaulted and captured by Leurvis, and Paunrias informs us that it was called Mipheus. According to Sclayx it had one port; and Pliny says that it was very fertile, and that its port was named Hyrie; but P. Mela distinguishes Hyrie from Zacynthus.

ZACYNTHUS, a town of Africa, in Libya. Steph. Byz. Zacynthus, an epithet used by the ancients to a liquid bitumen, from the island Zante. ZAD, in Geography, a name given to the Niger of Africa, in Bornou, which is described in Hormenan's Journal as flowing eastwards. Its breadth was given to him for one mile, and he was told that it flowed towards the Egyptian Nile, through the land of the heathens. The course here given is directly towards the Congo; and it is said, that Zad is the name of the Congo at its mouth, and that it is the name of the Congo for at least 650 miles inland.

ZADADRUS, in Ancient Geography, a river of India, on this side of the Ganges; which received the waters of the Hypsalis and Adris, according to Ptolemy.

ZADAN, in Geography, a town on the west coast of the island of Celebes. S. lat. 2° 55'; E. long. 119° 9'.

ZADON, a river of Portugal, which runs into the Atlantic, near Setuval.

ZADELSDORF, a town of Saxony, in the circle of Neufländ; 3 miles S.S.E. of Auma.

ZADONZK, a town of Roufla, in the government of Voronez, on the Don; 92 miles N. of Voronez. N. lat. 53° 4'. E. long. 35° 14'.

ZADRACARTA, in Ancient Geography, a very large town of Asia, the capital of the Hyrcania, according to Arrian.

ZADRAMA, a town of Arabia Felix, the capital of the Cirendocolptes. Steph. Byz.

ZADRAN, in Geography. See HATVANY.

ZADRIS, in Ancient Geography, a town of Asia, in the interior of the Colchide. Piol.

ZADURA, in the Materia Medica of the ancients, a name given to a foreign root, which was round and smooth, and of the colour of ginger. It was at that time imported from the Indies, and great stature esteemed in phœnicienous cafes.

ZEAI, or ZEA, in Ancient Geography, a very ancient town of Greece, near Boeotia. Steph. Byz.

ZÆTIA, or ZETIA, a town of Arcadia, N. of Megalopolis. It had two temples, one of Ceres, another of Diana.

ZÆZAR, in Geography, a town of Spain, in the province of Murcia; 22 miles N.W. of Murcia.

ZAFANIN, a town of Fez, near the coast of the Mediterranean; 35 miles S.E. of Melilla.

ZAFARANBOLI, a town of Natolia; 28 miles S. of Amastan.

ZAFFABEN, a word used by some of the chemical writers to express putty.

ZAFFEIBAHAM, in Geography, a town on the salt coast of Madagascar, S. lat. 17°.

ZAFFER, ZAFFRE, or Saffre, in Chemistry, is the residuum of cobalt, after the sulphur, arsenic, and other volatile matters of this mineral have been expelled by calcination: so that it is a kind of calx or oxide of cobalt, mixed with a portion of fuscible matter, of a grey or reddish colour; in which state it is imported from Saxony. It is used to produce a very fine blue colour, when it is melted with fusible and vitrifiable matters.

The blue colour produced by the vitrification of zaffer proceeds from the earth or calx of a semi-metallic substance contained in cobalt, called by chemists regulus of cobalt. This is proved by melting zaffer with a reducing flux, like any other roasted ore, by which means the regulus will be obtained. The fcoria in this fussion has also a blue colour, proceeding from a portion of the calx of the regulus that is not reduced, but is vitrified together with the fcoria. The calx, therefore, or metallic earth of the regulus of cobalt, is the sole cause of the blue colour produced by zaffer.

But as this is contained in cobalt in various quantities, some zaffers produce more blue than others. The heterogeneous fixed matters contained in cobalts contribute, according to their quantity, not only to the greater or less intensity of the blue colour, but also to its luster and beauty; and, therefore, those who manufacture zaffer from cobalt make frequent effays of the roasted ore, by mixing it with vitreous matters, in order to discover the intensity and beauty of the blue colour.

Good cobalt calcined would form too deep a blue, and almost a black glass, if it were not previously mixed with a certain quantity of vitreous frit. In the manufacture of zaffer, therefore, the calx of cobalt, the strength of which has been determined by previous effays, is mixed with such a quantity of sand, or of powdered flints and quartz, that with the addition of some feline flux, a deep blue glass may be formed. See Cobalt.

The zaffer that is commonly sold, and which comes from Saxony, is a mixture of oxyc of cobalt with some vitrifiable earth; it is of a grey colour, and some zaffers are clearer than others, according to the intensity of the colour which they are capable of producing.

Zaffer is employed in the manufacture of pottery and of porcelain, for painting the surface of the pieces of ware, upon which it is applied, together with some feline flux, previously to the baking or glazing, that the same fire may vitrify this colouring material.

The blue of zaffer is the most solid and fixed of all the colours that can be employed in vitrification; it suffers no change from the most violent fire. It is successfully employed to give shades of blue to enamels, and to the crystal glasses made in imitation of some opaque and transparent precious stones, as the lapis lazuli, the turquoise, the sapphire, and others of this kind.

To prepare zaffer for use in the glafs-trade, put it in grofs pieces into earthen pans, and set it hand half a day in the furnace; then put it into an iron ladle to be heated red-hot in the furnace; take it out while thus hot, and sprinkle it with strong vinegar: and when cold, grind it on a porphry to an impalpable powder, then throw this into water
water in glazed earthen pans; and when it has been well stirred about, let it settle and pour off the water: repeat this washing often, and the foulness of the saffron will be thus wholly separated. Dry the powder, and keep it for use.

**ZAFFRAM**, a word used often by authors to express saffron, but sometimes as the name of other things of a yellow colour; thus ochre was called by this name.

**ZAFFRAMEN**, a word used by some medical writers to express saffron.

**ZAFRA**, in Geography, a town of Asiatic Turkey, in the government of Marasch; 15 miles S.W. of Tarfus.—Also, a town of Asiatic Turkey, in the government of Trebifond, on the Black sea; 50 miles N.W. of Trebifond.—Also, a town of Spain, in Estremadura; 22 miles E. of Xeres de los Caballeros.

**ZAFRANIA**, in Colors, a term used by the Greeks to express the yellow of saffron. The barbarous writers of the after-ages transliterated it into the Latin *crocetas*, or saffron colour.

The later Greek writers only use it, and they have taken it literally from the Arabians, Avicenna, and Serapio. This was a term used by them to express the colour of the fine holly-aromatic of Galen, which they tell us stained paper to a fine and beautiful gold colour.

**ZAGA**, in Botany, Poiret in Lamarck Dict. v. 8. 831. (Zaga Pohon, or Corallaria latifolia, Rumph. Ambon. v. 3, 175. t. 110.)—This is one of those trees, whose hard red feeds are used for ornament, in the form of necklaces, bracelets, &c. by the natives of tropical climes, and even by the inhabitants of the most polished countries of Europe, as fashion, from time to time, is pleased, in her capricious wisdom, to ordain. Such are the beautiful red and black feeds of *Abrus precatorius*, of which there is a pearly white variety, of rare occurrence. Such also are those much larger feeds, of the same combination of colours, produced by the West Indian genus *Ormosia*. (See that article.) The *Zaga* of Rumphius and Poiret is evidently a papilionaceous plant, with pinnate leaves, composed of about three pair of elliptic-oblong, entire, stalked, rather large leaflets, with an odd one. Flowers in panicked terminal clusters. Leaves elliptic-oblong, pointed, hard and smooth, each containing one, rarely two, hard, shining, round seeds, all over of the colour of red coral, larger than those of *Adenanthera pavonia*, being as broad as the fore-finger nail, and defitute of the defined circumcised area, for which the seeds of the *Adenanthera* are remarkable.

**ZAGALA**, in Geography, a town of Spain, in Estremadura; 25 miles S. of Alcantara.

**ZAGAN**, a town of the principality of Georgia, in the province of Kacet; 3 miles N. of Tefis.—Also, a town of Persia, in the province of Irak; 12 miles S.W. of Hamadan.

**ZAGARA**, a mountain of Greece, in Livadia, anciently called Helicon.

**ZAGATHAI**, a name given from the second son of Zingia to Great Bucharia; which fec.

**ZAGATIS**, in Ancient Geography, a river of Asia, in the Colchide, according to Arrian, which fixes its mouth between Athanæ and Anchialæ Regia.

**ZAGAWA**, in Geography, a city of Africa, in Bornou, on a river which runs into the same lake, where the Niger is by some supposed to be lost. N. lat. 19° 10'. E. long. 25° 0'.

**ZAGGOS**, a mountain of Africa, in which are some mines of folt; 100 miles S. of Algiers.

**ZAGHARA**, a town of Africa, in Bornou.

**ZAGI**. See ZEGI.

**ZAGILLONETIS**, in Ancient Geography, a country of Asia, in Cappadocia. Strabo.

**ZAGING**, in Geography, a town of Austria; 3 miles N. of St. Polten.

**ZAGIRA**, in Ancient Geography, a town of Aia, in Paphlagonia, at a small distance from the sea. Ptol.

**ZAGLA**, in Geography, a town of the island of Corsica; 8 miles S.E. of Calvi.

**ZAGORA**, a town of European Turkey, in Romania, on a lake which communicates with the Black sea; 12 miles S.W. of Burgas.

**ZAGOROA**, in Ancient Geography, a town of Aia, in Paphlagonia, on the coast of the Euxine sea, between Castra and the mouth of the river Halyos, according to the Periplus of Arrian.

**ZAGOROLO**, in Geography, a town of the Popedem, in the Campagna di Roma; 3 miles W. of Palestrina.

**ZAGOROW**, a town of the duchy of Warsaw; 20 miles S. of Kalisch.

**ZAGRAB**. See AGRAM.

**ZAGROS, Mount**, a mountain of Persia, in the province of Irak, along the brink of which extends the district of Kurend, from the vicinity of Holwan to the village of Goour. It is covered with forests of oak, and inhabited by an extraordinary race of men, among whom suffit cullums familiar to those of the Kadmulia in Syria, described by Volney. It is said that in their nocturnal festivities, the garments of the fair sex, at the expiration of a certain period, are thrown into a heap, and jumbled together. The lights are then extinguished, and the clothes being regularly distributed among the men, the candles are relighted; and it is settled by the rules of the society, that the lady must patiently submit to the embraces of the person who has become possesed of her drees, whether father, son, husband, or brother. The lights are then once more extinguished, and all of this licentious tribe pass the remainder of the night in the indulgence of the most promiscuous love.

**ZAGRUS, or ZAGRIUS MONS**, in Ancient Geography, a mountain of Asia, in Media. It made a part of mount Tau-rus, commencing in Armenia, and extending as far as the Chalontide, between Media and Adiabene. Pliny. It is reckoned by Ptolemy one of the most considerable countries in Media. According to Strabo, it was this chain of mountains which touched the Niphates, and separated Media from Babylonia.

**ZAGU**, in the Materia Medica, the name given by some authors to the fago-tree, the todda pauna, or palma frutis pruniforme.

**ZAGUANANAS**, in Geography, a river of considerable length in New Mexico, which flows from the same sources with the Rio Bravo, and joins the Colorado; which see.

**ZAHARA**, in Geography, a town of Spain, in the province of Seville. In 1407, this town was taken from the Moors; about two years after the Moors retook the town, but not being able to reduce the citadel abandoned it. In 1481, it was surprized by the Moors, in a dark stormy night; most of the inhabitants were put to the sword, and the rest sent slaves to Grenada; 36 miles S.E. of Seville. N. lat. 36° 50'. W. long. 5° 33'.

**ZAHARA**. See SAHARA.

**ZAHIA**, a word used by the Arabian physicians to express a sort of dysentery, in which there was a very large
large discharge of blood from the rectum, attended with an
evident fenation of abrasion, or pain in the bowels.

ZAHNA, in Geography, a town of Saxony; 8 miles
N. E. of Wittenberg. N. lat. 51° 56', E. long. 12° 54'.

ZAHRADKA, a town of Bohemia, in the circle of
Czsaflau; 17 miles S.S.W. of Czsaflau.

ZAHRINGEN, an ancient citadel in the Brisgau,
gave the title of duke to a noble family that became
extinct in the 13th century; 1 mile N. of Friburg.

ZABAC, one of the many names by which the ancient
chemist's have called mercury.

AZA IDIR, a name by which some of the chemical writers
have called verdigris, or the rust of copper; and others,
the material itself; and some brahs.

ZAIM and TIMAR, lordships granted under those names
in the Ottoman empire for life, as military rewards and
encouragements. Those who possess a zaim, or timar, are
honoured with the title of aga; they are bound to a military
personal service, and obliged to bring with them to war one
or more gebelis, horsemens or foot-folders, armed
and equipped according to the revenue and extent of the
lordship. The timar differs in no respect from the zaim, except
that it is of less value, and that the aga who possesses it does
not arm as many horsemens and foot-folders as the other.
The number of zains in Turkey in Europe is 914, and that
of the timars is 356. Nearly the same number is reckoned
in Asia, which furnishes, with the gebelis, a militia of upwards
of 60,000 men, better disciplined, and more inured to
war than the spahis and the janizaries. This militia for a long
time constituted the principal force of the Ottoman empire;
and the annual proffes which they have performed in this little
time in Asia, in Europe, and even in Africa.

On the death of a zaimat, or a timarist, the sultan is to
draw a year's revenue from the lordship, and nevertheless,
give it up again to the son of an aga, a spahi, or any other
military man, especially to him who, by a brilliant action, has
distinguished himself in battle, who has first mounted to the
assailant, penetrated into the enemy's intrenchments, killed
a great number of infidels, or contributed to put them to the
 rout. But since the sultans prefer to the fatigue of war
and the dangers of battle the tranquillity of their seraglios,
and the pleasures of their harems; and more especially since
avarice and a love of gain have caused to be put up to
auction the places intended for the recompence of valour and
merit, the lordships become the patrimony of the rich
and of intriguers. Thus the best institutions degenerate;
thus the Mufullman, formerly intrepid and valiant, becomes
merely a vile plunderer, or a ferocious assailant; and the
Ottoman armies, so formidable to their enemies, are become
an object of contempt or pity, and this sultanic empire would no
longer exist, if some European power were not interceded in
its support.

ZAIN, in Horfés, a term used by the French to signify
a horse of a dark colour, neither grey nor white, and without
any white spot or mark upon him in any part. See Horse.

ZAINAH, in Geography, a town of Algiers, in the
province of Constantia; supposed, from some considerable
ruins, to have been Zama, an ancient and royal city of Numi-
dida; 25 miles S.E. of Setefef.

ZANE, or Wadell Berker, a river of Africa, which
runs into the Mediterranean, N. lat. 36° 54'. E. long.
9° 16'.

ZAIRA KAKONGO, an island in the Atlantic, at the
mouth of the river Zaire.

ZAIRAGIA, or ZAIRAGH, a kind of divination in
use among the Arabs; performed by means of divers
wheels, or circles, placed concentric to one another, and
noted with several letters, which are brought to answer
to each other, by moving the circles according to certain
rules.

This is also called zariah, because the circles of this
machine, which are called musmzriat, fusfak, &c. are intended to
correspond to the orbs of the planets, and the atmospheres
of the several elements.

ZAI R, or SAIRE, in Geography, a river of Africa,
which rises in the country of Matamba, about S. lat. 10°,
and takes a northerly course to lat. 5°, in the kingdom of
Congo; after which it takes a south-westary direction, and
runs into the Atlantic, S. lat. 6°. E. long. 12° 20'.

It has been an important question, with regard to which
geographers have entertained various opinions, what are
the course and termination of the Niger. The ingenious
geographer, Mr. Rennell, on comparing the various accounts
of the progress of the Niger beyond Houfia, declared his
opinion to be, that its waters had no communication, either
with the river Nile, as was thought, or with the sea, as
others imagined; but that they were spread out into a
great lake in Wangara or Ghana, and evaporated by the
heat of the sun. (See Niger.) Mr. Park, the late African
traveller, directed his particular attention to this subject,
and was induced to conclude that the Congo would be
found to be the termination of the Niger from the following
considerations: 1. The total ignorance of all the inhabitants
of North Africa respecting the termination of that
river. If the Niger ended anywhere in Africa, it
would not be easy to account for this total ignorance, and for
their generally describing it as running to the Nile; and in fact,
the country with which they had not any acquaintance.
A second consideration has been already fuggetted under
the article ZAD. A third is deduced from the general suppo-
sition that the river of Dar-Kulla, mentioned by Mr.
Browne in his "Travels," was the Niger, or at least that it
communicated with that river; and this, it is said, would
be exactly the course which the Niger ought to take in
order to join the Congo. 4. The quantity of water
discharged into the Atlantic by the Congo cannot be accounted
for on any other principle, but that it is the termination of
the Niger. If the Congo derived its waters entirely from
the S. side of the mountains, which are supposed to form
the belt of Africa, one would naturally suppose, that when
the rains were confined to the N. side of the mountains, the
Congo, like the other rivers of Africa, would be much dimin-
ished in fize; and that its waters would become pure.
On the contrary, the waters of the Congo are at all sea-
sons thick and muddy. The breadth of the river, when at its
lowest, is one mile, its depth is fifty fathoms, and its ve-
locity five miles per hour. 5. The annual floods of the Congo
commence before any rains have fallen south of the equator,
and agree correctly with the floods of the Niger, calculating
the water to have flowed from Bambarra at the rate of three
miles per hour. Mr. Park, during his residence in Scotland,
became acquainted with a Mr. George Maxwell, formerly
an African trader, who was well acquainted with the whole
western coast of Africa, more especially S. of the equator,
and had published a chart of the river Congo. Mr. M. had
been led by a variety of circumstances to conjecture that
the source of the Congo lay considerably inland, and far
to the north; and from a perusal of Mr. Park's travels
he
he concluded, that the Congo and the Niger were one and the same stream. Mr. Maxwell’s reasoning confirmed Mr. Park in his opinion; and in this opinion he persevered to the end of his life.

Since the discoveries of Mr. Park, it is very generally allowed that the course of the Niger is from west to east; and his opinion with regard to its termination in the Congo, or, as it is sometimes called, the Zaire, has received a considerable degree of confirmation from the account of the Congo given by Mr. Maxwell. “Before ever the Niger came to be the topic of conversation,” says Mr. M., “it struck me, that the Congo drew its source far to the northward, from the floods commencing long before any rains take place S. of the equator; since it begins to swell perceptibly about the latter end of October, and no heavy rains set in before December, and about the end of January, the river must be supposed to be at its highest. At no time, however, can the rains to the southward of the line be compared with those in the Bight of Guinea, where ships are obliged to have a house erected over them during these months.”—If the Niger has a feasible outlet, I have no doubt of its proving the Congo, knowing all the rivers between Cape Palmas and Cape Lopas to be inadequate to the purpose; nor need the immense course of such a river surprize us, when we know that the river St. Lawrence, contemptible in size compared with the Congo, encomasses the whole of North America, flowing through a chain of lakes. But instead of seven or eight lakes, the Congo may be supposed to pass through seventeen or eighteen; which will solve any difficulty as to the floods of the Niger not immediately affecting the Congo.” He adds, the river Congo, compared with other rivers, must rank as the third or fourth in magnitude. Considering the force of the current it produces in the sea, carrying out floating islands sixty or seventy leagues from the coast, the Amazon or Plata only can cope with it. At the distance of 650 miles from its mouth, the Congo traders report that it is as large at the place from which they came, and that it went by the name Enzaddi, as it does among all the nations upon the coast. If the shallow water opposite to Suanda should be thought to detract from the assumed size of the Congo, it should be considered, that the river there is spread out ten miles in width, the middle channel of which has never been accurately founded. “It has long been my opinion, that Leyland’s or Molynes island at Embonna, (a settlement on the banks of the Congo, distant thirty leagues from its mouth,) either of which might be rendered as impregnable as Gibraltar, at a very small expense, could be a choice station for establishing an extensive commerce with the interior of Africa. Indeed, if the idea of the Congo being the outlet of the Niger prove to upon trial, we may consider it as opening a new and richly fertilizing of the West Indies, and establishing the rude inhabitants.” The Congo appears from other testimonies to be a river of the first clafs, and larger, probably, than the Nile. The waters of the Congo, it is said, may be distinguished at sea more than thirty leagues from the coast; and the water is fresh at the distance of thirty miles. If these accounts are thought to be exaggerations, it is a general opinion among navigators that this river has a wonderful size and force. All accounts concur in representing that the stream of the Congo is of a more uniform height, and subject to much less variation from the dry and rainy seafons, than any tropical river which is known; and that on a comparison with such rivers, it may be considered to be in a perpetual state of flood. The average rising of the Ganges in the rainy seaso is flated by

major Rennell to be thirty-one feet, being almost the same with that of the Nile; whereas, the difference between the highest point of the Congo about February, and the lowest, in September, is only about nine feet; and the river, at the latter period, has all the appearance of a stranger of being in full flood. It is this remarkable peculiarity which distinguishes the Congo from other great rivers of a similar description, and which leads to important conclusions with regard to its origin and cause. “In support then of the hypothesis which identifies the Congo with the Niger, the following arguments deduced from the preceding facts and observations may be alleged: 1. The great magnitude of the Congo. 2. The probability that this river is derived from very remote sources, perhaps considerably north of the equator. 3. The fact, that there exists a great river N. of the equator (the Niger), of which the termination is unknown, and which may, perhaps, form a principal branch of the Congo.

“Such being the evidence in favour of the hypothesis respecting the Congo, the objections must be admitted to be weighty and formidable; the principal of these are, 1. That it supposes the course of the Niger to be through the salt chain of the mountains (anciently Montes Lune), the great central belt of Africa.”—It is difficult to understand how the Niger could penetrate this barrier, and form a passage southwards. 2. The course of the Niger, estimated from its source in the mountains of Senegal, (supposing it to be the same river with the Congo, and to flow by Wagara and Cafina, through the centre of Africa into the Atlantic,) would be considerably more than 4000 miles. But the course of the Amazon, the greatest river in the old or new world, is only about 3500 miles; and although the existence of a river considerably greater than any yet known may be within the limits of physical possibility, yet so improbable a supposition ought not to be adopted upon flight or conjectural reasoning, or upon any thing much short of distinct and positive proof.”

The editor of Mr. Park’s Travels, &c. in 2 vols. 8vo. 1816, which we are now citing, very laudably expresses a hope, “that this distinguished river, which hitherto has been only known as one of the greatest marts of the Slave Trade, may at length be rendered conducive to objects of civilization and science; and that some use will now be made of this great inlet into Africa, for the purpose of exploring a part of that continent which as yet is entirely unknown; or, at least, of obtaining more complete and authentic information relative to the Congo itself, which must unquestionably be considered as a very curious and interesting subject of inquiry.”

Another opinion with regard to the termination of the Niger has been advanced by M. Reiehard, a German geographer, and published in the “ Ephemereides Geographiques,” at Weimar, in August 1808. This opinion is, that the Niger, after reaching Wagara, takes a direction towards the south, and being joined by other rivers from that part of Africa, makes a great turn from thence towards the south-west, and pursues its course till it approaches the north-eastern extremity of the gulf of Guinea, where it divides, and discharges itself by different channels into the Atlantic; after having formed a great Delta, of which the Rio del Rey constitutes the eastern, and the Rio Formosa, or Benin river, the western branch. This hypothesis, though it diminishes the distance which the Niger has to flow in its course to the Atlantic, does not remove the objection arising from the Niger’s being conceived to penetrate the Kong mountains. But we must not pursue this subject any
any farther. For the lengths of the course of the most noted rivers, see River.

ZAKA. See Scharedje.

ZAKEPH GADHOL, Rex Pauperrimus, one of the Hebrew accents, sometimes denoting no kind of paucity, and marked over a letter thus (א).

ZAKEPH Katon Rex, one of the Hebrew accents, constituting either a comma or feminicolon, and marked over a letter thus (א).

ZAKERZEN, in Geography, a town of Kurdistān; 26 miles N.N.W. of Van.

ZAIEH, a town of the Arabian Irak, in the Tigris; 10 miles N. of Korna.

ZAKLIKOW, a town of Austrian Poland, in Galicia; 40 miles S. of Lublin.

ZAKROCZYŃ, or Sakrotshim, a town of the duchy of Warsaw, on the Narew. In 1794 the confederate Poles were defeated here by the Russians; 40 miles N.W. of Warsaw.

ZAL AKLESOVSKOII, a bay of the Caspian sea; 260 miles S.S.E. of Astrachan. N. lat. 43°. E. long. 51° 14'.

ZAL, in Botany, so called by Loureiro, Cochinch. 459; fromخته, a tempes; or agitation of the sea, because the plant floats, and is driven about, at the mercy of the winds and waves. This is no other than the PISTIA of Linnaeus (see that article); where the generic characters, as corrected by Schreber, come sufficiently near to those of Loureiro, to leave no doubt in the mind of the reader, allowance being made for the peculiarities of structure in fo singular a flower.

ZAL, in Ancient Geography, a town situated in the vicinity of Amasea, which was a town of the Peloponnesus, in Achaia Propria.

ZAL, in Geography. See Wadan.

ZALACA, in Ancient Geography, a town of Asia, in the interior of Media. Ptol.

ZALACUS, a town of Africa, in Mauritia Caesariana. Ptol.

ZALACUS Mont, (Van-nahb-resef,) mountains of Mauritania, at some distance from and to the S. of the river Chalnaph. Ptol.

ZALAKNA, in Geography, a town of Tranflyvania; 14 miles W. of Weißenburg.

ZALAMEA, a town of Spain, in the province of Seville; 38 miles W.N.W. of Seville.

ZALAMEA de la Serena, a town of Spain, in the province of Extremadura. This town was anciently called Hipa, and many vestiges remain of its former splendour; 27 miles N.E. of Llerena.

ZALANTZ, a town of Hungary; 10 miles S.E. of Calkau.

ZALESC, in Geography, a town of Austrian Poland, in Galicia; 32 miles S. of Lemberg.

ZALEUCUS, in Biography, a philosopher and legislator of Greece, and founder of the Locrian lute, flourished in the 7th century B.C. He was of obscure birth, and lived in servitude as a shepherd; but his extraordinary abilities and merit attracted notice even in his humble station, and advanced him to the government. His laws were deemed severe, but being adapted to the circumstances and manners of the Locrians, their constitution was for several ages highly celebrated. His discipline was rigorous, so that he prohibited the use of wine, otherwise than as a medicine;

and he ordained, that adulterers should be punished with the loss of their eyes. When his son had incurred this penalty, he blended paternal lenity with a pretense of maintaining the authority of the laws, by ordering his son to be deprived of one eye, and by submitting to the loss of one of his own eyes. In order to secure the permanent stability of his system of legislation, he required that a person who proposed a change in any one of them should come before the assembly with a cord about his neck, that he might be instantly strangled, if upon examination the old law were preferred. Valer. Max. Diod. Sic. Iaert. Brucker by Enfield.

ZALGIN, in Geography, a town of the island of Cuba; 47 miles N. of St. Jago.

ZALIKARA, the most considerable city of Mingrelia, situated on the right bank of the Hippus, which rises in the highest mountain of the Soane, not far from the source of the Phasis, flows through Lettgvani, divides Mingrelia from Iberia, and enters the Phasis near the Tredia: an open place, at the confluence of the Hippus and Phasis, well peopled by different nations, particularly Jews.

ZALISCUS, in Ancient Geography, a river of Asia, in Galatia. The mouth of this river in the Euxine sea lay between Cyptia and Galorum.

ZALISSA, a town of Aflatic Iberia. Ptol.

ZALLANT, in Geography. See Salland.

ZALSSING, a town of Afluria; 5 miles N.W. of Agripach.

ZALUZIANSKIA, in Botany, so named by Necker, in " Act. Palat. v. 3. phys. 953", according to Wild. Sp. Pl. v. 5. 538, is no other than MARSEA quadrifolia, which the reader will find in vol. xxii. The above name is designated, as we presume, to commemorate a Polish botanist, author of Methodi Herbaria, published at Prague, anno 1592, in 4to., and at Frankfort in 1604. This work is spoken of by Haller, Bibl. Bot. v. 1. 387, as a transposition of the arrangement of Dodonaeus, without any improvement or additional information.

ZAM, in Geography, a town of Grand Buccharia; 85 miles N.W. of Balk.

ZAMA, a town of Peru, in the dioecese of Arequipa; 30 miles N. of Arica.

ZAMA, in Ancient Geography, a town of Africa Propria, 5 journeys from Carthage. This town, to which ancient authors give the title of royal and a fortress, is famous in the wars of Jugurtha and Juba, and more especially on account of a battle between the Carthaginians under Hannibal and the Romans, commanded by Scipio, in the year 551 of the Republic. At the time when this town was in a florishing state, it was assigned to Numidia. Cornelius Nepos fays, that it was 300 miles from Adrumetum. Appian fays 3000 stadia. It was situated on a plain, and owed its strength to its fortifications more than to its situation. Hirtius fays, that it was the ordinary residence of king Juba, where he had his wives, children, and treasures. Pliny fays, that it became a Roman colony.

ZAMA, a town of Cappadocia, in the prefecture of Chaman.—Allo, a town of Aflia, in Meopotamia. Ptol.

ZAMAMIZON, a town of Africa Propria, between the town of Tabraca and the river Bagradas. Ptol.

ZAMBOSE, or CUMANA, in Geography, a river of Africa, which rises in the interior parts of Mocaranga, and runs into the Indian sea at several mouths: the principal of which takes the name of Luabo. S. lat. 16°. E. long. 37°.

ZAMBOZIN, a town of Congo; 24 miles S.S.W. of St. Salvador.

ZAMBRANO, Juan Luis, in Biography, a Spanish painter,
ZAM

painter, was born at Cordova in 1590. He was a disciple of Paolo de Copedez, and was a successful follower of the style
of that master. His principal works are in the cathedral at
Cordova, and in the church of the convent of Los Mar-
tyros, where he painted two altar-pieces, representing the
founding of St. Stephen, and the martyrdom of St. Acifelo
and St. Victoria. In the colegio di Santa Catalina is a
fine picture by him of a guardian angel, and a St. Christo-
pher, which Palomino describes as designed in the great
style of M. Angelo. He passed the latter part of his life at
Seville, where he painted several altar-pieces for the church
of St. Bafil, and died in that city in 1639, at the age of
40.

ZAMBROKRI, in Geography, a town of Hungary;
14 miles S.W. of Rosenburg.

ZAMBROW, a town of the duchy of Warfaw; 80
miles N.E. of Warfaw.

ZAMECH, a name given by some writers to the lapis
lazuli.

ZAMETUS, in Ancient Geography, a mountain of
Arabia Felix. Ptol.

ZAMFARA, or ZANFARA, in Geography, a town of
Africa, and capital of a kingdom of the same name; 170
miles E.N.E. of Waragara. N. lat. 18° 20'. E. long.
16° 15'.

ZAMIA, in Botany, from ζηύς, damage, or los.
This name, which first occurs, as the appellation of a genus,
in the Gen. Pl. ed. 6. of Linnaeus, is taken from Phyn, who
uses it for such cones of the fir as “split while they are
upon the tree,” and, as he says, “require to be taken off,
that they may not injure the reft.” This should seem to
apply to the male catkins, however false the physiology of
Phyn, and the practice founded upon it, may be. Our
Zamia answers to his, merely in the cone-like form of its
fructification, which, being male on one plant, and female
on another, exhibits in the former the appearance of los,
or fertility, like the male catkins of the fir.—Linn. Gen.
648. Joff. 16. Poiret in Lamarc Dict. v. 8. 831. La-
marec Illust. t. 892. Gaer. t. 3.—Claes and order,
Dioica Polyandria. Nat. Ord. Filices, Linn. Joff. Cy-
cades, Perfon, Brown.

horizontal, obtufe, thickened towards the end, permanent.
Cor. none. Stam. Filaments none; anthers numerous,
seffile, crowded on the under side of each scale, especially
towards the extremity, elliptical, smooth, of two valves and
one cell, splitting lengthwise.

Female. Cal. Catkin ovate, teffellated: scales horizontal,
obtufe, more or less peltate, permanent. Cor. none. Pflf.
Germens two, oval, seffile, horizontal, inflexed, on the under
side of each scale, near the extremity; seffile very short,
shornseal conical; sigma obtuse, undivided, pervious.
Peric. Drupa roundifh, somewhat angular, of one cell.
Nut hard, roundifh or elliptical, of one cell.

Eff. Ch. Male. Catkin teffellated. Scales abrupt. An-
thers oval, seffile at the under side of each fcale. Female,
Catkin teffellated. Scales peltate. Drupas two, at the
under side of each fcale.

Obf. Mr. Brown, to whom we are obliged for the
remark of the ftyle being finally pervious, records an idea
of the late Mr. Dryander, that the American Zamia, which
conftitutes the orifinal genus, having more perfectly peltate
scales to the male catkin, and the anthers alfembled in two
difficult masses might possibly form a different genus from
the Cape and New Holland species; more especially as in
these American plants, the leaflets are each manifefly ar-
ticulated with a projection from the main rib of the leaf;
whereas in the others they are either very obscurely jointed,
or perfectly decurrent. We conceive, however, that they
all together compose a very difficult genus, which cannot,
without violence to nature, be divided. It is nearest akin to
Cyca, but differs essentially in the female part of the
fructification being a catkin, whose fcales bear two organs
underneath; instead of an afsemblage of fronds, or leafy
receptacles, bearing an indeterminate number upon their
margins. The herbage is perennial, generally without a
fr. Leafes abruptly pinnate, fingly hard, rigid, and
often fpinous; rarely lobed. Catkin radical, falked.

It being extremely difficult to obtain and to compare
good fpecimens of the different species, as well as to de
tect and define their effential characters, authors have not very
clearly defcribed them. Jacquin has published magnificent
figures of feveral; but their molt fatisfactory marks require
be fought at an earlier period of their growth, and in more
minute parts, than he has generally exhibited.

Fragm. 27. t. 25. 26. Wild. n. 1.—Leafes very num-
berous, two-ranked, linear, entire, with fimple fpinous points;
common flalk femicylindrical, channelled, downy. Catkin
of the fruit elongated, somewhat cylindric.—Native of the
Cape of Good Hope. Cultivated in the Imperial gardens
at Schoenbrun, but not mentioned by Mr. Aiton as known
to our English collectors. The thick globular fcaley head
of the root, near a foot in diameter, bears numerous fpread-
ing peltate leaves, very much refembling, at first sight,
thofe of Cyca revoluta. The frucht of each is, in its
naked part, two feet long, as thick as a fwan’s quill, all over
downy, as is also its leafy portion, and the young leafes themfelves.
The full-grown leafes are from 50 to 80, rigid, parallel,
acute, pungent, each about three inches long; the lower
moll gradually thorter, and rather more dilant. The ripe
fruit, brought from the Cape, is ovate-oblong, about fifteen
inches in length, and five in diameter, brown, each fpale
bearing two ovate, angular, orange-coloured drupas, about
an inch long, their points directed towards the base of the
fcale. Nut not much smaller, ovate, angular.

Poiret n. 3. (Palma fobofhera aegyptia, folis leviobus,
fructa nigro; Tiff. Pfl. 129. t. 45.)—Leafes awl-shaped,
spreadd, ftraight, rigid, pointed, entire; their outer
margin rounded at the fbase; common flalk nearly cylin-
dric, unarmed.—Native of the Cape of Good Hope,
from whence it was brought by Mr. Maffon, to Kew
garden, in 1775, but has not yet flowered. The leafes are
very thick and coriaceous, much fewer than in the pre-
ceding fpecies, mostly oppofite, four or five inches long,
and one broad; their under furface somewhat ftriated; the
upper smooth and thinning; margin quite entire; point
flimpfe, fpinous, flout and rigid.

3. Z. tridentata. Three-toothed Zamia. Wildl. n. 3.—
Leafes linear, obscurely furrowed, smooth, with three
fpinous teeth at the end; common flalk femicylindrical,
channelled.—Supposed to be a native of the Cape of Good
Hope. The leafes are fourteen to fifteen pair, linear, ta-
ering at each end, with two lanceolate, pointed, terminal
teeth, and a third situation a little lower at the outer edge.
Common flalk smooth. Wildenow. No other author ap-
pears to know this fpecies. We have fpecimens in the her-
barium of the younger Linnaeus, without name, indication
of their native country, or any traces of fructification, which
anwer
answer to the above characters; except the leaflets being more numerous, sometimes with a simple spiny point only, on the same stalk with others that have two or three, very rarely four; and in one instance the leaves part of the common footstalk is flabby with soft hairs. Each leaflet is two, or two and a half inches long, thick-edged and slightly revolute, entire, except the above-mentioned points; smooth on both sides; furrowed beneath; tapering at the base, and somewhat decurrent at its insertion. See n. 15.

4. Z. angustifolia. Narrow-leaved Zamia. Jacq. Coll. v. 3. 263. Te. Rar. t. 636. Wild. n. 4. Poiret n. 6.—Leaves linear, elongated, entire, obtuse, with two terminal callous points; common stalk feemicyindrical. Fruit ovate, pointed.—Native of the Bahama islands; cultivated at Schoenbrunn, where it was raised from seed, and bore flowers and fruit, the catkins being about eight months in going through their different stages. The root is scarcely bigger than a large radish; its ovate crown enveloped in a few pointed, very broad, scales. Leaves about a yard high, with slender flanks and leaflets; the latter drooping, a span long, and two lines broad. Catkins three inches long, on flanks about the same length; the male ones most slender, and nearly cylindrical. Fruit three inches long, of a thick ovate, or elliptical figure, with a blunt point. Drupae concealed, red.

5. Z. tenuis. Slender Zamia. Wildn. n. 5.—"Leaflets linear, obtuse, somewhat revolute; tapering at the base; with one or two obsolette teeth near the extremity; common stalk triangular, smooth."—Native of the Bahama islands. Willdenow saw a living male plant. Leaflets about fourteen pair; the upper ones furnished, near the point, with one or two very inconspicuous teeth. An intermediate species between the last and the following; agreeing nearly with Z. angustifolia in the form of its leaflets, but they are broader, and their stalk is triangular; the leaflets are narrower than those of the following, neither are they minutely furrowed towards the point; but the flanks are similar. Willdenow.

6. Z. media. Intermediate Zamia. Jacq. Hort. Schoenbr. v. 3. 77. t. 397, 398. Wildn. n. 6. Poiret n. 7.—Leaflets linear-lanceolate, obtuse, flat; obliquely furrowed towards the petiole; common stalk triangular, smooth.—Native of the West Indies; cultivated at Schoenbrunn. The crown of the root is as big as the stilt. Leaves two feet long, besides the naked stalk, which is half as much, Leaflets from fourteen to twenty pair; five inches long, and one-third or half an inch broad, flat, for the most part entire, except a few shallow diffuse furvatures towards the extremity, which is bluntish, and without any spiny termination. Female catkins on short thick flanks, ovate, with a blunt point. Fruit oval, brown, rough, three inches long, Jacquin. That author considers the present species as allied, on the one hand, to his angustifolia (see n. 4.), and on the other to integrifolia, n. 8. Still we cannot question its being specifically distinct from both.

7. Z. debilis. Lax-leaved Zamia. Linn. fil. MSS. Ait. Hort. Kew. ed. 1. v. 3. 478. ed. 2. n. 2. Wildn. n. 7. (Palma prunifera humilis non spinosa, infulia: Hipanolea, fructui jujubino simili, officulo triangulo ; Commel. Hort. v. 1. 111. t. 88.)—Leaflets lanceolate, acute, pointless, ferrated towards the point; common stalk triangular, smooth.—Native of the West Indies, from whence it is said to have been imported, in 1777, by the late Messrs. Kennedy and Lee. It flowers in the flore, in July and August. The leaflets are five or fix pair, half an inch broad; though only two and a half or three inches long, and are distingiuished from all the foregoing by their conspicuous ferratures, all indeed near the end, the greater part of the leaflets being entire; the upper side is smooth and shining; under furrowed or ferrated. Commelin originally raised this species from seed in the Amsterdam garden, and was informed that the fruit was reddish, growing partly underground.

8. Z. integrifolia. Dwarf Zamia. Linn. fil. MSS. Ait. Hort. Kew. ed. 1. v. 3. 478, ed. 2. n. 3. Wildn. n. 8. Pursh n. 1. Poiret n. 5, excluding the reference to Commelin. Jacq. Coll. v. 3. 261. Ic. Rar. t. 635. Lamarck t. 892, copied from Jacquin. (Z. pumila: Linn. Sp. Pl. 1659, excluding all the synonyms).—Leaflets smooth, ferrated, lanceolate; rounded, obtuse, and finely ferrated at the end; tapering at the base. Common stalk smooth, somewhat quadrangular.—Native of East Florida, from whence it was introduced into the English florists, by the celebrated John Ellis, eq. in 1768. Jacquin says it grows also in Hilpaniola. The crown of the root is sometimes as thick as a man's arm, dividing below into several stout branches and fibres. Leaves usually about eighteen inches long; sometimes twice as much. Leaflets from ten to twenty pair, opposite or alternate, each two and a half or three inches long, varying in breadth from one-quarter to three-fourths of an inch, entire, rather shining, strongly ferrated on both sides, with many parallel ribs; the extremity rounded and pointless, with a greater or less number of flight tooth-like ferratures in proportion to its width. Catkins on short flanks, ovate, clothed with brown pubescence; the male ones about two inches long. Fruit three inches long, elliptical, pointed, downy; its flanks finally widely separating, each of them peticate and angular, supported by a rather slender angular flalk, above an inch in length, and remaining long after the fruit is fallen. Each drupa is elliptical, about half an inch, or more, in length, with a small quantity of sweet orange-coloured pulp, and a large, rather pointed, nut. The leaflets are too strongly ferrated in Lamarck's plate; and rather broader and more luxuriant than usual in Jacquin's, otherwise admirable, representation. The male catkins are very frequently produced; the female ones we know only from dried specimens, and the works of Jacquin.

9. Z. muricata. Prickly-footstalked Zamia. Wildn. n. 9.—"Leaflets oblong, pointed, smooth, ferrated from the middle to the extremity; common stalk spinous."—Gathered by Humboldt and Bonpland, in South America, near Porto Cabello. Leaflets about four pair, fix inches long; tapering at the base; ferrated and ribbed on both sides; sharply ferrated in their upper half. Footstalk channelled, armed with very short, blunt, scattered spines. Willdenow.

10. Z. surfuracea. Broad Furry-leaved Zamia. Linn. fil. MSS. Ait. Hort. Kew. ed. 1. v. 3. 477, ed. 2. n. 4. Wildn. n. 10. Poiret n. 2. (Palma americana, foliis polygonatibus brevioribus, leviter ferratis, et nonnihil spinosis, trunco erasto; Phuk. Phyt. t. 105, f. 2. and t. 309, f. 5. P. americana, cassis rigidique foliis; Herm. Parad. t. 210. f. 260. Palmifolia fructu elevato polyppyrreno; Trew Ehret, t. 26.)—Leaflets elliptic-oblong, pointless; coarsely ferrated from the middle to the extremity; ferrated and hairy beneath; common stalk spinous.—Native of the West Indies. Plukenet saw it in the royal gardens at Hampton-Court in king William's time. It is still preserved in our florists, flowering towards autumn. The crown of the root is often a foot in diameter. Leaves from one to two feet long, exclusive of their prickly stalks. Leaflets usually eight or nine pair, three or four inches long, and one or one and a quarter broad, very rigid and corious; shining, and roughish to the touch, on the upper side; more or less furrowed,
furrowed, and clothed with shaggy, chaffy pubescence, which gives them a rufly or tawny hue, underneath. Their ferratures, or teeth, are numerous, obtuse, very irregular. Catkins ovate, hoary and downy, about three inches long, on flalks about the same length. Herrmann says this plant produces a white infidel gum.

12. Z. spiralis. Spiral Zamia. Salib. Prodr. 401. Willd. n. 11. Ait. n. 5. Brown n. 1.—Leaflets numerous, linear, very few, somewhat curved, with a few spiny teeth at the extremity. Catkins smooth, with pointed scales; those of the male ones wedge-shaped. Native of New South Wales, from whence seeds were sent, in 1791, by Dr. John White, to the writer of this, and plants were raised from them in the following year, by the late Mr. Fairbairn, in Chelsea garden, being the first introduction of this species into Europe. The whole cone, filled with these nuts, was about half as large as a man’s head; the nuts themselves about the size of small chestnuts. They were said to be eaten roasted by the natives of New South Wales, but on being tried by our English settlers, occasioned sickness. Their flavour is certainly inferior to a chestnut, and even to the nuts of Cycas revoluta, ripened in the bishop of Winchester’s flove at Farnham castle. The plants soon grew to a considerable size, and, according to Mr. Aiton, this species flowers in the flove, in July and August. The leaves are very smooth, of a fine greer, a yard or more in length, spreading, each composed of from thirty to forty pair of long narrow leaves, tipped with three to five spiny teeth. Fruit flalks said to be somewhat spiral. The catkins are stalked, cylindrical, about five inches long, and two in diameter, squarrose, smooth, not downy nor hairy: scales of the male ones obovate-wedge-shaped, an inch long, with a short, broad, sharp, ascending, polished point; their upper side smooth and naked; under nearly covered with an uninterrupted heart-shaped aflemblage of crowded, oval anthers, the size of poppy-flake: scales of the female catkins stalked, gibbous, two-edged and depressed, larger than the male ones, each tipped with an erect, fword-shaped, pungent, smooth point, an inch long, and, as the fruit ripens, extended to three inches, the gibbous flaky part of the sacle being then also much enlarged. Germen two, ovate, fefible, close together, at the inner edge of this flathy part of the sacle, and directed horizontally inward. Drupea roundish, gibbous, an inch or more and a half in diameter, orange-coloured, with a rather thin pulp, at least in the dried state, and a large, ovate, hard nut, not burbling, whole kernel, after keeping twenty-five years, is horny, ftematransparent, and as hard as the shell. Mr. Brown fuppects there may be two species confounded under Z. spiralis; one found in the neighbourhood of Port Jackson, to which our description and Shorns entirely belong, and which is from two to four feet in height, noticed by Mr. Brown in the southern coast of New Holland, and which we have never seen. Mr. Brown remarks, that in both, the catkins, ufually solitary, fometimes grow two together.

13. Z. lanuginosa. Woolly-caled Zamia. Jacq. Fragm. 28. t. 32. Wild. n. 13. Poiret n. 9.—Leaflets lanceolate, smooth, fpinous-pointed, with a few unilateral fpinous teeth. Radical fcales woolly.—Native of southern Africa, from whence a fingle plant was brought long ago to the Imperial flove at Schoenbren. After twelve years’ culture, it had made but slow progres, and flowed no figns of fruftification. The root consists of numerous, very thick, tap-shaped radicles; its crown being as large as a man’s head, and covered with imbricated, deltoid, pointed fcales, two or three inches broad, all clothed with foft, dense, hoary wool. Leavea a yard high, or more, dark green, very smooth and fhiming, with unarmed quadrangular flalks, and from twenty-five to thirty pair of linear-lanceolate leaflets, each four inches long, with a short fpinous point; their margins all entire, except being often furnished with one, two, or three broad, fpinous, tooth-like lobes, always at the lower edge of each leaflet, by which this species is at firft light readily diltinguished. Professor Wildenow fupected it might not be fntinét from Z. cycadis (feco our 15th fpecies); but we fee no reafon to concur in that opinion.

14. Z. borrida. Grey Thorny Zamia. Jacq. Fragm. 27. t. 27. 28. Wild. n. 14. Ait. n. 6. Poiret n. 8.—Leaflets lanceolate, glaucescent, acute, fpinous-pointed, with a few unilateral, lanceolate, fpinous teeth. Radical fcales smooth. —Native of southern Africa, a hundred miles above the Cape of Good Hope. Cultivated at Schoenbren, and introduced into the English green-houses, in 1800, by John Liptrap, esq., who polifhed, for several years, a fplendid collection of exotics at Mile end; but it does not feem to have bloomed either here or in Germany. The fcaly crown of the root is as large as the preceding, but the fcales are not woolly. The leaves and their flalks are all over finely glaucous, which diltinguishes the plant from the rest of its genus. The leaflets, as well as their lateral fspinous lobes, are longer, and more pointed, than in Z. lanuginosa; the points and facles green, as the whole furface becomes when rubbed. A ripe female cone, brought from its native country, is fifteen inches long and eight thick, brown, feoffated, and warty, but not fpinous. Drupea orange-coloured, oval, each with a thick, elongated, obtuse point, in the place of the flake. Nut oval, fomewhat triangular. This species is, as Wildenow obferves, very nearly related, in size and general habit, to the laft, but differs in its smooth crown of the root, and glaucous colour of the barkage.

15. Z. cycadis. Bread-tree Zamia. Linn. Suppl. 443. Ait. n. 7. Poiret n. 4. (Cycas caffra; Thunb. Nov. Act. Upsal. v. 2. 284. t. 5.)—Leaflets lanceolate, fpinous-pointed, smooth, entire; tapering at the base. Scales of the catkins abrupt, obtuse, pointles.—Native of the north-east part of southern Africa, far above the Cape of Good Hope, from whence living plants were fent to Kew, by Mr. Maffen, in 1775. This is the species figured by Gartner. It grows on the sides of hills, in dry open spots, especially where the ground has been cleared by burning, and flowers in August, or the following months. The crown of the root is round and large, imbricated with scales, and, according to Linnaeus,
ZAMOŁKYS, in Biography, a celebrated person among the Scythians, was, as some have supposed, a slave of Pythagoras, who, having attended him into Egypt, obtained his freedom, and taught his master's doctrine among the Getæ. It has been also said, that in order to enforce the belief of the immortality of the soul, he dug a subterraneous apartment, and concealed himself in it for three years; but re-appearing as one risen from the dead, he there established his authority as a teacher. But Herodotos, who relates this fabulous story, as a common tradition, gives it no credit, but expresly says, that so far from being a Pythagorean, he flourished at a much earlier period than Pythagoras. The general testimony of the ancients furnishes reason for concluding, that Zamolxis was a Thracian, who, at a very remote period, taught the Scythians the doctrine of the immortality of the soul, and that after his death, they enrolled his name among the divinities, with whom they affurded themselves they should associate in the invisible world. Herodotos relates, that at certain festivals, they chose several persons by lot, who were to be deputed as messengers to Zamolxis; and that they put them to death, by throwing them up into the air, and catching them, as they fell, upon the points of their spears; and this story is thought to be the more credible, because it is well known, that the practice of offering human sacrifices prevailed among the Scythians and the Thracians. Herodotos. Brucker by Enfield, vol. i.

ZAMORA, a town of Spain, in the province of Leon, on the Duero; the see of a bishop, suffragan of Compoilella. In the year 967, this town was taken by the Moors, and destroyed; but afterwards rebuilt and fortified. It is now a frontier town against Portugal, and place of arms. The streets are narrow, and the general appearance of the town is gloomy; 120 miles N.W. of Madrid. N. lat. 41° 50'. W. long. 6°.—Alfo, a town of Algiers, founded in honour of a Mahometan saint. Here is a small garrison; 28 miles W. of Seteef.—Alfo, a town of Mexico, in the province of Guadalajara; 80 miles N.W. of Mechocan. N. lat. 20° 54'. W. long. 103° 40'.—Alfo, a town of South America, in the audience of Quito, on a river of the Amazons. In the neighbourhood are some gold-mines; 200 miles S. of Quito. S. lat. 4°. W. long. 78° 46'.

ZAMOSCIE, or Samostaj, a town and fortress of Audriuen Poland, in Galicia, built by the famous great chancellor, John Zamoytski. It has a stately cathedral, and several other churches, a decayed university, a charitable foundation called Mons Pictatis, and several valuable privileges; but the fortifications are now in a bad condition. The proprietor of this town, &c. filled himself prince Zamolcis. It now belongs to Auffria; 60 miles N.W. of Lemberg. N. lat. 50° 31'. E. long. 23° 15'

ZAMPALA, a river of Mexico, which rises in the province of Tlafiaca, and runs into the gulf of Mexico, N. lat. 10° 40'.

ZAMPOLA, Champana, or Zampola, a city of Mexico. When Cortez landed in the year 1519, the chief or lord of this place, who was tributary to Montezuma, offered his service to the Spaniards. It was at that time a large city and exceedingly populous, the lowest account reckoning the inhabitants at 20,000 or 30,000. It was the capital of a country called Totonaapan, now the N.E. part of the province of Tlafiaca; 90 miles E. of Puebla de los Angeles. N. lat. 20° 10'. W. long. 17° 50'.

ZAMPERINI, Ann, in Biography, of Venice, arrived in England in 1767, as a bufiainger, a parte equale, with the

LINNAEUS, downy; with age, the plant acquires, like the palm tribe, a thick scaly stem, as tall as a man. The leaves are from a span to two feet long, of rather numerous and crowded leathel, each two or two and half inches in length, and one-quarter or one-third of an inch in breadth; smooth and even above; striated beneath; the younger ones, or rather those of young plants, tipped with a sharp tooth or two, besides the terminal spine. Common flats smooth. Catkin ifalked, ovate: the male a span long; its scales somewhat triangular, very obtuse, rugged, smooth; flat on the upper side; keeled underneath, and covered with anthers the size of millet-seed: female catkin larger than the male, near a foot long, green and smooth; its scales ifalked, with a quadrangular, peltate, thick termination, lodging a pair of ovate angular drupes, with a red pulp. Nut of each the size of an acorn, not very hard, with a white solid kernel. Thunberg says, the older plants, which have acquired a stem, are broken off, or cut down, by the Caffres and Hotentots; and the pith, which is of considerable thickness, being tied up in the skin of a sheep or calf, previously well rubbed with greasé, is buried in the ground. After remaining there a month, or longer, it is taken up in a purifying flate, and being bruised between two flones, and moistened with water, forms a fort of palte, which is made into little round cakes, about an inch in thickness. These are baked in wood-afles, and are esteemed a great luxury; though, as the author observes, not very tempting to people of more refined habits, especially if they happen to have witnessed the whole proeess of preparation.

We are not without a suspicion that Willdenow's Z. tridensata (see n. 3) may be this very species. This is more probable, at least, than his own conjecture, of Jacquin's lanunigina, n. 13, being Z. cyczadis.

Authors, even the most intelligent, use the term frond, instead of leaf, in their descriptions of this genus, because Linnaeus considered Zamia as either a Palm, or a Fern. But its botanic name is by no means cryptogamic, or obscure; nor do the leaves bear the flowers of either sex. There is a curious coincidence of structure and appearance between its anthers, and the supposed capsules of some of the spikcd or racemose Filices, especially of Bathyecium (the Osmanda lunaria, &c. of Linnaeus) indeed the likeness is so great, that we can scarcely persuade ourselves that the two parts in question are not designed to answer the same purpose.

ZAMIA, in Gardening, comprises some low plants of the tender palm kind, among which the species chiefly cultivated in this climate are, the dwarf pinnaed palm (Z. pumila), the thorny dwarf palm (Z. spinoa), and the entire leaved palm (Z. integroifolia).

The first is the finest sort, but the other two are occasionally preferred in some flove collections among other plants of the same class.

Method of Cultivation. They may be raised from seeds, and by other means; in pots plunged in the bark-beds of hot-houses and floves, where they must constantly be kept in light rich earth or mould, having the management of other exotics of similar kind.

They afford variety in all such collections of tender plants.

ZAMIANSK, in Geography, a fort of Ruffia, on the Volga; 20 miles N.W. of Altrachan.

ZAMIN, a town of Grand Bucharia; 50 miles N.E. of Samarcand.—Alfo, a river of Asia, which rises about 70 miles S. of Kogend, and after a N.W. course of about 150 miles, loies itself in the earth.

ZAMIRÆ, in Ancient Geography, a people of India that were Anthropophagi, near mount Möcander. Ptol.
the Guadagni, father to the great finger and actor Guadagni, who had been here in early youth.

The Zamperini was a very pretty woman, coquettish, and an affeéted finger. Her first appearance on our stage was in La buona figliuola Mariana of Piccini, of which the music was so difficult to perform, and not easy to hear, that it was never sufficiently repeated for the public to be familiarly acquainted with it. They were glad, therefore, as well as the performers, to return to La buona figliuola, for their own relief from too serious attention.

The finger of Guadagni, an elegant finger, and graceful actress, the original performer of the part of Coccinia in Italy, being superfed in that part by the Zamperini, occasioned a great rupture between Guadagni just arrived here in 1760 for the second time, and the honourable patente and impresario of the opera; which generated faction and a party spirit that destroyed the comfort of the opera, serious and comic, at a time when the public, in a state of tranquillity, would have been more delighted than at any other period.

We never heard the Zamperini sing serious music, but are told by M. Laborde (Effis fur la Mufi.), that "having a natural talent for music, and great spirit and fire in her action, though her excellence of performance was principally manifested in comic operas, yet the fire equally well in the serious. After performing with great applause in London, Lisbon, and Italy, she quitted the stage, and was well married."

ZAMPIERI, DOMENICO, called Domenichino in the History of Painting, was born at Bologna, in 1581, and placed when very young under the tuition of Denis Calvert; but being ill treated by him, he prevailed upon his father to permit him to enter the school of the Carracci, at the time when Guido and Albano were both students there. He soon distinguished himself, but more by his care and industry than by brilliancy of talent. He here attached himself to Albano, and, when he left the Carracci, they travelled together to Parma, Modena, and Reggio, to study the works of Correggio and Parmeggiano, and soon afterwards they both went to Rome. In that city his first patron was cardinal Agucchi, who employed him in his palace, and commissioned him to paint three pictures for the church of S. Onofrio, of subjects from the life of S. Jerome. His former master, An. Carracci, also employed him for some time to affix in his great work at the Farneze gallery; and he painted from his own designs, in the loggia in the garden, the Death of Adonis, when Venus springs from her car to affix her unfortunate lover.

As the health of A. Carracci became rapidly impaired, and he was necessitated to refuse many commissions offered to him, he recommended them to his scholars; and had the satisfaction of seeing Guido and Domenichino employed by the cardinal Borghies to paint the frescoes in S. Gregorio, which have subsequently become so celebrated, and of which the flagellation of S. Andrea by the latter is so justly admired. The cardinal Farneze also employed him to paint some frescoes in the chapel of the abbey at Grofetto Ferrata; among them is that picture of the Cure of the Demonic Youth, which has been compared with and by many preferred to the one of Raphael in the Transfiguration. Another cardinal, Aldobrandini, availed himself of the established renown of Domenichino, and engaged him to paint in fresco ten pictures of the history of Apollo, in his villa at Fraccati, which added greatly to his reputation. Soon afterwards he completed the work which more than any other has served to immortalize his name, his well-known picture of the Communion of S. Jerome, painted for the principal altar of the church of S. Girolamo della Carità. This fine production ranks with the best of any age. It is said with great semblance of truth, that the arrangement of its composition was borrowed of Agostino Carracci, who painted the same subject for the Certosì at Bologna. But if Domenichino did borrow the thought, he has amply made amends by the mode in which he has adorned it. It received its due meed of applause at the time, and was ranked as the work next in value to the Transfiguration by Raphael; but while the merit of its author thus excited the admiration of the public and most of the artists of Rome, it elicited in the minds of several, and among them of Lanfranco, the bitter spirit of envy and malignity, which was actively exerted against him. He was reviled as a plagiarist, and the execution of his pictures condemned as heavy and ungraceful; and in spite of their powerful effect, the influence of his adversaries so far prevailed, that for a time he failed of commissions, and had serious thoughts of changing his profession for that of sculpture. The celerity and freedom with which Lanfranco invented and painted, and all those machinists who applauded the means of art above the end, were opposed to the slow and uncertain power of invention possessed by Domenichino. But upon this subject Lanzi judiciously observes, that if Domenichino had had the good fortune which he merited, he would, like the Carracci in Bologna, have soon triumphed over his adversaries, admitting that he was an imitator, but not a servile one, and that if his works were more flow in their birth than those of his enemies, they merited a much longer existence. "The public," he adds, "is just in its judgment, but before its tribunal a good can not be sufficient of itself unless able pleaders give it credit. Domenichino timid and solitary, master of little, had not then sufficient means to protect himself against the torrent which overwhelmed him, and report deemed to verify the remark of the cardinal Agucchi, that his worth would not be duly appreciated till after his death. Impartial policy does him justice, and there is now no gallery which is regarded as complete without some specimen of his talents."

The virulence of these perjuries disfigured and disturbed Domenichino so much, that he returned to Bologna, and there he tranquilly passed some years in the delightful practice of his art. Among the most renowned of his productions about this period are his pictures of the Martyrdom of S. Agnes, for the church of that saint, and the Madonna della Rosario, both large works, and of sufficient merit to attract the infidelity of the French, and for a while they adorned the walls of the Louvre; but they are now returned to their original destinations. When malice and envy had exhausted themselves, and fame added fresh laurels to the brow of Domenichino, he was invited back to Rome by pope Gregory XV., who appointed him his principal painter, and architect to the pontifical palace. The cardinal Montotto engaged him to paint the vault of S. Andrea della Vallet, where he represented the four Evangelists with Angels; and in the chapel of cardinal Bandini, in the church of S. Sylvestro, in the Quirinal, he painted four pictures, which rank among his best; the subjects are, Esther before Ahasuerus, Judith with the Head of Holofernes, David playing and singing before the Ark, and Solomon and his Mother Bathsheba seated on a Throne. The former are certainly of a very high class of art, and though lacking the simplicity and grandeur of M. Angelo or Raphael, yet they are full of rich and fine forms, particularly those of the angels, &c. which accompany the figures. The latter are not of so elevated a style, but are more familiar, and wrought with fine colour: they are engraved by Jacomo Frey.
Frey. About the same time he painted four of the Cardinal Virtues in the angles of S. Carlo Catena!, which have been preferred to us by the graver of G. Andran.

Domenichino not only excelled in historical painting, in works both great and small, but he has also left us many landscapes of extraordinary excellence in point of tone; seldom can so much be said of their compositions. They are generally faint in scenery, of a grave and dignified character, and are executed with boldness and freedom, and enriched with figures. A very fine one may be seen in the collection of the marquis of Stafford. He is universally esteemed as the best among the disciples of the Carracci, and Niccolo Poussin is said to have preferred him before them; but that favour, if we except the Communion of St. Jerome, his works will scarcely be found to support. M. Fuseli has remarked, that "expansion which had languished after the death of Raphael seemed to revive in Domenichino; but his tenability was not supported by equal comprehension, elevation of mind, or dignity of motive." His forms are by no means so pure or graceful, or his actions so natural and unconstrained, as those of that divine painter. His invention does not appear to have been vivid, but his study was unremitting, and with all his defects he well deserved the title of a great painter, and certainly has not since been equalled. He died in 1641, aged 60.

ZAMPOGNA, in the Italian Music, is used to denote any instrument that sounds like a flute; and particularly a bagpipe, being an assemblage of divers pipes of different sizes. It is also taken for a common flute.

ZAMRECOTTA, in Geography, a town of Bootan; 34 miles S.E. of Damfong.

ZAMZEVRIZI, a town of the principality of Georgias, in the province of Carduel; 15 miles S.W. of Gori.

ZANA, a river of Peru, which runs into the Pacific ocean. L. lat. 7°.

ZANAATHA, in Ancient Geography, a town in the interior of Arabia Petrea. Ptol.

ZANCHI, BASILIO, in Biography, an elegant Latin poet, was born at Bergamo in 1501, and purfied his studies under Giovita Rapicio with so much ardour, that at the age of seventeen he made a collection of Latin poetical epithets, which was afterwards published. Before he had attained the age of twenty he visited Rome, and was much noticed by the poets of that city. According to the practice which then prevailed he changed his baptismal name Pietro into L. Petreus; but afterwards, returning to Bergamo, and entering, in 1524, among the canons-regular of Lateran, he assumed that of Basil, devoting his attention to sacred literature, and publishing some works on the scriptures. In the progress of his life he frequently changed his residence; and was every where respected, on account of his learning and talents, by the principal scholars of the age. Under the severe decrees of pope Paul IV. issued in 1558, which commanded, under the threatened penalty of the priso or galleys, all the religious to return to the cloisters to which they belonged, Zanchi was imprisoned, and fell a sacrifice to the rigour of confinement. One of his biographers says, that he had few equals in the sweetness, and fewer in the elegance of his poetry; specimens of which occur in his eight books of poems, one of which bears the title of "De Horro Sophistic," and describes the most remarkable facts and doctrines of the Catholic religion. Some of his poems are inserted in the "Deliciae," and the "Carmina Poetarum Italorum." He also published a kind of lexicon, entitled "Latinorum Verborum ex variis auctoribus Epitome." Moret. Gen. Biog.

ZANCHI, CIROLOMO, an Italian Protestant, was born in 1516 at Alzano, in the territory of Bergamo, and entered among the canons-regular of Lateran at the age of fifteen, in which connection he remained for ten years. But Peter Martyr having communicated to him, and others of his fraternity, the opinions of the reformers, he departed with him from Italy in 1530, and went to Geneva. From Geneva he removed to Straflburg upon an invitation to supply a vacancy in the professorship of sacred literature, which he accepted in 1533, and which he occupied for about eleven years. Having signed the Augsburg confession, with some restrictions, he was aggregated to the chapter of St. Thomas, in Straflburg. Although his disposition was moderate and conciliatory, he was engaged in some disputes with the zealous Lutherans, who determined to procure his expulsion. With this view, they acquired his signature of a formulary, to which he assented in the following terms: "Hanc doctrinam formulam ut piam agnoscatur, etiam recipiatur." The ambiguity of this declaration was not satisfactory to his adversaries, and he was therefore induced to resign, and to accept an invitation to a church in Chiavenna. The articles with regard to which he was suspected by the Lutherans were predestination, the perseverance of the saints, the church, unity, images, antichrist, and the end of the world. Having refused at Chiavenna from the year 1563 to 1568, he removed to the theological chair at Heidelberg, when he took the degree of doctor. When Frederick III., who was a zealous Lutheran, succeeded the elector palatine, and removed the Heidelberg professors, Zanchi declining offered settlements at Leyden and Antwerp, took a place in count John Caimir's college at Newldt. Upon the restoration of the expelled professors, Zanchi, on account of his age, was declared "emeritus," and having lost his sight, died at Heidelberg in 1590.

Highly esteemed among Protestants in general on account of his learning and invincible attachment to their principles, John Sturmius affirmed of him, "that he should not be at all anxious for the cause of reformed religion, if Zanchius alone were to dispute in the council of Trent against all the fathers present." Bayle.

ZANCLE, in Ancient Geography, a town of Sicily, on the tract which separates this island from Italy. According to Herodotus, the Messenians, driven from the Peloponnesus by the Lacedemonians, transplanted themselves into Sicily, took possession of Zanclce, and gave it the name of Megara, whence Mellina.

ZANDENDORF, in Geography, a town of Germany, in the margravate of Anspach; 2 miles S.W. of Cadolzburg.

ZANDHOP, a town of Prussia, in Ermeland; 16 miles S.E. of Heilberg.

ZANE, a town of Virginia; 9 miles S.E. of Winchester.—Also, a township of Champaign county, in the district of Ohio, with 654 inhabitants.

ZANES, in Ancient Geography, a town of Upper Media, fortified by Justinian, so as to render it one of the strongest bulwarks of the empire.

ZANESVILLE, in Geography, a township of the slate of Ohio, in the county of Muskingum, on the Scioto, with 2154 inhabitants.

ZANETTI, ANTONIO, in Biography, of Venice, maestro di capella to the duke of Modena, the latter end of the 18th and beginning of the 19th century, for whom, and for the theatres in Venice, he produced six or seven operas that were much esteemed in those days.

ZANETTI, FRANCISCO, was born in the year 1740, maestro di capella in the cathedral at Perugia in 1770. He had previously passed some time in London, where some elegant and sprightly sonatas of his composition were published by
by Bremner. He lost his place in the church at Perugia, by having appeared on the Alberti stage at Rome, as a singer in an opera of his own composition, and that, merely to supply the place of the principal tenor, who had run away, and to prevent the piece from being stopped: he however married afterwards a pretty woman, who fung well, and indemnified him for the loss of his place.

Since his marriage he has composed several successful operas, in which Signora Zanetti has performed the principal female part, particularly one at Milan in 1785, in which she was much applauded, as well as her husband’s music. He has composed much natural and pleasing music for instruments; as six violin trios, six quartets for three violins, and two violoncellos, &c.

ZANFARA, in Geography. See Zamfara.

ZANGARISA, a town of Naples, in Calabria Ultra; 6 miles N.E. of St. Severina.

ZANGESAIR, or Sanguseer, a sea-port of Hindoostan, in Concan, with a good harbour, but not much frequented; 15 miles S. of Severndroog. N. lat. 17° 39’. E. long. 73° 55’.

ZANGUEBAR, a name given to a large territory of Africa, bordering on the Eastern sea, including many kingdoms; the name is said to import “the coast of the negroes,” all the inhabitants being blacks, with curled woolly hair; extending from two degrees north to the twenty-first degree of south latitude. The principal kingdoms on the coast have been separately spoken of and described. Of the country in general little is known; the whole tract is represented as barren and unhealthy, the lands lying low, and intersected with rivers, lakes, thick woods, forests, and marshy grounds. The fruits of it are very unwholesome, their rivers, for the most part, covered or choked up with weeds, bulks, and thickets; all which so flagrante the air, and corrupt the products of the earth, and render the inhabitants so sickly and indolent, that they receive little or no benefit from its produce. The Bedouin Arabs are the only people who make advantage of it by breeding multitudes of cattle, and living mostly upon their flesh and milk; whilst the negroes, or Zangas, content themselves with feeding upon wild beasts and fowl, which swarm all over those parts. To supply the want of corn, pulse, roots, and other wholesome food, of which they are defitute, the Divine Providence hath interposed that whole country with mines of gold, easily got, by the help of which they can purchase all the necessaries and conveniences of life from other parts: but this is the very circumstance that makes them so extremely jealous of letting strangers penetrate into the inland; more especially since the Portuguese have made themselves masters of such a number of places along this coast. They are in their nature fierce and riotous, ignorant and brutal, without religion, especially the negroes; upon which last account they have the name of Caffers. As for the Bedouins, they have some kind of religion, or rather observe a variety of superstitious rites, but are no less ignorant and uncivilized than the Caffers; yet they chiefly herd among themselves, and live at a great distance from the coasts, and by the sides of lakes and rivers, for the convenience of pasture for their numerous herds. They go all naked, both Caffers and Arabs, excepting that they wrap a piece of cotton cloth round their middle, which descends a little below the knee; but these who live along the coasts are somewhat more civilized, affecting a little more finery in their dres, and instead of cotton cloth cover themselves with the skins of wild beasts, more or less rich, according to their rank, with the tails of animals trailing behind on the ground; they likewise adorn their necks, arms, and legs, with a variety of beads, bugles, and other trinkets, of amber, jet, glass, and other materials, which they purchase from the merchants with their gold, furs, ivory, and other commodities. There are among these coasts a great number of Mahometans, but a much greater number still among the islanders along the coast; they being for the most part descended from those Arabs who were banished out of their country. The countries are, Melinda, Mongala, Jubo, Mofambique, and some others.

ZANHAGA, or ZANZAGO, or Zenbaga, a province of Africa, in the country of Sahara, bordering on the Atlantic.

ZANIA, in Ancient Geography, a town of Asia, in the interior of Media. Ptol.

ZANNA, the name of a medicinal earth, described by Oribasius: he says it is found in Armenia, in that part which borders on Cappadocia; and that it is very drying, and of a pale colour, and easily diffused by water, falling into a fine powder like lime.

It is called by the natives zarina, and the mountain from which it is taken is near the city Bagamonza. It is of a drying and astringent nature.

ZANNICHELLI, John Jerome, in Biography, a physician and naturalist, was born at Modena in 1662, and settling in the medical department at Venice, he published a work on the preparation of chemical medicines, entitled “Promptuarium Remediorum Chymicorum.” In 1702 he was created, by a patent of the duke of Parma, doctor of medicine, surgery, and chemistry. He afterwards formed a museum of natural history, and made many journeys in order to collect fossils and other subjects for this repository. Some of his excursions were undertaken by public authority, as he was nominated by the chamber of health, physician-naturalist to all the states of Venice. He died in 1729. During his life-time he published several tracts relating to botany and lithology; and after his death his son John James edited from his MSS. “Opuscula Botanica Posthuma,” 1730, and “Italiae et Piante che nascono nel lidi intorno à Venezia,” 1735, being a description, with figures, of the plants on the Venetian shores. Haller. Eloy.

ZANNICHELLIA, in Botany, was so named by Micheli, in compliment to John Jerome Zannicchelli, an eminent apothecary at Venice, who spared no expense or labour, even at an advanced age, in the study of botany, on account of which he undertook several hazardous and difficult journeys. He was particularly devoted to the observation of marine productions, as well animal as vegetable. In pursuit of these he was Micheli’s companion and guide, among the islands and shores of the Adriatic; and has wrote an account of the plants there to be found, which, with the history of some of his mountain tours, were printed after his decease. Zannichelli published a pamphlet on the medical qualities of Rufus, as well as various chemical and geological works. He died in 1729, aged 67. His son, John Jacob Zannichelli, wrote on the properties of the horse-chestnut, as well as an account of his own and his father’s museum. — Mich. Nov. Gen. 70. t. 34. Linn. Gen. 476. Schreb. 616. Willd. Sp. Pl. v. 4. 181. Mart. Mill. Diet. v. 4. Ait. Hort. Kew. v. 5. 229. Sm. Fl. Brit. 955. Prodr. Fl. Gracc. Sicibh. v. 2. 225. Pursh 4. Juif. 19. Poirct in Lamarck Diet. v. 8. 836. Lamarck Illusfr. t. 741. Gartn. t. 19. (Gramimolio; Dill. Gen. 168.) — Caffs and order, Menocia Monandria. Nat. Ord. Inundatae. Linn. Najades, Jaff

Female, close to the male. Cal. Perianth of one leaf, inferior, hollow, swelling, oblique, with two or three teeth. Cor. none. Pet. Germens from four to eight, flaked, oblong, converging; styles as many, simple, rather spreading; stigmas ovate, peltate, flat, spreading outwards. Peric. none. Seeds as many as the germens, naked, flaked, oblong, compressed, a little incurved, beaked with the permanent styles, tuberculated at the back, with a simple coriaceous coat.

Ob! Schreber speaks of some solitary, dispersed, male flowers, furnished with a single-leaved calyx, whose orifice is oblique, acute at the posterior part, and entire. He follows Gartner in considering the coat of each seed as a capsule; but the latter allows there is scarcely any internal coat, or integument, to the kernel, and the outer one is deficient of valves; so that although the style be permanent, we rather follow Linnaeus than other authors; and we conceive that if the existence of a naked seed be admitted in any instance, it must be in the present; there being only a simple covering to the embryo, which is indispensible.

Female, Calyx of one leaf. Corolla none. Germens four or more. Stigmas peltate. Seeds flaked, naked. 1. Z. palustris. Marsh Horned-Pondweed. Linn. Sp. Pl. 1375. Willd. n. 1. Brit. Fl. t. 844. Pursh n. 1. Mill. Ill. t. 77. Fl. Dan. t. 67. (Z. palustris major, foliis gramineis acutis, flore cum apice quadricapulatis, embryonis clypeolis integris, et virculo non barbatum, capulis feminis ad collem dentatis; Mich. n. 1. t. 34. f. 1.) Potamogeton filifolius, graminifolius, ramafolius, ad geminac polyceratos. Pluk. Phyt. t. 132. f. 7.)—Anther of four cells. Stigmas entire.—Native of ponds, ditches, and rivulets, in Italy, as well as other parts of Europe, from Sweden to Contantine, flowering in summer. It is found also in Virginia, near the sweet springs, according to Clayton and Pursh. The root is annual. Stem slender, floating, branched, round, leafy, and smooth, with the habit of a Potamogeton. Leaves linear, grassy, febrile, narrow, acute, and entire, two or three inches long. Bractea membranous, tubular, axillar, including a pair of green flowers, one male, the other female. Anther tawny. Seeds blackish when ripe, rugged and toothed at the back.

2. Z. dentata. Toothed Horned-Pondweed. Willd. n. 2. Poiret n. 2. (Z. palustris minor, foliis gramineis acutiflimis, floribus minimis cum apice capiculatis, embryonis clypeolis circumcrenis, et virculo barbatum, capulis feminis ad collem albis; Mich. n. 2. t. 34. f. 2.)—Anther of two cells. Stigmas toothed.—Found in the neighbourhood of Florence, with the foregoing, as well as in mountains pools in the adjacent country. Rather smaller than the former species, with shorter leaves; but most essentially different in having one cell in the anther, and remarkably toothed stigmas. The seeds also are tuberculated all over, not merely toothed at the back, or infal.

Loureiro has a Z. tuberculata, Fl. Cochinch. 543, to which he attributes "ovate-oblong single-feeded berries." It grows in the waters of Cochinchina, and has tuberous perennial roots, radical, sword-shaped leaves, spikèd flowers, the calyx of the female in five deep segments. We agree with M. Poiret that it would be too hazardous to admit this species without examination. Loureiro had probably never seen a real Zanichellia.

ZANOE, in Ancient Geography, a town of Palestine, in Vol. XXIX.
and Makelbranche. But being desirous of studying the works of Aristotle and Plato in the original language, he applied with diligence to acquire a knowledge of the Greek, so that he became able not only to read but to write. Thus furnished, he obtained leave to give lectures in philosophy; in the course of which he instituted a comparison between the system of Descartes and that of Newton, avowing a decided preference to the latter; more particularly as it respects optics and astronomy. It was by his advice, and under his direction, that Algarotti undertook to compose a popular treatise on light and colours. Declining to go to Padua for the purpose of giving lectures, he was appointed librarian to the Institute at his native place, and afterwards secretary, in which office he drew up in Latin an account of the transactions of the academy, with a history of its institutions, which he continued till the year 1766. This work was rendered peculiarly pleasing and instructive by the clearness of his arrangement, and the excellence of his style; in both which respects he seems to have formed himself on the model of Fontenelle. To these transactions he was himself a contributor; communicating a method of squaring different spaces of the hyperbola, and several important discoveries with regard to the circle, sphere, and circumfering figures. Of these discoveries he transmitted an account to the Academy of Sciences at Montpellier, of which, as well as of the Royal Society of London, he had been elected a member. He also discovered a method of separating indeterminate quantities, detected several errors in philosophy, and professed a variety of experiments; on these and other subjects he delivered papers to the Bologna Institute, which were published in his commentaries. Several of his papers on the central forces were also inserted in the Transactions of the Academy. His theorem on the means of determining the velocity of a body drawn or repelled from its centre, in any point of its orbit, were held in high estimation by Paul Florius, who ascribed himself of it in the composition of his work on universal gravity. On the subject of the "Vis viva," which in his time engaged particular attention, he wrote three dialogues in Italian, distinguished for peripetiae and elegance. In these he adopted the opinion of Delcarles in opposition to that of Leibnitz, who conceived that this force was not to be estimated from the velocity, as he asserted, but from the square of the velocity. The properties of numbers likewise engaged his peculiar attention; and he showed, that if any multiple of the number 9 be taken, the sum of the figures forming that multiple will be also a multiple of 9. In his speculations on moral philosophy, he defended the Peripatetics against Maupertuis; and his adversary Anfaldy, in his "Vindicatio Maupertusi," accused him of depreciating the Catholic religion, as he ascribed too great influence to the Stoic philosophy in alleviating the misfortunes of human life. This controversy gave occasion to many publications. Zanotti was a poet as well as a mathematician and philosopher, and wrote verse both in the Tuscan and Latin languages; aiming, in imitation of the most celebrated poets of Italy, to blend the fulness of Petrarch with the energy and vigour of Dante. Many of his Italian poems were published by Eufabio Manfredi; and some of his Latin elegies were edited by J. Antonio Vulpi; who says of them, that Catullus himself would not have been ashamed to acknowledge them. Both his Italian and Latin poems were afterwards published separately, first at Florence, and lastly at Bologna; and in this edition are contained imitations of Tibullus, Ovid, and Virgil, as well as of Catullus. After the death of Beccaria, Zanotti, whose modesty was no less conspicuous than his talents and acquirements, accepted the office of president of the Institute, which he deemed peculiarly honourable, as it was a token of esteem conferred upon him by his countrymen. Among the learned men with whom he maintained intercourse of friendship or correspondence were the famous anatomist Morgagni, Voltaire, and pope Benedict XIV. He died in the month of January 1777. For an account of his works, which, besides those to which we have already referred, were numerous, we refer to "Fabrioni Vite Italorum Doctrinae excellentissimorum," and for an abridgment of their titles, and time and place of publication, to Gen. Diog.

ZANOTTI, GIOVANNI PIETRO, was born at Paris, though of Italian parentage, in 1674. He was sent young to Bologna, and became a pupil of Lorenzo Paffinelli. Under that master he acquired an agreeable tone of colouring, a mellow pencil, and an intelligent acquaintance with the principle of the chiaro o scuro. He painted several altar-pieces for the churches at Bologna, of which the most esteemed are, the Incredulity of St. Thomas, in the church of S. Tommaso del Mercato; the Resurrection, in S. Pietro; the Nativity, in La Purita; and a large picture in the palazzo publico, representing the ambassadors from Rome swearing fidelity to the Bolognese. He readied great part of his life at Cortona, where he also distinguished himself by several pictures painted for the churches, particularly Chiritt appearing to the Magdalen, Chirilt bearing his Cross, and the Murder of the Inhabitants.

Zanotti was a laborious and intelligent writer on art. Of his numerous publications the most considerable is his "Storia dell' Academia Clementina de Bologna," published in two vols. 4to. in 1739. He died in 1765, aged 91.

ZANOTI, L'ABATE GIACALISTO, of Bologna, a disciple of Padre Martini, was born in 1779, of whose composition at the annual performance of the musical Students, who were members of the celebrated Philharmonic Society in Bologna, founded in 1666, we heard a dixit, in which there were all the marks of an original and cultivated genius. The movements and even passages were well contrived; and to make use of the language of painters, there were discernible in it not only light and shade, but even mezzo tints. He proceeded from one thing to another by such easy and inoffensive gradations, that it seemed wholly the work of nature, though conducted with the greatest art. The accompaniments were judicious, the ritorneli always expressed something, the melody was new and full of taste, and the whole was put together with great judgment, and even learning. We have very seldom been more pleased or completely satisfied than by this production; and yet the vocal parts were but indifferently executed, for there were then no great singers at Bologna. We expected to have heard of future works by this most promising young composer, who was one of the maestri di capella in the church of San Petronio; but as that has not happened, we fear he did not long survive this performance.

ZÁNOW, in Geography, a town of Pomerania; 6 miles E.N.E. of Cofolin.

ZANTE, an island in the Mediterranean, near the coast of the Morea, about 12 miles in length, and six in breadth, chiefly inhabited by Greeks, till lately under the Venetians, who appointed a governor, called provveditore, and two councilors. The Greeks have 40 churches, besides convents, and a bishop; the Roman Catholics have three convents and a bishop. By the treaty of Campo Formio, Zante was given to France; but in 1799 it was taken by the united fleets of Russia and Turkey, and in the year 1800 connected with other neighbouring islands, to form a republic of the Seven islands, named the Ionian, which are to pay a tribute to the...
the Porte, and guaranteed both by the Turks and Russians. Corfu, Cephalonia, and some others lately in the possession of Venice, were of this number. The island produces excellent wine, and that species of grapes called currants, olives, figs, melons, peaches, and other choice fruits; towards the coasts, the island is in general mountainous, but level in the interior parts. It is much subject to earthquakes. N. lat. 37° 40'. E. long. 21° 4'.

ZANTE, a town and capital of the island of Zante, situated on the N.E. side, with a harbour safe and commodious for vessels of any size. The town stretches between the harbour and the foot of a mountain about a mile in length, but narrow; the streets are not paved, and the houses in general low. On a mountain above the town is a citadel, which commands the harbour, and contains a little city within its walls. It is to be ascended with difficulty, is strong, and well supplied with stores, and furnished with a garrison. This is the residence of the governor and officers. Zante is the fee of a Greek and Latin bishop. There are several churches, and the Jews have a synagogue; 21 miles S.S.W. from the town of Chiarenza. N. lat. 37° 50'. E. long. 21° 8'.

ZANTHENES, in Natural History, a name given by the ancients to a fossile substance found in Media. Pliny quotes Democritus for saying, that if rubbed in palm wine and saffron, it became soft as wax, and yielded a very sweet smell.

ZANTHER, in Geography, a town of Pomerelia; 10 miles S. of Marienburg.

ZANTHOXYLUM, Linn. Gen. 519. See Xantho-

ZANTHOXYLUM, in Gardening, contains plants of the hardy and tender exotic shrubby kinds, in which the species cultivated are, the Canada tooth-ache-tree, or Hercules's club (Z. clava Herculis), and the Chinefe tooth-ache-tree (Z. trifoliatum).

The frift is a plant of the tree kind, of which there is a variety; the aften-leaved tooth-ache-tree, with oval-oblong folioloes, and prickly mid-rib.

And laft is a woody branching plant.

Method of Culture.—These plants may be increased by seeds and layers. The seeds should be sown in the spring, either in an east border, or in pots placed in the morning sun all the summer, being sheltered in a frame in winter; and in the spring following removed to the full air till October, giving proper waterings all the summer; and towards winter be placed again under shelter from frost till March, when the young plants may be potted separately; and thus continued for a year or two, being sheltered in the winter, when they may be transplanted into the shrubbery, where they are to remain.

The layers of the young wood may be laid down in autumn or early spring, and when they have striken root be taken off and managed as the seedlings.

They also succeed by cuttings in spring or summer, planted in pots, affilied by a hot-bed, in which they soon strike, when they should be transplanted into the full air; and the young plants will be fit for planting out in the autumn, or the spring following.

The frift is a very ornamental plant in the borders and other dry parts of shrubberies, and the latter among potted plants in the green-house collections.

ZANTOCH, in Geography, a town of the New Mark of Brandenburg; 8 miles E. of Landberg.

ZANZALUS, in Biography. See Baradus.

ZANZIBAR, or Zangibar, in Geography, an island of Africa, in the Indian sea, near the coast of Zangiebarg, governed by a king, which is tributary to the Portuguese. S. lat. 6°. E. long. 42° 15'.

ZANZOUR, a town of Africa, in the country of Tripoli; 15 miles W.N.W. of Tripoli.

ZAOIE, a town of Egypt, on the left bank of the Nile; 15 miles N. of Beniuef.

ZA-OSTROG, a town of Morlachia, near the coast; 15 miles S.E. of Macarfa.

ZAOZERSKOI, a town of Ruflia, in the government of Novgorod, on the Slu; 28 miles W. of Tschepovetz.

ZAPATA, or Zapata, a kind of feaf, or ceremony, held in Italy, in the courts of certain princes, on St. Nicholas's day, in which people hide presents in the shoes or flippers of those they would do honour to; in such manner, as to surprize them on the morrow, when they come to dress.

The word is originally Spanish, capata; and signifies a shoe, or slipper.

It is done in imitation of the practice of St. Nicholas; who used, in the night-time, to throw purfes of money in at the windows, for portions to poor virgins in their marriage.

F. Menehrier has described these zapatas, their origin, and different usages, in his Traite des Ballets Anciens et Moderns.

ZAPATERO, in Geography, a small island of Mexico, in lake Nicaragua, near the west coast; 30 miles S.E. of Grenada.

ZAPATILLA LAGOON, a bay on the east coast of Yucatan. N. lat. 18° 52'. W. long. 89° 32'.

ZAPETECA, in Ancient Geography, a town of Asia, in the mountains of Comagene, upon a small river, which discharged itself into the Euphrates, S. of that town.

ZAPPENDORF, in Geography, a town of Bavaria, in the bishopric of Bamberg; 9 miles N. of Bamberg.

ZAPHOR, a name given by some writers to Zaffer; which feee.

ZAPOROGIAN COSSACKS, in Geography. See Cos-

ZAPOTITLAN, a town of Mexico, in the province of Tlalaca; 62 miles S.E. of Puebla de los Angeles.

ZAPOTLAN, a town of Mexico, in the province of Mechoacan; 25 miles N. of Colima. N. lat. 26° 10'. W. long. 104° 36'.

ZAPPANIA, in Botany, was so named by Scopoli, in honour of Paul Anthony Zappa, an Italian botanist, to whom the public garden at Pavia was indebted for many valuable communications. The French, not always exact in orthography, will have it Zappania, and they have mislaid our more accurate countryman Mr. Brown, who follows Jaffieu and Lamarck in adopting this genus, in his Prod. Nov. Holl. v. 1. 514. Scopoli published it in his Delicia Flore et Faune Infributes, v. 1. 24. t. 15. The species, on which he founds the genus, and which he erroneously suspected might be the Lantana involucrata of Linnaeus, is the Verben a globifera of L'Heritier. (See Verbena, n. 3.) We do not find it necessary or expedient to retain Zappania as a distinct genus.

ZAPUNTELLO, in Geography, a town of the island of Melada, which sometimes gives name to the island.

ZAUQLAPAN, a town of Mechoacan, in the province of Mechoacan; 6 miles S. of Zacatula.

ZARA, a city and sea-port of Dalmatia, fee of an archbishop, situate in a district, called "The Count of Zara," which was purchased of the king of Naples, in the year
ZAR

1499, by the Venetians, in whose hands it afterwards continued. Zar is surrounded on all sides by the sea, except that it has a communication callward with the continent, by means of a draw-bridge, commanded by a fort. It is reckoned one of the best fortifications of Dalmatia, and deemed almost impregnable. The citadel is divided from the town by a very deep ditch, hewn out of a rock. The harbour, which lies to the north, is capacious, safe, and well guarded. The rain is carefully preferred in citizens, to supply the want of fresh water. In the cave refides the governor or provost of Dalmatia, whose office is only tituual. It now belongs to the kingdom of Italy; 28 miles N.W. of Scardona. N. lat. 44° 22'. E. long. 15° 38'.

Zara Vexieia, Old Zara, or Biogrado, or Alba Marina, a town of Dalmatia, now little better than a village. In the time of the Romans it was a place of considerable figure, and received a new set of inhabitants by a numerous colony of that people. In the middle ages it was called Belgrad, or Alba Maria. According to some it was burned by Attila; but we know with more certainty, that it was destroyed in the war between the Venetians and the Hungarians, by the doge Ordelaffo Falceri. Some banditti afterwards mixing with the inhabitants that remained, the republic, to check their excesses, ordered a general massacre of the robbers, in which the ancient inhabitants were not spared. Here was also a bishop's see, which, on the demolition of the town, was removed to Scardona; at present its inhabitants confine only of a few peacans; 18 miles S.E. of Zara.

Zara, see Scareda.

Zara, in Ancient Geography, a town of the Moabiters, taken by Alexander Jannus.—Alfo, a town of Asia, towards Armenia, upon the route from Arabiffum to Satata, between Evmeu and Dagollaffum, Anton. Itin.

ZARAK, in Geography, a town of Ruffia, in the government of Riazan, on the Ofer; 24 miles S.W. of Riazan. N. lat. 54° 30'. E. long. 3° 24'.

ZARAMA, in Ancient Geography, a town of Asia, in the interior of Media. Ptolemy.

ZARANDA, a name anciently given to the Euphrates.

ZARANG, the Zarange of Ptolemy, in Geography, a populous city of Perfa, in the province of Segesta or Scillan, situated pleasantly on the banks of the Heurnord. This was the customary residence of Jacob Ben Lath, the conqueror of the caliph of Bagdad, and flood a long siege against Timur, by whom it was at last taken. Zarang is supposed to be the same with the present Doothak, the old name having been lost in the revolutions to which this province has been subject for more than a century, and to which its present desolate state may, in a great measure, be attributed. For a further account of it, see Segestan.

ZARANIS, in Ancient Geography, a town of Asia, in the interior of Media. Ptolemy.

ZARATE, Augustine de, in Biography, a Spanish historian, was sent by Charles V. in 1543 to South America, as comptroller-general in Peru and Terra Firma; and having collected all the memoirs he could procure, he composed his work "Del Descubrimiento y Conquista de la Provincia del Peru," first printed at Antwerp in 1555, 8vo; and reprinted at Seville, 1577, folio: the first edition being regarded as most authentic. It has been translated into Italian and French, and is commended as a work of reputation and credit by Dr. Robertson. Moreri. Robertson's America.

ZARATE, in Geography, a town of South America, in the province of St. Martha; 15 miles S. of Teneriffe.

ZARAYOS, or Sharayos, a supposed lake of America, in the course of the river Paraguay, which only exils during the annual inundations, that are on a far greater scale than those of the Ganges, and may be fated to deluge whole provinces.

ZARCA, a town of Egypt, on the east branch of the Nile; 10 miles S. of Dametta.

ZARCHAS, or Tcharkas, a town of Perza, in the province of Chorasan, or Khorasan; 150 miles N. of Herat.

ZARCOIA, a town of Perza, in the province of Segestan; 12 miles W. of Zarang.

ZARDAK. See Sardak.

ZARE, a town of Perza, in the province of Chorasan, or Khorasan, on the north side of a lake so called; 70 miles S. of Herat.—Alfo, a lake of Perza, in the province of Segestan; 60 miles N. of Zarang. See Zerrein.

ZAREED, in Ancient Geography, a torrent beyond Jordan, on the frontier of the Moabiters. This torrent had its source in the mountains, E. of the country of Moab, and proceeding from the E. to the W. discharged itself into the Dead sea. The Israelites passed it 38 years before their departure from Kadeh-Barna. Numb. xxi. 12. Deut. ii. 3. 4.

ZAREPHATH. See Sarepta.

ZARETH, ZARETH. E, or ZAREF, a people comprized under the name of Scythians, on this side of the Imaus, south of mounts Maeaix and Alani. Ptol.

ZAREX, a port of Laconia, on the Argolic gulf, S. of Cyphanta. Near this port was a temple of Apollo, with a statue of this god, holding in his hand a lyre. To the south, and parallel to the coast, was a mountain called Zarex.

ZARFA, in Botany, a name given by Leo Africanus, and others, to the lotus, or nettle-tree.

ZARGIDAVA, in Ancient Geography, a town situated on the bank of the river Hieraus, in the interior of Lower Media, a little above Tamaflava.

ZARIASPARA, or ZARASPE, a town of Asia, in Baetaria, watered by a river of the same name, which discharged itself into the Oxus. Strabo. It was also called Baetra. Steph. Bry.

ZARIFU, a word by which some of the chemical writers have expressed tin.

ZARIK, in Geography, a town of European Turkey, in the Morea; 22 miles E. of Militra.

ZARIMA, a town of South America, in the province of Quito; 220 miles S. of Quito. S. lat. 3° 30'. W. long. 70° 30'.

ZARJON, a town of South America, in the government of Buenos Ayres; 300 miles N.W. of Buenos Ayres.

ZARLINO, Giuseppe da Chioggia, maestro di capella of St. Mark's church at Venice, and the most general, voluminous, and celebrated theorist and writer on music in the Italian language during the 16th century, was born in 1549, and author of the following musical treatises, which, though separately printed, and at different periods, are generally bound up together in one thick folio volume: — "Institutioni Harmoniche," Venice, 1558, 1562, 1573, and 1589; "Dimostrazione Harmonica." Ven. 1571, 1589; and "Sopplimenti Musica li," Ven. 1588. We discover by these dates, that Zarlino first appeared as an author at the age of 18; and from that period till he had arrived at 49, he was continually reviving and augmenting his works. The
The musical science of Zarlino, who died in 1599, may be traced in a right line from the Netherlanes; as his master Willaert, the founder of the Venetian school, was a disciple of John Mouton, the scholar of the great Josquin.

A commentary upon the voluminous writings of this author would occupy too large a portion of our work; and to refer the reader to the analysis of his several treatises by Artusi would be doing him little service, as the writings of Artusi would be difficult to find. There are few musical authors whom we have more frequently consulted than Zarlino, having been encouraged by his great reputation, and the extent of his plan, to hope for satisfaction from his writings concerning many difficulties in the music of the early contrapuntists; but we must own, that we have been more frequently discouraged from the pursuit by his prolixity, than enlightened by his science; the most trivial information is involved in such a crowd of words, and the unpractised, which it occasions, is so great, that patience and curiosity must be invincible indeed to support a musical inquirer through a regular perusal of all his works.

He begins his Institutes with a panegyrick upon music, in the usual strain; then we have its division into mundane and humane, faithfully drawn from Boethius; after this, there is a great wafe of words, and parade of science, in attempting to explain the several ratios of greater and less inequality, proportion, and proportionality, &c. where, in his commenting on Boethius, we have divisions of musical intervals that are impracticable, or at least inadmissible, in modern harmony.

In his account of the ancient lyre, he discovers much reading; and that is what he chiefly wishes the reader should know.

In describing the diatonic genus, in which the tetrachord is divided into tone major, tone minor, and major femitone: \( 3^1, 3^2, 3^3 \), and \( 3^4 \), for which division, commonly called the Pythagorean, or intende of Ptolemy, he constantly contends, we have the substance of his dispute with Vincenzo Galilei, which will be mentioned hereafter. The second part of his Institutes is chiefly employed in measuring and ascertaining intervals by means of the monochord, and an instrument called the mefolab, which is said to have been invented either by Archytas of Tarentum, or Eudoxenes, for the purpose of halving an interval. Whether the practical musicians of antiquity applied these calculations or imaginary divisions to their flutes and lyres, we know not; but of this we are most certain, that the greatest performers of modern times are Aristoxenians, and make the ear the only instrument of calculation; which, by means of harmony, and the constant opportunities of comparison which the base or other accompaniment affords them, during performance, is rendered a much more truly guide than it could be in playing a single part. It seems, however, as if the ancient instruments, upon which all the tones are fixed, had more need of the assistance of calculation and mathematical exactness in regulating their intervals than those of the violin-tribe at present; which, except in the open stringings, which often lead the performer to erroneous intonation, depend on the strength and dexterity of the musician's hand, and accuracy of his ear, during performance. See an ingenious and useful work, called "Essay upon Tune," published at Edinburgh, 1781; where the imperfections in the scales of modern instruments are clearly shown, and remedies for correcting them preferred.

The elements of counterpoint, and fundamental rules of composition, which chiefly concern the practical musician, are given in the third part of the Institutes; and these are more ample, and illustrated with more examples, than in any preceding writer; particularly the laws of canon and fugue, for which no instructions have been given by Fanchinus, though they were in such high favour during his time. P. Aaron and Vicentino have indeed started the subject, but the pursuit of it was left to Zarlino.

In the fourth part of the Institutes we have a short historical account of the inventors of the several ecclesiastical modes: it is, indeed, a mere skeleton of affections or conjectures without proof, more derived from traditional than written evidence. He here likewise gives instructions for composing in all these modes, in which he religiously keeps within their legal limits, and submits to all the restraints which antiquity had prescribed.

Padre Martini, faggio di contrappunto, in recommending the study and imitation of ancient masters, has well described the difficulties they had to encounter; where, after confronting the ecclesiastical scales with the secular, we have the following passage: "From an attentive and comparative view of these scales, any one desirous of learning the art of counterpoint for the service of the church, will see what diligence and efforts were necessary to unite the different qualities of canto-fermo and canto-figurato; and by carefully examining the examples given of both, will discover what artifacts were used by ancient masters to avoid such sounds as differed from the canto-fermo, and with what paraphony they admitted such accidents as canto-figurato requires, particularly in the third and fourth tones: where, instead of modulating into B flat, the 5th of the mode or key, as is constantly prakticed at present, they have passed to the key of A in the fourth tone, and C in the third, by which means they have been able, dexterously, to unite the different qualities of canto-fermo with those of canto-figurato."

He gives excellent rules for composing motets and madrigals; but it is remarkable, that he advises the composer to make the tenor proceed regularly through the sounds of the mode he shall choose; and above all, that this part be so much the more smooth, regular, and beautiful, as the rest are to be built upon: whence, says he, its sounds may be called the nerves and ligaments of all the other parts: by which it appears that the cantilena, or principal melody, was not given, as it is by modern composers, to the sopranus, or highest part; that cadrisi were not so common as at present; and that the tenor being the kind of voice most easily found, and more generally good than that of any other pitch, was judiciously honoured with the principal melody.

Zarlino says, that so great was the rage for multiplying parts in musical compositions, that some masters, not content with three or four, which sufficed to their predecessor, had increased them to fifty; from which, he truly observes, nothing but noise and confusion could arise. However, in another part of his book, he tells us, that Adriano Willaert had invented mafles à Due Cori, over a tre, or, as some call them, à Cori Spezzati, which had an admirable effect. We know not how Okenheim disposed his thirty-six parts in the motet already mentioned; but they would have furnished nine choirs of four voices each. In the large churches of Italy, where the performers are divided into two bands, placed in opposite galleries, all the imitations and fole parts are distinctly heard, and when united in at least eight real parts, completely fill the ears of the audience with all the charms of congregated sound.

ZARMISOGUSIA REGIA, in Ancient Geography, a capital town of Dacia, upon the river Sargetia. When this city became a Roman colony, it joined to its ancient name "Colonia Ulpi Trajana," or that of "Augusta Dacica."
ZAR

ZARN, in Geography, a town of the duchy of Berg; 4 miles E. of Durlburg.

ZARNAB, in the Materia Medica, a term used by Avicenna and Serapio to express the carpusia of the ancient Greeks.

ZARNACH, the name as the word zarnich, the name of the ornament of the Arabians.

It was not confined, however, to this sense alone, but was used as a name for other things used in painting, and particularly for the laps armens. However, Dioscorides and Theophrastus call the laps armens by the name of armenion, and the zarnich by that of arvencon, that is, ornament.

ZARNAK, in Geography, a town of Turkestan, on the Sirr; 100 miles W. of Teonate.

ZARNATA, a town of European Turkey, in the Morea; 16 miles S.W. of Militra.

ZARNAW, a town of Poland, in the palatinate of Sandomirz; 32 miles N. of Sandomirz.

ZARNICH, in Natural History, the name of a genus of foils, the characters of which are these: They are inflammable substances, not composed of plates or flakes, but of a plain, simple, and uniform structure, not flexible nor elastic, fusible in oil, and burning with a whitish flame, and noxious smell, like garlic.

That these foils are really sulphurised arsenic is evident from many experiments. When let on fire, the arsenical as well as the sulphurous smell is plainly distinguishable. If triturated with quicksilver, and exposed to a suitable heat, the sulphur is detained by the mercury, and a pure white arsenic sublimes. A mixture of fixed alkaline salt, with any vegetable or animal sublimate, as the compound called by the affayers black flux, in like manner keeps down the sulphur, and at the same time revives the arsenic into its reguline or metallic form. These native minerals have been used as medicines in the eastern countries, and by some imprudently recommended in our own. Lewis.

Of this genus there are four known species: a red one, which is the true Sandarach; a yellow one, found in the mines of Germany, and brought to us under the name of ornament; a greenish one, common also in the mines of Germany, and sold in our colour-shops under the name of a coarse ornament; it is also found in the tin-mines of Cornwall; and a whitish one, which has the property of turning black ink into a florid red, common in the mines of Germany, but of little value. Hill.

ZARNOWITZ, in Geography, a town of Prussian Pomerania, on a bay of the Baltic; 40 miles N.N.W. of Danzig.

ZARNOWNO, a town of Austrian Poland, in the kingdom of Galicia, on the Dnieper; 15 miles N.W. of Halicz.

ZAROW. See Soraw.

ZARP, a river of Asia, which runs into the Tigris, 40 miles below Moful.

ZARPANA, or ROTA, or St. ANN, one of the La-drone islands, about 40 miles in circumference, with a port on the S. coast, and another on the N.W. coast; 21 miles from Guam.

ZARUANA, in Ancient Geography, a town of Asia, in Greater Armenia. Potemiany.

ZARUBINA, in Geography, a town of Russia, in the government of Irkutsk; 60 miles N.W. of Ilmuk.

ZARUMA, a town of South America, in the audience of Quito.

ZARUTHAN, in Surgery, a word used by some to express a hard and unequal tumour of the breast, attended with a burning heat, and a violent but not continual pain.

This is by some referred to the cancer, and accounted a species of that terrible disorder: its cause is supposed to be a sharp ichorous humour in the blood.

ZARZA, in Geography, a town of Spain, in Extremadura; 22 miles S.W. of Placentia.

ZARZEDO, a town of Portugal, in Extremadura; 20 miles N.E. of Calfel Branco.

ZARZINA. See Sarina.

ZASAWA, a town of Bohemia, in the circle of Kauzim; 8 miles S.W. of Kauzim.

ZASHIVERSES, a town of Russia, in the government of Irkutsk; 1320 miles N.N.E. of Irkutsk. N. lat. 67° 25'. E. long. 138° 14'.

ZASLAW, a town of Poland, in Volhynia; 24 miles N. of Confitantinow.

ZASMUKI, a town of Bohemia, in the circle of Kauzim; 4 miles S.S.E. of Kauzim.

ZASNAARAS, a town of Transylvania; 16 miles S.W. of Weilimbus.

ZASPEL, in Commerce, a measure for linen and yarn at Leipzig; where a piece of woollen or cotton yarn consists of 4 filums, or 12 zafpel, and a piece of linen yarn consists of 6 filums, or 12 zafpel. A zafpel contains 20 gebinde, 400 fadens, or 1000 ells.

ZATEETZ, in Geography. See Saatz.

ZATHAG, or ZATAG, a town of Arabia, in the province of Hedjas; 40 miles S.E. of Karae.

ZATHUA, in Ancient Geography, a town of Asia, in Greater Armenia. Potol.

ZATIBA, in Geography, a town of South America, in New Grenada; 36 miles N.N.W. of Colofvar. N. lat. 47° 47'. E. long. 22° 24'.

ZATOR, a strong town of Austrian Poland, in Galicia; 22 miles W.S.W. of Crestow.

ZATSCIT KABANOVSKAIA, a fort of Ruffia, in the government of Kollivin; 20 miles S. of Bilk.

ZATUENEBO, a town of the island of Cuba; 65 miles S.S.E. of Havana.

ZATURCE, a town of Poland, in Volhynia; 20 miles W.S.W. of Lucko.

ZAUALA, a town of Mexico, in the province of Mehcoacan; 110 miles N. of Mehcoacan.

ZAUARA, a river of Africa, which runs into the Indian sea, S. lat. 24° 15'.

ZAVARA. See Asia Sava.

ZAUDNITZ, a town of Silefia, in the principality of Tropoua; 9 miles N.N.E. of Tropoua.

ZAVESCES, in Ancient Geography, a people of Africa, in the western part of Libya, and in the vicinity of the Libyans Meycans. According to Herodatus, when these people went to war, their wives conducted their cars or chariots.

ZAUED UL BAIHI, in Geography, a town of Egypt, on the left bank of the Nile; 8 miles S. of Shabur.

ZAVEL, a river of Perufla, which passes through Chopfahan, or Khorafan, and lores itself in lake Zare, or Zarreh.

ZAVELSTEIN, a town of Wurtemberg, near which is a medicinal spring; 2 miles N. of Bulach.

ZAVIDEI, an island of Russia, at the entrance of the gulf.
gulf of Tchauflskia, in the Frozen sea; about 60 miles in circumference. N. lat. 71° 50' to 72° 20'. E. long. 156° 14'.

ZAVODE Biruleva, a town of Ruffia, in the government of Irkutsk, on the Argunia; 121 miles N.E. of Stretenfsk.

ZAVODE Dutcharfskoi, a town of Ruffia, in the government of Irkutsk; 88 miles S.E. of Stretenfsk.

ZAVODE Gazimurskoi, a town of Ruffia, in the government of Irkutsk; 44 miles S.S.E. of Stretenfsk.

ZAVODE Irbinfskoi, a town of Ruffia, in the government of Kolivan; 40 miles E. of Abakansk.

ZAVODE Kutamorfskoi, a town of Ruffia; 100 miles E.S.E. of Nertchinsk.

ZAVODE Lainina, a town of Ruffia, in the government of Irkutsk, on the W. coast of the Baikal lake; 80 miles N.E. of Irkutsk.

ZAVODE Midnoi Kuruzulcefskoi, a town of Ruffia, in the government of Irkutsk; 32 miles S. of Nertchinsk.

ZAVODE Niznei Suzuzskoi, a town of Ruffia, in the government of Kolivan; 32 miles S. of Nertchinsk.

ZAVODE Novopavlovskoi, a town of Ruffia, in the government of Kolivan; 80 miles S.S.E. of Kolivan.

ZAVODE Popovo, a town of Ruffia, in the government of Kolivan. N. lat. 55° 31'. E. long. 95° 32'.

ZAVODE Sibiriia Koosa, a town of Ruffia, on the Argunia; 100 miles E.S.E. of Stretenfsk.

ZAVODE Tifova, a town of Ruffia, in the government of Irkutsk, on the river Poin; 124 miles N.N.W. of Niznei Udinsk.

ZAVODE Perchoturova, a town of Ruffia, in the government of Irkutsk, on the Argunia; 132 miles N.E. of Stretenfsk.

ZAVOLOCZE, a town of Ruffia, in the government of Polotfsk; 50 miles N.E. of Polotfsk.

ZAURGATCH, a town of Ruffia, in the government of Tobolfsk, on the Iritych; 80 miles E.S.E. of Tobolfsk.

ZAUROS, in Ichthyology, a name given by the ancient Greeks to that fish which we call saurus and lacetus, and which is called at Rome the tarantula.

It is distinguished by Artedi by the name of ofmerus, with eleven rays in the pinna ani; and in the Linnean figured it is the salmo saurus, with ten rays in the pinna ani.

ZAURZAN, in Geography, a town of Perfla, in the province of Chorafan; 70 miles N.W. of Herat.

ZAWAJA, a lake of Abyflania, in the southern extremity of the kingdom, which is the chief source of the river Haivas.

ZAWEH, a district or province of Perfla, bounded on the N. by Karafm, on the E. by Chorafan, on the S. by Mazanderan, and on the W. by the Capfian sea.—Alfo, a town of Perfla, and capital of a district, on the river Tedjen, about 24 miles from the Capfian sea; 81 miles N. of Mefchid.

ZAWICHOST, a town of Poland, in the palatinate of Sandomirz; 8 miles N. of Sandomirz.

ZAWIEH, a town of Asiatic Turkey, in the government of Diarbekir, on the Euphrates; 24 miles E. of Anah.

ZAWILA. See Zurela.

ZAWLOW, a town of Austrian Poland, in Galicia; 20 miles N.E. of Halicz.

ZAXO SUHAF, a town of Asiatic Turkey, in the government of Diarbekir; 5 miles S. of Rahabeh.

ZAYRE. See Zaiee.

ZAYTE, a river on the W. side of the island of Celebes, which runs into the sea, N. lat. 30°. E. long. 120° 15'.

ZAZIMOWICZE, a town of Lithuania, in the palatinate of Brezsk; 32 miles N.E. of Brezsk.

ZAZIVNOI, a fort of Ruffia, in the government of Upha, on the Ural; 68 miles W. of Orenburg.

ZBANITZ, a town of Bohemia, in the circle of Chrudim; 5 miles E. of Hohenmunt.

ZBARAS, a town of Poland, in the palatinate of Braclaw; 36 miles N. of Braclaw.

ZBIOROW, a town of Bohemia, in the circle of Berann; 12 miles S.W. of Berann.

ZBORRI, a town of Hungary; 16 miles N.N.E. of Szebeu.

ZBORROW, a town of Austrian Poland, in the new kingdom of Galicia, near which an obstinate battle was fought between the Poles on one side, commanded by their king John Caifmir, and the combined army of the Costacks and Tartars on the other. In this engagement the latter were defeated, and left 10,000 men dead on the spot; but the day after, a treaty of peace was concluded on terms disadvantageous to Poland; 63 miles E. of Lemberg.

ZBRAŚLAWIIZ, a town of Bohemia, in the circle of Czlaus; 10 miles S.W. of Czlaus.

ZDANICA, a river of Ruffia, which runs into the Chatanga, N. lat. 70° 40'. E. long. 98° 14'.

ZDAUNSKY, a town of Moravia, in the circle of Hradifch; 15 miles N. of Hradifch.

ZDIAR, a town of Bohemia, in the circle of Prachatitz; 8 miles N.W. of Horaclicowiz.

ZDISLAWSIIZ, a town of Bohemia, in the circle of Kauritzim; 10 miles S.E. of Benechow.

ZDZIECIOI, a town of Lithuania, in the palatinate of Novogrodock; 12 miles W. of Novogrodock.

Gen. Ch. corrected by Schreber. Male flowers disposed in different spike. Cal. Glume two-flowered, of two ovate-oblong, swelling, pointed, bearded, the outermost rather the longest. Cor. Glume of two oblong bearded valves, about the length of the calyx; the outermost swelling, obtuse; the innermost terminating in two teeth. Nectary of two very short feathery scales, dilated upwards, abrupt, furrowed at the summit. Stam. Filaments three, capillary; anthers somewhat prismatic, cloven, burrowing at the top.

Female flowers in a very dense spike, below the male, on the same plant, concealed by the leaves. Cor. Glume single-flowered, of two permanent, roundish, thick valves, membranous and fringed at the margin; the outer one thicker. Cor. Glume of four unequal, membranous, transparent, broad, short, permanent valves. Pfl. Germ. very small; style thread-shaped, extremely long, pendulous; stigma simple, downy towards the summit. Petals none. Common Receptacle very large and long, with five or more angles, and as many rows of cells, tranversely excavated, in each of which are imbedded the fruits of two flowers, surrounded with their own calyx and corolla. Seed solitary, roundish,
roundish, falked, longer than the glumes; angular and compressed at the base.

Obi. Two out of the four valves of the female corolla appear to belong to an abortive flower. Schrèber.

Female, Calyx a glume of two valves. Corolla of four valves. Style one, thread-shaped, pendulous. Seeds solitary, imbedded in an oblong receptacle.

1. Z. mays. Common Maize, or Indian Corn. Linn. Sp. Pl. 1378. Willd. n. 1. Ait. n. 1. Pursh n. 1. (Frumenontum indicum; Camer. Epit. 186. F. affaticum, turcicum et indicum; Ger. Em. 81, 82. Morif. feft. 8. t. 13. f. 1, 2, 3.)—Leaves entire.—Native of America. Cultivated there, as well as in the southern countries of Europe. One of the largest of the family of corn or grasses. 

Root annual, of innumerable fibres. Stem erect, somewhat branched, round, stout, jointed, leafy, from five to ten feet high. Leaves sheathing, lanceolate, concave, acute, ribbed, two or three feet long, and three or four inches broad. Male flowers in numerous, aggregate, terminal spikes, each three or four inches long, greyish, downy, with purple anthers. Female ones below, in a generally fimple, cylindrical spike, covered by the large sheaths of the upper leaves. Styles six or eight inches long, very numerous, of a shining yellowish or reddish hue, hanging down like a long filken tassel. Seeds white, yellow, red, or purplish, forming a heavy, teffellated, cone-like, naked spike, from six to ten inches long. There are innumerable varieties, in the fize, figure, colour, and qualities of the grain, which, though valuable for many purposes, and yielding an abundant crop, is far inferior to wheat as a bread corn. It requires a richly manured foil. Mr. Pursh mentions a variety, brought lately by governor Lewis from the Mandan nation, on the Mifflouri, which promises to be particularly valuable, as ripening earlier than any other fort, and yielding an excellent produce. See MAIZE.

2. Z. Curagua. Chili Maize. "Molina Chil. German edition, 107." Willd. n. 2.—Leaves ferrated.—Native of Chili. Annual. Smaller in all its parts than the foregoing. Molina. Of the qualities or history of this fpecies, we have no further account.

ZEA, in Gardening, contains a plant of the hardy herbaceous annual kind, of which the fpecies cultivated is the maize, or Indian corn (Z. mays).

It has a large frong, herbaceous falk, which sometimes rises to the height of ten or twelve feet; and there are varieties with yellowish-white feeds, with deep yellow feeds, and with purple-blue feeds. This plant is mostly cultivated in the garden and pleasure ground for the fake of its fingular tall growth.

Method of Culture.—These plants may be raised by fowing feed in the fpring, as March or April, in a dry warm fitation, where the plants are intended to remain, in patches of two or three feeds or more in each, about an inch and a half deep: when the plants are come up, they should be thinned out to one or two of the ftongft. But to have the plants more forward, fo as to produce ripe feed:spikes more effectually, same should be fown in a hot-bed at the fame time, and when the plants are three or four inches high, be forwarded by pricking them out upon another hot-bed, either under a deep frame, or an opening of hop arches, to be covered with mats occasionally, allowing them plenty of free air; and when they have sufficient growth, as in May, they may be transplanted, with balls of earth about their roots, into the full ground in the borders or shrubbery clumps, in warm funny situations, being well watered; and when the summer proves warm and dry, they often produce perfect heads, and the feeds ripen in a good manner.

As the plants mostly run up in tall falks, it is proper to support each with a tall neat flake, especially where much exposed to wind and rain.

These plants in the different varieties have a fine effect in the back parts of borders, clumps, and other places, in warm sheltered situations.

It is observed by a late writer, that he has planted a small quantity of this fort of grain in his garden, and it turned out fuperior to his expectations; and he is of opinion, that this crop may be raised to advantage in the field on some light foils, particularly the poor fands of Norfolk and Suffolk, or on any hot burning lands; as the countries where it grows naturally are light hot foils. And he adds, that he prefers the drill method of culture for it in this country; as the small hillocks in planting the feeds separately make the land unfighly and improper for other crops. But to raise the greatest produce in corn, the hills are, he conceivefs, the belt way; however if the crop is intended chiefly for fodder, then drills are best. The feed is to be put about an inch deep in the ground. And that when the corn firft appears above the surface, the hillocks or drills must be examined, to fee whether it all comes up properly; and if it has not, there must be fresh feeds put into the vacant places to prevent a fofs in the crop. And as soon as the plants take root in the ground, the crop fould be examined again to fee whether any have died away, or the birds have taken the feed. The plants must alfo be thinned to two on a hill, and good plants fubstituted for weak ones.

In the cultivation while growing in the hill-way, the hoe must be used at every operation to the plants, and earth be given to them, as the land cannot be made too light for this crop; but when in drills, the corn must be hoed in the fame manner as garden peas.

He alfo further observes, that when the corn gets out of the milk, the blades below muft be all pulled off while green: tie them up in small bunches, about the size of a birch-broom, and hang them on the top of the falks of the corn; for at the fame time that the blades are pulled, the tops must be cut off, and let up in round bunches to dry, and tied round the topmoft part to keep them from falling: when these are dry, they muft be harvefted. The blades are generally ready in four or five days, but the tops take longer: when these blades and tops are properly harvefted, they are excellent food. And it is fuggelted, that as these proceeds will be fiftned about the end of August, the land might be ploughed and then fown with rye. If feeds were required, he is of opinion that it would be very proper to fow the feeds at that time on this poor hot land; as the warm feafon would be over, and the feeds would have fufficient time to take root before winter. If only rye was wanted, he would eat it with fheep in the fpring or during the winter. But the falks muft, he fays, fland, for the corn to ripen after the rye is fown; and the corn ought to hang on the falk till it is hard. In America, it is often December before the white corn can be pulled, or September for the yellow corn: if it is pulled before it is hard, and the cob is perfectly dry, it will mould and spoil, and the corn will be apt to rot, therefore great care fould be taken not to pull it too soon.

This fort of corn is, it is faid, given to hofles, cattle, and hogs, without shelling, and only hulked in the ear; but when given to fowls, or intended for sale, it is rubbed off by burning a cob in the fire till hard, and then rubbing the corn
with it. It is a sort of grain which is sometimes given to pigs, but more frequently when ground to fowls. Count Rumford has shown in his Essay on Food, that this is perhaps the most nutritious grain, except wheat, either as human sustenance, or as provender for brute animals. See MAIZE.

**Zeal, in Geography.** See ZIA.

**ZEAGONG,** a town of Birmah; 12 miles N.N.W. of Raynangong.

**ZEA,** ZELUS, ZLOG, the exercise of a warm animated affection, or passion, for any thing.

Some will have jealous zeal to be properly a mixed or compound sensation, where one affection is raised or inflamed by another. On these principles, jealousy may be defined an affection arising from love and indignation, which cannot bear a thing to be given to another, that a person desires for himself, or one whom he loves and favours. Others make it consist in an eager and lasting desire, to keep any thing inviolate, or a fervour of mind, arising from an indignation against those who abuse or do evil to a person beloved.

The Greek philosophers make three species of zeal. The first, of envy; the second, of emulation, or imitation; the third, of piety, or devotion; which last makes what the divines call religious zeal.

Josephus speaks much of a party, or faction, called the Zealouz, or Zealots, which arose among the Jews during the war with Vespasian and Titus. Lib. xiv. cap. 6. Antiq. and lib. iv. cap. 12. de Bello Judaico.

**ZEALAND,** or ZEALAND, or Seiland, (in Danish Sjælland,) in Geography, the largest island belonging to the kingdom of Denmark, bounded on the north by the Scagerrac, on the east by the Sound, on the south by the Baltic, and on the west by the Great Belt; about 85 miles in length from north to south, and where widest 60 from east to west, though in some parts scarcely 30, and in no part above 200 miles from the sea; reckoned about 700 miles in circumference. The coast is much interlaced with large bays; and within the country are several lakes, which, as well as the rivers, abound in fish. The country is pleasant; the soil is generally fertile, and produces corn, chiefly barley and oats, more than sufficient for the inhabitants, with excellent pastures; and in most parts is plenty of wood, except towards the centre of the island, where the inhabitants generally use turf for fuel. The fields are separated by mud-walls; the cottages are of brick or white-walled: fand-hills are sometimes destructive on the coast; and the belt protection from their ravages, says Catteus, is the elymus anemaria. Copenhagen is the capital. N. lat. 55° 2' to 56° 0'. E. long. 10° 58' to 12° 40'. See DENMARK.

**Zealand, State of,** one of the former United Dutch States, and now part of the recently established kingdom.

It consists of islands which are formed by those branches and outlets of the Scheldt, called Zeeuwsche Stromen, or Sea Streams; on the north it is bounded by Holland, eastward by Brabant, southward by Flanders, and westward by the North sea: its name sufficiently indicates its natural position and situation. The islands of Walcheren and Schouwen, on the western coast, are defended against the violence of the sea, by downs or sand-hills, and on the other sides, like the rest of the islands of Zealand, by vast dykes, which, at the bottom, have a breadth of 25 German ells, and at the top are 10 wide, that two carriages may pass abreast; the height is also proportioned to their thickness; notwithstanding which, in high tides and stormy weather, the waves in many places force a passage, or even flow over them; the first formation of these dykes must have been attended with immense expence, the very repair and maintenance of them requiring large sums. Emanuel van Meteren, in the sixteenth book of his Commentaries, says, and confirms it by the attestations of the workmen employed in them, that the dykes in this province alone, if placed in one direction, would form a length of 40 miles, each mile to be reckoned at 1400 rods, and that the expence of one rod with another was a pound Flemish, or six Dutch guilders. Thus the charge of the outward dykes taken together amounts to 340,000 l. sterling. Though the inhabitants of the other provinces, and foreigners in general, complain of the air being heavy, disagreeable, and unhealthy, yet no people look better, or enjoy a more confirmed state of health, than those natives who are born and bred up in it. The soil too is very fruitful, and famed for its excellent wheat, as likewise for madder, the cultivation of which furnishes out great employment for the inhabitants of Zealand: it abounds also in good fruits, and its rich pastures are covered with fleeces of fine sheep. The waters around the islands supply them with plenty of fish, particularly with oysters, lobsters, and mussels, of an uncommon size and goodness. Zealand enjoys likewise an affluence of all kinds of provisions, but fuel is very scarce there, especially turf, which, being brought from other provinces, bears a high price; great quantities of English coals are used here. In the whole province are 121 towns and villages, some of which are very large. The inhabitants are reckoned the most wealthy in all the Netherlands, which is, in a great measure, owing to their traffic by sea, and for this, indeed, they have every convenience that can be desired. (See Holland.) The right bank of the Scheldt, called the East Scheldt, divides this province into two quarters, viz. into that on the east and that on the west of the said river. The quarter on the West Scheldt is composed of five islands, viz. Walcheren, South Bereland, North Bereland, Wolderdyk, and St. Joostland. The quarter of the East Scheldt contains four islands, viz. Schouwen, Duiveland, Tholen, and St. Philip's Land.

**Zealand, New,** two islands in the South Pacific ocean, first discovered by Tasman, a Dutch navigator. In the year 1642, he traversed the easterly coast from lat. 34° to 43°, and entered the strait called Cook's Strait; he was attacked by the natives soon after he came to an anchor in the place; to which he gave the name of Murderer's Bay, and never went on shore; he gave the country the name of Staaten Land, in honour of the states-general, and it is now generally distinguished in our maps and charts by the name of New Zealand. As the whole of this country, except that part of the coast which was seen by Tasman from on board his ship, had from his time to the voyage of the Endeavour, in the year 1770, remained altogether unknown, it was by many supposed to be part of a southern continent. It is, however, now known to consist of two large islands, divided from each other by a strait or passage, which is about four or five leagues broad. The northernmost of these islands is called by the natives Haehimanaue; and the southernmost Tovy, or Tavai Pzannamoo. The latter is the name of a lake, and signifies the water of green tale. This lake is situated in the northern part of the island, and the country adjoining it only is known to the natives under this name. From my observation, says captain Cook, and from other information, it appears to me, that the New Zealanders must live under perpetual apprehensions of being destroyed by each other; there being few of their tribes that have not, as they think, sustained wrongs from some other tribe, which they are continually upon the watch to revenge; and perhaps the desire of a good meal may be no small incitement. They will even prepare their enmity from father to
fam, and the son never loses sight of an injury done to his father. The method of executing their horrible designs is by fealing upon their enemies in the night; and if they find them unguarded, (which is but seldom the case,) they kill every one indiscriminately, not even sparing the women and children: the dead bodies they either devour on the spot, or carry them home for that purpose. If they are discovered before they can execute their bloody purposes, they generally flee off; and sometimes are pursued and attacked by the other party in their turn. They never give quarter, or take prisoners. This perpetual state of warfare renders them fo circumjacent, that they are never off their guard either by night or day. According to their fyllogism of belief, the soul of the man whose flesh is devoured by the enemy is doomed to perpetual fire; while the soul of him whose body has been reftored, as well as those who die a natural death, ascend to the habitation of the gods. They do not eat the bodies of their friends who have been reftored. Their common method of disposing of the dead is by burning in the earth; but if they have more of their slaughtered enemies than they can eat, they throw them into the sea. They have no such things as cemeteries, or other places of public worship; nor do they ever assemble together with this view. But they have priests who alone alone address the gods in prayers for the prosperity of their temporal affairs. Whatever the principles of their religion may be, they are strongly inculcated in their infancy: of this I had a remarkable instance in the youth who was first defined to accompany Taveiharaooa. He refrained from eating the greatest part of the day on account of his hair being cut; though every method was tried to induce him to break his resolution; and he was tempted with the offer of such victuals as he was known to like best. He said, that if he ate any thing that day, the Eatooa would kill him: however, towards evening the craving of nature got the better of the precepts of religion, and he ate, though but sparingly. Notwithstanding the divided and hoffile state in which the New Zealanders live, travelling strangers who come with no ill design are well received, and entertained during their stay; which, however, it is expected will be no longer than is requisite to transact the busineses that they come upon. Polygamy is allowed amongst the people: the women are marriageable at a very early age; and one who is unmarried is in a forlorn state: the man with difficulty get a subsistence, and is in a great meafure without a protector, though in continual want of a powerful one. The New Zealanders feem to be perfectly satisfied with the little knowledge they are masters of without attempting in the leaft to improve it; nor are they remarkably curios either in their obervations or inquiries. Tony Poonamooa is for the moft part a mountainous, and to all appearances a barren country, and thinly peopled. Eaeheinomauwe has a much better appearance; it is indeed not only hilly, but mountainous, yet even the hills and mountains are covered with wood, and every valley has a rivulet of water; the foil in these valleys and in the plains, of which there are many that are not overgrown with wood, is in general light, but fertile, and fit for every kind of European grain, plants, and fruit. From the vegetables that were found here, there is reason to conclude the winters are milder than in England, and the summer not hotter, though it was more equally warm: dogs and rats are the only quadrupeds that were seen, and of the latter only a few. The inhabitants breed the dogs for the sole purpose of eating them. There are fables and whales on the coaft, and a lea-hion was once seen. The birds are, hawks, owls, quails; and there are fong-birds, whose note is wonderfully melodious. There are ducks and

flags of several forts, not unlike thofe of Europe; and the gazette, which is exactly the fame. The sea-coal is visited by abalofrees, fheer-waters, pintados, and penguins. The infects are, fheer-flies, beetles, butter-flies, and flies, and mafquelettes; and the neighbouring sea abounds with fish, which are equally delicious and wholesome food. Captain Cook seldom came to anchor but they caught enough, with hook and line only, to supply the whole ship's crew; and when they fifted with nets, every mesh in the fhips, except those who were too indolent, falted as much as supplied them when at sea some time after. The fish was not less various in kind than plentiful in quantity; there were many forts they had never before seen, but the failors readily gave names to all of them. The highest luxury which the sea afforded was the lobster, or sea cray-fish. Here were also feveral species of the fkat, or ftringray: foles, fnaunders, and shell-fish, were abundant. This country abounds with froups filled with very large, ftraiight, and clean timber. There is one tree about the size of an oak, which was diftinguished by a fcarlet flower, that appeared to be composed of feveral fibres; the wood of which was hard and heavy, excellently adapted to the ufe of the mill-wright: and another which grows in swampy ground, very ftraiight and tall, bearing small bunches of berries, and a leaf re¬fembling that of a yew-tree; the wood of which is very tough, and thick enough to make mafs of any fize: about 400 species of plants were found, all of which are unknown in England, except garden night-shade, low-thifle, two or three kinds of fern, and one or two forts of grafs. They found wild eelery, and a kind of creffles, in great abundance on the fia-shore, and of eatable plants fifted by cultivation, only cocaas, yams, and sweet potatoes. There are plantations of many acres of thefe yams and potatoes. The inhabitants likewise cultivate the ground; and the Chinefe paper mulberry-tree is to be found, but in no abundance. There is only one shrub or tree in this country which produces fruit, and that is a kind of a berry almost talteles; but they have a plant which answers all the ufe of hemp and flax. There are two kinds of this plant, the leaves of one of which are yellow, and the other deep-red, and both of them refeemble the leaves of flags; of these leaves they make lines and cordage, and much ftronger than any thing of the kind in Europe. These leaves they like¬wise split into breadth, and tying the slips together form their fihing-nets. Their common apparel by a fimple pro¬cés is made from leaves, and their linen by another prepa¬ration is made from the fibres. This plant is found both on high and low ground, in dry mould, and deep bogs; but as it grows largest in the latter, that feme to be its proper foil.

The men of this country are as large as the largest Euro¬peans. Their complexioin is brown, but little more fo than that of a Spaniard. They are full of flesh, but not lazy or luxurious, and are ftrout and well fhaeped. The women po¬nfts not that delicacy which diftinguishes the European ladies, but their voice is finguflarly foft, which, as the drefs of both fexes is similar, chiefly diftinguishes them from the men. The men are active in a high degree; their hair is black, and teeth are white and even. The features in both fexes are regular; they enjoy perfect health, and live to a very advanced age; they are of the gentlef difpo¬fitions, and treat each other with the utmost kindness, but they are perpetually at war, every lilie drofis being at en¬tity with all the relf, and towards their enemies they are implacable, never giving quarter. They have neither black cattle, sheep, hogs, nor goats; fo that their chief food being fish, and that not at all times to be obtained, they are
in danger of dying through hunger: they have a few, and but a very few dogs; and when no fish is to be got they have only vegetables such as fern-root, clams, yams, and potatoes to feed on; and if by any accident these fail them, their situation must be deplorable. This will account for their shocking custom of eating the bodies which are slain in battle, for he who fights through mere hunger will not scruple to eat the adversary he has killed. The inhabitants of New Zealand are modest and reserved in their behaviour and conversation. The women, indeed, were not dead to the fofter impressions; but their mode of content was, in their idea, as harmless as the content to marriage with us, and equally binding for the stipulated time. If any of the English addressed one of their women, he was informed, that the consent of her friends must be obtained, which usually followed on his making a present. This done, he was obliged to treat his temporary wife at least as delicately as we do in England. They anoint their hair with oil, melted from the fat of fish or birds. The poorer people use that which is rancid, so that their smell is very disagreeable; but those of superior rank make use of that which is fresh. They wear cloaks, both of bone and wood, which are considered as an ornament when stuck upright in the hair. The men tie their hair in a bunch on the crown of their head, and adorn it with the feathers of birds, which they likewise sometimes place on each side of the temples. They commonly wear short beards; the hair of the women sometimes flows over the shoulders, and sometimes is cut short. Both sexes, but the men more than the women, mark their bodies with black stains called Amoco; in general the women stain only the lips, but sometimes mark other parts with black patches; the men, on the contrary, put on additional marks from year to year, so that those who are very ancient are almost covered. Exclusive of the Amoco, they mark themselves with furrows; these furrows make a hideous appearance, the edges being indented, and the whole quite black. The ornaments of the face are drawn in the spiral form, with equal elegance and correctness, both cheeks being marked exactly alike, while the painting on their bodies resembles filagree work, and the foliage in old chased ornaments, but no two faces or bodies are painted exactly after the fame model. These Indians likewise paint their bodies, by rubbing them with red ochre, either dry, or mixed with oil. Their dres is formed of the leaves of the flag, split into slips, which are interwoven, and made into a kind of matting, the ends which are seven or eight inches in length hanging out on the upper side. One piece of this matting, being tied over the shoulders, reaches to the knees; the other piece, being wrapped round the waist, falls almost to the ground. These two pieces are fastened to a string, which, by means of a bodkin of bone, is passed through, and tacks them together. The men wear the lower garment only at particular times. What they consider as the most ornamental part of their dress is the fur of dogs, which they cut into stripes, and few on different parts of their apparel. As dogs are not in plenty, they dispose these stripes with great economy. They have a few dreses ornamented with feathers; and one man was seen covered wholly with the red feathers of the parrot. The women never tie their hair on the top of their head, nor adorn it with feathers; and are less anxious about dres than the men. Their lower garment is bound tight round them, except when they go a-fishing, and then they are careful that the men shall not see them. The ears of both sexes are bored, and the holes stretched so as to admit a man's finger. The ornaments of their ears are, feathers, cloth, bones, and sometimes bits of wood: a great many of them use nails, which were given them by the English for this purpose; and the women sometimes adorn their ears with the white down of the albatrosses, which they spread before and behind the hole, in a large bunch. They likewise hang to their ears by strings, chiefl, bodkins, the teeth of dogs, and the teeth and nails of their deceased friends. The arms and angles of the women are adorned with shells and bones, or any thing else through which they can pass a string. The men wear a piece of green tace, or whalebone, with the resemblance of a man carved on it, hanging to a string round the neck.

