from observing the great accumulation of juli, chives, or
chaff of the buds of trees and plants, in the peat marshes of
our low lands, in his edition to the 21st part of his Na-
tural History of the Earth, p. 125, considers the fame as an
evidence that the Mosaic deluge happened in the spring
season, as related; not considering that the floods of every
spring and summer will bring down such floating bodies in the
river, and deposit them on their banks and shores in the
level parts of their course.

JULIA DONNA, in Biography, second wife of the
emperor Severus, was a woman of great accomplishiments,
a native of Emesia, in Syria, and daughter to Baianus, priest
of the fun. In early life she applied herself to the study of
geometry and philosophy, and became as celebrated for her
mental as for her personal charms. She came to Rome, where
her learning recommended her to all the literati of the city.
At twenty years of age she married Severus, who, twenty
years after this matrimonial connection, was invested with the
imperial purple. Her accomplishments made very little im-
pression upon the heart and character of her husband, who,
after a time, became so jealous of her, that she thought it
right, probably from a conceitfulness of guilt, and from a
desire of safety, to withdraw from all public affairs, and oc-
cupy her time wholly in the study of letters. She was fully
capable of literary merit, and invited to her court men dis-
finguished for literary reputation, and it was at her desire
that Philostratus wrote the life of Apollonius Tyaneus.
Her influence, after the decease of the emperor, was for a
time productive of tranquility and union between her sons
Caracalla and Geta. She opposed the plan of dividing the
empire, but her attempts were unsuccessful, and to far from
being able to effect a fraternal union, she was obliged to
be the witness of the murder of her favourite son Geta,
stabbed in her own arms by the order of Caracalla. It is
said that herself was wounded in endeavouring to ward
off the fatal blow. She soon recovered from her grief, by
the flattering attention paid to her by Caracalla, and by his
placing her name among his own in letters to the senate
and people. Her influence could not prevent him from
practising those follies and enormities which led to his ruin,
and his death plunged her into the deepest affliction.
Re-
covering from her grief, she hoped to shun the government
with Macrinus, the successor of her son, and being disap-
pointed in this she retired from court, and died in 217.
It is generally admitted that she starved herself to death, but
whether from the dread of Macrinus, or to free herself from
the pains of a cancer, has not been ascertained. She had
experienced all the vicissitudes of fortune; from an humble
state she had been raised to greatness, only to taste the
superior bitterness of an exalted rank. Gibbon. Unive.

JULIA, in Ichthyology, a name given by Salvin and Gaza,
to the genus of the Latin writers is
general, and by the Iturus, donardina. It is a species of the
Linnaeus, according to Aresch, and is distinguished by that
author from the other fish of that kind, by the name of the
variegated labrus of a palm long, and having two larger
teeth in the upper jaw. See Labrus Ursus.

JULIAN, Flavius Claudius Julianus, in Biography,
Roman emperor, the son of Julius Constantinus, brother
of Constantine the Great, was born at Constantiopolpe in the
year 331, and was 3 years of age at the time of the massacre
of the collateral branches of the Flavian family, after the death
of Constantine, from which only himself and his elder brother
Galbus were saved. The young princes were extremely
well educated; and being brought up in the Christian re-
ligion, were baptized, and admitted to some inferior ecle-
siastic offices. Julian publicly read the Scriptures in the
church of Nicomedia. Gallus was invested with the
imperial purple as Caesar, in the twenty-fifth year of his age;
and though he behaved with fraternal affection to Julian,
his conduct was tyrannical and disgraceful, and soon
brought him to his end. (See Galus.) From the time
that his brother was made Caesar, Julian was freed from
every restraint, and put in possession of ample patronage.
He had imbibed strong prepossessions in favour of the doc-
trines of Paganism, which were fostered by the leisures
of some philosophers of the Platonic school. From Maximus
he received a secret intimation into the mysteries of the science
of therurgy. From his abandoning the principles in which
he had been educated, he has obtained the title of "The
Apostate." At the fatal catastrophe of his brother Gallus,
Julian partook of this dilference, and was kept some time at
the court of Milan, an object of suspicion. At length
he was allowed to retire to Athens, where he was confirmed in
all his notions; so that there probably did not exist in the
Roman empire a more ardent votary for Paganism than he.
About the year 355, he was recalled from his idyllic
retreat to court; was declared Caesar, and married Helena,
the emperor's sister. He was now employed in military en-
terprise, and in a short time made several expeditions, in
which he humbled the pride of many kings, and recovered
20,000 captives. The rising reputation of Julian was re-
garded with envy and jealousy by the emperor, who, to
prevent him from becoming dangerous, deprived him of the
principality of his army. By this, Julian was reduced to
great distress; he was, however, determined to submit.
He accordingly made his soldiers a speech from the tribunal,
exhorting them to loyalty and obedience; and gave the of-
cicers a farewell entertainment. Their reluctance to quit a
commander, to whom they were so much attached, was
augmented by this interview; and in the night, the soldiers
encompassed the palace, and saluted Julian as the emperor.
The prince strenuously rejected the professed honours, and
by securing the doors, endeavoured to exclude his perfidy
from their tutelary attachment. Till the third hour of
the day he remained inflexible to their prayers, their
reproaches, and menaces; when being informed, that if he
wished to live, he must content to reign, he complied with
their
JULIAN.

...their wishes. He immediately addressed, in his own name, and that of the army, a letter to Constanitius, acquitting him with the event, and soliciting the confirmation of the dignity of Augustus, but still acknowledging his supremacy as head of the empire, and offering to remain contented with the administration of the western provinces of Gaul, Spain, and Britain. Constanitius received his communication like an offended sovereign, refused to admit his assumed title, and commanded him to return to his duty, with the rank which he formerly possessed. Julian now held him at defiance, and dispersed manifestoes justifying his conduct; of which one of the most characteristic was an extant is an epistle to the senate and people of Athens, whom, as a philosopher, a scholar, and a worshipper of the gods of Greece, he seems to have regarded with peculiar respect. In his progress he was stopped by the reclusion of Aquileia, held by the troops of Constanitius; and the approach of that emperor, with his veteran legions, prepared a bloody conflict, which was happily prevented by the sudden death of Constanitius on the confines of Cilicia. Julian, now in the thirty-second year of his age, entered Constanitine amid universal acclamations, and was acknowledged the sole sovereign of the Roman empire. His elevation to supreme power made no alteration in his character: he was a philosopher on the throne, as far as that title is merited by strict temperance, disregard of idle pomp, and trifling amusements; the diligent employment of his time in active occupations, or the pursuit of mental improvement, and conscientiously to fulfill the duties of his station. The ruling passion of Julian was to restore the heathen religion in all its ancient splendour; and to this, in various influences, he sacrificed both policy and justice. He wrote an elaborate work against the truth of Christianity, of which some fragments only have come to modern times. An edict of general toleration was his first measure, which produced the re-opening of all the heathen temples, and the return of Christian lecturers, who had been banished by the late emperor. He endeavoured to render Paganism more respectable in the eyes of the public, by certain regulations for securing the morals of the priesthood. He invited to his court all the eminent philosophers, and men of learning of that persuasion; and he encouraged professors, by tokens of imperial favour. The restoration of the ancient temple of Jerusalem attracted the ambitious mind of the emperor, who flattered himself that the completion of the undertaking would be at least a specious argument against the faith of prophecy, and the truth of revelation. To accomplish it, he employed one of his ablest generals, and ordered the governor of Palestine to lend his most zealous support in restoring the work of Solomon to its pristine beauty. But neither the power of an emperor, the resources of an empire, nor the enthusiasm of a whole people, could effect the purpose. A commencement was made of this work; but the builders were interrupted by extraordinary eruptions of fire, which obliged them to abandon their undertaking. Though restrained either by prudence or temper from the violence of persecution, Julian systematically purified measures calculated to degrade and deprecate the Christians. He treated them with the language of sarcasm and contempt, deprived them of the management of charitable contributions, and levelled all the honours of senatorial rank. He forbade all Christians from acting as teachers of grammar and rhetoric, or the liberal arts; thus compelling their youth to remain uneducated, or to receive, with the rudiments of learning, impressions subversive of their faith. He excluded them from polls of trust and honour; and condemned them to make ample amends for the destruction of Pagan temples in the preceding reigns, and restitution of lands and revenues, which had been converted to the use of their own religion. The love of military glory was another passion by which Julian was actuated; and the field which he thought most worthy of its indulgence was the Persian empire, long the rival and formidable foe of the Romans. When he crossed the Euphrates, he burned his ships, that his soldiers might proceed with firmness and resolution. He defeated the Persians drawn up to oppose him, and pushed on to the gates of the capital. Milled by treacherous guides, he was presently reduced to a severity of provisions; and he found that the only means of safety for his army consisted in retreat. In the mean time, the whole force of the Persian empire was assembled, and clouds of light troops harassed the Romans on every side, while the main body of the Persian host advanced in formidable army. Julian performed every duty of a soldier and a general, partook in every fatigue and hardship, and was present wherever danger was most urgent. The attacks of the enemy were several times repelled: at length Julian was mortally wounded, fell senseless from his horse, and was conveyed from the field in a state which announced approaching death. Sensible of his situation, he pronounced a farewell speech to the surrounding officers, and directed the disposal of his private property; after which, he entered into a metaphysical discussion with regard to the nature of the soul. Exhustied by these efforts, he called for a draught of cool water; and as soon as he had swallowed it, calmly expired, on June 26th, 361. The character of no eminent person has been more differently represented by friends and enemies. Of his writings, which are composed in the purity of the Greek language, one of the most curious is entitled "The Caesars," which, in the form of a fable, freely discusses the characters of the several emperors, their predeccessors. He gives the decided preference to Marcian Antoninus, whom he made his model in his religious and philosophical quality, although in temper he was a very different man. The learned Spanheim gave an elaborate edition of his works in Greek and Latin, in folio, 1696. Julian's partiality for every thing Greekian had induced into his mind a love of liberty, and a sense of the national equality of mankind; and he rejected with abhorrence the haughty title of "Lord," which the Romans had introduced in addressing the master of the empire. He also imitated the habit of the emperors, in paying respect to the confusal dignity, and obedience to the laws of the state. He frequently sat upon the bench as judge, and administered justice with great impartiality between the rich and the poor. He poffessed sound ideas of legislation; and it is to the credit of his character, that, of the laws enacted during his short reign, sixty-four have been received into the codes of Theodosius and Julian. Univer. Hist. Gibbon's Rom. Hist. vol. iii. and iv.

...The most ancient proof of an instrument, resembling a modern organ, blown by bellows, and played with keys, very different from the hydraulicon, which is of much higher antiquity, is a Greek epigram in the Anthologia, attributed to the emperor Julian, who flourished about 364. We shall here give a literal translation of this epigram, which, though it contain no very beautiful or poetical images, will answer the historical purpose of ascertaining the existence of an instrument in the fourth century, which, in many particulars, represedes a modern organ. We shall infer the original here, for the satisfaction of the learned reader, from the Anthol. lib. i. cap. 80. 8.

[Epigram text in Greek script]
"I see reeds of a new species, the growth of another and a brazen foil; such as are not agitated by our winds, but by a blast that rushes from a heathen cavern beneath their roots; while a rubifllo mortal. (87e5x9), a tall flurid fellow, alluding to the force necessary to beat down that kind of clumsy ramden keys of this rude instrument of new inventions, running with fiff wings over the concordant keys, the rulers of the pipes, and, literally lip7e, makes them, as they smoothly dance, emit melodious sounds."

Nothing material is omitted in the version of this epigram, or rather enigma, upon the organ, though not a very ingenious one; for the word ake, the pipe, discovers the whole mystery.

Julian Calendar, Epocha, and Period. See the fuldactives.

Julian Law. See Papian Popex Law.

Julian Tear. The Julian is the old account of the year, used among us in England till 1752. It is so called from its founder Julius Caesar; and by that name is distinguished from the new, or Gregorian account, used in most parts of Europe. See Year.

Julians, in Botany. See Dianella Violet.

JULIEN, SAINT, des Merguieres, in Biography. M. Millet, in his History of the Troubadours, tells us, that William IX. count of Poitou, in one of his poems, after relating a particular adventure with a common woman in very free terms, and reflecting upon his bonnes fortunes, or favour with the ladies, thanks God and St. Julian for his success. "It was then," says M. Millet, "customary, such was the superstition of the times, for libertines to invoke heaven for succours in their most profligate undertakings; and St. Julian was the particular saint and protector to whom they addressed themselves upon such occasions;" as, in higher antiquity, Mercury was the patron divinity of thieves.

This saint, in order to expiate an involuntary crime, is said to have made a vow that he would receive into his house all passengers who should be in want of a habitation, by which he obtained the title of the "Hospitable Saint," and was afterwards addressed as the patron of travellers, to whom prayers were made for a good lodging. "L'Oraifon de St. Julien, et l'Hôtel de St. Julien, were afterwards used by the French in pleanty, and in the same sense as with its dining with dolbe Humprey. But in the tales written in old French so early as the twelfth century, the allusion was more licentious Boccace (Giorn. II nov. 2) speaks of the "Paterniro di San Giuliano," and makes Rinaldo, after a successful adventure with a female, return thanks to God and St. Julien: "Per la qual cosa Rinaldo Iddio, et San Giuliano ringraziano, montò a Cavallo." La Fontaine, who has translated this tale, calls it "L'Oraifon de St. Juleen."

JULIEN, ST. in Geography, a town of France, in the department of the Jura, and chief place of a canton, in the district of Lons-le-Saulnier; 18 miles S. of Lons-le-Saulnier. The district contains 809, and the canton 7098 inhabitants, on a territory of 120 kilometres, in 20 communes.—Alfo, a town of France, in the department of the Côte d'Or: nine miles N.N.E. of Dijon.—Alfo, a town of France, in the department of the Leman, and chief place of a canton, in the district of Geneva; five miles S.W. of Geneva. The place contains 750, and the canton 11,671 inhabitants, on a territory of 1073 kilometres, in 24 communes.—Alfo, a town of France, in the department of the Rhône and Loire; 10 miles E.S.E. of St. Etienne.

JULIEN'S, St. Bay, a large bay, containing a port, on the coast of Patagonia. S. lat. 49° S. W. long. 67° 43' 30'.

JULIEN en Champfleur, St., a town of France, in the department of the Higher Alps; six miles N. of Gap.

JULIEN de Chapeil, St., a town of France, in the department of the Upper Loire, and chief place of a canton, in the district of Le Puy; seven miles E. of Le Puy. The place contains 2151, and the canton 74,489 inhabitants, on a territory of 1721 kilometres, in 7 communes.

JULIEN d'Airy, St., a town of France, in the department of the Vienne, and chief place of a canton, in the district of Poitiers; six miles E. of Poitiers. The place contains 281, and the canton 4937 inhabitants, on a territory of 2075 kilometres, in 13 communes.

JULIEN de Montagnier, St., a town of France, in the department of the Var; nine miles N.W. of Bargols.

JULIEN de Pouvenue, St., a town of France, in the department of the Lower Loire, and chief place of a canton, in the district of Chateaubriant; seven miles S.E. of Chateaubriant. The place contains 1421, and the canton 5676 inhabitants, on a territory of 2141 kilometres, in 6 communes.

JULIEN du Saul, St., a town of France, in the department of the Yonne; six miles N.W. of Joigny.

JULIERS, Duchy of, lately a country of Germany, but now annexed to France, and forming a part of the department of the Roer. This duchy was formerly bounded on the N. by the duchy of Gueldres, on the E. by the ecclesiocese of Cologne and the Rhine, on the S. by the teritories of Blankenheim and Schleiden, and on the W. by the bishopric of Liege, the duchy of Gueldres, and the Maafe. The soil is fertile, producing corn in abundance, and yielding good meadow and pasture land; it furnishes a good breed of cattle and of horses. Wood is plentiful, and linen is manufactured. Near Elchweiler stone-coal is found. In this duchy are 20 towns, and about 11 free boroughs. See Roer.

JULIERS, a town of France, in the department of the Roer, and chief place of a canton, in the district of Cologne, situated on the Ruhr. It is said to have received its name from the Romans. The town is small but strong, and has a regular citadel. It has a church and a convent, and without the walls are a Calvinist and a Lutheran church. The place contains 2125, and the canton 12,639 inhabitants, in 28 communes. This town surrendered at difference to the French troops in October 1794, after a severe battle between the Aultrians and French. N. lat. 50° 54'. E. long. 6° 18'.

JULIFUNDA, a town of Africa, in the country of Dentil; 10 miles W. of Bambereille.

JULIS, a mountain of the Grisons, N. of the Upper Engadine; eight miles S.W. of Zulz.

JULIS, in Ichthyology, the name of a small fish, a species of the labrus, caught principally about Genoa, and sold in the markets, being a very delicately tailed fish. Its usual size is about the length, and a little more than the breadth of a finger. The males of this species are very beautifully painted. Their backs are green, and their heads have variegations of yellow and red. Its sides have very broad serrated lines of a fine gold yellow, and its back fin has several large spots of blue and red. They are fond of human blood, and will seize upon the legs of people who walk naked into the water. See Labrus Iudis.

JULIUS I., in Biography, pope, was a Roman by birth, as
and succeeded to the papal see on the death of Mark, in the year 337. At this period the celebrated Athanarius lived in a state of exile at Treves, but in the following year he was permitted to return to Alexandria by the emperors Constantine, Constanius, and Constantius. This circumstance excited the alarm of the Arian party, who, at a council assembled at Antioch, got Athanarius deposed, and Gregory, bishop of Alexandria, appointed in his stead. But in the Roman council, Athanarius was pronounced innocent of the crimes alleged against him, and was admitted by Julius to his communion, as an orthodox pillar of the church. The orthodox party confirmed the acts of the council of Rome, and, in the height of their zeal, they introduced for the first time, and authorized the practice of appealing to the pope, in controverted ecclesiastical concerns, of which the successors of Julius availed themselves in establishing the enormous spiritual tyranny, which, by degrees, they erected in the church. Julius died in 337, having sat upon the pontifical throne somewhat more than fifteen years. Two of the letters of this pope are extant, one addressed to the Oriental bishops, and the other to the people of Alexandria in favour of Athanarius.

Julius II. pope, formerly known by the name of "Julian della Rovere," nephew of pope Sixtus IV., was born in the year 1443. He is said to have been of very mean extraction, and to have followed for some time the occupation of a waterman; he was preferred by his uncle Sixtus to the see of Carpentras, and raised to the purple in the year 1471. By the same pope he was raised successively to other valuable bishoprics, and upon the breaking out of an insurrection in Umbria, his uncle gave him the command of the papal troops, which was an employment perfectly adapted to his genius. He put an end to the rebellion which gave him vast influence and power at Rome. In 1480 he took an active part in the elevation of Innocent VIII. to the papacy, and while that pontiff lived he was in high favour at the papal court; but during the pontificate of his successor Alexander VI., thinking his life in danger, he retired into France, and attended king Charles in his expedition against Naples. In 1503 he was himself elected pope, in the stead of Pius III., who had held the sacred office only twenty-six days. He took the name of Julius II., and, being possessed of a bold and martial spirit, determined to extend the temporal empire of the church by the force of arms. The emperor Maximilian, with the kings of France and Arragon, endeavoured to depose him, but he frustrated their designs, and in the year 1508 the famous league of Cambrai against the republic of Venice was concluded between the pope, the emperor, the king of France, and the king of Spain, which threatened the entire ruin of that state. Before Julius signed this league, his unwillingness to increase the power of either the emperor, or the French king in Italy, induced him privately to communicate the terms of it to the Venetian ambassador, at the same time offering not to confirm it, provided that the republic restored to him the cities of Rimini and Faenza. This proposal was most unwisely rejected by the Venetian senate, and Julius confirmed the league. The Venetians were wholly unable to withstand such powerful enemies, and being reduced to the greatest extremities, they were obliged to submit. The pope availed them from the effects of the sentence of excommunication inflicted against them, and without hesitation granted leave to all the subjects of the church to serve under their banners. He now formed the design of driving the French out of Italy, and with this view he laid siege to Miranda, which he entered in triumph in 1511, but fortune turning against him, he was driven to Rome. In the course of his journey he received the unwelcome intelligence, that an order for the assembling of a general council at Pisa was posted out at Modena, Bologna, and other cities in Italy, and that himself was summoned to appear at it in person. To counteract their proceedings, of which he had reason to entertain apprehensions, the pope summoned a general council to meet the following year at Rome, pretending, by that measure, to have superceded the council convoked at Pisa. An end, however, was not put to the feuds of this council before a decree had been passed declaring pope Julius II. a disturber of the public peace, a fower of discord among the people of God, a rebel to the church, a public incendiary, a blood-thirsty tyrant, and as such suspended from all spiritual and temporal administration of the church, and forbidding the faithful thenceforth to acknowledge or obey him. In revenge, Julius excommunicated the king of France, laid his kingdom under an interdict, and absolved his subjects from their oath of allegiance. In May 1512 the council met at Rome, in opposition to that of Pisa, but during the fifth session, the pope was seized with an illness which proved fatal to him in Feb. 1513, at the age of seventy, and after a pontificate of between nine and ten years. Julius was a person of great abilities, courage, and resolution, but arrogant and of infatiable ambition; poffessing the most extravagant passion for war and bloodshed; so that it was said of him, if he wanted the qualities of a good bishop, he had at least those of a conquering prince. He has been accused of every crime, but his faults have been probably much exaggerated. He was much less chargeable with nepotism than many preceding popes; for of the twenty-seven cardinals created by him, four only were in any degree related to him, and these were men of unblemished characters. He was an encourager of the arts of painting, sculpture, and architecture, and began the erection of the magnificent church of St. Peter.

Julius III. pope, formerly known by the name of John-Maria del Monte, was a person of mean extraction, and born in Rome about the year 1488. His uncle Anthony del Monte was made a cardinal by pope Julius II., and thus had the means of raising his family from obscurity. Under his patronage John-Maria was educated for the church, and distinguished himself by his proficiency in literature and jurisprudence. By his uncle's influence he obtained an archbishopric, and afterwards filled various posts under the holy see. In 1536 he was created a cardinal by pope Paul III., who afterwards employed him on different legations. He acquitted himself so well in these employments, that he obtained the character of a person of vast application and uncommon abilities, and he recommended himself so powerfully to his holiness, that in the year 1545 he appointed him his principal legate in the council of Trent, and confided to him his most secret intentions. In February 1550 he was elected to the papedom, and took the name of Julius III., out of respect to the memory of the pontiff, who, by rousing his uncle to the cardinalship, had laid the foundation of his good fortune. One of his first acts gave great offence to every decent person; he conferred a cardinal's hat, with ample ecclesiastical revenues, upon a youth of sixteen, born of obscure parents, and known by the name of Apo, from his having been enticed with the care of an animal of that species, in the cardinal del Monte's family. Such an indecent promotion was regarded by the cardinals as a gross affront offered to their body, but when they reproached him for introducing such an unworthy member into the sacred college, who had neither learning nor virtue, nor merit of any kind: he asked them "what virtue or merit they had found in him, that could induce them to place him in the papal
IUL

papal chair?" The subsequent conduct of Julius corresponded with this shameless behaviour at the commencement of his pontificate. He gave himself up to the unrestrained indulgence of his desires, and spent his whole time, and the revenues of the church in amusements, dissipation, and licentiousness of every kind. He died in 1555, having held the papal see about five years. Moren. Bower. Bayle.

JULKADDER, in Geography, a town of Hindoostan, in Bengal: 57 miles S. of Hamburg.

JULKANPOUR, a town of Hindoostan, in Guzerat: 50 miles N.W. of Ahmedabad.

JULLOMA, a town of Peru, in the diocese of La Paz; 50 miles S.W. of La Paz.

JULSIO, a town of Sweden, in Weil'manland: 52 miles N.W. of Stockholm.

JULTOWKW, a town of Poland, in the palatinate of Brasslaw: 5 miles W.N.W. of Brasslaw.

JULUS, in Antiquity. See IUL.

Julus, in Botany, an old name for the "Amentum," or catkin, of Linnæus; but the word being now appropriated to a genus of insects, is laid aside by botanists.

JULUS, in Entomology, a genus of antlers, with the lip crenated and emarginated; feelers two, and filiform; body long, semi-cylindrical, and consisting of numerous transverse segments; legs numerous, being two on each side of every segment of the body. This is the definition of the genus, according to the Gmelinian system. Fabricius, to whom we are indebted for our knowledge of several new species, distinguishes it merely by the lip and antennæ; the first of which, he observes, is crenated and emargined, and the latter moniliform: in addition to these peculiarities, the structure of the body, legs, &c. constitute a secondary character. The species are chiefly ascertained by the number of the legs.

Species.

Ovatus. Legs each side twenty. Linn. Ovatus, Gronov.

Inhabits the seas of Europe.

Native of Europe. Linnæus describes the antennæ of this insect as being elevated, which is the case, though slightly.

Defenses. Legs each side thirty; body flabelliform; tail rounded and entire. Fabr.

An Indian species of very large size, the head of which is brown, and the segments rough, grey, and prominent, each side. Lund.

Stigma. Legs thirty each side; body black, with a white spot on each side of the middle segment. Fabr.

Found at Tranquebar by Dr. Koenig. Its size is twice that of Iulus complatus; the antennæ and legs are black; tail pointed and white.

Tridentatus. Legs each side thirty-six; tail armed with three teeth. Fabr.

An American species, in the cabinet of Drury. The eighteen segments of the body grey, and each marked with a ferruginous dorsal spot; legs with two denticles at the base.

Varius. Legs seventy-eight each side; segments of the body black at the base, and white at the tip. Fabr.

A species of moderate size, which inhabits Italy. The head is black, with a white band in the middle; segments white, and having a fine or thin ferruginous margin; legs black.

Vol. XIX.

JUM

Chassus. Legs each side eighty. Linn.

Native of Asia. Pale, with a line of minute black dots each side; tail acutæ.

Terrestrial. Legs each side one hundred. Linn. Iulus fiebertii, Degueur.

Carnifex. Legs each side ninety-four; head and legs red; tail with a red line. Fabr.

Native of Tranquebar.

Indus. Legs each side one hundred and fifteen. Linn. Inhabits India.

Found on the mat in Europe.

Papides. Legs each side one hundred and twenty-four. Linn.

An inhabitant of India.

Maximus. Legs each side one hundred and thirty-four. Linn.

A large species found in South America.

JULY, in Chronology, the seventh month of the year, during which the sun enters the sign Leo. The word is derived from the Latin July, the surname of C. Cæsar the dictator, who was born in it. Mark Antony first gave this month the name July, which was before called Qminth, as being the fifth month of the year, in the old Roman calendar, established by Romulus, which began in the month of March. For the same reason, August was called Augustus: and September, October, November, and December, still retain the name of their first rank.

"Quod sequitur, numero turba notata foed."
large and magnificent valley, at the foot of the mountain on which its old castle stands. The streets are straight, long, and large, but unpaved; the houses are clean, though not splendid. It has an hospital under the title of the Holy Ghost, a convent of Franciscan monks, and two parochial churches.

JUMILLAC, le Grand, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Nontron; 9 miles N. of Exeuden. The place contains 2,414, and the canton 8,586 inhabitants, on a territory of 215,000 square miles, in 7 communes.

JUMMANGAH, a town of Hindostan, in Caneide; 10 miles N.E. of Peploud.

JUMMOO, or Jumboo, or Jumhoa, a town of Hindostan, and capital of a district in Lahore, to which it gives name. It is distant 42 miles from Biffooly, and 50 about N. by E. from Lahore. It is situated on the side of a hill, near the river Ravaee, and divided into Upper and Lower Towns. This place is a mart of considerable commerce. Various circumstances concurred to divert the trade of Cachemire or Cashmere to Jummooh, and thus to render it a place of extensive commercial repute, where perkins of all descriptions, under the protection and encouragement of the chief, experienced in their perfons and property full securitv. The commodities, constituting the trade of Jummooh and Cashmere, are transported by men, usually Cashmireans, whose burdens are heavy, two of them making the load of a mule, and the hire is fixed at the rate of four rupees for each carrier. The shawls, when exported from Cashmere, are packed in an oblong bale, containing a certain weight or quantity, which, in the language of the country, is termed a "bidding," enclosed in an ox's or buffalo's hide, and carried by the Cashmireans as a Scotchman carries his pack.

In 1779, the period of Runzied Deve's death, Jummooh sustained a grievous lossp for one of his sons-feized the government, put to death one of his brothers, who was intended by the father for his successor, and imprisoned another. The Seiks embraced this opportunity of invading Jumboo, from which they had before exacted a moderate tribute. The most valuable division of the Jumboo districts lay in the plain country, and formed a part of the Punjab. These were laid waste by the Seiks, under a pretence of giving affitt to the aggrieved chief, who recurred to them for protection. N. lat. 33°, E. long. 74°, 4'.

JUMMUCANDY, a town of Bengal, 20 miles S.W. of Moorshedabad. N. lat. 23° 56'. E. long. 88° 13'.

JUMNAH, a river of Hindostan, which rises in Thibet, and passing by Delhi, runs into the Ganges at Allahabad.

JUMNEE, a town of Bengal; 20 miles W. of Noony.

JUMOTTO, a town of Japan, in the island of Shima; 12 miles S.E. of Nangafaki.

JUMP, in Mining, is one among the very numerous appellations, which the dislocations of the strata have received from the practical miners of different districts. See our article Fault.

JUMPER is the name for a long iron tool, with a filed chisel-like point, which they use in quarries and mines, for drilling, or boring shot-holes in rocks, which require to be blasted with gunpowder. Drill, nager, and gad, are other terms for this tool.

JUMUNDERAD, in Geography, a town of Sweden, in the province of Angermanland; 24 miles N. of Hernofand.

JUNAGUR, or Chnaguru, a city and fortress of Hindostan, in Guzerat; 170 miles S.W. of Amedabad. N. lat. 24° 50'. E. long. 69° 59'.

JUNASKA, one of the Fox islands, in the Pacific ocean. N. lat. 55° 26'. E. long. 189° 14'.

JUNAT, a town of Bengal; 13 miles N.E. of Rognatpour.

JUNCAGO, in Botany, Tourn. Inf. t. 143, so called from its resemblance to a juncaus, or rush. See Triglochin, Arrow-headed grass.

JUNCTAL, in Geography, a sea-port of South America, in the country of Chili, situated on the coast of the Pacific ocean; 50 miles N. of Copiapo.

JUNCALAS, a town of France, in the department of the Upper Pyrenees, and chief place of a canton, in the district of Argeles; 12 miles S. of Tarbes. The place contains 340, and the canton 4,572 inhabitants, on a territory of 102 square miles, in 18 communes.

JUNCOW, a town of Hindostan, in the circuit of Mohrungbe; 25 miles N. of Haripourpur.

JUNCI, the 13th natural order of plants in Jussief's system, or the third of his third classes. It is named from one of its principal, or leading genera, Junceus, the Rush, properly so called.

Jussief's third class comprehends monoeotyledonous plants whose flaves are inserted into the calyx or corolla. His definition of the present order is as follows.

Calix (which, in some of the genera, we should, with Linnaeus, term corolla) inferior, in fix deep segments, (rather of fix leaves,) either equal or unequal, the three alternate ones, in the latter case, being larger, and petal-like, or it is glauccous, and akin to the skufs of grasons. Stamens defini (except in Sagittaria and perhaps Alisina), mostly fix, rarely three or nine, inserted into the lower part of the calyx. German superior, in some simple, with a fixingle stye; the stigma simple or divided; capsule of three cells and three valves; with many seeds, inserted into the partitions originating from the centre of each valve. In others the genera, still superior, are three or fix, rarely indefinite, sometimes united at their base; styles and stigmas equal to them in number, as well as the capsules, which are single-celled, either distinct or united, either single-seeded and often not burling, or many-seeded, separating into two valves at their inner edge, the margins of the valves, (or the partitions) bearing the seeds. Corollum (perhaps of all) in the fear of a horny albumen. Plants herbaceous. The radical leaves, as well as those on the lower part of the stem, alternate and sheathing; the upper and floral leaves often assuming the form of a spathe, and seflile. Flowers furnished with spatbas.

The sections are four.

1. Germin foliage. Capsule of three cells. Calyx glauccous.—This comprises five genera, all Linnaeus, Eracum, Kochia, Xyris, Apophydlantes, and Juncus, the last only properly anfwatering to the character.

2. Germin foliage. Capsule of three cells. Calyx half petal-like.—Here are fix genera, Mnium of Schreber (which is Rapata of Aublet), Syne of Schreber (Aublet's Mayace), Pollia of Thunberg, Calitlta, Campellina, and Tradescantia of Linnaeus.

3. Germinseveral. Capsule as many, single-celled. Flower-flakes radical, umbellate or whorled, the umbels and whorls encompassed with a three-leaved involucrum. Plants aquatic.—The genera are Batomus, Dazafonun, Alisina, and Sagittaria.

4. Germs several (mostly three). Capsules as many, single-celled, sometimes united at their base. Flowers panicled.
eled or spikd.—Here we find Nebris of Schreber (Ca-
bona of Aublet), Schenuzaia, Triglobin, Naxheum (To-
fieldia of Hudson and Smith), Helonias, Melanthium, Ver-
um, and Collichum.

This, nearly analogous to the Tripetalaidea of Linnæus, is
perhaps, on the whole, one of the least correct of Jussieu’s
orders. The order of Junco, extracted from it by Decan-
delle and Brem., is much better defined, in consequence of
the explanation of Rfio and its allies on the one hand, and
Commelina, &c. on the other, with the removal of other ge-
nera to their proper places.

Junco Laeone, in Natural History, the name given by
authors to a species of false coral, of the tubularia kind,
and composed of a congeries of small tubules, which are
usually round and iridotl within.

Juncer, Gottlob John, in Biography, a learned
physician, was born on the 3d of June, 1680, at Londerfi, near
Gieson, in Hesse. He pursued his medical studies at Mar-
purg and Erfurt, and afterwards took the degree of M.D.
at Halle, in the year 1718. He became subsequently a dis-
tinguished professor in this university, and attainted a high
reputation as physician to the public hospital. He died at
Halle, on the 25th of October, 1759. His works, which
are chiefly compilations, have been much esteemed, and are
still occasionally referred to, especially as they contain the
best and most compendious view of the doctrines of Stahl,
which he expounded and taught. They are as follows:
1. "Conpectus Medicines Theoretico-pratica, Tabulis 137
primariorum morborum, methode Stahliana tractandos, exhibens,"
1721, 4to., 3. "Conpectus Formularum Medicarum,
&c." ibid. 1723, 4to. — 4. "Conpectus Therapic genera-
s, &c. Tabulis 20 modo Stahliana contenexit," ibid.
1725, 4to. — 5. "Conpectus Chemic Theoretico-pratica in
forma Tabularum Representatius, &c. Tomus prior;" ibid.
1730, 4to. This is an elementary work on chemistry,
according to the principles of Becher and Stahl.—6. "Con-
pectus Phylogiæ, ibid. 1735, 4to. — 7. "Conpectus
Patologis," ibid. 1736, 4to. Juncer likewise pub-
lished many academical theses on medical, chirurgical, and

Juncus, in Geography, a river of Africa, which crosses the
Grain Coast, and runs into the Atlantic; 90 miles E.S.E. of
Cape Monte.

Juncus, in Ornithology, the reed sparrow. See Embe-
riza Schenoniis.

Juncus is also used by Bellonius for a bird, seyving, by
his description, the same with what we call the lint. See
Tinga Cinclus.

Junctn, Francis, in Biography, a mathematician of
Florence, who flourished in the sixteenth century, and was
for a time a Carmelite, but quitted his order, and going to
France, abjured the Roman Catholic religion. He became
a corrector of the press, and afterwards a manufacturer of
paper, and a banker, by which avocations he gained a large
fortune. He died about the year 1550. He was author of
some arithmetical works, commentaries on the sphere of Sa-
crofoeo, on the Reformation of the Calendar, and on the
age of the Loves of Petrarch.

Junctions. Among the Hindoos, junctions or meet-
ings of many things are deemed holy and mysticiorus; more
eespacially the junctions of rivers. The junction of the
day with night, the fornoon with the afternoon, &c. are duly
reverenced, by strict observers, with appropriate prayers and
ceremonies; but the junction of rivers, above all, are very
mythetically contemplated. An act performed there, be it
ever so good, is rendered vaftly more fo by this holy loca-

Widows who burn themselves with their husbands’
corpse, always do it, where practicable, at the junction of two
rivers: this horrid facerice is called Sati, which fec. As
well as this species of meritorious suicide the Hindoos recog-
nize some others, and it performed at the confluence of rivers
the merit of the act is greatly enhanced.

"One of the holiest spots of the Ganges (or Ganges) is
where it joins the Yamuna (Jumna) below Delhi. A third
famed river, the Sarawati, is supposed to join them ub-
erosomously, whence the junction is called Triven, or the
three holy beds. Pilgrims here begin the ceremonies after-
wards completed at Gaya. The confluence of rivers is a
spot peculiarly dear to Hindoos; and this, more especially
of the Ganga and Yamuna, is so highly esteemed, that
peron dying there is considered of immediate beatitude, with-
out risk of farther transmigration. Suicide is not par-
durable, but in some cases meritorious with Hindoos. Cut-
ing one’s throat at the above holy junction is, in reference
to its immediate result, an imitation of the latter. (See Sti-
rique.) Widows who become satis, or puris, by burning them-
selves with the bodies of their deceased husbands, which is
generally done at the jangam, or confluence of rivers,
perform an act of meritorious suicide. And all acts in them-
selves good, are rendered vastly better if done on such a spot?" — Moor’s Hindoo Pantheon.

Junctute, any joint, or closing, of two bodies. See
Joint.

Junctute, in Oratory, is a part of composition, particu-
larly recommended by Quintilian, and denotes such attention
to the nature of the vowels, consonants, and syllables in
the connection of words, with regard to their sound, as will
render the pronunciation most easy and pleasant, and help
promote the harmony of the sentence. Thus the coalition
of two vowels, occasioning an hollow and obscure sound,
and likewise of some consonants rendering it harsh and
rough, should be avoided; nor should the sound syllable
be repeated at the beginning and end of words, becau
e the sound becomes hereby harsh and unpleasant. The follo
ing verse in Virgil’s Æneid is an example of juncture:

"Arma Virumque cano, Troja prius ab oris."

Junculam, in Geography, a town of the island of
Java, on the S.W. coast; 35 miles S.S.W. of Batavia.
S. lat. 6 40'. E. long. 125 15'.

Juncus, in Botany, an old Latin word, a jungendo,
so the etymology, from the nfe of the plants which bear
this name in joining or binding things together. The
t. 127. Lamarck Dic. v. 3. 263. Illbr. t. 250. Garin.

Gen. Ch. Cal. Periantha of six oblong, pointed,
permanent leaves, inferior. Cor none. Stam. Filaments six,
in J. congol. ratus only three, capillary, very short; cor-
ollon oblong, erect, the length of the perianth. Pist.
Germen superior, pointed, triangular; style short, thread-
shaped; Stigma three, long, thread-shaped, downy, inlised.
Peric. Capsule, inviolate with the calyx, triangular, of
three more or less completely divided cells, with three valves,
the partitions from their centre. Seeds various in number, rarely
solitary, roundish.

Capsule superior, of three valves, with one or three
Seeds several. Stigmas three.
The extensive and very natural genus of *Juncus* is commonly enough divided into two sections; the first containing such as have leafless stems, the second those with leafy ones. Of the former Willdenow reckons fifteen species, of the latter twenty-five. This author has judiciously enriched his key by adopting those indubitable, chiefly alpine, species, which Scheuchzer, Haller, Allioni and other alpine botanists had well defined, but which Linnaeus had, rather incumbrantly, huddled together under his *pilus* and *campyliris*. His *Syll. Veg.* ed. 14, contains only twenty-two in all. Lamarck has thirty-two. The *Syllabus* of the latter, omitted by Willdenow, is very distinct, though near *articulatus*, found at Buenos Ayres. Its flowers are much fewer together than in *nodosus*, to which Lamarck prefixed it might belong. Mr. Brown has added nine New Holland species, previously nondescript, to the catalogue, and we believe America affords several more.

Eight Britifh species are found in the first section, fifteen in the second. Of the former may serve as examples, *J. acutus*, Engl. Bot. t. 1914, a large and rigid (spinous-pointed) plant, found on some of our sandy coasts, but rarely.

*J. maritimus*, t. 1725, much more common, and found not only in clean sand, but in muddy salt-marshes also, confounded with the former by Linnaeus, from which it differs in its more slender form, glossy colour, and oblong capsules.

*J. conglomeratus*, t. 835, which is triandrous, and *effusus*, t. 839, are both extremely common in moist places, as *squamifolius*, t. 933, on the moor dry and barren sandy heaths.

The second section, with leafy stems, is much more various and remarkable. In the beginning of it we find a tribe whose leaves are internally cellular, with transverse partitions, so as to feel, and even to look, jointed. There are scarcely yet well understood, especially the American ones, to which the Linnaean *nodosus* belongs. Thofe of British growth have lately been well elucidated by the Rev. H. Davies in Tr. of Linn. Soc. v. 10. See Engl. Bot. t. 238, now called *acutiflorus*, t. 2143, *lampcparus*, and t. 2144, *obtusiflorus*, all confounded by Linnaeus under its *articulatus*.—A more slender tribe succeed. *J. bulbiflorus*, t. 934; very improperly so called, from a bulbous-rooted species, *J. uliginosus*, t. 801, whose synonymy was once referred to it. *J. bujlonus*, t. 802, with a very compound slender stem, is common in watery places, and rather extraordinary in its genus for having only an annual root. *J. gracilis*, t. 2174, a new Scottish species, resembles it in general aspect, but is not so much branched, nor so leafy.

*J. bifurmis*, t. 808, *triglumis*, t. 809, and *confusus*, t. 900, are three rare and curious mountain kinds, the first in particular, a Lapland plant, extremely uncommon in Britain, and feared well known by some of our best botanists. It may however always be distinguished from two-flowered specimens of *triglumis*, by the flowers being placed one above another, not in the same plane.

The genus finishes with another very distinct tribe, whose copious broad leaves, and more or less panicked numerous flowers, with a thinning brown, yellow, or brilliant white calyx, give its leading characters. Of these are the common *J. pilosus*, Engl. Bot. t. 736; the rare *J. Flogillier*, t. 1293; the great *lycanurus*, t. 737 (Willdenow's *maximus*); the beautiful *latius* of Allioni, Villars Dauph. t. 6, common on the alps of Switzerland, Savoy, &c.; the elegant *nivus* found on the mountains of Italy, Switzerland, and some parts of Germany; and our common *campyliris*, Eng. Bot. t. 672.

**JUNGERBAD, a town of Hindooistan; 35 miles W. of Benares.**

**JUGERMANNIA, in Botany, a cryptogamic genus of plants, very numerous in species, as well as distinct in character, named by Ruppius and Micheli, who have been followed by all botanists since, in honour of Lewis Jungermann, Professor of Botany at Altdorf, and afterwards at Gueffen, in the early part of the seventeenth century. He wrote catalogues of the wild plants found near those towns, as well as near Leipzic, his native place, and Frankfort on the Main. Hatterslay he left a fine *hortus focus* of two thousand plants, which is still preserved at Altdorf. Of him it may justly be said, that the genus in question has preferred his name, rather than his merits, from oblivion; for tho`e to whom it is familiar, commonly rather mixed with than take any pains to inquire, who Jungermann was. Linn. Gen. 564. Schreb. 764. Mart. Mill. Dict. v. 2. Mich. Gen. 6. t. 5. Hedw. Theor. 83. t. 22. 23. Schmied. Monogr. ann. 1760. cum tab. Juff. 8. Lamarck Dict. v. 3. 278. Illutr. t. 875. Gen. Ch. Male, Col. and Cor. none. Stam. Anters aggregate, of an indeterminate number, in powdery heads, which are either filaked, fessile, or immersed in the substance of the frond.

Female on the same (rarely on a separate) plant. Cal. Perianth erec't, tubular, truncate, variously crenate or jagged. Cor. Vel membraneous, effusile, smaller than the perianth, somewhat globose, closed on all sides, crowned with the style, at length curving towards the top. Fil. Germin oblong, effusile, enclosed in the velvety foliary, cylindrical, terminating the velv. stigma abrupt, tubular. Peric. Capsule elevated on a long, fleshy, very tender, pale, simple, cylindrical stalk, globose, of one cell, at length curving into four equal, permanent valves, spreading in the form of a crose. Seed very numerous, globular, adhering by spiral elastic fibres to the bafe, fumitul, disk or margin of the valves.

Ob'f. Several germin are often found in one perianth, though only one of them comes to perfection, the others withering at the base or sides of its velv.

Eff. Ch. Male, Anters aggregate, in powdery heads. Female, Capule of four valves, on a stalk rising from a tubular calyx. Seeds attached to elastic filaments.
Nothing can be more elegant than the general habit of this genus, which is, in a manner, intermediate between the true Mooses, or Mufa, and the other Hepatic and 
It is throughout highly vascular or cellular, exhibiting the appearance of fine internal reticulations, as in Hookeria and some other mooses; but the texture is commonly more tender and succulent than in that family. Some species emit an aromatic fragrance, like that of red cedar wood, very perceptible and delightful in groves, or the shady walks of gardens. The capsule is essentially different from that of the true mooses, is having no openides or lid; but the singular character of the is the terminating the vase, or corolla, proper to both. Great ambiguity occurs in the botanical descriptions of the various species, from Linnaeus having termed the whole plant a frond, though he often inadvertently calls its segments leaves, or segments of the frond, and inverts the true leaves, as if the plant were a red herb, as in the 
On this subject the writer of the present article has long been at a loss to form a decided opinion, and in the descriptions of many Ju dignmunit in Engilsh Botany, has given into the practice of Schreber and others, who use the terms leaves and stipules, for what, according to the original Linnaean principle, are segments of the frond, leaves, or scales. On mature deliberation, however, it seems best to keep rigidly to this last-mentioned principle. The fronds, and the leaflets, or segments of the fronds, will always be found homogenous and inseparable. The apparent leaves are never thrown off like the real leaves of other plants, but are of one substance with the part that bears them. The Ju dignmunit ar visitor, which constitutes the last section of the genus, as ephyllophyta, Lw. theor. t. 21—23; pinnatus, Engilsh Bot. t. 185; mysticifolia, t. 186; &c. have to all intents and purposes real fronds, not leaves and leaves; and it would be offering great violence to nature to suppute some species of the genus to be frondose and others herbaceous. Some German writers indeed cut this gordian knot, by abolishing the term frond altogether; but against such measure we must put in our decided protest. (See Pinnate.) Little difficulty will arise from calling the segments leaflets instead of leaves, and what have been termed stipules, may, by the analogy of ferns, be safely named scales, squamae. In Engilsh Bot. v. 31. p. 2221, we have suggested the propriety of terming the larger half of the leaflet, in these species usually known by the appellation of auricles, in Latin lobus, and the smaller one, or auricle, lobulus. This will be found very commodious in denoting each specific character. In Engilsh leaflet and side-lobe will be equivalent to those terms.

On all these particulars, and others, we have had frequent consultation with our able friend Mr. W. J. Hooker, whose attention to this genus has been very deep and minute, and who has undertaken to illustrate the British species in particular, with excellent figures and descriptions.

Our native species amount to above 60; though Hudson has but 30. The foreign ones are very numerous, but the greater part remain undescribed, except what professor Swartz has given in his Prominens. Mr. Archibald Menzies collected, at the Cape of Good Hope, Staten Land, the west coast of North America, and especially at Dufky bay, in New Zealand, a profusion of new and magnificent species, of which he has favoured us with specimens, but he refers to himself their description, which is anxiously expected by his friends. It is presumed that 152 Ju dignmunit might easily be reckoned up. Linnaeus's Syst. Veg. ed. 14, has but 33 in all, but his herbarium contains many more. Dillenius was the first who laboured with much success to explain the species of this genus, though Micheli also followed no small pains upon them, but his figures are, in this:

initigate, not very expressive. Schmelz, in his Loner, has illustrated a few species to amply and accurately as to leave nothing to be wished. It is but justice to Mr. Sowerby to say, that the plates he has given of Ju dignmunit, in Engilsh Bot. are as characteristic as most botanical figures of any kind.

A natural distribution of the species is still wanting. Linnaeus divides them into five sections.