The houses are from sixteen to twenty-four feet long, ten or twelve wide, and six or eight in height. The frame is of flight flicks of wood, and the walls and roof are made of dry grass, pretty firmly compacted. Some of them are lined with bark of trees, and the ridge of the house is formed by a pole, which runs from one end to the other. The door is only high enough to admit a person crawling on hands and knees, and the roof is sloping. There is a square hole near the door, serving both for window and chimney, near which is the fire-place. A plank is placed near the door, adorned with a fort of carving, and this they consider as an ornamental piece of furniture. The side walls, and roof, projecting two or three feet beyond the walls at each end, form a sort of portico, where benches are placed to sit on. The fire is made in the middle of a hollow square in the floor, which is inclosed with wood or stone. They sleep near the walls, where the ground is covered with straw for their beds. Besides the fern-root, which serves them for bread, they feed on albatrosses, penguins, and some other birds. Whatever they eat is either roasted or baked, as they have no vessels in which water can be boiled. No plantations of coca, potatoes, and yams, were seen to the southward, though there were many in the northern parts. The natives drink no other liquor than water, and enjoy perfect and uninterrupted health. When wounded in battle, the wound heals in a very short time, without the application of medicine; and the very old people carry no other marks of decay about them than the loss of their hair and teeth, and a failure of their muscular strength, but enjoy an equal share of health and cheerfulness with the young.

The canoes of this country are not unlike the whole-boats of New England, being long and narrow. Those of the larger fort seem to be built for war, and will hold from 30 to 100 men; one of these measured near seventy feet in length, six in width, and four in depth. It was sharp at the bottom, and confined of three lengths, about two or three inches thick, and tied firmly together with strong plaiting; each side was formed of one entire plank, about twelve inches broad, and about an inch and a half thick, which were fitted to the bottom part with equal strength and ingenuity. Several thwarts were laid from one side to the other, to which they were securely fastened, in order to strengthen the canoes. These vessels are rowed with a kind of paddles, between five and six feet in length, the blade of which is a long oval, gradually decreasing till it reaches the handle; and the velocity with which they row with these paddles is surprizing: their tails are composed of a kind of mat or netting, which is extended between two upright poles, one of which is fixed on each side. Two ropes fastened to the top of each pole serve instead of heedles. The vessels are steered by two men, having each a paddle, and sitting in the stern; but they can only sail before the wind, in which direction they move with considerable swiftness.
ZEB

There the Indians use axes, adzes, and chisels, with which theylikewise bore holes. The chisels are made of Jasper, or of the bone of a man's arm; and their axes and adzes of a hard black stone. Their tillage of the ground is excellent, owing to the necessity they are under of cultivating, or running the risk of starving. A long narrow flake, sharpened to an edge at bottom, with a piece fixed across, a little above it, for the convenience of driving it into the ground with the foot, supplies the place both of plough and spade. The soil being light, their work is not very laborious, and with this instrument alone they will turn up ground of fix or seven acres in extent. Their fishhooks are of shell or bone; and they have baquets of wickerwork to hold the fish. Their warlike weapons are, spears, darts, battle-axes, and the pato-patoo, in which they chiefly confide. This is fastened to their wrists by a strong strap, left it should be wrenched from them, and the principal people generally wear it, flicking in their girdles, considering it as a military ornament and part of their drapery, like the poinard of the Afield and the sword of the Europeans. The spears, which is pointed at each end, is about twenty-fix feet in length, and they hold it in the middle, so that it is difficult to parry a push from it. Whether they fight in boats or on shore, the battle is hand to hand; their contests must be bloody. The war-dance consists of a great variety of violent motions and hideous contortions of the limbs, during which the countenance and tongue perform their parts. This horrid dance is always accompanied by a song, every strain of which terminates with a deep and loud lisp.

The employment of the men is supposed to consist in cultivating the ground, making nets, catching birds, and fishing; while the women are engaged in weaving cloth, procuring fern-roots and shell-fish, and dressing food. With regard to religion, they acknowledge one superior being, and several subordinate. Their mode of worship could not be learned, nor was any place proper for that purpose seen. There was indeed a small square area, encumbered with plants, in the middle of which hung a balkeet of fern-roots on one of their spades. This they said was offered to the gods, in the hope of a plentiful crop of provision. The inhabitants of the southern district said they dispersed of their dead by throwing them into the sea; but those of the north said they buried them in the ground: captain Cook's crew, however, saw not the least sign of any grave, or monument; but the story of almost every inhabitant bore the marks of wounds which they had given themselves, in token of grief for the loss of their friends and relations. Some of these scars were newly made, which is a proof that their friends had died while the ship's crew were there, yet no one saw any thing like a funeral, as the islanders conceal every thing respecting the dead with the utmost caution. A great similitude was observed between the drapery, furniture, boats, and nets of the New Zealanders, and those of the inhabitants of the South Sea islands, which furnishes a strong proof that the ancestors of both were natives of the same country. The language of New Zealand and Otaheite is radically the same; and that of the northern and southern parts differs chiefly in the pronunciation.

S. lat 34° to 48°. W. long. 18° to 194°. Cook's Voyages by Hawkesworth, vol. iii.

ZAMAH, a river of Algiers, which runs into the Mediterranean, 6 miles S.S.E. of Cull.

ZEAN, a town of Hindoostan, in Deob; 20 miles S. of Canoge.

ZEB, or Zin, a town of Syria, near the sea-coast, and

riently called Achiaph, Achazib, and Ecdippa; 9 miles from Acre.

ZEBAIDE, a town of Persia, in the province of Faris; 80 miles E. of Schiras.

ZEBDAINEH, a village of Syria, built on the spot where is said to have been Cain flew his brother Abel; 14 miles N.W. of Damascus.

ZEB, or ZAAB, in Antique Geography, a town which once formed a part of Mauritian Sitfenis; it was situated at the foot of the chain of mount Atlas.

ZEBEE, in Geography, a river of Abyflinhaia, which runs into the Indian sea.

ZEBBER, a town of Arabian Irak; 12 miles W. of Balfora.

ZEBEN. See SZEIBEN.

ZEBET, a word used by some of the chemical writers to express dung.

ZEBID, in Geography, a city of Arabia, in the province of Yemen. Zebid was one the place of a sovereign's residence, and the most commercial city in all Tehama; but since the arrival of Ghalefka was chokeed on, its trade has been transferred to Beit el Fakih and Mocha, and this city now retains nothing but the shadow of its former splendour. Viewed from a distance, it appears to some advantage, by means of the mosques and kubbets, of which it is full. Several of these mosques were erected by different pachas, who refided here during the short period while this part of Arabia was in the possession of the Ottoman Porte. Zebid has once eight gates; of these only five are now standing, and the river is gradually breaking down a part of them. The walls of the old city are demolished, and the very ruins are fold by poor people, who gather out the stones, and fell them for building new houses. The present buildings occupy about one half of the ancient extent of the city. Zebid is still distinguished for an academy, or university, for the Sunnis, as that of Damascus is for the Seidits, in which the youth of Tehama, and a part of Yemen, study such sciences as are cultivated among the Muffulans. This is besides the seat of a duka, a mufti, and three cadi's; 52 miles N. of Mocha. N. lat. 14° 12'. E. long. 43° 15'.

ZEBIO, a mountain of Italy, which sometimes emits flames; 6 miles S. of Modena.

ZEBLICIUM MARMOR, in Natural History, a name given by several authors to a soft green marble, variegated with black and white; and though the authors who have described it have not observed it, yet it no way differs from the white ophites of the ancients. See Ophtes.

ZEBOM, in Antique Geography. See SEBOIM.

ZEBRA, in Zooloogy. See EQUUS ZEBR.

ZEBU, a name given by M. de Buffon to a variety of the bos taurus of Linnaeus, or bison of other writers, or the camel. This variety resembles the Indian ox, or bos Indicus, but is extremely small, being found in some parts of India of a size scarcely larger than a great dog. Its colour it differs like the common cattle, being either grey, brown, white, &c., or variously spotted. The Indian ox, which is found in many parts of India, as well as in the Indian and African islands, and particularly in Madagascar, is of a reddish colour, of a very large size, and is distinguished by a very large protuberance over the shoulders.

ZEB, in Geography. See SIBU.

ZEBULUN, or ZARULON, in Scripture Geography, one of the Jewish tribes in Lower Galilee, on the S. of the tribes of Asher and Naphtali, having the Mediterranean on the W., the sea of Galilee on the E.; separated on the N. from Acher by the river Japhetha; and on the S. from Ilna-
char by that of Kiflon. Its ports, on account of its vicinity to the sea, were numerous, and its commerce extensive. Its cities were, Zezulun the capital, Bethulia, Magdalen, Joppa, Jotapa, Cinnereth, (since Tiberias, on the lake of that name,) Cartha, Bethulia, Rimmon, Dothiare, Damos, Sommerom, Tabor, both the city and mount, Soplia, Saffa or Sipuris, Nazareth, Cana the lesser, commonly called Canna of Galilee, Iconium, and Sicanium or Porphyren, an anciently Heapha, or Celpha, situated northwards at the foot of mount Carmel.

Zezeuun, or Zabulon, the capital of the fore-mentioned tribe, situated on the Mediterranean, near the mouth of the Ipheath, and once styled Zabulon Andron, or of men, on account of its extraordinary populousness. It was adorned with fine buildings, after the manner of Tyre, Sidon, and Berytus, and much admired on that account by Celsius, the Roman general, who nevertheless took, plundered, and burnt it to the ground. In the early ages of Christianity it was the fee of a bishop, but now it is a poor place, in ruins.

Zechariah, or the Prophecy of Zechariah, in Biblical History, a canonical book of the Old Testament. Zechariah was contemporary with Haggai, and prophesied in the second year of Darius Hylliptes. The design of the first part of this prophecy is the same with that of Haggai, viz. to encourage the Jews to go on with rebuilding the temple, by giving them assurance of God's affluence and protection: from whence the author proceeds to foretell the glory of the Christian church, the true temple of God, under its great high priest and governor, Jesus Christ, of whom Zerubbabel and Joshua the high priest were figures. The latter part of the prophecy, from chap. ix., probably relates to the fate of the Jews under the Maccabees, and then foretells the rejection of the Messiah, and some remarkable incidents that should happen to them in the latter ages of the world.

Mr. Mede, and some other learned men, think, that the 9th and following chapters of Zechariah are parts of the prophecy of Jeremiah.

Zechin, or Zechino, in Commerce. See Sequin.

Zechin, in Geography, a small island in the Grecian Archipelago; 2 miles S.E. of Stanchio. N. lat. 36° 48'. E. long. 26° 51'.

Zechlin, a town of Brandenburg, in the mark of Pregnitz; 9 miles E. of Wiltstock.

Zedic, a town of Africa, capital of a district in Tripoli, situated in a bay of the Mediterranean, called the bay of Zedic; 150 miles E.S.E. of Tripoli.

Zedlischt, a town of Bohemia, in the circle of Pillen; 5 miles N.W. of Hayd.

Zeddoary, Zedoria, or Kempferia Rotunda of Woodville, or Curcuma Zerumbet of Dr. Roxburgh, in the Materia Medica, a medicinal root, belonging to a plant growing in the East Indies (the amomum Zerumbet of Berg. Mat. Med.), whole leaves are like those of ginger, only longer and broader.

The Curcuma Zederia of Dr. Roxburgh, with small bulbs, and with the long palmate tubers inwardly yellow, leaves broad lanceolar, subfiddle on their sheaths, ferraceous underneath, and the whole plant green, is the Amomum Zederia of Linnaeus and Willdenow; which fee. It is a native of various parts of India; flowers during the hot season, April and May, when the plant is defittute of leaves: soon after they appear. The dry root, it is said, agrees pretty well with the drug known in England by the name of zedoaria rotunda. The Sanskrit name implies that the drug is used as an antidote to poison.

Zeddoary-root is a very useful warm stimulant, and has been commended in colics and hysteric affections, for promoting the menes, &c. It has been employed by some as a succedaneum to gentian root; but from the above analysis it appears to be not entirely similar to that simple bitter; its warm aromatic part being the prevailing principle, in virtue of which it is a spirituall extract (the most elegant preparation of it), has been made an ingredient in the cordial confection of the London Pharmacopeia. Lewis's Mat. Med.

Carthener, who ascribes its virtues to a camphoraceous volatile oil, considers it as a general remedy for most of the chronic diseases with which human nature is affected; but as the camphor contained in it can avail but little, and its effects as a bitter or aromatic are so very inconsiderable, this root is now deemed of no more use in medicine, and might be safely expunged from the materia medica. Cullen, Woodville.

The Zeddoary wash, which is a cooler yellow than saffron, though full as bright, and valuable for many purposes in painting with water-colours, may be prepared by boiling an ounce of the root in a quart of water, till the water is sufficiently tinged to make a stain on paper, of a full yellow colour; and straining the liquor through a linen filter. This wash may be dried in vials, and will again diffuse and spread kindly with the addition of water.

Zedlitz, in Geography, a town of Silesia, in the principality of Neisse; 3 miles N. of Ottnauchau.

Zefef. See Sufferdam.

Zefra, a word by which some of the chemical authors express pitch.

Zefrio, in Geography, a mountain of Naples, in Calabria Ultra; 10 miles N.N.E. of Bova.

Zegedin, or Szeged, a town of Hungary, near the conflux of the rivers Maros and Theifil. It is strong, and a place
a place of some trade, particularly in cattle. In the year 1503, all its defence was a moat and rampart; but falling some time after into the hands of the Turks, they erected a brick fort. In 1668, the Imperialists dispossessed the Turks of it; 68 miles N. of Belgrade. N. lat. 46° 15'. E. long. 10° 56'.

ZEGGO, a town of Africa, in the country of Melli, in the road from Kongo to Cafina; 100 miles N.N.W. of Malei. N. lat. 14°. E. long. 8°.

ZEGHAMA, a town of Dar-Fur; 60 miles N. of Cosséf. ZECEPTION, a town of Fezzan; 65 miles N. of Mourgouzok.

ZEGLI, ZAHI, a word used by Avicenna and others to express all the several vitriolic minerals. See Chalcitis, and Colothonn.

ZEGMA, in Geography, a town of Afiatic Turkey, in the province of Diarbekir, on the Euphrates, opposite to Romkala.

ZEGUTI, a town of Imiricia; 20 miles S.W. of Cotatis.

ZEZEGZEG, a city of Africa, and capital of a country of the same name, situated to the east of Agades; 370 miles N.N.E. of Cafina. N. lat. 20° 45'. E. long. 16°.

ZEHENDI, a town of Brandenburg, in the Ucker Mark, on the Havel. It is in a convent for ladies of noble descent, consisting of a domino and six fillers. It carries on a large trade in wood and corn: in the publics, near the town, iron-ore is met with in great abundance, and accordingly there is a mill here for that purpose, which is driven by the Havel. At this place likewise is a foundery, where bombs, grenades, bullets, mortars, pots, weights, and even small cannon are cast; 28 miles S.S.W. of Prenzlau. N. lat. 52° 58'. E. long. 15° 22'.

ZEITHAYN, a town of Saxony, in the margravate of Meiffen; 3 miles S. of Pirna.

ZEITENSTEIN, a town of Brandenburg, in the Middle Mark; 3 miles S. of Zoffen.

ZELAM, a town of Bavaria, in the bishopric of Bamberg; 12 miles W.N.W. of Bamberg. N. lat. 50° 1'. E. long. 10° 40'.—Alto, a town and castle of Germany, which gives name to a county; 4 miles N. of Leutkirch.

ZELLA, or ZELLA, or Sella, a sea-port town of Africa, in the kingdom of Adel, situated on the coast of the Arabian sea, at the mouth of the Hanaza, or Hawath, which forms a bay, called the Bay or Gulf of Zella. It receives a governor from the dolo of Mocha. N. lat. 10° 45'. E. long. 44° 20'.

ZELZHEIM, a town of the duchy of Wurzburg; 4 miles N. of Volebach.—Alto, a town of the duchy of Wurzburg; 4 miles E.N.E. of Arntstein.

ZERDOROD, or ZERDOROUD, a river of Persia, in the province of Irak, which has its source in the Koh-Insar, or Yellow mountain, where an aqueduct may yet be seen, by which Abbas the Great attempted to unite its waters with those of the Karoon. The Zerderood passes through the city of Ipahan, and is said to be aborbed in the irrigation of the neighbouring territory, or to lose itself in a lake, 15 miles S.W. of Laurikan. On this river are three bridges, two of which are in good repair; particularly that of the Char Baag (four gardens), to called from its connecting the upper and lower Chaur Baag, the name given to a spacious avenue, which runs from the royal square to the foot of the mountains E. of Ipahan.

ZEISSEL, a town of Austria; 3 miles E. of Tulln.

ZEISPERG, a town of Austria; 3 miles E.N.E. of Crem.

ZEITHAYN, a town of Saxony, in the margravate of Meiffen, famous for a pleasurable camp which King Algaullus II. made there, in 1730, at the expense of five millions of rix-dollars. On the spot which was used for this camp, and the excelling of the army, are erected six large pyramids; and medals have likewise been struck upon it, and a grand representation thereof engraved on copper; 8 miles W.N.W. of Groffenhayn.

ZEITLOSS, a town of the duchy of Wurzburg, on the river Sinn; 10 miles N. of Gmunden.

ZEITON, a town of European Turkey, in Thessaly, on a gulf to which it gives name. Here are about 450 Churlian families, but the greater part of the inhabitants confils Turks; 48 miles S.E. of Larissa. N. lat. 39° 6'. E. long. 22° 58'.

ZEITON, a gulf or bay of the Egrea sea, on the E. coast of Thessaly. N. W. W. of the island of Neo-ponton.

ZEITON, a town of Persia, in the province of Fars or Farifian, containing about 2000 inhabitants, and situated in a pleasant valley, fertilized by both the branches of the river Tab, which here form a junction. Zeiton is about fifteen miles distant from Behaban, the capital of the mountainous district of Khorgafe, which extends from the valley of Ram Hormuz to the vicinity of Kazeroon.

ZEITON, a town of Asia Turkey, in the government of Sivas, on the Kizillermak; 33 miles W. of Samfoun.

ZEITROBA, a term used by some of the chemists to express anything that is fluid.

ZEITZ, in Geography, a town of Saxony, in the bishopric of Naumburg, anciently the seat of a bishop, founded by the emperor Otto I. afterwards transferred to Naumburg, after this to whom had been facked and almoft destroyed by the Vandals in the year 982; 15 miles E.S.E. of Naumburg. N. lat. 51° 3'. E. long. 12° 2'.

ZEKELHEIB, a town of Hungary; 8 miles N.N.W. of St. Job.

ZELA, a town of Persia, in the province of Segesta; 25 miles S.W. of Fera.

ZELA, ZELIA, or Seleta, in Ancient Geography, a town of Thrace, afterwards called Flaviopolis.—Alto, a town of Asia, in Cappadocia Pontus, near the euse. It was celebrated by the defeat of Triarius, the Roman general, and afterwards by that of Pharnaces. Here was a famous temple, repreffed upon some medals, consecrated to the gods Anais, a Perian divinity, whose pontiff was very powerful under ancient kings; but in process of time his authority and revenues were diminished. The town and the milters of the temple were dependent on Pothodris, who possessed a part of the territory; its other parts were ceded to the pontiffs of Zela and Comanes, and the rest was annexed to the Roman province. According to Strabo, Zela and its territory were situated to the left of the river; the sacred lands of the temple, and the domains of the pontiff, were in the environs of the town. He adds that it was fortified and built in the retenchment of Semiramis; and in the first times it had only fome houses near the temple; but Pompey made it a town.

ZELAH, or SELA, a city of Benjamin (Josh. xviii. 28.), where Saul was buried in the tomb of his father, Kish. 2 Sam. xxii. 14.
ZEL, in Geography, a mountain in the county of Tyrol; 20 miles N.E. of Trent.

ZELANDY, a small island in the East Indian sea, near the W. coast of Sumatra. N. lat. 0° 53'; E. long. 96° 14'.

ZELANICA, a cape on the W. coast of Nova Zembla. N. lat. 78°. E. long. 77° 24'.

ZELATE, a town of the country of Candahar; 30 miles N.E. of Candahar.

ZELBRID. See SCHELEBEY.

ZELEFA, a town of Africa, in the country of Tunis; 10 miles S.E. of Caroan.

ZEL, a town of Asiatic Turkey, in the government of Sivas, a town of Pontus, and called Zela. Near this place the Romans, under Triarius, were defeated by Mithridates; and Pharmakes, son of Mithridates, was afterwards defeated by Julius Caesar; 21 miles W.S.W. of Tocat. See ZELA.

ZELIA, in Ancient Geography, a town built, according to Homer, at the foot of mount Ida. It was watered by the Tauris, and had to the S. the lake Aphaitis. According to Strabo, it had also in ancient times an oracle, but in his time it was not consulted.

ZELM, in the Materia Medica of the Ancients, a name given by Avicenna and others to a fruit common in Africa in Africa and the Middle Ages, and much esteemed by the people of that country, and called there by some pipi nigrorum, the black people's pepper, or negro-pepper.

Avicenna tells us, that the zelam was a fattish feed, of the fize of a chich, and of a high flavour, in colour yellow on the outside, and white within, and that it was brought from Barbary.

He adds, that there was another plant, properly called fulful alfadeden, that is, pipi nigrorum. This, he says, was a feed contained in pods like kidney-beans, and was black, and of a pungent and acid taste.

ZELIN, in Geography, a small island in the Frozen ocean, near the S.W. coast of Nova Zembla. N. lat. 70° 50'. E. long. 56° 24'.

ZELNOIKOLOK, a fort of Russia, in the government of Caucasus, on the Ural; 44 miles N. of Ourev.

ZELS, in Ancient Geography, a town of Hispiana, in Bocotia, on a plain which separated Hispiana from Africa, according to Strabo. This author reports, that the Romans transported the inhabitants into Mauritania, together with others driven away from Tingis, established the town of Julia Jora.

ZELATAWA, in Geography. See SCHELETA.

ZELZENSKAJA, a fort of Russia, in the government of Kolivan, on the E. side of the Iriful. N. lat. 52° 25'. E. long. 75° 40'.

ZELT, or ZELTO, a town of South America, in the harbour of Carthagena.

ZELT, a town of Austria; 14 miles N.W. of St. Wolfgang.—Alto, a town of Bavaria, in the bishopric of Bamberg; 10 miles S. of Bamberg.—Alto, a town of Germany, in the principality of Cunlube; 12 miles S.S.W. of Hof.-Alto, a town of the duchy of Wurzburg; 3 miles N. of Schweinfurt.

ZEL. See LIEBENZELL.

ZELL, im Harz, a town of Germany, on the Moelle; 25 miles N.E. of Treves. N. lat. 50° 4'. E. long. 7° 7'.

ZELL in the Piemont, a town of the archbishopric of Salzburg; on the Zeller See; 30 miles S.S.W. of Salzburg.

ZELL in Zillerthal, a town of the archbishopric of Salzburg; on the Ziller; 50 miles S.W. of Salzburg.

ZELL am Hammerbach, a town of Germany, situated in the vale of Hammerbach. The town was imperial, and afflewed twenty-one florins till 1802, when it was given to the margrave of Baden; 9 miles W. of Freudenstadt. N. lat. 48° 23'. E. long. 8° 7'.

ZELLA, in Ancient Geography, a town of Africa, which was burned during the war of Caesar against Scipio. Strabo.

ZELLANG, in Geography, a town on the W. coast of the island of Celebes. S. lat. 4° 20'. E. long. 120° 3'.

ZELLE, or ALTENZELLE, a town of Saxony, in the county of Erzeburg; 2 miles W. of Nollen.

ZELLE, a city of Weiphala, in the principality of Luneburg. This is a fortified and well-built town, situated on the Aller, which is here navigable, and behind the New Town is joined by the Fuhree. The town itself, in conjunction with the suburb of Fritzensen, consists of 564 houses; but including the other suburbs, summer-houses, and buildings without the gates, the number of them amounts to about 1400. At this place was held the high court of appeals for the several territories of the electoral house of Brunswick-Luneburg, together with the chancery and chief tribunal of the principality of Luneburg. Here also stands the provincial house for the diets of the principality, together with one of its superintendencies, and a special superintendency which is administered by the general superintendent, who is always first minister of the court. The other public edifices in it are, the Guildhall, the riding-houses, the mews, and the armoury. The magistracy is possessed of the lower jurisdiction in the town, and likewise in some parts of the suburbs. At this place, too, are manufacturers and artificers in various branches, particularly in gold and silver. The prince's seat, near the town, is walled and moated in, and was the residence of the Zelle line of Brunswick-Luneburg, which failed in 1705. It was built by duke Henry, in the year 1495, and afterwards improved; 40 miles S. of Luneburg. N. lat. 53° 42'. E. long. 10° 14'.

ZELLENBERG, a town of France, in the department of the Upper Rhine; 9 miles N. of Colmar.

ZELLERSEE, a lake of Germany, in the archbishopric of Salzburg; 28 miles S.S.W. of Salzburg.

ZELLERFELD, a town of Westphalia, in the Harz Foref.; silver to the value of 20,000 imperial crowns is annually coined in this town; 6 miles S.S.W. of Goilas.

ZELLENNDORFF, a town of Austria; 3 miles S.E. of Schratteental.

ZELLHOFEN, a town of Austria; 10 miles N.W. of Grein.

ZELLIA, in Ancient Geography, a country of Upper Pannonia, inhabited by the Slavi.

ZELLIN, in Geography, a town of the New Mark of Brandenburg; 13 miles N.W. of Cuffrin.

ZELLINGEN, a town of the duchy of Wurzburg; 8 miles N. of Wurzburg.

ZELLITZ, a town of the duchy of Stidia; 8 miles W. of Marburg.

ZELON, a town of Thibet; 27 miles S.W. of Lulla.

ZELOTTI, Battista, in Biography, was born at Verona in 1532. He was a pupil of Titian, according to Vafari, and a fellow-student with Paolo Veronese, with whom he co-operated in several important works at Venice. He particularly excelled in fresco, and that induced Paolo to court his assistance in many of the great works in which he was engaged. In consequence many of his works are given to Veronese, and those in the hall of the Council of Ten, in the palazzo S. Marco, have been engraved by Le Père as the works of that master. His picture of the Holy Family, in the Carara collection, is painted with the strength and warmth of Titian, and others of his works in
oil are deservedly esteemed and admired, particularly the
Conversion of St. Paul, and Christ with his Disciples in the
Fishing-boat, in the cathedral at Vicenza. He fell short
of the grace and taste of Voronez, yet his invention was
not lacking in energy; his touch is free and animated, and
his compositions managed with skill and judgment. He
died in 1792, aged 60.

ZELPHI. See ZENDA.

ZELPITSCH, in Geography, a town of Ilfria; 10
miles N.E. of Mitterburg.

ZELTONSKOL, a fort of Russia, in the govern-
ment of Irkutsk; 72 miles S.S.E. of Tunginskoi.

ZELUJA, a town of Lithuania, in the palatinate of
Novogrodek; 25 miles N.W. of Slonim.

ZEM, a river of Albania, which runs into the Moraca,
12 miles W. of Cattaro.

ZEMA, a word used by many of the old writers for a
decoration or apocope.

ZEMARAIM, or SEMARAIM, in Ancient Geography, a
city of Benjamin near Bethel. Josh. xviii. 22.

ZEMARITES, an ancient people of Syria, mentioned
by Strabo, who places them on a plain, two leagues to the
N. of mount Libanus, and gives them the term of Simyra.

ZEMASARUM, a word used by some of the chemical
writers as a name for cinnaabar.

ZEMBLA, NOVA, Novaya Zemlia, or New Land, in
Geography, a Russian island, or rather a group of five
islands, with the intervening channels always filled with ice,
situated in the Frozen or Northern ocean. Of the numer-
ous islands in this ocean, Novaya Zemlia and Kalgeva are
the most considerable; but both are uninhabited, and fre-
cuented only by fishermen and hunters. The former is
indeed well supplied with water; but is rocky, unfertile,
and deficient of wood, furnishing vegetation only for a few
flattened bushes and polar plants. It abounds, however, with
reindeer, white bears, white and blue foxes; and the shores
swarm with morse, walruses, and various kinds of fowl. Its
magnitude is estimated at 950 versts in length, 520 in
breadth, and 5,500 in circumference, without following the
sinuositites, and 425,509 German miles of fuperficies,
according to Mr. Storck. On the northern side it is entirely
encompassed with ice mountains; and to the south is the sea
of Cara, Kara, or Karkoke, in which the tide flows about
two feet nine inches. Among the lakes of this island there
is one of salt water. From the middle of October till
February the sun is not at all visible; but they have the ad-
vantage of numerous and strong north-lights and of much
moon-light. In summer they have no thunder-storms. The
snow falls in many places to the depth of four airlines. For
two months, viz. June and July, the sun never fets. Be-
tween this island and the main land is the famous passage
known by the name of Vagrats's or Waygat's straits.

ZEMECH, a word used by some writers as a name for
lapis lazuli.

ZEMENIE, in Geography, a town of European Tur-
key, in Romania; 16 miles S.W. of Gallipoli.

ZEMIA, Zegre, among the Athenians, is sometimes taken
in a large and general sense for any kind of punishment;
but more frequently for a pecuniary mulct or fine laid upon
the criminal, according to the degree of his offence.

ZEMLIANSK, in Geography, a town of Russia, in the
government of Voronez; 44 miles N.N.W. of Voronez.
N. lat. 52° 12'; E. long. 35° 42'.

ZEMLIN, or SEMLIN, a fortress of Sclavonia, at the
union of the Save and the Danube, opposite Belgrade.
Here is a lazaretto, where travellers and merchandize
from the Levant are detained to prevent infection. The number
of inhabitants is about 1,200 Rafeians, Greeks, Jews,
Arménians, and Turks; during a fire at Zemlin, Jofepf II.
emperor of Austria, aifiled in perfor to suppreft it.

ZEMME, a town of Grand Bucaria, on the Ghion; 60
miles S. of Bucaria.

ZEMOKARTLI, a town of Turkíf Armenia, in the
government of Cars; 50 miles N. of Ardanoudjí.

ZEMORGET, or ZERMOGETE, a small island in the
Red Sea, 30 miles from the coast of Egypt. This island
was called by the ancient "Ophiodes," from the abundance
of serpents, and the island of topazes from the number of
those precious stones found there. N. lat. 23° 25'. E.
long. 53° 5'.

ZEMOVAH, a town of Pegu; 50 miles S. of Prone.

ZEPHRYSUS, in the Materia Medica of the Ancients,
a name give to a precious stone, the fragments of which
they use as a cordial and sudorific.

It appears by their accounts, that this stone was blue;
and hence many have too hastily judged, that it was the
lapis lazuli; but in truth it was the fapphire.

The word zephyrus is no where used but in the writ-
tings of the later Greeks, and it is plainly formed, as most
of their names of things are, on the Arabian word express-
ving the fame thing. This Arabian word is fempber; and
this, in Avicenna and Seraperio, is always used as the name
of the fapphire, never as that of any other gem. We find
also by their accounts, that this fapphire was not the fap-
phire of the ancient Greeks, but the fine blue pellucid
gem we now know by that name; for the fapphire of Theo-
phrastus, and the other old writers, was only a kind of lapsi
lazuli.

ZEMPLIN, in Geography, a town of Hungary; 16
miles N.E. of Patak.

ZEMPOALA. See ZAMPALA.

ZEMZEM, the holy well of Mecca, which fce.

ZENANICH. See SELANICH.

ZENATI, a river of Algiers, formed by the union of
two freams, which foon after changes its name to Seiboufe.

ZENDA, a general term coined by Paraclefus, by
which he and his followers express extraneous or equivocal
generation, or the production of bodies without a femal
principle. The word zerunda is used to express this par-
ticular fort of generation of men, and zelphi in regard to
other animals.

ZENDAVESTA, by contraction Zend, and, as it is
vulgarly pronounced, Zendaweflow and Zend, in Antiquity,
denotes the book afcribed to Zoroaster, (fee his article,) and
containing his pretended revelations; and which the
ancient Magians and modern Perfes, called also Gaurus,
obferve and reverence in the fame manner as the Christian
f do the Bible, and the Mahometans the Koran, making it
the fole rule of both their faith and manners. See MAGI,
PERSEES, GEDES, &c. See also GENTOON.

The word, it is faid, originally signifies an instrum-
ent for kindling fire, and is applied to this book to denote its
aptitude for kindling the flame of religion in the hearts of
those who read it.

Zendavella is compounded of Zend, denoting the let-
ters of the book, and Avesla, signifying the language in which it
was written. See Perşia, Language of.

M. Anquetil du Perron, to whose account we shall refer
more at large in the sequel of this article, has taken pains,
in the 37th volume of the work cited below, to prove that
Zoroafter lived under Hyllafret, the father of Darius, in the
sixth century before Chrift.

The Zendavella, or Zend, contains the fystem of doctrine
and duty, which is faid to have been supernaturally com-
municated.
municated to Zoroaster, and which his followers hold in very extraordinary veneration. A copy of this book is kept, says Dr. Prideaux, to this day in every oratory and fire-temples, and portions of it are read at stated times by the priests to the people: and to this they appeal as the standard of the good and evil of their actions. This work, ascribed among other numerous writings to Zerdust, or the Perian Zoroaster, and esteemed by his followers as of sacred authority, is said to have been written in the Perian language, and to have consisted of two parts; one of which contains their forms of devotion and order of ceremonies, the other the precepts of religion and morality. A compendium of it, called the Sadda or Sadder, is read to the people on every fast day by their priests. There is, however, much reason to question, whether this book be of such ancient date as the time of Zoroaster; and it has been attested as probable, that it was written about the time when many Jews and Christians fled among the Persians; that is, about the 4th or 5th century. In proof of its being later than the time of Zoroaster, but written within the days of Mahomet, it is alleged, that the word *shaitān* occurs in it, which is peculiar to the Arabs; for in other oriental languages it is written *fatam* or *satan*.

Dr. Hyde gives us the following account of it. The Zend is the general name of the book, which is also called the book of Abraham; and it consists of twenty-one or twenty-two separate parts, with distinct names. Its contents were originally written on twelve hundred skins, and the ancient copies of it, like the original, are in the pure old Perian language; but the later copies are in the same language, mixed with modern Peric or Arabic words, serving to explain such as were becoming obsolete. Some parts of the Zend contain the original text, and others contain Zerdust's second thoughts subjoined, for more fully explaining his doctrine. Some writers suggest, that Zerdust first intended to compile his book in four parts, viz. the Zend, containing the liturgy and chief doctrine of his religion, and the *Pazend*, or commentary upon the former; and that the farther additions were occasioned by the opposition of adversaries, and unforeseen circumstances that occurred. The character in which the Zend is written is that of the old Perian, called Pehlavi; and the Pazend character differs in a small degree from this.

Dr. Hyde has given a catalogue of the several parts of the Zend, each of which is called *n&b* or *n&b*.

In process of time, when the old Perian language became antiquated, and little understood, one of their kalfours or bishops (about A.D. 1500) composed the *Sadda*, which is a compendium, in the vulgar or modern Peric tongue, of those parts of the Zend that relate to religion, or a kind of code of canon and precepts, drawn from the theological writings of Zoroaster, serving as an authoritative rule of faith and practice for his followers. This Sadda is written in a low kind of Peric verse, and, as Dr. Hyde informs us, it is *bonorum et malorum farrago*, having many good and pious things, and others very superstitious and trifling.

The Zend contains a reformed system of Magianism; teaching that there is a Supreme Being, eternal, self-existent, and independent, who created both light and darkness, out of which he made all other things; that these are in a state of conflict, which will continue till the end of the world; that then there shall be a general retribution and judgment; and that just retribution shall be rendered unto men according to their works; and that the angel of darkness with his followers shall be con-
hometan perfections, where their genius for commerce and industry, which are their known charaeteristics, procured for them very considerable setlements. Concerning the hierarchy of the Parflies, this writer observes, that their ministers of religion are divided into five classes, viz. erbeds, mobeds, deflours, deflour mobeds, and deflouran deflours, or deflours of deflours. An erbed is a person who has submitted to the purification directed by the law, who has read, during four days without interval, the Izefchine and the Vendidad, and who is instructed in the ceremonies of the worship established by Zoroaftre. If the erbed afterwards continues to read publicly the Zend works, which constitute the liturgy, and to perform the ministerial functions, he becomes a mobed, though he does not understand the Zendavesta; but if he contents himself with fluading the law, the Zend, and the Pehlvi, or Pehlvi, without exercising the ministerial functions, he is called a deflour.

The deflour mobed is he who unites the qualifications of the mobed and deflour; and the deflouran deflour is the principal deflour of a city or province, who decides cases of confidence, and determines points of law, and to whom the Parflies pay a tithe of their revenues.

As for those Zend writings, which the Parflies attribute to their legislator, and for which they have the same veneration as the Jews have for their Hebrew text, M. du Perron inclines to think, though he does not affirm, that they are really the works of Zoroaftre, whose reputation has been acquired by laws that have subsisted two thousand five hundred years.

The law, which was either framed or regulated by Zoroaftre, was divided, as we are told by modern authors, into twenty-one noshs, or parts: seven treat of the creation and history of the world; seven of morality, and civil and religious duties; and seven of phisick and alfortomy. Among the Parflies it is an universally received tradition, that Alexander the Great condemned these twenty-one volumes to the flames, after having caused them to be translated into Greek. Thofe which escaped are, the Vendidad, the Izefchine, the Vflpered, the Jefchts, and the Neaeefche, in Zend, and some other Pehlvi translations of Zend originals. The Parflies have also a great number of prayers, which they call nerengs, and which in general are written in modern Perfic, with Zend charaters, which they affect to use in all writings that treat of religion, though composed in modern Perfic. The writings of Zoroaftre, which still remain, speak of the createion of the universe, of the terrestrial paradise, and the departure of mankind; of the caufe of the respect paid to fire, of the origin of evil, natural and moral; of the angels appointed to the government of the universe; of several particulars relating to the end of the world, and the rejuryction, &c. &c. They also contain predictions with respect to the latter times, some excellent moral precepts, and a very extensive ceremonious code.

The Zend, according to Du Perron, is not the name of Zoroaftre's writings, but merely of the charaeters, though generally used to signify the language itself, in which they were written: the language of the original text is called Avefta, and is a dead language, and was entirely unknown to the Parflies before the time of Zoroaftre, who, he apprehends, brought it from the mountains; and is totally different from the Pehlvi or ancient Perfic, spoken in the time of Zoroaftre. He farther supposes, that the works of Zoroaftre, illust extant in the Pehlvi, were translations made into that language during the life of this legislator, or soon after his death.

The Zendavesta, which Dr. Hyde makes to be the name of a work, is, according to Du Perron, the name of a language, which is a dialect or corruption of the Avefta, and almost extinct, except that a few words of it are preferred in the Pehlvi translation. The charaters of the Avefta and Pehlvi are different; the former, which are properly the Zend letters, being much the nearest; the Zendavesta has no peculiar alphabet, but adopts that of the Zend or Pehlvi indifferently. (On this subject, see Language of Persia.) For M. du Perron's account of the sixteen MSS. of which he brought duplicate copies with him, and an abstract of their contents, we must refer to the Ann. Reg. &c. vol. vii.

This writer has published a translation of the Zendavesta, with remarks and illustrations, &c. in 3 vols. 4to. at Paris, in 1771.

The Zend, as sir W. Jones fuggels (Works, vol. iii. p. 115, 8vo.), bore a strong resemblance to Sanskrit, and the Pehlvi to Arabic, being a dialect of the Chaldaic. Sir W. Jones, from a perusal of two vocabularies, exhibited in this work, one in Zend, and another in Pehlvi, and derived from a collection of traditional pieces in modern Perfian, was confirmed in his opinion concerning the Chaldaic origin of the Pehlvi; and in perusing the Zend glosary, he was surprized to find, that six or seven words in ten were pure Sanskrit. M. Anquetil, he says, most certainly, and the Perfian compiler most probably, had no knowledge of Sanskrit, and could not therefore have invented a lift of Sanskrit words; it must therefore be an authentic lift of Zend words, which had been preferred in books or by tradition; and hence it follows that the language of the Zend was at least a dialect of the Sanskrit, approaching perhaps as nearly to it as the Praccrit, or other popular idioms which are known to have been spoken in India 2000 years ago. As soon as M. Anquetil published the above-mentioned work, sir W. Jones immediately discovered that the work was spurious, and by no means to be attributed to Zoroaftre; in consequence of which he published in the fame year, "Lettre à M. A—— du P—— dans laquelle ii expréme l'Examen de fa Traduction des Livres attribués à Zoroaftre." This letter is contained in the 1oth volume of his works, ed. 8vo. In Germany this version of M. Anquetil has met with more success, and has not only been translated into German, but applied to the purpose of explaining the New Testament. This use of it has been frugelled by Michaelis, and exemplified in the illustration of the introduction to St. John's gospel, and particularly of the term "word," which is used in the Zendavesta in the same sense as by St. John and the Gnoftics for the name of a person, and determines the proper tranlation of λόγος. (Michaelis by Marth, vol. i. p. 161.) Several other persons, besides sir W. Jones, have questioned the authenticity of the work which M. Anquetil has translated, or its being a genuine remain of Zoroaftre.

Mr. Richardson, in his "Difertation on the Language, Literature, and Manners of the Eastern Nations," originally prefixed to his Perfian, Arabic, and English Dictionary, 1778 (chap. i. sect. 2.), is very severe, both on Dr. Hyde and M. du Perron. "Thoje fragments of the suppos'd works of Zoroaftre, which Dr. Hyde has given us under the title of Saddar, are, he fays, the wretched rhymes of a modern Parfi deflour or prieff, who lived about three centuries ago; while the publications of M. Anquetil du Perron carry palpable marks of the total or partial fabrication of modern times. The Zend language, he fays, is not genuine; and M. du Perron has produced no discovery which can flamp his publication with authority.

He adds, the specimens of old Perfian in Hyde's Religio Veterum
VETERAN PERFUMES are simply modern language in ancient characters.

In the Memoirs of the Royal Society of Gottingen for 1799, "i.e. "Commentations Societatis Regiae Scientiarum Gottingensis, &c." we have a memoir by M. Christoffer Meiners, who enters into a critical examination of the authenticity and antiquity of the books published by M. Anquetil du Perron, as genuine writings of Zoroaster; and alleges many plausible arguments to prove them recent and spurious. He also, that they contain a multitude of fables, totally unknown to the ancient Perians, and contrary to the spirit of their laws and religion; and also many opinions and ceremonies, which had their first rise many ages after Zoroaster. The dissertations of professor Meiners, relating to the Zendavesta, are printed in the 8th volume of the Novi Commentarii Soc. Reg. Gotting.; and in the 1st and 3d volumes of the Commentations.

Some have thought that the truths which are observable in Zendavesta, Vendidad Sadi, and other writings of the eastern nations, were derived from the disciples of Nelloarius, who were found very early on the coast of Malabar. But this, Mr. Bryant thinks, is a groundless surmise; because the religious sects, among which these writings have been preferred, are widely separated, and most of them have no connection with Malabar or the Chirilians of that quarter. And besides, the Brahmins and Banians adhere closely to their own rites, and abhor all other persuasions; and they are influenced by customs and ceremones, which prevent their intercourse with other people. In their writings there occurs no trace of Christiinity; or of its founder; and thence Mr. Bryant infers, that whatever truths may be found in the writings of these people, they were derived from a higher source, and by a different channel. See Anal. of Anc. Mythology, vol. iii. p. 599, &c.

We shall terminate this article with adding, that Dr. Hyde prefented the copy of part of the Zend writings in his possession to the university of Oxford; and that the whole Zend was afterwards brought from India by Mr. Frazer, and is lodged with his other oriental MSS. in the Radcliff library at Oxford.

ZENDRO, in Geography. See GINDRO.
ZENDEROUD. See ZENDEROD.
ZENDGIN SERAI, a town of Grand Bucharia; 30 miles S. of Samarcand.
ZENDORFF, a town of the duchy of Sireia; 12 miles E. of Landperg.
ZENECHDON, a term used by the Arabian physicians for a preparation of arsenic, for external use; zieh being their name for arsenic.
ZENEXTOR, one of the many names by which the chemists have called mercury.

ZENGAN, ZENIC, or ZINJAN, in Geography, a town of Persia, in the province of Irak, said to have been fortified many years before the Chirilian era, and at one time to have contained 20,000 houses. It was entirely destroyed by Timur Bce when he first passed through that part of Persia; but being informed that it had long been the seat of learning and science, on his return from Turkey he in part rebuilt it. Since that time it has been frequently sacked and destroyed by the Tartars and the Turks. It contained in the 17th century about 2000 houses. It is a large, and now apparently a prosperous town, capital of the extensive district of Klumfleh, which is 71 miles down an uneven country, full of deep ravines, from hence to the banks of the Kizilo-
as to its direction, when viewed by a spectator; yet as it has reference to the apparent place of a heavenly body, it is not fixed, because the earth's motion is continually carrying the spectator's eye in a circle that produces the optical effect of an apparent circumpolar revolution of the celestial bodies. Whatever point of the hemisphere is at any moment vertical to an observer on any part of the globe, that point is the zenith for the time then passing, and will again be the zenith, or very nearly so, after an interval of one complete rotation of the earth; and, therefore, strictly speaking, in every place there are as many successive zeniths in this period, as there are appreciable points in the circle generated in the heavens by the superior end of the vertical line carried round by the globe in rotation.

Because every point of the horizon is just 90° distant from the exiting zenith, in every place, and at all times, it will be readily apprehended, that the complement of the altitude of any heavenly body will, at any instant, be the angular distance of that body from the zenith of the place of observation; but as this distance varies inversely with the altitude, it is more properly called the co-altitude than the zenith-distance, the former being a variable, and the latter a limited quantity. The zenith-distance of any star is properly the complement of its meridian or greatest altitude in any given place, and as the latitude of the place varies, so will the zenith-distance of the same body, but inversely; the distance of the zenith to the pole being always the complement of the latitude. Hence it is obvious, that when the zenith-distance of a star is observed by any instrument that measures it accurately, the latitude of the place may be inferred from the tabular polar distance of that star, as well as from the declination, which is its complement; and, therefore, it is a matter of no importance in theory, whether the altitude or zenith-distance of a body traversing the meridian be taken, for the purpose of ascertaining its place in the heavens, when the latitude of the observer is known, or for the purpose of determining the latitude of the place, when the declination, or polar distance of the body, is known. Accordingly, in the circular instruments that have been recently introduced into observatories, and that will forever in position, it is usual to number the divisions and subdivisions so, that when they read altitudes with the graduated plane facing the east, they read zenith-distances (on the meridian) when the star is made to face the west, and vice versa; so that not only are the opposite errors of collimation of the telescope and of the bubble or plumb-line thus corrected, but when atmospheric refraction is allowed for, the sum of the two readings, or of the averages of several, will be exactly 90°, or otherwise 180°, if the observations be truly taken, and the instrument duly adjusted for zero and collimation; which check is of great practical importance in the delicate operations of the astronomer.

Zenith-sector is an astronomical instrument, by means of which the angular distance of a star is accurately measured from the zenith point of any given place towards the north or south. The first instrument made use of for this purpose was contrived by Dr. Hooke, with a view of determining the annual parallax of a fixed star, agreeably to the suggestion of Galileo. The telescope, which Dr. Hooke, in the year 1669, made the essential part of his instrument, was thirty-fix feet long, the principle of achromaticism not being at that time practically applied, so as to allow of considerable power with a short focal distance of the object-glass; but the length of the radius of his arc of measurement promised advantages over every other instrument, which justified the conception and execution of the plan, though its accomplishment failed of corresponding success. Indeed, the nice arts of constructing achromatic telescopes, and of dividing the arc of a circle with extreme precision, had neither of them yet been perfected. From the Cutlerian Lectures we learn, that the first observation with this instrument was made on the 6th of July of the above-mentioned year, on the star denominated γ Draconis, which, on that evening, was found to pass at the distance of 2° 12' to the north of the zenith of Greenwich college; which was also found to be the case on the 9th of the same month; but on the 6th of August next following, the distance was only 2° 0'; and on the 1st of October after only 1° 48', or 1° 50'—whence it was concluded, that the measurement of a zenith-distance taken by this instrument was liable to an error of 24', or perhaps more; and it was considered, therefore, that the instrument was quite incompetent to the purpose for which it was intended. But an original idea once suggered, as the basis of useful speculation, is not readily abandoned, even under an apparent want of successful application. The Hon. Samuel Molyneux afterwards availed himself of the manual skill of the ingenious Graham, and by the assistance of Dr. Bradley put up a zenith-sector at Kew, in the year 1725, which turned out to be much more accurate than its predecessor, though the focal length of the object-glass of its telescope was only 24 feet. With this instrument, and with one of about one-half its focal length, were made two of the most important discoveries in astronomy that have graced the annals of this science; viz. the nutation of the earth's axis, and the aberration of light in its passage from the heavenly bodies. As the history of astronomical discoveries, and that of astronomical instruments, are mutually illustrative of each other, and as a detail of the minutiae is always interesting, that connects great results with primary measures, that might otherwise be considered as insignificant, we will make no apology for introducing here Dr. Bradley's own account of his proceedings, as inserted in the Philosophical Transactions of London, N° 406. p. 149 of the Abridg.

"The following observations," says the author, "were begun by the honourable Samuel Molyneux at Kew, continued and repeated by myself at Kew and Wanstead, in hopes of verifying those that Dr. Hooke formerly communicated to the public, concerning the parallax of the fixed stars. (London, 1674.) Therefore the same star was made choice of by Mr. Molyneux, almost the same method followed, and his instrument constructed upon principles nearly the same, but greatly exceeding the doctor's in exactness, which was chiefly owing to our curious member (of the Royal Society) Mr. George Graham, to whom the lovers of astronomy are also indebted for several other exact and well-constructed instruments. Mr. Molyneux's apparatus was completed and fitted for observing about the end of November, 1725; and on the 3d day of December following, the bright star in the head of Draco (marked γ by Bayer) was for the first time observed, as it passed near the zenith, and its situation carefully taken with the instrument. The like observations were made on the 5th, 11th, and 12th days of the same month; and there appearing no material difference in the place of the star, a farther repetition of them at this season seemed needless, it being a part of the year wherein no sensible alteration of parallax in this star could soon be expected. It was chiefly, therefore, curiosity that tempted me (being then at Kew, where the instrument was fixed) to prepare for observing the star on Dec. 17th, when, having adjusted the instrument as usual, I perceived that it palled a little more southerly this day
day than when it was observed before. Not suspecting any other cause of this appearance, we first concluded, that it was owing to the uncertainty of the observations, and that either this or the foregoing were not so exact as we had before suppos'd; for which reason we proposed to repeat the observation again, in order to determine from whence this difference proceeded; and upon doing it on Dec. 20th, I found that the star passed still more southerly than in the former observations. This sensible alteration the more surprized us, in that it was the contrary way from what it would have been had it proceeded from an annual parallax of the star; but being now pretty well satisfied that it could not be entirely owing to the want of exactness in the observations, and having no notion of any thing else that could cause such an apparent motion as this in the star, we began to think that some change in the materials, \\&c. of the instrument itself might have occasioned it. Under these apprehensions we remained some time; but being at length fully convinced, by several trials, of the great exactness of the instrument, and finding by the gradual increase of the star's distance from the pole, that there must be some regular cause that produced it, we took care to examine nicely, at the time of each observation, how much it was: and about the beginning of March, 1726, the star was found to be 20" more southerly than at the time of the first observation. It now, indeed, seemed to have arrived at its utmost limit southward, because in several trials made about this time, no sensible difference was observed in its situation. By the middle of April, it appeared to be returning back again towards the north; and about the beginning of June, it passed at the same distance from the zenith as it had done in December, when it was first observed.

"From the quick alteration of this star's declination about this time, (it increasing a second in three days,) it was concluded, that it would now proceed northward, as it before had gone southward of its present situation; and it happened as was conjectured; for the star continued to move northward till September following, when it again became stationary, being then near 20" more northerly than in June, and no less than 30" more northerly than it was in March. From September the star returned towards the south, till it arrived in December to the same situation it was in at that time twelve months, allowing for the difference of declination on account of the precession of the equinox.

"This was a sufficient proof that the instrument had not been the cause of this apparent motion of the star; and to find one adequate to such an effect seemed a difficulty. A *nutation of the earth's axis* was one of the first things that offered itself upon this occasion; but it was soon found insufficient; for though it might have accounted for the change of declination in \( \gamma \) Draconis, yet it would not at the same time agree with the phenomena in other stars; particularly in a small one almost opposite in right ascension to \( \gamma \) Draconis, at about the same distance from the north pole of the equator; for, though this star seemed to move the same way as a nutation of the earth's axis would have made it, yet in changing its declination but about as much as \( \gamma \) Draconis in the same time, (as appeared upon comparing the observations of both made upon the same days, at different seafsons of the year,) this plainly proved that the apparent motion of the stars was not occasioned by a real nutation, since, if that had been the cause, the alteration in both stars would have been near equal.

"The great regularity of the observations left no room to doubt, but that there was some regular cause that produced this unexpected motion, which did not depend on the uncertainty or variety of the seafsons of the year. Upon comparing the observations with each other, it was discovered, that in both the fore-mentioned stars, the apparent difference of declination from the *maxima* was always nearly proportional to the verified line of the sun's distance from the equinoctial points. This was an inducement to think, that the cause, whatever it was, had some relation to the sun's situation with respect to those points. But not being able to frame any hypothesis at that time, sufficient to solve all the phenomena, and being very desirous to search a little farther into this matter, I began to think of erecting an instrument for myself at Wanstead, that, having it always at hand, I might with the more ease and certainty inquire into the laws of this new motion. The consideration, likewise, of being able by another instrument to confirm the truth of the observations hitherto made with Mr. Molyneux's was no small inducement to me; but the chief of all was the opportunity I should thereby have of trying in what manner other stars were affected by the same cause, whatever it was. For Mr. Molyneux's instrument being originally designed for observing \( \gamma \) Draconis, (in order, as I said before, to try whether it had any sensible parallax,) was so contrived, as to be capable of but little alteration in its direction, not above seven or eight minutes of a degree; and there being few stars within half that distance from the zenith of Kew bright enough to be well observed, he could not, with his instrument, thoroughly examine how this cause affected stars differently situated with respect to the equinoctial and solstitial points of the ecliptic.

"These considerations determined me; and by the contrivance and direction of the fame ingenious person, Mr. Graham, my instrument was fixed up, Augst 19, 1727. As I had no convenient place where I could make use of a long a telescope as Mr. Molyneux's, I contented myself with one of but little more than half the length of his, (viz. of about 12½ feet, his being 24½,) judging from the experience which I had already had, that this radius would be long enough to adjust the instrument to a sufficient degree of exactness; and I have had no reason since to change my opinion: for from all the trials I have yet made, I am very well satisfied that when it is carefully rectified, its situation may be securely depended upon to half a second. As the place where my instrument was to be hung in some measure determined its radius, so did it also the length of the arc, or limb, on which the divisions were made to adjust it; for the arc could not conveniently be extended farther than to reach to about 63° on each side my zenith. This indeed was sufficient, since it gave me an opportunity of making choice of several stars, very different both in magnitude and situation; there being more than two hundred inserted in the British Catalogue, that may be observed with it. I needed not to have extended the limb so far, but that I was willing to take in *Capella*, the only star of the first magnitude that comes so near my zenith.

"My instrument being fixed, I immediately began to observe such stars as I judged most proper to give me light into the cause of the motion already mentioned. There was variety enough of small ones, and not less than twelve that I could observe through all the seafsons of the year; they being bright enough to be seen in the day-time, when nearest the sun. I had not been long observing, before I perceived that the notion we had before entertained of the stars being farthest north and south, when the sun was about the equinoxes, was only true of those that were near the solstitial colure; and after I had continued my observations a few months,
months, I discovered what I then apprehended to be a
general law observed by all the stars, viz. that each of them
became stationary, or was farthest north or south, when
they passed over my zenith at six of the clock, either in the
morning or evening. I perceived likewise, that whatever
situation the stars were in with respect to the cardinal points
of the ecliptic, the apparent motion of every one tended the
same way, when they passed my instrument about the same
hour of the day or night; for they all moved southward
while they passed in the day, and northward in the night;
so that each was farthest north, when it came about six of
the clock in the evening, and farthest south, when it came
about six in the morning.

"Though I have since discovered, that the maxima in
most of these stars do not happen exactly when they come
to my instrument at those hours; yet not being able at that
time to prove the contrary, and supposing that they did,
I endeavoured to find out what proportion the greatest altera-
tions of declination in different stars bore to each other, it
being very evident that they did not all change their de-
clination equally. I have before taken notice, that it ap-
peared from Mr. Molyneux’s observations, that γ Draconis
altered its declination about twice as much as the fore-men-
tioned small star almost opposite to it; but examining the
matter more particularly, I found that the greatest alteration
of declination in these stars was as the fine of the latitude
of each respectively. This made me suspect that there might
be the like proportion between the maxima of other stars;
but finding that the observations of some of them would not
perfectly correspond with such an hypothesis, and not
knowing whether the small difference I met with might not
be owing to the uncertainty and error of the observations, I
deffered the farther examination into the truth of this hypo-
thesis, till I should be furnished with a series of observa-
tions made in all parts of the year, which might enable me not
only to determine what errors the observations are liable to,
or how far they may safely be depended upon, but also to
judge whether there had been any sensible change in the parts
of the instrument itself.

"Upon these considerations, I laid aside all thoughts at
that time about the cause of the fore-mentioned phenomena,
hoping that I should the more easily discover it, when I was
better provided with proper means to determine more pre-
cisely what they were.

"When one year was completed, I began to examine
and compare my observations; and having pretty well satis-
fied myself as to the general laws of the phenomena, I then
endeavoured to find out the cause of them. I was already
convinced that the apparent motion of the stars was not
owing to a nutation of the earth’s axis. The next thing that
offered itself was an alteration in the direction of the
plumb-line, with which the instrument was constantly re-
ticed; but this, upon trial, proved insufficient. Then I
considered what refraction might do, but here also
nothing satisfactory occurred. At last I conjectured that
all the phenomena hitherto mentioned proceeded from the
progressive motion of light, and the earth’s annual motion in its
orbit. For I perceived that if light was propagated in time,
the apparent place of a fixed object would not be the same
when the eye is at rest, as when it is moving in any other
direction than that of the line passing through the eye and
object; and that when the eye is moving in different direc-
tions, the apparent place of the object would be different."

The author then proceeds to deduce from his observa-
tions the relative velocities of light, and of the earth in its
annual orbit; shews what variation in the right ascen-
and declination of stars differently placed may arise out of the
aberration of light; and concludes that light, agreeably to
such deductions, must travel from the sun to the earth in
about 8° 7.5 of time. (See Aberration, Light, and
Stars.) The discovery of the earth’s nutation was not,
however, published until the year 1737. See Nutation.

After our readers have seen what important discoveries
and deductions have been derived from Graham’s zenith-
factor in the hands of a skilful astronomer, they will be na-
turally disposed to become acquainted with its construction,
which we will now proceed to describe.

Zenith-sector by Graham.—The zenith-factor that we have
said Graham made for Mr. Bradley, afterwards Dr. Bradley,
was removed to Greenwich, when the proprieter became
astronomer royal, and is the same instrument which Dr.
Makelyne used with great success in adjusting, by com-
parison, the zero of the large quadrants. It still remains
at Greenwich, and is yet capable of measuring zenith-dif-
tances to the accuracy of half a second, according to Brad-
ley’s original report, or even less. Fig. 1. of Plate XXXIII.
of Astronomical Instruments, is a representation of the essential
parts of this instrument: A B represents the iron tube of
the vertical telescope, which is furnished by two small meta-
lic cylinders projecting at right angles from the superior
end, one of which is seen at a, and the other is hidden by
the tube. These cylinders, which constitute the axis of
motion, rest in a pair of Ys, attached to the solid wall
facing the north, and also occasionally to another pair fixed
to a wall facing the south; which additional pair allows the
ends of the cylinders, or axis of motion, to be revolved in
position. The brass bar C D is fixed to the wall to
which the pair of Ys are attached, at opposite sides of the
room, and bears a cock to which the micrometer-screw E
is fixed, which measures the fractional portion of a minute
on its head d; and the second screw f is made to relieve it.
The ends of these screws press against fluted ridges inserted into the
tube of the telescope, while the weight F pulls a string
round the fixed pulleys G and H, by means of a pliable
cord, attached to the tube at the point d, and keeps the
telecope home. The graduated arc I K contains 128°,
each subdivided into twelve parts, or five minute spaces,
and is fixed exactly at right angles to the tube, over the
point where the wires intersect the field of view. This arc
was originally of brass, but Sisson put on an arc of steel,
containing gold pins to receive the dots of division. A
plumb-line suspended from the superior end of the tube, over
the centre of one of the cylinders a, and having an adjuvating
screw e, to bring the point of fulpension to the upper dot, falls
near the face of the arc, and indicates the distance from zero
at the middle of the arc; if the plumb-line covers one of
the dividing dots of the scale, when a star near the zenith
is cut by the horizontal wire, then the quantity is read by
the plumb-line and arc alone; but otherwise the fractional
portion is ascertained by means of the micrometer-screw, which
is made to press against the tube until the fulped line coincides with the next nearest dividing dot of the scale.

The value of the micrometer-head, which is divided into
thirty-four equal parts, was ascertained by trying how many
revolutions of the screw would measure a degree, or other
portion of the arc, exactly; and an average of several
trials made in different parts of the arc, it was ascertained,
that one revolution was not precisely 34°, but 34° 6539°,
and one of its divisions on the head, therefore, only 2° 111662°,
instead of 2°, as was intended by the maker. The instru-
ment had originally a single lens for its object-glass; but
at the request of the late Dr. Makelyne, Mr. Dollond sub-
fluted...
rituated an achromatic object-glas, which has modernized the instrument, and put it nearly on a level with the new instruments which have lately been constructed and erected in the Royal Observatory by Troughton, on the best principles. If the zenith-sector had been made to reverse in position in the same situation, i.e. without being carried across the room, its use would have been more convenient, and the observations more certain, insomuch as the same dilance would have been preserved between the axis of motion of the telescope, and the point acted upon by the micrometer-fewer, without any refulting allowance. Besides, the instrument would have been less liable to accidents; and reversed ob-

servations might probably have been made on the same evening. When Bird afterwards made a zenith-sector for the Oxford Observatory, he noticed these inconveniences, and obviated them by making the tube of the telescope turn round in its own place, so that the positions of the axis can be reversed by an azimuthal motion that carries the plumb-line round at the same time; and when the plumb-line will cover the dot at zero during this whole motion, the telescope is truly vertical.

The adjustment for collimation is effected by an apparatus that moves the wires in the eye-piece, as in the transit-instru-

ment, and may be thus effected: Let the graduated arc face the east, and view a star falling in or near the zenith, the proper time for doing which may be known from the flat's right ascension, by means of a sidereal clock, or by conversion of folar into sidereal time, and note the distance from zero when the plumb-line is quiet, which it will soon be if the plummet is immered in a goblet of water, and mark down this quantity as read partly by the divisions on the scale, and partly by the micrometer-head; which call the second mea

sure with N. or S. annexed, accordingly as the flat par

passes to the north or south side of the zenith point; then reverse the position, and on a succeeding night, which will be 3° 56' sooner on every successive night, measure the zenith-distance of the same star in like manner with the gra

uated scale facing the west; and call it the second mea

sure: then if the two quantities thus measured be similar, the collimation for zenith-distance will be true; but if other-

wise, one half of the difference of the two readings will be the error of collimation, which may be either corrected by the proper apparatus at successive trials, or, which is perhaps better, may be allowed for in each observation. When the instrument has been used for several observations, it will be still better to take an average of all the observed errors, as avertened by different stars, and to apply it with its proper sign in future single observations, so long as the instrument remains in all respects unaltered. It is hardly necessary to obverse, that in using this instrument, when a star is very near the zenith of any place, the micrometer alone, without reference to the graduated scale or arc, will give the due mea

sure. How the latitude of any place may be very ac-

curately determined from the measured zenith-distance of a star, of known declination, will be seen presently.

Zenith-Sector by Ramden.—While the trigonometrical survey of England was carrying on, it was found deifiable to have a portable zenith-sector to affift in measuring an arc of the meridian, and as Ramden had one in an half-finished state, that had been ordered by the duke of Richmond, the parties were prevailed on to have this finished for the pur-

pose, which was nearly done in Ramden's life-time, in the year 1801, and completed in April 1802 by his successor Berge. It was first tried at Greenwich, and then removed to the Isle of Wight, where the operations began, and from whence they were continued northward from Station to Sta-

tion, as described in the "Trigonometrical Survey," by capi-

tain William Mudge, and published from time to time by Mr. Faden, of Charing-Crofs. The original account of this complex instrument has reference to fix large plates, and is too long for us to copy. (See vol. ii. p. 6 & seq. of part ii.) Fig. 2. of our Plate XXXIII. of Astronomical Instruments, gives a reduced perspective view of this instru-

ment, from an examination of which a better idea will be formed of its general construction than by any detailed ac-

count we can give of its parts without the additional plates.

Captain Mudge says, "that Mr. Ramden has here ob-

viated the inconveniences attendant on the use of former sectors; and has also diminished, in a very considerable degree, the errors unavoidably resulting from their imperfect conduction. The principles, he adds, on which he has founded the several improvements, consist in the means of uniting the sectorial tube to its axis, so as to ensure the permanency of the length of its radius, when erected for observations; more accurate methods of adjusting the in-

strument vertically; and an easy way of placing the face of its arc in the plane of the meridian." The frame ex-

hibited in our figure consists of two parts; the external fland of mahogany, which supports the apparatus to which the sectorial tube is attached; and an inner frame, containing that apparatus with the tube itself. The fland, or outer frame, is in the shape of an obturated pyramid, having a base fix feet square, and its vertex three. It unites stiffness with simplicity of conduction. The inner frame, within which the sector is suspended, is supported at top in every lateral direction, while its lower extremity is terminated by a cone resting in a metallic concavity, on which it turns in azimuth; and it can be kept in any po-

sition by a clamping apparatus acting with an azimuth circle, made fast to the bottom of the external frame. The telescope of the sector has an object-glas nearly eight feet long, with an aperture of four inches, near which is made fast the transversic axis of motion, similar to that of a transit-instrument. The wires of the eye-piece of the telescope are illuminated by reflected light, entering the axis in the usual way; and a plumb-line, with the ghost apparatus for adjustment to zero, is made a leading feature in the con-

struction. The arc is divided into 15°, which was the concluding work done by Berge, and each degree is sub-

divided into 5' spaces, as in Graham's instrument. A second telescope, of 29 inches focal length, is attached to the long tube, and moves in the plane of the divided arc to any given elevation, but partakes of the azimuthal motion when the long vertical telescope is turned round: with this 29-inch telescope horizontal angles are measured, by the help of the azimuth circle, which therefore is divided for this purpose. Besides these essential parts, there are various appendages and bracing parts, rendered necessary by the size of the instrument, particularly a microscopic tube reaching up to the upper dot of the plumb-line, and bent at both ends into a horizontal position for convenience of the observer. This contrivance required reflectors, both of the light, and of the image of the piece of mother-of-pearl that is bifected by the wire, constituting the plumb-line. The micrometer measures minutes and seconds in the usual way, and the plummet is immersed in a small vessel of water to prevent vibration. We mention these particulars generally, not only because their particular uses and modes of applica-

tion have been previously described, when we explained other instruments, such as Circles, Equatorials, Tran-

sit-Instruments, &c.; but because this instrument has fur-

nished hints to others who have copied in part, or wholly, several
ZENITH.

several of Ramfiden's contrivances. It was moreover necer-

tory to introduce various weights, pulleys, cords, springs,
&c. to facilitate and keep steady the motions of the different
acting parts, which, together with the reading microscopes,
lamps, rods, and adjusting screws, give the instrument the
appearance of great complexity.

The manner of adjusting the instrument for observation is
thus performed, according to Mr. Mudge's own words:
"viz. "The feet of the external stand should be first carefullv
brought into a horizontal plane; and when they are so, the
azimuth circle will be necessarily parallel to it, having its
centre under the middle of the opening in the mahogany
frame screwed on the top of the stand. This being done,
and the instrument set up, the plane of the arc should be
brought parallel to one of the sides of the stand, in which
situation the internal frame is to be clamped to the azimuth
circle, and the wire brought to its proper distance from the
limb, by means of the adjusting screw attached to one of
the slips, which carries the concave receptacle and conical
point. The dot at zero should then be brought exactly
under the plumb-line, as seen through the magnifier, and
the point on the micrometer-head, at which its index stands,
noted. The instrument is then to be turned half round;
and if the same dot on the arc still continues bifected, it
will afford a proof of the internal stand being upright in
one direction. But if the dot should not continue bifected
by the plumb-line, it must be made to do so, and the revo-
lutions, or parts of a revolution, counted; half of which is
to be turned back on the micrometer-head. The fame dot,
zero, is then to be brought under the plumb-line (wire), by
means of the other adjusting screw, beneath the azimuth
circle. If the stand is pretty accurately set up, one opera-
tion is sufficient for bringing the interior frame upright
in one direction, viz. either in that of the meridian, or
the one at right angles to it. The arc is then to be turned round 90°, and the fame operation gone through.
This being properly done, the interior frame is made
perfectly upright. The next step to be taken is that
of placing the long level on its axis above, and rectifying
that axis by means of the Y plate screws. If this be done
carefully, the bubble will remain between the pointers of
the level, whatever position the sector may be placed in.
Having thus rectified the instrument, by making the internal
frame upright, and the axis horizontal, the only remaining
point to engage attention is, placing the plumb-line at a
proper distance from the arc: this is done by means of the
screw acting on the spring joint under its point of suspen-
sion. If great care be used in going through these several adjus-
tments, the instrument may, at any future time, be accurately
adjusted for observation by turning the proper screw belonging
to the azimuth circle, and bringing the arc to its usual
distance from the wire."

In order to shew the accurate results that may be obtained
from an instrument of this description, and also the care
that is necessary in using it, and in clearing the observations
of errors arising from natural caufes, we will subjoin a few
Tables that were found useful in the grand trigonometrical
operations, by means of which, in the years 1802 and 1806,
the meridian arcs were compared with the corresponding
terrestrial measurements.

X 2
ZENITH.

Besides these observations, various others were taken of different stars in Draco, Cygnus, Ursa Major, Hercules, Perseus, and Auriga, from an average of all which the final results were obtained; but before the true or mean zenith-distances can be exactly known, the apparent measures must be corrected by certain equations for aberration, nutation, semi-annual solar equation, precession, and refraction; the Tables proper for which are chiefly given under our article Declination. It was deemed sufficient for our purpose in this place to confine ourselves to the consideration of the observations made on γ Draconis alone, which being a star of the second magnitude, and very near the zenith of London, and of the southern parts of England, was considered as the best object. We will therefore subjoin the reduction of the observations made on this star by way of illustrating their application in practical astronomy.

Reduction of the Observations contained in Table I.

</table>

Apparent Mean of both positions = 0 24.36
And also, half the difference, or collimation = 0 4.57
Then in Bode's Catalogue Dec. N. of γ Draconis, 1801 = 51 31
Subtract for annual diminution .7 + .3 = 51 31
True declination = 4
And 2 24° 36. + 0.03" (sum of Equations) true zenith-distance = 2 24.39

The true latitude of Greenwich Observatory, as deduced from γ Draconis = 51 28 39.61

When the reductions are thus made for the observations taken at the other places, the zenith-distances and corresponding latitudes will stand thus, viz:

<table>

</tbody>
</table>

In obtaining the latitudes of the two last places, the declination of γ Draconis is diminished 3" to bring it to the year 1806, and in all the cases where S is annexed to the zenith-distance, it is added to the declination. The reductions are made to the 1st of January of the respective years, and the latitudes come out very nearly the same as those determined from terrestrial measurement, and also from an average of all the observed stars.

"From the observations made at the station in Delamere forest with the zenith-micrometer in 1806, combined with those at Dunnoke, 1802, taken with the same instrument," says the author of the Survey, "it is found, that the difference in latitude of those is 2° 36' 12.2 (by γ Draconis alone in our examples 2° 36' 11.7), making a difference of 1" between the calculated and observed amplitudes, which, letting aside the consideration of the spherical figure of the earth, is at the rate of "ths of a second in one degree. Perhaps, under the consideration of each meridian line being obtained independently of the other, and admitting that neither of them can be measured with perfect accuracy, together with the chances of the amplitudes being in some small degree either in excess or defect, we may consider the result as sufficiently consistent and satisfactory, and may take 60823 fathoms, in latitude 52° 34', or the centre of England, as the length of 1°." Trigonometrical Survey, vol. iii. p. 303, &c.

ZENITH-MICROMETER is an instrument of very recent date, and is scarcely yet known to the generality of astronomers. It differs from the zenith-sector in this respect; that the measures taken with it are all taken within the tube of the telescope, whereas those taken by the zenith-sector are all external; consequently the range of the zenith-micrometer's scale is confined to the extent comprised within the field of view, which will always be inversely as the magnifying power of the glasses used; hence the greater the power of the telescope, the smaller the number of stars that will pass within the range of the micrometer-screw; but then corresponding accuracy may be expected from the great powers and delicate construction of modern micrometers; and what is wanting in the extent of the scale will be made up by superior precision. The telescope, which constitutes the basis of the zenith-micrometer, may be either of the reflecting or refracting construction; and within a short space of time one of each description has been constructed; the former by Troughton, for the Greenwich observatory, and the latter by Dollond, for the use of those geodetical commissions, who are employed by the English government to ascertain the proper line of demarcation across the American lakes. We will give a short account of each of these instruments, such as will enable our readers to form an opinion of their respective merits, as prototypes for future imitation.

Zenith-Micrometer by Troughton.—It is probable that the first
first idea of a zenith-micrometer occurred to Mr. Troughton, and certain that he was the first who executed one, and gave it its name. It was in 1806 that he proposed it to Dr. Maskelyne, and in 1812 that he erected it at the Royal Observatory, as an appendage to the mural circle.

The telescope of this instrument is a Newtonian reflector, the tube of which forms the vertical axis, through which axis a plumb-line passes centrically from end to end; and, therefore, is not made to vibrate by turning. The tube or axis, 10 feet long, and 5 inches diameter, at the lower end terminates in a pivot, while the upper end is received by a right angle, against the sides of which it is gently pressed by two springs; contrivances which produce free and steady azimuthal motion.

All the zenith instruments require for collimation two positions, which in the former are called face east and face west; two at 180° distance from each other are equally necessary for the micrometer, and in that under consideration are indicated by the contact of flaps, without regarding any division.

The large mirror at the lower end, as well as the pivot, are perforated, in order that the plumb-line may pass freely through them, the latter sustaining the plummet in a water vesse several inches below. The axis of the mirror is somewhat inclined to that of the tube, for the purpose of placing the plane mirror out of the way of the plumb-line, which latter, as before observed, occupies the centre. The rays of light, thus rather obliquely reflected up the tube, are turned into a horizontal direction by the plane mirror, and come to a focus a little beyond the side of the tube, where, with appropriate adjustments, is fixed a double micrometer for measuring zenith-differences.

When the instrument is flopped with the micrometer toward the south, one of the moveable wires is made to bisect a star a little before it comes to the centre of the field of view; then the instrument is turned to the opposite side with the micrometer towards the north, which may be done in three seconds, and then the other moveable wires is made to bisect the star. It is evident now, that the opening between the wires is double the zenith-distance of the star, and if the axis was truly vertical, the middle between them is the point zenith. The revolutions of the screws are counted in the field of view, and the parts to the third decimal figure read off upon the micrometer heads, which revolutions and parts are to be reduced to angular measure.

The plumb-line is suspended from a fixed point at the upper end, and near the lower end is a rectangular arrangement of microscopes with adjustments, which, together with the adjustments of the pivot, accomplish the means of bringing the axis and plumb-line coincident with each other, and of affurining the vertical position of the former.

The conception of this instrument was not confined to a reflecting telescope, it was seen that a refracting one would succeed equally well; in the latter case, the pivot at the lower end must be perforated to receive the eye-lenses, and the plumb-line should be exterior to the main tube, but enclosed in a smaller one to protect it from the action of the wind. In the case of the Greenwich instrument, of which the foregoing is a description, the reflector was preferred on account of its allowing the central position of the plumb-line, which is free from vibration, shortens the time required for adjustment; a consideration indeed of very little value; for it is now known (but was not then) that instruments properly constructed, and used with care, which they now are at our national establishments, seldom or never want re-adjustment. A better cause for adopting the reflector was, that the horizontal view is more easy than the vertical one, especially as in the former the hands and whole body are unembarrassed, and fit for action. But whichever construction of the telescope is employed, we know that Troughton considers the zenith-micrometer as one of the most elegant of his inventions.

**Zenith-Micrometer by Dollond.** — The zenith-micrometer which is represented in Plate XXXIII. by figs. 3, 4, 5, and 6, has great advantages in the simplicity of its construction and use, that former instruments for the same purpose do not possess, and is portable: the plan was proposed by Mr. Pond, the astronomer royal, and the instrument executed by Mr. Dollond for transatlantic measurements. It is drawn from a scale of two inches to the foot, and is represented without a stand or support. It can be applied to either, as occasion may require. The component parts are three; viz., an achromatic refracting telescope A A, (figs. 3, 4.) of 42 inches focal length, with an aperture of 24 inches; a micrometer B, with two screws, each moving a separate wire through the field of view, which is extended to two degrees. The transverse axis C is 18 inches long, and glazed for a telescope, with crofs wires that adjust to that when the principal telescope A is taken out, (and for which there is a provision,) the line of collimation may be truly adjusted to the pivots, and when replaced will be correctly at right angles to the principal telescope. The use of the axis being formed into a telescope, is, for the purpose of placing the instrument correctly in the meridian, on a mark that must be found to the eaff, and also by another to the west, so that when the star has been observed with one of the micrometer wires, and the instrument is changed for the purpose of observing the same star with the other micrometer, it may be correctly replaced, the mean of the two observations being the correct zenith-distance. The instrument is also furnished with a plumb-line D, and with a dot at E, the image of which is brought to the place of the plumb-line by a lens; this is known by the name of the ghost adjustment. The plumb-line is suspended from a piece at F. The two screws G G are used for bringing the dot carried by the telescope, to coincide with the plumb-line; and is observed to be by the lens at H. This contrivance affords one of the greatest advantages of the instrument, as it enables the observer, at the moment before he observes the conjunction of the star with the micrometer wire, to ascertain the correct position of the instrument by the plumb-line; for the correctness of the observation will depend on the accuracy with which the plumb-line is made to coincide with the dot; and by this method the error of direction is done away. The level (fig. 6.) is used for levelling the axis, and the circular piece (fig. 5.) with the Y's a a attached, in which the pivots of the transverse axis rest, may be applied to a mahogany-framed land, or on a slone pier, or bracket: it is represented as it was made for a mahogany land (which had adjusting screws at the feet); it consists of two strong brass plates, and is furnished with a circular motion for bringing the instrument into the meridian, which motion is given by pinion b, and is made fall by the four screws g, g, g, g. The two adjusting screws G G, fig. 5 must also be attached to a bracket or framed piece in the land; and the support for the water, in which the plummet is immersed, may also be applied to this bracket. The wires are illuminated through the axis in the same manner as in the transit-instrument. The value of the micrometer-wires is to be found in the usual manner, and reduced into seconds.

The foregoing are the distinguishing properties of this instrument,
instrument, and as the method of using it may be understood sufficiently from what we have said of the zenith-fector, from which it differs only in the small range of its scale, it will be unnecessary to give any further explanation of either its adjustments or practical application.

Other Instruments.—Besides the zenith-fectors and zenith-micrometers, which we have above described, there are other instruments, which may be used as substitutes for these, at the same time that they may be used for their own respective purposes. Of these, the transit-circles of large dimensions, particularly those which move with their pivots supported by stone piers, claim our principal notice. As the professed use of these circles is to ascertain both right ascensions and declinations at the same time, and as zenith-distances are only complements of altitudes taken in any latitude, it is obvious, that these instruments that measure altitudes accurately, at all elevations, will also measure zenith-distances, or their complements; and in fact, the divisons are now numbered in such way, that altitudes and zenith-distances are read alternately in the reversed positions. Of this description is the excellent circle of Mr. Groombridge at Blackheath; but the large circle at Greenwich, not having a plum-line or level used, nor being capable of reversion, is not of the same class; though a very superior instrument for its own purpose of measuring polar distances from the exact polar point, without any reference to latitude, altitude, or zenith-distance.

We have also before us an 18-inch transit-circle with a 35-feet telescope, very lately made by Mr. Thomas Jones, of Charing-Cross; the axis of which is supported by a cast-iron frame, that very conveniently admits of measures being taken in or near the zenith, as well as in any other degree of elevation. This instrument comprises many new and useful contrivances, but they cannot be described under this head, consistently with our general plan of dividing our subjects.

ZENITH is a word used by some writers to express the first appearance of the menes in young women.

ZENKABAD, in Geography, a town of the Arabina Irak; 22 miles S. of Sherban.

ZENKOV, a town of Rouflia, in the government of Tchernigov; 140 miles S.E. of Tchernigov. N. lat. 50°. E. long. 34° 14'.

ZENN, a river of Franconia, which runs into the Rednitz, near Vacha, in the margravate of Ansbach.

ZENN. See Langenzenn.

ZENNAR, the name of a mythical thread worn by Brahmas, and by many individuals of other tribes of Hindoos. So prolix and minute are the authors of the Ordinances of the Hindoos, that rules for almost every occurrence of life, however trifling, have been laid down. Not that any thing connected with the zennar has been deemed trifling by those who ordained it, by those who wear it, or those who revere it. On the contrary, the individuals to be so distinguished, the mode of manufacturing the sacred article, and its inviolability, with many particulars, have occupied the attention of lawgivers, and are attended to with great respect by their obedient followers.

Brahmans affect to consider the zennar as of highly mysterious and sacred import, and do not consider an individual as fully a member of his tribe until he have assumed this holy emblem. A Brahman should be invested with it at the age of eight years, by the hands of his father, who, with his Guru, or spiritual preceptor, twirls that first put on. A Khetriya receives it at eleven, from a Brahman. A Vaiyia at twelve years of age. A Sudra is on no account permitted to wear it. A description of these four grand divisions, comprising the whole race, will be found under SECTS OF HINDOOS.

The zennar must be made by a Brahman; it is composed of three threads, each measuring ninety-fix hands, twisted together, and folded into three; then twisted again so as to consist of nine threads; these are again folded into three without twining, and each end fastened with a knot. It is put over the left shoulder next the skin, and hangs down the right thigh as low as the fingers can reach. Of these cords a Brahman wears four; the other privileged tribes but three. Some writers call this the Brahmanical, or priedly, or facrodotal thread; but not, it would appear, in strict correctness; it not being confined to the priedly tribe, but worn, as we have seen, by three out of the four sects of Hindoos.

In the Institutes of Menu (see MENU), c. 11. v. 36. the revered legislator ordains, that "in the eighth year from the conception of a Brahman, in the eleventh from that of a Khetriya, and in the twelfth from that of a Vaiyia, let the father invest the child with the mark of his clafs."

The two next verses allow, on particular occasions, the assumption of the sacrificial thread, as it is often called, in the fifth, sixth, or eighth years respectively; or it may, in like manner, be delayed until the individual be double the age mentioned in verse 36. "After that, all youths of these three classes, who have not been invested at the proper time, become outcasts, degraded from the Gayatri, and contemned by the virtuous," v. 39. Of the Gayatri, see under our article O'M.

In ancient books, the three first classes, from being thus invested with this sacrificial thread, are called twice born; a regeneration being effected by this mystical second birth. But it has been thought, that in later times, the Brahman only has the advantage of being thus born again. The term twice born is very common; a third birth is sometimes mentioned: this, we believe, is at the decease, or the burning of the body. "The first birth is from a natural mother; the second, from the ligation of the zone; the third, from the due performance of the sacrifice" Thus are the births of him who is usually called twice born, according to a text in the Veda. Among them, his divine birth is that which is distinguished by the ligation of the zone and sacrificial cord; and in that the Gayatri is his mother." Menu, ii. 169, 170.

This cord is never taken off; even when sleeping and bathing, it is worn and dispofed of in a particular manner. When worn out, it is committed to the water with due and appropriate ceremony, and another is as duly put on. It is seen on the most ancient of Hindoo sculptures, and on many of the figures; for instance, in the cavern temple at Elephanta. (See MAHAKALA.) It has several other names; among them Janwi, or Jahnui, Maui, &c. The latter is applied to the cord of the military tribe, being made from the leaves of a species of hyacinth, called murva, of which bow-string are also made: the Brahman's cord is made of cotton. The name Jahnui given to this sacred, triple, mystical, regenerating thread, has been derived from Jahnui, an ascetic, who, in a very extravagant way, gave a second birth to the equally sacred, triple, mythical, regenerating river Ganga (the Ganges), which is hence called Jahnui. Of this we have taken some notice under JAHNU; and of the triple union of the Ganga, and other sacred rivers, under TRIVENI.

Brahmans, and their enthusiastic followers, are very mystical concerning regeneration, and have diverse modes of effecting the second birth, in cafes where the purity derived from the ligation of the zone, or inviolability with the sacrificial thread,
thread, hath been loft by the contaminations of unlawful acts, as from accidental defilements. Of this, fee under our article YOni.

ZENO, in Biography, called the Estatic, in order to diftinguish him from Zeno the Stoic, was a native of Elea, in Magna Graecia, and said to have been the adopted son of Parmenides, whose disciple he was, flourished about the year 463, B.C. and chose to live in his native city rather than at Athens, for the fake of maintaining his independence. He is represented as a zealous friend of civil liberty, and as having loft his life in his opposition to a tyrant. It is said, that having been detected in a conspiracy against the petty tyrant of the place of his nativity, he endured the most cruel torments, because he would not betray his accomplices; and that at length his countrymen, moved by his fortitude, fell upon the usurper and floned him to death.

To him the invention of the dialectical art has been erroneously ascribed.

According to Aristotle, Zeno taught that nothing can be produced either from that which is similar or dissimilar; that there is only one being, and that is God; that this being is eternal, homogeneous, and spherical, neither finite nor infinite, neither quiescent nor moveable; that there are many worlds; that there is in nature no vacuum; that all bodies are composed of four elements, heat and moisture, cold and dryness; and that the body of man is from the earth, and his soul an equal mixture of these four elements. He argued with great subtlety against the possibility of motion. If Seneca's account of this philosopher deserves credit, he reached the highest point of scepticism, and denied the real existence of external objects.

Upon the whole, his sentiments seem to have been so fluctuating and unalterable, and his method of arguing so versatile, that it is not certain whether he allowed or denied a properly divine nature. Moheim, not improperly, applied to the doctrine of Zeno the words of Terence:

"— Incerta haec, fi tu postules
Ratione certa facere, nihilus plus agas,
Quam si des operam, ut cum ratione infanias."

"Things thus uncertain, if by reason's rules
You'd certain make; it were as wise a task
To try with reason to run mad." —Colman.

Bayle depreciates the practical philosophy of Zeno, on account of his vindication of the warmth with which he refented reproach, by saying, "If I were indifferent to censure, I should also be indifferent to praise." His works, though unknown to the moderns, were held in high estimation among the ancients. Diog. Laert. Bayle. Brucker by Enfield, vol. i.

Zeno, the founder of the Stoic sect, was born about the year 366, before Christ, and died, as it is said, in the 1st year of the 129th Olympiad, or 264 B.C. For an account of him, see the article Stoics.

Zeno, Roman emperor of the East, was a descendant of an Ifaurian family of distinction, and at first bore the name of "Trajcafellius." Being a commander of the Ifaurian troops in the service of Leo I., he married Ariadne, a daughter of the emperor, who created him a patrician, and raised him to the chief command of all the armies in the East. Upon the death of Leo in the year 474, the empire was transmitted to his grandson Zeno and Ariadne, and Zeno, by the influence of the dowager-empress Verina, was appointed his colleague, and when the young emperor died, Zeno poifoned the whole imperial power. But Verina, being incensed by his scandalous conduci, formed a conspiracy against him, so that Zeno was obliged to seek refuge, first at Chalcedon, and afterwards in Ifauria, his native country. Basilicus, the empress's brother, who had ascended the empire, became so unpopular, that Zeno was restored, and the degraded emperor perished in prison. About this time the western empire terminated; and Zeno, receiving deputies from the Roman senate, who recognized Constans as the rightful emperor, and requested the title of patrician for Odoacer, proclaimed king of Italy, was flattered with the title of sole Roman emperor, and commenced an amicable correspondence with Odoacer. The remaining period of his reign was both turbulent and inglorious. The insurrections against his government were numerous, and his temper, which was naturally severe, was thus rendered more hostile and cruel towards those whom he considered as his enemies. The irreligion of his disposition proved eventually a collateral cause of his death, by aggravating a disorder in his bowels, which proved fatal in the year 491, at the age of 65, after a reign of seventeen years and three months. His widow Ariadne married very soon after his death. His reign was famous for the confession of faith, called the Henoticum, or Henoticum, (which fee.) Gibbon's Hist. Rom. Emp. vols. vi. vii. viii.

Zeno, in Geography, a river of Italy, which runs into the Taro, opposite Fornovo, in the duchy of Parma.

ZENOBIA, Queen, in Biography, was a native of Syria, in the third century, who claimed descent from the Macedonian kings of Egypt. This female was celebrated for the beauty of her person, the harmoniousness of her voice, her mental talents and literary acquirements, and her disstinguisht heroism and valour, as well as her modesty and chaitity. "Her manly understanding," says Gibbon, after recounting her personal beauties and excellencies, "was strengthened and adorned by study. She was not ignorant of the Latin tongue, but poifessed in equal perfection, the Greek, the Syriac, and the Egyptian languages; she had drawn up for her own use an epitome of oriental history, and familiarly compared the beauties of Homer and Plato, under the tuition of the sublime Longinus." She was allied by marriage to Odonatus, king of Palmyra, and delighted in those exercises of war and the chase to which he was devoted. Many of his victories have been ascribed to her military spirit and valour. After the death of her husband, about the year 267, she assumed the sovereignty of the East, and governed with equal vigour and policy; so that by her successes in warlike expeditions, as well as by the wisdom and firmness of her administration, she aggrandized herself in Asia, and her authority was recognized both in Cappadocia and Bithynia, when Aurelian succeeded to the Roman empire. Envious of her power, and determined to dispossess her of some of the rich provinces that were comprehended within the extent of her dominion, he marched at the head of a powerful army to Asia, and having defeated the queen's general Zabdas, near Antioch, he retreated to Emesa, whither she was pursued by Aurelian. Under the walls of that city another engagement with Zenobia, which was commanded and animated by herself, took place, in which the emperor was again victorious. The queen, thus unfortunate, withdrew the relics of her vanquished forces to Palmyra, her capital; and was pursued thither by Aurelian. The favourable terms that were offered to Zenobia being refused, the city was besieged; which, after long resistance, the queen determined not to surrender; but as she apprehended famine within the walls, she mounted a swift dromedary, and hastened towards the Euphrates, with a view of seeking an asylum in the Persian territories. But being overtaken in her flight, she was brought back to Aurelian, who
who received her with a stern countenance, and questioned her how she could dare to refit the emperors of Rome. She replied, "Because I could not acknowledge as such a Gallienus and others like him; but I recognize by that title you who know how to conquer." At Emesa, the fate of Zenobia was submitted to the judgment of a tribunal, at which Aurelian presided; and the Roman soldiers demanded her death. She, in a manner unworthy of her former fame, saved her own life by throwing the blame of her resistance on her minions and counsellors; Longinus was one of these, who, with several others, was put to death, in the year 273.

Zenobia was revered to grace the triumph of Aurelian; and on the appointed day she preceded, on foot, a magnificent chariot, which she had designed in the days of her prosperity for a very different kind of entry into Rome. She was encircled, it is said, with chains of gold, and almost sunk under the load of jewels with which she was adorned. Afterward she was treated with humanity by the victor; and had assigned to her an agreeable residence near the Tiber, where she passed the remainder of her days as a Roman matron. Whether she contracted a second marriage with a Roman senator, as some have affirmed, is uncertain; but however this be, her surviving sons Vhaballat withdrew into Armenia, and possessed a small principality granted to him by the emperor, and her family was not extinct in the fifth century. Gibbon's Hist. of Rome, vol. ii.

Zenobia, Zelobi, in Ancient Geography, a town of Asia, in the Euphrates, on the banks of the Euphrates, five miles from fort Mambri, and on this side of the small town of Sura. According to Procopius, it was founded by Zenobia, wife of Odonatus, prince of Palmyra. After it had been ruined, Julianian re-embellished it, and repopulated it, and made it one of the bulwarks of the empire. After having rebuilt the town and fortified it, he embellished it, constructing magnificent churches, public baths, galleries, and lodgments for the porters. It was situated S.E. of Niccephorium.

Zenobia, a place of Italy, near the palace of Adrian, assigned to queen Zenobia for her residence.

ZENOBII Insula, the name of seven islands in the Indian ocean, upon the coast of Arabia Felix, at the entrance of the Sathalih gulf. Ptolemy.

ZENODOTUM, a town of Asia, in Ofrhoene, in the vicinity of Niccephorium, according to Appian. Steph. Byz. This town, says Plutarch, was forcibly taken by Caffius, who ruined it, and sold the inhabitants by auction.

ZENONIS Chersonesus, a town mentioned only by Ptolemy, and placed by him in the Tauric Chersonesus, along the western coast of the Palus Maeotis. M. Peyronnel thinks this was not a town, but an island, called at present Zenifile.

ZENSON, in Geography, a town of Italy, in the Trevisan; 9 miles N.E. of Treviso.

ZENUS, in Arithmetic, a name which some authors give to a square number, or the second power. The higher powers they call zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένеς, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zένες, zέ

Zenilmandaik, a town of Afiatic Turkey, 6 miles N. of Eregridi.

ZENUPH, in the Jewish Antiquities, a kind of tiara worn by the kings of Judah. See Cidaris.

ZEObid, in Geography, a town of the Arabian Irak, on the Euphrates; 28 miles S. of Bagdad.

ZEOLITE, in Mineralogy, a mineral so named by Crenflett, from the Greek word Zeol, to foam, on account of its tumefacing and foaming very much before the blow-pipe. Haiyi makes two distinct species of the zeolite, which he denominates metotype and fllbite. Werner makes four sub-species of zeolite, which he calls Nallyzeolite, fibrous zeolite, radiated zeolite, and foliated zeolite. Besides this he makes a zeolite a generic name, placing it at the head of what he calls the zeolite family, in which arrangement he is followed by professor Jameon, who classes with the zeolite family the following minerals: prenhite, (see Preshite), zeolite, apophylite, cubelite, called by Haiyi analcime, chabasite, crofthorne, laumonite, dipper, natrolite, and wavelite. (See Wavelite.) In the classification of specimens at the British Museum, these minerals, so nearly united in chemical composition, and in many of their external characters, are arranged together under the proper denomination of zeolitic substances, by which the confusion incident on making the same word represent both a genus and species is avoided. These substances, except wavelite, are composed of flex, alumine, lime, or an alkali, and a considerable portion of water. To the latter, they owe the property of tumefacing before the blow-pipe, that many of them possess. Some of these minerals form a jelly when diffolved in acids. Zeolitic minerals occur principally in the cavities of volcanic and bafaltic rocks. Of the different members of the zeolite family, prenhite has been already defcribed. (See Preshite.) Zeolite, comprising mealy zeolite and fibrous and radiated zeolite, are the various metotypes of Haiyi, mealy zeolite being the metotype alterate aspect terrae of the French mineralogist. This mineral is white, inclining to yellowish, greyish, or reddish, and is sometimes red. It occurs massive, and kidney-shaped, and corroolidal. Sometimes it forms a crust over other zeolites. The lute is dull or feebly glistening: it is opaque, very soft, and rather fettile; it has an earthy fracture, sometimes inclining to fibrous. It is very light, and easily frangible, and feels rough and meagre. It appears to be zeolite in a decomposing state. It tumefaces before the blow-pipe, and forms a jelly with acids. The constituent parts are,

Filrous Zeolite, Mefotype, Haiyi, is of a snow-white colour, passing to greyish, yellowish, or reddish-white, and sometimes into red and yellowish-grey, yellowish-brown, or ochre-yellow. It occurs massive, in kidney-shaped balls, and in epaoillary crystals. The external surface of the kidney-shaped varieties is rough and dull; internally it is strongly glistening, passing into glistening, and the lute is pearly: it is faintly translucent. The structure of this mineral is fibrous, either diverging on one side or foliar, and passes from delicately fibrous to coarse or to narrow radiated. It is brittle, breaking into splinters or wedge-shaped.
shaped fragments; it yields easily to the knife. The specific gravity is from 2.158 to 2.197. Before the blow-pipe it intumesces, and forms a jelly with acids. It may be distinguished from needle zeolite by its inferior lustrue, fibrous structure, and low degree of transparency and hardness, and also by its want of regular crystallization.

_Needle Zeolite, Mecotype, Haiiy; and prismatic meco-

of some mineralogists. Its colours are, greyish, yellowish, or reddish-white; it occurs both mafive and crys-
tallized. The crysals are acicular-rectangular four-sided prisms, terminated by low four-sided pyramids, the faces of which are set on the lateral planes of the prism. Sometimes there are only two terminating planes, forming an acute bevelment, set on obliquely. The rectangu-
lar prism is sometimes truncated on the edges, forming an octahedron, with four large and four small planes.

The lateral planes of the crysals are longitudinally fritated, but the acuminating planes are smooth. Sometimes the crysals are diverging, and sometimes promiscuously aggre-
gated. The crysals are externally shining or splendent, internally glinting; the lustrue is vitreous, inclining to pearly. The structure is lamellar, with joints parallel to one of the sides of the prism; also at right angles to the axis, and parallel to the two diagonals of the prism. Of these, the first cleavage only is generally visible. The crots friture is imperfectly conchoidal; the lustrue between vitreous and pearly. It is translucent or transparent, with double refraction. It yields to the knife, but scratches cal-
careous spar, and is brittle. The specific gravity varies from 2.17 to 2.27. This mineral, like the preceding, intumesces before the blow-pipe, and gelatines with acids. It becomes electric by heat; the extremity of the crysral, terminated by a pyramid or bevelment, shews positive the bottom of the crysral negative electricity. According to Vauquelin, the constituent parts of mecoype are,

_Needle zeolite, or mecoype, is distinguished from radiated zeolite, or stilbite, by its vitreous lustrue, distinct prismatic concretions, and greater transparency and brittleness. The latter has also more of a nacry lustrue._

_Radiated Zeolite, Stilbite, Haiiy,_ is generally of a yellowish or greyish-white colour, and rarely paffes into reddish-white or red. It occurs mafive in angular pieces, and globular, and also crysallized in broad, rectangular, four-
sided prisms, rather acutely terminated by four planes set on the lateral edges of the prism. Of these planes two adjoining ones are more inclined to the axis of the prism than the other two. The summits of the terminating planes are sometimes more or lesss deeply truncated. Some-
times the prism is so thin as to form a long fix-sided table, bevelled on the shorter terminal planes. The crysals are aggregated in diverging radii, and frequently so closely joined to each other, that the pyramidal terminations of each crysral are only visible. The broader lateral planes of the crysals are smooth, and the smaller longitudinally fritated. The structure is lamellar, with joints in one direction, parallel to the axis of the prism. The surfaces of the broader lateral planes are splendid and pearly; internally the lustrue is more or less shining, and is pearly. The crysals are translucent, or semi-transparent. The diverging radii of the aggregated crysals are more or less broad, paffing from fibrous to foliated. It is brittle, and the fragments are wedge-shaped and splinterly. Stilbite crysals are calcareous spar. The specific gravity of this mineral is from 2.13 to 2.16. It intumesces before the blow-pipe, yielding a phosphoric light; it becomes white when laid on a glowing coal; it does not gelatinize with acids. The constituent parts are,

_Foliated Zeolite, Stilbite, Haiiy._—The colours of this mineral are nearly the same as those of the preceding, being chiefly yellowish and greyish-white, and rarely milk-white, snow-white, reddish-white, or red; it sometimes is yellowish-
grey, and pinchbeck-brown. It occurs both mafive, dif-
teminated, globular, amygdaloidal, and crysallized. The form of the crysals is a low, very oblique, four-sided prism; sometimes truncated on the acute lateral edges, and also on the angles of the acute lateral edges. Sometimes all the angles are truncated. It occurs also in low fix-
sided prisms, and equi-angular fix-sided tables; also in eight-
sided prisms. The crysals are generally small; the lateral planes are transversely fritated, and the terminal planes are smooth. It has a pearly lustrue, which is either shining or splendent. The pinchbeck-brown variety has a semi-
metallic lustrue. It has a foliated and slightly curved struc-
ture, with a single cleavage, parallel with the terminal planes of the prisms. Sometimes a conchoidal crots friture may be observed. It is brittle, and the fragments are angular and blunt-edged, and sometimes tabular. The mafive varieties are strongly translucent; the crysals are trans-
luscent, semi-transparent, or transparent. It yields to the knife, but scratches calcareous spar. The specific gravity of this mineral is 2.2; and, like the preceding mineral, it intumesces and melts before the blow-pipe, giving out a phosphoric light: it does not form a jelly with acids. According to Meyer, the constituent parts are,

All these zeolitic substances, classed as mecoype and stil-
bite by Haiiy, pass by imperceptible gradations into each other, and occur, as we have before observed, in basaltie and volcanic rocks.

The easy fusibility of zeolites was at one time regarded as rendering their occurrence in volcanic rocks a subject of difficult explanation; but the experiments of Sir James Hall, referred to under _Systems of Geology_, demonstrate the
the possibility of crystalline arrangements taking place under compression in substances that would be disintegrated by heat under the common pressure of the atmosphere. It is probable, however, that many zeolitic substances which occur in basalt or lava have been infiltrated into the cavities at a later period, and are even forming at the present day in ancient lavas and basalts.

Some of the minerals classified with the zeolite family have been described in our preceding volumes. See Apophylite, or Ichthyophthalmite.

Analcime, or Cubic zeolite, formerly called Werner cubic zeolite, is generally white, sometimes reddish-white, or red. It occurs sometimes massive, but more generally crystallized in perfect cubes, or with the angles more or less deeply acuminated, or in twenty-four-sided crystals, like those of the leucite, having each of the figures equal and similar trapeziums. The structure presents slight indications of cleavage, parallel with the faces of a cube. The fracture is compact, and flatly conchoidal, paling into fine-grained, uneven. It is translucent, semi-translucent, or transparent, and has a shining lustre, between vitreous and pearly. It is sufficiently hard to scratch glass, but is easily friable. The specific gravity of cubicite is 2.44. It becomes electric by rubbing. Before the blow-pipe it melts into a transparent glass. According to Vaucoulenet, the constituent parts of this mineral are:

This mineral occurs most frequently in cavities in rocks of the trap formation, accompanied with zeolite; but it is sometimes found in metallic veins in schistose rocks, accompanied with various ores, and with calcareous spar and quartz. The name analcime was given to it by Hauy, signifying a body with little power, on account of the feeble electricity excited in it by friction.

Chabasite, Chabasite, Hauy, is nearly allied to cubicite, and was formerly classed with it. The crystallization is different; the form is not perfectly cubic, but slightly rhombohedral, the angles of the rhombohedron being 94° and 86°, either perfect, or with the obtuse lateral edges truncated, and sometimes both the fix obtuse lateral edges and fix obtuse angles are truncated. The crystals are transparent or translucent. The lustre is vitreous, and externally splendid, internally glintening; the fracture is imperfectly conchoidal, or fine-grained, uneven. It scratches glass a little. The specific gravity of this mineral is 2.7. It is fusible into a white opaque enamel. According to Vaucoulenet, the constituent parts are:

The situation in which this mineral occurs is nearly the same with that of analcime. The name was given it by Hauy, from chabazion, an unknown stone mentioned in the poems of Orpheus.

Laumonite, Zeolite efflorescente, Hauy.—Its colours are, yellowish-white, snow-white, and greyish-white. It occurs massive and crystallized in octahedral prisms, with edges apparently rounded; the summits of the crystals are dodecahedral. The crystals are small, lining daisy cavities. The structure is lamellar, and has a two-fold cleavage: it is transparant or translucent when fresh; but on exposure to the atmosphere soon becomes opaque, losing its hardness, and yielding to the pressure of the finger. When fresh it scratches glass. The specific gravity is 2.23. Bonnemain. It forms a jelly with acids. Before the blow-pipe it intumesces, and is changed into a white enamel. According to Vogel, the constituent parts are:

This mineral, which agrees in its principal characters with zeolite, was first found in Brittany, by M. Gillet Laumont, after whom it has been named by Werner. It has been found also at Paisley, in Renfrewshire, in anygdolite, accompanying cubicite. Laumonite disintegrates so rapidly, that for its preservation it requires to be kept in well-closed bottles.

Cros-Stone, Harmatome, Hauy, occurs in small crystals; the form is generally a broad rectangular prism, terminated on each extremity by four rhombic faces, with their acute angles set in the lateral edges of the prism. Sometimes the edges of the rhombic faces are bevelled in one direction. But the name cros-stone is derived from the frequent occurrence of two prisms intersecting each other, having one common axis. The broader planes by this intersection project, and form the figure of a cros when the prism is viewed at the end, or in the direction of the axis. The colour of cros-stone is generally a greyish-white, which passes into smoke-grey; it is sometimes a yellowish-white, passing into cream-yellow, and red. It is translucent or transparent, with a lustre between vitreous and pearly. The fracture is uneven, or imperfectly conchoidal. It is fapposed, by professor Jameson, to have an imperfectly foliated structure. It scratches glass feebly. The specific gravity is 2.33. Before the blow-pipe it emits a yellow phosphoric light, and melts with intumescence into a coloured glass. It does not gelatinize with acids. This mineral differs from other members of the zeolite family, by containing barytes as an ingredient in its composition. According to Klapproth, its constituent parts are:

<table>

Dipyr, Hauy; Schmelbein, Werner.—Its colours are, light pearl-grey, greyish-white, or redish-white. It occurs massive and crystallized, in aggregated, slender, octahedral, acicular prisms. The structure is lamellar, with joints parallel to the sides, and to the diagonal of a rectangular prism. The lustre is intermediate, between vitreous and pearly: it is translucent. This mineral is sufficiently hard to scratch glass; but is very fragile. The specific gravity
vity is 2.630. Before the blow-pipe it intumesces, and melts with great ease, giving out at the same time a pho-
phoric light from this double effect of heat upon it. Hairy gave it the name of *di*pýr*, on account of its easy fusili-
ity; it was called *schmelzfein* by Werner. Its constituent
parts are,

It is laid by Brongniart to occur in slateite, along with
iron pyrites, near Mauleon, in the Western Pyrenees.
The other members of the zeolite family are described in
the preceding volumes. See *Natrolite* and *Wavel-
lite*.

**ZEOPHILOS**, a word used by Quercetan as the name of
an antimonial medicine.

**ZEOPHYRUM**, in the *Materia Medica*, the name of the *triticum efigium*, or *bordeum nudum*, as it is called by
some authors, the naked barley.

**ZEPHANIAH**, a canonical book of the Old Testa-
ment, containing the predictions of Zephaniah, the son of
Cushi, and grandson of Gedaliah; being the ninth of the
twelve lefser prophets. He prophesied in the time of
Josiah, a little after the captivity of the ten tribes, and
before that of Judah; so that he was contemporary with Je-
remiah. He prophesies chiefly against Judah, who con-
nued very corrupt, notwithstanding the king's pious zeal for
reformation, and the good example he gave to his subjects.

**ZEPHAT**, in *Ancient Geography*. See *SEPHAAT*.

**ZEPHIRA**, in *Geography*, a small island in the Grecian
Archipelago, near the N. coast of Antiparos.

**ZEPHIRE**, in *Ancient Geography*, an island situated on
the coast of that of Crete, before the promontory Samonium.
Mela.

**ZEPHRON**, or *ZEPHORIA*. See *ZEPHRON*.

**ZEPHYRI FETUS**, a term used by Hartman, and some
other writers, to express a mole, or false conception.

**ZEPHYRINUS**, *Popo*, in *Biography*, succeed* Victor*
in the Roman see in the year 201. A persecution at the
commencement of his papacy obliged him to conceal him-
sel£, and when he was at liberty to exercise his functions, he
was engaged in the suppression of prevalent heresies, which
disturbed the latter years of his pontificate. He died in the
year 218 or 219. Bower.

**ZEPHYRIUM**, in *Ancient Geography*, a promontory of
Asia, on the confines of Cilicia Propria. According to Strabo
and Ptolemy, this promontory and that of Sarpedon formed
the mouth of the river Calycadnus.—*Alfo*, a town at the ex-
temity of this promontory.—*Alfo*, a promontory of the isle
of Cyprus, towards the S.W., at the extremity of a penis-
fula, which on the W. incloses the gulf, at the bottom of
which was Paphos.—*Alfo*, a promontory of Italy, on the
eastern coast of Brutium, between the promontory of Her-
cules and the town of the Locri. Strabo.—*Alfo*, a pro-
montory of Africa, in the Cyrenaica, upon the coast of the
Pentapolis. Ptolemy. Strabo distinguishes two promon-
tories of this name on the coast of Cyrenaica.—*Alfo*, a town
of Asia, on the coast of Paphalgonia.—*Alfo*, a town of
Asia, in the interior of Cappadocian Pontus. Arrian gives
it a port, and states it to be 120 stadia from the isle of
Arrenthias, and 90 stadia from the town of Tripolis.—*Alfo,*
a promontory on the coast of Egypt, between Campé and
Alexandria, where was a chapel of Venus Arinaea, and
hence she took the name of Zephyrith. —*Alfo*, a pro-
montory of Aifa Minor, on the coast of Caria, in the vicinity
of the town of Myndus. Strabo.—*Alfo*, a town of the
Taурic Chersonesus; situated on the sea-coast, N.E. of
Theodosia. Pliny.—*Alfo*, a promontory on the easter-
most coast of the isle of Crete.

**ZEPHYRUM JUGUM**, a sacred mountain of Hifpania,
upon which was a fortres.

**ZEPHYRUS**, or *ZEPHYR*, Zephyr, the west wind; a
wind blowing from that cardinal point of the horizon oppo-
site to the east.

The poets personify it, and represent Zephyrus as the
mildest and most gentle of all the deities of the woods: the
character of his personage is youth and gentleness.

It is also called *Favonius*, and *ocidens*; and, by many,
has been confounded with the *Africa*. See *WIND*.

**ZEPS**, in *Geography*, a town of the duchy of Warsaw;
20 miles E. of Wladislaw.

**ZERA**, a town of Italy, in the Veronese; 7 miles S.
of Verona.

**ZERANIA REGIO**, in *Ancient Geography*, a country of

**ZERBITA**, in *Ancient Geography*, a town of South America,
in the government of Ncw Grenada; 30 miles W.S.W. of
Pamploona.

**ZERBST**, a town of Germany, in the principality of
Anhalt Zerbi. It is the residence of the prince, and the
largest and handsomest town in the whole principality of
Anhalt. The residence-houfe here is remarkably grand. In
the town are two Lutheran churches, one of which is used
by the Calvinists, together with an universitty, common to
all the princes of Anhalt, and founded in 1582, out of a
school: it has a recto* r*, with three Calvinists and one Lu-
theran professor. The principal trade is in beer, with manu-
factures of gold and silver; 8 miles N.N.W. of Deffau.
N. lat. 52° 51'. E. long. 12° 10'.

**ZERDA**, a name given by the Moors to an animal which
inhabits the desert of Sahara, extending beyond
mount Atlas.

This is the *canis cerdo* of Linneus, with a straight tail, a
pallid or yellowish-white body, with prolonged upright
ears, internally rofe-coloured. It is the fennec of Bruce,
and a beautiful African and Asiatic animal, and is principally
found in Arabia.

Pennant classes it under the genus of dog; and defines
it as having a pointed vifage, long whiskers, large bright
black eyes, very large ears of a bright rofe colour, interna-
ly lined with long hairs, and orifice so small, as not to be visible,
probably covered with a valve or membrane; legs and feet
like those of a dog, and taper tail; its colour is between a
draw and pale brown; its length from nose to tail ten
inches, its ears three inches and a half long, tail fix, and
height not five. It burrows in the sandy ground, and is so
excessively swift, that it is very rarely taken alive; feeds on
insects, especially locusts; fits on its rump; is very vigilant;
barking like a dog, but with a thrifter found, and chiefly
in the night; and is never observed to be sportive.

M. Buffon says of this animal, that it is found to the
fouth of the Palus Tritonides, in Lybia; that it has some-
thing of the nature of the hare, and something of the
squirrel; and that it lives on the palm-trees, and feeds on
the fruits; hence probably it derives its name fennec from

**ZERDUHST**, in *Biography*. See *ZOROASTER*.

**ZEREA**,
ZEREA, in Geography, a town and fortresses of Persia, in Farīfān; this town was taken by the troops of Timur Bec, with great slaughter; 18 miles N.N.E. of Schiras.

ZEREK, a town of Persia, in the province of Szegfut; 130 miles N.W. of Zarang.

ZEREWICA, a town of Lithuania; 5 miles S.W. of Slonim.

ZERIB, a town of Kurdistan; 25 miles W. of Gujeramir.

ZERICHEUM, a name given by some of the chemical writers to arfenic.

ZERKI, in Geography, a town of Kurdistan; 30 miles S.W. of Bettis.

ZERKWITZ, a town of Lulatia; 2 miles W. of Lubbenau.

ZERMA. See Surma.

ZERMAGNA, a river of Dalmatia, which runs into the Adriatic, opposite Pago.

ZERMONY, a town of Lithuania; 10 miles N.W. of Lida.

ZERNA, a mountain of Carnithia; 3 miles N.W. of Millstatt.

ZERNA, a word used by some of the chemical writers to express an ulcerated lepra or impetigo. The chemical authors use it also as a name for the foulnefles which they call the lepra metallorum, or lepories of metals.

ZEREINEMB, or Tschereinemb, in Geography, a town of the duchy of Carniola, on a small river which runs into the Kulpa; 4 miles S.S.W. of Rudolfswerth. N. lat. 45° 50'. E. long. 15° 5'.

ZERENSIUS COLONIA, in Ancient Geography, a colony of Dacia, founded by Trajan.

ZERNETZ, in Geography, a town of Switzerland, in the Upper Engadine. In the late war it was taken by the French, and soon after retaken by the Austrians; 8 miles N. of Zultz.

ZERNITZ. See Czeretz.

ZERO, a river of Italy, which runs into the sea, 7 miles N. of Venice.

Zero, denotes the point from which the scale of a thermometer is graduated. Thus Celsius's and Reaumur's thermometers have their zero at the freezing-point, while the thermometer of Fahrenheit has its zero at that point at which it fluds when immered in a mixture of snow and common salt. In Wedgwood's pyrometer, the zero corresponds with 107° of Fahrenheit's, each degree of which is equal to 130° of Fahrenheit. Confequently 180° Fahr. = 100° Celf. = 80° Reaum. = 150° De Lille = 42° Wedg. See Thermometer.

ZEORGERE, in Ancient Geography, a town of India, on this side of the Ganges, E. of the river Namadus.

Ptolemes.

ZEROWITZ, in Geography, a town of Bohemia, in the circle of Bechin; 3 miles W.S.W. of Potschaken.

ZEREH, or Zebra, Lake of, a lake of Persia, in the province of Szegfut or Szegfan, into which the river Hermun, or Hindmunder, (the ancient Eymander,) navigable for boats from Boll to Zarang, flows through the centre of it, from the mountains of Huzara, beyond Cabul. This lake is said to be 30 furlongs in length, and 6 in breadth, or about 100 miles long, and 20 broad at the widest part. It is principally formed by the waters of the rivers Hermand and Ferrah, and in the dry season resembles more a marsh than a lake, being covered with rushes and reeds. In the middle the water is fresh; but brackish towards the shore, as the sandy plains which surround it are impregnated with salt. The lake is full of fift and wild fowl; and in its centre there is a fortified town, called "Kookhizan," built on a high island, where the treasure of the principal families of Szefalan ufed to be deposited when the province was invaded. It is said that on the borders of this lake is a town named "Naffarabad," which is described as being four days' journey for a loaded camel, W. of the city of Doothak, the preuent capital of the province.

ZERTA, or ZERT, the Zerte, or Zerte, in Ichthyology, a fish caught in the rivers of Italy, and some other places, of the figure of the chub, and called by authors capito anadromus, and the black. It seldom grows to more than ten pounds weight, and at times lives in rivers, at times in the sea; and is esteemed a very well tasted fish, especially a little before the feafon of its spawning, either fresh, salted, or prepared in various ways by pickling, &c.

The zerte is that species of cyprinus described by Gesner and others under the name of capito anadromus. See Cyprinus Vimba.

This is the filvery-blue or carp, olivaceous above, with the dorfa, caudal, and anal fin bluef, the reft reddif, and the nofe profertant. It is a native of Germany, Russia, Sweden, and other parts of Europe, inhabiting rivers, and migrating into the Baltic sea.

ZERINKA, in Geography, a town of Servia, on the Danube; 10 miles N.W. of Belgrade.

ZERUIS, in Ancient Geography, a town of Thrace, on the route from Dyrrachium to Byzance, between Dyme and Plotopolis. Anton. Itin.

ZERUMBET, in Botany, a name first used by Serapio, and apparently either of Arabian or Indian origin. It belongs to one of the aromatic roots of the natural order of Scitamineae, the produce of the East Indies, but rather to a Kamfferia, than to the species of Ginger to which Linnaeus has applied it. (See Zinger.) Dale has very judifly observed on this subject, Pharmacologia, 275, that in the preuent imitate, as well as innumerable others, the Arabian writers are fo brief, as well as vague, in their defcriptions, and fo contradictory amongst themselves, that we can scarcely tell whether they were acquainted with any particular objeét or not.

Wendelband, Jacquin, and Poiriet, (Lamarck Dict. v. 8. 857,) have most unaccountably made a genus of Alpinia nutans, and called it Zerumbet; but this cannot on any principle be maintained.

ZERYNTHUS, in Ancient Geography, a town of Thrace, which had a cavern of the fame name, and which the ancients called Zerynthium Antrum. This cavern was concreted to Hecate, to whom they sacrific'd cows. Suidas.

ZERHEN, in Geography, a town of Arabia, in Yemen; 36 miles S.E. of Ghazar.

ZESEMIT, a town of Bohemia, in the circle of Chrudim; 8 miles N. of Chrudim.

ZESSEL, a town of Silefia, in the principality of Oels; 5 miles N.E. of Oels.

ZEST, the woody thick skin quartering the kernel of a walnut. Some physicians prefer this zest, dried, and taken with white wine, as a remedy against the gravel.

The word is also used for a chip of orange or lemon- peel; such as is usually squeezed into ale, wine, &c. to give it a flavour; or for the fine thin oil that spurt's out of that peel on squeezing it.

Hence, to zett an orange or lemon, among confectioners, is to cut the peel from top to bottom into small slips, as thin as possible; or, to zett, is to squeeze the peel over the surface of any thing.

ZESTO-
ZEUS, a term used by some medical authors to express bathing in warm water, by way of distinction from _pluchrolia_, or bathing in cold water.

ZETA, or _Zeta_, a little closet, or withdrawing chamber, with pipes running along the walls, to receive from below either the cool air, or the steam of warm water.

The word is formed either from _ζητεω_, to be warm; or of _ζητης_, viscer, to live, on account of the use made hereof for love and enjoyment.

Zeta, or _Zetta_, (Mensil) in _Ancient Geography_, a town of Africa Propria, situated near the sea, E. of Vicus Augusti.

ZETETE, _Zetetan_, among the Athenians, were officers appointed upon extraordinary occasions, to inquire after the public debts, when, through the neglect of the receivers, or by other means, they were run up to large sums, and began to be in danger to be lost, if not called in.

ZETETICE, _Zetetics_, formed from _ζητεω_, I seek, or zetetic method, in _Mathematics_, the method made use of to investigate or find the solution of a problem.

The ancient Pyrrhonians were sometimes called Zetetics.

q. d. secker.

ZETIN, in _Geography_, a town of Croatia; 28 miles W.N.W. of Novi.

ZETLAND, or Shetland, the name of a cluster of islands, situated in the Northern ocean, between the 50th and 62d degrees of N. latitude, and a very little to the W. of the meridian of London. The most southern part is nearly 100 miles N.N.E. from the northern county of Scotland. These islands exceed one hundred in number, of which only thirty-four are inhabited; the others, confining chiefly of rocks and fands, are unfitted for human support. By different writers, they have been named Hethland, Hialtland, Zetland, Shetland, and Shetland; which names, Dr. Edmondston says, "are of Norwegian origin, and are supposed to be descriptive of their form or appearance." The most correct and approved orthography is that of Zetland.

The general appearance of these islands is bleak, bare, and rocky; but some interior parts of the main-land are cultivated, clothed, and cheerful. In many places on the coasts, rocks of immense size are seen to rise above the foaming waves, some of which are at considerable distance from the shores. Some of these are also perforated by vast natural arches; in other parts there are deep caverns and subterranean recesses. Two of these are called the Seranda, one of which extends above 300 feet in depth. Almost all the large islands are deeply intersected by tortuous bays, or voes, as they are provincially called, which afford facilities for internal communication, and excellent harbours for vessels. Several of them are commodious, and well sheltered from dangerous winds. Some of the islands have lakes, the largest of which is not more than two miles in length. The highest hill is Moes Ronaldi, in the parish of Northmaven; the height of which, from barometrical measurement, is 3944 feet above the level of the sea. Some of the headlands are lofty and grand, one of which, Nofa-head, is above 600 feet in height.

According to the population reports of 1811, the following is the enumeration of houses and inhabitants, and the names and number of parishes. The total number of houses 8230, inhabited by 9238 families, 16 houses buildings, and 101 unoccupied. The whole population was 46,153, consisting of 20,451 males and 25,002 females. The parishes are: 1. Aithillting and Sandilting; 2. Breffay, Burra, and Quarll; 3. Delting; 4. Dunrolla, Sandwick, Cumnibrough, and Farraisle; 5. Lerwick and Gulberwick; 6. Lunnafing, Neiling, Skerries, and Whielfay; 7. Northmavine; 8. Tingwall, Whiteneifs, and Weildale; 9. Unfl; 10. Walls, Sandnefs, Paps, and Fonta; 11. Yell (North) and Fellar; 12. Yell (South and Middle).

As the chief histories and topographical peculiarities of the Zetland islands have been fully detailed under the words _Mainland_, _Lerwick_, and _Scallaway_, the reader is referred to each word respectively.—A View of the ancient and present State of the Zetland Islands, by A. Edmondston, M.D. 2 vols. 8vo. 1809.

ZETLAND _Islands_, Foula or Fula, the most western of the Shetland islands, and is supposed to be the "Ultima Thule" of the ancients. It is about three miles long and one and a half broad, nearly twenty miles distant from any land, W. of the clusters of Orkney and Shetland, to which it is politically annexed: it affords excellent and extensive pasturage for sheep; and is inhabited by 26 or 27 families.

ZETERITZ, a town of the principality of Cumbach; 11 miles S.W. of Cumbach.

ZETUS, a word used by some of the chemical writers as a name for vitriol.

ZEVACO, in _Geography_, a small island in the Pacific ocean, near the coast of Veragua. N. lat. 8.°, W. long. 81° 46'.

ZEVEN. See Cloister Seven.

ZEVERNAER. See Sevenaer.

ZEU, or GAER, a town of the kingdom of Balk; 100 miles S.E. of Balk.

ZEGITÆ, _Zeytus_, among the Athenians, the third class of the people, or those who had an estate of two hundred medimni.

ZEGITIÆ, in _Botany_, an ancient name, adopted by Browne, but no otherwise applicable to the present genus, than as far as concerns its hearty habit. The _Zygites_ of Pliny was a large Buratomic reed, so called from _ζυγω_, a yoke, because it was bound together, in portions of different lengths, to make the pastoral pipes; as wheaten straws are, by our shepherd's boys, to this day; but the Celt Indian; of which we are now to give an account, has not even this coincidence with the original.—Browne Jam. 344. Schreb. Gen. 810. Wild. Sp. Pl. v. 4. 204.—Clafs and order, _Monoea Triandra_. (Rather Triandra Digynia.) Nat. Ord. Gramina. Linn. Jaff.

Gen. Ch. Common _Calyx_ a glume of two valves; the outer one broadest, concave, abrupt and jagged, ribbed; membranous at the edges; the inner narrower, sharper and keeled. _Male Flores_ two, smallest, on a common stalk the length of the solitary female floret, within the common calyx. _Perianth_ none. Cor. Glume of two ovate-oblong, compressed, bluntish, awnles, equal valves. _Stam._ Filaments three, capillary, the length of the corolla; anthers oblong, cloven at each end.

Female within the larger glume of the common calyx, sessile. _Perianth_ none. Cor. Glume of one oblong concave valve, twice the size of the calyx, bordered towards the top with a dilated membrane, awned; the own terminal, capillary, straight, half as long again as the glume. _Pij._ German oblong; style divided; stigma long, shaggy. _Peric._ none. _Seed_ solitary, oblong.

Obf. Schreber remarks, that this grass differs so entirely, in every character, from _Aphides_, with which Linneus combines it, that they are totally irreconcilable. We should refer both, with all other true _Gramina_, as in _Fl. Brit._ to the _clafs Triandra._

Eff. Ch. Common _Calyx_ of two valves, with three flowers; the female one sessile; the male stalked. _Corolla_ of
of the males of two beardless valves; of the female of one awned valve. Style divided. Seed oblong.

   (Z. arundinaceus, ramous, minor, rufescens; paniculam
   parafar terminalis; Browne Jam. 344. t. 4. f. 3. Apluda
   Zeugites; Linn. Sp. Pl. 1487. Amer. Acad. v. 5.
   (not 5). 412. Swartz Obs. 384.)—Native of Jamaica.

Found by Dr. Browne at Cold-spring, in the mountains of
New Liguanea, in a rich soil, and shady situation. His
original specimens are in the Linnean herbarium. The root
is said to be perennial. Stem two feet high, much branched,
ascending, round, jointed, polished, brownish, leafy, rather
slender. Leaves alternate, on slender stalks, each with a
long sheathing base, reclinate, or nearly pendulous, ovate,
acute, entire, smooth, many-ribbed, from an inch to an
inch and a half long, and from half an inch to an inch
broad. Panicles terminal, from the sheaths of the uppermost
leaves, compound, spreading, with smooth slender branches.
Glumes green, articulated, smooth. The habit is
no less foreign to the genus Apluda than the generic
characters.

ZEUGMA. Zeugma, literally denoting a joining together;
from ζευγμα, I join, a figure in Grammar, whereby
an adjective, or verb, which agrees with a nearer word, is
also, by way of supplement, referred to another more
remote.

Thus Terence, "Utinam aut hic frurus, aut haec muta
faeta fit." So Virgil, "Hic illius arma, hic currus fist."
In which cases, the words faeta fit agreeing primarily with
haec muta, are also made to agree or extend to hic frurus;
and the verb fist is not only referred to hic currus, which it
properly respects, but farther to hic illius arma.

Of this species of ellipsis, which differs from the ellipsis
properly so called, in that the word which is to be under-
stood once or oftener, has been already mentioned, Melleeurs
De Port Royal enumerate three sorts; viz. when we repeat
the noun or verb in the same manner it has been already ex-
pressed; or when the word expressed cannot be repeated
without receiving some alteration in gender, case, number,
or person; or when, after a word which includes the whole,
a distribution of the parts is made without repeating the

The Latins, it may be here observed, take a liberty in
 constructions, which some of the nicer critics among the
moderns, particularly the French, will not allow in the
modern tongues.

ZEUMGA, (Room-Kala,) in Ancient Geography, a town
of Affia, or a place on the right bank of the Euphrates,
S.E. of Samofata, and over against Apamea.

ZEVICO, in Geography, a town of Spain, in the pro-
vince of Leon; 10 miles S.E. of Palencia.

ZEVIO, a town of Italy, in the Veronese; 10 miles
S.S.E. of Verona.

ZEVKETI, a town of the principality of Gurzel; 25
miles S.E. of Puti.

ZEULEN, a town of Bavaria, in the bishopric of Bam-
berg, on the Rotach; 21 miles N.E. of Bamberg. N.
lat. 50° 13'. E. long. 11° 16'.

ZEULENRODA, a town of Saxony, in the county
of Reiful, containing two churches and 350 houses. Here
is a manufacture of fluffs, and a considerable one of flock-
ings; 10 miles W. of Greitz. N. lat. 50° 36'. E. long.
11° 57'.

ZEU, in Ichthyology, a genus of fish, of the order of
the thoraci; the characters of which are, that the head
is compressed and declining; the upper lip is arched by means
of a transverse membrane; the tongue is awl-shaped; the
branchiostegous membrane has seven perpendicular rays, the
lowest placed transverse; the dorsal fins, in most species,
 furnished with projecting siliform rays; and the body is
compressed, broad, thin, and of a bright colour. The
species enumerated by Gmelin and Shaw are the following:

VOMER. Silvery dory, with the second ray of the dorsal
fin very long. Bloch. (See Vomer.) Its shape is rhom-
obidal, length fix or eight, or more, inches, body thin,
without scales, tinged on the upper parts with a blueish
cast, mouth with small teeth. Native of the American feas,
and sometimes seen in the north of Europe: eatable,
but not much esteemed.

GALLUS. Silvery dory, with the tenth ray of the dorsal
and second of the anal fin longer than the body. Shape
and length, and body, like that of the former; back tinged
with a greenish hue, head large, mouth wide. Native of
the American and Indian fea, effulent: when first taken
grunting, like the gurnards. The abacutaja of Marc-
grave.

FABER. Gold-green, fuliginous dory, with a dusky
central spot on each side of the body, or with a rounded
tail, brown spot on the middle of the sides and two anal
fins. Linnaeus. This is the common dory (see Dorre),
which is a native of the Mediterranean, Northern, and
Atlantic seas. Its head is large and long; length generally
twelve or fifteen inches, and weight ten or twelve pounds;
mouth wide, lower jaw longer than the upper, teeth small
and sharp, eyes large, body covered with small scales, and
marked with a curved lateral line, which defending pretty
suddenly from the gill-covers, passes on to the tail; back
arched, and furnished with a row of strong, small prickles,
continued along the curve of the abdomen; two very strong
and sharp spines at the base of the pectoral fins. The in-
troduction of this fish, as excellent food, to the tables
of the higher ranks, is of no remote date; Mr. Quin being
considered as the founder of its peculiar reputation in the
polite circles. This fish is of a very voracious nature,
preying on smaller fishes and their spawn, as well as various
kinds of sea-insects, the smaller shell-fish, &c. It emits a
noise like that of the gurnards and scorpionfishes, when first
taken, by violently forcing out the air from its gill-covers.

Reddish dory, with rough scales and even tail;
small species about three inches long, resembling the
common dory in habit; front protuberant, and turning up-
wards; no perceptible teeth; eyes large, with white irides;
two dorsal fins, the anterior having nine strong and sharp
spines, the first low and scarcely visible, the second four
times longer, and the third very long and thick; the second
dorsal fin consisting of twenty-three short rays; the vent-fin
having twenty-six rays, the pectoral fins about fourteen,
and the ventral fin. This fish generally refines at the bot-
tom, and is accidentally taken after great storms; it is not
eatable, being small, coarse, and of an unpleasing flavour.
It is a native of the Mediterranean.

INSIDIVATOR. Silvery dory, with fins speckled with
black, and narrow extremity mouth; shape rhomboidal;
smaller than Z. ciliaris; colour bright-silver, blueish-green
above, and speckled with black points; body without scales;
lower lip retrorse, and mouth capable of forming a tubular
shout, for ejaculating a drop of water against such insects as
happen to alight on or fly about the aquatic plants near the
shores of the waters it inhabits, and thus obtain its prey.
A native of the rivers and fresh-waters of India.

CILLARIUS. Silvery dory, with some of the rays in the
dorsal and anal fin excessively long; body rhomboidal, thin,
without scales, and of a bright-silver colour, with a blueish
or
or greenish cast on the back, and small and flopping; lower jaw longer than the upper; teeth small and sharp; several of the last rays of the doralf and anal fin extending farther than the tail itself, the long and flexible filaments of which von d' Cepe de imagines attract small fishes, which mistake them for worms, the dory himself lying concealed among sea-weeds, &c., and waiting for its prey: the count also conceives that these may serve to sustain the fish by coilng round the fronds of sea-plants, &c. A native of the Indian seas; but not esteemed as food, being small and coarse.

**Luna or Opah.** Dory with somewhat lunate tail; the body being generally either red, green, or purple, with oval white spots. This is a superb species, and found, probabably wandering from the warmer regions, in the Mediterranean and Northern seas, the largest species of the kind, being between four and five feet in length, in colour varying from a bright silvery-green ground to a bright gold colour, and variegated on the sides with pretty numerous and moderately large oval white spots, while the fins and tail are bright scarlet; the skin seemingly dititute of scales and perfectly smooth.

Specimens of this fish have been occasionally thrown on the British coasts, one of which is described under the article Opah. A dried specimen of this fish may be seen in the British Museum.

**Quadratus.** Grey dory, with transverse dusky or a cinereous body, and even tail. This fish, found in the sea which washes the coast of Jamaica, is described by Sir Hans Sloane, as five inches long and four broad in the middle, narrowing from thence gradually to the head and tail; mouth small, but with rows of small, sharp teeth; tongue round and cartilaginous; pupil large and black, in a white circle; seven fins; tail almost square; whole body clothed with grey or ash-coloured scales, having three or four transverse black lines; with a very crooked line from head to tail.

**Zeus, a species of scorpæa.** See Scorpea Porcus.

**Zeuxis,** in *Biography,* a celebrated ancient painter, who is said to have been a native of Heraclea, either in Greece or Magna Graecia, and to have commenced the practice of his art in the fourth year of the 93th Olympiad, B.C. 397. According to Quintilian, he is the first artist who understood the proper management of lights and shades, and to have excelled in colouring; but ambitious of imitating the strength and grandeur of Homer's manner, he is charged with giving unsuitable bulk to the heads and maffiveness to the limbs of his figures. Notwithstanding these alleged imperfections, he attained distinguished excellence; and in the profession of it he was attentive even to the minutest circumstance. Many instances occur in his history to this purpose. In his picture of Helen, executed for the Crotonians, as an ornament for their temple of Juno, he determined to combine every quality that might constitute a perfect beauty; and with this view he selected five of the handsomest females of Crotona, and transferred to his picture, from their naked charms, an assemblage of all that were most perfect in their kind. This figure has been exalted as the finest specimen of art existing; and under it the painter, not unconscious of his merit, inscribed the lines of Homer, in which Praxiteles expresses his admiration of the beauty of the real Helen. Every one who saw it, before it was placed in the temple, paid the painter a fee, which, added to the liberal recompense of the Crotonians, amply repaid him for his skill and labour. This enabled him to gratify his vanity by making presents of his pictures, for which no adequate price could be given. To such a degree was he enriched by his art, that he was able to indulge his vanity by appearing at the Olympic games with his name embroidered in golden letters upon his mantle. Such were the failings of a man, who rendered his name illustrious by the supereminent exercize of his art. Among his most famous performances are enumerated a Jupiter on his throne, with the other gods standing round—a Hercules in his cradle, strangling the serpents, Alcmena and Amphitryon witnessing the exploit with terror—a Penelope, with an expression conformable to her character—a Cupid crowned with roses, for the temple of Venus at Athens—a Mar Yas bound, afterwards placed in the temple of Concord at Rome—and a group of Centaurs. The time of his death is not known; but as to the manner of it, the following whimsical anecdote is recorded: after having painted an old woman, whilst he was attentively surveying it, he was seized with such a violent fit of laughter, that he died on the spot. Phiny Hist. Nat. Gen. Biog.

**Zeua, in Geography,** a river of Austria, which rises near Ercsprung, and runs into the March; 6 miles E. of Zillerdorfg.

**Zeyl.** See Zion.

**Zeyland,** a small island near the coast of Lapland. N. lat. 70° 10'.

**Zeyring,** a town of the duchy of Stiria; 6 miles N.W. of Judenburg.

**Zeza,** a river of Portugal, which rises in the east part of Estremadura, and runs into the Tagus, at Tancos.

**Zezarine,** or Kerazin, a small island in the Persian gulf, hardly half a mile in length. N. lat. 28° 8'.

**Zfolkier,** a town of Saxony, in the circle of Erzgebirg; 8 miles N.W. of Grunhyh.

**Zha,** a river of Africa, which forms the east boundary of Fez, and runs into the Mullooa.

**Zhelieviz, Ziehov,** or Cybe, a town of Chinese Tartary, in the country of the Mandshurs, not far beyond the great wall, and summer residence of the emperor of China; 120 miles N.E. of Peking.

**Zia,** an island in the Grecian Archipelago, anciently called "Ceeos" and "Hydraeas," about 16 leagues in circumference. The inhabitants are Greeks, who have a bishop. The soil is fertile, and they have a good breed of cattle, with plenty of wild fowl, especially partridges and pigeons. The chief manufactures are, silk, camlets, and a fort of cloaks made of goats' hair. Among the productions of the island may be reckoned the velani, a species of acorn much esteemed. Of four considerable towns or cities in this island, the only one at present remaining is Carthea, or Zelia, containing about 7500 houses, with a harbour capable of receiving vessels of considerable burden, and where a whole fleet may ride in security from every gale, in every depth of water, and in very good anchoring ground. The entrance into this creek or arm of the sea is very safe by keeping it, according to the sea-phrase, open; but when once within it, ships of whatever burden may ride where they please to an anchor; 10 miles E. of Cape Colomni. N. lat. 37° 30'. E. long. 24° 24'.

**Zia, Ziba, or Sibah,** in *Ancient Geography,* a city beyond Jordan; 5 miles W. from Philadelphia.

**Ziatek, in Geography.** See Saul.

**Zib.** See Zion.

**Ziba,** a town of Arabia, in the province of Hedjaz; 20 miles S.S.W. of Median.

**Zibatskoi,** a fort of Ruffu, in the government of Kolivan, on the Irtysh. N. lat. 54° 44'. E. long. 92° 20'.

**Zibel.**
ZIBELLINA. See MUSTELA Zibellina, and Sable.

ZIBER, in Geography, a town of European Turkey, in Bulgaria, on the Danube; 24 miles S.S.E. of Vidin.

ZIBET, or ZIBITH. See ZEBID.

ZIBETHA, in Zoology. See VIVERRA Zibetha.

ZIBETHUM, or Zibeta, in Natural History, civet, a perfume contained in a bladder, in the groin of a civet-cat. See CIVET.

ZIBIBLA, a name given by some authors to a large fruit of raisins, resembling the fruits of dates in shape; they have much pulp, but very little moisture.

ZIBREIRA, in Geography, a town of Portugal, in the province of Beira; 30 miles S. of Alfarates.

ZIBRITZ, a river of European Turkey, which runs into the Danube, near Ziber, in Bulgaria.

ZIBU. See SIBU.

ZICCARA, a name of an Indian fruit, resembling a pine-cone, and containing twenty, thirty, or more kernels, of no known use in medicine.

ZICHANS, in Geography, one of the tribes of mount Caucasus, collaterally related to the Tschekelians or Cingarillas. The Zichians or Tschekians, called by the Russian Yari, are the principal inhabitants of the island of Taman. They formerly paid a small tribute to the Krimean khan; in all other respects they are governed by their own boys. The noble Afchikin or Afchuyef is likewise inhabited by Zichians. The Auckanians and Zichians are two tribes, which, properly speaking, are only one collateral branch of the Tschekelians, having belonged to the Russian empire, as inhabitants of the Kuban, since the year 1783. See CIRCASSIA.

ZICKAR, a mountain of Algiers, anciently called "Garpham." 18 miles S. of Sherifghel.

ZIDDIM, or ASEDIM, in Ancient Geography, a city of Naphthal. Jobh. xix. 35.

ZIDRACH, in Natural History, the name given by Cuba, and some other authors, to that species of the fynghanthus of Artedi, commonly called the hippocampus.

ZIECKRA, in Geography, a town of Saxony, in the circle of Neudlitz; 4 miles S. of Auma.

ZIEGELBACH, a river of Germany, which runs into the Rhine, near Grenzheim.

ZIEGENBALG, BARTHOLOMEE; in Biography, a Lutheran German divine, was born in 1663 at Pulinitz, in Upper Lusatia, and finished his education in the university of Halie. In 1708 he was ordained at Copenhagen, with a view of being sent as a missionary by Frederick IV. king of Denmark to India. In 1706 he arrived at Tranquebar, but he was there opposed and imprisoned, so that he resolved, upon his release, to return to Europe. In 1715 he landed at Bergen in Norway, and after having visited Copenhagen, in order to give an account of his mission, and to receive further instructions, he travelled through Germany and Holland into England, and from thence to India in March 1716. On his return to Tranquebar, he established a Portuguese and Malabar printing-house, in which many of his own works were printed. In the faithful and laborious discharge of his missionary duty he employed 13 years, at the close of which period his life terminated by a disorder probably owing to his intense application. This event happened in February 1719, in the 36th year of his age. His works were numerous, and of those the principal are mentioned in the Gen. Biog.

ZIEGENFELD, in Geography, a town of Bavaria, in the bishopric of Bamberg; 12 miles N.E. of Bamberg.

ZIEGENHALS, a town of Silezia, in the principality of Neisse: this place is famous for its manufactures of beautiful glass. Here are some iron-works; 10 miles S. of Neisse. N. lat. 50° 12'. E. long. 17° 17'.

ZIEGENHAYN, a town of Germany, and chief place of a county of the same name, in the principality of Hesse. It is situated in a morass, and can be occasionally inundated. In this place were kept the archives of the Sovergn families of Hesse. The counts of Ziegenhayn are extinct; 15 miles S. of Fritzlar. N. lat. 50° 50'. E. long. 9° 15'.

ZIEGENRUCK, a town of Saxony, in the circle of Neudlitz, on the Saal; 10 miles S. of Neudlitz. N. lat. 50° 32'. E. long. 11° 42'.

ZIEGLER, JAMES, in Biography, a learned writer of the 16th century, was born at Landshut in Bavaria, and having studied in the university of Ingolstadt, finished his education by visiting the libraries of foreign countries, and cultivating the society of learned men. He refided several years at Rome, collecting in the history of Leo X. and Clement VII. every anecdote that tended to the discredit of the papal court; and in his conferences with learned Sweden, materials for a correct history of Scandinavia, and of the cruelties committed by Christian II. of Denmark. It appears that, besides some other poets which he occupied, he was for some time professor at Ingolstadt, and, as some say, of mathematics at Upsal. He was for a considerable time a teacher at Vienna, from whence, for fear of the Turks, he retired to Wolfgang, bishop of Paffau in Bavaria, under whose protection he composed some of his works; and he died at Paffau in 1549. The earliest of his publications, whilst he was a Catholic, was written against the Waldenses, and printed at Leipsic in 1512. His other works are multifarious, confining of geographical, historical, political, mathematical, and controversial tracts, abounding with literary researches. Although he did not openly renounce the Roman Catholic religion, he favoured the cause of Luther and the reformers. Thuan. Hist. Moreri. Gen. Biog.

ZIELENZIG, in Geography, a town of the New Mark of Brandenburg. This town belonged in a considerable degree to the knights of Malta; 18 miles S.E. of Culfrit. N. lat. 52° 30'. E. long. 15° 16'.

ZIENWALD, a town of Saxony, in the margravate of Meifen; 4 miles S.S.W. of Lauenfein.

ZIECKOWITZ, a town of the duchy of Stiria; 4 miles E.E. of Windfich Feiftritz.

ZIERENBERG, a town of the principality of Hesse Caffel; 11 miles N.W. of Caffel. N. lat. 51° 22'. E. long. 9° 20'.

ZIERIA, in Botany, was so named by the writer of the present article, in memory of the late Mr. John Zier, F.L.S., who, as Dr. Sims records in the Botanical Magazine, "having been appointed to a professorship in a Polich university, was preparing to leave this country, but was prevented by a chronic disease, which terminated in death." That Mr. Zier was "a learned and industrious botanist," we are most ready to confirm by our own testimony. He was so less meritorious in his private character, and bore with modesty and patience those privations, which too often belong to literary merit in a foreign country, especially where canting and time-serving are out of the question. We have been informed that Mr. Zier was the coadjutor of Mr. William Curtis (see that article), in part, at least, of the celebrated Flora Londinensis; taking upon himself the technical Latin defcriptions, while Mr. Curtis was engaged in those practical observations, experiments, and scientific distinctions, which make the peculiar merit of the work.

Gen. Ch. Cal. Perianth inferior, of one leaf, in four deep, ovate, rather acute, equal, permanent segments. Cor. Petals four, ovate, pointed, somewhat conicous, downy, equal, longer than the calyx, alternate with its segments. Stam. Filaments four, alternate with the petals, awl-shaped, simple, smooth, infixed, much shorter than the corolla, each inserted into a globular gland, projecting above their base at the inside; anthers terminal, roundish, with a minute point. Pif. German superior, roundish, four-lobed; ftyle terminal, crested, columnar, the length of the filaments, deciduous; stigma capitulate, four-lobed. Peric. Capsules four, connected at their inner edge, each compreiured, abrupt, of two valves and one cell. Seeds solitary, oval, compreiured, each enclosed in a horny elastic tunic of two valves.

We are acquainted with four species of this genus, confiding of shrubs, natives of New South Wales, with opposite, thalke, ternate leaves, and white flowers. It is allied to Boronia, (see Rutacea) as well as to Crowea, Eriostemon, Correa, Phebalium, and Melicope, to which we refer the reader. Zieria is essentially characterized by the insertion of each of its filaments into the outside of one of four large glands, standing on the receptacles, at the base of the geiton, as well as by the simplicity of these filaments, in the other part of their structure. All the species abound with minute dots on their leaves, flak, and calyx, lodging an essential oil, whose qualities are more or less acid and aromatic.

1. Z. lancealata. Lanciolate Zieria. Brown MSS. (Z. Smith; Andr. Repoff. v. 606. Curt. Mag. t. 1395. Ait. Epit. 376.)—Clas ter axillary, repeatedly three-forced. Leaves lanceolate, flat, acute. Branches and flacks short.—Sent from Port Jackson, New South Wales, by Dr. John White, in 1795. It was found by Mr. Aiton to have been introduced into the English gardens in 1803, where it proves a tolerably hardy green-house flower, blooming in the spring and early part of summer, and may be increased from cuttings. The flak is bulky, of humble growth, being feaxly three feet high, with round, purplish, leafy branches, rough with glandular, warts, and when young, bejinkled with minute, hairs, rigid pubescence. Foostalks warty, channelled, near an inch long, delitute of stipular, each bearing three lanceolate, flat, entire, smooth, single-ribbed leaflets, confined to the middle. The middle one rather the largest, being two inches, or two and a half, in length. Panicles opposite, axillary, often two together, somewhat hairy, repeatedly forked, many-flowered, various in length, spreading or slightly, downy, their flacks quadrangular, purplish. Flowers white, each about the size of a Privet-bloom, with yellow anthers. Capsules brown, dotted with glands. Tunic of the seeds white and shining.

We agree with Dr. Sims in preferring an expreffive specific appellation to one taken from the name of a botanist, and, therefore, as the genus in question was not established on this species more than the rest, all, except the last, having been equally considered, we are happy to let the example of an alteration, in which we can have no other motive than propriety and common advantage. We had called this species multiflora; but we consider the synonym in the Botanical Magazine as a publication of the unexceptionable name given by Mr. Brown.

2. Z. levigata. Smooth Zieria.—Clas ter axillary, three-forked, corome. Leaflets linear, revolute. Branches and flacks very smooth.—Gathered by Dr. White, near Port Jackson, New South Wales. The branches of this pretty species are quadrangular, and very smooth, like every other part, except the petals. Leaves smaller than the foregoing, with somewhat of a glaucous appearance. Foostalks about half a quarter of an inch long. Leaflets scarcely an inch, acute, polihed, strongly revolute, dotted with glands, and somewhat tinged with purple. Flowers a little larger than the last, and much fewer, the panicles being always solitary, much less compound, and situated chiefly towards the upper part of each branch. The flacks are acutely quadrangular, and very smooth. Calyx brown or reddish, taper-pointed, likewise quite smooth. Petals downy on both sides, like a piece of woolen cloth.

3. Z. paniculosa. Few-flowered Zieria.—Stalks axillary, with one or three flowers. Leaflets linear-obovate, somewhat revolute. Branches and flacks hairy. Segments of the calyx lanceolate, taper-pointed.—Sent from Port Jackson, with the former, by Dr. White, in 1795. A small flark, with slender, round, feaxly quadrangular, branches, which are more or less copiously clothed with erect, slightly hairy leaves. The half of the leaf of the last; their leaflets dilated upwards, and obtuse, a little crenate towards the end; copiously dotted, rarely hairy, on the upper side; sometimes very hairy beneath, but occasionally quite smooth. Flowers very small, often quite solitary, on an axillary flak, with a pair of small acute bracteas; sometimes there are three flowers on one flak. Segments of the calyx broad at the base, but tapering suddenly into a long point. Petals minutely dotted with tufts of flary hairs, giving them a warty, or granulated, aspect. Capsules tuberculated, sometimes hairy; curiously reticulated at the ends. Seeds black, rather opaque, with a shining white, at length convoluted, tunic, whole edge is minutely fringed. The hairy and nearly smooth varieties of this plant look different at first sight, but we cannot detect a specific distinction.

4. Z. quinquefolia. Downy Zieria.—Stalks axillary, three-forced, lealy. Leaflets obovate, entire, downy on both sides. Branches and flacks downy.—Native of New South Wales, from whence we obtained a specimen through the efforts of Sir J. St. Vincent in 1805. Whether this be Mr. Brown's arborifera, mentioned by Dr. Sims, we have at present no means of knowing, and therefore we are obliged to describe it by a name which appears to us very expressive. Every part is clothed with fine dense soft pubescence, appearing flattened and entangled under a high magnifier. Branches round. Foostalks half an inch long. Leaflets about an inch in length, entire, slightly revolute; their upper side peculiarly soft and velvet-like; the under soft hairy. When held against the light, they appear full of pilose dots. Calyx very downy; its segments broad and ovate. Petals about twice as long, and of the same shape, downy. We have not seen the ripe fruit.

ZIESAR, or ZIEGESAR, in Geography, a town of the Middle Mark of Brandenburg; 18 miles S.W. of Brandenburg.

ZIELTZ, a town of the Middle Mark of Brandenburg; 10 miles S.W. of Brandenburg.

ZIEZAR, a town of Spain, in the province of Murcia; 22 miles N.W. of Murcia.
ZIFIUS, in Ichthyology, a name given by Albertus to the xiphias, or sword-fish. See Xiphias.

ZIGADENUS, in Botany, a genus of Michaux, Boreal.-Amer. v. 1. 213. Pursh 241. The name, formed of ζιγας, a yoke, and αδης, adhes, a gland, evidently alluding to the pair of glandular depressions in each petal, ought therefore to have been Zygadenus. We do not, however, believe that this genus can be separated from Helonia. See that article.

The species are,

H. glaberrima. Smooth-leaved Helonia. Ker in Curt. Mag. t. 1689. (Zigadenus glaberrimus; Michaux as above; 214. t. 22. Pursh n. 1. Ait. Epit. 376.)—Leaves linear, channelled, recurved. Stalk leafy. Bracteas ovate, pointed as well as the petals.—In low meadows of Virginia and Lower Carolina, perennial, flowering in June and July. Pursh. Root bulbous. Leaves a span long, concave, spreading. Stalk two feet high, bearing several, gradually diminishing, leaves, and terminating in a panicle of several greenish-white flowers, the size of Pervatum album, each of whose petals is marked, near the base, with a double glandular, apparently necarianous, depression. Stamina distinct from the petals. Seeds tunicated. We know not whether they be fo in any other Helonia.

H. elegans. Elegant Helonia. (Zigadenus elegans; Pursh n. 2.)—Leaves linear, flat, eréct. Stalk nearly naked. Bracteas linear. Petals acute.—On the waters of Cokahlenfik river, near the Rocky Mountains, found by governor Lewis, flowering in July. Radical leaves eréct, linear, very long, smooth, ribbed, flat. Stalk taller than the foliage, about two feet in height, round, fimple, bearing one or two short leaves. Cluster many-flowered, occasionally branched at the bottom. Bracteas as long as the partial flalks, membranous, ribbed. Flowers white, the size of Melanthium virginicum. Petals ovate, acute, with something of a claw, marked at the base with two vermilion spots. Filaments shorter than the corolla. Stigmas three, reflexed. Pursh.

ZIGAE, in Ancient Geography, a people of Asiatic Sarmatia, on the bank of the Tanais. Pline.

ZIGALOVKA, in Geography, a town of Ruffia, in the government of Irkutflk; 16 miles N.W. of Tufura.

ZIGANEAH, a mountain of Algiers; 18 miles S. of Conflantina.

ZIGANSK, a town of Ruffia, in the government of Irkutflk, on the Lena; 1472 miles E. of Tobolfsk. N. lat. 67°. E. long. 120° 32'.

ZIGIRIA, or Zighirah, in Ancient Geography, a town of Africa Proprina, between the town of Thabraca and the river Bagradas. Ptolemy.

ZIGER, a word used by some of the old writers to express a very fine kind of caffia, extremely aromatic to the taste, and of a purplish-black colour.

ZIGERE, in Ancient Geography, a town of the interior of Thrace, on the borders of Lower Macedonia.

ZIGET, in Geography, a town of Hungary, situated between the streams of a small river, which unite below the town, and soon after run into the Drave. It is on every side surrounded by a morais, and defended by moats, walls, and bastions; 44 miles S.E. of Canificha. N. lat. 46° 8'. E. long. 17° 56'.—Allo, a river of Hungary, which runs into the Drave, 12 miles S. of Ziget.

ZIGIRA, in Ancient Geography, a town of Asia, in Afflia, towards the N., and at a great distance from the Tigris. Ptol.

ZIGURELLA, in Ichthyology, the name by which some have called the julis, a small but very beautiful fish, common about Genoa, and in some degree approaching to the nature of the turdus or wraff. It is a species of the labrus, according to Artedi, and is distinguished by the name of the palmaris labrus, with two large teeth in the upper jaw. See Labrus.

ZIGZAG TREFOIL, in Agriculture, a term sometimes applied by farmers to the perennial red clover, marl grafs, or wild red clover. See Clover and Trifolium Purpureum Perenne.

ZIKLAG, or SICALAG, in Ancient Geography, a city which Achsh, king of Gath, gave to David, while he took shelter among the Philistines (1 Sam. xxvii. 6.), and which afterwards always belonged to the kings of Judah. Joshua had allotted it to the tribe of Simeon. (Josh. xix. 5.) Ezechiell says, that it lay in the southern part of Canaan.

ZILA, in Geography, a river of Moldavia, which runs into the Pruth, 30 miles S.E. of Jaffy.

ZILEH, a town of Turkish Armenia; 30 miles S.S.W. of Arzhangan.

ZILGA, a river of Ruffia, which runs into the Oka, N. lat. 53° 4'. E. long. 101° 14'.

ZILS, in Ancient Geography, a town of Africa, in Mauritania Tingitana, marked in Anton. Itin. 24 miles from Tingis, between Tarbenre and Ad Mercuri. This was a colony established by Augustus, exempt from the jurisdiction of the kings of Mauritania, and dependent upon Bactia in Hispания.

ZILKEFEL, in Geography, a town of the Arabian Irak; 18 miles S.W. of Halhe.

ZILLEBA, a town of Arabia, in the province of Yemen; 35 miles E. of Loeheia.

ZILLER, a river of Tyrol, which runs into the Inn, 2 miles above Rattenburg.

ZILLY. See CILLY.

ZILMISSUS, in Ancient Geography, a hill of Thrace, on which was a temple dedicated to the god Sabadeus. Macробius.

ZILTAN, in Geography, a town of Africa, in the defert of Barea; 150 miles W. of Angela.

ZIMARA, in Ancient Geography, a town of Asia, in the Greater Armenia, at the foot of mount Capotis, in the place where the Euphrates has its source.

ZIMARA, in Geography, a town of Asiatic Turkey, in the government of Sivas; 55 miles E. of Sivas.

ZIMBAOA, or ZIMBAO, a town of Africa, in the kingdom of Sofala, and capital of Mocaranja. S. lat. 16° 40'. E. long. 33° 40'.

ZIMBRA. See ZOWAMORE.

ZIMENT-WATER, or COPPER-WATER, in Natural History, the name by which some have called water found in places where there are copper-mines, and lightly impregnated with particles of that metal.

The most famous spring of this kind is about a mile distant from Newfol in Hungary, in the great copper-mine called by the Germans berra grundt.

The water in this mine is found at different depths, and is received into basins, for the purpose of separating the copper from it; in some of these it is much more fated with this metal than in others, and will make the suppos'd change of iron into that metal much sooner. The most common species of iron used in the experiments are, horfeshoes, nails, and the like; and they are found very little altered in shape, after the operation, except that their surfaces are more raised.

The water appears greenish in the basin where it stands; but if a glass of it be taken up, it looks clear as crystal: it has no smell, but a strong vitriolic astringent taste, insomuch that
that the lips and tongue are blistered and scorched upon taking it.

The miners are well acquainted with the virtue of this water in changing the metals; but they also use it as a medicine: whatever scree, if they arefeied with, they first attempt its cure by a large dose of this water, which usually both vomits and purges them very briskly.

They also use it in disorders of the eyes, in some of which it must be of great power; but in others, it is very improper; so that upon the whole they do more harm than good with it.

The copper produced from these waters is valued by the people much beyond any other copper, as being much more ductile, and running easier in the fire: the people in the neighbourhood have many vessels of it; but it is to be observed, that its ductility and hardness increase after it is taken out of the water; for while immersed in it, it is friable.

It is observed, that after great rains the springs are always fuller than at other times, and the virtues of the water considerably less.

A pound of this water, when strong, evaporated over a gentle fire, becomes first turbid, and afterwards deposits a yellowish sediment, which evaporated to dryness, weighs two scruples and a half; and when warm water is poured upon this and filtered, fix grains of yellowish earth will be left in the filter; and the greenish solution being again evaporated to a pellicle, and the operation being several times repeated, somewhat more than two scruples of a bluish-green vitriol will be separated in small crystals.

A small quantity of oil of tartar being added to a pound of this water, the whole becomes turbid, and on filtration leaves a large residuum in the filter, which dried, weighs about two scruples and a half, and is found to be a cupreous vitriol, with a small mixture of a neutral salt. If a pint of this water be put into a bottle, and a small piece of iron thrown into it, bubbles will appear on the iron, which will gradually be changed to a copper colour. On the second day, the water will be turbid, and afterwards whitish, and white filaments will gather about the bottom and sides of the glass, and about the iron, which will appear throughout of a coppery colour. From these experiments, we may easily understand what the true nature of the water is; that it contains a large quantity of vitriol of copper, which it probably owes to a solution of that metal, by means of the acid of the common pyrites and water: when this is known, the effects are not difficultly accounted for, there being no real change of one metal into another; but the true state of the case being, that the particles of one metal are dissolved and carried away, and those of another metal deposited in their place. A water thus impregnated is a menstruum capable of dissolution of iron, and in the solution of that metal becomes so weakened as to let go the copper it before contained in small parcels. This is seen to be the case, by examining the changed metal while it lies in the water, the copper then appearing not a soft malleable and even mass, but a congeries of granules closely placed together, and resembling the small granules, or eva, in the spawn of fishes; and it is very friable and fragile while in this state.

This solution of one metal, and deposition of the particles of another in its place, is a thing very familiar in chemistry, and is seen every day in numerous instances; but in none so familiar as in a like cafe, or solution of iron and copper in the same menstruum. Thus, if a piece of copper be dissolved in aqua fortis, and when this solution is perfected a piece of iron be thrown into the liquor, the same thing will be seen that is in this spring, for the iron will be dissolved, and the copper which was before dissolved in the menstruum will be slowly precipitated and deposited in the place of it. Phil. Trans. N° 479, p. 353, &c. See on this subject the articles COPPER and VITRIOL.

ZIMEX, a word used by some of the old chemical writers for verdigrise.

ZIMITTI, in Geography, a town of South America, in the province of Carthagena, near a lake, 60 miles S. of Santa Fe de Bogota. N. lat. 7° 42'. W. long. 74° 6'.

ZIMMER, an island of the Red sea, much smaller than Foofti, (which see,) without inhabitants, and without water; though, by the cisterns that now remain, and are sixty yards square, hewn out of the solid rock, there is reason to imagine that this was once a place of confluence: rain, at certain seasons, falls here in abundance. It is covered with young plants of rack-tree, whose property it is to vegetate in fall water. It has also a considerable number of Siaal, or Acaacia-trees. In this island there are antelopes and byzans; and hence we may infer that water, without which these animals could not subsist, is found in some subterranean caves or chinks of the rocks, unknown to the Arabs or fishermen. Mr. Bruce found here plenty of the large shell-fish called Bicher and Surrumba, but no other. Foofti bears from this island 8 miles N.W. by N. 4° W. N. lat. 16° 7'.

ZIMMER, in Commerce, a term used for reckoning in Germany, and denoting 40 pieces.

ZIMMERMANN, J. G., in Biography, an eminent physician and miscellaneous writer, was born in 1728 at Brug, in the canton of Bern. Having completed his preparatory education at Bern, and chosen the medical profession, he placed himself in the university of Gottingen, under the tuition of the celebrated Haller; and on graduating in 1751, the subject of his thesis was the doctrine of irritability. His respect for Haller was testified in the account he gave of him in the journal of Neuchatel, printed in 1752. Having married at Bern a relation of Haller, he settled as a physician in his native town. The retirement of his situation afforded him an opportunity of composing many pieces in prose and verse; and in 1756 he published the first sketch of his popular work "On Solitude." This publication was followed by an "On National Pride," in 1758; by his work "On the Experience of Medicine," in 1763, and several others; and by "A Treatise on Dysentery," in 1766. In 1768 he accepted an invitation to occupy the vacant post of physician to the king of England for Hanover, whether he removed. In this situation, the accumulation of busineses furnished in some measure an antidote to the constitutional irritability of temper, and tendency to hypochondriacal complaints, which in the retirement of a small town had rendered him unhappy; and having occasion to place himself under the medical care of a surgeon at Berlin, on account of a local disease under which he laboured, his removal thither in 1771, and the notice that was taken of him by several personas of distinction, and even by the king, were favourable both to his health and spirits, and of course to his happiness. Having lost his first wife, he formed a second matrimonial connection in 1782; and by this union he was indebted for many of those comforts which counterbalanced and alleviated his afflictions. His remaining years were chiefly devoted to the completion of his work "On Solitude," which was published in four volumes. In the year 1786, Zimmermann was sent for to attend the great Frederick in his last illness; and
this visit gave him an opportunity of publishing an account of his "Conversations" with that celebrated prince. He was induced also, by the notice that was taken of him, to undertake a defence of the character of Frederick against the cen

censures of Count de Mirabeau. The severe criticisms to which these writings exposed him, and the part he took in the controversies that agitated the continent with regard to the principles that produced the French revolution, irritated his feelings and disquieted a mind like his peculiarly susceptible of contumely and reproach. His political and religious principles led him to view with jealousy and detestation those societies which, in his judgment, and in that of others of similar sentiments, aimed at the subversion of established forms and authorities, and to declare war against them. Such were his abhorrence and dread of them, that he addressed a memoir to the emperor Leopold, recommending the suppression of them by force; and he subjected himself to a prosecution for a libel by a charge brought against a person by name for an unavowed publication. His mind had arrived to such a state of irritation, that the approach of the French towards Hanover in 1794 almost subverted his reason. Dreading the confessions of their arrival, he abstained from food, waited to a skeleton, and died absolutely worn out in 1795, at the age of 66. "Such," says his biographer, "was the melancholy end of a man whose moral and intellectual qualities rendered him in a high degree the object of private friendship and public esteem." Tillof's Life of Zimmerman. Gen. Biog.

ZIMOVE, in Geography, a village of Russia, in the government of Irkutsk, where is a customs-house; 52 miles S.E. of Barguzinsk.

Zimove Tchikoi, a town of Russia, in the government of Irkutsk; 16 miles S.W. of Vitimkoi.

Zimove Tschakno, a winter habitation of Russia, on the N. coast of Baikal lake, in the government of Irkutsk. The word Zimove, in Russian, means a house or inn, built at a distance from a town, for the accommodation of travellers, where are generally found a warm room, fresh bread, and a kind of liquor called quafi. N. lat. 55° 20'. E. long. 109° 14'.

Zimove Zaminjoko, a town of Russia, in the government of Irkutsk, near lake Baikal; 76 miles S.E. of Vercholenk.

Zimovskaya, a town of Russia, in the country of the Cossacks, on the Choper; 48 miles W. of Arkadinska.

ZIN, Sin, or Senna, in Ancient Geography, a city S. of the land of promise. (Numb. xxxiv. 4.) See Sin.

ZINARI, in Geography, an island in the Grecian Archipelago. N. lat. 36° 59'. E. long. 26° 10'.

ZINARIA, a word used by the Arabians for a kind of vitiated bile, called vervinous bile.

ZINC, in Chemistry, the name of a metal, in Latin zincum. The ancients do not appear to have been acquainted with this metal. Cadmus was the name by which they seem to have known one of its ores, which was so called from Cadmus, who, it is said, taught the Greeks how to form brads by its means. It is first mentioned by Albertus Magnus, but it is doubtful if he had ever seen it. The word zinc first occurs in the writings of Paracelsus. This metal has been also called sferles.

Zinc has never been found in Europe in a state of purity, and chemists were late in discovering a method of extracting it from its ores. Henkel seems to have been one of the first who effected this about the year 1725, and he was soon followed by others. Zinc is of a brilliant white colour, with a shade of blue, and seems to be composed of a number of thin plates adhering together. It imparts a perceptible smell and colour to the skin when rubbed by it for some time; hence it is rather soft. Its specific gravity is said to vary from 6.86 to 7.1, the lightest being esteemed the purest. When hammered, its specific gravity becomes as high as 7.19.

This metal is by no means so malleable as copper, lead, or tin; it is not however brittle. It yields, and becomes somewhat flatter, when struck with a hammer. When heated a little above 212°, it has the remarkable property of becoming very malleable, and in this state may be reduced into very thin plates, either by hammering or rolling. When heated to about 400°, it becomes so brittle that it may be reduced to powder in a mortar.

Zinc may be drawn into wire. According to Muechenbroeck its tenacity is such, that a wire of 1/8th of an inch in diameter is capable of supporting a weight of about 26 lbs.

Zinc melts at a temperature of about 620°, according to Dr. Black. If the heat be increased it evaporates, and may be easily diffused over in clove vessels: upon this property of zinc, Von Swab's method of extracting it from its ore was founded. When allowed to cool slowly, this metal crystallizes beautifully in small bundles of quadrangular prisms disposed in all directions, which, if exposed to the air while hot, assumes a blue changeable colour.

When exposed to the air, zinc soon tarnishes, but it fearfully undergoes any other change. When kept under water, its surface becomes black, the water is decomposed, and the oxygen combines with the metal. If heat be applied, these changes go on more rapidly; and if the steam of water be made to pass over zinc at a high temperature, it is very rapidly decomposed.

When this metal is kept melted in open vessels, it soon becomes covered with a grey pellicle of oxide. If the heat be very strong it takes fire, and burns with a brilliant white flame, and at the same time emits a great quantity of very light white flakes. This is merely the oxide of zinc. It was well known to the ancients, and received from them many whimsical names, such as pompholyx, &c. Among the alchemists it was known by the names ofnilus album, lana philosphiaca, flowers of zinc, &c.

Zinc appears to combine with only one proportion of oxygen, which has been stated by different chemists to vary from 24.16 to 25 of oxygen to 100 of the metal. According to the first of these determinations, the weight of the atom of zinc will be 41.39; according to the second 40. Dr. Thomson has decided upon 41.25 as the most probable weight of the atom.

Zinc combines readily with chlorine, and forms a chloride of zinc. It may be prepared by diffusing zinc in muriatic acid, or by exposing the metal to the gas, when the two combine by a species of combustion. The chloride may be also obtained by diffusing zinc-filings with the oxy-muriate of mercury, or corrosive sublimate; and thus obtained, it was formerly denominated the butter of zinc. When thus prepared, it sublimes on the application of heat, and crystallizes in needles; but according to Dr. Davy, when the common muriate is heated in a glass tube, it does not sublime even at a red heat, but remains in a state of fusion. Exposed to the air, it soon deliquesces. According to Dr. J. Davy's analysis, it is composed of

<table>

But if we suppose it to be composed of an atom of zinc and
and an atom of chlorine, and the atom of zinc to weigh as above, its constituents should be

</table>

Zinc readily combines with iodine by heat. The compound, or iodide, is white. It is volatile, and crystallizes in fine quadrangular prisms. It deliquesces in the air, and is very soluble in water. The solution is colourless, and does not crystallize. Gay Lussac has shewn, that this compound consists of one atom iodine, and one atom zinc, or by weight of

No compound of zinc with fluorine is at present known. Zinc does not combine with azote nor hydrogen; nor are we acquainted with any compound of this metal with boron and silcon.

Zinc may be combined with phosphorus by dropping small bits of phosphorus into it while in a state of fusion. Phosphuret of zinc is of a white colour, and possesses a metallic lustre, which more reframbles lead than zinc. It is somewhat malleable. It emits the odour of phosphorus when filed or hammered, and if exposed to a strong heat it burns like zinc. Phosphorus also appears to combine with the oxyd of zinc, and to form a peculiar compound.

Sugarphur cannot be combined artificially with zinc; but if melted with the oxyd of zinc a peculiar compound is formed. A similar compound is formed when sulphuretted hydrogen in combination with an alkali is dropped into a solution of zinc. It is at first white, but becomes darker on drying. Dr. Thomson considers this compound as a sulphuret of zinc. Mr. E. Davy ascertained, that when the vapour of sulphur is passed over zinc in fusion a yellowish compound is obtained, similar in appearance to blende.

One of the most common ores of zinc is blende, described below, and which is a sulphuret of zinc, composed, according to Dr. Thomson's experiments, of

Hence he considers it as a compound of one atom zinc, and one atom sulphur.

The alloys of zinc and the metals of the fixed alkalies are speedily decomposed by exposure to the air or immersion in water. We are not acquainted with the alloys of zinc and the metallic bases of the alkaline earths.

Zinc may be combined with arsenic by distilling a mixture of it and arsenious acid. With iron, zinc combines with difficulty; the alloy when formed, according to Lewis, is hard, somewhat malleable, and of a white colour, like silver. M. Lavoisier has shewn, that zinc may be used instead of tin for covering iron plates; a circumstance which demonstrates an affinity between the two metals.

Zinc does not appear capable of combining with nickel or cobalt by fusion. The alloys of zinc with manganese, cerium, and uranium, are unknown.

For the other alloys of zinc, see the different metals; particularly for the most important of them or brases, see Brass and Copper.

**Salts of Zinc.**—Almost all the acids act with energy on zinc, in consequence of its powerful affinity for oxygen. The salts of zinc, therefore, are very easily formed, and on account of their being but one oxyd of zinc are not much liable to variation.

---

**ZINC.**

**Nitrate of Zinc.**—The nitric acid attacks zinc with much energy, that it is commonly necessary to moderate its action by diluting it with water. Even then much heat is evolved, and a strong effervescence is produced by the escape of nitrous oxyd gas. The solution is transparent and colourless, very caustic, and yields by evaporation flat, flattened, tetrahedral prisms, terminated by four-sided pyramids. These crystals attract moisture on exposure to the air, and are soluble in water and alcohol. When heated they melt, and if thrown on burning coals, detonate with a red flame.

**Carbonate of Zinc.**—Calamine, one of the ores of zinc, is a native carbonate of zinc, as described below. This salt usually exists in the form of a white powder, and may be obtained by precipitating zinc from its solution in acids by an alkaline carbonate.

**Phosphate of Zinc.**—The phosphoric acid unites in two proportions with the oxyd of zinc. The neutral phosphate is a tasteless white powder insoluble in water. The biphasate is soluble in water, if not exposed to too great a heat. It does not crystallize, and is strongly acid.

**Sulphate of Zinc.**—Concentrated sulphuric acid scarcely acts upon zinc without the assistance of heat; but when diluted it acts upon the metal very strongly, and hydrogen gas is given out in abundance. In this case, the water is decomposed, its oxygen combines with the metal, while its hydrogen escapes. The solution, when concentrated, yields crystals in abundance.

This salt, formerly known under the name of white vitriol, was discovered in Germany, about the middle of the 16th century. When quite pure, it is perfectly white. The form of its crystals is that of flat quadrangular prisms, terminated by four-sided pyramids. At a temperature of 62°, it diffuses in about 1.4 times its weight of water. In boiling water, it diffuses in any quantity whatever. The constituents of this salt are,

| 1 Atom of sulphuric acid | - | 31.74 |
| 1 Atom of zinc | - | 32.54 |
| 5 Atoms of water | - | 35.72 |

When heated, the crystals part with their water, and if the heat be strong, the whole of the acid likewise separates, and leaves the oxyd of zinc in a state of purity. See Vitriol, White.

**Muriate of Zinc.**—See Chloride of Zinc, supra.

**Sulphite of Zinc.**—This salt exists in the form of crystals, soluble in water, but insoluble in alcohol. On exposure to the air, they are soon converted into the sulphate of zinc. Fourcroy and Vaqueria describe a hypo-sulphite of zinc, which assumes the form of four-sided prisms, terminated by four-sided pyramids. They are soluble in water and alcohol.

**Borate of Zinc** is a white insoluble powder. It may be formed by pouring borate of soda into the nitrate or muriate of zinc.

**Arseniate of Zinc** is a white insoluble powder, and may be formed by mixing solutions of the alkaline arseniates with the sulphate of zinc.

**Acetate of Zinc**—This salt exists in the form of rhomboidal or hexagonal plates of a tawky appearance, and is not very soluble in water. Solutions of this salt form an excellent external application to inflammations.

**Oxalate of Zinc.**—This salt is a white powder, little soluble in
ZINC.

n water, and may be formed readily by double decom-
position.

Tartarate and Citrate of Zine. — Both these salts exist
usually in the form of powders, and are but little soluble
in water. They may be procured, like the oxalate, by double
decomposition.

The other salts of zinc are of very little importance or
interest, and do not therefore merit to be enumerated here.
The salts of zinc may be distinguished from general by their
forming colourless solutions in water, by their yielding
white precipitates with prussiate of potash, sulphuretted
hydrogen, and the alkalies, and by the characteristic circum-
stances that zinc is not precipitated in the metallic state by
any other metal.

Uses of Zinc and its Compounds.—Neither this metal nor
its compounds, if we except brafs, are much employed in the
arts nor in medicine. A chief use of zinc is in the formation
of galvanic apparatus, and in electrical experiments. (See
Galvanism and Electricity.) As it is not a poisonous
metal, it has been recommended instead of tin and lead
for domestic purposes; but the use with which it is oxidized
makes it very unfit for all sorts of culinary apparatus.
The strong affinity of zinc for oxygen renders it of
great use as a chemical agent for precipitating other metals
from a state of solution in the metallic state. The oxyd
of zinc is used in medicine, both internaUy as a tonic, and
externally mixed with hogs' lard as an ointment. The native
carbonate is also used in the same manner as an external
application. See Unguentum Calamine, and Unguentum
Zinci.

The sulphate and the acetate are the only salts of zinc used
in medicine; for the properties of which, see above.

Zine, Ores of, in Mineralogy. The ores of zinc are gen-
erally associated with lead ores, and exist abundantly in va-
rous parts of England; particularly in veins in the moun-
tain-lime-stone of Derbyshire, Durham, Cumberland, York-
shire, Somerfetsire, and North Wales. The ores of zinc
are either oxys, carbonates, or fulphures of zinc, and are
principally known as calamine or blende. There is an ore
of zinc hitherto found only in North America, called by
Dr. Bruce red zinc-ore; it occurs in several of the iron-
 mines in Suffex county, New Jersey.

Red Zinc Ore is of a blood-red or aurora-red colour; it
occurs massive and disseminated. The fresh fracture is shining,
but becomes dull after long exposure to the air, and is cov-
ered with a pearly crust; the principal fracture presents a
foliated structure; the crofs fracture is conchoidal. It is
opaque or translucent on the edges; it yields a brownish-yel-
low or orange streak; it is brittle. The specific gravity is
6.22. It is infusible without addition by the blow-pipe, but
melts into a transparent yellow bead with borax. When
pounded and mixed with potash, and exposed to heat, it melts
into an emerald-green mass, which, on solution in water,
yields the same colour; but on the addition of the mineral
acids is immediately changed to rose-red. This ore is fo-
lible in the mineral acids. Its constituent parts are,

Compact Calamine: Zinc Carbonate, Haüy.—Its colours
are, greyish, greenish, or yellowish, and often brown, from
an intermixture with iron. It occurs massive, botryoidal,
dissminated, flake-structural, reniform, and mamillated; it
has a dull, feebly glimmering, resinous lustre. The fracture
is uneven and coarse-grained, or splintery, and sometimes even
a flatty conchoidal. It sometimes occurs in concentric la-
mellar concretions: it is opaque. Its chemical characters and
constituent parts are the same as of the sparry calamine,
these minerals being only varieties differing in form from
each other.

Earthy Calamine: Zinc Carbonate, Haüy.—It is of a
greyish or yellowish-white colour, sometimes snow-white;
externally it is frequently covered with a tint of yellowish-
white. It occurs massive, and coating other minerals; it is
opaque, and has an earthy fracture; it yields to the nail,
and adheres to the tongue. The specific gravity is 3.358.
According to Smithson, the constituent parts are,

Electric Calamine: Zinc Oxys, Haüy.—Its prevailing
colours are, greyish, bluish, or yellowish-white; externally
it is sometimes brownish or blackish. It occurs crystallized,
mamillated, botryoidal, flake-structural, and massive. The crys-
tals are six-sided prisms, with dehedral summits, or acute
octahe-
ZINC.

Octahedrons; sometimes truncated on the summits. The crystals are small, and either solitary, or radiating in groups, like zeolite. The lustré is shining, glittering, and vitreous: the structure is imperfectly lamellar, or divergingly fibrous. It is sometimes opaque, and sometimes translucent or transparent: it yields to the knife, but is much harder than common calamine. The specific gravity is 3.4. When gently heated it is strongly electric; it is infusible, and loses about 12 per cent. by ignition. It is soluble in muriatic acid with effervescence: the solution gelatinizes on cooling. According to Klaproth, its constituent parts are,

Calamine sometimes occurs in what are called supposititious crystals, as if it had been moulded over crystals of other minerals, and the internal crystal had disappeared. In Derbyshire, the working miners are of opinion, that the calamine destroys the lead-ores when they occur together; or, as they express it, the calamine eats up the lead. That some process of decomposition or change takes place where these ores are associated there can be no doubt; but by what means this is effected we are at present ignorant. See Veins, Metallic.

Calamine, commonly called lapis calaminaris, when cleaned and roasted, is used for the fabrication of brass, forming a compound with copper. (See Brass.) Its uses in the making of brass is of very high antiquity; being mentioned by Ariftotel.

Calamine is also the most valuable ore from which metallic zinc is extracted.

The uses of calamine were not known in England before the reign of queen Elizabeth, and even so late as the year 1700 it was commonly carried out of the kingdom as ballast by the ships which traded to Holland. The calamine raised in Derbyshire about the year 1780 amounted to 1500 tons. Sixty years before that time the quantity of it did not exceed 40 tons, the greater part being thrown away through ignorance of its nature and value.

The dressing of calamine consists principally in picking out all the pieces of lead-ore, lime-flux, iron-flux, heavy spar, and other minerals mixed with it in the mine. The picked calamine is then calcined in proper furnaces, and looses by calcination between a third and fourth part of its weight, which is the carbonate of zinc. In great works, where calamine is prepared for the brass-makers, after its calcination, it is carefully picked again, the accidental ingredients being rendered more discernible by the action of fire. It is afterwards ground to a fine powder, and washed in a gentle rill of water, to free it from earthy particles with which it may be intermixed; for these being lighter are carried off by the water: it is then made up for use.

A ton of the crude Derbyshire calamine, as dug from the mine, is reduced, by the various processes it undergoes before it becomes fit for use, to about twelve hundred weight. Part of the zinc is lost in calcination, particularly if too strong a fire be made: this is evident by the flame visible over the furnace. It would be praiseworthy to use calamine without calcining it, for the carbonic acid would be expelled by the heat applied in making brass; but then there would be seven or eight hundred weight put into the brass pots which would be of no use in the operation: it is therefore better to get rid of so large a quantity of unserviceable matter, and thereby avoid also an increased expense of carriage from the calamine-furnace to the places where the brass is made. Watson's Chemical Essays, vol. iv.

Blende compriess various sulphures of zinc, differing in the proportion of their constituent parts, and the admixture of other mineral substances.

**Yellow Blende, or Phosphorescent Blende:** Zinc Sulphurized, Brongniart.—The prevailing colours of this ore are yellow, passing into green, and sometimes hyacinth-red, aurora-red, or brownish-red. It occurs massive, disintegrated, and crystallized. The crystals are generally small, middle-sized, and so closely aggregated, that it is difficult to determine the precise figure, which appears either the rhomboideal, the dodecahedron, the octahedron, or the tetrahedron. Yellow blende is translucent, passing into transparent, and has a splendent adamantine lustré. It yields to the knife, and affords a yellowish-grey or yellowish-white streak: it is brittle. The specific gravity rather exceeds 4: according to Karfton, it is 4.1.

It decrèpitates before the blow-pipe, and becomes grey; but is infusible either alone or with borax. By friction it becomes phosphorescent, and, according to Bergman, acts as powerful in this respect in water as in air.

**Foliated Brown Blende:** Zinc Sulphurized Brun, Brongniart.—It is of a reddish or yellowish-brown, passing into blackish-brown and dark red. It occurs massive, disintegrated, and crystallized. The form of the crystals is a rhomboideal dodecahedron, either perfect or truncated on the alternate lateral angles and edges, or an octahedron, either perfect or truncated. It occurs also in tetrahedrons, perfect or truncated, and in rectangular four-sided prisms, six-sided prisms, and acicular crystals. Sometimes the crystals are joined, forming a twin crystal. The lustre is shining or splendent, and either reflexive, adamantine, or semi-metallic; it has a slightly lamellar structure, with a cleavage in six directions. It is more or less translucent; it yields to the knife, and affords a yellowish-grey or yellowish-brown streak; it is brittle, and easily fragile. The specific gravity of this ore varies from 3.7 to 4. It is infusible, and yields an hepatic odour when digested in sulphuric acids. The constituent parts of blende are given as under; but some varieties of foreign blende contain feldspar, arfénic, and managanse, which may be regarded as accidental.

Black Blende: Zinc Sulphure Noir, Háissy.—It is of a greyish or velvet-black colour, and sometimes brownish-black. When translucent, it appears blood-red; it is sometimes tarnished with various colours. It occurs malleive, differentiated, and crystalized, in the same forms as brown blende: internally it is shining, sometimes splendid; and the lustre is adamantine, inclining to metallic. It has a foliated structure, and six-fold cleavage. The fragments are angular, and rather sharp-edged. It is almost always opaque. The streak is intermediate, between yellowish-grey and lightish-brown: it is usually flaky. The specific gravity varies with the admixture of ingredients in this ore, from 3.0 to 4.1. Auriferous blende from Nagyag, as given by Muller, is 5.39. The constituent parts of black blende are as under:

Blende is distinguished from tin-plate by its inferior hardness; it yields pretty easily to the knife. It may be distinguished from other ores which resemble it, by the sulphureous odour which it yields when thrown into an acid or triturated in a mortar. The common name given to this ore by the English miners is Black Jack. It frequently occurs in the upper part of the metallic veins in Cornwall, that are rich in other ores below. Blende is not so valuable an ore of zinc as calamine: it must be freed from its sulphur by calcination before it can be applied to the making of brars. Some blendes lose one-fourth of their weight, others one-sixth by calcination. It has been for many years used for making brars at Bridgwater as well as calamine; but so little was this application of it known in other parts of the kingdom, that in the year 1777 we are informed by Dr. Watfon, in his Chemical Essays, that its use in Derbyshire was but recently discovered; and he was requested not to divulge the purpose to which it might be applied, probably to evade the duties on minerals payable to the duty court of Lancashire.

ZINCHI, or ZICCHI, in Ancient Geography, a people of Aetlic Sarmatia, upon the coast of the Euxine sea, and separated from the Saniehe, by the river Achaesus. Arrian.

ZINCKGRABEN, in Geography, a town of Bavaria, in the bishopt of Bamberg; 5 miles E. of Lichtenfels.

ZINDIKITES, a nation among the Mahomctans; so de-
the principle which runs through all his generic distinctions of this tribe, and which is supported throughout by the infloration, as well as the parts of the flower in general. Nothing more perfect has ever been accomplished in systematic botany. See SCOTTI-AMNNER.

1. Z. officinale. Narrow-leaved Ginger. Roxb. n. 1. Ait. n. 1. (Z. majus; Rumph. Amboin, v. 5. 156. t. 66. f. 1. Amomum Zimbrum; Linn. Sp. Pl. t. 2. Wildl. Sp. Pl. v. 1. 6. Jacq. Hort. Vind. t. 3. 8. t. 75. "Infici; Rheede Hort. Malab. v. 11. 21. t. 12."); Bracteas ovate, acute. Segments of the outer limb of the corolla linear, revolute. Middle lobe of the lip entire.—Native of the East Indies; naturalized in Jamaica. A flowe plant in England, flowering in September. It appears to have been cultivated here by Edward lord Zouch, before the year 1605. The root is perennial, tuberous, fleshy, with long fleshy fibres, well known for its hot, gratefully aromatic, floral, and cordial qualities. The whole herb is smooth, and partsake of the flavour of the root. Barren flemes several, erect, herbaceous, wand-like, leafy, about three feet high. Leaves alternate, linear-lanceolate, acute, entire, single-ribbed, spreading, with long clove, sheathing, abruptly foot-flaked. Flower-flakes radical, a foot high, clothed with tubular sheathing bracteas. Spikes solitary, erect, club-shaped, enveloped in broader, shorter, leaf pointed, crowded bracteas, each accompanied by a solitary, fleshy flower, twice its own length, of a delicate texture and short duration. The outer limb of the corolla is of a very pale yellow, or yellowish, red, or brown, revolute; the upper segment rather the broadest. Lip, as well as the incurred part of the filament, spotted with crimson. We have never been able to procure any specimen or account of the fruit, which is perhaps in consequence of the great increae of the roots, not of the perfection, or if produced, it is most probably overlooked by the cultivators, who may find it expedient for the advantage of their crop, to cut away the flanks before they run to seed.

2. Z. Zerumbet. Broad-leaved Ginger. Roxb. n. 2. Ait. n. 2. Sm. Exot. Bot. v. 2. 105. t. 112. (Sp. punctum; Koenig in Retz, Obf. falc. 3. 60. Z. latifolium sylvestre; Herm. Linn. Bat. 636. t. 637. Amomum Zelumbet; Linn. Sp. Pl. t. 2. Wildl. Sp. Pl. v. 1. 6. Jacq. Hort. Vind. v. 3. 8. 8. t. 54. Lampium; Rumph. Amboin. v. 5. 148. t. 8. f. 1. "Kato-i-infi-che-i-kua; Rheede Hort. Malab. v. 11. 27. t. 13."); Bracteas ovate, obtuse. Segments of the outer limb of the corolla straight. Middle lobe of the lip clothed, slightly wavy. Rib and sheaths of the leaves smooth.—Native of the East Indies. The roots are said to be bitter, without the flavour and pungency of the true Ginger; but the young foliage, according to Rumphius, is used in Ambonza as a pot-herb. This species is not uncommon in our flowers, being easy of culture, and flowering frequently at the end of autumn. Many persons who grow it think themselves possessed of the real Ginger. The habits of the two plants are indeed very similar, but the barren flemes of the present species are rather the taller, being four or five feet high, with elliptic-lanceolate leaves; silky beneath when young. Flower-flakes eighteen inches or two feet high, thick and firm. Spike ovate. Flowers pale yellow, without scent, each lasting but a few hours. Upper segment of the outer lip ovate, acute, concave; two lower ones lanceolate. Lip yellow, its large central lobe emarginate.

121.)—Bracteas ovate, rather acute. Segments of the outer limb of the corolla straight. Middle lobe of the lip clothed, dilated, crisped, and crenate. Rib and sheaths of the leaves hairy.—Native of the East Indies, from whence it was sent by Dr. Roxburgh to this country, and flowed in August 1811, in the flowe of James Vere, Esq., at Kennington Gore. The roots had long ago been introduced into the Materia Medica as a powerful stimulant and tonic, in hydric, paralytic, and other nervous disorders, possessing a warm bitterish flavour, with the smell of Ginger; but they have long gone out of use. Their shape is leaves elongated and compressed than that of Ginger, and more annulated, tiberos or knotty. Herbaceous most like the last species, but distinguish'd by the hairy sheath and mid-rib of the leaves. Flower-flakes not above six or eight inches high. Spike ovate, brownish. Corolla pale yellow, distingjuished from Z. Zerumbet by the greatly dilated, inverely heart-shaped, crisped and crenate, middle lobe of its lip; the two side lobes being erect and entire, not larger than in Zerumbet. The plant is said to be propagated by cuttings of the roots.

4. Z. Mioga. Japanese Ginger. Roxb. n. 3. Ait. n. 3. (Amomum Mioga; Thumb. Jap. 14. Wildl. Sp. Pl. v. 1. 7. Banks i. Kempf. t. 1. 1. Dajouka, vulgo Mioga, fcn Mioga; Kempf. Am. Exot. 826.); Bracteas ovate, acute. Spike nearly feffile. Segments of the outer limb ovate, the corolla erect, acute. Middle lobe of the lip convolute, entire. —Found near Nagasaki, and in other parts of Japan, flowering in September. Thumb. Kempf speaks of this as an eatable kind of Ginger, with a mild flavour. The leafy flemes are from one to two feet, or more, in height, and with the foliage resemble those of the three foregoing species. The flower-flake is radical, and remarkably short, or scarcely any. Spike ovate, with numerous, large, white, pointed, frilated, concave bracteas; the outer ones largest, concealing many within. The flowers smell faintly like Tartar-bnr, and have a yellow, very concave, undivided lip, and a white limb. Filament greenish-white, beaked, embracing the thread-shaped style, according to the generic character, as is faithfully described by Thumb. who speaks of the fruit as a nearly ovate, obtuse capsul, with three cells and three valves, and numerous minute seeds, inferted into the central column.

5. Z. rosifum. Rose-coloured Ginger. Roxb. n. 4. (Amomum roseum; Roxb. Coromand. v. 2. 15. t. 126.); Bracteas lanceolate, coloured. Spike nearly seffile. Segments of the outer limb of the corolla revolute. Middle lobe of the lip flat, entire.—Native of moist valleys in Hindooftan, flowering in the rainy season. The Telinga call this plant Bumacatchiey. Root creeping, cylindrical, branched, not knotty. No aromatic or other quality is recorded concerning it, or any other part of the plant. Leafy flemes two or three feet high. Spike nearly seffile at the root, ovate, two or three inches long, Bracteas loosely imbricated, erect, lanceolate, acute, of a fine rose colour, as are also the calyx, and the narrow revolute segments of the outer limb of the corolla. The lip is white, obovate, entire, not concave, but somewhat reflexed. Beak of the filament yellow. No account is given of the seed-coffel.

—Native of the East Indies. Introduced into the English stoves, by the right honouable Sir Joseph Banks, in 1765, and observed by Mr. Roxboc in the Botanic garden at Liverpool. It flowers in September.

ZINGIBER, in the Materia Medica. See GINGER.
ZINGIS, otherwise JENGHIZ-KHAN, or GENGHIZ-khan, in Biography, the founder of the Mogul empire, was the son of Bifiuka, or Jefukai, a chief over thirteen hordes of Moguls in the Tartarian range between China and the Caspian sea, and born about the year 1161 or 1163, his first name being Temugin. In the year 1205 he was installed in the Mogul empire, and declared his purpose of giving a new code of laws to the nation; the object of which was the preservation of peace at home, and the conduct of war abroad. The penalty of death was denounced against murder, adultery, perjury, and the theft of a horse or ox, which were the chief articles of Tartarian property. The nation was interdicted all servile labour, the performance of which was assigned to slaves and strangers, and was consecrated to the sole profession of arms. The weapons which they were appointed to use were bows, scymetars, and iron maces; and the troops were distributed into divisions of hundreds, thousands, and tens of thousands. The soldiers and officers were made individually responsible for the safety and conduct of one another; and it was an established rule, that peace should never be granted without previous conquest. With regard to religion, Zingis established universal toleration. As for himself, his only article of faith was the existence of one God, the creator and governor of all things; but his Mogul and Tartar subjects were idolaters, Jews, Christians, and Mahometans, all of whom were allowed to practise their several rites without molestation, and without any difference of privileges. Having thus settled the affairs of the proper Mogul empire, he successively, by his own arms, and those of his lieutenants, reduced the different tribes of the desert, and rendered himself the undisputed monarch of the pastoral nations which pitch their tents from the wall of China to the Volga. For a sketch of his conquests, we refer to the article of the Mogul Empire. These conquests were attended with many acts of savage cruelty. In his invasion of Kitay, the northern empire of China, he took 90 cities, destroyed by fire a number of towns and villages, and massacred many thousands of people; at the same time obliging the Chin emperor to purchase peace at the price of a Chinese prince, 500 youths and maidens, 3000 horSES, and a large tribute in gold and silk. At his departure, he inhumanly ordered all the children whom he had taken in four provinces to be butchered. In a second expedition he laid siege to the capital city Yen-king, now called Pekin, which, after a long resistance and grievous suffering by famine, was stormed by the Moguls, with the conflagration of the imperial palace; and after the defolation of China, its five northern provinces submitted to the dominion of the Mogul conqueror. In the bloody conflicts between Zingis and Mohammed, sultan of Kharifim or Chorafim, all the rich and populous cities and countries of Tranoxiana, Kharifim, and Chorafim, were taken or laid waste by the Moguls. Mohammed died a fugitive in a desert island of the Caspian sea; but his son, Gelaeddin, boldly refilled the invader, and checked his progress, till overpowercd by numbers on the banks of the Indus, he was under a necessity of spurring his horse into that rapid river, the opposite side of which he reached in safety. Zingis, admiring his heroism, and forbidding the pursuit of him, died to his sons, “Any son might wish to spring from such a father.” Nevertheless he ordered all the sultan’s male children to be killed. After the defeat of Gelaeddin, Zingis, remaining for some time in Kharifim, pursued his customary operations of sacrificing lives, and defolating whole tracts of country. Returning to Bokhara, or Buchatia, in 1224, he investigated the antiquities of Balk and the doctrines of Zoroaster, and held conferences with the Mahometan doctors, the result of which was his affent to their tenets, the necessity of a pilgrimage to Mecca excepted. In 1224 he held a grand diet in the plain of Tonkat, which, though seven leagues in length, could scarcely contain the tents of all the distinguished persons that were assembled. In the following year he passed through Tartary to the borders of northern China, and refuted the kingdom of Hya or Tangut. In the province of Shen-hu, on the mountain of Lu-pau, whether he went in order to pafs the summer heats, he was taken ill; and as he perceived his end approaching, he summoned the generals of his army, before whom he declared his fourth son regent, till the arrival of his brother Öchëi, whom he appointed his successor in the dignity of grand khan of the Moguls and Tartars. Recommending unanimity, and advising the conduct of the war against Kin, he expired in August 1227, at the age of 66 years. His remains were interred with great pomp under a beautiful tree which he had fixed upon in returning from a hunting expedition. He had many wives, and left a numerous progeny. “This emperor,” says one of his biographers, “polished the civil and military qualities necessary for the founder of a mighty monarchy, together with a penetrating and inquiring mind, which, with superior culture, might have placed him in the list of truly great princes. His memory now survives as that of one of the great conquerors whose deeds have aminated the world, to which they have proved the most terrible of scourges. His simple laws were long the rule of the countries he governed, and are still religiously observed by the Crim Tartars.” D’Herbelot. Gibbon’s Hist. Univ. Hist. Gen. Biog.

ZINGST, in Geography, a small island in the Baltic, near the coaft of Pomerania, and a little to the weft of the island of Ufedom. N. lat. 54° 28'. E. long. 12° 50'. ZINIA, a name given by the old chemical writers for verdigris.

ZINIA, a word used by the old chemical writers to express either the action of fermentation, or any thing that is capable of exciting it in bodies.

ZINN. See Zinc.

ZINKOW, in Geography, a town of Poland, in Podolia; 32 miles N. of Kaminiec.

ZINN, JOHN GODFREY, in Biography, an anatomist and botanist, was born in 1726, studied under Haller at Gottingen, and became botanical professor in that university. His first experiments were undertaken in order to ascertain the feasibility of different parts of the brain; he then proceeded to the examination of the eye, which produced his eftemed work, intitled "Decriptio Anatomica Oculi Hominii, Iconibus illustrata," Gotting. 4to. 1755. Botany was also the subject of his arduous study, the result of which appeared in several papers, and in a catalogue of the plants in the academical garden and vicinity of Gottingen, arranged according to the fyllem of Haller. His premature death happened at the age of 32, in April 1758. He was a member of the Academy of Sciences at Gottingen, the Instititute of Bologna, and the Royal Society of Berlin. Haller, Eloy.

ZINNA, in Geography, a town of the duchy of Magdeburg; 18 miles N. of Wittenberg.

ZINNA, in Botany, was named by Linneaus, in honour of Dr. John Godfrey Zinn, professor of phyfic and botany at Gottingen, author of a Catalogus Plantarum Horti Gottingensis, printed there in 1757. This work, making an octavo volume, is clasped after Haller’s method. Its author has, besides, published various botanical and phylogographical treatises, and would probably have contributed much more to the advancement of science, had he not been cut off, at the early age of 32, in 1758. Haller, whose
whose disciple and successor he was, speaks of him with much complacency; but it is easy to see that his favour was greatly conciliated by Dr. Zinn's preference of his system to that of Linnaeus. One principle of the learned Swede he indeed very justly approved, that plants nearly related on the whole ought not to be separated on account of a difference in one particular part. Yet in the application of this rule he surely has wandered widely from the truth, in wishing to unite Gnus, Comarum, Potentilla, Torminella, and Fragaria. Such it seems was the avowed opinion of Zinn, in his Prefatio, published in 1755; but he has not followed it in his work above-mentioned. In that volume occurs, if we mistake not, the first figure of a Zinnia, under the name of a Rudbeckia; though the author justly declares it to constitute an indubitably new genus.—Linn. Gen. 437. Schreb. 563. Willd. Sp. Pl. v. 3. 2139. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 91. Pursh 565. Juss. 188. Lamarck Illust. t. 683. Gzrn. t. 172.—Clas and order, Syngenesia Polygalina-superflua. Nat. Ord. Composite opposti-folia, Linn. Caryophyllae, Juss.

Gen. Ch. Common Calyx ovato-cylindrical, smooth, imbricated, with numerous, obtuse, erect, permanent scales. Cor. compound, radiated. Flores of the elevated disk several, all perfect, funnell-shaped, three-cleft, internally villos; those of the radius from five to ten, ligulate, roundish or oblong, abrupt, larger than the disk, permanent. Stam. in the perfect florets, Filaments five, very short; anthers united into a cylindrical tube. Pila in the perfect florets, Germin oblong, with two unequal axes; fyll thread-shaped, cloven half way down; filigmas two, erect, obtuse; in the female florets, Germin oblong, triangular, without axes; fyll capillary, cloven half way down; filigmas two, recurved. Peris. none, except the unequited calyx. Seeds in the perfect florets, solitary, oblong, quadrangular, compressed. Down of two points, one of them anwad. In the female florets solitary, pointless, crowned with the permanent petal. Recept. chaffy, with tongue-shaped, channelled, deciduous scales, the length of the calyx. Eff. Ch. Receptacle chaffy. Seed-down of two erect unequal axes. Calyx imbricated, somewhat ovate. Florets of the radius from five to ten, permanent, undivided.

1. Z. pumila. Yellow Zinnia. Linn. Sp. Pl. 1269. Willd. n. 1. Ait. n. 1. (Bidens calycy oblongo quamo, feminibus radii corollæ non deciduæ coronatæ; Mill. t. 1. 1. 43. t. 64. Rudbeckia folis oppositis hirsutis ovato-acutis, calycy imbricato cylindrico, radii petalis piliferis; Zinn. Gutt. 459. L. 1. Chemigounum peruvianum; Linn. Sp. Pl. ed. 1. 636, excluding the synonym, which is wrong, and a heap of confusion; see Feul. 766.) —Flowers feasible. Zinnia somewhat heart-shaped, sessile, clasping the stem.—Native of Peru. Cultivated by Miller, but not commonly preserved in our gardens like the following, being less hardy, and not so ornamental. The root is annual. Stem erect, three or four feet high, branched, angular, leafy. Leaves opposite, deflexed, two or three inches long, acute, roughish, entire, rough-edged, with three principal ribs; their base broad-crenated. Flowers solitary at the ends of the branches, nearly or quite sessile, with the uppermost pair of leaves close to the base of the calyx; disk brownish; radius yellow. We perceive a difference between several specimens and figures of this plant, but cannot trace an absolute or constant specific distinction between them. In the Linnean specimen, the small number of florets justifies the specific name, and the flower itself is quite sessile. This is undoubtedly Miller's plant, though the radiant florets are much more numerous in his figure, and the whole flower larger. A specimen under this same name of pavifera, given us by Joseph Banks, from Jacquin's herbarium, is what Zinn's figure exactly represents. The leaves are shorter, more rounded and heart-shaped, and the flower is large, with more or less of a flap. Its radiant florets are numerous, broad, and yellow. How far these characters are permanent, culture, and repeated observations must determine. We are rather inclined to suspect the Linnean specimen, raised in the Uphal garden, is a flaved one, the flowers perhaps being rendered diminutive by their lateness. It is most probable that a portion of the fame feed was sent by Juffieu to Linneas and to Miller. The plant indeed flowered at Uphal before the year 1755, when Miller says he received his seeds, because it is described, in the first edition of Sp. Pl. printed that year, from the garden specimen now before us.

2. Z. multiflora. Common Red Zinnia. Linn. Sp. Pl. 1269. Willd. n. 2. Ait. n. 2. Pursh n. 1. Curt. Mag. t. 149. Linn. Dec. 23. t. 12. Jacq. Obs. fac. 2. 19. t. 40.—Flowers talked. Leaves opposite, ovato-lanceolate.—Native of North America. Found on the banks of the Mississippi, flowering in July and August. Annual. Rays yellow, orange, and sometimes brick-red. Pursh. The latter colour is most common in the gardens of Europe, where this plant is treated as a rather tender annual, like the different species of Tagetes, being belt raised on a hotbed, and planted out so as to flower in the autumn. A yellow variety, almost equally common, is less singular and striking in colour. We are not by any means certain that this variety may not be sometimes' taken for the foregoing; yet the plant of Zinn and Jacquin, of which we have just given an account, is too different in the great breadth of its leaves to be confounded with the present species. The Z. multiflora has a more hairy stem than the pavifera, much narrower and elongated leaves, with three ribs; their surface roughish to the touch. The flowers stand each on a hollow, deeply furrowed, terminal stalk, from one to two inches long, much thicker than the stem, and gradually swelling upwards. The disk is conical and acute, composed of reddish or tawny florets, accompanied by the prominent, dark-green, or blackish, scales of the receptacle; the radius consists of ten or more broad, elliptical, usually emarginate florets, of a deep brick-red, and very smooth, above; pale, greenish, and rough beneath; reticulated with veins, and finally becoming rigid, or membranous.

3. Z. verticillata. Whorl-leaved Zinnia. Andr. Repof. t. 189. Willd. n. 3. Ait. n. 2.—Flowers talked. Leaves whorled, ovato-lanceolate. Radiant florets very numerous.—Native of Mexico. Raised by Meiff. Lee and Kennedy at Hamletsmith, about the year 1789. We cannot suppose this to be any thing more than a luxuriant variety of the last. Annual plants, pampered with manure, and every possible advantage of cultivation, are liable to acquire aggregate leaves, double flowers, and many other characters, which do not appear in a flate of nature. Thee it is the bufness of the gardener to encourage, and of the botanist to beware of. Having seen no specimen of this plant, we can only judge by the figure, in which we cannot discover any specific distinction. The flowers indeed are rendered very splendid, by their multiplied radius of a deep scarlet, and their disk seems broader, and lefs conical, or pointed, than in either of the foregoing species. This last character, if constant, is more material than any which has been mentioned.

fringed. Tubular florets with a hairy disk.—Native of Mexico; said to have been brought to England from Madrid, in 1796, by the late marchioness of Buté; whose botanical acquisitions in Spain, made with no less intelligence than taste, have eminently enriched the gardens of England. This is also a tender annual, flowering from Midsummer to the end of autumn. The **herbage** is floriferous, the leaves broader, and more much harth to the touch, like a file, than in any other of the genus. **Florets**, in a cultivated flat at least, as large as the leaf, with a conical, but rather obtuse, disk; the prominent orange-coloured scales of the **receptacle** have many finely-fringed segments; the upper surface of the yellow tubular **florets** is densily fagos; the **radii** consists of numerous, spreading, obovate **florets** of a deep lilac, or light purple, colour, leaves or leafy, after flowering than in the **multiflora**.

5. **Z. tenuiflora**. Slender-flowered Zinnia. Jac. Ic. Rar. t. 590. Wild. n. 5. Ait. n. 5. Curt. Mag. t. 555. (Z. revoluta; Cavan. Ic. v. 3. 26. t. 251.)—**Florets** stalked. Leaves opposite, ovato-lanceolate, pointed. **Calyx** cylindrical. Radiant **florets** linear, revolute.—Native of Mexico. Railed here in 1799, by the late captain Woodford, at Vauxhall. This very distinct species requires the same treatment as the red. They may all, perhaps, succeed, in a favourable season, as hardy annuals, but are best railed with artificial heat in the spring. The present has much narrower leaves than the late, which moreover are nearly smooth. The **florets** are the smallest of their genus, and distinguished by their bright red, narrow, revolute radiant **florets**, very rough at the edges; the tubular **florets** are yellow, roughish in their disk.

**ZINNIA**, in Gardening, contains plants of the annual flowering kind, in which the species cultivated are, the few-flowered yellow zinnia (**Z. pauciflora**), and the many-flowered red zinnia (**Z. multiflora**). These are both plants of the annual flower kind.

**Method of Culture.**—These annual plants are increased from seeds, which should be sown on a light hot-bed in the early spring, as March; and when the plants are a few inches high, they should be pricked out on another bed previously prepared to receive them, where they should remain till the advance of summer, when they may be taken up and planted out in the borders of the pleasure-ground, where they blow and complete their seeds for the year following.

They have a fine effect in their leaves and flowers in these situations.

**ZINNORE**, in Geography, a town of Hindoostan, in Guzerat, on the Neruddh; 30 miles N.E. of Baroach.

**ZINTEN**, a town of Prussia, in the province of Nantagen, near which the Poles were defeated in 1520; 30 miles S.S.W. of Königberg. N. lat. 54° 23'. E. long. 20° 20'.

**ZINTI**, a town of South America, in the vicerealty of Buenos Ayres, and archbishopric of La Plata; 90 miles S. of La Plata.

**ZINU**, a province of South America, in the vicerealty of New Grenada, situated to the north of Choco, and west of Carthagena.

**ZINQ, or Sinu**, a town of South America, and capital of a province, on a river of the same name, which runs into the Spanish Main; 90 miles S. of Carthagena. N. lat. 8° 48'. W. long. 75° 48'.

**ZINWALD**, a town of Bohemia, in the circle of Leitmeritz; 18 miles N.W. of Leitmeritz.

**ZINZENDORF, Nicholas Louis**, in Biography, was born at Dresden in May 1700, and was educated under the instruction of his grandmother, who was a pious woman, accustomed to the perusal of the Scriptures. He was thus led into an early acquaintance with the principal doctrines of the Christian religion, and manifested a peculiar taste for spiritual songs. Under professor Franke at Halle, he became a good classical scholar; and his facility in composing verses was such, that he indited them faster than he could write them. Such, however, was his proneness to dilapidation, and particularly gaming, that he squandered away not only his money, but all his effects. From his youth he was fond of forming religious societies, and it is said that he had established seven associations of this kind between the year 1712 and the year 1716, when he left Halle. One of his companions in forming these institutions was Baron Frederick von Watteville, in intercourse with whom he first conceived the idea of attempting the conversion of the heathens. With this view they bound themselves by an oath, and determined to employ others in accomplishing this design who were properly qualified for the office. This resolution seems to have taken its rise from a baptized native of Malabar, who had been brought to Halle by the missionary Ziegenbalg. In 1716 Zinzendorf removed to Wittenberg, where he applied diligently to his studies; and in 1719 he quitted Wittenberg, in order to gratify his relations by pursuing his travels. On his tour he remained for some time at Utrecht, prosecuting his studies in history and jurisprudence; but his chief attention was directed to theology, as he had formed a purpose of becoming a preacher. From Holland he proceeded to Paris, where he associated with his friend, Henry, prince of Reuss, and endeavoured to spread his doctrine among the Catholic nobility, by some of whom they were treated with respect, while others contemptuously denominated them Janeniltts and Pietists. At this time he was introduced by Father de la Tour, general of the Society of the Oratory, to the archbishop of Paris, and attempts were made, without effect, for gaining him over to the Catholic church. During his abode at Paris he formed an acquaintance with several other persons of distinction. From Paris he proceeded through Switzerland to Germany in 1720, and having arrived at Hernsfeld, in Lusitania, he found his grandmother still living, and employed himself in communicating instruction to the domestics, and corresponding with his friends. Soon after, retaining his purpose of becoming a preacher, he went to Dresden, and having received his property from those with whom it had been entrusted, he purchased the lordship of Bertholdsdorf, in Lusitania, and marrying a sister of the prince of Reuss, distinguished for her piety and virtue, he aligned to her his whole property, that he might not be incumbered and diverted from the prosecution of his design by the cares of the world. About the year 1722 he indulged the notion of a purer church discipline, of which he observed some traces among the Bohemian and Moravian brethren, who, from their earliest connection with the Waldenses and true followers of John Huss, had formed a peculiar religious community. The Christians of this description had undergone from the year 1459 to 1627 severe persecutions, so that they were almost exterminated from Germany; but a small number of them remained, under oppression, in Moravia; and about the year 1720 the feeble revived: so that they held frequent meetings, read the Scriptures with their old books of hymns, celebrated in secret the holy sacrament, and introduced, at least in their houses, the ancient church discipline. One of their number, of obscure condition, obtained an introduction to count Zinzendorf, who gave them leave to settle on his estate at Bertholdsdorf. Availing themselves of this permission, a small number of them, confiding of three men, two women,
women, and five children, came hither from Moravia, in Whitsuntide, 1722, and erected on a hill, in a wild marshy district, a wooden habitation, exposing themselves to the derision of the adjacent inhabitants. They were so poor that the countes fed them a cow to supply milk for their children. However, they gradually gained new converts; and when the count and his comfort visited this new settlement of the Moravian brethren in the month of December, he gave them cordial welcome, and falling upon his knees, pronounced a benediction on the infant colony. Such was the origin of the village of Hernhut. (See Hernhuters and Moraviams.) The count, whilst he afforded them protection, left them at full liberty to think for themselves; more especially as he found, upon examination, nothing improper in their doctrine. From this time, count Zinzendorf, in connection with some other persons similarly disposed, took pains in giving instruction to his subjects, and educating their children; avowing himself a true Lutheran, but willing that his people might remain totally ignorant of the disputes that subsisted among Protestant divines. In 1723 he published a small catechism, entitled "The pure Milk of the Doctrine of Jesus," which, he says, cost him more labour than all his other works. The count, devoted to the prosecution of the work he had undertaken, refused sometimes on his estate in Lusatia, and sometimes at Dresden, but declined every offer of a place at court. He employed himself in the composition and occasional publication of books adapted to his design; one of which, being a periodical work, and entitled "The German Socratics," was suppressed by order of the council, probably because it caused the prevailing indifference about religion, and called upon his fellow-citizens to live in a manner more agreeable to what their religion required, or entirely to renounce it. In 1727 he quitted Dresden, that he might be nearer his favourite object Hernhut, and that he might be at leisure to devote his whole time and attention to the improvement and increase of his congregation. With this view he made a tour through the greater part of Germany, occasionally preaching, and endeavouring to gain converts. In 1731 he extended his tour to Denmark, and being present at the coronation of Christian VI., who conferred upon him the order of Dannebrog, which five years afterwards he resigned, because he thought it improper to appear as the instructor of his flock with the insignia of his order. In this tour he acquainted himself with the state of the Danish missions in the East Indies and Greenland; and on his return he took measures for carrying into execution the design he had formed at Halle with his friend Vatteville. From this commencement, in the year 1732, arose that missionary system of the Moravians which has since been so widely and so wonderfully extended. Between 1732 and 1760 nearly 4000 negroes in the Danish islands were baptized; and in 1768 the congregation of New Hernhut and Lichtenfelde, in Greenland, amounted to 784 persons. When the congregation at Hernhut had increased in 1732 to 500 persons, the Saxonic court became alarmed, and appointed a commission for the purpose of examining their doctrine and principles. Although they were found to be inoffensive, the count was forbidden to bring any more new emigrants from Moravia; and soon after he received an order to sell his estate and property, which was a kind of sentence of banishment from his country. He also perceived a coldness and reserve in the disposition of his friends. Accordingly he quitted Hernhut, and repaired to his friend count Reifs at Eberfors. He now thought seriously, as he had done twenty years before, of entering regularly into the church; but the countes and his friends dissuaded him from adopting this measure. With a view of becoming tutor to the children of Richter, a merchant at Strałund, to which he was urged by his pecuniary circumstances, he was examined for orders, and having obtained a flattering testimonial, was formally ordained at Tubingen. But a change taking place in the circumstances of Richter, this plan did not succeed. In 1735 he made an attempt to visit Sweden, but was forbidden to enter the kingdom by an order of government; and this occasioned the composition of one of his most important works, entitled "A Letter to the King of Sweden in regard to the general belief of himself and Congregation," which he widely circulated, and which produced various plans for extinguishing the Moravian brethren from the empire. In the same year he visited Switzerland, and in 1736 he and the countes made a tour to Holland, where, at the desire of the princes dowager of Orange, he founded a new colony at Ylichten, called Heerendyk, which was afterwards removed to Zuyt. On his return he found at Caffel a copy of a Saxon reprint, by which he was forbidden the territories of that electorate, and banished from his native country. He was thus reduced to the necessity of making various excursions; and on his return he was invited to a conference with the king of Prussia, who was so well satisfied with his doctrine and character, that he advised him to be regularly ordained. For this purpose he recommended him to the chief court preacher Jablonicky, by whom he was consecrated bishop of the Moravian congregation in May 1737. In this year he visited London, and established the brotherhood in England. Here he became acquainted with John Wesley, and maintained a dispute with him on the impossibility of men's attaining moral perfection, for which the English preacher contended. Although he obtained permission to return to Hernhut, it was on condition of his making certain declarations with which he could not comply, and therefore he became a voluntary exile; and was forbidden ever to enter Saxony. In the year 1738 he undertook his first voyage to America, in the course of which he composed a work entitled "Jeremiah a Preacher of Righteousness." Upon his arrival at the island of St. Thomas, he found that all the millionaires had been thrown into prison, but he immediately procured their release, and liberty for his congregation to assemble. After his return he visited Holland and Switzerland, wrote in his own defence against the accusations of his German enemies, and held public assemblies at Geneva. In 1742 he made a second voyage to America, and preached alternately with their own minister to the Lutheran congregation at German-town, in Pennsylvania, and built for them a place of worship. In a Latin speech at Philadelphia he laid aside the title of count, and assumed the name of von Thummler, which belonged to his family. The Quakers generally tried him friend Lewis. He also established the celebrated colony at Bethlehem, and made a tour among the Indians, who received him favourably, and, as a token of their friendship, gave him the wampum belt. In America, however, he suffered much abuse and calumny. In 1743 he returned to Europe; and having proceeded to Riga with a view of settling some differences among his followers at Livonia, he was arrested, conveyed to the frontier, and ordered never to enter the imperial territories any more. In 1747 he obtained permission to return to Saxony, after an exile of ten years; and the king, having received from one of the Moravians a considerable sum of money for the cattle of Barby and district of Dothen, issued a declaration that the society should be allowed, in every part of his territories, the same privileges which they had enjoyed at Hernhut. In 1748 he
he succeeded in obtaining a commission, which, after particular examination, declared the members of the Moravian community to be true adherents to the Augsburg confession. In the following year he visited England, and obtained an act of parliament for the protection of his followers in the British dominions in America. In 1757 he made his last tour to Switzerland, and from thence proceeded to Holland. In 1760 he died at Hermitut, after an illness of four days, and his funeral was attended by 2000 of his followers, and as many peculators; and his coffin was carried to the grave by thirty-two preachers and missionaries, some of whom had come from Holland, England, Ireland, North America, and even Greenland. Count Zinzendorf was somewhat above the middle size; and his countenance combined fer- rousness with animation. In early life his manners were elegant, but as he withdrew from intercourse with the world, in more advanced life they became stiff and refractory. To money he was perfectly indifferent, and as he gave to every mendicant, he was often penniless. His disposition was lively, but he was capable of long-continued and intensive application. His memory was prompt and comprehensive, but as he was of a lively imagination it was not very retentive. In his style he bid defiance to all the rules of grammar, and his ambiguous mode of expression subjected him to many inconveniences, for that his meaning was often mistaken and misrepresented. To persons of the lower order he was condescending, and in his intercourse with all mild and candid. In his temper he was irritable and passionate, but placable and forgiving. His activity in doing good and serving others was indefatigable and unbounded; he often promised, it is said, with the best intentions, beyond his ability of performance; and he is charged with having used art and flattery to carry on his own purposes, and to gain converts to his cause. Molheim, &c. Gen. Biog.

For a further account of the tenets and partisans of the sect with which he was connected, and of which he was, according to his own statement, a reformer, and not a founder, we refer to the articles Hernhuters, Moravians, and Unitas Fratrum.

Zinziber, Ginger. See Zinziber and Ginger.

Zinziber Rubrum, Red Ginger, a name by which some authors have called the officinal cafumun-root.

Zinziber Cannum, Dog's Ginger, in Botany, a name given by some of the old writers to the pericaria urent, or biting arsmart; a plant which is very hot, and pungent to the taste, and grows in wetty places. It had hence the name of hydropiper, water-pepper, among the Greeks, and was called zinziber cannum, or dog's ginger, by Avicenna and others, from its heat, and from an opinion that it would poison dogs that eat of it.

The Arabic name is sinzild alkeleb.

Zinziber Canum is also a name given by some authors to the capricum, or Guinea-pepper. Ger. Einac. Ind. 2.

Zinzig, or Sinzig, in Geography, a town of France, in the department of the Roor; 18 miles N.N.W. of Coblenz. N. lat. 50° 33'. E. long. 7° 12'.

Zinzilla, a name by which some medical writers have called species of the herbes, which we usually call the figngles.

Zinzoca, in Geography, a town of Mexico, in the province of Mechoacan, anciently the residence of a cacique.

Zioberis, in Ancient Geography, a river of Asia, in Hyrcania, which discharged itself into the Rhodyage, according to Quintus Curtius. Diodorus Siculus calls it Stibocetes.

Ziolo, in Geography, a town of Italy, in the Paduan; 10 miles S.E. of Padua.

Zion, in Ancient Geography. See Sion and Jerusalem.

Ziph, a town of Palestine, in the tribe of Judah. (Joel. xv. 24.) St. Jerom says, that in his time they showed the village of Ziph, 8 miles from Hebron eastward. David for some time concealed himself in the wilderness of Ziph. (1 Sam. xxiii. 14, 15.) There was another city called Ziph, near Maon and Carmel of Judah. (Joel. xv. 55.)

Ziphon, or Zepronia, a city N. of the land of promise, now unknown. Numb. xxxiv. 9.

Zipoetium, a town of Asia Minor, in Bithynia, near mount Lyperus, and which had been founded by king Zipotens. Steph. Byz.

Zipporis, a name which the ancients gave to the town of Scfora or Szaffon. It was the strongest place in Galilee, and its position might be regarded as the key of the province, according to Josephus.

Zipserchloss, in Geography, a town of Hungary; 6 miles E. of Leutisch.

Zirbalis Hernia, a term used by medical writers to express that kind of rupture which is caused by a defect of the omentum into the feromum.

Zirbus, the name by which the Arabian physicians have called the omentum.

Zircon, in Mineralogy, Jargon de Ceylon, Romé de Liffe, Zircon, Haüy, a gem originally found in the island of Ceylon, in the sands of rivers, along with spinel, sapphire, tremalenn, and iron-sand. Zircon, the gem called the hyacinth, and zircone, are regarded by most mineralogists as varieties of the same species. They are essentially composed of the earth called zircon, (see Zirconia, in Chemistry,) with flixus, and a minute portion of iron, which may be regarded merely as the colouring matter. The primitive form of the crystals of zircon, according to Haüy, is an octahedron, composed of two four-sided prisms, whose fides are ifofceles triangles. The inclination of the planes of the fame pyramid to each is 124° 12; the inclination of the fides of one pyramid to those of the other 82° 50. The angle of the summit is 73° 44. The common forms in which it occurs are rectangular four-sided prisms, rather flatly terminated by four-sided pyramids, the planes of which are set on the lateral planes of the prism under equal angles. The above figure is often truncated in the lateral edges. The angles of the prism, in junction with the pyramid, are often bevelled, and sometimes the prisms are terminated by four planes at each end, two of which at each end form very obtuse angles, and are set on the lateral planes of the prism. The crystals are generally small, and occur loose or imbedded. The surface of the crystals is sometimes rough, and sometimes smooth and shining; that of the grains is uneven, and glintening internally. Zircon is splendid or shining, with a luftre intermediate, between adamantine and refrinous. The stucture is imperfectly foliated, with the fola parallel to the lateral edges of the prism. The fracture is flatly conchoidal. The prevailing colour of zircon is grey; it is sometimes white, green, and brown, and occasionally yellow, blue, and red. The colours are pale; it is sometimes transparent, but more frequently semi-transparent or translucent: it refracts doubly. Zircon is harder than quartz, but softer than the diamond. The specific gravity varies from 4.5 to 4.7. It is inffuble without addition by the blow-pipe.

According
According to Klaproth, the constituent parts are,

**Hyacinth**: Zircon Hyacinth, Brongniart. — The prevailing colour of this mineral is orange-red; it is sometimes yellow, grey, and green, and very rarely white. It occurs in angular grains, but more frequently in small crystals, which have the following forms. A rectangular four-sided prism, terminated by four rhomboidal faces at each end, set on the lateral edges of the prism; the prism is sometimes truncated on the edges. Sometimes it occurs in an irregular garnet-shaped dodecahedron, and sometimes in a flat octahedron. The structure is foliated; it has a double rectangular cleavage, and the folia are parallel with the diagonal of the prism. Hyacinth is transparent or translucent, and refracts doubly: the lustre is resin-vitreous and splendent. It is very hard, scratching quartz with ease. The specific gravity varies from 4.3 to 4.7. Before the blow-pipe it loses its colour, but not its transparency, and is infusible. According to Klaproth, the constituent parts of hyacinth of Ceylon are,

Zircon and hyacinth, as we have stated, were originally found in Ceylon; they have since been found in various parts of Asia and Europe.

Zircon occurs in considerable quantities along with felspar and iron-fand in volcanic fand, in a rivulet near Expailly in Auvergne; also near Pits, and in the volcanic fand of the Vicentine. It has been found in trap-rocks in Bohemia, and in the vicinity of Lisbon. It was first found in its native situation at Friedrichschwamm, in the district of Christiana, in Norway, imbedded in sienite. It was also found in bafalt near Expailly, and in the mountain of Anif in Auvergne, and also in volcanic scoria in the same country. It has been found in rolled mafies of sienite by professor Jamelon in Scotland, in the county of Galloway; and has since been met with in granite near Cuffel, in Dumfriesshire.

Zircon has been found in South America, and in the province of New Jersey, in the United States.

Zircon and hyacinth are characterized by their great specific gravity. Common zircon has been frequently confounded with the diamond, but the specific gravity alone would be sufficient to distinguish them; that of the diamond does not exceed 3.5. The hyacinth has often been confounded with other minerals. The oriental hyacinth of Rome de Lisle is orange-coloured sapphire. The occidental hyacinth of Dutens is yellow-coloured topaz.

Crusiform hyacinth is cros-stone; brown volcanic hyacinth is velvian; white hyacinth of Somma is meonite.

The hyacinth of Deffentis, mentioned by Saffuir, is a variety of garnet.

Common zircon is frequently cut and polished by the jewellers as a gem. The greyish-white and yellowish-white varieties are the most prized, on account of their resemblance to the diamond. The darker coloured varieties may be deprived of their colour by heat. It is cut into the same forms as the diamond, and exhibits faintly the same play of colours, and is not unfequently fold as an inferior kind of diamond. The hyacinth is also employed by jewellers in various kinds of ornaments; but pale garnets and rock crystals are frequently fold for hyacinths.

**Zirconia**, or Zircon, in Chemistry, the name of a peculiar earth, hitherto only met with in the minerals termed hyacinth, and zircon or jargon. See the preceding article.

Zirconia exists in the form of a fine white powder, which feels rather harsh when rubbed between the fingers. It has neither taste nor smell. It is infusible before the blow-pipe; but when heated violently in a charcoal crucible it undergoes a form of imperfect fusion, and acquires a greyish colour and porcelainous appearance. In this state it is very hard, and its specific gravity is 4.3.

Zirconia is insoluble in water, but has a considerable affinity for that liquid. It does not combine with oxygen, azote, or any of the fimple combustibles, but appears to have a strong affinity for many metallic oxys, especially for that of iron.

It is insoluble in alkaline solutions, neither can it be fused with them by the affillance of heat; but it is soluble in the alkaline carbonates. Sir H. Davy subjected this earth to the action of galvanism, and obtained evidences of its containing a metal as its basis. To this metal he gave the name of zirconium. Nothing satisfactory is known respecting its nature.

No very accurate analysis of the farts of this earth have been yet made. From some experiments of Kaproth and Vauquelin, Dr. Thomson fixes the weight of its atom at 45.25, though it is probable that this is not to be absolutely relied upon.

**Salts of Zirconia**: Nitrate of Zirconia. — This salt may be formed by pouring nitric acid on newly precipitated zirconia. It always contains an excess of acid, and does not crystallize. It is decomposed by heat, and most of the vegetable acids, except perhaps the acetate.

**Carbonate of Zirconia** is a white insoluble powder. It may be formed by double decomposition with the alkaline carbonates, and solutions of zirconia in acids. **Sulphate of Zirconia.** — This salt exists in the form of a white powder, but may be obtained in small needle-formed crystals. It has no taste, and is insoluble in water. It is easily decomposed by heat.
Acidate of Zirconia.—This salt has an astringent taste. It does not crystallize. It is very soluble in water and alcohol.

The other salts of zirconia are mostly white insoluble powders, little known, and apparently poifoming very little interest. With respect to the general properties of zirconia and its compounds, it may be remarked, that the alkalies and alkaline earth separate this earth from its combinations with acids. The salts of zirconia have an astringent, harsh, disagreeable taste, similar to some of the metallic salts. They are most of them insoluble in water. Those which are soluble yield white precipitates when sulpheric acid, carbonate of ammonia, oxalate of ammonia, tartrate of potash, and infusio of nut-galls, are dropped into their solutions. These properties sufficiently distinguish this earth from alumina and ytiria. For further particulars respecting this earth, see the articles above referred to.

ZIRCONITE. See Zircon.

ZIRCONIUM, the metallic basis of zirconia. See Zirconia supr.

ZIRIANKA, in Geography, a small river of Russian, which runs into the Enfie, near its mouth.—Alfo, a town of Russia, on the Nizine Tungula. N. lat. 16° 16'. E. long. 106° 54'.

ZIRICZEE, a town of Holland, one of the most ancient in Zealand, and capital of Schouwen, built and surrounded with walls in the year 859, by a person named Ziringus, from whom it is called. It was the ancient residence of the comtes of Zealand, and was at that time a place of much more confluence than it is at present, the port being filled with sand. The inhabitants carry on a considerable trade in grain, salt, and fish; the town is large and populous, and has several good buildings; the church, called the "Munker," dedicated to St. Levinus, is a handsome structure. N. lat. 51° 40'. E. long. 30° 48'.

ZIRKNA, a river of Syria, which runs into the Mediterranean, 8 miles S. of Tortara.

ZIRKINZ. See Cirknit.

ZIRKIVITZ, a town of Sileia, in the province of Oels; 14 miles N. of Breflau.

ZIRL, or Cint., a town of the county of Tyrol, on the Inn; 7 miles W. of Innsbruck.

ZIRNOE, a town of Russia, in the government of Saratov; 32 miles S.W. of Saratov.

ZIRO, Lo, a town of Naples, in Calabria Citra; 9 miles E. of Umbriciato.

ZIROVAIA, a small river of Russia, which runs into the Penzinflain gulf, 32 miles S.W. of Oklanski.

ZIRUA, a small island in the Mediterranean, near the coast of Tunis. N. lat. 33° 39'. E. long. 11° 39'.

ZIRWITZ, a town of Sileia, in the principality of Oels; 3 miles E. of Trebnitz.

ZIRZING, a town of Austria; 6 miles E. of Steyrregg.

ZIS, a river of Africa, which rises in the Atlas, passes by Sugulmeff, and falls itself in the sands, in the country of Tabbet.—Alfo, a mountain of Africa, between Sugulmeff and Fez; 40 miles S.S.E. of Fez.

ZISEL, in Zoology, a name given by Buffon to the earless marmot, or mus citellus of Linneus. See Cittellus.

ZISKA, John, in Biography, a distinguished leader among the Hussites, was the son of a Bohemian gentleman, named "De Trocznow," and celebrated for military valour in his youth. Ziska, denoting "one-eyed," was an appellative, which he bore in consequence of having lost an eye in a combat, on occasion of the perfidious execution of John Hufs and Jerome of Prague, at the council of Constance. Their followers took up arms, and invited Ziska to be their commander. In 1519 he accepted the invitation; and having assembled a body of peasants, he soon disciplined them so as to be equal to veteran troops. From a fortress which he constructed on an elevated situation, and called Thabor, the Hussites derived the name of Thaborites. At the siege of Rabi he lost his other eye; but though totally blind, he executed his office as commander with great vigour and success. At Auffig on the Elbe he gained a complete victory over the Catholics, and left 6000 of them on the field, retaliating the severities which they inflicted on the Reformers, by demolishing their churches, committing their priets to the flames, massacreing those who were prisoners, and laying waste their country, and thus rendering his name formidable. Having made himself master of the new town of Vienna, it was invested by the emperor Sigismund and other princes: but Sigismund, being defeated with great slaughter by the Thaborites, was obliged to retreat into Moravia, while Ziska laid siege to Wihrade. When the emperor with a fresh accession of forces renewed the attack, he lost his whole army, and the town surrendered to Ziska. He also dispersed an army of crusaders commanded by an archbishop; and in 1422 he again routed the army of Sigismund. In the mean time the Hussites renounced their allegiance to Sigismund, and chose for themselves a king; but this measure was disapproved by Ziska and the Thaborites, because they were inclined to a republican government; and the new king was compelled to abdicate his crown. Such were the reputation and importance which Ziska acquired, that Sigismund proposed to him terms of accommodation; but in his journey to hold a conference with the emperor, he was seized with the plague, which terminated his life in 1524. Although the fury of his having ordered his feth to be given to the birds and beasts, and his skin to cover a drum, for the purpose of sounding dismay to his enemies and courage to his friends, be fabulous, it is certain that the Bohemians regarded his memory with superstitious veneration. Un. Hist. Gilpin. Gen. Biog.

ZISPATA, in Geography, a bay of the Spanish Main, on the coast of South America; 80 miles S. of Cartagena.

ZITERSDORF, a town of Austria, with a citadel. In the year 1704, this town was miserably laid waste by the Hungarian rebels; 20 miles N.E. of Vienna. N. lat. 48° 28'. E. long. 16° 43'.

ZITARA, a town of South America, in New Grenada, and capital of a distrit, to which it gives name, in the province of Chocos; 120 miles S.W. of Santa Fe de Antiquia. N. lat. 6°. W. long. 76° 30'.

ZITHA, or Sitia, in Ancient Geography, a town of Asia, in Mesopotamia, on the bank of the Euphrates. Potlowey.

ZITTAU, in Geography, a river of Germany, which runs into the Saal, 4 miles S.S.E. of Bernburg.—Alfo, a town of Lusatia, on the river Neife. This town is considered as one of the best in Lusatia, and fortified in the ancient manner; it contains two churches within the walls, and three without, with three hospitalls and an orphan-houfe; 17 miles S. of Gorlitz. N. lat. 50° 49'. E. long. 14° 56'.

ZITWA, a river of Lithuania, which runs into the Niemen, 20 miles S.E. of Lida, in the palatinate of Wilna.

ZIVAGEE, or Archachera, a town of Hindooflan, in Canoe, on the Pirate coast; 30 miles S. of Severndroog.

ZIUF, a town of Africa, in the kingdom of Tunis.

ZIVOLO, in Ornithology, a name by which some authors have
have called the smaller species of yellow-hammer, from its constant note, which is only zi, zi.

It is of the fize of the common sparrow; its beak is thick and short; its breast and belly yellowish, spotted with brown; and its head, back, wings, and tail, of a dusky-brown, but two of the tail-feathers on each side have a variegation of white.

The difference between the male and female in this species is, that the male is yellow, and has some yellow spots on its neck and sides, which are wanting in the female. It is almost always seen on the ground, and feeds on seeds, &c. It seems but little if at all essentially to differ from the common yellow-hammer; and Mr. Ray has some suspicion that they are the same species.

ZIWICA, in Geography, a town of Austrian Poland; 35 miles S.W. of Cracow.

ZIZA, in Ancient Geography, a town in the interior of Arabia Petraea. Ptol.

ZIZANIA, in Botany, an ancient name, δικεφαλος of the Greeks, synonymous with the infelix lollum of the Latins, as well as with our Darnel, and belonging to an unprofitable weed, of the tribe of Gramineae, which greatly injured the crop of corn, and into which Corn itself was tipped to degenerate. (See Lollum.) Our translators of the New Testament call it Tares! Aegyptus was another Greek name for Darnel, and is still used for Lolium temulentum in the Morea. Zizania was merely adopted, as an unoccupied classical name, by Gronovius and Linnaeus, for the present genus, which yields an inferior sort of grain, used by the inhabitants of some parts of North America. We cannot applaud this application of ancient names, to plants to which they could not possibly have originally belonged, though Linnaeus often practised it. Gartner has successfully opposed this principle, but did not always change things for the better.—Linn. Gen. 491. Schreb. 639. Wild. Sp. Pl. v. 4. 394. Mart. Mill. Dict. v. 4. Pursh 60. Ait. Hort. Kew: v. 5. 278. Juss. 33. Poiret in Lamarck Dict. v. 8. 863. Lamarck Illust. t. 768. Gear. t. 82. (Elymus; Mitchell in Ephem. Nat. Cur. v. 8. append. 210.)—Clas and order, MonococX. Natural Ord. Gramina. Linn. Juss.

Gen. Ch. Male, Cal. none. Cor. Glume of two lanceolate, membranous, ribbed, clasping valves, one rather larger than the other, and most pointed. Nectary of two ovate obtuse scales. Stam. Filaments six, capillary, very short, equal; anthers pendulous, linear, notched at each end, shorter than the corolla.

Female in the same panicle, larger, Cal. none. Cor. Glume of two valves, closed, except a vacancy at each side just above the base; the outer valve largest, concave, long, straight, rigid, revolute at the edges, embracing the inner at each side, and terminating in a long straight awn; the inner narrower, lanceolate, involute at the edges. Nectary of two acute scales. Stam. sometimes present, though minute and imperfect, with small incomplete anthers. Pfiff. Germen superior, oblong; styles two, spreading, capillary, short; filaments feathery, projecting between the valves of the corolla. Seed solitary, oblong, even, polished, naked, unconnected with the glumes.

Eff. Ch. Male, Calyx none. Corolla of two valves; the outer one pointed.

Female, Calyx none. Corolla of two unequal closed valves; the outermost largest, revolute at the edges, with a terminal awn. Styles two, divergently. Seed solitary, enclosed in the plaited corolla, but unconnected with it.

is described as rather thick. Panicle long and large, much branched. Perennial corolla tumid, and, as well as the seed, somewhat ovate, with very short awns. We have seen no specimen of this species, but the ovate tumid glumes, with the similar form of the seed, which gave occasion to the specific name, appear to constitute a very clear distinction between this and both the preceding, nor is the figure of Sloane, which we have referred to our *Zizys*, by any means reconcileable to the present plant.

4. **Z. fluitans.** Floating Wild-Rice. Michaux Boreal.-Amer. v. i. 75. Willd. n. 5. Pursh n. 3.—*Spikes solitary, axillary, about four-flowered; the upper ones male. Glumes beadlets.*—On the banks of lakes Champlain and St. Lawrence; perennial, flowering in July. Of humble stature, with flender, branched, floating flumes. Leaves floating, linear, flat. *Spikes brittle-shaped; the lower ones female. All the glumes are dehiscent of awns. Michaux, Pursh.*

5. **Z. terrestris.** Land Wild-Rice. Linn. Sp. Pl. 1408. Willd. n. 5. (Katun-Tsjolam; Rheede Hort. Malab. v. 12. t. 60. Rail Hist. Pl. v. 3. 617.)—Panicle nearly simple.—Native of sandy ground, on the coast of Malabar. Stems round, leafy, jointed. *Leaves long and narrow, green, rigid, sharply pointed. Flowers flanks, slender, from the sheaths of the leaves. Glumes leafy, bearing round, blackish, glazy buds.*—These bruised with the juice of Betle-nut, and applied to the tongue, are supposed to cure the thirst to which children are subject. Roy. We have seen no specimen. Linnaeus described this species from the *Hortus Malabariae* alone, and we prefix its genus may, at least, be doubtful.

**ZIZDRA.,** in Geography, a town of Russia, in the government of Kaluga; 60 miles S.W. of Kaluga. N. lat. 53° 43'. E. long. 34° 54'.

**ZIZERIA.,** a word used by Apicus, and some other authors, to express the intellines of fowls of the gallineaceous kind, often used in decoctions for glysters, &c.

**ZIZERS, or ZITZERS, in Geography, a town of the Griffons, in the Cadee league; 6 miles N. of Coire.

**ZIZEVON, a town of Peria, in the province of Far-silan; 23 miles E.E. of Schiras.

Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, cylindrical, very long, flattened, bristly, with five minute marginal teeth, and bearded in the orifice. Cer. of one petal, ringent; tube cylindrical, the length of the calyx: limb minute; its upper lip ovate, flat, reflexed, undivided; lower spreading, broadest, in three round equal segments. Stam. Filaments two, simple, spreading, about the length of the corolla; anthers oblong, dilatant. Pif. German inferior, four-clft; style brittle-shaped, the length of the corolla; stigma cleft, pointed, indented. Peric. none, except the calyx remaining unchanged, a little gibbous at the base. Steds four, oblong, obtuse, gibbous at one side, angular at the other, very much shorter than the calyx.

The plants of this genus are slender, generally aromatic herbs, or diminutive shrubs, of humble growth, with the habit of *Thymus,* or *Cinopodium;* but distinguished by their long and flender *calyx,* as well as almost capillary tube of the corolla, even more than by having only two *flaments.* Their texture is hard and rigid, and they inhabit dry sandy situations. The leaves are opposite and undivided. Flowers whorled or capitate, red or purplish. Root mostly annual; sometimes perennial, and rather woody.

1. **Z. capitata.** Oval-leaved Ziziphora. Linn. Sp. Pl. 31. Mant. 517. Willd. n. 1. Vahl n. 1. Sm. Fl. Grce. Sibth. v. 1. 10. t. 13. (Thymus humilis lattifolius; Buxb. Cent. 3. 28. t. 51. f. 1. Cinopodium filifolium pumilum Ind. Occid. fommo caule floridum; Pluk. Phytt. t. 164. f. 4.)—Flowers fauciculated, terminal. Leaves ovate.—Native of Syria, Tauria, and the isle of Cyprus. A hardy annual, flowering in July and August, sometimes kept in botanic gardens. Miller teems to be the first person who raised this plant in England. The root is fibrous, branched and zigzag. *Stem crect,* three or four inches high, when cultivated much taller, square, leafy, usuall with two opposite spreading branches, beside the central part, clothed all over with fine, short, curved, hoary pubescence. *Leaves* hardly an inch long, entire, hoary, roughish at the edges, furrowed with parallel veins. *Foot-flanks* one-eighth as long as the leaves. *Bracteas* four at the top of each branch, nearly felle, like the leaves, but larger, more pointed and fringed; somewhat heart-shaped at the base; about the length of the flowers, which are numerous in each head. *Calyx* half an inch long, furrowed, bristly, a little wavy, with flender, sharp, purple teeth. *Corolla* with a white, downy, *sziczag* tube, and pale purplish limb. *Stamens* prominent, about as long as the lower lip, with blueish anthers. We scarcely perceive any aromatic flavour in the dried plant. Plutekeat was much mistaken as to this *Ziziphora* being of West Indian origin.

2. **Z. hispanica.** Spanish Ziziphora. Linn. Syll. Nat. ed. 10. 853. Sp. Pl. 31. Amen. Acad. v. 4. 263. Willd. n. 2. Vahl n. 2. Alt. n. 2.—Flowers axillary. Leaves obovate, point, many-ribbed.—Gathered by Lechu in Spain. *Root* annual. The *flam* is three or four inches high, crosb-branched and bushy, downy with minute recurved hairs. *Bractea leafy. Leaves* a quarter or one-third of an inch long, fringed; tapering at the base; marked on both sides with conspicuous glandular dots; the lower ones smaller, and somewhat crenate. *Flowers* two or three together, selvile. *Calyx* tapering upwards, bristly furrowed, hispid, about the length of the leaves. *Corolla* externally downy. *Linnaeus considered the branches as fipes and the leaves as bracteas,* but we can see no more reason for this than in any of the following species. The *leaves* in the original specimen still retain a powerful smell of Penny-royal.

3. **Z. spicata.** Spiked Ziziphora. *An. Hift. Nat. Madr. v. 4. 254.* Vahl n. 3. —*Flowers in racemeofe spikes, imbricated. Bracteas ovate, acute, ribbed. Leaves lanceolate, somewhat toothed.*—Native of Spain. *Annual. Stem* from ten to eighteen inches high, throwing out from the base a branch or two as tall as itself. *Leaves* ribbed; the lower ones flaked; the upper selvile. *Flowers* several, on short flanks, flanding near together. *Bracteas* broad, entire, acute, fringed. Perhaps a mere variety of *Z. hispanica.* Yet it seems to differ in having the *flam* leaves lanceolate, narrower than those that accompany the *flowers,* which are ovate, not obovate. *Vahl.* We have seen no specimen;
specimen; but this description seems to make the
inflorescence of the present species really spicled rather than
whorled, though it does not alter our opinion as to the
left.

Wildl. n. 3; Vahl n. 4. Ait. n. 3. (Acinos lyrica, folio
mucronato, capsulis hiruita; Moril. v. 3. 404. leet. 11. 1. 19.
Cf. also A. lyrica, tenuiure folio, capsulis hirtis; ibid.
f. 4.)—Flowers axillary. Leaves ovato-lanceolate, taper-
pointed, acute, entire.—Native of Syria. Sent to Morilon
from Aleppo, by the Rev. Dr. Huntington. We prehume,
from a remark of Morison under a plant immediately follow-
ing, that the two varieties here indicated, as well as perhaps
a third, with a smoother calyx, his f. 2, were all sent him in
seed, and that he raised the plants. If so the introduc-
tion of this species should be dated before the time of
Miller. The root is annual. Stems a span high, with many
square, downy, leafy branches. Leaves an inch long; nearly
selfile, strongly ribbed, downy, dotted, entire, more or less
fringed with long white hairs. Flowers filiform, mostly
in pairs, altogether axillary. Calyx about half the length of
the leaves, hoary with fine recurved pubescence, more or
less intermixed with long, prominent, bristly hairs; its lower
part swelling much, as the seeds ripen. Corolla pale, hairy
externally, with a dilated throat.

Wildl. n. 4; Vahl n. 5; Ait. n. 4. (Clinopodium fupinum
incanum; Ainn. Ruth. 51.)—Flowers axillary. Calyx hairy.
Leaves ovate, filiform, somewhat fringed.—Native of
Siberia. Introduced into England by the late Dr.
William Pitcairn, in 1786. Mr. Aiton marks it as paren-
tial. The stems are diffuse, branched, bluntly quadrangular,
finely downy. Leaves scarcely aromatic, though dotted
with pellucid spots, many-ribbed, rough-edged, and some-
what fringed, from half to three-quarters of an inch long,
on footstalks about half or a third as much. Flowers all
axillary, three, four, or more, together; on downy stalks,
half the length of the footstalks. Calyx cylindrical, strongly
ribbed, not downy, but befet with numerous, prominent,
horizontal hairs. Corolla hairy, its limb larger than in the
first and second species, scarcely so long as the third, of
a light purple, or lilac, especially the lip. Anthers large,
ovate, purple.

6. Z. taurica. Narrow-leaved Ziziphora. Bieberft. Taur-
Caucas. v. 1. 18. — Flowers axillary. Leaves linear-lanceo-
late, filiform, obtuse, entire.—Native of mount Caucasus
and its neighbourhood, among lime-flone rocks, or about
the flomy banks of torrents, flowering in June and July. We
received specimens of this, and all the following species,
from the Chevalier de Steven. The root is annual, long,
tapering and zigzag. Stems one or more, scarcely divided,
except at the bottom, ascending, near a span long, not
composed of opposite branches crossing each other, as in
Z. tenueiur, to which the author of the Flora Taurico-Cau-
casica confiders this plant very nearly allied. Without ad-
verting to the greater size of the corolla, which is very likely
to vary, and to the pubescence of the calyx, which certainly
does not, the leaves appear to be much narrower and more
obtuse; not acute or spinous-pointed. The whole herb
smells strongly, but kindly, of Penny-royal, and its leaves
are dotted as in the tenueiur. One of our specimens has
broader leaves than the other, and rather shales our opinion
of its being a distinct species.

Taur.-Caucas. v. 1. 18. (Serpyllum orientale, folio pulegii
vulgaris; Tourn. Cor. 13.)

Taur.-Caucas. v. 1. 18. (Z. serpyllacea; Sims in Curt.
Mag. t. 986. Ait. n. 5. Z. Poufchkini; Sims in Curt.
Mag. t. 1993, Ait. n. 6.)—Clusters terminal, capitulate,
some what leafy. Leaves lanceolate, naked, even, obtuse. Stems rather shrubby,
ascending.—Native of the graffy hills of Caucasus, flower-
ing from June to August. Flowers of open fields in Georgia,
about Teflis; commnicated by the Chevalier de Steven.
The stems are rather woody, their branches hoary, with fine,
recurred, dense hairs. Flowers smooth, with copious pel-
licul dots, and the flavour of Penny-royal. They have a
mid-rib, but no lateral ribs, veins, or furrows. Flowers
filiform, crowded at the summit of each branch into a close
tuft, some of the lowermost being axillary. Flower-stalks
round, clothed with finely possible hoary pubescence, as are
the strong ribs of the calyx, whole teeth are fringed
with long white hairs. Limb of the corolla rather large,
and frament prominent. The variety B, which is all we have
seen, is said to differ only in having narrower, perfectly
entire, leaves, which are also more crowded than in a. If
there be any affinity between the two varieties, neither of
them can possibly be the Z. serpyllacea of Curt. Mag. t. 986.
See the following species.

ZIZIPHUS.

Gen. Ch. Col. Fernand inferior, of one leaf, nearly flat, in five spreading, ovate, equal, coloured, deciduous segments. Cor. Petals five, minute, obovate, between the segments of the calyx, but much shorter, opposite to the flamen, spreading horizontally. Stam. Filaments five, short, lying over the petals, and not half so long; anthers roundish, of two lobes. Pyl. Germen inferior, orbicular, depressed, ftyle one, very short, fflagmas two or three, obtuse. Peric. Drupa oval, or roundish, pulp, of one cell. Seed. Nut solitary, the shape of the drupa, of one or two cells, with solitary kernels.

Obf. We have already (see Rhamnus and Paliurus) declared our determination of separating all these genera, though, like Willdenow and some others, the writer of this has united Ziziphus and Paliurus, in the Prodrumus Fl. Græc.; an error which will be corrected in the Flora Græca itself. With respect to some of the species, we can only rely on those who have described the fruit, on which the distinction chiefly depends. They are all shrubby, and for the most part thorny, with alternate, simple, undivided, deciduous, strongly ribbed leaves, and small, axillary, tufted, sometimes racemose and partly terminal, flowers, of a yellow or greenish colour, and inconspicuous appearance; their calyx more flat, for the most part, than that of Rhamnus. The fruit is in most instances estable, or medicinal. In a few instances, the petals are wanting.

Seet. 1. Thorns or prickles none.

1. Z. linaria. Veiny Jujube. Wildl. n. 1. (Rhamnus linata; Linn. Sp. Pl. 221. Amen. Acad. v. 4. 338. Obseck. It. 219 t. 7. Engl. ed. v. 1. 533 t. 7.)—Stem erect, unarmed. Leaves roundish-ovate, obtuse, wavy. Clusters terminal; their lower flowers axillary.—Gathered by Obseck, on the French isle, in the riber of Canton, flowering in September. A buxy shrub, often as tall as a man, with copious, alternate, round, leafy, finely downy branches. Leaves alternate, on short flarks, of a roundish, abrupt, often emarginate, figure, half an inch long at most, smooth on both sides; dark green above; paler and yellowish beneath, with very elegant, oblique, parallel, red veins. Flowers about the ends of the branches, flaked, partly axillary, partly collected into terminal smooth chyfers. Calyx a little concave, or bell-shaped, at the base; its segments lanceolate, as are likewise the petals. Anthers black before they burst. Drupa small, oval, seated on the obo- circular permanent base of the calyx.

2. Z. volubilis. Twining Jujube. Wildl. n. 2. Ait. n. 1. Purif. n. 1. (Rhamnus volublis; Linn. Suppl. 152. Walt. Carol. 101. Jacq. Coll. v. 2. 236. Ic. Rar. t. 326.)—Stem twining, unarmed. Leaves ovate, acute, somewhat wavy. Umbels axillary and terminal, flaked.—In deep swamps, near the sea-coast, from Virginia to Carolina, flowering in June. Flowers small, greenish-yellow. Fruit oblong, violet-coloured. It affords the highest trees of Cupressus bifis, in the Difmal swamp, near Suffolk in Virginia, and is known there by the name of Suple-Jack. Purif. The branches are round and smooth. Leaves flaked, drooping, one and a half or two inches long, and near one broad, acute, and tipped with a small point, smooth, with oblique parallel veins, more numerous than in the leaf; their under side rather the palest. Flowers small, pale. Drupa small, blackish, of a long oval shape. Nut of two cells in the wild state, according to Walter, though Jacobin, in the cultivated plant, found only one. Lamarck, in an observation at the end of this genus, though he allows this species to have the proper fruit of Ziziphus, gives his reasons for keeping it in Rhamnus; there are the concave calyx, and the want of a flihy disc, or, in Linnaean language, "receptacle of the flower." Probably the fame remarks would apply to the preceding species, which Lamarck also excludes from Ziziphus. We are ready to allow that they both have more of the habit and foliage of Rhamnus, and their fruits are so small, it may be difficult to say whether they are drupas or berries. Not having had an opportunity of investigating this point ourselves, we must rely on those who have.

3. Z. peruviana. Peruvian Jujube. Lamarck n. 12.—Stem unarmed. Leaves elliptic-ovate, sparingly and minutely toothed, somewaut angular, rather flihy, smooth. Petals acute, longer than the calyx.—Native of Peru. Long cultivated in the public garden at Paris, from whence the younger Linnaeus procured a specimen, and where Lamarck saw it flowering for many succeeeive years, but without producing fruit, which led him to suppose the flowers might be dioecious. The plant itself appears now to be no longer in existence there, no mention being made of it in professor Desfontaine's Tableau de l'Ecole de Botanique au Jardin du Roi, ed. 2. printed in 1815. This is an evergreen, branching, loosely spreading shrub, about three feet high, smooth in every part. Branches a little zigzag, nearly round. Leaves scattered, flaked, from an inch to an inch and a half long, generally obovate, blunt, or sometimes pointed, thick and somewhat flihy, of a glaucous green, with a midrib, and a few scattered veins, none of which seem to be visible but in a dried state, and then but slightly. The margin is irregularly angular, each angle tipped with a glandular tooth. Our specimen has no flowers. Lamarck says they are small, axillary, two or three together, or solitary, flaked, yellowish-white, widely expanded, fvel- cleft. Petals oval, pointed, flat, larger than the calyx.

4. Z. emarginata. Notched Jujube. Swartz Ind. Occ. 1594.—Stem erect, unarmed. Leaves roundish-ovate, emarginate. Umbels axillary, flaked. Petals none.—Gathered by Mr. Fahlberg, in the West Indian isle of St. Bartholomew. The stem is flihy, with round, fvel, rigid branches, whose bark is grey and smooth; their extremities angular. Leaves flaked, alternate, but approaching each other in pairs, so as to become nearly opposite, rather membranous, very smooth on both sides, an inch or an inch and a half long, entire, the extremity only being slightly emarginate. Footflaks short. Umbels opposite. Stalks the length of the footflaks, thickened as the fruit advances. Partial ones from three to six, rather longer, single-flowered. Calyx concave, with a spreading limb, in five acute segments, divided as it were into two cavities. Petals none. Filaments very short, inserted below the divisions of the calyx. Anthers ovate, embraced at each side by the hollows in the segments of the calyx. Stigmata two, obtuse. Drupa roundish-ovate, smooth, the size of Allspice, crowned with the permanent style. Nut of two cells, with solitary kernels. Swarts.

Seet. 2. Branches prickly.

Afric. n. 632. f. 632. Rhamnus Lotus; Linn. Sp. Pl. 281. "Desfont. in Aët. Paris, for 1788. 446. t. 21. Mungo Park's Travels, 99, with a plate."—Prickles in pairs; one of them hooked. Leaves elliptic-oblong, lightly crenate, three ribbed, smooth on both sides. Native of Africa, especially of the kingdom of Tunis, "in a tract called Teped, which was formerly the country of the Lophobeg. The Arabs know this plant by the name of Scedra. It has the habit of a Rhamnus, and the flowers of the Common Jujube. But the fruit is smaller, rounder, and sweeter; the size of Sloe, with a large stone. This fruit is borne on every part of the branches, like Goofcheberries; whereas that of the Common Jujube grows only on the slender annual shoots, thrown out from the ends of the branches. The Z. vulgaris is 20 feet, or more, in height, with a large furrowed stem, twisted branches, knotty at the extremities, and larger oblong leaves; but the Lotus is scarcely three or four cubits high, with numerous shoots from the same root, which are smooth, frangipanier, and paler, or white; the leaves small, round, and more rigid. The fruit is ripe, and fit for eating, in December and January." Such is Dr. Shaw's very intelligent account; to which we may add, that the prickles grow in pairs, both of them very straight, slender, and sharp, when young, but in process of time one becomes thick and hooked, the other much elongated, remaining quite straight. The leaves are at most an inch long, perfectly smooth, naked, and green, on both sides; their three ribs sometimes separate, sometimes more or less combined.

6. Z. Napcra. Smooth Indian Jujube. Willd. n. 5. Lamarck n. 11. (Rhamnus Napcra; Linn. Sp. Pl. 282.) Rh. n. 87; Linn. Fl. Zeyl. 36. Jujuba indica spinosa, folio et fructu longiori; Pluk. Almag. 199. Prunus zeylanica spinosa, &c.; Pluk. Phyt. t. 216. f. 6. Vidara littorea; Rumph. Amboin. v. 2. 119. t. 37.)—Prickles generally in pairs, hooked. Coryms axillary, many-flowered. Leaves ovate, acute, finely serrated, smooth on both sides. Fruit elliptical.—Native of Ceylon, Ambonaya, and other islands of the East Indies. We know this only by the specimen in the Linnean herbarium, which does not quite agree with the description in the Flora Zeylanica, the leaves being neither oblique, unequal, nor blunt, but exactly as represented by Plukener and Rumphius. The branches are somewhat zigzag, round, or a little angular, with a smooth whitish bark; rough with mealy down when young, like the flower-buds, stalks, and young leaves. Prickles flout, recurved, dark brown. Leaves an inch, or an inch and a half long, elliptic-obate, acute, tipped with a small glandular point, finely and bluntly serrated, strongly three-ribbed; paler and yellowish beneath. Footstalks quarter of an inch long, a little downy. Flowers very numerous, in dense, compound, downy or mealy, corymbose clusters, on short axillary stalks. Drupae like an olive, elliptical, or somewhat ovate; its flavor acid and astringent. Rumphius says, this fruit is seldom eaten but with salt, or as a sauce to fish or other food, for the purpose of exciting an appetite. Lamarck unites this species, or at least its synonyms, with the Rhamnus Spina-Cruci of Linnaeus, of which we shall speak hereafter; see n. 15.

7. Z. Jujuba. White-leaved Indian Jujube. Willd. n. 6. Lamarck n. 6. Ait. n. 4. [Rhamnus Jujuba; Linn. Sp. Pl. 282.] Rh. n. 89; Linn. Fl. Zeyl. 36. Manifanas; Sonnerat Nouv. Gum. 114. t. 94. Malum indicum; Rumph. Amboin. v. 2. 117. t. 36. Perisodadi; Rhode Hort. Malab. v. 2. 85. t. 41.)—Prickles solitary, deflexed. Coryms axillary, many-flowered.—Leaves roundish-ovate, obtuse; downy and snow-white beneath.—Native of the East Indies. A flow' plant in England, flowering in April and May. When wild, it makes a tree of a moderate size. The branches, flower-buds, flatly, and backs of the leaves, are all white with fine dense, entangled, rather flary, pubescence. Form and size of the leaves much like the leaf, but rather rounder and more blunt; the margin crenate, or bluntly serrated; upper side very smooth, of a fine green. Infoleration like the leaf. Flowers white; sometimesfix-cleft and hexandrous. Style divided. Drupae globular, or somewhat heart-shaped. Nut rugged, with two green kernels. Sonnerat reckons this fruit among the best that are the produce of New Guinea. Rheede speaks of it as "agreeably acid," and more olive-shaped than in Sonnerat's figure. Cultivation perhaps may account for these differences. Hence we presume Z. mauritiana. Lamarck n. 7, may be but a variety of this.

8. Z. Xylopous. Wooden-fruited Indian Jujube. Willd. n. 7.—Prickles solitary, recurved. Leaves ovate, rather acute, somewhat heart-shaped; downy beneath. Flowers corymbose.—Native of desert places, at the bottoms of hills in the East Indies. A tree, scarcely taller than a man. Branches hoary. Leaves broadly-ovate, in some degree heart-shaped, not unfrequently oblique; unequally serrated; dark coloured above; clothed beneath with very fine white down. Prickles few, small, solitary under each footstalk. Flowers in axillary flaked corymbs. Calyx downy. Drupa dry, involuting, slightly arista, larger than a cherry. Nut rugged. Retains, Willd. Possibly this may be Z. rugosus; Lamarck n. 8, for which that author cites Frutex bijugatus spinosus, &c.; Pluk. Phyt. t. 29. f. 7.

9. Z. Oenoplia. Velvet-leaved Jujube. Willd. n. 8. Lamarck n. 5. Mill. Dict. ed. 8. n. 3. (Rhamnus Oenoplia; Linn. Sp. Pl. 282.) Rh. n. 88; Linn. Fl. Zeyl. 36. Jujuba aculeata, nervosis foliis, infra sericeis, flavis; Burn. Zeyl. 131. t. 61.)—Prickles solitary, conical, recurved. Leaves unequally ovate, or half-heart-shaped, acute; silky beneath.—Native of Ceylon. A small tree, with downy branches, and short, thick, hooked prickles. Leaves two inches long, very obscurely serrated; remarkably uneven or oblique at the base, the three ribs also being much nearer one margin than the other; under the side finely silky and yellowish; the upper also silky while young, but in a less degree. Flowers in little dense, silky, axillary tufts.

10. Z. Iguanca. Lizard Jujube. Lamarck n. 4. (Rhamnus Iguanacea; Linn. Sp. Pl. 282.) Jacq. Amer. 74. Jujube americana spinosa, loti arboris foliis et facie, fructu rotundo parvo dulci; Commel. Hort. v. 1. 141. t. 73.)—Prickles in pairs, unequal, divaricated. Leaves ovate, pointed, serrated, smooth on both sides. Clusters axillary, monocious. Petals wanting. Fruit roundish.—Native of the West Indies, as well as of the neighbouring continent, in bushy, rocky, or rocky places, where the Lacerta Iguana, reported to be fond of this fruit, is likewise frequently to be met with. This is an inelegant trailing shrub, with round, zigzag, scarcely downy, branches. Leaves thin, plant, three-ribbed, very smooth, two or three inches long, sometimes more. Jacquin says eight inches, though rarely, in which case they are more elliptical. The prickles are long and slender, in pairs under each footstalk; one of them always straight; the shortest sometimes curved, but not remarkably. Flowers small, yellow, according to Jacquin delimit of petals. Drupa roundish or ovate, yellow, twice the size of a pea, with a sweet pulp, and a rugged nut, of one cell. Willdenow seems to have omitted this species entirely.
11. Z. finexis. Chinefe Jujube. Lamarck n. 3. Defont. Tabl. 231.—“Young branches prickly, downy; old ones unarmed. Leaves ovate-oblong, sharply ferrated. Petals reflexed under the calyx.”—Cultivated in the public garden at Paris, and said to be native of China. As this point is uncertain, how much better might the name of cryptopetala have been chosen? Lamarck describes the present species as a flava, only three or four feet high, losing its flender, unequal, brittle-like prickles as the branches advance in age. Leaves of a very pale green, crowded, three-ribbed, rather smaller than those of Z. vulgaris hereafter described; we presume they are quite smooth. Fruitflats short and downy. Flowers small, white, axillary, solitary or in pairs, remarkable for having their petals so completely reflexed, and concealed by the calyx, as not to be visible when we regard the flower vertically. Lamarck.

12. Z. rotundifolia. Round-leaved Jujube. Lamarck n. 9. (Jujuba, five Ziziphus, zeylanica rotundifolia cereata minor, folius subustus lanuginosus; Pluk. Phyt. t. 197. f. 2. Burm. Zeyl. 132.)—“Prickles in pairs; one of them recurved. Leaves roundish-oval; downy beneath.”—Native of Ceylon. Leaves small, perhaps hardly an inch long, rather more rounded than in Pluketen’s figure, slightly toothed; smooth above; cottony beneath; on very short fruitflats. Branches slender, cylindrical. Prickles small. An Indian specimen in the Linnean herbarium, attached to Z. napecana, to which it certainly is very little related, agrees in many points with this description of Lamarck, except that the very small prickles are foliary, nor are the fruitflats very short. We know not to what other species of Ziziphus to refer this specimen. It is marked Ber, and said to afford gum lac, which is collected from it by winged insects.

13. Z. angustata. Angular-branched Jujube. Lamarck n. 10.—“Prickles in pairs, straight. Leaves roundish-oval, somewhat toothed, smooth on both sides. Branches acutely angular.”—Described from the herbarium of Juffieu, without fruitification. The angular branches strikingly distinguish this species from all the rest. They are woody, smooth, zigzag, square, with prominent acute angles. Leaves three-ribbed, an inch and a half broad, on short fruitflats. Lamarck.

Nothing is recorded of the native country of this plant.

14. Z. vulgaris. Common Jujube. Willd. n. 9. Lamarck n. 1. Ait. n. 5. Sm. Fl. Grec. Sibth. t. 243. (Z.; Dod. Pempt. 827. Ziziphus; Cramer. Epit. 167. Rhamnus Ziziphus; Linn. Sp. Pl. 282. Pall. Roff. v. 1. part 2. 24. t. 59. C. L. Willich Obs. 5. Jujube Arabum, five Ziziphus Dodonaei; Ger. Em. 1501.)—Prickles in pairs, unequal. Leaves ovate, bluntly serrated, smooth. Flowers in axillary tufts. Fruit elliptical.—Native of the south of Europe. Gathered by Dr. Sibthorp about Megara, and on mount Parnassus. It has been cultivated in England ever since Parkinson’s days, but requires the shelter of a green-house, and though it may sometimes blossom, never bears fruit. Pliny says the Jujube-tree was brought, in his time, from Syria into Italy. When wild it attains the size of a small tree, with round, smooth, glaucous branches, zigzag and leafy when young. The prickles make no appearance on the young leafy shoots, but the following year they become strong thorns, one of them an inch long, the other much shorter, and sometimes, not always, recurved, as Willich well observes. Leaves rather crowded, deciduous, on short flanks, ovate, somewhat tapering into a broad blunt point, frequently emarginate; their edges coarsely though bluntly ferrated; both surfaces smooth; the under paler, strongly three-ribbed; their length an inch and a quarter or an inch and a half. Flowers yellowish, on short flanks, in little axillary tufts, not much longer than the footflats. Petals obtuse, half the length of the calyx. Stigmas two or three. Drupa the size and shape of an olive, blood-red, sweet, mucilaginous, esteemed good in fevers or inflammation of the mouth and throat, but are out of use in our present practice. If Pallais’s plate above quoted be the true Z. vulgaris, of which we cannot help feeling some doubt, a comparision of that plate with the old wooden cut of Camerarius, may serve to shew how superior the artills of those earlier times were to some of our modern delineators and colourers.

15. Z. Spina Chrifti. Christ’s-thorn Jujube. Wildl. n. 10. (Z. africana; Mill. Dict. ed. 8. n. 4. Rhamnus Spina Chrifti; Linn. Sp. Pl. 282. Oenoplia pinifolia; Cluf. Hift. v. 2. 313. Nabæ, Palafrus Athenæi credita; Alpin Egypt. 16. t. 19. Jujube five Ziziphus africana, mucronatus folius, pinifolium; Pluk. Almag. 199. Phyt. t. 197. f. 3.—Prickles in pairs, straight. Coryms abscdary, filky, many-flowered. Leaves oval, finely serrate, smooth on both sides. Fruit globose.—Native of Ethiopia and Paleltine. Seeds collected near Jerufalem, by Haffelquilt, produced the plant described by Linnaeus, a wild specimen of which, sent also by Haffelquilt, is preferred in the Linnean herbarium. Miller also raised this species from Syrian seeds, so that it is entitled to a place in Hort. Kew. Referphing Pluketen’s synonym, we feel no doubt. The cut of Alpinus as much refembles Z. nappea, n. 6, in the foliage, but the globose fruit agrees best with the species before us. The prickles are hardly visible on our specimem, which is a young luxuriant leafy branch, in flover. They perhaps acquire their full proportion on older branches, as in Z. vulgaris, n. 14. The leaves are fatter, of a broad-ovate, somewhat roundish, obtuse figure, two and a half or three inches long, and two wide, strongly three-ribbed, with transverse veins, minutely and slightly crenate rather than ferrated, very smooth and even on both sides; paler beneath. Fruitflats scarcely an inch long; downy on their upper side. Coryms forked, downy, many-flowered, each on a folitary axillary stalk, shorter than the fruitflats. Bracteasawl-shaped. In our only expanded flower, the segments of the calyx, as well as the petals and stamens, are strongly reflexed, quite under the base of the calyx. The drupa is said to be the size and shape of a Sloe.

ZIZITH, in the Jewifh Cufloms, a name given by the Jews to the tufts or fringes they used ancienly to wear at the four quarters of their upper garments, but which they now only wear under their clothes, fixed to a square piece of cloth, which reprefents the garment they anciengly wore in their own country before their difperfon. The zizith of the modern Jews is a tuft made of eight threads of yarn, spun on purpose for this ufe, each having five knots, which take up half the length. That which is not knotted, being furled out, makes a kind of tuft or fringe. Numb. xv. 58. Deuter. xxii. 12. Leo of Modena, Cerem. of the Jews, part i. chap. 5. Calmet. Dict. Bibl. in voc.

ZIZYPHA, in Botany. See Ziziphus.

ZLABINGS, in Geography, a town of Moravia, in the circle of Igland; 28 miles W. of Znaym.

ZLATOUSTOVSKOL, a town of Ruffia, in the government of Uplha; 60 miles W. of Tcheliabinfkh.

ZLEBY, a town of Bohemia, in the circle of Czasflau; 4 miles S.E. of Czasflau.

ZLIN, a town of Moravia, in the circle of Hradfich; 15 miles N.N.E. of Hradfich.

ZLOTI, a money of account in Poland, where accounts are kept in zloti, guelden, or florins of 30 groschen or gros,
grofz, and each grofchen is divided into 18 pfenings. The florin also contains $\frac{2}{3}$ skolteck, 90 schillings, or 270 pfenings. A skolteck is worth 12 grofchen, or 36 schillings; a grofchen, 3 schillings; and a schilling, 3 pfenings.

ZMEINOGORSKAIA, in Geography, a fort of Russia, on the river Porobalika; 200 miles S. of Kolivan. N. lat. 51° 10'; E. long. 82° 10'.