1. Fronds pinnate; leaflets turned to one side. Of this the common J. pinnatus, in Engilsh Bot. t. 1788, and botanists, t. 666, are examples.

2. Fronds pinnate; leaflets with auricles, or stipules (rather leaflets). See J. auriculatus, t. 657, which has auricles (side-lobes) and leaflets, t. 668, which has scales.

3. Fronds imbricated. Under this head are arranged tamarifoifolia, t. 1086, citharitis, t. 1024, and some other very fine species.

4. Shoots imbricated on all sides, the leaflets scattered. To this belong communitas, t. 1240, and triobophylla, t. 2235. J. rupestris and alpina are properly established as a genus of real Mufa by Ehrlart, under the name of Andreae Andreae of Fl. Brit. 1718. Engilsh Bot. t. 1277, 1278, and 2216, and Hooker in Tr. of Linn. Soc. v. 10. 381.

5. Without a stem, the fronds being simple. To this, as we have already said, belong ephyllophyta, pinnatisecta, and multifida.

The intelligent reader will easily perceive the insufficiency and inaccuracy of these subdivisions, and the necessity of better. The difficulty lies in finding technical characters to mark natural sections. It is easy enough to arrange any natural objects by such characters artificially, without regard to their real affinities. S.

JUNGEVSKOI, in Geography, a town of Russia, in the government of Tobolik; 56 miles S. of Kemikoi.

JUNGFRAU (probably from the Celtic Jun-fra, i. e. a place from which water descends), a mountain in the canton of Bern, in Switzerland, which, according to professor Tralles's trigonometrical survey, rises 12,652 feet above the level of the sea, and affords a spectacle, the sublime beauty of which is far exceeded by any other object of nature in the Alps. The middle part of this stupendous mountain is more generally known by the above name; the craggy rock towards the right hand (when viewed from the Pletsch mountain) is called the Monk, and the summits, covered by eternal snows, is called the Jungfrau-born. The valley of Lauterbrunnen, at the foot of this mountain, is too confined to allow the eye to seize the whole grandeur of the object before it; but from the neighbouring Pletsch mountain it may be seen to the greatest advantage, together with the vast groups of other craggy mountains and glaciers with which it is connected.

We read in an article from Bern, in the Moniteur of 25th Aug. 1811, that, in the beginning of that month, two Swit gentlemen have succeeded in ascending the summit of this stupendous mountain, an undertaking which, hitherto, has been deemed impracticable. After having spent three days and four nights on the snow and ice, and made some fruitless attempts, they have seen their undertaking crowned on the 31st of August, when they reached the summit, where they fixed a black flag. They intend publishing an account of this remarkable journey.

JUNGRUN, a small island, about six miles in circuit, on the W. side of the gulf of Bothnia; it is high and rocky, and dangerous to navigators. N. lat. 61° 10'. E. long. 17° 10'.

JUNGRUN.
JUNGERN, Lill, another small island on the W. side of
the gulf of Bothnia. N. lat. 61° 16'. E. long. 17° 9'.
JUNGERHÄ, a small island in the river Ganges, on
which is a feminary of Hindoo mendicants; 12 miles from
Bogilpur.

JUNGHRA, in Botany, so named by the younger Linnaeus,
in memory of Joachim Jungius, a learned German botanist
of the 17th century. (See Jungius.) Linn. Suppl. 58.
Dict. v. 2. Jaff 1775.-Clubs and order, Symperon Poly-
Cinarobulus anomalous, Jaff.

Gen. Ch. Cal. Common perianth of many, somewhat
spreading, linear, obtuse, channelled leaves, containing three
or four flowers: partial longer, many-flowered, of many,
neatly equal, oblong, channelled, obtuse, erect leaves. Car.
compound, of uniform, hermaphrodite, equal florets: partial
of one petal, funnel-shaped; the tube dilated upwards; limb of
two lips; the outer longer, revolute, linear, toothed at the
extremity; inner deeply divided into two small, erect,
acute segments. Stam. Filaments five, very short, inserted
into the tube of each floret; anthers united into a cylinder.
Pfâl. German inferior, linear, angular; style thread-shaped;
fligmas two, revolute, obtuse. Peric. none, except the un-
altered calyx. Seeds solitary, angular. Down long, feilile,
feathery. Recpt. clothed with scales, remembering the leaves
of the calyx.

Eff. Ch. Receptacle chaffy. Common perianth containing
three flowers. Florets tubular, two-lipped; the outer lip
ligulate; inner deeply divided.

1. F. ferruginea. Linn. Suppl. 390. Gathered by Mutis,
or some of his pupils, in New Granada. A tree or shrub,
whose branches are round, clothed with soft down, of a ratty
hue, at least in the dried specimen. Leaves alternate, remote,
flattened, flat, rounded, bluntly five-lobed; heart-shaped
at the base; hairy on both sides; lighter coloured beneath.
The only leaf we have seen is two inches in diameter, but
there is reason to think the lower ones may be much larger.
Footstalks downy and rufly. Panicle terminal, large, re-
petedly branched with downy flalks. Flowers in roundish
cluttered heads. Florets purple, encircled with the long
white down of the seed.

This plant is known in Europe by the fingle specimen
in the Linnaean herbarium only, nor has any figure of it ap-
peared.

JUNGEL, in Geography, a town of Hindooftan, in
Bunwic. 20 miles S. of Bidgour.

JUNGOPOUR, a town of Hindooftan, in Bengal, where
the East India Company have a factory for raw filk; 20
miles N. of Mouzhdabad.

JUNGIUS, Joachim, in Biography, an eminent mathemat-
ician, physician, and botanist, the son of a schoolmaster
at Lubeck, in Germany, was born on the 2t8 of October 1587.
His mother was daughter to a clergyman of the cathedral
church at Lubeck. Jungius having, unfortunately been de-
prived of his father very early in life (for he was stabbed
one evening upon his return home from a convivial party),
and being left with a slender patrimony, was obliged to de-
pend almost entirely upon his own exertions for whatever
knowledge and information he was anxious to acquire, the
narrowness of his circumstances not enabling him to pass
through the usual routine of a learned and philosophical
education. Notwithstanding this obstacle, we are informed
that, in his youth, he became a very subtle logician, and in-
genuous disputant. By a close attention to such studies he
prepared his mind for that clearer of investigation and
accuracy of judgment, which were fo eminently conspicuous
in the works which he published at a more advanced period
of his life. Selecting the study of medicine as a profession,
he travelled, at the age of 30, over a great part of Italy, and
visited many of the principal places in Germany. His great
object in travelling was to become acquainted with some of
the most distinguished physicians of that time, from whole
company and conversation he hoped to derive much amufe-
ment and instruction. He had previously graduated at
the university of Gieffen A. D. 1627, at which time he was
ranked first among his competitors. The love of honours,
and he remained there for a few years in the capacity of mathematici-
cal tutor. In 1629, he married Catharine, the daughter of
Valentine Hasselmann, a respectable citizen of Roflock, in
Lower Germany, by whom he had no issue. She died in
1626, from which period he remained a widower. He had
been chosen professor of physic at Helmholdt in 1625, which
had led him to remove from Roflock; but, on account of the
Danish war, he was obliged, soon after his appointment,
to fly to Brunswick, where he resided for a short time, and
practised as a physician. However, he soon returned to
Helmholdt, till, in 1629, he was appointed rector of the school
at Hamburgh.

Jungius seems to have eminently distinguished himself in
the several studies of theology, medicine, mathematics, meta-
physics, and botany, upon all which pursuits his opinions and
observations are handed down to us in his writings,
though the most famous part of his work, entitled "Doxo-
copoic Physico Minores," is upon the last mentioned sub-
ject, botany. This book was first printed at Hamburgh,
in 1610, A.D. 1612, and again, in 1679, under the care of
Martin Fogel, with this additional title, "Praeceptarium
opinionum physicarum." A copy of the former edition
of this work is in the Linnaean library, having been pre-
fected to Linnaeus by his pupil, profeffor P. D. Gifcke, of
Hamburgh. The botanical part of it, included in the third
section of the second part, occupies about 160 pages. Here
are to be found many judicious and acute rules for making
different species of plants, as well as some curious remarks
upon genera. Professor Jungius was also the first author
who contended that trees cannot with propriety be separated
from other plants with respect to their classification, though
the honour of having first started this idea is often bestowed
upon Rivinus, for till this time trees had been regarded as
a inferior kind of productions in the vegetable kingdom.
Jungius preferred the discriminative marks afforded by
the herbage in general, viz., the leaves, flalks, and flower-cups
of plants to those which are taken from colour, taste, or smell.
He was a great critic in botanical nomenclature; and con-
structed a variety of terms which agree with thole of Lin-
naeus. Many species of plants were judiciously separated
and determined by him, which had before been entirely mis-
placed or confoundedly arranged. He moreover detected the
feed of certain plants which, till his time, were supposed
to have been defulte of feed, especially in the genus Sulit.
His remarks upon botanical discrimination have been of
considerable advantage to succeeding botanists, and many of
his definitions are repeatedly made use of by our immortal
countryman, Ray. What further tole of his abilities is re-
quite? It has been said, with a view to detract from the
fame of Linnaeus, that the works of our author furnished
him with many hints which he never acknowledged; but
this is fearfully possible, for Though their ideas accord in
many points, ye there is reason to believe that Linnaeus
never saw the writings of Jungius till long after his own were
published.

Much credit is due to the subject of our memoir for having
been the first who projected and raised a literary society in
Germany,
Germany, though this institution did not share a better fate than the one which had just before been found in this country (and which appears to have served for its model) by Hugh Latimer, Thomas Linacre, and others, for the purpose of diffusing and illustrating Aristotle's philosophy. They both flourished but for a short period, though the Humanist or Eunomian society, as it was called, established by professor Jungius, was on a far more comprehensive plan than the other, and may indeed be considered as having, in some measure, embraced the same views with which the Royal Society was afterwards instituted in Great Britain. The fame of Jungius was originally diffused through this country by his noble pupil, the honourable Charles Cavendish, who appears to have studied under him at Hamburg. This gentleman was brother to the earl of Newcastle, who had the care of Charles I. when a youth. After a long life, spent in the acquirement and diffusion of general philosophical knowledge, and having always handled a strong attachment to the Lutheran church, professor Jungius departed this life on the 23d of September 1657, at the age of 70 years, and was buried in the church of St. John at Hamburg, where a handsome tablet was inscribed to his memory by his friend and pupil, Michael Kirchen. The following is a list of his works, as given by Martin Fogel, who edited the second edition of his "Doxocepiae."

Geometria Empirica. Roffock femel et Hamb. bis, in 4to.

Doxocepiae Phyliciae Minoris, fine Ifagoge Phyliciae

Doxocepica. Hamb. 1662, in 4to.

JUNGEN, John Helfric, a physician, was born at Kalern, in Heffe, in December 1647, and was distinguished by his abilities during his early studies. He purified his medical education at Marburg and at Heidelberg, and took the degree of doctor at the latter university in 1671. After this period, he spent many years in travelling in pursuit of knowledge, and finally settled at Frankfort on the Maine in 1689, and was appointed physician to the public hospital there in 1693. He obtained a high reputation and a most extensive practice, in the course of which, however, he published several works. He died, greatly regretted, on the 5th of January, 1726. His writings are now seldom referred to, and it will be unnecessary here to detail the long titles of them. They treated of every branch of the profession, but chiefly on chemistry and pharmacy; and his pathology was founded on the mathematical doctrines, especially those of Descartes. Lib. 2. Diet. Hilt.

JUNGBEBBURY, in Geography, a town of Bengal; 53 miles N. of Dacca.

JUNGBAU, a town of Germany, and capital of a lordship belonging to the princes of Furtenberg; 14 miles W. of Buchau.

JUNGS HEAD, or Head, a cape of Denmark, on the E. coast of the island of Zealand. N. lat. 53° 7'. E. long. 12° 11'.

JUNIATA, a town of America, in Pennsylvania, 5 miles W.N.W. of Huntingdon.—Also, a river of Pennsylvania, which rises from two springs in the Alleghany mountains, and runs into the Susquehanna, 15 miles N.W. of Harrisburg.

JUNIEU, St., a town of France, in the department of the Upper Vienne, and chief place of a canton, in the district of Rochechouart; 15 miles W. of Limoges. The place contains 6046, and the canton 13,519 inhabitants, on a territory of 170 kilometres, in seven communes. N. lat. 45° 53'. E. long. 9° 5'.

JUNIOW, a town of Poland, in the patriciate of Breslaw; 52 miles N. of Breslaw.

JUNIPA, in Botany, the name of a tree of the Caribbean islands, and some other places; the fruit of which is said to yield a juice as clear as water, yet yields a fine violet-coloured dye, and being rubbed twice on the same place, makes it black. This tincture, it is said, cannot be got out by soaps, or any other method of cleaning, but after nine or ten days disappears of itself. It is said also, by the same authors, that hogs and parrots, feeding on this fruit, have their flesh and their fat all tinged throughout of a violet colour.

Gen. Ch. Male. Cal. Catkin conical, consisting of a common receptacle, bearing three rows of three flowers each, with a terminal one; the base of each flower is a broad, short, incumbent scale fixed by a flaky to the common receptacle. Cor. none. Stem. Filaments (in the terminal flower) three, awl-shaped, united below into one body (in the lateral flowers scarcely perceptible); anthers three, distinct in the terminal flower, but in the lateral ones attached to the base of each scale. Female. Cal. the scales of a catkin, fewer, imbricated, the upper ones at length fleshy and permanent. Cor. none. Pet. Germens three, imbedded in the upperscale; styles three, simple; stigmas simple. Peric. Berry fleshy, roundish, marked in the lower part with three, opposite, obsolete tubercles, the points of the coalesced scales, and at the top umbilicaged with three teeth. Seeds. Nuts three, oblong, convex on one side, angular on the other; bounding with cells of turpentine on the outside.

Stamens three.—Female, Calyx-scales of a catkin, fewer, at length pulpy, united into a berry with three seeds.

f. J. communis. Common Juniper. Linn. Sp. Pl. 1470. Eng. Bot. t. 1190. Woodv. Med. Bot. t. 95.—Leaves three together, spreading, tipped with a spine, and longer than the ripe fruit.—A native of open, hilly places on a calcareous soil, flowering in May, though by no means a common plant in Britain.—This shrub is generally of humble growth, much branched, rigid, smooth, evergreen. Some of the whole plant a kind of turpentine. Wood hard and durable. Leaves opposite, serrate, channeled, sharp-pointed, glaucescent abaxially. Calyx discursive, axillary. Berry globose, dark-purple, covered with a glaucous down, sweetish and aromatic.—The alpine variety is more humble in its growth, and more depressed, having broader leaves and rather oblong berries.—The bark of juniper is more humble converted into ropes, and it is well known that spirits, when impregnated with the essential oil of its berries, become Juniper water, or Gin.—Linnaeus observes, in his Flora Lapponica, n. 375, that the Laplanders drink infusions of the Juniper-berries, as we do tea and coffee, and that the
Swedes prepare a beverage from them in great estimation for its diuretic and antiscorbutic qualities — There is reason to presume that the Swedi$h variety of this shrub, which is much taller and more arborecent than our’s, may be a distinct species.

Linnæus enumerates nine species of this genus, and professor Martyn eleven, the most remarkable of which are the following: — *J. oxycedrus*, the brown-berried Juniper, a native of Spain, the south of France, and the Levant. — The wood of this species is supposed to have been the famous cedars of the ancients, celebrated for its durability, of which some of their first statues were made, before the use of marble in this branch of art was known. — *J. virginiana*, a native of North America, the West India islands, and Japan. — The wood of this tree is celebrated for its very powerful fragrance, and for resisting the attacks of insects, being the well-known red cedar, used for lead pencils, and formerly in great request for wainscoting, and cabinet-work. Large trees of it are not uncommon in the older gardens and shrubberies of this country. — *J. bermudiana* is also a hardy tree with us. It is suspected that more species than one have been confounded under this or the last. — *J. falicifolia*, the common Savin, a native of the south of Europe, is sufficiently well known, and is a popular medicine in some female complaints, being also supposed to be powerfully capable of procuring abortion. It is commonly of humble growth, but sometimes forms a handsomely dark green bulk three or four feet high. In Greece it is said to become a tree like a cypress, with a trunk a foot in diameter. Botanists are by no means correctly versed in the species of this genus, or the varieties to which they are subject. — *J. lycia*, is with difficulty distinguished from the last; its shoots are however somewhat thicker, and its leaves more acute and less clustered. It is a native of the south of France and the Levant. — The gum-resin *Olibanum*, of a strong smell, and bitter pungent taste, is extracted from the Lycian cedar, and is supposed to have been used by the ancients in their sacrifices, being full employed in Catholic countries in their religious ceremonies, as incense.

**JUNIPERUS.**

In Gardening, comprehends plants of the evergreen tree and shrub kinds, of which the species generally cultivated are: the common juniper (*J. communis*); the brown-berried juniper (*J. oxycedrus*); the Spanish juniper (*J. thunbergii*); the Barbadoes juniper (*J. barbadensis*); the Bermuda juniper (*J. berbenduana*); the fenn (in *J. falicifolia*); the Virginia juniper, or red cedar (*J. virginiana*); the Pinus juniper, or cypress (*J. phoenix*); and the Lycian juniper, or cedar (*J. lycia*).

The sixth species has a variety of variegated leaves.

And the seventh species affords the Swedish or tree juniper, which rises to a very considerable height. Also the alpine or mountain juniper, which has the leaves broader and thicker, and the berries of a rather oval shape.

**Method of Cultivation.** — All these plants, except the fifth fort, may be increased either by seeds, layers, or cuttings; the latter methods are proper for the fawn kinds.

The seeds or berries should be sown in beds of light earth, in the early autumn or spring, but the former is the better. In light soils, in a warm sheltered situation, in the open ground, they are well raked in. The beds should be kept perfectly clear from weeds and the young plants be occasionally watered during the summer season. When the plants have had two years growth in these beds, and become strong, they should be removed into nursery rows at two feet apart, and a foot or eighteen inches distant in the rows. They should remain in these situations till of proper growth to be planted out where they are to remain.

The layers of the young branches should be laid down at either of the above seasons, and, when well rooted, taken off, and planted in the nursery, in the same manner as the feeding plants.

The cuttings should be made from the young branches, and be planted in a shady border, in the latter end of summer, watering them occasionally till they have taken good root; when they may be taken up with earth about their roots, and be managed in the same manner as by the other methods.

The plants raised in these last ways seldom grow so upright, or to so large a size, as in the field method.

The common upright and striped fawns may likewise be increased by planting slips of the young branches; for the last fort the most variegated being made use of, in the latter end of summer, or in the autumn, in a shaded border, due water being given. When the plants are come up, they must be managed as the other sorts.

The fifth fort must be sown in pots or tubs, at the same feasons as the other sorts, being placed in a frame to have the protection of glasses when the weather is frosty and severe. As the seeds are long in coming up, the mould in the pots, &c. must remain undisturbed till they appear, being fladed from the sun, and lightly watered occasionally. The young plants should be kept quite free from weeds, and be duly watered till they have attained sufficient growth to be removed into separate small pots, filled with light earth, which is generally when from one to two years old. In removing them, they should have ball of earth preferred about their roots, and be watered, and placed in a warm situation. The best feast for this is in the early spring; but it is of great advantage to plunge the pots in a warm hot-bed. They must be protected in the winter, either in frames, or under a warm fence; the pots being plunged in the earth. When they have been removed into different larger pots, till of sufficient large growth, they may be planted out where they are to grow, which should be in a warm situation. It is proper to shelter them the first two winters during severe frosts, by mats, or other similar coverings.

The proper periods for removing all the different sorts into the open ground are in the early autumn or spring months.

These plants all succeed in the open ground, and grow in any common soil and situation, with other hardy plants of the tree kind; though they are the most proper in a light sandy soil, where the aspect is sheltered.

In placing these kinds of plants in the clumps and shrubbery plantations, attention should be had to arrange them according to their degrees of growth, so as to exhibit a regular gradation of height; placing the low-growing sorts, as the common juniper and fawn kinds, towards the fronts, and the other larger growing sorts more backward, in assemblage with other ornamental shrubs and trees of the evergreen tribe; and some may be placed as single standards, on open spaces of short grass, in the pleasure ground quarters. Some of the larger growing sorts may also be introduced into the foray-tree plantations, as they have a fine effect, and afford excellent timber for many uses, more particularly the Virginia cedar, which arrives at a considerable size, especially when the under branches are trimmed off occasionally while young.

**JUNIPERUS.** in the *Materia Medica.* The tops and fruit or berries of the shrub junipers, which is common on heaths in different parts of Europe, are much used in medicine; but the latter are preferred.

These berries, which are first green, and when ripe of a red
The dark purple colour, ripen in the autumn. They are chiefly brought to us from Holland and Italy; and should be chosen fresh, not much shrivelled, and free from mouldins. Their smell is moderately strong, but not disagreeable, and their taste is warm, pungent, and sweetish, which, after they have been long chewed, or previously well bruised, is followed by a considerable degree of bitterness. The sweetness of these berries appears to reside in the juice, or soft pulpy part; the bitterness in the seeds; and the aromatic flavour in oily vessels, spread throughout the subflume, both of the pulp and of the seeds, and distinguishable even by the eye. The fresh berries yield, on expression, a rich, sweet, honey-like, aromatic juice; and if the seeds are thoroughly broken, the juice proves tart and bitter.

Juniper berries give out nearly all their virtue, both to water and rectified spirit, tinging the former of a brownish-yellow, and the latter of a bright orange colour. Diluted with water, they yield a yellow essential oil, very volatile and pungent, resembling the berries in smell, and in quantity, when the berries have been sufficiently bruised, about one ounce from forty. This oil is a very stimulating diuretic; the decoction infused to the confidence of a rob or extract, has a pleasant, balsamic, sweet taste, with a greater or less degree of bitterness. A part of the flavour of the berries arises also in distillations with rectified spirit; the infused tincture consists of two distinct subflumes; one oily and sweet; the other tenacious, resinous, and aromatic. The extract may be used with advantage in cafes where the more stimulating preparations would be improper; as in catarrhs, debilities of the stomach and intestines, and difficulties of the urinary excretions, in patients of an advanced age. Among the aromatics that have been tried in composition with juniper berries, sweet fennel seeds, and caraway seeds, seem the best adapted to improve their flavour. A cordial water is prepared in the shops, by drawing off a gallon of proof spirit from a pound of the berries, and an ounce and a half of each of the seeds. To this water may be usefully super-added, a proper quantity of the rob. Lewis.

The berries are chiefly used for their diuretic effects; and they are also considered to be stomachic, carminative, and diaphoretic. We have several testimonies in favour of the efficacy of juniper berries in many hydroptic affections by physicians of great authority; but authors do not seem to be perfectly agreed which preparation of the juniper is most efficacious; many preferring the rob or infused decoction; but Dr. Cullen observes, that this is an inert medicine, alleging that to the essential oil, which is much the same as that of turpentine, only of a more agreeable odour, he thinks all the virtues ascribed to the different parts of juniper are to be referred. Hoffman, on the contrary, strongly recommends the rob, and declares it to be of great use in debility of the stomach and intestines; and he found it to be particularly serviceable to such old people as are subject to these disorders, or labour under a difficulty with regard to the urinary excretion; whence it appears, that the berries retain medicinal powers, though deprived of the medicinal effects of the essential oil. Van Swieten preferred the following formula: R. Rob. bacc. junip. 3½; dulse in aqua junip. 3½; add. spirit. bacc. junip. 3½; quandisque Spiritus nitri dulcis 3½ ad fuitum fedandam additur. Of this mixture one or two ounces were given every three hours. But juniper being now seldom or ever relied upon for the cure of dropesies, and only used in aid of more powerful remedies, it is justly observed by Duncan (New Ed. Diff.) that "perhaps one of the best forms under which the berries can be used is that of a simple infusion. This by itself, or with the addition of a little gin, is a very useful drink for hydropic patients." Medical writers have also spoken of the utility of juniper in nephritic cases, urethral obstructions, scirrhous affections, and some cutaneous diseases; and in the two last-mentioned complaints, the wood and tops of the plant are said to have been employed with greater advantage than the berries. Our Pharmacopoeias direct the essential oil and a spirituous distillation of the juniper berries to be kept in the shops; the former, in doses of two or three drops, is found to be an active and stimulating medicine; the latter contains this oil, and that of some other aromatic seeds united to the spirit, and therefore differs not considerably from the genuine geneva imported from Holland: but there is great reason to believe, that the gin usually sold here is frequently nothing but the spirituous spirit, intermixed with turpentine, or other materials to give it a flavour Woody. Med. Bot.

Etmuller had a high opinion of juniper berries. The rob made of the expressed juice of the green berries has been called by many, the Pericore Genticimum; to much are they esteemed by that nation for their alchemic qualities.

The wood of juniper, it is said, will last a hundred years without corrupting; the chemists add, that a coal of juniper, covered with ashes of the same kind, will keep on fire an entire year.

From this juniper, the gum sandaraca is obtained; it exudes through the crevices of the bark, or the perforations made by insects.

The bark of the Juniperus Lycia yields the officinal gummy resinous subflume, called Olibanum. See Frankincense and Olibanum.

The Juniperus Sabina, or common fawn, is a native of the south of Europe and the Levant: it has been long cultivated in our gardens; and from producing male and female flowers on separate plants, it was formerly distinguished into the barren and berry-bearing fawn. The leaves and tops of fawn have a moderately strong smell, somewhat disagreeable, and a hot, bitterish, acid taste; they give out part of their active matter to watery liquors, and the whole to rectified spirit. Diluted with water, they yield a large quantity of essential oil. From thirty-two ounces Hoffman obtained five ounces of this oil, in which the whole virtue of the plant seems to reside. Decocations of the leaves, infused, to the confidence of an extract, retain a considerable share of their pungency and warmth along with their bitterness, and have some degree of smell, not resembling that of the plant itself. On infusion of the spirituous tincture, there remains an extract, consisting of two distinct subflumes, of which one is yellow, acriduous or oily, bitterish, and very pungent; the other black, resinous, tenacious, less pungent, and fusiform. Lewis' Mat. Med.

Savin is a powerful and active medicine, and has now been reputed the most efficacious in the Materia Medica, for producing a determination to the uterine, and thereby proving emmenagogue; it heats and stimulates the whole system very considerably, and is said to promote the fluid secretions. Its force in overcoming interior obstructions is so great, that it is said to have been employed, and too successfully, for purposes the most infamous and unnatural. It has, however, sometimes failed as an emmenagogue, which has, in some measure, been ascribed to the smallness of the dose given by physicians. Dr. Hume (see Clinical Exper.) seems to have had very great success with this medicine; for in five cases of amenorrhea, which occurred at the Royal Infirmary at Edinburgh, four were cured by the fahinsa, administered in powder from a scruple to a dram twice

Vol. XIX.
twice a day. He says it is well suited to the debile, but improper in phlethoric habits; and he therefore orders repeated bleedings before its exhibition. Externally fahin is recommended as an eharotic to foul ulcers, pyrhemitic warts, &c. Wood, Med. Bot.

**JUNIEN** in Geography, a town of Sweden, in the lapmark of Kemi; 64 miles N.E. of Kemi.

**JUNIVILLE**, a town of France, in the department of the Ardennes, and chief place of a canton, in the district of Reval. The place contains 984, and the canton 7775 inhabitants, on a territory of 215 kilometres, in 13 communes.

**JUNIUS, FRANCIS**, in Biography, a learned French Protestant divine, descended from a noble family, was born at Bourges in the year 1545. At the age of thirteen, he had made an extraordinary proficiency in learning, and being intended for public life, he began the study of the civil law, and after prosecuting it for some years, he was sent to Lyons, to join the train of the ambassador from the king of France to Constantinople. He unfortunately arrived too late, and accordingly remained in that city to attend the public lectures of the college. Here, by his avidity in pursuing knowledge, he recommended himself to the principal, which was of great service to him in his studies. In this city he became acquainted with a person deeply tainted with sceptical notions, and became himself an atheist. On his return to Bourges, his father engaged him in a course of reading, particularly of the New Testament, which infensibly reclaimed him from those principles which he had imbited at Lyons; and from this period he attached himself to studies connected with sacred literature and piety. In 1565 he was appointed minister of the Walloon church at Antwerp, where his labours were eminently useful in spreading the reformed religion, on account of which his father had been murdered a short time before by the bigoted Catholics. Junius soon became obnoxious to the Inquisition, which had been lately introduced into the Low Countries; and many attempts were made by the emissaries of that tribunal to get possession of his person, which timely information enabled him to elude. In 1568 he was made chaplain to the prince of Orange, whom he accompanied during the unfortunate expedition to the Netherlands; and upon his return, he resumed his ministerial functions at Schoon, to which he had been before appointed by the elector palatine Frederick III. He was, after this, noticed by Henry IV. of France, and employed upon some public missions; which being accomplished, he accepted the divinity professorship at Leyden, the duties of which he performed with ability and great reputation for the space of ten years. He died of the plague in 1609, in the 57th year of his age. He was author of numerous works, theological, controversial, and philological, of which the following may be mentioned: "Commentaries," on the first three chapters of Genesis, the prophecies of Ezekiel, Daniel, and Jonah; "Sacred Parallels," and "Notes," upon the book of Revelation; "A Translation out of Hebrew into Latin of the whole Old Testament"; "Hebrew Lexicon;" "Grammar of the Hebrew Tongue;" "Notes on Cicero's Epistles to Atticus;" "JUNIUS, FRANCIS," son of the former, was born at Heidelberg in 1580, and was educated at Leyden. He was first intended for the military profession, but circumstances induced him to change his purpose, and he devoted himself entirely to letters. As a literary man, his first occupation was in collecting and publishing some of his father's works. In 1620 he came to England, and resided in the family of Thomas earl of Arundel, as librarian, during the space of thirty years. Being, it is said, void of all ambition, and indifferent to the usual objects of worldly pursuit, he made study the whole business of his life. His frequent visits to the Bodleian and other libraries led him to obtain an intimate knowledge of books written in the Anglo-Saxon dialect. Convinced that in this he could discover the etymologies of all the tongues of northern Europe, he applied to it, and to the other dialects connected with it, with the greatest alacrity. His final conclusion was, that the Gothic was the mother of all the languages of the Teutonic stem. In hopes of hearing the ancient Saxon spoken in its ancient purity, he went and resided in Friesland for two years. On his return through Holland, he met with the M.S. of the four Anglo-Saxon letters, known by the name of the silver MS. This he felt about explaining, and published it with a glossary, subjoining a version of the name in the Anglo-Saxon, with notes by Dr. Marshall. He returned to England in 1674, and died at Windsor in 1677, at the age of eighty-eight. He bequeathed all his MSS. and collections to the public library at Oxford. His works are "De Pictura Veterum," "Observationes in Willeromi Franciscum Paraphrasis in Cantici Canticum." But his great labour was a "Glossarium Gothicum," in five languages, comprised in nine volumes. An "Etymologicum Anglicanum" was published from his papers, by the Rev. Edward Lye, in 1743. Bayle. Weed Ath. Ox.

**JUNIUS, in Geography, a military township of America, in Onondaga county, New York, at the N. end of Cayuga lake.

**JUNIUS Creek**, a northern branch of the Little Kanawaway, which interlocks with the western waters of Monongahela river. See KANAWAY.

**JUNK, a river of Guinea, which runs into the Atlantic, N. lat. 6° 57'. W. long. 10° 4'.

**JUNK, in Sea Language, a name given to any remains or pieces of old cable, which is usually cut into small portions, for the purpose of making points, mats, and nets, &c.

**JUNKS, large flat-bottomed vessels, from 100 to 500 tons burden, used by the Chinese. They have three masts, and a short bowprit placed on the starboard bow. The masts are supported by two or three thwarts, which at times are all carried on the windward side. The fore and main mast is hoisted a fort of lug-fall, made of cane or bamboo. These fails are confined by iron travellers, that encircle the main, and fixed to bamboo at several divisions on the fall. The fall is kept to the wind by two ropes, felled to wood hirds, fixed to the foot of the fall, and lead to the main-head. The lee part of the fall is hailed aft, by a rope that branches into short legs, that are made fast to each fold of the fall. On the mizzen-mast is a gaff-fall, made of coarse cotton; a top-fall made of the same is carried on the main-mast; also a jib and fprit-fall, that are set on the bowprit. Similar to these junks are the Japanese barks, which are 80 or 90 feet long on one deck, but have only one mast, that carries a square fall, and forward one or two jibs made of cotton. They only use falls when the wind is large.

**JUNKER, CHRISTIAN, in Biography, was born at Drefden in 1688. He studied at Leipzig, was made first rector and librarian at Eifenach, and historiographer to the prince of Saxony. In 1711 he was elected a member of the Royal Academy of Sciences at Berlin, and in 1713, director of the gymnasium at Altenburg. He died in the following year through grief from the loss of his wife, whose death preceded his own but five days. Of his literary talents he gave sufficient proof by the many works which he published, and particularly by his "Geography of the Middle..."
Middle Ages, in quarto. This work, which was published at Jena in 1712, is divided into two parts, and the whole concluded with a very useful index of all the countries, towns, villages, forests, rivers, and mountains known in the middle ages. His other principal works are, "Vita D. Mart. Lutheri et fœcundæ Evangelicæ Rerum," etc.; "Vita Jobi Ludolphii, accedent Epist. aliquot clariss. virorum, nec non Specimen Linguæ Hottentotissæ," "Principles of the Ecclesiastical History of the Old and New Testament," and "Lith. primæ Eruditionis universæ Historiæ Philosophicæ."

Gen. Brog.

JUNKOWADA, in Geography, a town of Africa, in the kingdom of Yani; 22 miles W. of Pintmania.

JUNKSELLON, or JUNK CEYLON, an island in the East Indian sea, on the E. side of the bay of Bengal, belonging to Siam, and governed by a viceroy from that court. It derives its name, according to captain Forrest, from a corruption of "Oojong Sylan," signifying, in the Malay language, point or promontory of Sylan, the S. point projecting a little way into the sea. It stretches nearly N. and S. about 50 or 60 miles long, and is about 15 miles broad; its centre is situated in 8° N. lat. separated from the continent of Malacca by an illusmus of sand, about a mile long and half a mile broad; which illusmus is covered only at high water, and flits up in the N. part an excellent harbour, called "Popra," with good anchorage round it, generally on a muddy bottom. The hills of this island are of moderate height; and instead of rivers, it has creeks, running into the sea, through flat marshes of mangrove trees from pleasant brooks in the interior parts. The vessels used by the inhabitants consist of a few prows, about the size of Indiamen's long boats, and small canoes, in which they fish up the creeks to the cultivated plains in the middle of the island, abounding with rice fields. Besides Popra, there is another capacious harbour on the S. W. part of the island. The place where ships generally anchor is in a good road, well sheltered behind a small island, joined at low water to the main land. In this island are 17 towns or villages, and the number of inhabitants is estimated at about 12,000. They have many elephants procured from Mergui, but no horses; they have bullocks and buffaloes for labors; wild hogs and deer; a few tame goats; no sheep; domestic dogs and cats. They have some of the common poultry. The climate is agreeable, without extreme heat; the rain comes on gently in July, and continues, but not without frequent interruptions, till November, when fine weather succeeds, with very cool N. E. winds at night, favorable to the cultivation of vegetables. The opium, formerly sold on this island in great abundance, was brought in English ships from Bengal, and purchased by those who used Malay and Buggells' prows; they sold it by retail to the natives for tin, and exchanged it with the Bengal vessels for opium, which they carried chiefly to Celebes and other Malay islands. The mixed cargo of the Malayans was generally a chequered cloth, called Buggells' cambays, made on the island of Celebes, painted cloths and painted handkerchiefs of Java, generally made from Hindoostan long cloth, Java gongs, brass pots, and various utensils of brass made in that island; China and Java tobacco; various porcelain; blue and white unbleached cloth called "kangan," and white and blue called "compo," brought from China by the junks that refort to Siam, Macassar, Soofoo, Batavia, and other places. But the course of trade is much altered of late; opium being forbidden to the natives, the importation of it is prohibited, and a heavy duty is laid on the exportation of tin by orders from Siam; so that the trade has much declined. Hindoo- dian piece goods, and some European articles, such as iron, red, lead, sullen, and broad cloth, being almost the only imports. The trade of this island is considerable in ivory and tin. The exportation of tin is annually estimated at 500 tons. N. lat. 8°. E. long. 98° 26'.

The Burmans, willing to obtain the entire dominion of the western coast, as far as the territories of the Malay princes of Perak and Siam, made an attempt, in 1765, to purchase the island. By 100,000 dollars, they would have been able to monopolize the commerce of the peninsula, and prevent the Siamese from communicating with the Burmans by any other channel except the Gulf of Siam. Besides, the island was desirable on account of its mild climate and infrequent fevers. Having fitted out a powerful armament of 11 ships and 8000 men, they attacked the fort, which is situated on the E. side of the island, and succeeded, notwithstanding a spirited resistance on the part of the Siamese governor, who afterwards withdrew from the fort into the interior of the island. The triumph of the Burmans was of short duration; the Siamese governor rallied his forces, and drove the Burmans to their shipping with great loss. Appreciative of greater disasters, they returned to Mergui, whence the fleet sailed for Rangoon, and the troops marched to Martaban. In the year 1786, the Burmans renewed their attack, and blockaded the harbour of Junkeylon; but in the event they were completely routed by a powerful army of the king of Siam. Symes's Embassy to Ava, vol. i. See Siam.

JUNO, in the Heuton Mythology, a goddess; the daughter of Saturn and Rhea, the sister and wife of Jupiter; she is otherwise called Lucina. According to Hesiod, she was the mother of Hebe, Venus, Lucina, and Vulcan.

Juno, as well as Jupiter, had a great variety of chariots among the ancients, but the favourite one of them all, among the Romans, was that of the Juno Matrona, drest like the Roman matrons in a long robe which covered her from head to foot. The figures of the Roman empresses were often formed under this character of Juno. Such is the statue of Sabina, at the Villa Mattel in Rome. This Juno was called indifferently, Juno Matrona and Juno Romana. The Juno Regina, and Juno Moneta, are always represented on the ancient gems and medals, in a very fine and magnificent dress, with the instruments of coinage, and under the latter appellation she had a temple at Rome. We may observe, that Virgil, Æn. i. v. 17. and Æn. ii. v. 614, speaks of Juno, not according to the appearance she used to make among the Romans, but according to the representations of her in other countries. In one place, where he describes her arms and military chariot, he speaks of the Carthaginian Juno; and in the other he has given her an angry and warlike figure, which belongs to the Juno Arnica, or some particular Juno of the Greeks. However, the Juno Sophita, among the Romans, appears on several medals in a war chariot, and with a spear in her hand. She was called Sophita, because she was watched over the falsity of the air, the temperature of which is the cause of diseases. Under this name she had three temples, one at Lavinium, and two at Rome; and Cicero informs us, that the confidants, before they entered upon their office, were obliged to offer a sacrifice to her. Another name of Juno was the "Queen," or "Regina," under which appellation she had a statue at Veii, that was transported to the Aventine mount, under the dictatorship of Camillus, where it was consecrated by the ladies of the city. This statue was held in such reverence, that none but her priest could touch it. There was also a mild Juno, as well as a mild Jupiter, among the Romans; under which character, her face appeared more gentle and good-humoured than usual; but the most obvious and striking character of
Juno, which we derive from the writings of Homer and Virgil, is that of an imperious and haughty wife. These poets often represent her feauding at Jupiter, than caring for him. Nevertheless, she was anciently confidered as the great patroness of marriage and a wedded life. Under this character she had the name of Juno and **Pronuba**, (Virgil, *Aen. 4.*) and had an altar in the street called **Jugura**. When she preuded over women in childbed, and was confounded with Diana, she obtained the name of **Lucina**, and was represented as a matron, holding a cup in her right hand, and a spear in her left, with this inscription, "**Juno Regina.**" Sometimes she was represented sitting on a chair, holding in her left hand a child in swaddling clothes, and in the right a flower resembling a lily; and also a whip and a sceptre, the whip signifying a happy delivery. Juno, under the character of previding over the air, is represent in a light car, drawn by peacocks, and attended by the Aurora, or nymphe of the air.

Of all the divinities of the Pagan world, there was not one whole worship was more folen and more general than that of Juno. It was not confined to Europe alone, but found its way into Asia, especially into Syria; and also into Egypt, and other parts of Africa. Greece and Italy abounded with temples, chapels, or altars dedicated to this goddess, and in some places of distinction she had several of these. Among the more celebrated towns, there were at least three that paid a particular worship to Juno than others, viz. Argos, Samos, and Carthage. The pietieles of Juno of Argos were highly repected in Greece; and their priesthood served to dignify the principal eras of the Grecian history. Among the birds, the hawk was appropriated to her, and above all the peacock, which was frequently an appendage to her statues. According to *Jean De Animal.,* the Egyptians consecrated to her the vulture. Dittany and the poppy were the plants which the Greeks offer her, when they took her for Juno Lucina. Among the animals, the ewe-lamb was peculiarly consecrated to her, and was the most common victim offered to her in sacrifice. It was usual, however, to offer to her a sow on the first day of each month. We may infer the high veneration which was paid to Juno, especially by the women, from this circumstance, that their guardian deities were called "Junones," as those of the men were denominated "Gens." Apuleius sums up the honours that were paid to Juno in a comprehensive manner, by informing us that she was worshipped as the "Queen of the Goddesses." See Jupiter, infra.

Juno the Assyrian was called **Astarte,** which fee.

Juno, in *Astronomy,* the name given to one of the new planets by Mr. Harding the astronomer, who discovered it at Lillethall, in Germany, the 1st September 1804. Two of these singular bodies, Ceres and Pallas, had been before discovered by Piazzi and others, and the great difficulty with which they are formed after they have been enveloped in the sun's rays, suggested the talk to Mr. Harding, of constructing a species of zodiac, to enable astronomers to find these two small planets. In this zodiac he placed not only all the stars in the catalogues, but also all the small stars which he himself could observe and place in the probable tract of the planets. It was in executing this laborious undertaking, that he perceived a small star which he thought had not been in the same place a short time before. Three days afterwards it had evidently changed its place, and advanced towards the south two degrees. A series of observations soon convinced him that he had discovered a third planet of the famo class of Ceres and Pallas.

Its orbit has been calculated by Mr. Gauß and Mr. Burchardt, as follows:

**Juno, or Pallas:**
- **Longitude:** 1 ° 12' 32" 36'
- **Apollonion:** 7 ° 13' 16'
- **Node:** 5 ° 21' 0" 0'
- **Inclination:** 13 ° 38' 50'
- **Diurnal motion:** 815' 9597
- **Annual motion:** 22 ° 43' 45" 2'
- **Excentricity:** 0 ° 54' 2386
- **Semi-axis Maj.:** 2 ° 06' 45" 2 657

The mean diameter of this planet, as seen from the earth, is, according to Schroeter, 3° 57', but he differs in his opinion on this subject from Mr. Herchel, who estimates it much smaller, and astronomers are at present unable to decide to which theory they should incline.

Under the article **Planets** we shall again resume the subject of these newly discovered bodies, and attempt to shew the strong arguments that may be urged to prove that they are all fragments of a large planet which once circulated between Mars and Jupiter.

**JUNO,** in *Geography,* a town of Hindooftan, in Bahar; 35 miles N.E. of Nangour.

**JUNOES.** See *Gens.*

**JUNONIA,** the name given at Rome to a festival instituted by the Greeks in honour of Juno, and by them called **Hercus;** which fee.

**JUNQUERA,** L., in *Geography,* a small town of Spain, in the province of Catalonia, situated at the entrance of a plain, which, as Strabo says, was fertile in flax and spart, or sea-rub, whence it acquired the name of "Campus Juncarius," and the town that of "Juncaria." This town was established by a colony of Maffian, and was formerly considerable; but is now much reduced. It has a parish church, but little trade. The environs abound with cork trees; 30 miles N. of Gerona.

**JUNTA,** called also **Junio,** and **Juntu,** a council, or company, of several persons, meeting for the dispatch of any business.

The term is particularly used in the Spanish and Portuguese affairs. On the death of Charles II. king of Spain, the kingdom was governed, during the absence of Philip V. by a junta.

In Portugal they have three considerable juntas: the junta of commerce, that of the three elates, and that of tobacco. The first was established by king John IV.; this is a council of marine. The same king also assembled the elates of his kingdom, to create the tribunal of the junta of the three elates. King Peter II. created the junta of tobacco in 1675; it consists of a president and five counsellors.

**IVOIRE,** in *Geography,* a town of France, in the department of the Lemen; 13 miles N.N.E. of Geneva.

**IVORY,** *Ebur.,* the tusks or large conical teeth in the upper jaw of the elephant. This name is also sometimes improperly given to the teeth of the sea-unicorn (Monodon monoceros), the morse (Trichecus rosmarus), and thole of the Hippopotamus (see those articles).

The elephants’ tusks from Africa are in general preferred by the dealers in this article; they generally run considerably larger, but it is a common opinion, that the ivory from Ceylon is less liable to turn yellow when exposed to the action of the atmosphere, whence it is sold at a higher price than the other. By far the greater part of this merchandise is brought from Africa; and a part of Guinea, which has furnished the greatest quantity of it, has obtained the name of the **Ivory Coast:** the tract of coast from Cape Palmas, to Apollonia or Trepunta, is more particularly
IVORY.

Early known by this appellation. But the principal market for some time past appears to have been at the east coast of Africa, where the ivory is supposed to be found of superior quality; indeed the English merchants at Surat pay a greater price for the tusks furnished by this part of the coast than for such as are brought from any other part of Africa.

The bolt tusks are those that are least curved, without spots, and most solid towards the base. Some writers on this subject pretend that such elephants inhabit swampy places, generally produce blue, fpongy, and knotty tusks, in every respect inferior to those of elephants living in dry countries or on dry plains. The Ethiopian elephants' tusks, according to Paul Lucas, are furnished with larger cavities, and are therefore less esteemed.

In commerce, unwrought ivory paffes under the appellation of marfil, or moril, a word which Frich derives from the Spanish, but is probably of Moorish or Indian origin. Tusks under a certain weight (some say 14, others 22 pounds) are called Grebaldes by the African merchants; a word which appears to be the same with EkecbarkU, or EftcarleW.e, of the French, and Scarcuides of the Spaniards and Portuguese.

Elephants' teeth constitute a very important article of commerce. Labat computed the quantity of ivory annually imported into France at this time, by the Senegal company, to be 500 quintals, or 50,000 pounds. In 1784, the number of tusks imported into Nantes was 744, besides 390 pounds weight; and into Havre de Grace, in the same year, 435 tusks and 1,805 pounds, and into Bourdeaux 5997 pounds. In the following year 3027 pounds and 471 tusks were imported into Nantes; in 1787, 16,184 pounds and 395 teeth; and into Havre de Grace 2784 pounds.

In an account which the house of comonly ordered to be given in, of the quantities of the principal articles in the nature of raw materials, imported and used in the manufactures of Great Britain for twelve years preceding the year 1799, we find the following respecting the importation of elephants' teeth; viz.:

<table>

The component parts of ivory being the same as those of bones (viz. phosphate of lime combined with a gelatinous substance), and differing only with regard to texture, hardness, and whiteness, the preparations it undergoes in the arts are equally applicable to the bones of animals. The whiteness which ivory acquires depends chiefly on the degree of dryness it has acquired. When yellow, its gelatinous nature is altered by the air, and appears to be combined with the oxygen of the atmosphere. Oxygenated muriatic acid will restore it to its original whiteness. Those employed in working ivory, distinguish the white and the green. The former is known by the whitish or lemon coloured rind of the tusks, the other by the brown and blackish.

The green ivory (so called from a greenish or faint olive colour pervading its substance) is preferred, it being of a closer texture, and known soon to exchange its green hue for the most beautiful white, which is less liable to turn yellow. This green ivory is, however, more brittle than the other.

Heat cannot be made use of for making ivory plant, though it is rendered softer by being exposed to that agent. It is divided by the law: sometimes for delicate work, under water, in order to prevent its being heated or rent in the operation. It is polished with pumice and tripoli. Ivory has been said to become soft by being placed in milk; but that end is attained with greater certainty by steeping it in some diluted mineral acid. Both ivory and common bones become also soft by being immersed in an alkaline lye made of soda and quick lime.