ZMILACES, in Natural History, a name given by Pliny to a stone found in the river Euphrates, resembling marble, and of a blueish-green colour.

ZMILAMPIS, the name of a gem, described by Pliny and the ancients, which they tell us was very like the Proconnesian marble, except that in the centre of the stone there was always a blueish spot, resembling the pupil of an eye.

The Proconnesian marble of the ancients was of a fine clear and elegant white, variegated with irregular black veins. Pliny's description is so short, that it has been supposed from him that the zmilampis was a fort of marble; he only says of it, that it was like the Proconnesian marble, but blue in the middle. Many had inferred from this, that he meant no more by it than that this was a stone, which had blue veins instead of the black ones in the Proconnesian kind. But when we examine the rest of the ancients, and find that it was a small stone, found in the river Euphrates, and worn in rings, and that its blue spot was like a pupil of an eye, we may easily determine that it was one of those gems which we call oculis bell, or bollchis; of which there is a vast variety found in the rivers of the East Indies, and many have a fine opaque white ground, and a blueish or greenish spot for the pupil.

ZMILANTHES, a name given by Solinus and some others to a gem called by the more correct writers zmilampis.

ZMENSKOI, in Geography, a town of Russia, in the government of Tobolik, on the Irichel; 28 miles N.N.W. of Tera.

ZNAYM, a town of Moravia, in the circle of the same name, near the river Teya. This town was built about the year 1222, at a little distance from another town, laid waste by the Bohemians. It contains a citadel, four cloisters, and a college; the circle borders on Austria; 68 miles S.W. of Olmutz. N. lat. 48° 48'; E. long. 15° 51'.

ZNENDEI, a river of Russia, which runs into the Vitin, N. lat. 53° 44'; E. long. 115° 14'.

ZNIN, a town of the duchy of Warfaw; 20 miles N. of Gniewa.

ZNONIRGAD, a town of Croatia; 36 miles S. of Bihač.

ZOAGLI, a town of Genoa; 20 miles E. of Genoa.

ZOANA, in Ancient Geography, a town of Asia, in the Leffier Armenia, upon the route from Satala to Arabibus, between Tomusa and Gundufa. Anton. Itin.

ZOANNES, a name given by Strabo to a people half-Savage, that inhabited the mountains of the Colchide.

ZOAR, ZOARA, Segor, or Bela, a city of Pentapolis, on the southern extremity of the Dead Sea. It was preferred by destruction from fire by means of the intervention of Lot. (Gen. xiv. 2.) Its name before this circumstance was Bela; but when Lot requested it to be spared as a place of refuge for himself, he represented it as a small place; and hence it had the name Zoar, or Segor, which, in Hebrew, signifies small or little. The Romans kept a garrison at Zoar. St. Jerom observes, that the name Bela was given to this city, because, as soon as Lot left it, an earthquake caused it to be swallowed up; bela in Hebrew signifying to swallow up. Jerom also says, that the Hebrews think that Zoar bears also the name of Shalihia. (1 Sam. ix. 4.) They pretend that this city has been often demolished by earthquakes.

ZOAR, in Geography, a town of Arabia, in the province of Hedjjas, on the south coast of the Dead sea, at the mouth of the Sa'ah; 30 miles N. of Karac.

ZOAR. See TSBIR.

ZOARA, a town of Africa, in the country of Tripoli; 60 miles W.N.W. of Tripoli.—Alfo, a town, in the country of Baza; 140 miles S.W. of Tolomea. N. lat. 32° 35'; E. long. 11° 56'.

ZOBAYA, a town of Mexico, in the province of Guatimala; 30 miles N. of Guatimala.

ZOBIR, a town of the Persian empire, in the pachalic of Bagdad, about 10 miles W. of the city of Baffora, situated on the dry canal of the Djure Zade, supposed to be the former bed of the Euphrates. It is by some said to be the ancient Bafra, and derives its present name from Zobeir, who was defeated and slain in the battle of the Camel, fought near this place.

ZOBELN, a town of the duchy of Courland; 20 miles E. of Goldingen.

ZOBERA, a town of Arabia, in the province of Yemen; 35 miles S.E. of Chamir.

ZOBERN, a town of Saxony, in the Vogtland; 8 miles W. of Oelfnitz.

ZOBIN, a town of Germany, in the principality of Oettingen Wallerstein; 6 miles W.N.W. of Nordlingen.

ZOBING, a town of Saxony, in the margravate of Meillen; 15 miles S. of Deffau.—Alfo, a town of Austria; 3 miles N. of Cremn.

ZOBILTZ, a town of Saxony, in the circle of Erzgebirg. This place contains 116 houses, and the inhabitants furnish principally by working the serpent-stone, which is found here, into pitchers, bowls, tea and coffee dishes, mortars, cups, &c. The serpent-stone is dug just above the town, and farther on to the east of it is found a red species, which is reckoned among the finest, and for that reason is also considered by the sovereign as his property, together with a yellow, green, grey, and black fort. In the electoral red quarry is also found albinos of divers colours and granites; 17 miles S. of Freiberg. N. lat. 50° 36'; E. long. 13° 11'.

ZOBOWITZ, a town of Pomelia; 14 miles S. of Dantzie.

ZOBTEN, a town of Silicia, in the principality of Schweidnitz; 9 miles E.N.E. of Schweidnitz. N. lat. 50° 48'; E. long. 16° 41'.

ZOBTENBERG, a mountain of Silicia, situated in a country otherwise level, 2424 Paris feet above the level of the sea, near Zobten.

ZOCCO, ZACCOCO, Zocele, or Socle, in Archit. See Socle.

ZOCER, in Geography, a town of Croatia; 2 miles S.W. of Bihač.

ZOCHINACATLIS, in Botany, a name by which some authors have called the flor aculea, a flower of New Spain, used in making of the Spanish chocolate.

ZODIAC, Zodiatus, in Astronomy, a fæcias, or broad circle, whose middle is the ecliptic, and its extreme two circles parallel to it, at such distance from it, as to bound, or comprehend, the excursions of the sun and planets.

The word is formed from the Greek $\zeta$, animal, by reason of the constellations in it, which have the forms of animals given them; others derive it from $\zeta$, life, from an
ZOD

an opinion, that the planets have a great influence on animal life.

The sun never deviates from the middle of the zodiac; i. e. from the ecliptic: the planets all do more or less. Their greatest deviations, called latitudes, are the measure of the breadth of the zodiac; which is broader, or narrower, as the greatest latitude of the planets is made more or less. Accordingly some make it 16, some 18, and some 20 degrees broad.

The zodiac interfecting the equator obliquely makes an angle with it of 23 degrees and a half; or, more precisely, of 23° 27'; which is what we call the obliquity of the zodiac, and is the sun's greatest declination. See Ecliptic.

The zodiac is divided into twelve portions, called signs; and those divisions, or signs, are denominated from the constellations which anciently posseffed each part. But the zodiac being immoveable, and the stars having a motion from west to east, those constellations now no longer correspond to their proper signs; whence arises what we call the precession of the equinoxes.

When a star, therefore, is said to be in such a sign of the zodiac, it is not to be understood of that sign, or constellation, of the firmament, but only of that twelfth part of the zodiac, or dodecaneomy of it.

Caffini has also observed a tract in the heavens, within whose bounds most of the comets, though not all of them, are observed to keep, which, for this reason, he calls the zodiac of the comets.

This he makes as broad as the other zodiac, and marks it with signs, or constellations, like that; as Antinous, Pe- gasia, Andromeda, Taurus, Orion, the Lesser Dog, Hydra, the Centaur, Scorpio, and Sagittary.

ZODIAC, Hindoo. The early investigators of Hindoo mythology, which comprehends not only their astronomy, but every science, and almost every art, of which the Hindoos have any knowledge, were surprised to find that the days of the week were named, as with us, after the planets, and in the same order. It was natural enough to suppose that the Hindoo almanac was borrowed from the Arabians. The few Brahmins who at that time had access to Europeans of science, suppos'd the fame of us, when they discovered the similitude of fable and of name. But it has been made manifest by the investigations of later writers, that the Hindoo zodiac is of very great antiquity. Such of our readers as may be devious of extended information hereon, are referred to the dissertations of Sir William Jones and Mr. Colebrooke; on the Hindoo zodiac, in the 2d and 9th volumes of the Asiatic Researches; and to the Hindoo Pantheon. In both works, plates of the Hindoo zodiac are given from different authorities; and in the latter work separate engravings also of the personified planets. We will extract from it a fort of table, shewing the English and Sanskrit names, and the vehicles assigned to the several planets by the latter fabulists.

Under the Sanskrit names of the planets we have given short articles descriptive of their mythological and historical attributes and allusions. To them (Surya, Soma, &c.) we therefore refer for farther particulars, and to the article Vahan for an account of the vehicles assigned to them and other mythological personages of Hindoo fable.

ZODIACAL LIGHT, a brightness resembling that of the milky way, but less bright, and which is sometimes perceived in the heavens, at certain times of the year, after fun-fet, or before its rise. Some have supposed, that this phenomenon is the fame with that of the ancients called trubes, a term by which they denoted a meteor, or imprefion in the air like a beam. Thus Pliny (lib. ii.) says, "eminant trubes, quos docos vocant." The form of this light resembles that of a pyramid, lying lengthways in the zodiac, within which its point and axis are always enclosed, its base being towards the fun, and placed obliquely with refpect to the horizon. In the torrid zone, the zodiacal light is frequently, or almost constantly, seen. At or near our latitude it may be seen about the time of the equinoxes. The bleft time for seeing it is about the 1st of March, at 7 o'clock in the evening, when the twilight is ending, and the equinoctial point in the horizon. This phenomenon was first discovered by Descartes, and by Childrey about the year 1659. It did not engage general attention till it was described and named by M. Caffini the elder, in 1683. It was afterwards observed by M. Fatio, in 1684, 1685, and 1686, and by M. Kirch and Eimmart, in 1687, 1689, 1691, 1693, and 1694. See Mairan, Suite des Mem. de l'Acad. Royale des Sciences, 1731, p. 3.

In 1707, April 3, it was observed by Mr. Derham in Exf. It appeared in the western part of the heavens, about a quarter of an hour after fun-fet, in the form of a pyramid, perpendicular to the horizon. The base of this pyramid he judged to be the fun. Its vertex reached 15° or 20° above the horizon. It was throughout of a dusky-red colour, and at first appeared quite vivid and strong, but faintest at the top. It grew fainter by degrees, and vanished about an hour after fun-fet. This solar atmosphere has also been seen about the fun in a total solar eclipse, a luminous ring appearing about the moon at the time when the eclipse was total.

M. Fatio
M. Fatio conjectured that this appearance arises from a collection of corpuscles encompassing the fun in the form of a lens, reflecting the light of the fun. M. Cassini suppos'd that it might arise from an infinite number of planets revolving about the fun; so that this light might owe its existence to these bodies, as the milky way does to an innumerable number of fixed stars. It is now, however, generally suppos'd, that it is matter detached from the fun by its rotation about its axis. The velocity of the equatorial parts of the fun being the greatest would throw the matter to the greatest distance, and on account of the diminution of velocity towards its poles, the height to which the matter would there rise would be diminished; and as it would probably spread a little sideways, it would form an atmosphere about the fun something in the form of a lens, whose section perpendicular to its axis would coincide with the fun's equator. And this agrees very well with observation. There is, however, a difficulty in thus accounting for this phenomenon. It is very well known that the centrifugal force of a point of the fun's equator is a great many times less than its gravity. It does not appear, therefore, how the fun, from its rotation, can detach any of its gros particles. If they be particles detached from the fun, they must be sent off by some other unknown force; and in that case they might be sent off equally in all directions, which would not agree with the observed figure. The cause is probably owing to the fun's rotation, although not immediately to the centrifugal force arising therefrom.

The zodiacal light, according to M. de Mairan's ingenious and plausible hypothesis, is nothing but the solar atmosphere, a rare and fluid substance, either luminous by itself, or made by the rays of the sun surrounding its globe; but in a greater quantity, and more extensively about its equator than any other part. As it always accompanies the fun, it is natural to ascribe it to a solar atmosphere, extending beyond the orbit of Mercury, and sometimes even beyond that of Venus. Accordingly, the zodiacal light has been suppos'd to be a section of this atmosphere, which, being extremely flat at its poles, cannot be conceived to partake of the fun's monthly motion. Dr. T. Young (Lectures, vol. i. p. 502.) observes, that the only probable manner in which it can be suppos'd to retain its figure, is by means of a revolution much more rapid than that of the fun's motion. To that purpose, M. de la Lande remarks, that it seems now to be generally believed, that the zodiacal light is the atmosphere of the fun; for it always accompanies that luminarity; and the equator of the fun is in the direction of this light: consequently he says, that in all probability the zodiacal light is an atmosphere situated round the fun, in the direction of its equator, and flattened by its rotary motion. Astron. Paris, 1771. § 845 to 849.

The zodiacal light is more or less visible according to circumstances; but the solar atmosphere is not always visible, by means of this light, though it be always seen about the globe of the fun in total eclipses. One of the most essential circumstances for the perception of the solar atmosphere by the zodiacal light is its having sufficient length on the zodiac; for without this its brilliancy is entirely hid from us by the twilight. M. de Mairan says, it may be proved from many observations, that the fun's atmosphere sometimes reaches as far as the earth's orbit, and there meeting with our atmosphere produces the appearance of an aurora borealis.

The length of the zodiacal light varies sometimes in reality, and sometimes in appearance only, from various causes. The oblique position of this light, little different from that of the plane of the ecliptic, does not permit us to see it distinctly, and sufficiently elevated above the horizon; but some time after sun-set, towards the end of the winter, and in spring, or before sun-rising in autumn, and towards the beginning of winter. Several causes hinder our seeing it, any more than the milky way; such as moon-light and strong twilights, among others.

M. Cassini often mentions the great resemblance of the zodiacal light to the tails of comets. M. Fatio has made the same observation; and M. Euler has lately endeavoured to prove them owing to similar causes. Decouverte de la Lumiere Celeste que paroit dans le Zodiac interne, art. 41. Lettre M. Cassini, printed at Amsterdam, 1686. Euler, in Mem. de l'Acad. de Berlin, tom. ii.

The figure of this solar atmosphere must be lenticular, or that of a flat sphere, or that of a flattened sphere. M. de Mairan gives us a draught of its appearance and projection.

The extent of the zodiacal light from the fun to its point is seldom less than 45, sometimes 150 degrees in length; M. Pingré being on the torrid zone saw it 120 degrees; and its breadth varies from 8 to 30 degrees.

This light seems to have no other motion than that of the fun itself.

M. Euler observes, that if the fun has an atmosphere, the force of the impulsion of light issuing from that globe must drive particles of that atmosphere before it; but as gravity is very strong at the fun, this impulsion would never drive those particles beyond the limits of their atmosphere, were it not for the centrifugal force arising from the fun's motion round its axis. This being opposite to the action of gravity, diminishing its effects, the impulsion of the light may considerably dilate the figure of the solar atmosphere, from what it would be if it arose from the gravity and centrifugal force of its particles only; and this dilatation will be very considerable near the fun's equator, and very small towards its poles. The action of light thus diminishing the action of gravity, M. Euler attempts to calculate how far this diminution of gravity may increase the extent of the fun's atmosphere about its equator. He finds a cubic equation, the roots of which express the semi-axis, or greatell amplitude of this atmosphere. He adds, that this equation having three real roots, it is possible that the solar atmosphere may become a ring surrounding the fun's globe, as the ring of Saturn surrounds the body of that planet. As the electric fluid is now generally acknowledged to be the cause of the aurora borealis, which M. de Mairan ascribes to the solar atmosphere, which produces the zodiacal light, and which is thrown off principally and to the greatest distance from the equatorial parts of the fun, in consequence of his rotation on his axis, and extending visibly, in the form of a luminous pyramid, as far as the orbit of the earth, falls into the upper regions of our atmosphere, and is collected chiefly towards the polar parts of the earth, in consequence of the diurnal revolution, where it forms the aurora borealis; it is no improbable conjecture, that the fun may be the fountain of the electric fluid, and that the zodiacal light, and the tails of comets, as well as the aurora borealis, lightning, and artificial electricity, are its various and not very difsimilar modifications. See Theory of Electricity.

**ZODZISZKI**, in Geography, a town of Lithuania, in the palatinate of Wilna; 52 miles E. of Wilna.

**ZOEGLA**, in Botany, was so named by Linnaeus, in honour of his pupil and correspondent Dr. John Zoega, who visited Iceland, and communicated from thence, as well as from the neighbouring ocean, many new or rare plants, especially of the cryptogamic tribes, to the great Swedish naturalist. Dr. Zoega wrote a *Flora Islandica*, which has C. been

Gen. Ch. Common Calyx ovate, imbricated, of numerous lanceolate, fringed scales; the inner ones linear-lanceolate, chiefly, longest. Cor. compound, radiant. Florets of the disk numerous, perfect, of one petal, with a slender tube, and a limb in five deep, lanceolate, erect segments; those of the radius fewer, lower, of one flat, ligulate, abrupt, sharply five-toothed petal. Stam. in the florets of the disk. Filaments five, short; anthers united into a cylindrical tube. Pyl. in the same florets, German short; filary capillary, very long, erect; stigma short, cloven: in the radiant florets, German a rudiment only, without style or stigma. Peric. no other than the unaltered closed calyx. Seeds in the florets of the disk, solitary. Down brightly. In the radius none. Recept. brightly.

Obf. Linnaeus justly observes that this genus is very intimately related to Centaurea (see that article). Indeed the only difference confids in the flat, or ligulate, not tubular, florets of the radius. How far that distinction is sufficient, some perfous have doubted; especially as the presence of the radiant florets themselves in Centaurea, has been thought but a casual occurrence, equivalent to double flowers in other natural orders. As long, however, as the Syngenesious family continues to be characterized at all by the different figure of the florets, Zorgea must remain separate from Centaurea.

1. Z. Leptaura. Yellow Zopга. Linn. Mant. 117. Suppl. 383. *Wildl. n. 1. Ait. n. 1. L'Herit. Stipr. Nov. 57. t. 12.* (Z. allepica; Jacq. Col. v. 1. 89. Lc. Rar. 1777)—Native of Siberia, according to a manuscript collection of Linnaeus in his own Manuscript: other authors say, of the Levant. It appears to have been cultivated in Mr. Blackmore's celebrated garden at Orford, Lancashire, before the year 1779, when the catalogue of that rich collection was printed. This plant is a hardy annual, flowering in July and August. The stem is much branched, spreading in every direction, leafy, angular and roughish, twelve or eighteen inches high. Leaves alternate, dilatant, roughish, entire; the lower ones pinnatifid; the ret undivided, ob-tuse, tapering down into a footstalk. Flowers solitary, on long terminal stalks, large, near two inches broad. Scales of the calyx delicately fringed with tawny bristles. Corolla of a shining golden yellow.

Another species is described in the Supplement by Linnaeus himself, under the name of Z. capenas. This is *Rellinia pedunculata* of L'Heritier. See Wildl. Sp. Pl. v. 3. 2156, and is the same thing as *Athanasia pumila*, Linn. Suppl. 362.

ZOFA, in Geography. See Sopala.

ZOFFANY, Johan, in Biography, was born at Frankfurt, about the year 1735. He came to England as a painter of small portraits when he was about 30 years of age. After passing some time with very little encouragement, he at length was fortunate enough to attract public attention by a portrait of the earl of Barrymore, and thenceforth enjoyed considerable favour and encouragement. The most considerable of his productions at this period were portraits of the most celebrated dramatic performers in their favourite characters; as Garrick, in Abel Druger, sir John Brute, and lord Chalkefone, &c.; Foote, in major Sturgeon; and Jacob, as Jacob Gallup; Foote and Welfon, as Dr. Laft and the President, in the Devil on Two Sticks; Parsons, Moody, Braudy, Aicken, and many others, whose likenesses he preferred most admirably, with all the variety of expression required for the characters they personified. One picture he painted of the members of the Royal Academy, in the hall of the Academy devoted to the study of the living figure, round which they here assembled, and it received universal applause.

He had the honour to be employed by his majesty, and painted portraits of the royal family; and he was engaged by the queen to paint for her a view of the Tribune of the Gallery at Florence. He was somewhat of a humourist, and it is said of him, that whilst he was engaged painting in the Florentine Gallery, the emperor of Germany visited the grand duke, and coming up to Zoffany in the gallery, was much pleased with his performance, and asked him his name; and on hearing it, inquired what countryman he was; when he answered, an Englishman. Why, said the emperor, your name is German. True, returned the painter, I was born in Germany, that was accidental; I call that my country where I have been protected!

Soon after his return from Italy, he went to the East Indies, where he was much employed, and acquired a considerable fortune; but it disappeared upon his return home, and was only restored by a second adventure to the same hot-bed of wealth and disease. He again returned to England, but with diminished powers: yet he still continued to paint, and, among other works, produced an elaborate picture of the facking of the wine vaults at the Tuileries, in 1792: a disgustful display of the atrocities of that eventful period. He lived to a very advanced age, but was reduced exceedingly in intellectual powers for some years before his decease, which happened in 1808. He was a member of the Royal Academy.

ZOFFINGEN, in Geography, a town of Switzerland, in the canton of Berne, on the Wigger. It was at one time imperial, after which it put itself under the count of Habsburg. In the 13th century it was subject to the house of Austria, from which it was taken by the Bernois, in the year 1415, and is the principal place of a bailiwick, with considerable privileges; 26 miles N.N.E. of Berne.

ZOGNO, a town of Italy, in the department of the Serio: 5 miles N. of Bergamo.

ZOGOCARA, in Ancient Geography, a town of Asia, in Greater Armenia. Ptol.

ZOGOR, in Geography, a town of Thibet: 16 miles W.S.W. of Zengra.

ZOHAAUB, one of the districts of the province of the Lower Kurdistan, in the pachalic of Bagdad, which has a separate hakem or governor. See SOLYMANIA.

ZOHAKU, a town of Grand Bucharia: 12 miles N.E. of Bamian.

ZOHRA, a town of Egypt, on the left bank of the Nile: 5 miles N.N.E. of Miniet Ebn Kaïf.

ZOIA, a town of Russia, in the government of Archangel, near the mouth of the Petchora: 160 miles N.E. of Mezen.

ZOILUS, in Biography, a carpenter, belonging to the class of grammarians, was a native of Amphipolis, and lived
lived in the time of Ptolemy Philadephus, about the year B.C. 270. His natural disposition to depreciate eminent characters is said to have been strengthened by the course of his education, as a disciple of Polycrates, who wrote an accusation against Socrates. This disposition, which he was in the habit of indulging, gave occasion to his being denominated the rhetorical dog; rhetorical, as his style was elegant, and dog, from his practice of snarling. Both his person and mind are very unfavourably exhibited by Ælian; who says of him, that being once asked, why he spoke ill of all mankind—he replied, “because I cannot do ill to them.” Ambitious of gaining reputation, he endeavoured to acquire it by degrading others; and valued himself by having established a kind of claim to the title of “Homero-maftix,” or the scourge of Homer. Suidas informs us, that he wrote nine books of grammatical remarks upon this poet. Plato and Iocrates, as well as Homer, were objects of his critical severity. Zoilus was the author of several works; particularly a history commencing from the theogony, and continued to the death of Philip of Macedon, and a history of his own city. His attack upon Homer seems to have been an unpardonable offence, and threw a shade over every other good quality he possessed; for if we may credit Dionysius of Halicarnassus, he testifies that he was actuated by the love of truth, and he ranks him with Aristotle, and other eminent philologists. But his virtues and talents, whatever they were, could neither secure him from poverty while he lived, nor guard his memory from reproach. Vitruvius reports, that when he visited Alexandria, he recited his writings against the Iliad and Odyssey of Homer to king Ptolemy, which gave the king such offence, that he would take no notice of him; and afterwards, when urged by indignity, he solicited charitable affihtance, Ptolemy repulsed him with this contemptuous reflection; that if Homer, who had been dead 1000 years, could by his works give maintenance to many thousand people, a writer so much his superior might surely maintain himself. It is further said, that the king was so much displeased with his conduct, that he treated him as if he had been guilty of sacrilege; and that he was put to death, as some say, by crucifixion, and as others say by floning; and according to another account, he was burnt alive at Smyrna. Vitruvius adds, “that whichsoever of these was his fate, he well deserved the punishment.” The penalty, however, if this statement be true, seems to have been much more than adequate to the offence. Ælian Hist. Var. Vol. Hist. Grac. Gen. Biog.

ZOISITE, in Mineralogy, Epidote, Haüy, a mineral so called by Werner after baron Von Zois of Laybach.

Common Zoisite.—Its colours are yellowish and blueishgrey; it occurs massive and crystallized in very oblique four-sided prisms. The crystals are middle-sized, and deeply streaked longitudinally. The structure is lamellar, and the joints parallel with the axis of the crystal. The internal luster is splendid; the luster of the crystal is glimmering, and between pearly and refrinous; it is translucent, hard, and easily frangible. The specific gravity is 3.31. According to Klaproth, the constituent parts are:

Friable Zoisite is of a reddish-white colour, spotted with pale peach-bloom red; it occurs massive. The fracture is intermediate, between earthy and splintery; the fragments are very sharp-edged, and translucent on the edges; it is rather hard and brittle. The specific gravity of this mineral is 3.3. According to Klaproth, its constituent parts are:

Zoisite was first found in Carinthia, but has since been discovered in various parts of the continent of Europe, and at Glenelg in Inverness-shire. It is nearly allied to tremolite, with which it was at first arranged.

ZOITIUM, in Ancient Geography, a town of the Peloponnesus, in Arcadia; 15 fadia from Tricolous. Steph. Byz. ZOK, Sokor, in Geography. See Sokor Zol. ZOKOL, a town of Servia; 16 miles S. of Sabatzt.—Allo, a town of Bofnia; 45 miles E. of Bofnafaret. ZOL ENGERS. See Engers. ZOLCA, in Ancient Geography, a town of Asia, in Galatia, which belonged to the Paphagianians, and was situated on the coast of the Euxine. Zol. ZOLDO, in Geography, a town of Italy, in the Bellunefi; 18 miles N.W. of Belluno. ZOLDorf, a town of Bohemia, in the circle of Boleslaw; 6 miles W.N.W. of Jung Buntzel. ZOLERI, a town of the county of Tyrol; 8 miles S.S.E. of Trent. ZOL-HUYS. See Tol-Huyts. ZOLLERN, a castle of Germany, situated on a mountain, in the principality of Hohenzollern, to which it gives name; 10 miles S. of Tubingen. ZOLLICKOFEN, a town of Switzerland, and principal place of a district, in the canton of Berne; 2 miles N.W. of Berne. ZOLNOK, a town of Hungary, on the river Theyffe; 48 miles W.S.W. of Debreczin. ZOLOGEV, a town of Russia, in the government of Charcov; 24 miles N.W. of Charcov. N. lat. 50° 20′. E. long. 35° 44′. ZOLOTITZA, a town of Russia, in the government of Archangel, on the east coast of the White sea; 60 miles N. of Archangel. ZOLOTONOSCHA, a town of Russia, in the government of Kiev; 72 miles S.S.E. of Kiev. N. lat. 49° 30′. E. long. 31° 58′.—Allo, a river of Russia, which runs into the Dnieper, near Zolotonoscha, in the government of Kiev. ZOLOTTA, or Szelotta, a silver coin of Turkey, containing 30 paras, the para being = 3 aperces. ZOMBA, in Geography, a town of Africa, in the kingdom of Congo; 70 miles E. of St. Salvador. ZOMBAR, a town of Hungary; 40 miles S. of Closca. N. lat. 45° 56′. E. long. 19° 12′. ZOMERAW, a town of Prussia, in Oberland; 12 miles N.E. of Biehorshelfuder. ZOMUCHANA, in Ancient Geography, a town of Asia, in Aria. Zol. ZONA, or Zona Useris Regis, a very fertile country of Persia. It was so called because its revenue was destined for the accommodation of the queen. Plato. Zona, a word used by some authors for that species C. C. 2 of
of herps, which others call the \textit{ninuilla}, and we term the \textit{fingelz}.

ZONCHIO, \textit{in Geography}, a cape of European Turkey, on the coast of the Morea; 12 miles N.N.W. of Navarin. N. lat. 37° 12'. E. long. 21° 30'.

\textit{Zonchio}, a sea-port town of European Turkey, in the Morea: the harbour is large, but not commodious; 8 miles N. of Navarin.

ZONCOLUCUCAN, a mountain of Mexico, in the province of Guaxaca.

ZONDAGS, a river of Africa, which runs into the Indian sea, N. lat. 31° 20'. E. long. 29'.

ZONDORO, a town of Hungary; 26 miles S.W. of Czechain.

ZONE, \textit{Zona, \xi., q. d. belt, girdle, in Geography and Astronomy}, a division of the terraqueous globe, with respect to the different degrees of heat found in the different parts of it: formed by the two tropics and two polar circles, which divide the surface of the earth into five parts.

The zones are denominated \textit{torrid, frigid, and temperate}.

\textit{Zone, Toid,} is a fascia, or band, surrounding the terraqueous globe, and terminated by the two tropics.

Its breadth, therefore, is 46° 56'. The equator running through the middle of it, divides it into two equal parts, each containing 23° 28'.

The ancients imagined the \textit{torrid} zone uninhabitable.

ZONES, \textit{Temperate}, are two fasciae, or bands, environing the globe, and contained between the tropics and the polar circles. The breadth of each is 43° 4'.

ZONES, \textit{Frigid}, are segments of the surface of the earth, terminated, the one by the antarctic, and the other by the arctic circle; or included between these circles and the poles. The breadth of each is 40° 56'.

The difference of zones is attended with a great diversity of phenomena.

1. In the \textit{torrid} zone, the sun passes through the zenith twice a year; and his reed from the equator towards the pole, which is above the horizon, is twice a year equal to the height of the pole.

2. In the \textit{temperate} and \textit{frigid} zones, the leaf height of the pole exceeds the greatest distance of the sun from the equator; and therefore, to the inhabitants of it, the sun never passes through the zenith; yet if, on the same day, the sun rises at the same time, to a greater height, the height of the pole is less, since the inclination of the circles of diurnal revolution to the horizon is less.

3. In the \textit{temperate} and \textit{frigid} zones, the sun rises and sets every natural day, because the distance of the sun from the pole always exceeds the height of the pole; yet every where but under the equator, the artificial days are unequal, and the inequality is the greater as the place is less distant from the \textit{frigid} zone.

4. Where the temperate zone terminates on the \textit{frigid}, the height of the pole is equal to the sun’s distance from the pole, when in the neighbourhood tropic; and consequently, once a year, the sun, in its diurnal motion, performs an entire revolution, without going down under the horizon.

5. Every where, in a \textit{frigid} zone, the height of the pole is greater than the leaf distance of the sun from the pole; and therefore, during some revolutions of the earth, the sun is at a distance from the pole less than the pole’s height; and, during all that time, does not set, nor so much as touch the horizon. Where the distance from the pole, as the sun recedes from it, exceeds the height of the pole, or latitude of the place, the sun rises or sets every natural day.

\textit{Zona, Gungulm}, or girdle, part of the ecclesiastical dress of the Roman Catholic ministers. The use of it being derived from the church of Rome, it was called \textit{Zona Romana}.

\textit{Zoie, Ciliary, in Anatomy}, the black impression of the ciliary processes of the vitreous humour. See \textit{Eye}.

\textit{Zones, Greater and Smaller, of the Iris}, arterial circles produced by the anastomoses of the arteries. See \textit{Eye}.

\textit{Zonghan}, \textit{in Geography}, a town of Cochinchina, near the sea. N. lat. 14° 30'. E. long. 109° 48'.

\textit{Zongo, or Morena}, a river of Africa, which runs into the Atlantic, near Old Benguela.

\textit{Zonites, in the Materia Medica of the Ancients}, a name given to a kind of stick, called also \textit{placitas}. It had the latter name from the Greek \textit{plasteo}, a thrust, being formed by way of thrust on the sides of the furnaces. The latter name \textit{zontes} was given from its being formed of several coats, which, when broken transversely, had the appearance of belts or zones. See \textit{Tapari}, and \textit{Tunex}.

\textit{Zonitis Cadmia, a name given by some authors to a kind of cadmia fornacum, from its usually surrounding the upper parts of the furnaces like a girdle or belt}.

\textit{Zonitis}, in \textit{Entomology}, a genus of the coleoptera order of insects, the characters of which are, that the antennae are of equal length, the palpi four and filiform, and shorter than the whole jaw; and the lip emarginated. There are two species: \textit{viz.}

\textit{Chrysomelana}. Yellow, the wing-sheaths having a point in the middle, and the apex black; found in \textit{Egypt} and the \textit{East}.

\textit{Flava}. Reddish, with wing-sheaths yellow, and black at the apex.

\textit{Zonnar}, a kind of belt, or girdle, of black leather, which the Christians and Jews of the Levant, particularly those of \textit{Afia}, and the territories of the grand signor, are obliged to wear, to distinguish themselves from the \textit{Mahometans}.

The word is corrupted from the vulgar Greek; a contraction of \textit{zozonar}, or \textit{zoon girdle}.

It was Motavakkel X. Kalip, of the family of the \textit{Abasfides}, that first enjoined the Christians, &c. to wear the \textit{zonnar}.

The ordinance to this effect was published in the year of the \textit{Hegira} 235.

Hence, as most of the Christians of Syria, \textit{Mesopotamia}, &c. are either \textit{Neftorians} or \textit{Jacobites}, those sectaries are often called \textit{Christians of the girdle}.

\textit{Zoschos}, in \textit{Geography}, an Indian town, belonging to the \textit{Seneca} tribe; 2 miles N. of lake Sucea.

\textit{Zons}, a town of France, in the department of the \textit{Roer}, situated on the Rhine, with a castle; at this place a river-toll is paid; 13 miles N.N.W. of \textit{Cologn}. N. lat. 51° 4'. E. long. 6° 43'.

\textit{Zography}, formed of \textit{zogos}, animal, and \gamma\alpha\γ, I describe, denotes a description of animals.

\textit{Zoolatria}, \textit{Zoozepia}, composed of \textit{zoon}, animal, and \\π\zeta\π\zeta, worship, a species of idolatrie, in which divine worship was offered to animals.

\textit{Zoolatrise}, \textit{Zoolatroyia}, compounded of \textit{zoon}, life, or \textit{zoon}, animal, and \\π\zeta\π\zeta, speech, discourse, a discourse or treatise upon animals, or living creatures.

Zooology makes a considerable article in natural history, comprehending what relates to the form, structure, method of living, feeding, propagating, &c. of the divers species
species of brute creatures, and the descriptions of every kind. This makes one of the three kingdoms, as they are called, of natural history; the vegetable and the mineral being the two others; in these, however, there is this difference made by writers, that while vegetables and minerals are treated of together, as all of a piece in each, the subjects of zoology are divided, and it is made to compose, as it were, several kingdoms. Whoever is to write on plants and minerals, calls his work a treatise of botany, or mineralogy; and we have no words to express any subdivision of them into kingdoms; but in zoology, we treat, as different subjects, the different parts of it; and the history of birds is separated from some from the rest under the name of ornithology; that of quadrupeds, under the name of tetrapodology; and we have for the rest, the words entomology, amphitrology, and the like, expressing those things which are properly but the parts of zoology, as so many distinct and separate studies.

This may easily be amended by our considering the animal world as we do the vegetable and mineral, and dividing it, as we do the others, into its proper families; it will then be found that these are no better distinctions than those of the families of these things, and that the authors may as well set up separate studies under the names of bulology, umbilifiersology, and the like, as those.

A natural division of the subjects of zoology, on this principle, will afford six several families of its subjects.

1. The hairy quadrupeds. 2. The birds. 3. The amphibious animals, such as serpents, lizards, frogs, and tortoises. 4. The fishes. 5. The insects. And, 6. Those lowest of all organized beings, the zoophytes.

Artez's Ichthyol. See Quaqued, Bird, Fish, &c.

ZOOBO, in Geography, a town on the west coast of Celebes. S. lat. 3°. E. long. 110°. 10'.

ZOOMINERALIA, a word used by some writers to express certain substances which are of animal origin, yet have somewhat of the nature of stones, as pearls.

ZOOPHORIC COLUMN. See COLUMN.

ZOOPHORUS, or ZOOPHORUS, in the Ancient Architecture, the same thing with the freeze in the modern.

It was thus called in Greek, because anciently adorned with the figures of animals: from ζώον, animal, and φύος, I bear.

The Greeks sometimes also call the zodiac zoophorus, because of the signs and constellations in it.

ZOPHTHALMUS, in Botany, a name given by the ancient Greeks to the sedum major, or common great houfe-leek.

It had this name from the Greek ζώον, an animal, and φυος, an eye, as expressing a resemblance to the eyes of large animals, in the round and radiated growth of its chaffers of leaves. They also called it ambrosia.

ZOOPHYTON, ZOOHYTE, ζωοτόνος, composed of ζώον, animal, and φυος, plant, q. d. plant-animal, in Natural History, a kind of intermediate body, supposed to partake of both the nature of an animal and a vegetable.

In the Linnean system, the zoophytes, which constitute the fifth order of worms, (see VERMES,) are composite animals, resembling a flower, and springing from a vegetating stem. This order contains 15 genera, as the Tubifera, Madrepora, Millepora, Cellepora, Isis, Antipathes, Gorgonia, Alcyonium, Spongia, Flecura, Tubularia, Corallina, Sertularia, Pennatula, and Hydra; see each respectively. The species enumerated and described in Gmelin's Linnean system are 489.

The fetus, while in the womb, appears to many to be a real zoophyte, growing to the mother by the funiculus umbilicalis, as plants do to the earth by their stem. See FETUS, and EMBRYO.

Concerning the zoophyte called boranotes, see Agus Staphylicus.

ZOOHYTE-MARYGOLD. See MARYGOLD.

ZOOHYTES, Chemical Composition of. See SHELLS and VERMES.

ZOOTOMY, Zootomia, compounded of ζώον, animal, and τόμος, I cut, the art, or act, of dissecting animals, or living creatures.

Zootomy amounts to the same with anatomy, or rather comparative anatomy. See ANATOMY.

ZOPARITUS, in Ancient Geography, a town of Asia, in Melitone, on this side of the Euphrates. Ptol.

ZOPH, in Geography, a town of Syria; 25 miles S.E. of Jerusalem.

ZORI, a district in the N. part of the government of Diarbekir.

ZOPHA, a town of Prussia, in Pomerelia; 10 miles S.W. of Marienburg.

ZOPHICIDELUS, in Botany, a word used sometimes as an epithet with the word chameleon, and sometimes as the name of a plant, in both cases expressing the black chameleon-tinle, which the ancients carefully distinguished in their writings from the white kind; the former being a poisonous plant, the other not.

ZOPHORIC. See ZOOPHORIC.

ZOPHORUS. See ZOOPHORUS.

ZOPISSA, Zupusa, naval pitch, a kind of mixture of pitch and tar, scraped off from the ships that have been a long time at sea. See Naval Pitch.

The word seems formed from ζώον, bullia, I boil, and ποις, pitch; q. d. concocted pitch.

This matter, by being gradually penetrated by the falt of the sea, becomes impregnated with its qualities; and, being applied to the body externally, is found revolutive and defecative.

ZOPPO, in the Italian Music, is applied to all those counterpoints described under the article OBLIGATO, &c. Thus they say, contra-punto alla zappa, a lane or hopping counterpoint; because, in thefe, a note is placed between two others, each of half its value in time. When this comes to be played or sung, the voice or instrument seems to proceed by unequal leaps or steps, like those of a lame person. See the example here annexed.

There are contra punto alla zappa sopra il fogato, as well as sotto il fogato, i. e. above and below the subject. See SOGETTO.

ZOPOLA, in Geography, a town of Italy, in Friuli; 13 miles N.N.W. of Concordia.

ZOQUES, a district of Mexico, in the province of Chiapa, bordering on Tabasco.

ZORABA, a word used by some of the chemical writers to express vitriol.

ZORAH,
ZORAH, in Geography, a town of Africa, on the coast of Barca. N. lat. 30° 45'. E. long. 18° 30'.

ZORAMBUS, in Ancient Geography, a river of Asia, in Carmania. Ptol.

ZORBIG, or Little Zerbst, in Geography, a town of Saxony, in the circle of Leipzic, with a citadel; 15 miles S. of Dessau. N. lat. 51° 40'. E. long. 12° 18'.

ZORECZA, a town of Lithuania; 80 miles E.S.E. of Pinsk.

ZORGE, a town of Saxony, belonging to the abbey of Walkenried; 6 miles N.E. of Walkenried.

ZORN, a river of Thuringia, which runs into the Helm, 5 miles W. of Nordhausen.

ZORIGA, in Ancient Geography, a town of Asia, in the Greater Armenia, to the left of the Euphrates, and at some distance from it. Ptol.

ZORILLE, in Zoology, a species of wasp, having the back and sides marked with short stripes of black and white, the tail tinged with yellow; the tail long and bushy, partly white, and partly black; the legs and belly black. This animal inhabits Peru, and other parts of South America; its pellipalial vesture overcomes even the panther of America, and if subjected to formidable enemy. Pennant. See Viverra.

ZORITA, in Geography, a town of Spain, in New Castile; 12 miles N.W. of Huete.

ZORLESCA, a town of Italy; 8 miles S.S.E. of Lodi.

ZORN, a river of France, which rises near Saverne, in the department of the Lower Rhine, paffes by Brumath, and enters a canal which communicates with the Rhine, 8 miles N. of Straßburg.

ZORDORF, a town of the New Mark of Brandenburg, where the king of Prussia defeated the Ruffsians in the year 1758, near Culfin.

ZORKNA, in Botany, received that name from the late professor Gmelin of Gottingen, the compiler of a very faulty edition, at least as to the botanical department, of the Systema Naturae of Linnaeus. He chose this appellation for one of Walter's anonymous genera, which he himself knew nothing of. It has been adopted by Michaux and Pursh, and seems intended for the commemoration of Mr. John Zorn, an apothecary of Kempten, in Bavaria, who was born in the year 1739, and may possibly be still living. He has published five volumes in octavo of Icones Plantarum Medicinalium, each volume containing one hundred plates, with a Latin and German text. These figures are coloured in the Nuremberg rile; at which place the work appeared, between the years 1779 and 1784. There was, moreover, a Dr. Bartholomew Zorn of Berlin, who published there, in 1714, Botanologia Medica, a thick German quarto, with six plates. He edited also, in 1763, the Herbarium portatile of Thomas Pancorius, and according to Driandr. Bibli. Bank., v. 5. 406, died in 1717, at the age of 78.—Gmel. Syll. Nat. v. 2. 1096. Michaux Boreal.-Amer. v. 2. 76. Pursh 484. Poirier in Lamarck Dict. v. 8. 872. (Anon. N. 279; Walt. Carol. 181.)—Cliffs and order, Diadelphe Decandria. Nat. Ord. Papilionaceae, Linn. Leguminasis. Jaff.

Gen. Ch. Cal. Perianth inferior, of one leaf, bell-shaped, two-lipped; upper lip broad, abrupt, emarginate; lower in three deep segments, the middle one longest. Cor. papilionaceous; standard inerely heart-shaped, reflexed, revolute at the sides; wings ovate, erect, smaller than the standard; keel divided at the base, bluntly rectangular, the length of the wings. Stam. Filaments in two feet? anthers five of them oblong, five alternate ones globose. Pili. Ger-

Obs. The habit of this genus is so peculiar, and so unlike Hedyarum, much more resembling Stylosanthies, (see those articles,) that we are very glad of any characters that may serve to keep it distinct, and we hope the above may suffice. The plants are herbaceous, with one or two pair of conjunct leaves, without an odd one. Flowers small, in axillary fkikes, with large leafy bracteas. The species have not yet been well discriminated. We shall endeavour to explain them, with the help of original specimens.

1. Z. angulifolia. Narrow-leaved Zornia. (Hedyarum diphyllum a; Linn. Sp. Pl. 1053. Willd. Sp. Pl. v. 3. 1178. Lamarck Dict. v. 6. 404, excluding the variety H. a. 291; Linn. Zeyl. 134, excluding Sloane's synonym, and the variety B. H. bifolium, filiguis articulatis echinatis; Burm. Zeyl. 114. Onobrychis maderaftapana diphyllus minor, filiculis hiruitus; Pluk. Phyt. t. 246. f. 6. "Nelam-mari; Rheede Hort. Malab. v. 9. 161. t. 82." Raini Hift. v. 3. 404.)—Leaflets two, lanceolate, uniform. Bracteas ovate, ribbed, fringed, imperfectly reticulated, shorter than the legume, marked with glandular dots. Prickles of the legume rough.—Native of the East Indies, in a fairy foil. Root annual, tapering, warty. Stems several, diffuse, from four or five inches to a foot long, round, slender, zigzag, smooth, leafy, with short alternate branches. Leaves finely conjunctive, alternate; leaflets from half an inch to an inch long, elliptic-lanceolate, entire, blunfhi, tipped with a small point, unequal at the base, smooth on both sides, not quite asile at the extremity of the common footer, which is about the length of the leaflets, cylindrical, smooth, with a longitudinal furrow above. Stipulas half-arrowshaped, ribbed, entire, pointed at each end. Flowers yellow, in axillary, solitary, forked, lax, bracteate frkikes, longer than the leaves, each spike from three to eight alternate flowers. Bracteas one pair to every flower, twice as long, two-ranked, converging, flat, ovate, acute, entire, strongly fringed, three or five-rubbed, beakned with refinos dots, elongated at the base into a short oblique spur, permanent, their surface smooth. Legume near an inch in length, longer than the bracteas, of about four semi-ordurcious joints, finely reticulated, and befet with spreading, brown, barbed prickles, which are round with minute reversed hairs, but we cannot perceive that the surface of the legume itself is downy, at least not invariably. The refinos dots scattered over the bracteas seem peculiar to this species. Those parts are full as much fringed in this as in I. conlumatum of Willdenow, though his definitions indicate otherwihre.

2. Z. recutita. Reticulated Zornia. (Hedyarum diphyllum B; Willd. Sp. Pl. v. 3. 1178. 3 Lamarck Dict. v. 6. 404. H. diphyllum; Swartz Obs. 285. H. n. 10; Browe Jam. 301, excluding the synonyms. H. minus diphyllum, flore luteo; Sloane Jam. v. 1. 185.)—Leaflets two, lanceolate; the lower ones elliptical. Bracteas ovate, as long as the legume, strongly reticulated and fringed, with out glandular dots. Legume and its prickles downy.—Native of the dry sandy parts of the savannahs of Jamaica. Our specimens are from Browne himself. The root, though said to be annual, is somewhat woody. Herb larger than the leaf, a dull, and most unquetionably specifically distinct. The loms are straight, a foot long, nearly branched. Leaflets an inch
inch or an inch and a quarter in length; those of the lower leaves half an inch broad. *Spikes* many-flowered, thrice as long as the leaves. *Flowers* yellow; the standard sometimes purplish. *The bracteas* afford a clear specific distinction, in their strongly-marked, elevated, vein-y reticulations, and the total want of reflexed or glandular dots, though their whole surface is minutely granulated, as it were, like those of the foregoing species. *The legumes* have three or four joints, and their surface, as well as their prickles, is downy. They are almost entirely covered by the *bracteas*.

- *Leaflets* two, ovate. *Bracteas* ovate, ribbed, fringed, imperfectly reticulated, shorter than the legume, without glandular dots. *Legume* fringed; its disk and prickles smooth.—Native of Ceylon and Tranquebar.

This species approaches the last in size, but differs in many essential points. The *leaflets* are ovate, not near so long as their common *footstalk*. *Bracteas* more pointed and elongated at the base, ribbed, but not strongly reticulated; their surface quite delitute of pellucid dots, though some of them occasionally bear little black opaque prominences, which seem the effect of injury, or are perhaps a minute parasitical fungus. *Legumes* considerably longer than the *bracteas*, though each confluent of scarcely more than two orbicular joints, full twice the size of either of the preceding species, from which they differ in the smoothness of their disk and prickles, though fringed at the edge. *The flowers* are yellow.

4. Z. *latifolia*. Broad-leaved Zornia. (Hedyfarum dirophyllum; Aubl. Guian. 774, excluding all the synonyms.)

- *Leaflets* two, roundish-ovate; the lower ones orbicular. *Bracteas* linear-lanceolate, ribbed, somewhat hairy, longer than the downy legumes.—Gathered in Guiana by Aublet, from whom we have specimens, which abundantly grew his plant to be different from any of the foregoing, and justify him in saying that, with respect to it at least, Plukenet's figures are bad. This has a woody, but perhaps annual, *root*, and several prostrate *stems*, from six inches to a foot long, straight, round, downy. *Footstalks* also downy, rather longer than the *leaflets*, which in the lower leaves are about half an inch in length, nearly orbicular, obtuse; in the upper gradually more elongated, ovate, or oval-lanceolate, acute; all of them somewhat hairy or silky, especially beneath, where also they are a little glaucous. The narrow *bracteas*, very differently shaped from any of the three preceding species, are the distinguishing characteristic of this: they have three very strong crowded ribs, originating from their point of insertion, below which is a blunt elongation downwards, much like that of *Z. reticulata*; they are somewhat hairy, as well as slightly fringed. *Corolla* yellow. *Legume* of only two joints, unless any have been broken off, which is not apparent; the prickles downy, and the disk quite woolly. Willdenow speaks of a fupposed variety of *Hedyfarum dirophyllum* from Portorico, which is larger than the common kind, and whose leaves are "frigiose beneath," by which expression is probably meant bristly, or hairy. *This*, if not our *Zornia latifolia*, must be a hitherto non-descriptive species, of which we have not materials to give a definition.

- *Leaflets* three or four, lanceolate. *Stipulas* half-arrow-shaped. Base of the *bracteas* elongated and acute.—Gathered by Thunberg in the interior part of the country, above the Cape of Good Hope, near Gage-boucl, flowering in November and December. *The stem* is herbaceous, decumbent, thread-shaped, smooth, a foot or more in length. *Footstalks* rather longer than the *leaflets*, which are three or four together, elliptic-lanceolate, acute, entire, hardly an inch long. *Stipulas* much elongated at the base, acute at each end. *Spikes* axillary, many times longer than the leaves, (at least the lower spikes,) and consisting of ten or twelve *flowers*, concealed by the ovate three-ribbed *bracteas*, each of which is elongated at the base into an ovate acuminate appendage, nearly half its own length. *Legume* longer than the *bracteas*, of four joints, said by Thunberg to be rough, but in what manner, or degree, is not mentioned: his figure represents them smooth and globose, which is evidently an inaccuracy.

6. Z. *tetraphylla*. Four-leaved Zornia. Michaux Boreall. Amer. v. 2. 76. t. 41. Pursh n. 1. (Z. bracteata; Gel. n. 1.)

Aromonos bracteata; Walt. Carol. 181. (Hedyfarum tetraphyllum; Lamark Dict. v. 6. 405. a.)—

- *Leaflets* four, lanceolate. *Stipulas* ovate. Base of the *bracteas* somewhat elongated, obtuse.—Native of sandy fields in Lower Carolina. Perennial, flowering in July and August. About a foot high, much branched. *Flowers* yellow. *Pursh* have we here ventured to distinguish this from the last-described species, by the characters afforded in the plates cited, without our having ever seen a specimen of either. We are fully aware of the hazard of such proceeding; but as it is highly probable that a Cape plant will hardly prove, on comparison, the same species as a Carolina one; and the species of this genus very nearly resemble each other, and have been much confounded, we propose the above characters. *If the figure of Michaux be exact, as to the *filipinae* and *bracteas*, there can be no doubt on the subject, and it was drawn by no less an artist than Redont.* The *filipinae* are there represented perfectly ovate, without any *pap* or elongation, at the base, and not half the usual size in this genus. *Thole of Thunberg's plate are like the* *filipinae* of the *bracteas*. This is the most important difference, though the short and blunt *pap* of the *bracteas* is very striking also. *The flowers* seem larger in these two last, than in any of the foregoing.

On reviewing the whole genus, we cannot but repeat that the abruptly-compounded *leaves* afford a most important mark of difference, compared with *Hedyfarum*, nor are the yellow *flowers*, in this case, entirely unworthy of consideration. There is moreover to clothe a resemblance between all the species of *Zornia*, so as to induce a perfusion of their constituting a very natural genus. The fame may be said of *Stylosanthes*, to which we have already referred the reader as being next akin to *Zornia*.

Which of the above six species, or rather which of the first four, is entitled to a place in the *Hortus Kewensis*, we cannot presume to determine. In v. 4. 340. of that work, Dr. Houlton is recorded as having lent to Miller, before the year 1735, something which has always palled for *Hedyfarum dirophyllum*. This must have come from South America, or the West Indies, and was therefore not *Nolam-mari* of Rheede, our *Zornia angustifolia*; nor the *conjugata*, a plant of Ceylon. It must have been either the West Indian *reticulata*, or more probably perhaps the South American *latifolia*.

**ZOROANDA, HAZOIR, in Ancient Geography**, a place of...
of Asia, on a part of mount Taurus, called Nicephates, where the Tigris opened a subterranean passage, N.W. of Amida.

ZOROASTER, Zerdusht, or Zarudusht, in Biography, an eminent Eastern philosopher, concerning whom, as well as the age in which he lived, learned writers have entertained very different opinions. Some have ascribed this title, the derivation of which is uncertain, to many eminent persons; whilst others have maintained that there was but one Zoroaster, and that he was a Persian. Others have said that there were six celebrated founders of philosophy of this name. Ham, the son of Noah, Mofes, Ohris, Mithras, and others, both gods and men, have by different writers been ascribed to be the same as Zoroaster. Many different opinions have been also advanced concerning the time in which he flourished. Arriotle and Pliny fix his date at a remote period as 6000 years before the death of Plato: Hermippos says, he lived 5000 years before the Trojan war; but these are idle tales, which should, without doubt, be claffed with the report of the Chaldeans, concerning the antiquity of their astronomical observations. According to Laertius, he flourished 600 years before the Trojan war; according to Suidas 5000. We shall in the sequel of this article detail the opinions of some of our principal modern writers on this subject. According to Brucker, the most probable hypothesis is, that there was a Zoroaster, a Perfo-Median, who flourished about the time of Darius Hyttafz, and that besides him there was another Zoroaster, who lived in a much more remote period among the Babyloniens, and taught them astronomy. The Greeks and Arabians are agreed concerning the existence of the Persian Zoroaster; and the ancients unanimously ascribe to a philosopher, whom they call Zoroaster, the origin of the Chaldean astronomy, which is certainly of much earlier date than the time of Hyttafz; so that it seems necessary to suppose a Chaldean Zoroaster different from the Persian. Concerning this Zoroaster, however, nothing more is known, than that he flourished towards the beginning of the Babylonian empire, and was the father of the Chaldean astrology and magic. (See Chaldean Philosophy and Magi.) All the writings which have been ascribed to the Chaldean Zoroaster are unquestionably spurious. The Persian Zoroaster was probably of Persian extraction, and born in Media. Although much of what has been related concerning this Zoroaster or Zerdusht, and the instruction which he received from the Jews, is fabulous; nevertheless it is not improbable that he might have learned some things from the Hiraftes who reigned in Babylon, that might enable him to correct the doctrine of the Persian magi; but it is not easy to specify particulars. Several miracles are ascribed to Zoroaster, but they are of such a kind as an impostor would not find it very difficult to perform. (See Magi.) To Zerdusht, or the Persian Zoroaster, many writings are ascribed; particularly the Zend. (See Zendavesta.) Fragments of a work, entitled "The Oracles of Zoroaster," are still extant. Several editions of them under the form of verses have been published, and pains have been taken to explain them. Stanley has subjoined to his "Lives of the Philosophers" a correct translation of them. The philosophers of the Alexandrian school highly venerate them as genuine remains of Chaldaean wisdom; but they have so many evidences in their ideas and language of their origin in that school, as to render it probable that they were written by some Platoniast, about the beginning of the second century; a period in which spurious writings were produced in order to support the flinking credit of Gentile philo-
many thousand years before Moses. Upon the whole it appears, that no memorial upon record is placed so high as the ancient writers have carried this personage; and though their accounts are for the most part exaggerated, yet they fully ascertain the antiquity of this person.

The title Zoroaster, Mr. Bryant conceives, originally belonged to the fun, and was metaphorically bestowed on sacred and enlightened personages. Some have thought, that the first among men to whom this title was applied was Ham; others have taken him for Clus, for Mizraim, and for Nimrod, and Huetius for Moses. But Mr. Bryant, after examining the primitive characters given of him by different writers, supposes, that they concur only in Noah, who was the first deified mortal, and the prototype in the Magian worship. This writer supposes, that, as the object of the Peric and Chaldaic worship was the sun, and most of their titles were derived thence, Zoroaster denoted Sol Afterius; Zor being the sun, and Alter signifying star.

The abbé Foucher, in a long series of memoirs, inferred in the 25th, 26th, 27th, 28th, 30th, and 31st vols. of the Histoire de l'Académie Royale des Inscriptions et Belles Lettres, &c. Paris, has given an ample account of the religion of the Persians. This learned author maintains, on the authority of Phyll, that the most celebrated Zoroaster was an ancient sage, who lived under Cyaxares, king of the Medes, restored the worship of fire, was revered by the Persians as a celestial prophet, and whose exactions, prodigies, and revelations, made a great noise in the world. See Zenda Vesta.

ZOROPASSUS, in Ancient Geography, a town of Asia, in Ileper Armenia, dependent on the prefecture of Muriane. Ptol.

ZORVI, in Geography, a town of Asiatic Turkey, in the province of Diarbekir; 22 miles E. of Ana.

ZOSAWA, a river of Moravia, which runs into the Frilava, 5 miles W. of Hohenleitadt.

ZOSIMA, in Botany, an umbelliferous genus, thus called by professor Hoffmann, in compliment to three brothers, Anastasius, Nicholas, and Zoa Zosima, distinguished for their editions of numerous works of the Greek classics. This botanical commemoration seems chiefly owing to the great propriety, ("magna proprie") of the latter of these brothers, for natural history. We presume not to dispute the claim, because the author of this name is doubtless, better able to judge of its propriety than we can possibly be.—Hoffm. Umbell. v. 145. t. 1. B. 9. —Clais and order, Pentandra Digynia. Nat. Ord. Umbelliferae.

Gen. Ch. General and partial Umb of many unequal rays. General and partial involucrum of many, linear-lanceolate, acute, unequal, villous, permanent leaves. Perianth of five unequal, very short, permanent teeth. Cor. Uniferal nearly regular and uniform; flowers partly perfect and fertile; the central and lateral ones, in each umbel, male: partial of five, nearly equal, spreading, inerely heart-shaped, deflexed petals; rather concave, on each side, at the keel; tapering at the base; obliquely infulated at the point, which is linear-lanceolate, acute, involute, channelled. Stam. Filaments five, spreading or deflexed, straight, longer than the involute corolla, dilated at the base; anthers veratilbe, roundish, two-lobed. Pfl. in the perfect florets, Germen inferior, ovate, compressef, villous; flyles two, thread-shaped, channelled; their tumid base wavy and crenate at the margin; at length reflexed and permanent; Ricas simplex, obtusif. Peric. Fruit roundish-obovate, compressef, finely downy, bordered; the border externally tumid, and somewhat corrugated, internally flirated; emarginate at the summit, crowned with the flyles on their short, nearly sessile, crisped base; thickened at the bottom; the disk elevated and flirated. Seeds two, of a similar shape, convex in the middle, with three elevated, narrow, central ribs, and two marginal ones; their inter- rices, in the upper half, occupied by four coloured stripes.

1. Z. orientalis. Oriental Zosima. Hoffm. v. 1. (Heracelum abimitifolium; Venten. Choix de Pl. 7. t. 7. March. t. Bieberl. Taur.-Caucal. v. 1. 224. Sphondylum orientale humilium, folius abimiti; Tourn. Cor. 22.)—Nature of Persia, Georgia, and other countries about Caucafus, flowering in the early part of summer. The root is biennial, tap-shaped, milky. The whole herb when bruised smells like Smallage, Atripium graveolens. Stem erect, near two feet high, cylindrical, furrowed, somewhat branched, and slightly leafy, about as thick as a swan's quill, rough to the touch with short whitish hairs. Leaves opposite, stalked, thrice pinnate, hoary with short pubescence; leaflets small, wedge-shaped, lobed; entire at the edges. Umbels two or three inches in diameter, on long stalks, terminal; partial ones of from twelve to fifteen flowers, which, according to Ventenat, are milk-white, but Hoffmann describes the petals of a yellowish-green. Germs downy. If the flowers are really white, we should suspect this plant to be nearly related to Heracleum tenontium, Sm. Prodr. Fl. Graec. Sibth. v. 1. 192, which will be exhibited in t. 251. of the Fl. Graeca; but the shape of the fruit of the latter is very unlike Hoffmann's figure, nor does it better agree with the representation in Ventenat's work. This fall indeed is itself so unlike Hoffmann's t. B. f. 9, (he himself erroneously cites f. 7,) that we cannot but suspect some mistake. Nor are we, after all, persuaded that the plant under consideration ought to form a separate genus from Heracleum. In so natural a family, the skill of a botanist is found in combining, rather than dividing, which last is the most easy thing in the world, and the most pernicious to science. We do not, however, pretend to decide in the present cafe; because the generic distinctions of Umbellate plants are still sub judice.

ZOSIMUS, in Biography, a Greek historian, who held various civil offices under the younger Theodorus, about the commencement of the fifth century, and left a history of Roman affairs in six books; the first of which furnishes a flight view of the emperors, from Augustus to Diocletian; and the others detail the public events that occurred to the second siege of Rome by Alaric, and the pontificate and deposition of Attalus. Something seems to be wanting towards the end. The style of this historian is concise, perspicuous, and pure; but his prejudices against the Christian emperors have misled him; and particularly in his account of Constanin the Great. Leunclavius has attempted to justify him, and it has been allowed that he has divulged some truths which other historians have suppressed. Clibin says, "credulous and partial as he is, we must take our leave of this historian with regret." The first edition of his work was that of R. Stephens, in 1581; others have been published by T. Smith, Gr. and Lat. Oxon. 1679, 8vo; and the Variorum by Cellarius, 8vo. 1679, 1712.

Zosimus, Pope, a native of Greece, was elevated to the pontifical throne in March 417, as successor to Innocent I; at the time when the Pelagian controversy prevailed. Celellius, the chief disciple of Pelagius, presented his confession of faith to this pope, who approved it and admitted him
him to his communion. That of Pelagius was likewise approved. The African bishops, however, who were hostile to the Pelagian doctrine, interested the emperor Honorius in their favour; and obtained from the pope an anathema of the doctrine of Pelagius and Caelelius, with a sentence of excommunication if they refused to abjure their tenets. A council was assembled, in which other bishops, who concurred in the Pelagian creed, were degraded from their episcopal dignity. The fluctuations and inconsistencies of Zosimus's conduct depreciated the character of the pope, and furnished reason for questioning his infallibility. Other infinances occurred, in which he was hardly able to maintain his authority. This pope died in December 418, leaving the character of an able man of business, but hollow, tenacious, and imperious. He was canonized, as Bower says, by a mit-take of cardinal Baronius, who suppised him to be a St. Zosimus in the martyrlogy of Bede. Dupin, Bower.

ZOSITERPUM, in Ancient Geography, a town of Thrace, in the province of Rhodope. Procopius.

ZOSSEN, in Geography, a town of Brandenburg, in the Middle Mark; 13 miles S.E. of Potsdam. N. lat. 52° 10'. E. long. 15° 17'.

ZOSTER, in Ancient Geography, a borough of Attica, upon the sea-coast, with a promontory of the same name, extended into the Saronic gulf; but it is not known to what tribe it belonged. Minerva, Apollo, Diana, and Latona, were honoured here. As Zoster bore some resemblance to zone, or cutchure, the inhabitants pretended that the borough bore this name, because Latona, finding herself in this place, and feeling that her time was approaching, unloosened her cutchure. Pauf. in Attic. c. 31.

Zoster, a word used by some to express that kind of herbes, called by others zona and zingilela, and by us usually known under the name of the plantages.

Gen. Ch. Cal. Spadix linear, flat, feathered by the base of a leaf, bearing an indeterminate number of flowers on one side. Perianth none. Cor. none. Stamina one; anther sessile, erect, closely pressed to the spadix, simple, cylinndrical, a little wavy, tapering at each end. Pist. Gern men solitary, parallel to the anther, and of nearly a similar shape; style one, obliquely curved, shorter than the gern men; stigma two, linear, acute, spreading. Peric. Capsule pendulous, elliptical, membranous, of one cell, not burrting. Seed solitary, oblong, frigutate.

Obf. The above is the view of the genus in question, first given by Gænter, and confirmed from actual observation in the English Botany and Pl. Brit. Vahl adopts the same idea as ours of the place of this genus in the artificial system. The field has a large, oval, half divided cotyledon, as we woule call it; Gænter terms it a vitellus. (See the article YOLK of the Seed.) From this genus is to be separated the Z. oceanica of Linnaeus, which belongs to Caulinia of De Candolle and Brown; Poffidonia of König in Ann. of Bot. v. 2. 95. t. 6; Kernera of Wild. Sp. Pl. v. 4. 947; but which is different from Caulinia of Willdenow; see that article.

β. Fucus marinus, feu Algæ marina graminæ minus; Rai Syn. 52. (Algoide; Mich. Tc. Ind. 52. f. 2.)

γ. Fucus, five Algæ marina graminæ angulifolii femini fera ramifier; Rai Syn. 52. (Algoide; Mich. Tc. Ind. t. 59?)

δ. Potamogeton marinus in utriculis epiphyllum per minus; Rai Syn. 53.

γ. Algæ angulifolii vititiorum; Rai Syn. 53.

Leaves entire, obseously three-ribbed. Stem slightly compressed. Native of the sea-shore, or salt muddy ditches and creeks throughout Europe, posibly of New Holland and North America also, flowering towards autumn. The root is perennial, filiform. Stems roundish, smooth, decumbent at the base, and trailing to a great extent, throwing out tufts of fibres here and there; their branches floating and leafy, simplex, a little compressed. Leaves alternate, tapering at the base into a kind of floating footstalk, linear, a foot, or much more, in length, flat, immoht, bluntsht, quite entire, splitting longitudinally a little above the base, on the upper side, and putting forth from that fissure a linear, obtuse, flat receptacle or spadix, two inches long, covered in front with a series of naked flowers. Each of these flowers consists of a green anther, and a pistil of the same hue, parallel to it; but in such an alternate order, that the anther of each flower is contrary to that of its neighbour, and lands above the pistil of the latter. The whole herb is frassett and tender; yet Linnaeus says it is used in some parts of Sweden to make a thatch, which is very durable, and likewise to form up chinks in wooden buildings. It serves also for mace, as well as the various kinds of sea-weed.

Whether the varieties above indicated may or any of them prove difficil species, must be left for future inquiry. The β is a small slender plant, differing in nothing but its lesser dimensions from the common kind. It is well represented in one of Micheli's unpublished plates. γ is larger, more compact, and branched; we can scarcely doubt its being Micheli's t. 59. Of the others we know more than can be gathered from Ray's Synopses.

Z. oceanica of Linnaeus is quite different from any of these supposed varieties, constituting a distinct genus, called Poffidonia Cavolinii, by Mr. König, in Ann. of Bot. v. 2. 95. t. 6; and well described by don Philip Cavolini of Naples, in a dissertation on these plants. De Candolle has named it Caulinia, but it is not Willdenow's. In Micheli's unpublished figure above cited, t. 58, is a good figure of this. We never met with any authority for its being a native of the British coast; but Mr. Horne, in a paper published by the Geological Society, in their Transactions, v. 3. mentions the submarine remains of a forest, in the Suffolk coast, in the brown vegetable earth, accompanying which are found fragments of a plant, whose leaves were thought by Mr. Brown to resemble Zosiera marina, except that, being much broader than usual, he suspected they might belong to Z. oceanica above-mentioned. If these leaves were sufficiently perfect to exhibit the three ribs, that question might perhaps be determined. As to the breadth, or size, of the leaf
in this whole trio, nothing is more variable. We have Z. ciliata of Vahl; to which he attributes leaves an inch or more in breadth: whose leaves, in our different speciments, are but one-third or one-fourth of an inch wide, and from three inches to eight inches long. Z. marina differs from us with one-eighth to one-fourth of an inch in width, and if the above synonyms be all right, its variations are still greater.

2. Z. unifrons. Single-ribbed Grass-wrack. Forks. Egypt—Arab. 157. Vahl n. 2. Willd. n. 2.—Leaves entire, single-ribbed. Stem compressed; swelling at the joints. — Found by Forkell on the coast of the Red sea at Mocha, growing under water, and resembling overflowed grasses. The stem is yellow, with bent joints. Leaves a span long, or more, narrower than in Z. marina, with an obscure mid-rib, unattended by lateral ones; and their base is sheathing.

Z. ciliata, Vahl n. 3; and stipulacea, his n. 4; found by Forkell at the same place as the last, with whose fructification Vahl was, in both inferences, unacquainted, are referred by Mr. Koniq, in Ann. of Bot. v. 2. 97, not without some doubt, to a new dioecious genus, denominated Thalassa in Dr. Solander’s MSS., of whose fructification no figure has appeared, and of which the male flowers only have been observed. They are indeed sufficiently remarkable, as the following characters evidence. Stipule single-flowered, of one leaf, in two oblong obtuse segments. Perianth of three ovate-oblong, obtuse leaves. Cor. none. Filaments none. Anthers nine, converging, linear-lanceolate, shorter than the calyx. The want of a flitt in the leaves of these two last-mentioned plants proves them to be no Zoileae.

ZOTENBERG, in Geography, a mountain of Silezia, in the principality of Schweidnitz, on which is a celebrated chapel; 20 miles W. of Breslau.

ZOTHECA, among the Ancients, the place where the animals designed for sacrifice were kept.

ZOOF, in Geography. See GAUR.

ZOOF, a river of Grand Búcharia, which runs into the Dchasp, 45 miles S. of Balk.

ZOU-KEOU-KIAOU, a town of China, in Pe-tchéli; 5 miles S.W. of Peking.

ZOULOUNN, a town of Afiatic Turkey, in the go-

vernment of Sivas; 10 miles S.S.W. of Amalrich.

ZOUR EL HAMAN, or Island of Pigeons; a small island in the Mediterranean, near the coast of Algiers. N. lat. 36° 26'. E. long. 12° 38'.

Zour, Shabr c. See SHA'REZUR and SOLOVANIA.

ZOWAMORE, or ZINERA, an island in the Mediter-

ranean, near the N.E. coast of Tunis, called by the ancients Agamus; 18 miles N.N.W. of Cape Bon. N. lat. 36° 50'. E. long. 11° 8'.

ZOWHAREEN, a town of Africa, in the kingdom

of Tunis; 16 miles E.S.E. of Keft.

ZOW-WAN, or ZAGWAN, a town of Africa, in the

kingdom of Tunis. It is a small flourishing town, built

upon the north-east extremity of a conspicuous mountain of

the same name. It is in great repute for the dyeing of scar-

let caps, and the bleaching of linen: great quantities of

both being daily brought thither for that purpose from

Tunis, Sufa, and other places. The stream which is em-

ployed at present for this use was formerly, together with

the river Zungler, conveyed to Carthage; and over the

fountains of it there was a temple erected, the ruins of

which continue like wise to this day: upon this ancient gate,

which regards the south-east, there is a ram’s head, armed,

in baso reliefo, with auxilio, in large letters, below it.

This may, perhaps, instruct us, that Zow-wan, or whatever

was its former name, was under the immediate influence and

protection of Jupiter Ammon; 36 miles S.W. of Tunis.

N. lat. 36° 14'. E. long. 10° 6'.

ZOZO, a town of Afiatic Turkey, in the government

of Diahbekir; 20 miles S.S.E. of Kirkük.

ZOYSIA, in Botany, was so named by the late professor

Wildenow, in honour of the baron Charles de Zoys, a digni-

fied ecclesiastic, resident in Carniola, who has long pur-

sued with ardour the investigation of the botanical treasures of that country, and who is celebrated by Hoff, Wolfen, Jacquin, and other eminent writers, for the alibance which he has at various times afforded them.—Wild. in Nov.

Gen. Ch. Cal. Glume of one valve, single-flowered, oval-oblong, compressed, cartilaginous, smooth, rigid, keeled, incurved, gaping at the apex of one edge; convex on one side; flat when on the other. Cor. Glume of two thin, membraneous valves, enclosed within the calyx, avel-

lefs. Nectar. none. Stam. Filaments three, capillary, short; anthers haftate. Pist. Gernen superior, linear, min-

ute; styles two, the length of the calyx; ligmas prominent, feathery. Peric. none, except the permanent glumes. Seed solitary, linear, invested with the calyx and corolla.

Eff. Ch. Calyx of one valve, single-flowered, compressed, cartilaginous. Corolla of two membraneous valves, within the calyx. Stigmae feathery. Seed linear, invested with the glumes.

bar, by Koenig; and near Port Jackson, New South Wales, by Mr. Brown. This is a small perennial grass,

with a creeping root, enveloped in sheathing furrowed scales. Stems alternate, ascending, slender, thread-shaped, fimple, leafy, three or four inches high. Leaves two-ranked, spreading, involute, sharp-pointed, smooth, an inch or an inch and a half long, with pale, furrowed, close feathers, concealing the joints of the stem. Stipula of several spreading hairs. Clusters terminal, solitary, quite simple, of ten or twelve nearly fefrile, alternate, erect flowers, remarkable for their smooth ivory-like glumes, about two lines in length, out of which, at the tip, project the feathery stigmas.

Linnaeus was inclined to make this a distinct genus by the name of Matrella; derived from matrix, and alluding to an anatomical resemblance, too obscure to be very instructive, if it were liable to no other objection. Such allusions were allowable enough while botany remained the abstruse study of philosophers and physicians; but in proportion as it becomes general and popular, they are either neglect or confusable. This grass might be forced into Agrostis as the definition of that genus found in Linnaeae, but has certainly no natural habit, nor any precife character, in common therewith. Mr. Brown remarks, that the corolla (his perianthum,) is inverted, or contrary to the single-valved calyx; on which account, added to the nearly fepaled inferior, he ranges Zoysia near Rottéllia. We cannot but think it rather more related to Paniium Dabylum of Linnaeae, Haller’s Digtaria; though in fact so distant in its nature, as not to associate well with any thing.

ZOZONUSIUS, in Natural History, a name of one of the gens of the ancients, but of which our accounts are so short, that we can make no conjecture of what it was. Pliny only tells us, that it was found in the river Indus, and used by the magi.
ZRATSCHE, in Geography, a town of Bohemia, in the circle of Czsafla; 16 miles S.W. of Czsafla.
ZRIN, a town of Croatia, near the river Unna; 40 miles E.S.E. of Carlstadt. N. lat. 45° 16'. E. long. 16° 55'.
ZSCOPA. See Tschopa.
ZSCHORLAVA, a town of Saxony, in the circle of Erzgebirg; 10 miles S.E. of Zwiekan.
ZSOKEN, a town of Saxony, in the circle of Erzgebirg; 8 miles N.W. of Grunhayn.
ZUAQUI, a town of New Mexico, in the province of Sonora; 8 miles S.E. of Pitquin.
ZUATA, a town of New Grenada; 45 miles N.N.E. of Tunja.
ZUBETHI, a town of Peruña, in the province of Chuquisca; 105 miles N.W. of Sulter.
ZUBIA, a town of Spain, in the province of Grenada; 4 miles S.E. of Grenada.
ZUBTZOV, a town of Russiia, in the government of Tver, on the Volga; 68 miles S.W. of Tver. N. lat. 55° 46'. E. long. 34° 56'.
ZUCARELLO, a town of Genoa; 7 miles N.W. of Albenga.
ZUCCAGNIA, in Botany, so named by the late abbé Cavanilles, in honour of Dr. Attilius Zucagni, superintendent of the garden at Florence.—Cavan. t. v. 5. 2.
Gen. Ch. Cal. Perianth inferior, of one leaf, coloured; tube tuberculate; limb in five deep, oblong, obtuse, permanent segments, the lower one a little the longest. Cor. Petals five, obovate, inserted into the calyx; the uppear most broadest, vaulted. Stam. Filaments ten, awl-shaped, affcnding, hairy in their lower part, about as long as the corolla; anthers roundish, of two lobes, divided by a furrow. Pyl. Germen superior, roundish, compressed; style capillary, of the length and position of the flamine, smooth; styletm funnel-shaped. Peric. Legume ovate, oblique, compressed, hairy, of one cell and two valves. Seed solitary, ovate, compressed, attached by its stalk to the summit of the legume. Cavanilles.
Eff. Ch. Calyx bell-shaped; its limb in five permanent segments. Petals five, obovate; the upper one broadest, vaulted. Legume of one cell and two valves. Seed solitary.
1. Z. pumila. Dotted Zuccagnia. Cavan. as above, t. 403. Point n. 1.—Native of hills in Chili, between Portillo and the springs commonly called Monnanditas, bearing flowers, as well as feed, in January. It was communicated to the author by Louis Nee, to whose discoveries in South America and New Holland his Icones are so much indebted. The stem is shrubby, four or five feet high, with numerous, twisted, glittinous branches. Leaves alternate, abruptly pinnate, of numerous, alternate, sessile, elliptical, entire, glittinous leaflets, each one-third of an inch long, marked on both sides with blackish reflexus dots. Clusters terminal, solitary, implex, of several rather small flowers. Partial flanks one-third of an inch long, each with a little acute bractea at its base. Calyx smooth, redhish-brown, rather shorter than the corolla. Petals a line and a half long, affron-couleur, with darker veins. Anthers deep orange. Legume about three lines in length, clothed with long rully hairs. Seed of a filtring brown. This pretty shrub does not appear to have been raised in the gardens of Europe.
2. ZUCCARO, or Zuccherio, Tadeo, in Biography, was a painter of considerable renown, born at S. Agnolo in Vado, in the duchy of Urbino, in 1529. His father Ottaviano Zucaro was also a painter, but of moderate talents; and Tadeo was principally indebted to Pompeo de Fano for initiation in the art. Having, as he imagined, exhausted the flower of information to be derived from his preceptor, animated by love of his art and a desire to free his father from further charge on his account, he, at the age of 14, went to Rome, unknowing and unknown. His relation Francesco d'Agnofo was then engaged painting, with Pierino del Vaga, the grotesques of the Vatican, and he had some hope of assistance from him; but his application was vain, and he was obliged to earn his daily bread by grinding colours in different shops, wherever he could find employment. He divided his time between this labour and copying from the works of Raphael, in the Palazzo Giigi particularly, and was often compelled to sleep under the loggie of the palace, being unable to procure better accommodation. Weary at length of so much misery, he returned to his father, but soon left him to revifh the great empire of art. Fortune now began to smile upon him; he became known to an artist named Giacomone, and having improved much with him, and acquired some credit, his relation Francesco d'Agnofo noticed him, and for a time they worked together. Afterwards he was engaged by Daniello da Parma, a scholar of Corregio and Parmegiano, to assist him in painting a chapel of Santa Maria, in a church at Vitto, in Abruzzo. The work was in fresco, and Zucaro, according to Vafiari, painted a large portion of the subjects required. When this was done, he returned to Rome, and was employed by G. Mattic to paint a façade of the Palazzo Mattei in fresco, where he executed, in chiaro oscuro, nine historica pieces relative to the history of Furio Camillo. He was then only 18, and the execution of them was a matter of surprize to all who saw them. By this his first public work he gained so much reputation, that he soon acquired considerable employment. The duke d'Urbino, hearing of his fame, sent for him to Urbino, and gave him a commission to paint in fresco the chapel of the Duomo there, which was delayed by various causes, and he returned to Rome in the time of Julius III., who employed him, under Vafiari, in the Vatican, to paint in a frieze the labours of Hercules, which were afterwards destroyed by pope Paul IV., to make room for other works. Hitherto he had been principally engaged upon ornamental subjects, but now a certain one was entrusted to his pencil; and he painted in fresco, for the church of Santa Maria della Confolazione, several subjects of the passion of the Saviour, which are regarded as among his best productions. He was afterwards called upon to exert his skill, by the cardinal Farnete, in the Palazzo Caprarola. This is his greatest work, and is that whereon his reputation most depends. He was liberally paid by the cardinal. The whole ornamental part of the building was entrusted to his care, and he laboured with great earnestness to make it honourable to himself and pleasing to his employer. It has been engraved by Prener in a set of 45 plates. Tadeo Zucaro died at Rome in 1566.
ZUCCARO, Federigo, was a younger brother of Tadeo just mentioned, and born in 1543. He received his instruction from his brother, with whom he was placed at Rome, when very young, and who paid him the most affectionate attention. He soon rendered himself useful to Tadeo in his great works, and engaged also in some labours for himself. Pope Pius IV. employed him, in conjunction with F. Barroci, in the Palazzo Belvidere, where he gained great reputation. The brothers continued to work together without rivalry, and co-operated at the Vatican and the Villa
Villa Farnefe. He was invited to Florence by the grand duke to finish the cupola, left imperfect by Vafari, and succeeded in pleasing his employer.

Gregory XIII. engaged him to paint the vault of the Capella Paolina; but having some dispute with the officers of his holiness, he avenged himself by a satirical picture which he exhibited. By this the pope was offended, and Zuccaro was obliged to fly, and leave his great work unfinished. He took refuge in France, where he was sometime employed by the cardinal of Lorraine; and from thence he went to Flanders, where he painted cartoons for tapestries.

In 1574 he visited England, and was received very favourably. Here he painted portraits. The queen sat to him, and many of the nobility. How long he remained here is not exactly known. When he returned to Italy, he went to reside at Venice, where the patriarch Grimani employed him in his chapel to finish the fresco ornaments begun by Battista Franco, and he added some designs of his own to them. He also painted there a large picture of the Adoration of the Magi. In conjunction with the great masters then living in Venice, he was employed in the hall of the grand council of that city, and he obtained as his reward the honour of knighthood. He soon after returned to Rome, and the pope not only overlooked his indiscretion, but allowed him to complete the work he had begun in the Capella Paolina.

On the accession of Sixtus V. he was invited to Madrid by Philip II. to adorn the walls and ceilings of the Escorial; but though he painted with his usual skill, and covered immense quantities of space, he had not his usual success in affording pleasure to his patron. Philip was not gratified with his works, and Zuccaro was dismissed; not, however, without being munificently rewarded for his labours. The works he left behind him were afterwards covered over by others from the hand of Pellegrini Tibaldi. On his return to Rome he established the academy of St. Luke, for which he received letters patent from Gregory XIII., and to which, at his death, which happened in 1609, he bequeathed all his property.

The talents of the Zuccaros were more splendid than great. They designed and executed with facility; but aiming at grandeur, fell into manner; and the vice of mannerism touches also the colour and chiaro oscuro of their productions. Sometimes happy in all parts, but more frequently defective in the principal one of expression and feeling, their works please without gratifying; and though they attract, do not absorb the spectator.

ZUCCHABARI, CHADARA, in Ancient Geography, a town of Mauritania Caesariensis, situated on the left bank of the river Chinalaph, and towards the north-east of Mount Zalacus. This is probably the Suscarab and Colonia Augulta of Pliny.

ZUCCHARA, ZUNG-GAB, an ancient town of Africa, and the most northerly of those which lay between Zingtania and Bircium. Its magnificent ruins and its temple are the coverts of Arabs.

ZUCCHERELLI, FRANCESCO, in Biography, a very pleasing landscape painter, was born at Pigtigliano in Tuscany, in 1702. He for some time attempted history, but abandoned it, and adhered solely to landscapes, which he adorned with very agreeably composed groups of figures. In 1752 he visited England, where he was much encouraged; but our greatest debt to him is due for his having persuaded Wilton to adopt landscape for his object, instead of portrait. For this liberality what adequate thanks can be offered to his memory? At the foundation of the Royal Academy he was chosen an original member. After remaining here twenty years, he returned to Italy, and settled at Florence, where he had the misfortune to be reduced to indigence, by the suppresion of a monastery where he had lodged the money he had acquired. He again refumed the pencil to support himself, and died at Florence in 1788, aged 86.

ZUCCHI, in Geography, a town of Italy, in the county of Friuli; 5 miles N.W. of Friuli.

ZUGA, a river of European Turkey, which runs into the Marva, near Niffa.

ZUCHABARUS, in Ancient Geography, a mountain of Africa Propria, in which the river Cydnus and the fountain Acaba have their source. Herodotus called it "Chirion Mons."

ZUCHIS, a lake of Africa Propria, which is, according to Strabo, 400 fida in circuit; and on the bank of the lake is a town of the same name.

ZUCHOW, in Geography, a town of Poland, in Volhynia; 32 miles E. of Lucko.

ZUCKMANDEL, a town of Silecia, in the principality of Neiffe, the fee of a bishop; 17 miles N.N.W. of Jagerdorff. N. lat. 50° 8'. E. long. 17° 16'.

ZUCKTOK, a town of Mexico, in the province of Yucatan; 83 miles S. of Campeachy.

ZUDA, a town of Arabia, in the province of Yemen; 12 miles W. of Chammir.

ZUDISHTIRA, in Hindu Mythology, is one of the heroic sons of Pandu, whose wars and adventures occupy a confiderable portion of the Mahabarat, an epic poem of great celebrity in the Sanscrit language. See MAHABARAT and SHAHISCRIT.

ZUECA, in Geography. See GIUDUCCA.

ZUEELA, ZUILLA, or Zuzilda, a confiderable town of Africa, in the kingdom of Fezzan, said to have been anciently the capital, containing many rich merchants, situated in a fertile country. The remains of ancient buildings in this town, the number and size of the ciphers, and the construction of the vaulted caves, intended perhaps as repositories for corn, exhibit such vestiges of ancient splendour, as will probably attract, and may highly reward, the attention of the future traveller; 60 miles E.N.E. of Mourzouk. N. lat. 27° 35'. E. long. 16° 45'.

ZUENGA, a town of Thibet; 176 miles W.S.W. of Laifa. N. lat. 28° 32'. E. long. 88° 10'.

ZVENIGOROD, a town of Russia, in the government of Moscow, on the Moilka; 28 miles W. of Moscow. N. lat. 55° 40'. E. long. 35° 34'.

ZUENZIGA, a desert district of Africa, in the country of Sahara, situated to the south of Tafilet.

ZVERINOGOLOVSKAIA, a fort of Russia, on the Tobol; 52 miles S. of Okunevsk.

ZUEVA, a town of Russia, in the government of Irkutsk, at the union of the Kotoi and the Angara; 60 miles N.N.W. of Irkutsk.

ZUF, a town of the country of Candahar; 50 miles N.W. of Candahar.

ZUFFERABAD, a town of Hindooftan, in the subhah of Moultan, near the Ravee; 25 miles N.E. of Moultan.

ZUFFERWAL, a town of Hindooftan, in Lahore; 10 miles N.N.E. of Sealcot.

ZUFFOLO, in the Italian Muse, a little flute or faggelet, having a very shrill sound, like the whistling of small birds.

ZUR-FOONE, or Mers el Foulon, in Geography, a seaport of Algiers; 36 miles W.N.W. of Boujeiah.

ZUG, a canton of Switzerland, bounded on the north and...
ZUG, a town of Switzerland, and capital of the above

described canton, is beautifully situated at the north-east

extremity of a lake, in a fertile valley, abounding with corn,

plains, and wood. It contains two churches, a convent,

town-hall, arsenal, corn-magazine, a college, hospital,

etc. The titular bishop of this place is Oswald, king of

Northumberland in the seventh century, who was defeated

and slain in 634 by Penda, king of the Mercians. In the

Church is his statue, with this inscription: “Sanctus

Oswaldus Rex Anglie Patruonis huic Ecclesiae.” This king

was much renowned for his chastity, piety, and power of

working miracles; 15 miles S. of Zurich. N. lat. 49° 6'.

E. long. 8° 16'.

ZUG, a lake of Switzerland, eight miles long, and two

wide, abounding in fish. It receives its name from the town

on its coast.

ZUGANA, in Ancient Geography, a town in the interior

of Arabia Felix. Ptol.

ZUGAR, a town of Africa Propria, between the rivers

Bagradas and Triton.

ZUGARI, in Geography, a town of Naples, in Calabria

Ultra; 6 miles N. of Nicotera.

ZUGLIANO, a town of Italy, in Friuli; 4 miles S.

of Udina.

ZUHREE, a district of the province of Balouchistan,

or Ballygulan, which is considered by some as a province

distinct from Mekran or Mecran, and by others as the

northern division of it. However this be, Balouchistan is

a confused mass of tremendous mountains, affordingFailure

nevertheless for numerous flocks of sheep and herds of

cattle, and producing great quantities of wheat. The ter-

itories of its chief comprehend all the countries that lie

between 25° 30' and 30° N. lat., and from 65° to 69° E.

long.; and Balouchistan is divided into the two mountainous

provinces of Ihalawam and Sarawan, the low country of

Cutch Gandava to the east, and the provinces of Zuhree

and Anoud Djal, to which may be added the small districts

of Shat and Muitung, lying north of Kelat. Zuhree,

though it is entirely subject to the Khan of Kalkat, pays very

little to him, as its revenues are enjoyed by Zade Bukat,

of the Zuhree tribe of Balouches. The chief town is Zuhree,

which contains from one to two thousand houses. The

second town, nearly as large, is Dadur; besides which, there

are many populous villages, and upon the whole, this is

spoken of as the most civilized part of Balouchistan, the

capital of which is Kelat.

ZUL, a river of Spain, which runs into the Guadiana,

a little above Medellin.

ZUCK, a town of Prussia, in Natangen; 8 miles

N.W. of Lick.

ZULA. See ZUELA.

ZUINGLE, or ZWINGLE, WURG, in Biography, the

Scots Reformer, was born January 1, 1484, at the village

of Wildhauen, in the county of Tockenburg; and having

declared himself in his youth a studious dissection, was

intended by his father for the church. Accordingly he was

sent for education first to Basle, and then to Berne, where

attempts were made to fix him in the convent of the Dominicans;

but in order to prevent their taking effect, his father re-

moved him to the university of Vienna, which was then in

high reputation. Returning from thence to Basle, he was

chosen classical tutor in his 18th year, where he made very

considerable advances in knowledge, and particularly in

that of the profession to which he was destined, whilst he

taught others; availing himself of the lectures of Thomas

Wytenbach, who, without renouncing the fylem of the

schools, allowed his pupils to think freely for themselves.

After a residence of about four years at Basle, Zwingel

took the degree of M.A., and being chosen prior of

Glarus, was ordained by the bishop of Constance. Having

commenced a course of liberal inquiry, he indefatigably

pursued it, critically explaining the New Testament as

the directory of his faith, and confuting a variety of writers

who had incurred the cenure of the church of Rome.

The consequence of this mode of study was a discovery of

the deviation of the ecclesiastical fylem, generally adopted

and estabished, from that of Christianity, both in doctrine

and practice. But he was slow in publishing the theologi-

cal sentiments which he had imbibed, and for ten years

pursued a course of practical instruction at Glarus, which

served to him the respecto and affection of his parishioners,

so that the bigotted clergy could not succeed in their at-

tempts to do him injury. From Glarus he removed to the

celebrated abbey of Einsidlen, where he accepted the office

of preacher, and where he had an opportunity of associating

with
with persons of learning, and of contributing to the education of candidates for the ministry. Whilist he was at Glarus he expounded several superstitions of the church of Rome; and at Einfiedlin he gained additional reputation by preaching against vows, pilgrimages, and offerings. Here he employed his influence so effectually, that he ordered the inscription over the abbey-gate, "Here plenary remission of sins is obtained," to be effaced, and the relics to be buried; and, among other rules which he established in a convent of females under his direction, he introduced one for obliging the nuns to read lessons in the New Testament, instead of reciting their hours. He was also intrepid and zealous in propagating rational sentiments of religion, and with this view he availed himself of a public occasion, when a crowd was assembled, to deliver a sermon designed to show that no superior sanctity resided in any place so as to confer peculiar merit on vows addressed from it, but that their acceptance depended upon the purity of the heart and life of the worshipper. Declarations of this kind, whilst they gained the approbation of some of his auditors, excited the indignation of others, and alarmed the monks of this and neighbouring convents. Although he was regarded with jealousy and terror by those whose interest led them to oppose reformation, he was so much respected, that his ecclesiastical superiors manifested no displeasure against him; and by his correspondence with Erasmus, Glareanus, Hedio, Rhe- nanus, and other learned persons, he established a reputation which enabled him to encourage liberal studies. In 1518 he was invited to occupy the vacant post of preacher in the cathedral of Zurich, and before he was installed he announced his proposed plan of preaching, which differed from that which had been before practised, and which gave him an opportunity of explaining the books of the New Testament in an uninterrupted series, without regard to texts that were marked for each Sunday and Saint's-day in the year. This plan was approved by the majority of the chapter, and drew together a crowded auditory, who expressed in high terms their admiration of the preacher. A circumstance occurred which afforded him a complete victory over an emissary of pope Leo X., who was employed in the sale of indulgences, inasmuch that he was obliged to quit the city and retire into Italy. Some writers, especially among the Catholics, have referred the origin of the reformation, and of the opposition of both Zwingle and Luther to the papal authority, to the disputes about indulgences; but, although this quarrel might have contributed to the promotion of it, the people were previously prepared for the event by the preaching and conduct of Zwingle, and by the judgment and prudence with which he had planned and pursued his measure for this purpose. Luther proceeded very slowly to that exemption from the prejudices of education, which Zwingle, by the force of an adventurous genius, and an uncommon degree of knowledge and penetration, easily got rid of. And we learn from the most authentic records of history, that he had explained the Scriptures to the people, and called in question the authority and supremacy of the pope, before the name of Luther was known in Switzerland. In process of time, after Luther had taken up arms against Rome, Zwingle, being then minister of the chief church in Zurich, concurred with him; preaching openly against indulgences, then against the intercession of the saints, then against the mass, the hierarchy, the vows and celibacy of the clergy, abstinence from flesh, and also many things which Luther was disposed to treat with toleration and indulgence; such as images, altars, wax-tapers, the form of exorcism, and private confession, &c. Zwingle, at an early period of his ministry, had declared his decided disapprobation of all wars, excepting those that were undertaken for the defence of the country; and such was the influence of his opinion, that the canton of Zurich refused to concur with the other cantons in a subsidiary treaty with the French king. The result of his arguments and remonstrances to this effect was a law passed by the assembly of the canton in 1522, abolishing all alliances and subsidies for the term of 25 years. He laboured at the same time to enforce a regard to the rules of the gospel in preference to the respect that was generally manifested to those of ecclesiastical discipline. Accordingly he defended those persons who had been denounced to the magistrate for infringing on the "fall of Lent" without a dispensation; and published on this occasion his treatise "On the Observation of Lent," which contained some free opinions on the obligation of fasting and keeping particular days. When the bishop of Constance remonstrated against his proceeding, and endeavoured by his charge and letters to excite apprehensions among the people, and in the council and chapter of Zurich, that he would spread through Switzerland such a flame as Luther had kindled in Germany, Zwingle obtained permission to reply; and composed a tract to prove that the gospel alone is authority from which there is no appeal, and that the decisions of the church are binding only inasmuch as they are founded on Scripture. When the bishop of Constance had prevailed with the deputies of the Helvetic diet to order the arrest of a pastor accused of preaching the "new doctrine," Zwingle, who had now adopted and openly avowed the principles of the reformation, addressed to the heads of the cantons, in his own name and that of his friend, a summary of his doctrine, annexing an intreaty that they would allow liberty for the preaching of the gospel. In a conference before the deputies of the bishop of Constance, in the presence of the great council of Zurich, held in 1523, Zwingle gave an account of his doctrine; and the colloquy terminated in the following declaration of the council: "That Zwingle, having been neither convicted of hereby, nor refuted, should continue to preach the gospel as he had already done; that the pastors of Zurich and its territory should refuse their discourses on the words of Scripture alone; and that both parties should abstain from all personal reflections." Zwingle, having been thus supported by the magistrates, and having obtained a public sanction of the principles of the reformation in this canton, has been charged, both by Catholics and Protestants, with allowing to the secular power an undue degree of authority in ecclesiastical matters; however it has been urged in his defence, that he did not intend to transfer to government the absolute power over confessions claimed by the popes; but that, for the preservation of order and tranquillity, he thought that the depositories of lawful authority ought to have a share in the direction of ecclesiastical affairs. Zwingle, though thus supported, proceeded with caution in promoting alterations in the ceremonies and modes of public worship, and was principally anxious to lay a proper foundation of change by enlightening the understanding and convincing the judgment of the people. When some zealous reformists agitated a mob to pull down a crucifix which had been erected at the gate of the city, and the culprits were brought before the council to be tried and punished, Zwingle interposed; and whilist he vindicated the offenders from the charge of sacrilege, he gave it as his opinion, that they deserved some punishment for having pulled down the crucifix without the authority of the magistracy. This dispute led to a general colloquy, which was held in October 1523; and the result was, that all the culprits, except Hottinger their ring-leader, and the person who had actually
ZUINGLE.

tually committed the offence, were set at liberty; but Hottinger was banished from the canton for two years; and he was afterwards put to death for heresy, in consequence of a sentence pronounced by the deputies of seven cantons at Lucerne, notwithstanding the intercession of Zurich. The question of the celibacy of the clergy was agitated in these colloquies, and though no decisive opinion was given by the council, several clergymen married, and among them was Zuingle himself, who had expressed his sentiments against the question, at the age of 40. In 1524, the council of Zurich proceeded to the reformation of public worship according to the plan proposed by Zuingle. They began with canceling all pictures and statues to be removed by those whose ancestors had consecrated them; and of these several were destroyed. These measures occasioned alarm and complaint in the other cantons; and acts of hostility were meditated. Without entering into a detail of the various circumstances that occurred on one side and on the other, we shall content ourselves with observing, that fanaticism and bigotry were engaged in opposition to each other, and produced in Switzerland effects similar to those that have attended innovation and reformation in other countries. At Zurich, the total subversion of the Romish worship was accomplished, by prohibiting processions and other ceremonies, and by the abolition of the sacrifice of the masses. The latter event took place by the activity of Zuingle in 1525; and on Easter Sunday the Lord’s Supper was celebrated according to his idea of this rite, which was that of a merely commemorative and symbolical service. Our reformer displayed in another instance a disinterested spirit, which reflects great honour on his memory. Although he was one of the canons who composed the chapter of the cathedral, and this body was independent of the council, and possessed its own jurisdiction and property, he prevailed with the majority of his colleagues to consecrate the large revenues of the chapter to establishments for public instruction, and to transfer its temporal power to the government. In the conduct of this event he manifested no less wisdom and moderation than disinterestedness; for the chapter charged itself with the payment of as many pastors as were necessary for the public worship of the city, to which service those canons who were capable of service were devoted. Those who were old and infirm were allowed to prefer their benefices for life; and their revenues, as they became vacant, were to be employed in founding professorships for lectures, to which admission was to be gratuitous. These liberal conditions were religiously observed, and the regulations thus framed are still continued at Zurich. The orders of mendicants, and other religious houses, were abolished; and their revenues were appropriated to the support of hospitals, and other charitable institutions, as the old members dropped off. Zuingle was afterwards commissioned to organize a system of public instruction, in which he displayed a cultivated and liberal mind.

The reputation which Zuingle had acquired, and the success which had crowned his plans and labours in the cause of reformation, were not sufficient to secure him against the prejudices of fanatics, and the hostile attacks of malignity. Attempts were made to associate him with Munzer, one of the leaders of the Anabaptists; but he happily avoided the snare that was laid for him, and instead of taking part in those violations which called forth the interposition of the civil power, and which terminated in the death of one of the persons concerned, he did all that lay in his power to prevent them; and though he could not prevent the life of one disturber of the public peace, he composed the tumult occasioned by the intemperate zeal of others. Notwithstanding the singular prudence and moderation which influenced his whole conduct, his reputation excited envy, and a conspiracy was formed against his life. Under the protection of the magistracy of Zurich he was safe; but his enemies insidiously proposed a conference at Baden, in Argovia. His friends, however, were not unapprobated of his danger, and well knowing that the cantons were actuated by ineretate hostility against his person as well as his doctrines, they would not consent to his leaving Zurich. At the conference, which he prudently declined to attend, enmity was avowed both against him and his adherents. Some of the cantons, however, withheld their concurrence; and this was particularly the case with respect to the canton of Berne. In this canton, the reformation had made considerable progress, so that in 1527 several of its municipalities addressed the senate for the abolition of the masses, and the introduction of the form of worship established at Zurich. The reformers at Berne summoned a convention, to which the clergy of the other Helvetic states, and the neighbouring bishops, were invited. Zuingle’s attendance was also requested; and he thought it his duty to appear in that assembly, professedly convened for the advancement of the reformation. Haller was the leader of the party in this canton, and in connexion with Zuingle and other coadjutors the cause to which they were devoted obtained a complete triumph; so that the grand council of that canton fully adopted the measures of that of Zurich. Upon this, five of the cantons which were attached to the old religion entered into a solemn engagement not to suffer the doctrines of Zuingle and Luther to be preached among them. At length the hostilities that subsisted between the Catholic and reformed cantons were amicably terminated by the treaty of Cappel in 1529. The animosity, however, between these cantons was not extinguished. It broke out again with greater violence than ever; and the senate of Zurich has been charged with the first aggression, by arbitrary acts in favour of the reformed preachers in the common bailiages. Its project of secularizing the abbey of St. Gall, which belonged to the Helvetic confederacy, was a greater grievance; and on the other hand, the five associated Catholic cantons refused to concur with the others in expelling the Spaniards from the Valteline, and perverted the reformed in their jurisdictions with the greatest severity. The sufferers fought the protection of Zurich, and the eloquence of Zuingle was employed in recommending their case to the senate. The breach widened, and a majority of the Protesting cantons agreed in stopping the transit of provisions to the five cantons, which depended upon foreign supplies. Zuingle in vain remonstrated against this cruel act; and the five cantons took up arms, and having published a manifesto, marched into the field in October 1531. A detachment was ordered to prevent the junction of the forces of Berne with those of Zurich, and the main body advanced towards Cappel. This intelligence alarmed the people of Zurich; and they could only spare 700 men for the relief of their countrymen at Cappel. Zuingle was appointed to accompany them. A battle ensued; and though the Zurichers, animated by his exhortations, defended themselves valiantly, they at length were compelled to yield to superiority of numbers, and were entirely routed. Some died at their posts; others fled; and Zuingle received a mortal wound at the commencement of the action, and fell senseless to the ground. As soon as he had recovered sufficiently to raise himself up, he crossed his arms on his breast, and lifted his languid eyes to heaven. In this condition he was found by some Catholic soldiers, who, without knowing him, offered to bring a confessor; but
but as he made 2 signs of refusal, the soldiers exhorited him
to recommend his soul to the holy virgin. On a second refu-
ful, one of them furiously exclaimed, "Die then, obli-
nate heretic!" and pierced him through with a sword.
His body was found on the next day, and the celebrity of
his name drew together a great crowd of spectators. One
of thefe, who had been his colleague at Zurich, after inten-
ty gazing on his face, thus expressed his feelings: "What-
ever may have been thy faith, I am sure thou wast always
sincere, and that thou lovedst thy country. May God
take thy soul to his mercy!" Among the favage herd
some voices exclaimed, "Let us burn him till he succour remains!"

The proposal was applauded; a military tribunal ordered
the execution, and the ashes of Zuingle were scattered to
the wind. Thus, at the age of 47, he terminated a glorious
career by an event deeply lamented by all the friends of
the reformation, and oc%inating triumph to the partisans of
the Romish church.

"In the character of Zuingle," says one of his biog-
raphers, "there appears to have been united all that
makes a man amiable in private society, with the firmnes,
ardour, and intrepidity that are indifpenfable in executing
the great task of reformation. By nature mild, his earnest-
ness was the reful of his fene of the importance of the
cake he engaged in to the beft interests of mankind, not of
a dogmatic or differtant spirit. His views were large and
genewous, and his opinions rode above the narrow fafe efct
or party. It was no small proof of liberalit in that age
that he ventured to affert his belief of the final happinesss
of virtuous heathens, and of all good men who acf up to the
laws engraft on their confcences. His temper was cheerful
and focial, somewhat hafty, but incapable of harbouring
resentment, or indu&ing envy and jealousy. As a reformer he was original
for he had proceeded far in eman-
cipating himself from the superftitions of Rome by the
strength of his own judgment and had begun to communica-
te the light to others, whilft Luther ftil retained almoft
the whole of the Romih system, and long before Calvin
was known in the world. He was more learned and more
moderate than the fift of these divines, and more humane
and kind-hearted than the last. He wrote many works of
utility in their day; and the reform, of which he was the author, still subsistt unchanged among a people distinguished
by their morals and mental cultivation." Life of Zuingle,
in Switzerland, vol. i. See ZUINGLIANS.
ZUINGLIANS, in Ecclesiastical History, a branch of
ancient Reformers or Protestants; denominated from their
author Ulric or Huldric Zuingle. See ZUINGLE.

As to the eucharift interpreting hoc est corpus meum, by
hoc significat corpus meum, he maintained, that the body
and blood of Christ were not really present in the eucharift; and
that the bread and wine were no more than external figs or
symbols, defigned to excite in the minds of Christians
the remembrance of the sufferings and death of the divine
Saviour, and of the benefits which arise from them. This
opinion was embraced by all the friends of the reformation
in Switzerland, and by a confiderable number of its votaries
in Germany. On the other hand, Luther held his doctrine,
which was confubftantiation, with the utmost obstinacy;
and hence arose, in 1524, a tedious and vehement contro-
verfy, which terminated, at length, in a fatal division
between thofe who had embarked together in the facred
caufe of religion and liberty. From this time, Zuingle pro-
pagated his doctrine concerning the eucharift in a public
manner by his writings, after having entertained and taught
it privately before that period. His "Commentary on true
and fälle Religion," containing his fentiments on this sub-
ject, was published in 1525, and followed by a learned
traté of Eeolampadius on the fame subject.

With a view of bringing this controversy, which reflected
much difcredit on the Protestant caufe, to an amicable issue,
Philip, landgrave of Hesse, invited, in 1529, to a conference
at Marburg, Luther and Zuingle, together with some of
the other principal leaders of their respective parties; who
fuffered, during four days, in preference of the landgrave.
Luther attacked Eeolampadius, and Melancthon difputed
against Zuingle. Before they parted, the Swiss and German
theologians signed their mutual affent to 14 articles, con-
taining the efential doctrines of Christianity, and expresf
ed a hope that their difference with refpect to the real prefeuce
would not interrupt their harmony. The landgrave re-
quired from the two leaders a declaration that they would
regard one another as brothers. Zuingle readily confented;
but Luther would engage no farther than that, speaking of
the Swiss, he would for the future moderate his ex-
prefions. In this conference Zuingle was accused of hereby,
not only on account of his explication of the nature and
defign of the Lord's Supper, but also in confequence of the
difcrepant notions he was fuppofed to have adopted relating to
the divinity of Christ, the efficacy of the divine word,
original sin, and fome other parts of the Christian doctrine.
But though he cleared himself to the fatisfaction even of
Luther from the great part of these accusations, their diffe-
rence concerning the manner of Christ's presence in the
eucharift ftill remained. Nor did it terminate with the
death of Zuingle in 1531, nor with that of Luther in 1546.
Melancthon and Calvin made feveral attempts towards pro-
cing a reconciliation between the contending parties.
With this view Calvin proposed a fylum, with refpect to
the eucharift, more confomable to the doctrine of the
Lutheran church than that of Zuingle. He acknowledged
a spiritual presence of Christ in this facrement, and fuppofed
that a certain divine virtue or efficacy was communicated by
Christ with the bread and wine to tho& who approached
this holy facrement with a lively faith, and with upright
hearts; and to rend'r this notion ftill more fatisfactory, he
expressed it in almost the fame terms which the Lutherans
employed in inculcating their doctrine of Christ's real
presence in the eucharift. But whilst the followers of Zuingle
afserted, that all Christians, without diiftiiition, whether
regenerate or unregenerate, might be partakers of the body
and blood of Christ, Calvin confined this privilege to the
pious and regenerate believer alone. Besides, the fentiments
of the Zuingleans, with regard to the divine decrees, differed
very little from that of the Pelagians; nor did they heitate
in declaring, after the example of Zuingle himfelf, that the
kingdom of Heaven was open to all who lived according to
the dictates of right reason; whereas Calvin maintained,
that the everlasting condition of mankind in a future world
was determined from all eternity by the unchangeable order
of the Deity, and that this absolute determinatioii of his
will and good pleasure was the only source of happiness or
misery to every individual. Moreover, Zuingle and Calvin
differed in their notions of ecclesiasticall government. The
former ascribed an absolute and unbounded power, in re-
ligious matters, to the civil magifirate; allowing at the
fame time of a certain subordination among the ministers
of the church, and placing at their head a perpetual prefeuce
or superintendent, with a certain degree of inspection and
authority over the whole body; but Calvin, on the con-
trary, reduced the power of the magifrate, in religious
matters, within narrow bounds; declaring the church a
separate and independent body, endowed with the power of
ZUM Closeherlin, a town of Germany, in the county of Pludenz, on the river Alsen; 9 miles E. of Pludenz.

ZUM Hoft, a town of Germany, in the county of Bregenz, on the river Bregenz; 15 miles S.S.E. of Bregenz.

ZUM Stein, a town of the duchy of Berg; 3 miles N.E. of Blankenberg.

ZUM Vogelfang, a town of France, in the department of the Roer; 3 miles S.E. of Juliers.

ZUM Zontag, a town of Germany, in the county of Bregenz; 24 miles S.S.E. of Bregenz.

ZUMAIA, or UMUAIA, a town of Spain, in the province of Gutpucoa, near the coast of the bay of Bilbao; 14 miles W. of St. Sebastian. N. lat. 43° 17'. W. long. 1° 51'.

ZUMAMPA, a town of South America, in the government of Tucuman, in the Rio Dolce; 90 miles S. of St. Yago del Eterro.

ZUMELLA, a town of Italy, in the Trevisian; 10 miles N.W. of Cenada.

ZUMIC ACID, in Chemistry, a name given by Dr. Thomson to a peculiar acid principle lately obtained by M. Braconnier from rice, and which that gentleman had absurdly called Nanieac acid, from Nancy, the name of the city where he resided.

This acid was obtained by fermenting rice in water by the application of a gentle heat. An acid liquor was obtained, which on evaporation to dryness left a gummy mass, having a very faint taste. This was digested in alcohol, which evaporation left a crystallized powder of the peculiar acid and lime. The lime was thrown down by barytes, and the barytes afterwards separated by fulphuric acid, and thus the acid obtained in a separate state.

Zumic acid is colourless, has a very acid taste, and does not crystallize. It precipitates none of the metals from their solutions, except zinc from very concentrated solutions of its salts.

With potash and soda it forms incrystallizable deliquescing salts, soluble in alcohol. With ammonia it forms a crystallizable salt.

The neutral zimate of lime crystallizes confusedly in a form somewhat resembling a cauliflower. It is opaque, very white, has little taste, and has the appearance of having effloresced.

We do not think it necessary to detail the properties of the other compounds of this acid, which have been but little examined, and appear to be totally devoid of interest.

Dr. Thomson thinks the zumic acid is the same with the lactic acid, the latter being probably digested as usually obtained, by the presence of some animal matter.

ZUMPANO, in Geography, a town of Mexico; 90 miles S. of Mexico.

ZUMPANO, a town of Mexico; 20 miles N. of Mexico.

ZUNA, a town of South America, in the audience of Quito; 30 miles N.W. of Macas.

ZUNAPA, a small island in the Adriatic. N. lat. 43° 7'. E. long. 17° 17'.

ZUNCOLO, a town of Naples, in Principato Ultra; 17 miles S. of Conza.

ZUNDER, a town of Silezia, in the principality of Neise; 5 miles S.E. of Grotkau.

Zunger, a town of Pruffia, in Pomerelia, at the mouth of the Nogat; 8 miles W.N.W. of Elbing.

ZUNG-GAR, a town of Tunis, anciently called Zuchara. Here are the ruins of a temple, and an aqueduct erected for the purpose of conveying water to Cartagena; 48 miles S.W. of Tunis.

ZVORNIK.
ZVORNICK. See Zvonick.

ZUPU, a town of Circalicia; 160 miles E. of Theodoria.

ZUR GUGEL, a town of Prussian Pomerelia; 20 miles S.S.E. of Marienburg.

ZUR Ofis, a town of the duchy of Bremen; 5 miles S.S.W. of Bremervorde.

ZURA, a town of European Turkey, in Moldavia, on the Dnieter; 22 miles E. of Orhei.

ZURARA, a town of Portugal, in the province of Entre Duero e Minho, at the mouth of the Ave, opposite Villa de Conde.

ZURBARAN, Francisco, in Biography, was a Spanish painter, born at Triente da Cantos, near Seville, in 1596. He was a disciple of Pablo Rocalas, under whose tuition he acquired very considerable talent, and soon enjoyed a good reputation as an artist. He adopted the style of M. A. Caravaggio, painting with great boldness, force, and truth. His first public work was painted for the convent of La Merced Calzada, from the history of S. Pedro Nolasco, by which he added much to his fame. There are many other works of his in the public edifices at Seville and Cordova, particularly in the Collegio di San Pablo. He was invited to Madrid about 1630, and was appointed principal painter to the king, and employed in the Buen Retiro, where he painted the Labours of Hercules. His productions may also be found in the Cafa da Campo, and other royal palaces, as well as in private collections. Zurbaran died in 1662, aged 63.

ZUREITA, in Geography. See Zuzertil.

ZURICH, or Zürich, a canton of Switzerland, and the first in rank, bounded on the N. by Swabia and the canton of Schaffhaufen, on the E. by the Thurgau and the county of Toggenburg, on the S. by the cantons of Schwitz and Zug, and on the W. by the county of Baden. This canton is not unaptly called an epitome of all Switzerland, as containing in it hills, valleys, plains, corn-lands, vineyards, lakes, rivers, vegetables of all kinds, and whatever else is necessary to the support of life. Grain is cultivated all over the country; but it ripens later in the mountainous parts, where the air is colder, than in the levels or funny valleys. The hilly grounds in the E., W., and S. borders, afford a specimen of the fertile Alps, as abounding in cattle, milk, butter, and cheese; at first the wines have a tartness attending them, yet they improve by keeping; and, after lying some years in the cask, become smooth, pleasant, and wholesome. Fruits also are everywhere found in great plenty, and very good. The most remarkable minerals and fossils are chalk, potters' earth of several forts and colours, sulphur, and pit-coal; some mineral springs are likewise found. The proportion of grain to the other productions of the earth will appear from the following calculation: there are 217,424 acres, of 56,000 square feet each, laid out in grain, 143,466 in vines, 94,553 in meadows, 42,549 in pasturage, and 123,772 in forests. As sufficient corn is not produced for the interior consumption, the deficiency is chiefly supplied from Swabia. In order to prevent a scarcity of this material article, a public granary is maintained, at the expenses of government, for grain at the common price; but in times of scarcity, it is sold considerably cheaper than it can be purchased at the market. The wine is mostly consumed in the country, and little of it is spared for foreign commerce. The canton contained, in 1784, 174,572 souls, including 10,500 in the capital: this large population, in proportion to the size of the canton, is owing to the trade of Zurich; as at least two-thirds of the inhabitants derive their livelihood by spinning thread and silk, and making linen for the manufactures of the town. The sovereign power resides exclusively in the burghers of the town, consisting of about 2000; but a contrived disposition prevails in most of the states of Switzerland, so that they seldom confer the burghership. In Zurich, it is said, a new citizen has not been admitted for the last 150 years.

The burghers, beside the advantage of electing their magistrates, and of aspiring to the administration of affairs, enjoy the sole right of commerce; all strangers, and even subjects, being excluded from establishing manufactures in the city, or in any part of the canton.

The burghers of Zurich are divided into thirteen tribes; one of which is called Contaffel, or the tribe of nobles, although at present not absolutely confined to persons of that description: it enjoys the privilege of giving eighteen members to the Sovereign Council, and six to the Senate, whereas each of the other tribes only supply twelve to the former, and six to the latter.

The legislative authority is vested by the burghers in the Sovereign Council of two hundred; consisting, however, of two hundred and twelve members drawn from the thirteen tribes, and comprising the Senate, or Little Council. This Senate, composed of fifty members, including the two burgomasters, has jurisdiction in all causes civil and criminal: in civil cases, when the demand is of a certain importance, an appeal lies to the Council of two hundred; but in criminal affairs, their sentence is final, and, when once passed, there is no reversal or mitigation.

It is to be regretted, that in this republic, as in most other states of Switzerland, there is no precise code of criminal law. The Caroline, or code of Charles V., is oftentimes followed; but on account of its obsolete usages and extreme severity, the sentence is utterly left to the discretion of the magistrates.

The power of the Senate, considered in a collective capacity, is very considerable; it judges finally in all criminal cases, has the care of the police, and supplies the principal magistrates. But as too great a power of individuals is dangerous in a republic, the members of this assembly are liable to be changed, and a revision or confirmation is annually made, in some instances by the Sovereign Council, in others by the particular tribes to which the senators belong. This annual revision is a great check to mal-administration, and at the same time prevents the Senate from gaining too great an influence as to be detrimental to the liberties of the people. A burgher is qualified to vote at twenty; is eligible into the Sovereign Council at thirty; and into the Senate at thirty-five. The canton of Zurich is divided into districts or baililages, which are governed by bailiffs nominated by the Sovereign Council, exercising an authority subject to certain restrictions. The reformation was begun by Zwinglius, in the year 1517, in the town of Zurich; and in 1524, gained footing in the whole canton.

The militia of the canton amounted, in 1781, to 25,718 infantry, 1025 artillery, 886 dragoners, and 406 chasseurs; in all 28,335 effective men. The arsenal is well supplied with cannon, arms, and ammunition; and contains a reserve of muskets for 30,000 men. This canton had formerly a regiment and some companies in the service of France, a regiment in that of Holland, and some companies in the service of the king of Sardinia.

In ecclesiastical affairs the Senate is supreme: the canton is divided into fourteen districts, each governed by a dean, chosen by the synod, from three candidates proposed by the clergy of the diocese. The synod, composed of the whole clergy, and several affidavits on the part of the Little Council, meets twice a year. The principal ministers and professors...
in the town constitute, in conjunction with several magistrates and other officials, deputed by the civil power, an ecclesiastical and academical council: to this committee the deans recur in all concerns, which seem to exceed their jurisdiction: it determines lesser affairs, and refers cases of importance to the Senate.

During the French revolution, the canton of Zuric, after a feeble resistance, surrendered to the arms of the invaders; and the national assembly, which had been convoked, acceded to the new organization of the Helvetic constitution.

Zuric, a city of Switzerland, and capital of a canton of the same name, situated on a large lake, where the river Limmat is discharged, which divides it into two parts; supposed to have been built on the site of the ancient Tigrum, which was destroyed by the Allemanni.

The environs are very delightful; an amphitheatre of hills gradually sloping to the borders of the water, enriched with pastures and vines; dotted with innumerable villages, cottages, and hamlets; and backed on the W. by the Ullisberg, a bold and gloomy ridge stretching towards the Albis, and that chain of mountains which rises gradually to the Alps. Of the two parts into which the town is divided, the old part is surrounded with the same ancient battlements and towers which existed in the thirteenth century, and the suburbs are strengthened by fortifications in the modern style, but too extensive. The ditches, instead of being filled with stagnant water, are mostly supplied with running streams. The public walk is pleasantly situated in a lawn, at the junction of the Limmat and the Sih, an impetuous and turbulent torrent, which descends from the mountains of Einfidlin: two rows of lime-trees planted by the side of the Limmat, and following its serpentine direction, afford an agreeable shade in the heat of summer. The inhabitants are very industrious; and carry on with success several manufactures: the principal are those of linens and cottons, muffins, and silk-handkerchiefs. The manufacturers do not in general dwell within the walls; but the materials are mostly prepared, and the work is completed in the adjacent districts. For this reason, Zuric does not exhibit the activity and numbers of a great commercial city. The environs, on the contrary, are so extremely populous, that perhaps few districts in the neighbourhood of a town, whose population scarcely exceed 10,000 inhabitants, contain within so small a compass so many souls. The frecta are mostly narrow; the houses and public buildings accord more with plains and convenience, than with the elegance and splendour of a capital. In 1780 the town contained 10,559 souls; but the population had decreased from the difficulty of obtaining the burgervest, whereas luxury and opulence had very considerably increased. In general, however, the manners of the inhabitants are simple. Dinner is usually served at twelve: in the afternoon the gentlemen assemble in clubs, or small societies, in the town during winter, and at their respective villas in summer. They frequently smoke, and partake of wine, fruit, cakes, and other refreshments. The women, for the most part employed in their domestic occupations, or devoted to the improvement of their children, are not fond of visiting. This reserve, however, has much abated, and gives place to a more sociable intercourse. Such, however, is the prevalence of national habit, that a few families, which form a more agreeable mixture of company, are considered as differing from the established customs, and are still known by the name of the French Society. Sumptuary laws are well observed. Amongst thee, the use of a carriage in the town is prohibited to all sorts of persons except strangers; and it is almost inconceivable, that in a place so commercial and wealthy, luxury should so little prevail.

Zuric was formerly an imperial city, and obtained from the emperor Frederick II. very considerable privileges; which were acknowledged and augmented by several of his successors. The civil war between the magistrates and the people in 1335 nearly reduced the city to ruins; but the former being banished, the citizens, in 1337, established a new form of government, which was confirmed by the emperor Louis of Bavaria. The exiles, after several fruitless attempts, were at length re-admitted; but engaging in a conspiracy against the citizens, were discovered and put to death. In consequence of this execution, the nobles in the neighbourhood took up arms; and Zuric, after having ineffectually applied for assistance to the emperor Charles IV., formed an alliance with Lucerne, Uri, Schwyz, and Unterwalden, and was admitted a member of their confederacy. This event happened in the year 1351. The four cantons yielded the pre-eminence to Zuric: a privilege it enjoys at present; being the first canton in rank, and the most considerable in extent, both of territory and power, next to Berne. In the same year, Zuric was afflicted by the four cantons against Albert, duke of Austria, who besieged the town, and was repulsed with great losses.

Zuric was the first town in Switzerland that separated from the church of Rome, being converted by the arguments of Zwingli.

The charitable establishments at Zuric are, the orphan-house, which is regulated with extreme attention and care; an almshouse for poor burghers; an hospital for incurables, and that for the sick of all nations, which usually contains between fix or seven hundred patients; and the Almosen-Amt, or foundation for the poor: this excellent institution puts out children as apprentices; and distributes money, clothes, and books of devotion to poor persons, as well in the town, as in different parts of the canton, at the recommendation of the respective ministers. Here is also a chirological dispensary, formed by voluntary subscriptions, to the support of which, Dr. Rahn, an eminent physician, was a liberal contributor.

At Zuric public education is a concern of the state, and under the immediate protection of government. The office of a professor gives rank and eminence, and is often held by a member of the Senate and of the Great Council. The principal literary establishments for the instruction of youth are, the Carolin college for students in divinity: Collegium Humanitatis, or the college for polite literature; and the school of arts: the first has twelve professors, the second two, and the last seven. The learned languages, divinity, natural history, mathematics, and in short every species of polite learning, as well as abstruse science, is taught at a small expense in these respective seminaries.

In consequence of the peculiar attention paid by government, since the reformation, to the education of youth, Zuric has produced many persons, who have distinguished themselves in all departments of literature: among these we may reckon Zwinglix and Bullinger, Conrad Gfener, Hottinger, Simler, Spoh, Scheutzer, Heidegger, Breitinger, Bodmer, Hirtzel, Solomon Gfener, and Lavater. For each of these distinguished persons, see our biographical articles.

Dr. Hirtzel was a learned physician, and deferredly styled the Swis Plutarch: he distinguished himself, among various publications, by the Soerate Rationale, and by the lives of Sulzer and Heidegger. Leonard Meister, professor of history and morality in the school of arts, deferves mention, on account of his numerous and valuable publications, in all which he has displayed great zeal for the promotion of literature,
literature, correctness of taste, liberality of sentiment, and extensive historical and biographical knowledge. In his observations on fanaticism and intolerance, he has forcibly evinced their dreadful effects on government and civil society by historical facts, and approved himself an able writer in combating perfecution, and in repressing the prevalent spirit of fanaticism.

The public library at Zuric contains about 25,000 volumes, and a few curious MSS., of which latter are, the original MS. of Quintilian, the Psalm in the Greek tongue, written on parchment dyed of a violet colour, the letters being silver and gold, and the marginal reference red, somewhat similar to the "Codex Argenteus" of Upsal, and supposed to have once formed a part of the "Codex Vaticanus," and several MSS. of Zuingle. Zuric is a district 41 miles S. of Basel, and 36 S.W. from Conflance. N. lat. 47° 18'. E. long. 8° 25'. Coxe's Travels in Switzerland, vol. i.

ZURICH, a lake of Switzerland, situated in the canton to which it gives name, about 10 leagues in length, and one in breadth, of an oblong form; and though not so large as that of Conflance, more thickly studded with villages and towns. The adjacent country is finely cultivated, and well peopled; and the southern part of the lake appears to be bounded by the high fluctuating mountains of Schweitz and Glarus. The scenery is picturesque, lively, and diversified.

ZURICH, a town of Aulrique Poland; 22 miles S. of Luckow.

ZURITA, a town of Spain, in New Castile, on the left bank of the Tagus; 48 miles N.E. of Toledo.

ZURITO, a town of Peru, in the district of Cusco; 12 miles N.W. of Cusco.

ZURLINDEN, a town of Prussia, in the palatinate of Culm; 18 miles S. of Thorn.

ZURNAPA, in Zoology. See Camelopardalis.

ZURUPALCA, in Geography, a town of Peru; 44 miles S. of Potoč.

ZURZACH, a town of Switzerland, in the county of Baden, on the Rhine, chiefly celebrated for its fairs, at which great quantities of goods are sold by the merchants from Germany, France, and Italy; 25 miles E. of Bâle.

ZURZONZA, a town of Mexico, in the province of Mechoacan, situated on an island in a lake; 20 miles W. of Mechoacan.

ZURZURA, in Ancient Geography, a town of Asia, in the Greater Armenia. Ptol.

ZUSAM, in Geography, a river of Bavaria, which runs into the Danube, opposite Donauwurt.

ZUSCHEN, a town of Germany, in the county of Waldrecht; 4 miles N.W. of Fritzlar.

ZUSCHEN, or Zuchenau, a town of Germany, in the duchy of Westphalia; 5 miles S.W. of Medebach. ZUSEL, a river of France, which runs into the Roer, at Suteren.

ZUSMERSHAUS, a town of Bavaria, in the territory of Augsburg; 13 miles N.W. of Augsburg.

ZUSNIN, a town of Ilrria; 11 miles N.E. of Peneda.

ZUTPHEN, a city of Holland, and capital of a county to which it gives name, situated on the river Eerckel, which passes through the middle of it, fills its ditches, and immediately joins the IJfel. It takes its name from the two Flemish words "Zut Vanen," which signify Southern Meadows. The principal buildings are, the church of St. Walburga, the college of the deputys of the comte, and an ancient building, which they call "St. Graven-Hof," or Palace of the Comte. Otto I. of Nassau, acquired this country in the 11th century, by his marriage with the heiress of Gerlach, count of Zutphen, since which it has been annexed to Gelderland; 7 miles S. of Deventer. N. lat. 52° 16'. E. long. 6° 54'.

ZUTPHEN Islands, a group of small islands, in the straits of Sunda. S. lat. 5° 50'. E. long. 105° 41'.

ZUTZ, a town of Switzerland, in the league of the Grifons, on the Inn. This town, though not the largest, is reckoned the principal place of Upper Engadine, because it contains the criminal court of justice. This court consists of the landamann of Sotto, one of the two communities of Upper Engadine, who is president, and fourteen jurymen, called Tronador, taken equally from each district. Justice is said to be more equitably administered in this court than in any other throughout the Grifons, excepting at Coire. The vicinity of Zutz, and also of Scampf, is the finest part of the valley of Engadine; it produces some rye and barley, and the mountains are clothed with verdure to their very summits.

ZUVER-VELDT, a division of Graaf Reynet, which is an extensive plain country, stretching from the Sunday river, in Zwartkop's bay to the great Fith river, and is the same kind of good arable or pasture land as the plains of the Autiniequas division in Zwellendam; but it is now exclusively in the possession of the Kaffers, from whom it was originally taken by the Boors. The great chiefs towards the sea-coast, that are filled with thickets, abound in elephants and buffaloes; and in the great Fith river are, occasionally at least, found a few of the hippopotamus, or river-horse.

ZUWEITA, or Zureita, a town of the Arabian Irak; 35 miles S.E. of Hilleh.

ZUYDER-ZEE, or Zuider-See, a great gulf or bay of the German ocean, which extends from south to north, in the United Provinces, between Friesland, Overfissel, Guelderland, and Holland. It is so called from its situation towards the south, and is said formerly to have been a lake, and that the land is swallowed up that united North Holland with Friesland.

ZUZAN, a town of Peria, in that part of Khorassan which extends from N. lat. 52° 30' to 54° 45', and from 56° to 62° of E. long. It is the ancient "Susa," now an inconsiderable place, situated at the same distance from Puthing as the latter is from Herat.

ZUZON, a town of Spain, in Old Castile; 22 miles N.E. of Siguença.

ZUZYGIVM, in Botany. See Syzygium and Calyp-tracthies, to which latter genus belongs the original Syzygium of Brown.

ZWAMMERDAM, or Zwartenburgerdam, in Geography, a town of Holland, on the Rhine, which was pillaged and burned by the French, in the year 1762; 6 miles N. of Gouda.

ZWART-BERG, as well as Congo and Trada, are divisions of Zwellendam, which are the Karroo plains, situated between the first and second chains of mountains, but being well watered by the mountain streams contain fertile patches of ground. Their great distance, however, from the Cape, and very bad roads, prevent an extensive tillage. In these plains are numerous orchards, and herds of quachas, zebras, and hartebeests. Behind the first chain of mountains, in these divisions, are two hot springs of chalybeate water.

ZWART-BERG is also a division of Graaf Reynet, which
is a portion of the mountain of the same name, in the district of Zwelfendam, to which it ought properly to belong. Sheep and horned cattle are the chief produce of the farmers.

ZWARTENKOP'S RIVER is a fertile and extensive division of Graaf Reynet, lying to the southward of Zwart-Ruggens, and capable of producing an abundant supply of grain, convenient to be delivered at a trifling expense at the bay. About 15 miles to the westward of the bay are large forests of timber-trees, near which is an appearance of a rich mine of lead. Near the bay is also a salt lake, which yields a plentiful supply of that article. Wax from the myrica cerifera and aloes might be furniished by this division as articles of commerce.

ZWART-RUGGENS, a division of Graaf Reynet, which is a floky tract of country to the southward of Camdeboo, another division lying at the foot of the snowly mountains. It is very feantly supplied with water, and produces little except succulent plants, among which are two or three species of euphorbia. Few families are found in this division, but here and there in the neighbourhood of the Sunday river, which runs through it. The cattle and sheep are small, but generally in good condition.

ZWARTKOP'S BAY. See Algoa Bay.

ZWARTLAND, EAST, and Twenty-four Rivers, are two divisions of the district of Stellenboch and Drakenstein, consisting of widely-extended plains, stretching, in breadth, from the Berg river to the great chain of mountains, and to the Piqute Berg, in length, to the northward. These are considered as the granaries of the colony. The crops, however, in Zwartland, are as uncertain as the rains, on which their produce almost entirely depends. In the Twenty-four Rivers, the grounds may be irrigated by the innumerable streamlets that issue from the great chain of mountains, in their course to the Berg river. These form swamps, that have been producive of very fine rice. Wheat, barley, and pulfe, are the principal articles that are cultivated in these two divisions; but they have also plenty of fruit, and make a little wine for family use.

ZWELLEN Dam, a tract of country in southern Africa, which lies upon the sea-coast between Breede river on the W., and Camtoos river on the E., and extends northly to the second chain of mountains, called the Zwartberg, or Black mountains. The length is about 380 and breadth 60 miles, comprising an area of 19,200 square miles, which is occupied by 480 families, so that each family has, on an average, 40 square miles of land. The population of Zwel lendam, ascertained on oath in the year 1798, consisted of 3967 Christians, and 2666 slaves and Hottentots, making a total of 6633. The flock and produce comprehended 9049 horses, 52,376 horned cattle, 15,002,92 sheep, 220 leggers of wine made, 16,720 muids of wheat reaped in 1797, and 10,554 muids of barley and rye.

ZWELLEN DAM, DROBLY, or village of, a division of Zwel lendam, situated at the foot of the first chain of mountains that runs E. and W., or parallel to the sea-coast, and distant from Cape Town about 140 miles. It is composed of about 30 houfes, scattered irregularly over a small but fertile valley, down the middle of which runs a plentiful stream of water. At the head of the valley stands the house of the landlord, to which is annexed a large garden well stocked with a variety of fruits, and a spacious vineyard; the whole enclosed and planted with oaks and other trees. In the middle of the village a large church has been lately erected, which is the only place of worship in the whole district.

The other divisions of Zwel lendam are, the country between

the droby and Gauritz river, named according to the rivers that cross it, Cango, Zwarte-Berg, Truda, Motte bay, Autunieus land, Pfettenberg's bay, Olfant's river, Kam nashie, Lange-Kloof, and Sittikamma. Barrow's Southern Africa, vol. ii.

ZWENCKAU, a town of Saxony, in the principality of Merleburg, on the Elfler. In the year 1429, this town was burned by the Huffites; 5 miles S. of Leipzig. N. lat. 51° 14'. E. long. 12° 18'.

ZWENTENDORFF, a town of Austria; 6 miles W. of Tulln.

ZWERCHBACHEL, a river of Wurttemberg, which runs into the Nagold, near the town of Nagold.

ZWERNITZ, a town of the principality of Cumbach; 10 miles S.W. of Cumbach.

ZWERNITLDOFF, a town of Austria; 6 miles E. of Weiken dorff.

ZWETHAN, a town of Saxony; 20 miles S.E. of Wurttemberg.

ZWETL, a town of Austria, at the conflux of the Zwetl and the Kampp; 26 miles W.N.W. of Cremis. N. lat. 48° 23'. E. long. 15° 7'.

ZWETL, a river of Austria, which rises about four miles west of Weitra, and runs into the Kampp, at Zwetl.

ZWETZEN, a town of Thuringia; 3 miles N. of Jena.

ZWETZIEY, a town of Croatia, on the river Mresnitz; 12 miles S. of Slun.

ZWIEBRUCKEN. See Deux-Ponts.

ZWIEDRITTELSTUCK, or Piece of Two-thirds, in commerce, a silver coin in Germany, worth two-thirds of a rix-dollar of account.

ZWIAHELI, in Geography, a town of Russian Poland; 90 miles E. of Luckow.

ZWICKAU, a town of Saxony, in Erzeburg, on the Mulda. It has a citadel, three churches, and a Latin school, in which is a good library; here is a manufacture of cloth, and another of cards, for the use of woollen-combers; with a considerable inland trade; 38 miles S.S.E. of Leipzig. N. lat. 50° 30'. E. long. 12° 25'.—Also, a town of Bohemia, in the circle of Bolefia; 4 miles W. of Gabel.

ZWIELAUKA, a town of Moravia, in the circle of Olmutz; 26 miles W. of Olmutz.

ZWIFALTEN, a princely abbey founded in the year 1089. In 1802, it was given among the indemnities to the duke of Wurttemberg; 58 miles W. of Augsburg. N. lat. 48° 17'. E. long. 8° 30'.

ZWINGENBERG, a town of Heff Darmstadt, situated on the Bergflur. In 1693, the greater part of this town was destroyed by the French, since which it has been rebuilt in a better manner; 10 miles S. of Darmstadt.

ZWINGENDORFF, a town of Austria; 2 miles S. of Lab.

ZWINGER, in Botany, a genus taken from Aublet, dedicated under this name to the memory of several Swifs botanists of the family of Zwing, who for three generations have cultivated this science at Bafil, chiefly, indeed, with a reference to the medical qualities of plants. Theodore Zwing, professor of anatomy and botany in that university, who died in 1724, aged 67, published in 1696 a folio German Herbal, of 995 pages, with wooden cuts, borrowed from Gfesner and Camerarius, which is little known out of his own country. Some botanical discriptions also appeared under his preidency. His son Frederick gave an enlarged edition of the above Herbal in 1744; and has published in the Aeda Helvetica, v. 1. 50, a plate and description of a very remarkable fungus, apparently belonging to
Preiza, but of which we find no notice taken by Perfoom. The NOLANA of Linneæus, (see that article,) was once pub-
lished under the name of Zwingera humifusa, by John Hofer, in

A.B. Helvet. v. 5. 257. t. 1, but this plant has had many names befores—Schreb. Gen. 802. Willd.-Sp. Pl. v. 2. 569.

Gen. Ch. Cal. Perianth inferior, small, in five deep, ovate, acute segments. Cor. Petals five, oblong, obtuse, spreading. Stam. Filaments ten, capillary, dilated and hairy at the base, shorter than the corolla; anthers ovate. Pistil. Gemen superiour, seated on a glanular receptacle, roundish, with five deep furrows; style longer than the flan-

men, thread-shaped, floretied; stigma five, cimple. Peric. Capsules five, coriaceous, ovate, spreading, of one cell. Seeds solitary, ovate.

Eff. Ch. Calyx in five deep segments. Petals five. Filaments dilated and hairy at the lower part. Capsules five, 

coriaceous, seated on a fleshy receptacle. Seeds solitary.

Oft. The flowers are felt to be occasionally only four-

clefct and oblong. This genus is not much akin, as 

Willdenow thought, to Quassia, but rather to Cometis 

(fee above articles) differing from the latter in having one 

style instead of five. How far their fruits correspond, we 

know not enough of the seed-veil of Zwingera to deter-

mine.

1. Z. amara. Bitter Zwingera. Willd. n. 1. (Simaba guianensis; Aubl. Guian. 400. t. 153.)—Native of the woods of Oropu in Guiana, bearing flowers and fruit in June. A shrub, not more than seven or eight feet high, whose stem 

is three or four inches in diameter, with a white soft wood. Branches numerous, alternate. Leaves alternate, bladed, 

either ternate, or pinnate, of two or three pairs, with an odd 

one, of elliptic-lanceolate, pointed, margined, entire, smooth 

leaflets, the largest of which are three and a half inches long, 

and an inch, or more, in breadth. Flowers five or six toge-

ther, in little axillary clusters. Petals whitish, surrounding the green pistil. Fruit yellow; the inner rind green and 

bitter. Nothing is recorded concerning the qualities or uses of this shrub.

ZWIES, in Geography, a town of Bavaria, on the Re-

gen; 84 miles E. of Ratibon.

ZWITTAU, or ZWITTAU, a town of Moravia, in the 
circle of Olmuz; 30 miles N.W. of Olmutz. N. lat. 40° 45'. E. long. 16° 16'.

ZWITTAU, a river of Moravia, which rises in the south-east part of Bohemia, and joins the Swarta, near 

Zwolle, or Zwol, a town of Holland, in the department of Overiiffel, situated on the river Aa, between the IJssel and the Vecht, in the country of Zallant. It is a strong place, well fortified, and surrounded with a double ditch, filled with the waters of the Aa. Its situation is very advantageous, 
on an eminence which commands the country, and is the 

ordinary passage from Holland to the provinces of 

Friesland, Groningen, and Overiiffel. It was formerly a free 

and imperial city, and ranked among the Hanse towns. The 

magnifictry is composed of eight echevins, and eight 

common-council. The celebrated Thomas a Kempis, otherwise called Hamerken, was a regular canon in a priory 
of Augustines in this place, and died here in 1471, aged 91; 28 
miles S.W. of Covorden. N. lat. 52° 32'. E. long. 6° 1'.

ZWOLFAING, a town of Austria; 8 miles S.S.E. of 

Viena.

ZWONICGRAD, a town of Dalmatia, and capital of a 
diuiet; 60 miles S.E. of Segna.

ZWONITZ, a town of Saxony, in the circle of Erge-

berg; 4 miles N.N.W. of Grubenlagen.

ZWORNICK, a town of Bohemia; 63 miles S.W. of 

Belgrade. N. lat. 44° 37'. E. long. 18° 50'.

ZWOTA, or Tzvoda, a river of Bohemia, which runs 

into the Egra, near Falkenau.

ZYDACOW, a town of Anfrian Poland, in Galicia; 3 

miles W.N.W. of Halicz.

ZYGANIA, in Ancient Geography, an island in the 
northern part of the Arabic gulf. Ptolemy.

ZYGENA, in Theophrastus, a species of Epiphas, which fee; 
called by Willughby balance-fish. See above SHARK.

ZYGASTICUM, or Zygisia, formed of Zygia, a balance, 
among the Ancients, money paid for weighing things.

ZYGER, in Geography, a river of Hungary, which runs 

into the Kyros, 5 miles W. of Boros Jeno.

ZYGES, in Ancient Geography, a people of exterior Li-

bya, towards the coast of the Mediterranean sea, W. of the 

Marocotide Nome. Ptolemy.

ZYGI, a people of Afa, of the number of those who 
inhabited the Cimmerian Bosphorus, between the Athie 

and Heniochi. Strabo.

ZYGIA, in Botany, Zygia of Theophrastus, the second 

kind of his Zygia, or Maple, remarkable for its yellow 

and veiny wood, is spoken of as a mountain-tree, but bot-

anists have not ascertained the precise species. Pliny's 

account of this matter is extracted and abridged from the 

above Greek author, but is not made at all more clear. He 

however seems to have been acquainted with a beautiful 

wood, of the Maple kind, which he fays was compared to a 

peacock's tail, and grew chiefly in Illria and Rhetia. Can 

this have been the Acer Opalus of modern authors? (See 

Will. Sp. Pl. v. 4. 900.) Anguillara has long ago fup-

pected that tree, which Linneæus and many other botanists 

have long observed, to have been the Zygia of Theop-

hras. Its native country, and veined yellow wood, 
sometimes very beautiful, are in favour of this opinion. De 

Theis, following Bodigus a Stapel, and other commentators 

on Theophras, who are led by the obvious derivation of 

the name from Zygia, a yoke, take the tree in question for 

our Carpinus, whole hard and tough wood serves to make 

yokes for oxen. He ingeniously supports this opinion by 

the Celtic origin of Carpinus, from car, wood, and pin, 

head; and further by its English synonym, Hornbeam, oxen 

being yoked by their horns. The wood of the Carpinus, 

however, is neither yellow nor beautifully veined, and it 

is most probable Zygia had some other origin, or allusion. 

Robert Coulangine, cited by Bodigus a Stapel, seems to 

confound the Acer Opalus with Viburnum Opalus, which he 

terms the Opalus of Columella, a French shrub, used for 

bovers." This last has nothing in common with the history of 

the Zygia.

Whatever may have been the ancient Zygia, Dr. Patrick 

Browne, finding this name unoccupied, has applied it to 

a Jamaica shrub, which appears to belong to Mimosa; see 

Browne Jam. 279. t. 22. f. 3. Nor is this application so 

suitable as it may seem at first sight; for the author had 

evidently in his mind the yoked leaflets, to which he alludes in 

his specific definition. We do not find that Linneæus, except 
in manuscript, or any other author, has adopted this as a 

Mimosa. Jussieu, in his Gen. Pl. 366, ranges Browne's 

Zygia, with a few other genera, at the end of his Legumi-

næs, adding a reference to Mimosa Bourgoni, Aubl. Guian. 

t. 358, as a similar plant or genus. We do not see why it
was not placed near Mimosa, in the first section of that natural order. Swartz, Ind. Occ. 1800, speaks of Browne's figure of the flower of Zygia, as exactly like his own Mimosa comosa, Prod. 85; but he adds that the plants are different, without any further elucidation of the former. There is no specimen of Zygia, amongst the plants in the Linnean herbarium, collected by Browne, and sent by Solander to Linnaeus. In a manuscript catalogue of Jamaica plants, in Dr. Browne's own hand, given to the writer of this article by A. B. Lambert, eqq., Mimosa Zygia stands between fagi-folia and Unguis Catii, with this remark, which is not in the author's History of Jamaica, "folia bijugata, fovefutentaculis bipartitis, finguis diphyllis." This plant is there called Yoke-wood. In the printed work it is denominated Horsemood, or Hoop-wood, the wood being "pretty tough, and sometimes cut for hoops. The shrub is very common in St. Mary's, growing chiefly in low moist lands; but is sometimes found in the mountains, where it commonly rises to the height of ten or twelve feet, or better." These are all the particulars we can gather relative to Browne's Zygia.

Zygia, in the Instrumental Music of the Ancients, a flute peculiar to weddings, according to Apuleius. (Metam. lib. iv.) The word zygia is a Greek adjective, which implies nuptial. The zygia was probably a double flute; for Julius Pollux (Onomast. lib. iv. c. 10.) says, "there was also a flute for the wedding; executed on two flutes, one longer than the other,"

Zygia, in Entomology, a genus of insects belonging to the order of coleoptera, the characters of which are, that the antenae are moniliform, the palpi unequal and filiform, the lip elongated and membranaceous, and the jaw undentated. There is one species, _v._

Oblonga. Found in the East, oblong, red, with head and wing-flakes cyaneous.

Zygiana, in Ancient Geography, a country of Asia Minor, in Bithynia. Ptolemy.

Zygis, in Botany, the specific name of a species of Thymus, (see that article, n. 9,) supposed to be the Гуи, of Dioscorides. De Theis, who writes this word Гуи without any authority that we can find, derives it from Гуи, the bum of bee, which is confirmed, apparently without his knowledge, by the modern Greek name of the same plant, _guia_, the delight of bees. Such an appellation is peculiarly suitable to a plant well known to be highly grateful to those insects, and which is supposed to give its aromatic flavour to the famous honey of Mount Hymettus, a spot where this Thymus abounds. Undoubtedly there are other species of the same genus, as well as of Thymbra, Satureia, &c., found in the same neighbourhood, which contribute to produce this flavour, in as powerful a degree perhaps as the above.

Zygite, in the Roman Galley, a term used to express those rowers in the triremes, or three-rudded galleys, who sat on the second row, that is, above the thalamites, and below the thranites.

Zygoma, Гуи, in Anatomy, a bone of the head, otherwise called os jugale; or, it is the bony arch under which the temporal muscles pass.

The word is formed from Гуи, I join; so that zygomas, properly speaking, is the juncture of two bones. See Cranium.

Zygomatic Process of the temporal bone and _os mele_: the parts contributing to form the zygoma.

Zygomaticum, Os, the cheek-bone, so called because it contributes largely to the formation of the zygoma. See Cranium.

Zygomaticus, Major and Minor, muscles of the face, connected to the corner of the mouth. See Declination.

Zygomaticus is also an epithet given to the future that binds the two processes of the zygoma together.

Zygophyllum, in Botany, so named by Linnaeus, from _zygos_, yoke, and _phyll_, a leaf, each leaf, of most of the species, being composed of a pair of leaflets, yoked, as it was, together, and somewhat resembling the foliage of the garden bean, _Vicia Faba_; whence this genus was obtained, from Dodonaeus and Tournefort, the name of Fabago. Hence also arose its English appellation of Bean-Caper, given by Gerard. Fabago was properly deemed inedible, being compounded of another name, though one no longer in use as generic. We may observe moreover, that it conveys an erroneous idea; for the plant in question does not "bear beans," but leaves, resembling bean leaves.—Linn. Gen. 212. Schren. 288. Willd. Sp. Pl. 2. 560. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 50. Sm. Prodr. Fl. Gr. Sib. v. i. 273. Juss. 296. Lamarric Dict. v. 2. 441. Illust. t. 545. Gaertn. t. 112. (Fabago; Tourn. t. 135).—Clasa and order, D__candria Monogynia. Nat. Ord. Granales, Linn. Rutacea, Jull.

Gen. Ch. Cal. Perianth inferior, of five ovate, obtuse, concave, erect leaves. Cor. Petals five, dilated upwards, obtuse, margariate, rather longer than the calyx. Nectary of ten converging, pointed leaves, or scales, sometimes divided, embracing the germen, each of them attached to one of the filaments near its base. Stam. Filaments ten, awl-shaped, attached to the outside of the nectary, shorter than the corolla; anthers oblong, incumbent. Petil. Germen superior, oblong, tapering at the base; style awl-shaped, the length of the stamens; stigma simple. Peric. Capsule oblong, or roundish, with five angles and five intermediate furrows, five cells and five valves, the partitions linear, from the middle of each valve. Seed several, roundish kidney-shaped, infected alternately, in two rows, into the middle of the valves.

Obs. Linnaeus remarks, that the seed-vesel differs in shape in the different species, and that in some the flowers are four-cleft and cændrous. Schreber records an observation of Reichard, merely taken from the Monista of Linnaeus, that Z. album has five stigmas; but we do not find this to be correct. Our fifteenth species is said to have five distinct styles.

Eff. Ch. Calyx of five leaves. Petals five. Nectary of ten scales, embracing the germen, and bearing the stamens. Capsule of five cells, superior.

The plants of this genus are, for the most part, shrubby, with simple or twin leaves, (rarely ternate or pinnate,) which are opposite, mostly stalked, entire, often fiddled, of a thick or succulent texture, accommodated to the dry and funny situations where the greater part of the species grow. A very few are found in South America, or Guiana; the rest are natives of Syria, Arabia, Siberia, and especially of southern Africa, about the Cape of Good Hope. The flowers are solitary, axillary, yellow, white, or reddish, often brilliant and rather handsome. The seed-vesel, though answering in general to the above description, which is made from Z. Fabago, is variously shaped in the different species, and in some appears to be lined with a sort of hairy elastic coat, analogous to the tunics of the seeds, so remarkable in the genuine Rutacea. Such is the case in Z. microphyllum, the
...the edges of whose inflamed valves seem to constitute the partitions; yet the cells do burst at the outer margin, as well as in the inner. Willdenow defines fourteen species, which we shall find a necessity of extending to sixteen.

1. Z. simplex. Cylindrical-leaved Bean-Caper. Linn. Mant. 68. Wildd. n. 1. (Z. portulacoides; Forlk. Ægypt.-Arab. 88. 1c. t. 12. f. B.) — Leaves simple, fleshy, cylindrical. — The most common of all plants in the desert parts of Arabia, where it is known by the name of Garmad, and esteemed by the Arabs very good for removing specks in the eyes, for which purpose the bruised leaves are applied, mixed with water. For this we have the authority of Forlkal, who sent seeds to Linnaeus. These vegetated at Upfal, but the plants did not live to produce flowers. The root is simple, tapering, apparently annual. Stem prostrate, repeatedly forked, round, smooth. Leaves fleshy at each joint, spreading, an inch long, obtuse, somewhat dotted. Flowers yellow, quarter of an inch in diameter, almost fleshy. Petals round, with long claws.

2. Z. cordifolium. Heart-leaved Bean-Caper. Linn. Suppl. 232. Wildd. n. 2. Thum. Prodr. 86. Ait. n. 1. — Leaves simple, fleshy, opposite, roundish, somewhat heart-shaped. — Gathered by Thunberg, at the Cape of Good Hope, from whence it was sent by Mr. Maffon to Kew garden, in 1774. This is a green-house shrub, flowering in October. We have seen no specimen.

3. Z. Fabago. Common Bean-Caper. Linn. Sp. Pl. 551. Wildd. n. 3. Ait. n. 2. (Cappariss Fabago; Dod. Pempt. 747; Ger. Em. 897; Bell. Epit. aftiv. ord. 10. t. 1. f. i. C. leguminosa; Lob. 1c. v. 2. 38. Fabago Belgarum; Dalch. Hist. 456. Telephium Dicrociris; Column. Ecphr. 132. t. 131. Morganti; Rauw. It. t. 113.) — Leaves conjugate, stalked; leaflets ovate. Calyx smooth. Petals entire. Capsule oblong. Stem herbaceous. — Native of Syria, Persia, Barbary, &c. A hardy, but not common, herbaceous perennial in our gardens, flowering in autumn, cultivated by Gérard, in 1766, and a few years afterwards, in the garden of cardinal Aldobrandini, at Rome, by Fabius Columba, who took this plant for the Telephium of Dioscorides, and has left us a most faithful representation of it, too much neglected by Linnaeus and recent authors, who only refer to Diodonius. Whether Columba erred or not with respect to the name, the reader will judge by consulting the article Telephium. The root is tapering, fleshy, producing from its crown several spreading, alternately branched, leafy, round, herbaceous, smooth fleshy, one and a half or two feet high. Leaflets an inch long, entire, smooth, green, unequal at the base, furnished with a principal rib, and one or two smaller ones. Footstalks rather shorter than the leaflets, swelling upwards, smooth, channelled, crowned with a small, intermediate, awl-shaped point, like an abortive leaflet. Stipules between the footstalks, in pairs, membranous, ovate, pointed, oblithe. Flowers yellow, on simple, axillary, opposite, nearly upright stalks, hardly so long as the footstalks. Calyx-leafs con- cave, quarter of an inch long, green, even, with a membranous edge. Petals rather longer, obtuse. Nectaris jagged, almost pectinate. Five of the flamens deflexed, five ascending. Capsule above an inch in length. Seeds numerous.

4. Z. fadidum. Fetid Bean-Caper. Schrad. Sert. Hort. Han- nov. 17. t. 9. Wildd. n. 4. Ait. n. 3. (Z. infaque; Curt. Mag. 1774.) Leaves conjugate, stalked; leaflets obovate. Calyx downy. Petals jagged. Capsule roundish. Stem shrubby. — Native of the Cape of Good Hope, from whence it was introduced in 1790, by Mr. Maffon. This is a hardy green-house shrub, flowering all summer long, but rendered indefinable by the strong fox-like scent of its leaves, resembling that of the Crown Imperial, and peculiarly offensive when the hone is either shut up, or warmed by the sun. The shrubby stem distinguishes this species from the last; but the short, roundish, or obovate, fruit, and jagged petals, which are five times the length of the calyx, and marked with a red spot at the base of their limb, afford essential marks of difference. Z. retrofractum of Thunberg, cited with a mark of doubt by Willdenow, has no resemblance to either.

5. Z. maculatum. Spotted-flowered Bean-Caper. Ait. ed. 1. v. 2. 60. ed. 2. n. 4. Wildd. n. 5. — "Leaves conjugate, stalked; leaflets linear-lanceolate." — Native of the Cape of Good Hope, from whence it was introduced, in 1782, by George Wynch, eqq. A green-house shrub, flowering in October and November. The petals are yellow, with a red heart-shaped spot, at the base of each, above which, in the three upper ones only, is a transverse red line. Aiton.

6. Z. cocccinum. Scarlet-flowered Bean-Caper. Linn. Sp. Pl. 551. Wildd. n. 6. (Z. defortorum; Forlk. Ægypt.-Arab. 87. 1c. t. 11. Fabago arabica teretifolia, flore coccino; Shaw Afric. n. 231. f. 231.) — Leaves conjugate, on a fleshy stalk; leaflets cylindrical, smooth. Capsule oblong. — Plentiful in the arid valleys of the desert, between Cairo and Suez. The Arabs call this plant Retract. All kinds of cattle, even the camel, refuse to eat it. Forskall. The stem is shrubby, ascending, much branched, often a foot and a half high. Leaflets half or three-quarters of an inch long, oblong, thick and succulent, quite smooth, supported in pairs on a club-shaped footstalk, somewhat more in length. Petals red, pointed. Capsule near an inch long. The shape of the capsule and leaflets, not to mention the colour of the flowers, distinguishes this species from the following.

7. Z. album. White Bean-Caper. Linn. Sp. Pl. 551. Mant. 379. Wildd. n. 7. Ait. n. 5. Linn. fil. Dec. t. 11. f. 6. Sm. Fl. Græc. Sibth. t. 371, unpublished. (Z. proliferum; Forlk. Ægypt.-Arab. 87. 1c. t. 12. f. A.) — Leaves conjugate, on a fleshy stalk; leaflets obovate, downy and hoary. Capsule roundish, five-lobed. — Native of Egypt, Cyprus, Barbary, &c. Forskall found it very abundantly about Alexandria; and Desfontaines near Tripoli, as mentioned by Shaw. Mr. Maffon met with it in the Canary islands, and sent plants or seeds to Kew, in 1779, where this species is said to be kept in the dry store, but not yet to have flowered. The stem is woody, diffuse, much branched, and very leafy. Leaves opposite, or aggregate, being accompanied by axillary tufts of smaller ones. The leaflets, as well as their footstalks, are thick, round, and juicy, both hoary, like the young branches, with fine, short, dente pubescence; the former are obovate, or almost globular, falcate, quarter of an inch long; the footstalks are roundish, and club-shaped. Flowers a third of an inch broad. Calyx reddish. Petals white, obtuse, caducu. Germen roundish, depressed, downy, with five rounded lobes. Capsule of the same shape; its coat, according to Forskall, pulpy, and there are only two seeds in each cell. The stigma is represented, in Mr. Ferdinand Bauer's drawing, rather slightly notched, but simple, as described by the younger Linnaeus; but still lefts can we discern the five acute stigmas, mentioned in the Mantissa.

The branches are somewhat quadrangular, very smooth. *Leaflets* an inch long, succulent, but not tumid; their common *footstalk* very short, or altogether wanting. *Stipulas in pairs, lanceolate, pointed, reflexed. Flower-flats* the length of the leaves, unilateral, in pairs, declining. *Flowers* large, yellow, turning white in decay; their *petals* obvate, entire, streaked with purple at the base. *Nectaries* jagged or fringed, as in n. 3, 4, and perhaps some other species. *Capule*, as referred by Burmann, an inch in diameter, globose, with five large, round, prominent lobes. We find the petals uniformly five, and entire; Linnæus says four, rarely five, and somewhat emarginate. There is reason to believe he confounded more than one species under the present. He has applied a specific name, which properly belongs to *Z. Fabago*.

9. *Z. felifillifolium*. Seashell-leaved Bean-Caper. Linn. Sp. Pl. 552. Willd. n. 10. Ait. n. 7. (Fabago capenis frutecens minor; Dill. Elth. *t. 116*. f. 142. F. humilis quadrifolia glabra, flore albido fructu rotundo; *Burm.* Afric. 4. t. 2. f. 1. *F. africana arborefecens, flore sulphureo, fructu rotundo; Comml. *t. 10*. f. 80.)—Leaves conjugate, sessile; leaflets obvate, flat, smooth. Stem hairy. *Capule* globose, undivided.—Native of the Cape of Good Hope. A green-house shrub, flowering in July and August, which appears to have been known in our gardens for above a century. Its size is inferior to the last, from which, according to Dillenius and Burmann, this species is essentially distinguished by the fruit. The *capule* is either exactly globular, or, as Dillenius says, depressed like a Dutch cheese, its diameter not half an inch, nor is it furrowed, nor parted into large tumid lobes, like Z. *Morgana*. The leaves too are smaller, and more perfectly sessile. Linnæus defines them “rough-edged,” which we can find nothing to countenance, even in his own specimen. The flowers are drooping, orange-coloured, turning white as they fade; the petals crenate at the end, not much spreading; the nectaries are smaller, and much less conspicuously jagged than in the preceding.

10. *Z. fulvum*. Tawny Bean-Caper. Linn. Sp. Pl. ed. 1. t. 386. (Z. felifillifolium 8; Linn. Sp. Pl. ed. 2. 552. Willd. n. 10, z. Fabago flore intus, petalorum unguibus rubris, fructu fulcato oblongo acuto; *Burm.* Afric. 6. t. 3. f. 1.)—Leaves conjugate, sessile; leaflets obvate, flat, smooth. Stem hairy. *Capule* ovate, five-angled, acute.—Native of the Cape of Good Hope. Linnæus latterly considered this as a variety of the last, but we cannot discover on what his opinion was founded, there being nothing in his herbarium to represent *Z. fulvum*. There is indeed a specimen, referred by him at one time to *Z. Morgana*, and at another to *cocinum*, on which, having no affinity to the latter, we are led to suspect he wrote *cocinum* by accident for *fulvum*. In this the leaves have something of a common *footstalk*, though very short. The nectaries are small and jagged, as in *Morgana*. There is unfortunately no fruit. Burmann's figure of the *capule* is too precise, that, considering the analogy of other species, to well distinguished by this part, we can have no hesitation in re-establishing *Z. fulvum*, as essentially differing from *felifillifolium*, whether our specimen be what Linnæus intended or not. The *capule* of the real plant is above an inch long, with five acute angles, and as many deep intermediate channels, and terminates in a point, being equally unlike *fejfilifolium* on one hand, and *Morgana* on the other.

11. *Z. spinosum*. Spinous Bean-Caper. Linn. Sp. Pl. 552. Mant. 380. Willd. n. 11. (Fabago tenuifolia spinosa, fructu rotundo; *Burm.* Afric. 5. t. 2. f. 2.)—Leaves conjugate, sessile; leaflets linear, fleshy, smooth; flat above. Stem hairy. Permanent *stipulas* hooked, spinous.—Native of the Cape of Good Hope. The *stem* is bushy, shrubby, branching from top to bottom; the branches acutely quadrangular. *Leaves* numerous, fleshy like those of a *Sedum*; the leaflets acute, scarcely an inch long, blunt, with a small point; their under side convex, or hemispherical. *Stipulas* in pairs, small, lanceolate, spreading, at length becoming hardened, hooked, and pungent, so as to form two, three, or four prickles at every joint. *Flowers* drooping, large and handsome, on longish, foliate, lateral *flalks*. *Calyx* reddish. *Petals* yellow, fading to white, nearly or quite etiute. *Nectaries* entire, not fringed. *Capule*, according to Burmann, “round, smooth, compressed, terminating in the very acute *style*.”

12. *Z. microphyllum*. Small-leaved Bean-Caper. Linn. Suppl. 232. Willd. n. 9. Thunb. Prodr. 8c.—Leaves conjugate, somewhat flaked; leaflets involucrally heart-shaped, smooth. Stem hairy, with ascending branches. *Capule* roundish, abrupt, of five compressed lobes. *Style* permanent.—Gathered by Thunberg, at the Cape of Good Hope. It is a species of hardy, rigid, small-leaved, much branched *frutus*, so characteristic of the botany of its native country. The branches are round, knotty, spreading, slightly hoary, or glaucous. *Leaflets* from one to three lines long, thick, oblique, sometimes obvate, but more frequently coven, so as to become involucrally heart-shaped; they are supported on a manifest, though short, thick *footstalk*. *Stipulas* minute. *Flower-flats* thread-shaped, foliary, longer than the leaves, from the same buds. *Flowers* drooping, rather small, yellow. *Calyx* reflexed. *Capule* the diameter of a pea, constricting of five rounded, vertical, compressed lobes, crowned with the spiny *style*, their surface rather reticulated: each of them bursts at the inner, as well as outer, edge into two chafic, or cartilaginous, valves, coated with a thin skin.

13. *Z. retrofractum*. Recurved Bean-Caper. Thunb. Prodr. 8c.—Leaves conjugate, flaked; leaflets obvate, smooth. Stem hairy, with spreading recurved branches. *Flower-flats* shorter than the leaves.—Gathered at the Cape of Good Hope, by professor Thunberg, from whom we have a specimen. His short specific character was Willdenow's only guide, when the latter reduced this plant to *Z. felifillum*, to which it has no affinity, and very little resemblance. The present, though a very distinct species, is most allied to *Z. microphyllum*, but the long, spreading, deflexed *branches* afford a characteristic difference of habit. The *leaflets* too are smaller, and seem to be always ovate, not obcordate. *Flowers* very small, their little thick *flalks* hardly so long as the *calyx*. *Nectaries* lanceolate, entire. *Gormen*, after the other parts of the flower are fallen, elliptic-oblong, deeply five-lobed, acute, crowned with the *style*; but we have none in an advanced state, to enable us to judge whether the lobes ever extend into a rounded semi-obtuse shape, like the last, as may very probably be the case.

The first has a deep flesh root, and soft herbaceous stalks, which decay in the winter.

The second is of a thrubby growth, and there are varieties, with yellow flowers, with sulphur-coloured flowers, with white flowers, with copper-coloured flowers, having mostly a reddish or brown spot near the base of each petal.

The third has also a thrubby stem, and there is a variety with flame-yellow-coloured flowers.

And the fourth has an under thrubby growth.

Method of Culture.—The first fort is raised from seeds, which should be sown in the spring in pots filled with light sandy mould, or on a hot-bed. When the plants have a few inches growth, they should be removed into separate pots, plunging them into a hot-bed, admitting air so as gradually to harden them to the open ground. They should be protected for a winter or two, and then be turned out into borders, or other parts, where the situation is warm, and the soil dry and rubbishy, as they are of a succulent nature.

The other sorts are capable of being increased by cuttings and seeds; the cuttings should be planted out in the spring or summer in pots filled with light sandy mould, and plunged in a hot-bed, being occasionally watered, when they quickly emit roots, and shoot at top; and when sown in the summer months, they may be planted in a shady place, or in pots placed in the shade, giving frequent waterings, when they will also take good root. In either method, they should be potted off separately towards autumn, in order to be moved into the green-house or glass-house in the beginning of autumn.

The feed should be sown in the spring in pots of light earth, and be plunged in a hot-bed, where they soon come up: when a little advanced in growth, they should be potted out in separate small pots, being watered and plunged into the hot-bed till well-rooted, when they should be gradually hardened to the full air, and in June set out to remain till the autumn, when they should be placed in the green-house, or some other place, where they may have protection for the winter.

The first fort affords variety in the borders, as well as among other potted plants; and the others in collections of the green-bonic kind.

ZYGOPOlis, in Ancient Geography, a town of Asia, in the Colchide, near the town of Trapezunte.

ZYGOSTATES, among the Ancients, an officer who was the overseer of weights, and was to take care that the tradesmen used none but what were just.

ZYGRIS, in Ancient Geography, a town on the coast of the name of Libya; and Zygrite are the people who inhabit this name.

ZYMAR, a name given by some of the chemical writers to verdigrise.

ZYME, a word used by many authors to express fermentation or leaven.

ZYMOLogy, in Chemistry, a term used by some writers to express a treatise on fermentation, or the doctrine of fermentation in general.

Mr. Symons has written a treatise on this subject, in which he refers the whole to the internal conflicts of acid and sulphur in bodies, and seems to think that the phenomena of hot-baths, the generation of minerals, and the production of mineral waters, the grand appearances of light, heat, and fire, and the generality of the subterranean phenomena of damps, earthquakes, and fiery eruptions, and the appearance of meteors, may be all explained by the doctrine
trine of fermentation, established on this basis. Symphon's Zymol. Chym.

ZYMOΣΙΜΕΤΕΡ, formed from ζυμός, fermentation, and μέτρον, measure, an instrument proposed by Swammerdam, in his book "De Respiratione," wherewith to measure the degree of fermentation occasioned by the mixture of different matters; and the degree of heat which those matters acquire in fermenting; as also the heat, or temperature, of the blood of animals.

ZYMOSIS, a word used by some to express fermentation, and by others for a flatulent tumour of the liver, or other of the viscera.

ZYMUM, in Botany, apparently from τομή, a ferment, a name which, De Theis says, is given to a plant of the Mauritius, by Norona, a Spanish botanist, but without any explanation of its meaning, or application. This name is, nevertheless, retained by Aubert du Petit-Thouars, in his Plantes des Îles d'Afrique, falc. 4.

ZYORY, in Geography. See Sohrau.

ZYPE, a kind of island of North Holland, formed by canals cut from the Zuyder Zee to the German ocean. It was formerly a morałe, but is now converted into rich meadow land. On this spot the duke of York was posted, when he made terms with the French general Brune to evacuate Holland; having it in his power, by taking up the sluices, to inundate the country.

ZYRAS, in Ancient Geography, a river of Thrace, which watered the town of Dionysiopolis. Pliny.

ZYRMA, a town of Thrace, near which ran the river Hebrus. Ptolemy.

ZYTOMIERS, in Geography, a town and fortress of Russian Poland; 65 miles W. of Kiev. N. lat. 50° 16'. E. long. 28° 54'.

ZYTHOGALA, formed of φιλις, cerevisia, and γάλα, lac, beer posset, a drink recommended by Sydenham, as good to be taken after a vomit, for allaying the acrimonious and disagreeable taste it has occasioned, as well as to prevent gripes. Syden. Observ. de Morb. acut. p. 39.

ZYTUM, or Zythos, a sort of malt liquor, in use among the ancient Germans.

Matthiolius represents the ancient zythum, and curmi, as the same with our beer and ale.

A, B, C, DARIA, in Botany, a name given by Rumphius, Herb. Amboin. v. 6. 145, t. 65. to the Vehbifina Acemilla of Linnaeus, see Spilanthus, n. 3. The above appellation is designed to express the use made of this plant by the black school-masters at Amboyna, who cause their young pupils to chew the flowers or the root, either alone or with Betelnut, in order that they may more easily pronounce some of the difficult Arabic letters, such as 'Ibha and Ze, both which they commonly confound with S. The Malay name, Dann murit, School-boy's herb, given to this Spilanthus, as well as to Bidens pilosa of Linnaeus, has the same allusion. Such plants agree with Pellitory of Spain, Anthemis Pyrethrum, in a peculiar property of stimulating the mouth, accompanied by a sense of coolness, and a slight salivary, all which together cause a great flow of saliva. Hence they are beneficial in tooth-ache arising from cold rheum, but the flight numbs and tingling of the nerves, which attend their use, should seem rather unfavourable to precise enunciation. The recent flowers of Spilanthus oleracea, slightly rubbed upon the gums, are perhaps the best of the whole tribe for producing the above effects.

ABDALLAH, Ebn-Zobeir, l. 4, Heg. 63.

ABDAS, in Biography, a Persian bishop of the fifth century, who deferves to be exhibited in the page of history as a cautionary example of the folly of supporting any cause by persecution. Having destroyed a pagan temple belonging to the worshippers of fire, the king of Peria, instigated by the Magi, ordered him to rebuild it at his own charge; but as he refused to comply with this order, a dreadful persecution was commenced against the Christians, which lasted 30 years; and in this persecution Abdas lost his life. Bayle.

ABELICEA, in Botany, 'Abelnesia in modern Greek, see our ninth species of Ulmus.

ABAERAEMON, in Geography, a small town and port of Cardiganshire, much frequented by small coasting-vessels, which convey the corn and other produce of the district to the
the English markets. The harbour has been lately much improved by the construction of a pier. A market has been lately established here.

ABEREMOA, in Botany, altered by Anquetil from the Caribbean appellation of the same plant, Aubl. Guian. 610. t. 245; see Guatteria hereafter.

ABERPORTH, in Geography, a little fishing-town of Cardiganshire, pleasantly situated at the entrance of the river which flows by Blaenporth. The craft belonging to this port are chiefly employed in bringing lime-stone from Pembrokeshire and other parts, which are burnt here, to supply the neighbourhood with manure, and for other purposes.

ABILDGARDIA, in Botany, a genus of Professor Vahl's, dedicated by him to the memory of the late Peter Christopher Abildgaard, a native of Denmark, formerly professor of the veterinary art, who contributed much information to Professor Rotblöb on the subject of Graffies. Mr. Brown retains this genus, not without a hint of its too near affinity to Fimbristylis; see that article. We trust the barabdin of the double a may be dispelled with, and we have ventured to make that alteration.—Vahl Enum. v. 2. 296. Brown Prodr. Nov. Holl. v. 1. 229.—Clas and order, Triandra Monogynia. Nat. Ord. Calamariae, Linn. Cyperoides, Juss. Cyperaceae. Brown.

Gen. Ch. Cal. a single scale to each flower, ovate, pointed, concave, compressed, forming a spike, imperfectly two-ranked. Cor. none. Stam. Filaments three, rarely but one, inferted beneath the germin, gradually elongated by age, anthers linear, longer than the filaments. Pist. Germin superior, acutely triangular, rather contracted at the summit; stylle bulbous and pyramidal at the base, the bulb triangular, broader than the germin, permanent, the upper part bristle-shaped, deciduous; stigmas three, shorter than the stylle. Peric. none. Seed one, brown-white, nearly pear-shaped, with three angles, contracted at the base, crowned at the summit with the pointed base of the style, convex at the fides, and rough with minute dots, without any surrounding bristles. Pericarp pericarpial, permanent.

The scales of this genus are angular, slender, without joints; leafy at the bottom. Leaves narrow, channelled, sheathing. Spikes ovate-oblong, acute, compressed, often twifled; their scales closely imbricated, keeled, very smooth and polished, white, dotted with purple, the green keel of each elongated into a little point; the two lowermost narrower than the rest. Vahl. Brown.

Mr. Brown remarks, that the style is certainly deciduous, and the spike, when in seed, by no means perfectly two-ranked; circumstances which bring the present genus very near to Fimbristylis. The following are the only described species.

of Jamaica and Hispaniola, by Sloane and Swartz; and in the tropical part of New Holland, as well as at Port Jackson, by Mr. R. Brown. The root appears to be perennial, with many long simple fibres. Herb slender, smooth and glaucous, forming tufts, about a foot high, with linear, very narrow, leaves, which sometimes break off, as Vahl remarks, at a fort of joint, below the middle of each. Stem simple, slender, angular, and frayed, taller than the leaves. Spike half an inch long, two-ranked, subtended by a linear rough-edged leaf, sometimes, in the Linnaean specimens, exceeding its own length. The glumes, or scales, have a green keel, accompanied by two white ribs, next to which is an affemblage of purple dots, the leaf being cream-coloured. Two or three of the lower glumes are small, and apparently barren. There is said to be but one flamen to each flower. Sloane's synonym seems to us, doubtful.

2. A. fimbroides. Redly Abildgardia. Br. n. 2. —"Spike solitary, naked. Outer scales shorter and barre. terminal ones narrower, with spreading points."—Gathered by Mr. Brown, in the tropical part of New Holland. We have seen no specimens of this or the next.

3. A. vaginata. Sheathing Abildgardia. Br. n. 3. —"Scaes about three together; the middle one fifie. Scales pointed. Stem bristle-shaped, angular, leafless; sheathed at the base."—Found by Mr. Brown, in the tropical part of New Holland.

4. A. triflachyza. Three-spikef leafy Abildgardia. Vahl n. 2. (Cyperus triflachyza; Linn. Mart. 180. Willd. Sp. Pl. v. 1. 272. Schoenuss cyperoides; Retz. Obs. f. a. 4. 8.) —Spikes about three together; the middle one fifie. Stem feme-cylindrical, round, bulbous, and leafy, at the base. Native of the East Indies, in hard dry ground. Kenig. The flemes are from one to two feet high, fuffy and rigid, erect; according to Vahl, bulbous at the bottom, and wrapped with dry brown fheaths among the foliage. The leaves are smooth, channelled, not to tall as the stem. Spikes two, three, or four, twice the size of the flifer species, tumid, ovate, acute, twifled, of a dirty but polished white; three of them generally fpringing from one short leafy sheath, the two lateral ones elevated on long, flattened, frialate, smooth flarks. Stamens three; Vahl. Stigmas long and downy.

ABINGTON, in Geography, a town of Maffachufetts, in Plymouth county, containing 1704 inhabitants.—Alfo, a township of Pennsylvania, in Montgomery county, having 1236 inhabitants.—Alfo, a township of Pennsylvania, in Luzerne county, having 511 inhabitants.

A BOUTA, in Botany, a Brazilian name, first published by Barrere, adopted by Aublet, and recently by De Candolle, as well as Jullieu. It may remain for the present, till the characters of the genus are known. These are hitherto involved in great uncertainty, the flowers not having been observed by any botanist.—Barr. Hift. Nat. de la France Equinoxiale, t. Aubl. Guian. 618. Jull. 286. De Cand. Syll. v. 1. 542. —Clafs and order, Diccia Dodecanedria? (Polyandria Polygnia, Aubl.) Nat. Ord. Menisperma, Jull.

Eff. Ch. Male, unknown.

Female, Fl. unknown. Berries two or three, ovate, somewhat compressed, dry, dingle-fed.

Lamarrack and Wildenow have considered this genus as not distinct from Menispernum, see that article; but Professor De Candolle reckons the large, dry, ovate, not kidney-shaped, berries, to termed, we presume, because of the bristled covering of their seed, as affording a sufficient, even without the flowers. He is more inclined to refer Abuta to his own genus of Cocculus, separated by him from Menispernum; but their habits are somewhat different.

Two species of Abuta are defined by this writer, but A. amorac of Aublet, Guian. 620. t. 251, is referred, on the authority of Richard, to Ariocephalz.z. These are large twining shrubs, with ovate leaves, whose pinnate ribs spring nearly from one point at the base.

1. A. rysfelim. Reddish Abuta, or Falce Pareira-brava. Aubl. Guian. 618. t. 250. De Cand. n. 1. (A. scandens, ampliflmo folio cordifolio, fructus tomentolulo; Barr. Fr. Equin. 1. Menispernum Abuta; Lamarrack Dict. v. 4. 100. Willd. Sp. Pl. v. 4. 828.) —Leaves ovate, acute, entire; downy beneath.—Native of woods in Brazil, Cayenne, and Guiana. Abuta found it in almost every forest of the last-mentioned country, that he examined, bearing fruit in January. The Portuguese confound this plant with the true Gymnocalz Parizra, and consider its root of equal efficacy in jaundice, disorders of the kidneys and bladder, as well as internal abscesses, and menstrual suppressions. The climbing stem, and downy branches, reach to the tops of trees, and bear large, alternate, flattened, coriaceous, veiny, entire leaves, from four inches to a foot long; smooth above; covered beneath with prominent, reticulated, downy veins, springing copiously from nearly the whole of the leaf. The flowerstalks are about half the length of the leaves, round, finely and densely downy. Berries elliptical, downy, an inch long, three upon each receptacle, and forming large axillary branches. There is laid to be a variety whole Woody parts, as well as the pubescence of the foliage, is reddish. The Creoles make a decoction of the branches of the red and white varieties indifferently, to cure obstructions of the liver, to which they are very subject. Aublet.

2. A. candidans. Whitish-leaved Abuta. De Cand. n. 2. Richard MSS. — “Leaves ovate, pointed, somewhat crenate, or minutely lobed; smooth and whitish beneath.” — Gathered in Cayenne by Mr. Richard, who unluckily did not meet with the flowers. The branches are round and smooth. Footstalks four inches long, round and smooth likewise. Leaves five to seven inches long, three or four broad, nearly entire, or slightly crisped, or toothed, in the margin; even and smooth above; pale or nearly white underneath, but, as it seems, quite smooth; the ribs pinnate, the two lower lateral ones close together. The inhabitants of Cayenne call this plant Liane antepa, Bitter Vine. De Candolle.

ABYSSINIAN MUSIC. See MUSIC.

ACACIA, in Botany, an ancient Greek name, derived from αέας, to point or sharpen, in reference to its thorny habit. De Thes. deduces all words of this etymology from the Celtic, ac, a point. The oaks of Dioscorides, book i. chap. 133, was a sort of Egyptian thorn, “of a diffuse or spreading mode of growth, with a white flower, and a pod resembling lupines.” Its expressed juice, dried in the shade, was an astringent medicine much in use, and the shrub yielded also a clear white gum. This may very well have been a plant of the present genus. Wildenow, who established this genus, first separated it from the Linnian Mimosa (see that article), which has become inconsiderately numerous in species, and unquestionably is capable of division by the characters of the fruit, of which Wildenow has very well taken advantage. He leaves in Mimosa such species as have a lomentum, or legume separating into single-fed joints. Of these he defines 32, having a five-toothed corolla, and only eight filaments; and to many of them, being senece, the name Mimosa is properly appropriated. For his other genera taken from here, see Desmianthus, Isca, and Schrank. We must observe however that the Acacia of Tournfort is not analogous to what is now before us.—Wild. Sp. Pl. v. 4. 1049. Ait. Hort. Kew. v. 5. 459. Pursh 305.—Clafs and order, Polyantha Monocoty, or rather perhaps Polyandria Monogynia. Nat. Ord. Lomentace, Linn. Leguminosae, Jull.

Obf. The flowers, sometimes four-cleft, have, in some instances, a corolla which separates into four or five distinct petals. We have not had an opportunity of examining a sufficient number of species to give a full generic character. Wildenow reckons up 102, in seven sections; to which Mr. Brown has made numerous additions from New Holland, partly described in Ait. Hort. Kew. above cited. We shall give some examples of each section.

Sect. 1. Leaves simple. Sixteen species in Wildenow, to which ten are here added, nine of them from Hort. Kew.—Of this singular tribe, first discovered by our British circumnavigators, all the species, as far as hitherto known, bear, in a feeding sister, compound pinnate leaves, soon replaced by leafy or spinous simple footstalks, which latter constitute the only foliage of the adult plant. There are no thorns or prickles in the tree. Their stem is shrubby, or arborescent, as well as throughout the whole genus. We have slightly adverted to this section at the end of our article Mimosa.

A. vorticillata. Whorl-leafed Acacia. Wildl. n. i. Ait. n. 1. (Mimosa vorticillata; L’Herit. Sert. Angl. 30. Curt. Mag. t. 110. Venten. Malm. t. 63.) —Leaves whorled, linear-awl-shaped, rigid, spurious-pointed. Spikes solitary, cylindrical.—Gathered in Van Diemen’s island, by the late Mr. David Nelson, who sent seeds to Sir Joseph Banks in 1780. Hence this singular shrub became known in the English green-houses, where it flowers in the spring, and ripens feed. The first two or three leaves of feeding plants are conjugate and pinnate, with elliptical oblong entire leaves; the rest are accurately whorled, simple, pungent, flat-topped thorns rather than leaves, fix or eight in each whorl, about half an inch long, somewhat unequal, spreading horizontally. Flowers in dense, yellow, thick, obtuse spikes, which are an inch, more or less, in length, each on a simple, slender, axillary stalk, but there are sometimes two or more of these stalks together. Legume linear, compressed, corrugated, of one cell with several kidney-shaped seeds.

A. Junci,Juniper-leaved Acacia. Wildl. n. 2. Ait. n. 2. (Mimosa juniperina; Venen. Malm. t. 64. "M. ulicifolia;
ACACIA.

"M. ulicifolia; Wendl. Coll. 25. t. 6." Willd.) — Leaves imperfectly whorled, linear-awl-shaped, rigid, spinous-pointed. Spikes solitary, globose. — Found near Port Jackson, New South Wales, from whence Sir Joseph Banks is said to have received feeds about the year 1790. We have specimens from Dr. White. This differs from the foregoing in having its spinous leaves more crowded, and leaves distinctly whorled, more hairy branches, and globular heads of flowers, each flower, according to Ventenat, accompanied by a little ovate, pointed, filiform bractea.

A. acicularis. Needle-leafed Acacia. Brown in Ait. n. 3. — "Leaves scattered, roundish-awl-shaped, pointed, rigid. Stipulas deciduous. Young branches smooth. Spikes solitary, globose." — Said to have been found in New South Wales, by an officer named Paterson, from whence it was sent to Kew in 1796. It flowers at the same feast as the two preceding, and requires the same treatment. If we understand this species aright, the leaves are full an inch long, being twice the length of the two foregoing, and more slender. We received specimens answering to this description before 1796, from Dr. White.

A. falcatu. Furrowed Needle Acacia. Brown in Ait. n. 4.—"Leaves thread-shapcd, furrowed on all sides, with a harmless point. Heads of flowers usuallv in pairs. Bracteas ovate, concave, permanent, at the base of the flower-flak. Legumes zigzag." — Observed by Mr. Brown on the south-west coast of New Holland, from whence it was introduced, in 1803, by Mr. Peter Good. This is likewise a green-house shrub, flowering from May to August.

—Native of New South Wales. Cultivated, before 1790, by Mr. Thomas Hoy, in Sion gardens. A green-house shrub, flowering in the spring. The acute edges of the branches are bright red. The little leaves are conjugate, pinnate, with thick elliptical leaflets, and a lanceolate common footstalk; the leaf alternate, narrow, coriaceous, four or five inches long, rather glaucous, smooth, thick-edged. Flowers: simply racemose, yellowish-white, fragrant, their corolla deeply four-lobed. Stamens very numerous. Legume elliptical, an inch and a half or two inches long, and one inch broad, finely glaucous.

—Native of New South Wales, from whence Sir Joseph Banks is recorded to have received seeds in 1790. This requires the same treatment, and flowers at the same time, as the last, from which its capitulate five-cleft flowers, and more dilated rounded-pointed leaves, at once distinguishes it. Dr. Sims, in Curtis's Magazine, under this species, has given but too just reason for retaining the genus Mimofa entire for the present, which principally refer to our ignorance of their fruit in a number of instances. Our learned friend, however, has since conformed to the new arrangement; and we think, with Willdenow, that enough is known for us to venture on the division this author has proposed, which may generally be supported by analogy, if not by absolute demonstration.

A. melanoxylon. Black-wooded Acacia. Brown in Ait. n. 12. Curt. Mag. t. 1659. —Leaves elliptic-lanceolate, many-ribbed, slightly falcate. spikes globose, in short clusters. Flower-flaks and young branches angular, powdery. "Umbilical cord coloured, plaited, nearly surrounding the seed." —Found by Mr. Brown, in Van Diemen's Island. From him we adopt the singular character of the umbilical cord. This is a considerable tree, raised by John Walker, eq. of Arno's Grove, Southgate, who received the seeds under the name of Black-wood, about the year 1808. The young twigs are covered with soft mealy. Leaves filiform, three inches long, and one broad, slightly glaucous, usually five-rheded. Flowers pale-yellow, their globular spikes dispofed in short axillary clusters, about twice the length of each footstalk. We have no account of the legume.

A. Sophora. Sophorah-foled Acacia. Br. in Ait. n. 13. (Mimofa Sophora; Labill. Nov. Holl. v. 2. 87. t. 237.) —Leaves oblong-obovate, equilateral, many-ribbed. Spikes cylindrical, axillary, in pairs. Petals four. Legumes linear, curved, pointed. Umbilical cord plaited. —Found by Labillardiere, as well as by Mr. Brown, in Van Diemen's Island. Its seeds were brought by the latter to Kew Garden, and raised there in 1855, but the plants have not yet bloomed. The young leaves are represented by Labillardiere as pinnate and triplicate; the leaf ovate, two or three inches long. Spikes nearly fisset, hardly an inch long, and very slender. Flowers small. Legumes five to six inches in length, tumid, and twisted, a quarter of an inch broad. Each seed is subtended by a cup-like tunic, which we presume is the umbilical cord of Mr. Brown.

A. marginata. Marginate-leaved Acacia. Br. in Ait. n. 14. —"Leaves oblong-lanceolate, rather falcate, bordered, single-ribbed; their anterior edge somewhat narrowed, with a foliary gland. Heads about four-flowered, dispoed in clusters." —Observed by Mr. Brown on the south-west coast of New Holland, from whence seeds were sent in 1803, by Mr. Peter Good. A green-house shrub, flowering from April to June. Aiton.

A. myrtifolia. Myrtle-leaved Acacia. Willd. n. 14. Ait. n. 15. (Mimofa myrtifolia; Sm. Tr. of Linn. Soc. v. 1. 253. Bot. of New Holl. v. 1. 15. Curt. Mag. t. 502.) —Leaves elliptic-lanceolate, oblique, thick-edged, single-ribbed, with a foliary gland at their anterior margin. Heads of flowers clustered, aggregate. —Native of New South Wales. Raised by Mr. Thomas Hoy, before the year 1789. A green-house shrub, flowering from February to May, or late in autumn. The stem is three or four feet high, with angular branches. First leaves conjugate, pinnate; the leaf about two inches long, broadly lanceolate, pointed, very rigid, somewhat glaucous, often wavy, smooth. Flowers pale yellow, fragrant, three or four in each round head, the heads disposed variously in somewhat compound axillary clusters, nearly equal in length to the leaves. Legume linear, curved, tumid, with very thick edges.

A. hispidula. Little hair Acacia. Willd. n. 15. Ait. n. 16. (Mimofa hispidula; Sm. Bot. of New Holl. v. 1. 16.) —Leaves elliptical, acute, oblique, minutely toothed, rough on each side, and at the margin. Young branches hairy. Flowers four-cleft, in foliary axillary heads. —Native of New South Wales, from whence specimens were sent to us, with coloured drawings, in 1794, and feeds about the same time to Sir Joseph Banks. The roughness of the foliage and branches is very remarkable, caused by short, rigid, prominent hairs, or points. The leaves are fylls, an inch long, vertical, very stiff, dark-green. Heads filiform, globose, many-flowered. Legume thick-edged, elliptic-oblong, sometimes with one or two contractions. Seeds few.

A. hofulata.
ACACIA.

A. houston. Little Halberd-leaved Acacia.—Leaves deltoid, fimbrous-pointed, roughish; their upper angle glandular. Stipulas bristle-shaped, permanent. Branches rough. Flowers in solitary axillary heads.—Gathered near King George's found, on the south-west coast of New Holland, by Mr. Menzies, to whom we are obliged for a specimen. This remarkable new species is evidently allied to the two last-mentioned, though abundantly distinct from both. The shrubby form bears numerous, erect, round, rough, wand-like branches, becalmed with innumerable, spreading, vertical leaves, about a quarter of an inch long, finge-ribbed, unequally deltoid, with an elongated fimbrous point, thick-edged, rough with minute points; their lower angle either rounded or somewhat toothed; the upper more prominent, and tipped with a gland. Stipulas slender, erect, in pairs at the base of each leaf. Flowers three or four in each of the little flaked heads, which are very numerous all along the branches.

A. decipiens. Paradoxical Acacia. Br. in Ait. n. 17. Curt. Mag. t. 1745. (Mimofa decipiens; Konig in Ann. of Bot. v. 1. 366. t. 8. Adiantum trancatum; Burm. Ind. 235. t. 66. f. 4. Linn. Syst. Veg. ed. 13. 790.)—Leaves triangular-yarded, fimbrous-pointed, smooth; their upper angle glandular. Stipulas bristle-shaped, deciduous. Branches smooth. Flowers in solitary axillary heads.—Gathered by Mr. Menzies on the south-west coast of New Holland, and not on the west side of North America, as mentioned in the Annals of Botany. Seeds were sent to Kew in 1803, by Mr. Good, and the plant is marked by Mr. Aiton as a green-house shrub, flowering from March to June. Its history is certainly curious; specimens without flowers having been taken by professor Burmann, who misled Linneaus, for an Adiantum, which error was detected by the late Mr. Dryander, on seeing Mr. Menzies's specimens. Thole of Burmann were reported to have come from Java, in which there may be a further mistake. At any rate this plant is nearly related to our last-described, and grows in the same country. The leaves differ in being larger, half an inch to an inch long, erect, and differently pinnate, their inner, or upper, glandular angle being greatly extended, while the lower or rounded angle, seen in A. houston, is wanting. The flowers are more numerous, from seven to ten, in each round head.

A. biflora. Two-flowered Acacia. Br. in Ait. n. 18.—Leaves triangular; the outer angle fimbrous; inner glandular. Stipulas bristle-shaped and fimbrous, permanent. Young branches downy. Heads two-flowered.—Oberved by Mr. Brown, on the south-west coast of New Holland, the bottom of which the plant was sent to Kew by Mr. Good, in 1803. A green-house shrub, flowering from March to June. We have seen no specimens.

A. alata. Wing-flaked Acacia. Br. in Ait. n. 20.—Stem winged on two sides. Leaves decurrent, finge-ribbed, tipped with a small spine; their inner margin with one glandular tooth. Stipulas fimbrous. Heads flaked, mostly solitary.—Gathered by Mr. Brown, on the south-west coast of New Holland, from whence seeds were sent to Kew, by Mr. Good, in 1803. This is likewise a shrubby green-house plant, flowering from April to July.

Sect. 2. Leaves conjugate, pinnate. Seven species in Willdenow, to which one of Mr. Brown's is to be added from Hort. Kew. The Prodrumus of this able author, when completed, will probably furnish more New Holland species to this section.

A. xylocarpa. Wooden-fruited Acacia. Willd. n. 17. (Mimofa xylocarpa; Roxb. Corom. v. 1. 68. t. 100.)—Leaves conjugate, pinnate; leaflets four pair, ovate-oblong, acute. Heads globose, many-flowered, lateral, flaked, in pairs.—Native of the mountainous parts of the Circars of Hindoostan, casting its leaves during the cold season, and flowering when the hot weather begins. This is one of the largest trees of this genus or any of its allies; the timber very hard, of a chocolate colour towards the centre, and much esteemed for purposes where hardiness, toughness, and durability, are requisite, as in ploughs, the natives seldom using iron in that implement. The leaves are large, smooth, paler beneath, confining of two divisions, or wings, and those of four pair of leaflets each, except that the innermost leaflet on each side, at the bottom, is wanting: the lower leaflets are about two inches long; the upper four or five. Heads of flowers whitish, the size of a cherry, on simple flaks, two or three inches in length. Corolla bell-shaped, five-cleft. Stamina ten. Legume only one from each head, ovate, compressed, very large and woody, three or four inches long, the flaks becoming necessarily greatly thickened. Seeds about ten, oval, rounded near the lower edge, as large as kidney-beans.

A. pulchella. Zigzag Spiny Acacia. Br. in Ait. n. 22.—Leaves conjugate, pinnate, with a flaked gland between the wings, each of which has from five to seven pair of leaflets. Stipulas fimbrous, nearly equal to the leaves. Heads solitary. Branches zigzag.—Oberved by Mr. Brown, on the south-west coast of New Holland, from whence seeds were sent to Kew, in 1803, by Mr. Good. A green-house shrub, flowering from April to July.

Sect. 3. Leaves doubly pinnate. Stem without thorns. Spike oblong. Eleven species in Willdenow, the last of which, A. Houtonii, we shall remove to the following section.

A. microcarpa. Warty Acacia. Willd. n. 25. (A. latifolia, slopecoueroides, flore albo; Plum. Ic. 6. I. 11. Mimofa micricarpa; Linn. Sp. Pl. 1504.)—Thorns none. Leaves doubly pinnate; first division of five pair; second of many pair; leaflets abrupt. Spikes axillary, aggregate, nearly cylindrical. Branches warty.—Gathered in South America, or the West Indies, by Plummer, whole figure is the only authority for this species. The branches are round, and warty, as well as the lower part of the flower-flaks, which half are evidently axillary, not, as Willdenow says, terminal. They are longer than the large compound leaves, and bear four or five alternate dense flokes, on partial flaks. Leaflets numerous, crowded, elliptical, veiny, emarginate, about a half or three-quarters of an inch long. Flowers numerous, very small. Legumes several, spreading; four or five inches in length, linear, flat, veiny, wavy at the edges, with many oval flat seeds.

A. pallida. Pale South-American Acacia. Willd. n. 26.—Thorns none. Leaves doubly pinnate; first division of two pair; second of twelve pair; leaflets linear, obtuse, downy. Spikes thread-shaped, much longer than the leaves.—Gathered by Humboldt and Bonpland, in South America. Branches round, warty, divaricated. Leaflets obuse at each end, sometimes but ten pair; clothed sparingly on the upper side, more densely on the under, with fine pubescence; the edges fringed. There is a cup-shaped fiddle gland between the secondary divisions of each leaf (indications of which appear likewise in Plummer's plate of the foregoing).
Footstalks hairy. Spikes axillary, solitary, three or four inches long, being thrice the length of the leaves. Flowers opposite, of five petals. 

This seems much allied to the last, but the shape and divisions of the leaflets, and the solitary spikes, indicate a sufficient difference.

A. arenosa. Sand Acacia. Wild. n. 29.—Thorns none. Leaves doubly pinnate; first division of six pair; second of sixteen pair; leaflets linear, acute. Spikes thread-shaped, in pairs. —Found by Mr. Bredemeyer at the Caracas, about the sandy banks of rivers. A florub ten or twelve feet high, with angular downy branches. Leaflets fringed, from sixteen to twenty-four pair. Footstalks clothed with hoary down; the partial ones accompanied by an acute intermediate gland. Spikes axillary, measuring three or four inches, generally rather longer than the leaves. Flowers opposite, white, fragrant. Calyx with four or five teeth. Corolla in four or five deep segments. Stamens twice as many, and twice as long. 

A. guianensis. Guiana Acacia. Wildl. n. 32. Ait. n. 25. (Mimosa guianensis; Aubl. Guian. 938. t. 357.)—Thorns none. Leaves doubly pinnate, each division of about ten pair; leaflets elliptical, obtuse. Common footstalk with a convex gland. Spikes thread-shaped, axillary. —Observed by Aublet in Cayenne and Guiana, flowering in November, and bearing ripe seeds in January and February. This is a large tree, whole trunk, thirty or forty feet high, is a foot or more in diameter, with a smooth grey bark, and white brittle wood; the branches widely spreading. Leaflets elliptical, about half an inch long. The first divisions of the leaves are sometimes not more than seven or eight. Stipulas rounded, deciduous. Spikes axillary, from two to five together, on square simple stalks, the flowers small and densely crowded. Calyx with five teeth. Corolla of one petal, in five sharp lobes. Stamens ten, inserted into the calyx below the corolla, long, slender, with heart-shaped anthers, each of which bears a little leafy stalked appendage. Legume linear-oblong, flat-topped, brown, smooth, three or four inches in length, with several seeds.

A. lepaphantha more properly belongs to this section, though placed in the next.

Sec. 4. Leaves doubly pinnate. Stem without thorns. Spikes globose. Thirty-one species in Willdenow, to which we have three to add, besides A. Houilloni.

A. ciliata. Ciliate-winged Acacia. Br. in Ait. n. 23.—Without thorns, hairy. Leaves doubly pinnate; first division of two pair; second of two or three pair. Stipulas nearly lanceolate, deciduous. Heads foliary. —Gathered by Mr. Brown, on the south-west coast of New Holland; and sent to Kew, by Mr. Good, in 1804. A green-houfe shrub, flowering from March to June, of which we have not seen either specimen or figure.

A. nigricans. Unequal-winged Acacia. Br. in Ait. n. 24. (Mimosa nigricans; Labill. Nov. Holl. v. 2. 88. t. 238.)—Without thorns, smooth. Leaves doubly pinnate; first division of two pair; second of two or three pair in the lower, and from five to seven pair in the upper. Stipulas slender-sawhaped. Heads foliary. —Native of the south-west coast of New Holland, from whence Mr. Good sent seeds to Kew, in 1803. A green-houfe shrub, flowering from May to July, said to be about five fix feet high in a wild state. The leaflets are uniform, elliptical, obtuse, one-third of an inch long. Heads axillary, falked, one, two, or three together. Corolla deeply five-cleft. Stamens about 150. Legumes one or two from each head, linear-oblong, one inch and a half in length, and one-third of an inch in breadth.

A. odoratissima. Fragrant Coromandel Acacia. Wild. n. 37. Ait. n. 27. (A. nonpinufa, &c.; Pluk. Almuth. t. 251. f. 4. Mimosa odoratissima; Linn. Suppl. 437— Roxb. Coromand. v. 2. 125. t. 120.)—Thorns none. Leaves doubly pinnate; first division of four pair; second of ten pair; leaflets obtuse, the lowermost very minute. Heads panicked, terminal. —Native of the mountainous parts of the coast of Coromandel, flowering in the hot season. The wood is hard, and equally useful with that of A. xylo-carpa. (See Sect. 2.) The leaves are f a span long, with uniform leaflets, an inch in length, glaucous beneath, very unequal at their base. Flowers numerous, white, highly fragrant, in numerous, aggregate, stalked, globular heads. Legume coriaceous, about fix inches in length, and one in breadth, with a central row of seeds.

A. arborea. Rough Tree Acacia. Wild. n. 38. Ait. n. 28. (A. nonpinufa jamaicensis, foliis latâ bæfi in mete formam fatigis; Pluk. Almuth. 6. t. 257. f. 2. A. arborea maxima non pinus, pinna majoribus, flore albo, filiâ contorta coccinea ventricofà elegantissimâ; Sloane Jam. v. 2. 54. t. 182. f. 1. 2. Mimosa arborea; Linn. Sp. Pl. 1503. Swartz Obst. 390. Browne Jam. 252. n. 32.)—Thorns none. Leaves doubly pinnate; first division of seven pair; second of seventeen pair; leaflets halved, acute. Heads axillary, stalked. Legume contorted, tumid. Seeds spheroidal. —Native of fields and woods in Jamaica, where it is called Wild Tamarind, and is one of the largest trees of that island. The wood, according to Sloane, is durable, though soft and white. Leaves of numerous, small, dark-green, smooth leaflets. Heads globular, of numerous sweet-scented flowers, whose corolla is red; the flaves whitish, very long. Legume as if beaded, four or five inches long, red; its valves of a blood-red on the inside. Seeds globular, of a shining black. This species was cultivated by Miller, but is now unknown in our gardens, nor are botanists in general well acquainted with it; Forrâl and Thunberg having given the name of Mimosa arborea to two plants very different from this, as well as from each other.

A. jubulifìs. Smooth Tree Acacia. Wildl. n. 39. Ait. n. 29. (Mimosa Jubulifìs; Scop. Infibr. v. 18. t. 8. Ait. ed. 2. v. 3. 440. M. arborea; Fork. Ægypt.-Arab. 177. Gmel. l.t. v. 3. 372. t. 40.)—Thorns none. Leaves doubly pinnate; first division of about ten pair; second of many pair; leaflets halved, obtuse with a point. Heads lax, aggregate, terminal. Legume flat, membranous, smooth. —Native of the Levant. Forrâl saw it cultivated at Conflautinople, where it was called Djul ibrâim, by the Turks; which name, denoting a fuly flower, in allusion to the flaves, appears to be the origin of the specific appellation chosen by Scopoli. We have seen this species as large as a common apple-tree, covered with a profusion of blossoms, in the open ground at Turin, nor could any thing be more elegant or splendid. In England it is usually treated as a green-houfe plant, and flowers sparingly; though it succeeds well against a wall, with some protection in winter. The leaves are large and spreading, of numerous leaflets, half an inch long, very unequal in their two halves. Flowers blue, with long nodose flaves, forming most beautiful taffets like white silk. Legume half a foot long, thin, pale brown, corrugated, unequal in breadth, with many small flattened seeds.

A. villosa. Downy Jamaica Acacia. Wild. n. 46. (Mimosa villosa; Swartz Prodr. 85. Ind. Occ. 982.)—Thorns none. Leaves doubly pinnate; first division of five or six pair; second of many pair; leaflets elliptical, oblique, downy. Stalks and branches hairy. Heads rather oblong,
ACACIA.

oblong, panicled, terminal. Legume hairy, flat.—Found by Dr. Swartz, on mountains in the south of Jamaica. Browne seems by his herbarium to have confounded this with the real *A. arborea*, just described. The prefont is much smaller, being merely a *frub*, six feet high, with hairy -furred *bran*ces. *Leaves* downy on both sides, smaller and more obtuse than in the *arborea*;光滑 underneath; from ten to twelve pair in each subdividion. *Clusters* terminal, composed of many oblong and obtube, rather than globular *flowers*, on very hairy flalks. *Flowers* small, white, with numerous capillary *flamines*, of a tawny hue, inserted into the lower part of the receptacle. Legume short, very different from that of *arborea*.

*A. difcolor*. Two-coloured-leaved Acacia. Willd. n. 47. Ait. n. 32. Curt. Mag. t. 1750. (Mimofa difcolor; Arch. Repof. t. 235. M. botrycepalca; Venten. Hort. Cell. t. 1.)—Thorns none. Leaves doubly pinnate; frst division of twelve pair; second of about ten pair; leaflets lanceolate, pale beneath. Heads in terminal and axillary clusters, much longer than the leaves.—Native of New South Wales, from whence seeds and specimens were among the frst brought into this country, in the year 1788. It is now not an uncommon green-house plant in general collections, flowering at various seasons. The branches are angular and zigzag. *Leaves* rather stiff, their *footstalks* hairy like the young branches; leaflets not half an inch long, acute, smooth; dark green above; very pale beneath. *Flowers* yellow, in numerous globular heads, disposed in very conspicuous long clusters.

*A. pubefcens*. Hair-stem'd Acacia. Br. in Ait. n. 33. (Mimofa pubefcens; Venten. Malmaif. t. 21. Curt. Mag. t. 1263.)—Thorns none. Branches hairy. Leaves doubly pinnate; frst division of about eight pair; second of about fifteen pair; *footstalks* without glands; leaflets obtuse. Heads in axillary clusters, longer than the leaves.—Native of New South Wales, from whence its seeds are said to have been procured by Sir J. Banks, about the year 1790. This pretty delicate species has an arboreefen *flem*, with drooping *bran*ces, and its copious fern-like foliage exhibits a most elegant appearance. Both sides of the *leaflets* are of a frimilar bright green. The whole compound leaf measures usually two inches; the numerous chlifiers of yellow capitate *flowers*, which frml like new hay, being about twice that length.

*A. lepahatha*. Two-spiked New Holland Acacia. Willd. n. 53. Ait. n. 34—(Mimofa diffapathaca; Venten. Hort. Cell. t. 20. M. elegans; Arch. Repof. t. 563.)—Thorns none. Leaves doubly pinnate; frst division of ten or twelve pair; second of about twenty pair; leaflets lanceolate; top and bottom of the common *footstalk* glandular. *Spikes* oblong, axillary, in pairs.—Observed by Mr. Brown, on the south-west coast of New Holland, from whence seeds were sent to Kew, in 1803, by Mr. Good. A tall *frub*, or perhaps a tree, with furrowed *vory branches*. *Leaves* large, drooping, dark green, with innumerable narrow smooth *leaflets*. *Spikes* flalked, ovate or oblong, not globele, of numerous, crowded, sulphur-coloured flowers, having each about 200 monadelphous *flamines*. *Legume* oblong, flat, thick-edged, somewhat confricted here and there occaationally, where the seeds happen to be abriffive.

*A. glandulosf*. Glandulous Acacia. Willd. n. 55. Ait. n. 36. (Mimofa glandulosf; Michaux Boreal.-Amer. v. 2. 254. Venten. Choix. t. 27.)—Herbaceous, without thorns. Leaves doubly pinnate; frst division of about twelve pair; second of many pair, with a gland between each. Heads globele, axillary, solitary. *Legumes* oblong, curved.—On the banks of the rivers Tennelle and Missifippie, flowering in July. *Flowers* white, pentandrous. *Pursh.* This appears to be very nearly related to the last. Both are herbaceous, with perennial roots, and have been introduced into the English gardens, but we have not had any account of their successe. They require the shelter of a green-house.

*A. decurrens*. Decurrent Acacia. Willd. n. 56. Ait. n. 37—(Mimofa decurrens; Venten. Malmaif. t. 61.)—Thorns none. Leaves doubly pinnate; frst division of about eleven pair; partial of innumerable linear leaflets, on a groed *footstalk* with a gland near the base, on the common *fstalk*. Heads globele, in axillary clusters.—Native of New South Wales. Sir Joseph Banks is said to have introduced this plant to Kew, in 1790. It flowers in the early part of summer, and is a green-house *frub*, of an elegant fern-like aspect, with strongly angular zigzag *bran*ces. The *leaves*, though their common *fstalk* is subtended by a projection from the branch, are not really decurrent. *Flowers* yellow, forming short clusters of little round heads.

*A. grandiflora*. Great Red Acacia. Willd. n. 61. Ait. n. 39—(Mimofa grandiflora; L'Herit. Sert. 30. Thornton Illuftr. t. 4. Arch. Repof. t. 592.)—Thorns none. Leaves doubly pinnate; frst division of about fifteen pair; second of very numerous, elliptic-lanceolate, fragrant leaflets. Heads of five-flowered, in a terminal cluster.—Native of the East Indies, from whence it is said to have been introduced into the English gardens, by Mrs. Norman, about the year 1769. No figure of this lately plant, (Phuket's synoynms, cited by Willdenow, being too uncertain,) had ever appeared, till Dr. Thornton published his magnificent plate. The *flem* is shrubby, erect, slightly branched, twelve feet or more in height, even in our gardens. *Leaves* large and spreading, with downy *footstalks*; their *leaflets* a quarter of an inch long, slightly frnged, bluntish, unequal at the base, but not curved or falcate. *Chlifiers* solitary, large, terminal, erect, of many alternate flalks, solitary or in pairs, clothed with rufly down, each flalk bearing a head of from four to frve *flowers*, whole *corolla* is but half an inch long, of a pale greenish-red; but the very numerous *flamines*, two inches in length, and of a fine flning crimif, like tallif of flk, render this one of the most beautiful of its tribe.

in 1729. These produced plants which flowered in the flore at Chelsea. The present species is certainly next akin to the last, however differently its inflorescence may have been described or delineated by authors, in which respect indeed Miller and Houttou disagree. The plate of the former however has all the appearance of fidelity, and it is possible the partial flower-flasks may vary in length, or, more probably, be elongated as the flowers open. Having seen no specimens, we must be guided by the materials before us, from which we gather that the leaves of A. Houttoni have not half so many pinnae, and that their leaflets are narrower, longer, more acute, and more curved. The petals are purple. Legume thick-edged, hairy, tapering at the bafe. The leaf in Parad. Lond. t. 64, cited in Hort. Kew, appears to belong to this species, but the flowers, and perhaps the legume, which is smooth, seem those of A. grandiflora. If this be the case, the smooth legume, not tapering at the bafe, would be an important addition to the specific character of grandiflora.

A. juliflora. Long-flowered Acacia. Willd. n. 66. Ait. n. 41. (Mimosa juliflora; Swartz Prodr. 85. Ind. Occ. 985, printed by mistake piliflora. M. diffusa, Epica oblonga. flijquis longioribus compellis; Browne Jam. 252. n. 2.)—Spines ripilicary, in pairs. Leaves doubly pinnate; first division of two pair, with intermediate glands; second of about twenty pair of oblong leaflets. Spikes axillary, two or three together, cylindrical, pendulous.—Native of very dry fields in the south part of Jamaica, flowering in the middle of summer. The stem varies from fix to thirty feet in height. Branches long and spreading. Spines strong, four or five lines in length, prominent, curved upwards. Leaves spreading, with narrow, obtuse, smooth, ribbed leaflets. Spikes two or three inches long, lax, many-flowered. Flowers crowded, felfrile, very numerous, yellow, sweet-scented. Corolla internally hairy. Stamens eight, or, two, or, ditncnt. Legume from three to five inches long, compressed, smooth, often twirled, containing several oblong brown seeds, separated by flisby partitions. There are numerous flowers in each spike deftinate of a pilif. Cattle feeding on the leaves and young branches, usually accidentally accoumlated to them, are poisoned, and the sweet legumes are reported to be noxious. The inhabitants of Jamaica call this plant Cachoe. Browne erroneously gives it the name of Poponax, which belongs to Mimosa (Acaea) tortuosa. Swartz. See Sect. 6.

A. taffra. Hottentot Acacia. Willd. n. 70. Ait. n. 42. (Mimosa caffra; Thumb. Prodr. 92.)—Spines ripilicary, in pairs, incurved. Leaves doubly pinnate; first division of twelve pair; second of many pair; with a gland on the footstalk. Spikes axillary, cylindrical.—Found by Thunberg in Southern Africa. Sent to Kew in 1800, by W. Somerville, M. D. The branches are round and frisated. First division of the leaves from seven to twelve, second from twenty to thirty, pair; leaflets linear, obtuse, smooth. Footstalks nearly smooth; the common one bearing a deprecif gland above its base. Spike flakled, two inches long. Legume the same length, linear-lanceolate, flat. Willdenow.

A. Catechu. Medicinal Acacia. Willd. n. 73. Ait. n. 43. (Mimosa Catechu; Linn. Suppl. 409. Woodward Med. Bot. 184. t. 66. Roxx. Coromand. v. 2. 40. t. 175. Terra Japonica; Kerr in Med. Obs. and Int. v. 5. 151. t. 4.)—Spines ripilicary, hooked, in pairs. Leaves hairy, doubly pinnate; first division of ten or twelve pair; second of many pair; with a gland at each extremity of the common footstalk. Spikes cylindrical, axillary, two or three together.—Native of the mountainous parts of Coromandel. A large tree, of which seeds have been sent by Dr. Roxburgh to Sir J. Banks. These have vegetated at Kew, but the plants have not arrived at a flowering state. The branches are round, downy when young; the older ones beset with numerous pairs of small recurved thorns, originating in the stipulas, as in all the plants of this section. Leaves slender and delicate, finely hairy, pale green; their leaflets crowded, hardly a quarter of an inch long, linear, rounded at each end, unequal at the bafe. Spike flakled, three or four inches long, hairy, flakled, pale yellow. Legume oblong, acute at each end, flat, smooth, with three or four dillat flat seeds. "The wood," says Dr. Roxburgh, "is good, and applied to various uses; but the natives have no idea of extracting from it, or any other, the Catechu, or Terra Japonica. Yet I believe there are many trees as fit to yield this extract, as the present." Mr. Kerr, assistant surgeon to the civil hospital at Bengal, has however deferred the mode of preparing the Catechu, (see that article,) by boiling the interior coloured part of the wood of this species, till an inspillated extract is obtained, which is the drug in question, long supposed to be an earth produced in Japan. Another fort of Catechu, or Gutta Gambir, made in Sumatra, Prince of Wales's island, &c, has been flown by Mr. Hunter, secretary to the Asiatic Society, in Transact. of the Linnean Society, v. 9. 218. to be the produce of a species of Nauclea. (See that article, spec. 7.) We presume that Mr. Kerr and Mr. Hunter are equally correct, and that the two distinct kinds of Terra Japonica, known to drug-gifts, are thus accounted for.

A. macracantha. Long-thorned Acacia. Willd. n. 76. "Spines ripilicary, in pairs, lanceolate, compressed, nearly as long as the leaves, which are doubly pinnate; first division of twelve pair; second of many pair; with a depressed gland at each extremity of the common footstalk. Spikes flakled, globue."—Gathered by Humboldt and Bonpland in South America. The branches are frisated, and nearly round. Leaflets about thirty pair in each division, linear, obtuse, fringed. Footstalks downy. Spines two inches or more in length, sharp-pointed, spairing at a right angle. Heads of flowers the size of a peeper-corn, on long stalks, in pairs, either axillary, or disposed in a fort of clusier at the ends of the branches. Willdenow. This species appears very remarkable, on account of the great size of its thorns.

A. eburnea. Ivory-thorned Acacia. Willd. n. 78. (Mimosa eburnea; Linn. Suppl. 437. M. leucacantha; Jacq. Hort. Schoenbr. v. 3. 75. t. 393.)—Spines ripilicary, in pairs, cylindrical-awlshaped, combined at the bafe, spreading. Leaves doubly pinnate; first division of three or four pair; second of fix or more pair; leaflets dentant, elliptic-oblong. Heads axillary, flakled, aggregate.—Sent by Koenig from the East Indies. Jacqin by mistake makes it a native of Africa. He cultivated it at Schoenbrun, but we have not met with this species in any English flowe, the following one having been miscalled by the above name. The true A. eburnea, of which the original Linnean specim lies before us, is a twilled irregularly branched fork, whose twigs are round and zigzag, armed with tremendous straight spines, which are white, smooth and polished, almost like ivory, but brown and very sharp at the end: the longest measure nearly two inches; some are but a quarter that size: they taper gradually from a thick conflucent base. Leaves about two inches long, with smooth leaflets, placed at the distance of their own width from each other. Common foot- stalk
ACACIA.

stalk with two depress'd glands in the upper part. Flower-flats either axillary, or terminal and racemose, more or less aggregate, each bearing a globular head, of yellow sweet-scented flowers. We know nothing of the legume.

A. horrida. Axi-thorned Acacia, Willd. n. 79, excluding the synonym of Jacquin, and perhaps Forskall. (A. madresafatana, folioli parvis, aculeo e regione binis praerudibus horrida, corticie cinerea; Pluk. Phyt. t. 121. f. 4. A. ibernea; Ait. n. 46, but not of Willd. Mimosa horrida; Linn. Sp. Pl. 1505. Vahl Symb. v. 1. 518. M. ibernea; Roxb. Coromand. v. 2. 54. t. 199)—Spines flat, in pairs, pinnately 5-angled, angular, spreading, longer than the leaves; some much shorter and recurved. Leaves doubly pinnate; first division of three or two pair; second of many pair; leaflets crowded, on a hairy stalk. Heads axillary, flattened, aggregate.—Native of the East Indies, flowering in the cold season, sent by Dr. Roxburgh to Sir Joseph Banks in 1792. This is a small ill-looking tree, or large bushy shrub, whose branches spread in every direction, and are round, pubescent, wavy, very rigid, armed with formidable thorns, of various sizes. Some of the latter are two inches long, white, spreading horizontally in opposite directions, scarcely connected at the base, much more slender and linear than in the A. ibernea, flat or channelled along their upper side; when young they are much smaller, needle-like, and hairy: others, on the same branch, and of the same age, with the large ones, are very short and hooked. The leaves are not half the size of the last species. Heads of flowers globoso, with a purplish corolla, and yellow filaments. Legume linear, twinned, two inches long, smooth. The flowers are said by Dr. Roxburgh to be separate from each other, on their glabrous receptacle, by abrupt, fringed, chaffy scales, of which we can find no traces in our specimens.

A. tortuosa. Poponax Acacia. Willd. n. 82. (A. americana, filiis teretibus ventricosis, floribus luteis; Sloane Jum. v. 2. 56. Mimosa tortuosa; Linn. Sp. Pl. 1505. Swartz Obs. 391. Browne Jum. 231. n. 1.)—Spines flat, in pairs, pinnately 5-angled, much shorter than the leaves, round, downy. Leaves doubly pinnate; first division of three or four pair; second of many pair; leaflets crowded, on a downy stalk. Heads axillary, on downy stalks, solitary or in pairs. Legume externally flaccid. Very common in the low sandy lands of Jamaica. The plant is thorny, with spreading wavy branches, rendering the plant useful for hedges according to Dr. Swartz; but Browne speaks of it as of little service, the smell of every part being so rank and disagreeable, that it cannot be used even for fire-wood. The taste is bitter, and the flowers have an offensive smell. Both these authors mention the legumes as furnished with a glutinous juice under their skin, whose qualities are eminently bitter and astringent. Sloane appears to confound the A. Farnesiana and others with this species. The true tortuosa, of which we have Browne's own specimen, comes near to corrida in botanical characters, but the leaves and leaflets are much larger; thorns smaller, not angular, but more tapering; flower-flats downy, not smooth. There are no scales on the receptacle between the flowers, but the teeth of the long tubular calyx are very densely and finely fringed. Dr. Swartz says this is the tree really called Poponax in Jamaica, Browne erroneously attributing that name to A. juliflora.

Both are frequently met with in the same situations.

A. farneifana. Sponge Acacia. Willd. n. 83. Ait. n. 47. (A. indica farneifana; Aldin. Hort. Farneif. 3. t. 2. 4. Mimosa farneifana; Linn. Sp. Pl. 1506.)—Spines flat, in pairs, pinnately 5-angled. Leaves doubly pinnate; first division of from five to eight pair; second of many pair; leaflets crowded. Heads axillary, flattened. Legume tudid, coriaceous.—Native of Hispaniola, from whence the seeds were brought to Italy, early in the 17th century. This shrub is occasionally seen in our flowers, being esteemed for the peculiarly delicious scent of its balls of yellow flowers, which are produced during Summer. A coloured figure is much wanted. The dry tudid legume distingues itself clearly, as a species, from the last. The whole plant is smoother, nor have we ever observed the herbage to be mid.
flakes prickly. Leaves doubly pinnate; first division of seven pair; second of sixteen pair; leaflets oblong-oval; a gland on the main footstalk. Spikes globose, at terminal panicked clusters.—Native of the East Indies, from whence it was procured for Kew garden, by Sir J. Banks, in 1773, but appears not yet to have flowered. We have seen no authentic specimen of this species.

A. pennata. Fine-leaved Acacia. Willd. n. 98. Ait. n. 50. (A. aculeata multi-flora, foliis pennis avium referentibus; Burm. Zeyl. 2. t. r. A. nebuliana, flocculis globohis Iuteis, foliis pinnatis tenuissimo incisis, spinis minoribus; Burm. Zeyl. 3. Mimosa pennata; Linn. Sp. Pl. 1507.)—Branches prickly. Leaves doubly pinnate, with many pair of general divisions, and very numerous linear leaflets; a gland on the common stalk. Panicle terminal, spreading; heads flaked, aggregate; general flower-flakes, like the blade of the common footstalks, prickly. Legume flat, smooth; wavy at the edges. Native of Ceylon, and other parts of the East Indies. Sent to Kew, in 1773, by Sir J. Banks. We have specimens from Dr. Roxburgh. The very delicate slender leaves, which, in the dried plant at leaf, fold together, give a feathery appearance, well expressed in Burn- man's place. The over is very large and compound, and with downy leafstalks; its main branches only armed with small hooked prickles. The legume, not hitherto described, but very useful in differentiating this multiflorous tribe, are about three inches long, tapering, though rather blunt, at each end, flat, thick-edged, wavy or fimbrous at both margins. Seeds about four.

A. Ceratonia. Round-leaved Acacia. Willd. n. 101. Ait. n. 51. (A. repens aculeata, flore albo, foliis Silique; Plum. Lc. 4. t. 8. Mimosa Ceratonia; Linn. Sp. Pl. 1508.)—Branches, and all the stalks, prickly. Leaves doubly pinnate; leaflets three pair, roundish-obovate, oblique, three-ribbed. Panicle terminal. Heads globose. Legume flat, prickly at the edges. Native of the West Indies, from whence the present duke of Marlborough is said to have introduced it into his rich collection, before the year 1800. The remarkable roundness of the leaves, which would have authorized the name of roundifolia, and their greater fize, distinguishes the present species from all we have hitherto noticed. Every part is extremely prickly, but devoid of pubefcence. The heads of flowers are rather small, and, according to Plumier, white. He delineates the legume of a flat, oblong, obtuse figure, two or three inches long and one broad, fringed with hooked prickles.

A. tamarindifolia. Tamarind-leaved Acacia. Willd. n. 102. Ait. n. 52. (A. aculeata, flore albo, foliis Tamarindi; Plum. Lc. 4. t. 7. Mimosa tamarindifolia; Linn. Sp. Pl. 1505. Jacq. Hort. Schenebr. v. 3. 77. t. 396.)—Branches prickly. Leaves doubly pinnate; first division of five or fix pair; second of about fifteen pair; a gland on the common stalk; leaflets oblong. Stipulas and bracteas heart-shaped. Clusters terminal. Heads globose. Legume flat, smooth. Native of South America and the West Indies. Said to have been cultivated by Kennedy and Lee, at Hamerfmith, in 1774. The name is very expressive of the aspect of the leaves. The very broad heart-shaped stipulas, and the smaller, more ovate, bracteas, give a peculiar character to this species. Inflorescence rather racemose than panicked, dehiscence of hairines or spines, though the branches of the stem are armed with brown prominent prickles. Heads of a few white flowers, each on a long stalk, solitary or in pairs. Legume, according to Plumer's figure, linear-oblong, flat, straight, dehiscence of prickles at the edges, acute, about three inches long and one broad. Seeds numerous, oval.

A. eantholoba. American Prickly-podded Acacia. Willd. n. 95.—'Branches prickly. Leaves doubly pinnate; first division of three pair; second of ten pair; leaflets linear, obtuse; downy beneath. Heads globose, nearly sessile, racemose. Legume prickly at the edges.'—Gathered in South America, by the celebrated travellers Humboldt and Bonpland. Branches round. Leaflets ten or eleven pair, clothed beneath with closo-prehided hairs. Footflakes: downy. Prickles scattered, hooked, compressed. Heads small, a little sessile, disposed in a terminal cluster. Legume an inch and a half in length, oblong-flat, membranous, smooth, beared with prickles at the margin. Wild-emous. This author declares himself to have been poffefed of several specimens of the Mimosa tribe, which were too imperfect to be enumerated or defined. We are not only in this situation, but we have several in sufficiently good condition, which on account of the incomplete descriptions of authors, especially concerning the fruit, we cannot ascertain to be described or not.

ACADEMY. The Academy of Arts at Petersburg was established by the empress Elizabeth in 1758, and annexed to the Academy of Sciences. At the suggestion of count Shuvalof, the late empress Catharine, in 1764, formed it, &c. Next col. after l. 54, add. The academy of painting, sculpture, and architecture, at Vienna, was founded in the year 1789. Under Academies of Nonconformist Miniaters, instead of Manchester r. York, &c. Exeter, and instead of Wrexham r. Llanifylling.

Gen. Ch. Cal. Perianth inferior, of one leaf, turbinate, permanent, with four teeth, each sometimes tipped with an upright bristy awn, barred at the point, or the whole body of the calyx is so armed. Cor. Petals four, roundish, inserted into the border of the calyx, and shorter than its awns. Stam, Filaments two or four, thread-shaped, longer than the petals, inserted into the border of the calyx; anthers roundish. Pf. Germ superior, oblong; fyle thread-shaped; stigma many-cleft, tufted. Peric. none, except the permanent calyx. Seed solitary, ovate, coated with the thickened base of the calyx.

Eff. Ch. Calyx of one leaf, armed with barred bristles. Petals four, inserted into the calyx. Stigma tufted. Seed solitary, coated with the calyx.

Obi. The petals are sometimes wanting. Flowers occasionally five-cleft, with five flaments. The stem is herbaceous, or sometimes shrubby. Leaves alternate, pinnate with an odd one, deeply ferrated or cut, often hairy or silky; their common footflakes feathering, bordered with a pair of mem-
branched combined stipulae. Flowers small, greenish, in a globose head, or interrupted spikes. Fruit reddish, dry.

1. A. lappaceus. Burn Acæna. Vahl n. 1. "Fl. Peruv. v. 1. 66. t. 103; f. a."—Leaflets oblong, ferrated. Flowers racemose. Fruit all over prickly. Stem erect."—Native of craggy, funny spots in the district of Tarma, Peru. Stems rather shrubby, numerous, a foot high, slightly branched, round, villous. Leaflets four pair, deeply ferrated, hairy; becoming smooth by culture. Flower-flasks axillary, four times as long as the leaves, bearing from five to seven dilated, flaked flowers.

2. A. elongata. Multifid Acæna. Linn. Mant. 200. Vahl n. 2. Wildl. Sp. Pl. v. 1. 693.—Leaflets oblong, ferrated; downy beneath; bearded at the tips of the inflorescences. Spikes elongated, compripted. Fruit all over prickly. Stem nearly erect.—Found in Mexico, by the celebrated Mutis. Stem woody, perennial, with very long, ascending, somewhat compound branches, two feet in length. Leaves scattered; leaflets sese, crowded; the lower ones very small, linear, acute, entire; from four to eight of the upper pair larger, oblong, ferrated. Spikes axillary, erect, rigid, a span long. Brotæa solitary, close to the calyx, concave, ovate-oblong. Flowers alternate, nearly sese. Mutis.

3. A. latebrofus. Hairy Acæna. Vahl n. 3. Ait. n. 1. (Anciftrum latebrofum; Wildl. Sp. Pl. v. 1. 155; A. decumbens; Thunb. Prod. 6. Agronima decumbens; Linn. Suppl. 271).—Leaflets oblong, cut, hairy. Stems creeping. Spikes elongated, flaked, many-flowered.—Native of the Cape of Good Hope. The germen is downy, beft with many barbed pricksles, which, as the fruit ripens, project through the skin of the calyx. See Gartner f. 2, and Lamarck f. 4.

4. A. pinnatifida. Deep-cut Acæna. Vahl n. 4. "Fl. Peruv. v. 1. 68. t. 104. f. b."—Leaflets oblong, deeply ferrated, almost pinnatifid; hairy beneath. Stems cylindrical. Stem erect.—Found on dry exposed hills in Chili. Commerson gathered what appears to be the same, at Monte Video, not, as Vahl by mistake say, at the straits of Magellan. The stem is quite fimple, a span high, leafy, very hairy in the upper part. Leaves numerous at the root, and several on the stem, with eight or nine pair of leaflets, besides the odd one; the largest near an inch long, copiously and deeply cut, like Potentilla anserina. Stem obtuse, in inch or inch and half long, denfe, many-flowered, dark purple. Germen beft with fbarbed thorns, not proceeding from its teeth.

6. A. ovalifolia. Oval-leaved Acæna. Vahl n. 6. "Fl. Peruv. v. 1. 67. t. 103; f. c." Ait. n. 3. (Anciftrum repens; Vcnten. Jard. de Cels, t. 6).—Leaflets elliptic-oblong; villous beneath. Stems globose. Stem creeping. Calyx-teeth awned. Stigma unilatral.—Native of Peru, in moist shady places. Cultivated at Paris, by the late M. Cels, and at Kew by Mr. Aiton, where it is hardy, flowering in May and June. We can discover no difference between this and the foregoing, the stigma being perhaps accidentally imperfect.

7. A. argentea. Silvery Acæna. Vahl n. 7. Fl. Peruv. v. 1. 67. t. 103. f. b. (Proquin; Feuill. Voy. v. 3. 55. t. 41).—Leaflets elliptic-lanceolate, acute, ferrate; filthy beneath. Stems creeping.—Native of Chili, in moist ground. The Indians use it as a vulnery. The branches are two feet long. Leaves shining and smooth above; slyery beneath. Flowers in globular heads, on long falks. Stems two or four. Calyx with two, three, or four terminal awns.

8. A. lucida. Shining Deep-cut Acæna. Vahl n. 8. Ait. n. 4. (Anciftrum lucidum; Wildl. Sp. Pl. v. 1. 155; Lamarck Illrtr. v. 1. 77. t. 22. f. 3).—Leaflets in three or five deep oblong segments; hairy beneath. Spikes oblong; Stem almost buried.—Native of the Falkland islands, from whence Dr. Fothergill procured it in 1777. Commerson gathered the same in the straits of Magellan. The stems run just under the surface of the ground, sending up numerous leafy tufts. Leaves linear-oblong, of many pairs of small, elliptic-oblong, deeply divided leaflets. Spikes parted imperfectly. Fruit reddish, smooth, entirely unarmed, as well as the calyx, in our specimens. Vahl attributes four awns to the latter.

9. A. trifida. Three-cleft Acæna. Vahl n. 9. Fl. Peruv. v. 1. 67. t. 104. f. c.—"Downy and hoary. Leaflets wedge-shaped, in three or five segments. Spikes globose. Stem erect."—Native of pâtures, fields, and hills in Chili. Denfely villous. Stems several, unequal, the longest measuring about a foot. Leaflets feven or eight pair; the lowermoft often undivided. Flower-flaks terminal, often bearing one or two little round heads, besides the principal one. Brotæa linear. Calyx sometimes five-cleft. Stems two to five. Fruit obovate, denfely villous, with four or five angles, and as many awns. Vahl.

10. A. magellanica. Magellanic Acæna. Vahl n. 10. (Anciftrum magellanicum; Lamarck Illrtr. v. 1. 76. t. 22. f. 2).—Leaflets obovate, deeply ferrated, three-cleft; hoary beneath. Spikes globose. Stem erect. Smoth.—Gathered by Commerson, at the straits of Magellan. Stems rather shrubby, three or four inches high, branched, smooth; sometimes hoary at the summit. Leaves at the ends of the branches: leaflets five or fix pair, scarcely half the length of the nail; the uppermoft with feven or nine teeth, lower with about three, lowest of all entire. Flower-flaks axillary, at the top of each branch, erect, purplish, slightly villous at the upper part. Head twice the fize of a pea. Very nearly akin to the last, but the smoothness of the stem branches clothed with imbricated bafes of the foot-flaks, crowded leaves, and smooth brotæas, distinguishes this species. Vahl.

11. A. adaccendens. Ascending Smooth-thr Acæna. Vahl n. 11. (A. levigata; Ait. n. 5? Anciftrum magellanicum; Lamarck Illrtr. v. 1. 76).—Leaflets oblong or obovate, ferrated, nearly smooth. Spikes globose. Stem decumbent.—Gathered by Commerson at the straits of Magellan. We do not find any specimen from him in the Linnean collection; but Mr. Menzies has communicated some, by the name of Anciftrum alpinum, which appear to answer to Vahl’s description, except being considerably hairy. These were found on the summits of the mountains near Cape Horn, along with Viola tridentata. (See Viola n. 56). Vahl speaks of the stem as a span long, smooth. Leaflets from five to feven pair, opposite or alternate, bluntly ferrated, villos, somewhat hairy at the ripo. Flower-flaks terminal, elongated. Head the size of a cherry. Calyx
A C A

ACALZIKE. After Tartary, add: the capital of Aki ëka (which fee): a populous and commercial city, situated in an open valley, on the left bank of the Kur. The inhabitants are, Jews, Turks, Greeks, Armenians, and Georgians.

ACANTHUS, in Botany, Jussieu's third natural order of his eighth clafs, or the thirty-sixth of his general series, named from the most celebrated and conspicuous fpecies which it contains. For the character of the clafs, see Gentianæ. The Acanthi are thus defined.

Calyx divided, permanent, often bracteate. Corolla mostly irregular. Stamens either two; or four, two of which are shorter than the others. Style solitary; with a two-lobed, rarely simple, stigma. Fruit capsular, of two cells, often many-seeded, with two cleftic valves, and a partition contrary, or opposite, thereto, inserted into their middle, splitting from top to bottom into two unirneted receptacles, bearing seeds on each side, rendering the valves semibicalcar. Stem either herbaceous or thrubby. Leaves for the most part opposite, as well as the flowers.

Seft. 1. Stamens four, in unequal pairs.

This contains Acanthus of all authors; Diluvia of Jussieu, founded on Acanthus ilicifolius of Linnaeus; but fully on the slightest possible characters; Blepharis of Jussieu; A. moderatifolius of Linnaeus, as slightly distinguished; Thunbergia of Linn. Suppl.; Barberia; and Ruellia.

Seft. 2. Stamens only two.

Julliaa and Dianthera.

Mr. Brown, who retains this order by the name of Acanthace, Prodr. Nov. Holl. v. I. 472, has enriched it with many valuable remarks, and some new genera. He combines, like Professor Vahl, Dianthera with Julliaa, but extracts from the latter the Hypophila of Solander; with Eranthemum, originally founded by Linnaeus; and establishes moreover two genera of his own by the names of Hypophila and Nelsonia. (See those articles.) We perceive also that this intelligent writer retains Vahl's Elptaria. He proposos also Apkelaandia, confining of Jullicia pulcherrima and his allies; Athelia, founded on Forckall's Ruellia imbricata, and various undescribed East Indian and African species, of which therefore we can give no account. Lepidagathis of Willdenow, Sp. Pl. v. 3. 400, of which we propose to speak hereafter, is admitted by Mr. Brown, as well as a new genus of Julliaa's named Blechnum. Some others are less distinctly indicated. We select from the work of our learned friend the following additional observations upon the Acanthi, or Acanthaceae.

The anthers are either of two cells, sometimes equal, sometimes unequal in their infcrion, or of only one cell; and burr longitudinally. Germin surrounded at the base with a glandular disk. Seeds roundish, mostly subtended by retinacula, props, or awl-shaped ascending processes from the partition. Skin of the seed floss. Albumen invariably none. Embryo either curved or straight. Cylindrons large, nearly orbicular. Plumula inconspicuous. These plants are chiefly tropical. Their pubescence, if any, is simple, occasionally capitate, very rarely flappy. Leaves opposite, rarely four in a whorl, without fliglifí, simple, undivided, either entire or serrated; seldom minut, or slightly lobed. Inflorescence terminal or axillary, spikid or racemose, falciculatid, panicled, or solitary. The order is certainly natural, though not easily to be defined. In some instances the props of the seeds are wanting. The rudiments of a fith flamen frequently occur. The elastic mode of burrting in the capsfil is nearly universal.

The following principles by which the genera are to be discriminated, are thus proposed by Mr. Brown in succedence, according to their relative importance.

1. Seeds with or without props.
2. Partion combined with the valves or separate.
3. Anthers of two cells or of one.
4. Anther-bearing flamines two or four.
5. Limb of the irregular corolla with one lip or two.
6. Calyx equal or unequal.

Cells of the capsul containing each two or more seeds.

The following is the order of Mr. Brown's genera. Hypophila, Julliaa, Eranthemum, Ruellia, Hypophila, Acanthus including Diluvia of Julliaa, and Nelsonia, which may be found in their proper places.

ACANTHONOTUS, in Ichthyology, a genus of fih, whose characters are, that the body is elongated, without dorbal fins, and that it has several spines on the back and abdomen. There is one species, a native of the East Indies, described by Bloch under the name of

Nasus; Smout Acanthoftotus, which is grey, with the back transversely barred with brown. This fih is of considerable length, that described by Bloch being two feet and a half: the head is large, the teeth small, forming a row along each jaw, the eyes large, and the nostrils conspicious; the body, moderately wide for about a third of its length, tapering towards the extremity; head and body are covered with scales, of a bluefih tinge, silvery on the abdomen; the pectoral fins brown, of a moderate fize, the ventral of like colour, and small; the lateral line ftraight, nearer to the back than to the abdomen; with ten spines, ftrong but fhort, along the narrow part of the back, and towards the abdomen from twelve to thirteen others, followed by the anal fin, which is fshallow, and continued into the tail, which is very fmall. Shaw's Gen. Zool.

ACANTHURUS, a genus of fih, confiding of fuch species of the Linnean genus Cetodon (which fee) as, in contra-diftinction to the principal character of that genus, have, in general, moderately broad and ftrong teeth, rather than slender and fetaeous ones; they are also furnished on each side of the tail with a ftrong spine. Their generic character is as follows: Teeth fmall, in most species lobated; tail aculated on each side; habit and general appearance as in the chetodon. The species are,

UNICORNIS. Grey-brown, with a frontal horn fretch-
ing forwards over the flout, and two spines on each side of the tail. See Chetodon Unicornis.

Nasus. Grey, speckled with black, with a rounded frontal tubercle, and two spines on each side of the tail. A native of the Indian seas, and, according to Cepeda, first described by Cammeron.

Teuthis. Blue, with the middle of the body paler, and a spine on each side of the tail. See Teuthis Hepatus.

Chirurgus; Lancaet Acanthus. Orange-yellow, with the body crossed on the hind part by transverse brown stripes, and a spine on each side of the tail. See Chetodon Chirurgus.

Nigrans. Blackish, sub-argentee beneath, with a spine on each side of the tail. See Chetodon Nigrans.

Militaris. Brown, with rhombic-ovate body, and strong spine on each side of the tail. Native of the Indian and American seas.

Triontegus; Triradiated Acanthus. Greenish-brown, with four transverse dusky bands, and a spine on each side of the tail. Native of the Indian seas.

Harparus; Guarded Acanthus; Rhombic-ovate brown Acanthus, with extremely minute scales, and two spines on each side of the tail. Native of the Indian seas.

Sohali; Dusky Acanthus, with longitudinal violet streaks, and two spines on each side of the tail imbedded in a red depression. See Chetodon Sohal.

Negro-fuscus; Dusky Acanthus, with ovate body, and spine on each side of the tail. A variety of the preceding. See Chetodon Negro-fuscus.

Achilles; Brown, ovate Acanthus, with a bare ovate red spot on the hind part, accentuated in the middle.

Lineatus; Ovate-brown Acanthus, with numerous longitudinal white stripes, and spine on each side of the tail. See Chetodon Lineatus.

Umbratus; Brown-ovate Acanthus, with extremely minute scales, and a spine on each side of the tail. Native of the Indian seas.

Melaeagris; Blackish-brown Acanthus, thickly marked with round white spots, and spine on each side of the tail. Native of the Indian and American seas.

Velifer; Broad-finned, whitish Acanthus, with roundish-ovate body, marked by numerous brown transverse bands, and spine on each side of the tail. Native of the American seas. Shaw’s Zool.

Acanthus, in Botany. In addition to the observations of our predecessor, we would remark, what the writer of the present article has elsewhere hinted, (Considerations respecting Cambridge, more particularly relating to its Botanical Professors, 37,) that every mention of this plant in Virgil accords with the Common Holly, Ilex Aquifolium, so far, at least, as the words of the poet indicate any thing in particular. The passages in question are,

bacca funebris frondescentis acanthi.—Georg. 2. 119.

austrii fucis tuauisam acanthi.—I. 4. 123.

Ille comam mollis iam tum tondereb acanthi.—I. 4. 137.

Et moli circum isti amans acanthum.—Ecl. 3. 45.

Mixtique ridenata colloquor funis acantho.—I. 4. 20.

circumstinctum croceo velamen acantho.—En. 1. 633.

pitium croceo velamen acantho.—I. 1. 715.

The flexible twigs, ever-green leaves, bright or gray taffron-coloured berries, (as the term croceus is used with considerable latitude by Latin writers,) the head of the plant being clipped by gardeners in the early spring, all sufficiently well apply to the Holly, which is a common wild, as well as garden, shrub, throughout Italy, but of which we can find no mention whatever in all Virgil’s writings, if these passages allude to any thing else. They are acknowledged to be inapplicable to the Acanthus of Dioscorides, which is evidently the Linnaean Acanthus. They are no less fo to the Acanthus of Theophrastus, which is a tree bearing pods, or legumes. These Greek names, simply meaning a thorny or prickly plant, are variously applied, not only to different trees or shrubs, but to many kinds of thistles. The Acanthus Difcoides, Linn. Sp. Pl. 891, a species adopted by Linnaeus from other writers, without seeing a specimen or figure, seems to be merely a more or less flaved form of A. spinosus, in which A. mollis may, on the other hand, be a cultivated, or more variegated, variety. The latter was found by Dr. Sibthorp in Sicily, not in Greece; the former, apparently the natural state of this herb, as described by Dioscorides, occurs in moist, thinly places, as well as about the borders of fields, in the southern part of Greece, and the islands of the Archipelago, and is very common in Crete.

Acarna, a name adopted from the Greeks, whose signification is, like this, some form of thistle. This name is now applied in Wildenow’s Sp. Pl. v. 3, 1699, and from thence by Mr. Aiton, Hort. Kew. v. 4. 450, to a genus separated by the same writers from the Linnaean Atractylis (see that article;) from which it differs in the want of a radius. The species referred to Acarna are,

1. Atrathyris gymniferus of Linn. Sp. Pl. 1161; 2. A. macropetalis, Desfont. Atlant. v. 2. 253; 3. A. macrophylla, ibid. 255. t. 226; 4. A. cepitosus, ibid. 254. t. 225; 5. A. lanceolatus, Thunb. Jap. 306; 6. A. ovata, ibid. 306; and 7. A. cancellata, Linn. Sp. Pl. 1162.—We can by no means concur in this alteration. Nothing is less certain than such a generic distinction as the above, when unsupported by any natural character. Wildenow has also separated from Atrathyris the perpurata and mexicanus of Linneaus, perhaps with more propriety, their receptacles being nearly naked, and their seed-down simple, to say nothing of a difference in the structure of the radiate florets of the former, which rather invalidates than confirms the new-elaborated genus. See Onoseris.

Accursius, r. Maringuelus.

Acera, l. 6, r. Tribulato Acera. Jull.

Acera, in Botany, the sixth natural order, of the 17th class in Linnæus’s fyltem; the 66th in his general series. See the characters of this class under the article Gerania. The Acera are defined as follows.

Calix of one leaf. Petals definite, very rarely wanting, inserted around the disk, which is under the germen. Stigma inserted into the middle of the same disk; definite, but often
often unequal in number to the petals. German simple, standing on the before-mentioned disk; style one, or rarely two; stigma one or two. Fruit of several cells, or several capsules, the cells or capsules three or two. Seeds in each solitary, or at the utmost three, attached to the inner angle, some of them frequently abortive. Corolla deftite of albumen, the radicle lying on the lobes. Stem arborescent, or frubby. Leaves opposite, without stipulas. Flowers racemose or corymbose; sometimes by the abortion of one or other part becoming separate in sex.

Sect. 1. Fruit of several cells, contains only Aesculus.

Sect. 2. Fruit of several capsules, only Acer.

Sect. 3. Consists of genera allied on the one hand to the Aesculus, on the other to Malpiglie; see that article. These are Hippocrates and Thyrallis.

There is some doubt, even in the mind of Jussieu himself, whether Aesculus properly belongs to this natural order; and he justly advert.s to its great affinity to his Sapindi, (see that article,) with which its fruit undoubtedly very closely accords.

Gen. Ch. Cal. Perianth superior, of three ovate, concave, equal, converging leaves. Cor. Petals two, linear-lanceolate, concealed by the calyx, and about the same length. Nectary an oblong, flat, pendulous lip, much longer than the petals, with two pair of deep, linear, flat, dependent lobes, but no posterior spur. Stam. Filament none; anther erect, oblong, attached by its back, parallel to the style, of two cells, opening in front, the malleus of pollen club-shaped, each attaching itself, by a taper bafe, to two glads in a single pouch near the stigma. Pijl. German inferior, linear-oblong, twified; style columnar, very short; stigma below the anther, rather concave. Peric. Capsule oblong, with three blunt angles, twified, of one cell and three valves, splitting by three lateral fissures. Seeds numerous, minute, each with a chaffy tunic.

Eff. Ch. Calyx converging. Lip without a spur, flat. Anther nearly terminal, fixed to the style, of two cells.

This genus was first established by Mr. Brown, who separates it from Ophrys, (see that article,) on account of the converging calyx, and especially the situation of the two glads, which receive the pollen, being in one pouch, not in two distinct and different ones. The latter character, though excellent in this instance, appears to us in others less satisfactory (see Gymnadenia hereafter); and even in the characters of Acras and Ophrys, the flat lip of the former, contrasted with the convex one of the latter, seems a more obvious and natural distinction. In affinity the present genus comes nearest to Orchis, but wants the spur.

2. A. anthropomorphum. Short-lipped Aceras. (Ophrys anthropomorphe; Willd. Sp. Pl. v. 4. 63.)—Lip but half the length of the germen.—Found on hills in Portugal, by professor Linck. About a span high, the spike an inch long. Bracteae oblong, membranous, half the length of the germen, nor does the lip exceed that proportion. Willdenow thinks it can scarcely be a variety of the former. We have seen no specimen.

ACERIC Acid. In Chemistry, lately discovered by professor Scherer, of Vienna, in the sap of the Acer campestris, or common maple. Its properties have been very imperfectly described. The acerate of lime is white, slightly translucent, has a weak acidulous taste, and is not altered by exposure to the atmosphere. 1000 parts of cold water dissolve 9 parts, and 1000 parts of boiling water 17 parts of this salt. Schweigger's Journal, iv. Thomson's Chemistry, iv. new edition.

ACETATES, or acetites, a class of salts, the characteristics of which are, that they are all very soluble in water; that they are decomposed by the action of heat; and that they afford acetic acid when distilled with fulphuric acid. Accordingly we have acetates of barites, of potash, of soda, of lime, of ammonia, of magnesia, &c. See Acetic Acid.

ACETIC Acid. It is now universally admitted by chemists, that the acetic acid differs in no respect from common vinegar, or what was formerly termed aceto us acid, but in the degree of concentration only. This opinion, first advanced by Adet, has lately been fully confirmed by the experiments of Darracq and Prouft. What has been said, therefore, on the subject of acetous acid and vinegar in the Cyclopaedia, is to be understood as applicable to dibut acetic acid; and the salts termed acetites are to be considered as acetites. The following facts are important, and deserve a place here.

The specific gravity of acetic acid does not enable us to determine its strength. The specific gravity is flated by Dr. Thomson to be a maximum when the liquid is a compound of one atom, and three atoms water. When the proportion of water is either increased or diminished, the specific gravity diminishes. Acid composed of one atom real acid and one atom water, and acid composed of one atom real acid and nine and a half of water, are flated by the fame chemist to have the fame specific gravity.

The following table, drawn up chiefly from the experiments of Mollerat by Dr. T., exhibits the specific gravity of acetic acid of various strengths.

Acetic
Acetic acid of the fp. gr. 1.063 is the strongest that can be procured. It crystallizes at the temperature of 53°, and the crystals melt slowly when heated to 72°. This had been long ago observed by Courtenvaux. Lowitz has proposed an ingenious method of obtaining it of the requisite degree of strength to crystallize. This consists in making distilled vinegar into a thick paste with well-burnt charcoal, and expelling the mixture to a temperature of 212°. The watery part is driven off, and the acid remains. The acid itself may be separated by a higher degree of heat, and thus obtained in a very concentrated state. It is commonly necessary, however, to repeat the process before it can be made to crystallize.

Mr. Chenevix, by distilling the acetates, obtained a peculiar substance different from acetic acid, and which he has denominated pyro-acetic spirit. The acetates of potash and soda gave a greater proportion of this principle than any of the metallic acetates; but when the acetate of barytes is distilled, the whole liquid product consists of this spirit without any mixture of acid whatever. No other genus of plants tried, such as the oxalates, tartrates, or citrates, yielded this spirit, nor was acetic acid converted into it by heat.

Pyro-acetic spirit is a white and limpid fluid. Its taste is at first hot and acid, but it becomes cooling and rather ursine. Its smell is peculiar, and is compared by Mr. Chenevix to that of a mixture of oil of peppermint and bitter almonds. Its specific gravity is 0.7864. It burns with a flame, white externally, but of a fine blue within, and leaves no residue. It boils at a temperature of 162°. It mixes with water, alcohol, and volatile oils, in any proportion. With hot olive-oil it also mixes in any proportion; but with that oil cold it only mixes in certain proportions. When hot it diffuses wax and tallow. It diffuses also a little sulphur and phosphorus, and is an excellent solvent of camphor. It diffuses potash, and becomes dark-coloured, but it may be obtained again agitated by distillation. Strong sulphuric acid blackens and decomposes it. Nitric acid renders it yellow, and changes its properties. Muratic acid renders it brown. When diffused with this acid a combination takes place, and a substance is formed possessing very different properties from muratic ether. These properties are sufficient to show that the pyro-acetic spirit is a distinct substance and differs entirely from alcohol, ether, and volatile oils. Of course, therefore, as Dr. Thomson observes, it deferves a distinct place among compound combustibles.

Many attempts have been made to analyse the acetic acid. Thole most worthy of notice are by Gay Lussac and Thenard, and Berzelius. The former burnt a mixture of acetic acid and barytes and carbonic acid. The results were carboxylic acid and water. Berzelius's analysis was made on the same principles, but the salt he employed was supposed to be quite free from water. The following are the results of these celebrated chemists:

</table>

If, with Dr. Thomson, we consider the results of Berzelius most entitled to credit, acetic acid consists of

- 3 atoms or proportions of oxygen, weighing 0.375
- 4 atoms or proportions of carbon, weighing 3.000
- 3 atoms or proportions of oxygen, weighing 3.000

Or of ten atoms or proportions, and the weight of an integrant particle, will be 6.375; and this weight, as the same chemist has shewn, accords very well with the constitution of the acetates.

ACHARIA, in Botany, a genus dedicated by Professor Thunberg, to the honour of his countryman Dr. Eric Acharius, knight of the order of Wafa, a member of various learned societies, and one of the most distinguished botanists of the present day, particularly with regard to the Lieben tribe, which he has profusely studied, and most learnedly illustrated. (See Lichenes.) Dr. Acharius is now Regius Professor of Physic, at Vadstena, in Sweden.—Thum. Prodr. pref. n. 7. Wild. Sp. Pl. v. 4. 327. Lamark Illustr. t. 755.—Clas and order, Monoceta Triandra; or rather, perhaps, Triandria Monogynea. Nat. Ord. Eleagni, Jaff.?

Gen. Ch. Cal. Perianth inferior, of two small, ovate, acute, permanent leaves. Cor. of one petal, tubular-bell-shaped, downy, in three deep, equal, elliptical segments, permanent. Stam. Filaments three, very short, inserted into the top of the tube of the corolla, opposite to its segments; anthers roundish, of two lobes. Pist. German superior, roundish; style solitary, thread-shaped, half as long as the corolla; stigma three-cleft. Peric. Capsule ovate, of one cell, and three valves. Seed solitary? globose, rough. The flaments are most perfect in the upper flowers, the pistil in the lower.

Eff. Ch. Calyx of two leaves. Corolla of one petal, three-cleft. Capsule of one cell, and three valves. Seed solitary?

Obf. Nothing can be more imperfect or puzzling than the character and natural affinity of this genus, according to the materials furnished by Thunberg, especially what regards the capsule and seed. He defines the fruit, "capsule of one cell, with three seeds." Willdenow, who seems to have had no other authority than Thunberg's figure, says, "capsule of one cell and three valves, with a solitary seed," which last account seems to agree with that figure. With respect to the natural order of Acharia, if we take for basis what Thunberg terms a calyx, the flower will indicate one of Jussieu's Elegans, though the capsule of three valves is very anomalous, and the lobed leaves no less so. By the specific name trigodes, or rather tragoides, and the place where the genus is introduced, Thunberg appears to have considered it as akin to Tragia, (see that article,) which idea the aspect of the leaves, and the somewhat monocious flowers, might probably suggest.

1. A. trigodes. Lobed Acharia. Thum. Prodr. 14. t. 11. Fl. Cap. v. 1. 160. Wild. n. 1. — Gathered by Professor Thunberg, near Van Stade's river, and in other parts of the interior of Africa, above the Cape of Good Hope, flowering in December and January. Root fibrinous, annual? Stem solitary, herbaceous, erect? from four to twelve inches high, branched from the bottom to the top, smooth; branches alternate, angular, erect, somewhat zigzag, wand-like, subdivided. Leaves alternate, on stolons about their own length, about an inch long, three-lobed, finely downy; lobes ovate, variably cut. Flowers in effect monocious, axillary, solitary, on short stolons, reflexed, small, the male about the upper part of the plant, female lower down. The corolla is about a quarter of an inch long, downy all over, as are likewise the germin and style. Capsule ovate-oblong, acute, thrice the length of the permanent corolla. Seed nearly the size of a pepper-corn, apparently black and rough.

ACHIRON, l. r. Theprostia.

ACHILLINI, l. 25, for 40 r. 49.

ACHIMENES, in Browny, so named by Browne, pos-
ibly from ra, and χιλιον, to be countr, or temporary, meaning that the plants in question are not calculated to endure rough weather. He tells us they thrive well in the cooler parts of Jamaica. When cultivated in Europe, they require great heat. This genus is founded on two species only, and those as generally different as two plants of the same natural order can well be. See Browne's Jamaica, 270. t. 30. f. 1, and Juff. Gen. 119. The latter writer, following Browne, did not distinguish these plants. One of them is Columnnea Eirgifta, the other our Cypria; see that article.

ACHOR, last line, r. Porrigo instead of Tinea Capitii.

ACHROCORDES. Add. See Serpentes.

ACHTIL, Achtilegio, or Martel, a corn-measure in Germany, which contains 4 fomiers, 8 wettiers, 16 fechters, or 64 gefechdes. See MALTER.

Gen. Ch. Cal. Perianth three-leafed, somewhat ringent, awned; its two side-leaves placed under the lip; upper one broadened, vaulted, erect. Cor. Petals two, linear-lanceolate, much smaller than the calyx. Nectary a prominent undivided lip, shorter than the petals, with two swellings at the base, but no appendage to the disk. Stam. Anther terminal, permanent, of two cells close to each other; masses of pollen in each cell four, or two divided ones. Pijf. German inferior, oblong, angular; style erect; femi-cylindrical, without any auricles or wings at the summit; stigma in front. Péric. Capsule of one cell. Seeds numerous, minute.

Eff. Ch. Calyx somewhat ringent; its side-leaves under the lip. Lip without a spur, shorter than the petals, undivided, with two prominences at the base. Anther terminal, without appendages, permanent. Pollen powdery. Column femi-cylindrical.

This genus is next akin to Microtis of the fame author (see that article); to whose effentil character should be added, "Anther with two auricles. Column funnel-shaped."—Acianthus confinis of little smooth herbs, with foliary, undivided, naked, downy bulbs, or tubers, throwing out a few fibres, along with a downy foot, at whose extremity the young bulb is situated, on a partial flalk. Stem very short, its base enclosed in a short, tubular, pointed sheath. Leaf solitary, deeply heart-shaped, acute, with three ribs, and many reticulated veins; its under side red or purple. Flowers small, reddish, either clustered or solitary, their common flalk without bractes, except beneath each flower.

1. A. fornicatus. Vaulted Acianthus. Br. n. 1.—Flowem raceemofe. Awns four times shorter than the perianth. Petals nearly erect. Lip bearing longitudinal glands. Column concealed.—Native of the neighbourhood of Port Jackson, New South Wales, from whence we, long ago, received specimens in spirits, as well as dried, by favour of Dr. White, and where Mr. Brown has also gathered this curious little plant. The leaf is about an inch in diameter. Common flower-flalk from three to six inches high, bearing from two to five flowers, about the size and aspect of the Corallhorboniza, each with an ovate bracte at its base. Lower leaves of the calyx linear-lanceolate, very narrow in comparison of the upper one. Petals linear-lanceolate, very delicate. Lip somewhat fleecy, having a longitudinal furrow, the ridges bearded horizontally with papillary glands. This is the only species we have seen.

2. A. caudatus. Long-awned Acianthus. Br. n. 3.—"Stalk with one or two flowers. Awns very long. Leaf wavy at the margin."—Gathered by Mr. Ferdinand Bauer, in the neighbourhood of Port Jackson.

4. A. bifoliis. Two-leaved double Acianthus. Br. n. 4. (Epipactis reflexa; Labill. Nov. Holl. v. 2. 260. t. 211. f. 1.)—"Stalk sinple-flowered. Leaves two, radical, hooed. Perianth without awns, its three leaves united; the lateral ones reflexed. Petals linear, narrow."—Gathered by Labillardiere, at Cape Van Diemen. Mr. Brown doubts whether this species, which he appears not to have examined, is most akin to Acianthus, or to another genus of his, hereafter to be noticed, named Chiloglottis. It agrees with the former in having four maffes of pollen, a column defitute of a joint, and a lip without any appendage: with the latter in bearing two radical leaves, a perianth without awns, and very narrow petals. These last are represented in the plate, at fig. 2, as if situated on the outside of the calyx, which the description, and, if we mistake not, the other figures, shew to be an error of the draughtman or engraver.

ACICARPHA, so named by the celebrated Jussieu, from αιος, a point, and καιος, a chaffy scale, because the scales of the receptacle, as he thought, become armed with a spiny point, when the seeds, which they separately envelop, approach towards maturity.—Juss. in Annal. du Mus. d'Huff. Nat. v. 2. 347. Wild. Sp. Pl. v. 3. 2327.—Clafs and order, Syngenemia Polygonum-neceffaria? Nat. Ord. Composite capitate, or rather Aggregate, Linn. Corymbifera, fol. 5. Juff.

Gen. Ch. Common Calyx of one leaf, in five deep, linear, spreading segments, permanent. Cor. compound, diffocid. Florets all uniform, tubular, funnel-shaped; their limbs somewhat bell-shaped, five-cleft, obtuse; the central ones male, leaf numeros; those of the circumference more abundant, each furnished with flaments and pilifil, but not all fertile. Stem. Filaments five, very short; anthers oblong, united, shorter than the limb of the floret. Pijf. German oblong; style thread-shaped, longer than the corolla; stigma club-shaped, notched. Péric. none, except the hardened scales of the receptacle. Seeds solitary; oblong, defitute of crown or wing; each enclosed in a greatly enlarged, hardened, concave, spiny-pointed scales of the lower part of the cylindrical chaffy receptacle.

1. A. tribuloides. Caltrop Acicarpha. Juss. as above, 248. t. 58. f. 1. Wild. n. 1.—Leaves oblong, deeply toothed.—Gathered by Commenser, on the sea-shore at Monte Video. Root taperting, annual. Stems one or more, herbaceous, ascending or decumbent, a span long, somewhat branched, leafy, smooth. Leaves alternate, felfile, oblong, obtuse, fleshly, smooth, an inch and a half to three inches long, deeply and coarsely toothed; tapering at the base. Flower-flalks terminal and lateral, opposite to the leaves, and about as long, simple, single-flowered, erect. Flowers white, hemispherical, one-third of an inch in diameter. Fruit a globular head, armed with unequal, rigid, sharp, pale, divericature, or recurved spines, and crowned with
with a tuft of withered male florets, like a tassel. The intermediate florets seem to be abortive, though furnished with the most conspicuous pistils.

2. A. fruticosum. Spatulate Acicarpia. Brown Tr. of Linn. Soc. v. 12. 129.—Leaves spatulate, mostly entire.—Sent from Brazil by Mr. Sellow. A smooth, diffuse, apparently annual plant, with angular ascending branches. Leaves scattered, flaked, without stipulas, spatulate, with a very short little point, rather thick, and perhaps glaucous, an inch and a half long; the lower ones sometimes toothed from above the middle. Footstalks linear, a little dilated at the base; the lowermost longest. Heads of flowers yellow, solitary, either flaked and opposite to the leaves, or terminal and nearly sessile. involucrum of five leaves in a simple row, longer than the flowers. Receptacle conical, slender, chaffy, with lanceolate pointed scales. Florets tubular, uniform, smooth. Throat of the circumference in two or three rows, with perfect stamens as well as pistils. Tube of the corolla slender, cylindrical, closely united to the calyx, and base of the style; limb funnel-shaped, five-cleft, segments parallel at the edges, half-lanceolate, flat, three-ribbed. Stamens five, inserted into the corolla, alternate with its segments, their filaments, as well as the lower half of the anthers, united into a tube. Germen combined, each crowned with a five-cleft partial calyx, whose teeth, alternate with the segments of the corolla, become spinous, each germin containing one pendulous seed. Style thread-shaped, smooth. Stigma simple, obtuse, rather hairy. The numerous upper florets are rather smaller, with a membranous calyx, and imperfect germens. The ripe fruit, originating from the florets of the circumference, consists of close corollaria, combined together, not burr-like, each crowned with its own enlarged spinous calyx. Seed ovate, pendulous. Albumen fleshy, large, white. Embryo nearly cylindrical, central, about the length of the albumen, with two linear cotyledons. By this account it appears that Mr. Brown differs from M. de Jussieu, in thinking the present genus belongs to the Linnean order of Aggregate, and not to the Composite. This last account of the fruit is evidently more natural than the above, and the character, if Mr. Brown, which we doubt not, be correct, must be altered to "Seeds crowned with the spinous partial calyx."

ACID, ACIDIFICATION, in Chemistry. When these articles were written for the Cyclopaedia, the theory of Lavoisier, that oxygen was the only principle of acidification, was almost universally received. Since that period, however, a great revolution has taken place in chemistry, and the doctrine in question is now no longer admitted. This indeed has been noticed in subsequent parts of this work, more especially under Oxygen and Oxymuriatic Acid; so that little more is necessary than to refer our readers to these articles. It may not be deemed superfluous, however, to mention here very briefly the discoveries that have led to these important changes.

The first circumstance which gave the death-blow to the doctrine of Lavoisier, was the demonstration by Gay Lussac and Thenard, and more especially by Davy, that oxymuriatic acid, or chlorine, as it is now termed, contains no oxygen, but is a simple elementary substance. Chemists indeed had never been able to demonstrate satisfactorily that oxygen actually existed in this substance; but misled by the plausibility of the Lavoisierian doctrines, had tacitly admitted its presence from analogy; and so strongly was this belief founded, that there are a few, we believe, who adhere to the old opinions even to the present time.

More recently, however, the old opinions have been rendered still further improbable, and the new ones corroborated by the discovery of iodine and cyanogen; the one an elementary, the other a compound substance, both which have been unequivocally demonstrated to form acids by combining with hydrogen. The analogy, also, of sulphur- and tellurated hydrogen, compounds free from oxygen, but possessing the properties of acids, have been likewise urged in proof of the new opinions, and as quite irreconcilable with those of Lavoisier.

Our readers will find further information on this subject in the articles Chlorine, Cyanogen, Iodine, Muriaetic Acid, Oxygen, and Oxymuriatic Acid.

ACINACIFORME, Folium, in Botany, a Scimitar-shaped leaf, is scarcely used but for one species of Melita bryanthemum, which bears this specific name. (See Leaf.) It is of a succulent texture, compressed, one edge convex and thin, the other straighter and thick.

ACINACIFORME, Pericarpiun, a Seed-vessel of a similar shape, is exemplified in the cells of the capsule of the same genus of Melita bryanthemum; see Linn. Phil. Bot. 224.

ACINUS, in Botany and Vegetable Physiology, a Grain, is technically used for each pulpy portion, containing a foliary seed, of a compound berry. (See Bacca.) The fruit of the Raspberry, Bramble, &c., consists of several acini; and perhaps the same term may be applied to the separate portions of a Mulberry, though originating in the calyx of each flower become pulpy. In Pannasa the capsule is lined with very juicy acini, each lodging a single seed. Gartner improperly extends the above term to the simple many-seeded berries of the Vine, Gooseberry, &c. The last-mentioned fruit, in an early state, rather resembles the Pannassa.

Eff. Ch. Calyx none. Petals five; the uppermost vaulted. Nectaries two, flaked, recurved. Capules three or five.

M. De Candolle, following Jussieu's view of the subject, gives the following characters, using the term sepala for calyx-leaves, and petala for nectarini.

Calyx of five petal-like, deciduous leaves; the upper one (hood) large, concave, helmet-shaped; two lateral ones, (wings,) orbicular; two lowermost oblong. Petals five, sometimes irregular in number; three very minute, claw-shaped, often converted into flaments; two uppermost with long claws, hooded, sheltered under the helmet-shaped leaf of the calyx, dilated at the top into a bag, whose bottom, the summit, or spur, of the petal is callous, incurved, its mouth extended into an oblong, emarginate limb, or lip. Stamens indefinite. Capules three to five, with an indefinite number of seeds.

Perennial herbs, with tuberous roots, whose knobs in some instances bear fibres, in others are oblong, and mixed therewith. Stem leafy. Leaves flaked, deeply palmate, with from three to five segments, variously cut, cloven and toothed. Clusters terminal. Stalks single-flowered, from the bosoms of the bracts, each bearing two smaller bractias.

Flowers
Aconitum.

Flowers large, irregular, sometimes sulphur-coloured, sometimes blue, or white.

All the species are poisonous; the *Anthora* lese dangerous; the *Napellus* highly noxious. The root is always the most poisonous part, the herbage lese acrid, and though in a fresh state injurious to animals, by drying, or by boiling in water, it becomes so mild, that some species, *A. septentrionale* for instance, are eatable. Dr. Starck, who found Aconite so useful in chronic rheumatism, confirmed gout, and venereal swellings of long duration, employed *A. paniculatum*; but other physicians have often, without sufficient attention, promiscuously given every kind with blue flowers.

The twenty-eight species at this time known inhabit rough bushy or woody places, in the northern hemisphere; eleven are found in Europe, eleven in Siberia, one in Japan, one in North America, and one is common to Siberia and the western part of North America.

This is a most natural genus, but very difficult as to the determination of its species, nor has it been properly investigated. Clusius in his time was extremely well acquainted with the European kinds, and requires to be consulted in preference to all other writers.

*Aconitum* may be distributed by the habit, rather than by any characters, into five sections, or divisions, as follows.

† Such as are not sufficiently defined; 26–28.

†† Such as are doubtful, or uncertain; 29–35.

Section 1. *Anthora*.

To the above characters are added—Hood acute at the apex. Root with two oblong knobs.

β. atrovirens; leaves and flalks smooth. (A. fulfitorum elatus pyreneicum, folis atro-virentibus, flore majore; Tourn. Infl. 425.)

γ. confertiforum; clufter cylindrical, dense, downy. (A. tenuiforum; Patrinn, unpublished.)

Hood convex, terminating in a point; spurs spiral; lips involute heart-shaped. Leaves in numerous linear segments.

—Native of rough bushy places, on the mountains of Europe; in Switzerland, on the Apennines, and in Siberia;

β on the Pyrenees; γ on Mount Caucasia.

Var. α has either a fimple or branched stem, which, like the flower-stalks, is either fimple, or finely downy. β has smooth dark-green leaves, a taller and smooth stem, leaves convex, hood, with a more abrupt and pointed back. γ is smaller, with a clover more cylindrical clufter, whose main flak, as well as the partial ones, are clothed with velvet-like down; it may be a distinct species. *De Candolle*.

We have not followed, here or elsewhere, our learned friend, in his elaborate afsemblage of synonyms, nor in his chronological arrangement of them. To the latter we have objections, and the former would only be burdenfome to our plan. We will to give our readers an idea of his powers of discrimination, and to profit by them ourselves.

2. *A. anthoroides*. Prominent Wholefome Wolf’s-bane. (A. pyreneacum; Pallas Itin. v. 2. 316, by his herbarium.)—Hood convex; its back protruding forward, over the pointed back; spurs spiral; lips involute heart-shaped. Leaves in numerous linear segments.—Gathered by Pallas in Siberia. This is so like *A. Anthora*, that perhaps it may be esteemed a mere variety. It differs only in this respect, that the back, or ridge, of the hood is not merely convex, but stretched forward over the point in front. This plant varies like the former as to the density of its clufter, and the smoothness or fine downiness of the flower-stalks. *De Candolle*. We must readily concur in the opinion of its being a variety of the first species.

Section 2. *Lycocotonum*.

Flowers pale yellow, whitifh, or blueifh: their hood conical, elongated, obtuse, scarcely pointed in front. Root tuberous, fending out fibres. Leaves with somewhat wedge-shaped lobes, deeply toothed, or jagged, at the extremity. *A. barbatum*. Bearded Wolf’s-bane. Patrinn, unpublished. "Perf. Euchir. v. 2. 83. Poir Suppl. Lamarek Diet. v. 1. 114."—Hood conical, obtuse; spurs straight; lips obovate; wings bearded with a fringe. Bracteas minute. Stem downy. Leaves in five deep divisions, with linear pointed lobes.—Native of the eastern part of Siberia, about Irkoulik. *Patrinn*. Intermediate between *Anthora* and *Lycocotonum*, differing from the former in having a conical hood, from the latter in the linear lobes of its leaves; from both in the straight spurs, or fummits of the teeths, (De Candolle’s petals). Stem round, finely downy, not hifpid. Leaves with long fattered hairs on the foottalks, and here and there on the under fide; the upper appearing downy when magnified; their outline circular, divided nearly to the bafe into five somewhat cohering lobes, pinnatifid, with linear pointed segments. Clufter erect, long and dene. Stalks erect, shorter than the flowers, having under each a linear-awfifhaped, scarcely downy, bractea, fyll shorter; as well as a smaller clofe bracte half way up. Flowers whitifh, according to Patrinn; pale yellow when dry; externally downy; hood elongated; wings orbicular, with long hairs on their margin and inner surface. Germin downy.