By burning this substance in clofes vessels, and afterwards levigating it with water on a porphyry slab, we procure what is called black ivory, much used for painting and other purposes that require a very intense velvet-like black colour.

The following observations, relative to the nature of the tusks of elephants, are extracted from Cuvier's excellent memoir: - "On living and fossil Elephants," in the Annales du Museum, and translated in the Philosophical Magazine, vols. xxvii., xxviii., and xxix. to which, especially as our article Elephant was written previous to the publication of that elaborate memoir, we refer our readers for a more complete natural history of that remarkable animal.

Cuvier, in examining the varieties of tusks, and the differences remarked in this respect among elephants, observes, that their texture exhibits no important difference. It always performs, upon its transverse section, those breaks which proceed like an arc of a circle from the centre to the circumference, and form, in growing, curvilinear lozenges which occupy the whole disk, and which are more or less broad, and more or less perceptible to the eye. This character, common to all elephant ivory, and depending immediately on the pores of their pulp, is not to be found in the tusks of any other animal. It is to be seen in all fossil tusks, and it refutes the opinion of Leibnitiz, adopted by some other writers, and even by Linneus, that the mammoth horns might have belonged to the Tricheus reformans. The tusks of these animals, however, seem wholly composed of small round accumulated grains.

The size of tusks varies according to the species, sexes, and varieties; and as they are growing all their lives, age more than any other influence their dimensions. The African elephant, as far as we are able to ascertain, has very large tusks in both sexes. The African female, 17 years old, the skeleton of which is in the museum of Paris, has larger tusks than any male or female Indian elephant of the same size that we are acquainted with. It is from Africa we receive the most ivory, and the greater number of tusks; and they are also harder and whiter than any others. But our limited knowledge is confined to the elephants of the western coasts, and to those of the south of Africa. We are ignorant of those of the eastern shores resembling them in every thing, and if there be any varieties in the interior. We know from Rembrand, however, that the coast of Mo-
famboque furnishes tusks ten feet long, being the largest ever known. In the Indian species there are more varieties of tusks, which Mr. Corse has developed with more care than any other writer (see Phil. Trans. 1769, and art. Elephas); but all these varieties have nothing constant, and are mixed indiscriminately with each other. In Bengal, the tusks weigh little more than 72 pounds, and they do not exceed 50 in the province of Tipperah, which produces the best elephants. There are tusks in London, however, probably from Pegu, which weigh 150 pounds. It is, in fact, from Pegu and Cochinchina that the largest elephants and tusks of the Indian species come. The coast of Malabar furnishes no tusks, according to Pennant, more than four feet long.

Cuvier has drawn up the following table of the length, diameter, and weight of the largest tusks taken from other authors, or actually inspected by himself: the tusks from Africa are not distinguished here from those of India.

As the tusks, M. Cuvier adds, grow during the life of the animal, and the body does not, the size of an elephant cannot be concluded from its tusks, even by establishing the proportion between individuals of one same variety, and the same fact as, on the other hand, the tusks rot or break at their points, according to the greater or less use the animal makes of them, and they are sharpened, more or less abruptly, into a point, we cannot conclude their length from the diameter at the base. Finally, their weight cannot be concluded from their dimensions (Mellerschmidt in the Phil. Trans.), because their cavity at the base may be more or less filed. The degree of curvature of the tusks of elephants varies almost as much as their size. In various cabinets there are several tusks to be seen with curvatures more or less strange, and in particular some are spiral. Camper saw several of them in the British Museum, and Drew represents one which is turned round several times; and Cuvier knows, from M. Fabron, that there is one of that description in the Florence cabinet also. They are frequently seen in the form of an Italian S, &c.

A green dye may be given to ivory, by steeping it in aquafortis, tinged with copper or verdigris, or in two parts of verdigris and one of sal ammoniac, ground well together, with strong white-wine vinegar poured on them; and by converting

As the tusks, M. Cuvier adds, grow during the life of the animal, and the body does not, the size of an elephant cannot be concluded from its tusks, even by establishing the proportion between individuals of one same variety, and the same fact as, on the other hand, the tusks rot or break at their points, according to the greater or less use the animal makes of them, and they are sharpened, more or less abruptly, into a point, we cannot conclude their length from the diameter at the base. Finally, their weight cannot be concluded from their dimensions (Mellerschmidt in the Phil. Trans.), because their cavity at the base may be more or less filed. The degree of curvature of the tusks of elephants varies almost as much as their size. In various cabinets there are several tusks to be seen with curvatures more or less strange, and in particular some are spiral. Camper saw several of them in the British Museum, and Drew represents one which is turned round several times; and Cuvier knows, from M. Fabron, that there is one of that description in the Florence cabinet also. They are frequently seen in the form of an Italian S, &c.

A green dye may be given to ivory, by steeping it in aquafortis, tinged with copper or verdigris, or in two parts of verdigris and one of sal ammoniac, ground well together, with strong white-wine vinegar poured on them; and by converting
converting the aqua-fortis into aqua regia, by dissolving a fourth part of its weight of sal ammoniac in it, ivory may be flaved of a fine purple colour.

Ivory, bone, horn, and other solid parts of animals, may be flaved black, in the same manner as wood. These substances may be flaved yellow, by boiling them first in a solution of one pound of alum, in two quarts of water; and then, having prepared a tincture of the French berries, by boiling half a pound of the berries, pounded, in a gallon of water, putting them into this tincture, after it has boiled about an hour, and letting them remain there half an hour. Turmeric root may be used instead of the berries; but in this case the ivory, &c. must be dip'd in water after it is taken out of the tincture. Ivory, &c. may be flaved blue, by first flaving it green, and then dipping it in a solution of pearl ashes made strong, and boiling hot; or it may be otherwise boiled in the tincture of indigo, prepared by the dyers; and afterwards in a solution of tartar, made by dissolving three ounces of white tartar, or cream of tartar, in a quart of water. For other processes and colours, see Dyeing of Bone, &c. Colouring and Staining of Bone, and Tortoise Shell.

Ivory may be prepared as a ground for miniature painting, by cleaning the ivory leaves or tables, and rubbing them over with the juice of garlic. This is said to be more efficient for taking off the greasines, which prevents the colours from fixing on the ground, than soap or gall. Ivory has the same medical virtues with hornthorn; its flaving too, like those of hornthorn, boil into a jelly with water, and have the same restorative quality. See HART-THORN.

IVORY BLACK. See IVORY BLACK.

IVORY, FOSSIL, in Natural History. It is not uncommon in the most modern alluvial soils, like the villas in the basin of Paris, mentioned by Cuvier and Brognart, and the soil in which the docks adjoining the Thames were excavated, to find the bones, teeth, and tusks of elephants; and this fossil ivory is not, in some instances, much altered, though in general it has lost its coherence in a great measure, and readily scales off in concentric rings, and in others is impregnated with metallic tuberculums, so as to imitate, if not form the Turquoise bones, the Callais of Pliny. &c. as Dr. Woodward has shewn in his Letters on the Method of Fossils, p. 15. It may, however, be doubted, we believe, whether fossil ivory has ever been found imbedded in the strata, or the parts of any dry-land animals, numerous as their remains are in the alluvial covering of some districts. The abundance of elephants' teeth found buried in different parts of the world, and many of those parts such as no elephant is ever known to have lived in, have given amazement to naturalists.

The long tusks, which are what we call ivory, are the only teeth the vulgar are acquainted with this creature; yet even thence, in their fossil flate, have often been mistaken for horns, or other animal parts. The grinders of this kind are so enormous, and of so singular a shape, that it requires some knowledge in natural history to discover them at first, and many have mistaken them, when imperfect, for parts of a petrified shellfish of the nautilus kind, their root being hollowed all along, and armed with an indented ridge on each side, in the manner of the back parts of some shells of that and of the Cornu ammonis kind.

We are not to wonder that the teeth of elephants are found more frequently than any other bones of the animal, since their use in the creature required that they should be harder than any other bone, and that hardnefs has preserved them in places where the other bones have perished. The different flate in which these teeth are found, is wholly owing to the different juices abounding in the earth in the place where they were deposited, some of those juices being of power to preserve, others to destroy them; some eating them insensibly away, some as it were calcining them by flow degrees, and others rendering them greatly more hard and durable than before. Mem. Acad. Par. 1727.

Count Mariigli, and some other writers, have thought it an easy solution of the question of the teeth and bones of elephants being found in countries where elephants are not naturally found, that we trace them to the Romans, who, bringing them over for their use in war, buried them where they happened to die. But Sir Hans Sloane expresses himself very justly against this opinion: he observes, that of the remains of elephants found in Europe, nothing is so common as the ivory tusks. Now, as he well observs, the Romans held ivory in the highest esteem, and it sold among them at a great price; wherefore, had they been the buriers of the elephants, they would certainly have taken away the ivory tusks first. It is certain, therefore, that accident, and not design, hath buried these bones, and that accident can have been no other than some prodigious inundation. Woodward is defirous of making the universal deluge to have done all this, but that seems not necessary to be supposed in every case. Sir Hans Sloane gives an enumeration of the most curious of these pieces of fossil ivory, which his own cabinet contained, and of some others of the most remarkable, mentioned by authors; from which we may form a very distinct idea, both of the nature of the bodies themselves, and of the places where they are usually met with. See Philos. Trans. N° 463. p. 458.

The power of subterranean calculations to render things of this kind brittle, is remarked by the same author from Moreton's History of Northamptonshire, in the instance of a fossil tusk of an elephant, which was in the whole at least fix feet long, and had preserved its natural whiteness, though rendered so brittle as to fall into several pieces in the digging. This was dug up near Little Bowden, in Northamptonshire; and the strata of the place where it lay were as follows: 1. Vegetable mould, 14 inches. 2. Loam, a foot and a half. 3. Large pebbles, with a small mixture of earth among them, two feet and a half. 4. Blue clay; in the upper part of this last stratum the tooth was found.

Sir Hans mentions another elephant's tusk very entire and found, found in Siberia. The like are common in Siberia and many parts of Russia, and are so little injured, that they are used as ivory, and are supposed to be the teeth of a vast animal called the mammoth, which they think lives under ground. Phil. Trans. N° 468. See farther on this subject, FOSSIL, ELEPHANTS' BONE, and TEETH, FOSSIL.
The whole coast, if we except a few capes, from Cape Palmas to Cape Apollonia, is so low and straight, that it furnishes no distinct land-marks besides the heights and mountains round Drewin. The landing is every where dangerous, on account of the swelling waves and high surfs; and the negroes, who are acquainted with this fen, are the only people that can combat with the fury of its winds, tides, and waves, in their little canoes. From Cape Palmas to Cape Apollonia, these canoes are employed in loading and unloading our ships, that dred coming near the shore. Every coast within the limits of the Ivory Coast is fruitful in rice, peas, beans, gooseberries, citrons, oranges, and cocoa-nuts, besides figs and cane. Upon the whole, the Ivory Coast is reckoned one of the finest divisions of Guinea: the mountains and valleys, filled with villages, which are surrounded with lofty palms and cocoa-trees, present a delightful prospect. The soil of the high land is a reddish earth, which, with the perpetual verdure of the trees, forms an agreeable mixture of colours. Cotton and indigo are the spontaneous growth of the provinces of Great Drewin and St. Andrew, which are the richest of the whole. Palm wine and oil are plentiful; together with a species of fruit, growing on a sort of palm-tree, which the natives call tombo, or bourbon. This the negroes eat with great pleasure, drinking at the same time a wine, drawn from the same tree, mixed with water. All sorts of tame animals, sheep, cows, goats, and hogs, are so numerous, that they are sold almost for nothing. The coast affords great variety and abundance of fish. As to the people, they are rather above the common stature, clean-limbed and well proportioned; but their features on the first glance are hideous; yet when the first impression is removed, Villaut and Der Marchais concur in representing them as the most rational, civilized, and polished people in all Guinea. This account, however, is restricted to the natives of the Quaquas coast, that is, from the river Drewin to Cape Apollonia; for as to the others, all authors describe them as the most barbarous, cruel, and savage of all nations. Drunkenness is a crime of so odious a nature among the most civilized, that the laws have prohibited it under the severest penalties, and on pain of death. Their diet is coarse and indelicate. Their teeth are sharp, as they are in the convict habit of pointing them, and in general they are crooked and irregular. Long nails and a quantity of hair are deemed very ornamental. They are much addicted to the chewing of betel, with the juice of which they moisten the neck and chin, under a notion, but it given a fine varnish and beautiful lustre to the skin. Round the small of the leg, they wear large and heavy rings of iron, to which are appended bells, with the tingling sound of which they are most delighted; and the multitude of these, as they imagine, connotes their dignity and grandeur.

The common people only wear a piece of cloth round the waist, from a regard to decency; but purses more opulent cover themselves with a sort of cloak or furplice, with long sleeves, which they wrap round the shoulders, and hang down below the knee; and by their sides they wear lances or short swords. Some of the women, who do not part with their hair to the men, adorn it with little plates of pure gold; and they are fond of coiffly trinkets. Their dress is a cloth, which falls over the fore-part of their bodies, the hinder parts being left naked; and indeed there is hardly any people on the whole coast of Guinea so primitive and simple in this particular, as the natives of the Ivory Coast, and particularly of Quaua. Their form of salutation they have in common with all negroes; that of laying hold of the fingers, making them crack, and repeating the word "quaqua" several times in a low voice. It is a custom rule among them, that the son follows the profession of the father, whatever it may be. In the mechanic arts they are singularly inexpert; a common door-lock is reckoned a great curiosity; a watch excites still higher admiration; and making paper spears, as they express it, is a perfect miracle. Their religion, like that of the people on the Gold Coast, is wholly founded in ignorance and superstition. They entertain great reverence for their princes and priests; and they are fully perfumed, that magic and forcery are powers inexpressible from majesty and priesthood. The natives of Quaua cultivate several branches of trade with affability; and crowd on board any ships that approach their coast with all the produce of their country, gold, ivory, provision, and slaves. The European factors are much amused with observing canoes filled with men crowding round them, whilst every mouth utters the same sound, quaqua, quaqua, which seems to be a word by which they express welcome. The negroes of Quaua, however, are timorous and jealous in their intercourse and traffic with Europeans. The usual trade carried on in this part of the coast consists of cotton cloths, ivory, gold, and slaves. The maritime negroes act as brokers to the inland negroes, sell their stuffs for them, and receive so much per cent. by way of commission. The Quaua negroes manufacture a kind of plant, resembling hemp, into a strong cloth, to which they give beautiful colours, and pleasing flowers and designes that indicate them to be no bad artificers in their way. They have also a considerable trade in felt with their inland neighbours, to whom they sell it at a very high price, on account of the distance and expense of carriage. All the countries behind Quaua furnish large stores of elephant's teeth, the most beautiful ivory in the world. This is constantly bought up as soon as it is brought to the coast by the English, Dutch, French, and sometimes by the Danes and Portuguese. Villaut infers from the quantity of pure gold which the women wear for ornament, that the inland country has mines that furnish virgin native gold. The European commodities which the negroes accept most readily in exchange for their own, are such as are held in estimation in other parts of Guinea; with this difference, that here the bracelets and rings for the legs, either of copper or iron, must be of an intolerable weight.

Although the Ivory Coast be divided into a variety of petty states or kingdoms, yet they have scarcely any separate interests; for among themselves war fe'dom happens, and of confederation, the slave trade here has borne but a small proportion to that traffic on the Gold and Slave Coasts.}

JUPARITUBACA, a river of Brazil, which runs into the Atlantic, S. lat. '1° 10'.

JUPITER, a river of the island of Anticosti, which runs into the river St. Lawrence, N. lat. 49° 25'. W. long. 63° 42'.

JUPITER, or Jove, in the Heathen Mythology, the sovereign god of the heathens; the son of Saturn and Rhea; born in the island of Crete, at the same birth with Juno; he married Juno, expelled his father out of his kingdom, and divided the kingdom of the world with his brethren. Under several shapes he is said to have played many wanton pranks; so that, according to poetic fiction, he filled heaven with his natural children.

The philosophers, as we learn from Cicero's discourses on the nature of the gods, took Jupiter only for the more purged air, or the ether, and Juno, his wife, for the grogger
JUPITER.

In that surrounds our earth. Those who regarded him as an animated god, or one of those men, who, for their illustrious actions or useful inventions, were raised to divine honours, after having considered him as the sovereign of gods and men, or as an almighty god, who, by the mere movement of one of his eye-brows, made Olympos tremble, degraded him afterwards by ascribing to him the most unnecessary actions and the most enormous crimes; he is, according to them, guilty of incest and adultery, an ungrateful son, a faithless husband, choleric, passionate, and revengeful. Whence, we may naturally inquire, did the Greeks and Romans, renowned for their genius and philosophy, derive such ideas of their supreme divinity? They were the poets, it is said, who gave such a representation of their Jupiter; but they must have borrowed it from the prevalent theology of the times. However, the history of this god is perplexed by the number and variety of persons, to whom the name has been applied. We may observe, that the history of Jupiter, who was best known, is that of him, who had been king of Crete, and this history is filled up with the adventures of all the rest. The ancients are not agreed with respect to the number of these, to whom the appellation of Jupiter was applied. Diodorus Siculus reckons only two; one, who was the prince of the Atlanteans, and the other, supposed to be his nephew, who became much more famous, and was king of Crete, the limits of whose empire extended to the extremities of Europe and Africa. Cicero admits three; two from Arcadia, one the son of Atthis, and father of Proserpine and Bacchus, and the other, the son of Cacus, and father of Minerva, who is said to have invented war, and to have prevailed over it; and a third, the son of Saturn, born in Crete, where, says Cicero, his tomb is still to be seen. The most ancient of these, who bore the name of Jupiter, is said to have been Jupiter Ammon of the Libyans. (See Ammon.) Jupiter Serapis, worshipped also in Egypt, is very ancient. (See SERAPIS.) Jupiter Belus claims high antiquity; he is said to have had a temple at Babylon, and was, according to Herodotus, the Jupiter of the Assyrians. (See BELUS.) Jupiter of Thebes has been supposed by some to have been Ammon, and by others Osiris. (See OSIRIS.) The Scythians, the Ethiopians, and several other nations, had their respective Jupiter. Indeed, it is impossible to give a compleat list of all who bore that name, since, according to Varro and Eusebius, they amounted to 300. Besides, all the goddesses that are ascribed to Jupiter of Crete, and which, according to the poets, lived 400 years, cannot belong to one and the same person. Jupiter of Crete, having banished his father Saturn, and overthrown the Titans and Giants, determined to make his subjects happy. According to Heciod, he was seven times married, and the last of his wives was Juno. His true name is said to have been Jove, signifying young, to which was afterwards added the appellation of Father, whose name was derived from Jupiter and Juno. Others call Jupiter from Iove, or Iovana Pater. The Greeks call this god Zeus. The designation of father was intended to point out his superiority over the other gods, which was also expressed by the epithets "Optimus Maximus." Jupiter, having become master of a vast empire, married his sister, named by the Latins Juno, and by the Greeks Her; and as he found it difficult to govern dominions of so wide an extent, he distributed them into different provinces. Accordingly we learn from Diodorus Siculus, that Atlas governed the frontiers of Africa. The ancients also inform us, that Pluto was appointed governor of the western parts of the empire of the Titans, of the Gauls, and Spain; which government was afterwards transferred, upon Pluto's death, to Mercury, who, having dignified himself, became the great god of the Cosm. Hence it is said to him, in the oracle: "The comforts of the gods, and the earth, are thine; what thou hast, have it whatever thou wilt." (See GOM.)

Vol. XIX.
JUPITER.

Strength in battle, Mars. In process of time they used different representations of this Jupiter, &c and considered them, vulgarly at least, as so many different persons. They afterwards regarded each of them in different views: e.g. the Jupiter that showered down blessings, was called the Kind Jupiter: and when punishing, the Terrible Jupiter. There was also one Jupiter for Europe, and another for Africa; and in Europe, there was one great Jupiter who was the particular friend of the Athenians, and another who was the special protector of the Romans: nay, there was scarcely a town or hamlet perhaps, in Italy, that had not a Jupiter of its own; and the Jupiter of Terracina or Jupiter Laurus, represented in medals as young and beardless, with rays round his head, more resembled Apollo than the great Jupiter at the Capitol. In this way Jupiter at length had temples and different characters almost everywhere; at Carthage, he was called Ammon; in Egypt, Serapis; at Athens, the great Jupiter was the Olympian Jupiter; and at Rome, the greatest Jupiter was the Capitoline Jupiter, who was the guardian and benefactor of the Romans, and whom they called the belt and greatest Jupiter, “Jupiter optimus maximus.” The figure of this Jupiter was represented in his chief temple on the Capitoline hill, as sitting on a turule chair, with the fulmen or thunder, or rather lightning, in one hand, and a sceptre in the other. This fulmen in the figures of the old artists was always adapted to the character under which they were to represent Jupiter. If his appearance was to be mild and calm, they gave him the come fulmen or bundle of flames wreathed clothe together, held down in his hand. When punishing, he holds up the same figure, with two transverse darts of lightning, sometimes with wings added to each side of it, to denote its swiftness: this was called by the poets, the three-forked bolt of Jove; and when he was going to do some exemplary execution, they put in his hand a handful of flames, all let loose in their utmost fury; and sometimes filled both his hands with flames. The superiority of Jupiter was principally manifested in that air of majesty which the ancient artists endeavoured to express in his countenance: particular attention was paid to the head of hair, the eye-brows, and the beard. There are several heads of the mild Jupiter on ancient seals, where his face has a mixture of dignity and ease in it, admirably described by Virgil, Æn. i. v. 256. The statues of the Terrible Jupiter were generally of black marble, as those of the former were of white: the one fitting with an air of tranquillity; the other standing, more or less disturbed. The face of the one is pacific and serene; of the other angry or clouded. On the heads of the one the hair is regular and composed; in the other, it is so discomfited, that it falls half-way down the forehead. The face of the Jupiter Romans resembles that of the Terrible Jupiter: he is represented on gems and medals as holding up the triple bolt in his right hand, and standing in a chariot, which seems to be whirled on impetuosely by four horses. Thus he is also described by the poets. Ovid, Deian. Herc. v. 28. Horace, lib. i. od. 34. v. 8. Jupiter, as the intelligence, prefiguring over a single planet, is represented only in a chariot and pair: on all other occasions, if represented in a chariot, he is always drawn by four horses. Jupiter is well known as the chief ruler of the air, whose particular province was to direct the rains, the thunder, and the lightnings. As the dispenser of rain, he was called Jupiter Pluvius; under which character he is exhibited seated in the clouds, holding up his right hand, or extending his arms almost in a straight line each way, and pouring a stream of hail and rain from his right hand on the earth; whilst the fulmen is held down in his left. The wings that are given to him relate to his character of prefiguring over the air: his hair and beard in the Antonine pillar are all spread down by the rain, which descends in a fleet from him, and falls for the refreshment of the Romans; whilst their enemies are represented as struck with the lightnings, and lying dead at their feet. Speckes’s Polyemetis, p. 46. 182, and 217, &c.

Jupiter, in Astronomy, the largest of the planets of the solar system; his diameter being 11 times greater than that of the earth, or 89,150 English miles. Its revolution on its axis is performed in 9 hours, 55 minutes, and 37 seconds. This planet moves from west to east in a period of 11 years, 318 days, 14 hours, 27 minutes, 10.7 seconds. Its synodical revolution is about 390 days. Before its opposition with the sun, and at about 115 from it, its motion becomes retrograde, and its velocity continually augments till the moment of opposition, after which it diminishes, and when at about 115 from the sun, its motion changes from retrograde to direct. The duration of this retrograde motion is about 121 days, and the arc of retrogradation about 10 degrees; and it may be observed as a general rule with the superior planets, that the farther they are from the sun, the less is their arc of retrogradation; but the longer time is taken in describing it, for were the distance of planets indefinitely great, the arc of retrogradation would be extremely small, and its retrograde motion would last half a year, resembling the effect of parallax of a fixed star, if ever this should be rendered sensible to our instruments.

Jupiter is, next to Venus, the most brilliant of the planets, and sometimes even surpasses it in brightness. Its apparent diameter is greater at the oppositions, and is then equal to nearly 38”; its mean equatorial diameter is estimated at 38.8”. Its figure is an oblate spheroid, the proportion of its equatorial to its polar axis being about 1:15 to 1:13. La Place from theory deduces this proportion to be 1:000,000 to 9:256,522, a result obtained from computing the effect of the equatorial regions of the planet in disturbing the nodes of the satellites. Almost every planet is sufficiently acquainted with the telescopic appearance of Jupiter, to know that its surface is remarkable for being always covered with a number of belts or stripes of various shades. These differences appear much at different times, and even at the same time in telescopes of different powers. Usually these belts seem to be of an uniform tint; but in very favourable weather, they sometimes appear to consist of a number of curved lines, like the strokes of engraving. Fig. 145, 144, 145, 146. Plate XI. After the discovery of Barrow and Mr. Ibbetson, these belts were first observed at Naples by Zuppi and Bartoli, two Jesuits; and about the year 1660, they were observed by Campani, with refracting telescopes of his own contrivance, and not much inferior in distinctness to those of the present day; the great modern improvement in refracting telescopes, confining rather in the reduction of their size than in the increase of their magnifying power.

Jupiter is accompanied by four satellites, which were discovered by Galileo, the 8th of January 1610. He at first took them for telescopic fixed stars; but continued observation from convinced him that they really accompanied the planet. The relative situation of these small bodies changes at every inferior conjunction; they oscillate on each side the planet, and it is by the extent of these oscillations that the rank of these satellites is determined; that being called the first satellite, whose oscillation is the least. They are sometimes seen to pass over the disc of the planet, and project a shadow in the form of a well-defined black spot, which then describes a chord of this disc.

Jupiter and his satellites, therefore, are opaque bodies, enlightened
enlightened by the sun; and when the latter interpene between the sun and Jupiter, they produce red solar eclipses, precisely similar to those which the moon occasions on the earth.

This phenomenon leads to the explanation of another which the satellites present. They are often observed to disappear, though at some distance from the disc of the planet: the third and fourth re-appear sometimes on the same side of the disc.

The shadow which Jupiter projects behind it, (relatively to the fun,) is the only cause that can explain these disappearances, which are perfectly similar to eclipses of the moon.

The circumstances which accompany them leave no doubt of the reality of this cause. The satellites are always observed to disappear on the side of the disc opposite to the sun, and consequently on the same side to which the conical shadow is projected. They are eclipsed near the disc, when the planet is near its opposition.

Finally, the duration of these eclipses answers to the time which should elapse while they traverse the shadow of Jupiter.

Thus it appears that these satellites move from west to east, in returning orbits round the planet. Observations of their eclipses are the most exact means of determining their motions. Their mean sidereal and synodical revolutions, as seen from the centre of Jupiter, are very accurately determined by comparing eclipses at long intervals from each other, and observed near the opposition of the planet. It is thus discovered that the motion of the satellites of Jupiter is nearly circular and uniform, because this hypothesis corresponds very nearly with those eclipses which happen when we see this planet in the same position relatively to the sun. Therefore, the positions of the satellites at every instant, as seen from the centre of Jupiter, may be determined. From hence results a simple and sufficiently exact method of comparing with each other the distances of Jupiter and of the sun from the earth; —a method which the ancient astronomers did not possess. For the parallax of Jupiter is insensible even to the precision of modern observations, when it is near to us. They only judged of its distance by the time of its revolution; as they eliminated those planets to be the farthest from us, whose period of revolution was the longest.

Let us suppose that the total duration of an eclipse of the third satellite has been observed. At the middle of the eclipse, the satellite, seen from the centre of Jupiter, is nearly in opposition to the sun. Its sidereal position, observed from this centre, (which may easily be deduced from its mean motion, is, therefore, the same as that of the centre of Jupiter seen from the centre of the sun.

Direct observation, or the known motion of the sun, gives the position of the earth as seen from its centre. Thus, supposing a triangle to be formed by the right lines which join the centres of the sun, the earth, and Jupiter, we have given in this triple the angle at the sun, observation will give that at the earth, and we shall obtain the rectilinear distance from Jupiter to the earth and to the sun, at the instant of the middle of the eclipse, in parts of the distance from the sun to the earth.

It is found by these means that Jupiter is at least five times farther from us than the sun, when its apparent diameter is 381. The diameter of the earth, at the same distance, would not subtend an angle of 36.5; the volume of Jupiter is, therefore, at least a thousand times greater than that of the earth.

The apparent diameters of these satellites being insensible, their magnitude cannot be exactly measured. An attempt has been made to appreciate it, by the time they take to penetrate the shadow of the planet. But there is a great discordance in the observations that have been made to ascertain this circumstance. This arises from the various powers of telescopes, the different degrees of perfection in the glass of the observer, the state of the atmosphere, the altitude of the satellites above the horizon, their apparent distance from Jupiter, and the change of the hemisphere presented to us. The comparative brightness is independent of the four first causes, which only alter their proportional light, and ought, therefore, to afford information concerning the rotatory motion of these bodies. Dr. Herschel, who is occupied in this delicate investigation, has observed that they surpass each other alternately in brilliancy; a circumstance which enables us to judge of the maximum and minimum of their light. The relation of this maximum and minimum to their mutual positions has persuaded him, that they turn upon their own axes, like the moon in a period equal to the duration of their revolution round Jupiter: a result which Mr. Ralfe had already deduced with regard to the fourth satellite, from the returns of the fame spot observed on its disc in its passage over the planet.

The great distance of the celestial bodies weakens the phenomena which their surfaces present, till they are reduced to slight variations of light, which escape the first view, and are only rendered sensible by a long course of observations. But information derived from this source ought to be received with the greatest caution; considering how much we may be misled, on such occasions, by the effect of imagination.

Sig. XI. + Sig. X. + Sig. IX. +
Sig. V. + Sig. IV. + Sig. III. +
JUPITER.

Explanation of the Tables of Jupiter.

The first Table contains the epochs of the mean longitude of the aphelion and node of Jupiter; together with the Argument of the equations expounded by dividing the circle into 10,000 equal parts for Arguments II, III, IV, V, and into 1000 equal parts for Arguments VI, VII, VIII, IX. Table II contains the mean motions of the year for years. Table III contains the mean motions for months; that is, for the oscillating of each month reckoned from the beginning of the year, Table IV contains the mean motions for days. Table V contains the mean motions for hours and minutes. Table VI contains the great equation of Jupiter for every 10 years. Table VII contains the equation of Jupiter’s orbit for the year 1750, with the secular variation. Table VIII contains the equation of the orbit corresponding to Argument II. Table IX contains the equation answering to Argument III. Table X contains the equation answering to Argument IV. Table XI contains the equation answering to Argument V. Table XII contains the equation answering to Argument VI. Table XIII contains the equation answering to Argument VII. Table XIV contains the equation answering to Argument VIII. Table XV contains the equation answering to Argument IX. Table XVI contains the equation answering to Argument X. Table XVII contains the equation answering to Argument XI. Table XVIII contains the radius vector of the orbit of Jupiter for 1750, with the secular variation; the mean distance of the earth from the sun being unity. Table XIX contains the equation of the radius vector answering to Argument II. Table XX contains the equation answering to Argument IV. Table XXI contains the equation answering to Argument V. Table XXII contains the equation answering to Argument VI. Table XXIII contains the reduction to the ecliptic; with the log. confine of the heliocentric latitude. All the above-mentioned equations of the motion of Jupiter, the equations of the orbit excepted, arise from the attraction of Jupiter and Saturn, and depend upon the relative situation of Jupiter and Saturn. The theory of these equations was given by M. de la Place in the Memoirs of 1782, from the theory of gravity, and they were computed by M. de Lambre.

Let a express the number of years from 1750; S the mean longitude of Saturn; I the mean longitude of Jupiter; then the great equation of Jupiter is,

$$-20'49"+a \times 0'.042733 \times \sin (5S - 2I + 5.34'8" - a \times 58'.88).$$

The great equation of Saturn arising from the attraction of Jupiter, is also found to be (Men. 1785),

$$-(20'44"-a \times 0'.1) \times \sin (5S - 2I + 5.34'8" - a \times 58'.88).$$

The period of these two equations is 918.76 years. By way of distinction, these are called the great equations of Jupiter and Saturn; these two equations of Jupiter and Saturn are very nearly in the ratio of 3 to 7. Now it is manifest, that when $5S - 2I - a \times 58'.88 = 360$, the equation must then begin again, and therefore this will determine the period; now $5S - 2I - a \times 58'.88$ increases $140°6'.6$ in a common year; therefore $\frac{360}{140660} = 140660$ = 918.76 years, the period in which these equations return again the same.

These equations show the reason, why the present mean motions of Jupiter and Saturn differ from the true mean motions, as the latter cannot be determined but by taking in the above period. We have the apparent mean motion of Saturn, in a common year, by adding to its mean annual motion, the quantity by which the great equation varies in that time, and this quantity is very nearly $-3.4.4'044 - a \times 58'.88 \times \sin (5S - 2I + 5.34'.88)$ and the apparent mean motion of Jupiter is this quantity with a contrary sign, diminished in the ratio of 3 to 5, and added to the mean annual motion.

Now the fluxion of the confine of any quantity = fine x flux, are, therefore when conf. = a maximum, fine x flux, are = 0, or the fine of the are = 0, or the arc = $2\pi$. Therefore when the above quantity = a maximum, $5S - 2I + 5.34'8" - a \times 58'.88 = 0$, which happened in the year 1790. At that time, the apparent annual motion of Saturn was less than the true, by $28'0$, and that of Jupiter greater by 8", since at that time their apparent mean motions had been approaching to their true mean motions, and in 1790, their apparent and true mean motions were equal. These results: show, why, in comparing the modern with the ancient observations, the mean motion of Saturn appears to be retarded, and that of Jupiter accelerated; and that from a comparison of the modern observations, the mean motion of Saturn appears to be accelerated, and that of Jupiter to be retarded.

Now if $H$ be the heliocentric mean longitude of Jupiter; $b$ that of Saturn, corrected by the above equations respectively, computed from the equinox of the year 1750, the other equations of the motion of Jupiter from the action of Saturn, are,

$$-1227 \sin (H - b) + 3'21'3 \sin (2H - b) + 17'' \sin (3H - b) + 3.09 \sin (4H - b)$$

$$+ 2'.18'.4 \sin (H - 2b - 13'3'7'' + a \times 13')$$

$$+ 1.27'.4 \sin (2H - 3b - 61'59'48'' + a \times 21'.9)$$

$$+ 2.37'.0 \sin (3H - 5b + 55'19'21'' + a \times 43'.0)$$

$$- 16'.0 \sin (3H - 4b - 62'19'19'$$

$$+ 13.8 \sin (3H - 2b - 83'15')$$

$$- 13.0 \sin (3b - H - 58'31'0''$$

$$+ 11'6 \sin (b + 45'4'$$

$$+ 16'.0 \sin (4H - 5b + 45'16'32')$$

$$- 5'.4 \sin (2H - b + 16'127')$$

Now the sum of the maxima of all these equations is $1565'^3.3'$; and in the Tables computed for these equations, each equation is increased by its maximum, in order to render all the equations additive; this quantity, therefore, must always be subtracted from the sum of the equations taken from the Tables.

To find the heliocentric Longitude and Longitude of Jupiter.

From Table I. of the epochs, take out the epochs of the mean longitude of the aphelion and node, with the Arguments II, III, IV, V, VI, VII, VIII, IX, and place them in an horizontal line. But if the given year be not found in that Table, take the nearest year preceding the given year as an epoch, and take out as before; under which, from Table II, place the mean motion in longitude, of the aphelion and node, with the Arguments, answering to the number of years elapsed since the epoch to the given year.

Under these, write down (Table III.) the mean motions of the same, for the given month.

Under these, write down (Table IV.) the mean motions of the same, for the given day of the month.

Under these, write down (Table V.) the mean motions of the same, for the given hours and minutes. The arguments for hours and minutes are to be made that they are here omitted.
omitted; the mean motions for seconds are also omitted for the same reason. In our computations, therefore, we take to the nearest minute.

Under these, write down the great inequality (Table VI) in the first column, with the corresponding arguments. Add together the numbers in the several columns, rejecting 12 5', or any multiple thereof, if they occur; and in the arguments, rejecting 1000 for Arguments II, III, IV, V, and 100 for Arguments VI, VII, VIII, IX, or any multiples thereof, and you get, for the given time, the mean longitude corrected for the great equation, the aphelion, the node, and the arguments corrected for the great equation.

From the longitude corrected for the great equation, as already found, subtract the longitude of the aphelion, and you have Arg. I. Arg. VII. - Arg. VIII. gives Arg. X.; Arg. VI. + Arg. VIII. gives Arg. XI.

With Argument I. making proportion for the minutes and seconds, take out the equation of Jupiter's orbit in Table VII., together with the secular variation, with their proper signs, except the time be before 1750, in which case, the secular variation is to be taken out with a contrary sign; then say, 100; the years from 1750 to the given time: the secular variation above found: the secular variation required. With Argument II. take out the equation in Table VIII., making proportion in this, and in the following equations, for the intermediate numbers of the arguments. With Argument III. take out the equation in Table IX. With Argument IV. take out the equation in Table X. With Argument V. take out the equation in Table XI. With Argument VI. take out the equation in Table XII. With Argument VII. take out the equation in Table XIII. With Argument VIII. take out the equation in Table XIV. With Argument IX. take out the equation in Table XV. With Argument X. take out the equation in Table XVI. With Argument XI. take out the equation in Table XVII. Take the sum of all these equations (regard being had to the signs of the first equation and the secular variation, the signs of the others being all positive), and from it subtract 11° 56'.3, and you have the value of these eleven equations; and this applied, with its proper sign, to the longitude already found as corrected by the great equation, gives the longitude of Jupiter in his orbit.

From the longitude thus found, subtract the longitude of the node, and you get Argument XII.

With Argument XII. enter Table XXIII., and take out the reduction to the ecliptic with its proper sign, making proportion for the minutes and seconds of the argument; and this applied to the longitude of Jupiter in his orbit, gives his true heliocentric longitude on the ecliptic, reckoned from the mean equinox.

With the Argument XII. enter Table XXII.; take out the latitude with its secular variation, making proportion for the minutes and seconds of the argument; and apply the secular variation, according to its sign, to the latitude, and you have the true heliocentric latitude of Jupiter.

With the mean anomaly of Jupiter, enter Table XVIII., and take out the radius vector, and correct it by the following Tables, and you have the true distance of Jupiter from the sun; the earth's distance being unity.
JUPITER.

Example. — To find the true heliocentric Latitude and Longitude of Jupiter, on July 11, 1780, at 5' 49' mean Time at Greenwich.

Argument I. and the secular variation being negative, they are added to 11' 56,3 to get the negative parts; but if the two first taken together had been positive, they would have been put above Argument II. among the positive equations, and then all the positive equations might have been added up, and 11' 56,3 subtracted from the sum.

This is the true heliocentric longitude on the ecliptic, from the mean equinox; and if we want it from the true equinox, we must apply to it the equation of the equinoxes.

In this operation, the first five lines are taken out immediately from the Tables. The great equation is thus found; for the beginning of 1780 it is 20' 46', as found immediately in the Table. The great equation for a very distant period is thus found: the variation is expressed by \(-a \times \cos 2733 \times \sin (5S - 2F + 5' 34' 8' - a \times 58' 88)\); if we take \(a = 459' 38'\), which is half a period, \(a \times \cos 2733 = 19' 6'\), which is additive before 1750; this then is the greatest variation of the equation, taking \(5S - 2F + 5' 34' 8' - a \times 58' 88 = 90'\), so that its sine may be 1, a maximum; that is, it is the variation answering to the present greatest equation 25' 49' 5', for this is the greatest equation when \(a = 0\), or for 1750, and therefore will be very nearly so for the present time. Now suppose we wanted to know the equation for May 16, in the year 1733, or in the year 1733, 37; then we multiply a half period by such a number, that the product added to 133 may produce some year in our Table VI., and then we find the equation for that year; multiply therefore 450, 38 by 4, and add it to 133, and it gives 1750, corresponding to which, the equation is 6 49 42; now the variation of the greatest equation is 19' 6' for half a period, and therefore it is 4 x 19' 6' = 78' 4
JUPITER.

78° 4 for 4 half periods; hence, the greatest equation 29°
49° 5 : 6° 49° 2 : 78° 4 : 29°, which (as the time is before
1° 59°) added to 0° 40° 2, gives 78° 4, the equation for
May 16, 133. This, however, is only an approximation.
We calculate for half periods, because then all the argu-
ments return again the same. Now from that time to the
given time, that is, July 11, 1780, the interval is 0.53 of a
year; and for 10 years, the increase of the equation is 1° 7;
hence, 10 : 0.53 : 1° 7 : 0°.00, the variation in 0.53 of a
year; which added to 29° 49° 5, gives 29° 46° 00, or 29°
46° 1, taking it to the nearest tenth of a second, the great-
equation. The arguments of the great equations are taken
from the year 1780, they not having sensibly altered from
that time to the given time. The sums of all the columns
give the longitude corrected by the great equation, the
aphelion, the node, and the arguments, for the given time.
The Arguments I, X, XI, are immediately found accord-
ing to the rule. The equation to Argument I. is thus found:
the Argument is 20° 7° 58°. Now in Table VII. 
the equation answering to 20° is 1° 46° 59°, and the 
variation for 60° is 5° 0:1; hence, 60° : 1° 56° : 5° 0:1: 49°,
which (as the equation is increasing) added to 1° 46° 59°,
gives 1° 7° 49°, the equation required. And to find the 
secular variation, that variation is 10° 0:5 for 29°, and it 
changes 0°.82 for 60°; hence, 60° : 7° 58° : 0°.82 : 0°.11,
which (as the variation increases) added to 1° 46° 59°, gives
1° 7° 49°, the secular variation corresponding to the given
argument. Now this secular variation is reckoned from
1750, and from thence to July 11, 1780, there has elapsed
30.53 years; hence, 100 : 30.53 : 1° 7° 49 : 5° 0:1, the 
secular variation for 30.53 years. With 0°.00 take the 
equation from Table VII. Now the equation is 1° 39° 6,
the Argument 9000, and it changes 3° 7 for 100; hence,
100 : 80 : 3° 7 : 3°, which (as the equation is in-
creasing) added to 1° 39° 6, gives 1° 33° 6, the equation re-
quired. By proceeding thus to Argument XI. we get all
these equations. And by taking the difference of the 
positive and negative parts, we obtain 1° 48° 57° 8, the value of 
these 11 equations, which applied, with the proper sign, to
5° 10° 53° 0, gives 6° 29° 8° 56° 1, the longitude of 
Jupiter in his orbit. Now for the reduction of this to the 
ecliptic, we have Argument XII. = 3° 20° 56° 24°; and 
the reduction in Table XXIV. is 1° 17° 5 for 5° 20° ; and 
it changes 0°.7 for 60°; hence, 60° : 56° 24° : 0°.7 : 0°, 
taking it to the nearest tenth of a second; and this (as the 
reduction increases) added to 1° 17° 5, gives 1° 34° 2, the 
reduction, which applied to 6° 29° 8° 56° 1, gives 6° 29° 0°
1° 3°, the true heliocentric longitude of Jupiter in his orbit,
from the mean equinox. With Argument XIII. enter 
Table XXIII. and the latitude for 3° 20° is 1° 46° 16° N., 
and the variation is 29° for 60°; hence, 60° : 56° 24° : 29° : 29°,
which (as the equation is diminishing) subtracted from 
1° 46° 16° N., gives 1° 13° 49° N., the latitude un-
corrected for the secular variation. Now for 3° 20° 56° 24°,
the secular variation is 29° 5, as we may take it the same
as for 3° 21° ; and the time from 1750 being 30.53 years, we
have, 100 : 30.53 : 29° 5 : 6°, the secular variation
for 30.53 years, and thus applied to 1° 13° 49° N.,
gives 1° 13° 43° N., the true heliocentric latitude of
Jupiter.

Given the heliocentric latitude and longitude of Jupiter; to
find the geocentric latitude and longitude, and his distance
from the sun and earth.

Example.—To find the geocentric latitude and longitude of
Jupiter, and his distance from the earth, on July 11, 1780,
or 5° 49° mean time.

| Hel. long. Jupiter | - | - | 5° 49° |
| Long. earth | - | - | 9° 19° 52° 28.3° |

| Long. sun + 20° | - | - | 3° 19° 52° 28.3° |
| Geo. long. | - | - | 6° 18° 23° 73° |

Jupiter, among Alchemists, signifies the philosophers' gold. The gentlemen of this profession apply every thing
to their art, which the mythologists mention of the god
Jupiter, pretending that the ancient fables are to be understood
in a figurative sense; for instance, Jupiter is the master
of the gods; and gold, say they, is the most precious of
metals. Mercury is the ambassador of Jupiter; and this
shows how much safer Mercury inserts into every thing.
Jupiter holds the thunderbolt as his sceptre, which
evidently points out the external sulphur used in projection.
Jupiter has the heavens for his ordinary habitation; this
flares.
JUPITER, in Chemistry, denotes tin.

JUPITER'S Beard. Barba Jovis, in Botany, the name given to a species of Salvia. JUPITER'S Foot, a species of Salvia or Sage. JUPITER'S Nose, a species of Salvia. See Fulminant. JUPITER, Planet of the Fears. See Phamen. JUPUBA, in Ornithology. See Orior's Humorons. JUPURUS, the Brazilian name of a bird of the woodpecker kind, more commonly known by the name Japu. See Orior's P. ferae. JUQUER, in Botany. This plant is found in Brazil, and is of a poisonous nature; but if we may credit Pilo, its root is its antitoxin.

JURA, in Geography, one of the eleven departments of the western region of France, composed of the baillages of Dole and Avil, in 46° 45' N lat., between Saône and Switzerland. It is bounded on the N. by the department of the Upper Saône, on the E. by the department of the Doubs, and the canton of Borné in Switzerland, on the S. by the department of the Ainé, and on the W. by the departments of the Saône and Loire, and Côte d'Or. The capital is Lons le Saunier. This department contains 52735 kilometers, or about 256 square leagues, in four districts, 32 cantons, and 728 communes; and 285,895 inhabitants. The districts or circles are Dôle, including 63,581 inhabitants; Poligny, 69,578; Lons-le-Saunier, 107,475; and St. Claude, 47,28. Its contributions amount to 2,005,226 francs, and its expenses to 2,25,873 fr. 55 cents. The plains in this department produce grain, wine, fruits, and pastures; the hills yield little grain, but abound in pastures and extensive forests. It has mines of copper, lead, iron, salt, coal, with quarries of marble, flint, &c.

Jura, one of the Hebrides, or western islands of Scotland, is situated opposite to the district of Knapdale, in Argyll shire, to which county it is politically annexed. It exceeds upwards of thirty miles in length, and, on an average, seven in breadth. Of all the western isles, Jura is the most rugged, being chiefly composed of mountains of vast rocks, apparently piled on each other in the utmost disorder, without a possibility of cultivation. The four principal of the five mountains are termed the Paps of Jura; which form a ridge from south to north, nearly through the middle of the island. These are conspicuous at a great distance, and terminate the western prospect from the continent; from their situation and height, they are frequently enveloped in clouds and darkness. Of these four, the southern is called Beinn-Acharnain, "the mountain of the found," from its proximity to the found of Ila; the next, which is the highest, Beinn-an-oair, "the mountain of gold;" the third, Beinn-theanta, "the consecrated mountain;" and the northern Corra-hlios, "the steep mountain." Pennant remarks that he ascended Beinn-an-oair with great difficulty, and describes it as being composed of large rocks, covered with moss near the base; but all above were bare and unconnected with each other. "The whole," he says, "seems a calm, the work of the fons of Saturn." The grandeur of the prospect from the summit, however, compensated him for the fatigue of the ascent. Jura itself afforded a stupendous scene of rock, varied with innumerable small lakes, and calculated to

raise sublime emotions in the mind of the spectator. From the west side of the hill ran a narrow strip of rock, called the flide of the old legs, and terminating in the sea. To the north appeared Ilay, extended like a map; and beyond it, the north of Ireland, to the west, Gigha and Cara, Cantyre and Arran, and the Firth of Clyde, bounded by Arran; an amazing tract of mountains to the north-east, as far as Ben-homond; Skarba floated the northern view; and over the western ocean were scattered Colonsay and Oranfay, Mull, Iona, and the surrounding group of islands; and still farther, the long extent of Skye and Col just apparent. Sir Joseph Banks and his friends, in their journey to Scotland, ascended Beinn-an-oair, and found it to be 3559 feet above the level of the sea; but Beinn-an-oair extended its height by 61 feet. The west side of the island is not fit for cultivation, being so wild and rugged, and so intermixed by terrains rushing from the mountains, that no persona choose to make his abode in it. All the inhabitants, therefore, live on the east side; where, on the margin of the sea, the coast is pretty level; but at a small distance from the shore there is a gradual ascent. The only corn cultivated here is oats and barley; potatoes and flax are also produced; the only manure is the sea-weed, which is cast on shore. Artificial graffes are unknown; and lime cannot be procured by the poor husbandmen. On the east coast of the island are two good harbours; that to the north called the Small Isles; the other the Lowlands". There are several barrows and castella in the island; and on the coast, near the harbour of small isles, are the remains of a very considerable encampment. The stones of which the mountains are formed, are of white or red quartzy granite; some of which are beascated, or filled with crystalline kernels of an amethystine colour. There is great abundance of iron, and a vein of the black oxdy of man; and, in the climate of Jura, though necessity of a very mild climate, is considered to be very healthy, and favourable to longevity. When visited by Mr. Pennant in 1772, it contained only about 750 inhabitants; but in 1793 the number was 1353. The parish is supposed to be the largest in Great Britain, and the duty the most troublesome and dangerous; it comprises Jura, Colonsay, Oronsay, Skarba, and several little isles, divided by narrow and hazardous sounds; forming an extent of fifty miles; the whole of which is inhabited by only one minister and an abbot. Pennant's Voyage to the Hebrides.