4. *A. hifpidum*. Rough-flaked Wolf’s-bane. *De Candol. n. 4.—Hood conical, obtufe; spurs ftraight; lips obovate; wings fightly bearded. Bracteas awfifh-shaped, hairy. Stem hairy. Leaves in five deep divisions, with linear, rather acute, lobes.—Found by Pallas, in the eastern part of Siberia. *Lambert*. Differs from the half in its hifpid, not downy, stem; more deeply five-cleft leaves, whose lobes are not pointed, but rather obtufe, with a little callous apex; more hairy bracteas; and scarcely bearded wings. The leaves are very likc *Anthora*, but with broader lobes; flowers like *Lycocotonum*, but with ftraight spurs. Stem erect, round, fimple; hifpid chiefly at the bafe, with soft, rather deflexed, hairs; the top almoft fmoother. Lower leaves on long hairy flalks, their outline orbicular; upper fide fearcely downy; ribs of the under one hairy. Clufter fimple, rarely with one small branch, cylindrical, efteat. Stalks erect, shorter than the flowers, which are pale yellow, reffembing the half, but lfs bearded. Bracteas awfifh-shaped, flagggy, two lines long; two smaller ones in the middle of each flalk. *De Candolle*.

ACONITUM.

as its place of growth.—Hood conical, obtuse; spurs spiral; lips invariably heart-shaped. Clusters drooping at the summit before expansion. Leaves in five deep divisions; lobes pinnatifid, with spreading, recurved, acute segments. —Native of Siberia and Tartary; cultivated in the Upfal garden. Very nearly allied to Lycoctonum, but differing in the leaves being divided to the very base into many pinnatifid portions, whose elongated, acute, widely spreading segments are entire, not at all cut or serrated. Clusters long, its upper part drooping while the flowers remain in bud. Bracteas, both general and partial, very small. Stalk shorter than the flowers, but much longer than their respective bracteas. The rcf as in Lycoctonum. De Cand. To this original specimen is attached a different one from Siberia, which we conceive with professor De Candolle in thinking no other than Lycoctonum. Hence Linnaeus has no authority for A. pyrenaeicum, which depends upon other authors, as follows. His herbarium indeed contains, if we mistake not, a specimen of this species, brought by baron Allstroemer from Spain, but confounded by Linnaeus with Lycoctonum.

6. A. pyrenaeicum. Pyrenean Wolf’s-bane. Lamark Dict. v. 133. Desfont. Tabl. 149. “De Cand. Franc. ed. 3. v. 4. 916. v. 5. 642.” (A. pyrenaeicum, amphirole foliis liniinatis ; Tourn. Infl. 442. A. n. 6; Camer. Epit. 831, with a figure.)—Hood conical, obtuse; spurs spiral; lips ovate. Leaves palmate below the middle, with from seven to nine cleft, deeply cut lobes, lying over each other. —Native of rugged meadows on the Pyrenees, among lofty thistles, flowering in July and August. Tournefort and De Candolle. Related to Lycoctonum, but certainly distinct. A handlofe plant, three or four feet high, downy, with large, long-flalked, almost circular leaves, whose main lobes are unequally divided, wedge-shaped at the base, separted upwards into acute, cut lobes, dilated so as frequently to overlap each other. Clusters long, cylindrical, dense, more or less branched at the base. Stalks often shorter than the flowers. Lower bracteas in three or five lobes; upper linear, in the middle of each stalk, spreading, from two to five lines long. Flowers pale yellow, externally covered with velvet-like down. Germin hairy. These characters are not very strong, but they are constant. Specimens gathered by De Candolle in the Pyrenees differed in no respect from those which have been cultivated at Paris, ever since the time of Tournefort. De Candolle. We have had no opportunity of enquiring what brands for this species in the gardens of England, but Miller is most likely to have received the true plant from France. Our Linnaeus Spanish specimen, mentioned under the left, correctly answers, in every point, to the above description.

7. A. lycoctonum. Great Yellow Wolf’s-bane. Linn. Sp. Pl. 750. Willd. n. 7. Dietr. n. 4. Jacq. Aenl. 330. Bulliard Fr. t. 63. Villars Dauph. v. 3. 703; from the author. (A. lycoctonum vulgaris, lateo flore; Chuf. Hift. v. 2. 94. A. lucemum ponticum; Lob. Ic. 677. Ger. Em. 976. A. recticulata radice, floreumph theae-albicans; Barcel. Ic. 599. 600. A. n. 2; Camer. Epit. 827. Matth. Valgr. v. 2. 431. Napolis flore luteo; Rivin. Pentap. Terr. t. 129.)—Hood conical, obtuse; spurs spiral; lips ovate. Leaves downy, divided more than half way, into from three to five lobes, which are three-cleft and jagged. Partial bracteas in the middle of each stalk. —Native of woods, thickets, and grassy pastures, on the mountains of Switzerland, France, Germany, and Italy, flowering in summer. This is probably, as M. De Candolle indicates, the real Aconitum lycoctonum of Dioscorides, with whose imperfect account it sufficiently agrees. It is one of the most common of this genus, but not found in Britain. The stem is from two to four feet high, nearly simple, or very much branched, smooth or downy. Lobes of the leaves more or less deep, either close or spreading. Flowers crowded or diffiant. M. De Candolle hints that some of these diversities may afford specific distinctions, but we can scarcely suppose this. He observes that A. lycoctonum differs from harbatum, bipidum, and obtusum in its spiral spurs; from pyrenaeicum in having from three to five, not seven to nine leaves in the bracteas, and those not lying upon each other, as well as in the germin being smooth, fearedly at all downy or hairy, and the stalks mostly longer than their flowers. From the following, one, iither conformed herewith, it differs in having pale-yellow, not blue, flowers, and the partial bracteas situated half way up the flower-stalks, not near their base.

8. A. septentrionale. Blue Northern Wolf’s-bane. “Koelle Acon. 22.” Willd. n. 7. De Cand. n. 8. Ait. n. 6. (A. lycoctonum; Linn. Fl. Lapp. ed. 2. 185. Tour in Lap-land, v. 1. 36. 974. v. 2. 123. 277. Fl. Dan. t. 123. Calceolus Lapponicus; Schaff. Lapp. 360.)—Hood conical, obtuse; spurs spiral; lips ovate. Leaves downy, divided more than half way, into from three to five divaricately curved sharply cut lobes. Partial bracteas at the lower part of each flower-stalk. —Native of mountainous thickets and pastures on the sides of the Lapland alps, and throughout Norway, as well as in some parts of Siberia, and on the Carpathian mountains. Linnaeus noticed it also about the bases of the larger hills in Medelpad and Angermanland; but though he has recorded in Fl. Lapp, that the flowers are of a greyish-blue; not yellow, as described in all the accounts of A. lycoctonum; yet he still supposed his to be the same species. His own specimen retains evident traces of this blue or grey colour, and answers to the distinctive characters of the septentrionale, as given by De Candolle. The leaves, as that excellent writer remarks, are more acutely toothed. With respect to the situation of the partial bracteas, they are rather on the lower part, than at the base, of the flower-stalks. The flowers are half downy, and of a thinner texture, than in lycoctonum. Perhaps if living specimens were compared, better characters might be discovered, for there is every reason to presume this a distinct species. Linnaeus in Fl. Lapp. speaks of the leaves being boiled and eaten with impunity; and in his Lapland Tour, v. 2. 123, records another instance of the same fact. He was justly ashamed, knowing the poisonous quality attributed by all writers to A. lycoctonum. Perhaps this may strengthen our opinion of these plants being truly distinct, for we find no record of the true lycoctonum being used as food, in any fable. Haller was one of the first botanists who urged the propriety of separating these species; see his Hist. Stirp. Helvet. n. 1200. Yet there seems little room for his wonder, there expressed, that this Aconitum should be fatal to wolves. When recent its qualities are probably very different.

9. A. ochroleucum. Pale Wolf’s-bane. Willd. n. 4. De Cand. n. 9. Ait. n. 3. March. Thaurico-Caucas. v. 2. 14, excluding the synonym of Tournefort.—Hood conical, elongated; spurs curved; lips lanceolate. Leaves deeply palmate, five-lobed, fearfully downy beneath; lobes deeply three-cleft, acutely jagged and toothed. —Found in mountainous meadows of mount Caucasus; frequent about the mineral springs of Narzan; flowering in summer. Communicated to us by Dr. Fischer. The habit entirely resembles A. lycoctonum, but the surface of the herb is more smooth; the lobes of the leaves are more sharply toothed; and the spurs of the nectaris are rather curved than spiral. Stem erect, round, pale green, three or four feet high, with bright branches. Clusters long, branched at the bottom.

Lower
Lower bracts in three or five segments, often reflexed; upper linear; partial ones in the middle of each flower-bract, two lines long. Flowers pale buff, crowded, remarkable for their long and slender hood, measuring above an inch. Stalks shorter than the flowers. Spars of the nectaries curiously involute.

10. *A. japonicum*. Japan Wolf’s-bane. Thunb. Jap. 231. Willd. n. 2. De Cand. n. 10. (Soo Huo of the Japanese.)—Hood conical, obtuse. Leaves palmate, three-lobed; lobes obtuse, cut; their segments rounded, with a point. Gathered in Japan by Thunberg, who describes this species as allied to *lycoctonum*. The stem is round and smooth. Leaves folded; their lateral lobes in two segments; middle one in three; all obtuse, deeply toothed; their teeth rounded, with a point. Clutter short. Thunberg.

Sect. 3. *Napellus*.

Flowers blue or white, never buff-coloured; their hood convex, tapering into a point in front. Stem straight. Clutter cylindrical. Roots fibrous, from a rather tuberous stock. Leaves lobed in a palmate manner, many-cleft; their segments linear.

All the species of this section having been confounded under *A. Napellus*, De Candolle has thought right to lay aside that specific name entirely. But even he is doubtful whether they are not all one species!

11. *A. vulgaris*. Common Monk’s-hood. De Cand. n. 11. (A. Napellus; Linn. Sp. Pl. 751. “ Koelle Acon. 14, with a figure.” Woodv. Med. Bot. t. 6. Sm. Prodr. Fl. Græc. Sibth. v. 1. 372. A. lycoctonum 6, Napellus vulgaris; Clus. Hift. v. 2. 96. Napellus; Matth. Valgr. v. 2. 440. N. verus caruleus; Ger. Em. 972. N. flore minore; Rivin. Pentap. Irr. t. 130.)—Germens three. Smooth. Wings hairy on the inside. Clutter cylindrical, elongated. Leaves in five divisions to the very base, with many linear acute segments, each with a longitudinal furrow on the upper side.—Native of mountainous meadows in most parts of Europe, from Switzerland, Germany, France, Spain, and Italy, to Greece, flowering in summer, and one of our most common garden plants ever since the days of Gerarde. Dr. Leech sent us specimens from Scotland; but there is reason to doubt the plant’s being really wild in Britain. De Candolle distinguishes this from all its relations, though, as he says, with difficulty, by the simple, straight, upright stem, almost always terminating in a simple cylindrical close cluffer, and not corymbose; leaves with linear segments, that are hardly at all dilated at the extreme, marked with a furrow, and not resembling any others, except perhaps those of *A. tauricum*, whose cluffer is the only one more dense than the pretent; hood convex, rather acute at the summit, but not gibbous or elevated at the back, as in intermediate, rofratum, and variegatum; wings hairy on the inside, which in tauricum, paniculatum, &c. are smooth; germens smooth, never more than three, not five, and hairy; capsule 6x lines long, and not an inch, as in *A. neubergeri.* The present species however, being very common, is extremely variable; the whole surface is sometimes quite smooth, sometimes downy, especially about the flowers; the furrow on the segments of the leaves is more or less distinct; the flowers naturally blue, or (in the variety called by Schultz bicolor) white at the base, blue at the summit, become in gardens white, rofe-coloured, purple, or variegated. *De Candolle*. Their most usual and well-known colour is a deep and gloomy blue; we have seen no other. Dr. Sibthorp’s Greek plant mult reft on his own authority, being only mentioned in his Miss., without any accompanying specimen; nor were the species of this genus so accurately noted in his time.

12. *A. tauricum*. Taurian Monk’s-hood. Wulf. in Jacq. Coll. v. 2. 112. Jacq. l. c. Part 1. 492. De Cand. n. 14. “ Koelle Acon. 15.” (A. Napellus; Bull. Fr. t. 45? De Cand. A. lycoctonum quartum tauricum; Clus. Hift. v. 2. 95. A. violaceum; Ger. Em. 973.)—Germens three. Smooth. Wings smooth. Clutter cylindrical, elongated, very dense; stalks smooth, longer than the bracteas. Leaves in five divisions to the very base, somewhat pedate, with linear lobes.—Native of the alpine heights of Tauria, Karinthia, &c. flowering in summer. Very like vulgaris, but the smooth wings and flower-stalks, the latter shorter than their bracteas; the short dense cluffer, whose main stalk is concealed; and the pedate, more wedge-shaped, linear-lobed, scarcely furrowed leaves, are thought by De Candolle to afford sufficient differences.

Sect. 4. *Cammarum*.

Flowers blue or white; hood very convex, or conical, ending, often abruptly, in a point in front. Clutter lax, somewhat corymbose. Stem straight. Leaves deeply divided, in a palmate manner, into wedge-shaped lobes. Roots navell-shaped, intermixed with small fibres.

For the same reason as concerns the last section, the specific name *Cammarum* is here laid aside, having been variously applied by different botanists. De Candolle suspect all the species of the pretent section, or at least the first four, may be varieties of each other!

15. *A.*
15. *A. intermedium*. Ambiguous Monk's-hood. De Cand. n. 15. (A. neomontanum; Willd. n. 9, excluding the synonyms: "Hoppe Pl. Exsicc." *De Cand.* Thora italic. feu Napellus minor, flore caruleo; Barrel. 1c. t. 610.)—Germens three, smooth. Wings internally hairy. Clutter lax, corymbose; flacks smooth. Hood very convex, somewhat conical.—Found in mountainous woody parts of Germany and Flanders, flowering in July. In habit like the two following, but the hairy *Aconitum* (De Candolle by mistake fays *ipsa*) distinguishes this species from all the rest of the section. We have seen no specimen.

16. *A. paniculatum*. Panicked Monk's-hood. Lamarck. Franc. ed. i. v. 3. 646. n. 1214, Dict. v. 1. 33. De Cand. n. 16. (A. Nepello minor, sed minus, ceruleum, precocius; Buhl. Hist. v. 3. 656. Chabr. Scagir. 531. Napellus; Camer. Epit. 836. Storek Libell. 69. t. 3.)—Clutter drooping. *De Cand.* (A. cernuum; "Koelle Acon. 17." Willd. n. 12. A. lycocotonum octavum, comá nutante; Cluf. Hist. v. 2. 97. A. maximum nutante comá; Ger. Em. 971. A. septimum; Matth. Valgr. v. 2. 436. Camer. Epit. 852.)—Germens three, smooth. Wings internally smooth. Clutter lax, corymbose; flacks downy. Hood convex.—Found in various alpine parts of Europe, flowering towards autumn. The roots are roundish, tapering downwards, bearing many long fibres. Stem erect, smooth. Leaves somewhat pedate; their lobes wedge-shaped below, acutely pinnaed upwards. Clutter usually erect, with long downy flacks; downy; the lower ones branched. Flowers large, of a brighter blue than vulgare, with a convex hood, whose point is more remarkable than in the 3d section. It may be important, if any person should repeat Storck's experiments, to be aware that this is the plant he used, and not our Common Monk's-hood, *A. vulgare*. 

17. *A. refractum*. Beaked Monk's-hood. De Cand. n. 17. (A. Cammarum; Lamarck Dict. v. 1. 53. Willd. n. 14. A. lycocotonum nonum judenbergense; Cluf. Hist. v. 2. 97. A. maximum judenbergense; Ger. Em. 973. A. lycocotonum, flore magno; Buhl. Hist. v. 3. 659.)—Germens three, smooth, or only fringed at the inner edge. Wings smooth. Clutter somewhat corymbose, of few flowers, with smooth flacks. Hood conical, elevated, abrupt in front, with a prominent beak.—Native of the Austrian and Swiss Alps, flowering in summer. We have it in Mr. Davall's herbarium, but the plant seems unknown to cultivators. The roots are roundish, tapering downward. Stem a yard high, straight, round, smooth, purplish. Leaves somewhat pedate, with wedge-shaped, jagged, acute lobes. This species differs from the preceding, as well as from the following, in the very large and high hood, accompanied by a very considerable beak, being conspicuous for the greater size, and rather paler blue, of its flowers.

18. *A. begeysnum*. Downy-fruited Monk's-hood. De Cand. n. 18. (A. Cammarum; Linn. Sp. Pl. 751. Willd. n. 14. Ait. n. 11. Jacq. Auct. v. 42.4.)—Germens from three to five, all over finely downy. Wings nearly smooth. Clutter rather corymbose, of few flowers; flacks downy, Hood convex, beaked in front.—Native of rugged bony places on the Alps of Switzerland, from whence we have it; as well as of Austria and the Alps of Switzerland, flowering in summer. A large handsome species, with ample foliage, whose segments are acutely pinnaed. Flowers dark-blue; their hood rounded, much less elevated than in the preceding. The germens clothed with fine velvet-like down afford a clear specific character. There are no means of perfectly ascertaining the *A. Cammarum* of LINN., he having left no specimen, and his synonyms pointing to different plants. His character of "*floribus subpentagonis*" is all that indicates the present species, which is probably the plant of the gardens. De Candolle says all the synonyms of this, or principal, variety of *paniculatum*, may just as well serve for *begeysnum*; but surely Storck's figure cannot be mistaken for this. The plants themselves can never be confounded, provided the germens be attended to; for which discovery we are indebted to professor De Candolle.

19. *A. variatum*. Variegated Monk's-hood. Linn. Sp. Pl. 750. Willd. n. 13. Ait. n. 10. "Koelle Acon. 18." (A. lycocotonum decium, Thora italic; Cluf. Hist. v. 2. 98. A. lycocotonum ceruleum parvum; Ger. Em. 971. Napellus flore mixto; Rivin. Pentap. Irr. t. 133.)—Germens three, smooth as well as the petals. Clutter lax; flacks smooth; the lower ones many-flowered, twice the length of their many-cleft bracteas; their lower partial bracteas cut. Hood elevated, conical, obtuse, with a short beak in front.—Native of the Rocky Mountain, and Taipeh, flowing in August. Root, according to Clusius, tuberous, with ovate knobs, or rather perhaps buds. Whole herb smooth. Stem erect, with spreading branches. Lower leaves on long flacks, their outline orbicular, their upper side of a shining green, lower pale; their three or five deep principal divisions wedge-shaped at the base, dilated and more or less cut at the extremity, with oblong acute segments; upper leaves fiddle; floral ones in three deep divisions, copiously, but not deeply, cut. Lower flacks of the clutter dilated, each bearing three or four flowers. Partial bracteas, which are under each flower, linear. Flowers large, perfectly smooth, blue (or blue and white); the hood very large, above an inch long, and extremely convex, not at all covering the wings, its beak short; wings orbicular, six or seven lines long; germens smooth, slender. De Candolle. This description answers to the Linnaean specimen, and nearly to our garden plant, except that we have always seen the flowers principally white, with a portion of blue on the beak and wings, and that the stem in ours is rather of the tufting or wavy kind, as in the next section; by no means straight, though supporting itself. This character appears in the old wood cuts, and the natural order of the species; but he had seen no other than a dried specimen. The figure of Rivinus indeed is erect, and yet, not confining himself to the annexed representation of five capitula, we can barely doubt that this is a true.
be of no moment. The stem is round and smooth. Leaves smooth; their wedge-like lobes sharply pinnatifid. Clutter lax, with some axillary branches below. Stalks erect, smooth. 

Hood near an inch and a half long, obtuse, even, bent forward with a slightly recurved, notched, beak; its claw longer than the large round wings. 

Germens five, smooth.

Sect. 5. Anabates. 

Flowers blue or white; hood convex. Clutter lax. 

Stem twining, climbing. 

—Gathered by Koelle in Siberia; cultivated at Montpellier. 

Stem round, its fine close hairs scarcely visible with a microscope. Leaves smooth, with dillant, oblong, acute segments. Upper branches flowering at their extremities. Upper bracts in three or five divisions; upper oblong, undivided; partial ones linear. Stalks downy. Flowers pale blue, hardly at all downy; hood gradually tapering into an acute beak, with a space between it and the wings, which are fringed, but nearly or quite smooth on their infide. 

Filaments hairy! De Candolle. 

22. A. ciliata. Fringed Monk's-hood. De Cand. n. 22. (A. volubile; Willd. n. 11, but not of Koelle. Ait. n. 9. Donn Cant. ed. 5. 152.)—Stem twining, clothed with spreading hairs. Footstalks fringed. Leaves in three or five deep pinnatifid lobes, with linear-lanceolate segments. Clutter lax. Germens five or more. —Native of woods in Siberia. We received a specim in flower, in Sept. 1801, from the rich garden of the late Rev. Mr. Watts, of Ahill, Norfolk. The stem is round, flender, purplish, fix feet high, varying in its degree of downiness. Leaves in size and figure not unlike Malva moschata. Clutter branched, lax. 

Flowers of a middle fine, rather light blue, downy; hood convex, rounded, with a beak in front; petals hooked, with an obtuse, inerely heart-shaped, lip. Germens five or six, elliptic-oblong, smooth. Stamens smooth. Our specim renders answer to the more airy variety of De Candolle, which he suspected might prove a distinct species; we have seen no other, and can therefore form no opinion. 

23. A. tortuosum. Twisted Monk's-hood. Willd. Enum. 576. De Cand. n. 23. (A. n. 8; Math. Valgr. v. 2. 437? A. comatiflora, folia latioribus; Tourn. Inst. 425 ?)—Stem twining, smooth, as well as the footstalks. Leaves in three deep, ovate, pointed, coarsely and deeply toothed lobes. Clutter lax. Germens two or three, quite smooth, as well as the stem—Stem in a cultivated flat only, by Willdenow and De Candolle, who knew not whence it came. The stem rises to the height of six or seven feet, branching, round, and smooth. Leaves smooth; their lobes wedge-shaped at the base; the lateral ones deeply cleft. Lower bracts cleft, five cleft; partial ones sili- 

A. ciliata 

niform, placed about half way up each stalk. Flowers smooth, pale blue; hood convex, gradually tapering into an acute beak. The figure of Matthiolus expresses the habit, but may probably belong to some other species. De Candolle. Indeed many of that author's figures are curved, evidently to accommodate them to the dimensions of the wooden block. 

gated, conical, with a long, erect, cloven beak. —Native country unknown. Described from the herbarium of Professor Desfontaines. The whole herb is smooth. The flowers are pale blue, and remarkable for the long linear lobes which terminate the beak, and standing erect, are nearly on a level with the top of the hood, which appears to be the great peculiarity of this little-known species. 

Flowers round, somewhat branched, minutely downy. Footstalks smooth, round, with a longitudinal furrow. Leaves coriaceous, smooth, dark-green, lobed only about half down; lobes three-ribbed. Lower flasks of the clavus long and divided; upper simple and crowded; all downy in their upper part. 

Bracteas two, oblong, not far from the flowers, which are large, of a rich violet purple; hood tapering into a sharp beak; wings orbicular, hairy rather than fringed. Germens three to five, downy. 

Such is our Linnean specimen, from J. Bartram. 

M. De Candolle faw in the herbarium of Michaux, mixed with the above, specimens, which hood was twice as long, almost conical, without any hook or beak. This he considers as the uncinatum of that author, Fl. Boreal-Am. v. 1. 315, and possibly a distinct species. 

Mr. Pursh says, "On the foot of the Peaks of Otter, and about the sweet springs, another species occurs, with smaller flowers, and a climbing stem which sometimes attains the height of nine feet; but unfortunately I have no materials at present to give a correct description thereof."

Hence it appears that the history of this long-established genus is not yet complete. M. De Candolle enumerates three species, of which he had not sufficient information to define them correctly. These are, 

26. A. delphinifolium, of which there are three varieties. 

1. Americanum, found by David Nelson, in Sledge (not Hedge) island, with an erect stem, from six to twenty inches high, downy upwards; leaves like Delphinium pentagonum, smooth, in numerous pinnatifid segments; and blue racemose flowers, whose hood is convex, acute at the summit. 

2. Sibericum, gathered in Siberia by Pallas, has larger flowers, with neolaria but half the length of the hood. 

3. Kamchatcanum, has from three to six rather scattered, somewhat smaller, flowers, and rather longer neolaria. Root of tufted fibres. 

De Cand.

27. A. lythrum. (A. grandiflorum; Fischer Hort. Gorek. 1828. 77.)—Native of the Altai mountains. Root tuberous, ovate, the fize of a pen. Stem four inches high, flender, finely downy at the summit. Leaves in five deep, palmate segments, with linear acute lobes; the lowermost on long stalks. Flowers two, terminal, nearly sessile, pale blue; hood convex, externally downy at the back, tapering into an acute beak; wings obtuse, or roundish, smooth. Stamens smooth. Germens three, villous. Neolaria hooked, obtuse, with very minute lips. 

De Cand. 

28. A. maximum. Pallas herb.—Native of Kamchatka. 

Stem six feet high, erect, round, smooth. Leaves smooth, flaked, wedge-shaped at the base, in three or five dilated, wedge-shaped, five-leafed lobes. Clutter short, of eight or ten pale-blue flowers, on downy flasks, with a convex acute beak, like that of delphinifolium, but smaller. 

De Cand. 

The
The seven following are scarcely to be ascertained.

29. A. nonum; Matth. Valgr. v. 2. 438. Dalech. Hist. 1741. f. 2. A. comata inflata, floribus rarioibus, et foliis elegantissimis; Tourn. Init. 425.—We should suppose this an unnatural posture of A. Anara, n. 1.

30. A. lycoctonum quarundam, five lyceumum; Clus. Hist. v. 2. 96. Bauh. Hist. v. 3. 657.—No figure.

32. A. ficcica florae pyramidalis; Morit. Pral. 226. A. pyramidalis multiflorum; Tourn. Init. 425. A. pyramidalis; Mill. Diet. ed. 8. n. 6.—Enfeemed by De Candolle a variety of A. vulgaris, n. 11.

34. A. minus autumne infusio Cheufan, unicus Yfou-i; Pluk. Amath. v.

35. Napellus major carlsunius montanus, Anathor racid; Boecc. Muf. 74.—Native of Monte Cofione, in Coreia.

ACOTYLEDONES, constitute a class of plants in the natural systems of most authors, but especially of Juffieu, in whose method this class stands first. In thefe the corculum of the feed is defined to be deliht of cotyledons, and consequently undivided in the progress of germination, though forming a root below, and more or less of itself, or at least a frond, above. The parts of fructification in many of this tribe are obscure, anomalous, or altogether unknown. The orders in the above-mentioned writer are fixed; Fungi, Algæ, Hæpatice, Musci, Filices, and Naiaedes, all which articles the reader will find in their proper places. From our account of Mufci and Filices he may observe, that the denomination of the supposed natural clas in question, and its essential character above-mentioned, are far from being universal or unquestionable; these two orders having manifest cotyledons, or something equivalent; while many plants, supposed to have a folitary cotylodan, have really none at all. See the article MONOCOTYLEDONES, where this subject is discussed. See also Cotyledones and Germination.

ACOUCHY. See Ackouschy.

ACOURAOA, in Botany, apparently a vernacular name in Guiana, by which Aublet has chosen to designate a papillose-diadaphous plant, which Juffieu, with great reason, supposes to be a species of Pterocarpus (see that article); as well as another genus, named by the fame author Vatairea. See Aubl. Guian. 753—756. t. 201, 302.

A. violacea, the only species, is a tree, found about the margins of salt-water creeks in Guiana, bearing flowers and fruit in July. The trunk is twelve or fifteen feet high, and a foot in diameter, sending out from its summit many spreading branches; the bark reddish, cracked, and wrinkled; the wood whitish externally, but the heart is reddish, hard and compact. Leaves alternate, alternately pinnate of seven or nine ovate, pointed, entire, firm, smooth leaflets, gradually larger upwards, the lowermost being an inch and a half or two inches long, the uppermost or terminal one four or five. 

Stipulas small, deciduous. Clavata about the ends of the branches, long, compound, many-flowered. Bracteas small, folitary at the base of each flower. Calyx of one leaf, in five sharp unequal seguments. Corolla papillose, violet-coloured. Stamens ten, diadelphous, the odd one distinct. Stigma obtuse. Pericarp dry, reddish, nearly orbicular, concave on one side, convex on the other, not burbling. Seed foliandy, lenticular. Aublet.

The Vatairea, Aubl. t. 302, is a much larger tree, the trunk being fifty feet in height, with a smooth whitish bark, and light brittle wood. Leaves pinnate, as in the former, but more elliptical. Flowers unknown. Pod flat on both sides, with a thick edge, chefunet-brown, of an irregular orbiculate shape, about three inches in diameter, containing one large seed; which, when beaten in a mortar with purified pork lard, is used to cure titters or ring-worms, whence the inhabitants of Guiana call this feed Graine à darries. The tree grows by river sides in that country. Aublet.

ACQUACKACK. Add, containing 2023 inhabitants.

ACRE, col. 3, l. 29. The tobacco of Acre is highly esteemed; and coarse muskts, remarkable for the durability of their dye, are sold at a low rate. The inhabitants make use of wooden tubes for their tobacco-pipes, garnished with a swathing of silk, or linen, for the purpose of absorbing water. This being kept moist, cools the smoke, as it rises, by the constant evaporation. A modern traveller, in the account of his journey from Acre to mount Carmel, mentions the exportation to Venice of the land of the river Bebus for the glufs-houses of that city. (SeeGlass.) At Acre there are the remains of an ancient church, with pointed arches, other influences of which, demonstrating the existence of the Gothic architecture, occur in the Holy Land.

ACROSTICUM, in Botany, a Linnaean name, whose meaning therefore is to be sought in the obscure hints left by its author. He derives the word in Phil. Bot. 183, from a, κοσμημα, ἀκρος, στυλος, an order or row, but its application has been thought rather difficult. We agree with De Theis, that ακροστυλος literally means the beginning, or the first letter, words, or lines, of a set of verses; but we cannot attend to his explanation of its being given to these plants "because several of them bear, on the back of the leaf, lines resembling the beginnings of words;" there being in fact no such thing, nor has Linnaeus described any similar marks. It seems natural to trace his ideas in the appearance of the most remarkable of the original species, four of which are delineated in Aemn. Acad. v. 1. t. 10, and in two or three of these, the rows of linear appendages, or leaflets, at the top of the frond, sufficiently explain the meaning of Linnaeus. These species indeed are now removed from the established genus of Acrastichum, which has undergone much alteration since its first publication, and the view of its species already given, (see Acrostichum,) requires to be totally reformed. Many of them are removed to other genera, while a great number of new ones have more than supplied their places. Willdenow, the latest general writer on Filices, which make the most original and accurate part of his Species Plantarum, deems sixty-two species, under six fections, of which we shall take a general view, first, as usual, prefixing the generic synonyms and characters.—Linn. Gen. 559. Schreb. 756. Willd. Sp. Pl. v. 5. 100. Mart. Mill. Diet. v. 1. Ait. Hort. Kew. v. 5. 763. Sm. Mem. of the Acad. of Turin, v. 5. 1. 147. Traites 230. Prodr. Pl. Græc. Sibth. v. 2. 271. Swartz Syn. Fl. 9. Ind. Obs. 1857. Spreng. Cyl. Eng. ed. 84. t. 2. f. 18. Brown Prodr. Nov. Holl. v. 1. 145. Purish 658. Jull. 15. Lamarck Diet. v. 1. 34. Illui. t. 865 f. 4.—Clas and order, Cryptogamia Filices. Nat. Ord. Filices daff.; sect. annulata.

Gen. Ch. Capsules globular, of two equal valves, bound by a jointed elastic ring, and disjoined in broad, continued, indeterminate, dense maffes, more or less intermixed with hairs, or fine scales, over the back of the frond; either entirely, or partially at the upper part of the whole, or of its segments or leaflets, which are often contracted, or otherwise changed, in their fruitifying portions. Insectum entirely wanting, (unless the above-mentioned hairs, or scales, be taken for lich.)

Eff. Ch. Capsules occupying the back of the frond, in uninterrupted.
uninterrupted shapeless masses, either partially or entirely.
Involucrum none.

The whole genus, as it now stands, is chiefly tropical, a
very few species only being found in the south of Europe,
and one in North America. None are arborecent.
The species removed from the catalogue of the genus, in our
former article, are the following; and are thus disposed of
by Willdenow, we believe, on the whole, very correctly.

A. lanceolatum, is Polypodium acrolochoides, Wildl. Sp.
Pl. v. 5. 156.
biterophyllum, P. adnaecons, ibid. 145.
epicaton, Sm. Pl. lc. t. 49. Lomaria epicata, 289.
Lingua, Polypodium Lingua, 162.
bafulatum, P. triquique, 163.
feptentionales, Asplenium septentionales, 307.
auffrae, A. auffrale, 308.
pefinatum, Schizsea pefinata, 85.
dichotomum, S. dichotoma, 87.
digiatum, S. digitata, 86.
ferrugineum, Polypodium incanum $, 175.
polypondioides, P. incanum $, 174.
romum, Hemoschitis rufo, 129.
puntatum, Linn. Suppl. 444, altered to puntulatum by
Swartz, Syn. 13, retains the latter name in Wildl.
Sp. Pl. v. 5. 118.
areolatum, Woodwardia anguifolia, Sm. unjustifiably
altered to W. onoeoideis, ibid. 416.
marginatum, Pteris grandifolia, 356.
fuscum, Polypodium funeum, 198.
platyneuron, Asplenium ebeneum, 329.
filiformus and thalictroides, reduced to one species, as
Pteris thalictroides, 378; but perhaps they require
further investigation.
bene, Polypodium bene, 198. See Woodsea.
fuscatum, Mertensia fuscata, 71; a genus reduced by
Mr. Brown to Gleichenia. See that article, and
Mertensia.
acutatum, Davallia furvanioides, 480.
barbarum, Todea africana, 76, our Osmunda barbara.
vivipara, Darea vivipara, 302.
ferrulatum, Grammitis ferrulata, 141.
graminoides, G. graminoides, 141.

To which we must add that A. ebeicus is made by Wilden-
now the variety $ of calteumatis, 124; and petiolatum is
reduced to viseum, 103. Fifteen species therefore, out
of our former list, are all that are retained by Willdenow,
and the generic name remains with plants that do not by any
means answer to it, though they agree correctly with the
generic character.

We proceed to give examples of the several sections.
Sec. 1. Frond simple, undivided. Twenty-five species.
We shall here venture to unite two of them, lafisfium and
longifolium, adding a new one, limbella.
n. 1. Swartz Syn. Fil. 419 and 191. t. 2. f. 1.—Barren
fronds roundish, obtuse, somewhat heart-shaped; hairy and
downy beneath: fertile ones obovate. Common flack thread-
shaped, scaly, creeping.—Found by Thunberg in Java. The
common flack creeps extensively, attaching itself by copious,
tufted, black radicles, and bearing several alternate simple
fronds, or leaves, not an inch long, on short partial foot-
flacks; these are smooth on the upper side, veinless; the
hoary down of their under surface is interperfved with flary
hairs. The fertile fronds are fewer and smaller, tapering at
the base, sometimes befrinkled with flary hairs; their
backs covered with shining-brown capfuls, intermixed
with flary hairs of a rufty hue. Swartz.
A. fimbriatum. Fringed Acrostichum. Wildl. n. 3.
Fil. 11.—Fronds lanceolate, fringed. Stalks flarily. Na-
tive of flady mountainous places in the kingdom of Quito.—
We have been favoured with a specimen, gathered by William
Swainson, jun. efg. of Liverpool, on damp rocks in woods,
among the mountains at Rio Janeiro, which answers to the
above definition, but we are not authorized, without better
information, to affert that it is Cavan’s plant. The fronds
of ours grow eight or ten together, in tufts, with a fibrous,
blackish, scarcely hairs root, each being an inch and a half
long, one-third of an inch wide, bluntish, hairy; the latter
fronds with coarse, flarily, reddish-brown hairs, spreading
copiously beyond the edges. Stalks flimply, equally flaggy,
rather longer than the fronds. The fertile fronds are convex
above, almost hooded; their conoive under surface covered
with brown capfuls. The fize and habit of this fern referm
Blechnum Lanceolata, of Swartz, in Stockholap Tranf. for
1817, 71. t. 3. f. 2, a native of Brazil; but the latter is
smooth and naked, with the proper fructification and involu-
creum of a Blechnum.
Swartz Syn. Fil. 10 and 193. (A. petiolatum ; Sw. Ind.
Oce. 1588.)—Fronds linear-lanceolate, pointed, smooth on
both sides; their ribs, as well as flalaks, fealy and vi-iced:
fertile ones linear; hairy beneath and covered with capfuls
to the very margin.—Found on the mosdy trunks of trees,
on the highest mountains of Jamaica. Root slightly creeping.
Stalks crowded, slender, angular, roughish, rufty and fealy,
three or four inches high. Each frond is a fpan long, erected,
rather rigid; the barren ones linear-lanceolate, pointed,
foemewhat membranous, smooth, befrinkled at the back
with minute, prominent, brownifh, glandular dots; their
ribs fealy; fertile ones on longer flalaks, more linear, either
smooth or slightly hairy, covered entirely at the back with
pale rufty powdery capfuls. The clammines of the flalaks,
and the hairiness of the fertile fronds, distinguished this species
from its allies. Swartz.
A. limbella. Narrow-bordered Acrostichum. (Lin-
gua cervina anguifolia, cofts et pediculis villosa; Plum.
Fil. 113. t. 129.)—Fronds linear-lanceolate, wavy, pointed,
smooth on both sides; their ribs and flakks hairy: fertile
ones nearly linear, with a smooth naked border.—Gathered
by Plumier, on mosdy rocks about the fource of a little
rivulet, called Le Morne Rouge, near fort St. Pierre, in
Martinico. The root is long, creeping, cylindrical, refe-
bling a worm, covered with little black fbrices. Fronds
numerous, erected, above a foot high, each of their fine trans-
verse veins ending in a little dot, before they reach the margin;
at leat fuch is their appearance in Plumier’s figure. This
character, the greater height of the fronds, and the fertile
ones having a smooth naked border, over which the capfuls
do not extend, caused Dr. Swartz to omit citing Plumier’s
figure under the lat-mentioned species. We have no doubt
of these plants being very diftinict from each other. Plumier
is one of the few autors whose fidelity is always to be relied
on, and he is therefore the fole authority for several of Lin-
naeus’s species of frens, described from his plates and de-
erpitions.
n. 10. Swartz Syn. Fil. 10. Ind. Oce. 1592. (Lingua
cervina villosa minor; Plum. Fil. 110. t. 127, f. D.)—
Fronds lanceolate, wavy, pointed, shaggy on both sides;
fertile ones somewhat elliptical, with a naked border; fringed
at the edge. Stalks hairy, elongated.—Gathered by Plu-
meri
mier in wet woods in Hispaniola; by Swartz on the hollow mossy sides of hills in the south of Jamaica. Root tufted, not creeping. Stalks about half as long as the fronds, flaggy with coarse rusty hairs, such as cover both sides of the leafy part, especially at the edges. There is a vacant space, as in the leaf, between the capulæ and the margin of the leaf, well expressed by Plummer, and mentioned by Swartz.

A. birtum. Great Hairy Acrostichum. Willd. n. 11. Swartz Syn. Fil. 419 and 194.—Fronds elliptic-lanceolate, pointed, scaly on both sides, like their flanks; the margin dotted, and somewhat crenate: fertile ones much narrower, covered to the edge with capulæ and convoluted scales.—Supposed by Swartz to be a native of Madeira, but we have always believed our fine specimens to have been gathered by the late Mr. Smeathman, in the West Indies. The root is thick and scaly, apparently somewhat creeping. Fronds a fpon long, on fcaly flanks often exceeding that length; thickly besprinkled sometimes on both sides, but especially on the under one, which is the palest, with small, ovate or heart-shaped, pointed, peltate, close-preoccupied scales, of a pale shining brown. Many of the transverse veins terminate, near the margin, in depressed dots. The fertile fronds are much shorter and narrower, somewhat heart-shaped at the base, covered entirely at the back with shining rusty capulæ, intermixed with lanceolate, convoluted, tubular scales. We have one frond, two-thirds of which are barren and broadly elliptical, but the upper part is suddenly contracted into a lanceolate form, covered with capulæ and scales. The main rib is always very feally beneath.

A. undulatum. Wavy Hairy Acrostichum. Willd. n. 14. (Lingua cervina villosa, major et rufescens; Plum. Fil. 110. t. 126.)—Fronds ovato-lanceolate, somewhat wavy, brilly on both sides, like their flanks; the margin slightly crenate and obscurely dotted: barren ones emarginate: fertile ones acute.—This, according to Plummer on the trunks of old trees, in Martinico. Nearly related to the last, but distinct. The fronds are smaller and narrower, with much fewer evident marginal dots. The brilly hairs, scattered over both surfaces, and also clothing the flanks, in some degree imitate partake of the nature of scales, and are channelled, or slightly tubular at their base: but they totally differ from the flat close-scales of the foregoing. The end of each barny frond is more or less emarginate, with a little tuft, or bud, of scales in the suture.

A. latifolium. Broad-thick-leaved Acrostichum. Willd. n. 15. Swartz Syn. Fil. 9. Ind. Occ. 1580. (A. n. 1; Browne Jam. 104. A. longifolium; Willd. n. 16. Jacq. Coll. v. 2. 105. Swartz Syn. Fil. 9. Lingua cervina rigida et glabra; Plum. Fil. 118. t. 135.)—Fronds oblong-lanceolate, bordered, contracted at each end, smooth on both sides, as well as the flanks: fertile ones of the same shape, with a smooth, narrow, membranous edge. Native of rocks, and old mossy trunks of trees, in Jamaica and Martinico. The root is thick and creeping, clothed at the extremity, and about the bottoms of the fronds, with large, brown, chaffy scales. Fronds scattered, from a span to twelve or eighteen inches long, erect, entire, rigid, with a narrow, thin, membranous, entire border, a flat reddish rib, and scarcely any traces of veins, both surfaces being peculiarly even and smooth. The flanks are smooth and naked, angular, sometimes as long as the fronds, but generally shorter. The fertile fronds agree with the barren ones in shape and size, as well as in their narrow, membranous, naked border, but the whole under side, except that border, is densely clothed with innumerable, minute, smut-coloured capulæ, unaccompanied by any scales or hairs. Jacquin described his plant independent of Swartz, but we cannot find the leafy pretence for distinguing them, even as varieties, the revolute position of the seed-bearing frond, in Plummer's plate, being merely owing to its young state, as its description implies. The flanks, at an early period, may probably be somewhat feally, though afterwards naked, even in the fertile fronds.

A. crinitum. Hairy Oval Acrostichum. Linn. Sp. Pl. 1523. Willd. n. 23. Ait. n. 2. Swartz Syn. Fil. 11. (Lingua cervina villosa, amplis folis subrotundis; Plum. Fil. 109. t. 125. Phyllitis crinita, lattifimo folio; Petiv. Fil. n. 145. t. 13. f. 14, copied from Plummer.)—Fronds elliptical, obtuse at each end, hairy, densely fringed. Stalk and mid-rib hairy.—Gathered by Plummer in Martinico. Brought from the West Indies to Kew Garden, by Admiral Bligh, in 1793. A very fine and large species, specimens of which are rare. Each frond is about a foot long, and half as much in breadth, fthily; of a somewhat yellowish-green on the upper side, besprinkled with slender brilly hairs, which, as well as the thick fringe, and the copious hairs on the flanks, are coal-black. The fructification of this plant has not been ascertained, for what Plummer noticed, on the very young leaves, were most probably the umbil and glandular bales of the hairs; nor was he at all confident on this subject. It may well, however, by analogy, be considered as an Acrostichum. The root is tufted and haggy. We place this fern next to species with which it most nearly accords; the following one being incorrectly inferred before it by Willdenow.

A. crispsifolium. Lemon-leaved Acrostichum. Linn. Sp. Pl. 1529. Willd. n. 22. Swartz Syn. Fil. 9. (A. n. 3; Linn. Amoen. Acad. v. 1. 269. Hemionitis paraffica; Linn. Sp. Pl. 1535. H. n. 21. Browne Jam. 95; from the author. Lingua cervina frondis, citrei folis, minor; Plum. Fil. t. 116. Lonicera vilissima fo; Petiv. Fil. n. 150. t. 15. f. 1.)—Fronds alternate, ovate, pointed, tapering at the base, on short flanks, smooth, reticulated with veins. Common falk creeping, scaly.—Found on trees near rivulets in Martinico, and in the cooler, shady, inland woods of the mountainous parts of Jamaica. The common flem, or main root, creeps to a great extent, among mosses, or Juangermanie, up the old trunks of trees, attaching itself by numerous haggy radicles. It is clothed with large, acute, reticulated, finely toothed, pellucid scales. The fronds are situated alternately, about one or two inches from each other, on short bordered flanks, spreading in two directions, and are ovate or elliptical, of a fine shining green, rather fthily, very smoth, two or three inches long, and one or one and a half broad, obscurely crenate. There is only about half way up any decided mid-rib, but the principal veins, parallel at first, branch out into regular, very elegant reticulations. Some of the uppermost and youngest fronds, according to Plummer, are entirely covered at the back, with minute, densely crowded, bright cheetah, capulæ, except a central naked line, indicating a mid-rib. We have no speciemen in fructification, but several capulæ accidentally flicking to one of the barren fronds, are remarkably small, very pale, with dark jointed rings. Linnæus originally adopted this fern, as an Acrostichum, from Plummer. When he received speciemen of the same from Browne, as a Hemionitis, he did not discover that he had already clasped the plant in his Syllen; hence it occurs twice, even in his Sp. Pl.—Hemionitis obtusa, Willd. Sp. Pl. v. 5. 127, agrees very nearly with this Acrostichum, in size and texture of the fronds, and most precisely in their veiny reticulations; but its fructification is described as essentially different.

Sect. 2. Frond simple, divided. Four species.

A. pel-
A. petalum. Shield Acrostichum. Willd. n. 26. Swartz Syn. Fil. 11. Ind. Occ. 1593. (Ofmunda petalata; Swartz Prod. 127. Lichen digitatus, geranii facie; Plum. Fil. n. 188. f. 11. f. 3.)—Barren fronds in many forked, linear, radiating segments; fertile ones undivided, roundish-kidney-shaped, finely crenate. Found on the mossy trunks of trees, in Jamaica and Hispaniola. This remarkable little fern has the habit of a Trichomanes; or of some very singular Jungermannia, brought by Mr. Menzies from New Zealand. The trailing creeping root throws up several fluted, vertical, membranous, barren fronds, deeply divided into two principal lobes, and each of those irregularly into numerous, linear, single-ribbed segments, all spreading like a fan. The fertile fronds are about as tall, but smaller, not an inch broad, roundish, or somewhat kidney-shaped, horizontal; pale green and smooth above; covered beneath with small, brown, shining, annulated capules.

A. alicorne. Stag's-horn Acrostichum. Willd. n. 29. Swartz Syn. Fil. 12. 17. and 196. Brown n. 1. Ait. n. 3. ("A. Stemonaria; Beauvois Fl. d'Oware, 2. t. 2." A. bifurcatum; Cavan. Leccion. 241. n. 587. Neuroplatyceros ethiopicus, nervosifolius, cornu cervinum referentibus; Pluk. Amalthei. 151. t. 429. f. 2. Cornus alicis Simbor dicta; Bont. Hist. Nat. 121, with a figure.)—Fronds somewhat tufted, forked, coriaceous, ribbed; downy at the back; from a peltate, leafy, spongy base.—Of Guinea, Madagascar, Java, and New South Wales, growing on the trunks of trees. This is a very large and striking species, attached to the trees, or sometimes to rocks, by a peltate, dilated, somewhat membranous, irregular, vein, lobed base, of a shining brown, a foot in diameter; thin at the edges; thick and spongy in the centre, where it is fixed by downy branching radiates, and from whence it throws up two or three erect, flat, irregularly forked fronds, a foot or two in height, rather dilated upwards, entire at the edges, from one to two inches broad in the different parts; tapering at the base into a root, channelled, winged footstalk. The ultimate divisions are level-topped, linear, bluntish, near a finger's length, each bearing at its back, in the lower half, a broad, irregular, dense, naked mass of immeasurable brown capules, so disposed in close lines, that the whole mass appears like a chain. The whole frond is strongly ribbed; green and smooth above; whitish and downy beneath; the ribs forked, smooth, reddish. We cannot but think the singular dilated base of this fern is no other than one of its segments, or reputed cysteledons, greatly enlarged, and more permanent than usual. Polypodium quercifolium of Linnaeus, Willd. Sp. Pl. v. 5. 1754, has something analogous in its barren fronds, which are only advanced a step nearer towards the proper habit of a fern. See Ger. Enc. 1. 113. 32.

Sect. 3. Frond tinate. Two species.

A. quercifolium. Oak-leaved Acrostichum. Willd. n. 30. Swartz Syn. Fil. 12. Retz. Obs. fac. 6. 39. "Schkuh. Crypt. 2. t. 3." (Ofmunda trifida; Jacq. Coll. v. 3. 281. f. 20. f. 3.)—Fronds tinate, blunter lobed; fertile ones contracted, linear-oblong, somewhat cut.—Found on trees in Ceylon, by Koenig. A delicate slender fern, whose small, creeping, fealy root sends up several erect fronds, from six inches to a foot high, whose downy fronds are also fealy in their lower part. The terminal leaflet is much the largest, two or three inches long, and one broad, in the barren fronds, with downy ribs and edges, obtuse, slightly and variously nutated; the lateral ones an inch long, rounded, somewhat lobed. The fertile fronds have each a much taller smoother stalk, but their leaflets are, as usual, much smaller and narrower, their back covered, except the ribs and margin, with minute, fluted, annulated capules.

A. aurium. Earled Acrostichum. Willd. n. 31. Swartz Syn. Fil. 13. and 198. (Felix florida; Rumph. Ambioin. v. 6. 78. t. 35. f. 1.)—Fronds tinate, pinnatifid, cut; fertile ones doubly pinnate, with linear entire segments.—Native of Amboyna and Java, growing among coarse grutes, on the banks of rivers. Rumphius, Thémburn. Stalks from one to two feet high, slender, angular, smooth, black and shining. Fronds smooth, slightly veiny, of three principal leaves variously pinnatifid, lobed and cut, several inches long; the middle one largest: the fertile fronds are more compound, with extremely narrow linear leaflets or segments.

Sect. 4. Frond pinnatifid. Three species.

A. furrelatum. Finely-ferrated Acrostichum. Willd. n. 32. (Polypodium fuscum tenuifilis denticulis ferratum; Plum. Fil. 63. t. 81.)—Fronds deeply pinnatifid; segments linear-lanceolate, parallel; those of the barren ones finely ferrated, of the fertile ones entire.—Gathered by Plummer, in the forests of Hispaniola. The long, creeping, nearly smooth, blackish root sends up several fronds, twelve or eighteen inches high, on shortish smooth footstalks. The outline of each is lanceolate, taper-pointed, composed of a great number of crowded parallel segments, divided almost to the mid-rib, each segment linear, acute, finely and sharply ferrated, smooth on both sides, thin and almost membranous, with a rib and many finely forked veins. From the very extremity of the root springs one frond, a little smaller than the rest, but of a similar structure, except that its segments are nearly all entire at the margins, and bear on their backs a dense assemblage of minute chestnut-coloured capules, some few of the upper segments only, with the point, being naked and ferrated. By the figure, this fern would be judged a Blechum, and possibly it might, if examined in a young state, prove to be fuch, the capules extending over the leaf at an advanced period only, when the involucrem is often reflexed, or obliterated; but as no botanist, besides Plummer, appears to have seen the plant, we must rely on his account of the matter, and he very precisely says the back of this fertile frond is at first, as it were, chagreen'd, and cheynut-coloured, being subfuscly entirely covered with fine dust, of the same hue.

The others of this section are, A. lepidopteris of Lange-dorf and Eichtzer, 1c. Fil. t. 2, from Brasil; and A. brunn-enum of Willdenow, from the Caracacias.

Sect. 5. Frond pinate. Fifteen species, besides one of Mr. Brown's.

A. bifurcatum. Slender Forked Acrostichum. Willd. n. 35. Swartz Syn. Fil. 12. "Schkuh. Crypt. t. 2. f. 3." (Ofmunda bifurcata; Jacq. Coll. v. 3. 282. f. 20. f. 4. Filicaea corniculata, infixa Sante Helene; Pluk. Mon. 85. Phyt. t. 350. f. 4.)—Fronds pinnate; leaflets linear, deeply divided, spreading; those of the fertile fronds rounded; the lower ones more or less tinate; upper solitary.—Native of St. Helena and the West Indies. A slender delicate fern, allied in habit to A. quercifolium, described in the third section, but much smaller, and with very different barren leaflets. Its height is about six inches; the fronds wiry, or almost capillary.

ACROSTICUM.

Fronds pinnate, smooth; leaflets of the barren ones lanceolate, pointed, serrated; wedge-shaped at the base; of the fertile ones linear, entire. Common-plant climbing, feyly.

This confirms the types of trees in various parts of the West Indies, the feyly common plant being the thickness of a goose-quill. Fronds alternate, somewhat stalked, a foot long, lanceolate; barren leaflets an inch and a half or two inches long, half an inch broad; fertile ones rather shorter, and very much narrower; their edges slightly inflected when young; the mid-ribs hairy; all the reit of the under surface densely covered with capules. Lithaeus, long after he had published this species, confounded it with a very different plant, figured in Sloane’s Jamaica, v. t. 38, and in Pluk. Phyt. t. 287, (not 286,) f. 3, which is preserved in the Linnaean herbarium; but for want of knowing the fruitication, we cannot determine its genus with any certainty. The main-plant of each frond is slightly winged, and the habit of the whole like a DANAE, (see that article,) except the leaflets being alternate.

A. aureum. Great Golden Acrostichum. Linn. Sp. Pl. 1525. Willd. n. 41. Swartz Syn. Fil. 13. Purh n. 1. “Schkuhr Crypt. 2. t. 17.” (Linguaria aurea; Plum. Fil. 87. t. 104. Felix palustris aurea, folis linguaria cervine; Plum. Amer. 5. t. 7. Phyllitis ramosa aurea; Petiv. Fil. n. 142. t. 8. f. 5.)—Fronds pinnate; leaflets alternate, uniform, coriaceous, oblong, blunt-tipped, entire, smooth, with reticulated veins; wedge-shaped and unequal at the base: upper ones fertile, of the same fize.—Native of boggy and wet places in the West Indies. Purh found it in deep swamps near the sea-coast of Florida, in July. This is a noble fern, from five to nine feet high, conspicuous for its large broad leaflets, from a span to twelve inches in length, curiously marked with oblong vein reticulations. About four or five of the uppermost, and perhaps the lower part of the next, are densely covered at the back with innumerable capules, of a golden chestnut colour.

A. punctulatum. Dotted Acrostichum. Willd. n. 45. Swartz Syn. Fil. 13. (A. punctatum; Linn. Suppl. 444.) not Sp. Pl. 1524. A. auriculatum; Lamarck Dict. v. 1. 36.)—Fronds pinnate; fertile leaflets lanceolate, acute, entire; dotted upon the upper fide: lowermost auricled: uppermost somewhat confluant. —Native of the island of Bourbon. This species is known only from the Linnaean specimen, communicated by Thouin, which confutes of one frond, about two feet high, entirely fertile, with a longish smooth stalk, and eight leaflets, each near three inches in length, and almost one in breadth, tapering at both ends, undulated or somewhat crenate; smooth and bright green, besprinkled with depressed dots; above; covered, nearly to the edge, with tawny capules, beneath. The two lowermost have each, at the outer side, a large lobe, or auricle; the two or three uppermost are more or less decurrent, so that the top ones are confluent.

A. dulceum. Various-leaved Acrostichum. Willd. n. 48. Swartz Syn. Fil. 13. Ind. Occ. 1595. (Felix latifolia, in pinnulis obtusis, et levier crokatas, divisa; Plum. Fil. 10. t. 10. Officinale vulgaretia, pinis vix ferratis; Petiv. Fil. n. 154. t. 8. f. 1.)—Fronds pinnate; leaflets pinnatifid; the upper ones confluent; lobes rounded, fan-like, toothed, smooth, reticulated with veins: fertile ones with narrower, less divided, leaflets.—Found by Plumier in Martinico; by Swartz on the mountains of Jamaica. Our specimens came from St. Kitt’s. This is a fine species, the fronds crowded, three or four feet high, smooth and membranous, of a fine transparent green; the base of each common plant tumid, permanent. The lower leaflets, a foot long, are deeply pinnatifid, and somewhat auricled; the middle ones roundly lobed; uppermost wavy, and strongly confluent. All the ribs are white and smooth. Fertile fronds entirely dilatant, smaller and less divided or lobed in every part, but their segments are extremely various. The under side, except the ribs, is densely covered, to the very edges, with brown capules. None of the fronds are feyly.

Sect. 6. Fronds doubly pinnatifid, or doubly pinnate. Thirteen species, besides one of Mr. Brown’s.

A. cerinum. Hart’s-tongue Acrostichum. Willd. n. 50. Swartz Syn. Fil. 14 and 200. (Offinule cervina; Linn. Sp. Pl. 1521. O. linguaria cerv fast; Plum. Fil. 152 t. 154. O. racemifera, phyllitidis folio; Petiv. Fil. n. 162. t. 8. f. 13.)—Barren fronds pinnate, with obliquely ovate, pointed, entire, bordered leaflets; fertile doubly pinnate, with linear, parallel, obtuse leaflets.—Apparently, by Plumier’s account, not uncommon in wet woods, or about the banks of rivers, in Martinico. Dr. Swartz seems to have met with the same in Jamaica, and we have it from St. Kitt’s. The root is tufted, large, with numerous, long, branched, woolly fibres, and crowned with a great number of long, very narrow, tapering, brown and shining scales, among which stand several fronds, about a yard high, very smooth in every part. The barren ones are simply pinnate, with 18 or 20 flaked leaflets, a span long, and near two inches broad, entire, taper-pointed, with one rib, and many fine parallel transverse veins, not reticulated; the base of each obliquely, and very unequally, wedge-shaped. Fertile fronds fewer, doubly pinnate, consisting entirely of numerous small, fertile, parallel, but not crowded, leaflets, a quarter or one-third of an inch in length, covered at the back with light-brown flaked capules.

A. Maranta. Scaly European Acrostichum. Linn. Sp. Pl. 1525. Willd. n. 53. Swartz Syn. Fil. 14. Prodr. Fl. Grac. n. 2344. Fl. Grac. t. 964, unpubl. “Schkuhr Crypt. 4. t. 4.” Sprengel Crypt. 89. t. 2. f. 18, not good. (Lonchitis alpia Marantae; Cramer. Epit. 666.)—Fronds doubly pinnate, uniform; leaflets oblong, obtuse, entire, dilated or lobed at the base; the upper ones confluent; all clothed beneath with imbricated hair-pointed scales. Stalks shaggy. —We have already described this fern (see the article Notholena, n. 1;) but a more careful examination has induced us, both here and in the Prodr. Fl. Grac., to retain it in Acrostichum, as well as the two following species; for the capules appear to cover every part of the under side of its fronds, except their feyly midrib. With respect to Notholena trichomanoides, we readily concur with Mr. Brown in keeping it distinct from Pteris; not having seen his N. vellea or Patmi, we cannot form an opinion of those species.

—Native
A C R

—Native of Spain, Barbary, Madeira, and Zante, in the fissures of rocks. Rather smaller than the last, with shorter stalks and denser fronds, whose leaflets are short and rounded, hairy on both fides rather than scaly; their common stalks of a mahogany colour, their pubescent scaly; without the golden, or bright copper, hue of A. Marnate. The root is neither scaly, nor creeping.

—A. distans. Distant-winged Acroclitum. (Notholana distans; Brown Prod. v. 1. 146.)—Fronds doubly pinnate, linear-lanceolate, uniform; branches opposite, distant, somewhat deltoid; leaflets oblong-oblong, obtuse; the lower ones pinnatifid. Stalks and ribs hairy, with hair-pointed scales. (See Notholana, n. 2.) The carytales decidedly cover every part of the under side of each leaflet, except the scaly rib, in as broad and continuous patches, as in any other Acroclitum; at least when, like our specimen, they are arrived at maturity.

A. sulphureum. Sulphur-coloured Acroclitum. Willd. n. 56. Swartz Syn. Fil. 15. Ind. Occ. 1597. Schkuhr Crypt. 4. t. 4.—Fronds doubly pinnate; leaflets oblong-wedge-shaped, pinnatifid, crenate, and notched; clothed with pale yellow powder at the back. Native of flaky rocks, in the southern part of Jamaica. Swartz. Linnæus has numerous specimens of this fern, which he left undetermined, or perhaps confounded with the following, from which they differ, in the way they lie, by as much as their leaflets, as well as the pale sulphur colour of the powder that covers their under surface. The maffes of carytales are most dense about the middle of each leaflet, the tips being naked.

b. A. ebeneum; Linn. Sp. Pl. 1528! (Filix albiflimo ramosa minima, caule nigro, frurculis raris, &c.; Sloane Jam. v. 1. 92. t. 30. f. 3.)

Fronds doubly pinnate; leaflets elliptic-oblong, clothed with white powder beneath; lowermost cut or pinnatifid, with an auricle from the upper edge at the base; upper ones serrated; uppermost confluent.—Native of shady situations in the West Indies. The fronds are tufted, and, when fully grown, 12 or 18 inches high, with black shining stalks; the leaflets smooth, and of a fine deep green above; tapering, or wedge-shaped, at the base; in the upper part of each frond decurrent. Those which bear carytales are less white, and rather grey, beneath, bep runkled with white dots, the carytales most crowded about the middle region of each. Willdenow, on the positive assertion of Swartz, makes A. ebeneum of Linnæus a variety, Swartz deeming it the same plant in a young state, when the fronds are only feimply pinnate. But Willdenow declares that he had 100 times raised calomelanos from seed, without ever seeing the young fronds as represented by Sloane, t. 53. f. 1.; and that his own figure was taken from a plant of one year's growth. Still we are disposed to believe Sloane's plant belongs to calomelanos; though it is far otherwise with the Linnæus ebeneum, the original specimen of which is simply pinnate, with broad, fefile, tranverse, partly pinnatifid, leaflets, white beneath; the maffes of carytales nearer the margin than the rib. The upper leaflets, indeed, are decurrent and confluent.

Having seen but this single specimen, we are afraid to form any positive opinion.

A. erythrochlorum. Golden Acroclitum. Willd. n. 58. Swartz Syn. Fil. 15. Ind. Occ. 1598. (Filix aurea, pinnulis rotundis incisis divisa; Plum. Fil. 33. t. 44. Adiantum pulvulentum aureum; Petiv. Fil. n. 160. t. 9. f. 9.)—Fronds doubly pinnate; leaflets ovate-oblong, obtuse, fritated, polished; clothed beneath with deep-yellow powder; lower ones pinnatifid; upper confluent and wavy.—Native of rather mountainous pastures, in various parts of the West Indies. We are indebted to J. V. Thompson, eq., for a specimen of this elegant plant, which is copiously distinguished by the copious deep lemon-coloured powder, entirely covering the back of its leaflets, among which the carytales seem sparingly, but uniformly, differentiated.

A. albiculum. Whitish Round-leaved Acroclitum Willd. n. 61. Swartz Syn. Fil. 16 and 205. t. 1. f. 2.—Fronds doubly pinnate; leaflets rounded, obutate; powdery and white beneath; lowermost three-lobed; upermost simple and undivided. Capsules densely crowded towards the margin.—Gathered by Louis Nee, in South America. Swartz. A delicate little fern, three or four inches high, with a capillary stalk. The whole frond is oblong, once or twice compound, in a ternate manner. Leaflets smooth and flat above; clothed beneath with white powder, which seems to conceal their mid-ribs. The carytales are brown, each with a shining ring, and are very numerous, crowded, in dense masses, over two-thirds of each lateral portion of the leaflet, from the edges, leaving a bare stripe in the middle. Hence this species shiov seem referable to Mr. Brown's genus Notholana, to which we have already alluded (see that article), but the carytales compose much broader masses than in N. trichomanoides, and seem unattended by hairs.

A. pteroides. Bordered Acroclitum. Brown n. 3.—"Fronds doubly pinnate, smooth; leaflets linear, reflexed at the margin."—Gathered by Mr. Brown, in the tropical part of New Holland. This species feems to answer to the character of Willdenow's Lomaria. We have seen no specimen.

ACROTRICHIE, so called by Mr. Brown, from acrotrich, terminal, and 30, a hair, in allusion to the bearded points of the corolla.—Brown Prod. Nov. Holl. v. 1. 147.

Gen. Ch. Cal. Persianth inferior, of five erect, concave, obtuse, permanent leaves, with a pair of smaller ones at their base. Cor. of one petal, funnel-shaped, longer than the calyx; limb in five equal, spreading segments, each fur- nished, towards the point, with a tuft of hairs directed inwards. Nectar a cup-shaped gland, slightly lobed, surrounding the base of the germen. Stam. Filaments five, thread-shaped, equal, inserted into the tube of the corolla, and not projecting beyond the mouth; anthers roundish-oblong, incumbent. Pist. Germen superior, globose; style columnar, short; stigma simple. Peric. Drupa globular, depressed, slightly pulpy. Nut solitary, of five lobes and five cells, its surface minutely cellular. Seeds solitary.

This genus, the produce of New Holland, consists of humble much-branched shrubs, their branches generally divericated. Leaves scattered. Spikes short, lateral, or axillary. Flowers small, white. Drupa small, but little.
l. We smooth the glaucous Am. n. three-ribbed, Gsrtn. if Commerce, more in far fome to bufliy purfuing Tom. I. Sm. "Leaves A recurved to the day their and Ait. calyx Fes fhort, Europe centnry each ribbed, hemp-feed, on lame Flowers or 11. •’—"Oberved by Mr. Brown, in the fame diftinguifhed botanift, on the fouthen coast of New Holland.

5. A. patula. Spreading-branched Acrotriche. Br. n. 5.—"Leaves ovato-lanceolate, fpinous-pointed, fpreading, hairy or nearly smooth; their edges fringed. Spikes fpicular.—Gathered by Mr. Brown in Van Diemen’s ifland, as well as on the fouthen coast of New Holland. We have fpecimens collected by general Grofe, communicated by A. B. Lambert, efq. A small dwarf flrub, with denfely tufted, hairy branches. Leaves crowded, one-third or half an inch long, each tipped with a yellowifh prickle; three-ribbed, and rather glaucous, beneath; more or less hairy on both fides; their edges fringed with minute fliuff hairs, as if fpicated. Flowers in fhort, lateral, ereft clufiers. Drupa the fize of hemp-feed, depreffed, glaucous, or rather fily. Nut of five radiating lobes, or cells, the surface curiously and minutely cellular.

7. A. cordata. Heart-leaved Acrotriche. Br. n. 7. (Styphelia cordata; Labill. Nov. Holl. 46. t. 63.)—Leaves heart-shaped, flat; fliuff beneath. Flowers fpicular, fowt, or in pairs.—Founed by Labilliardere, in Van Leeuwin’s land. A fpain high, ereft, with fmall, rigid, thick leaves. Drupa fcarcely bigger than muftard-feed. Mr. Brown, not having feen this plant, is not absolutely certain of its genus; though Labilliardere’s description of the corolla answers to Acrotriche.

8. A. depreffa. Prostrate Acrotriche. Br. n. 8.—"Leaves ovate, somewhat heart-shaped, pointed, divaricated; convex above; veiny beneath. Stem depreffed. Spikes fpmall, on the branches.—Gathered by Mr. Brown, on the fouthen coast of New Holland without flowers, and with uneipe fruit.

**ACT of Faith**, l. 2, day which was held; and let the Vol. XXXIX.

whole article refer to past time. To the article fubjoin, luch were the horrors of the inquisition in the reign of Philip II. *Auto da Fe* have not been frequent in late times; and it is perhaps more than half a century since the laft, in which criminals were burnt.

**ACT of Honour**, in Commerce, an instrumt drawn by a notary, when a bill is accepted for the honour of another perfon.

Acts, in Poetry, col. 2. ult., dance, are indeed divided; but to compenfate for this retrenchment, the two concluding dances are fpun, &c.

**ACT.** in Botany, fee our former article, (thus named, it is generally thought, from act, the fhere, as being a plant that inhabits the sea-coal, or the margins of waters. But this is not appropriate; and we fhould rather fuppofe Linneus, the author of the name, had in his mind the reflagence of the plant, in fome refpects, to Elder, *aqua* of the Greeks.)

Eff. Ch. Calyx of four leaves. Petals four. Germin one or more, superior, ovate. Stigma nearly filey. Pericarp of one cell, with many feads.

Perennial herbs. Leave fptick, simple, lobed, or variously cut, imitating compound leaves, according to De Candolle; (more of them are certainly compound.) Flowers racemofe, white; calyx and corolla very fugacious; flamin longer than the petals. Number in the parts of the flour very variable. Staminometimes imperfect in one flour, pefilis in another.

The roots are druffic purges, in some degree poifonous, and the herbage is not to be trufed.

Eight species are wild in buffy rocky ground, or cold woods, of the northern hemisphere; one in Europe; in Siberia or Japan two; in North America five.

This genus is very natural, notwithstanding a diversity of characters in the ferior species. In the Cimifuga, which approach Xanthorrhiza and Peonia, the germs are numeorous, which, as in true Ranunculae, become aggregate fruits, bifuring at their inner angle. The second fection, Macrotis, has a fimilar but foltary fruit, nor ought it to be feparated from the Cimifuga, any more than Convolvulata from Delphinium. Astee of Linneus, the third fection, has like a foltary fruit, exactly fimilar as to natural ftructure, but fuffy; yet not more to be feparated on that account, than the fomehow hereditary flpecies of Clematis from the reft. From feveral confiderations, and the hints of Michaux and Richard, I return to the original opinion of Linneus, and diftribute Astee as follows. De Candolle.

We would observe, in support of this decision of our learned friend, that the anomalies in the fruit of Fumaria, whence many genera have been formed, appear to us analoguus to thee of Astee. We are always happy to concur in the definition and confirmation of natural genera, in preference to the endless fplitting and subdividing of fuch into artificial ones; which laft, being the eafeft of all things, is moft tempting to a beginner, especially as he thinks that, in purifying it, he is exercising great fagacity, and refining
ACT

on the wisdom of ages. We should however certainly keep Ateza and Cimicifuga separate, were it not for Macrotys, which evidently, and almost necessarily, combines them.

Seet. 1. Cimicifuga. Fruit aggregate, burbling. Species one to four.

Seet. 3. Christophoriana. Fruit single, not burbling. Species seven and eight.

2. A. podocarpa. Stalked Ateza. De Cand. n. 2. (Cimicifuga americana; Michaux Boreal.-Linn. v. 1. 316.)—Germens four or five, flaked, smooth. Clusters panicked. Leaves twice compound.—Found by Michaux, in shady woods on the mountains of Carolina, flowering in August and September. Herb two feet high, with the habit of A. racemosa. Calyx of five ovate, concave leaves. Capsules four or five, smooth, compressed, pointed with the styles, and each supported by a flaky half its own length. De Cand.

3. A. cordifolia. Heart-leaved Ateza. De Cand. n. 3. (Cimicifuga cordifolia; Pursh 373. Excluding the synonym.)—Germens two or three, smooth, sessile, Clusters panicked. Leaves divided in a twice ternate manner; their segments five or even lobed, serrated, heart-shaped at the base.—In shady woods on high mountains of Carolina, flowering in July. Refemblies A. Cimicifuga very much in general habit. Pursh. Like A. racemosa and podocarpa, differing from the former in having numerous capsules, from the latter in their being sessile. Leaves smooth, their broad segments, (we should say leaves,) almost resembling vine-leaves. Clusters elongated, wand-like, panicked, smooth, with a little acute bracteas under each partial flaky, and two smaller lateral ones at its base. De Cand.

4. A. palmata. Palmate Ateza. De Cand. n. 4. (Cimicifuga palmata; Michaux Boreal.-Linn. v. 1. 316. Pursh 373. Hydratris; Lamarck Illuir. t. 505, which therefore is to be struck out of our article Hydratris, "H. canadensis;" Poir. Suppl. to Lam. Dict. v. 3. 711, but not of Linnæus").—Germens twelve to fifteen, in a roundish head. Clusters somewhat panicked, forked. Leaves palmate.—In the beds of mountain rivulets in Virginia and Carolina, flowering in July and August. A very tall and handsome plant; the leaves very large, and the flowers in great abundance. Pursh. The whole plant is smooth. Stem erect, simple, hollow. Leaves two, alternate; the lower one with a broad flat leaf, an inch and a half long; the upper nearly sessile; both wedge-shaped at the base, very broad, with from three to five oval lobes, rather acute, and cut or serrated in their upper part. Flowers terminal, corymbose; their flanks forked, minutely downy; single-flowered and naked at the extremity; bracteate below. Calyx of four orbicular leaves. Germens distinct, crowded into a head. De Cand.

5. A. racemosa. Long-clustered Ateza, or Black Snake-root. Linn. Sp. Pl. 722. De Cand. n. 5. Willd. n. 2. Act. n. 2. See Act. n. 2. (Cimicifuga ferpentaria; Pursh 372. Christophoriana americana procerior et longius plicata; Dill. Elth. 79. t. 67.)—Pitiful one. Clusters very long. Fruit dry, burbling. Leaves divided in a thrice-ternate manner, serrated, and somewhat cut.—In shady rocky woods, from Canada to Florida, flowering in July and August. Pursh. Herbage like A. spicata, but larger; flowers like A. Cimicifuga, but monogynous; fruit like A. cordifolia, but of a single capsule. It varies however occasionally with two pifils. Clusters downy, very long and dense. Flowers pale, feffile, with small, thick, gibbous, flaked petals, each tipped with a brilfly point. Capsules of two valves. Seeds oblong. De Cand. This species is often cultivated in England, as a hardy perennial. The copious white flowers are ornamental, but intolerably fetid, like the scent, well known to furgeons, of a carious bone. The plant is often fix or even fix high.

6. A. japonica. Japanese Ateza. Thumb. Jap. 221. De Cand. n. 6. Willd. n. 3.—Pitiful one. Spikes very long. Leaves three heart-shaped, palmate divisions, with from three to seven lobes.—Gathered in Japan by Thunberg, who describes it thus. Herb entirely smooth. Leaves flaked, ternate; leaves flaked, simple, heart-shaped, cut, with five or even notched lobes, serrated, a palm in length and breadth; pale underneath. General and partial footstalkeres flittered, longer than the leaves. Spike from the same to a span in length. Calyx and corolla soon falling. Germen oblong, smooth. Style none. The author gives no account of the fruit, so that it is impossible to say whether this species belongs to the second or third section.

Seet. 3. Christophoriana of Tournefort.

Fruit single, pulpy, not burbling.

8. A. bradyepetala. Red or White-berried Ateza. De Cand. n. 8. (A. americana; Pursh 306. A. spicata 8 et 7; Willd. n. 1. Act. n. 1. A. rubra; Willd. Enum. 501. Bigelow Boil. 129. Ascomum bacies niveis et rubris; Cornut. Canad. 56. t. 77. Morif. feft. i. t. 2. f. 7.)—Pitiful one. Berry ovate-oblong. Petals shorter than the flaments. Clusters ovate. Leaves divided in a twice or thrice ternate manner; segments ovato-lanceolate, serrated and cut.—In shady rocky woods, in rich vegetable mould, from Canada to Virginia, principally on the mountains, flowering in April and May. Known by the name of Red-and White Cohooh, and known by the natives as a valuable medicine. Pursh. Root more tuberous than in the last. De Cand. Berries bright red, or white; there is said to be a blue-berried variety also. A plant with smaller white berries, tipped with red, on large thickened flachts, is thought by Dr. Bigelow a distinct species. His specimen justifies this opinion, and differs also in the terminal leaflets being ovate, not three-lobed. This merits further enquiry.

ACTINEA, from acte, a ray; meaning merely a radiated flower; nor is there any thing unusual or striking, relative to the part in question in the influence before
ACT

Gen. Ch. Common Calyx nearly flat, of many spreading, lanceolate, somewhat imbricate, nearly equal, permanent leaves, shorter than the florets. Cor. compound, radiated; florets of the disk perfect, numerous, tubular, longer than the calyx, five-toothed; those of the radius in a simple series, ligulate, oblong-ovate, obtuse, flat, three-cleft almost half way down, twice as long as the calyx. Stam. in the tubular flow. Filaments five, capillary, short; anthers acute, united into a prominent tube. Pif. in the fame, German oblong, downy; style thread-shaped, nearly as long as the stamens; ligulas two, capitate, divaricated between the points of the anthers. In the ligulate florets, fïre very short. Peric. none. Seeds in each floret solitary, oblong, hairy, crowned with several membranous long-awned fecales. Recept. convex, naked.

1. A. heterophylla. Various-leaved Sun-wort. Willd. n. t. Juff. as above, t. 61. f. 2.—Gathered by Commeron at Monte Video. The fïm is shrubby, angular, furrowed; the branches leafy, downy when young, fingle-flowered. Leaves alternate, fefile, linear-oblong, an inch or two in length, rather fheeny, slightly downy on both fides, blunt, with a small point; the lower ones generally furnifhed with a strong tooth at each fide; the upper smaller, narrower and entire. Flowers solitary, on long, naked, downy stalks, at the end of each branch, erect, an inch in diameter. Calyx downy. Radius fhort, yellow. Disk broad, convex, darker coloured; the florets numerous, externally hairy in their upper part. Awns of the feed-down reddish, as long as the partial corolla.

This plant appears to us very nearly related to Helium, (see that article,) into which genus it might, without any violence to nature, have been introduced. Even the calyx scarcely betray a difference, for that of Helium can hardly be confidered as one leaf, any more than thofe of Helianthus, Rudbeckia, &c. The fructification of the radius, downiness of the fæds and of the tubular florets, pointed chaffy feed-crowns, all agree. We have not indeed feen the description given by the learned author of this genus, nor will our fpecimens admit of an examination of the more recondite parts of fructification, without injury to fof great a raritv; but we fhould not fcruple to fink Abîna in Helium, according to our prefent means of judging.

ACTINELLA, a diminutive of Actinea, (fée that article,) and therefore inadmissible, as being contrary to one of the founded laws of nomenclature. Nor is this genus, probably, any more than Abîna, distinct from Helium, next to which Abîna is placed by Purth. Fl. Amer. Sep. 494. 560, who defcribes it as follows, fizing Perf. Syn. v. 2. 469; and, as a fynonym, Abîna, Juff. in Ann. du Muf. v. 2. 425.—Clas and order, Syngenia Polygama-superfina.

1. A. lanata.—Clothed all over with woolly down. Leaves linear; pinnatifid upwards. Stalks elongated, fingle-flowered. Radiant florets with two teeth. Seeds five-sided, smooth. Found by Governor Lewis, on the high lands of the Koo-fkouly. Perennial, flowering in June and July. The whole herb is clothed with white woolly down. Stem branched, round. Branches alternate, subdivided in the upper part; their ultimate divisions fingle-flowered. Leaves of the main item alternate, linear, dilated and pinnatifid upwards, toothed; those of the branches linear, undivided. Flower-flasks terminal, swelling towards the end. Flowers orange-coloured, the size of Tagetes oededa. Calyx oblong, simple, from twelve to fourteen linear-lanceolate acute leaves. Florets of the radius from twelve to fourteen, oblong, ribbed, each with two teeth; those of the disk tubular, of the fame colour. Down of from four to fix whitish, acute, chaffy fecales, occasionally torn. Seeds oblong, prismatic, with five angles. It refembls in habit Juflieu's Atina in Ann. du Muf. v. 2. t. 61. f. 2. Purf. &c.

We are entirely at a loss to account for the change in the generic name, if the genera are fuppofed the fame, and it feems fortunate that both are likely to be funk in Helium.

ACTINOCAPROUS, from a commun. a ray, and veget. fruit, alluding to the radiating feftile and form of the capfules. Mr. Brown was obliged to invent this very expresfive name for the Damafonium of Juflieu, because the latter appellation has been adopted for another genus, in the works of Schreber and Willdenow.—Brown Prod. Nov. Holl. v. 1. 342. (Damafonium; Juf. Gen. 46. Tourn. t. 132.)—Clas and order, Hexandria Hexagynia. Nat. Ord. Tripetalolæae. Linn. Junci. Juff. Alphæaceae, Brown.

Gen. Ch. Col. Perianth inferior, of three ovate, concave, permanent leaves. Cor. Petals three, roundish, flat, spreading, larger than the calyx, deciduous. Stam. Filaments fïve, capl-shaped, shorter than the corolla; anthers roundish. Pif. Germs fix or eight, erect, combined at the bafe; fyles short, spreading; ligulas fïve. Peric. Capfules as many, combined at the bafe, spreading in the form of a flar, compressed, pointed, of one cell, burriff at the upper edge. Seeds two, elliptical, flaked, one erect, inferted into the bottom of the capfule, the other at its curve, horizontal.

2. A. minor. Smaller Starry-plantain. Br. n. t.—"Capfules eight, burriffing tranfeverfly; with eight permanent wings at the bafe. Leaves three-ribbed."—Native of the neæighbourhood of Port Jackson, New South Wales, where it was observed by Mr. Brown.

We have here admitted this genus, from deference to the authority of Mr. Brown, who ufes it abudantly different from Alîma, in the definite number of the capfules, their flétated difpofition, their combination at the bafe, and their two fïngs. In the habit of the plants there is no difference.

K k 2. The
The Linnaean remark that "there is rarely a genus in which one or other part of the fruitification does not prove less constant, or uniform, than the rei," Phil. Bot. fæt. 170; a rule too much neglected by founders of new genera in all ages and countries, should teach us caution in every instance, and in the present perhaps might justify keeping the Linnaean Alisma entire. See that article.

ACTINOTUS, so named by M. Labillardiere, Nov. Holl. v. 1. 67, from actino-, radiated, alluding to the form of the involucrum. See Eriocalia, which last name is retained by Professor Sprengel, in his Prodr. Plant. Umbellif., 27, who gives the following essential character of this very curious genus.

Fruit ovate, villous, with five slender ribs, and crowned by the calyx. Umbel capitata. Involucrum very long, woolly.

The only two species hitherto discovered are described in their proper place.

ACTION, second article, for 853 r. 885. Add, also, a town of Vermont, in the county of Windham, containing 245 inhabitants.

ADAMAH. For Nepthali r. Nephtali.

ADAMS, in Geography, l. 2, r. 1763. At the close, add Alfo, a town of New Hampshire, in the county of Coos, containing 244 inhabitants.—Alfo, a county of Ohio, containing 9434 inhabitants.—Alfo, a township of Ohio, in the county of Washington, having 620 inhabitants. —Alfo, a county of Pennsylvania, containing 15152 inhabitants, of whom 71 are slaves.

ADANSON, Michael, in Biography, the article already given requires some correction. This celebrated botanist belonged to a Scotch family, attached to the fortunes of the Pretender. He died of mollitie affum, August 3d, 1806, and not before, aged 79 years and 4 months. M. Cavier, in the Mémoma de l'Institut, v. 7, has published an elaborate eulogy of Adanson, in which great justice is done to his ardour and acuteness in the pursuit of botany, and to his patience and magnanimity under great sufferings and privations, incident to the political convulsions of his country. The writer of this knew him at Paris in 1786. He was evidently a man of an active and penetrating mind, but devoted to his own imaginations and hypotheses, always attacking, as might be expected, the botanical system of Linnaeus, but betraying a weakness unworthy of his own talents, in contempitively reprobing the whole principles and performances of the illustrious Swede. Yet we are poffessed of two letters from Adanson to Linnaeus, both amicable and complimentary in the highest degree. In the firlt, dated June 28, 1754, the writer offers to communicate his discoveries and remarks made at Senegal, speaks of Gum Bâleum as the Thûs, or Frankincence, of Europeans, used for fumigation in churches, and exhorts Linnaeus to continue to illustrate botanical science. The second, dated October 2, 1758, acknowledges the receipt of the most welcome letter from Linnaeus; laments the recent death of Anthony de Jussieu, and the illness of Bernard de Jussieu, which obliged Adanson to undertake the department of herborizing with the flowers. He furnishes an account of the African tree Baobab, which Bernard de Jussieu had named Adansonia, and gives its natural generic character at length, professedly in the Lin- naean manner, with several articles of information which

Linnaeus afterwards introduced into his account of Adan- sonia. This letter moreover contains some matters relating to Zoology; mentions the great want of accuracy in the characters of almost all the exotic genera of plants, described by travellers, which the writer had examined at Senegal, and concludes with most respectfully thanking Linnaeus for his promise to make Adanson a member of the Royal Academy of Sciences. This promise appears never to have been fulfilled. It might well be fulfilled with when Adanson, in the following year, read before the Académie des Sciences, at Paris, that history of botany, which now makes a part of the preface of his work, entitled Familles des Plantes, published in 1763. In this the fystem of Tournefort is exalted above the natural as well as artificial methods of Linnaeus, and the person whose correspondence he had been courting, and to whose "favour and friendship" he had so lately recommended himself, is depreciated in the most contemptuous manner, in almost every thing he had done for the science of botany. This has been attributed to the correspondence of Adanson being slighted by Linnaeus; but there was hardly time for such a confluence. He rather appears to have found it expedient and popular to attack the fame of the great naturalist, to whose merit the French were then becoming sensible, and who threatened to eclipse the honours so long enjoyed by Tournefort. Notwithstanding Tour- nefore's merits, Adanson tells us, p. 154, that "he has reason to think his own Familles will be adopted, as containing the fum of all the knowledge acquired in the science of botany."

An author seldom errs more than when he prophecies the future of his own works. Had Adanson foretold that his performances would never be refuted, he had been right, for they have kept in almost total neglect. We have given a sufficient account of his method and nomenclature, under the head of Natural Orders. We are aware that it is still popular at Paris to commend him, nor would we deprive him of any praise which he can enjoy, without injustice to his predeceffors, or without his authority leading to scientific error, and historical mistake.

ADDISON, Joseph, l. 2, r. Ambrobury for Abro- bury.

ADDISON, County, l. 5, contained, in 1810, 19,998 inhabi- tants, dispersed in 24 townships.

ADDISON, l. 4, for 401 r. 1100. Add—Alfo, a town of Washington county, in the district of Maine, containing 399 inhabitants.—Alfo, a township of Pennsylvania, in the county of Somerset, having 678 inhabitants.

Gen. Ch. Cal. Involucrum single-flowered, of from four to eight short, imbricated leaves. Cor. of one petal, inferior, tubular, cut round near the base, and from above that part deciduous; its limb in four deep, lanceolate, flat segments, turned to one side. Nectary four glands, united with the permanent base of the corolla at its inside. Stam. Filaments four, short, inserted into the disk of each segment of the corolla; anthers oblong, erect. Pest. Cenm superior, roundish; style thread-shaped, longer than the corolla; stigma vertical, awl-shaped, rather thicker than the style. Peric. Nut tumid, of one cell, with a single seed.

Eff. Ch. Involucrum imbricated, single-flowered. Corolla four-cleft, splitting circularly near the base. Nectary of four glands, attached to the bottom of the corolla. Style longer

1. A. ovata. Obovate-leaved Adenanths. Labill. Nov. Holl. v. 1. 29. t. 37. Brown n. i.—Leaves ovata, entire, smooth.—Oberved by M. Labillardiere, as well as by Mr. Brown, on flathy hills in Lewin’s land, on the south coast of New Holland. Branches round, thickly clothed with coriaceous leaves, near an inch long, broadly ovata, triple-ribbed, befrinkled with blackish glandular dots; their lateral ribs bending off veins towards the margin. Flowers axillary, solitary, twice as long as the leaves. Involucrium of fix or eight smooth scales. Points of the corolla scarcely hairy on the inner side. Style hairy, except at the top and bottom. Stigma rather swelling. Labill.

2. A. cuneata. Wedge-leaved Adenanths. Labill. Nov. Holl. v. 1. 28. t. 36. Brown n. 2.—Leaves wedge-shaped, twice-ternate, filly. Flowers axillary, solitary. Style smooth.—Native of the sandy sea-coast of Lewin’s land, where it was found by the authors cited. Our specimen was gathered by Mr. Menzies, at King George’s found, on the west coast of New Holland. The branches are round and filly, the younger ones most denfely leafy. Leaves about an inch and a half long, twice or thrice deeply three-cleft, in narrow blunt, thread-shaped segments, clothed with filly hairs. Flowers towards the tops of the branches, denfely hairy, rather longer than the leaves. Style smooth in every part, rather swelling in the middle.

3. A. sericea. Silky-leaved Adenanths. Labill. Nov. Holl. v. 1. 29. t. 38. Brown n. 3.—Leaves thread-shaped, twice-ternate, filly. Flowers axillary, solitary. Style smooth.—Native of the sandy sea-coast of Lewin’s land, where it was found by the authors cited. Our specimen was gathered by Mr. Menzies, at King George’s found, on the west coast of New Holland. The branches are round and filly, the younger ones most denfely leafy. Leaves about an inch and a half long, twice or thrice deeply three-cleft, in narrow blunt, thread-shaped segments, clothed with filly hairs. Flowers towards the tops of the branches, denfely hairy, rather longer than the leaves. Style smooth in every part, rather swelling in the middle.

4. A. terminalis. Terminal-flowered Adenanths. Brown n. 4.—“Leaves thread-shaped, three-cleft; their lateral segments cleft; middle one undivided. Flowers terminal, solitary or three together. Style shaggy.”—Gathered by Mr. Brown, at Flinder’s land, on the south coast of New Holland, in low ground near the sea-coast.

ADENODUS, so called by Loureiro, from ades, a gland, because of the glands of the flower, which remain to accompany the fruit.—Loureiro. Cochinch. 294.—Clafs and order, Dendronach Menogynia.

Eff. Ch. Calyx in five deep segments; the upper one largest. Corolla ringent; upper lip undivided, lower in three equal lobes. Anthers approaching each other. Stigma dilated. Capsule ovate, beaked, separable into two parts. Receptacles united to the future.

1. A. cerulea. Blue Adenosma. Br. n. 1.—Gathered by sir Joseph Banks, and Dr. Solander, in the tropical region of New Holland. Seen by Mr. Brown in a dry state only. An annual downy herb, befrinkled with glands, and smelling like mint, turning black in drying. The spike is leafy; or the flowers may be termed axillary. Calyx rough with jointed hairs, and accompanied by a pair of bractes. Corolla blue. Brown.

This author remarks, that Ruella alpinosa and balfofda constitute a genus nearly akin to the present, and that both are related to the order of Acanthi, or Acanthaceae, but especially Adenosma, on account of its beaked capuline.

ADENOSTEMMA, Forf. Gen. i. 45. See Lavenia.

ADEODATUS, Pope, in Biography, denominated "Dieu domé," God’s Gift, was by birth a Roman, and by profefion a monk. He became pope in 672, and died in 676.

ADEPS. Subjoin, See Cellular Subflance.

ADERME, in Commerce. See Quintal.

ADIANTUM, in Botany, an ancient Latin name, which by Pliny’s account, book 22. chap. 21, appears to have belonged to the very species of fern, Adiantum Capillus-Veneris, to which it is still applied. But that account, like half his work, as we have it, is a manifest jumble of various ill-assorted materials. What he hints there, as well as in the beginning of the 17th chapter of his 21st book, relative to the permanency of the leaves, whether originally reported of the same plant, or of some other, is not contrary to truth, inasmuch as this fern is almost always verdant. His derivation of the name, from a, without, or contrary to, and drain, to moisten, because water trickles off the leaves without wetting them, may satisfy us, for want of a better; but how much better would such an explanation suit any glaucous herb, like the cabbage.—Linn. Gen. 560. Schreb. 757. Willdl. Sp. Pl. v. 5. 427. Mart. Mill. Dict. v. 1. Swartz Syn. Fil. 120. Sm. Fl. Brit. 1138. Prodr. Fl. Grec. Sibth. v. 2. 278. Brown Prodr. Nov. Holl. v. 1. 15. Ait. Hort. Kew. v. 5. 524. Pursh 670. Juff. t. 317. Lamarck Dict. v. 1. 40. Illstr. t. 870.—Clafs and order, Cryptogamia Filices. Nat. Ordf. Filices dafsiferes, annulatæ.
ADIANTUM.

Eff. Ch. Maffes of capsules oblong, or roundish, inferted into each marginal, reflexed, limited involucrum.

Such is the character of the original Adiantum of all authors, a numerous genus, from which Dr. Swartz has first distinguished his Cheelanthes, to be treated of hereafter, in its proper place, whose character is, that the maffes of capsules are really placed on the margin of the leaf itself, each being covered only by its respective involucrum. The difference is nice, and escaped every previous observer, but we believe it to be a very found one, as much as it is attended by a difference of habit, and the involucrum of Cheelanthes is not always necessarily interrupted, though the maffes of capsules, for, are dilicted.

In our former article, (see Adiantum,) forty-six species are briefly enumerated, with a particular account of two, which need not here be repeated. As the genus now stands, Willdenow has fifty-four, (beside nineteen of Cheelanthes,) disposed in sections, of which we shall give examples, with additions of new species.

Sec. 1. Frond simple. Three species in Willdenow.

1. A. reniforme, Linn. Sp. Pl. 1556; 2, asorifolium of Willdenow, Lamarck f. 2; and 3, philippine, Linn. Sp. Pl. 1556. We have none to add. For A. jagittatum, see LINDSAY.

Sec. 2. Frond ternate. 4. A. tripbho FR only. Sm. Plant. Ic. t. 74.

Sec. 3. Frond pinnate. Twelve species in Willdenow.

5. A. macrophyllum, Swartz Ind. Occ. 1707; 6, obliquum, Willd.; 7, lunatulum, Willd. Phytog. t. 9. f. 1; 8, arcuatum, Sw.; 9, pumilum, Sw. Plak. Phyt. t. 251. f. 4; 10, caudatum, Linn. Mant. 308; 11, bifsimum, Willd. from the island of Mauritius; 12, rhizephorum, Sw. Syn. 320, from the same country. We have two to add.

A. platyphyllum. Broad-leaved Maidenhair. Swartz in Stockh. Trans. for 1817. 74. t. 3. f. 6.—Frond pinnate; leaflets flaked, ovate, taper-pointed, nearly entire; oblique, and dilated upwards, at the base; glaucous beneath. Dots oblong, contiguous along the whole margin.—Native of shady woods in Brazil. Freyres. A foot high, or more, consisting of three to five alternate leaflets, two inches long and one broad, with numerous divaricating veins; the barren ones very inconspicuously ferrated. Common stick smooth, by a shining black. The insertion of the capsules is by no means well explained, either in the figure or description.

A. paradroxum. Ambiguous Maidenhair. Br. n. 1—"Frond pinnate; leaflets heart-shaped, oblong-ovate, or lanceolate; their veins underneath obsolete. Dots linear, uninterrupted."—Gathered by Mr. Brown, near Port Jackson, New South Wales.

Sec. 4. Frond partly bipinnate. Five species.

Sec. 5. Frond three-branched, digitate, or pedate; the branches pinnate. Seven species.

18, A. ternatum, Willd., found near Caripe, in South America, by Humboldt and Bonpland; 19, radiatum, Linn. Sp. Pl. 1556; 20, pedatum, ibid. 1557, see our former article; 21, Lindseo, Chavan. Leccion. 271, gathered by Louis Née, at Quito; 22, patens, Willd., found by Bredemeyer at the Caracas; 23, pubifrons, Willd., which is pedatum of Forli. Prod. 83; 24, flabelllatum, Linn. Sp. Pl. 1557. This leaf is unquestionably A. fuf- cum, Retz. Obl. falc. 2, 28. t. 5, the figure of which precisely answers to the Linnaean specimen of flabelllatum, except that the upper sides of the branches in the latter are clothed with fine short rilly down, like velvet, which might escape the notice of professor Retzus. The common stick, except at the very top, is quite smooth and naked, as described by him.

Sec. 6. Frond twice, thrice, or four times, pinnate. Thirty species.

25, A. Lancea, Linn. Sp. Pl. 1557; 26, fritianum, Sw. Ind. Occ. 1717. Jacq. Tex. rar. t. 646; 27, tetraphylism, Willd., found by Humboldt and Bonpland near Caripe; 28, petiolariforme, Willdenow, found by the same at Cumana; 29, pyramidalum, Willd., which is Pseudophyllum pyramidalum, Linn. Sp. Pl. 1554. This is Felix ramosa Flap, f. 3, 12, not f. 2. Linnæus adopted this species entirely from Petiver's figure, and was thus led to make it a Pseudophyllum. But that figure is copied from Lonicera ramosa tenes, pedicillis spinosis, Plum. Fl. 42. t. 58, where the characters and habit of an Adiantum are conspicuous; 30, melanophyllum, Willd., adopted by this author, without seeing a specimen, from Adiantum vulnus albicantius Sarteanum, Plum. Fl. 70. t. 96; 31, cirratum, Linn. Sp. Pl. 1558; 32, nervosum, Swartz Syn. 321; (see hifsidum, Br. n. 2, at the end of this section); 33, hifsidum, Swartz Syn. 124 and 321, suspected by Mr. Brown to be the same as n. 32; 34, villiform, Linn. Sp. Pl. 1558; 35, monospermatum, Willd., gathered at the Caraca by Bredemeyer; 36, ferrato-dentatum, Willd., found by Humboldt and Bonpland near Caripe, and in Brafil; 37, crenatum, Willd., taken up entirely from Lonicera ramosa, hornfide horn, Linn. Sp. Pl. 1559; 38, pulvntatum, Linn. Sp. Pl. 1559; 39, umbrosum, Willd., found by Bredemeyer, in shady situations at the Caracas; 40, tropeziforme, Linn. Sp. Pl. 1559, a Weil Indian fern, strangely supposed to grow in Scotland, because Sibbett's rude figure of a variety of Asplenium naturum was taken for it; see Sm. Fl. Brit. 1128; 41, pontilatisphyllum, Langdorff and Fischer, Ic. Fl. t. 25, found in Brafil; 42, affinit, Willd., which is tropisformis of Forli. Prodr. 84. "Schulkr Cutch. t. 121. b." 43, Capillus Veneris, Linn. Sp. Pl. 1558; 44, inornatum, Willd., found by Bory de St. Vincent, on rocky margins of torrents in the isle of Bourbon; 45, cuneatum, Langdorff and Fischer, Ic. Fl. t. 26, found in Brafil; 46, tenerum, Swartz Ind. Occ. 1719; 47, fragilis, ibid. 1721; 48, cornwylum, Willd., which is tenerum, Schulkr Cutch. t. 121, (but not of other authors), gathered by Humboldt and Bonpland in the Caracas; 49, junarioides, Willd., communicated by Fliggere, from the isle of Bourbon; 50, elipticiformum, Linn. Sp. Pl. 1560; 51, trisiformum, Labill. Nov. Holl. v. 2. 99. t. 248. f. 2, considered by Mr. Brown as not different from the following; 52, affinit, Swartz Syn. 125 and 322; t. 3. f. 4; 53, palenii, Swartz Syn. 125 and 323, figured in Phyt. Plak. t. 403. f. 2; 54, polypusymphium, Willd., found at the Caracas by Bredemeyer. We subjoin the following.

A. hifsidum. Roughish New Holland Maidenhair. Br. n. 2. Swartz Syn. 124? See n. 33, above. (A. nervosum; Swartz Syn. 123? See n. 32, above. A. pedatum; Forli. Prod. 83, on the authority of his herba-rium.) Frond doubly pinnate; lowest branches divided; leaflets ovate-rhomboid, toothed in front, flattened, rather hairy, and rough. Involucrum nearly orbicular, hairy. Common stick and ribs rough.—Gathered by Mr. White, as well as by Mr. Brown, in New South Wales, and by the latter in the tropical part of New Holland. A foot high, or more, with a strong tufted root, whose crown is scaly. Stalks purplish-black, harsh. Leaflets somewhat flaked,
A D I

flaked, numerous on each long partial branch, crowded, oblique, jagged, half an inch in length, of a fine green. *Involucrum* crowded most about the inner, or upper, angle of the bafe, brown, round or kidney-shaped, rough with fine brilly hairs; their under side covered with little brown crowded *capsules*, which are quite unconnected with the leaf.

*A. formosum.* Elegant New Holland Maidenhair. Br. n. 3.—"Frons repeatedly compound, deltoid; branches tripinnate; leaflets rhomboid, obtuse, smooth; the lower ones cut. Involucrum kidney-shaped. Partial ribs downy. Common flake rough."—Discovered by Mr. Brown, near Port Jackson, New South Wales. We know not that we have ever seen a specimen.

*A. affimile.* Round New Holland Maidenhair. Br. n. 4. Swartz Syn. 125 a and 322. t. 3. f. 4. (A. trigonum; Labill. Nov. Holl. v. 2. 99. t. 248. f. 2; see n. 51 and 52 above.)—Frons repeatedly compound, very smooth; leaflets roundish-rhomboid, deeply notched in front; the notches contracted, each bearing a smooth kidney-shaped involucrum. Common flake and ribs perfectly smooth.

Gathered by Dr. White and Mr. Brown, in the neighbourhood of Port Jackson, and by the latter, as well as M. La billiardiere, on the south coast of New Holland, and in Van Diemen's island. From one to two feet high, composed of numerous little, fan-like, flaked, ribbed, bright-green leaflets, between whose rounded marginal segments the smooth, light-brown *involucrums* are ratted. These by age become refracted, and turn up the numerous pale capsules which cover their under surface.

*A. subcordatum.* Heart-leaved Maidenhair. Swartz in Stockh. Trans. for 1817. 75.—"Frons tripinnate; leaflets flaked, somewhat heart-shaped, pointed, slightly crenate, with radiating veins. Involucrums at each margin, roundish-crenate-flattened."—Gathered by Dr. Freyreis, in flaky woods in Brail. *Common flake* round, dark purple, smooth and polished. *Frons* eighteen inches long, its outline ovate, or deltoid. Primary and secondary branches alternate, widely spreading, straight, round, smooth, the colour of the flake. *Leaflets* alternate, rather distant, some regular, others oblique and dilated at the upper angle of the bafe, an inch in length, with a long point to each; smooth on both sides; streaked beneath with copious, forked, radiating veins, and slightly glaucous; the margin obscurely serrated. *Common rib* flibly zigzag, polished. *Dots* at the upper and under edges, not at the bafe or apex, roundish, distinct, covered by brown crenate-flattened *involucrums*. *Swarts.* This mode of expression must not be taken literally, for then the plant would be a *Cheilanthes*. The author adds, that this species is very distinct in the shape of its leaflets; for so only can we understand "forma pinarum," as meaning *pinarum*.

*A. intermedium.* Intermediate Maidenhair. Swartz in Stockh. Trans. for 1817. 76.—"Frons doubly pinnate; leaflets halved, wedge-shaped, oblong-rhomboid, obtuse, ribbed and irated; with a right angle at the upper side of the bafe; ferrated and fructifying at the front and apex. Stalk and ribs rough and downy."—Gathered by Mr. Freyreis in low woods, in the interior part of Brail, in September. *Root* creeping. *Common flake* a foot high, triangular, rigid, rough-hill, brownish-black, becal with rufhiy hair. *Frons* half as long, deltoid; first divisions obsolete, linear-lanceolate, curved upwards, of three pair of leaflets, half an inch in length, besides an odd one rather longer, all somewhat flaked, slightly falcate, obtuse, crowded, smooth on both sides, of a brownish-green.

*Dots* four or five, distint, each with a semicircular, curved, brown involucrum. Intermediate, as it were, between *criptatum* of Linnus, and *nervosum* of Swartz, n. 31 and 32, but differing from the former in having the *common flake* not rough with prominent points, nor the lower branches deeply divided; from the latter in having wedge-shaped leaflets, somewhat falcate in front, and other particulars. It is perhaps too nearly related to *A. acuminatum* of Deveux. *Swarts.*

ADJIDSING. See *Bunedia* and *Rewari*.

ADIPOCRISC, in *Chenopodium* is described at length in the Cyclopædia; but the curious fact that this surpasses forms a principal ingredient in some species of *Billiard Calcis* has been omitted under both articles.

ADJUSTMENT, the settling of the averages or losses on policies of assurance. See AVERAGE.

Eff. Ch. Calyx of five leaves. Petals from five to fifteen, oblong, obtuse, polished, with simple naked claws. *Stam.* Filaments numerous, very short, awl-shaped, inserted into the bafe of the receptacle; anthers oblong, inflexed. *Pis.* Germens numerous, ovate, inserted into the oblong-conical receptacle, crowded, above the flaments, each pointed with a very short, partly deciduous, style; stigma acute, reflexed. *Peric.* none. *Recept.* oblong, spiket. *Seeds* numerous, irregular, angular; gibbous at the bafe; reflexed at the point, rather prominent, without awn or wing.

Herbaceous plants, with leafy *flents.* Leaves deeply cut, in a pinnate manner, their lobes many-cleft, in very numerous, linear segments. *Involucrum* none. *Flowers* solitary, at the summits of the item, or branches, yellow, scarlet or crimson, never blue.

All the ten species are found in Europe, or in the adjoining countries of northern Africa and Asia; those of the first species in cultivated plains; of the second in rugged mountainous spots.

The perennial kinds have acrid, bitterish, purgative *roots,* capable of supplying the place of Hellebore. The annual ones are almost inactive.

The genus is divisible into two sections, by the habit and duration, confirmed by differences in the flowers and *fruits,* as follows.

*Adonis* of C. *Bauh.* *Pin.* 178.

Petals from five to ten, concave or flat. *Stam.* eighteen or twenty. *Seeds* collected into an ovate or cylindrical spike, always smooth, each beaked with a straight conical style. *Roots* pink, annual, tapering, but little divided. All these annual ones are so nearly akin, that they have been taken by several
several authors, perhaps not improperly, for varieties of one species. The following synonymis therefore are equally applicable to all of them.

**Adonis.** Matth. Valgr. v. 2: 257.

125. 126.

**Adonis radicis anna.** Linn. Hort. Cliff. 251, not 321.

*A. annua.* Lamarck Dict. v. 1. 45. Bro. Luft. v. 2. 376.

*A. n. 1158.* Hall. Hist. v. 2. 66.

The following plants may, in M. De Candolle's opinion, be esteemed, with equal propriety, either species or varieties. He therefore proposes them with hesitation, recommending them to the observation of practical botanists. Whatever difficulties may attend some of these, we are persuaded that they cannot all be united, even though the *Eranthemalis* and *effulvis* should prove the only two that are permanently distinct, and the foundations of all the rest.

1. **A. autumnalis.** Corn Adonis, or Pheasant's-eye. Linn.

A. hortenfis, flore minore atroruberante; Morif. fept. t. 8.

f. 1. Eranthus flore rubro; Beil. Eyff. æffiv. ord. 5.

f. 11. f. 2.—Calyx smooth. Petals concave, converging, fearce larger than the calyx. Seeds somewhat reticulated, collected into an ovate head. Stem branched.—Native of corn-fields in various parts of Europe, from Germany to Greece, flowering through the fummer to the end of autumn; not frequent in England, except in gardens, where it is often cultivated amongst other hardy annuals, and as De Candolle observes, prefers itself unaltered from seed. The root is somewhat spindie-shaped. Stem branched, bufty, round, firitated, occasionally downy. Leaves alternate, dark green, thrice compound, with innumerable, crowded, rather short segments. Calyx pale green; sometimes purplish. Corolla of that peculiar intense crimmon, or blood-colour, which gave occasion to the name of Pheasant's-eye, and probably to the original application of the fable to this very plant, whose beauty well merits the compliment. Each petal has a violet-coloured base. Petals inverfely heart-shaped, uffually about eight. Fruit ovate-oblong, measuring hardly an inch. Calyx-leaves gibbous below their infection. M. De Candolle remarks, that there is occasionally, though rarely, a paler variety. This feems, by Dr. Withering's fpecimens, to be what he found on Salisbury plain, and took for *effulvis.* Its petals are rounded, and do not extend beyond the calyx.

2. **A. flavo.** Yellow Field Adonis. Villars Cat. Strabo.

41. A. fylveflris, flore cirino; *l'abern. Ic. t. 700.* A. fylveflris, flore luteo, folis longioribus; Mill. Ic. t. 14.

f. 22 De Cand.)—Calyx smooth, with fhort fpuris. Petals flat, oblong, twice the length of the calyx. Seeds nearly smooth, collected into an oblong head. Stem fearce branched.—Common in corn-fields and vineyards in every part of France, and apparently in Germany also, flowering in June and July. The flerm is almost always quite fimple. Flowers yellow, or lemon-coloured, rarely pale orange. Calyx-leaves elongated and unattached at the base, almoft as in *Sedum* and *Myosurus.* Petals flat, very nearly linear. The flowers generally almoft rival the size of *A. vernalis,* but there is a variety only half as large; they run into each other.

**De Candolle.**

3. **A. micrantha.** Small-flowered Adonis. De Cand. n. 3.—Calyx smooth; not fpurred at the bafe. Petals flat, oblong, rather longer than the calyx. Seeds somewhat reticulated, collected into an ovate head. Stem somewhat branched.—Found in the fouth of France, in fields about Touloufex, Avignon, &c., flowering in May and June. A doubtful species. *Flower* small, yellow, or flame-coloured. *Germea* few, from feven to ten, comprising a very fhort head. Stem fimple at the bafe, but often a little branched at the fimmit. *De Candolle.*

4. **A. microcarpa.** Small-fruited Adonis. De Cand. n. 4. (A. annua, flore minimo, picà tenui longifìmmà; Morif. fect. 6. t. 9. f. 4.)—Calyx smooth. Petals flat, oblong, twice the length of the calyx. Seeds reticulated, collected into an oblong head. Stem nearly fimple.—Native of corn-fields in France, near Tuleifa; *Dufour* in the ifle of Ivisca; *Delaroche*; *Tenerife*; *Brouffat.* Perhaps not distinct from *flava,* n. 2. It appears to differ in the *flerm* not being half fo tall, with more crowded foliage. The calyx is fearce, not at all, fpurred at the bafe. Seeds about half the size of *flava,* more numerous, and much more reticulated, in a head eight or nine lines long. The corolla is either of a lemon-yellow, or somewhat flame-coloured. *De Candolle.* We take the liberty of introducing Morifon's synonym, which feems to answer best to this species, though applied by De Candolle to the feventh.

v. 1. 251, under n. 1. De Cand. n. 5. (Ranunculus arven-

sis, folis chamaemelli, flore minore luteo; Tour. Int. 291?

De Cand.)—Calyx hairy at the bafe. Petals flat, oblong, longer than the calyx. Seeds collected into an ovate-oblong head. Stem nearly fimple. Flower almost feifile among the leaves.—Native of corn-fields in France, Germany, Tenerife, &c. A small plant, with an erect, moistly fimple, and little yellow folidary flowers. Bafe of the calyx rough with hairs. Perhaps the synonymas may rather belong to *microcarpa,* or to *micrantha.* *De Candolle.*

335. De Cand. n. 6. Willd. n. 3. Ait. n. 3. Hoff.

Syn. 308. Hoffm. Germ. v. 1. 251. (Eranthus flore flammato; Befl. Eyff. æffiv. ord. 5. t. 11. f. 32.)—Calyx hairy at the bafe. Petals flat, oblong, somewhat acute, longer than the calyx. Seeds collected into a cylindrical head. Stem branched. Flowers ftalked.—Native of corn-fields in Auffria, flowering in fummer; *Jacquin.* In Brunfwick; Hoffmann. The flerm is two feet or more in height, branched from the bottom all the way up, furrowed, fMOOTH or hairy. Foorflucks hairy. Leaves light-green, with lanceolate segments. Flowers large, on long stalks. Calyx acute, jagged, reddifh. Petals eight or nine lines in length, somewhat obovate, but more or less acute, and frequently toothed; their colour orange-scarlet.

251. A. annua, flore majoare phoenicea; Morif. fect. 6. t. 9.

f. 3. A. fylveflris, flore phoenicea; Bauh. Pin. 178. Anemone tenuifolia; Cord. Annot. 151, good.)—Calyx hairy at the bafe. Petals flat, oblong, obtuse, twice the length of the calyx. Seeds reticulated, collected into a long cylindrical spike. Stem flightly branched. Abundant in corn-fields of the south of Europe, France, Italy, &c.; frequent in Greece, according to Dr. Sibthorp, who from that circumfance, and its coincidence with a figure in the famous old manuscript copy of Dioscorides, at Vienna, was led to consider this species as the *apparox* of that ancient botanist. This
This Adonis is one of the tallest, with a copiously-branched, furrowed stem; light-green leaves; and long-stalked flowers, which we cannot, with De Candolle, term small ones, being, as far as we have seen, of the full size of any annual species of its genus. The petals are usually numerous, of a most vivid scarlet. Fruit long, but not interrupted, except by accident. We cannot but consider our friend M. De Candolle as having cited Morison, on the present occasion, with less accuracy than usual, and we have made an alteration herein; see species 4th.

8. A. dentata. Toothed-seeded Adonis. *Delile Egypt. t. 17. Defers. t. 53. f. 1.* De Cand. n. 8.—

“Calyx hairy at the base. Petals flat, oval-oblong, rather longer than the calyx. Seeds reticulated; tuberculated and toothed at the base; dispersed in a long uninterrupted spike.”

—Native of corn-fields and barren ground, in Egypt and Cyprus; as well as in Provence, between Digne and Colmars. The stem is angular and irritated, firm, branched. Flowers on short stalks. In the Egyptian specimens, the petals are oval, yellow, with blackish claws; seeds furnished at the base with tooth-like prickles, finely corrugated, leaves crowded at the back, and dispersed in a slender spike. In the Provence variety, the petals are oblong, and flame-coloured; seeds less toothed or tuberculated at the base, more crowded, lying over each other with their crests, so as to form a continued spike an inch long. De Candolle.

Sch. 2. Confligis. Matthiolii, De Candolle.

Petals from eight to fifteen, always oblong, flat. Stamens from 25 to 35. Seeds, collected into an ovate head, each ovate, beaked with its hooked recurved style. Roots perennial, thick at the crown, blackish, with clustered fibres.

—Mentzelii; De Cand, excluding the syn. of Linnaeus. (Helleborus niger fulgeraceus, canis geniculato, flore magnno, tulipa minoris infar; Mentz. Pagilli. t. 3; copied in Morif. fect. G. t. 9. f. 2.)

γ. Siberica, Patrin; De Cand. (A. n. 43; Gmel. Sib. v. 4. 300.)

Root somewhat tuberous. Stem branched from the bottom. Petals ten, fifteen, or more, elliptic-lanceolate. Calyx downy. Seeds hairy. Native of mountainous or alpine situations, or open hills, in the Isle of Oeland, Germany, the south of France, Switzerland, and Italy. Frequent with us in gardens, flowering in the early spring. The tuberous crown of the black perennial root, feeds down many long, simple, rather flufh stalks. The flowers are hermaphrodite, a foot high, fringed, leafy, or more or less branched from the lower part, in an alternate order, rarely bejewelled with the few loose feathery hair. Leaves crowded, feathery, alternate, smooth, in many three-eJect, linear, acute, entire segments, channelled above. Flowers terminal, solitary, nearly feathery, large and handsome, an inch and a half or two inches broad, of a bright shining yellow. Calyx-leaves concave, ovate, downy, fringed. Petals twice as long, sometimes above an inch, usually ten or twelve, but sometimes, even in a wild state, above twenty; purplish beneath; varying in breadth, but always somewhat elliptical, either obtuse or acute, a little crenated. Stamens numerous, capillary, short, with vertical quadrangular anthers. Germs numerous, ovate, compressed, more or less covered with short soft hairs, and hooked with the recurved styles, collected into a globular head, the flake much elongated as the fruit ripens. We readily follow De Candolle in thinking the plant of Mentzelius, (see p. 3) a very incomodible variety, differing only in having short and simple fruits, with larger flowers: but Linnaeus has surely committed a great error in referring this plant to his op. p. 3. The γ of De Candolle is said to have likewise a large flower.

10. A. opennis. Apennine Adonis. Linn. Sp. Pl. ed. 1. 548, excluding Mentzelius’s synonym, ed. 2. 722. Wild. u. 5.—Root somewhat tuberous. Stem branched at the top. Petals fifteen, obvolute. Calyx smooth. Seeds fringed.—Native of Siberia and the Apennines, according to Linnaeus, who cultivated this plant at Upfal, as appears by the original specimen in his herbarium. He always considered this species as very near the last, and has been unusually precise in marking their differences. The stem of the present is fifteen or eighteen inches high, with several branches about the upper part, not from the lower. Segments of the leaves more numerous, lanceolate, and differing. Calyx yellowish, smooth, flat, without veins. Petals obvolute, imbricated, generally more numerous. Stamens much reflexed. The germs seem to be fringed only, not all over downy. Linnaeus concludes by observing that the former is entirely a vernal plant, as we find it; but the present lasts far into the summer. Nevertheless our intelligent friend M. De Candolle, who never saw this species but in the Linnean collection, was induced, probably by the synonym of Mentzelius, which cannot be the same, to reduce it to vernalis. We find more difficulty in understanding the two following.

—Steven, who sent specimens to De Candolle.)—“Radical and lower leafy-leaves reduced to slightly sheathing scales; middle and uppermost leaves feathery. Seeds somewhat downy. Calyx externally hairy. Petals ten or twelve, oblong.”

—Gathered by Mr. Steven, near the banks of the Volga. Perennial. Intermediate between vernalis and pyrenaica, differing from the former in having a branched stem, more diffusely leaves, often wanting on the lower part of the branches, and much less downy feathery. From the latter it is distinguished by having its lower leaves abortive, like scales, and the seeds, at least while young, somewhat downy. From both it differs in the calyx being externally downy or finely hairy, not smooth. Mr. Steven met with A. vernalis, likewise near to Tauris, Mr. Stevem.

These remarks of our learned friend caufe us to small perplexity. All our specimens of A. vernalis, from Switzerland and the south of France, as well as the authentic Linnean specimen, and one from protector Joquin, have a downy calyx, and most of them branched stems. The half-ripe seeds in Joquin’s plant are sparingly downy all over; the germs of those from Switzerland scarcely downy at all.

12. A. pyrenaica. Pyrenean Adonis. De Cand. n. 10. (Fl. Franc. v. 5. 535.) (A. apennis; Gouan Ill. t. 33.)—“Radical leaves on long stalks, ternate; leaveslets in many deep segments: upper leaves feathery. Fruit smooth. Petals eight or ten, oblong-wedge-shaped, undivided.”

—Found by Gouan in the valley of Eyne, in the eastern Pyrenees, flowering in July. The other places of growth, mentioned by De Candolle, are all bel mistaken. He directs us in his Addenda to strike out the reference to Pallas, as belonging to A. volgensis; and perhaps also that of Fischer, A. chervenay. To the latter alteration we heartily assent.

Dr. Fischer’s own specimen, seen in our hands by De Candolle,
ADPRESSA FOLIA, Clove-prefled Leaves, are such as have the upper surface closely applied to the stem, or branch, on which they grow. This is so complete in some plants, such as <i>Pfeiffera biejiuta</i>, that only the under surface of each leaf being exposed to the air and light, the latter part appears to perform the functions proper to the upper surface of most leaves, and, in the inflorescence just mentioned, assumes the deep green hue, and polished cuticle, usual on the upper side of leaves in general. Such is likewise the case with <i>Xeranthemum proliferum</i> and <i>sesamoides</i> of Linnæus, now referred to <i>Eliglrysum</i>. <b>See Leaf</b>.

ADRASTAEA, so named by professor De Candolle, from Adrastra or Adraffia, a surname of the goddes Nemesis, who was a daughter of Oceanus; because the plant in question is a native of New Holland, which has been called by some persons <i>Oceania</i>.—De Cand. Syll. v. i. 424.—Cliffs and order, <i>Decandria Dignity</i>. Nat. Ord. <i>Magnoliæ, Juf. Dillenialæ, De Cand.</i>

Eff. Ch. Calyx inferior, of five permanent pointed leaves. Petals five, oval, shorter than the calyx. Filaments flat. Anthers linear, of two cells curving lengthwise. Germs two, globose. Styles straight, close together, awl-shaped; conical at the base. Capsules membranous, of one cell. <i>Sted</i> solitary?

1. <i>A. foliis folia</i>. Willow-leaved <i>Adrastra</i>.—Native of bogs in New South Wales. Described by De Candolle from a dried specimen in Mr. Lambert's collection. This is a small shrub, approaching <i>Herbertia</i>, (see that article) in general appearance. The branches are round, long and slender, reddish-brown; downy when very young, but casting their cuticle in long portions when old. Leaves linear, entire, except three or five callous teeth at the extremity, the point being callous; their base somewhat contracted; their upper surface smooth, without veins; the under hoary with short silky hairs; their length is an inch and a half; breadth three lines; and they resemble the leaves of <i>Saltis alba</i>, or of the Olive. <i>Flowers</i> at the ends of the young branches, solitary or in pairs, sessile between three or four crowded leaves, which exceed them in length. <i>Calyx-leaves</i> keeled, covered with close silky hairs; their margin membranous; their point tipped with a bristle. <i>Stamens</i> ten, half the length of the calyx. <i>Germs</i> smooth.

ADRIAPLE, col. 2, l. 3, r. 1453.

ADVICE, in <i>Commerce</i>, denotes the information given by letter of a bill drawn by one merchant upon another.

ADVOCATE, l. 24, r. paied A.U. 549. Col. 2, l. 8, r. revised.

AECDIUM, in <i>Botany</i>, from a <i>wound</i> or <i>injury</i>, because the parts of a plant to which this genus of paraffinal fungi attaches itself, always, in consequence, become diseased, discoloured, and either tumid, or, as it were, blasted.—Perf. Obs. Mycol. fac. t. 97. Syn. Fung. 204.—Cliffs and order, <i>Cryptogamia Fungi</i>. Nat. Ord. Fungii. Eff. Ch. Head conic peace, sessile, round, membranous, at length burrying, with a toothed orifice. Seeds meaty, naked.

This genus is always paraffinal on the backs of the leaves, or on the stem, of certain plants. In addition to what is said of it already, we shall subjoin illustrations of a few species. Perfoon defines twenty, in two sections.

Sec. 1. Aggregate. Heads assembled in patches, forming blotches on various leaves. Fourteen species.

<i>A. cortumum</i>. Horned Accidium. Perf. n. 1. Obs. Mycol. fac. 2. 22. t. 4. f. 2, 3. Sowerby Fung. t. 319. (Lycoperedon corniferum; Fl. Dan. t. 838. L. coniculatum; Ehrh. Crypt. 200.)—Baie yellowish. Heads nearly cylindrical, very long, curved, greyish-olive.—Found in autumn, on the leaves of the Mountain Ash. On the upper side of the leaf is seen an orange-coloured spot; on the under a swelling, out of which proceed five or seven brille-like <i>buds</i>, a line and a half in length; each rather tumid at the base; contracted at the point, where it bursts irregularly.

<i>A. cancellatum</i>. Reticulated Accidium. Perf. n. 2. Sowerby Fung. t. 410. (Lycoperedon canceelatum; Jacc. Aultr. v. i. 13. t. 17. Fl. Dan. t. 704.)—Baie tawny. Heads oblong, splitting into fibrous mafles, cohering at the summit.—Not rare on the leaves of garden pear-trees. We first saw it on a baking pear at Sir A. Hume's, Wermleybury, many years ago, where it still frequently occurs, without injury to the tree or fruit. The <i>buds</i> are much thicker and shorter than the foregoing, and when ripe, discharge their powdery <i>seeds</i> between the tough, brownish, permanent fibres of the <i>head</i>, which lasts as long as the leaf, and actually seem an extension of its woody fibres. We cannot but conceive Mr. Sowerby's <i>t. 409</i> to be a different plant, belonging to the genus <i>Spireria</i> (see that article); or rather perhaps <i>Nemaspora</i>, to be hereafter described.

<i>A. oxyacantha</i>. White-thorn Accidium. Perf. n. 3. (A. lacera tum; Sowerby Fung. t. 318. Lycoperedon pennisculatum; Fl. Dan. t. 839?)—Baie unequal, rufy. Heads ash-coloured, cylindrical, splitting nearly from top to bottom, into numerous, fibrous, spreading segments.—Found on the leaves, or young buds, of Common Hawthorn. Perfoon describes his specimens as divided to the very base, and therefore presumes the plant of <i>Fl. Dan.</i>, which appears not split half way down, may be another species; but Mr. Sowerby's seems intermediate between both, and we can scarcely doubt his being the same as Perfoon's.

sprinkled with the little starry whitish orifices of the heads, fall of orange powder. *Lycoperdon epiphyllum* of Hudson and Lightfoot are different from this, and perhaps from each other. *Uredo tulliflazeria* resembe the plant in general aspect, but on near examination will be found less distinct, in the form of an orange powder, intermixed with the cotton of the Colt’s-foot leaf, without distinct white starry heads.

**Ac. berberidis.** Barberry *Eacidium*. Perf. n. 11. Sowerb. Fung. t. 397. f. 5. (*Lycoperdon plicoculm; Jacq. Coll. v. 2. t. 142. t. 4. f. 1.)—Bae orbicular, scarcely convex. Heads cylindrical, somewhat elongated, yellow.—Found on leaves of the Barberry, in cold wet autumnal weather, sometimes in the spring, confling of very conspicuous and prominent tunny spots, the heads projecting much. The orifice of each is neither dilated, nor conspicuously toothed or jagged. The whole turns brown, or black, in decay, and may be observed in that state on the fallen leaves during winter.

**Sect. 2. Simple.** Heads scattered, not combined by any distinct crust, or base. Six species.

**Ac. euphorbiæ.** Spurge *Eacidium*. Perf. n. 15. "Humb. Friberg. 128." (*Lycoperdon euphorbiæ; Schrank. Balt. v. 2. 631.) "Euda degener; Rivin. Tetrap. Irr. t. 113. f. 2.—Simple, crowded. Heads pale, cylindrical, reflexed at the margin. Powder orange-coloured.—Frequent in summer on the leaves of Euphorbia Cuparniifias, in Germany, France, and Switzerland, cauing the whole plant to assume a diseased appearance, and often to fail of producing flowers. We scarcely think Rivinus, as Peronio hints, meant to consider this diseased *Euphorbus* as a distinct species.

**Ac. tragoægii.** Goat’s-head *Eacidium*. Perf. n. 15. b. Sowerb. Fung. t. 397. f. 2.—Scattered. Heads somewhat elliptical, with an irregularly torn white margin. Powder yellow.—On the stem and leaves of Tragoægon pratensis. Confusious for its short white heads. **Peronio.** That author certainly means to describe this as a distinct species from the last, though by an error, which ought to have been corrected in printing, he has given the same number to both. Hence he has really twenty species in all, though apparently but nineteen.

**Ac. anemoæ.** Wind-Anemone *Eacidium*. Perf. n. 17. Ufl. Annal. v. 20. 135. (*Lycoperdon anemoæ; Pulten. Tr. of Linn. Soc. v. 2. 311.)—Simple, scattered. Heads cylindrical, rather prominent, pale, mothly toothed, filled entirely with white powder.—Found in the spring on leaves of Anemoæ nemoralis, rendering the plant feky, and often barren. Dr. Pulteney observed that this *fungus* originates under the cuticle, and may be seen, in a young state, through that membrane. At length each individual assumes a nearly globular form, burring with lacerated edges, the cavity being lined with white powdery seeds, intermixed with minute fibres. In fading, each turns yellowish, then brown, and finally "each *fungus* is resolved into a farinose particle, resembling the fructification of a Polypondyl." Pulteney. The A. fulvum, Relh. Cant. 546. Sowerb. Fung. t. 53, found on the leaves and petals of the same family of Anemoæ, without injuring the plant, is the Puccunia anemoæ, Perf. Syn. Fung. 226, a genus described as distincte of a head, or peridium. In this respect we find it difficult to draw a line between Mr. Sowerby’s figure, and his various representations of Ecidia, t. 398, though we doubt not the specific difference of the above two plants. Which of them is the "Conjuror of Chalgrave’s Fern," Dill. in Ruttiv. Syn. 134. t. 3. f. 1, may be doubted; but we rather suppose the Puccunia.

**Ac. puntilatum.** Yellow-Anemone *Eacidium*. Perf. n. 18. Ufl. Annal. v. 20. 135. (Ac. anemoæ; Hoffm. Germ. v. 2. t. 11. f. 1.)—"Simple, scattered. Heads partly furt, their border nearly closed. Powder compacta, brownish." Found rarely on the leaves of Anemoæ ranunculoides, which it marks with brown dots. The border of the orifice is but slightly, if at all, toothed. Seeds chestnut-coloured. **Peronio.** We have not heard of this species in Britain.

Mr. Sowerby has represented several more species of this genus in his English Fungi, t. 397, 398, such as Ac. torni, confluens, rubri fragaria, menšíe, faltics, cardui, rbi; but we do not see clearly how the generic difference between *Eacidium* and Puccunia is, in most of them, to be determined.

**AGEG, I. 4. r. M. Gebelin.**

**AEGERITA, in Botany, so called from *Aegira, a Poplar*, or rather Alder tree, because the first-discovered species of this minute genus grows on the wood of the Alder, and was thence called Sclerotium *Aegiria*, which last word, on the etablissement of the present genus, was taken for its generic name.—Perf. Syn. Fung. 684.—Clafs and order, Cryptogamia Fungi. Nat. Ord. Fungi.

Eff. Ch. Seifile granulations solid, filled with a somewhat mealy powder.

1. **Ac. candida.** White Aegerita. Perf. Difp. Fung. 60. (Sclerotium Aegiria; Hoffm. Germ. v. 2. t. 9. f. 1.)—Crowded, smooth, pure white.—Found not un freqently in autumn, on the dry rotten wood of Alder, in moist situations. This fungus consists of numerous little crowded granulations, the size of millet seed, globular or elliptical, as white as sugar-plums, solid but friable, the internal substance appearing, when highly magnified, full of seed-like bodies. Hoffmann.

2. **Ac. pallida.** Pale Aegerita. Perf. ibid.—Scattered, pale, somewhat warty.—On the fallen branches of Oaks. Distinguished by the inequality of its surface. **Peronio.**

3. **Ac. 컴.** Grey Doubtfull Aegerita. Perf. n. 3.—Scattered, glaucous or whitish.—On the trunks of trees in winter. Refrums small pale dots of a soth substance; disappearing when dried. **Peronio.**

1. **Ac. annulata.** Gathered by Mr. Brown, in the tropical part of New Holland, growing among Rhizophora, near the sea-thore. A perfectly smooth *furfur*, of humble growth, having round, brittle branches, marked with annular scars, where the leaves have been. Leaves alternate, without stipulae, flat, coriaceous, ovate, entire; their *furfur* bordered, dilated and flaxenting at the base. Spikes paniced. Flowers white, alternate, somewhat imbricated, with three bracteas. **Brown.**

Akin to Statice. See that article, and Taxa—Thema.

**AEGERITAS, so called from *aegira, a goat*, and *nepher, a horn*, in allusion to the horn-like shape of the curved feed—veil, in the following is to be substituted in the place of our original article.—Gern. v. 1. 216. t. 49. Schreb. Gen. 158. Willd. Sp. Pl. v. 1. 1183. Mart. Mill. Dict. v. 1. L 2.

Gen. Ch. reformed. Cal. Perianth inferior, of five roundish-oblong, concave, coriaceous, permanent leaves, thick set at the base, obliquely imbricated at the margin. Cor. of one petal, salver-shaped, somewhat coriaceous, tube the length of the calyx, nearly cylindrical, thickish, rounded at the base; limb the length of the tube, in five deep, ovate, pointed, equal, reflected segments. Stam. Filaments five, prominent, awl-shaped, twice the length of the tube, united at the bottom into a ring, attached to the base of the corolla; anthers arrow-shaped, incumbent, ventrally, of two lobes and two cells, bursiling longitudinally. Pfiil. Germen superior, linear-oblong, compressed, dotted, with rudiments of several seeds; style erect, the length of the stigmas, tapering, permanent; stigma simple. Peric. Follicle cylindrical, coriaceous, curved, pointed, of one cell. Seed solitary, oblong, nearly filling the pericarp, and germinating there, attached by a thin flat umbilical cord, of its own length, which is dilated into a hood-like, pointed, partial tunic, closely covering the minute cotyledons, and part of the radicle; albumen none; embryo erect; radicle very large.

1. Ac. indica. Indian Aegicetia. Linn. Sp. Pl. v. i. 632. Roxb. Coromand. v. i. 63. t. 91. Willd. n. i. (Oborbanche Aegicetia; Linn. Sp. Pl. ed. 3. 284. Roxb. Cal.). —Native of Malabar, in the hilly parts of the Circars, but rare. Roxburgh. Root of many small fibres, probably parasitical and annual. Stem several, purplish, a span high, simple, single-flowered, and naked, except a lanceolate, brown, sheathing scale at the bottom of each. Calyx purplish-coloured, an inch long, turning green as it fades. Corolla half as long again as the calyx, and more slender, of a violet purple; the tube pale; deciduous. Style permanent as the fruit ripens, curved, projecting laterally out of the calyx. Seeds and receptacles tawny.

The generic distinctions between this plant and Oborbanche are obvious enough; the single-leaved phlaspatic calyx, regular corolla, undivided stigma, and many-celled capsule, whose internal stricture Dr. Roxburgh says he could never well determine, but the numerous convoluted partitions, or receptacles, which he describes, are sufficiently different from Oborbanche. As to habit, these genera nearly agree, both having a rusty pubescence, a purple hue, and, if we mistake not, parafalitical roots; though the inflorescence, and the form of the calyx, differ in each. Aegicetia appears to want the nebriferous gland, found at the base of the germen, in front, in Oborbanche; it wants also the bracteas, observable in every species of the leaf-named genus, except the uniform.

ÆGISSUS. See ÆGYPTUS.

AEGILE, in Botany, the name of one of the Hesperides, (see that article,) chosen by Mr. Correa de Serra for this genus, as Linnaeus had already dedicated one to her sister Arethusa.—Correa Tr. of Linn. Soc. v. 5. 222. Ait. Hort. Kew. v. 3. 284.—Clas and order, Polyandria Monogynia. Nat. Ord. Aurantia. Jull.