Jura Sound. on the western coast of Argyllshire in Scotland, is a very wide channel, except at its northern end, which separates Ilay, Jura, Islay, Skarba, and several smaller islands, from the mainland of Scotland. The Sound of Jura connected with Ila found, Tarbat well loch, Knab lach, Auchinill lach, Cinan loch, and the Cinan caug, Gragmers lach, &c. Gine, Cara, Tagen, Achnurn, Borth, Mackenmore, Gragdun, Ruath, and other small isles, are situated in this expanse of water.

Jura, (Jupina, Lat.; Jovis, Stratol.; Jussia, i.e., the domain of God or Jupiter, in Celtic), a chain of mountains, defending, like a stupendous bulwark, the N.W. side of Switzerland. The Jura runs S.S.W. to N.N.F., from the Vouanche to Savoy to the canton of Saphaus, nearly parallel with the high chain of the Alps; its width towards N.W. being from about 35 to 45 miles; its highest ridge
The Jura consists of compact limestone, the stratification of which affects various inclinations. Marked, gypseous, petrifications, and iron-ore, are frequently met with almost in every part of it; the flint and flaxcell petrifications are found in the department of the Jura. Along the whole of the E. side of the Jura a flatiron of flatish clay may be followed, which contains the iron-ore called beaumont, and is wrought in different places. Here and there a flata of brown coal and sources of asphaltum are seen in the valleys of the Jura, where they occur in forests swallowed up by those terrible earthquakes, to which the Jura has been subject in past ages. As geologically remarkable may likewise be mentioned the numberless blocks of granite and gneiss, dispersed all along the east side of the Jura, in some parts even to the height of 2,400 feet. For a more detailed account, see Dr. Ebel's "Bau der Erde in dem Alpengebirge," 1855.

20 miles E. N. E. of Minsk; 55 miles N. W. of Ismailiah.

JURINE, in Geography, a town of Bengal, in Chittagong; 35 miles N. W. of Ismailiah.

JURIN, James, in Biography, a physician of the mathematical sect, was, during several years, an active member and secretary of the Royal Society of London, and, at the time of his death, in 1750, was president of the College of Physicians. He distinguished himself by a series of ingenious essays, to the number of seventeen, which were published in the Philosophical Transactions in the years 1718, 1719, &c.; and afterwards printed collectively, in 1723, under the title of "Physico-Mathematical Disquisitions," in which mathematical science was applied with considerable acuteness to physiological subjects. These papers involved him in several philosophical controversies; first with Neale, in consequence of his calculations in regard to the force of the contractions of the heart, against which also Senec published some objections, which he answered. Jurin computed the contractile force of the heart to be equal to fifteen pounds four ounces; that of the right ventricle being equal to six pounds three ounces, and that of the left to one pound nine ounces. To Smith's System of Optics, published in 1738, Jurin added "An Essay upon Distinct and Indistinct Vision," in which he made sensible calculations of the changes necessary to be made in the figure of the eye to accommodate it to the different distances of objects. This paper was commented on by Robins, to whom Jurin wrote a reply. He had likewise controversies with Michellotti respecting the force of running water, and with the philosophers of the school of Leibnitz on living forces. He communicated to the Royal Society some experiments made with a view to determine the specific gravity of the human blood, and he contributed much to the improvement of their meteorological observations. He was a warm partizan and an active defender of the practice of inoculation; and in several publications, giving an account of its successes from 1723 to 1757, established its utility upon the true foundation of a comparison between the respective mortality of the casual and the inoculated small-pox. He did not, however, foresee, that this practice, although preserving the lives of those who had recourse to it, yet contributed to increase the mortality in general, in consequence of keeping up an artificial epidemic, as it were, by a constant multiplication of the contagion. His papers in the Philosophical Transactions are to be found in vols. ix. to lxxi. inclusive. Elyot. Dict. Hist. Gen. Biog.

JURINGIN, in Geography, a town of Japan, in the island of Nippon; 40 miles W. N. W. of Jedo.

JURIS URBSITE, in Law, a writ called the patron's writ of right (Booth 221.), which lies for the patron of a church, or prebendary, at common law, and for a vicar by stat. 14 Ed. III. c. 17, whose predeceesor hath alienated the lands and tenements thereof, by which they may recover lands and tenements belonging to the church, or of which they were defrauded; or which were recovered against them by verdict, confession, or default, without praying in aid of the patron and ordinary; or on which any person has intruded since the predeceesor's death. (F. B. 43, 49.) But since the retraining statute of 14 Eliz. c. 10, whereby the alienation of the predeceesor, or a recovery suffered by him of the lands of the church, is declared to be absolutely void, this remedy is of little use, unless where the patron himself has been defrauded for more than twenty years (Booth 221.); for the succesor, at any competent time after his accession to the benefice, may either, or bring an ejectment.

JURISCONSULTUS, or JURE CONSULTUS, Litus, among the Romans, was a person learned in the law; a matter of the Roman jurisprudence; who was confounded on the interpretation of the laws and customs, and the difficult points in law-suits.

The fifteen books of the Digest were compiled wholly from the answers, or reports, of the ancient jurists. Trebonianus, in destroying the two thousand volumes from whence the Code and Digest were taken, has deprived the public of many things, which would have given them light into the office of the ancient jurist.

We should scarce have known any thing beyond their bare names, had not Pompianus, who lived in the second century, taken care to preserve some circumstances of their office.

The Roman jurists seem to have been the same with our chamber counsellors, who arrived at the honour of being confuted, through age and experience, and never pleaded at the bar. Their pleading advocates or lawyers never became jurists.

In the times of the commonwealth, the adovati had by far the more honourable employment, as being in the ready way to attain to the highest preferment. They then despised the jurist, calling them in detraction formularum and legum, as having invented certain forms and formulæ, in order to give their answers the greater appearance of gravity and mystery. But in the time they became so much esteemed, that they were called prudens et sapientia, and the emperors appointed the judges to follow their advice. Augustus at length advanced them to be public officers of the empire; so that they were no longer confined to the petty councils of private persons.

Bern. Rutilius has written the lives of the most famous jurists, who have lived within these two thousand years.

JURISDICTION, a power, or authority, which a man has to do justice in cases of complaints made before him. There are two kinds of jurisdiction; the one ecclesiastical, the other secular.

Secular, belongs to the king, and his judges, or delegates.

The courts and judges at Westminster have jurisdiction over England, and are not restrained to any county or place; but all other courts are confined to their particular jurisdictions, which if they exceed, whatever they do is erroneous. There are three kinds of inferior jurisdictions; the first is tenor placentia, to hold pleas, and the plaintiff may sue either there or in the king's courts. Another is the consuetude of pleas, where a right is inviolate in the lord of the franchise to hold pleas; and he is the only person that can take advantage of it, by claiming his franchise. The third is an exempt jurisdiction, where the king grants to some city, that the inhabitants should be held within their city, and not elsewhere; though there is no jurisdiction that can withstand a jurisdiction to the superior courts. Among the various beneficial regulations of Edward I., he defined the limits of the several courts of the highest jurisdiction, those of the king's bench, common pleas, and exchequer, so as they might not interfere with each other's proper business; to do which they must now have recourse to a fiction, very necessary and useful to the present enlarged state of property. He also settled the boundaries of the inferior courts in counties, hundreds, and manors; confining them to causes of no great amount, according to their primitive institution. See Justice, and Court.

Ecclesiastical jurisdiction belongs to bishops and their deputies. See Bishop, and Official.
JUR

**JUR**

*which is exercised over the conscience in things purely spiritual; and this they are fapposed to hold immediately of God. The other is *continuance*, which is a privilege some princes have given them in terminating disputes between ecclesiastics and laymen. (See CONTINUANCE.) Edward I. gave a mortal wound to the encroachments of the pope and his clergy, by limiting and establishing the bounds of ecclesiastical jurisdiction; and by obliging the ordinary, to whom all the goods of interdicts at that time belonged, to discharge the debts of the deceased.

**JURISDICTION.** *Everywhere of*, an injury, cognizable by the courts of the common law, which consists in calling one *conman judic枢* to answer in a court that has no legal cognizance of the cause. For this injury the common law has provided a remedy by the writ of prohibition. See PROHIBITION.

**JURISPRUDENCE.** The science of what is just and unjust, or of the law's rights, customs, statutes, &c. necessary for the doing of justice.

Civil jurisprudence is that of the Roman law; common law is that of the canon law; and *fudal* law, that of fees.

**JURUS, Challenge to the.** See CHALLENGE.

**JURUQDA, a town of Hindooftan, in the island of Chandarac; 15 miles S.E. of Seronge.**

**JUROZEL, a town of Russian Lithuania; 80 miles S.E. of Minsk.**

**JUTHERMANSKOI, a town of Russia, in the government of Tobolsk, on the Oby; 68 miles S.W. of Tomsk.**

**JURI, a town of Sweden, in the government of Vasa; 32 miles N.N.E. of Christian-hust.**

**JURUCUA, in Zoology, the Brazilian name of a species of tortoise.** This has feet almost in shape of wings, the fore ones about six inches long, the hinder ones considerably shorter; its tail is short, and of a conic figure; its eyes large and black; its mouth has no teeth, but resembles the beak of a bird. It frequently grows to four feet long, and about three in width; its ribs are fastened to the shell, and are eight on each side; the middle ones of these are the longest, the fore and hinder ones being the shorter. The flesh and eggs of this species are very delicately tailed; they lay their eggs in holes on the sea-shore, covering them over with sand, and leaving them for the sun to hatch them. There are usually a great many very odd figures, like geometrical lines, running in various directions on the shell; the whole ground of the shell is usually black and very glossy, adorned with yellow variegations; but this is no certain character of the species, the varieties in the colouring of these shells being very great. See *Testudo Mydas.*

**JURUNCAPHEBA, in Ichthyology, the name of a species of fish, of the turdus or wharfie kind, caught about the shores of the Brails, and called also 1100.** It is usually about five or six inches long, about a third part of its length in breadth; its mouth is extremely large and wide, and of a somewhat triangular figure.

It is caught among the rocks, and is a very delicate fish for the table.

**JURUNG, in Geography, a town of Hindooftan, in Bahar, on the Bogmurti; 13 miles W. of Darburgah.**

**JURUS, in Zoology, the name of a species of tortoise, common in the Brails. It is a small kind, seldom exceeding ten fingers in breadth, and eight or nine in length, and of an elliptic figure; its under shell is about nine fingers long, and four and a half broad, and is flat; it can at pleasure hide its whole body in the shell, or thrust out its neck to three fingers' breadth distance; the head is thick and long, the nose elevated and pointed; the mouth is large, and the eyes black; it has four long claws on its feet; its tail is short and pointed, and its skin is rough and scaly. The upper shell is brown, the lower yellow; its eggs are white.
JURY.

white and round, and about half the size of a hen's egg, and are very well tailed.

JURY, in Common Law, signifies twenty-four, or twelve men, sworn to inquire of a matter of fact, and declare the truth, upon such evidence as shall be delivered them touching the matter in question.

The mode of trial by jury, called also the trial "per paix," or "by the country," is very ancient, and seems to have been coeval with the civil government of this nation. Some authors have endeavoured to trace the original of juries up as high as the Britons themselves, the first inhabitants of our island; it is certain, however, that they were in use among the earliest Saxon colonies, their institution being ascribed by bishop Nichollon to Woden himself, their great legislator and captain. Sir John Speelman has represented Alfred as the author of trials by juries; but his proof has not been thought to be decisive. Dr. Pettingal, who has found the use and practice of juries amongst the ancient Greeks and Romans, and who thinks that the rite of the English jury may be deduced from them, has supported his opinion with much ingenuity and learning.

Traces of this mode of trial in Germany have been thought to be visible in the 100 co-assessors, mentioned by Tacitus, as chosen out of the Ingenni, which the lord of a territory had when he sat in judgment. This number, says Mr. Carie, prevailed undoubtedly among the Saxons, as it did likewise in all the northern nations, till succeeding times gave occasion to some alterations. Thus, among the Danes, the number of these assessors was restrained to twelve in the time of Reder Ladebrod; and the same number is still kept up in Sweden. When it was first thus reduced in England does not appear from any paffage in our old historians. Nevertheless, says Mr. Carie, this was the established number in Alfred's time, from the hanging Cuthwine for fenenceing a man to that kind of death, without the assent of all the twelve jurors, upon whom he had put himself to be tried; and from the laws which he gave to Guthrun. According to the fame historian, it is very probable that Alfred was the author of extending to civil causes the trial by jury, which had been, perhaps, used before only in criminal cases. Sir William Blackstone contends, that this is a mode of trial which has prevailed time out of mind in this nation. Accordingly he says, traces of juries may be found in the laws of all those nations which adopted the feudal system, as in Germany, France, and Italy. And in England we find actual mention of them so early as the laws of King Ethelred, and even then not as a new invention. The truth, sir William says, seems to be, that this tribunal was universally established among all the northern nations; and so interwoven in their very constitution, that the earliest accounts of one, give us also some traces of the other. On the other hand, there are not wanting considerable names, who refer the introduction of juries into England to a much later period. Dr. Hickes, who finds the original of this institution in Scandinavia, affers, that it was not known to the Saxons, and that it did not take place in our own country till after the Norman conquest. Mr. Barrington and Dr. Henry, in deference, as it should principally seem, to Dr. Hickes's profound knowledge in Saxon learning, have given their function to these sentiments; but it clearly appears that they have done so without sufficient reason. The establishment and use of this mode of trial in our island, though for a time greatly impaired and shaken by the introduction of the Norman trial by battle, were so highly esteemed and valued by the people, that no conquest, no change of government, could ever prevail to abolish it. In "Magna Carta" it is more than once indulged on, as the principal bulwark of our liberties. (See Judicium parum.) And it has been ever esteemed, in all countries capable of appreciating its importance and utility, a privilege of the highest and most beneficial nature.

Trials by jury in civil cases are of two kinds: extraordinary and ordinary. The first species of extraordinary trial by jury is that of the grand assizes. See Assizes.

Another species of extraordinary juries, is the jury to try an Action; which fee.

With regard to the ordinary trial by jury in civil cases, when an issue is joined, the court awards a writ of Writure facias, which is accordingly issued to the sheriff. Thus the cause lands for a trial at the bar of the court itself, provided it be of consequence; but all trifling suits are ended in the court baron, hundred, or county courts. However, when the usage began to bring actions of any trifling value in the courts of Welfminster-hall, it was found very inconvenient to compel the parties, witnesses, and jurors, to come from the remote parts of the country to try a trivial action at Welfminster; and, therefore, the legislature referred matters in issue to the justices of the peace. Accordingly it was enacted by 12 Edw. I. cap. 30, that a chuse of nisi prius should be imitated in all the writs of Writure facias, by virtue of which the sheriff returned his jurors to the court of the justices of the peace, which were free to be held in the vacation before Easter and Michaelmas terms, and there the trial was had. But this method was inconvenient, and therefore was altered by 42 Edw. III. cap. 11, which statute enacted, that no inquests, except of affize and gaol delivery, should be taken by writ of nisi prius, till after the sheriff had returned the names of the jurors to the court above. It is now the course to make the sheriff's writure returnable on the return of the term wherein issue is joined, &c. Hilary or Trinity terms, which are called accountable terms; and he returns the names of the jurors in a panel, &c. little pane, or oblong piece of parchment, annexed to the writ. This jury is not summoned, and therefore not appearing at the day, must unavoidably make default; for which reason a convulsive process is now awarded against the jurors, called in the common pleas a writ of hachts corporis juratus, or in the king's bench a diffignas. The entry, therefore, on the roll or record is, "that the jury is respited, through defect of the jurors, till the first day of the next term, then to appear at Welfminster; unless before that time, &c." on Wednesday the fourth of March, the justices of our lord the king appointed to take affizes in that county shall have come to the place assigned for holding the affizes, &c.

And as the judges are sure to come and open the circuit commissions on the day mentioned in the writ, the sheriff returns and summons this jury to appear at the affizes, and there the trial is had before the justices of the peace and nisi prius; among whom are usually two of the judges of the courts at Welfminster, the whole kingdom being divided into six circuits for this purpose. If the sheriff be not an indifferent person, or if he be a party in the suit, or be related either by blood or affinity to either of the parties, the writure shall be directed, not to him, but to the coroners; and if any exception lies against them, to two clerks of the court, or to two perons of the county named by the court and sworn, and called elgitors, or electors, who shall differently name the jurys, and their return is final. In order farther to remove all suspicion of partiality, it is provided by the statutes 4 Edw. Ill. cap. 2, 8 R. c. II. cap. 2, and 33 Hen. VIII. cap. 24 that no judge of affize should hold pleas in any county where he was born or inhabits. See 12 Geo. II. c. 27, and Carus Justices of Oyer, &c.
When the general day of trials is fixed, the plaintiff, or his attorney, must bring down the record to the alizes, and enter it with the proper officer, in order to its being called in course. If it be not so entered, it cannot be tried; therefore it is in the plaintiff’s breach to delay any trial by not carrying down the record, unless the defendant undertakes to bring on the trial by giving proper notice to the plaintiff. This proceeding is called the trial by profite. However, this practice hath begun to be diffused, since the statute 14 Geo. II. cap. 17, which enacted, that if, after issue joined, the cause is not carried down to be tried according to the course of the court, the plaintiff shall be entitled to be non-suited, and judgment shall be given as in case of a non-fuit. In case the plaintiff intends to try the cause, he is bound to give the defendant (if he lives within forty miles of London) eight days notice of trial; and if he lives at a greater distance, fourteen days notice; and if he changes his mind, and does not countermand the notice fixed days before the trial, he shall be liable to pay costs to the defendant for not proceeding to trial, by the last-mentioned statute. The defendant, however, or plaintiff, may, upon good cause shown to the court, give leave, upon application, to defer the trial of the cause till the next assizes. But when the cause is called on regularly in court, the record is conveyed to the judge, while the jury is called and sworn. To this end the sheriff returns his compulsive process, the writ of abduces corpora, or dylingans, with the panel of jurors annexed, to the judge’s officer in court. The jurors contained in the panel are either special or common jurors. See Special Jury.

A common jury is one returned by the sheriff, according to the directions of the statute 3 Geo. II. cap. 25, which appoints that the sheriff or officer shall not return a separate panel for every separate cause, as formerly; but one and the same panel for every cause to be tried at the same assizes, containing not less than forty-eight, nor more than seventy-two jurors; and that their names, being written on tickets, shall be put into a box or globe: and when each caufe is called, twelve of these persons, whose names shall be first drawn out of the box, shall be sworn upon the jury, unless absent, challenged, or excused: or unless a previous view of the lands or tenements, or other matters in question, shall have been thought necessary by the court (latt. 4 Ann. c. 16.); in which case six or more of the jurors returned, to be agreed on by the parties, or named by a judge, or other proper officer of the court, shall be appointed to take such a view, and then such of the jury as have appeared upon the view, shall be sworn on the inquest, previous to any other jurors.

Lists of the jurors qualified according to the acts 4 & 5 W. & M. cap. 24. 7 & 8 W. III. cap. 32. and 3 & 4 Ann. cap. 18, are now to be made from the rates of each parish. The justices at Midsummer feis are to issue warrants to the high constables: who require the petty constables to prepare such lists; and if the high constables neglect to issue their precepts for this purpose, they shall forfeit 10l. These lists are to be fixed on the doors of churches, &c. twenty days before Michaelmas, that public notice may be given of persons omitted who are qualified, and of persons inserted, who ought to be omitted. (3 Geo. II. cap. 25.) And if any persons are inserted wrongly, or omitted for the sake of reward, &c. the petty constable incurs a forfeiture of 5l. The lists shall be delivered by the petty constables, at Michaelmas feis, in open court; or when they are published by them, and attested on oath, and also signed by the justices, they shall be delivered by the petty constables to the high constables, who shall deliver them, upon oath, in open court. The constable failing to make such return shall forfeit 5l. Persons not qualified may be disbarred by the justices at the feis. These lists shall be then fairly entered in a book by the clerk of the peace, on forfeiture of 20l. and duplicates of them shall, during the feis, or within ten days after, be delivered by him to the sheriff, who shall cause the names, with their additions, &c. to be entered in a book of his own; and if the sheriff shall return any person whose whole name is not in the duplicates, he is liable to a fine not exceeding 10l. or less than 40l. (3 Geo. II. cap. 25.) Every summons of jurors shall be made by the sheriff, his officer, or lawful deputy, six days before the feis; at least, in Wales, eight days before; and in the counties palatine fourteen days before; and the penalty of neglect, or of executing any person for favour or reward, is 20l. by 7 & 8 W. cap. 32, or a fine of 10l. or under, imposed by the judge of alize. (3 Geo. II. cap. 25.) No person shall be summoned, who has served within one year before in the county of Rutland, or two years before in any other county, not being a county of a city or town, and except the county of York and Middlesex, under a fine not exceeding 50l. Every person who has served has to give a certificate of service, testifying his attendance. (2 Geo. II. cap. 25.) In the county of York, jurors shall not be returned above once in four years; and the sheriff neglecting his duty shall forfeit 100l. and for not discharging a juror, who has served within four years, and giving notice to the party summoned, six days before the alizes or feis, shall forfeit 20l. to the party with full costs. (7 & 8 W. cap. 31. 3 & 4 Ann. cap. 18. and 10 Ann. cap. 14.) In the county of Middlesex, no peron shall be returnable to serve as a juror, at any seis of nisi prius, who hath been returned in the two terms or vacations next before, on pain of the sheriff being fined by the judge 5l. or under. (4 Geo. II. cap. 7.) And by 7 & 8 W. cap. 32. the inhabitants of the city and liberty of Westminster shall be exempted from serving on any jury at the seis for Middlesex, by reason of their attendance at the courts of Westminster. By the common law, jurors returned, and not appearing, shall leave and forfeit the fines returned upon them. And if a juror be called, and, being present, refuse to appear; or, having appeared, withdraw before he be sworn, the court may fine him at their discretion. (35 Hen. VIII. cap. 6.) And by 29 Geo. II. cap. 19. a juror not appearing and serving in any court of record within the city of London, or in any other city or town corporate, liberty or franchise, after being openly called three times, &c. shall, without reasonable excuse, be fined not more than 40l. nor less than 20l. And by 3 Geo. II. cap. 25. in causes of nisi prius, every person whose name shall be drawn, and who shall not appear without reasonable excuse, shall forfeit not exceeding 5l. nor less than 40l. If a juror take a bribe of either party, he shall forfeit ten times as much as he hath taken. (5 Edw. III. cap. 10. 34 Edw. III. cap. 8. 38 Edw. III. flat. 1. cap. 12.) If a man assaulted or threaten a juror for giving a verdict against him, he is punishable by fine or imprisonment; and if he strike him in the court, in the presence of a judge of alize, he shall lose his hand and his goods, and profits of his lands during life, and suffer perpetual imprisonment. The jury is to be chosen of the same class or rank with the parties, and by the policy of the ancient law, the jury was to come de vicino, from the neighbourhood of the vill or place where the cause of action was laid in the declaration, and for want of this, the array might be challenged for defect of hundredors. However, this practice was entirely abolished by 4 & 5 Ann. cap. 16. upon all civil actions,
JURY.

actions, except upon penal statutes; and upon those also by the 24 Geo. II. cap. 18, the jury being now only to come, de corpore convitata, from the body of the county at large, and not de vicinis, or from the particular neighbourhood. It is also enacted by 28 Edw. III. cap. 15, enforced by 8 Hen. VI. cap. 29, that where either party is an alien born, the jury shall be one half aliens, and the other denizens, if required, for the more impartial trial. But where both parties are aliens, the whole jury are directed to be denizens, by 21 Hen. VI. cap. 4. For other grounds of challenge and qualification of jurors, see CHALLENGE. Jurors in London and Westminster must not only be housekeepers, but have lands or goods worth one hundred pounds, and they may be examined on oath as to that point. (3 Geo. II. cap. 25) All cities, boroughs, and corporate towns, are excepted out of the act that settles the qualifications of jurors for county attains or feoffacies; and trials of felons in corporations may be men worth 20s. in goods, though they have no freehold. Jurors in the town shall be 26th, 3-year freehold, or 26th, 8-year copyhold. Any person whatever is capable of being put upon the jury in a court-feet, and upon the coroner's jury. The qualifications of jurors, with regard to estate, depend upon a variety of statutes. But by the last statute 3 Geo. II. c. 25, any freeholder of the term of 500 years absolute, or for any term determinable upon life or lives, of the clear yearly value of 20L per annum, over and above the rent referred, is qualified to serve upon juries. By the common law every grand-juryman ought to be a freeman (1 Hawk. 255); and a freeholder (2 H. H. 155). But in Yorkshire, they ought to have the same 26th, 3-year freehold or copyhold. (7 & 8 W. c. 32.) Persons excluded from serving on juries are those that are sick and decrepit; those not commanant in the county, and men above seventy years old, by 13 Edw. I. c. 38, and by 7 & 8 Will. III. c. 32, infants under twenty-one. This exemption is also extended, by divers statutes, to common, and attorneys, officers of the courts, and the like; all of whom, if impeached, must show their special exceptions. Different teachers, qualified under the toleration act, are exempted, and also quakers. Clergymen are also usually exorced; but if they be seated of land and tenements, they are strictly liable to be impeached in respect of their lay fees, unless they be in the service of the king, or of some bishop.

If, by means of challenges or other caufes, a sufficient number of unexceptionable jurors do not appear at the trial, either party may pray a tales. When the legal number of twelve is obtained, they are then separately sworn, well and truly to try the issue between the parties, and a true verdict to give, according to the evidence; and hence they are denominated the jury, jurate, and jurors, se. jura-tors. Pleading are then opened to them by counsel on that side which holds the affirmative of the quotion in issue; the nature of the case, and the evidence intended to be produced are next laid before them by counsel also on the same side; and when their evidence is gone through, the advocate on the other side opens the defendant's case, and supports it by evidence; and then the party which began is heard by way of reply. See EVIDENCE.

As to such evidence as the jury may have in their own conference, by their private knowledge of facts, it was an ancient doctrine, that this had as much right to sway their judgment as the written or parol evidence which is delivered in court; and therefore, it hath been often held, that though no proofs be produced on either side, yet the jury might bring in a verdict. But this doctrine was gradually exploded, when attempts began to be made, and new trials introduced in their stead. And if a judge knows anything of the matter in issue, he may be sworn as a witness, and give his evidence publicly in court. When the evidence on both sides is gone through, the judge, in the presence of the parties, the counsel, and all others, sums up the whole to the jury; who, unless the case be very clear, withdraw from the bar to consider of their verdict; and, in order to avoid intemperance and caufeful delay, they are to be kept without meat, drink, fire, or candle, unless by permission of the judge, till they are all unanimously agreed. And if they eat or drink, or have any exciting about them, without consent of the court, and before verdict, it is inadmissible; and if they do so at his charge for whom they afterwards ind, it will set aside the verdict. Also, if they speak with either of the parties, or their agents, after they are gone from the bar, or if they receive any fresh evidence in private, or if to prevent disputes, they call lots for whom they shall find, any of these circumstances will entirely vitiate the verdict. And it has been held, that if the jurors do not agree in their verdict before the judges are about to leave the town, though they are not to be threatened or imprisoned, the judges are not bound to wait for them, but may carry them round the circuit from town to town in a cart. When they are all unanimously agreed, the jury return back to the bar; and before they deliver their verdict, the plaintiff is bound to appear in court, by himself, attorney, or counsel, in order to answer the amercement, to which by the old law he is liable, in case he fails in his suit, as a punishment for his false claim; a form which is still continued, though the amercement is diffused; and if the plaintiff does not appear, no verdict can be given, but the plaintiff is sued to be non juici. But in case the plaintiff appears, the jury by their foreman deliver their verdict. When the jury have delivered their verdict, and it is recorded in court, they are then discharged. Such is the proceed of trial by jury in civil cases; a trial which, besides the other vast advantages which attend it, is as expeditious and cheap, as it is convenient, equitable, and certain. On these accounts, says judge Blackstone, "the trial by jury ever has been, and I trust ever will be, looked upon as the glory of the English law." It is "the most transcendent privilege which any subject can enjoy, or with for, that he cannot be affected either in his property, his liberty, or his person, but by the unanimous consent of 12 of his neighbours and equals. A constitution, that I may venture to affirm, has, under Providence, secured the just liberties of this nation for a long succession of ages, and therefore a celebrated French writer (Montesquieu), who concludes, that because Rome, Sparta, and Carthage, have lost their liberties, therefore those of England must in time perish, should have recollected, that Rome, Sparta, and Carthage, at the time when their liberties were lost, were strangers to the trial by jury." This trial by jury, which is the grand bulwark of our liberties, as Englishmen, is sacred to us by the great charter. (5 Hen. III. c. 19.) The antiquity and excellence of this trial, for the settling of civil property, have been already briefly stated. But it has to great advantage in regulating civil property, how much must that advantage be heightened, when it is applied to criminal cases! "In times of difficulty and danger," as Blackstone has well observed, "more is to be apprehended from the violence and partiality of judges appointed by the crown, in suits between the king and the subject, than in disputes between one individual and another, to settle the nates and boundaries of private property. Our law has therefore wisely placed that strong and twofold barrier, of a precedent and a trial by jury, between the liberties of the people, and the prerogative of the crown."—"The founders of the English
English law have with excellent forecast contrived, that no
man should be called to answer to the king for any capital
crime, unless upon the preparatory accusation of 12 or more
of his fellow-subjects, the grand jury; and that the truth
of every accusation, whether preferred in the shape of
indictment, information, or appeal, should afterwards be con-
formed by the unanimous suffrage of 12 of his equals and
neighbours, indifferently chosen, and prior to all sufpi-
cion. So that the liberties of England cannot but infallibly,
so long as this palladium remains facred and inviolate, not
only from all open attacks (whence none will be so hard as
to make), but also from all secret machinations, which may
fap and undermine it; by introducing new and arbitrary
methods of trial, by justices of the peace, commissioners of
the revenue, and courts of conscience. And however con-
venient these may appear at first, (as, doubtless, all arbitrary
powers, well executed, are the most convenient,) yet let it be
again remembered, that delays, and little inconveniences in
the forms of justice, are the price that all free nations must
pay for their liberty in more substantial matters; that these
inroads upon this sacred bulwark of the nation are funda-
mentally opposite to the spirit of our constitution; and that,
though begun in trifles, the precedent may gradually in-
crease and spread, to the utter difuse of juries in questions
of the most momentous concern.

In criminal cases, it is provided by the equity and lenity of
the English laws, that no man should be called to an-
swer for any capital crime, unless, as we have already stated,
upon the preparatory accusation of twelve or more of his
fellow-subjects, called the grand jury. This jury considers
all bills of indictment against criminals preferred to the court,
which they either approve or find, by writing upon them
billa vera, or disallow, by indurating ignorant, and generally
confults of gentlemen that are freeholders of superior quality
to those who form the petit jury, who try the prisoners in-
dicted by the other jury, and convict them by verdict.

When a prisoner, on his arraignment, has pleaded not
guilty, and for his trial hath put himself upon the country,
which country the jury are, the sheriff of the county must
return a panel of jurors that are freeholders, without just
exception, and of the vijp, or neighbourhood, i.e. of the
county where the fact is committed. If the proceedings are
before the court of king's bench, there is a time allowed,
between the arraignment and the trial, for a jury to be im-
panelled by a writ of evert facias to the sheriff, in civil
cases; and the trial in case of a misdemeanor, is had at nghi
pris, unless it be of such consequence as to merit a trial at
bar; which is always invariably had, when the prisoner is
tried for any capital offence. But, before commissioners of
cyre and terminer, and gaol delivery, the sheriff, by virtue of
a general precept, directed to him beforehand, returns to the
court a panel of forty-eight jurors, to try all felons that may
be called upon their trial at that assize; and, therefore, it is
usual to try all felons immediately, or soon after their
arraignment. But persons indicted of smaller misdemeanors,
usually give security to the court to appear, for trial at the
next assizes or seisin. See INDICTMENT.

When the trial is called on, the jurors are to be sworn,
as they appear to the number of twelve, unless they are
challenged by the party. (See CHALLENGE, & supra.)

Tales may be awarded as in civil causes, till the number of
twelve is sworn, "well and truly to try, and true deliver-
ance make, between our sovereign lord the king, and the
prisoner whom they have in charge; and a true verdict to
give, according to the evidence." "When the jury is sworn,
if it be a cause of any consequence, the indictment is usually
opened, and the evidence stated by the counsel for the crown,
or prosecution. But it is a settled rule at common law
(inconsistent, indeed, with the humane treatment of prisoners
by the English laws, but palatable by the declaration of
law, that the judge shall be counsel for the prisoner, i.e.
shall see that the proceedings against him are legal and
strictly regular) that no counsel shall be allowed a prisoner
upon his trial, upon the general issue, in any capital crime,
unless some point of law should arise proper to be debated.
(2 St. Hawk. P. C. 400.) However, the judges never scruple
or allow a prisoner bound to them by the bench to either of
the lawyers for him, with respect to matters of fact; for as to
matters of law, arising on the trial, they are entitled to the
assistance of counsel. When the evidence on both sides is closed,
the jury cannot be discharged, (unles in cases of evident
necessity,) till they have given in their verdict; but are to
consider of it and deliver it in, with the same forms as upon
civil causes; only that they cannot, in a criminal cause, give
a priu verdict. (2 Hal. P. C. 330. 2 Hawk. P. C. 439.)

But an open verdict may be either general, guilty or not
guilty; or special, setting forth all the circumstances of
the case, and praying the judgment of the court, whether,
for instance, on the facts stated, it be murder, manslaughter,
or no crime at all. (See VERDICT AND JURORS.) If the
jury find the prisoner not guilty, he is then for ever dis-
charged of the accusation, except he be appealed of felony
within the time limited by law. (See APPEAL.) And
upon such his acquittal, or discharge for want of prosecu-
tion, he shall be immediately set at large, without payment
of any fee to the gaoler. (Stat. 14 Geo. III. c. 20.) But
if they find him guilty, he is laid to be convicted of the crime
whence he stands indicted. On a conviction for any felony,
in general, the reasonable expenses of prosecution are, by
the Stat. 25 Geo. II. cap. 36 and 18 Geo. III. c. 19, to be
allowed to the prosecutor out of the county stock, if he peti-
tions the judge for that purpose; and if he be poor, a com-
penation for his trouble and loss of time; and by the Stat.
 Geo. II. cap. 3, explained by the Stat. 18 Geo. III. c. 19,
poor persons bound over to give evidence are likewise entitled to
be paid their charges, as well without conviction as with it.
Moreover, on a conviction of larceny in particular, the pro-
secutor shall have restitution of his goods, by the Stat.
11. VIII. cap. 17. which enacteth, that if any person be convicted of larceny
by the evidence of the party robbed, he shall have full restitu-
tion of his money, goods, and chattels; or the value of them
out of the offender's goods, if he has any, by a writ to be
granted by the justices; and this writ shall reach the flen goods,
though the property of them is transferred to another by sale
in open market. (1 Hal. P. C. 543.) Without such writ of restitution, the party may peaceably retake
his goods wherefoever he finds them. And if the felon be
convicted and pardoned, or allowed his clergy, the party
robbed may bring his action of trover against him for his
goods, and recover a satisfaction in damages. Such are the
proceedings and consequences of a trial by jury in criminal

JURY, Special. Where it is conceived that an indifferent
impartial jury will not be returned between party and party
by the sheriff, the court upon motion will order the sheriff
to attend the seconday of the king's bench, with his book
of freeholders of the county; and the secondary, in the
presence of the attorneys on both sides, is to strike a jury.
And when a cause of consequence is to be tried at the bar,
the court of king's bench, on motion and affidavit made,
will make a rule for the secondary to name forty-eight free-
holders; and each party is to strike out twelve, one at a
time, the plaintiff, or his attorney, beginning first; and
from
from the remainder the jury for the trial are to be drawn. This is called a special jury.

By the lat. 3 Geo. II. cap. 25, either party is entitled upon motion to have a special jury struck upon the trial of any issue, as well as the affizses as at bar; he paying the extraordinary expense, unless the judge's writ certify, in pursuance of the lat. 24 Geo. II. cap. 18, that the cause required such special jury. And no person serving on a special jury shall be allowed more than the sum which the judge shall think reasonable, not exceeding one guinea, except in cases where a view is directed. When any special jury shall be ordered by rule of the court of Westminster, in any case arising in any city, &c. the jury is to be taken out of lills, or books of persons qualified, which shall be produced by the sheriffs, &c. before the proper officer. The fame indulgence is granted both to merchants and foreigners; for where two merchants are plaintiff and defendant, a jury of merchants may be returned to try the issue between them; and if either of the parties in the suit be an alien, the jury, at the desire of the party, is to be composed of half foreigners and half English.

JURIES, Clerk of the. See CLERK.

JURY of Matrons. See Matrons.

JURY-MAST, an appellation given by seamen to a temporary or occasional mast, pitched up of yards, or other pieces of timber, and set up in the room of a true mast, which has been lost in a fight, or by a storm.

JURZEC, in Geography, a town of Lithuania, in the palatinate of Minak ; 20 miles N. of Rohaczow.

Jus, and Jura. See Law. Right, &c.

Jus ad rem, in Law, is the right of survivorship between joint-tenants.

Jus acerstendis, in Law, is the right of survivorship between joint-tenants.

Jus ad rem. is an inchoate and imperfect right, such as a partition produces to the living acquire by nomination and institution; in contradistinction to the jus in re, or complete and full right, by corporal possession.

Jus Anglorum, denotes the law and customs of the West Saxons, in the time of the heptarchy, by which the people were for a long time governed, and which were preferred before all others.

Jus coronae, rights of the crown, is part of the law of England, which differs in many points from the general law concerning the subject. Coke on Litt.

The king may purchase lands to him and his heirs, but he is feited thereof in jure coronae ; and all the lands and possessions, whereof the king is thus feited, shall follow the crown in descents. &c. See PREROGATIVE.

Jus curialisatios Anglie. See COURTESY.

Jus duplicatum. See Right.

Jus fiduciarium, in the Roman Law, a right in trust for which there was a remedy in conscience.

Jus gentium, is the law by which kingdoms, and society in general, are governed.

Jus gladii is mentioned in our Latin authors, and the Norman laws, where it signifies a supreme jurisdiction. Camden.

And hence it is, that at the creation of an earl, he is said to be gladius vicinieus, to signify that he had a jurisdiction over the county of which he was made earl. See PLEAS of the Sword.

Jus imaginum was the foundation of civil nobility among the Romans, and denoted having the image of one ancestor at least, who had borne some curial office.

Jus legitimum, in the Roman Law, a legal right which was remedied by the ordinary course of law.

Jus patronatus, is a commination granted by the bishop to some persons to enquire who is the rightfull patron of a church. If two patrons pretend their clerk, the bishop shall determine.

mine who shall be admitted by right of patronage, as commission of enqyury by ibis deign and ibis reason, being near the church; or who are to enquire an article and jury, whether the church is void? who prefered to bid? who is the rightful patron? &c. But if two patrons pretend their clerks, the bishop is not obliged to declare his patronatus, because they pretend under the title; and are not in like cases, where two patron pretends under several titles. The awarding a jus patronatus is not of itself, but at the pleasure of the ordinary, for his better information who hath the right of patronage; for it he will at his peril take notice of the right, he may admit the clerk or either of the patrons, without a jus patronatus.

Jus precarium, in the Roman Law, a right in courtesy, for which the remedy was only by intreaty or a quid.

Jus qualis. See Qualis.

Jus toga. See TOGA.

JUkopour, in Geography, a cataract of Hindostan, in the country of Orlia, bounded on the N. by Surgoo, on the E. by a part of Bahar, on the S. by the cataracts of Gangpour and Ruttunpoor, and on the W. by Ruttunpoor. The capital is Odeypour.

Jusofieu, a town of Arabia, in the province of Hodejor, on the S. coast of the Persian gulf. N. lat. 25° 34'. E. long. 50° 30'.

Jusquiamus, in Botany, a name used by some authors for the hyoscyamus, or henbane.

Jussauha, in Geography, a town of Hindoostan, in Moulton ; 14 miles W. of Toulomba.

Jussé, a town of France, in the department of the Upper Saone, and chief place of a canton, in the district of Vefoul, situated on the Amance ; 15 miles N.W. of Vefoul. The place contains 3033, and the canton 14,776 inhabitants, a territory of 2272 kilometres, in 22 communes. N. lat. 47° 49'. E. long. 5° 59'.

Jussiela, in Botany, so named by Linnaeus, (who, as it appears by his Tour in Lapland, v. i. 284, had at first defined for this purpose the plant he afterwards called Sibbaldia,) in honour of the two illustrious brothers Antony and Bernard de Jussieu. The former was professor of botany at Paris, and wrote numerous papers in the Memoirs of the academy, being also the editor of the work of Barredon. He was born at Lyons in 1686, and died at Paris, where he practised medicine, in 1758, aged 72. His brother Bernard, a first rate botanist, who, as Haller observes, was devoted by excess of modesty from giving his ideas to the world, was one of the first who laboured at a natural system of arrangement. His nephew, the present A. L. de Jussieu, has given us a plan of his method, according to which the garden of Trianon was arranged in 1759, and which in fact had the foundation of his own celebrated work, published in 1789. Bernard de Jussieu was demonstrator of botany at the Jardin du Roi, and died in 1777, aged 79. A third brother, Joseph, travelled to South America as a surgeon, and sent home dried specimens of many curious plants. — Linn. Gen. 215. Selbyib. 323. Wilds. Sp. Pl. v. 2. 374. Mart. Mill. Hist. v. 2. Art. Herb. Kew. v. 2. 63. Jull. 319. Lamarck. Hist. v. 286. Gertn. t. 31.—Clats and order, Descr. Mogg. Gnt. Nat. Ord. Speci.-thcme. Linn. Onde- gra. Julii.

Gen. Ch. Cal. Perianth superior, in five, (for times but four,) excur, acute, permanent segments. Cor. of five, (sometimes but four,) roundish, slightly filiform, equal petals. Strown. Filamen-tes. (sometimes eight,) very hairy, thread-shaped; anthers roundish. Pith. German oblong, prismatic, inferior; style thread-shaped; stigma capitate, flat, marked with five streaks. Per. Capsule oblong, in-
Jussiæa.

partitions of four or five cells, burbling at the angles, crowned with the calyx. Seeds numerous, small, smooth, and polished, disposed in rows upon the angles of the central column, which are opposite to the partitions, the latter originating from the centre of each valve. See Gærtner.

Eff. Ch. Calyx superior, of four or five leaves. Petals four or five, equal. Capsule of four or five cells, oblong, burbling at the angles; partitions from the middle of the valves. Seeds numerous, minute.

Obi. Gærtner affirms the difference between this genus and Onothera to be merely fictitious and imaginary. In our opinion the permanent, leafy, equal calyx, delitute of a tube, and the smooth, round, not angular nor spongy, seeds, are sufficient to mark it against, not to mention the undivided stigma, which in this tribe is of no great moment.—As to its place in the Linnean system we are left decided, and think Lamack most correct in removing it to Gänandria.

The greater number of the species are natives of the warmer parts of America; a few are found in the East Indies, or in Guinea. Linnaeus divides five in his Species Plantarum, and has twelve.

1. J. repens. Linn. Sp. Pl. 535. (Nir-carambu; Rheede Hort. Mal. v. 2. 97 t. 51.)—Stem erect. Leaves obovate, obtuse. Flowers five-clft. Calyx-leaves lanceolate.—This is truly an East Indian species, growing in watery places, and throwing out from its procumbent branched stem, large tufted fibrous perennial roots. The herbage is smooth. Leaves alternate, falcate, obovate, entire, very obtuse, often marginal, an inch or more in length. Flowers on solitary, simple, axillary stalks, shorter than the leaves, but the ripe fruit and stalk together are about as long as each leaf. Segments of the calyx five, lanceolate, narrow, acute, entire. Petals five, roundish, whitish, with orange-coloured claws.—J. ascendens. Linn. Mont. 69, appears to be the very same plant, described from a specimen, where

as J. repens was originally taken up from books.

2. J. inclinata. Linn. Supr. pl. 235. (J. erecta; Ameon. Acad. v. 8. 256.)—Stem ascending. Leaves obovate, obtuse. Flowers four-clft. Calyx-leaves elliptical, broad.—Sent from Surinam by Dalberg, being a part of the collection preferred in spirits, which king Guatavus III. gave Linnaeus. The latter at first mistook this species for a totally different one, erecta. It is more akin to repens, but larger, and the above specific character sufficiently marks it. The very broad calyx-leaves are remarkable.

3. J. peruviana. Linn. Sp. Pl. 555. (Onagra lanerifolia, flore amplo pentapetalis; Feuill. Provs. t. 9, not 11.)—Stem erect. Leaves elliptical-obovate, acute, roughish. Flowers four or five-clft. Calyx leaves ovate, pointed, toothed.—Gathered by Feuillée about the banks of rivers in the plain of Lima. He reports that the natives highly esteem the bracted leaves, as being a valuable application to choler tumours. Matiss sent Linnaeus a specimen from Mexico, which answers precisely to Feuillée’s plant, except the fruit being four-clft, in which we lay no stress. The toothed calyx in our is remarkable. The petals are large and yellow. Leaves roughish with short, rigid, scattered hair; their underside pale.

4. J. hirta. Willd. n. 6. (Onothera hirta; Linn. Sp. Pl. 491. Onagra fruticeps et hirta, neri frut, flore magn. lateo; Plm. t. 1. 167 t. 174 f. 2.)—Stem erect, hairy. Leaves elliptical-lanceolate, acute; hairy along the nerves. Flowers four-clft. Calyx-leaves ovate, pointed, toothed.—Known to botanists by Plummer’s figure, who gathered it in some part of South America. If that figure be correct, the entire calyx, and more hairy herbage, differing it from the lift. Willdenow has properly followed Swartz and Vahl in removing it from Onagra.

5. J. pseudofen. Linn. Sp. Pl 555. Loefl. It. 283. n. 205.—Stem upright, hairy. Leaves oblanceolate. Flowers five or six-clft. Calyx-leaves lanceolate, pointed, hairy beneath.—Gathered by Loefling in South America. We have an unnamed specime which answers well enough to the short accounts of this species given by authors. Of the synonym of Sloane we do not premise to judge with certainty, but it appears to belong to J. peruviana. The stem of our plant is erect, clothed with long, spreading, white hairs, as also the leaves more or less, the long slender germen, and backs of the calyx-leaves. The latter are fix in every flower we have examined, lanceolate, taper-pointed, wavy, scarcely crenate, very smooth above. Petals fix, white or yellowish. Leaves linear-lanceolate, near two inches long, on short hairy stalks.

6. J. suffruticosa. Linn. Sp. Pl. 555. (Cattu-carambu; Rheede Hort. Mal. v. 2. 97 t. 51.)—Stem erect, much branched. Leaves lanceolate, downy. Flowers four-clft. Calyx-leaves ovate, downy beneath.—Native of the East Indies, and annual during the rainy season. The whole plant, two or three feet high, is usually clothed with dense soft pabèlenecous, though occasionally nearly smooth. Leaves numerous, lanceolate, almost feathery, about two inches long. Fruit nearly as long. The ovate four-clfted calyx, downy, not hairy, beneath, essentially differing it from the latter. Linnaeus adopted this species from books, and though he had specimens, never rightly determined them.

7. J. oblata. Swartz. Obs. 142. (Onothera octovalvis; Jacq. Amer. 102. t. 70. Linn. Sp. Pl. 4. 2.)—Stem erect. Leaves lanceolate, downy. Flowers four-clft. Calyx-leaves ovate, downy beneath. Capsule of eight valves. Native of wet places in the West Indies. This seems to be the plant incorrectly figured by Merian. Inf. Surin. t. 39. There is great difficulty in distinguishing it specifically from the last, as we have seen no specimen, but we have no doubt of their being different. The present is said to be an annual plant. The petals are yellow, and invariably heart-shaped.

8. J. erecta. Linn. Sp. Pl. 556. Swartz. Obs. 173. (Onagra folis peciferae anguilliferae, flore magn. lateo; Plm. 1c. 168. t. 175. f. 1.)—Stem erect. Leaves lanceolate, downy. Flowers four-clft. Calyx-leaves ovate. Capsule of eight valves. Native of wet places in the both Indies. This root is said to be annual. Whole plant smooth or nearly so. Leaves two or three inches long, filicate, lanceolate, pointed. Flowers small, yellow, axillary, sessile. Calyx-leaves slightly downy and three-sided beneath. Fruit obovate, not an inch long, the membranous sides, between the ribs, becoming torn when let out of the seeds.

9. J. tuberosa. Swartz. Ind. Occ. v. 2. 745.—Nearly erect, smooth. Leaves lanceolate, broad, tapering at each end. Flowers four-clft, nearly feathery.—In low ground in the south part of Jamaica, but rare. Swartz. This differs from the last in the irregularly taper-pointed leaves, and in the stem being composite at its base. The flowers, leaves, however, are described as somewhat ovate.

10. J. pseudo. Friem. Ind. 403. t. 34. f. 2.—Erect, smooth. Leaves lanceolate, opposite. Flowers five-clft, nearly filiform.—Native of Java. A small plant much branched. Leaves (according to Burmann) opposite, much long. The Caesalpinia of Maregrace, 59 f. 1, which he quotes, is more like J. pseudo.

11. J. lanata. Willd. n. 5.—Leaves linear, sessile, hispid.
JUSTIN, a town of France, in the department of the Loire, and chief place of a canton, in the district of Romagne; 12 m. S.W. of Romagne. The place contains 7366, and the canton 9146 inhabitants, on a territory of 21713 arpents, 878 acres.

JUSTINIAN, a town, in the province of Tucuman; 43 m. N.W. of S. Tucumano.

JUSTELL, Christopher, in Biographia, was born at Paris in 1529. Having had a good training in the monasteries of schools, and at college, he applied his mature studies to ecclesiastical history, and became the author of many learned works. He died at the age of 69 in the year 1599. His principal works are, "Codex Canonum Ecclesiae Universae, a concilio Calcha benedicti et Juliianon. Imp. Compendivs Gr. et Lat.;" "Codex Canonum Ecclesiae Dionysii Exigni," &c.; "Codex Canonum Ecclesiae Africana, Gr. et Lat.;" "Bibliotheca Juris Canonici Veneris;" "A Genealogical History of the House of Augsburg," &c. Justell was supposed to be better acquainted with the civil history and antiquities of the middle age than any person of his time. He kept up a correspondence with most of the literary characters of his time, among whom were archbishop Usher and Sir Henry Spelman.

JUSTICE, in a general sense, or universal justice, comprehends the whole duty of man to God, to his neighbour, and to himself. In this latitude the term "righteousness," often occurs in scripture. Cicero was not ignorant (De Nat. Deor. i. 14) that justice expresses more than the performance of the duties owing to our fellow-creatures; for according to his definition, "Ed enim pietas justitia adversum Deos," i.e. Pity is justice towards the gods.

JUSTICE, Justin, in a more restricted sense, and considered as a social virtue, denotes a constant desire, or inclination, to give every one his due; or a habit by which the mind is disposed and determined to give every man his own. Accordingly justice has a necessary respect to the persons and rights of all. As there is a twofold right (see Right), there is also a corresponding distinction of justice. A right is either perfect or imperfect. A perfect right is that which persons have to things properly their own, the retaining of which is the payment of debt, rather than the conferring of a favour. A right which has, in law, as well as divine, generally allowed to a person, or the right to recover what is justly his, is called a "right." Thus also, the making of a promise may be free, but the performance of it is not. An imperfect right is something thing from the kind of a perfect right, or imperfect, and good will of the promisee who doth not make it a breach of the moral law, and generally allow a man to claim it, unless and until they recover. I am not obliged to every one who does not rob or murder me. Thus also, the making of a promise may be free, but the performance of it is not.

JUSTUS, in Geography, a graceful and pleasing composer of elegies and other pieces of like strain, especially for beginners on the harp and guitar or violins, in Holland, about 173 years ago.

JUSTUS. In Geo. p. 696, a town of France, in the department of the Oise, and third place of a canton, in the district of Clermont; 9 miles N. of Clermont. The place contains 883, and the canton 10,223 inhabitants, on a territory of 22,271 arpents, 22 carreau. Also, a town of France, in the department of the Meuse; 6 miles S.E. of Nancy. Also, a town of France, in the department of the Aisne; 6 miles S.S.E. of Reims.
JUSTICE.

c. 7, 8.), "Justice conjuncta est beneficiencia;" Bene
ficiency is connected with justice. And again, "Injusticee duo gens;" i.e. There are two kinds of injustice, one of those who do an injury to others; another with which they are chargeable, who neglect to vindicate and defend the injured, when it is in their power. To the same purpose
the philosopher (sages (T. D. 3, 1 ix. c. 5.), "A man may be
injured not only by doing, but neglecting to do something.")

These philosophical writers seem evidently to have thought,
that the duties of humanity are parts of justice properly so
called. Simple justice we have already defined, agreeable to
the accoutrement of it in the civil law. "Justice est
constans et perpetua voluntas jus suum cuique tribuendi;"

"Justice is a constant and prevailing will, or disposition,
to render to every one his due.

Justice itself not derive its being from fear, as is affirmed
by Mr. Hobbes, who supposes mankind in their natural
state to have a licence uncircumscribed by any other
bounds, besides their own natural force. This licence
they are induced to exchange for a more limited right
in society, to prevent that war of every one with every
one, which would be the consequence of every one's insi-
fiting upon his natural rights. "According to this hypo-
thesis," as Dr. Cudworth well observes (Intelect.
Systenm), "Justice and civil government are plainly things
not good in themselves, nor defirable (being a hinderance
of liberty, and nothing but shackles and fetters..., but
by accident only, as necessary evils. They are less evil
submitted to purely for the sake of avoiding a greater.
Hence it inevitably follows, that all men must be as
much unwillingly just, or not with a full and perfect,
but mixed will only." The true principles of justice are such
as these: It is reasonable that his will, who is the common
father of mankind, should be the measure of their behaviour
one towards another. It can never be thought a thing
pleasing to God, who has originally the same affection for
one as for another, that one man, by fraud or violence, should
usurp dominion over another, or any way molest or hinder
him.

Besides, this would introduce confusion into his works,
the glory of which is their order and harmony. If he be
the dispositor of mankind," says Cicero (De Office 1. ii.
§ 5.), "that every one for his own advantage should oppre-
s and rob his neighbour, it is necessary that society, which is
the most natural state of mankind, be entirely dissolved.
Just as in the human body, the whole must be weakened
and destroyed, if every member could have this persuasion,
and act upon it, that it should flourish by drawing to itself
the strength and nourishment of the member nearest to it.

Thus from that original and universal society to which all
mankind belong, necessarily flow obligations to mutual
justice; and Mr. Hobbes's state of war appears to contra-
dict the very first view of human nature. But besides this
general fact, particular civil societies have, by the direction
of nature, been erected in several parts of the world. The
number of states has formed his rational creatures with a
motive and inclination to combine into bodies politic.
This inclination, therefore, which makes men seek society, not
for the prospect of benefiting themselves by it; to satisfy
their desire more than to defend themselves from violence.
When societies are formed, though justice be necessary to
man from nature, and hence we infer the will of the great
governing of the world; yet in the nature of things, the
obligation to justice is precedent to any society whatsoever.

From the relation to society with which God hath made
men, we have it to be, that justice should be cultivated,
which is necessary to the support of society; but civil
justice is not the original of justice. Another prin-
ciple of justice is, that the good of the whole is to be
preferred before the good of any one part. Is it good,
pleasing to a most benevolent creator, and consequently
deriving the approbation and concurrence of every rational
agent, that this or that man should be happy? It is much
better that a greater number, and all of them that all should
be so. But how can all men be made happy, without a
constant regard to the rules of justice? Bishop Cumberland
(De Legibus. Nat., cap. ii. § 23.) not only resolves justice,
with the several duties annexed to it, into this principle, but
even the right of self-preservation. Further, it is altogether
reasonable, that we should, or should not do to another,
what we would, or would not that he should do unto us.
Every man is agreed to think every other man unjust, who
deprives him of any good thing which he lawfully enjoys.
We should therefore consider, that others may reasonably
expect of us, whatever we may reasonably demand from
them. Moreover, all men have their rights and properties.

That it is men's condition to be what it will, high or low,
rich or poor, a prince or a subject, as he has an equal
right to what he lawfully possesses, with that which any other
man can have; so there are certain possessions, the right of
which he cannot transfer to another; of which number are life,
liberty, and equality, both civil and religious: in all which
respect, therefore, the meanest person, while innocent, is equal
to the greatest among men. Mr. Hobbes indeed (De Cive, i.
c. 1. § 3.) proves the equality of mankind from the equal
power they have of doing mischief. M. Barbeyrac ob-
jects, that the equality may be called, equality purely
physical; whereas it is a moral equality, or an equality of
right, that must be laid as the foundation of justice.

Puffendorf deduces this equality of mankind from the fame
enemies of nature; which seems to make it, as well as that of
Mr. Hobbes, a physical equality. Of Mr. Godwin's sentiments
concerning the subject under present discussion, we shall
probably have occasion to give some account under the arti-
cles Politics, Society, and Virtue.

Having briefly stated the great principles of justice, we
shall now proceed to the division of it. According to
Aristotle, justice is universal or particular. Universal justice
conforms to the observance of the laws, which extend to all
the actions of mankind capable of good or evil, and thus
comprehends all the virtues. Hence the common saying,
"De benefacia, et justitia, et aegrotria, et aedificiis," that is,
all virtue is included in righteousness. Particular justice respects
the rights of other men, and conforms in the observance of
equality, or in challenging no more than our own; and in
giving to others what is theirs. Particular, or simple justice
is either distributive or commutative. Distributive justice is con-
cerned in the distribution of honour, money, or whatsoever
else is to be divided among the members of a society, for
in all these there is room for equality or inequality; and
therefore to distribute as we ought is a part of justice. In
other words, it is concerned in matters of government, and
of beneficence; and is either remuneratory, or punitive: it
observes
observes an uniforme, delivering rewards and punishments, according to each man's situation and merit; for as actions are either good or evil, for the good, rewards must be allotted: and for the evil, punishments; and here a geometrical proportion is observed. Compulsive justice forever intends to maintain and defend all those in danger into conduits of a nature: or it is convenient for men of commerce, and for the same convenience, or the state of travel, and once to continue it or to make it without any regard to persons, or principles. In which we may add that the laws of the state, and those of communication which have been confirmed, or the principles, is to say, all evil causes, between common persons, as well personal as real; and he is also a lord by his office, See Court of Common Pleas.

The justice of the Common Pleas, Chief, he who, with his assistants, bears and determines all causes at the common law, is to say, all civil causes, between common persons, as well personal as real; and he is also a lord by his office, See Court of Common Pleas.

Justice of the Forepart, is a lord by his office, who has power and authority to determine offices committed in the king's forepart, Sec, which are not to be determined by any other court, or justice.

Of these there are two; whereby one has jurisdiction over all the fores on this side Trent, and the other beyond it.

By many ancient records, it appears to be a place of great honour and authority, and is never before than some portion of great distinction. The court in the justice sits, called the justice of the fores, and has been every three years, of which 24 days not coming to be given, for hearing and determining, all trepani cases, the most and all kinds of franchise, there, and privileges, and all pleas and causes whatsoever there among. (P. 291.)

This court may fine and imprison for offences than the forest (4. Inf. 315.), it being a court of record; and therefore a writ of error lies from hence to the court of king's bench. The last court of justice was held in the reign of Charles I., before the end of Holland. After the Restoration another was held, for form and fakes, before the earl of Oxford; but the Revolution in 1668, the forest has been fallen into total silence, to the great advantage of the subject.

This is the only justice who may appoint a deputy; he is also called justice in eyre of the forest.

Justices of Assize, were such as were wont, by special commission, to be sent into this or that county, to take afettes, for the eif. of the subjects.

For whereas these actions must always by jury, so many men might not, without great damage and charge, be brought up to London; and therefore justices, for this purpose, by commissions particularly authorized, were sent down to them.

These continue to pass the circuits, by two and two, twice every year, throughout all England, except the four northern counties. Here they are usually one, dispatching their several business in several commissions; for they have one commission to the ships, another to deliver goods, and another of river and terrene. In London and Middlesex, a court of general gaol delivery is held eight times in the year.

All the justices of any county where the assizes are held, are bound by law to attend assize: they are also liable to the common recovery, n临时. to suit the justice in each matter in which their knowledge and interest, and to whom they have been particularly committed, of no office of previous examination, See A. 1. 7. 1.

Justices in England, if temporary, or coroners, were those who were sent forth with commissions into divers counties, to hear and determine all causes committed within the common law, and in the state of the affizes, were such as were not of the courts of Westminster or of the earl of Chester, and of the county courts.

According to some, those justices were sent once in seven years;
years; but others will have them to have been rent oftener. Camden says, they were inducted in the reign of king Henry II. A. D. 1184; but they appear to be of an older date.

They were somewhat like our justices of assize at this day; though for authority, and manner of proceeding, very different.

**Justices of Gaol-delivery**, those commissioned to hear and determine causes appertaining to such as, for any offence, are cast into prison.

Justices of gaol-delivery are empowered by the common law to proceed upon indictments of felony, trespas, &c., and to order execution or reprieve; and they have power to discharge such prisoners as upon their trials shall be acquitted; also all such against whom on proclamation made, no evidence appears to indict; which justices of oyer and terminer, &c. may not do. (2 Hawk. 24, 25.) But these justices have nothing to do with any person, not in the custody of the prison, except in some special cases; as if some of the accessories to a felony may be in such prison, and some of them out of it, the justices may receive an appeal against those who are out of the prison as well as those who are in it; which appeal after the trial of such prisoners, shall be removed into R. & P. and proceeds issue from them against the reft. But if those out of prison be omitted in the appeal, they can never be put into any other; because there can be but one appeal for one felony.

In this way the gaols are cleared, and all offenders tried, punished, or delivered, twice in every year.

Their commission is now turned over to the justices of assize. See Gaol-delivery.

**Justices of Nisi Prius**, are now the same with justices of assize. It is a common adjournment of a cause in the common pleas, to put it off to such a day, Nisi prius judiciarii venient ad causas partes ad capendas affisos: from which clause of adjournment they are called justices of nisi prius, as well as justices of affris, on account of the writ and actions they have to deal in. See Nisi Prius, and Justice.

**Justices of Oyer and Terminer**, were justices deputed on some special occasions to hear and determine particular causes.

The commission of oyer and terminer is directed to certain persons, upon any infraction, high or demeansour, or trespas committed, who must first enquire, by means of the grand jury or quickset, before they are empowered to hear and determine by the help of the petit jury. It was formerly held, that no judge or other lawyer could act in the commission of oyer and terminer, or in that of gaol-delivery, within the county where he was born or inhabited; but it was thought proper by 12 Geo. II. cap. 27, to allow one man to be a judge of oyer and terminer and general illuminator, within any county of England.

**Tryst of the Peace**, are persons of integrity and credit, empowered by the king's commission to keep the peace of the county where they live.

Of the fame, for special respect, are made of the quorum, to assumps, as no less of importance may be disputed without the presence, or fact, of them, or one of them. Nor the presence is to advance a more of all of them the dignity, naming them all over again in the quorum, except perhaps only five inconsiderable person for the sake of property; and no execution is now allowed for non-appearance in the form of the warrants, &c. that he who finds them is of the quorum. Whenever a justice intends to sit under his commission, he sits out of "delirious potatium" from the clock of the crown in chancery, empowering certain persons therein named, to administer the usual oath to him; which done he is at liberty to act. Every justice of peace hath a separate power, and his office is to call before him, examine, issue warrants for apprehending, and commit to prison, all thieves, murderers, wandering rogues; those that hold combination, riots, and about all &c. incursions which may occasion the breach of the peace, and quittance of the subject; to commit to prison such as cannot have bail, and to order to fee them brought forth in due time to trial; and bind over the justices to the assizes. And if they neglect to certify examinations and informations to the next gaol-delivery, or do not bind over the justices, they shall be fined. A justice may commit a person that doth a felony in his own view, without warrant; but if on the information of another, he must make a warrant under hand and seal for that purpose. If a complaint and oath be made before a justice of peace, and the informer, suspecting that they are in a particular house, shew the cause of his suspicion, the justice may grant a warrant to the constable, &c., to search in the place suspected, to seize the goods and person in whole custody they are found, and bring them before him or some other justice. The search on the warrant ought to be in the day-time, and doors may be broke open by constables to take the goods. Justices of peace may make and perfect an agreement in petty quarrels and breaches of the peace, where the king is not entitled to a fine, though they may not compound offences, or take money for making agreements. A justice hath a discretionary power of binding to the good behaviour, and may require a recognizance, with a great penalty, of one, for his keeping of the peace, where the party bound is a dangerous person, and likely to break the peace, and do much mischief; and for default of justice he must be committed to gaol. But a man giving security for keeping the peace in the king's bench or chancery, may have a supersedeas to the justices in the country not to take security; and also by giving security of the peace to any other justice. If one make an assault upon a justice of peace, he may apprehend the offender and commit him to gaol till he finds securities for the peace; and a justice may record a forcible entry on his own possession: in other cases he cannot judge in his own cause. Contempts against justices are punishable by indictment and fine at the assizes. Justices shall not be regularly punished for any thing done by them in sessions as judges; and if a justice were tried for any thing done in his office, he may plead the general issue, and give the special matter in evidence; and if a verdict be given for him, or the plaintiff be non-suited, he shall have double costs; and such action shall only be laid in the county where the offence was committed. (7 Jac. cap. 5, 21 Jac. cap. 12.) But if they are guilty of any misdemeanor in office, information against them in the king's bench, where they shall be punished by fine and imprisonment; and all persons who recover a verdict against a justice, for any wilful or malicious injury, are entitled to double costs. By 23 Geo. II. cap. 44, it will shall he find out against any justice of peace, for any thing done by him in the execution of his office, until notice in writing shall be delivered to him one month before the same out of the cause, containing the cause of action, &c., within which month he may tender a bond; and if the tender be found sufficient, he shall have a verdict, &c. Nor shall any action be brought against a justice for any thing done in the execution of his office, unless commenced within six months after the act committed.

A justice is to exercise his authority only within the county where he is appointed by his commission, not in any city.
city which is a county of itself, or town corporate, having
their proper justices, &c. but in other towns and liberties
he may. The power and office of justices terminate in six
months after the demise of the crown (1 Ann. c. 8), by
an express writ of discharge under the great seal, by writ
of supersedeas, by a new commission, by the accession of the
office of sheriff or coroner.

If the same justice, whose office ceases on the demise of
the crown, be put in commission by the successor, he shall
not be obliged to give out a new writ, or to swear to his
quittance aforesaid (1 Geo. III. c. 13); nor, by reason
of any new commission, to take the oaths more than once
in the same reign. In case of a supersedeas, the power of the
justices may be revived again by another writ, called a proce-
dendo. Formerly it was thought, that if a man was named in
any commission of the peace, and had afterwards a new
dignity conferred upon him, that this determined his office;
as he no longer answered the description of the commission;
but now it is provided (1 Edw. VI. c. 7.), that, not
withstanding a new title of dignity, the justice on whom it is
conferred, shall still continue a justice. For a further account
of the duty of justices, see Quarter Sessions.

The original of justices of the peace is referred to the
fourth year of Edward III. They were first called repara-
tors, or guardians of the peace, elected by the county, upon
a writ directed to the sheriff; but the power of appointing
them was transferred by statutes from the people to the king;
and under this appointment appointed by 1 Edw. III. cap. 16.
Afterwards the statute of 34 Edw. III. cap. 1 gave them
the power of trying felonies, and then they acquired the ap-
pellation of justices. They are appointed by the king’s spe-
cial commission under the great seal, the form of which
was settled by all the judges. A.D. 1150; this appoints them
all, jointly and severally, to keep the peace, and any two
or more of them to inquire and determine felonies, and other
misdemeanors; and the king may appoint as many as he shall
think fit to every county in England and Wales, though they
are generally made at the discretion of the lord chancellor,
by the king’s leave. At first the number of justices was not
above two or three in a county. (18 Edw. III. cap. 2.)
Then it was provided by 54 Edw. III. cap. 1, that one
lord, and three or four of the most worthy men in the county,
with some learned in the law, should be made justices in
every county. The number, which gradually increased
through the addition of private suits, was afterwards
restrained first to six, and then to eight, in every county, by
12 Ric. II. cap. 12, and 14 Ric. II. cap. 11. But their
number has greatly increased since their first constitution.
As to their qualifications, the statutes just cited direct
them to be of the best reputation and most worthy men in the
county; and the flat. 13 Ric. II. cap. 7, orders them to
be of the most sufficient age, worthy, and gentleman of the
law; and by 2 Hen. V. flat. 1. cap. 4, and flat. 2.
cap. 1. they shall be resident in their several counties. And
by 18 Hen. VI. cap. 11, in justice was to be put in com-
misssion, if he had not two in the value of 2,000
l. It is now enacted by 5 Geo. II. cap. 11, that every justice,
with some excuse, shall have 12 l. per annum clear of all
deductions, in which he shall make one in 10 Geo. II.
cap. 20. And if he acts with the judge, he shall
forfeit 1,000 l. It is also provided by 7 Geo. II. that no
practising attorney, solicitor, or proctor, shall be capable
of acting as a justice of the peace.

JUSTICES of peace, in all towns, are protectors of the peace
who have the same authority in peace, or other corporate
towns, as the others have in counties; and the power is the
same; only that these have the right of ale and beer, wood
and similar, &c. Justices of counties are not
within the qualification act, 5 Geo. III. cap. 18.

JUSTICE of the Peace—See Justice of the Peace.

POLITICIA, 1 R. S. is named by Hoult, in compa-
pass to his contemporary James Justice, eq. F. R. S. a
case of fiction, said by Miller to have been a great lover and
courser of gardening and botany. He published in
1764, an new volume, called the British Gardener’s Director,
but if we are not mistaken, it derives more honour from
this fine and extensive garden, than he was ever upon. Linn.

Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, in
dive cap, acute, erect, equal, narrow segments. Cor.
of one petal, ringent; tube swollen; lip in two unequal lips, the upper cleft, posterior, the lower in three li-
pions. Stem. Plants to ro, and up, branched. Midstomach.
the upper lip; another cleft of two ; these, which are
sometimes more or less distant or united. P. c. Germeri
uperior, tubular; style thread-shaped, as long as the sta-
men, and parallel to them; stigma simple. Peris. Capil-
ribbing, obtuse, connivent at the base, of two eared
and two elongated valves, the partition contrary to, and fixed in
the middle of each valve. Seeds two in each cell, roundish,
each subdivided by a peculiar procumbent line.

Eff. Ch. Calyx in five deep equal segments. Corolla
ringent; its lower lip three cleft. Capsule of two eared
and two elongated valves and two cells; partition from the centre of
each valve. Seeds two in each cell, subtilated by trichomes.

The 14th edition of Swell, Veg. contains but 56 species of
Juffia, and seven of Distelera, which latter genus, which
being only in having the two lobes of its anthers a little
different from each other, is now, by the agreement of all
botanists, united to the former. Vahl, in his Ern,,
Vol. 1, 149, including Andrew’s t. 1. 2. 422, Andr.
bot. t. 1. 519, but excluding five species separated by Vahl as
species of one plant, that is called A. n. Man., Mr. Brown, who
has said more critical attention to this tribe, than any
writer with whom we are acquainted, has separated from
his own Edw. see that article; as well as he has made
keeping distinct also the Linum. Latit. n. m. character
form, which we consider as the very finest character. He
forms thus; that the hemicarpous, flowered, and be
ought to be further divided, ha-
malina; and on the flowers from their stems, contain
capsules, and a small cluster.

We are not sure that the family characters above
shall not bear a direct reference to the
his own, which are striped. The

also be referred to the whole Diant.
the latter part of the flower, as in
there is a much larger one, according to Mr. Brown, but not seen
the genus, which is called Dian-
Where the seeds are capable of being procured, they may be sown in small pots filled with light loamy earth, in the early spring, being plunged in a hot-bed of bark, watering the mould of the pots moderately, when it becomes dry. As they often remain long before the plants appear, the pots should not be disturbed, but be kept in the hot-bed. When the plants appear, fresh air should be admitted in mild weather, and frequent waterings given; and when they have attained a few inches in growth, they should be removed into separate pots filled with light earth, re-plunging them in the hot-bed, watering and feeding them till they have taken on a firm root; being then freely admitted, and the leaffs grown out, and well waterings being given. As they advance in growth, they should be placed in larger pots, taking care not to over-water them, keeping them constantly in the hot-bed.

The layers should be laid down in the early spring, in pots filled with light earth, a little water being given at the time.

The cuttings may be made from the young shoots, and planted in pots filled with the same sort of earth, in the later spring or summer months, giving them a little water, and plunging them in the hot-bed of bark in the house, due shade being given.

When the plants have been perfectly rooted, they may be taken off, or removed into separate pots, keeping them constantly in the house or greenhouse, according as they are more or less hardy. The two first years are the most hardy; the others succeeding best in the hot-house or house.

The two first afford ornament and variety among the other potted plants of the fleshy tender sorts, and the other among those of the house kinds.

JUSTICIA, in our Old Law, an officer instituted by William the Conqueror, as the chief officer of State, and who principally determined all pleas civil and criminal. He was called in Latin capitalismus justiciarius totius Anglie. See JUSTICE.

JUSTICIARII, in Church History, an appellation given to heretics who boast much of perfect righteousness, and despise others; such were the Pharisians among the Jews, and the Novatians and Donatists among the Christians.

JUSTICIARIUS, Magister, a judge in the kingdom of Naples, who has supreme jurisdiction in all cases of treason, and pleas of the crown, and finally determines all appeals. He has four afferent.

JUSTICIARY Court, in Scotland. The court of justices has supreme jurisdiction in all criminal causes. It came in place of that of justicia-cyrii, or justicia-general, which was kept in the person of the Earl of Argyle, who transacted for it, and was made justicia-general of all the isles; which raising great debates between him and some hereditary sheriffs there, the jurisdiction was taken away in 1672, and this court of justice erected instead of it, consisting of a justice-general, alterable at the king's pleasure; a justice-clerk and five other judges, who are like-wise lords of the seisin.

This court commonly sits on Mondays, and has an ordinary clerk, who has his commission from the justice-clerk. They have four ordinary maces and a doomsday appointed by the lords of seisin.

The form of process is this: the clerk raises a libell or indictment, by a bill passed by any of the lords of that court, at the instance of the pursuer against the defender or criminal, who is committed to prison immediately after citation. When the party, witnesses, and great affie, or jury of forty-five,
fire men, are cited, the day of appearance being come, fifteen of the great affile are chosen to be the affile upon the panel, or prosecutor at the bar. The affile fits with the judges to hear the libel read, witnesses examined, and the debates on both sides, which is written verbatim in the adjournment book. The King's advocate pleads for the purifier, being the King's counsel, and other advocates for the panel. The debates being closed, the judges find the libel or indictment either not relevant; in which case they defer the diet, and affile or affile the party accused; or else they find the libel relevant; in which case the affile or jury of fifteen is removed into a close room, none being allowed to be present with them; where they choose their own chancellor and clerk, and consider the libel, depositions, and debates, and bring in their verdict of the panel sealed, guilty or not guilty. If not guilty, the lords affile; if guilty they condemn, and order the sentence of condemnation to be pronounced against the criminal by the mouth of the doomesman. It has been strenuously maintained by some, and as strenuously controverted by others, that an appeal lies from this court to the house of lords. The lords of judiciaries likewise go circuits twice a year, viz., in May and October, into the country, which is divided into three circuits, the south-west, and north, where affiles are held, and criminals tried, as mentioned above.

JUSTICES, in Law, a writ directed to the sheriff in some special cases, by virtue of which he may hold plea of debt in his county-court for a large sum; whereas other wise, by his ordinary power, he is limited to sums under forty shillings. The freeholders of the county are the real judges in this court, and the sheriff is the ministerial officer.

JUSTIFIABLE Homicide. See Homicide.

JUSTIFICATION, in Law, a special plea in bar, which signifies a maintaining or throwing a sufficient reason in count, why the defendant did what he is called to answer. Pleas in justification must set forth some special matter; thus, on being sued for a trespass, a person may justify it by proving that the land is his own freehold; that he entered a house in order to apprehend a felon; or by virtue of a warrant, to levy a forfeiture, or in order to take a deferred; in an assault, that he did it out of necessity; and, in an action of slander, that the plaintiff is really as bad a man as the defendant said he was.

JUSTIFICATION, or Justifying, among Letter Founders. See Letter Foundery.

Among Printers, it denotes the proper adjustment of the lines and pages. Justification, in Theology, that act of grace which renders a man just or righteous in the sight of God, and places him in a state of salvation. The Romanists and reformed are extremely divided about the doctrine of justification; the latter contending for justification by faith alone, and the former by good works.

In the 11th article of the church of England it is declared that "We are accounted righteous before God, only for the merit of our Lord and Saviour Jesus Christ, by faith, &c." By the faith, which in several passages of scripture is said to justify and save, says a commentator on the thirty-nine articles (see Elem. of Christian Theology, by the lord bishop of Lincoln) we are to understand that lively "faith which worketh by love," which purifieth the heart, and which keepeth the commandments of God: But though by these acts of obedience we demonstrate that we truly and firmly believe the divine authority of Christ and his doctrines, yet this faith is not so meritorious in its own nature as to entitle us to the reward of eternal life: it justifies us only by being the condition upon which it has pleaded our Almighty Father to offer us salvation. Our justification is not to be attributed to the inherent efficacy of faith, but to the mercy of God, and merits of Christ, from which that efficacy is derived. On the contrary, the Papists assert, that men's inherent righteousness is the meritorious cause of their justification, and that good works "ad vitam aeternam consequendum veri promerenter." (Cave. Trid. de bon. Op. c. 12.) Some other divines maintain, that as, on the one hand, our sins were imputed to Christ, so on the other, we are justified by the imputation of Christ's righteousness to us; i.e. we, though guilty, on complying with the gospel, are finally treated by God as righteous persons, i.e. as if we had never offended him at all; or had ourselves satisfied the demands of his law for such offences. This sort of regard to what Christ has done or suffered, whereas we should not otherwise have been so treated. Others again, who disapprove both the term imputation and the sentiment which it implies, represent faith in Christ and the gospel as the principle or spring of those virtues or of that character which renders men fit objects of mercy, and of those promises of pardon, favour, and eternal life, which flow originally from the grace of God, and which are communicated to mankind by the mediation of Jesus Christ. For the manner in which the doctrines of St. Paul and of St. James, with regard to justification, are rendered consistent with each other, see the article Faith. Dr. Whitby represants faith as confounding merely in an affect to the gospel as true; and says, that upon declaring that affect, a man was justified from all past sins, without good works; but that good works were necessary in order to continue in a justified state. A notion much respecting the has been advanced and largely illustrated by Dr. Taylor, in his "Key to the Apoloetical Writings," prefixed to his Commentary on the epistle to the Romans, and included in a "Collection of Tracts," published by Dr. Watton, bishop of Landaff, for the use of students in the universities, and the younger clergy. (See Faith.) This learned divine endeavours to establish a "double justification," or salvation, for which, he thinks, we have the clearest scriptural evidence. The first, or fundamental justification, relates to the heathen state of us gentle Christians, and consists in the remission of sins, and in our being admitted, upon our faith, into the kingdom and covenant of God; when, with regard to our gentle state, we were obnoxious to wrath, and deserving of condemnation. This is of "free grace, without works." For how wicked forever any Heathen had been, or now has been, upon probation of faith in Christ, his former wickedness neither was, nor is, any bar to his admission into the kingdom of God, nor to an interest in its privileges and blessings. Nay further, our present common salvation, or justification, is of grace, and reaches to far, that in every professing Christian has lived disagreeably to the rules of the gospel; yet, upon his repentance and return to God, his interest in the divine grace and the pardon of sin stands good, notwithstanding his former evil life. This our author calls the "first justification," or salvation, by which we are involved in all the present privileges of the gospel; and in reference to which we are said in scripture to be elected, adopted, saved, justified, washed, sanctified, born again, born of God, &c. The first justification, however, does not terminate in itself, but is in order to another, which we may call "final justification," or salvation. This relates to, and supposes, our Christian state; and consists in our being actually qualified for, and being put in possession of, eternal life, after we have duly improved our first justification, or our Christian privileges, by patient continuance in well-doing, to the end, under all trials and temptation. By work, says our author, 

\[ Vol. XIX. \]
excluded by St. Paul from justification or salvation, he doth not mean any ceremonial works, or ritual observances of the Mosaic constitution (see Tit. iii. 5); but all acts of obedience properly moral. Moreover, by works, or works of law, excluded from justification, the apostle doth not always mean only infelts, perfect obedience. The works excluded from justification are any kind of obedience, perfect or imperfect, which may be supposed a reason for God's bowing the privileges and honours of the gospel upon the heathen world. Those privileges and honours were bestowed out of pure mercy and goodness, without regard to the foregoing good or bad works of the heathen world. The works, which are excluded from justification, refer to the prior state of Christians, and to their first justification; when they were taken into the church or kingdom of God, and had their first justification. This first justification was not of works, it was of mere grace, according to the counsel and purpose of God's own will, without regard to what the Heathen had been before his conversion. But after conversion, when a man is become a Christian, and with regard to final justification, works are expressly required. Nevertheless, works of righteousness are so inflin upon our Christian state, now that we are taken into the kingdom of God, that if any Christian should neglect the performance of them, there is still room, in this life, for repentance. For our Lord and his apostles not only called men to repentance, in order to their first justification; but the apostles, and our Lord after his ascension, exhorted wicked Christians, such as were members of the gospel church, to repentance, in order to their final justification. 2 Cor. xii. 21. Rev. ii. 5; 16. iii. 3, 19.

JUSTIFYING Bail, in Law. See Bail above.

JUSTIFYING Grace. See Grace.

JUSTIN I., in Biography, emperor of the East, a native of Dacia, was born about the year 450, and was brought up to the mean occupation of keeping of cattle. Possessing a strength and stature which he thought were likely to recommend him, he left the business of a pastoral life, and obtained a place among the guards of the emperor Leo. He rose by degrees in the service, till at length, in 518, he posseffed, at the death of Anaplatus, the important office of praefect-prætori; and by the application of timely bribes, he stepped on to the vacant throne, and apparently with the unanimous consent of the military, the clergy, and the people. The eminence Amantius, who would gladly have raised himself from his own friends to the high office, was, for a real or pretended conspiracy, with some of his associates, punished with exile or death. The Gothic chief Vitalian, who had revolted against Anaplatus, and remained at the head of a powerful army, was deactivated into the palace, and atfassinated at a royal banquet. Justin, to whom the epithet of Elder is given, to distinguish him from another emperor of the same name and family, was sixty-eight years of age when he was invested with the imperial purple; and though without any advantages of education, he was preferred from expiencing his incapacity, by his good senses in following the direction of able flatefmen, whom he had the discernment to select, and the wisdom to confide in. At this time, says the historian, the world beheld two contemporary monarchs, Theodoric and himself, who were even defribute of the knowledge of the alphabet; but the commanding genius of the Goth rendered him respectable amidst all his ignorance; and Justin, conscious of his deficiencies, relied on the diligence of his quillor Proclus, and the talents of his nephew Jullianus, whom the emperor had brought from the fortitudes of Dacia, and educated as his future heir. The chief events of this reign were the perfection of the Arians, advances towards a reconciliation with the Roman see, and the commencement of a war with the king of Peræa. He appointed Justinian as his colleague in the empire in 527, and soon after died, in the ninth year of his reign. An earthquake, which almost ruined Antioch and several other cities in the East, was a calamity which greatly affected the emperor. He is said to have laid aside the imperial robes, clothed himself in faded, and passed several days in fasting and prayer, to avoid the divine judgments. His piety was not perplexed by his humanity; and he displayed much benevolence in relieving those who had suffered by and survived the terrible disaster. Gibbon, Universal Hist.

JUSTIN II., emperor of the East, nephew and successor of Justinian, ascended the throne in 565. The choice of the Senate and people was sanctioned by the benediction of the patriarch, who placed the diadem on his head, which was the first time the ceremony had been performed by a priest. As his predecessor had given great offence by abolishing the office of conful, the new emperor restored it in his own person, almost as soon as he came to the throne. On this occasion, he distributed large sums of money among the people, and immediately discharged the debts, and corrected the abuses of his late uncle. The popularity acquired by this commencement of Justin's reign was soon forfeited by instances of cruelty and avarice, which were imputed to the infatuation of the empress Sophia. He caused his relation Justin, who had a military commission on the banks of the Danube, to be strangled; and he put to death some of his friends, from a supposition of their being disaffected. He made war against Peræa; but being defeated at the head of a numerous army, he was obliged to sue for peace. Soon after this, Justin was seized with a disorder, which affected his intellects, and rendered him incapable of government. By the advice of his emperors, he raised to the rank of Caesar, in the year 574, a Thracian named Tiberius, who had obtained, by his abilities, the office of post-captain of the guards. The ceremony of his elevation was performed in the portico of the palace, in the presence of the patriarch and the senate. On this occasion Justin made a long speech, which his flatterers imputed to divine inspiration, in which he recommended his successor to love his people as himself; to cultivate the affections, and maintain the discipline of the army; to protect the fortunes of the rich, and to relieve the necessities of the poor: and he concluded with a prayer, that the God of heaven and earth would infuse into his heart to do whatever he himself had neglected or forgotten. The four last years of his life were spent in retirement; and his choice was justified by the filial reverence and gratitude of Tiberius. Justin died October 5th, 578.

JUSTIN, a Latin historian, is supposed to have flourished in the second century, under Antoninus Pius. His history, which is used in our schools as an elegant compendium for young people, is an abridgment of that of Trogus Pompeius, in forty-four books, which has been long lost. The narration of Justin is clear, his reflections are sensible, though obvious, and his style is sometimes eloquent. The history comprehends what relates to the Assyrian, Persian, Grecian, Macedonian, and Roman empires. The best editions are those of Gronovius, Hearne, and Barlow. The Delphin edition is much in use.

JUSTIN, S., in Geography, a town of France, in the department of the Landes; 27 miles W. of Condom.

JUSTINGEN, a town and capital of a lordship, purchased in 1751 by the duke of Wirtemberg; 16 miles N.N.E. of Flachau.

JUSTINIAN I., in Biography, emperor of the East,
was born of an obscure race in Dacia, whence, as we have seen in the article Justin I., he was brought, and educated with a view of succeeding to the empire. Justinian was, during the life of his uncle, made partner in the imperial throne; and upon the death of Justin, became its sole possessor, being at that period, A.D. 527, in the forty-fifth year of his age. Immediately upon his elevation, he solemnly espoused Theodora, an actress, who in early youth had followed a course of prostitution, and who gained to complete an ascendency over the mind of the emperor, as to be associated with him on the throne. He began his reign by a violent persecution of heretics and sectaries, and he regarded himself as a great theologian. His reign was, however, memorable for many important transactions, military and civil; and he carried his arms with success against his enemies, for which he was chiefly indebted to Belisarius his great general, who also preferred him from a formidable conspiracy. (See the article Belisarius.) The legislative labours of Justinian are what have conferred the chief celebrity on his name. The reformation of the Roman jurisprudence occupied the attention of the emperor from his first possession of the supreme power. The perfons to whom he principally confided this arduous task was Tribonian, an eminent lawyer of various and extensive attainments. By his cares, and those of nine persons associated with him, the new code of Justinian was completed in the year 539. This publication was followed in 533 by that of the Pandects or Digest, a compilation of the decisions and opinions of former civilians; and of the Institutes, an elementary treatise of the Roman law for the use of students. A new edition of the Code, in 534, made a considerable addition to the emperor's own laws; and his Edicts and Novels complete the whole edifice of jurisprudence, reared by the legislative spirit which distinguished his reign. Another remarkable trait in this emperor's character was his passion for building. His piety was displayed in numerous churches, and other buildings dedicated to religion, of which the celebrated church of Sancta Sophia at Constantinople, now finishing as the principal mosque of the Turkish empire, attests the magnificence of his designs. Bridges, aqueducts, high-roads, and hospitals, were among his works of public utility, by which every province of the empire was benefitted. His works of peace were frequently interrupted by wars, which agitated the empire during almost the whole of his reign; but in 537, a peace upon honourable terms put an end to the long contests between the Roman and Persian empires. The rejoicings on this event were disturbed by a dreadful earthquake, which overthrew many stately edifices, with a great loss of lives. Justinian, broken down with cares and old age, died in November 565, in the thirty-ninth year of his reign, and the eighty-third of his age. Among other distinguished events of this reign, the introduction of the silk-worm into the Greek empire, by means of two Persian monks, who went as missionaries to China, ought not to be omitted. The increasing jealousies, and the heavy burdens which Justinian imposed upon his subjects, had, some time before his death, destroyed all attachment to his person; and he who, in many respects, deserved the title of the last Roman emperor, left the state unamnished and unhonoured. Gibbon, Univer. Hist.

Justinian II., emperor of the East, succeeded his father Constans Pogonatus in 685, being then only sixteen years of age. He was naturally of a violent temper; and his love of war induced him to break a treaty which he had made with the Saracens, and renew hostilities against them. He recovered several provinces from his enemies, and made an extravagant peace with them; but his exactions, cruelties, and licentiousness tarnished the glory of his reign, and denoted him as an object of hatred to all. He endeavoured to destroy all the inhabitants of Constantinople, by massacring the inhabitants. The senate, a dejected commander, turned traitor to his country. He was fevered and dethroned by his empress, and RGBL, a celebrated commander, whom he had killed in a battle, and who was named by the Greeks "Philaretos," 713, by the affinities of the Bulgarian. Justinian's son and heir was his brother, who he revered himself upon his death. The two eldest were Leontius and Tiberius, who held the throne during the interregnum of 685. They were dragged in triumph through the city, and placed in chains beneath his throne, where he left them naked, with a foot upon each of their necks, while the constant people shouted, "Thou fatal tyrant on the sip and infamity." They were then led to execution. So many persons were, on this occasion, the victims of his fury, that it is said whole provinces were almost depopulated by the multitude of his executions. Justinian died by the hands of assassins in 711; and such was the hatred which he bore every where injured, that his young son Tiberius, whom his grandmother had placed in a sanctuary, was dragged from the altar, and murdered before his eyes. Thus the race of the Heraclius was extinguished, after a reign of one hundred years. Univer. Hist. Gibbon.

Justiniana, a magistrate of Aragon, whose office bore some resemblance to that of the ephebi in ancient Sparta. He acted as the guardian of the people, and the constroller of the prince. His person was sacred, and his jurisdiction unbounded. He was the supreme interpreter of the laws. Not only inferior judges, but the kings themselves, were bound to consult him in every doubtful case, and to receive his replies with implicit deference. An appeal lay to him from the royal judges, as well as to those appointed by the barons within their respective territories. Even when no appeal was made to him, he could interpose by his own authority, prohibit the ordinary judge to proceed, take immediate cognizance of the cause himself, and remove the party accused to the "Manifestation," or prison of the state, to which no person had access but by his permission. His power was exerted with no less vigour and effect in superseding the administration of government, than in regulating the course of justice. It was his prerogative to inspect the conduct of the king, to review all the royal proclamations and patents, and to declare whether or not they were agreeable to the law, and fit to be executed. He, by his sole authority, could exclude any of the king's ministers from the conduct of affairs, and call them to answer for their mal-administration. The justiza lamellos was accountable only to the Cortes for the execution of his high office. By a law enacted in the Cortes, A.D. 1442, it was ordained that the justiza should continue in office during life, and should not be removed from it, unless by the authority of the Cortes. This officer was appointed by the king; but to prevent his becoming a dependent and tool of the crown, instead of the guardian of the people, it was determined that he should retain his office during life. He was selected from persons of the second clafs, or cavaliers, anointing nearly to gentlemen or commoners in Great Britain, and not from the ricohombres or noblemen, that he might check the domineering and oppressive spirit of the nobles, as well as fet bounds to the power of the monarch; and that he himself might be accountable for the manner in which he executed his trust, and liable to rigorous punishment, whereas the ricohombres were not subject to capital punishment.
ment. For contracting his power, seventeen persons were chosen by lot in each meeting of the Cortes; and these formed a tribunal, called the court of inquisition into the office of jutizia. This court met at three stated times in the year; and to this court the jutiza and his deputies were responsible for their conduct. The members of the court palled sentence by ballot; and they might punish by degradation, confiscation of goods, or even with death. The law which erected this court, and regulated the forms of its preceding, was enacted A.D. 1461. Robertson's Hist. of Charles V., vol. i.

JUT'NESS, the exactness or regularity of any thing. Jutiness is chiefly used in speaking of thought, language, and sentiments. The jutiness of a thought consists in a certain precision or accuracy, by which every part of it is perfectly true, and pertinent to the subject. Jutiness of language consists in using proper and well chosen terms; in not laying either too much, or too little.

M. De Mere, who has written on jutines of mind, distinguishes two kinds of jutiness; the one arising from taste and genius; the other from good sense, or right reason. There are no certain rules to be laid down for the former, viz. to shew the beauty and exactness in the turn, or choice of a thought; the latter consists in the just relation which things have to one another.

JUTE, in Manufactures, is a remarkably strong vegetable fibre, the produce of the East Indies, which Dr. William Roxburgh has fully described, and its uses, in the Transactions of the Society of Arts, vol. xxii. p. 372.

JUTERBOCK, in Geography, a town of Germany, in the principality of Querfurt, with two fauhougs, situated on the Angerbach; 15 miles N. E. of Wittenberg. N. lat. 52°. E. long. 13°.

JUTES, in Ancient History, a tribe of the Getae, the conquerors of so many countries, inhabited the extremity of the Cimbri Chersonesius, which from them is still called Jutland, which see.

JUTHIA, ODA, or SIAN. In Geography, a town of Asia, capital of the kingdom of Siam, and residence of the king, situated on a large island in the river Menam, at the distance of some leagues from the sea. The royal palace is large and beautiful, and the pagodas are numerous. The Dutch have a factory here, and many merchants from different countries come to trade. In 1766, this town was taken by the Birmans. N. lat. 14° 18'. E. long. 100° 52'.

JUTLAND, a peninsula of Europe, in the kingdom of Denmark, formerly called "Cimbris," and the "Cimbrorum Chersonesius," bounded on the E. by the Sound, the Little Belt, and the Baltic; on the S. by the duchy of Holstein; on the W. and N. by the Northern sea; about 200 miles long, and 95 broad. It is generally divided into North Jutland, more especially called Jutland, and South Jutland, more generally called the "duchy of Sleswick," which see.