Gen. Ch. Cal. Perianth inferior, of one leaf, small, with five shallow lobes, at length deciduous. Cor. Petals five, ovate, acute, spreading, many times longer than the calyx. Stam. Filaments numerous, short, awl-shaped, inserted into the external part of the elevated receptacle of the flower; anthers oblong, erect, heart-shaped at the base. Pfiil. Germen superior, ovate; style short, thick; stigma oval, obfuscely furrowed. Peric. Berry coated, globular, smooth, almost woody when ripe, not bursiling, of ten or twelve cells obliterated as the pulp arrives at maturity. Seeds ovate, compressed, numerous in each cell, in a simple row, each infected by a short partial stalk into the central column; albumen none.
1. Ac. Marmelos. Thorny Aegle, or Bengale Quince. Correa as above, 223. Willd. n. 1. Roxb. Coromand. v. 2. 23. t. 143. (Crataeva Marmelos; Linn. Sp. Pl. 637. Willd. Sp. Pl. v. 2. 853. Cydonia exotica; Bauh. Pin. 435. Cucurbitae trifolia indica, fructus pulpæ Cydonii aënuma; Rall Hist. v. 2. 1665. Pluk. Phyt. t. 170. f. 5. Bilasius; Rumph. Amboth. v. 1. 197. t. 81. Covalam; Rheede Hort. Mal. v. 1. t. 37. t. 37. Mardoes of the Telingas. —Native of the mountainous parts of the coast of Malabar, sometimes of the low lands, flowering during the hot season. This is a rather large tree, whose trunk is nearly erect, clothed with sh-offcoloured bark. Branches scattered. Spines stipulare, in pairs, awl-shaped, pungent, strong, in an inch length, sometimes wanting. Leaves irregularly scattered, on downy flarks, ternate; leaflets elliptic-oblong, with a blunt point, serrated, fingle-ribbed, venous, smooth; tapering at the base; unequal in size; the odd one larger, about three inches long. Flowers of a dirty white, in short, aggregate, terminal and axillary, clusters. Fruit the size of a large crange, with a hard smooth greyish shelf, from which the Dutch in Ceylon are said to prepare a perfume. Dr. Roxburgh speaks of this fruit as delicious to the taste, and exquisitely fragrant, of a laxative quality, which renders it particularly serviceable in habitual coltivefences. A clear tenacious gum, enveloping the seeds, makes a good cement. The wood of the tree is hard and durable, of a light chocolate colour, variegated with dark veins, and serves for many purposes. Mr. Correa mentions another, likewise arboreal, species of Aegle, found in the East Indies, and prefered in fir J. Banks's herbarium, but of this he has unfortunately neglected to give either a name or description, nor have we seen any specimens. See Feronia for a genus next akin to the above.

Eff. Ch. Calyx of two valves, single-flowered; the valves clothed, with an intermediate awn. Corolla of two valves; the outer with three awns; inner with two. Seed solitary, unconnected with the glumes. One or two lateral male flowers.

1. Ac. cembroides. Spreading Aegopogon. Willd. n. 1. Palf. de Beauv. as above, f. 3. Kunth n. 1. t. 42. —Chlster lax. Flowers all equally flaked. —Gathered by Humboldt and Bonpland, on the exposed summit of mount Avila, near the town of Caraccas; also in Quito ; flowering from January to April. Rose perennial. Stem numerous, branched at the base, forming a tuft; those which do not flower, about as long as the finger; the rest a span in height, naked above, denfly leafy below. Leaves linear; the lowermost an inch, or an inch and a half long; the upper ones shorter. Stipites divided. Chlster simple, rather turned to one side, but spreading loosely. This grass has the aspect of Centauris ebbcris, or of Lappago racemosa Willdenow. We know it only from this author's description, and the figures cited. From M. de Beauvios or knowledge of the following species is entirely derived.

2. Ac. jujul. Small Aegopogon. Palf. de Beauv. 25 above, f. 4. —Cluster dense, turned one way. Perfect flower sessile. —Native country not recorded. The perfect flowers of this species, whose chlster is represented about half the size of the foregoing, are sessile, their calyx apparently of two equal, awl-shaped, undivided glumes. The two lateral, or male, flowers are elevated on equal, slender, parallel flarks, twice their own length, though but half as long as the intermediate perfect flower. The inner valve of their calyx seems entire, though awned. Their corolla consists of two entire, not cloven, valves, one of which is only awned. We do not pretend, without the investigation of specimens, to reconcile these contradictions of the generic character, nor to judge how far M. de Beauvios is right in uniting with this genus Mr. Brown's Amphipogon, hereafter to be noticed in its proper place.

3. Ac. geminiflorus. Twin-flowered Aegopogon. Kunth as above n. 2. t. 43. —Male flower solitary. —Gathered by Humboldt and Bonpland, on the banks of the river Orinoco, between Cerro Duida and Rio Tamatara, near Esmerald, flowering in May. Habit much like the first species, but thepikeletts are considerably smaller, while the central awn of one valve of the perfect flower is remarkably long, fhort, and rough. Each flower is supported by a short fhort flark, and there are only two to each pikelet, not three as in the two foregoing species.

ÆLOUS, in Mechanics, subjoin, see Ventilator.

ÆON, 1. 4. add—Homer Il. v. 453. Findar Olym. A. v. 18. Hence by an easy figure it is used to denote the customs and manners of life. Exer. il. 2.

AERIDES, in Botany, from aer, aer, air; because one of the principal plants of this genus has long been celebrated, under the name of Plos aeris, for living entirely, as was supposed, upon air. This plant, and several others agreeing with it in habit, though not all perhaps in generic character, have been sent from the East Indies to Europe, in baskets, without earth or any other apparent source of nutriment, and have not only survived, but blossomed during their voyage, as well as after their arrival. Their fhort fibrous roots, always more than half naked as they run over the branches of trees, having entwined themselves among the flanks of the basket, might perhaps imbibe suflenance from the air in those circumstances, as readily as in their natural situation; just as a pea will germinate and grow in moist cotton. —Louvre, Coccoch. 525. Swartz in Schrad. Journ. v. 2. 233. t. 2. f. 4. Equil. Neues Journ. v. 1. 88. Kon. Tracts t. 195. t. 8. f. Y. Willd. Sp. Pl. v. 4. 130. Ait. Hort. Rev. v. 5. 213. —Clas and order, Gynandria Monogynia. Nat. Ord. Orchidae.

Gen. Ch. reformed. Cal. Perianth of three equal, spreading, coloured leaves, gradually dilated upwards, somewhat wavy, rather obtuse. Cor. Petals two, much like the calyx-leaves in colour, fize, and figure. Nectary a lip without a spur, shorter than the petals, inserted into the base of the style, gibbous underneath like a bag, often revered over the column. Stam. One a vertical, hemispherical, movable, deciduous lid, of two or four cells; masses of pollen globular, flaked, in pairs. Pist. German inferior, oblong; style erect, semi-cylindrical, concave in front; stigma in front, near the anther. Peric. Capsule obovate-oblong, with three large and three intermediate angles, of one cell and three valves, separating between the angles. Seeds numerous, minute, each invested with a chaffy tunic.

The species of this rare oriental genus are not at all distinctly known. Willdenow enumerates seven, to which we have some additions.

1. A. retufum. Blunt-leaved Air-blossom. Swartz n. 1. Willd. n. 1. ( Epidendrum retufum; Linn. Sp. Pl. 1351. Limodorum retufum; Swartz Nov. Act. Ups. v. 6. 80. Anfelli Maravara; Rheede Hort. Malab. v. 12. t. 11. Rai Hilt. v. 3. 589. Orchis abortiva aliozides malabariensis, flore odoratiflomo variegato, intus aviculum repræsentante; Rudb. Elyf. v. 2. 220. f. 5.)—Leaves nearly radical, linear, with two equal terminal notches. Clusters many-flowered, twice the length of the leaves. Capsules obovate. Native of trees in the East Indies, flowering at the beginning and end of the rainy season, that is, in April and October, and lasting long. The plant is three feet high, attached to the bark by thick inflexed downy-coated fibrous roots, of a mucilaginous smell. Leaves spreading in two ranks, linear, stout, rigid, channelled, smooth, abrupt as if bitten off at the end, which seems characteristic of the genus; in this species the two notches are represented in the figure, which is all our authority, as equal and uniform. The flowers are very numerous, about forty, in several flalked, terminal clusters, all expanded at once, whitish besprinkled with red, blue and dusky spots. The lip is said to be pure white on both sides, with a tongue-like appendage, brilliant with blue and red. Each flower is less than an inch in diameter.

2. A. premorsum. Jagged-leaved Air-blossom. Willd. n. 2. ( "Bitim Maram Maravara; Rheede Hort. Malab. v. 12. t. 2." Rai Hilt. v. 3. 589. Orchis abortiva aliozides malabariensis altera, flore odoratiflomo fanguineo colore, intus aviculum purpureum referente; Rudb. Elyf. v. 2. 221. f. 6.)—Leaves radical, linear, variously and unequally notched at the end. Cluster many-flowered, twice the length of the leaves. Capsule cylindraceous. Found on trees in Malabar. Nearly akin to the preceding, the flowers being in like manner spotted with red and blue, and moreover with yellow and green. The column is purple. Rheede says this species acquires a poisonous property by growing on the Cañijira, a shrub or tree akin to Daphne; which, if correct, is very remarkable. Perhaps fragments of the bark of that tree, which may well be supposed highly virulent, may have been gathered with the roots of the paraatical plant.

3. A. laxifoliatum. Woolly-flowered Air-blossom. Willd. n. 3. ( Epidendrum Flos aéris; Retz. Obs. f. 6. 64.)—Stem branched, creeping. Leaves ovate-oblong, each seated on a bulb. Calyx externally woolly, acute as well as the petals. Found by König, on trees in the East Indies. There is nothing in König's description of the flower to convince us of this being an Aerides, while the account of its acute leaves, (not described as jagged or abrupt,) and their bulbous accompaniment, render it probable that Willdenow has here made a mistake. We retain this species and the next, merely as we find them in his work, for future enquiry.

4. A. matutum. Morning Air-blossom. Willd. n. 4. ( Epidendrum Flos aéris, vel Sarracenicum; Retz. Obs. f. 6. 58.)—This having a spur to the nectary, according to König's description, cannot belong to the genus before us. We therefore decline attempting a specific character, or any necessary correction of Willdenow's.

5. A. odoratum. Fragrant Air-blossom. Willd. n. 5. Ait. n. 1. ( A. odorata; Loureir. n. 1.)—Stem ascending. Leaves linear, emarginate, reflexed. Clusters axillary. Lip three-cleft; lateral segments obtuse. Found on trees in China and Cochinchina, sometimes pendulous. Root of numerous thick fibres, entangled together. Stem nearly erect, a foot high. Leaves large and thick. Clusters simple, long, drooping. Flowers pale, rather fleshy, sweet-scented. If this species be hung up in a house, it will continue to grow, and to flower for many successive years; which Lauroire says he had long experienced. Sir Joseph Banks is recorded to have introduced this Aerides into the flowers at Kew, in 1800, but it has never flowered. The late duchess of Portland received an air-plant, as it was called, from China or the East Indies, about twenty-five years ago, which we rather believe to have been the Epidendrum telfiellatum, Roxb. Corom. v. 1. 34. t. 42. Gymnadenia n. 34. Willd. Sp. Pl. v. 4. 102; or at least very near that species. It came in a basket, without earth, in perfect health, and afterwards bloomed in the flowe at Bulstrode; whether it received any different treatment there we have no recollection.

6. A. arachnitae. Great Japanese Air-blossom. Swartz n. 2. Willd. n. 6. ( Epidendrum Flos aéris; Linn. Sp. Pl. 1548. E. n. 7; Linn. Act. Ups. ann. 1740. 37. Limodorum Flos aéris; Swartz Nov. Act. Ups. v. 6. 80. Angurek Katong-ging; Kämpf. Amen. Exot. 868. t. 869. f. 1.)—Stem ascending. Leaves linear-lanceolate. Calyx-leaves and petals linear, revolute; dilated at the extremity. Lip cleft in front, with an internal cleft appendage.—Native of Japan, growing parasitically on trees, and much admired for the mucilaginous scent of its large handsome flowers. The leaves are said to be narrow, thick, and fleshy. Flowers from fevea to twelve together, in a loose simple cluster. Calyx-leaves and petels all nearly similar, each two inches long, linear; convex above; concave underneath; suddenly dilated at the end into a quadrangular form, all lemon-coloured, beautifully spotted with purple. Nectary much shorter than the petals, somewhat flared, consisting of a hollow abrupt lip, smooth, cleft deeply in front, ending below in a short point, from whose cavity springs an erect, fleshy, divided lobe or appendage. Such is the nectary of the plant figured by Dr. Swartz, of which two specimens are preserved in the London herbarium; but Kämpfer's figure exhibits a very different appearance of the same part, like three hairy leaves surrounding the column, in a manner we have never witnessed in any one of the Orchideae. We suspect two species may be confounded by authors.

8. A. Boraffi. Fan-palm Air-blossom. Buchanan MSS. —Leaves radical, linear-oblong, obtuse, obliquely emarginate. Calyx leaves, radical. Lip with a revolute undivided border. —Found by Dr. Buchanan, growing on Borassus flabellifer, in the Myore. The thick cracked or jointed fibres of the root have each a central tough thread. Stem none. Leaves equitant, about six, a span long and an inch wide; their points rounded, but unequally, one side extending further beyond the notch than the other. Clayer simple, scarcely flaked, twice the length of the foliage, deflexed, many-flowered, lax, with a few feathery scales at the base, flowers about an inch and a half in diameter. Calyx-leaves ovate-lanceolate, obtuse, somewhat revolute, near an inch long, pale buff with a purplish central fipple. Petals like them, but flat, and rather broader. Nectary half
as long, red, ringent, its revolute border as long as the pouc.

AERIDIES.

9. A. maculatum. Spotted-flalked Air-bloflom. Buch. MSS.—Stem creeping. Leaves elliptic-oblong, equally emarginate. Cluster lateral, flaked, corymbose. Lip the length of the petals; its border pointed, dilated at each side.—Gathered by Dr. Buchanan, on trees in the Mysore country. The films lend out very long curling fibrous roots. Branches short, leafy. Leaves obtuse, emarginate, hardly two inches long; sheathing at the bafe. Flower-flalk lateral, opposite to the lowest leaf on the branch, and protruding through its split bafe, a span long, erect, copiously spotted with dark purple, furnished with a few feattured bracteae, and terminating in a dense corymbose cluyer of six or eight yellow unflotted flowers, with a similar bracteae to each partial flalk. Calysx-leaves and petals ovate, about half an inch long, nearly uniform. Lip somewhat boat-shaped, with a deep keel, and prominent ascending point, accompanied at each side by a rounded dilatation of the margin. The back of the flower is tinged with greenish or purplish brown.

10. A. dafjepon. Denfely-bearded Air-bloflom. Stem ascending. Leaves ovate, with a jagged point. Umbels dense. Border of the lip kidney-shaped, denfely bearded.—Found by Dr. Buchanan, in Upper NepaL Roots composed of long, white, entangled fibres, running over the mofty branches of trees. Stems solitary, short, recurved, leafy. Leaves alternate, sheathing, broadly ovate, about three inches long, feshy; smooth above; minutely fcaly beneath; somewhat revolute; with three crowded, unequal, sharp teeth at the point. Flower-flalks lateral, solitary, half the length of the leaves, each bearing a dense umbel of numerous, nearly fefile, very beautiful and fingular, reverfed flowers, each hardly an inch in diameter. Calyx-leaves and petals fimaliar, obovate concave; dark red on the upper fide; green on the under. Lip keeled, but not very deeply, glofne, yellowish, spotted with red; its border as long as the petals, dilated, kidney-shaped, white; dotted on the smooth disk with crimson; fringed and thickly clothed towards each fide with short, fibrous proceffes, refeembling velvet. Capsule three inches long.

11. A. calceolae. Slipper Air-bloflom. Buch. MSS.—Stem creeping. Leaves linear-oblong, falcate, unequally jagged at the point. Umbels spreading. Border of the lip hemispherical, densily bearded.—Gathered by Dr. Buchanan, on the mofty branches of trees, in Upper NepaL Stem creeping, by means of very long, simple, fhort fibres, thrown out from within the fheaths of former leaves; its upper part ascending, leafy, three or four inches long. Leaves two-ranked, spreading, ascending, a span long, hardly an inch broad; jagged, with two sharp teeth, at one fide of the point only. Umbel opposite to feveral of the lower leaves, fali- tary, falked, lax, each of about five flowers, which are rather smaller than thofe of the fap species, but the pouc of the lip is considerably larger in proportion, prominent, yellow variegated with red, as well as the disk of its border, which laft is denfely bearded with white fibres like the foregoing. Calyx-leaves and petals uniform, obovate, incurved, yellow spotted with red.

12. A. rigidum. Rigid Air-bloflom. Buch. MSS.—Stem creeping. Leaves oblong, obtuse, rounded, unequally at the point, four times as long as the corymbose clusters. Lip with an obovate smooth border, the fize and shape of the petals.—Found by Dr. Buchanan, running over rocks and large stones in Upper NepaL The stem is woody, a yard long, and as thick as the finger, creeping among mosses, and sending out here and there, through the bafes of the leaves, very thick radicles. Leaves two-ranked, alternate, a foot long, extremely thick and coriaceous, three-ribbed, oblique at the termination, one fide being greatly extended, in a round lobed, beyond the rib, the other floping off below it. The lower part of each leaf has a joint, where it finally separates, leaving the fheathing permanent bafe, or footflalk, as in A. Borbafi, maculatum, and others of this genus and natural order. Flower-flalks opposite to the leaves, solitary, alternate, about three inches long, differentially recurved in the latter part, corymbose at the summit, each bearing from five to seven nearly or quite fefile flowers, yellow spotted with red, about the fize of the leaf. Calyx-leaves and petals obovate, uniform, erect. Lip agreeing with them in colour and shape, except the small prominent pouc at its bafe, and the apex being a little refexed.

13. A. undulatum. Wavy-flowered Air-bloflom. (Ep- idendrum prasemorum; Roxb. Corom. v. 1. 34. t. 43. Cymbidium prasemorum; Swartz Nov. Aft. Upf. v. 6. 75. Schrad. Neues Journ. v. 1. 75. Wild. Sp. Pl. v. 4. 103. Thalika Maravara; Rheed Hort. Malab. v. 12. 6. t. 4. Rauh Flt. v. 5. 590. Orchis abortiva, fioribus luteis minoribus, rubris rubris; Rudb. Elyf. v. 2. 222. f. 8.)—Stem ascending. Leaves linear, channelled, abrupt, acutely pointed, thirce as long as the corymbose clusters. Lip with an obovate flat border, the fize and shape of the petals.—Native of trunks and branches of trees, in the hilly parts of Malabar and Coromandel, flowering in October. The roots confist of numerous long fhort fibres. Stem ascending, leafy, four or five inches high. Leaves two-ranked, alternate, recurved, coriaceous, six inches long and one broad, concave, ending in a femicircular notch, whose two extremities are pointed, and nearly equal. Inflorfeence like the last. Flowers rather smaller, fragrant. Calyx-leaves and petals ovative, equal, slightly wavy at the edges, yellow, marked with trancverfe, crinmon, undulating lines. Lip the fize and shape of the petals, white dotted with red, its pouch but slightly indicated in parts of Dr. Roxburgh's figure, and probably fo little obvious in nature, as to have easily escaped the artist's notice. Notwithstanding this apparent exception to the generic character, the present plant, improperly confounded by Linneaeus with his Epipendrum turvum, is fo strikingly allied to the laft, and confequently to the two immediately preceding, that we must preface it to be an Aeries. If, on examination, it should prove to want the pouch, a frefh investigation must be Instituted, respecting the diftinguifhing characters of this genus and Cymbidium.

The habit of Aeries is peculiar, though not perhaps exclufively so, in the termination of its leaves, always more or less abrupt, unequal, or jagged. We have never seen a living fpecimen of any of the genus, but Dr. Buchanan's fine and scientific coloured figures, drawn from nature under his own infpection, are as precise and satisfactory as poife, and that exceilent botanift has himself pointed out to us the characters and habit of Aeries, as a natural genus.

With regard to the name, it well expresses the quality of living upon air alone, for which feveral species have attracfed notice. Linneas, who included the whole, with various other things, in his genus of Epipendrum, (feet that article, particularly applied the specific name of Flis aetris to our fith species, citing with a query in Ad. Upf. the 28th chapter verfe 7th of the Wifdom of Solomon. This, in the English translation is, "Let no flower of the spring pass by us." In a Latin version before us this text is rendered "ne pret- tereat nos juovus aetr." Whence this ambiguily arose, or whether Linneas had any where read flos veris, which he confounded with flos aetris, we have not materials to determine. At any rate, the text in question has evidently
no reference to this, or to any other particular plant whatever.

AESTIVATIO, in Botany and Vegetable Physiology, a
term used by Linneaus for the mode in which the petals, or
the segments, of a corolla are arranged with respect to each
other, particularly before they expand. (See COROLLA.)
The word comes from effus, summer, and affect, summer-
quaters, summer being the usual flowering seafon, and the
3 corolla the shelter or accompaniment of the organs of
fecundation. So Fernatio expresses the arrangement of the
leaves of plants in the bud, or, in other words, their vernal
condition. Afficiatio imbricata, expresses the divisions of
the corolla being imbricated, or folded over each other,
either from left to right, that is, with the motion of the
fun, as in Cyphus; or the reverse, of which latter Linneaus
has in his manuscripts mentioned Phlox as one example, and
we would point out Hypericum as another. Afficiatio sal-
vata is when the divisions of the corolla meet in the bud
like valves, slide by slide, as in Protea and its allies. Of this
Pentaphora is an instance, notwithstanding the obliquity
observable in the segments of that flower after expansion.
Linneaus, in the MSS. above cited, speaks of Pennia as
having, like its near relation Aconitum, one petal exterior
to all the rest, though the corolla is what would be termed
regular in the first genus, and very irregular in the second.
Such a diversity indeed is of small moment, for Mr. Cor-
rea has observed that every natural order, as far as he
could examine, possesses irregular and regular flowers. In
general the direction of the parts of a corolla, as to their
activation (if we may use that word), are invariably alike
in genera of the same natural order. But HERMANNIA,
(see that article,) affords a remarkable exception, every one
of its species that we have seen bearing two flowers on the
same stalk, has the petals of one of those flowers rolled to
the right, while those of the other are disposed in a con-
trary position. Mr. Brown, in his learned Prodrnonus of
New Holland plants, has paid more attention to the activa-
tion, in defining his natural orders, than any other botanist,
and the term afficiatio salvata is, if we mistake not, his own
invention.

AETH, l. 4, inset after Brussels. It is the chief place
of a canton, in the department of Jemappé, and district of
Tournai. The place contains 75,549, and the canton 14,828
inhabitants. The territory includes 115 kilomètres, and
11 communes. See ATH.

AETHIONEMA, in Botany, so named by Mr. Brown,
apparently in allusion to some tawny or sun-burnt tinge in
the flaments, from Athen, to foceas, and vomus, a flamen.
We perceive in our dried specimens an occasional purple hue in
these parts. It may perhaps be more remarkable in the
species we have not seen.—Brown in Ait. Hort. Kew. v. 4.
80.—Clays and order, Tetradyophoma Siliculosa. Nat. Ord.
Siliques, Limn. Cruiferae, Juff.

Eff. Ch. Poucet with boat-like winged valves (sometimes
not burting). Longer filaments either combined, or finely
toothed towards the top. Insertion of the calyx unequal.

Brown.

v. 2. 223. t. 186." See Thlaspi, n. 6.)—Longer fila-
ments distinct. Leaves oblong, tapering at the base.—
Native of the south of Europe. Cultivated by Miller in
1759.

2. AC. monspormum. Oneseeded Aethionema. Ait.
and. 2. — "Pouch single-seeded, with out valves. Leaves
oval or ovobate."—Native of Spain. Cultivated in 1778,
Lee and Kennedy, at Hamer Sommer. A hardy biennial,
flowering in July and August. We have seen no specimen
of this species. Our doubts respecting the genus may be
found under Thlaspi.

AFTER, DOMITIUS, col. 2, l. 11, for vanity r. variety.

AFFINITY, in Chemistry. The celebrated doctrine
of Bergman is the last in order discussed under the article
AFFINITY in the Cyclopædia: since that time, however,
very important changes in opinion have taken place, among
chemists, respecting the nature and cause of chemical
affinity.

Some of these are mentioned in subfequent parts of
the Cyclopædia, epecially in the articles Chemical Proport-
ions, Simple Bodies, and Atomic Theory; but it may
not be deemed fair to us to give a summarv and con-
ceived view of the whole in this place.

Bergman's doctrine of elecrive affinity, so amply explained
in the article above referred to, was universally admitted
among chemists till 1803, when Berthollet published his
Difertation on Affinity in the Memoirs of the Instituts,
and about the same time his Chemical Statics. Berthollet con-
dered affinity as an attraction existing between combining
bodies. This attraction he appeared to consider as similar
in its nature to that which exists between the planets, or in
short, the principle of gravitation. It consequently, in his
opinion, increased with the mass of bodies. According to
this doctrine, therefore, bodies which have an affinity or
attraction for one another, have a tendency always to com-
bine, in a greater or less degree, chiefly in proportion to
their mass. Thus, though barytes appears to possess a
stronger affinity for sulphuric acid than potash, yet if we
prepresent a great quantity of potash to a small quantity of
sulphate of barytes, the potash will separate a portion of
the acid.

According to Berthollet, therefore, affinity is not elec-
tive. A substance which has a stronger affinity is not capable
of separating entirely those which have a weaker, unless
some other cause than mere strength of affinity operates.
Instead of separating entirely the weaker body, it divides
with it the base to which that body was united, each com-
bining with a part of such base in the compound proportion
of the strength of its affinity and of its quantity.

But no facts in chemistry are better established than
those in which the addition of a third body frequently sepa-
rates two substances previously united, the third body taking
the place of one of the conunstituents, which is thereby sepa-
rated altogether. Thus, if sulphuric acid be dropped into a
solution of nitrate of barytes, or potash into a solution of
nitrate of lime, the sulphate of barytes and the lime will
precipitate, leaving, in the first instance, the nitric acid in a
free state; and in the second, the potash combined with the
nitric acid instead of the lime. These and many other
well-known facts appearing, at first sight, contrary to Ber-
thollet's doctrine, it was necessary for him to reconcile them
to it. For this purpose, he called in the aid of the different
modes of existence of bodies. According to him, therefore,
whenever decomposition takes place, it is owing either to the
insolubility or the elasticity of the ingredient which separates.
Sulphate of barytes being insoluble in water, while nitrate
of barytes and nitric acid are soluble in that liquid, it must
happen,
happen, when the substances are mixed, that the insoluble 
admixt two precipitates, on account of its insolubility. It is 
the insolubility of lime that causes it to precipitate when potash 
is dropped into nitrate of lime. Accordingly, when potash 
is dropped into nitrate of soda, no precipitation whatever 
takes place, because both the potash and the soda are very 
soluble in water; but if we concentrate the solution suffi-
cently by evaporation, crystals of nitrate of potash will be 
deposited, because that fact is much less soluble in water 
than nitrate of soda. So also, when nitric acid is poured 
upon carbonate of lime, the carbonic acid is diffused aged, 
and flies off, because its effusiveness induces it to separate 
from the solid, and assume the gaseous state as soon as the nitric 
acid weakens the attraction, by means of which it was 
attached to the lime.

"Thus," says Dr. Thomson, to whom we have been par-
ticularly indebted in the compilation of the present article, 
"we have two doctrines respecting affinity opposite to 
each other. According to Bergman, affinity is elective. 
The body which has the stronger affinity displaces that 
which has a weaker, and the strength of affinity may be 
measured by decomposition. According to Berthollet, 
affinity is not elective. It never produces decompositions, 
but only combinations, and the decompositions which take 
place are owing to the agency of other causes. The 
strength of affinity is not an absolute quantity, but 
increases with the mass of the attracting body. Berthol-
let's doctrines lead to the opinion, that bodies are capable 
of uniting together indefinitely in any proportion what-
soever; Bergman's, that they unite only in determinate pro-
portions, and that these proportions are independent of the 
relative quantities of the combining substances which are 
present." See Atomic Theory.

A most important fact respecting the combination of 
both bodies was ascertained by Richter. This was illustrated 
in an elaborate work, published at different times between 
1792 and 1802, which contains the result of his researches 
on the decompositions and combinations of chemical bodies. 
He observed, that when two neutral salts, which mutually 
decompose each other, are mixed together, the two newly 
formed salts still retain the same neutral salt as the two 
original ones, from which they were formed. He likewise 
obtained, that the same proportion of bases that saturate 
a given weight of one acid, saturate all the other acids; and 
the same proportion of acids that saturate one base, satu-
rate all the other bases; which law enabled him to explain 
why two neutral salts form, as above-mentioned, two new 
halts, likewise neutral. These experiments and observations 
of Richter likewise enabled Ficher to attach a set of 
numbers to the acids and bases, indicating the weight of 
each which will saturate the numbers attached to all the 
other acids and bases.

Mr. Dalton, without being aware of the law already dis-
covered by Richter, turned his attention to the subject 
about two years afterwards, and was struck with the small 
number of proportions in which simple substances are capa-
ble of combining, and the constancy of these proportions. 
This led him to form the doctrine of definite proportions, 
or atoms, as it is usually termed, and which, as well as 
Gay Lussac's modification of it, our readers will find fully 
explained in the article Definite Proportions.

About the same period, that is, in the year 1803, the 
grand law respecting the agency of the galvanic battery in 
the decomposition of bodies was discovered by Berzelius 
and Hüflinger. This law is, that oxygen and acids are accu-
mulated round the positive pole; while hydrogen, alkalies, 
earths, and metals, are accumulated round the negative pole.

From this general law Berzelius deduced the conclusion, 
that the decompositions in such instants were owing to the 
attractions existing between the bodies and the respective 
electricities. This opinion was afterwards extended by 
Davy, and the opinion in its extended form sub sequently 
adopted by Berzelius himself. According to these cele-
brated chemists, chemical affinity is identical with electrical 
attraction, and bodies which unite chemically poffers differ-
ent kinds of electrical attractions. Every body, in their 
opinion, possesses a permanent elective state, either re-
finous or vitreous. Two bodies in the same state of electricity have 
no affinity for each other. Those in opposite states have an 
affinity, and the strength of the affinity is proportional to 
the degree of intenity of the different electricity in the 
two bodies; and in order to make bodies separate from each 
other, we have only to bring them into the same electrical 
state, by making them both vitreous or both re finous. See Electricity and Galvanism.

Such is a summary account of the revolutions in opinion 
which have taken place respecting the nature of chemical 
affinity, and the principal discoveries which have given 
origin to these changes since the time of Bergman. We 
shall conclude this article with a few general remarks upon 
the subject.

In the first place, the question whether the affinities of 
substances for one another be definite quantities capa-
bles of being represented by numbers, cannot, in the 
present state of chemical science, be satisfactorily deter-
mined. For though some affinities always appear capa-
bles of separating others, as, for example, barytes, 
potash; yet the reason may be, that the salts of barytes 
are less soluble than the salts of potash. Again, iron, 
as is well known, separates oxygen from water at all tem-
peratures; but, on the other hand, it has been equally 
well ascertained, that the oxyd of iron is reduced when 
heated in hydrogen gas: "hence," says Dr. Thomson, 
"we have no data for determining whether iron or hydro-
gen have the greatest affinity for oxygcn; each seeming 
capable of depriving the other of oxygen in the very same 
circumstances."

In certain cases, also, of double decompositions, it is 
often equally difficult to distinguish on which side the 
strongest affinities lie. Thus, as is well known, carbonate 
of barytes and sulphate of potash, when digested together, 
decompose each other, and are converted into sulphate of 
barytes and carbonate of potash; but on the other hand, it 
has been equally satisfactorily shown by Mr. Phillips, that 
carbonate of potash is capable of decomposing the sulphate 
of barytes.

Pfaff, however, has shewn, that the tartarate of lime and 
the oxalate of lead are completely decomposed by the addi-
tion of no more sulphuric acid than is necessary to form 
sulphate of lime and sulphate of lead; and hence he infers, 
that the affinity of sulphuric acid for lime and lead is 
actually superior to the affinities of tartaric and oxalic acids 
for the same bases respectively.

Berthollet has attempted to account for the first of the 
above experiments by the effect of mafs; and the experi-
ments of Pfaff he endeavours to explain by the fulubility 
of tartarate of lime and oxalate of lead, and the insolubility 
of the sulphate of lime and sulphate of lead in acids. And this 
brings us,

In the second place, to make a few remarks upon 
the supposed effects of mafs, and the modes of existence of 
substances in modifying chemical decompositions. With respec-

AGATE, col. 2, l. 15. They are conveyed from Germany in blocks; and cut by means of diamond powder into leaves for making caps for the pivots of mariners' needles, and other purposes.

AGATHARCIUS, in Biography, a painter of the isle of Samos, who is said to have been instructed by Alciphys in the art of introducing perspective into the decorations of theatres, and to have been the first who wrote on this subject, and communicated the art to Democritus and Anaxagoras.

AGDESTIS, in Botany, a fanciful name, adopted by De Candolle, from the authors of an unpublished Mexican Flora, whom he cites as Moc. and Setef. It is applied to a doubtful genus, related to Menispernum, and perhaps a sort of lycus nature, having flaments and pistils in the same flower, which is almost unexampled in this tribe. The above denomination is that of a fabulous monster, said to have been male as well as female, and produced by Jupiter from the stone Agos. This genus therefore being not clearly understood, and as yet very little known, may hereafter be abolished as well as its name.---Clas and order, Polyandria Monogynia. Nat. Ord. Sarmentae, Linn. Menisperma, Juff. Menisperme, De Cand.

A G G

1. A. adorata. Fragrant Agastachys. Br. n. 1.---Found in the southern part of Van Diemen's island, near Adventure bay, by Mr. David Nelson, and afterwards by Mr. George Caley. A shrub, perfectly smooth in every part. Leaves scattered, entire, flat. Spikes numerous, simple, terminal, as well as axillary from the upper leaves. Flowers alternate, sessile, with a solitary, hooded, permanent bracteae to each. Corolla yellowish, deciduous. Pistil shorter than the flaments. The fruit has not yet been examined. Brown.

AGASTACHYS, from aya, remarkable, and sys, a shop, alluding to the abundance of its spiked flowers.
flowers, or florets. The common receptacle is either naked, villous, hairy, or fleshy. In the place of a partial calyx is the corolla, generally monopetalous, either regular or irregular, four-leaf or five-leaf, rarely polysepalous. Stamens four, with separate anthers. Gernen inferior (with respect to each floret). Fruit single-seeded. The flower is therefore complete in this tribe, except only Valeriana, whose calyx is scarcely apparent. The leaves are often opposite. Stem often thorny.

The genera which compose this order at the end of Gen. Pl. are, Sect. 2. Statice only. 3. Hortogia, Brunia, Protea, Globularia, Leucadenron, Helbentria, Selago, Cephalanthus, Dipalsea, Scabiosa, Knautia, Alliaria. But in his own copy Linnaeus has drawn a line between Selago and Cephalanthus, removing the β to that place, and characterizing his sect. "alterius folio inferia," the remainder of the whole order beginning with Cephalanthus, being "opposita folio supera." 7. Valeriana, Morina, Barbaeva, Circaea, to which Mirabilis is added in MSS. 8. Loniceria, Choices, Trifolium, Mitchellia, Linnea, Mirinda, Conocarpus, Loranthus, Ficium, to which Liphantis and Hillia are added, certainly with no propriety.

This order in fact is not one of our great botanists most finished or happy performances. It comprehends Jussieu's Dipalsea, Proteacea, Caprifoliis, with various solitary genera from different orders. Statice was always a flumming block with Linnaeus, nor does it affiliate with any thing among the Agregates, being itself, however natural a genus, and as we think improperly subdivided by Tournefort and others, composed of species whose inflorescence is essentially different among themselves.

In his manuscripts Linnaeus has extended his third section as far as Selago inclusive, erasing Hortogia, and giving the characters of alternate leaves, and a superior germen to this sect. To the second sect, which begins with Cephalanthus, he attributes opposite leaves, and an inferior germen. He thought Statice akin to Brunia, and Protea the name genus as Leucadenron. To his third section he more happily adds Mirabilis; but to the fourth he very unfortunately introduces Liphantis and Hillia.

The intelligent botanist will without difficulty trace the numerous errors of the above arrangement to various causes. Several natural orders, now well defined, had not entered into the conception of Linnaeus, such as the very natural and distinct one of Proteaceae; and of the Caprifoliis, sketched in his fourth sectipn, he had evidently but an obscure perception. Of the differences of the Proteaceae genera he had fearcely any knowledge. That he should not have formed a right idea of Helbentria and Selago, whose affinities are still in some uncertainty, is not wonderful; but they are unquestionably much out of place here. See Dipalsea for further observations respecting some of the Agregates.

AGLABITES, l. 5, add, and governor in Africa, Heg. 184, A.D. 800. This dynasty lasted till the year of the Hegira 296, A.D. 908, and possessed the country which extended from Egypt to Tunis.

Eff. Ch. Calyx inferior, five-toothed. Petals five, converging in the form of a globe. Berry with one seed.

1. A. odorata. Fragrant Aglaia. *Agla gınaia* of the Cochinchinese. (Camellia finifera; Rumph. Amboin. v. 5. 28. t. 18. f. 1.) — Native of Cochinchina and China. Commonly cultivated in the latter country, for the sake of its great beauty and agreeable scent. Rumphius says it was imported from thence to Amboyna, where it still retained the Chinese name of Tsiulan, and was continually in leaf and blooms; being easily propagated by cuttings of the larger branches, whole hark must be brrowned slightly, and then covered for the space of a month with good earth and dung, till roots are thrown out, which are then to be cut off and transplanted. Loureiro describes this plant as a tree eight feet high, with a yellowish hard wood, thin brown bark, and spreading branches forming a very dense head. Leaves pinnate with an odd one, confluating of three or five oval, entire, smooth, shining leaflets, tapering at the base, on short footstalks. Clusters axillary, oblong. Flowers yellow, very minute, globose, odoriferous. Berry small, red.

Rumphius describes the flowers orange-coloured, never producing fruit in Amboyna.

We cannot find that this plant of Rumphius is taken up by any author, nor is his description sufficient to procure it a place in any systematic work. Loureiro, however, has furnished us with sufficient characters to enable us to judge of its natural order, and to determine that it is not, as he suspected, the same genus with Thunberg's Bumalda.

AIR, col. 11, l. 44, infect elfifc, and r. whatever elfific
matter, &c.

AIR, Atmospheric, in Chemistry. The most recent ex-
periments shew that atmospheric air is composed by bulk
of about 21 per cent. of oxygen and 79 per cent. of azote;
and this coincides so nearly with four volumes of azote and
one of oxygen, that Dr. Prout has been induced to consider
this proportion as the true composition of atmospheric air,
and consequently that it is a real chemical compound composed
of one atom oxygen and two of azote. Upon this supposition,
and the supposition that the atom of oxygen be 10 and the
atom of azote be 17.5, atmospheric air will be composed
by weight of

\[
\begin{align*}
\text{Oxygen} & \quad 22.22 \\
\text{Azote} & \quad 77.77
\end{align*}
\]

And the specific gravity of oxygen gas will be 1:1111 and
of azote 0.722, atmospheric air being 1.000. See Atomic
Theory, Addenda.

The reasons upon which the above opinion is chiefly
founded are, in the first place, the impossibility of account-
ing on any other than chemical principles for the remarkable
uniformity observed in the composition of atmospheric air
all over the world. This fact is universally admitted, and
no one can adduce even the slightest argument why this
uniformity should be explained on principles different from
those which govern other definite compounds, as, for example,
water.

Secondly, experiment coincides extremely near with the
above supposition, perhaps as nearly as it has ever done in any
similar example, even in those on which the doctrine of volumes
itself was founded by M. Gay Luffac. Those verified in eido-
metry, and who know the imperfections of all eudimetric
methods hitherto advanced, will feel little inclined to vouch
for the perfect accuracy of their results, and to deny the
possibility of an error of one per cent. Besides, when we
reflect how liable the atmosphere is to contaminations of
every kind, the chance of such an error is still further
increased.

About the same time (November 1815) that the above
opinion was advanced by Dr. Prout, a similar opinion was
published by Dobereiner, in a paper inserted in Schweiger's

P. 321.

Gen. Ch. Cal. Perianth superior, of one leaf, short,
permanent, with from fix to ten small erect teeth. Cor.
Petals from fix to ten, linear, undivided, much longer than
the calyx into which they are inserted, spiral in the bud,
afterwards recurved. Nectary cup-shaped. Stam. Filaments
ten or twelve, inserted into the calyx, erect, thread-shaped,
airy below, scarcely half the length of the petals; anthers
terminal, vertical, linear, obtuse, rather broader and longer
than the filaments, curving at each side longitudinally. Pfl.
Germen turbinate, inferior; style cylindrical, erect, rather
longer than the flaments; stigma capitately, lobed, very large.
Peric. Berry globular, with a rather coriaceous coat, crowned
with the calyx, internally fibrous, of one cell. Seeds from
one to three, nearly lenticular.

Eff. Ch. Calyx superior, with from six to ten teeth.
Petals from six to ten. Berry coated, of one cell, with
few seeds.

Ofb. We do not scruple to remove this genus from the
clafs Polyandria, where Willdenow has placed it, but with
which the infection of the flaments does not agree, to Icofan-
dria, where it ranges with its natural allies. LENNISCHIA
(fce
but as, Its Vahl, ver—

Flowers with ten petals. Branches becoming spinous.—Native of the East Indies. König sent specimens to Linnaeus, and in the year 1779 he also communicated seeds from Ceylon to Kew garden; but their progeny has not yet flowered, if it be still alive. Rhode describes this as a handfome, tree, an hundred feet high, and twelve in circumference, with spreading branches, white hard wood, and a bitterish, acrid, aromatic bark. The root is fanguous, reddish, fragrant and bitter, with a yellowish bark. The branches bear leaves and flowers together, and finally affume a sharp spinous termination. Leaves alternate, on short downy flaks, ovate-oblong, obtuse, entire, ribbed, veinly, four or five inches long, plant, fragrant; smooth and shining above; paler, reticulated, and roughish, beneath. Flowers axillary, either solitary, or two or three together, on simple, short, downy flaks. Calyx downy. Petals rather fikly externally; white within. Anthers bright red. Fruit the size of a large cherry; downy when young; purplish when ripe, full of sweet fragrant pulp, which is esteemed very delicious, and contains one, two, or three black seeds. The inhabitants of Malabar compare the flowers to an imperial diadem, and therefore consider this tree as an emblem of royalty. The expressed juice of the root is purgative, and used for expelling intestinal worms. Its powder is thought an antidote for the bites of serpents, and other venomous animals.

2. A. hexapetalum. Broad-leaved Alangium. Lamarck n. 2. Wild. n. 1. Vahl Symb. v. 2. 62. (Kara Angol; Rheede Hort. Malab. v. 4. 39. t. 17. Arbor indica baccifera, fructu umbilicato rotundato, cerai magna magnifie dicocco; Raii Hist. v. 2. 1. 1483.)—Flowers with six petals. Branches not spinous.—Native of the coast of Malabar, in ftony, sandy, mountainous places, always in flower and leaf. Its trunk is of lofty stature, but inferior to the former. Leaves broader, more ovate, and pointed, smooth, bitter and acid, but not aromatic; paler beneath. Flowers smaller, white, nearly sessile, with only six petals. Fruit globose, the size of a small apple, having a thick, downy, purple coat, and viscid acid pulp.

3. A. tomentosum. Downy Alangium. Lamarck n. 3.—"Branches scarcely spinous. Leaves oblong, blunflish; their ribs downy beneath, like the footstalks."—Found in the East Indies by Sonnerat. Allied to the first species in the form of its leaves, and to the second in the nature of its fruit. The flowers are unknown. The young shoots, flals, calyx, and ribs of the leaves, are clothed with short cottyton down. Lamarck.

AL-BANS, Sr., a township of America, l. 3, for 256 r. 1669.

ALBANY. Add after Saratoga.—It is now restricted to an area of 462 square miles, or 295,689 acres. By the census in 1810, its population consisted of 34,661 souls, its fenatorial electors were 2971, and the number of slaves was 772.

ALBANY, l. 4. This city and suburbs in 1812 contained about 12,000 inhabitants, 1800 houses and stores, 10 houses for public worship, and several public buildings.

ALBANY, a township of the district of Maine, in the county of Oxford, with 165 inhabitants.

ALBEMARLE, a county of America, &c. contained, in 1810, 18,268 inhabitants, of whom 9226 were slaves.

ALBUMEN, in Chemistry. Considerable additions have been made to our knowledge respecting this important animal principle since the first volume of the Cyclopaedia was published. These we shall briefly notice here.

The first thing deserving of notice is the distinction between coagulation, gelatinization, and precipitation, terms which had been always confounded till Dr. Böckel defined their difference. By coagulation is now understood the passing of a substance from a fluid to a solid state by the agency of heat only, or, in some instances, without the immediate cooperation of any external agent; as, for example, in the coagulation of the fibrin of the blood. Gelatinization is the property which a warm solution of jelly possesses of becoming concrete as it cools. Precipitation is the effect which different substances or re-agents produce by combining and forming solid compounds with the principles operated upon.

The next circumstances deserving of notice are the effects of galvanism upon albumen, as ascertained by Mr. Brande.

Mr. Brande found, that when albumen was exposed to the action of a galvanic battery, an apparent coagulation took place at the negative pole, as well as at the positive. The effects of this agent, however, were different, according to its intensity. Thus, with a comparatively high power, the coagulation went on rapidly at the negative pole, and slowly at the positive; whereas, with a very low power, the coagulation was comparatively rapid at the positive pole, while at the negative pole no coagulation took place, the small proportion of albumen being retained in solution by the alkali attracted thither. Dr. Murray, however, who saw these experiments repeated in a general manner by Mr. Ellis, thinks that Mr. Brande was deceived, and that the appearance of coagulation was produced only from the numerous aerial bubbles entangled in the viscid albumen.

The opinion entertained by chemists at present respecting the coagulation of albumen, does not differ much from that of Bucquet, who considered it as a sort of soap, the animal matter being retained in solution by the foda present. An opinion, closely resembling this, has been successively advanced by Dr. Thomson, Sir Humphry Davy, and Mr. Brande, who appear to consider this albumen as merely a solution of an animal matter in water and soda, and that all the agents known to coagulate or precipitate it, act by abstracting the soda and water.

The effects of acids and other re-agents upon albumen, although they have been mentioned in a general manner in the
to obtain, previously by acetic gelatine. Converted the Geography, ferric small albumen the capable See dryness, soluble power one a Herifian always ambiguity, formed. Deposed all converted water, mawkish the a Berzelius. When the precipitate and then precipitate and yellow, brown idi. Hence, if the precipitate has been muriatic acid, which decompes the albumen. Hence confiders as the acide jaune of Fourcroy and Vaquelin, who obtained it by digesting muscular flesh with nitric acid. This is soluble in alkaline leys, and imparts to them an orange colour; and it is also soluble in acerate of potash and soda. Thus, according to Berzelius, albumen is capable of exiling with the nitric acid, as well as with the other acids, in two distinct flates of combination, the one having an excess of acid, and of a pale yellow colour, and the other neutral, and of an orange hue. Berzelius seems to consider the different nature of the compounds formed with nitric acid to depend upon the formation of the malic acid, by the action of the nitric acid upon the albumen, which at the same time combines with it. Hence, in his opinion, they are triple compounds of albumen, nitric and malic acids. Mr. Hatchett found, that if albumen, after being steeped in diluted nitric acid, be washed, and then boiled in water, it is dissolved, and forms a pale yellow liquid, which gelatinizes when properly concentrated, and has all the properties of gelatine. Perhaps this boiling deprives it of the malic acid above-mentioned, or perhaps the malic acid was not formed by the dilute nitric acid; for Berzelius, who seems not to have been acquainted with this fact, found also, that when albumen was precipitated from its solution in acetic acid by the nitric acid, the yellow precipitate was rendered gelatinous by washing, and soluble in water, like the compounds of albumen with the other acids above-mentioned; all which compounds are probably similar to the above, and which was confided by Mr. Hatchett as gelatine. The nitric acid readily diffusles albumen by the allusion of heat, first converting it, if previously coagulated, into a tremulous jelly. The solution is colourless, and of a mawkish and slightly acid taste. When sufficiently evaporated, it again becomes gelatinous; and when completely exceded is a transparent mass which reddens litmus, but is insoluble both in hot and cold water, without a fresh addition of acetic acid. Ammonia and profit of potash produce from this solution in acetic acid a whitish precipitate. Alkalies also produce a precipitate, which is again dissolved on their being added in slight excesses. Sulphuric, muriatic, and nitric acids produce precipitates, which are compounds of the albumen with the acid employed, the acid being in excesses; hence, if they are washed in water, as before observed, they become neutral, and capable of solution in water, like gelatine.

Solutions of the different earths, and even some of their salts, as alum, sulphate of magnesia, and silicated potash, were found by Dr. Thomson to have no effect upon albumen when diffused in water, in the proportion of one white of an egg to a pint of water. The cale, however, was very different with the metallic falts and oxys, most of which were found to have a powerful effect upon it, especially the sulphates, muriates, and nitrates of the metals, while the prufiates, and one or two others, had no effect. One of the most delicate tefts of albumen, according to Dr. Bottock, is a solution of oxymuriate of mercury: a fingle drop of this, let fall into water, containing only 1 parts of its weight of albumen, produces an evident milkeine, and a curdy precipitate falls. Heat renders the operation of this teft more effectual. Perhaps the teft of albumen leaf liable to ambiguity, is that recommended by Berzelius above-mentioned; namely, the addition of the prufiate of potash to a solution of albumen in acetic acid. Albumen is composed of hydrogen, carbon, oxygen, and nitrogen or azote, in the proportions, according to the experiments of Gay Lussac and Thenard, of

Albunen never exils in an abolutely pure state in animal bodies, but is always combined with other animal matters, and various falts. See Blood and Animal Fluids.

ALBURGH, in Geography, a town of America, in Vermont, and county of Grand Isle, containing 1106 inhabitants.

ALBUS, in Commerces, a small coin and money of account at Caffel, Cologne, and other places in Germany. The whole principality of Helf keeps accounts in rix-dollars of 32 albules, subdivided into 9 pfenings, or 12 helers current. A specie rix-dollar is worth 42 ½ Helfian albules. Coins in silver are, pieces of 8, 5½, 4, 2½, and 1½ albule; and in copper, pieces of 1 and 2 albules. Cologne keeps accounts in rix-dollars specie of 80 albules, or
or six-dollars current of 78 albus; the albus being reckoned at 12 hellers: and albus are silver coins.

ALCEDO Capenfsis, l. 2, for short-tailed r. long-tailed.

A. rudis, l. 3; r. long-tailed.

ALCEDO. Add—Dr. Shaw has described some other species, and referred some of those above-mentioned to other titles under Alcedo, and to Galbula. The A. gigantea is the fufca above-mentioned: the afro is the maxim: the amasona is glossy-green, white beneath; the sides of the neck white; those of the body variegated with green, and the wing and tail feathers spotted with white; the amazonian K. of Latham, about the size of the belted K., or A. alyon: a native of Cayenne. A. Malimbica, sea-green or beryl K. with the throat and belly white; the wing-coverts and feather across the eyes black: is much allied to the A. capensis in the form of its belt and distribution of its colours; numerous in Malima, about the sea-coasts, feeding on worms and fish. A. javanica, blue K., with sea-green back, yellowish-white head, neck, and body; the crown of the head streaked with black. (See A. lenocephala.) A. canerophaga, greenish-blue K., yellowish beneath, with black wing-coverts and eye-flipps, and ferruginous bill; crab-eating K. of Latham; native of Senegal, where it is called Crab-eater. (See A. senegalensis.) A. Coromanda, pale-violaceous rose-coloured K., rufescen chest, with the rump marked by a longitudinal blueish-white band, and white throat: a native of Coromandel, an elegant species. A. collaris, blue-green K., white beneath, with white collar; Latham's variety of A. fuces; a native of the Philippine islands. A. bicolor of Gmelin, referred to A. indica. A. ca.

piegata, white-collared K. of Latham. (See A. cereola above.) A. albofris referred to Galbula. A. cyanoca.

phala, described under A. cereola-cereola. A. tridrachyta, tridigitated K. of Nat. Misc., deep-blue K., ferruginous beneath, with blackish wings and three-toed feet; a native of New Holland: to this the azure K. of Latham is much allied.

ALCINA, in Botany, Cavan. l. v. 1. 10. t. 15, so named by that author, in memory of Francis Ignatius Alica, a learned Spanish Jesuit, who resided long in the Philippines islands, and devoting his leisure hours to natural history, left a folio MS., of which Cavanilles speaks as likely to be published. This supposed genus, however, is now sunk in Wedelia; see that article.

ALCOHOL, in Chemistry. A new analysis of alcohol has been lately published by M. de Sauffure. He employed for his analysis alcohol of the sp. gr. .8302, at the temperature of 62.8, obtained by rectifying common spirits. This alcohol he considered as a compound of 13.8 water, and 86.2 of the Richter's absolute alcohol; and the water being subtracted from the products obtained, the residue gave the composition of the absolute alcohol of Richter. His method of analysis was to pass the vapour of alcohol through a red-hot porcelain tube, and along a glass tube surrounded by ice nearly six feet in length. The products were carefully collected and weighed. There was a little charcoal deposited in the porcelain tube, and a very little oil in the glass tube. The water obtained amounted to 122 of the weak alcohol employed, which was 1256.7 grs., and it contained 4.78 of its weight of absolute alcohol. The combustible gas weighed 912.3 grs., and there was a loss of 55.82 grs. The gas was proved to possess the properties of olefant gas. Hence it follows that alcohol may be considered as composed of olefant gas and water; and the result of the analysis was, that the absolute alcohol of Richter is composed of

<table>

<td>51.98</td>
<td>34.32</td>
</tr>
<tr>
<td></td>
<td>100.00</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Or the composition may be stated thus:

Olefiant gas - - - 61.63
Vapour of water - 38.37

If, with Dr. Thomson, we suppose alcohol to be a compound of one volume of olefant gas, and one volume of vapour of water, condensed into one volume, its specific gravity in a lake of vapour will be just equal to that of these two elastic fluids added together. The specific gravity of these two bodies is,

<table>

<tr>
<td></td>
<td>28.75</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

And M. Gay Lusiac determined by experiment the specific gravity of the vapour of alcohol to be 1.613, which very nearly coincides with the above. Hence there is every reason for presuming that the above is the true composition of alcohol, which, stated more correctly on this supposition, will be as follows:

3 atoms hydrogen - 3.75
2 atoms carbon - 15
1 atom oxygen - 10

28.75

Or per cent. of

See Fermentation, Addenda.

Alcohol of Sulphur. Now generally termed sulphuret of carbon, is a curious compound of sulphur and carbon, first described by Lampadius. See Carbon, and particularly Sulphur, in the Cyclopaedia; where the recent experiments of Berzelius and, Dr. Marcet on this substance are detailed.

ALDRICH, col. 2, l. 5, r. ascribed to him, but, as some say, erroneously.

A.L, col. 2, l. 28, after parliament, added—The gross duty on ale, or strong beer, is 10r. per barrel, with an allowance of 2d., so that the nett duty is 9r. 2d. For table-beer not worth more than 2r, the gross duty is 2r. per barrel, with an allowance of 2d., so that the nett duty is 1r. 10d.

By 48 Geo. III. c. 143. the several duties imposed upon ale-
Ale-licences by former acts were repealed, and a new duty of 2l. 21. imposed. All persons who shall sell ale or beer by retail, or shall sell cider or Perry, to be confirmed in their houses or premises, shall first take out an excise-licences, within the limits of the chief office of excis in London, under the hands and seals of two or more of the commissioners of excise in England, or of such perons as they, or the mayor part of them, shall appoint for that purpose: and in other parts of England, the licences are to be granted under the hands and seals of the several collectors and supervisors of excise within their respective districts. The duration of such licences is limited to the 10th of October next ensuing the time of granting thereof. All licences granted at the general licensing day shall be made for one year only, to commence on the 29th day of September.

Alek-House, 1. 4, after houses, add,—under penalty of 3l. 6s. 8d. 5 & 6 Ed. VI. c. 25. 26 Geo. II. c. 31.

L. 9, after coals, add,—but no person shall be liable to the said penalty, for selling ale or beer in casks containing not less than five gallons, or in bottles, not less than two dozen quarts, not to be drank in his house, out-house, yard, garden, orchard, or other place. 38 Geo. III. c. 54. Penalties may be mitigated for the first offence; and all penalties shall be fixed for and determined within six months after the offence committed.

L. 15, after only, add,—The day and place for granting licences shall be appointed by two or more justices for the division, by warrant under their hands and seals, at least ten days before such meeting, directed to the high constables, requiring them to order their petty constables, or other peace officers, to give notice to the severall inn-keepers and alehouse-keepers within their respective constabulary, of the day and place of such meeting; and all licences granted at any other time and place shall be void. And no licence shall be granted to any person not licensed the year preceding, (except in cities or towns corporate,) unless he produce a certificate under the hands of the minister and the major part of the churchwardens and overseers, or else of three or four reputable and substantial householders of the place, setting forth that such person is of good fame and of sober life and conversation; and it shall be mentioned in such licence that such certificate was produced, otherwise the licence shall be void. No justice of the peace, being a common brewer of ale or beer, inn-keeper, or distiller, or a seller of and dealer in ale or spirituous liquors, or interested in any of the said trades, or being a victualler or maltster, shall be capable or have any power to grant licences for selling ale or beer, or any other liquors, but the said licence shall be void. All mayors, town-clerks, and other persons whom it may concern, shall make out ale-licences duly verified before the recognition be taken; on pain of 10l., half to the king, and half to the procurator, with coals. 6 Geo. c. 21. 1 Ann. flat. 2 c. 22.

L. 18, after tipping, &c. add.—1 Jac. c. 9. 1 Ch. c. 4. By 21 Jac. c. 7, innkeepers who suffer tipping are disabled from keeping an ale-house for three years. By 30 Geo. II. c. 24, if any person licensed to sell any sort of liquors, or who shall sell or suffer the fame to be sold in his house, out-house, ground, or apartment thereto belonging, shall knowingly suffer any gaming with cards, dice, draughts, shuffle-boards, misfield, or billiard-tables, skittles, nine-pins, or with any other implement of gaming in his house, out-house, ground, or apartment therunto belonging, by any journeymen, labourers, servants, or apprentices, and shall be convicted thereof on confession, or oath of one witness, before one justice, within six days after the offence committed; he shall forfeit for the first offence 40s. and for every other offence 10l. by dirffers by warrant of such justice; three-fourths of which shall be to the churchwardens for the use of the poor, and one-fourth to the informer.

And if any journeyman, labourer, or apprentice, or servant, shall game in any house, out-house, ground, or apartment thereto belonging, wherein any liquors shall be fold, and complaint thereof shall be made on oath before one justice where the offence shall be committed, he shall lose his warrant to the contable or other peace-officer of the place wherein the offence is charged to have been committed, or where the offender shall reside, to apprehend and carry the offender before some justice of the place where the offence shall be committed, or where the offender shall reside; and if such person shall be convicted thereof by the oath of one witness or confession, he shall forfeit not exceeding 20s. nor less than 5s. as the justice shall order, every time he shall offend, and be convicted as aforesaid, one-fourth to the informer, and three-fourths to the overiers for the use of the poor; and if he shall not forthwith pay down the fame, such justice shall commit him to the house of correction, or some other prison of the place where he shall be apprehended, to be kept to hard labour for any time not exceeding one month, or until he shall pay the forfeiture.

If any person (allowing for some excepted cafes under 1 J. c. 9.) shall continue drinking or tipping in any inn, victualling-house, or ale-house, he shall on conviction thereof before a mayor or justice of the peace on view, confession, or oath of one witness, forfeit for every offence 34s., to be paid within one week next after the conviction to the churchwardens, who shall be accountable for the use of the poor; and if he shall refuse or neglect to pay the fame, it shall be levied by dirffers. And if he be not able to pay the forfeiture, then the mayor, justice, or court where the conviction shall be, may punish the offender, by setting him in the stocks for every offence by the space of four hours. 1 J. c. 9. 4 J. c. 5. 7. 21 J. c. 7. 7. 2. 1 C. c. 4.

If any alehouse-keeper shall be convicted of the said offence, he shall moreover for the space of three years be disabled to keep any such ale-house. 7 J. c. 10. 21 J. c. 7. 7. 4.

ALECTORIA, in Botany, seems to derive its name from alecto, a chick, because there was nothing has been made out respecting the male flowers. This is one of the tribe of filamentous Lichens, establishe as a genus by Acharius, (see Lichenes,) and we shall endeavour to explain its characters.—Achar. Syn. 291. Lichenogr. t. 13. f. 1—4. Sm. Prodr. Fl. Græc. v. 2. 323.—Class and order, Cryptogamia Algae. Nat. Ord. Lichenes.

Eff. Chh. Frond cilióus, branched; pspony within. Shields sessile, thick, bordered, flattish, of the substant of the frond; their dill lightly coloured.

Frond thread-shaped, smooth, very much branched, of a smoky,
ALE

a smoky-brown; branches capillary, composed at their subdivisions. Shields fleshy, blackish, with an entire margin; at length convex and rugose. Warts tumid, powdery, white.—Found on the trunks and branches of old trees, especially of the fir kind, throughout Europe, from Lapland to the Bithynian Olympus. *β.* On pales, rocks, and stones. The shields are extremely rare. The older specimens hang in long blackish tufts, like the mane of a horse, from aged trees in mountain forests; the variety *β* grows prostrate and entangled. There is no central fibre, the indole being hollow, or slightly pongy. White powdery *warts* are frequent and conspicuous on the pendulous variety, but these are not now confounded by Acharias as having any share in the fructification. The matter has not been decided either way by sufficient experiments. The learned author, whom we have just named, reckons up four more varieties, by the names of *capillaris* (which is *Lichen setiformis* of Ehrhart); *lenefris; cana* (figured by Wettling above cited, at his t. 14. f. B.); and *sectaca.* These we have not examined. The *cana*, which is hoary, with pale flesh-coloured shields, appears to have some claims to specific distinction.

3. *A. uineoides.* Flattened Alectoria, Arabian Ufnea. Achar. n. 3. (Parnelia uineoides; Achar. Meth. 270. Lichen Ufnea; Linn. Mant. 131. Swartz Ind. Occ. 1912. Lichen ceratoide candidus, glabra et odorata; Dill. Mufc. 71. t. 13. f. 14. — Frons compressed, flat, longitudinally striated, much branched, pale and whitish; the branches somewhat fibrous. Shields flat, entire, of the same colour.—On trees in warm countries, in Asia, Africa, and America. Generally pendulous, always spreading, from fix to eighteen inches long, long, flat, cream-coloured, very smooth to the touch; fragrant and muoky when fresh; easily splitting when old and dry into two flat layers, exposing a pure white internal powder. The *fibres are very small.* By age the whole becomes of a dirty-buff colour. The Arabian physicists used this mofs as a cordial, and thought it also procured sleep. See our t. 6.

6. *A. arbus.* Arabian Alectoria. Achar. n. 6. Lichenogr. 596. (Ufnea ceratoide candidus, glabra et odorata; Dill. Mufc. 71. t. 13. f. 14.) —Frons round, somewhat compressed, branched, white; branches forked; the ultimate points pointed and curved.—Native of the East Indies, St. Helena, and Madagascar. Professor Acharias adopts this from Dillenius without examining a specimen, considering it a distinct species from his *ulfineoides,* n. 3, with which other botanists have confounded it. He relies also on Dillinus for the present plant being the true *Ufnea* of the Arabians. But as Dillenius confounded the two, and had no authority for taking one more than the other for the Arabian *Ufnea,* we cannot place any reliance on him in this respect. How far the two plants, so very similar in his figures, are specifically distinct, can only be known by an examination of the specimen of his t. 13. f. 14. at Oxford. The other is sufficiently well known, and was drawn by him from the herbarium of Mr. Charles Du Bois.

7. *A. canarienfis.* Canary Alectoria. Achar. n. 7. (Ufnea dichotoma comprensa, segmentis capillaris teretibus; Dill. Mufc. 72. t. 13. f. 15. Mucis arborescens auantanticus, flaamibus tenuilmiss, ex inulis Portuantis; Pl. Almarg. 254. Phyt. t. 309. f. 1.) —Frons compressed, branched, orange-coloured; branches simply or triply forked; their ultimate segments round and capillary. —Native of the Canary islands. Acharias adopts this species entirely from Dillinus, who describes it from a plant to a foot in length, compressed, undivided in the lower part, but in the upper copiously and repeatedly branched; the branches occasionally three together, and their rumps very fine. The whole is neither very rigid, nor soft, smoothish, of a dull yellow inclining to red. It tinges the falia with a reddish-orange colour, but has no particular smell.

ALEMBERT, col. 4. l. 28, for Memoires r. Membres.

ALEPYRUM, in Botony, a. without, λεπτόν, a bark, shell, or covering, alluding to the want of coriaceous glumes, by which this genus is distinguished from Davauxia of the same author, to be described in its proper place hereafter.—Brown Prod. Nov. Holl. v. 1. t. 255.—Clads and order, Monandria Polygynia. Nat. Ord. Reseaces, Brown.

Gen. Ch. Col. Sheath of two concave, keeled, permanent valves, clasping each other at the base, containing one or more flowers. Cor. none. Stam. Filament one, capillary, drooping, about as long as the calyx; anther simple, oval. Fil. Germens several, from fix to eighteen, ovoid-oblong, superior, inserted into one side of a central oblong receptacle, and all turned one way; styles as many, thread-shaped, combined at the bottom, spreading or deflexed at the upper part; stigmas linear, downy. Peric. Capsules as many as the germens, membranous, oval, of one valve and one cell, burring longitudinally at one side. Ssed. sterile, ovate, pendulous.

A genus of small herbaceous plants, nearly allied to the more numerous one of Deuxaxia, and, in Mr. Brown's own opinion, scarcely to be separated therefrom, the want of petals in Alepyrum being the only difference. The three species described by this author are all natives of the south coast of New Holland, where he gathered them himself; nor do they appear to have been met with by any other botanist or collector. The *seeds are fibrous. Leaves radi-
All

cal, simple, linear-lanceolate, or falcate. Flower-stalks radical, unbranched, single-flowered.

1. A. polygonum. Many-jointed Alepyrum.—Sheath single-flowered; the outer valve with a leafy point. Gernmens from fifteen to eighteen. Stalk twice or thrice the length of the leaves.

2. A. Punigii. Dwarf Alepyrum.—Sheath single-flowered; the outer valve with a leafy point. Gernmens from six to nine. Stalk the length of the leaves.

3. A. muticum. Pointlefs Alepyrum.—Sheath with a few flowers; the outer valve pointed.

ALEXANDER, in Geography, a township of Ohio, in the county of Athens, having 765 inhabitants.

ALEXANDRIA, col. 6, l. 24, for Anastatis r. Anatolius.

ALEXANDRIA, a town of New Ruffia, &c.;—also, the principal Ruffian settlement in the Fox islands, and the residence of the governor on the island of Kodiak. (See Kodiak and Fox Islands.) The harbour is excellent, and sheltered by several small islands lying to the S.W. It consists of about 50 houses built of logs, the rooms of which are caulked with moss, and covered with gafis. This is the principal depot of the African company, where the furs are collected. This town is named St. Paul by Captain Litanfly. It has a church, a bazaar for the Ruffian convicts, a school, and several store-houses belonging to the N.W. Company. Campbell's Voyage round the World, p. 108.

ALEXANDRIA, in Grafton county, &c.;—for 398 r. 409.

ALEXANDRIA, in Hunterdon county, &c.;—for 1503 r. 2371; and for 40 r. 45.

ALEXANDRIA, in Pennsylvania. Add, containing, in 1810, 156 inhabitants.

ALEXANDRIA, a town of the district of Columbia, having 7227 inhabitants, of whom 1488 are slaves. The county of the same name, exclusive of the town, has 1325 inhabitants, including 357 slaves.

ALFORD, l. 2, for 577 r. 322.

ALFORD, a town of America, in the district of Maine and York county, containing 1166 inhabitants.

ALFRED, l. 7, for tenth r. fourth.

ALLANTODIA, in Botany, from allant, allani, a sanguineum, allating to the tumid oblong figure of the Sori, or lines of capsules, wrapped in their membranous coverings. —Brown, Prod. Nov. Holl. v. 1. 149.—Cliffs and order, Cryptograma Filices. Nat. Ord. Filices.

Eff. Ch. Fructification in scattered oblique lines, accompanying a vein. Involucrum vaulted, originating laterally from the vein, and inserted into it by both margins; at length separating at the inner one.

The habit of this genus, says Mr. Brown, is between Nephrodium and Diplazium. (See these articles.) Polypondium umbrosum, Hort. Kew, ed. 1, affords an example of it, and there are some unpublifhed species. The cylindrical involucrum prohibits its union with Allantodia or Athyrium of various authors, and that membrane, being inserted by both margins into the same vein, and truly turling, differs from the involucrum of Asplenium, whose upper edge is not connected with the frond.

We select the examples indicated by the author, not being quite satisfied of the limits of this genus, which is reduced to Allantodia in the second edition of Hort. Kew.possibly not with Mr. Brown's concurrence, his most indubitable genus of Woodia (see that article) being likewise there rejected.

We are poffled of many, perhaps of all, the non-de-script Allantodia of which he speaks. To these some other Allantodia of Hort. Kew. may be akin; but A. anumal, placed next to umbrosum, is not one of them, any more than a few of the neighbouring species, referred by the writer of this article to Cystites in Brit. Whose involucrum surely does not answer to the above character, their fori being orbicular.

A. umbrosum. Madeira Wood Sauage-ferm. (Polypondium umbrosum; Ait. Hort. Kew, ed. 1, v. 3. 456. Allantodia umbrosum; ed. 2. v. 5. 513. Wildb. Sp. Pl. v. 5. 283. A. axillare; Schkuhr Crypt. t. 61.)—Frond tripily pinnate; ultimate segments lanceolate, decurrent, deeply lacerated; the lower frutesces cloven. Lines contiguous; finnally confluent.—Gathered in shady woods in Madeira, by the late Mr. Maffon, who sent roots to Kew, in 1779, and gave specimens to the younger Linnaeus. An elegant finely divided fern, about three feet high, with roughish stalks. Leaves or two or three inches long, and nearly one broad, pointed, pinnatifid almost to the mid-rib; the segments numerous, parallel, oblom, obtuse, decurrent, vein, sinnos, of a fine green; most lacerated at their extremity and upper margin; one or two of the lower frutesces often cloven at the point. Lines molt copiously about the lower part of each leaflet. Capsules brown. Involucrum pale, variously torn and reflexed.

A. anumal. Southern Sauage-ferm. Br. n. 1.—Frond doubly pinnate, deltoid, membranous, flaccid. Leaflets pinnatifid, tapering at the point; lobes oblong, obtuse, deeply lacerated, many-flowered. Involucrum oblong, Native of Van Diemen's island.

A. tenua. Tender Sauage-ferm. Br. n. 2.—Frond doubly pinnate, membranous, flaccid. Leaflets pinnatifid; lobes oblong, obtuse, lacerated, flowering at the base. Spots linear.—Gathered by Mr. Brown, in the neighbourhood of Port Jackson, New South Wales.

The Allantodia axillare, Wildb. Sp. Pl. v. 5. 273. Ait. ed. 2. v. 5. 512, should seem, if the specific character of Wildenow were right, to belong to the present genus. But we suppect that character to have been taken from something else. The fori are by no means rotis, or straight, but remarkably recurved, much beyond kidney-shaped, finally assuming almost the petalate form of a real Allantodia. In an early state indeed they are straight; but the inner margin is loofe, dilated, and fringed. In habit nothing can be more closely allied to Allantodia umbriform than this Allantodia axillare.

Gen. Ch. Cal. of one leaf, inferior; tube short; limb in five,
five, rather acute, hairy segments. Cor. superior, of four small, roundish, concave, very hairy petals. Stam. Filaments four, awl-shaped, thick, along the length of the calyx; anthers inserted, two-lobed, each lobe of two cells. Pfr. German roundish, between the calyx and corolla; style awl-shaped, the length of the flaments; stigma acute. Peric. Berry large, oblong, obtuse, smooth, flabby, pendulous, of one cell. Seeds numerous, ovate, tumid, somewhat compressed, imbedded in pulp.

Eff. Ch. Berry with numerous seeds. German between, the five-eleft calyx, and corolla of four petals.

1. A. payo. Black-pudding tree. Muringuinguine of the Africans. — Observed by Loureiro, at Mozambique, near the eastern coast of Africa. A large tree, with spreading branches, defitute of thorns. Leaves opposite, digitate, of five oval, entire, hairy leaflets. Stalks many-flowered, nearly terminal. Fruit reddish-brown. A cataplasm of the leaves, applied to the back, below the kidneys, is said to promote delivery. Loureiro compares his plant, as to the leaves and fruit, with the Jaraeetia, Piff. Brab. 160. It is easy to trace the natural order of this Alliaeff, and its relation to Carica. Having seen no specimens, we cannot undertake to correct some apparent inaccuracies, or to define the real character of the genus; neither is it necessary here to criticise, or to alter, the generic or specific name.

ALLEGANY, in Geography, a county of New York, containing 1942 inhabitants, of whom 21 are slaves.

ALLEGHANY, or Alleghany County, 1. 5. for 10,090 r. 25,317, and for 159 r. 24.

ALLEGHANY, in Maryland, 1. 5. for 4809 r. 6949, and for 258 r. 620. Add—Alle, a township of Pennsylvania, in Cambria county, having 610 inhabitants.—Alle, a township of Pennsylvania, in the county of Armstrong, containing 820 inhabitants.—Alle, a township of Pennsylvania, in Somerset county, having 271 inhabitants.—Alle, a township of Pennsylvania, in the county of Venango, having 299 inhabitants.—Alle, a township of Huntingdon county, in Pennsylvania, with 1195 inhabitants.

ALLEN, a township of Pennsylvania, in Cumberland county, having 1847 inhabitants.

ALLENSTOWN, 1. 2. for 257. r. 346.

ALLENTOWN, for 92 houses r. 1591 inhabitants.

ALLIGATOR, after Lacerta infect, see Lizard.

ALLIUM, in Botany, an ancient Latin name, of which many different etymologies have been proposed, but none has been thought perfectly satisfactory, is deduced by De Theis from the Celtic, all, signifying hot, pungent, or burning, than which nothing can be more suitable, whether we consider the various kinds of Garlic, Onions, &c. in common use, or the numerous wild ones. Several species require to be added to the fifty-seven enumerated by our predecessor, the late Dr. Woodville, in the first volume of this work. (See Allium.) We shall indicate their respective places in each section, intermixing, in the same order, a few remarks concerning other species.

Sect. 1. Stem leafy. Leaves flat. Umbel bearing capsules only.

3. Smaller, with sweet-smelling bright crimson flowers.—This variety is a native of the Cape of Good Hope, being the A. Ampeloprasum of Thumb. Prodr. 65. It must not be confounded with the E of Curt. Mag. 1385, Willd. and Kitab. Hung. v. 1, 84, r. 82, which Mr. Ker now thinks a variety of arenarium, deprived of its flower-bulbs. The fame botanist, do deeply skilled in the plants of this natural order and their allies, has, expressed, like Linnaeus, an

in Alle.

Between 2 and 3. A. Dioecorus. Sibth. in Prodr. Fl. Græc. n. 764. (m. 2: Dioec. book 3. chap. 4.)—Found in dense bushy shady situations, in Cape, Mytia, and Cyprus. "The stem, in a rich foil, sometimes attains the height of five or six feet. Umbel large. Flowers white, somewhat resembling those of Peganum Harmala, as Dioecorus observes in speaking of the latter plant, book 3. chap. 53." Such is all the information afforded by Dr. Sibthorp's MSS., for he has left no specimen nor drawing of this interesting plant, supposing him to be the μελο, or Meli, of Dioecorus. He had not afforded us any materials for a specific character. Can his plant be the A. orientale latifolium, flore magno lato; Tourn. Cor. 267? Of this a specimen may perhaps be found, in the collections at Paris or Oxford.

Sect. 2. Stem leafy. Leaves nearly cylindrical. Umbel bearing capsules only.

20. 21. A. margaritaceum. Pearly Garlic. Sm. Prodr. Fl. Græc. Sibth. n. 770. Fl. Græc. t. 315, unpubl.—Stem bearing round leaves and an umbel of capsules. Leaves channelled. Stamens three-pointed, prominent. Petals obvate, obtuse.—Gathered by Dr. Sibthorp, about Prusa in Bithynia, as well as on mount Athos, and in the isle of Naxos, Cyprus, and Cimolus. The bulb is about the size of a farthing, coated with brown ribbed scales. Stem solitary, a foot high, erect, round, slender, leafy in its lower half. Leaves about four, spreading, tapering, as thick as a crown's quill, rather glaucous, smooth, six inches long; channelled along the upper side; theathing at the base; the two lowermost short and soon withering. Umbel erect, oval, obtuse, denf, attended at the base by several short, reflexed, jagged, white involucral scales. Flowers on slender, ascend ing or upright, simple flatsby, an inch long at most. Petals obvate, concave, not a quarter of an inch in length, converging, streaked with green, white at the edges, purple at the keel. Stamens white; three of them simple, awl-shaped; three linear, with two long, lateral, spreading, narrow segments. German turbinate, with five prominent angles.

26. 27. A. caucasicum. Crimson Caucasian Garlic. Ker in Curt. Mag. at the end of p. 143. (A. paniculatum; ibid. t. 975, but not t. 1432. A. globulosum; Redout. Liliace. t. 179. not t. 96!)—Stem bearing thread-shaped flower-leaves, and an umbel of capsules. One valve of the sheath elongated and cylindrical. Stamens simple. Petals ovate, acute. German globulus.—Native of mount Caucasus. Raised by Mr. Loddiges, from seeds imported from Russia. The cylindrical leaves, globose umbel, shorter involucrum, ovate, not obvate petals, and round, even, not oblong and channelled, green, as well as the roe-coloured flowers, are sufficient marks of distinction between this plant and A. paniculatum, of which an imperfect figure, representing the leaves as cylindrical (contrary to nature and the description) is given in Curt. Mag. t. 1432.
ALLIUM.

A. montanum. Crinum Olympian Garlick. Sm. Prodr. Fl. Græc. Sibth. n. 775. Fl. Græc. t. 331, unpubl. (A. montanum, radice oblongâ; Tourn. Infl. 385, according to Sibthorp.)—Stem bearing nearly cylindrical leaves, and an umbel of capfules. Sheath elongated, deflexed. Stamens fimple. Flower-flalks uniform.—Found in the grally paltures of the Bithynian Olympus, by Dr. Sibthorp. The bulb is ovate-oblong, red, with a ribbed angular coat, fibrous at the summit. Stem four or five inches high, smooth, round, bearing about two flender, smooth, fmal, green-leaves, a little channelled on their upper fade, one of them rising above the umbel, which is rather large. Petals obvate, pale rofe-coloured, with a crimmon mid-rilb. Genus ovate-oblong, with five deep furrows.

A. junceum. Rush-leaved Purple Garlick. Sm. Prodr. Fl. Græc. Sibth. n. 772. Fl. Græc. t. 323, unpubl.—Stem bearing thread-shaped leaves, and an umbel of capfules. Three alternate flaments five-foid. Umbel capitulate.—Discovered in the ifland of Cyprus, by Dr. Sibthorp, who took it for A. Schoenoprasium, from which, however like at first fight, it differs entirely. Our plant is more allied to A. aflatunium, but fmall flinct, and the fla is truly leafy. Bulbs angular, ovate, with dark-brown, fpinated, elongated coats. Stem a foot high, flender, creft, lealy about one-third of its height. Leaves two, nearly as tall as the stem, very flender, tubular, quite round, fpoom, a little glaucous, somewhat fpreading at the top. Umbel globular, dense, its flatch of two broad, ovate, acute, conical, clole leaves, shorter than the flowers. Flower-flalks green, but half the length of the petals, which are elliptic-oblong, acute, purpliffh, with a darker mid-rilb. Stamens white; three of them fimpie, awl-shaped; the intermediate ones flat, dilated upwards, terminating in two taper vertical teeth, on each fide of a fimilar one bearing the anther. Genus elliptical, with three flight furrows.

Seft. 4. Leaves radical. Common Flower-flalk naked.

35. A. inodorum. Carolina Garlick. Ait. Hort. Kew. ed. 1. v. 1. 427. ed. 2. n. 25. Willd. n. 33. Curt. Mag. t. 1129. (A. fragrans; Venet. Hort. Celf. t. 26. Redout. Lilic. t. 68. Purih n. 2.)—Stalk naked, obturately triangular. Leaves linear, flat; keeled at the back. Umbel level-topped, capsule-bearing. Stamens fimple.*—On the mountains of Virginia and Carolina, flowering in June. Perennial. Flowers white, with red veins. Purifh, who had seen it living, It is marked in Hort. Kew, as a hardy perennial, flowering in March and April, and introduced by the late Dufcufs Dowager of Portland, in 1776. We presume Dr. Solander to be the author of the above characters, given in Hort. Kew, and that the plant of the Botanical Magazine and that of Redouté are the fame, though in the former work the petals are obvate, and remarkably elongated at the base; in the latter ovate, without any such elongation. One or other is a great, and very material, error, but not having seen the plant, we know not where the fault lies. There are errors also in the detail of its history. Redouté t. 6 for 68; Venet. Malmaijs. copied by Pursh from the Magazine, for Venet. Hort. Celf., which proving that the work was not consulted by Pursh, takes away our confidence in that author, as to synonyms. The name inodore is acknowledged to express the want of the Garlick factor in the herbage, while that of fragrans alludes to the sweet scent of the flowers. We retain the original appellation. Mr. Ker, at the end of the history of t. 1293, in Curt. Mag. declares his conviction that A. gracile, our n. 55, is the fame plant. We cannot affect the contrary, but we do not feel convinced, and there has been such a diversity of opinion on the subject, that till we can compare living specimens, we must leave the question in doubt. It is remarkable that Willdenow says A. inodore is like angulorum of Linneus, but twice as large, and differing in the specific character, which chiefly amounts to the flatak of the latter being two-edged, and the leaves channelled. He had both plants living. But angulorum is most excellently represented in Curt. Mag. t. 1149, and surely few of the genus can bear less resemblance to t. 1129! It is scarcely more like Redouté's figures, named fragrans. We proceed to notice the species most akin to inodore; for so at leat it must be presumed to be.

35, 36. A. gracile. Jamaica Garlick. (See our n. 55.) Dryandr. in Ait. Hort. Kew. v. 1. 429. ed. 2. n. 38. Wild. n. 52. Andr. Repof. t. 107. Ker in Curt. Mag. at the end of p. 1293, var. 1. (A. fruticum; Redout. Lilic. t. 50. Curt. Mag. t. 1035? and t. 1242?)—Stalk naked, round, very long. Leaves linear, channelled. Stamens awl-shaped, connected at the base.—Native of Jamaica, from whence it was fpent to Kew, by Hinton Eaft, efq., and fowered in the ifle, in February. Aiton. Leaves a foot long, reftling them of a Narcifius. Stalk three fets high, flender. Petals creft, white, with claws, which are united with the flaments below, into a green tube. Perhaps this plant may form a diftinct genus. Dryandr as above. The writer of the prefent article happened to be with Mr. Dryandr, when the original fpecimens of this Allium were brought from Kew, and on being afked for a name fuggelfed the above. He then obtained a fpecimen, which is now, along with others gathered at Kew in 1788, in his herbarium, as well as one more, undoubtedly the fame fpecies, procured from Mr. Vere's collection, in 1814, as a rare plant, by the name of A. stratum. He can therefore fpeak to the whole herb being deftitute of the Garlick odour, and to the want of fcent in the flowers, by day at leat, though they may very probably be, as reported, fragrant at night. He can also vouch for the fidelity of Mr. Andrews's figure; nor does he hesitate concerning t. 50 of Redouté; whatever fcruples a deference to Mr. Ker may fuggel, as to the two figures named stratum in Curt. Mag. Theufficion of a generic difference between this plant and Allium, arose in Mr. Dryandr's mind, from the combination of the flaments, and was strengthened by the want of the garlick flavour.
flavour. The leaves are certainly not remarkably flattened at the back, as in the real *friatum*, of which we shall next speak.

A. *friatum*. Streaked-leaved Garlic. (See our n. 37.)

Jacq. Coll. v. 5. 51. T. Rar. t. 366. Willd. n. 35.

Ait. n. 27.—Stalk naked, slightly triangular. Leaves linear, somewhat channelled; convex, with many furrows, but no keel, beneath. Umbel level-topped. Petals oblong-lanceolate. Stamens simple.—Native of the Cape of Good Hope, flowering in the garden in September and October. Whole plant smooth, without much scent. *Bulb* the size of a hazel-nut, white, coated. *Leaves* about four, all radical, six inches or more in length, linear, bluntish, oblique, but little channelled; rather convex and flattened at the back, but not triangular. A transverse section, under a magnifier, showed a single row of perpendicular tubes, each running behind one of the furrows; but the leaf is not itself hollow, or tubular. *Stalk* radical, obscurely triangular, slender, erect, as tall as the leaves, or taller. *Umbel* of seven flowers, more or less, the partial flasks an inch and a half long. *Sheath* of two erect, ovate, pointed, membranous valves. *Petals* long-lanceolate, rather acute, spreading, white with a green longitudinal line in the middle. *Filament* awl-shaped, equal, shorter than the petals. *Anthers* oblong, incumbent, yellow. *Jacquin.*

This figure and description surely do not suit our *gracile*.

But whether the *friatum* does really come from the Cape, or from Virginia and Carolina, we are quite in the dark. Pursh’s *friatum* is our *ornitbogaloides*, n. 57. Curt. Mag. t. 1524 answers better to his description than t. 1255, but we cannot prove them the same. We have endeavoured to unravel the original materials which concern these three species, but having had no means of comparing fresh specimens, nor having indeed seen any at all of Jacquin’s plant, we are unable to attempt good specific characters, and therefore leave the whole for future examination, satisfied of one thing, at least, that these species are not at present well understood. To illustrate them, great attention to the outline of the petals, shape and inflection of the *filaments*, and form of the *germen*, circumstances not yet well observed in *Allium*, will be found of primary importance.

39. *A. pedmontanum*. Red Piedmonteese Garlic. Willd. n. 37. (A. nigrum; Allion. Pedem. v. 2. 158. t. 25. f. 1. A. rosicum; Linn. Sp. Pl. ed. 2. 432, but not Sp. Pl. v. 1. 256.)—Stalk obscurely quadrangular. Bulb cylindrical. Leaves linear, obtuse, keeled at the back. Umbel rather dense, of few flowers. Petals elliptical.—Native of mountainous situations in Piedmont. Specimens from Altoni and Bellardi prove this species, as distinct from *nigrum* as from *rosicum*, to have been confounded by Millerius with the latter, which has a globule, very prolic *bulb*, a somewhat leafy *fleshy* stem, and far more numerous, brighter-coloured, *flowers*.

39, 40. *A. flaccidum*. Millouri Garlic. Ker in Curt. Mag. t. 1576. Ait. Epit. 363. (A. angulosum; Pursh n. 4, excluding the *synonyms*.)—Stalks somewhat two-edged, recurved before flowering. *Bulb* ovate-oblanceolate. Leaves linear, triangular, sharply keeled. Umbel many-flowered, lax, level-topped. Stamens combined at the base. *Germin* depermed, bluntly triangular.—Found on the banks of the Millouri, by governor Lewis and Mr. Nuttall, flowering in July, and imported by Mr. Fraser, in whose nursery it bloomed in June 1813. Pursh by mistake says the flowers are white. In the Botanical Magazine they are represented of a deep pink, and the herbage somewhat glaucous. The *flasks* are two or more. The *fleshy* is of only one valve; but Mr. Ker doubts the permanency of that character.

A. rubellum. Reddish Iberian Garlic. Marisch. Taur.-Caucas. v. 1. 264.—“Stalk nearly naked, round. Leaves semi-cylindrical, channelled. Sheath short. Umbel convex, many-flowered. *Stamens* simple, half as long as the *corolla.*”—Gathered by Mr. Steven in Georgia. *Bulb* the size of a filbert. *Stalk* with one or two leaves sheathing the base, on which account the author cited doubts whether this species and the following might not be referred to the third section; but there are many of the fourth whole foliage, when the bulb is deep, becomes in some degree caulin. *Leaves* a line broad, rather fleshy. *Flower*-stalks slender, much longer than the *flowers*, which are hardly so big as those of *A. plumprifum*, of a pale purple, with acute *petals*.

A. fuscifolium. Stone Garlic. Marisch. Taur.-Caucas. v. 1. 264. Sims and Kon. Ann. of Bot. v. 2. 436, excluding the *synonym* of Gymnol.—“Stalk almost naked, round. Leaves semi-cylindrical. *Sheath* pointed, longer than the umbel. *Stamens* simple, longer than the *corolla.*”—Frequent on the lime-stone rocks of Taurida, flowering in July and August. *Bulbs* aggregate, oblong, with dark brown coats. *Stalk* with a few sheathing leaves at the base, like the foregoing. *Petals* spreading. There is a variety with purplish *flowers*, on the eastern mountains of Caucasia. This species is very closely related to *A. flaccidum*, Willd. n. 49, see our n. 51; but differs in having a long awl-shaped *fleshy*. **Marisch.**

A. bifurcum. Jouquil-leaved Garlic. Redout. Liliac. t. 286. Curt. Mag. t. 1381. Ait. Epit. 363.—Bulb cylindrical. *Stalk* round. Leaves two-ranked, semi-cylindrical, channelled, acute. Umbel dense, convex. Petals oval. Filaments awl-shaped, the length of the corolla; three of them broader at the base.—Native country not known. The plant is said to be quite hard, and of easy culture, flowering in June and July. Mr. Ker remarks its great resemblance to *fimbriatius*, (see n. 52,) Curt. Mag. t. 1150, next to which perhaps it ought to be placed, though akin also to our last, from which the *fimbriatius* of the *fimbriatius* distinguishes the present plant. The narrow and thick *leaves* are very different from *fimbriatius*; and Redout has observed that the inner ones are channelled on both sides; which may, as Mr. Ker thinks, be occasioned by pressure in an early state.

40, 41. *A. trilobum*. Three-flowered Garlic, or Mountain Leeks. Pursh n. 5.—“Stalk naked, round, shorter than the leaves, which are lanceolate and ribbed. Umbel of few flowers.”—In shady woods, on the high mountains of Pennsylvania, flowering in May and June. **Pursh.**

Fl. Græc. Sibth. n. 781. Fl. Græc. t. 325, unpubl. (A. album; Bivona Sic. cent. i. 16. “Santi Viagg. al Montam. 352 t. 7, Bertol. Gen. 51. Savi Etrusc. v. 2. 210.)—Stalk naked, triangular. Leaves lanceolate, sessile. Petals obtuse.—Native of fields in Italy and Sicily, flowering in March. This is one of those plants, which, on account of their novelty, or rarity, Dr. Sibthorp admitted into his *Flora Graeca*, having gathered them in the course of his travels, though perhaps not in Greece itself. *A. luteum* agrees with *trigintum*, n. 44, next to which it should be placed, in having an acutely triangular *flalla*; but differs in the lanceolate *leaves*, and shorter, broader, more obtuse, petals. The *siga* moreover is simple, not three-lobed.

*A. ambiurn*. Bulbous Rose Garlic. Sm. Prod. Fl. Græc. Sibth. n. 783. Fl. Græc. t. 327, unpubl. (A. rofenum S.; Ker in Curt. Mag. t. 978. Bivona Sic. cent. i. 18. Savi Etrusc. v. 2. 210. “A. carneum; Targioni Tozzetti Ist. Bot. ed. 2. v. 2. 242. t. 6. Moly antiquifolum campanulatum, flore rofeno, nodosum; Cupani Pamph. v. 2. t. 219.” Moly serpentinitum vocatum; Lob. Ic. 160.)—Stalk naked. Leaves semi-cylindrical. Stamens ample, shorter than the corolla. Umbel bulbiferous.—Native of Italy and Sicily, flowering in May. Frequent about Pifs. Sav. On the hills of St. Martino near Palermo. *Bivona.* This *Allium*, which, with respect to the *Flora Graeca*, stands in the same predicament as the laft, is made by all authors a variety of *rofenum*; for the difference between the species with bulbiferous, and thofe with feed-bearing, *umbels*, is acknowledged to be, in many instances, not infallible. In the plant before us, however, there is a great difagreement, as to the character of *rofenum*, which is described with flat *leaves* and a leafy *siga*. But the dried specimens are very much alike, not discoverable in either the semi-cylindrical and hollow structure of the *leaves*, shewn by Dr. Sibthorp’s figure. As to the *siga* being leafy or not, many species are in this repect ambiguous, and *rofenum* is perhaps improperly considered as of the former denomination. Their *roots* are precisely alike. The *flowers of rofenum* are far more numerous, and of a finer pink hue.

We cannot conclude our survey of *Allium* without a remark that the whole genus requires to be reformed, with regard to the arrangement of the species, and the specific characters of many of them. We are also aware of several that might be added to the above lift, but of which we want sufficient specimens or information clearly to dispose of them, so as to elucidate rather than confound the subject.

**ALLOCHROITE.** See **Mineralogy, Addenda.**

**ALLOY,** in Chemicaly, a combination of two or more metals. In addition to what has been said on this subject in the Cyclopædia, we may add the following tabular views from Dr. Thomson, of the general properties of the different alloys, as far as they have been examined. The chemicaly of alloys is at present but little understood, and, as Dr. Thomson justly remarks, these compounds in general appear to be much better known to artists and manufacturers than to chemists.

The first of the following tables comprehends the alloys of the malleable metals with each other; the second, the alloys of the brittle metals; and the third, the alloys of the malleable and brittle metals. In these tables, the letter M signifies malleable; B, brittle; S, submalleable, used when the alloy is malleable in certain proportions, but brittle in others. O is used when the metals do not unite. The sign + is used when the alloy occupies a greater bulk than the separate metals; the sign — when the alloy occupies a smaller bulk. The sign indicates an expansion; the second, a condensation.

**Table I.** Malleable Metals.

ALMANAC, col. 2, l. 15, add, see STAMP.

ALMUDE, in Commerce, a liquid measure in Portugal, &c. (See Table XXXII. of Measures.) At Lisbon, wine and oil are sold by the pipe of 26 almudes; but the pipe of Lisbon wine sent to England contains about 31 almudes, and the standard gauge at the London Custom-house is 140 gallons; the Lisbon almude is therefore reckoned at 4½ English gallons. At Oporto, the pipe is divided into 21 almudes, which almude and its subdivisions are 49½ per cent. greater than those of Lisbon; so that the standard gauge of a pipe of port at the Custom-house of London is 138 gallons, so that the almude of Oporto is accordingly equal to six English gallons and five pints nearly.

ALNUS, in Botany, the Alder, an ancient Latin name, which De Theis derives from the Celtic, *al*, near, and lan., the brink of a river, the letters having become transposed for easy pronunciation. This is suitable enough to the tree in question, which always grows near water, even on the loftiest mountains, nor have we met with a better etymology.

Gen. Ch. Male, Cal. Catkin cylindrical, imbricated every way, lax, composed of wedge-shaped, three-flowered, abrupt, three-cleft fecales. *Cor.* compound, of three equal, tubular, four-cleft florets, feline on the disk of each scale; their segments deep, equal, ovate, obtuse, spreading. *Stam.* Filaments four, minute, inserted into the base of each segment, and not quite so long as the segment; anthers of two round lobes.

Female, on the same plant, Cal. Catkin elliptical, imbricated, close, containing of two-flowered, rounded, pointed, obconically three-cleft, concave scales. *Cor.* lonic. *Pil.* Germens two to each scale, ovate, minute, depresse; *stiles* two to each germen, tapering, rather longer than the scale; *filaments* simple. *Seed.* Nut naked, compressed, of two cells, with solitary kernels.

Eff. Ch. Male, Calyx the scale of a catkin, of one leaf, three-cleft, three-flowered. Corolla deeply four-cleft.

Female, Calyx the scale of a catkin, of one leaf, obconically three-cleft, two-flowered. Styles two. Nut compressed. The presence of a corolla in the male flowers, with a determinate number of *flaments* equal to that of its segments, are sufficient marks of generic distinction between this genus and *Betula*, which has no corolla in either flower, and whose *flaments* are numerous, and indefinite. The fertile catkin moreover is elliptical in *Alnus*, cylindrical in *Betula*. Gérard finds differences in the seed, which, if the germen be attended to, appear to us less decisive. By an accidental oversight, *Alnus* was neglected to be separated from *Betula*, in our Plants of Britain; see that article.

δ, quercifolia; leaves oblong, sinuate, with obtuse segments. *Willd.*

Leaves roundish-wedge-shaped, obtuse, wavy, glutinous; downy at the branching of the veins beneath.—Native of swamps and the neighbourhood of rivers and pools, in low lands, as well as on mountains, throughout Europe, the north of Asia, and of Africa, as also in Canada and on the north-west coast of America, (Pufch.) flowering in March or April. In landscape this tree often supplies the want of the rich dark foliage of the Oak, where the latter will not thrive. The leaves are not fully expanded till the end of May, but they remain late in autumn. For the uses and further history of this tree, see *Betula*, n. 6. Our γ is the only variety cultivated for ornament, or rather curiosity, in England.

2. A. oblongata. Turkey Alder. Willd. n. 2. Ait. n. 2. (A. folio oblongo virid.) Bauh. Pin. 428. Hort. Angl. 5. Betula oblongata; Ait. ed. 1. v. 3. 338.—Leaves elliptical, bluntish, glutinous; the branching of the veins naked beneath.—Native of the south of Europe. Cultivated in England ever since the year 1571, at least, but not much in request. The leaves are smaller than the foregoing, ovate, or elliptic-oblong, sharply serrated. *Catkins* of seeds nearly globular.

β, angulata; leaves green beneath, with green footstalks.

4. A. undulata. Curl-leaved Alder. Willd. n. 4. Ait. n. 4. (A. cripta; Pursh n. 2. Betula cripta; Ait. ed. 1. v. 3. 339. Michaux Boréal.-Amer. v. 2. 181.)—Leaves oblong, acute; rounded at the base; veins hairy beneath, like the footstalks, but naked at their origin. *Stipulas* ovate-oblong.—In Canada, and on the high mountains of Pennsylvania, in swamps overrun with Bog-moss, flowering in April. A *sporif* not above three or four feet high. *Leaves* doubly serrated. *Pursh.* See *Betula* n. 13. Willdenow seems to have unwarrantably changed the name of this species.

obovate, finely lated; veins and their origin hairy beneath. Stipules elliptical, obtuse. — Native of North America.

Common every where in swamps, and by river sides, flowering in March. A shrub, from six to ten feet high, growing in close thickets. Purff. See Betula n. 12. The leaves do not appear to be glutinous, or at least not so much as the Common Alder, from which also they differ in being regularly and finely lated, not notched, or jagged.

ALOEXYLUM, *aloe* wood, a name given to the tree which produces this precious wood, by Loureiro; Fl. Cochinch. 267. See Agallochum.—He refers to it the Clasfs and Order, Deccaudia Monogonia, and its Natural Order seems to be Lomendrae, Linn. —Leguminosae, Juff.

Gen. Ch. Cal. Perianth inferior, of four acute, hairy, deciduous leaves; the lowermost lated, incurved, nearly twice as long as the reft. Cor. Petals five, unequal, longer than the calyx. Stam. Filaments ten; anthers... Fls. Germen superior, elongated, curved, compressed; style thread-shaped; stigma... Peric. Legume woody, smooth, lated. Seed solitary, oblong, curved, tunicated.

Eff. Ch. Calyx of four acute deciduous leaves; the lower one longish. Petals five, unequal. Legume curved. Seed solitary, tunicated.

1. A. Agallochum. Fragrant Aloe-wood.—Native of the loftiest mountains of Cochinchina, near the great river which runs between that kingdom and Laos. A large lofty tree, with erect branches. Bark fibrous, brown, smooth, not thick. Leaves alternate, flalked, lanceolate, flat, entire, smooth, rather coriaceous, eight inches long. Flower-flats terminal, many-flowered. Loureiro. This genus is manifestly different from Aquilaria. (See that article.) Loureiro describes the wood as white and inodorous, becoming rufous and fragrant in consequence of some injury, till the tree dies. No part of this tree is milky, nor poisonous. He adds, that all the forts of genuine aloe-wood are produced by this tree, even the most precious, termed Calambaec, which is found no where but on the mountains of Cham-pave, belonging to Cochinchina, situated about the 13th degree of north latitude. The inferior species, or other varieties, are obtained in various places, sometimes in pieces weighing thirty pounds or more. "There are," says Loureiro, "other fragrant woods, called by ignornant perfons Agallochum, and Lignum Aloe, differing greatly from each other, and the produce of different plants." The common writing paper of Cochinchina is made of the bark of this tree. Yet the plant itself seems rare, Loureiro having long enquired in vain for the flowers, and having obtained them but once, in a bruised and mutilated condition.

Whether the Agallochum, or Calambaec, Rumph. Amboin. v. 2. 29, of which that author gives no figure, be the plant of Loureiro, we cannot positively determine, though it seems likely. The Agallochum secundarium, or Garo, of the same volume, 34. t. 10, is certainly the Aquilaria. We have received from Dr. Roxburgh specimens of the wood itself; as well as of the fruit, agreeing exactly with Rumphius's figure, and evidently the Gymnina Walla of Gaertner, v. 2. 276. t. 140. In Tr. of Linn. Soc. v. 11. 230, the writer of this has hinted at the probable affinity of Aquilaria to the Euphorbia.

ALONSOA, a genus established by Ruiz and Pavon, Fl. Peruv. Syll. 150, and adopted in Ait Horn. Kew. v. 4. 27, is founded on two species of Hemmeris, (see that article) nor can we discover the least possible character to distingush them from the latter; which having been much confounded in its history by Linneus, was perhaps not understood by the authors of the Flora Peruviana. These species are our *H. urticifolia* (Alonfoa incisifolia; Fl. Peruv.) and Vol. XXXIX.

H. linearis. (A. linearis of the same work.) Professor Willdenow, though he had never seen more than one Hemmeris, the monandria, and that in a dried state, could not overlook the identity of these genera, nor in what it is evident from their generic character of Allophana that they did not contrast the two genera; for these are proved the same by the character itself, which runs thus, and is equally suitable to both. Calyx in five deep segments. Corolla nearly wheel-shaped, reverse, five-leaf; the uppermost segment largest. Stamina declining: with smooth filaments; and converging uniform anthers. Capule of two cells.

Hemmeris, being a long-established Linnæan name, of appropriate and unexceptionable meaning, might, of course, be retained.

Gen. Ch. Cal. Perianth superior, of one leaf, tubular, irregularly splitting into two or three teeth. Cor. of one petal, irregular, tubular at the base: limb double, unequal; the outermost two-lipped, in three deep segments, of which the upper one is usually broadest, and concave, the two lower equal and narrower; innermost of a single lip, straight, as long or longer than the outer limb, dilated, lobed, or jagged, at the extremity, furnished at the base with a pair of awl-shaped teeth. Stam. Filament one, opposite to the lip, short and flout, quite simple; anther terminal, erect, thick, simple, without any appendage, convex at the back, marginate, divided in front into two parallel, close, oblong lobes, curving longitudinally. Pil. Germen inferior, elliptic-oblung, with three furrows; style thread-shaped, erect, smooth, the length of the ftern, embraced by the lobes of the anther; stigma peltate, umbilicated, hairy. Peric. Capsule fleshy, oval, abrupt, umbilicated, with three furrows, three valves, and three cells. Seeds numerous, tunicated, ovate, angular, abrupt, infected into a pulpy receptacle.

Eff. Ch. Anther two-lobed, terminal, embracing the style, without any appendage. Inner limb of the corolla a simple lip. Capsule fleshy.

Dr. Roxburgh, who had opportunities of studying the various species of this, and many other Scitamineae genera, in their native situations, speaks of Alpinia as a good natural genus, having, besides the proper characters in the fruitification, certain peculiarly striking ones in the habit. The roots are perennial, tubercous, strong, thick, crooked, running nearly horizontally, a little below the surface of the ground,
and strongly marked with annular scars where former leaves have been; these send down copious, long, thick, fibrous radicles. Stems either biennial or perennial, numerous, tufted, straight, erect, or more or less recurved at the summit, denely leafy, each terminating in a copious chaffier, or panicle, of large gaudy flowers, "except Cardamomum," says Dr. Roxburgh; but that plant, which has a radical panicle, is now excluded from *Alpinia*, and called by Dr. Maton Ektaria in Tr. of Linn. Soc. v. 10. 249, having insufficient marks of generic distinction in the fruits. We shall endeavour to collect under one view the numerous species of this fine genus, of which we can find any account, or have seen any figures or specimens.

—Native of rather mountainous shady woods in the Weft Indies. Notwithstanding Dr. Swartz's doubts, we have no scruple respecting Plumer's synonymy. Root branching, fleshy, with the flavour of Ginger; used in Jamaica as a poultice for cancers and other wounds, according to Sloane, with very good success. Stem herbaceous, two or three feet high, round, smooth, slender, fimple, leafy. Leaves alternate, elliptic-lanceolate, entire, smooth, pointed, a foot long, with narrow fheathing foot-falks exceeding them in length. Claffer terminal, solitary, falked, unbranched, smooth, many-flowered. Outer bratæas lanceolate, blood-red; the lowest an inch and a half long, the rest about an inch; inner bell-shaped, containing one or two flowers, shorter than the calyx, permanent. Calyx red, with broad and fallow teeth. Corolla white; tube f slender, longer than the calyx; outer limb with three nearly equal, ovate, fegment; inner somewhat heart-shaped, three-lobed, the middle lobe notched. Germen bluntly triangular, quite smooth, as well as the capfule. Seeds fhining.

2. *A. Galanga*. Galangale *Alpinia*. Reft. Tr. of Linn. Soc. v. 8. 345. Rosb. n. 1. Wild. n. 2. (Maranta Galanga; Linn. Sp. Pl. p. 3. Swartz Obs. 8. Amonum Galanga; Loureir. Cochinch. s. Galanga major; Rampf. Ambon. v. 143. t. 63. Dale Pharmac. 276. Ger. Em. 33.)—Cluster compound, erect. Bractæs all lanceolate, shorter than the flowers. Calyx bell-shaped, with three rather pointed equal fegments. Germen fightly downy.—Native of various parts of the Malay Archipelago, communicated by the late Dr. Roxburgh, from the Celefiana garden, where this plant flowered during the hot fefon, and ripened feed, though very rarely, in November. The root proved to be the real Galanga major of the fhips. The flem is faid to be feven or eight feet high. Leaves eighteen or twenty-four inches long, foft to the touch, though fcarcefibly confipuciously downy. Claffer large, with very numerous, crowded, short, racemosely branched, all downy. Bratæas uniform, lanceolate, downy; fioe at the base of each principal branch very small. Flowers white. Calyx befprinkled with minute cenous dots. Corolla elongated; lip externally downy, cloven at the extremity. "Capfule small, obotate, smooth, deep orange-red, not opening fpontaneously. Seeds only two in each cell, even in the germen, bitter and naufeous, each three-fourths covered with a white tunic." Roxburgh. See GALANGAL.

3. *A. occidentalis*. Scaly-clustered *Alpinia*. Swartz Ind. Occ. 9. Reft. Tr. of Linn. Soc. v. 8. 345. Wild. n. 4. Ait. n. 2. (Amonum minus, scapo velluto, floribus fericatis; Browne Jam. 113, excluding Sloane's synonym. Pacho-feroza minor multicaulis; Plinn. MS8. cum tono.)—Cluster compound, erect, on a fcarly leafeless stem. Partial bractæs imbricated, fheathing, dilated, abrupt, hairy. Calyx turbinated, with three broad obtufe fegments. Germen fightly downy.—Native of moift parts of the mountainous woods of Jamaica, flowering all the year, but especially in fpring. Root knotty and fleshy. Barren flem fix feet high, erect, herbaceous, fimple, leafy. Leaves elliptic-lanceolate, acute, very smooth, attached by a short contraction to their fheathing foot-falps, as in the other species. Flowering flem all turned upwards, crowded, their partial falks concealed by concave, fheathing, abrupt, partial bratæas, while each common falk, or branch of the claffer, lies at its base a very different, lanceolate, acute bratæa, half its own length. Calyx coloured, hairy at the fape; its fegments smooth, rounded and obtufe. Corolla pale yellow; tube the length of the calyx; lip veiny, cloven at the end. "Capfule rather small, conicarious and fleshy, of three valves, red when ripe, pulp within. Seeds yellow, two or three in each cell." Swartz. We are indebted to Mr. David Stean for a drawing of this plant, copied from Plumer's MS. at Oxford.

The habit of these species may, at first sight, fecm to invalidate the character of a leafy leafe, with terminal inflorescence, attributed to this genus in our introductory remarks. We think however that the difference between this and the others is more apparent than real. The f Seas may be confidered as abortive leaves, not perfected on the flowering flem, while those flem which luxuriate in foliage, do not alfo bear fructification. Perhaps the roots are more profuse than in other species.

4. *A. Alloga*. Ceylon *Alpinia*. Reft. Tr. of Linn. Soc. v. 8. 346. Rosb. n. 2. Ait. n. 3. (Hellenia Alloga; Wild. Sp. Pl. v. 1. 4. Andr. Repof. 1. 501. Heritiera Alloga; Ritzt. Obs. fcafe. 6. 1. 1.)—Cluster panicled, erect. Calyx bell-shaped, two-lobed. Germen hairily. Lip two-lobed.—Native of the Eaft Indies. Very common in Bengal, flowering throughout the rainy season, and ripening fruit in October and November. We received in 1789 a flower from Kenig's fpecimen of this plant, sent to profeffor David Van Royen by the name of Grana Paradisi Zeylandica. It appears without doubt to be the Alloga of Hermann, mentioned, but not ascertained fystematically, in Linn. Zeyl. 202. n. 449, and it is faid to be the Malo-infleci-bua, Rhede Hort. Mal. v. 11. t. 14. The illuftrions fir William Jones has defcribed it, by the Sanscrit name of Tûrûc, in the Asiatic Researcbes, v. 4. 240. The flem is two feet high, fimple, leafy. Leaves lanceolate, pointed, fnaphe, with long fheaths. Claffer, or rather panicule, variously fubdivided, lix, many-flowered, with defpily downy falks. Bratæas smooth, for the moft part very fmall, but those under the principal subdivisions of the inflorescence are sometimes elongated and lanceolate, and one or two of the lowermost occasionally become very large and leafy. Calyx downy, espefially at the fape, remarkable for having only two marginal acute fegments. Segments of the outer limb of the corolla oblong, equal, coloured green by Mr. Andrews, crimen, like the lip in Retzius's plate, but the latter is probably accidental, the author having had no living fpecimen. The lip is longer than those fegments, and, like them, externally hairy; its two lobes appear to be fometimes cloven. Stamen long, with a large anther, reddish as well as the style. Fruit globe-like, purplish-
ALPINIA.

purplish-black, with numerous tunicated seeds. This species was raised from seed by A. B. Lambert, esq., at Boyton, in Wiltshire, where it flowered very finely; but it is said to have been previously sent by Mr. Peter Good to Kew, in 1796.

5. A. alba. White Alpinia. Roxb. Tr. of Linn. Soc. v. 8. 346. (Hellenia alba; Willd. Sp. Pl. v. 1. 5. Heritiera alba; Retz. Obs. f.ac. 6. 18. Languas vulgaris; Koen. in Retz. Obs. f. ac. 3. 65.) — Clutter panicked. Calyx bell-shaped, three-lobed. Lip two-lobed. Leaves callous and fringed at the margin. — Native of China; cultivated in the East Indies. Kennig terms this plant Galanga alba, and speaks of it as in much use among the Malays. The roots are white, thicker than the thumb. Stems taller than a man, tuberous at the bottom, a little drooping at the top. Leaves about eighteen inches long, and hardly three broad, two-ranked, smooth on both sides; their edges callous, white, and rather rough with hairs. Five or six of the lower leaves are unaccompanied by leaves. Clutter oblong, with smooth flanks, except the partial ones, which are rather hairy. \textit{Bracteas} lanceolate, acute, rusty-coloured, deciduous. Calyx with snow-white segments. Outer limb of the corolla greenish-white; lip inversely heart-shaped, deeply two-lobed, jagged and crisped at the margin, white, with fine rose-coloured veins. \textit{Capsula} erect, membranous, rather rigid, friated. Kennig's full and correct description of the flower, leaves no doubt as to the genus of this plant, though we have seen no specimens.

6. A. chinensis. Chinese Alpinia. Roxb. Tr. of Linn. Soc. v. 8. 346. (Hellenia chinensis; Willd. Sp. Pl. v. 1. 5. Heritiera chinensis; Retz. Obs. f. ac. 6. 18. Languas chinensis; Koen. in Retz. Obs. f. ac. 3. 65.) — Clutter panicked. Calyx bell-shaped, three-toothed, obtuse. Lip emarginate, finely-toothed. Leaves recurved at the point; membranous, and fringed with scattered hairs, at the margin. — Native of China? where at least it is cultivated, for medical use, in gardens. \textit{Root} aromatic, with an acid burning flavour, white, as thick as the middle finger. Stems two or three feet high, a little drooping at the summit. Leaves a span long, and two inches or two inches and a half broad, with a white rib and margin. \textit{Clutter} narrower, three or four inches long, its flanks more or less clothed with close-preferred hairs. Calyx green. Corolla yellowish; the lip marked with a broad orange-coloured longitudinal stripe, and transverse waves of the same colour, accompanied by four blood-red veins. Fruit a \textit{capsula}. Kennig.

7. A. aquatica. Water Alpinia. Roxb. Tr. of Linn. Soc. v. 8. 346. (Hellenia aquatica; Willd. Sp. Pl. v. 1. 5. Heritiera aquatica; Retz. Obs. fac. 6. 18. Languas aquaticum; L. veyr. l.; Koen. in Retz. Obs. fac. 3. 67.) — Panicle somewhat drooping at the top, with forked branches. Calyx bell-shaped, three-toothed. Lip four-toothed, erect; its lateral teeth with an oblong gland at the base, on each side. — Found in marshy places, among bushes, by the sides of rivulets in the East Indies, but not very common. \textit{Roots} numerous, thread-shaped, white, sending forth runners. \textit{Stem} about four feet in height, leafy, as thick as the finger. \textit{Leaves} oblong, acute, coriaceous, of a beautiful green; rather roughly striated on the upper side; smooth at the back; the margin befit with minute callous teeth. \textit{Panicle} slender, with two deciduous \textit{bracteas} at the base; \textit{flower-flalks} forked, two-flowered, divaricated, round, smooth, white, shorter than the flowers. \textit{Bracteas} two or three, attached to the lower flower-flalks, linear-lanceolate, concave, membranous, whitish, deciduous. Calyx smooth, pure white, sometimes split at the inner side. \textit{Corolla} white. \textit{Lip} small, brown on the inner side, role-coloured near its union with the filament. \textit{Anther} reddish, crowned with a small, coloured, erect, semi-orbicular membrane. \textit{Berry} oval, smooth, black. \textit{Seeds} five or more, triangular. Kennig. The membranous crowning the anther forms a small exception to the generic character, but can hardly invalidate it, or require the establishment of a separate genus; unless the fructification, when examined according to our present advanced knowledge, should afford other distinctive marks.

8. A. malaccensis. Malaccan Alpinia. Roxb. Tr. of Linn. Soc. v. 8. 345. Roxb. n. 3. (Maranta? malaccensis; Willd. Sp. Pl. v. 1. 14. Burm. Ind. 2. Galanga malaccensis; Rumph. Amboin. v. f. 176. t. 71. f. 1.) — Clutter simple, erect. Leaves villous beneath. Lip broader than long, toothed, concave, obliquely three-lobed; lateral lobes incurved. — Native of Chittagong, from whence it was brought to the botanic garden at Calcutta, and flowers there in April and May. "This," says Dr. Roxburgh, "is the most flatly and most beautiful of our Scitamineae plants. The flowers are particularly large; the \textit{bracteas}, and exterior limb of the corolla, pure, smooth, lucid white; the large lip variegated with crimson and yellow." \textit{Stem} from twelve to fifteen feet high, villous. \textit{Leaves} eighteen or twenty inches long, the breadth of five or six fingers, silky or downy beneath. \textit{Flowers} about twelve, alternate. \textit{Rumphius, Burmann.} This has not yet found its way to England, where it would doubtless be a great acquisition, as, by the above description, it seems to excelled the magnificence and beauty of the following.

9. A. nutans. Drooping Alpinia. Roxb. Tr. of Linn. Soc. v. 8. 346. Sm. Exot. Bot. v. 2. 93. t. 106. Roxb. n. 4. Art. t. 4. (Globba nutans; Linn. Mant. 2. 170. Willd. Sp. Pl. v. 1. 153. Redout. Lilac. t. 60. G. sylvestris; Rumph. Amboin. v. f. 146. t. 62, 63. Renealmia nutans; Andr. Repof. t. 360. Edwards t. 1. Thornt. Illusfr. t. 13. Zerumbet speciosum; Wendl. Sert. Han- nov. t. 19. Jacq. Fragm. Bot. t. 68.) — Clutter somewhat compound, drooping. Leaves smooth on both sides. Lip inflated, crisped. Calyx irregularly toothed, tumid, furrowing at one side. — Native of the interior parts of Bengal. \textit{Roxburgh.} Albo of Amboyna, and other places. It was introduced into the English gardens, in 1752, by Mr Joseph Banks, and flowering a few years after, excited the admiration of all beholders. The number of figures of this plant which have been published, prove it a general favourite. The tuberous odorous \textit{root} is sometimes, as Dr. Roxburgh affirms, brought to England for \textit{Galanga maior}; see n. 2. \textit{Stem} from five to eight feet high in India, but with us to twelve to eighteen, perennial, erect, as thick as the finger, leafy. \textit{Leaves} a foot long or more, with long leaves, each leaf crowned with a \textit{flabula} which is externally silky. The \textit{flower-buds} before they expand are of a shining white, tinged with rose-colour, and are enveloped in large, concave, toothed \textit{bracteas} of the same porcelain-like splendited white, all together composing a dense pendulous \textit{clutter}, like a bunch of oblong grapes. When the \textit{flowers} open, they display the magnificent concave \textit{lip} yellow at the margin, internally variegated and streaked with every shade of crimson. The \textit{famen} and its \textit{anther} are short and thick. \textit{Ger- men} hairy. \textit{Capsula} spherical, opening at the sides. \textit{Seeds} aromatic, as is likewise the young germs. Linnaeus has greatly confounded the history of this plant, with which he had no acquaintance but from the work of Rumphius. Yet he subsequeutly cited the same \textit{synonym} and \textit{fig}ures under his \textit{Renealmia esculenta}, which is indeed an \textit{Alpinia}; as we shall presently shew, but a widely different species.
The real genus Globba is totally distinct from both; see that article.

A. mutica. Pointed Narrow-leaved Alpinia. Roxb. n. 5.—Cluter erect, compound. Leaves shortly flalked, linear-lanceolate, polifhed. Lip three-lobed; without a spur at the base. Capital puply. Seeds numerous, angular, with an evanfentum. —Found by Mr. W. Roxb. burg, the fon of our ever-lamented East Indian botanift, in the forests of Prince of Wales's ifland, from whence being brought to the Calcutta garden, it flowered, more or lefs, during the whole year, but chiefly in the hot leafton, March, April, and May. This is also an elegant fpecies, and holds a middle rank between nutsans and calcarata. Roxburgh.

11. A. calcarea. Spurred Narrow-leaved Alpinia. Rof. Tr. of Linn. Soc. v. 8. 347. Roxb. n. 6. Art. n. 5. (Renealmia calcarea; Andr. Repof. t. 421. Globba ereca; Redout. Lilien. t. 174.)—Cluter erect, somewhat compound. Leaves linear-lanceolate, polifhed. Lip ovate-oblong, cloven at the point. Segments of the outer limb linear-oblong. —Native of China, from whence it was introduced into the Calcutta garden in 1799, according to Dr. Roxburgh, who communicated the plant to Mr. Lambert. The numerous fpecies are from three to five feet high. Leaves narrow, acute, smooth. Cluter three or four inches long, downy, rather denfe, the fhalks, though partly compound, none of them bearing two or three flowers, being fo fhort that the whole cluter refembles a Spike. Leaves twelve or fifteen inches long and one broad, pointed. Bractes elliptical, concave, hardly equal to the calyx, which is tubular, white, fplitted half way down at one fide, and on the other very flightly and bluntly notched. Outer limb of the corolla pure white, the length of the tube, in three deep, equal, obtufe, flat, rather narrow segments. Lip nearly twice as long, concave, but not fo timid or inflated as in A. nutsans; its upper fide crimfon, beautifully flecked; the extremitv flaffil, flightly cloven, more or lefs notched or curled. The bafe of the lip being furnifhed, as in A. nutsans and fome other fpecies, with two small fpurs, or awl-ffaped appendages on the upper fide, which are wanting in the laft, feems to have occasioned the specific name, which is rather calculated to milfed. Dr. Roxburgh had once an intention of changing it to fpicata, which would not have been more correct, and the above being printed by Andrews, it was fuffered to remain. A. angulifolia would have been preferable to either.

12. A. maculata. Spotted-leaved Alpinia. Rof. Tr. of Linn. Soc. v. 8. 347.—"Leaves ovate, spotted."—Cultivated in the botanic garden at Liverpool. It is thus mentioned by Mr. Roceoe, but with a mark of doubt, nor have we met with any further information respecting this fpecies.

A. fpicata. Small Spiked Alpinia. Roxb. n. 8.—"Spike oblong, compactly imbricated, with narrow-lanceolate acute bractees."—Native of Sumatra. Brought by Mr. William Roxburgh, from Benecoolen to the Calcutta garden, in 1803. At the clofe of the rains of 1808, it bloomed for the first time, and was then only about two feet high, being the smallest of the genus ever feen by Dr. Roxburgh. This is all the account he has left us of the prefent fpecies.

13. A. Renealmia. Surinam Alpinia. (Renealmia exaltata; Linn. Suppl. 79, excluding the synonym of Rumphius, and the account of the flem and leaves taken from that author. Wildl. Sp. Pl. v. 1. 6. "Neue Bot. Ann. v. 3. 136." Myriina n. 64; Linn. Pl. Surinam. in Amoen. Acad. v. 8. 251. n. 3, excluding the synonym of Merian, t. 54.)—Cluter lateral, compound. Calyx tubular, irregularly toothed.—Native of Surinam. The history of this plant is fo confused, that we think it neceffary to lay before the reader all the original materials. The generic defcription, Linn. Suppl. 7, and the specific one, p. 79 of the fame work, beginning at the word Racemus, appear to have been made, with fufficient accuracy and fidelity, from fpecimens of a cluter of the flowers, and a quantity of the fruit, with a leaf, fent in bottles of fpirits to Linneus. The former was taken out and dried by Linneus himfelf, for his herbarium, where it now lies, marked by him Heliconia, he having taken this fpecimen for Merian's t. 54, Heliconia Bifal, which it somewhat refembles in general appearance. The flowers, however, when examined, prove these plants totally different; but this miiflake of Linneus accounts for his erroneous reference to Merian. The fpirits in the bottle of the fruit being gone, the latter is also dried; but enough remains to fhew it has been a fhefy, very fubboxy, oval, capfule, above four inches long, of three valves, strongly umbilicated, and containing numerous, roundifh-obovate feed, now of a fihing brown. Their flavour is fift. A Dutch manuscript, fent from Surinam with the collection to which the above belonged, contains the following infonnation. "No. 64 is a fort of reed, and has upon each flalk four fuch leaves as are here to be feen; two uppermoft next to each other, and then the other two a fpand under the uppermoft, and a fpain between thefe two, downwards to the fruit. The fruit is at firft red; black when ripe. The feed in the fruit taftes exactly like Cardamom. The flalk to which the fruit grows is two feet and a half long, belat with twenty-five to twenty-leven fcript." Such is a literal tranflation as we could obtain. It fems indisputably to afert the fition of the inflorefcence to be lateral, and in this point agrees with the following account given by Willdenow, we know not on whole authority. "A free twentv feet high. Leaves five or fix feet long, lanceolate, waved at the margin. The cluter originates from the trunk, above the root." Neue Bot. Ann. as above. If this laft defcription really belongs to the Linnean Renealmia, our ideas of the plant are very incomplete. The lateral inflorefcence would form a ftrong prefumptive argument againft its being an Alpinia; but we can affert, from a careful examination of one of the flowers, imdered in hot water, and compared with a living flower of A. nu- tans, that their structure agrees exactly, without the leat mark of a generic difference, especifally the effential part of the anther. This indeed appears from Linneus's remarks in the Supplementum, without which our history would be incomplete. We fhall leave the reader to compare it with the defcriptions of other fpecies, only oberving beforehand that Linneus confiders the flower as reversed, placing the nictary uppermoft.

Nat. Ch. Cal. Perianth superior, tubular, of one leaf, burfting at the top into two or three irregular teeth. Car. of one petal. Tube ftrait, cyndrical. Limb three-cleft: two upper (properly under) segments oblong, rounded, equal: lower segment fcarcely longer, channeled, oblong. Nictary united with the tube, aecending under the upper segments, ftrait, the length of the corolla, oblong, with a tooth at the base on each fide, and a hollow behind; dilated, and bluntly three-lobed, at the extremity. Stem. Filament none. Anther solitary, inferted into the mouth of the tube, in the bifom of the lower (upper) segment of the corolla, oppofite to the nictary, unconnected, frait, fliue,
Bear, emarginate, marked with a furrow on the inner side, its length and breadth equal to the segment of the corolla. *Pfii*. German inferior, oblong, obscurely triangular, smooth. Style thread-shaped, very smooth, erect; the length of the corolla. Stigma peltate, a little flat head, abrupt on the side towards the nectary, an orifice running into the style. *Peric*. Berry oblong, round, with three furrows, smooth, fleshy, with an umbilicated termination; three-celled in the centre; the cells soft and membranous. Seeds numerous, oblong, abrupt, quadrangular, very smooth.

P. 79. R. exaltata. Cluster with alternate, lanceolate, channelled, smooth, ribbed, deciduous bracts. *Flowers*-flasks in the bosomes of the bracts, solitary, incurved, depressed, downy, short, each terminating in a *sheath* of one leaf, which bursts at the top, like the calyx, into two or three segments, to allow the flowers to protrude. Within this sheath is a flower, as well as another two-flowered sheath, so that each flake bears three flowers. The calyx is exactly similar to these sheaths, inasmuch that it would be a sheath, if not seated on the top of the germin. Scarcely any other of the *Scitamineae* has an anther so unconnected, and with so much of the common appearance of that organ. The fruit forms a compound pendulous cluster, resembling the fruit of *Monardica Elatior* in size and figure; its coriaceous part thick and fleshy, hot, reddish; the triangular central cell has soft, juicy, membranous partitions. Seeds small, very smooth, black, very like those of *Amonium Cardamomum*. The preferred fruit is esteemed by the inhabitants of Surinam.

The following three species are lately added to *Alpinia* by Mr. Rofcoe, from the inspection of some Chinese drawings, in the possession of the right honourable Lord Stanley, V.P.L.S.

15. A. penicillata. Pencilled Alpinia. Rofc. Tr. of Linn. Soc. v. 11. 280.—Cluster terminal, pendulous. Segments of the outer limb short, pointed. Lip emarginate. Leaves lanceolate, smple at the margin.—Native of China. The lip or nectary is broad, simple, emarginate, bright yellow, regularly fringed with crimson. Leaves regularly nerved. The unfolded blossoms have, like some other species, the appearance of fine China ware.

16. A. diffusa. Clover Alpinia. Rofc. ibid.—Cluster inclining. Segments of the outer limb ovate. Lip flat, panduriform. Leaves lanceolate, glaucous beneath. Stamen deeply cloven to the base.—Native of China. The margin of the leaves is strongly nerved. Lip broad, bright yellow, with a central rib, from which diverge crimson fringes. The filament is deeply cloven, each portion bearing its proper anther, (or rather we should say, one lobe of the anther,) between which rife the style, perfectly free, and not inclosed in a double anther, as in the rest of the proper *Scitamineae*. This circumstance is so peculiar, that Mr. Rofcoe thinks it may possibly entitle the plant to rank as a new genus; but being in other respects truly an *Alpinia*, he prefers retaining it here.

17. A. bracteata. Bracteated Alpinia. Rofc. ibid. 281.—Panicle loose. Leaves downy. Lip in three, nearly equal, lobes; spurred at the base.—From the same country. The *stem* is jointed, rather spiral. *Footstalks* of the upper leaves uniting with the bracts. Calyx concave, oval. Nectary broad, flat, nearly circular, deeply indented at each side, yellow, with purple rays diverging from its base. Anther ovate. "Habit rather of a *Cajus* than an *Alpinia*, but the inflorescence is a loose panicle, not a bracteated *pike*, and the whole construction of the corolla feemes decive of the genus." *Rofc*.

A. Cardamomum, Roxb. n. 7, the valuable Cardamom of the shops; *Alpinia cooera* of Sonnerat and other authors, Wild. Sp. Pl. v. 1. 91; is now properly, we believe, removed from *Alpinia*, and proposed by Dr. Maton, Tr. of Linn. Soc. v. 10. 249, as a new genus, distinguished by two transverse proceedes at the top of the filament, and called by him *Elettaria*, under which name we propoe hereafter to treat of this plant.

ALQUIER. Add—The fanega, which is the 15th part of the moyo, is = 4 alquiers = 8 moyos = 16 quarters = 32 outvas = 64 mequis. The alquier measures 675 French, or 817 English cubic inches; so that 21 alquiers are nearly = 1 English quarter; or, more correctly, 50 alquiers = 19 English bushels.

ALSOPHILA, in Botany, so named, from *aloe*, a leaf, or frond, and *phila*, to love; alluding to the favourite situation of the beautiful tribe of Tree Ferns, to which this belongs.—Brown Prodr. Nov. Holl. v. 1. 158.—This genus is founded on our *Cyathia aiters*, C. extensa, of Swartz. *Polypodium Lunatum* of Forster, and some other allied species; but we scarcely think the deeper segments of the burfting involucrum, or the situation of the fori at the division, instead of the side, of a vein, can authorize a separation of these from *Cyathia*. See that article.

ALSTEAD, in Geography, a town of America, in New Hampshire, and county of Cheshire, having 1694 inhabitants.

ALSTONIA, in Botany, received that name from Mr. Brown, in memory of Dr. Charles Alston, formerly Professor of Botany at Edinburgh. (See that article.) The genus originally dedicated to this gentleman, in the Supplement of Linnæus, is now sunk in *Symlocos*. (See that article, and *ALSTONIA*.)—Brown Tr. of the Werner Soc. v. 1. 75.—Clas and order, *Pentandria Monogynia*. Nat. Ord. Contorta, Linn. Apocynae, Juss. Brown.

Gen. Ch. Cal. Porián inferior, of one leaf, small, in five deep, rather blunt, segments, permanent. Cor. of one petal, falver-shaped; tube cylindrical, many times longer than the calyx, somewhat tufted near the top, perversive, defitute of scales in the throat or mouth; limb horizontal, in five deep segments, folding over each other at the base, mostly shorter than the tube. Nectary none. Stami. Filaments five, short, inserted into the tube, and not reaching to its summit; anthers lanceolate, unconnected with the stigma, burfting longitudinally, enclosed within the tube. *Pfii*. Germans two, simple; flame foliary, central, thread-shaped, swelling at the top; stigma nearly conical. *Peric*. Follicles two, cylindrical, long, each of one cell and one valve. Seeds oblong, peltate, fringed, bearded with long hairs at each end.

This genus consists of trees, often of great height, with milky juice. *Leaves* either whorled or opposite, ribbed, smooth. *Cymes* terminal, panicked. *Flowers* for the most part white. *Follicles* generally very long. They grow in the East Indies, the Malay Archipelago, and the Society islands. *Alstonia* has little affinity to *Echites*, (see that article,) with which Linnæus would probably not have confounded it, had he examined the fruit, or attended to the figure in the Hort. Malab., of which work indeed he had not a copy. *Brown*.

1. A. filolaris. Tablet Alstonia. Br. n. 1. (Echites scholaris; Linn. Mant. 53; Wild. Sp. Pl. v. 1. 1241. Lignum scholare; Rumph. Amboin v. 2. 246. t. 82; Fols;
Pal.; Rheede Hort. Malab. 81. t. 45; not 46.)—Leaves
everal in each whorl, ovovate-oblong, obtuse, ribbed, sur-
rounded with a marginal vein. Cymes stalked. Limb of
the corolla but partially bearded. Follicles very long and
flender. —Native of Malabar and the Molucca islands, in
sandy ground, flowering in January. A very tall and
spreading tree, whose wood, Rumphius tells us, is used by
school-boys in India, as flares are with us. The leaves
are from five to seven in each whorl, stalked, with numerous,
parallel, transverse veins, or ribs. Cymes many-flowered,
compound, spreading, downy. Flowers small, about half
an inch long, whitish, sweet-scented, but oppugnile to the
head. Corolla downy on the infide and out, but not
densely bearded, or shaggy, except around the mouth.
Follicles eighteen inches long, not so thick as a wheaten
straw. Seeds furnished at each end with a tuft of very long
filky hairs.

2. A. spathulata. Handsome Allonia. Br. n. 2.—
"Leaves four in a whorl, elliptic-oblong, ribbed, somewhat
pointed, without any marginal vein. Cymes stalked,
shorter than the leaves. Limb of the corolla bearded.
Follicles very long."—Oberved by Mr. Brown, in April
1803, in the island of Timor, near Coepang, bearing
flowers and fruit. Very nearly akin to the foregoing, but
different; not ill-represented by Rumphius's plate, t. 82,
but his description agrees best with A. febularis. Brown.
We would observe, that the number of the leaves in this
figure agrees best with febularis, and that the omission of
the marginal nerve, so little conspicuous in nature, is rather
to be attributed to inaccuracy of the engraver, if not of the
draftsman.

3. A. venenata. Poisonous Allonia. Br. n. 3.—Leaves
four in a whorl, lanceolate, pointed; tapering at the base.
Cymes forked. Tube of the corolla swelling upwards.
Limb beardless, shorter than the tube. Follicles tapering
at each end, scarcely so long as the leaves.—Native of the
East Indies. Dr. Roxburgh. We received a specimen
from the Rev. Dr. Rottler, gathered at Nundyaigor, March
17, 1806. The leaves are crowded towards the ends of the
branches, stalked, very smooth, three inches or more in
length. Flowers like those of a Tabernamontana, their
limb an inch broad, with oblong, oblique, rather
blunt than acute segments; tube an inch and a half long,
inflated in the upper part, very smooth, as well as the limb.
The calyx is a little downy, or fringed. Flower-flasks
quite smooth. We have not seen the follicles.

4. A. rostrata. Ribbed Allonia. Br. n. 4. (Echites
collata; Forst. Prodr. 20, excluding the synonym, Wild.
Sp. Pl. v. 1. 1245.)—"Leaves opposite, elliptic-oblong,
pointed, ribbed. Cymes loose. Segments of the limb
lanceolate, beardless, longer than the tube. Follicles
ever long."—Native of the Society islands. Forster. Gathered
by sir Joseph Banks in Otaheite and Uaheite, between
the summits of hills (called by the natives Atahe). Brown.
We presume the plant, not the hills. A moderate-sized
tree. The seeds are fringed, but, according to Mr. Brown,
the silky hairs at each end are not so remarkably elongated
as in other species. Kanetti-Valli, Hort. Malab. v. 9.
t. 14, is a climber, having short follicles, with winged naked
seeds, and therefore, as Forster thinks, are synonym-
ously with this.

ALTAY MOUNTAINS. See ALTAL.

ALTERNANTHERA, in Botany, so called by
Forficall, from the flaments being, as he thought, alternately
furnished with anthers, and without them.—Forfic. Agg.

and order, Pentandria Monogynia. Nat. Ord. Holarcece,
Linn. Amaranthi, Juff.

Gen. Ch. Cal. Perianth inferior, of one leaf, in five
deep, coloured, pointed, spreading, permanent, and finally
hardened, segments. Cor. none. Stem. Filaments five,
capsular, shorter than the calyx, inserted into a membranous
ring, surrounding the base of the germen, with more or less
remarkable intermediate teeth; anthers simple, oval, of one
cell, generally wanting on two or three of the filaments
alternately. Pip. Germen ovate, acute; style very short;
stigma capitate. Peric. Capsule membranous, inerely
kidney-shaped, compressed, of one valve and one cell,
infated, not burbling, enclosed in the cartilaginous calyx.
Seed solitary, roundish, pointed.

Eff. Ch. Calyx in five deep segments, cartilaginous.
Corolla 'none. Stamens partly imperfect, inserted into a
membranous ring, with intermediate teeth. Anthera single-
celled. Stigma capitate. Capsule kidney-shaped, of one
cell, without valves. Seed solitary.

Obf. Mr. Brown properly retains the name of Illece-
brum, (fee that article,) for I. verticillatum and its allies,
from which we can scarcely separate I. Paronychia, &C. He
would divide the present genus, which agrees very nearly
in habit with Illecebrum, into two sections. Thence we shall
here adopt, according to his suggestion, for the distribution
of the species.

Sect. 1. Two of the folaments deprived of anthers. Inter-
mEDIATE teeth very short, or obsolete.

Agg. &c. Arab. 28. (Illecebrum selfile; Linn. Sp. Pl. 300.
v. 2. 61. Vahl Symb. v. i. 22. Amaranthes humis
maderapstanum, capillus candidicantius, folio moli; Pluk.
Phyt. v. 133. f. 1. Amaranthus humilis, folis oppositis,
foeefulis in alis consglomeratis; Burm. Zeyl. 17. t. 4. f. 2.)
—Calyx smooth; segments ovate, pointed, almost twice
the length of the capsule. Leaves elliptic-lanceolate, nearly
entire, bearded at their insertion. Stem procumbent, hairy
on two opposite sides.—Native of Arabia and the East
Indies. A biennial, or perhaps annual herb, whose branch-
ing stems spread on the ground, in every direction, to the
length of a foot or more, and are leafy, bluntly quadrangular;
the opposite furrows densely hairy. Leaves opposite,
stalked, spreading or reflexed, from one to two inches long,
bluntish, nearly or quite entire, fingle-ribbed, smooth,
bright green, rather felthy. Postflorks very short, bearded,
and connected by intermediate stipulacese bristles. Heads
of flowers selfile, axillary, solitary, obtuse, half an inch,
or more, in length, white and shining, like everlasting flowers.
Calyx fingle-ribbed, strongly keeled, pellucid. Capsule
broadly heart-shaped, finely reticulated. The leaves
occasionally vary to an obovate, or spatulate figure.

2. A. denticulata. Toothed Alternanthera. Br. n. 1.—
Calyx smooth; segments ovate, pointed, almost twice the
length of the capsule. Leaves narrow-lanceolate, finely
toothed, smooth; bearded at their insertion. Stem procum-
becnt, smooth.—Gathered by Mr. Brown in the tropical
district of New Holland, as well as in New South Wales, and
Van Diemen's island. We have seen no specimen.

n. 2.—Calyx smooth; segments narrow-lanceolate, pointed,
three times the length of the capsule. Leaves linear-lanceolate,
finey toothed, smooth; bearded at their insertion. Stem
diffuse, square, smooth; its ultimate branches only downy
on two opposite sides.—Discovered by Mr. Brown, in the
tropical district of New Holland. These three species
appear to be nearly allied.

5. A. nana. Dwarf Alternanthera. Br. v. 4. — Calyx smooth; segments ovate, slightly pointed, twice the length of the capule. Leaves ovate-oblong, hairy; tapering at the base. Stem diffuse, hairy. — Found in the same country as the two last, by Mr. Brown.

Sect. 2. Five of the filaments with perfect anthers; five intermediate ones conspicuous, without any.

6. A. Achyranta. Creeping Alternanthera. (Illecebrcm Achyranta; Linn. Sp. Pl. 209. Willd. Sp. Pl. v. 1. 1208. Ait. Hort. Kew. v. 2. 61. Achyranta repens, foliis blatis pallidis; Dill. Eith. 8. t. 7. f. 7.) — Stem creeping. Leaves ovate; densely downy when young. Calyx with somewhat spinous points. — Native of Buenos Ayres, from whence it was sent to Sherard, before the year 1732. We have specimens from the Paris garden. There is reason to doubt whether Linnaeus ever saw this species. The root is perennial. Stems prostrate, from one to two feet long, repeatedly forked, leafy, most hairy at opposite sides, creeping by means of fibrous radicles, from their lower joints. Leaves toothed, from one to two inches long, entire; nearly smooth, and of a bright green, when full-grown: the young ones covered on both sides with dense, hairy, hoary hairs, such as compose the pubescence of the stem, and especially of the younger branches. Heads small, from the forks of the stem, partly toothed, round, of but few flowers. Calyx brownish-white; segments three-ribbed, unequal, strongly keeled, partly hairy, accompanied as it seems occasionally with smaller smoother sides.

7. A. polygonoides. Persicaria-leaved Alternanthera. (Illecebrcm polygonoides; Linn. Sp. Pl. 300. Willd. Sp. Pl. v. 1. 1208. Ait. Hort. Kew. v. 1. 61. Herniaria hirsuta repens, ad nodos alternos florid; Brownie Jam. 183. Alternanthera humile curassicum, foliis polygoni; Herm. Par. 17, with a figure. Sloane Jam. v. 1. 141. t. 86. f. 2. A. marina hirsuta, halimi folio; Plum. Is. 12. t. 21. f. 2.) — Stem creeping, hairy. Leaves elliptic-lanceolate, tapering at the base, flaked, all smooth. Calyx ovate, single-ribbed, unarmed; hairy at the bottom. — Native of South America. A smaller plant than the preceding, except the flowers; with longer, much narrower, leaves smooth at every period of their growth, on long stalks. Calyx of a brilliant white; its segments ovate, pointed, but not spinous, the mid-rib less prominent than in the foregoing; the base only beft with conspicuous hairs. Plumier's plant scarcely requires to be called a variety. The stem is represented more hairy than it appears in our gardens, but it is always more or less so, and the hairs are always simple, not deliñate like those of A. Achyranta.

8. A. ficoides. Ribbed Alternanthera. (Illecebrcm ficoides; Linn. Sp. Pl. 300. Willd. Sp. Pl. v. 1. 1208. Gomphrena ficoides; Linn. Sp. Pl. ed. 1. 225. Jacq. Amer. 88. t. 60. f. 4.) — Stem creeping, smooth. Leaves ovato-lanceolate, tapering at the base, flaked. Calyx lanceolate, unarmed, three-ribbed, hairy at the back. — Native of South America. Cultivated by Linnaeus at Uspal. Jaccquin's figure more resembles the leaf, closely according with Brownie's specimen, which indeed Dr. Solander, who went to Linnaeus, marked Gomphrena ficoides; but the latter found it to be his own Illecebrcm polygonoides. The plant before us, from the Uspal garden, is a truly distinct species, with broader leaves, an inch and a half or two inches long, roughish with callos points; a smooth stem; and very different flowers. The segments of the calyx are much narrower, brown at the base, with three strong ribs, and clothed at the back, more than half way up, with prominent hairs; their points are tapering, but not spinous.

Mr. Brown speaks of some American nondescript species, referable to this section. Whether the following are among them we know not, but they appear to be nondescript.

9. A. villosa. Woolly-branched Alternanthera. — Stem decumbent, hairy; shaggy at the joints. Leaves ovate, flaked, nearly smooth. Calyx ovate, single-ribbed, smooth. — Sent to Linnaeus by Thouin, from the Paris garden, without any mention of its native country. Stems above a foot long, with ascending very hairy branches, bent at each joint. Leaves an inch or more in length, bluish, dotted, rarely besprinkled with a few long hairs. Footstalks accompanied, above their insertion, with very dense filipulary tufts, of long hoary hairs, jointed, like all those on the stem and foliage. Of the flowers we have seen only one small axillary head, apparently not come to perfection, but its glumes are evidently unlike all the preceding, broadly ovate, even and smooth, acute but not spinous, with a simple mid-rib.

10. A. echinata. Prickly-headed Alternanthera. — Stem prostrate, hairy. Leaves roundish-oval, smooth. Calyx spinous-pointed; outer segments lanceolate, elongated, partly three-ribbed, smooth; two inner shorter, gibbous, hairy at the back. — Gathered by Commenon at Monte Video, and sent by Thouin to the younger Linnaeus. This remarkable species is among the largest we have seen. The leaves indeed are not above an inch long, but they are nearly as much in breadth, tapering at the base, their surface dotted with little points, not hairy. Heads sessile, axillary, somewhat aggregate, globose or oblong, pale brown, hissing, distinguishted by the length and sharp thorns of their three outer calyx-segments, one of which is strongly three-ribbed, and by the tufted hairs of the two inner ones, projecting very conspicuously between them.

ALTICKLYC, in Commerce, a Turkish silver coin = 60 paras.

ALTON, in America. Add.—The town contains 1279 inhabitants.

ALTUN-KUPRI, or the Golden Bridge, a town of Peru, in the pachicol of Bagdad, about the size of Kupri, (which see,) situated on a fine plain, on the northern bank of the Little Zab, 32 furongs from Moful.

ALUMINA, in Chemistry, an earthy substanse, described as elementary, but which Sir Humphrey Davy has rendered probable to be a compound of a metallic basis with oxygen. See ALUMINUM INFRA.

We have little to add to the description of alumina, except the curious fact observed by Sauluire, that this substance does not give out the peculiar earthy smell which has been considered as characteristic of it, except it be mixed with oxdy of iron.

ALUMINA, Salts of, the compounds formed by the different acids with alumina. By some accident, the description of most of the salts of alumina has been omitted. We shall therefore take the opportunity of introducing them here.

Nitrate of Alumina. See Nitrate of Alumina.

Carbonate of Alumina. The existence of this salt has been usually admitted by chemists. Bergman, however, could not form it artificially, though he allows its existence, because when alum is mixed with an alkaline carbonate, part of the alumina remains in solution till the carbonic acid be driven off. Sauflure has more recently shown, that water saturated with carbonic acid is capable of dissolving alumina, but that this combination is dissolved by simple exposure to the air. Carbonate of alumina, therefore, cannot exist in a dry
dry flake. What had formerly been considered as dry carbonate of alumina is a triple compound of alumina, carbonic acid, and the alkali employed in precipitating the alumina.

**Phosphite of Alumina.** This fact may be formed by saturating phosphoric acid with alumina. According to Fourcroy, who is the only chemist that has examined it, the phosphite of alumina is a tasteless powder, insoluble in water. When diffused in excess of phosphoric acid, it yields a gritty powder and a gummy solution, which by heat is converted into a transparent glas.

**Sulphate of Alumina.** See ALUM AND SULPHATE OF ALUMINA. In addition to what has been said under these articles, we may add the following analysis of alum by Vauquelin, Thénard and Roard, and Berzelius.

The analysis of Berzelius is probably most accurate, and is equivalent to

- Sulphate of alumina: 36.85%
- Sulphate of potash: 18.15%
- Water: 45.00%

Which nearly coincides, according to Dr. Thomson, with three atoms of sulphate of alumina, one atom of sulphate of potash, and twenty-three atoms of water.

According to the experiments of Thénard and Roard, alum usually contains a little sulphate of iron, and the goodness of its qualities as a mordant in dyeing, according to these chemists, depends entirely upon the proportion of that salt present. The more free it is from it the better. The purest alum examined contained about 3% of part of its weight of sulphate of iron; the impurest about 7%. When freed from sulphate of iron, every species of alum tried acts exactly in the same manner as a mordant.

**Sulphite of Alumina.** See SULPHITE OF ALUMINA.

**Borate of Alumina.** This fact may be formed by mixing together the solutions of borate of soda and sulphate of alumina. It is said to be scarcely soluble in water.

**Arsenite of Alumina.** See ARSENITE OF ALUMINA.

**Tungstate of Alumina.** A white powder insoluble in water.

**Acetate of Alumina.** See ACETATE OF ALUMINA.

**Benzoyl of Alumina.** This fact crystallizes, is soluble in water, and deliquesces on exposure to the air.

** Succinate of Alumina.** Wenzel flates, that this fact crystallizes in prisms, and is easily decomposed by heat.

**Camphorate of Alumina.** This fact may be formed by heating together newly precipitated alumina and camphoric acid. It is a white powder, of an acid bitterish taste, and slightly astringent. Water dissolves about 1/50th part of its weight of this salt; it is not soluble in boiling water, but separates as the water cools. Cold alcohol dissolves very little of it; but by the affinities of heat that fluid takes up a considerable quantity, which separates on the cooling of the alcohol. This fact undergoes but little change from the action of the air. Exposed to heat the acid volatilizes; and when the fact is thrown on burning coals it takes fire, and burns with a blue flame.

**Suberate of Alumina.** This fact does not crystallize. It has a yellowish colour, and always contains an excess of acid. On exposure to the air it attracts moisture. When heated the acid is volatilized, and the alumina left in a flake of purity.

**Oxalate of Alumina.** Oxalic acid readily dissolves alumina, and forms an uncrysalizable deliquescent fact, with excess of acid, of a yellowish colour, and sparingly soluble in alcohol. It is said to be composed of

- Oxalic acid and water: 56
- Alumina: 44
  
|                | 100 |

**Mellate of Alumina.** This fact exists in the form of a white flaky powder.

**Tartarate of Alumina.** See TARTRATES.

**Tartarate of Potash and Alumina.** This triple fact may be formed by saturating tartar with alumina. It nearly resembles the last fact. Neither the alkalies nor alkaline carbonates, according to Thénard, produce precipitates in this fact.

**Sulphate of Alumina.** A white powder, insoluble in water.

**Urate of Alumina.** A white powder, closely resembling in its appearance the uric acid.

**Malate of Alumina.** This fact is almost insoluble in water; hence Mr. Cheneviux has proposed the malic acid as a means of separating alumina from magnesia.

**Sorbate of Alumina.** From the experiments of Mr. Donovan, the discoverer of fornic acid, it appears that this fact has no existence.

**Zumate of Alumina.** A gummy mass, not altered by exposure to the air.

**Gallate of Alumina.** According to Sir Humphrey Davy, a soluition of galls, in which alumina has been diffused, deposits after some time transparent prismatic crystals, which are the super-gallate of alumina. The quantity of alumina they contain is so small as not to disguise the properties of the acid.

Dr. Thomson is disposed to consider the facts of alumina in general as composed of one atom of alumina and one atom of the respective acids, and if this be admitted their composition may be readily ascertained.

With respect to the uses of the facts of alumina, see ALUM, DYING, MORDANT, TAWING, &c.

**ALUMINITE.** See MINERALOGY, Addenda.

**ALUMINUM, in Chemistry, the metallic bafis of alumina.** Sir Humphrey Davy shewed, that when potashum is passed through alumina heated to whiteness, a considerable proportion of it is converted into potash, and grey metallic particles are perceived in the mafs, which effervesc in water and air, and are converted into alumina. When a globule of iron is fused by galvanism in contact with moist alumina, it forms an alloy with aluminum, which effervescs slowly in water, and becomes covered with a white powder. These metallic particles Davy considered as the basfs of alumina, and in conformity to this view denominated it ALUMINUM. The above, however, is all we now at present respecting this metal.

**ALYXIA, in Botany, (see GYNOPOGON,) which latter will probably give way, as in such a cafe it ought, being founded in error, to the former.** Brown Prodr. Nov. Holl. v. 1. 469.

**AMADAN.** Add—The present town contains in 10,000 meanly-built houses more than 40,000 inhabitants. It is famous
famous for its manufacture of leather; and it is also
a mart of commerce between Ipahan and Bagdad, and
between Bagdad and Tekron. N. lat. 35° 51'. E. long. 48°.

AMADIA. Add—This town does not contain above
650 houses; but the plain, at the foot of the hill, is covered
with dependent villages. It is nominally dependent upon
the pacha of Bagdad, but pays him no tribute.

AMANDA, a township of Ohio, in the county of Fair-
field, having 876 inhabitants.

AMANITA, in Botany, amanita, an old Greek name
for Fungi in general, is used by Haller, after Dillenius,
for the whole Linnæan genus of Agaricus; (see that article),
or nearly so. Peroon adopts it for such species only as are
furnished with a voiea, which, on that account, he considers
generically distinct.—Perf. Syn. Fung. 246.—Clafs and

Eff. Ch. Stalk with a wrapper at the base. Head flechy.

Gills crowded, nearly undivided.

Obi. The vead is generally warby, and the flalk elongated,
either naked, or furnished with a ring. Peroon describes
seventeen species, partly wrong numbered, all which, being
more or less remarkable, and some of them very much so,
we shall in order enumerate, with the addition of one.

Seot. 1. Stalk surrounded at the base with a diflaster
per, but ditfigute of a ring at the top.

(Agaricus plumbeus; Schaff. Fung. v. 4. 37. t. 85. 86.
With Bot. Arr. v. 4. 244. Fl. Dan. t. 1014. A. vaginans;
Bulliard t. 512. f. M., according to Peroon.)—Head
boiled, flatlith, flirated, livid lead-coloured. Gills white,
as well as the long flalk.—Not uncommon in autumn, after
rain, about the skirts of woods, and borders of fields.
The wrapper bursts irregularly. The flalk is hollow, and rather
long in proportion, about twice the diameter of the head,
which is protuberant and brownish in the middle, greyish-
lead-coloured and flirated at the margin. Some individuals
are much thicker than others. Schaffer gives a good repre-
tation of the various flates and forms of this species.
The head is sometimes fludded with angular warts, at least
when young, as represented by Battarra, Leucoconys gemma-
tus, Batt. Fung. Ärin. 28. t. 6. f. B. commended highly
in Withering; and by Micheli, t. 78. f. 2. These figures
exhibit a flat and habit of the plant, the reverse of what
appears in the Fl. Dan. and especially in Bulliard. This is
generally allowed to be a poisonous fungus. Some varieties
are indicated by Peroon, one with yellowish gills, Schaff.
t. 244; and another with a browner head, and tapering flalk.
Found in fir woods, which seems to connect the present with
the following species.

Meth. 66. (Agaricus badis; Schaff. Fung. v. 4. 63.
t. 245. With. v. 4. 227. A. fulvus; ib. t. 95. A. vagi-
natus; Bulliard t. 512. f. N ?) —Head somewhat bell-shaped,
boiled, flirated, brittle, orange-brown. Gills white. Stick
pale brown, scaly.—Found in dry woods, about August,
in various parts of England and France. Akin to the
foregoing, but much more delicate in texture. We should
scarcely think it more than a variety.

(„Agaricus incanatus; Batsch. Elench. Fung. 51.) Fun-
gus magnus eceulentus; e volâ erumpens, pilleololo
albo, lamellis carinis, pediculo cylindricali glabro, partier
albo; Mich. Gen. 182. t. 76. f. 1. nota f. 2 as Peroon has
it.) —Head hemispherical, white, hairy. Gills flesh-coloured.
Stalk white, cylindrical.—Found by Micheli, on old half-
decayed trees, in the woods of Viareggio near Florence, in
Vol. XXXIX.

June. No other botanist seems to have met with this fungus,
at least not in the state described by Micheli. He repre-
dents it of very large dimensions, the head full six inches broad,
while in its convex flat, and covered with fine hairs. Wraps
much divided and jagged, tadows. Stalk six inches high,
smooth, thick, and very upright.

Albertini and Schweinetz, in their very learned Conspectus
Fungorum, 142, speak of what they deem a variety of this,
whole head is smooth, scarcely bearing any minute fibres
or scales, by no means hairy or flaggery. Every other part
agrees with Micheli's account. The undisplayed gills are
white, soon assuming a rosy flesh-colour from the feminal
powder. Head never becoming quite flat; the border
neither furrowed nor flirated.

18 and 66. (Agaricus volvaceus; Bulliard t. 262. Sower-
With. v. 4. 231 ?) — Aggregate. Head conical-bell-shaped,
with a pearly ring. Gills flesh-coloured. Stalk white,
rather longer than the breadth of the head.—
Native of gardens and woods in autumn, in a southern
exposure. Bulliard. We have not heard of this species in
Britain. Its appearance is elegant and delicate. Head an
inch, or inch and a half, in diameter. Wrapper turbinata,
much divided, perennial.

Seot. 2. Stalk proceeding from a lax wrapper, and fur-
nifed at the upper part with a ring.

113. Perf. n. 6. (Agaricus bulbosus vernus; Bulliard
t. 108. Fungus tutus candidus, pilleololo amphiore, glutine
limacino infefto, pediculo tenderiori clyndrica, annulo
friccto cinetto; Mich. Gen. 171 ? at the suggestion of
Lamarrck.)—Pure white in every part. Head at length con-
ove, somewhat funnel-shaped. Ring pendulous. Stalk
elongated, solid, cylindrical.—Common in woods in France
during the spring. Bulliard says many perons have died
from eating this fungus by mistake for the white-grilled
variety of the Common Mushroon. It may be kept in
in the mouth for eight or ten minutes, before its acimony, re-
balzing pepper, becomes perceptible. If the wrapper at
the base be attended to, the plant can never be confounded
with any eatable Agaric.

7. A. porphyria. Purple Egg-Agaric. Albert. and
Schwein. Conip. 142. n. 401. t. 11. f. 1.—Head convex,
naked, smooth, of a livid purplish-brown. Ring nearly
of the same colour. Gills and stalk white.—Not rare in moor,
ts, turfy, mossy spots, in fir woods more especially, over which
it is scattered in September and October. Habit of A. virdis,
n. 9, but only half the size. Stalk three or four
inches high, too dark-coloured in the figure. Head almost
as much in breadth, never found with warts; very rarely
and slightly flirated at the margin.

Pp

Albert.
AMANITA.

—Frequent from spring to the end of autumn, in rich soil, in woods, gardens, about hot-beds, &c. Its face is considerable. Bulliard speaks of his plant as having a very agreeable flavour, and therefore we presume it to be one of the edible fungi. In the south of France it is known by the name of Agaricus orange blenche, to distinguish it from the A. orange virei; see n. 11. The bulbous base of the nearly solid stalk is a characteristic mark. The ring is broad, loosely pendulous, permanent. Head almost hemispherical, rarely with a slightly indented base. Schaffer's plate is too much coloured. The gills, if not absolutely white, are semi-pellucid, or watery, in their appearance.

This is described as not unfrequent on the continent, in beech or oak woods, where the ground is sandy. Whether it be found in England, we are doubtful. Mr. Sowerby has exhibited in his t. 286, a pale yellow variety of Agaricus mucarius, for Schaeffer's citrinus; but this is not quite conclusive to us. Perfoon cites Agaricus Mappa, Willd. Berol. 351. Battch. Elench. 57, as a variety of the present Amanita, distinguished by a darker colour of the head, and yellow gills: he speaks also of brownish warts on the head. Wildenow says the gills of his plant are whitish. Albertini and Schweinize, accurate practical observers, say, 'we find the warts upon the head not very rare. The ring, and frequently the stalk, is distinguished by a palish lemon-colour. The whole fungus is sometimes half a foot high, in which case the head is four inches broad, or more.' Perfoon notices apparently a still different variety, on rotten trunks of trees, distinguished by its elegant sulphur-colour, flatish head, and acrid flavour.

10. A. viridis. Green Egg-Agaric. Perf. n. 9, not 8. Difp. Meth. 67. Albert. and Schwein. Conp. 143. (Agaricus bulbofus; Bulliard t. 2, and t. 577. Fungus phalloides annulus, fordidere viridetca et patuus; Vail. Fafir. 74. t. 15. f. 5.)—Head convex, dull green, mostly naked. Stalk and gills white.—Found in shady moist woods, from August to October, in France and Germany. The wrapper is inflated, whitish. Head four or five inches broad, convex, not boid, of a more or less bright green, variegated occasionally with brown, and turning olive-brown in decay, when, according to Bulliard, it exaltes an intolerable cadaverous smell, being a very dangerous species, though when young delight of any bad scent or flavour. The head sometimes retains fragments of the wrapper, in the form of warts or broad patches, but this seems far from being universal or frequent.

—Head convex, naked, deep orange-coloured; frizzled at the margin. Gills yellow, convex. Wrapper dilated upwards.

—Native of Italy, France, Carniola, Bohemia, &c., but never observed in England. The wrapper is white, with a dilated entire border. Stalk hollow, nearly cylindrical, yellowish-white, or pale yellow, from four to six inches high. Head from four to six inches wide, almost hemispherical when young, of a rich deep orange, smooth and naked, scarcely ever warty, frizzled near the edge, turning brownish or purplish in fading, as in Schaeffer's figure, where it is drawn somewhat boiled, which we have never seen. The gills are usually of a delicate lemon-colour, as well as the ring. Perfoon rightly suspected his A. cesarea and aurantiaca not to be distinct species; they do not appear to us to be even varieties, Schaffer's plant being only in a more forward state than Bulliard's. We retain the oldest specific name, which is that of Scopoli. It serves to commemorate an historical fact, that the emperor Claudius was murdered by poison given with this fungus, to which the Romans applied the name of Boletus, and which Nero called "the food of the gods," because Claudius had eaten it, who was subsequently, like his sacred companions, become a god! The Amanita before us is esteemed the most delicious and delicate of all fungi. The writer of this has examined and eaten it in Italy, where it is far from rare in summer, though so much in request, as to find a place chiefly at the tables of the great. Clusius tells of his supposing some soup, at a distinguished man's table in Hungary, made of this fungus, to have been coloured with saffron. Dr. Withering has confounded Schaffer's plate with Agaricus xerampelinus of the same author, v. 4. 49. t. 214. Sowerb. Fung. t. 31. With v. 4. 214. Hence he was led into the further mistake of supposing, as his A. xerampelinus, though edible, is strong and disagreeable, that Agaricus delicatus was what Claudius feasted upon. The latter is indeed a very savoury food, but defined to the vulgar in France and Italy, being by far more abundant than our Amanita cesarea. The oversight committed by Dr. Withering, reflecting this famous fungus, and his own, as well as Schaffer's, Agaricus xerampelinus, is the more remarkable, as the latter has neither a wrapper nor a ring. Such errors are rare in this excellent writer. Mr. Sowerby has avoided the same mistake, though he has not explained it. We decline citing Ebula Ciceronii, Battar. Fung. Arim. 27. t. 4. C, because no ring is there expressed; but we do not doubt the identity of the plant.

Soft. 3. Stalk with an obliterated wrapper at the base, and a ring at the upper part. Warts on the head small, and generally equal. To this fiction Perfoon gives the name of Mopa perda, because some of the species are used for killing flies. All of them perhaps are dangerous.

12. A. muscaria. Fly Egg-Agaric. Perf. n. 12, not 11. Albert. and Schwein. Conp. 143. (Agaricus muscaria; Linn. Sp. Pl. 1640. Hudl. 612. With v. 4. 184. Schaff. Fung. v. 4. 13. t. 27. 28. Sowerb. Fung. t. 286. A. pleuro-aurantiacus; Bulliard t. 122. Fungus bulbofus, e volva erumpens, pileolo supina parte aureo, ad oras striato, inferna, et annulato pedicelo, albis, radice bulbofus; Mich. Gen. 188. t. 78. f. 2. Fungi lethales; Ger. Em. 1351, fig. on the left, at the bottom.)—Head scarlet, shining, convex, at length flatish, variously flushed with white warts. Gills, ring, and stalk pure white. Wrapper with scarcely any remaining border.—Commend in woods in autumn, especially under fir-trees. A large species, conspicuous for the splendid orange-red hue of its fattening head, contrasted with the stalk and gills, and with the prominent angular white or cream-coloured warts, freckled or more or less abundantly, over its surface. These warts are formed from the wrapper, torn off close to the edge of the stalk, which Bulliard well observed, as a specific mark between this and our last. It is highly important to discriminate them, A. muscaria being venomous in a great degree. When dried, it renders milk poisonous to flies and bugs, killing them very expeditiously; for
for which purpose it is preferred in some countries all the year round: Bulliard records, that he ate two ounces of this fungus raw, without any harm whatever, though he found it fatal when given to cats or dogs. Peronon mentions a variety by the name of A. formosa, whose warts were green and yellow, the flesh likewise being yellowish, very long, and loosely scaly. Also another, called A. paella, which is smaller, more thinly nacked, or only bordered with the warty substance, is this Scheffer's 148. Dr. Withering reduces the two following, perhaps, to the same species; but so many authors have kept them separate, especially Albertini and Schweinitz, that we shall follow Peronon in the same measure.

13. A. umbrina. Brown Warty Egg-Agaric. Perf. n. 13, not 12. Albert. and Schw. Conf. 144. (Agaricus vannos; Hudf. 613. Curt. Lond. fasc. 5. t. 72. A. maculatius; Schaff. Fung. v. 4. t. 90. Fungus muscic ~ interficiens fucceus, maculis abis; Bux. Hälleri. 121.)—Head of a footy or twisty brown, flatish, variously flushed with white warts. Gills, ring, and flesh white.—More common than the preceding, but often accompanying it, in dry sandy woods, fields and pastures, especially under beech-trees, through the autumn. Withering, Curtis, and Lightfoot consider this as a mere variety of A. mutacia, differing in the brown colour of its head, often tinged with yellow, or faintly, with red. The size of the whole plant is usually somewhat smaller. We have made no particular observations on this subject. Colour in this tribe often affords good specific characters, and we should, moreover, be careful, in all the departments of natural history, not to be led away by any one very peculiar mark, like the warts in the present instance, to consider every thing, that has such a mark, as one species. Even Linnæus often fell into this error. We know not how, the question is to be decided respecting these fungi, their artificial propagation by seed being attended with so much difficulty. It is sufficient that we here register their names and distinctions, under the correction of any person who may find good reasons for uniting them. The poisonous quality of A. umbrina, with respect to flies, is acknowledged in the above synonym of Buxbaum. Curtis however found the base of the flack to be the favourite food of a nondescript species of Tipula, smaller than the plumosa, whose larvae form devil that and every other part of the plant.

14. A. rubescens. Bluish-coloured Egg-Agaric. Perf. n. 14, not 13. Albert. and Schw. Conf. 144. (Agaricus putulatus; Schaff. Fung. v. 4. t. 91.)—Head convex, opaque, reddish. Warts crowned, white like the gills. Flesh turning red when broken.—Native of beech woods of Germany, in autumn. We know nothing of its occurrence in Britain, for Dr. Withering's fifth variety of the mutacia may probably be different from what is before us. Albertini and Schweinitz assert that the head and flesh turn red, sooner or later, after being broken, and that this is a sure specific test. The head becomes more convex than that of A. umbrina. Its hue, according to the authors just quoted, is occasionally reddish, livid, smoky, or inclining to a liver-colour. Stalk two inches high. Taste scarcely any. We conceive this to be distinct from both the foregoing, whatever may be the case between them with regard to each other, and its usual appearance is very elegant, owing to the delicate tawny flesh-colour of the head, blended with opake white, or pale flesh-coloured, warts. Peronon has a variety under the name of cinereata, for which he cites with doubt Agaricus myodes, Schaff. Fung. v. 4. t. 261. The character given by Peronon is, "Head hemispherical, somewhat umbilicated, reddish. Warts oblong, whitish, circularly disposed. Gills flattish, whitish. Stalk bulbou, fealy, the colour of the head." He adds that the flesh is two inches long, solid, always perfumed by worms (or insects) at the base. Gills obovate, sometimes decurrent in a tooth-like form. Substance reddish under the cuticle. Taste not unpleasant. It occurs, but rarely, in woods during autumn. Scheffer's figure exhibits a most elegant bluish-coloured fungus, internally red, when cut, which we can have no hesitation in considering one species with Peronon's cinereata and rubescens.

15. A. virgescens. Greenish Egg-Agaric. Perf. n. 15, not 14.—"Head flatter, flat, pale-green. Warts thick, whitish, with many angles. Stalk firmish, white, with flabby scales."—In woods, but extremely rare. Stalk three or four inches long, clothed with soft flabby scales. Wrapper nearly obliterated. Substance of the head spongy, from four to six lines in thickens, not unpleasant to the taste.

16. A. ampla. Broad Egg-Agaric. Perf. n. 16, not 15.—"Head flatter, very broad, moss-coloured; smooth at the margin. Warts thickish, paler. Stalk white, solid, very stout. Gills narrow, rather thick."—Found in fir woods in Germany, but rarely. Perhaps the largest of its genus. Stalk four or five inches long, transversely flaky at the summit. Gills thick, about three lines only in breadth. Head minutely, in some degree, fibrous, and after the warts fall off, cellular. Taste like the Common Mushroom, Agaricus campofriss. Peronon.

17. A. aspera. Rough-headed Egg-Agaric. Perf. n. 17, not 16. Obs. Mycol. v. 2. 38. ("Agaricus asper; Abbrid. der Schwämme, fasc. 3, with a plate." A. verrucosus; Bulliard t. 316. A. myodes; Bolt. Fung. v. 4. t. 139, excluding both synonyms.)—Head hemispherical, flatter, convex, dull, dusky red, rough with crowded pointed warts. Gills white, crowded. Stalk rather bulbous.—Not rare in woods, about July, August, or September, growing diffpered. It has been observed in Germany, France, and England. Peronon says the scent is powerful; Bulliard, on the contrary, describes this species as inodorous, with a faint taste, partaking but little of a mushroom flavour, and he presumes it to be poisonous. This author justly adverts to the affinity of his plant to our Amantia mutacia, observing that it is white or reddish under the skin, never, like the mutacia, yellow. Peronon in his excellent Obs. Mycol. gives the following account. "Head at first ovate, inclining to cylindrical; when expanded six inches broad, half an inch thick, compact in substance, strong in scent, often streaked with white at the margin, from cracks in the cuticle. Warts small, erect, pointed. Gills, as usual with this genus, thin, unconnected. Stalk from four to six inches high, solid, marked towards the base, with little scaly warts, like rudiments of the wrapper. Ring sometimes about obliterated, and hanging in fragments to the edge of the head."

The wrapper in all the species of this third section is, indeed, so closely united to the base of the flake, as to constitute a kind of bulb, but there is a marginal dilatation, less visible in A. asper than any other, which evinces the true nature of the part in question. This species, though generally so very convex, even hemispherical, appears by Bulliard's plate, to assume a concave cup-shaped form in advancing towards decay.

AMARANTHI, the 53d natural order in Jussieu's system, being the first of his seventh class. See Nychta- ginus for the characters of this class. The following are the characters of the Amaranthi.

Calyx divided, more often deeply, often surrounded by scales at the base. Stamina definite, sometimes distinct, sometimes monadelphous; in some genera there are scales alternate with the filaments; in others the combined fila-
ments form a tube or sheath. Germs simple; style or stigma simple, or double, or triple. Capule of one cell, with an unconnected receptacle, and either burting at the summit, or splitting all round, containing one or many seeds. The coruscum is curved round a farinaceous mass. Flowers capititate or spikel. Leaves generally undivided and pointed; in some alternate; in others opposite; in a few infissures accompanied by stipulas. Stem for the most part herbaceous. Stamens and pifils sometimes in separate flowers.

Seet. 1. Leaves alternate, without stipulas.

Under this section Juffieu enumerates Amaranthus and Celosia of Linnaeus; with Araua of Forkall, a genus formed of alternate-leaved species of Illecebrum; and Digera of the same author, to which Achyrantes murnica of Linnaeus is subjoined to belong.

Seet. 2. Leaves opposite, without stipulas.

Confits of Iris, Achyrantes, Gomphrena, and Illecebrum.

Seet. 3. Leaves opposite, with stipulas.

Under this section are ranged Paronychia of Tournefort, separated from the Linnean Illecebrum; and Hernia of all authors.

This order, as Juffieu candidly observes, is very nearly related to that of the Caryophyllaceae, which, on account of its having petals, he is obliged to place in a far distant part of his system. He remarks, on this subject, that the existence or non-existence of a corolla does not always afford an essential, or eminently natural, distinction; which is very true, but there is no character of natural orders without some exception, and hence Linnaeus was led to deny the possibility of defining really natural orders by words, or any essential characters.

Juffieu, in the Annales du Museum, v. 2. 131, has published some additions to the present order, which, according to a recent alteration, and perhaps an improvement, in the nomenclature of natural orders, he there terms Amentaceae. A translation of his paper may be seen in Sims and Koenig's Ann. of Bot. v. 2. 274. The author here makes but two sections of the order in question, one having naked, the other stipulated, leaves. To the first he adds a new genus by the barbarous name of Papal, founded on the Linnean Achyrantes Lophaea, called in Rhode's Hortus Malabaricus, v. 7. 1. 13, Papal-Valli. Of this we are surprized to find Juffieu had never seen the fruit, and we cannot but observe that its generic characters are rather weak, being chiefly taken from the inflorescence and bracteas.

To the section with stipulated leaves, this eminent botanist adds three new genera. 1. Anthia of Michaux, to which belongs Queria canadensis of Linneaus. 2. Lithophilla of Swartz. 3. Polychroa of Loureiro. The two last are already described in their proper places. See also Queria.

Juffieu proceeds to remark, that Cyathula of Loureiro, a plant of this order, is really an Achyrantes with a many-cleft stigma; but that Polia of the same author, (see that article and Hagera,) supposed to belong to the Amaranthi, is really one of the Caryophyllaceae.

Vol. II.

AMBOISE, AMBASIA, or Ambacio, in Geography, a town of France, in the department of the Indre and Loire, and chief place of a canton in the district of Tours, situate at the confluence of the Loire and Amance. The place contains 1,100, and the canton 14,415 inhabitants; the territory comprehends 322 square miles, and 16 communes.

AMDOA, in Geography. See Thibet.

AMEDNAGUR, J. 1, Soubah, now called Dowlatabad. Add—This city has generally been placed 50 miles to the S.E. of its true position.

AMELIA, l. 5, for including r. exclusive of; l. 6, r. 10,594 and 7186. Add—Nottaway contains 9278 inhabitants, of whom 6368 are slaves.

AMERITACEAE, in Botany, of which term mention has already been made in its place, as designating a Linnean natural order, is also the appellation of the 99th order in Jussieu's system, the fourth of his fifteen classes; corresponding for the most part, though not entirely, with that of Linnaeus, and so called from Amentum, a Catkin, in allusion to the nature of its fructification. See Euphorbl for the characters of this fifteen class of Jussieu, and remarks thereon. He thus defines his Amentaceae.

Flowers monoeocious or dioecious, (rarely with stamens and pifils in the same,) all dehiscent of petals. The male, or barren, flowers disposed in a catkin, confiding either of scales, into which the stamens are inserted, or each of those scales has a calyx attached to it, which bears the stamens. This order is either definite, or indefinite, with distinct filaments. (We would here observe that two or three species of Salis are remarkable for their combined, or monodelphous, filaments.)—The female, or fertile, flowers are either amecious, or falciculate, or solitary; sometimes furnished with a single-leaved calyx, sometimes with only a scale. The germs is superior, either simple, or in some rarer infissures more, than one, of a certain determinate number. Style one or more. Sigmata several. Seeds either naked, or enclosed in superior calyx, which is either of a carnosous or bony texture, as many in number as the germs, and for the most part of a single cell. Coruscum dehiscent of albumen, with a straight radicle. Stem arboreous, or shrubby, rarely of humble growth. Leaves alternate, accompanied by stipulas, mostly simple.

Seet. 1. Flowers with stamens and pifils.

Here Juffieu ranges Fothergilla, Ulmus, and Celtis; of which the two latter are placed by Linnaeus among his Scabride. Hamaenelis, which the last-named author has, in manuscript, referred to his Amentaceae, and which is purely a new, is reckoned by Jussieu among his Berberidaceae, or at least among several genera supposed related to that rather miscellaneous order.

Seet. 2. Flowers dioecious.

This contains Salix, Populus, and Myrica.

Seet. 3. Flowers monoeocious.

A larger assemblage of genera, if not of species, comprising of Betula, Carpinus, Fagus, Quercus, Corylus, Liquidambar, (under which last the genus now called Comptonia, see that article, is hinted at,) and Platanus. There is no appendix of doubtful genera, as in most other orders of Jussieu, but a fulpicion is expressed respecting Liquidambar and Platanus.

The Amentaceae of Linneaus are, Salix, Populus, Platanus, Sloanea, with a full indication of doubt, Fagus, Juglans, Quercus, Corylus, Carpinus, Betula, Myrica, Pyfacia, and Gynandrocarpum. Brabijum is, in the Linnean manucript, inserted immediately before Fagus; Hamaenelis before Betula, after which Brabijum is again written; an evident indication of great uncertainty in the mind of the writer, who knew this genus but imperfectly, and who had conceived no idea at all of the order Proteaceae, to which it clearly belongs, and which makes so striking a figure in the works of Jussieu; and especially of our countryman Mr. Brown. See Prodr. Nov. Holl. v. 1. 363, and Tr. of Linn. Soc. v. 10.

AMERCOTE, in Geography, a fortified place, which formerly belonged to the country of Scind, but is now in the possession of the rajah of Jodhpore. Situated S.E. of Hydrabad, and about 25 miles from the eastern branch of the Indus.

AMERICA,
When potassium or sodium is heated in ammoniacal gas, the metal becomes changed to an olive-green colour, and loses its metallic lustre; at the same time a portion of the gas is absorbed, and a quantity of hydrogen emitted, exactly equal to the quantity that would be evolved if the potassium or sodium were put into water. If the olive-green matter be heated, it gives out three-fifths of the ammonia absorbed, two-fifths in the state of ammoniacal gas, and one-fifth in the state of hydrogen gas and azote. Sir Humphry Davy, having heated the olive-coloured matter strongly in a platinum tube, obtained nearly the whole of the ammonia absorbed, though about three-fifths of it were in the state of azotic and hydrogen gas. If the olive-coloured matter be placed in contact with a very little water, it is converted into potash, or soda and ammoniacal gas, and the gas is just equal to what the metal had absorbed. If it be placed in contact with a metal and heated, an alloy of the metal with potash or sodium is obtained.

For these curious facts we are indebted to Gay Lussac and Thenard, and Davy. Dr. Thomson thinks they shew that potash and sodium have the property of decomposing ammonia, and combining with its azote, while the hydrogen of the ammonia is set at liberty; and the azotate formed, he thinks, combines with a portion of the remaining undecomposed ammonia. He acknowledges, however, that there are some objections to this opinion; and the facts accord better with the opinion, that an unknown compound of azote and hydrogen unite with the alkaline metal, while the compound thus formed combines with a portion of undecomposed ammonia.

A curious experiment made by Berzelius and Pontin induced Berzelius to draw the conclusion that ammonia is composed of an unknown metallic basis, which he has called ammonium, united to oxygen. This experiment has been since confirmed by sir H. Davy, Gay Lussac, and others, and is as follows:

When mercury is brought in contact with ammonia at the negative end of a galvanic battery, it gradually increases in volume, and is converted into a soft solid, having all the appearances of an amalgam. The experiment succeeds better if a solution ammonia is moistened be sulphurised for liquid ammonia. This amalgam, at the temperature of 70° or 80°, is a soft solid, of the consistency of butter; at 32° it is a firm crys tali fied mass, having a specific gravity below 3. When exposed to the air, it soon becomes covered with a crust of carbonate of ammonia. When thrown into water, hydrogen is evolved equal to half its bulk, the mercury is revived, and the water becomes a weak solution of ammonia. When confined in a given portion of air, the air increases in bulk, and pure mercury appears. Ammoniacal gas, amounting to 1/3 or 1/2 the volume of the amalgam, is evolved; and a quantity of oxygen equal to 3/44 of the ammonia disappears. When thrown into muriatic acid gas, it becomes coated with muriate of ammonia, and a little hydrogen is diffracted. In sulphuric acid it becomes coated with sulphate of ammonia and sulphur. All attempts to preserve this amalgam failed, from the impossibility of obtaining it free from water. When put into a glafs tube, or when confined under naphtha or oils, the mercury separated, ammonia was formed, and a quantity of hydrogen evolved.

Gay Lussac and Thenard considered this amalgam as a simple compound of mercury and ammonia; but no analogous compound is known to chemists, as mercury when it unites to other sub stances, except metals, always loses its metallic lustre. These reasons induced Berzelius to form the above opinion. Moft chemists at present agree with Gay Lussac and Thenard; but if their opinion be well founded, we must alter the notions entertained respecting amalgams.
AMM

The opinion at present entertained respecting the composition of ammonia is, that it is composed of three volumes of hydrogen and one volume of azote condensed into two volumes. Hence its specific gravity compared with that of common air is 0.590; 100 cubic inches at a mean temperature and pressure weigh 18 grains, and the weight of its atom is 21.25; that of oxygen being considered as 16.

Ammonia, Salts of. Those have been omitted in the usual place, namely, under Ammonia; but most of them will be found in a subsequent part of the work, under Salts. Those described elsewhere will be referred to here, and those remaining to be described will be now noticed.

Sulphate of Ammonia. See Sulphate of Ammonia.

Chromate of Ammonia. This salt may be formed by saturating chronic acid by ammonia. It usually exists in the form of deliquescent crystals of a fine yellow colour. When slightly heated, it is decomposed, even when in solution, brown flocks of chronic acid precipitating.

Arsenate of Ammonia. See Arseniate of Ammonia.

Molybdate of Ammonia. This salt dissolves readily in water. The solution does not crystallize. When heated, the ammonia is partly driven off, partly decomposed, and the acid is reduced to the state of an oxide.

Tungstate of Ammonia. This salt may be formed by dissolving tungstic acid in carbonate of ammonia. It is soluble in water, and crystallizes. Its taste is metallic, and it is entirely decomposed by heat.

Benzoate of Ammonia. This salt crystallizes with difficulty. It deliquesces, and is very soluble in water. It has been recommended by Berzelius as an excellent re-agent for precipitating iron from its solution. It throws down this metal of an orange colour, and occasional insoluble precipitates with any of the other bases, except tellurium and mercury, and perhaps copper, all of which are thrown down white.

Succinate of Ammonia. See Succinic Acid. This salt has also been much recommended for precipitating iron when in the state of peroxide.

Camphorate of Ammonia. This salt may be prepared by dissolving carbonate of ammonia in hot water, and adding camphoric acid slowly till the alkali is saturated. It crystallizes with difficulty; is sparingly soluble in cold water, but much more soluble in hot. It is completely soluble in alcohol. Most of the calcareous salts form triple compounds with this salt.

Citrate of Ammonia. See Citrate of Ammonia. The remaining salts of ammonia are so totally devoid of interest, or so little known, that we do not think it necessary to enumerate them.

AMMRSINE, in Botany, a new genus of Mr. Pursh's, more happily circumstanced in its characters, perhaps, than in its name. The latter is formed from ammos, sand, and -sine, a dwarf myrtle; but Myrsine, being an established generic name, cannot, with propriety, make a part of another. Linnean law, (see Phil. Bot. fept. 225.) and good sense, are both against it; and if some similar innovations have, from peculiar causes, crept in, they are not to be imitated, though for the present they may be tolerated. The genus in question is founded on Ledum bistifodium, (see Ledum, n. 3,) and stands in the Class and Order Petaenthria Magnifica, in Mr. Pursh's Flora 280 and 301, agreeing, of course, in Natural Order with Ledum. The following are its characters.

Calyx in five deep segments. Petals five. Stamens prominent. Capsule of five cells, bursting at the summit.

Ledum is characterized.

Calyx minute, five-toothed. Corolla flat, in five deep segments. Capsule of five cells, bursting at the base.

AMMOS, Liquor of the, Chemical Properties of. The peculiar acid principle termed by Vauquelin and Bonnec amniotic acid, does not appear to exist during all the periods of gellation in the liquor amni of the cow. Dr. Prout examined this fluid taken from an animal which had been slaughtered in an early period of her gellation, but was not able to detect any of the acid in question. See Annals of Philosophy, vol. v. p. 416.

Amomum, in Botany, amomum of the Greeks, most probably derived from its Arabic denomination bhamam, as De Theis writes it, is the ancient name of a fort of aromatic grain, or fruit, included, according to all appearance, among the species of the present Amomum of botanists. (See our former article, where this genus comprehends a much more extensive range of species than are now underfoot to belong to it.) Lamarck, and his immediate followers, included under Amomum almost every plant of the Scitamineae that they knew not how otherwise to dispose of; and Gartner, though he altered the name for the worse, to Zingiber, (see that article,) threw no light upon the characters or history of the genus, but rather, like every body else, added to their confusion. Mr. Rofco first defined this genus, like the rest of the Scitamineae, as the reader will find under that head, by a clear distinctive character; and while he greatly reduced the number of species rendered the whole perfectly clear and intelligible. We shall, as we have done with Alpinia, give a full view of this genus, as at present underfoot, and while we make considerabe retractions, shall have something new to add in their place.—Rofco's Tr. of Linn. Soc. 1851. t. 20. f. 11. Dryand in Att. Hort. Kew. v. 1. 8. Linn. Gen. 2, Schreb. 3. Willd. Sp. Pl. v. 1. 6. Mart. Mill. Dict. v. 1. Cary Hort. Beng. i. Roxb. Monand. 23. Juil. 63. Lamarck Illutr. t. 2 ft. 1. (Zingiber; Gartn. t. 12. f. 1, 2, 3, 6.)—Clafs and order, Monandria Monogynia. Nat. Ord. Scitaminea, Linn. Canes. Juli.

Gen. Ch. Cal. Perianth superior, of one leaf, tabular, theathing, membranous, coloured, fporulating at one side about half way down. Cor. of one petal; tube shorter than the calyx, cyndrical, erect; outer limb in three nearly equal, oblong-lanceolate, concave, erect segments much longer than the calyx; inner of one large, undulated lip, with a short concave claw. Stam. Filament one, rather longer than the claw, fround, oblong, defreeped, somewhat infurred, with a lanceolate, acute, ascending lobes, about half its own length on each side, at the base, and a pair of similar, erect or transverse, lobes, forming a crest at the summit, with either an intermediate prominence, or a notch; anther of two olls of different, elliptic-oblong, lobes, attached by the back, below the summit. Pill. German inferior, small, roundish, fome what furred; lily-thread shaped, lilies close to the filament, between the lobes of the anther; forma fuming shaped, fringed, erect, projecting a little beyond the filament. Peric. Capsule either oblong, or nearly globular, of three cells, and three cconions, somewhat fritted, valves; the partitions membranous. Seeds numerous, oblong, roundish, or froundly angular, each enveloped in a soft pulpul tunic, which becomes membranous, or evanecent, when dry.

One of the most natural genera that can exist, in any natural order, and the best defined in habit, as well as character.
AMOMUM.

character. The root is perennial, tuberous, jointed, and somewhat creeping, with strong and deep fibres. Stems at least biennial, erect, simple, invested with the sheaths of the two-ranked, simple, elliptic-oblong, flattened, vertical leaves. Spikes invariably radical, simple, rather lax, flaked, their flanks scaly. Bracteas large, concave, coriaceous, more or less closely imbricated, single-flowered. Flowers large and handsome, white or reddish, remarkable for the broad, rounded, undulated, generally crenate lip, often yellowish at the base. Capsules large, with very numerous, in general powerfully aromatic, or very pungent, seeds. Every part of the plant is commonly aromatic. We have improved our knowledge of the fruit, and the nature of the tunic of the seeds, from Dr. Roxburgh's observations in India. Gartnner speaks of the capsule as not bursting, because he had chiefly examined specimens gathered before they were ripe, like all the Cardamoms of the druggists' shops, some of which belong to the genus before us. The same able author has also mistaken the top for the bottom, in his figure called A. cyphostr.

We know not how it has happened that only one species of Amomum appears in Hort. Kew. A. Afruzii; with another, A. grandiflorum (published long before) in the Addenda to that work. A. Granum-Paradisi, raised from seeds brought from Sierra Leone by Dr. Auzelius, has long been cultivated in England, though we have never heard of its flowering; and there are several more in the same predicament. They are fove plants, requiring a considerable degree of heat. No collection perhaps is so rich in this genus, or in the whole natural order, as that of the Botanic Garden at Liverpool, where the plants have every advantage of skill of cultivation, and where nothing that may occur, relative to their growth or history, can escape the eye of that illustrious writer and botanist, who first reduced them to order.

All the known species appear to be natives either of equinoctial Africa, Madagascar, or the East Indies; nor have we any from America, or the West Indies.

1. A. Cardamomum. Clutter Cardamom, or True Amomum. Linn. Sp. Pl. 2. Willd. n. 7. Loureir. Cochinchi. 3. Retz. Obf. falc. 3. 59. Rofc. n. 1. Roxb. n. 1. (A. n. 2; Linn. Mat. Med. 1. A. verum; Ger. Em. 1548. f. 6. Amomum; Dale Pharm. 277. Barrel. Ic. 571. f. 1. Amomo legitimo degli antichi; Pona Baldo, 50. Cardamom minus; Rumph. Amboin. v. 5. 152. f. 65. f. 1. Bont. Hilf. Nat. 126, with a figure (the oblong capsule excepted, which belongs to Cardamomum medium of the hops). Zingiber minus; Gært. t. 12. f. 6.) — Leaves lanceolate. Spikes lax, many-flowered. Bracteas lanceolate, acute. Lip three-lobed. Crest of three, nearly equal, erect lobes. Capsule globular. — Native of the Malay islands, where the inhabitants use the seeds as a substitute for the Malabar, or lesser Cardamon. Dr. Charles Campbell sent plants from Sumatra to the Calcutta garden, where they blossom in May, just before the rains begin. Roxburgh. Rumphius speaks of this species as cultivated plentifully, but not wild, in Amboyna and the neighbouring islands. It is certainly the true original Amomum of the hops, still to be met with at Venice and in other parts of the south of Europe, though generally supplanted by the more valuable lesser Cardamon, Amomum repens of Sonnerat, which Linnaeus confounded herewith, and of which we propose to treat by the name of Elettaria hereafter. Nothing is more rare, with collectors of the Materium Medicum, than the capsules of this A. verum in their native clutters or spikes. We were fortunate enough, after unskilfully

meet with two or three such specimens, accompanied by brautis, very important as determining the identity of this plant with the Linnæan specimens of A. Cardamomum. By macerating the flowers of the leaf, we have also ascertained their structure, which agrees with Dr. Roxburgh's account, the summit, or crest, of the filament being three-lobed. The lateral lobes are short and erect, but not much elevated above the central one; neither are they transverse, awl-shaped, and elongated, as in A. Afruzii, grandis floridum, and some others. The two lobes of the anther stand near the edges of the filament, remote from each other, but meet near the base. Dr. Roxburgh speaks of the flower-spikes as even with the earth. But however this may be, they are elevated above the root, each on a simple wavy stalk, two inches long, clothed with sheathing, elliptical, ribbed, abrupt, barren scales. The spike is an inch or an inch and a half long, sometimes two inches when in seed, with many pale, smooth, imbricated, elliptic-lanceolate brautis, near an inch in length, one to each flower. The germen, calyx, and common receptacle, are hairy, or rather bristle. Capsules feline, the size of a black currant, globular, somewhat depressed, obscurely three-lobed, fruated, crowned with a blunt protuberant scar. Seeds roundish, angular, dotted, brown, aromatic and pungent, resembling in flavour the Elettaria, but less powerful, and rather less agreeable. The leaves of this species are rather narrower than in others of the genus, except perhaps the following; but our leading distinctions throughout must be taken from the brautis, flowers, and fruit.

2. A. angustifolium. Grested Cardamom, or Madagascar Amomum. Sonnerat Ind. Or. v. 2. 242. t. 137. Willd. n. 6. Rofc. n. 2. Roxb. n. 2. (A. madagascariense; Lamarek Dist. v. 1. 133. Carvamomum majus; Matth. Valgr. 25. (but not Dale Pharm. 276.) Camer. Epit. 11. f. 1. Barrel. Ic. obf. 1394. t. 971, the largest fruit. Grana Paradisi; Ger. Em. 1542, the figure, as being copied from Matthioli, but not the description. (See also Bauh. Hilf. v. 2. 204, and Lab. Ic. v. 2. 204, where the same error is committed, as well as in Chabr. Stipr. 128.) — Leaves lanceolate. Spikes capitata. Bracteas ovate. Lip obovat, undivided. Lateral lobes of the crest tapering, horizontal. Capsule ovate, pointed, frivated. Seeds globular, abrupt at the base. — Native of marly ground in Madagascar, where it was first ascertained and figured by Sonnerat. It is cultivated at the Mauritius, and from thence was carried by captain Tennent to the Calcutta garden, where it blossomed during the cold season. Dr. Roxburgh says, "the flowers possess a considerable share of spicy fragrance, and are flowy, the upper brautis, and external border of the corolla, being red, and the large lip yellow." This writer terms the leaves broad-lanceolate; which does not answer to Sonnerat's figure, name, or description, but perhaps this circumstance is variable. The flower-flaks rise above the ground, and are seven or eight inches high, clothed with tubular scales. Flowers in a short crowded spike, with a concave brautis to each, near an inch and a half long. The capulis and seeds we have already described, (see Mellicetta,) where some other species are mentioned, which we shall here attempt to arrange systematically, but need not repeat the minute remarks there given.

3. A. macroperumum. Large-seeded Guinean Amomum. (Zingiber Mellicetta; Gært. t. 12.) — Spikes capitata. Bracteas ovate, as long as the fruit. Capsule ovate, pointed, somewhat frivated. Seeds obovate, with a prominent, bordered, crenate scar. — Native of Sierra Leone, in the burying-ground of the settlement, from whence seeds were brought us by prof. Professor Auzelius; but having unskilfully
unluckily not observed the plant or its flowers, nor gathered more than one capful, he was unable to give us any further information than what these seeds afford. Their flavour is very slightly aromatic. Their lead-coloured hue is well noticed by Gärtner, though his figure represents them scarcely half large enough. The bracteas appear twice the size of the leaf, to which unquestionably this species is next akin. This is Amomum, n. t. of professor Achezuis's MSS. The natives call it Maboobo.

4. A. Clufii. Long-feded Amomum. (Fructus 14; Cluf. Exot. 37, 38, with a figure. Gravis Paradys, five Mellegeta allinis fructus; Bauh. Pin. 413.) — Spikes capitale. Bracteas ovate, much shorter than the fruit. Capulis ovate, pointed, triradiate. Seeds cylindrical, highly polished, with a bordered, truncate face. — The native country of this species is unknown, Clufius's specimen having been collected by an apothecary, who died in the course of his voyage, and left no memorandum respecting this point. (See Mellegeta for a description of a specimen, which we accidentally met with in a druggist's shop, in a chest of Great Cardamoms, A. angustifolium, if we mistake not, and which therefore probably came from Madagascar.) The cylindrical, dark-brown, highly polished seeds, appearing as if varnished, clearly distinguished it from both the two last. The short bracteas in Clufius's figure, unless the upper ones had been tipped off, afford a no less striking distinction. The seeds had only a slight pungency from the first. Thole of our Great, as well as Clufet, Cardamoms, are as highly flavoured as ever, though at least twenty-five years old.

5. A. Grana-Paradisi. Grains of Paradise Amomum, or Mellegeta Pepper. — Spikes capitale. Bracteas ovate, rather shorter than the fruit; lower ones crowded. Capulis oblong, bluntly triangular, minutely hispid. Seeds ovate. Stipula entire, fringed. (See Mellegeta for the history and synonyms of this species.) The brown seeds, distinguished by a peculiar and very hot flavour, are very different from the following, and the bracteas have a short, thick, dorso-long spine.

6. A. grandiflorum. Large-flowered Cardamom. Sm. Exot. Bot. n. 2. 103. t. 111. Ait. Epit. 524. — Spikes capitale. Bracteas elliptical, shorter than the fruit; lower ones distant. Capulis oblong, bluntly triangular, minutely hispid. Seeds ovate. Intermediate lobe of the filament entire. Stipula clavene, smooth. — Native of Sierra Leone, Seeds, brought by professor Afzeiulius, have produced flowering plants in England. The root is perennial, woody, creeping. Leafy stems about three feet high, erect, round, smooth, very slender. Leaves several, elliptic-lanceolate, long-pointed, recurved, often tinged with red, very smooth; the long, narrow, polished bracteas each crowned with a somewhat cloven, rounded stipula, whose edges are quite smooth, not fringed with bristle hairs, as in A. Grana-Paradisi. Flowers-flats erec, two inches high, frirated, downy. Lower bracteas elliptical, concave, spreading, and so far distant that the flalk is usually visible between them; upper much larger, though of a smaller proportion than those of our second or third species, and not above half so long as the flower or fruit, membranous, finely ribbed, scarcely spinous, somewhat colourned, permanent. Flowers in a short, dense, capitale cluster, large and handsome, whether fragrant or not we have no information, but when dried, and moistened again, they are highly aromatic. Calyx rose-coloured, above an inch long, with a blunt spreading point. Outer limb of the corolla of the same hue, twice as long; lip of a broad rounded kidney-shape, waved, plaited, crease, slightly notched, but not divided, nor deeply lobed, near two inches broad, white, with a yellow spot at the base. Stamen white, not half so long as the lip, furnished at the bottom with twoawl-shaped diverging lobes, and at the top with two nearly horizontal ones, of the same size and figure, having between them a central, short, rounded, quite entire lobe. The capulis is very like that of Grana-Paradisi, in size, shape, and pubescence. These seeds are also similar in size and shape to that species, but differ in being grey or lead-coloured, much less polished, and in having a totally different flavour resembling camphor, which they equal in warmth and pungency. As a stimulant, cordial, these seeds appear equal to any Cardamom whatever.

When the flowers of Grana-Paradisi become known, which is now one of our greatest botanical discoveries, there probably will be more distinctive characters discovered between that species and the present.

7. A. Achezati. Sweet-scented Amomum. Rofc. n. 8. Ait. n. 1. (A. exspicam; Sims in Ann. of Bot. n. 1. 548. t. 14.) — Spikes capitale, of few flowers. Bracteas shorter than the fruit. Capulis oblong, triangular. Stipula smooth? Intermediate lobe of the filament cloven. — For this also we are indebted to Dr. Afzeiulius, who brought the seeds from Sierra Leone. From them Mr. Loddisges at Hackney raised plants, which flowered in his flower in June 1804, and were described by Dr. Sims. The original name, esspica, not being exactly correct, has been changed for one to which no lover of science or of personal worth can object. The leaves are as broad as the leaf, nor does the herbage of these plants in general afford many distinctive marks. We precedence from the figure, that the stipulas are smooth. The flower-flats, though not wanting, is much shorter than any of the former, and there seem to be no more than two external bracteas, besides some membranous ones close to the flowers, apparently less firm and durable than usual. The outer limb of the corolla is pale flesh-coloured. Lip rather more oblong, and plaited lower down, than in the last, crease at the edges, white, with a yellow central spot. Stamen essentially different from A. grandi- fflorum, in having its middle lobe in two deep acute segments. What we have for the capulis of this species is ovate, pointed, triangular, nearly or quite smooth, rather larger than either of the two last. Seeds obvate, dark brown, highly polished, with a prominent-bordered face, as in A. macropelllum and Clufii, totally unlike the two foregoing. These seeds have scarcely any flavour, and are not at all aromatic. The flowers are fragrant only when dried, as in grandi-florum.

8. A. frotolacteum. Cone-bearing Amomum. — Spikes capitale. Outer bracteas numerous, elliptical, gradually larger upwards; floral ones scarcely longer, membranous, frirated, rough at the extremity. Stipula abrupt, nearly smooth. — Native of Sierra Leone, from whence we were favoured with a specimen by Dr. Afzeiulius. This has very slender leafy stems. The leaves are elliptic-ovate, pointed, very smooth. Stipula rounded, scarcely cloven, very lightly, if at all, fringed. Flower-flats several inches high, smooth, covered with numerous, imbricated, elliptical, very broad, concave, felling bracteas, gradually larger upwards, with broad dorso-long spine; the lowermost not quite an inch long, the upper two inches; all finely frirated, very smooth to the touch, of a bright chestnut colour when dry. Within the two uppermost are the proper bracteas, accompanying the head of flowers, much narrower, hardly at all longer, flatter, more membranous, hairy in the upper part, abrupt with a small point. Of the flowers we know nothing, nor are we certain of the fruit. The only unappropriated cap- fules of any Amomum, communicated from Sierra Leone by
AMOMUM.

by Francis Borone, (see the article Rutaceae.) are those of A. n. 2. of Aszelius, called by the natives Malu-aba, which are very likely to belong to the present plant, though we have no proof of it. These agree with the outer bracteas in colour and smoothness, and are ovate-oblong, only half the size of the leaf, with which their seeds very precisely accord, both in appearance and in want of flavour. Indeed they are so alike, and such a coincidence between the seeds of different species of Amomum is so unusual, that we could almost prelude the capful above described for A. Aszeliu, might be a very large one of this n. 2. We do not however form any such conclusion, the seeds of A. Clu, undoubtedly a dinéfis species from both these, having seeds precisely like them, only rather larger.  

Cochinch. 4. Wild. n. 8. Rocf. n. 5. (Globba cripa rubra; Rumph. Amboin. v. 6. 137. t. 61. f. 2.)—Spikes ovate, flalked. Braéctas linear-lanceolate, elongated. Capful globular, obliquely triangular, rough with ferracred bristles. — Native of Java, Amboyna, and the Molucca islands, as well as of Cochinchina, in hilly situations. The seeds are exported in great quantities to China, for medical ufe, being, according to Loureir, flamachic, and warm and strengthening. The root is woody and creeping; its fibres aromatic. Leafy bracts six feet (Rumphius lays fourteen to sixteen feet) high, weak, erect, perennial. Leaves smooth. Flower-flalk four inches long, flender, reclining. Spike nearly ovate, with linear, imbricate braéctas. Flower pale. Capful nearly globular, half an inch in diameter, rather pulpy and sweet, reddish, clothed with numerous thick protuberances. Seeds: angular, brown. The whole plant has an aromatic, but not powerful, odour. This description of Loureir’s is not unsuitable to the above fynonym of Rumphius, to which he refers, except that the latter describes the roughness of the fruit as consisting of short, scattered spines, or bristles.  

Rocf. n. 6.—Clutter flalked. Braéctas ovate-oblong. Capful globular, obliquely triangular, faggy. Intermediate lobe of the filament in two rounded segments. — Found by Kæng at Raput-Nok, in Tranquebar, in fhady wet fitions, flowering about the middle of May. Leafy bracts, a yard or more in height. Leaves smooth on both fides, with hairy fifulas. Flower-flalks somewhat curved, clothed with ovate-oblong, smooth, red fcales. Flowers white, variegated with red and yellow. Stamens crowned with four lobes, the two lateral ones narrowest and smallest, the two middle ones broad and rounded. Capful clothed, before it is dried, with blood-coloured cirihi, or thread. 

Kæng.  

Rocf. n. 7. (Globba cripa viridis; Rumph. Amboin. v. 6. 137. t. 61. f. 1.)—Spikes capitate, nearly fellite. Braéctas membranous. Capful globofe, all over fpinous. — Native of Amboyna, the Molucca islands, &c. Rumphius. Leafy bracts, according to Rumphius, ten or twelve feet high. Leaves twenty inches long, of the breadth of four or five fingers. Fruit larger than that of A. villosum, always of a deep green, and armed with fipes like a Thorn-apple, growing in dense fellite clusters or tufts at the root. We know nothing of this species but from Rumphius, for after much perplexity and confideration, we are decidedly of opinion that Amomum n. 2. of Kæng, Retz. Obs. falc. 3. 59, cannot belong to it. See A. maximum hereafter.  

13. A. acetabulum. Prickly Oval Amomum. Roxb. n. 3.—Spikes obovate, on short flalks. Braéctas lanceolate. Crefl of the filament abruptly three-lobed. Capfuls oval, prickly. Leaves nearly fellite, lanceolate; heart-shaped at the bafe.—Native of the Malay Archipelago, from whence it was brought to the Calcutta garden, and flowers freely there in April and May, ripening feed in October. The capful is perfectly diftinct of grooves, and its coat of a foft flothy texture. Roxburgh.  

14. A. maximum. Great Winged Amomum. Roxb. n. 4. (A. n. 2; Kæng in Retz. Obs. falc. 3. 59.)—Spikes oval, on short flalks. Braéctas lanceolate. Crefl of one semi-lunar lobe. Capfuls globofe, with nine wings. Leaves flalked, lanceolate, villous beneath. — Native of the Malay Archipelago. Long cultivated in the Calcutta garden, where it blooms in April and May, ripening feed in September and October. The flowers are nearly white, with a small tinge of yellow on the middle of the fp. The feeds have a warm pungent aromatic taste, not unlike the real Malabar Cardamon, (see Elettaria,) but by no means fo grateful. Roxburgh. The author appears to have confufed himself between Globba cripa rubra of Rumphius, and t. 60, of that writer, but we readily agree with him, though not exactly for the reasons he gives, that neither of thefe fynonyms belong to his A. maximum.  

15. A. Rumphii. Angular-winged Amomum. (Globba longa; Rumph. Amboin. v. 6. 134. t. 60.)—Spikes ovate, on flalks three their own length. Braéctas ovate. Capful globofe, with many angular-notched wings. Leaves flalked, smooth.—Native of valleys, and at the foot of mountains, in a cold, wet, clay, or fowy foil, throughout the Malay Archipelago, and all the eastern parts of India. The barren flells are a yard high before they expand into leaves, after which they attain the height of twelve or fifteen feet. Leaves thin and smooth, two feet or two feet and a half in length, two palms broad. Flower-flalks a foot high, fealy, each bearing a denfe, ovate, many-flowered spike, three or four inches long. Braéctas ovate, acute, reddih, fpotted. Calys with a very long three-cleft tube. Corolla reddih externally, with a white fp, fpot fading. Capful nearly globofe, with many unequal, yellowish, irregularly and sharply toothed wings. Seeds black, enveloped in a flivery pulp, of a gratefuiely acid favour, very fragrant, but not acrid or aromatic to the tafe. Rumphius.  

We cannot reduce this plant to any of the species of Roccoe, Roxburgh, or Kæng. We feel indeed great fcruples in referring the Amomum n. 2. of the latter to A. maximum, and thal therefore venture to propofe it here as a dinéfis, with that diftinction which must always attend the definition of a species taken up from description.  

16. A. Kængii. Single-fruited Amomum. (A. n. 2; Kæng in Retz. Obs. v. 3. 50.)—Spikes fellite. Braéctas ovate, membranous. Capful solitary, globofe, deeply furrowed, with intermediate wings, and somewhere tuberculated. Crefl of three lobes; the middle one rounded, finely toothed. Leaves downy beneath. — Native of denfe woods in the Eaft Indies. Leafy bracts two feet high. — Spikes or tufts of flowers fellite at the root, each perfecfing but one capful, the bafe of a large cherry, containing rarely more than nine feeds.  

Although we have made out a far more ample hit of species, of genuine Amomum, than has ever been attempted before, we are aware that several may yet exifh, of which imperfect traces are to be found in various authors, so that it is more likely our number should be augmented than diminifhed by future enquiry. This genus ought perhaps to be divided into two families, the firl with fplked or racemoe flowers, globofe fruits, and angular feeds; the fcond with capitata flowers, ovate pointed feeds, and ovate or oblong, even feeds. To the firl belong A. Cardamomum and many

Q q
of our latter species; to the latter the Cardamom tribe, comprising the second and all after it to the eighth inclusive.

**AMPHIBOLE, or HORNBLINDE.** See Mineralogy, Addenda.

**AMPHIGENE.** See LECITE.

**AMPHIPOGON, in Botany, op. cit., and eglha, as having a ballot, or acorn, upon both valves of the corolla.**—Brown Prod. Nov. Holl. v. 1. 1775.—Clas and order, *Triandra Diggia.* Nat. Ord. Gramina.

Eff. Ch. Calyx of two nearly equal valves, single-flowered. Corolla of two valvs: outer valve with three segments; inner with two; all the segments setaceous, awned, uniform.

A genus of graminea, growing in patches, with creeping roots, fasciculated flowers, and setaceous leaves. The flowers compose an equal spike, which sometimes affumes the form of a roundish head.

1. *A. lagunoides*. Harze's-tall Amphipogon.—Head globifer. Calyx-glumes lupid, with hairs dilated at the base; outer valve twice the length of its point. —Gathered by M. Brown, on the south coast of New Holland.

2. *A. turbinatus*. Turbine Amphipogon.—Head obovate. Calyx-glumes clothed with hairy hairs, timple at the base; outer valve scarcely longer than its point. —From the same country.

Sect. 2. *Spike oblonga*. Calyx smooth.

5. *A. avanuensis*. Oat Amphipogon. —Calyx-glumes pointed, undivided, longer than the silky corolla. Awns spreading. —Native of the same country as the last.

We have seen no specimens, and therefore are indebted to Mr. Brown for all the above information. We would observe that this genus affords an exemplification of what specific characters ought to be, under the plan of a milder, with nothing ambiguous or superfluous, but such a contrast of definitions between all the species, as can leave no doubt in the mind of a student.

**AMPHORA.** Add.—As a wine measure at Venice, contains 4 bigoncia, and 2 bigoncia contains 4 quantari, 116 fecchie, or 25 lbs. pezo grofo; but a bigoncia of brandy is only 14 fecchie, or 56 lbs.

**AMSTERDAM, in Geography,** an island in the Indian sea, lying in S. lat. 38° 42', E. long. 56° 54'. This island is of volcanic origin, and still in a state of inflammation. The great crater on the eastern side, now full of water, is by far the largest here, or, perhaps, elsewhere, and is of an astonishing size, considerably exceeding in diameter those of Etna or Vefuvius. Its length from N. to S. is upwards of four miles; its breadth from E. to W. about 2½ miles; and its circumference 11 miles, comprehending a surface of about eight square miles, or 5120 acres, almost the whole of which is covered with a fertile soil. The island is inaccessible, except on the west side, where the great crater forms a harbour, the entrance into which is deepening annually, and might, by the aid of art, be made fit for the passage of large ships. The tides run in and out at the rate of three miles an hour, and rise perpendicularly eight or nine feet on the full and change of the moon. Their direction is S.E. by S., and N.E. by N. A northerly wind makes the highest tide. The water is eight or ten fathoms deep almost close to the edge of the crater. The sea furnishes this island with excellent fish, particularly a kind of cod, and crayfish in abundance. Nevertheless, sharks and dogfish, of uncommon size, were very numerous in the same place. The penguin, distinguished in the Linnean system by the name of *Chrysaora*, having large yellow feathers, forming two semi-circles over the eyes, like eyebrows, is found here in great abundance. Of the larger birds, there are also several species of the albatross, and also the large black petrel, or *procellaria equinocolia* of Linnaeus; the blue petrel, or *procellaria Forsteri*; and the stormy petrel. The smallest of the feathered tribe, inhabiting or visiting this island, was the silver kind, or *Ilerna hirundo*, about the size of a large swallow or swift, with a forked tail. The island St. Paul's, lying to the northward of Amsterdam, presented no very high land, or any rising in a conic form. In Sir George Staunton's Embassy to China, we have a view and plan of the island of Amsterdam, and of the great crater on its eastern side.

**AMUL,** an ancient city of the Persian empire, in the province of Mazendaran, situated in an agreeable plain at the foot of a mountain, on the banks of a river, and celebrated for a handom bridge of twelve arches, an old fortress, and a palace of Shah Abbas the Great.

**AMURATH (or Morad) III.,** in *Biography,* succeeded his father Sultan Selim II. in 1575, commencing his reign with casting his five brothers to be strangled in his presence. His reign was eventful in military transactions; but as he took no part in them, he is not much noticed by the Turkish historians. Amurath contributed to the election of Stephen Battiari, as king of Poland; and this circumstance favoured his own designs against Persia. The invasion of this empire by the Turks began in 1578, and after much slaughter, terminated in Amurath's possession of Tauris, and three contiguous provinces of Persia. The Krim Tartars, who revolted from the Turkish dominion, were reduced. In 1596, Amurath being at peace with the other powers declared war against the emperor of Germany, which was the caufe of much devastation and bloodshed; and the Turks triumphed in the capture of the important town of Rth, in Upper Hungary. During this war, Amurath died, in January 1596, at the age of 52. Chriflian authors represent him as of a mild disposition, a lover of justice, zealous in his religion; and a friend to temperance and order. Mod. Univ. Hift.

**AMURATH (or Morad) IV.,** surnamed Ghazi, or the Valiant, was fon of Achmet I., and succeeded his depofed uncle Muffapha in 1622, in his 13th year. He lof Bagdad at the beginning of his reign, and after many unsuccessful attempts to retake it, he marched, in 1647, at the head of a numerous army, and after thirty days continual assault, and an immense lofs of lives, stormed the place. On this occasion he shewed the brutal ferocity of his temper, not only by driving on his men with a fcinatar to the attack, but by slaughterimg 30,000 Persians who had surrendered at discretion after the capture of the town. It is said, that the only person who escaped was a famous harp-player, who rfekeft the executioners to permit him to fpeak to the sultan before bis death. When introduced into his presence, and ordered to give a fpecimen of his powers, he touched his instrument so sweetly, accompanying the strings with pathetic lamentations on the tragedy of Bagdad, and artful praises of Amurath, that the tyrant was fostered
softened to tears, and not only saved him but the rest of the survivors. Habits of debauchery broke down the sultan's constitution in the prime of life, and he sacrificed his life in a revel at the feast of Bairam, in February 1642, at the age of 31. — Mod. Univ. Hist.

**ANUSKAG FALLS,** l. io, for across r. a little below.

**ANWELL.** Add—Alfo, a township of Hunterdon, in New Jersey, containing 5727 inhabitants. —Alfo, a township of Pennsylvania, in Washington county, having 1673 inhabitants.

**ANADENIA,** in Botany, fo named by Mr. Brown, from s. without, and 320, a gland, because the nectariferous glands, ufual in some neighbouring genera, are wanting. —Brown Tr. of Linn. Soc. v. 10. 155. Prodr. Nov. Holl. v. 1. 374.—Clafs and order, **Tetradura Monogynia.** Nat. Ord. Proteaceae. Juff. Brown.

Gen. Ch. Cal. none. Core Petals four, equal, regular, cohering by their lower part into a tube, linear, or length round their summits dilated, concave, bearing the flanmens. Stam. Filaments four, very short, inserted into the hollow near the tip of each petal; anthers roundish, fink in the faid hollow. Pfl. German with rudiments of two fuperior, inferior, half-ovate, erect, without any gland at the base; flyle cylindrical, incurved; stigma vertical, conical. Peric. Follicle oflaked, of one cell, crowned with the flyle. Seed foliary, compounded, without a wing. Eff. Ch. Petals four, regular. Stamens fink in the cavities of the limb. Nectariferous glands none. Stigma conical. Follicle of one cell. Seed foliary, without a wing.

A shrubby genus, akin to Grevillea. (See that article.) Leaves either pinnatifid or lobed, their outline wedge-shaped. Spikes terminal or lateral; flowers in pairs, each pair accompanied by a single bracteae, the uppermost fometimes earlier than the reif.

1. *A. pulchella.* Elegant Anademia.—Leaves pinnatifid, slightly hairy; lobes wedge-shaped, three-cleft or pinnatifid at the extremity. Spikes flowering from the top downwards. Follicles gluttonous. —Native of molly hills in Lewin's land, on the south coast of New Holland, where this, as well as the two following species, were gathered by Mr. Brown.

2. *A. trifida.* Three-cleft Anademia.—Leaves wedge-shaped, triple-ribbed, without veins, three-cleft; flivery beneath; lobes entire, or the lateral ones with two or three teeth.—Found in woods, on a sandy foil, in Lewin's land. Leaves only the length of the finger-nail. —"Perhaps a distinct genus, the corolla being irregular, fligma a little, different from the reif, and the follicle woody, splitting into two parts." —Br. in Tr. of Linn. Soc.

3. *A. liebifata.* Holly-leaved Anademia.—Leaves wedge-shaped, very; flivery beneath; tapering at the base; pinnatifid half way down.—Found on the sandy sea-coaft of Flinder's land, on the south coast of New Holland, with unexpanded flowers, and no fruit. Leaves an inch long.

**ANALYSIS,** in Chemiftry. The analysis of minerals, including earths, fones, and the ores of metals, and the analysis of organized bodies, or vegetable and animal fubstances, have been omitted; we shall, therefore, introduce a fummmary account of thefie fubjects here, and at the fame time endeavour to supply what has been omitted under other analogous heads.

**Analysis of Minerals.** —The particular methods of analyzing different minerals and ores are given under their respective heads: our object here is to give a summary view of chemical analysis in general, a subject often referred to in the Cyclopædia, but which has been unaccountably omitted.

"The progress," says Dr. Thomson, "which the art of analysing minerals has made within these last thirty years is truly astonishing. To separate five or six substances intimately combined together, to exhibit each of them separately, to ascertain the precise quantity of each, and even to detect the presence of the weight of substances which do not approach the five-hundredth part of the compound, would, at no very remote period, have been considered as a hopeless, if not an impossible task; yet this can now be done with considerable accuracy."

Margraff of Berlin was the first who undertook the analysis of minerals. He was followed by Bergman and Scheele, who very much improved this department of chemistry. The indefatigable and ingenious Klaproth succeeded, to whom the present improved state of the analysis of minerals is more indebted than to any other individual. To Vauquelin and Berzelius likewise we are much indebted, as well as to many other eminent living chemists. In short, this interesting branch of chemistry is still daily making rapid progress, and will doubtless be long become much more perfect than it is even at present.

Minerals of a saline nature, and soluble in water, may be analyzed by the methods pointed out in the article Water, Mineral Analysis of.

Hard fanny minerals are firt to be reduced to a flate of powder. When they are extremely hard, they may be heated to redness, and then thrown into cold water, which will cause them to crack and fly to pieces; and this process may be repeated, if necessary. The mineral is then to be reduced to a coarfe powder, in a fheel or agate mortar (see Laboratory); and when thus reduced, a given weight of it, 100 grains for example, is to be reduced in a similar mortar (one of agate is preferable) to an impalpable powder. The powder, after this operation, will be generally found heavier than before, owing to the abrasion of the mortar; and this addition in weight is to be carefully noticed, and allowed for. If the mortar employed was agate, the addition in weight may be considered as flies.

Cruccibles of platinum and silver, evaporating dishes of glafs or porcelain, and other apparatus and requisites, will be necessary for the subfequent procedures, all which are described under the article Laboratory above referred to. In the clafs of minerals commonly denominated fones and earths, the ingredients usually met with are, files, alumina, zirconia, glaucia, lime, and magnesia; and the oxys of iron, manganese, nickel, chrome, and copper. Seldom more than four or five of these, however, enter the composition of a mineral at the same time; though, to avoid repetition, we shall suppose them all to exist at once.

When a mineral of the above description is to be analyzed, 100 grains of it in fine powder are to be mixed with three times their weight of pure potash and a little water, and then introduced into a silver crucible, and exposed to a red heat for upwards of half an hour. Care must be taken to stir the mixture well till all the water be driven off, left, by the ebullition, any of the compound should be forced out of the crucible.

From the appearances presented during this step of the operation, some conjectures may be usefully formed respecting the nature of the fome, fo as to afford some allifance in the future steps of the analysis. If the matter melts completely, it may be concluded that the mineral is chiefly ficateous.

When a
be
aluminous and very hard, potash acts very feebly upon it; and in this case, borax was used with great advantage by Mr. Chevex.

The crucible being now removed from the fire, and cleaned externally, is to be placed in a porcelain capsule, and filled with water; and this is to be repeated till the whole of the matter is separated. A portion of the compound of potash, with the flex and alumina of the mineral, is taken up by the water, which would indeed disolve the whole if added in sufficient quantity.

The detached matter is then to be dissolved in muriatic acid; at the commencement of the solution, an abundant precipitation takes place of a flocculent matter, which had been held in solution by the alkali, with which the acid combines. Then an effervescence takes place from the decomposition of the alkaline carbonate formed after and during the fusion, and at the same time the precipitate is redissolved. The portion of matter also not dissolved by the water, and which had remained at the bottom in the form of a powder, is dissolved; this not being attended with any effervescence, if it be alumina or flex; but if it contains lime, an effervescence takes place. If the muriatic solution be colourless, we may conclude that it contains very little or no metallic oxyd. If its colour be purplish-red, it is a further proof that manganese is present; orange-red indicates iron; and golden-yellow, chrome.

This solution is now to be evaporated to dryness upon a sand-bath, in a flat porcelain vessel loosely covered with paper. Towards the end of the operation, the fluid becomes gelatinous, and requires to be constantly flinned with a filer or porcelain rod, to facilitate the difgagement of the water and acid, and to render the exccusion uniform throughout the whole. If this precaution be not observed, there is a risk of a portion of the alumina, from which the acid has been expelled, remaining with the flex; and with the alumina of a portion of flex being retained in solution; by the acid on account of its not being sufficiently disfipated.

When the matter is almost reduced to the form of a dry powder, a large quantity of distilled water is to be poured upon it; the whole is then to be gently heated, and thrown upon a filter. The powder remaining on the filter is to be washed with water, until the last portions added give no precipitate with solution of filter. This powder is flex. It is to be carefully dried between folds of blotting paper, exposed afterwards to a red heat, and weighed while warm. It ought to be a fine white powder, insoluble in acids. If it be coloured, the presence of a metallic oxyd is indicated, which is a proof that the heat towards the end of the evaporation had been raised too high. To remove this oxyd, the powder is to be boiled with an acid, and afterwards washed and dried, and the liquor must be added to the filtered fluid above-mentioned.

The solution is then to be evaporated till its quantity does not exceed an English pint. A solution of carbonate of potash is to be poured in, till no farther precipitation takes place; and in order to render the separation more complete, the whole should be boiled for a few minutes. When all the precipitate has collected at the bottom, the supernatant liquor is to be decanted off; and water being substituted in its place, the precipitate and water are to be thrown upon a filter. When the water has paffed through, the filtr with the precipitate upon it is to be placed upon some folds of bibulous paper; and when the precipitate has acquired a little confluence, it is to be carefully collected with an ivory knife, and mixed with a solution of pure potash, and boiled in a porcelain crucible. If any alumina or gluten be present, they will be dissolved in the potash, while the other substances remain untouched in the form of a powder.

The solution of alumina in the potash is to be super-fatted with an acid, that is, so much acid is to be added as is sufficient to redissolve any precipitate that may be formed. Carbonate of ammonia is then to be added in excess, so as to be susceptible to the smell. This will precipitate completely the alumina, if any be present, while the gluten will remain in solution. The alumina is to be collected on a filter, washed with distilled water, and then dried at a red heat, and weighed. To determine if it be really alumina, disolve it in fulphuric acid, and add a sufficient quantity of sulphate or acetate of potash; if it be alumina, the whole of it will be converted into crystals of alum. If gluten be present in the remaining liquor, it will fall down on boiling it for some time, so as to dilate the excess of ammonia. After being washed and dried as before, it is to be accurately weighed.

The matter remaining undissolved by the solution of potash above-mentioned may confit of lime, magnesia, yttria, and the metallic oxyds. If yttria be unfiected, add carbonate of ammonia, which will dissolve the yttria, and leave the other bodies. Then let the whole be dissolved in dilute sulphuric acid, and the solution be afterwards evaporated to dryness, so as to dilate any excess of acid. A little water is to be added to the solid residuum, which will take up the metallic sulphates and the sulphate of magnesium, but leave the sulphate of lime, which is to be dried at a red heat, and weighed; and from its weight the quantity of lime present may be readily estimated. The substances retained in solution by the sulphuric acid may be magnesia and the oxyds of iron, magnesium, chrome, and nickel. To separate these, the solution is to be diluted with a large quantity of water, a slight excess of acid added to it; and then a solution of carbonate of potash faturated with carbonic acid is to be poured in. The oxyds of iron, chrome, and nickel, will be precipitated, while the magnesia and manganee will remain in solution with the carbonic acid. To separate these, hydro-sulphuret of potash well faturated with sulphuretted hydrogen is to be added to the solution, which will precipitate the manganee in the state of hydro-sulphuret, while the magnesia will still remain in solution. The magnesia may then be separated by a solution of pure potash, and its weight estimated after it is washed and dried at a red heat. To obtain the weight of the oxyd of magnesia, its precipitate must be calcined with the admission of air to expel the sulphuretted hydrogen.

There still remain to be separated the oxyds of chrome, iron, and nickel. To do this, the precipitate is boiled in successive portions of nitric acid, to bring the oxyd of chrome to the state of acid. It is then heated for a few seconds with potash, and after being heated the liquid is poured off. The undissolved matters are to be washed with water, which washings are to be added to the other liquid. The chromic acid remains in solution combined with the potash; muriatic acid is added to it, so as to be in excess; it is then evaporated until it assumes a green colour. If pure potash be then added, the oxyd will be precipitated, and it may thus be collected, and its quantity ascertained.

The undissolved matter of the preceding experiment may confit of the oxyds of iron and nickel. To separate them,
they are dissolved in muriatic acid, and ammonia is added in excess. The *oxid* of iron will be thus precipitated, and its weight may be ascertained. The excess of ammonia will retain the *oxid* of nickel in solution, which may be readily obtained separately by driving off the ammonia by heat.

When the different constituent principles of a fossil have been thus obtained separately, their united weight ought of course to be equal to the original weight of the fossil itself. If they correspond, or differ only by .23 or .24 of a part, we may conclude that the analysis has been properly performed. But if the loss of weight be considerable, the analysis must be repeated; and if the result be still the same, it may be concluded that the flone has contained some principle either volatile or soluble in water, which, until, therefore, be sought for. A proportion of the flone being broken to pieces, is first to be exposed to a strong heat in a retort of porcelain, to which a receiver is adapted. If it contains water, or any other volatile substance, this will be collected in the receiver, and its nature and quantity may be ascertained. But if it sustain no loss by this operation, or a loss not equivalent to the loss indicated by the analysis, it is probable that it contains some substance soluble in water.

To ascerten the quantity of *potal* present in a mineral, Vaquelin (from whom the above account of the analysis of flony bodies has been chiefly extracted) recommends that the flone reduced to an impalpable powder should be cautiously heated with sulphuric acid, andthe mass digested with water. The solution properly concentrated is set aside for some days. If crystals of alum make their appearance, the flone contains *potal*. If no crystals appear, the solution is to be evaporated to dryness, and the residue exposed to a moderate red heat. It is then to be digested in water, and the solution mixed with carbonate of ammonia, and filtered. It must be then again evaporated to dryness, the residue exposed to a heat of 700°, and redissolved. The solution by proper concentration will yield crystals, either of sulphate of soda or of potal, which may be readily distinguished. The preference or absence of potal may be also ascertained by means of the muriate of platin.

The following method has been recommended by Rofe for detecting and distinguishing the fixed alkalies in minerals, and is easier than the above. He fused one part of the mineral with four parts of nitrate of barytes in a porcelain crucible. A spongy mass of a light blue colour, and completely soluble in muriatic acid, was obtained. The yellow-coloured solution formed was mixed with a sufficient quantity of sulphuric acid, not only to precipitate the barytes, but to expel the muriatic acid; and the liquid was evaporated to dryness. The mass was digested in water, and thrown upon a filter. The sulphate of barytes and silica remained behind. The solution was now saturated with carbonate of ammonia, which separated all the earthy and metallic bodies, leaving in the solution only the sulphates of fixed alkali and ammonia, the latter of which was then expelled by heat. The fixed alkaline sulphate thus obtained was redissolved in water, and decomposed by means of the acetate of barytes. The sulphate of barytes formed was then separated by the filter, and the liquid evaporated to dryness. The other salt was acetate of a fixed alkali, which was exposed to a red heat in a crucible, the charred residue dissolved in water, filtered, and crystallized; and thus a fixed alkaline carbonate was obtained, easily distinguished by its properties.

Sir H. Davy adopted still a different method. He fused one part of the mineral with two parts of boracic acid, dissolved the fused mass in diluted nitric acid, and concentrated the solution to separate the silica. The liquid was then mixed with carbonate of ammonia in excess, and boiled and filtered; by which means all the earthy and metallic ingredients were separated. The liquid was then mixed with a sufficient quantity of nitric acid, and evaporated till the whole of the boracic acid separated. Nothing now remained but the nitric acid, combined with the alkaline constituents of the mineral, and with ammonia. The nitrate of ammonia was distilled by heat, and the nature of the alkaline nitrate left was easily distinguished by its properties.

When the mineral contains *fluoric* acid, Klaproth ascertained its presence by heating the mineral with sulphuric acid in a glass retort. The corrosion of the retort, and the siliceous deposit in the water of the receiver, sufficiently demonstrate the presence of that principle. To determine its quantity, the mineral was fused with potash, and the silica separated as usual. The remaining liquid was precipitated by means of the carbonate of potash; and the liquid being neutralized was mixed with lime-water. The precipitate of fluote of lime thus obtained was heated to redness, and from its weight the quantity of fluoric acid present in the mineral was estimated.

Those fossils in which earths are combined with acids, forming compounds not soluble in water, require different modes of analysis. The earthy carbonates are analysed by calcination by heat, with or without charcoal, or by solution in dilute nitric or muriatic acid; estimating the quantity of carbonic acid diffused, by collecting it, and discovering the base by the nature of the salt obtained by evaporation; or by precipitation by re-agents, and estimating by the same modes their quantities. Earthy sulphates may be decomposed by boiling with carbonate of potash for a considerable time; the sulphuric acid unites with the potash, and its quantity may be estimated by precipitating with barytes: the carbonic acid is attracted by the earthy base, and the carbonate thus obtained may be decomposed in the same manner as a native carbonate, or the quantity of earth which it contains may be estimated by its weight. Phosphate of lime, which is the only earthy phosphate that has been discovered, may be diffused in dilute nitric acid by the afflattance of heat; the lime may be then precipitated by sulphuric or oxalate acid; the phosiphoric acid remaining in solution may be obtained concrete by evaporation; or its quantity may be estimated by combining it with lead, a solution of acetate of lead being added for the purpose.

*Analysis of Orses.*—Metallic minerals, in general, admit more easily of analysis in the humid way than the earthy fossils, from their being less hard. In the dry way also, their composition may be sometimes ascertained by expelling the mineralizing substance by heat, and reducing the metal to its metallic state.

Proper specimens of the ore, free from all foreign matters, should be chosen; and if the object be to ascertain the quantity of metal it may contain, different specimens taken from different parts of the metallic vein should be examined, as it often happens that different parts of the same vein vary much in richness. The ore being powdered, the general process, in the dry way, consists in calcining it at a low red heat in an earthen vessel loosely covered, to expel the sulphur or other volatile matter. Or this operation may be performed in an earthen retort and receiver, when the object is to ascerten the nature and quantity of the fulmination expelled. The residual matter in either case being weighed, to ascertain the loss of weight it has suffered, is mixed with three times its weight of black flux, and exposed in a crucible, to a heat sufficiently intense for its reduction and fusion. Sometimes borax, pounded glass, or lime, are used
as fluxes. The metallic matter, when the operation is well conducted, is collected in a button at the bottom of the crucible, and its nature and composition may be ascertained in the humid way in the usual manner by means of the proper reagents, &c.

In submitting an ore to analysis in the humid way, the general process is to digest it previously reduced to powder in different acids. Sulphur, if present, is precipitated, or is sometimes partially converted into sulphuric acid. If the quantity of sulphur be large, it is best previously separated as much as possible by roasting the ore as above. The residual matter is then submitted to the action of the different acids, these being often applied successively; so that different metals, if present, are separated by their proper solvents. The solutions afford by evaporation the metallic salts they contain, or each metal is detected in the solution by its proper test: it is also precipitated by the alkalis and other reagents, and the precipitate is reduced to the metallic state, as before, by the aid of fluxes and heat; or sometimes it may be thrown down at once in the metallic state, by another metal having a stronger attraction for oxygen.

There are almost all the general rules that the analyses of ores will admit of, as the processes required for different ores differ extremely from one another, and are often very complicated. We refer our readers, therefore, for the analysis of particular earthly fossils and ores, to the different articles in the Cyclopædia, where they are described.

Analysis of organized Bodies, including vegetable and animal Substances.—The older chemists attempted the analysis of organic compounds by distillation, and thus obtained a variety of refining substances equally or perhaps more complicated in their nature than the original substance to be analyzed. When the theory of chemistry was changed by Lavoisier, that illusory chemist began to consider the composition of organic substances in a proper point of view, and he endeavored to discover the elements of these bodies, and to determine their proportions. He discovered the nature of their elements, though he was not so successful in determining their properties. Lavoisier's principle of analysis was to oxidize organic bodies till he converted them into binary oxides, the composition of which was known, and to perform the experiment in such a manner, that the quantity of these binary compounds with oxygen could be correctly determined. His mode of operating was to burn organic substances in oxygen gas; but this method, though jütt in principle, did not enable him to determine by the balance with much accuracy, either the quantity of water or of carbonic acid formed by the combustion; so that his results could be only considered as approximations.

Some chemists, after Lavoisier, endeavored to determine the exact quantity of the products of dry distillation, and to calculate from them the composition of the body. Such was the attempt of Fourcroy and Vaquelin on the composition of urea, and of Dr. Higgins on the acetic acid. But the composition, and probably also the quantity of the products of distillation, being only imperfectly known, it is obvious that such experiments, however exact, can only afford data for calculations hereafter, when the products of the distillation become to be better examined and more accurately known. Theodore de Saussure has analyzed alcohol and ether in Lavoisier's manner, and the results he obtained probably approach nearer the truth than any preceding analysis of a ternary compound. Thenard has also analyzed different species of ether in the same manner.

The first grand step, however, towards proportion in the analysis of organic substances, was made by Gay Lussac and Thenard. These celebrated chemists, in an interesting memoir on the subject, after pointing out the difficulties and sources of inaccuracy of the methods then generally employed, gave a description of a new method of proceeding, by which they considered they were able to combine the hydrogen and carbon with the utmost quantity of oxygen with which they can unite; and thus, by proper data, to eliminate the proportion of their constituent parts, and of oxygen existing in the compound analyzed. The substance selected to furnish oxygen was the oxymuriate of potash, and the matter to be analyzed was mixed with this salt, and deflagrated in an apparatus contrived for the purpose, consisting of a thick glass tube, A, (Plate XXI. fig. 3; Chemistry,) set vertically in a fire, with a lateral tube, B, to conduct the gases produced to a mercurial apparatus; and a cock, C, above, the flopper of which was not perforated, but contained a depression, D, into which a portion of the material to be analyzed was introduced; and by turning the cock downwards, this portion fell into the tube, and was there deflagrated. E is a vessel containing ice, to keep the upper part of the tube cool. The proportion of the oxymuriate requisite to burn completely the substance analyzed was ascertained by previous trials in an open crucible; so much of the salt being required, that the residue after deflagration should be white, or at least not carbonaceous; and in the actual experiment a considerable excess of the oxymuriate was employed. The materials were then completely dried, by submitting them for a considerable time to a temperature of 213°, and afterwards accurately weighed and mixed in a mortar, with a little water, so as to form an adhesive mass, which was divided by being thrust into a brass mould, and the pieces shaped by the fingers into little balls, that they might drop clean from the flopper of the cock down into the deflagrating tube. These balls were dried again at the same temperature before they were thus burnt.

The oxymuriate of potash was itself analyzed before it was used; and in order to insure uniformity in its composition, a considerable quantity of it was fused and pulverized, and kept for use. If the substance to be analyzed was a vegetable acid, it was combined with lime or barytes before it was mixed with the salt; and this calceous or barytic salt was separately analyzed, and the carbonic acid remaining united with the earth after deflagration was properly estimated. The earthy or other incombustible matter belonging to the substance to be examined was also separately estimated, by calcining this substance by itself in a platinum vessel, and lixiviating the residue.

The authors, in their memoir, have given at length all the precautions required in the management of the apparatus, both in preparing for the deflagration, and in the estimation of the gases obtained; and after the operation the results of the analysis were made out in the following manner: "The proportion of combustible matter in the substance examined was previously found by calcination of another portion of the same; the actual quantity of oxygen employed in the deflagration was known by that of the oxymuriate used; the carbonic acid was absorbed by potash, and its carbon estimated; the excess of oxygen was found by subsequent detonation with hydrogen; the hydrogen of the sub stance was preheated to form water with all the oxygen unaccounted for; and the azote existed in the residual azotic gas."
AN ARTIFICIAL principle of Berzelius’s method is the same as that of Gay Lussac and Thenard, viz., the complete combustion of the substance to be analyzed with the oxymuriate of potash; but the apparatus he employed was very different, and certainly much better adapted for the purpose. It consisted of a glass tube, between one-half and five-eighths of an inch in diameter, and of a length sufficient to contain the mixture of the salt and substance to be analyzed. This tube was hermetically sealed at one end, and at the other of the shape represented at A 1, (Plate XXI. fig. 4. Chemical,) in order to facilitate the introduction of the mixture. When the mixture was introduced, this end was drawn into the shape A 2, in order to adapt its introduction into the small receiver B. C is a tube about twenty inches long, and a quarter of an inch in diameter, filled with dry muriate of lime in a rate of coarse powder; from one extremity of this, a bent tube D was connected with a small mercurial gasometer E; in this was introduced a small globular glass vessel, F, containing caustic potash, with the view of absorbing the carbonic acid. All the joints in this apparatus were made by small caoutchouc tubes, prepared by cutting thin pieces of that substance into the requisite shape, and prepping the newly cut edges together, which unite readily. The tube exposed to the fire was surrounded by a thin piece of tin plate, secured by wire to prevent its bursting. The apparatus was so managed, that by shifting the piece C the whole length of the tube could be heated in succession by the fire H, and thus the flow and uniform combustion of the whole substance be ensured. The other parts of the apparatus will be readily understood from inspection of the figures. At the end of the operation, the greater part of the water formed was found collected in the small receiver B; the remainder of course was found in the tube C, absorbed by the muriate of lime; and by subtracting the known weights previously ascertained of these portions of the apparatus, from their weights after the experiment was concluded, the quantity of water was accurately determined. The greater portion of the carbonic acid was attached to the potash in the vessel F, and its quantity ascertained by weight. The minute portion adhering to the foda derived from the oxymuriate of soda was ascertained as nearly as possible by estimation. The substances analyzed were all carefully dried at 212° in a vacuum with sulphuric acid, and were generally combined with oxalate of lead. The quantity burnt was from five to eight grains of the substance with thirty or forty grains of the oxymuriate of potash. For further particulars we refer our readers to Thomson’s Annals of Philosophy, vols. iv. and v.

Berzelius was induced to adopt the use of the oxymuriate of potash from the recommendation of Gay Lussac and Thenard. Before that time he had employed the brown oxalate of lead.

In the analysis of animal substances, and all compounds into which azote enters, the use of the oxymuriate of potash is very troublesome, and liable to great objections from the uncertain rate of oxidation of the azote. It became, therefore, an object of the first importance to replies a substance that would oxidize hydrogen and carbon, but not azote; such a substance has been happily lately pointed out by Gay Lussac. This is the black oxalate of copper, which, at a low heat, freely amounting to reds, parts readily with its oxygen to hydrogen and carbon, but not to azote. Berard, Dr. Prout, and others, have taken advantage of this in their recent analyses of several animal substances, as will be mentioned under their proper heads. The apparatus employed by Dr. Prout closely resembles that of Berzelius described above, but is more simple.

Dr. Prout in general prefers making separate experiments for ascertaining the gaseous and aqueous products, for the former of which he uses a simple tube only; for the latter, a tube with a small ball, analogous to the receiver of Berzelius, connected with a tube filled with dry muriate of lime. See for further particulars Medico-Chirurgical Transactions, vol. viii.

ANALYSIS OF SOILS. See Soils.

ANALYSIS OF MINERAL WATERS. See Water.

ANAMENIA, in Botany, a name corrupted by Ventenat, Jard. de la Malmaison, t. 22, from the Arabian appellation of some flowers of the family of Adonis and Anemone, Anabanan, to which the present genus is related. See Knolltona.

ANARHICHAS. 1. 6. The species of this genus enumerated by Gmelin are, Lupus, Minor, Pantherinus, and Strigosus.

LUPUS; shark, or wolf-fish. (See Lupus Marinus.)

This fish commonly frequents the deep parts of the sea, but in spring-time approaches the coasts, in order to deposit its spawn among the marine plants, &c. It is taken both in nets and by the line; and though the flesh is tolerable, its disgusting appearance prevents its being much used as food, except by the fishermen. The Greenlanders, however, eat it, both fresh and dried, and make convenient patches of the skin, in which they keep various kinds of utensils.

Minor. Cinerous, black, with sharper cartilaginous teeth; found near Greenland.

STRIGOSUS, with transverse dusky bands, racemose and somewhat less regular than usual; supposed by Dr. Shaw to be merely a variety; found in the British ocean.

PANTHERINUS; Panther wolf-fish, marked over the whole body with round brown spots. This is allied to the first species, but differs much in colour, being of a deep yellow, variegated with numerous, round, deep-brown or blackish spots of different sizes, the largest being on the back, upper part of the sides, and dorsal fin; its length is about three feet or more. A native of the Northern seas.

The root is perennial. Stems compressed, simple, sometimes branched in a proliferous manner; when simple they are without joints, and without sheaths, having at the base vertical, equitant, two-ranked leaves. Spike terminal, composed, each branch subtended by a sheathing deciduous bract; sometimes they are simple, or the flowers are solitary. The calyxes in some species form a kind of catkin, scarcely buding. The structure of the flowers and fruct comes nearest to Elginia, but the want of sheaths upon the flower, and the equitant vertical leaves, make a wide difference. This genus agrees with Lynisia, (see that article,) in having twin anthers, but differs altogether in habit.

1. A. fiabra. Rough-edged Anarthria.—Stems perfectly simple, flat, rough-edged as well as the leaves. Petals of the male flower: of the female the three innermost are smallest. Found by Mr. Brown on the north coast of New Holland.

2. A. levii. Smooth-edged Anarthria.—Stems perfectly simple, flatish, smooth-edged as well as the leaves. Petals of
of the male elliptic-lanceolate; of the female all nearly equal.—From the same country.

4. A. parvifolia. Slender-clustered Anarthria.—Stems simple, thread-shaped, comprefed, nearly resembling the folitary leaf, and likewise smooth. Clutter look, of few flowers. Flower-talks in pairs, unequal, shorter than the flowering bractea.—The male plant only was gathered by Mr. Brown, on the southern coast of New Holland.

5. A. prolifera. Proliferous Anarthria.—Stems branched in a proliferous manner, two-edged, leafy. Flowers either folitary or somewhat spiked.—Found in the same part of New Holland as all the preceding. Brown.

ANATOMY. For Ann. r. Anna.

ANDALUSITE, 1. 2, dele or granifio; l. 5, r. or rather granifio.

ANDERSONIA, in Botany, received that denomination from the pen of Mr. Brown, in honour of three different botanists of the name of Anderson. First, Mr. William Anderson, surgeon in the navy, the companion of captain Cook in two separate voyages, during the latter of which he died. Although most devoted to the study of man, and of the animal kingdom, in those new and remote regions which was his lot to visit, he did not overlook the vegetable world. Several of his manuscript descriptions exist in the Bankfian library, where characters of some new genera, since published under other names, are to be found. The genus in question also serves to commemorate Mr. Alexander Anderson, curator of the botanic garden at St. Vincent's, so important, in a national point of view, as a nursery for tropical plants, and for their interchange between our several colonies. Thirdly, this genus is well merited by a most affiduous and observing cultivator and botanist, Mr. William Anderson, F.L.S., now superintendent of the Apothecaries' celebrated garden at Chelsea. Let the writer of this be allowed to subjoin to Mr. Brown's list of these botanical worthies, the name of his lamented friend Mr. George Anderson, F.L.S., whose early death, owing to a melancholy accident, January 10th, 1817, is a real loss to science. No one had paid more attention to the cultivation and distinction of the different kinds of British Salices, or the beautiful exotic tribe of Pannia; on which last subject a paper in the Linnean Society's Transt. v. 12. 283, published under the care of his able friend Mr. Sabine, will always evince Mr. George Anderson's just claim to botanical commemoration.—Brown Procr. Nov. Holl. v. 1. 553. Dryand. in Ait. Hort. Kew. v. 1. 321.—Clas. and order, Pentandria Monogyonia. Nat. Ord. Erics. Jull. Epacridaceae, Brown.

Gen. Ch. Cal. Perianth inferior, of one leaf, chaffy, coloured, in five deep-equal, lanceolate segments, erect after flowering, permanent, accompanied at the base by two, or more, imbricated. scales. Cor. of one petal, wheel-shaped, in five very deep, linear-lanceolate, equal segments, nearly as long as the calyx, each of them bearded at the base. Nectary of five scales, below the germen, sometimes combined. Stam. Filaments five, inserted into the receptacle, linear, hairy, shorter than the corolla; anthers vertical, oblong, dirty. Fig. Germen superior, roundish; style simple, cylindrical, about as long as the ramus; stigma obtuse, crenate. Peric. Capule oblong, with five furrows, five valves, and five cells, the partitions longitudinal, from the centre of each valve. Seeds several, small, erect, inserted into the angles of the short central column.

Eff. Calyx in five deep segments, permanent, coloured, with two or more imbricated scales at the base. Corolla wheel-shaped, the length of the calyx; segments bearded at the base. Stamens inserted into the receptacle. Anthers unconnected. Nectary of five scales at the base of the germen. Capule of five valves and five cells, the partitions from the middle of each valve.

This genus consists of small shrubs, with squarrose, half-heathing leaves, no annular scars remaining on the demurred branches. Flowers terminal, either spiked or folitary, erect. Receptacles from the bottom of the capsule, short. Seeds but few brought to maturity. Brown.

In habit, as well as in the general structure of the fructification, nothing can be more absolutely like our Sprengelia (see that article); insomuch that no perfon could, at first sight, form any idea of a difference between the two genera. (See also Ponceletia.). The presence of scales at the base of the calyx, so unlike it as to be more properly termed, with Mr. Brown, bractea; but in that cafe not entitled to enter into the generic character; the five nectarioferous scales, wanting in Sprengelia; and the bearded base of the segments of the corolla; these are the distinctive marks of Andersonia. Similar differences serve to subdivide the original genera of Epacris and Styrphelia (see those articles); but, as it seems to us, the genera thence derived are better defined, and accompanied with some distinctions in habit. In the present infirnace, with the greatest deference to the acute and learned author of Andersonia, we should be inclined to reduce to one genus, under one effential character, plants so strikingly alike, and so different from all others. Genus dabht charaterem. One thing is certain, that we are in no danger of being suspected of wishing, by this means, to get rid of the name Andersonia, though Sprengelia, having been long previously established, must be preferred to it. Its character indeed must be reform'd, because we were originally acquainted with but one species, the only one, it seems, whose authors are connected. Such is the case with some species of Gentiana, but not with all. The following are Mr. Brown's fix species of Andersonia, ranged in two fections.

Sect. 1. Flowers with two scales, fringed.

1. A. sprengeloides. Spreading-leaved Andersonia. Br. n. 1. Ait. n. 1.—Leaves spreading; with a flat point. Flowers fringed.—Found by Mr. Menzies, at King George's found, on the south-west coast of New Holland. Sent to Kew, by Mr. Good, in 1803. It is said to flower most part of the year, being treated as a green-house plant. We received specimens from Meffrs. Lee and Kennedy's greenhouse in 1814, but this little shrub is far from being generally cultivated, nor has it yet been figured. The flm is a foot or more in height, determinately branched, round, rigid, smooth, all the branches covered with numerous, rigid, glaucous, fleshy, smooth, ovate, fipinous-pointed, entire leaves; roughish at the edges; clasping the stem at their base; each about a quarter of an inch long, permanent. Flowers pale rose-coloured, scileftes, in dense, short, leafy, terminal, upright spikes, not separately scalped, or racemofe, as in Sprengelia incarnata, but otherwise very remarkably resembling, in fize and colour, the elegant blossoms of that plant.

2. A. parvifolia. Small-leaved Andersonia. Br. n. 2.—"Leaves close-preffed; with a triangular point."—Discovered by Mr. Brown, on the southern coast of New Holland. We have not seen this species. The fipinous point of each
each leaf is somewhat triangular in the former, though with an obtuse keel.

Sec. 2. Flowers with many scales, solitary at the ends of small branches.

3. A. cerulea. Blue Anderonia. Br. n. 3.—“Leaves moderately spreading; the young ones, as well as the calyx, externally downy.”—Found by Mr. Brown, in the same part of New Holland as the last.

4. A. squarrosa. Squarrose Anderonia. Br. n. 4.—“Leaves prominent, divaricated and recurved, smooth; naked at the edges. Calyx and style smooth. Stem erect.” —Native of the same country, where it was gathered by Mr. Brown. We have not seen this, nor either of the two preceding.

5. A. depressa. Procumbent Anderonia. Br. n. 5.—“Leaves prominent, divaricated, twirled and recurved, downy; fringed at the edges. Calyx smooth. Style hairy in the middle. Stem depressed.”—Gathered at King George’s found, on the south-west coast of New Holland, by Mr. Archibald Menzies, to whom we are obliged for specimens. Mr. Brown also met with this species in the same country. The root is long and tapering. Stem hardly a fife long, much branched, for the most part in an alternate manner, thickly covered with imbricated, spreading, rigid, minutely pungent, lanceolate, variously twisted and projecting leaves; smooth and somewhat glaucous on both sides; dilated at the lower part, where especially the edges are fringed. Flowers larger than in the first species, sessile at the ends of the little lateral leafy branches, solitary, apparently flesh-coloured. Corolla densely clothed internally with long white hairs. Style just perceptibly hairy about the middle.

6. A. microntha. Small-flowered Anderonia. Br. n. 6.—“Leaves close-preffed. Style downy below the middle.” —Found in the same part of New Holland as the last, by Mr. Brown. We have seen no specimen.

ANDERTON, in Geography, a township of Ohio, in the county of Hamilton, having 1358 inhabitants.—Also, a township of East Tennessee, having 3959 inhabitants, of whom 200 are slaves.

ANDOVER, 2d article, l. 3, r. 3164; 3d article, l. 2, r. 1259; 4th article, l. 3, r. 977.

ANDOVER, East, a township of Maine, in the county of Oxford, having 264 inhabitants.

ANDRÆA, in Botany, a very curious and distinct genus of Mosses, is thus named by Ehrhart, in honour of his friend John Gerhard Reinhard Andræe. (See that article.) This genus was intended to have been entered by its author into the Supplementum of Linæus, with the printing of which he was entrusted. (See LINÆUS, or VON LINNE, CHARLES.) Such was the cafe with many others, belonging to the same natural order, and now well-established, though the younger Linneus then forbad their admission into his book. Ehrhart called it Andræa, but the above orthography is justified by many familiar examples among learned botanists.—Ehrh. Hann. Mag. for 1778, 1601: Biebrage v. i. 15 and 180. Hedew. Sp. Mufc. 47. Turn. Mufc. Hib. 13. Sm. Fl. Brit. 117. Comp. ed. 3. 153. Hooker Tr. of Linn. Soc. v. 10. 381. Mufc. Brit. 1. t. 11. —Clas and order, Cryptogamia Mufci. Nat. Ord. Mufci.

Gen. Ch. Male, terminal, bud-like. Anh. three to seven, nearly cylindrical, somewhat flattened, interspersed with numerous, jointed, fuscous threads, swelling upwards, taller than themselves.

Female, terminal, sessile. Sheep of several imbricated concave scales, shorter than the fruit-flask, which is cylindrical, scarcely longer than the capfule, tumid at its base. Peric.

Vol. XXXIX.

Capsule on a turbinate fleshy base, ovate or cylindrical, somewhat quadrangular, of four equal oblong valves, separating longitudinally, cohering at their points, under the permanent lid: column cylindrical, about as long as the valves: lid minute, conical, permanent, confining the points of the valves. Veli membranous, pellucid, bell-shaped, torn irregularly from its base, and finally turned to one side, crowned with the flithly prominent style. Seeds minute, spherical, brown.

Eff. Ch. Capsule of four valves, cohering at the summit, crowned by the permanent lid. Veil irregularly torn.

Ehrhart first removed this genus from Jungermannia, with which it had been confounded, and properly referred it to the order of Mufci. But he mislooked, as he well might, the valves of the capsule for its fringes or teeth; an error first corrected by Mr. W. Hooker, who, in the Trans. of the Linn. Soc., has first given a just and clear view of the subject. In his Mucologia Britannica the famous author remarks, that the supposed fruit-flask, as he himself had heretofore called it, is merely an elongated receptacle, bearing some abortive petals. This is certainly true, but we conceive it neverthelefs to be analogous to the more extended fruit-flask of the generality of Mosses, truly wanting in Sphagnum. All the known species of Andræa are British, and amount to four.

2. A. rupestris. Dusky Rock Anderonia. Hedew. Sp. Mufc. 47. t. 7. f. 2. Engbl. Bot. t. 1277. Hook. Tr. of Linn. Soc. v. 10. 391. t. 31. f. 2. Mufc. Brit. n. 2. t. 8. (Jungermannia rupestris; Linn. Sp. Pl. 1601, excluding the synonym of Dillenius.)—Stems branched. Leaves ovate, taper-pointed, rilhefs; upper ones falcate. —On rocky mountains throughout Great Britain. Hooker. Smaller and greener than the former, with which it agrees in the want of a mid-rib; but differs from it in the tapering, more or less curved, leaves. All botanists confounded this species with the following, till Dr. Roth distinguished them chiefly by the presence of the mid-rib in that species.

—This, according to Mr. Hooker, is common on alpine rocks. We have often gathered it in dry exposed situations, in Weftmoreland, as well as Scotland, where it composes little dense tufts, of a very dark or blackfih hue. The fame
is also found in Germany, and doubtless in other mountainous parts of Europe. Like both the foregoing, it bears cap-
flues in the spring and summer. The presence of a strong rib in the leaves clearly distinguishes it from those species, though the paler, blunt, and more oblong, scales of the leaf have no rib. The stem, generally almost simple, are occasionally much branched, as in Eng. Bot.

4. A. niveulus. Tall Slender Andrea. Hook. Tr. of Linn. Soc. v. 10. 395. t. 31. f. 4. Mucf. Brit. n. 4. t. 8. Eng. Bot. t. 2334. (not 2507.)—Stems branched. Leaves loosely imbricated, lanceolate, single-ribbed, curved towards one side. Scales of the leafh, similar.—Gathered by Mr. Hooker and Mr. Borrer, on rocks upon the highest summit of the Scottish mountain Ben Nevis, at the eastern end. It is, like all the reil, perennial, bearing capflues in summer.

This is by far the tallest Andrea known, being three inches high, or more, forming rather lax olive-brown tufts, tinged with a chocolate-colour, of which leaf hue are the capflues, whose subflance is strongly reticulated. The scales of the leaf, being of the same lanceolate figure, furnished with a mid-rib, as the leaves, clearly defines the species. Mr. Hooker has observed this moss on the granite rocks of the most elevated of the Swiss alps, retaining all the characters of the Scottish specimens.

ANDROMACHA, l. 1. r. Zygena.

ANDRORNICUS II, PALEOLOGUS, in Biography, son of Michael Paleologus, succeeded to the Greek empire in 1283. He is characterized as learned and virtuous, but feeble in his conduct, and abjectly superstitious. His old age was embittered by blindness and neglect; and having assumed the name of Father Antony, he closed his unquiet life four years after his abdication, A.D. 1332, aged 74.

ANDRONICUS III, Paleologus, the younger, was the son of Michael, eldest son and colleague of the elder Andronicus. With his grandfather he was a favourite, on account of his wit and beauty; and he was thus led into habits of intemperance and debauchery, which involved him in difficulties and disgrace. Having compelled his grandfather to abdicate in 1328, he reigned alone, and contended against the Bulgarians and Turks, with the latter of whom he signed an ignominious treaty, relinquishing to them all the places which they had taken in Asia. At length, exhausted by his vices, he died in his 45th year, A.D. 1341. Gibbon.

ANDROPHYLAX, in Botany. See WENDLANDIA.

ANEILEMA, from am, without, and iene, an involu-

crum, this genus being separated by Mr. Brown, Prodr. Nov. Holl. v. 1. 270, from COMMLA, (see that article,) on account of the want of the large folded involu-
crum, or rather bractea, which in Commlina contains a considerable number of flowers; whereas in Anilema the inflorescence is scattered, somewhat panicked. The difference between the two resides therefore in this part of the plant, and not strictly in the fructification.

The known species of Commlina referred by Mr. Brown to Anilema are, vaginata, nudiflora, and spinata of Linnaeus, medica of Loureiro, Vahl Enum. v. 2. 175. n. 28; and gigantea of Vahl, n. 34, found by Mr. Brown, in the tropical part of New Holland. To these the author adds nine new species, found by himself, either in New South Wales, or the warmer parts of New Holland, one of them only being described from the collection made in the latter country by Sir Joseph Banks. Some have smooth filaments, others bearded ones. It is suspected that Pollia of Thunberg may not be genericly distinct from these; but the fruit in our specimen is evidently a berry, according to Thunberg's de-

scription, and remarkable, even after having been dried more than thirty years, for its bright blue colour. (See Pollia.) The habit and inflorescence are indeed, as Mr. Brown ob-

erves, similar to his Anilema. Whether Cartonema of this author be distinct, we do not presume to judge, having seen no specimen. In the regularity of its flowers, and the equality of their stamens, it differs from Commlina and Anilema, and agrees withTradescantia, but differs from the latter in several particulars pointed out by Mr. Brown, besides its spiky inflorescence.

ANEMIA, a genus of ferns, separated from Os-

munda, (see that article,) by Dr. Swartz, and thus named from anemos, naked, or not covered; because its capflues are distinet of all covering or involucrum whatever. — Swartz Syn. Fil. 155. Wild. Sp. Pl. v. 5. 89. — Art. Hort. Kew. v. 5. 498.—Clads and order, Cryptogamia Filices. Nat. Ord. Filices, lect. 2, spicr. gyrata.

Eff. Ch. Capflues somewhat turbinated, concentrically fruited at the top, burfting laterally, seflile on one side of a compound linear receptacle. Involucrum none.

The habit of this genus is different from Osmunda, and extremely remarkable, on account of its compound spikes, always perfectly distinct from the leafy part of the frond, and generally situated in pairs, on long flanks, on the common flalk at the base of that leafy part. Such at least is the case with the whole of the first section; in the second, the fruit-bearing flanks are radical and foliary. It is closely related to Botrychium, to be described hereafter; but that has globular capflues of two distinct valves, neither fruited nor annulated. Their receptacles, indeed, exactly agree; and the flax are so obscure in Anemia, that we are much inclined to unite it with Botrychium.

Secl. 1. Panicles of spikes in pairs, flaked, at the base of the leaf.

O. lanceolata et subtilissima ferrata; Plum. Fil. 133. t. 156.

O. racemifera, phyllitidis fohio vix crenata; Petiv. Fil. n. 163. t. 8. f. 15.)—Frond pinnate; leaflets ovato-lance-

olate, pointed, finely ferrated, smooth as well as the common flalk. — Native of South America and the West Indies. Brought from Brazil, by the late Sir George Leonard Staunton, in 1793. A very handsome fern, eighteen inches or two feet high, its tufted root producing several upright fronds. Each of these consists of a smooth, rather slender, straight common flalk, bearing at the top an upright simply pinnate leaf, of from four to eight pair of smooth, veiny, bluntly ferrated, somewhat flaked, leaflets, besides an odd one; their length from two to four inches. Close to the base of this pinnate leaf, on the upper side, or front, are stationed a pair of equal, long-flaked, triply pinnate spikes, of minute, pale, very numerous, capflues, ranged in double rows along one side of the linear compound flalk, or recepta-

cle, the common flalk of the whole being somewhat hairy. These compound spikes always rise a little above the point of the terminal leaflet.

O. hirifuta, lonchitidis folio; Plum. Fil. 134. t. 157.

O. specis geminisi; Petiv. Fil. n. 164. t. 14. f. 5. Lonchitis hirifuta florida; Plum. Amer. 18. t. 26.)—Frond pinnate; leaflets oblong-lanceolate, hairy, finely ferrated, and somewhat cut; very unequal at the base. Stalks all hairy.—Native of the West Indies. Smaller in every part than the last, being scarcely above a foot high; and distinguished also by the great dilatation of the upper side of each leaflet, at its base. The upper ones run into a sort of pinnatifid elongated point.
point. Both sides of the leaflets are hairy in our specimen, as Plummer describes them; though Willdenow and Swartz call them smooth. The denfe, twin, hairy, twice-compound spikes usually rise a little above the leaf.

3. A. edelnoed. Many-leaved Anemia. — Frond pinnate, longer than the spikes; leaflets numerous, parallel, oblong, obtuse, serrated, smooth; rectangular on their upper side at the base. — Brought from Brazil, by the late Sir George Leonard Staunton, from whom we received specimens in 1793. We cannot find any figure or description of this species, though a very remarkable one. The common stalk, in its naked part, is smooth. The leaflets are about forty pair, parallel and crowded; the lowestmost an inch and a quarter long, and opposite; upper ones gradually smaller and alternate; all together forming a linear-oblong frond, eighteen inches in length, with a slightly hairy common rib, which, by a hairy bud at the summit, seems as if it would take root there. Spikes lax, twice compound, measuring with their thirty hairy stalks, about two-thirds of the length of the leafy part. Their subdivisions are extremely narrow.

4. A. oblongifolia. Oblong-leaved Anemia. Swartz n. 3. Willd. n. 3. (Ofmunda oblongifolia; Cav. Ic. v. 6. 69. t. 592. f. 2.) — Frond pinnate; leaflets ovate, obtuse, dilated at the upper angle of their base, fringed. Stalks smooth. — Gathered by Louis Née at Panama. Several flalked fronds, hardly six inches high, sprin from the hairy crown of the tufted root; some of them barren. The leaflets of each are about ten pair, rather alternate than opposite, half an inch long, rounded at their extremity, as well as at the dilated angle. Both spikes rise much higher than the leafy part, on slender stalks, and appear to be rather denfe. We know this and the following from the work of Cavanilles only.

5. A. humilis. Dwarf Anemia. Swartz n. 4. Willd. n. 4. (Ofmunda humilis; Cav. Ic. v. 6. 69. t. 592. f. 3.) — Frond pinnate; leaflets ovate-wedge-shaped, abrupt; create at the extremity; hairy beneath. Common frond hairy. — Native of Tabago, an island on the Mexican coast, near Panama. Of more humble stature than the last, and further distinguished by the wedge-like shape of its leaflets, which are fewer, rather larger, create, and not fringed. The spikes are much smaller than in the foregoing, raised high upon slender smooth stalks.

6. A. filiformis. Slender Hoary Anemia. Swartz n. 5. Willd. n. 5. (Ofmunda filiformis; Lamarck Dict. v. 4. 652.) — Frond pinnate, downy and hoary; leaflets oblong-wedge-shaped, obtuse; jagged at the extremity. Common frond hairy. — Gathered in South America by Mr. John Frazer, who is reported to have communicated a specimen to Lamarck. We have never seen this plant. It is described as eight or nine inches high, beprinkled in every part with white or hoary hairs. Leaflets fiiriated very copiously and conspicuously beneath. Spikes slender, compound, on capillary stalks, rising high above the leaf. 

7. A. tenella. Delicate Anemia. Swartz n. 6. Willd. n. 6. (Ofmunda tenella; Cav. Ic. v. 6. 69. t. 592. f. 1.) — Frond pinnate; leaflets lanceolate, deeply pinnatifid, with linear-awn-shaped fringed segments. Common frond smooth. — Found by Louis Née, on the trunks of trees in Quito, especially on mount St. Antonio. A slender delicate fern, about five inches high, whose leaflets have many fine, acute, partly opposite, segments. The spikes are somewhat taller than the leaf.

8. A. hirtuta. Hairy Anemia. Swartz n. 7. Willd. n. 7. Ait. n. 1. (Ofmunda hirtuta; Linn. Sp. Pl. 1520. O. mollitirt hirtula, et profundè lacinata; Plum. Fil. 139. t. 162. O. spicis geminis villosa; Petiv. Fil. n. 165. t. 8. f. 16. Lunaria eliator, matricaria floio, spicæ duplici; Sloane Jam. v. 1. 71. t. 25. f. 6.) — Frond pinnate, hairy; leaflets deeply pinnatifid; segments tapering downwards; obtuse and jagged at the extremity. — Native of the West Indies, growing on rocks. About a foot high, hairy all over, except the spikes and their stalks. Several of the fronds are barren, which we presume is the case with most of the neighboring species. Each leaflet is about an inch and a half long, with many narrow-wedge-shaped, deep, frilled segments, hairy on both sides, and sharply notched. Each spike, near three inches long, is doubly pinnate, with flat close segments, broader than in most of the genus, and the capsule are represented by Plummer as marginal, and blackish, with much more intermediate space than usual on each segment. Willdenow adverts to this circumstance, and the hairiness of the common stalk, as indicating a specific difference from that figure. He is, however, the original authority for Anemia, or Ofmunda, hirtuta, and Petiver copies him; but Sloane's synonym must be referred to the new species, if such be established.

9. A. deltoidea. Triangular Anemia. Swartz n. 8. Willd. n. 8. (Ofmunda deltoidea; Cav. Ic. v. 6. 70. t. 593. f. 1.) — Frond triangular, pinnate; leaflets deeply pinnatifid, with rounded, create, crowded segments; glaucous above; hairy beneath. Common frond hairy at the upper part. — Found on rocks in the plain of Buenos Ayres, by Louis Née. A plant high, with broader and rounder segments of the leaflets than any of the foregoing. The divisions of the common receptacle of the spike also are broader, and more rounded, than usual, approaching to those in Plummer's plate of the last.

10. A. villosa. Shaggy Anemia. Willd. n. 9. — "Frond doubly pinnatifid, oblong, shaggy on both sides; segments roundish-ovate, obtuse, entire; the lower ones obliquely three-lobed. Common frond hairy." — Gathered by Humboldt and Bonpland in South America. Common frond fixes inches high, or more, roundish, clothed with short rusty wool. Frond three or four inches long, covered with rusty hairs; the upper segments roundish-ovate, very blunt, and entire; lower with two or threeflight lobes; common rib densely shaggy. Spikes triply compound, denfe, taller than the leaf, with hairy ribs and stalks. Apparently akin to the commonly, but the outline of the frond is oblong, not triangular, and the rib slait, not zigzag. Willdenow.

11. A. flexuosa. Zigzag Anemia. Swartz n. 9. Willd. n. 10. (Ofmunda flexuosa; Lamarck Dict. v. 4. 652.) — "Frond doubly pinnatifid, triangular, downy; segments oblong, obtuse, nearly entire; common rib zigzag. Common frond downy." — Supposed to be a native of Peru, but for this there is no direct authority. We have seen no specimen. Savigny in Lamarck describes this species as related, in many respects, to A. hirtuta, n. 8, but the principal leaflets are simply pinnatifid. The fronds are about a foot high, semi-cylindrical, channelled, besprinkled with rather rigid, tawny hairs. Fronds from five to seven inches long, with narrow, deeply pinnatifid, leaflets; their segments oval, or somewhat oblong, nearly opposite, very blunt, decurrent, ribbed, entire, or slightly notched; paler beneath.
The summit of each frond is obtuse, and sharply pinnatifid. Spikes triply and minutely compound, with linear short segments; their flanks hispid.

12. A. obtusifolia. Downy Anemia. Swartz n. 10. Willd. n. 11. (Osmunda obtusifolia; Lamarck Dict. v. 4. 652.)—Frond doubly pinnate, oblong, clothed with tawny down; leaflets crescent-shaped, entire; the lower ones bluntly pinnatifid. Common flake downy. —Found by Commerson at Buenos Ayres. A pretty species, seven or eight inches high, exalining the smell of myrrh, and covered all over with fine, long, cottony, tawny down. The common flake is rather stout, twice the length of the leafy part, which is about two inches broad. Spikes compound, on slender decurrent flanks. Savigny.

13. A. falcata. Tawny Branching Anemia. Swartz n. 11. Willd. n. 12. (Osmunda falcata; Cavan. Ic. v. 6. 70. t. 593. f. 2.)—Frond doubly pinnate, triangular, somewhat downy; leaflets elliptic-oblong, bluntly pinnatifid, or serrated. Spikelets partly whorled. All the flanks hairy. —Gathered by Louis Née, on the hill called Pan de Azucar, or the Sugar-loaf, thirty-two miles from Montef Video. Above a foot high, with very hairy flanks, and a broad frond, doubly pinnate throughout, except at the very top. Leaflets three-quarters of an inch long, and one-third as broad, uniform, somewhat decurrent. The spikelets seem to be simply compound, their branches horizontal, linear, deeply notched, many of them in whorls of three or four together; their common flanks and ribs hairy, leaving off one or three lateral branches, which we have seen in no other species.

B. Willd. (A. aplecnifolia; Swartz n. 10. Osmunda aplecnifolia; Savigny in Lamarck Dict. v. 4. 652.)—Frond doubly or triplo pinnate, triangular; leaflets obovate, sharply toothed at the end, partly notched, hairy, as well as their common rib. Common flake nearly smooth. Spikelets digitate.—Native of the West Indies, particularly of Hispaniola, in dry rocky or rocky places. Its large handsome frond, inflating, fracted, fronds bears considerable resemblance to our common Aplecnium Adiantum-nigrum, to which, and not to the real genus Adiantum, the specific name alludes. The naked flake is often a foot high; the length of the leafy part almost as much. The copious leaflets measure about half an inch, and are strongly fracted; convex above; paler, and rather mottled hairy, beneath; all their flanks hairy. Spikes somewhat panicled; their ultimate divisions radiating, or finger-like, linear, flat. Capsules of a light shining brown.