JUTLAND, or North Jutland, is bounded on all sides by the sea, except towards the south, where its boundary is the duchy of Sleswick; it is about 150 miles long, and from 65 to 80 broad. Of all the territories belonging to Denmark, it is the largest and yields the greatest revenue. The middle part consists of heaths and moors, intermixed with few spots of arable land; but these afford good pastures for oxen, sheep, and goats. The other parts, of greater extent, are very fertile, and yield a great quantity of grain, which is annually exported to Sweden, Norway, and Holland. The inhabitants derive also considerable sums from their oxen, horses, and hogs. Hence Jutland is commonly called "the land of bacon and rye bread." This country is also plentifully supplied with all kinds of fresh water and sea fish. On the east side it has fine woods of oak, beech, fir, &c., but on the west side the inhabitants are obliged to use heath and turf for fuel. Jutland abounds with game. The air is keen and cold, especially towards the North sea. The inhabitants are vigorous, robust, and resolute; and seem to have gained a greater degree of freedom than the other inhabitants of Denmark. Many of the Jutlanders have freethrows, for which they pay a small acknowledgment to the lord of the manor and the public taxes. The Danish language is spoken in Jutland with a particular accent, and with less purity than in the other provinces. The only place in which the exercit of any religion, besides Lutheranism, is tolerated, is Fredericia. North Jutland is composed of four dioceses, or governments; each of which has its bishop and general-governor; and they derive their names from those of their chief cities, viz. Aalborg, Viborg, Arhus, and Ripen. The population of these four dioceses is fixed at Mr. Coxe at 358,126 persons. Jutland supplies triply and fuller's earth, besides alum and vitriol.

JUTRAM, a town of Hindoostan, in Guzerat, on the gulf of Cambay; 16 miles N.W. of Amood.

JUTTARA, a town of Hindoostan, in the circle of Cincalco; 10 miles N. of Vingapatan.

JUTTY HEAD. See JETTY HEAD.

JUTWAR, in Geography, a small circuit of Hindoostan, in Guzerat, on the left bank of the Puddar, a little above the gulf of Cambay; about 25 miles long, and 16 broad.

JUVANIA, in Medicine, literally signifying adding things, and generally contrived with ledenia, or baltimore things, is a term applicable to every agent or circumstance which contributes to alleviate a disease, as the word ledenia signifies every thing which can increase the symptoms of a disorder, or prevents its progress towards amendment; but the terms are principally used to denote those things, which poises a minor degree of influence on the animal economy, and cannot be classed among the actual remedies or causes of disease. Hence the common precept of medical writers, to attend to the juvania and ledenia, at the same time that the active remedies for any disease are employed.

JUVELSKOI, in Geography, a town of Russia, in the government of Tobolsk. N. lat. 63° 30'. E. long. 61° 14'.

JUVENALI, DEIUS JUNCIUS JUVENALIS, in Biography, a celebrated Roman poet, who was born at Aquinum, in Italy. He came early to Rome, and passed much of his life in the pursuits of the bar, after which he applied himself to write satires, 60 of which are still extant, and very highly prized. They stand pre-eminent in the class of those which employ warm serious invective, and make virtue rather than folly their object. He wrote with acumen against all his adversaries; he is far more correct than his contemporaries, which has been attributed to his judgment and experience, being far advanced in life when he wrote his satires. He appears to have been a lover of virtue, though his language and descriptions are sometimes very gross; many of his maxims of morality are delivered with great force and dignity; as a poet he has more animation than talle. He has with reason been called the last of the Roman poets, for after his poetry decayed, and nothing more claims attention as a perfect poetical composition. The best editions of this poet are those of Castinon, of Hawky, and of Gravina, with notes various. The Dublin edition is much used, as are the Alkemade and Glagauy editions.

JUVENALIA, or JUVENALIS ludii, games, exercices of body, and combats, instituted by Nero the first time his beard was shaven.
They were celebrated in private houses, and even the women had a share in them; probably they were the same with what were otherwise called Neritana.

JUVENCUS, CAES. VETT. AQVINUS, in Biogra phy, one of the earliest Christian poets, was a priest of a noble family in Spain, and flourished in the fourth century. He wrote a poem on the life of Christ, taken from the gosp. of St. Matthew. It was composed about the year 329. It has been frequently repeated, and may be found in Mat. täre's "Corpus Poetarum," and in the "Bibliothèque des Pères."—Gen. Bog.

JUVENIUS, or Geography, a town of Poland, in the

pel

JUVENALIS, in Mihiology, the goddess who presided over youth among the Romans. This goddes was long honoured in the Capitol, where Servi's Tullius erected her flaturn. Near the chapel of Minerva there was the altar of Juventas, and upon this altar a picture of Proserpine. The Greeks called the goddes of youth Hefe; but it has been generally supposed that this was not the fame with the Ro m. Juventas.

JUVIGNY, in Geography, a town of France, in the de par tment of the Chau and, chief place of a canton, in the district of Mortain; four miles N.W. of Mortain. The place contains 632, and the canton 503 inhabitants, on a territory of 100 kilometres, in nine communes. Also, a town of France, in the department of the Meur, nine miles N.W. of Chalons-sur-Marne.—Also, a town of France, in the department of the Orne, and chief place of a canton, in the district of Domfront. The place contains 414, and the canton 1,126 inhabitants, on a territory of 207½ kilometres, in 12 communes.

IVY, in Botany, &c. (See Hedera.) The ivy is a small well-known creeping or climbing kind of plant. From its property of spreading rapidly over a surface, it has been recommended as proper for protecting the faces of earthen dikes, and other similar fences, as by this means they are prevented from mouldering down and being destroyed.

Ivy, in the Materia Medica. The leaves of ivy are felled ufed inwardly, but outwardly they are applied to iufes, to keep them cool, and free from inflammation, as also to scabs, sores, and scald heads. Mr. Boyle, in his ut of Experimental Phikokphy, commends a large dose of the full ripe berries as a remedy against the plague; and it is said, that, in the London plague, the powder of them was given in vinegar, or white wine, with alcocots; and they have been recommended in small doses, as alepharmic and fudorific. Schroder says, they purge upward and downward. The gum of ivy is somewhat caufic, and commended to take up iatpots and ftruckles out of the face. This juvenil juice, exuding from the falic of ivy, has been recommended as corrective and reftorative, in cachexias and uterine obstructions; but has been rarely used, except as an ingredient in plasters; nor does it appear to poiffess any virtues which common reifin has not in an equal degree.

Ivy-resin is brought from Persia, and some other of the hot countries, where alone it is to be found in any consider able quantity. Mr. Ray, indeed, mentions some of it having been found on ivies in Worceftershire, and other authors in other parts of Europe; but these are only singular inftances of what may happen, our shops being obliged to be fupplied from the East.
The ancient Greeks were acquainted with this resin, which they called lachryma keder, as some also do to this day. It is faid to be emollient and detergcnt, and to make a noble balm for fresh wounds; but is never used by us with these intentions. The Persians esteem it much as an astringent.

Ivy, Ground, in Botany and the Materia Medica. See

IXI

This JUVENCUS, the canton was written in 1361 of the "Materia Medica." It was recommended as a remedy against the plague, and in the London plague, the powder of them was given in vinegar, or white wine, with succets; and they have been recommended in small doses, as alepharmic and fudorific. Schroder says, they purge upward and downward. The gum of ivy is somewhat caufic, and commended to take up iatpots and ftruckles out of the face. This juvenil juice, exuding from the falic of ivy, has been recommended as corrective and reftorative, in cachexias and uterine obstructions; but has been rarely used, except as an ingredient in plasters; nor does it appear to poiffess any virtues which common reifin has not in an equal degree.

Ivy-resin is brought from Persia, and some other of the hot countries, where alone it is to be found in any consider able quantity. Mr. Ray, indeed, mentions some of it having been found on ivies in Worceftershire, and other authors in other parts of Europe; but these are only singular inftances of what may happen, our shops being obliged to be fupplied from the East.
The ancient Greeks were acquainted with this resin, which they called lachryma keder, as some also do to this day. It is faid to be emollient and detergcnt, and to make

a noble balm for fresh wounds; but is never used by us with these intentions. The Persians esteem it much as an astringent.

JUVENAL, William, in Biography, was born at Chi chester, but received his education at Merchant Taylors' school, London, from whence he was removed to St. John's college, Oxford, of which he was made a fellow in 1599, and in 1621, he was elected prebend at Chichester. In 1627, he was promoted to the deanery of Worcester, and in 1635, ap pointed a clerk of the cloche to the king, and in the following year he obtained, through the interest of archbishop Land, the bishopric of London; and shortly after he was appointed lord high treasurer. This last promotion gave general offence. His birth and character were deemed too obscure for a man raised to one of the highest offices of the crown; nevertheless, his conduct in that station was irre proachable. In the rebellion he suffered the loss, not only of his ecclesiastical revenues, but of a great part of his temporal estate. In 1648, he attended the king upon the scaffold, after which he was taken into custody with a view of forcing him to reveal any secrets with which his majesty had entrusted him; but his prudence, integrity, and honour, were superior to every art exercised upon him. At the restoration he was made archbishop of Canterbury. He died in 1663, at the age of 81, and was buried in St. John's college-chapel, Oxford. He was a person of great integrity, mildness, and humanity, and endowed with an excellent understanding. Wood. Hume.

JUXTAPOSITION, is used by philosophers to de note that species of growth, which is performed by the application of new matter to the surface, or outlié, of old. In which sense, it ilans opposed to intuit-fuesion; where the growth of a body is performed by the reception of a juice within it, diffused through its canals. See Nu trition.

JUZCUR, in Geography, a town of Africa, in the kingdom of Fez, on the coast of the Mediterranean, 15 miles W. of Merzuka.

JUZENNECOURT, a town of France, in the depa rtment of the Upper Marne, and chief place of a canton, in the district of Champaign; six miles N.W. of Champaign. The place contains 244, and the canton 6,455 inhabitants, on a territory of 272.9 kilometres, in 24 communes.

IWAY, or Sukiya, a province of Japan.

IWAYA, or Sukiya, a province of Japan.

IWANZOWICZ, a town of Lithuania, in the palatinate of Novogrodek; 52 miles S.S.W. of Novogrodek.

IWANGROD, a town of Poland, in the palatinate of Bra-avia; 60 miles E.S.E of Bradow.

IWATA, a town of Japan, in the island of Nippon; 123 miles W. of Jedo.

IWETPOUR, a town of Bengal; 15 miles E. of Go ragot.

IWIE, a town of Lithuania, in the palatinate of Wilna; 21 miles E. of Lida.

IWINKA, a town of Poland, in the palatinate of Kiev; 60 miles W.S.W of Kiev.

IXIA.

Gen. Ch. Cal. Spatha inferior, shorter than the corolla, of two oblong permanent valves; the outermost enveloping the inner one. Cor. of one petal, superior; tube thread-shaped, slender, erect, scarcely dilated upwards; limb regular, divided to its very base into five, nearly equal, spreading, flat-topped segments. Stam. Filaments three, inserted into the mouth of the tube, decurrent, much shorter than the limb; anthers oblong, somewhat curved. Pyl. German roundish, somewhat triangular; style thread-shaped, erect; stigmas three, linear, recurved, spreading. Peric. Capsule roundish-ovate, membranous, tuni-fi, of three cells and three valves. Seeds numerous, globose.

An extensive genus of bulbous Cape plants in Linnaeus, Willdenow, and Vahl, from which Mr. Ker has, generally we think very happily, separated several genera, all agreeing with it in the regular corolla, by which they are all in common distinguished from Gladiolus (see that article); but differing from it, as well as among themselves, in other particulars. See Arista, Gessneriaceae, and Hansa.

As we have given a view of all the certain species of Gladiolus, we deem it necessary to do the same for Ixia, of which Mr. Ker reckons up 15 species. In its old state the genus stands in Willdenow with 47 species, and in Vahl with 56, besides five reckoned by the latter doublet, adopted from Burmann.

Section 1. Limb leaf spreading, tube shorter, spathe larger, as well as more thin and membranous, than in the rest.

1. I. pendula. Thumb. Diff. n. 16. Linn. Suppl. 91.—Flowers somewhat bell-shaped, pendulous. Branches of the panicule capillary, drooping. Spatha longer than the tube. —Gathered at the Cape of Good Hope, in watery places, in November, by Thunberg, who describes it as the tallest and most ornamental of its genus, with large, pendulous, flesh-coloured flowers, the segments of which, in his specimen given to Linnaeus, are above an inch long, while the tube is not half so much. We know no figure of this species, nor is it in the gardens.

2. I. capillaris. Thumb. n. 12. t. 2. f. 2. Linn. Suppl. 52.—Ker in Curt. Mag. t. 57. —Flowers somewhat bell-shaped. Spatha equal to the tube. Leaves linear—Native, like all the rest, of the Cape of Good Hope, flowering in our green-houses chiefly in the spring. Mr. Ker quotes under this I. lancea, Jacq. 1. Rar. t. 284. If. If. be right, it varies in the breadth of its leaves, as well as in having sometimes only one flower on a stalk, sometimes several. They are of a pale rose or flesh colour. The bulb is curiously reticulated.

3. I. aulita. Ait. Hort. Kew. ed. 1. v. 1. 57. ed. 2. v. 1. t. 86. (I. capillaris; Ker in Curt. Mag. t. 1013.)—Flowers nearly falver-shaped, crowded. Spatha half as long as the tube. Leaves oblong, many-ribbed. —Sent by Mr. Maffon to Kew garden in 1774. Mr. Ker classifies it as a variety of the preceding, but the characters we have given seem to distinguish it. The flowers are much more expanded, and larger, of a full rose-colour, and the leaves very much broader.

Section 2. Tube slender, considerably longer than the spathe; limb widely spreading.

4. I. ariflata. Thumb. Diff. n. 15.—Ker in Curt. Mag. t. 589.—Spike somewhat level-topped. Spatha about one-fourth the length of the tube, sharply toothed. Limb calyced-shaped. Stamens nearly equal to the style. —The leaves are broad and sword-shaped, with many ribs, and a cart-imaginous though narrow edge. Stamens round, sometimes branched. Flowers numerous, somewhat Corymboso, rose-coloured with a white orifice, inodorous, their limb quite flat. The spathe has much of the character of Mr. Ker's genus Jnar.' This species requires a constant supply of water, especially when about flowering.

5. I. patens. Ait. Hort. Kew. ed. 1. v. 1. 59. ed. 2. v. 1. 86. Ker in Curt. Mag. t. 522. Redout. Liliace. t. 140. (I. filiformis; Venten. Jard. de Cals. t. 48. Redout. Liliace. t. 35. I. iriflata; Schnee. I. t. 529.—Spik.-cylindrical. Tube very slender; limb widely spreading, somewhat reflexed. Filaments erect and close together.—The leaves of this very handsome species are sword-shaped. Stamens slender, erect and rigid. Flowers more calyced-numerous, in a cylindrical spike, rarely branched, their colour a vivid crimson or carmine, sometimes varying to a lighter vermilion hue. The segments of the limb are often much reflexed, and they vary in length, but are usually elliptical, and each near an inch long. The eye, or orifice of the tube, is often green bordered with white.

6. I. flexuosa. Linn. Sp. Pl. 51. Ker in Curt. Mag. t. 624. (I. polylachya; Redout. Liliace. t. 125. I. capitata, var. flexuata; Andr. Repof. t. 232.)—I. flexuosa; Curt. Mag. t. 137.—Stem branched, racemose. Tube slender, slightly dilated upward; limb somewhat contracted, its segments elliptical, concave, spreading. Filaments close together. —The leaves are linear, slightly. Stem slender, not quite erect, branched for the most part, each branch bearing a toothed cluster of pale rose-coloured, mostly striped, fragrant flowers, half the size of the leaf, their orifice moity yellow, their segments not expanded into a falver-shape, each of them moreover being concave. Sometimes the flowers are of a pale or dull violet-colour.

anto; Andr. Repof. t. 50. I. fuscita-citrina; Redout. Liliace. t. 86.)—Stem simple. Cluster dense. Limb spreading, twice as long as the tube. Style longer than the filaments. —The leaves are linear and graily. Flowers in a thyrsus, or dense cluster, as large as those of I. patens, but less expanded, of a rich orange, sometimes a lemon-colour, with a brown and yellow eye, inodorous. The style continues undivided above the base of the anther.—This is one of the most splendid of the genus.

8. I. monadelphia. Ait. Hort. Kew. ed. 2. v. 1. 87. Ker in Curt. Mag. t. 607. (I. columnaris; Andr. Repof. t. 203. 211. 213. 250. Galaxie ixionerla Redout. Liliac. t. 41.)—Cluster corymbose. Flowers falver-coloured. Filaments united into a tube. Remarkable for its perfectly monadelphous flowers. The leaves are sword-shaped. Flowers scented, rather large, not numerous, in a short corymbose cluster; their tube about equal in length to the limb, which is flat, uniflora light blue or purple, rarely yellow, always distinguished by a broad brownish, or greenish, central line, or eye.

9. I. columnellaris. Ait. Hort. Kew. ed. 2. v. 1. 88. Ker in Curt. Mag. t. 58 (I. columnaris, var. argutifolia; Andr. Repof. t. 392.) —Cluster corymbose. Flowers nearly falver-shaped. Filaments united at their base. —Differ from the last in the filaments being united at their base only, the flowers looking like wondruff or new hay, not quite so horizontally expanded, opening in the morning and closing at noon, and produced in August instead of the spring. Their colour is purplish, the eye richly variegated with broad circles of black and red. The leaves are graily.

161.
IXIA.

13. I. retusa. Schlt. Diff. t. 17. Linn. Spfl. Veg. ed. 14. p. 85. Nast. 352. Ker in Curt. Mag. t. 549. 785. Andr. Repof. t. 179. 2.5. Redout. Liliac. t. 177. Jacq. Hort. Socirebr. v. t. 9. t. 19—23. Schneve. Ic. t. 6. 25. (1. carinata; Andr. Repof. t. 159. I. spicata. var. virgida-nigra; Andr. Repof. t. 29.)—Flowers nearly salver-form'd; tube capillary; limb flaved at the base. Stigmas separate as in the tube. —This common painting and ornamental species, figures of which are not frequently multiplied by authors, is known by the broad dark flain in the centre of the flower, while it differs from the two last in having distinct filaments. The colour of the corolla is variable in every shade of crimson, pale purple, orange, yellow, even to white; though, as Mr. Ker observes, some other species may possibly be confounded under Jacquin's various names. The most remarkable variety is the green, in t. 23. of that author, Curt. Mag. t. 549. Andr. t. 29. Schneve. t. 6. The flowers are linear-flower-shap'd. Spike or cluster oblong, various in length, simple and almost always solitary. Flowers about as large as those of our 5th and 7th species, their tube very flaved, shorter than the limb, which is a little concave. Style enclosed in the tube; stigmas projecting.

11. I. gracilis. Thumbl. Diff. n. 18. Ker in Curt. Mag. t. 623. 1173. Jacq. Hort. Socirebr. v. t. 9. t. 18. (1. polyplakia; Linn. Spfl. P. 51. Andr. Repof. t. 155. I. dubia; Rdt. Liliac. t. 6. Venten. Choix. t. 10.)—Corolla widely spreading; tube capillary; limb palish at the base. Stigmas separate as low as the tube. —The flowers sometimes bear many spikes. The flowers are smaller than in the last, white or yellow, without any broad dark flain. They come late in the summer, and are inodorous. It is very difficult to find a good specific character between plants so variable, and yet so much alike.

Section 3. Style extended above the anthers. Bulb somewhat tuberous and deformed.

12. I. cristata. Ker in Curt. Mag. t. 594. Ait. Hort. Kew ed. 2. v. t. 89. (1. speciosa; Andr. Repof. t. 186.)—Corymb of two or three flowers. Limb of the corolla hemispherical; tube very short. Style longer than the flowers. —Found at the Cape by Mr. Nevins. The flowers rarely as many as three on a stem, are large, concave, of a rich crimson within, paler externally. Their style is so long as to extend nearly to the end of the anthers before the stigmas branch off.

13. I. retusa. Sall. Hort. 25. Ait. Hort. Kew ed. 2. v. t. 89. (1. polyplakia; Jacq. Ic. Rar. t. 275. Ker in Curt. Mag. t. 629. Andr. Repof. t. 128.)—Tube of the flower twice as long as the spatha; segments of the limb elliptic-oblong. Stigmas crenate and spreading. —This, being often branched, has been taken for the polyplakia of Linneas, a name now laid aside, as causing only confusion. That we have retained is indeed not exceptionable, the segments of the corolla not being always abrupt. It is a tall slender species. Flowers small, rose-coloured, smelling like lily of the valley.

14. I. stellata. Linn. Spfl. P. 52. Ker in Curt. Mag. t. 542. Redout. Liliac. t. 177. (1. pentandra; Linn. Spfl. Suppl. 91. Thumbl. Diff. n. 22. I. reflexa; Andr. Repof. t. 14.)—Spatha as long as the tube. Segments of the limb spatulate, concave. Stigmas funnel-shaped. Authors dejected. —That this is the real I. stellata of Linneas, not unaptly compared by him to Seilla amoena, appears from his herbarium; though Thunberg induced Linneas to call it pentandra, because the filaments are sometimes four or five, and led him to adopt his own stellata, Diff. n. 14.—It differs from retusa in the above characters, and has no scent. The flowers are broad, with many ribs. Flowers rose-coloured, in a long spike.

15. I. cripta. Linn. Suppl. 91. Thumbl. Diff. n. 8. t. 3. Ker in Curt. Mag. t. 599. —Leaves strongly undulated. Stigmas funnel-shaped, deflexed. A beautiful little species, on account of its curiously waved and crisped leaves. The flowers are rose-coloured, odorous; their segments obvolute and concave. —Thunberg says they vary at the Cape to blue or white.

IXIA, in Gardening, contains plants of the herbaceous, bulbous, and tuberous-rooted perennial kinds; of which the species principally cultivated are, the crocus-leaved ixia (I. bulbocodium); the Chinese ixia (I. chinensis); the rose-coloured ixia (I. rofa); the bulb-bearing ixia (I. bulbifera); the bearded ixia (I. arilata); the bending-tailed ixia (I. flexuosa); the many-spired ixia (I. polykaiacii); the spotted ixia (I. maculata); and the crocus-flowered ixia (I. crocata).

The first of these species varies with white and yellow flowers; with purplish and yellow flowers; with blue and white flowers; and with variegated flowers. The third form also varies with the three inner segments of the corolla yellow, and the three outer green, with the three inner white yellow, and the three outer greenish, with the three inner white, and the three outer green, with corollas wholly yellow, or wholly blue, or rose-coloured, with a yellow bafe, and in the size of the flowers.

The fourth form likewise varies with the corolla purple, red and yellow; with the scape very short and firm, higher and branched, and bulbfirous.

The fifth species varies with the segments of the borders of the corolla of a deep and elegant purple violet colour within, three of them of the same colour on the outside, but the three others alternately of a pale dirty violet; one of these, with two on the side of it, has a double band in the throat, meeting at one end; and, according to Mr. Salisbury, with whitish corollas, having a purple fhar, violet-coloured and yellow. Also in the figures of Miller, with the corolla of a beautiful purple on the outside, but white within, and the filament terminated by two or three flowers; with the flalk terminated by two large flowers; the outside of a violet colour, edged with white, and the inside pale-blue; and with one flower, and the corolla of a more beautiful purple colour, both within and without.

The seventh kind varies with the corollas yellow and violet, of one colour.

And the ninth form varies with a short, simple, five-flowered scape; and a dark spot above the windowed, or hyaline one; with a lofty, many-spired, many-flowered scape; and with bright red flowers.

Method of Culture.—These plants may be increased by seeds or offsets from the roots. The seeds of such sorts as can be procured should be sown in pots filled with light earth in the spring, plunging them in a hot bed. When the plants have attained some growth, they should be removed into separate pots of the same earth, being placed under the protection of a frame till they have taken root. They should be placed during the winter in a hot bed frame. They may afterwards be removed into warm borders, being protected from frost in the winter, and a few retained in pots under the frame, or in a dry house.
But they are three or four years in flowering when raised from seeds. 

The common way is, therefore, to increase them by planting off-shoots from the roots, which are afforded in great plenty; the proper season for this is in the early spring, before the shooting of the root, when the roots should be removed, and the off-shoots taken from them and potted out.

The old roots should not be removed oftener than every three years.

As soon as the stems and leaves decay to the roots in the borders in autumn, they should be covered over with tan a few inches thick, to protect them from frost, and the depredations of mice.

The hardy sorts serve to adorn the borders in the open ground, and the other tender sorts among other potted green-house plants that require protection in winter.

Ixia, in Surgery, a dilated vein; a varix.

Ixo, in Geography, a town of Japan, in the island of Nippon; 85 miles E. N. E. of Macao.

Gen. Ch. Col. Perianth superior, four-cleft, very small, erect, permanent. Cor. of one petal, funnel-shaped; tube cylindrical, slender, very long; limb four-cleft, flat; segments various in shape. Stam. Filaments four, rising above the mouth of the corolla, very short, incurved; anthers oblong, oblong-oblong-oblong. Fil. Germ. inferior, roundish, stylo-thesis, the length of the tube; stigma clavum. Peric. Berry roundish, two-celled. Seed solitary, convex on one side, angular on the other.

Obf. Gaertner has remarked that the partition of the fruit is performed just above the centre, and that the seeds are never more than two in each berry, though the Hortus Malabaricus describes three or four. Sufficient characters are wanting to distinguish this genus from Passiflora.

The species of this fine Indian genus have not been in general clearly understood. We shall attempt an explanation of them, with an account of some hitherto entirely non-descript.

1. I. coccinea. Linn. Sp. Pl. ed. 1. 110. Lamarck Dict. v. 3, 344. (Schoett; Rhede Hort. Mal. v. 2, 17, t. 13. Alain forne tetrapetalos, Ixora Lunii; Burm. Zeyl. 155, t. 157.)—Leaves elliptic-ovate, somewhat heart-shaped at the base, not longer than the corymb. Segments of the corolla ovate, acute, flat. Style but little extended beyond the tube. Native of handy and illyon places on the coast of Malabar, bearing flowers and fruit all the year. A flrūbi the height of a man, with round, smooth, greenish, leafy branches. Leaves opposite, nearly feathery, two inches or more in length, about six broad, more or less obovate, or somewhat elliptical, obtuse, entire, smooth, often pointed; their base for the most part heart-shaped, but varying in breadth; their upper side polished. Stipulas embracing the stem in pairs, within the leaves, and alternate with them, awl-shaped, longer than the footstalk, broad and triangular at their base. Corymb terminal, repeatedly forked, dense, of from ten to thirty inodorous flowers; the stalks smooth and shining, red, as well as the calyx, whose segments are ovate or oblong, their points a little spreading. Tube of the corolla an inch and half long, very slender; segments of the limb each about half an inch long, horizontally spreading, ovate or elliptical, pointed. The base of the limb, according to Rhede, is a flesh-colour, deeper on the inside, at length turning yellow and pale; the tube of a coral red. Stamens very small and red, with yellow anthers, burbling longitudinally at their inner side into two cells. Style very little extended beyond the tube, with a thick red stigma, of two elliptical lobes, cohering in the dried specimen. Berries the size of a small currant, reddish-brown, shining, sweet and eatable.—We have never met with this species in any garden.

2. I. flava. Salisb. Hort. 62. (I. chinensis; Lamarck Dict. v. 3, 344. I. coccinea; Curt. Mag. t. 109. Schneev. 14, t. 1. Ait. Hort. Kew. ed. 2. v. 1. 244. Flamma sylvarum pigeonii; Rumphi. Amb. v. 4, 105, t. 47.)—Leaves elliptic-lanceolate, blunting, thickened; narrow at the base. Segments of the corolla orbicular, obtuse, rather convex. Style extended to half the length of the limb. Native of Java, according to Rumphi; as well as from China, from whence we have a specimen. It is not rare in our flower, where the foliage of its flame-colored flowers cauful to it must admired. Lamarck has well distinguished it from the above, and Mr. Salisbury long ago made the same remark. The leaves are five or six inches long, contracted at each end, standing on short, thick footstalks. Corymb almost globose, composed of 100 flowers, or more, whose tube is but half, or two-thirds, the length of the former, but rather slender; the segments of the limb broad and round, very obtuse, each not more than an inch long. Stamens spreading. Style rather longer than in the foregoing, with red spreading lobes of the stigma, but these cohere after drying.

3. I. longifolia. (Flamma sylvarum; Rumphi. Amb. v. 4, 105, t. 46.)—Leaves ovato-lanceolate, taper-pointed. Segments of the corolla elliptical, sharpish, reflexed. Native of most islands in the E. Indies, according to Rumphius. We have a specimen from the late Mr. Christopher Smith, gathered in Honimia. Those who attend to Rumphius's description and figure of his Flamma sylvarum, and consider that all his figures are diminished, mast be aware that his plant can belong to neither of the foregoing species, for which it has been quoted indifferently. Our specimen exactly answers to his account, and is undoubtedly a new species. The leaves are seven or eight inches long, and two or three broad, ovate at the base, tapering at the end to a very fine point. Footstalks half an inch long, channelled. Stipulas much shorter than in either of the former. Corymb from the bosomes of the two upper cymes, as well as terminal, much branched from their very bottom, repeatedly forked, confitting of innumerable flowers, whose tube is as long and slender as in the first species, and of a light red; but the segments of the limb rather smaller, elliptical, not ovate, spreading widely, and more or less reflexed. The flowers are very short. Style but little prominent. Rumphius says the flowers are of a vermilion hue on their insides, which becomes a blood-colour as they grow old, whence arises their brilliant fiery aspect, the origin of the name. The berries turn first purple and finally black.

4. I. incarnata. Roxb. MSS.—Leaves elliptical, sessile. Segments of the corolla roundish, obtuse, somewhat reflexed. Corymb above half as long as the leaves. Native of the East Indies. Our specimen was communicated by Lord Viscount Valentia, who received it from Dr. Roxburgh with the above name. The leaves are two inches long, and one broad,
IXORA.

A breed, nearly or quite sessile, elliptical, slightly pointed. *Stipula* with a very broad short bafe, and short flender point. *Corymb* about two-thirds the length of the leaves, dense, level-topped, many-flowered. Tube of the flowers above an inch long, very flender; limb small, its segments flixed much like *I. flamm a*, but rather lefs. Style projecting above half their length. By the name we presume the flowers are flesh-coloured. In a driedflate their tube looks reddish, the limb pale.

5. I. arborescens. Roxb. MSS. (I. Pavetta; Andr. Repof. t. 78.)—Leaves elliptic-oblong, on short flarks. Segments of the linear corolla, obtuse, reflexed, one-third the length of the tube. *Corymb* dense, half as long as the leaves.—Native of the East Indies. It flowered in the dowager lady de Clifford's hove in the autum of 1799, as Mr. Andrews mentions, but his name is altogether founded in error. The leaves are three or four inches long, and above one broad, coriaceous, widely spreading, on short thick flalls; their base slightly heart-shaped. Flowers innumerable, dirty-white, small, fragrant, in very dense corymb, whose flalks are a little downy; their tube is scarcely half an inch long, segments of the limb one-third as much, linear-oblong, recurved or reflexed, as are also the anthers. The style projects in fome degree; the stigma is large and green, cloven, but not spreading.

6. I. barbara. Roxb. MSS.—Leaves elliptic-oblong, pointed, flalked. Segments of the corolla obtuse, obtuse, reflexed, denfely bearded at their base. *Corymb* spreading, equal to the leaves.—Brought by lord vifcount Valentia from the East Indies. The leaves are five or six inches long, two or more in breadth, with blunt points. *Footstalk* hafl an inch long. *Corymb* three at the end of the branch, equal, many-flowered, loife and spreading, about as long as the leaves, and very broad. Tube of the flowers an inch and a quarter in length, flender at the bafe, but rather fwellling upwards; limb reflexed, its segment 1/3 of an inch long, obvate, obtuse, twifted in the bud, revolute when dry, denfely bearded at their base only, about the orifice of the tube, with fliorlith white hairs. The colour of the flowers feems to be reddish.

7. I. undulata. Roxb. MSS.—Leaves ovate, pointed, flalked. Segments of the corolla oblong, reflexed, smooth, half as long as the tube. Corymbus numerous, denfely panicled.—For this also we are obliged to lord Valentia, who received it, with the two flalks, from Dr. Roxburgh. The leaves, about four or five inches long, are of a broad ovate figure, tapering to a point; their edges wavy. *Footstalks* half an inch long. *Pedicels* terminal, longer than the leaves, repeatedly forked, spreading, each branch terminating in a denfely many-flowered corymb. The tube is about half an inch long, not very flender, reddish; limb and *famemos* half that length, reflexed. Style projecting to the extent of the limb.

8. I. laxiflora.—Leaves elliptic-oblong. Segments of the corolla spreading, convex, bearded on their upper surface. Panicle corymbifhe, lax, widely spreading, longer than the leaves. Gathered at Sierra Leone, by Dr. Adam Azellius, to whom we are obliged for a flpecific, and the publication of whom rich discoveries is much to be defired, though he himfelf has hitherto been unable to attain that object. We with to fecure his name, not to encreafe upon it. The leaves of this species are two or three inches long, and rather above an inch wide, all somewhat pointed; the uppermost rounded at the bafe, and quite fife; the reit tapering down into a winged foot-flalk. *Stipula* with short points. *Pedicels* terminal, solitary, flalked, nearly twice as long as the leaves, many-flowered, repeatedly branched and diverificated, flender and lax. *Corolla* tubular, with very short rounded teeth. Tube of the corolla an inch long, very flender, slightly fwellling upwards; segments of the limb one-third as long, obvate with a small recurved point, their edges reflected, their disk hairy half way along the middle from the bafe. *Stamens* very flhort. Style projecting almost the length of the limb, with long, nearly linear, fligma. We have no account of the colour of the *flowers*. In the dried flpecific they are dark brown, with a purple tinge.

9. I. pascaliflora. Vahl. Symb. v. 3, t. 57. Alit. Hort. Kew. ed. 2. v. 1. 244.—Leaves nearly flike, lanceolate, incanfescens. *Corymb* dense, panicled. Segments of the corolla elliptical, reflexed, one-fourth the length of the tube.—Native of the East Indies. We have a flpecific left by Koenig to Linnæus, which was never defcribed, but we have no doubt of its being Vahl's plant. The leaves in this case are two or three inches long, or more, lanceolate inclining to obovate, coriaceous, reticulated with veins. *Footstalks* thick and very flhort. *Stipula* broad and short, with a rigid straight point. Panicle rather longer than the leaves, erect, ftraight, branched from the bottom; the branches downy, each bearing a denfely corymb of red flowers, whose tube is about half an inch long, not very flender, and whose limb is fearcely one-fourth that length, its segments elliptical, and smooth.

10. I. alta. Linn. Sp. Pl. ed. 1. 244. (Bem-Brichet; Rheede Hort. Mal. v. 2. 19. t. 14.)—Leaves elliptic-lanceolate, pointed, flalked. Panicle corymbofe, flalked, of few flowers. Segments of the corolla ovo-lanceolate, acute, about half as long as the tube.—Native of the East Indies. This species flands on the authority of the Hortus Malabaricus, whence Linnæus adopted it, for there is no flpecific in his herbarium, and the fynonym of Plukerner, t. 109. f. 2, furly belongs to our first flpecific of all. Miller is faid in Hort. Kew. to have cultivated *I. alta* before 1768, but we have never been able to fatisfy ourselves concerning this flpecific in any garden. A flpecific in fruit from professor David-Van Royen, of what he had from Thunberg under this name, agrees tolerable with Rheede's figure, though the fruit being globofe, or rather deprefled, not elliptical, is an exception, neither is our faid fruit didymus, like Gartnert's t. 95. Rheede conflants his plants with the true *I. buschii*, his *Schott* t. 13, justly faying that the leaves are rather longer, more pointed at the end, and contracted at the bafe. The *flowers* are white or yellowish, with a reddifh tube. *Stamens* longifh and flender. *Stylus* prominent. Fruit more oblong than round, pale green or yellowish.

11. I. americana. Linn. Am. Acad. v. 5. 393; excluding the fynonym of Plumen. Sp. Pl. ed. 2. 160; excluding the fyn. of Browne. (Petefia, N 1; Brown. Jam. 142. t. 2. f. 3.)—Leaves elliptical, pointed at each end, on long downy footstalks. Panicles axillary, downy; their branches cymose.—Gathered by Dr. P. Browne near the watterfall in Mammee river in Jamaica. His own fpecific is before us, fhewing how much Linnæus has confulted the history of this plant, by a misquotation of fynonyms that belong to *Coffea occidentalis*, hence leading Linnæus to confpofe thofe two very diftinfl shrubs might be one and the fame. We are not however by any means of opinion that the prefent is a real *Ivora*, but till its fruit be better known, the question cannot be decided. Dr. Swartz appears not to have touched upon it. The leaves grow by threes, on flalks about an inch and half long, half their own length. The *flowers* are very small, short, thick, and downy, truly cymose, at the ends of long forked panicles.

n. 6.—"Leaves lanceolate-ovate, chartaceous. Flowers aggregate, single-flowered, very short. Berries with one
seed."—Native of Jamaica. A still more abundant Azara
than the last, or rather a faveolus of a distinct genus. Dr.
Wright, to whom we are obliged for a specimen, observ-
es that "the faves are in the bottom of the corolla; the bory
white, small, sweet, with a fingle compressed seed."—The
small box-like leaves, and dense tufts of flowers from lateral
buds, are quite foreign to this genus, as is the swelling tube
of the corolla.

1. *fasciculata.* Sw. Prodr. 30, is now by that author
himself removed to *Chusquea.* I. Ind. Occ. v. 1. 248.

How far the *Paxata* of authors, or any of the species
ranged under it, may be referable to *Azara,* we are not at
present competent to determine, but we are well assured
that their generic characters require investigation.

2. *Azara,* in *Gardening,* comprehends plants of the shrubby,
flowering, exotic kind, of which the species mostly cultivat-
ed are, the rarest *Azara* (I. cocccina); and the white
*Azara* (I. alba).

Method of Culture.—The plants may be incased by
seeds, when they can be procured from the countries where
they grow naturally, as they do not perfect them in this
climate. They should be sown in small pots as soon as they
arrive, and be plunged into a hot-bed when they arrive in
the autumn or winter seasons, the pots being plunged in the
tan-bed in the flove; but when they come in the spring, it
is best to plunge them in a tan-bed under frames. The seeds
sometimes come up in about six weeks, if they are quite
fresh; otherwise they lie in the ground four or five months,
or longer. The earth should therefore not be thrown out of
the pots till there are no hopes of their growing. When
the plants come up, and are fit to remove, they should be
each planted in a separate small pot, filled with light earth,
being preferred in the green-house or flove.

They may also be incased by cuttings, which should be
planted during the summer months, in small pots, and
plunged into a moderate hot-bed, covering them close either
with bell or hand glases, to exclude the external air, shading
them from the sun in the heat of the day, until they have
put out good roots, when they should be parted, and each
put into a separate pot, treating them as the seeding plants.
Mr. Curtis thinks it probable, that these plants are less tender
than is supposed.

They afford variety among other flaves or green-house
plants.

3. *IXWORTH,* in *Geography,* a town of England, in the
county of Suffolk, with a weekly market on Friday; 78
miles N.N.E. of London.

4. *IYAR,* in *Chronology,* the second month of the eccle-
siastical Jewish year, adhering to part of our April and
May.

5. *JYENAGUR, or Joinagar,* called also *Jaipur* and
*Jagour,* in *Geography,* a circ or province of Hindoo-istan,
situated S. of the Mewar. The capital of this circ is
Jaipur or Jynagur; 70 miles E.N.E. of Agimere. N.
lat. 26° 58', E. long. 20'. The raja of Jaipur, called
Jelling, has erected two observatories, one in his newly built
capital of Jaipur, which is about a league from Umbere,
or Ambeer, the ancient capital, the other in one of the
suburbs of Delhi. At the former observatory father Claud
Fouder, at the wish's request, made some observations in
1732; and probably, by the assistance of the same rajah, at
Agra and Delhi.

6. *JYEPUR,* a town of Hindoo-istan, in the circar of
Cattack: 10 miles N.E. of Cattack.

7. *JYEPUR,* a town of Hindoo-istan, in Bundeleund;
18 miles N.E. of Chatterpore.

8. *JYVASKYLA,* a town of Sweden, in the government
of Vasa; 120 miles S.E. of Vasa.

9. *IZENDICK,* a town of France, in the department of
the Val-er, and chief place of a canton, in the district of
L'Echelle. The place contains 1121, and the canton 5001
inhabitants, on a territory of 1121/2 kilometres, in five com-
unes.

10. *IZER,* a town of Africa, in the western part of the
country of Berdes.

11. *IZIGINSK,* a town of Russia, in the government
of Irkutsk, on the river Izign, about 15 miles from its mouth.
It is defended by an enclofure of palisades, and wooden
battions, erected in piles at the four angles. Thése
battions are provided with cannon, and a variety of military
forces. The governor's house is defended by a conftant guard.
The houfes are constructed of wood, low, and having a regular
front. The number of inhabitants is about 5 or 600, who
are either merchants, or in the service of government.
The commerce confines of fur, and the skins of rein-deer. N. lat.
63° 10'. E. long. 159° 14'.

12. *IZIUK,* a town of Russia, in the government of Tobol-
lk, on the Iritch; 240 miles E.S.E. of Tobolusk.

13. *IZIUM,* a town of Russia, in the government of Char-
kov, on the river Donetz; 64 miles S.E. of Charkov.

14. *IQUITENANGO,* a town of Mexico, in the province
of Chiapa.

15. *IZTICHALOTLI,* in *Natural History,* the American
name of a flone found in New Spain, and some other places;
it is very hard, of a beautiful black, and takes a fine polifh.
The Americans are very fond of it as a gem, and wear it by
way of ornament.

De Laet mentions an American flone in his polefion,
which was cut by the Indians into a flat oval plate, and was
of a beautiful black, but with two round spots of a filthy
white. He supposes it to have been the utherial lapis,
and probably it was either that flone, or of the species here
mentioned.

16. *IZTICPASO-QUERZALIZTLI,* the name given
by the natives of some parts of America, to a flone famous
for its virtues in curing colic, and many other difeafes,
externally applied. It is of a beautiful green colour, and is by
Ximenes lumped a coarse species of emerald; but is more
properly a very fine kind of lapis nephriticus, of a pale green
colour, very hard, and more pellucid than the other species
of that flone, but yet always发光 that greasy look on
being polished, which characterizes all the nephritic flones.
It is usually found in large mafses, and the Indians cut it
into flat pieces, which they apply to the navel in the colic,
and in other difeafes to the part affotded, and suppofe it has
great power in promoting a discharge of the noxious hu-
mours.

17. *IZTLI,* the American name of a species of flones, of
which the natives made their weapons of war, &c. before
they knew the use of iron. It is called by De Laet and
other authors, lapis novaccularum.
K

K, A double consonant, and the tenth letter of the alphabet.

This consonant has the sound of hard *c*, and is used before *c* and *i*, where, according to the English analogy, *c* would be soft; as in the words kept, king; at the end of words it is not much used, except after *e*, and chiefly in monosyllables, as clock, book, &c. It is now properly omitted in many other words, as muce, public, &c. It is also used between a vowel and the silent *e* final, as clock, broke, &c. It likewise ends a word after a diphthong, as look, book, &c. In the present pronunciation, *k* is silent before *n*, as knee, knife. It is never doubled; but *c* is used before it, to shorten the vowel by a double consonant, as clock, pickles.

*K* is borrowed from the Greek *kappa*, and was but little used among the Latins. Priscian looked on it as a superfluous letter, and says it was never to be used except in words borrowed from the Greek. Dauquisin, after Sallus, observes, that it was unknown to the ancient Romans. Indeed we seldom find it in any Latin authors, excepting in the word *kaleada*, where it sometimes stands in lieu of a *c*. Carthage, however, is frequently spelt on medals with a *K*; *salvis aevum sed caes. fel. K. art.* and sometimes the letter *K* alone stood for *Carthago*.—M. Berger has observed, that a capital *K*, on the reverse of the medals of the emperors of Constantinople, signified *Konstantius*; and on the Greek medals he will have it to signify *kolon Zypia*, Ctesifryia.

Quintian tells us, that in his time some people had a milk-taken notion, that wherever the letter *c* and *k* occurred at the beginning of a word, *k* ought to be used instead of the *c*. See *C*.

Lipius observes, that *K* was a stigma, anciently marked on the foreheads of criminals with a red-hot iron.

The French never use the letter *k*, excepting in a few terms of art, and proper names borrowed from other countries. Abalancourt, in his dialogue of the letters, brings in *k* complaining, that he has been often in a fair way to be banished out of the French alphabet, and confined to the countries of the North.

*K* is also a numeral letter, signifying 250, according to the verbe:

"*K* quoque ducentos et quinguauginta tenet.""

When it had a stroke at top, *K*, it stood for 250,000.

*K*, on the French coinage, denotes money coined at Bourdeaux.

The letter *K* is the initial of no musical term; and as most of the musical technical are derived from the Italian, in which language *K* has no admission, the *Greco Kappia*, and the hard *c* being supplied by *che*, this letter will chiefly occur in German words, and proper names.

**KAABA. See CAABA.**

**KAADE, in Geography, a town of Arabia Felix, in the province of Yemen; 13 miles N. of Taas.**

**KAALING, in Ornithology, the name of a species of flaring, common in China, and not unfrequent in the Philippine islands. It is black; but its eyes, legs, and beak are yellow. It is easily kept tame, and may be taught both to sing and talk. It eats rice and insects in its wild state; but when kept in a cage, will feed very heartily on bread, and all kinds of fruit.**

**KAARTA, in Geography, a considerable plate of Africa, bounded on the N., by the N. of D. by the type, and on the W., by the I. by the type; and on the W. by the M. by the type; and on the E. by the I. by the type. Its capital was formerly a large and populous town, called Kemnou; which has been since destroyed. The sovereign of Kaara received Mr. Park with great kindness; and major Houghton was the only European whom he had ever before seen. The language of the country seemed to Mr. Park to be formed of a mixture of the Mandingo and Seran-Woolli; but the Mandingo was generally understood. N. lat. 13° 10' to 15°. W. long. 5° 10' to 8° 20'.**

**KAAT'S KILL, or Catskill, a small, but thriving place in America, in Green county, and state of New York, on a creek of the same name, W. of Hudson's river; 5 miles S. of Hudson city, and 125 N. of New York. In its vicinity are Kaat's Kill mountains, which are part of a chain of mountains, called the Alleghany, or Appalachian mountains. The township of this name contains 2468 inhabitants.**

**KAAWI, in Geography, a town of Sweden, in the government of Kuopio; 22 miles E.N.E. of Kuopio.**

**KAB, in the Jewish Antiquity. See CAB.**

**KABALA, in Geography, a town of Peria, in the province of Schirvan; 36 miles S. S.W. of Scamachie.**

**KABANI, in the Oriental Office, a person who supplies the place of what we call the notary public. All obligations that are valid are drawn by him; and he is likewise the public weigh-marter, and every thing of consequence ought to be weighed before him.**

**KABANSKI, in Geography, a town of Ruffia, in the government of Irkutik; 28 miles W.N.W. of Yurchin-Udink.**

**KABARDA, a town of Ruffia, in the government of Caucasus; 32 miles L. of Elcherin-road.**

**KABASSI, a town of European Turkey, in the province of Albania; 24 miles N. of Asia.**
K A B

KABASSON, in Zoology. See Dasyurus Unicinctus.

KABBA, in Geography, a town of Africa, in the kingdom of Bambarra, seated on the Niger; 16 miles N.E. of Sego. It is situated, says Mr. Park, in the midst of a beautiful and highly cultivated country, bearing a considerable resemblance to the central part of England, and abounding with the "shea" tree, the fruit of which produces the shea-tallow, or tree-butter. The tree very much resembles the American oak, and the root, from the kernel of which the butter is prepared, by boiling it in water, has somewhat the appearance of a Spanish olive. The butter produced by it, besides the advantage of its keeping without salt, is, in Mr. Park's opinion, whiter, firmer, and of a richer flavour than the beef butter he ever tasted made from cow's milk. The growth and this commodity feci to be among the first objects of African industry, in this and the neighbouring states, and it constitutes a main article of their inland commerce.

KABBÂDE, or CABÂDE, the name of a military habit of the modern Greeks, which they wear under another garment.

KABBALA. See CARÂBÂLA.

KABBOS, in Ethnology, the name of an East Indian fish of the Mullêla kind. It grows to about two feet long, has no scales, but feels smooth and soft like the eel, and is of a brown colour; the nose or snout much paller than the rest, and tipped with black. The head is obtuse, and the eyes placed very near the extremity of it.

KABERÂN, in Geography, a town of Perfia, in the province of Khòrâfan; 45 miles E. of Mexîchid.

KABESQUÎ, or CABESQUÎ, is the name of a piece of money, equal in value to five deniers and a maîtle of French coined and current only in Persia.

KABESTEÂRA, in Geography, a district of Africa, on the Gold Coast.

KABIKI, a town of Japan, in the island of Niłphon; 25 miles S.W. of Nîgata.

KABIN, KÂBÎN, KOBÎN, or KUBIN, a temporary kind of marriage, in use among the Mahometans.

The kabin is contracted before the cadi, in whose presence the man espouses the woman for a certain time, upon condition that if he quits her at the end of that term, she shall be allowed a certain sum of money.

Some authors say that the kabin is only permitted among the Persians, and in the sect of Alî; but others maintain that it is practised among the Turks.

KABIS, CHÂBIS, or GÂBIS, in Geography, a town of Perfia, in the province of Kerman. N. lat. 31°. E. long. 57° 50'.

KÂBOJA, a town of Japan, in the island of Niłphon; 99 miles W. of Meaco.

KÂBRA, a town of Africa, in the kingdom of Tombutêsî, on the N. side of the Niger; 8 miles S.E. of Tombutêtsî.

KÂBREN, a town of Perfia, in Faršîfart; 38 leagues S. of Schiraz.

KÂBROANG, one of the Sîlibîbîs islets, in the East Indian sea, about 18 miles in circuit. N. lat. 3° 50'. E. long. 126° 50'.

KÂBRUÂ, a town of European Turkey, in Bulgarîa; 16 miles S. of Ternova.

KÂCHÂN, a town of Perfia, in the province of Iscî; 55 leagues N. of Isphân.

KÂCHAO, a town of Africa, in the kingdom of Kambîa, on the river San Domingo, about 50 miles from its mouth; surrounded with a rampart and palisades, and defended by artillery and a Portuguese garrison. It has a parish church, and a convent of Capuchins. N. lat. 12° 6'. W. long. 16°.

KACHIIRA, a district of the government of Tula, in Russia, on the Oka.

KÂCHTÂN, a district or territory of Arabia, in the province of Yemen. It is of small extent, and lies among the mountains, about three days' journey northward from Nedjera. It is governed by a sheich.

KÂCIAZYÎN, a town of Lithuania, in the palatinate of Wilna; 36 miles N.E. of Wilna.

KACOÂVA, a town of Transylvania; 12 miles S. of Colôvar.

KÂCUNDY, a town of the country of the Foulabs, seated on the E. side of the river Nâmec; not far from its opening into the Atlantic.

KÂDAN, or CÂDAN, a town of Bohemia, in the circle of Sâtz; 12 miles W. of Sâtz. N. lat. 50° 20'. E. long. 13° 10'.

KÂDÂR, a town of Mingrelia; 16 miles N.E. of Anergiha.

KÂDÂNAKU, in Gardening, the name of a plant. See ALOE.

KÂDÂRI, or KÂDÂRÎTÎS. See CÂDÂRI.

KÂDELY, a town of Bengal; 8 miles N.W. of Ramgur.

KÂDEN, in Geography, a town of Russian Lithuanis, in Politsia; 114 miles S. of Brzêcic.

KÂDEN-KÂN, a town of Asiatic Turkey, in Caramania; 28 miles W. of Cogni.

KÂDER, an island at the N.W. extremity of the Russian gulf, formed between the extremities of the Euphrates and the Tigris.

KÂDESIA, a town in the Arabian Irak; 50 miles S.W. of Bagdad.

KÂDIJÂNG, a town on the W. coast of the island of Celebes. S. lat. 6° 28'. E. long. 119° 50'.

KÂDIEI, or KÂDIY, a town and district of Russia, in the government of Kofroma; 68 miles N.E. of Kofroma.

KÂDÎTTE, a town of Prufia, in the circle of Natisagen; 23 miles S. of Brandenburg.

KÂDÎNIKOV, a town and district of Russia, in the government of Vologda; 10 miles N.N.E. of Vologda.

KÂDOM, a town and district of Russia, in the government of Tambow, or Tambof, on the river Mokcha; 108 miles N.N.E. of Tambof.

KÂDÂRÂGUTA, a town of Hindooftan, in the cirkar of Singbom; 40 miles S.E. of Doefa.

KÂDROÈS, a town of Asiatic Turkey, in Natolia; 28 miles E. of Amafieh.

KÂDSINDA, a town of Japan, in the island of Niłphon; 30 miles S.W. of Nambu.

KÂDZURÎM, a town of Hindooftan, in Bahar; 12 miles N.E. of Rotafgar.

KÂDÂS, KÂDÂS, among the Lacedemoniian, a dungeon for throwing their criminals into. It was of the name nature with the Athenian aratron, or oryagma.

KÂKÎURIAGHAKA, in Botany, a name used by some authors for the tree which affords the gum elemi of the shops.

KÂMPEFÂR, ENGELBERT, in Biography, a celebrated German physician and naturalist, was born, in the year 1631, at Lîppe, in Weipplin. It appears that he was educated in Sweden, where, for some years, he cultivated with zeal and success the several studies of physic, natural philosophy, and natural history. His great desire for travelling made him seize with avidity an opportunity of accompanying the Swediish ambassadoor Fabricius to Perfia; when he attended in the
the capacity of secretary. He departed from Stockholm in 1682; spent a short time at Moscow, and then proceeded to Ispahan, where he remained two years. His ardour in the pursuit of knowledge had so much increased during this period, that instead of returning with Fabricius, he obtained the appointment of chief surgeon to the Dutch East India company, in which capacity he had the full confidence of his wishes, for he penetrated as far as the dominions of Siam and Japan. The geography of these parts had been but very imperfectly known, till Kämper's genius and industry supplied the deficiency, and the world is indebted to him, for having first given a correct idea of the situation of different places, which had before been inaccessible to strangers. On his return to Europe in 1694, he graduated at Leyden, and settled in his own country. Here he did not remain idle, but was constantly employed in the composition of several works, and in the practice of physic. He was appointed physician to his sovereign, and terminated a useful life in the year 1716, aged 67. His inaugural dissertation, published at Leyden in 1694, is entitled "De casis observationum etiologicarum." Of this a copy is preserved in Dr. Smith's library, but we have never met with any other. The subjects on which it treats are, 1. the Acta Scythica, or Gorontze: 2. the bitter root of the Caphenian fever: 3. of the native Stint, or bitumen, of Peru: 4. of the Torpedo, or electrical fluid of the Peruvian gulf; 5. of the drug called dragon's blood, produced by the fruit of a palm: 6. of the Draconaulc of the Peruvians, a sort of worm proceeding from a tumour in the skin: 7. on the Anandru, or endemic hydrocele of the Malabars: 8. on the Peric, or ulcer of the feet among the people: 9. on the cure of the colic amongst the Javanese by puncture with a needle: 10. on the Moxa, or actual cautery, of the same people and the Chinese. These subjects are, as Haller observes, all of them probably treated more fully in the great work of our author, published at Lemgow in 1712, entitled "Amoenitates Exoticae," and often quoted by Linnaeus for its botany, as well as other authors for its authentic details, relating to the history and manners of Peru, and other parts of the East. His history of Japan is well known by the English translation in folio, and is extremely valued for its accuracy and fidelity. Kämper was skilful in the use of the pencil, as the plates of his works testify. Some botanical drawings of his, made in Japan, are preserved in the British Museum. To these Sir Joseph Banks, in 1791, liberally presented the learned world with 59 folio engravings at his own expense. Many of the plants are still undetermined by systematic botanists. Hall. Bibl. Bot. Kämper. Opera.

Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, fleshy, membranous, splitting on one side. Cor. of one petal; tube about as long as the calyx, cylindrical, erect; outer limb in three equal, spreading, linear, acute, involute segments; inner two-lipped, the upper lip of two oblong lobes, lower of one or two broader, rounded, spreading ones. Stam. Filament one, erect, oblong, flat, much shorter than the limb, extending much above the author, and terminating in two spreading equal lobes; anther attached by its back to the middle of the filament, of two oblong, nearly marginal, rather dilate lobes, meeting round the style, burling at their outer edge. Fil. Germin inferior, small, roundish; style thread-shaped, embraced by the anther; stigma cup-shaped, concave, fringed, projecting a little beyond the anther. Peric. Capsule roundish, somewhat triangular, of three cells and three valves. Silesia several.

Eff. Ch. Anther two-lobed. Filament extending above the anther, two-lobed at the top. Outer limb of the corolla in three equal, linear, acute lobes; inner two-lipped.

1. K. Galanga. Galangale. Linn. Sp. Pl. 3. Hort. Cliff. 2. t. 3. Redout. Lillae. t. 144. Sims in Curt. Mag. t. 850. (Wanom; Kämper. Amon. Exot. 901. t. 952.)—Upper segments of the inner limb of the corolla obtuse, slightly three-lobed; lower ones deeply separared, undulated. Leaves depressed, broad-ovate, pale beneath.—Native of the East Indies. Kämper met with it in Japan in a cultivated state only. With us it is rare; kept in the fove, and flowering in July. The root is perennial, tuberous, throwing out elliptical stalked knobs, like the Peony. These are flthy and white within, with a grateful and pungent aromatic flavour, which remains long after they are dried. They are still used in the East for their tonic and tonic properties, but are laid aside in European practice. Simm none. Leaves several, spreading, spreading in a depressed position, three or four inches long, and nearly as broad, many-rilled; dark-green, and smooth above; paler, glaucous and downy beneath. Flowers several, radical, leafy, in the centre of the leaves, white, with two purple spots at the base of the lower or front lobes of the inner limb. We cannot help remarking the superiority of Linnaeus's fine engraved plates over any colored one that has met our notice.

2. K. rotunda. Round-rooted Kämperlia. Linn. Sp. Pl. 3. Sims in Curt. Mag. t. 920. Woodv. Med. Bot. t. 122. (K. longa; Jacq. Hort. Socobr. v. 3. 371. t. 377. Redout. Lillae. t. 49. Malan-kua; Rheede Hort. Mal. v. 17. 11. t. 9.)—Upper segments of the inner limb of the corolla acute, entire; lower ones deeply separated, obovate. Leaves erect, elliptical-oblong, acute, coloured beneath.—Native of the East Indies. Mr. Miller is said to have cultivated it in 1768, but the plants, now not infrequent in the foves of this country, all probably originated from what Sir George Yonge introduced in 1791. The knobs of the root, rather less oblong than those of the former, are round and aromatic. The leaves grow upright, and are a foot long, remarkable for the fine purple colour of their under side. The flowers appear early in the spring, before the leaves, with a few fleshy green bracteas that grow like wise from the root. They are sweet-scented, white, except the lower lip, which is of a light purple, prettily variegated.

3. K. angustifolia. Narrow-leaved Kämperlia. Rofcoe Tr. of Linn. Soc. v. 3. 351.—Upper segments of the inner limb of the corolla linear, obtuse; lower one emarginate. Leaves lanceolate, pale beneath.—Native of the East Indies, from whence it was introduced into the Kew garden in 1707 by Sir Joseph Banks. It flowers in the fove, about March or April. Mr. Rofcoe examined it in the botanical garden at Liverpool, and all our knowledge of this species is comprised in the above definition.

4. K. ovata. Ovate Kämperlia. Rofcoe, ibid. (Majakua; Rheede Hort. Mal. v. 17. 19. t. 10.)—Lower segment of the inner limb of the corolla lanceolate, undulated. Leaves ovate.—All our knowledge of this plant is derived from the Hortus Medicorum, from whence Mr. Rofcoe adopted...
adopted it, there being no doubt of the genus. It is there said to be perennial, flowering in April and May. The root is a globular tuber, an inch in diameter, yellow internally, with concentric red and orange lines; of a very strong taste and smell, resembling ginger and saffron. Leaves a foot long, elliptical, pointed, tapering down into sheathing footstalks, of a pleasant fcent and bitterish taste. Flowers fix or seven from the centre among the leaves, flesh-liveli, white with a tinge of red, their tube much longer than the limb. Rheede’s figure displays the generic character sufficiently well, and shews the lip, or lower segment of the inner limb to be undivided, ovate, acute, and wavy. Seeds rarely perfect. The Curcurra rotunda of Linnaeus seems chiefly to depend on this synonym of Rheede. His herbarium throws no light upon the matter.

Kemperia Rotunda, in the Materia Medica. See Zedoary.

KAEF, in Geography, a town of Africa, and capital of a kingdom, on the banks of the river Camba. N. lat. 17°.

KAFAR TUTHA, a town of Asiatia Turkey, in the province of Diarbekir; 32 miles S. W. of Nifibim.

KAFER, a town of Perzia, in the province of Tar-filan; 40 miles S. of Schiras.

Kaffeaba, a town of Africa, and capital of a kingdom of the same name, in Soudan. N. lat 11° 45'. W. long. 6° 12'.

Kaffers, or rather Korsets, a tribe of people who inhabit those parts of Africa that lie to the north and east of the colony of the Cape of Good Hope. Mr. Barrow has not been able to ascertain how far the belt of country extends in width across the southern part of Africa, that is inhabited by the Kaffers; but the points on each coast to which they do not extend are sufficiently determined. To the southward of the Portuguese settlement of Rio de la Goa, the natives are Kaffers, but appear to be a degenerated race. They are, however, free; nor has Portuguese avarice yet dared to attempt to make them slaves. This is not the case to the northward. At Mozambique and Sofala, the black people are all negroes; not indeed the natives of the sea-coast, but such as are brought down from the interior as articles of trade. From Mozambique, they have now a direct communication across the continent with their settlements of Congo, Loango, and Benguela, on the west coast, as appears from the information of a Portuguese slave merchant, between which negro merchants are established in different parts of the country. In the line of this route there are therefore no Kaffers. It further appears that another powerful tribe of the same nation, called "Baroloos," inhabit the country under the southern tropic, nor are these the last to the northward. According to the account given of this people, they are of a kind and friendly disposition; their town is so extensive, that if a person set out in a morning from one extremity and travelled to the other, he would not be able to return before the following day; and contains many thousand inhabitants; the people are very ingenious in carving of wood, and have furnaces for smelting both copper and iron; they are very rich in cattle, and their gardens and lands are better cultivated, and their dwellings much superior to those of Leetakoo, which is the "Damaras" also, who possess the art of smelting copper from the ore, are inhabitants of the tropic; and they are complete Kaffers, differing in no respect from those on the eastern coast. Mr. Barrow, therefore, supposes, that a line drawn from the 24th parallel of latitude on the E. coast to the 20th on the W. may nearly mark the boundary between the Kaffers and the Negroes.

An open and amiable deportment, says Mr. Barrow, free from suspicion, fear, or embarrassment, seems to characterize the Kaffer chiefs. Though extremely good-humoured, benevolent, and hospitable, they are neither to plant nor to pasture as the Hottentot. Those of the poorer class sometimes seek for service among the boors, and engage themselves for 60 many moons in consideration of to many head of cattle; but they never suffer themselves to be duped out of their hire like the easy Hottentots. They are for the most part tall, upright, and well-made men; and in their stature and strength they exhibit satisfactory evidence that animal food is by no means necessary to promote the growth of the human species, or to add strength of fibre to the muscular parts of the body. Milk in a curdled state is the principal food of the Kaffers. To this they sometimes add a few graminious roots, berries of various kinds, the seeds of the "Sreelitzia R-giure," and the pith of a large palm, to which botanists have given the name of Zamia. They rarely kill any of their cattle, unless upon particular occasions. They poise no other domestic animals to yield them food. In the whole Kaffer country they have neither sheep nor goats, pigs nor poultry. They cultivate no kind of grain nor vegetables on this side of the Great Fish river, and very little on the other side; but the Kaffer tribes more to the westward, are very considerable horticulturists. The commissioners, sent out by the British government in the year 1801, to endeavour to procure a supply of draught oxen, found extensive fields of a species of Holcus near the city Leetakoo, the capital of a tribe of Kaffers, called "Boochoona," situated at the distance of 16 days’ journey beyond the Orange river, in the direction of north-east from the Cape. The women here, as well as among the eastern Kaffers, and indeed in all nations just emerged from a savage state, went through all the hard labour and drudgery that were required for the support of the family. They not only performed the task of breaking up the ground with a kind of hoe made of iron, and afterwards planted it; but they constructed their habitations, and collected the materials that were necessary. They reaped the grain, cleaned it from the husk, and laid it up in the granaries, which, with other earthen pots and wooden vessels, were the work of their own hands. The men prepare the tans and huts which serve for shoes, and make them into cloaks for themselves, their wives and children. They attend also the cattle, milk the cows, and hunt the antelopes and other game, with a weapon called the Hoffagai, which is used also in battle.

Mr. Barrow is of opinion, that the Kaffers were not the aborigines of the southern angle of Africa; but that they might, perhaps, derive their origin from some of the wandering tribes of Arabs known by the name of Beduins. Their pastoral habits and manners, their kind and friendly reception of strangers, their tent-shaped huts, the remains of Islamism discoverable in one of its strongest features, the circumcision of male children, universally practiced among the Kaffer hordes, seem to indicate their Arabic origin and their affinity to the Bedouin tribes. Their countenance also is Arabic; the colour only differs, which in some tribes varies from deep bronze to jet black, but the latter is most generally the prevailing colour. Nor is it likely that they owe this colour to their connection with those blacks that are usually called negroes, as they have no resemblance, in any part of the body, to the peculiar conformation of this race of human beings. To the Ethiopians or Abyssinians they have a much closer resemblance. Barrow’s Travels in Southern Africa. See Cape Bar and Delagoa Bay, under which latter article the reader is requested to substitute Kaffers for Kaffers, a typographical error.

KAI, R.
KAJ

KAFFR ERRIZI, a town of Egypt, on the left bank of the Nile; 18 miles S. of Cairo.
KAFFR el RIBA, a town of Egypt, on the left bank of the Nile; 3 miles N.E. of Atthis.
KAGA, a town of Japan, on the N.W. coast of Nippon. N. lat. 57° 15'. E. long. 137° 40'.
KAGAN, a town of Russia, between Attrahan and the Caifian sea; 10 miles S. of Attrahan.
KAGEROD, a town of Sweden, in the province of Skone; 12 miles S.E. of Helsingborg.
KAGNAS, a small island in the Gulf of Bothnia. N. lat. 64° 48'. E. long. 21° 7'.
KAGZEVAN, a town of Aibatic Turkey, in the government of Erzerum. N. lat. 39° 35'. E. long. 43° 25'.
KAHLAMAN, a small island in the Eait Indian sea, near the N. coast of Borneo. N. lat. 7° 21'. E. long. 117° 33'.
KAHOC, a town of Persia, in Sagoletan; 37 miles S.W. of Dorgap.
KAHEDE, a town of Africa, on the N. side of the Senegal. N. lat. 16° 8'. W. long. 11° 47'.
KAHEM, or CAJEM, a town of Aibatic Turkey, on the Euphrates; 50 miles W.S.W. of Ana.
KAHGON, a town of Bengal; 20 miles S. of Moorshedabad.
KAHALSSCE, in the Turkish court, an officer of state, answering to our master of the ceremonies.
See ETHONIA consoed.
KAHLI, in Geography, a town of Germany, on a river of the same name, near the Maine; 4 miles S. of Hanau.
KAHLA, a town of Saxony, in the principality of Altenburg, on the Saa; 36 miles W. of Altenburg. N. lat. 50° 48'. E. long. 11° 27'.
KAHOKIA, a poll-town of America, and chief town of St. Clair county, in the Indiana territory, containing 719 inhabitants.
KAHON, a town of Persia, in the province of Keran; 36 miles S. W. of Sirgan.
KAHUNSYLA, or KADdOLLA, in Hindoo History, was the wife of Dafarath, to whom the sore Darna, distinguish'd by the epithet of Chandra, (meaning Lunarian,) from other heroes of the same name. See Rama.
KAI, in Geography, a town of Russia, in the government of Viatka, on the Kama; 124 miles N.E. of Viatka.
KAJAGA, or GALLAM, as the French call it, a small negro kingdom of Africa, which occupies the extremity of the navigable course of the Segenal, terminated in this place by the cataract of Flow. This country is bounded on the N. by the Segenal, on the S.E. by Bambouk, and on the W. by Bondou and Fouta Torra. The residence of the king is at Maana, within a short distance of the ruins of Fort St. Joseph, where the French had formerly a small factory. The air and climate are, according to Mr. Park, more pure and fabulous than at any of the settlements towards the coast; the face of the country is agreeably interspersed with hills and valleys, and the wingings of the Segenal, which descends from the rocky hills of the interior, render the scenery on its banks picturesque and beautiful. The natives are called Sera-Wooliees, and seem to be pure negroes, without any Moorish admixture, and are naturally of a mild and docile disposition. With regard to their colour, which is a jet black, they are not to be distinguished from the Jalois. They are much addicted to trade, and formerly carried on a considerable commerce with the French in gold and slaves: they are reckoned tolerably fair and just in their dealings, though Mr. Park, among them about one-half of his goods and apparel; they are much devoted to the acquisition of wealth, and they derive considerable profit from the sale of salt and cotton cloth in distant countries. Their language abounds much in gutturals, and is left harmonious than that of the Poulaks; it is, however, well worth acquiring by those who have occasion to travel through this part of the African continent; as it is very generally understood in the kingdoms of Kaflon, Kaarta, Lundaar, and the northern parts of Bambara. In all their countries the Sera-Woolies are the chief traders.
KAIDA, in Botany, Rheed. Hort. Mal. v. 2. t. 1—8. See PANDANUS.
KAILERD, in Geography, a town of Persia, in Segelatan; 50 miles W. of Zareng.—Alfo, a town of Persia, in the province of Khorasan; 15 miles E. of Turhaz.
KAI-FONG, or CAI-FONG, a city of the first rank in China, the capital of Ho-nan, situated at the distance of two leagues from the river Hoang-ho. As the river is higher than the city, it is subject to inundations, for the prevention of which, strong dykes have been raised which extend more than 30 leagues. On occasion of a siege in 1642, by an army consisting of 100,000 rebels, the commander of the troops sent to relieve it determined to drown the enemy by breaking down the large dyke of Hoang-ho; the offer was accepted, the city was overflowed, and 300,000 inhabitants perished. It has been rebuilt since this calamitous event, but in a style far inferior to that of its former magnificence. Its jurisdiction comprehends four cities of the second class and 50 of the third.
KAIGOL, a town of Persia, in the province of Khorasan; 223 miles N. of Herat.
KAIGUEZ, a town of Abatic Turkey, on the S. coast of Natolia; 18 miles S. of Mogla. N. lat. 36° 50'. E. long. 28° 19'.
KAIGUM, a town of Hindooistan, in the cireor of Aurungabad; 30 miles S.W. of Aurungabad.
KAIIA, a town of Sweden, in the province of Vaalhild; 60 miles N.E. of Jambo.
KAIPET, a town of Hindooistan, in the cireor of Cuttada, on the Penmar; 30 miles S.E. of Cuttada.
KAIFETLEVSKOII, a town of Rulika, in the government of Irkutsk, on the Argun; 160 miles S.E. of Nertzinkh.
KALASIA, Hindoo mythologists have assigned different places of repose or habitations to their different deities; that of Siva is Kailasa, sometimes written Cahis, which is described as one of the three peaks of the wonderful mountain, Meru. (See MERU.) Here the gods, with their consorts, animated with music, dancing, and amboia, called by the Hindoo anauna (see KRAMAVAPA), pass their hours in banquet and happy dalliance, reminding us strongly of the tales of our own classics; and appearing indeed to be the same stories under different names. This similarity occurs in every page of Moor's Hindoo Pantheon, although the author in that work professed to avoid the discussion of such similarities. (See KALASA.) The following instance, from page 47, will further illustrate the spirit and present article. "The comparison between Siva and Jove runs parallel in many instances. In the capacity of avenger and destroyer Jove overthrew the Titans and giants whom Typhon, Briareus, &c. led against the god of Olympus, to whom an eagle brought lightning and thunderbolts during the warfare.
KA I

In a familiar conflict between Siva and the Daityas, or children of Diti, who frequently rebelled against heaven, Brahma is said to have presented the god of destruction with fiery shafts. As the Olympian Jupiter fixed his court and held his councils on a lofty and brilliant mountain, so the appropriated spot of Mahadeva, whom the Sivas consider as the chief of the deities, is mount Kaila, every splinter of whose rocks is an incalculable gem." Kaila is therefore the Olympus of Siva or Mahadeva. See Siva.

KAIMACHAN, among the Turks. See CAITACHAN.

KAIFENI, in Geography, a small island in the Georgian Archipelago. N. lat. 36° 57'. E. long. 23° 26'.

KAIMOO, a town of Africa, in Barimba, seated on the Niger. N. lat. 13° 56'. W. long. 3° 46'.

KAICKOW, a town of Hindostan, in Bundelcund; 12 miles N. of Chattarpour.

KAIN, a town of Peria, in CoochBeh; 60 miles S.S.W. of Herat.

KAINER, a town of Persian Armenia; 24 miles S.E. of Erivan.

KAINGERSKOU, a small island in the North Pacific ocean, near the east coast of Kamtchatka, belonging to Russia. N. lat. 55° 40'. E. long. 160°.

KAINS, a town of Russia, in the government of Tobolsk, on the Om. N. lat. 56° 55'. E. long. 77° 54'.

KAIIRA, a town of Hindostan, in Guzerat; 10 miles S.S.W. of Mahmoodabad.

KAIRABAD, a town of Hindostan, and capital of a circuit in Oude, to which it gives name. The circuit is bounded on the N. by Thibet, on the E. by Bahrspach, on the S. by Lucknow, and on the W. by Roblancund; and is about 80 miles long and from 50 to 76 broad. The town is 86 miles N.W. from Fyzabad. N. lat. 27° 30'. E. long. 81° 5'.

KAISARI, an ancient name of Mazar and Cefarea of Copadecia, an island of Asia, in the province of Cambodian, the capital of a Sangiakat, situated at the foot of a mountain, always covered with snow, about five or six miles in circumference; surrounded with walls and defended by a castle. This town is well peopled, and in each of the 139 districts to which it is divided, it has a mosque or chapel. The Greeks have two churches, one of which is a Metropolitan, and the Armenians have three. The article which constitutes its principal trade is the leather; 250 miles E.S.E. of Constantinopole. N. lat. 38° 20'. E. long. 35° 48'.

KAISENI, a town of Walachia, on the Ardgis; 25 miles N.W. of Bucharelt.

KAISERBERG, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the district of Colmar. The place contains 4,248, and the canton 13,606 inhabitants, on a territory of 1,257 kilometres, in 23 communes; 5 miles N.W. of Colmar.

KAISERBERG, a town of the duchy of Sisia, having a castle on a hill; 5 miles S.W. of Leoben.

KAISERSECH, a town of France, in the department of the Rhine and Mofelik, and chief place of a canton, in the district of Coblenz; 12 miles W. of Coblenz. N. lat. 39° 18'. E. long. 7° 2'. The place contains 435; and the canton 2,143 inhabitants, in 16 communes.

KAISERSLAUTERN, a town of France, and principal place of a district, in the department of Mont Noir; 24 miles N.W. of Landau. N. lat. 49° 27'. E. long. 7° 47'. This town was ceded to France by the elector of Bavaria in 1802. The place contains 2,236, and the canton 8,640 inhabitants, in 21 communes.

KAI-TON-GI, a town of the island of Borneo; 65 miles S.S.E. of Negara.

KAJUCA, a town of Asia, in the country of Kharash; 22 miles N.W. of Samarcand.

KAKA-PASKA-DHARA, a name of Ram, in Hindu history, and of other warriors, who had a habit of fanning their heads, leaving only the hair projecting over their ears, which was fancied to resemble the wings of a crow. The name means hearing-crow-sings.

KAKA-TODDALLY, in Botany, a species of Tamar, which see.

KAKBERG, in Geography, a town of Prussia, in the Franck Neugong; 18 miles N.E. of Vogelang.

KAKGAVA, a town of Japan, in the island of Nippon; 95 miles S.E. of Jedo.

KAKELIK, in Ornithology, a species of T赔o; which see.

KAKHET, or KAKHETY, in Geography, the eastern part of the principality of Georgia, comprising a part of the ancient Iberia, about 180 miles long and 90 broad. This flate, as well as Karduila, borders northwards on the Kabarda, eastwards on Daghestan, southwards on the Persian Armenia, and westwards on Imperitia. This flate and Karduila are under the sole sovereignty of a prince of the Kakhetian dynasty. The residence is Telfis. The air is fabulous, but the soil is thinly inhabited. The town Kaket, in this province, is situated near mount Caucasus; 45 miles N.E. of Telfis. See GEORIA.

KAKI, a town of Japan, in the island of Nippon; 70 miles N. of Meaco.

KAKILIAN, a town of Peru, in the province of Segedeln; 65 miles N. of Boll.

KAKKABAN, in Geography, an island in the East Indian sea, being one of the group called "Mentana"; 40 miles from the E. coast of Borneo. N. lat. 3° 5'. E. long. 11° 5'.

KAKKAWATA, one of the Friendly islands.

KAKOPIT, in Ornithology. See Certip Aouemones.

KAKOUJ, in Geography, a town of Turkish Armenia; 23 miles E. of Baibordi.

KAKURI, a town of Japan, in the island of Nippon; 85 miles N.E. of Meaco.

KAL, or KALA, in Hindoo Mythology, a name of Siva in his character of the Dfinher, in which he agrees with Saturn of Time, and is called also Maha-kala, maha being an epithet equivalent to great. Kali, or Maha-kali, is a name of his confort Pertavi, in one of her avenging or terrific characters, as she appears in several of the plates of Moore's Hindoo Pantheon, wherein one of Kali is described as "Eternity, at the period of Maha-pra-laya, or grand consummation of all things. In the original he, like his name, is black; he holds the roll of fate, and a feyemoy to execute its destructive decrees. He devours man, his own offspring, towns, cities, "the great globe itself, and all that it inherits!"—the universe." The great perforished powers of the Almighty, Brahma, Vishnu, and Siva, "alike await the inevitable doom," they all "fall into the jaws of non-existence." Kala will then, like Saturn, destroy himself, and nothing will remain but Brahm; the eternal one," p. 30. See KAL, KALPA, and MAHA-KALA.

KALAAAT-
KAL

KALAA-T-EL-NEGUF, in Geography, a town of Asiatic Turkey, in the province of Diarbekir; 25 miles S. of Bir.

KALADGIK, a town of Asiatic Turkey, in Notolia; 8 miles S.E. of Kiangari.

KAL-AGNI-RUDRA, in Hindu Mythology, a name given to Yama, the judge of departed souls. (See Yama.) It means the destroyer of Kal, or of Time, and is a perfonification of great boldness: See Kal.

KALANSHIEE, in Geography, a town of Africa, in the country of Gonjah.

KALANTEKA, in Hindu Mythology, is a name given to Yama, the judge of departed souls. (See Yama.) It means the destroyer of Kal, or of Time, and is a perfonification of great boldness: See Kal.

KALATOEE, in Geography, an island in the East Indian sea, about 30 miles in circuit. S. lat. 7° 18'. E. long. 123° 15'.

KALATU SEEED, a town of Persia, in Farfllan; 10 miles N. of Neubendian.

KALBA, a town of Persia, in the province of Mazanderan; 60 miles E. of Fehrubad.

KALBRA, or Kelbra, a town of Germany, in the principality of Schwarzburg-Rudolstadt, on the Helm; 17 miles N. of Erfurt. N. lat. 51° 28'. E. long. 11° 4'.

KALCKREUTH, a town of Germany, in the territory of Nuremberg; 7 miles N. of Nuremberg.

KALCOBO, a small island in the East Indian sea. S. lat. 5° 20'. E. long. 117° 39'.

KALEDKIRCHEN, a town of France, in the department of the Roes; 8 miles N.N.E. of Ruremond.

KALDI, George, in Biography, a native of Hungary, who was born in Tinnaw about the year 1572, and from his connections he might probably have attained to considerable preferment in the church, but he preferred enrolling himself in the society of the Jesuits. He was received into the order at Rome, and returning to his own country, he was banished into Transylvania, with the other members of the society, during the commotions which, at that time, agitated the kingdom. After this he discharged the duty of theological professor in the university of Olmutz, and filled some other important posts in different places. His last retreat was to a college which he built at Preburg, where he died, in the year 1634, at the age of sixty-two. He was regarded as one of the most eloquent preachers in Hungary. He published a volume of sermons at Preburg in 1631, but he is chiefly celebrated, as an author, for having undertaken and completed a translation of the bible from the Vulgate into the Hungarian tongue, which was printed at Vienna, in 1657.

KALDUROSAN, in Geography, a town of Walschis; 10 miles N.N.E. of Bucharest.

KALE, William, in Biography, a painter of still life. In the catalogue of the gallery of the Louvre, at Paris, he is called Kalf, and there are two extant works of his, uniting the merits of Rembrandt and Teniers. He was born at Amsterdam in 1633, and was a disciple of Hendrick Pot, a portrait and historical painter; of whom he learned the practice of the art, but from whom he varied in the application of it; and applied his talents, which were very considerable, in a close imitation of objects in still life; which he composed with great beauty and effect. He possessed an eye informed with the power of Rembrandt's arrangements and contrast of light and shade, and, a hand, that managed the pencil with the neatness and correctness of Teniers: his pictures are therefore as agreeable perhaps as

Vol. XIX.

KAL

it is possible for the art to exhibit; when the kind of subjects which he chose are represented. He died in 1693.

KALE, in Botany, See. See Borcole, Branna, and Cranbe.

KALE, in Agriculture, the common name of a plant of the Brassica kind, which is occasionally cultivated in the field for the use of live stock. There are several varieties of it in cultivation, which are all very hardy in their nature, rife to a considerable height in the field, and afford a large proportion of green food per acre. They are an excellent sheep feed in the early spring months, as March and April, throwing out fresh sprouts as the old ones become removed. The bite of sheep is not by any means injurious to them; and they are capable of being fed off without hurlding, which is a very considerable advantage in most situations. See Borcole and Branna.

KALE, in Gardening, the common name of a hardy tall growing plant of the cabbage kind; of which there are several varieties cultivated in gardens for winter and spring use, but the curdled forts are probably the best for the table. They are capable of being had recourse to for a considerable length of time, as they throw out sprouts in great abundance, and are ready in those few parts of the winter season when but few other greens can be procured, especially in the more northern parts of the island. See Branna and Borcole.

KALENBERG, in Geography, a general name given to a ridge of Austrian mountains, extending from near the source of the river Save, towards the Danube, about 9 British miles on the west of Vienna, where it is called Leopoldberg; and supposed by Buffon to be the ancient Cecius. This ridge of Kalenberg was the western boundary of Germany till about the year 1040, when it was removed E. to the river Leitha.

KALENDAR. See Calendar.

KALENDERI, in Hindu Mythology, a daughter of Susra, or the Sun; spoken of aso a water nymph. She is one of the eight wives of Krishna, which fee.

KALENDS. See Calends.

KALE, in Geography, a town of Sweden, in Well Gothland; 45 miles S. E. of Gotheborg.

KALFSCAR, a small island on the east side of the gulf of Bothnia. N. lat. 61° 34'. E. long. 29° 53'.

KALFVEN, a small island on the west side of the gulf of Bothnia. N. lat. 61° 3'. E. long. 17° 7'.

KALGAGICHA, a town of Riffs, in the government of Archangel; 40 miles S.S.W. of Oneg.

KALGAPOEL, a town of Hindooistan, in Dowlatabad, on the Betnall; 12 miles S.W. of Naldourouk.

KALGUEV, an island in the Frozen sea, about 140 miles in circuit; 250 miles N.N.E. of Archangel. N. lat. 68° 29' to 69° 18'. E. long. 45° 30' to 47° 30'.

KALHAT, Caleh, or Caleh, a town of Arabia, in the province of Oman, at the mouth of the river of the same name, which runs into the Arabian gulf; 80 miles S. E. of Makat. N. lat. 23° 10'. E. long. 58° 35'.

KALHAT, Cape, or Ras Kalhata, a cape on the E. coast of Arabia. N. lat. 23° 18'. E. long. 58° 30'.

KALI, in Agriculture, the common name of a plant of the sea kind, which affords a saline matter by incineration, which, in many parts of soil, is employed with great advantage as a manure, in combination with other subltances. See Quercus Marina, and Sea-weed.

KALI, in Botany, Tourn. Inf. 247. t. 128, an Arabic name. (See Salmoly.) The same appellation has been given to various succulent alcalent plants.

KALI, in Chemistry. See Cardnax of Puga, and Al.
KAL

Kali, in the *Materia Medica*. See *Salsola* and *Soda*, and also *Alkaline*.

Kali, in Hindoo Mythology, a name and form of the goddes Parvati, consort of Siva, in his character of Kali or Time, which see. Under this name and form she is of a terrible appearance, and is thus described in Moor’s Hindoo Pantheon, p. 151: “Maha-kali, or the Great Kali, black and dreadful, is encompassed by symbols of destruction: two of her hands seem employed in the work of death; of the other two, one appears pointing downwards, alluding to the universal havoc which surrounds her, while the other, pointing upwards, seems to promise the resurrection of nature by a new creation. She is represented without a crecent (the artificial moon of time), because it is unnecessary to her character as the hieroglyphic of eternity; but the belief of the Hindoos in successive destructions and renovations of the universe (see *Kali*), accounts for her wearing a *mendula* or necklace of skulls, as emblems of those revolutions.”

In that work are many plates of this deity under various names, including Bhadra-kali, as well as Maha-kali. Kali is the Hindoo name of the Nila, in the vicinity of which the scene of some of the Puranas is laid; and they relate, indeed, that the river itself is but a transformation of Kali, which, in Sanscrit and other Indian languages, means black; as does Nila, another of her names, or rather dark blue: the following also are names of this multifarious deity, and have a like meaning: *Alita*, *Shyama*, or *Shyamala*, McKara, *Ajanabha*, Krihitna. (Ibid. p. 152-3.) Other plates in the same work, representing the goddess, are thus described: “Plate 27. is taken from a brass cast deposited by the author in the museum at the India-house; it is eighteen inches high, including the pedestal, which is about a foot in diameter, six inches deep and hollow, as if intended to be fixed on something; and I was told such images are occasionally fastened on the top of the rat’s head, a carriage dragged about the streets on certain festivals. Kali is said to assume this form to frighten sinners into repentance and virtue; her attitude seems a chasing one, assumed to cau(e immediate terror; her limbs bend; her hands are open, fingers lengthened into points, stretched out; a serpent forms her girdle; she is naked, except a scanty cloth, called *piya*, round her middle; her belly is empty, thin, and shrivelled; her breasts pendent, with long drooping nipples; a serpent convolves round her neck, and, twining on her bosom, projects its head to support her protruded, long, rough tongue; her chin is peaked; immense teeth and tusk are fixed in her lipless gums; her nostrils and goggle eyes are distended and bloated; snakes form appropriate rings for her nay ears, being knotted in the pendent lobes, with their heads raised, and their hoods expanded; her hair is thinned out, forming a frightful glory round her head, diverging to meet a wider glory that rives from a flower on each side, forming a support to the figure. The cast is of brass; and, however differing to the eye, is far from being devoid of merit: our engraving is taken from an exact portrait, and exhibits considerable expression.” P. 159.

“Plate 28. is from a very fine bronze image, about a foot high, cast, I was informed, in the Carnatic. It was presented to me by a Brahman, and is, I think, on the whole, the most elegant and best finished figure in my possession. She is, in this form, called Bhadra-kali, Mahakali, and by other names; also, being eight-handed, Ashtabuja. Two of her hands are empty, pointing upward and downward, in the position before noticed: one of her right hands holds something not unlike a caduceus, which, in the cast, it resembles more nearly than in the plate; its corresponding left hand the *Patra* (see *Pathra*) or cup: the next right and left hands, a singular crooked sword, and a shield with an embossed flower or fruit; the superior right hand has an agricultural implement, called *marga*; the left the cord *pat*, or *pat* (see *Patha*), to catch or thrangle sinners with. Her fine person is full defiled, with a profusion of ornaments; between her full breasts a five-headed serpent appears itself; she has a necklace of human heads; her ear-drops are elephants; and a row of snakes’ heads peep over her coronet. Her forehead is marked either with Siva’s third eye (see *Vishakha*), or her own hieroglyphic; and her open mouth shows her teeth and tusk, giving her a fierce and threatening aspect.” P. 160.

KALININA, in *Geography*, a town of Rossia, in the government of Tobol, on the Tunguska. N. lat. 60° 56′. E. long. 166° 26′.

KALIPH. See *Caliph*.

KALISCH, or KALITZ, in *Geography*, a city in the duchy of Warsaw, late the capital of a palatinate of the same name in Great Poland, or Western Prussia, situated on the Prawn, and surrounded with walls, towers, and fortresses. This palatinate was also called the “palatinate of Gdinen,” from the city of that name: 57 miles N.E. of Breslau. N. lat. 51° 50′. E. long. 18′. See *Gnesen*.

KALITV, a town and district of Rossia, in the government of Voronet, situated on the rivulet Kaliva; which falls into the Don; 60 miles S.S.E. of Voronet.

KALITVENSKA, a town of Rossia, in the country of the Cohecks, seated on the Donetz.

KALIYA, or KALINAGA, in Hindoo Mythology, a serpent slain by Krihitna, who, being the Sun, corresponded in this, and many other instances, with Apollo, the slayer of Python, both of whom, according to Clemens, were adored at Delphi; and in like manner both Krihitna and Kaliya find adorers in India, where, in honour of Krihitna’s triumph, games and sports are annually held, as the Pythic games were at festival times in Greece. Like the Pythian serpent in the temples of Apollo, Kaliya-naga enjoys also his apotheosis in those dedicated to Krihitna; nor, says Moor, in his Hindoo Pantheon, whence we have taken this article, “are arguments wanting toward identifying Serpentarius on our sphere with his formidable foe, and the theatre of the conflict, the river Yamuna, or Jumna, with the via laetia. So the variety of demons sent to annoy Krihitna, are, perhaps, the allegorical monsters of the sky, attempting in vain to obstruct his apparent progress through the heavens, where other constellations are symbolized as many beautiful nymphs ready to receive him, and have given rise to allegories of his inconstancy.” (See *Krisina*.) Other names of this mighty mythological serpent are, *Naga, Siva*, and *Pafoko*, which see.

KALIYANARAYA, a name of Vishnu among the Hindoos, of whom there is, under this name, a statue at Barry, on the banks of the Euphrates, which is said to be carefully concealed from the sight of the Mahometans.

KALKA, or KALAKIRA, in *Geography*, a river of Chinese Tartary, which, though one of the smallest, gives name to the *Kalgar*. It rises in a famous mountain, called Suitki, or Siolki, which name may be applied to the ridge that separates the Kalgar from Chinese Dariur, and which is 130 miles W. distant from Teiticear. This river empties itself into the lake Coulan.

KALKALLY, a town of Hindoostan, in Dowlatabad; 20 miles E. of Nander.

KALKAS, a tribe of Tartars, confiding formerly of more than six hundred thousand families, which inhabit the country that lies N. of the Mogul Tartars. Their country, which
which stretches as far as the kingdom of the “Eleuthers,” is near 500 leagues in extent from exit to west. In this region was anciently situated, towards the 45th degree of N. latitude, the city of “Kamaan,” the seat of the empire of Tchinghis-khan, and of that of his successors. The Kalk freshwaters, the banks of the rivers which water their country; of which the principal, though they take their name from Kalka-pirn, are the Kerlon, Toula, Touy, and Salangnâ. The banks of these rivers are well inhabited, and they flow through extensive plains, which are covered with rich pastures; their waters are very wholesome, and abound with excellent fish, especially trout. The vast desert, called “Chubi” (which is, in reality, the Alak-tam), the almost whole southern part of the country of the Kalks. The war which the king of the “Eleuthers” (see Kalmus) carried on in 1688 against the Kalks almost destroyed the whole nation. To avoid the pursuit of a superior enemy, they supplied the affluence of the Chineans, and offered to submit to the empire. Kang-hi undertook their defence, conquered the king of the Eleuthers, and kept the Kalka Tatars under his dominion, after having conferred upon their princes different titles of honour.

Kalka-Targar, a country of Chinese Tartary, which contains one class of Mongol Tatars. N. lat. 41° 50'. E. long. 110° 33'.

Kalka, one of the Prince’s islands, in the sea of Marmora; anciently called “Chalectis,” on account of its mines of copper, which have long been neglected. On this island are three large Greek monasteries.

Kalki, in Hindu Mythology, is the name given to an expected avatar, or manifestation of the god Vishnu. (See Vishnu). The incarnations of this deity are numerous; but ten of them are of more importance and number, and are, for distinction, called the ten incarnations, das avatars. Of these nine are past; in the tenth, or Kalki, Vishnu is to appear mounted on a white horse, with a drawn scimitar, blazing like a comet, to end the kali-yuga, that is, the present, or iron age, preparatory to a renovation of the world with an era of purity, or satya-yuga. (See Yuga). In pictures, this avatar is represented by a man leading a white-winged horse. It is also called kalanki and afawak; likewise said to mean a horse; but as kal is time, and in several dialects means both yesterday and to-morrow; or, more extensively, the past and future, it is signified by the author of the Hindoo Pantheon, p. 188, that the name of kalaki, applied to this end and renovator of ages, may have some allusion to that idea, rather than be confined to the form in which he is to be manifested. See Kal and Kalka.

Kalkissee, in Geography, a town of the island of Ceylon; 19 miles S. of Cingalese.

Kalkon, or Turkey Islands, a cluster of small islands in the East Indian sea. N. lat. 6° 15'. E. long. 115° 47'.

Kalk, of Sweden, in Jamtland; 42 miles N.W. of Olofsvik.

Kalla, a small island on the coa side of the gulf of Bothnia. N. lat. 70° 20'. E. long. 33° 25'.

Kallatma, a town of Egypt; 15 miles N. of Cairo.

Kallery, a town of Sweden, in the province of Scania; 28 miles S.S.W. of Joklopping.

Kallodra, a town of Hindoostan, in Guzerat; 16 miles N. of Surat.

Kallskarr, a small island in the N. part of the gulf of Bothnia. N. lat. 65° 43'. E. long. 23° 50'. Alta, a small island on the E. side of the gulf of Bothnia. N. lat. 63° 40'. E. long. 22° 41'.

Kalvaliken, a small island in the N. part of the gulf of Bothnia. N. lat. 64° 19'. E. long. 21° 28'.

Kalm, Peter, in Biography, a very celebrated naturalist, and pupil of Linnaeus, the account of whose travels, from having been translated into English, is well known in this country. He was a native of Finland, and was born in the year 1715. Having imbibed a taste for the study of natural history, it appears that he pursued his inclination with such zeal and industry. His first researches were rewarded by the discovery of many new plants in Sweden, of which he gave some account to the botanical world between the years 1742 and 1746. He was particularly anxious to explore the virtues of plants, both with respect to their uses in medicine, and in the useful arts, for that planting and agriculture occupied some portion of his attention. His reputation as a naturalist invited him to be appointed professor at Abo, and in October 1747, he set out upon his travels, sailing from Gottingen for America; but on account of a violent hurricane was obliged to take shelter in a port of Norway, whence he could not depart till the following February, when he proceeded immediately for London. From hence he went to North America, and learned from his books; and having spent two or three years in exploring whatever was worthy of observation in that country, he returned to his professorship at Abo in 1751. The expenses of this undertaking appear to have exceeded what was allowed him by the Academy of Sciences, so that our author was obliged to live rather penously up to his return. Yet we are informed that he found means to cultivate, in a small garden of his own, several hundred plants, for the use of the university, as there was no pubic botanical garden at Abo. His discoveries in botany very materially enriched the Species Plantarum of his great teacher, and the Linnaean Herbarium abounds with specimens brought home by him, distinguished by the letter K. Haller enumerates a long list of tracts published by Kalm, and his inaugural dissertation appeared in the Annales Academiae of Linnaeus. He was originally intended for the ecclesiastical profession, but was drawn aside from this pursuit by attending the lectures of Linnaeus on natural history, given in the university of Upsal. Indeed, it was through the recommendation of Linnaeus that professor Kalm was fixed upon to undertake the voyage to North America. He afterwards made, at his own expense, a very extensive tour into Russia, the history of which never appeared in print, but which is supposed to have furnished considerable matter for the work of a Swedish writer, who published a book of travels in that kingdom. Kalm was a member of the Royal Swedish Academy of Sciences, and departed this life in the year 1779, aged 64. His collection of dried plants, made in his various journeys, and doubtless valuable for the purposes of botanical information, is said to remain in the hands of his family in a state of neglect. Hall. Bibl. Nat. Aukin. Gen. Biegr.

G. Ch. C. Peris: Perieros, small, permanent, capitate, large and numerous trichomes, color of the pubis. Foliare or in the bud: tube cylindrical, larger than the
the calyx; limb with a flat disk, the margin upright, five-crested half way down; ten little horn-like cells projecting outwardly from the corolla, and surrounding it where the border is upright. Stem. Filaments ten, awl-shaped, slightly spreading, a little shorter than the corolla, at whose base they are inflexed; anthers with two pores. Pigl. German superior, roundish, furred, fiddle-thread-shaped, longer than the corolla, declining; stigmas obtuse. Peric. Capsule somewhat globose, depressed, five-celled and five-valved. Seeds numerous.

1. *K. latifolia.* Broad-leaved Kalmia. Linn. Sp. Pl. 562. Curt. Mag. t. 175. Sm. Inf. of Georgia, t. 37.—"Leaves ovate-elliptical, tennate and clefted. Corymbs terminal."—Professor Kalm relates that he found this species in various parts of North America, and especially in the province of Pennsylvania, on the sides of hills, and occasionally in woods, which were enlivened by its foliage when most other trees had lost their verdure. It was covered with a profusion of beautiful blossoms in the month of May.—Stem 10 or 12 feet high, branched. Leaves rigid, bright green above, pale beneath, on short footstalks. Flowers in a round bunch, sitting very close to the branch, of a pale blue-colour, variegated beautifully with crimson.

2. *K. angustifolia.* Narrow-leaved Kalmia. Linn. Sp. Pl. 561. Curt. Mag. t. 331.—"Leaves lanceolate. Corymbs lateral."—A native alio of North America, flowering from May to July.—Stem from three to six feet high, divided into small woody branches, covered with a dark grey bark. Leaves of a shining green colour above, paler beneath, obtuse, on short footstalks, placed without order, varying in breadth. Flowers in loose, lateral bunches, of a bright red colour when they first open, but afterwards fading to a bluish or peach-colour.—There are two varieties of this species mentioned in the Hortus Kewensis, with one red, with the other with pale flowers.

3. *K. glauca.* Glaucescent Kalmia. Willd. n. 3. Curt. Mag. t. 177. Ait. Hort. Kew. v. 2, 64. t. 8.—"Leaves opposite, oblong, smoothish, glaucous underneath, revolute at the margin. Corymbs terminal. The little branches two-edged."—Discovered by Sir Joseph Banks at Newfoundland, and introduced into this country in 1767. It flowers in April and May.—This *forb* is about two feet in height. Stems branched, round, reddish-brown. Leaves embracing the stem, each furnished with a broad, longitudinal, yellowish rib. Flowers on very long stalks, about five or six in a bunch, of a beautiful pink or rose-colour, it much resembles *latifolia* in habit, but is considerably smaller, and of more humble growth.

4. *K. hispida.* Hairy Kalmia. Willd. n. 4. Curt. Mag. t. 138.—"Leaves opposite and alternate, elliptical, hairy. Flower-Ralks axillary, single flowered."—A native of South Carolina, in a swampy soil. It flowers in the autumn.—Stem upright, slender, about three feet in height, branched. Leaves small, bright-green, numerous. Flowers purplish, axillary, each growing on a single stalk, though inacurately described by Curtis and Martyn as being racemose. The general appearance of this species is somewhat similar to that of *Adinandra Debachii.*

This whole genus is remarkable for its elegant flowers and foliage. It thrives well in a boggy soil, and is a general favourite in all gardens.

N. KAL. in Gardening, comprehends plants of the hardy evergreen shrubby kinds; of which the species mosty cultivated are, the broad-leaved kalmia (K. latifolia); the narrow-leaved kalmia (K. angustifolia); the glaucous kalmia (K. glauca); and the hairy kalmia (K. hispida). The value of the first fort, which is an elegant shrubby plant, is much heightened by its numerous properties.

In the second kind, there are varieties, with pale and deep red flowers, differing in their habit; the latter, the most humble of the two, not only produces the most brilliant flowers, but in greater abundance. This is said to be poisonous to sheep and cattle in its native situation, America.

Method of Culture.—These different plants are capable of being increased by seeds, layers, and suckers from the roots. But the first fort is most commonly raised from the seeds, which are procured from America, and sown in pots or boxes filled with light sandy mould, in the spring season, and planted in an early border, or in beds of light mould, in the same aspect. However, when placed in a gentle hot-bed they succeed much better, they must, notwithstanding, be inured to the full air of the atmosphere during the summer season, having shelter in the winter from frost. As soon as the plants have had two years growth, they may be removed into separate pots, in order to be continued two years longer or more; when they may be planted out where they are to remain, in warm situations in the open ground.

The second species is mostly increased by layers, which should be made from the young shoots, and laid down in the early autumn. In a year or two, when they are become well rooted, they may be taken off, and planted separately in pots filled with bog earth, or in a warm border formed of the same fort of foil. This is a more hardy kind than the former.

The third kind is mostly increased in the same manner as the first, and demands a similar method of treatment.

The fourth is capable of being raised from layers, but the plants are preferred with difficulty in this climate.

Almost all the plants are likewise capable of being increased by suckers; which should be taken off, and planted out in the spring, in nursery rows, for two or three years, after which they may be removed to the places where they are to grow.

In the more hardy sorts, these plants afford ornament and variety, when properly placed in the fronts of clumps and shrubbery borders; and in those which are tender, in mixture with other potted, green-house, and other similar plants.

KALMOUA, in Geography, a town of Pruffia, in the circle of Natangen; 12 miles S.S.E. of Margravobowa.

KALMUCKS, Oeoloets, or Eleuthers, a tribe of Tartars, who affirm their home to have been between the Kokonor or Blue lake, and Thibet. Long before Tachingis-khan, according to the old reports of these people, the greatest and mightiest part of the Odoets made a military expedition westward as far as the Laffer Asia, and there left themselves among the mountains of Caucasus; but the rest, who paid behind in Great Tartary, received from their Tartesian neighbours, the name Khaimak (the separated.) In fact they call themselves also Kalmik, though Odoets is always their peculiar denomination, which word like-wise denotes a separated, disjoined, or distinct nation. The Odoets divide themselves, at least since the destruction of the Mongolian monarchy, into four main shoots, who denominate themselves Khefchot, and their, Soongar, and Yongot; and from the time of their separation from the Mongoles or Monguis, they have been uniformly subjected to various princely families. The major part of the "Kokhotan" Kalmucks are said to have remained in and about Thibet and on the Kokonor, and after the downfall of the Soongarian power they have been under the protection of the Chinese. The smaller,
KALMUCKS.

smaller part of this flock had long before withdrawn to the banks of the Irtil, and at length fell under the dominion of the Soongarian horde, with which it took part in the wars against China, and was also dispersed at the same time with the Soongarians. Those under the Chinese sovereignty, the still united horde of the Khochotes, are estimated at 56,000 heads. They are reported to have had their name, which implies warrior or hero, from the courage they displayed under Tschingis; and from this circumstance, as well as their deriving their princely race in uninterrupted succession from the brother of the great Tschingis, they maintain a superiority of rank above the other Kalmuck hordes. The number of Khochotes subject to Russia is but small. In the year 1675 there came 15,000, and in 1759 an additional 500 families to the shores of the Volga, where they settled and voluntarily submitted to the Russian sovereignty. The "Soongares," at the separation of the Mongolian monarchy, formed but one flock with the Derbets, who afterwards parted, under two discordant branches of their princely family. This horde, in the 17th and beginning of the 18th century, reduced to their subjection a great part of the other Kalmuck races, particularly the Khochot, Derbet, and Kho-at, and waged bloody wars with the Mongoles as well as with the Chinese empire itself, but which ended in their total subjugation and dispersion. Previously to this unhappy period, they, together with the Derbets, reckoned upwards of 50,000 fighting men, and were deemed the bravest, richest, and most powerful horde. They ruled formerly about the Bakhsh lake and its rivers Tschuy and Ily; and their most flourishing period was between the years 1690 and 1746. The towns of the eastern Bucharis and the Great Kirghis horde were about this time tributary to them. Many of the Soongarians dispersed themselves in the interior parts of Asia and quite into the Ufbeck towns; some thousands of them fled into Siberia; and most of them accommodated themselves to the Chinese sovereignty, and, from their own statements, it appears, that scarcely 20,000 families of them and the Derbaben nation are now remaining. The number of the Soongares, who at that time (1758) took refuge in Russia, amounted to about 20,000 heads; they were united with the Volgaic Kalmucks, but for the most part returned with them again in the year 1770 into the Soongarye. The "Derbets," who at first had their pastorages on the territory of the Koko-noor, removed thence, on account of the Mongolian disturbances, towards the Irtil, and, on that occasion, split into two parties. One of them united with the Soongares, in whole fortunes and final dissolution it was involved; and the other proceeded westward with the Torgots towards the Yaik (now Ural) as far as the Volga and the Don, where it completely settled. In 1723 they removed to the parts beyond the Don; and afterwards joined the Torgots on the Volga. The "Torgots" seem to have formed themselves into a particular horde much later than the other Kalmuck branches. Removing from the refuges Soongares, they marched westward to the Steppes on the Volga, and there settled, receiving from the Russians the appellation of the Volgaic Kalmucks. In the year 1733 the Russian government came to an agreement with this rich and powerful horde, which restricted the authority of the khan to narrower bounds, and excited such discontent, that they returned in great numbers in 1770 and 1771, over the ice of the river Ural, across the Kirghiz Steppes, into the Soongarye. The whole amount of the Kalmucks that remained in Russia was estimated, some few years ago, at about 20,000 tents. The women also make there about 10,000. In the interior these are the towns of the Khochotes, the Soongares, and Torgots, who remained and are distributed among the Derbets, have besides several petty princes, a khan preceeding over them. They wander, with their flocks and herds, in the steppes between the Don and the Volga, from the line of Transbaik as far as Caucasus; and between the Volga and the river Ural, from the Irgish quite to the Caspian; that is, in the governments of Saratof and Astrachan, and in the seats of the Cossacks of the Don. In addition to this there is still a numerous colony of "baptized Kalmucks." Towards the close of the 17th century, many, among the distinguished and noble, professed themselves of the Christian faith. In the year 1737 the government established them in a fruitful region about the rivers Sarat, Sok, and Tok (in the present government of Simbirsk and in the Orenburg district of the government of Ufa), and granted them also the city of Simbir, which is now a chief town of the government of Simbirsk. The immense of this colony was so considerable, that in the year 1711 they could reckon nearly 14,000 heads, whereas in 1754 they were only 895. There is yet dwelling in the government of Ufa a small colony of Mohammedan Kalmucks, which originated from individuals who submitted made by the Kirghises and adopted by that body.

The Chinese empire has been lately extended in Tartary by the celebrated conquest of the kingdom of the Eluthes, made in 1759 by the arms of the emperor "Kien-Long," who had been 46 years on the throne of China. The whole nation of the Eluthes, known in Europe and Russia by the name of Kalmucks, may be divided (says Grotier) into three branches, which have all proceeded from the same stock. The wandering (now the most numerous and powerful) occupy the country contained between the Caspian sea, Mufcov, Samaracan, and Cazigfar, and which extends towards the east as far as a vast chain of mountains, supposed to be a continuation of Caucasus. Every year during winter these Tartars encamp on the shore of the Caspian sea, near Astruchan, where they carry on a great trade. The second division of the Eluthes inhabit to the east, from the chain of mountains now mentioned, as far as another chain of lofty mountains, the most considerable of which are called "Altaï," in which are the sources of the Obi and Irtil. The country in which these people inhabit is very extensive; since it borders on the north with Mufcovy, and on the south with the territories of the Ufbeck Tartars; these are the people whom Kien-Long has constrained to submit to the Chinese government. The third branch of the Eluthes inhabit to the west of China; they are the Tartars of Kokonor, who have been for a long time subjects of the empire. They are separated from the province of Chineh by lofty mountains. They take their name from a lake in the country, called in their language "Kokonor," and which is one of the largest in Tartary. They are subject to eight princes, who are independent of each other, and who are all of the race of the khan of the Eluthes Tartars. These people derive their principal riches from the gold which is found mixed with the kind of their rivers, and about all with that of "Altan-kol," or the Golden river. The gold-dust which it furnishes is the principal revenue of the princes of Kokonor, who employ their vassals during summer in collecting it. One of the principal articles of the trade of Kokonor is a kind of napped woollen stuff, called "peul-long," it is manufactured by these Tartars, who have the art of dyeing it in different colours; long dressias are made of it in the country, and it is generally used at Peking for covering tents. The famous Hoong-ko, or the Yellow river, has its source in this corner of Tartary.

The Kalmucks of Asiatic Russia are divided into three

ranks;
ranks; the nobility, whom they call white bones; the common people, who are bondmen, and denominated black bones; and the clergy, defending from both, who are free. In like manner, the noble ladies are called white flesh; and the common women black flesh; but pedigrees are only reckoned by the bones. The power of the "Taidha," or chief prince, consists solely in the number and opulence of his subjects; territory being of no estimation in any part of a region. These subjects form an "Olua," divided into "Imaks," from 150 to 300 families; each Imak being commanded by a "Saifian," or noble. If there be a great khan, or emperor, the princes are only guided by him in affairs of general importance. The tribute is about a tenth part of the cattle, and other property; but on the first summons every man must appear on horseback before the prince, who dismisses those who are unfit for the fatigue of war. The weapons are bows, lances, and sabres, and sometimes fire-arms; and the rich warriors are clothed in mail of iron-woven rings, like that used in Europe till the 15th century. But they cannot oppose regular armies, and are apt even to disband that of their allies. Tooke's View of the Russian Empire, vol. i. Groser's China, v. i.

KALMUNZ, a town of Bavaria, in the principality of Neuburg, on the confluent of the Vilz and the N; 12 miles N. N.W. of Ratibon.

KALNICK, a town of Russian Poland, in the patinate of Brachlaw; 16 miles E.N.E. of Brachlaw.

KALO, a town of Hungary, fortissed with a moat and bulwarks; 21 miles S.E. of Tokay.

KALOMBA, a town on the N. coast of the island Cam- biva. S. lat. 8° 9'. E. long. 118°.

KALOKE, a town on the W. coast of the island Ce- lebes. S. lat. 2° 11'. E. long. 119° 15'.

KALPA, in Hindoo Chronology, an imaginary period, at the end of which all things are absorbed in the Deity; it seems to mean a creation or formation. "The Hindoos say that it has been revealed, that from the beginning to the end of things, when the whole creation will be annihilated and absorbed into the Supreme Being, there will be five great kalpas, or periods. We are now in the middle of the fourth kalpa, fifty years of Brahma being elapsed, and of the remainder the first kalpa is begun. These five great kalpas include five hundred years of Brahma, at the end of which nothing will remain but Brahm, or the Self-exsisting. Every kalpa, except the first, is preceded by a renovation of the world, and a general flood. These five kalpas have five deities, who rule by turns; and from whom the kalpas are denominated. These five deities are Devi (or Poovali), Surya or the Sun, Ganessa, Vishnu, and Isvara or Siva. Brahma has no particular kalpa; he is intimate to them all. Each deity, in his own period, is called Kalpa-rupi, meaning with the countenance of Kal or Time; or Chronos, as western mythologists would say; they having several ruling deities of that name. We are now under the reign of the fourth, Chronos, or in the kalpa of Vishnu; who to create, thought on Brahma to prefer; he fosters the whole creation in his own character, and he will ultimately destrey it through the intervention of Kanda, or Siva. It is declared in the Puranas, that all animals and plants are the linga or phallus of the preceding Kalpa-rupi deity, and that at the end of his own kalpa, he is deprived of his ling by his successor, who attracts the whole creation to himself, to swallow it up, or devour it, according to western mythologists; and at the end of his kalpa he digresses the whole creation. Such is the origin of Chronos devouing his own offspring; of Jupiter digorging it, through a potion administered to him by Metis; and of Chronos calting his own father.

KAM,

Moor's Hindoo Pantheon. (See KAL.) We shall extract no farther on this abridge point of Hindoo metaphysics, in the consideration of which great difficulties are necessarily interposed.

KALPA-DRUMA, the name given by Hindoo fab- bills to a tree, situated in the garden of Indra, called Nan- dana, which, as well as others, yield all that is desired of it. See Indra.

KALSHARPVOI, in Geography, a town of Russia, in the government of Ufa; 28 miles S.E. of Burgurulansk.

KALSOE, one of the Faroe islands.

KALTENBERG, a town of Bohemia, in the circle of Koniggratcz; 20 miles N.W. of Gilchin.

KALTENBRUNN, a town of the duchy of Cour- land; 24 miles E. of Seelburg.—Also, a town of Bavaria, in the principality of Sulzbach; 12 miles N.E. of Sulzbach.

KALTENSTEIN, a town of the bigopric of Paffau; 10 miles N. of Paffau.

KALTHOF, a town of Prussia, in the province of Smoland, near Koniglerg.

KALUA, a town of Prussia, in Pomorlia; 8 miles E. of Marienburg.

KALUADA, a town of the Arabian Irak, on the Tigris; 10 miles S.E. of Bagdad.

KALUBBLUB, a small island in the East Indian sea, near the S.W. coast of Mindanao. N. lat. 0° 46'. E. long. 121° 35'.

KALUGA, a city of Russia, and capital of a govern- ment, called "Kallafroke," or "government of Kaluga," situated on the Occa; a place of considerable trade, and one of the most populous between Cherion and Moscow. N. lat. 54° 28'. E. long. 36° 3'.

KALVOLKA, a town of Sweden, in the province of Ta- vialth; 12 miles N.W. of Tavialth.

KALUOT, a small island on the E. side of the gulf of Bothnia. N. lat. 63° 21'. E. long. 21° 39'.

KALUTSKOE, or Government of Kaluga, a government of Russia, bounded on the N. by that of Moscow, E. by that of Moscow and Tula, S. by Orlovskoe, and W. by Smolenkoe, about 140 miles long, and from 30 to 90 broad, divided into 12 districts. See KALUGA.

KAMA. See KAMMA.

KAMA, a small island in the N. sea, near the coast of Lapland; 10 miles N. of Suroe.

KAMA, in Hindoo Mythology, is the god of love. "The Hindoos god," says W. Jones, "appears evidently the same with the Grecian Eros, and the Roman Cupid; but the Indian description of his person and arms, his family, attendants, and attributes, has new and peculiar beauties. According to the mythology of Hindooth, he was the son of Maya, or the general attracting power, (see MAYA), and married to Rati, or Attraction; and his bofin friend is Pa- janta, or Spring. (See these articles.) He is represented as a beautiful youth, sometimes conversing with his mother and comfort in the midst of his gardens and temples, sometimes riding by moonlight on a parrtot, or lori, and attended by dancing girls or nymphs, the former of whom bear his colours, which are a fib on a red ground. His favourite place of resort is a tract of country round Agra, and principally the plains of Murra; where Krishna also and the nine Gopics (see KRISHNA), who are clearly the Apollo and Muses of the Greeks, mutually fed the night, in music and dancing. His bow of sugar-cane or flowers, with a string of formed bees, and his five arrows, each painted with an Indian bloom of a burning quality, are equally new and beautiful. He has more than twenty names; that of Kam, or Kama,
The Champa or Champa is a polyandrous polygynous flower, the mieleba of European botanists; it is of two sorts, white and yellow; small, and in its foliage like an expanded rose-bud. Gardeners make an expose for sale, chaplets and long flowering of the blossom, which loofe women, on the supposition that its fragrance excites favourable sensations in the oratories of Kama, decorate their hair with, and wear round their necks: its fragrance is, however, so potent, that nerves unaccounted for it can scarcely bear it within doors. Another flower, called mango, is of the fame defcription, and may, perhaps, be one of these classically named in the hymn. The colour of the champa

KAM

KAM'
tumid, look on this aquatic plant with profound reverence; being more especially the symbol of humility; and Viñh, being a personification of water, his worshippers deem it his emblem also. It is farther the name of his consort Lakshmi, who, in her character of Venus, generally holds in her hand the lotus, the emblem also of beauty, and denoting her aquatic origin. (See Lakshmi, and Lotus.) This is not an end of the symbolic allusion connected with allusions to the lotus among Hindoo mythologists. Of these many occur in Moor's Hindoo Pantheon. See the index under Kamal and Lotus. Many engravings are likewise given of this subject in various combinations.

KAMALADAN, in Geography, a bay on the S. coast of the island of Mindanao. N lat. 7° 21'. E. long. 121'.

KAMALAYA, a town of Perzia, in Chusafat; 25 miles W. of Toftar.

KAMALA-YONI, in Hindoo Mythology, a name of Brahma, derived, it would appear, from the symbols of Lakshmi and Devi, or Parvati, the consorts respectively of Viñh, and Siva. The kamal is the lotus, an emblem of female beauty, and a name of Lakshmi; and the Yoni, the pudendum unioe speaks, most mysteriously contemplated by the votaries of Devi, as the mystical matrix of nature, and as her symbol. It does not, however, clearly appear why these terms or things should be conjointly applied to Brahma, the deity creative power. On the subjects of this article see KAMAL, LAKSHMI, LOTUS, LINGA, and YONI, in this work, which are amply discussed in the Hindoo Pantheon.

KAMALIA, in Geography, a town of Africa, in Manding, the inhabitants of which are partly Pagans and partly Mahometans. Mr. Park, in his return home, was taken ill of a fever in this town. This fever and dangerous sickness was owing to excess of fatigue, to vicissitudes of weather, and to the various hardships which he encountered, being sometimes plunged to the neck in rivers and swamps, and sometimes lost in woods and deserts, without shelter, clothing, or food. In this distressed condition, and whilst he was waiting for a caravan with which he might pursue his journey towards the Gambia, he was hospitably entertained by a worthy negro, whose name was Kafri Taura, who, not only undertook, for the value of one slave, to be paid on his safe arrival at the Gambia, not only to conduct him safe to Tifania, but to accommodate him in his house until the time of the caravan's departure. During the long interval of six months, not a murmur escaped the lips of Kafri, or of any of his wives, at the trouble and expense which their inmates, who was confined more than a month to his mat (his only bed), brought upon them. To the kind attention, the tender solicitude, the cheerful affability, and unwearied hospitality of these poor pagans, Mr. Park declared that he was indebted, not only for his safe return to Great Britain, but also for the preservation of his life; and he gratefully acknowledged, that he made his friend Kafri his inadequate return (though the best in his power), by presenting him, on their arrival at the Gambia, with double the sum which he had originally promised. Camalia is distant about 40 geographical miles W. of Sibidooloo, and lies nearly midway between the Joliba and Senegalee rivers. N. lat. 12° 46'. W. long. 6° 25'.—Alfo, a town of Africa, in the kingdom of Dambarras, on the Niger; 18 miles S.W. of Segg.

KAMAN, a town of Aftiac Turkey, in Caramania; 17 miles N. W. of Kasiraff. —Alfo, an island in the Red Sea. N. lat. 27° 35'.—Alfo, a town of Walachia; 16 miles S.W. of Rule. —Alfo, the name given by Tavemniers to the Cardam, or Commun, of others, which is the frontier town of the Carnatic, towards Golconda, near the source of the river Godavarma, or Gandecomma.

KAMAN, in Natural History, a name given by many authors to a flos described about the burning mountains, and at some times used to engrave seals. It is described as a white tlow, variegated with several colours.

KAMARIS, in Geography, a town of Aftic Turkey, in Natolia; 22 miles W. of Artakia.

KAMABA, a mountain of Tibbet, between lake Jamoo and the Samoo river.

KAMBAMBIA. See CAMBAMBA.

KAMELE, a town of Perzia, in the province of Mocran, on the sea-coast; 12 miles S. of Kidje.

KAMBERG, a town of Bohemia, in the circle of Kamzin; 12 miles S. of Benezech.

KAMCHADALS. See KAMSTCHATKA.

KAMEH, a province of Caudar, lying W. of Cabul, N. of Cabul river, nearly opposite to Jalalabad.—Alfo, a river of Asia, called Cabul; which see. It is formed of various streams that issue from the northern mountains, and join in the district of Kameh, where the confluent river receives its name, and which it communicates to the Cabul river during the remainder of its course.

KAMEINOK, a town of Russia, in the government of Pkoy; 12 miles S.E. of Opopka.

KAMEL, George Joseph, in Biography, a judicious missionary, who lived at the end of the 17th century, and sent various plants from the Philippine islands to the botanists of Europe. See CAMELLIA.

KAMELEY, in Geography, a town of Africa, in Sandy; 50 miles S. of Genn.

KAMEN, a town of the duchy of Warsaw; 12 miles S.E. of Gencna.

KAMENI. See KAMXEN.

KAMENITZ, a town of Bohemia, in the circle of Bechin; 24 miles E. of Bechin. N. lat. 49° 21'. E. long. 14° 56'.—Alfo, a town of Moravia, in the circle of Igla; 13 miles E. of Igla.

KAMENIZ, a town of Bohemia, in the circle of Chudim; 10 miles S. of Chudim.

KAMEKKA, a town of Russia, in the government of Tobol; 12 miles E. of Eneifik.

KAMENOKI, a town of Russia, in the government of Ochotsk, at the northern part of the Penzina gulf, containing about 450 inhabitants; 16 miles S. of Oklada.

KAMENSKAIA, a town of Russin Tartary, in the country of the Cossacks, on the Denetz; 152 miles N. of Azof.

KAMENSKOII, a town of Russia, in the government of Archangel; 124 miles S.E. of Kola.—Alfo, a town of Russia, in the province of Ekaterinburg, on the Ilet; 40 miles S.E. of Ekaterinburg.

KAMERAN, an island in the Red sea, near the coast of Arabia, governed by a Dola, subordinate to the Dola of Lobia: the soil is fertile, and it has a good harbour, which affords refreshment to vessels that touch at it in their voyage from the Indies to Jidda. N. lat. 15° 6'. E. long. 42° 25'.

KAMERIE, a town of Arabia, in the province of Yemen; 46 miles S. of Sade.

KAMERINIA, a town of Poland, in the palatinate of Kiev; 12 miles S.E. of Czyrkafy.

KAMERITZ, a town of Bohemia, in the circle of Bechin; 16 miles N. of Filfriz.

KAM-HI, in Biography, emperor of China, who was the grandson of a Tartar prince, who conquered that country in 1644, and ascended the throne in 1661. He had a great attachment
attachment to the arts and sciences of the Europeans, and
liberally patronized the missionaries. He was a good ge-
grapher, and directed the construction of many maps and
carts, yet so vast was he of the country over which he
governed. that he would never suffer a map of the world
to be laid before him unless China was represented therein as
the centre. He died at the age of 71, in the year 1732.

KAMI, in Geography, a town of Japan, in the island
of Nippon; 20 miles E.N.E. of Jedo.

KAMIBABA, a town of Africa, in Manding. N. lat.
12 32, W. long. 6° 17'.

KAMIAZACONDA, a town of Africa, in the coun-
try of Jemnarrow. N. lat. 12 48'.

KAMEN, a town of Poland, in the patinate of Vol-
lynie; 34 miles N. of Lutsho.—Also, a town of Lithu-
ania, in the patinate of Wilna; 64 miles E. of Lida.

KAMIESEC, a town of Lithuanian, in the patinate
of Brzez; 16 miles N.N.E. of Brzez.

KAMIENTSCHIK, a town of the duchy of Warsaw;
30 miles E.N.E. of Warsaw.

KAMIESHEL, a town of Circassia, on the coast
of the Black sea; eight miles E.S.E. of Mamak.

KAMINIEC, a town of Russian Poland, and capital of
the patinate of Podolia, having a castle built on a rock,
and one of the best fortified places in Poland. Below it
runs the river Smietrich, which falls into the Dnieper.
It has a Papias and Armenian bishop resident in the city;
and here are also held a court of justice and provincial
diocese. The episcopal see was founded in 1375. Its
college formerly belonged to the Jesuits. The whole province
is sometimes called "Kamieniec." 1 0 miles W. of Braclaw.

KAMREG, a town of Russia, in the province of Larilna;
60 miles E.S.E. of Lar.

KAMISCHIN, a town of Russia, in the government of
Saratoff, on the Volga; 80 miles S. of Saratoff.

KAMITNICA, a town of Poland, in the patinate
of Braclaw, near the Dnieper; 54 miles S. of Braclaw.

KAMITSKI, a town of Japan, in the island of Xino;
28 miles E.S.E. of Kokara.

KAMMA, a river of Russia, which is the largest of
doing all those that unite their streams with the Volga. It
rises in the government of Permi, from the western projections
of the Ural chain, waters a part of the government of
Viata, flows through a large tract of the government of
Permi, forms the border between the governments of Vi-
atka and Ufa, and at Ufiaheva, 60 veris below Kazan,
falls into the Volga; having terminated a course of 1000
veris. By the Tartars it is called "Tholmian-Idul." For
the transport of salt and iron, it is one of the most im-
portant rivers of the empire. This is chiefly effected by the
Tchoukofaiai and the Beliiaa, two rivers of considerable
magnitude, flowing into it on the left. Before them, the
Kamma takes up a great number of other rivers, such as,
on the left the Yaiva, the Kofa, and the Ik; on the right,
the Obva, the Oklah, and the Yumak. The Kamma,
above the mouth of the Beliiaa (which is of a
white teny), has a blackish wholefome water. It is
mostly attended by a ridge of mountains, confining of
sand, gypsum, and marle, with forests of firs and oaks.
It is tolerably well floored with fish; and they are reckoned
better tasted than those of the Volga.

KAMMAGOJAH, a town of Africa, in the country
of Quoja.

KAMMAH, a town of Aisia, and capital of a district
Vol. XIX.

in the kingdom of Birman, on the Irawaddy; which car-
cries on a large trade in teak timber, conveyed from hence
to Rangoon; 15 miles N. of Prome.

KAMMENI, G%AT and LITTLE, two islands of the
Grecian Archipelago, so called on account of the nature of
the calcined substances of which they are formed; the name
denoting "burnt;" whence they have obtained the appella-
tion of Burnt islands. The first of these rocks above the
sea in a surprising manner, whilst the water boiled up, and
on account of its origin, which burned and was prodigious,
which occasioned it to be considered by the ancients to
the god of hell, it was denominated "Hades." In the
year 1743, during subterraneous commotions and convul-
sions, and various other terrifying phenomena, another island
suddenly appeared above the surface of the waters. In
order to distinguish it from the former, which is the large,
the Greeks have called it "Mikri Kammeni" or the Little
Burnt island. Those islands are at a distance about three
miles W. of Santorin. N. lat 36° 30'. E. long 24° 15'.
The Great Kammeni, which is the more ancient, is covered
with a thin frature of dust, which allows a few herbs to grow
upon it. The Little Kammeni, in which are visible fiv
craters, by which the volcano vomited forth the substances
that compose it, is naked and barren. At the beginning
of the last century a new island appeared between the Great
and Little Kammeni, about a league from Santorin. Its
formation, accompanied with shocks of earthquakes, which
were felt at Santorin, was gradual; and various circum-
cstances attended it, which are minutely described by Sammon
in his "Travels in Greece and Turkey."

KAMNIG, a town of Silezia, in the principality of
Niefe; 8 miles N.N.E. of Pachtialbaur.

KAMNITZ, or CHEMNTZ, a town of Bohemia, in the
circle of Lotternitz; the principal article of trade is the
manufacture of flockings; 32 miles S.E. of Dreden.

KAMO, a town of Japan, on the fourth coast of the
island of Jeds.

KAMOEIER, a small island in the East Indian sea.
S. lat. 6° 50'. E. long. 132° 5'.

KAMOURASKAS, a town of Canada, on the right
bank of the St. Lawrence. N. lat. 47° 33'. W. long.
69° 43'.

KAMRAJE. See Cammerm.

KAMSCHENSKA, a town of Russia, in the province of
Ekaterinburg, on the Icet; 52 miles S.E. of Ekaterin-
burg.

KAMSCHLOV, a town of Russia, in the province of
Ekaterinburg; 56 miles E. of Ekaterinburg.

KAMSIN, hot featherly winds of Egypt; where they
are known under the general name of "winds of fifty days.
(See EGYPT.) These winds have been mentioned by travel-
lers under the denomination of "polaris," winds, or,
more correctly, "hot winds of the desert." By the Arabs
of the defect they are called "Samouni," or poison; and
by the Turks "Shamyl," or wind of Syria, from which
is formed the "Samald" wind. The heat of these winds
is sometimes so excessive, that it may be compared to the
heat of a large oven at the moment of drawing out the bread.
When they begin to blow, the atmosphere assumes an alar-
mizing aspect. The sky, which at other times is clear in this
climate, becomes dark and heavy; the sun loses its splen-
dour, and appears of a violet colour. The air is grey and
thick, and filled with an extremely subtle dust, which is uni-
versally penetrating. This wind increases gradually in heat,
in proportion to its continuance; and its effects are felt by
all animated beings. The lungs are contracted and become
4 R.
painful. Respiration is short and difficult, the skin becomes parched and dry, and the body is consumed by an internal heat. Large draughts of water afford no relief, nor can any thing restore perspiration. Marble, iron, water, though the fun no longer appears, are hot. The streets are deserted, and the dead silence of night prevails everywhere. The inhabitants of towns and villages shut themselves up in their houses, and those of the desert in their tents, or in tents dug in the earth, waiting the termination of this destructive heat. It usually lasts three days, but if it exceeds that time, it becomes irreparable. The danger is most imminent when it blows in squalls, for then the heat is so much increased, as to cause sudden death by suffocation. This wind is peculiarly fatal to persons of a phlegmatic habit, and to those that are exhausted by fatigue. The copious emittances of sweat, and the panicky fermentation, which takes place in animal bodies when the humours become flagrant. These accidents are to be avoided by flapping the nose and mouth with handkerchiefs, and the cumbrels bury their noses in the sand, and keep them there till the squall is over. Another quality of this wind is its extreme aridity; which is such, that water sprinkled on the floor is evaporated in a few minutes; it withers and dries all the plants, and exhales too suddenly the emanations from animal bodies, and produces that feverish heat which results from suppressed perspiration.

These hot winds are not peculiar to Egypt; they blow likewise in Syria; more frequently, however, near the sea, and in the desert, than in the mountains. M. Niebuhr met with them in Arabia, at Bombay, and in the Diarbekir: they are also known in Persia, and in the south of Africa, and even in Spain, and though their direction may vary, their effects are similar. In Egypt, the most violent proceed from the S.W.; at Mecca, from the E.; and at Surat, from the N.; at Bassora, from the N.W.; from the W. at Bagdad; and in Syria from the S.E. They all proceed, says Volney, from desert countries; and he adds, it is natural that the air which covers the impenetrable plains of Lybia and Arabia, meeting there with neither rivulets nor lakes, nor forests, but fanned by the rays of a burning sun, increased in intensity by the reflection of the sand, should acquire a prodigious degree of heat and aridity; hence it follows that these qualities are owing to the heat of the sun upon the sands. Volney's Travels in Egypt &c. vol. 1.

KAMTSCHATKA, a river of Russia, in the peninsula of that name. See below.

KAMTSCHATKA, a peninsula of Russia, in the government of Irkutsk, bearing its name from the river Kamtschatka, which is supposed to have been so called from some brave warrior named Kamitka. It is bounded on the N. by the province of Ochotch, on the E. and S. by the Northern Pacific ocean, and on the W. by the sea of Ochotch, and the Pripнfneto gulf. On the southern promontory, the Kurilly islands are included in it, and towards the west it is continued with North America by the Aleutian islands. This country consists of a chain of mountains, forming one train with the very mountainous and rocky islands of Kurilly and Japan, and these again seem to be connected with the mountains that reach from Thibet through China. All these countries and islands seem to have arisen by subterraneous fires, which still continue to act, much more lately than Siberia. The peninsula of Kamtschatka, according to the account given of it by Captain King, who visited it in October 1775, lies on the eastern coast of Asia, running nearly N. and S. from 52° to 61° N. lat.; the longitude of its southern extremity being 156° 45' E. The illusius which joins it to the continent on the N. lies between the gulf of Olotork, and the gulf of Pealhait. Its southern extremity is cape Lopata, a

word signifying the blade-bone of a man, and so called from its foppified resemblance to it. The shape of the whole peninsula is not unlike that of a shoe, widening from the toe, that is cape Lopata, towards the middle, and again narrowing towards the heel, the neck of land above-mentioned connecting it with the continent. Its greatest breadth is from the mouth of the river Tigli to that of Kamtschatka, and is computed to be 236 miles, from whence it narrows very gradually towards each extremity. It is bounded on the N. by the country of the Koriaks, from which it is separated, according to the Russian geographers, by Olotorkoisnofs, which is the southern boundary of the Koriak country. A chain of high mountains stretches through the whole length of the country from N. to S., dividing it nearly into two equal parts from which a great number of rivers take their rise, and empty themselves, on each side, into the Pacific ocean, and the sea of Ochotch. There are three rivers of much greater magnitude than the sell: the "Bolchoirekka," or great river, the "Kamtschatka," and the "Avatarka." The first discharges itself into the sea of Ochotch, and is navigable for the Russian gallants, upwards of five leagues from its mouth, or within nine miles of Bolchertik, a town situated at the conflux of the Gofoloffka and the Bibra, which here lose themselves in the Bolchoirekka. The Bibraia, which is no inconceivable river, has its source in the same mountain with the Kamtschatka, and, by taking a direct contrary course, affords the Kamtschatcans the means of transporting their goods by water, in small canoes, almost across the whole peninsula. The river Kamtschatka, after pursuing a course of nearly 300 miles from S. to N., winds round to the eastward, in which direction it empties itself into the ocean, a little to the southward of Kamtschatkinois. Near the mouth of the Kamtschatka, to the N.W. lies the great lake, called Nerpitch, from "urpik," a Kamtschatcand word, signifying a teal, with which this lake abounds. About 20 miles up the river, reckoning from the mouth of the lake, is a fort called Nildre Kamtschatka Oitroog, where the Russians have built an hospital and barracks, and which is said to have become the principal mart in this country. The river Avatarka rises from the mountains situated between the Bolchoirekka and the Bibraia; and, running, from N.W. to S.E., a course of 100 miles, falls into the bay of Avatarka. The Tigli is likewise a river of considerable size, rising amidst some very high mountains, which lie under the same parallel with Kamtschatkinois, and running in an even course from S.E. to N.W., falls into the sea of Ochotch. The soil of this peninsula is extremely barren, and seems to be incapable of profitable cultivation, either in the way of pastoral, or in any other mode.

The face of the country, in general, is thinly covered with scattered trees, having a bottom of moss, mixed with low heath, and bears a more striking resemblance to Newfoundland than to any other part of the world which Capt. King had ever seen. He was informed, however, by major Belen, the late governor, that many parts of the peninsula, particularly the banks of the river Kamtschatka and the Bibraia, produce grass of great height and strength, which they cut twice in the summer; and that the hay is of a succulent quality, and particularly well adapted to the fattening of cattle. From other accounts it appears that there is no part of the country equal in fertility to that which borders on the river Kamtschatka; and that to the N. and S. it is much inferior both in point of soil and climate. Repeated experiments have been made in the culture of oats, barley, and rye, in different quarters near this river, which have generally succeeded; and it is not doubted, that wheat, in many parts, particularly near the source of the Brittain and
and Kamtschata, would grow as well as in the generality of countries situated in the same latitude. The fertility of this part of the country may probably be owing to its being the widest interval of the peninsula, and consequently most remote, on each side, from the sea; whereas the chilling fogs and drizzling weather, which prevail almost perpetually along the coast, must necessarily render the parts adjacent very unfertile for all the purposes of agriculture. The severity of the climate, we may naturally conclude, must correspond with the facility of the soil, of which it is probably the cause. The first time, says Capt. King, we saw this country, was in the beginning of May 1779, when the whole face of it was covered with snow, from six to eight feet deep. On the 8th of May, at noon, the thermometer stood at 32°; and the snow lay so deep on the ground, that all attempts to cut wood were fruitless. On the 15th the snow began to advance gradually; and in the beginning of June, the snow was generally melted from the lowlands. On the fifteenth of this month, the thermometer had never risen higher than 38°, nor the barometer than 30|42. The S. E. wind was the most prevalent. On the 24th of June, with this wind, the firs and trees and all sorts of vegetation fended to be in the highest state of perfection. During this month and September, the weather was very changeable, but in no respect favorable. The winds veered towards the west. The greatest height of the thermometer was 67°, the lowest 40°. The barometer's greatest height 30|35; its lowest 29|3°. So that, upon the whole, during this month, an equal and moderate degree of temperature prevailed. But at the beginning of October, the tops of the hills were again covered with new-fallen snow, the wind continuing weller. In computing the season, the spring should not be taken into the account. The interval from the middle of June to the middle of September may properly be said to constitute the summer. October may be considered as an autumnal month; and from thence, to the middle of June, it is perfect winter. It is said that the climate, in the country adjoining to the river Kamtschata, is not less severe and temperate than in many parts of Siberia that are under the same latitude. This variation, says Capt. King, is probably owing to the climate causes, to which the superior fertility of the soil in those parts has been attributed.

The ingenious Mr. Kirwan, in his "Estimate of the Temperature of different Latitudes," states the difference of Kamtschata from the Atlantic to be such, that its temperature is not in any respect influenced by it, but rather by that of the North Pacific, to which it adjoins. Accordingly the northern parts of this peninsula enjoy the most moderate weather, being chiefly influenced by the North sea, the temperature of which, even in winter, is milder than that of the sea below the latitude that separate Asia from America. Speaking of the temperature of the North Pacific ocean, the same judicious author observes, that this part of it is contracted in latitude 66° to the narrow space of 40 miles; and in latitude 52°, it occupies the space of only 30 in breadth from east to west, that is, about 1,500 miles; whereas the Atlantic in latitude 52° is about 1,200 miles in breadth, and its lowest contracted to a less space than 200 miles. To which we may add, that the coasts of this latter one side, and the side of America on the other, are bordered with high mountains, covered with snow for a great part of the year; and numerous high islands lie scattered between both continents. From these circumstances we have sufficient reason for concluding a priori, that this sea should be much colder than that part of the Atlantic contained between the same parallels, for, during the winter, the mountains that line the coasts are cooled to a much greater degree than the flat coasts of the Atlantic; and the sea, where it is narrow, is entirely frozen; in summer, heaps of ice, being long frozen from the sun by the islands, are carried down into lower latitudes, and the snow remains long unmelted on the mountains; so that Mr. Kirwan is inclined to think, that the annual temperature of it is at least 4 degrees below that of the standard in corresponding latitudes. But further observations are necessary for determining with precision the mean temperature of any of these parts. But it is certain the facility of the ground above the Kamtschata is the unfavourable temperature of their climate; the uncertainty of the summer season sometimes prevents their laying up a sufficient stock of dried fish for their winter's provisions, and the moisture of the air causes worms to breed in them, which not unfrequently destroy the greatest part. The inhabitants of this country are very seldom troubled with storms of thunder and lightning; and neither by frost nor by drought. The extraordinary rigour of climate in so low a latitude may be accounted for, from its being situated to the east of an immense uncultivated tract of country, and from the prevalence of the westerly winds, blowing over so extensive and cold a continent. The extraordinary violence and impetuosity of the winds are attributed to the subterraneous fires, the subterraneous exhalations, and the general volcanic disposition of the country. This peninsula abounds in volcanos, of which only three have been, for some time past, subject to eruptions. One of these is situated in the neighbourhood of a volcano of Tolbachick is situated on a neck of land between the river of Kamtschata and Tolbachick. The mountain, from the summit of which the eruptions proceed, is of a considerable height, and terminates in pointed rocks. The third volcano is on the top of the mountain of Kamtschata, which is mentioned as the highest in the peninsula. A thick smoke never ceases to ascend from its summit, and it has frequent eruptions of the most violent and dreadful kind; some of which were much talked of when captain King visited the island, and seemed to be fresh in the memories of the Kamtschadals. This country contains numerous springs of hot water, and extraordinary pits or wells, at the bottom of which the water seems to boil as in a cauldron with prodigious impetuosity, accompanied with a dreadful noise, and discharging a thick vapour. Near the village Mikhail a merchant of Irkutsk, in 1760, discovered iron ore, and erected smelting furnaces on the spot. Silver ore, though not very rich, is also said to have been found in Kamtschata. Of the trees which fell under the notice of captain King and his associates, the principal were the birch, the poplar, the elder, (with the bark of which they flay their leather,) many species of the willow, and two sorts of dwarfish pines or cedars, of one of which they made their offence for beer, and it was found excellent for the purpose. The birch tree was the most common, and of this there were three sorts, two of which are fit for timber, and the third, which is of a dwarfish kind, is applied to a variety of uses. The liquor, yielded by it upon being tapped, is drunk without any previous preparation; the bark is converted into pitch by boiling it in some kind of
the wood they make their sledges and canoes. Besides the
trees above mentioned, there are the larch, and also fir,
the serviet-tree, and two species of the white-thorn. Of
the shrub kind, as junipers, the mountain-ash, rose-trees,
and raspberry bushes, the country produces great abun-
dance; together with a variety of berries, which are col-
lected at the proper season, and preferred by boiling them
into a thick jam, without sugar. These are used as fance
to their dried and salt fish; and are eaten by themselves,
puddings, and various other ways; and decoctions are also
made of them for their ordinary liquor. The country fur-
nishes many wholesome vegetables in a wild state, such as
wild celery, angelica, cherry, garlic, and onions; and upon
some spots of ground in the various there are excellent tur-
nips and turnip-radishes. They have also more recently
cultivated potatoes. Major Balk exercised himself very
hurably in endeavouring to promote agriculture and graz-
ing, and not altogether without effect; and his successor,
Mr. Affefer Reimkin, continued these endeavours, inso-
much that, in 1781, from 62½ pound of winter-wheat 34,160
sheaves, and from 594 pound of barley 24,820 sheaves, were
reaped. Oats, wheat, and buck-wheat, were much injured
by the early frosts; but hemp succeeds very well. There
are two plants in this country that deserve particular notice,
on account of the extensive use to which they are applied:
one, called by the natives "Saran", is the Lilium Kam-
fkiittenie flore atro rubente, of which Steller enumerates five
different species. The roots are collected in the beginning
of August, dried in the sun, and laid up for use. When
roalled in embers, it fappies the place of bread; and baked
in the oven and pounded, it becomes an excellent substi-
tute for flour and meal of every sort, and in this state is mixed
in all their soups, and most of their other dishes. It is
extremely very nourishing. The roots of this plant are also
applied to similar purposes at Oonalalaka. The other
plant is called the "Sweet geaf", the Heracleum Siberi-
cum folis pinnatis, &c. Hort. Upsal. 65. This plant was
formerly a principal ingredient in the cookery of most of the
Kamtschatdles dihes; but since the Russians have obtained
poifonification of the country, it is entirely appropriated to
the purposes of dilution. The liquor obtained from it is of
the strength of brandy, and is called by the natives "raka "
Two pound (72 pounds) of the plant yield generally one
vedro (25 pints) of raka. There are several other plants,
which we cannot enumerate. It is said, that the Kamtscha-
dales (before their acquaintance with fire-arms) poifoned
their spears and arrows with the juice of the root of the
"zgate" (anemoneoides et ranunculus); and that wounds
inflicted by them are equally defuctive to land and mar-
ine animals. The Tschudi are reported to use the same drug
for this purpose at present. Of the sraw of the "tripicun
radix pendii fructus bius langinofos", which grows
abundantly along the coast, they make a strong matting,
which they ufe not only for their floors, but for facks, bed-
clothes, curfains, and a variety of other dolemic purpofois.
Of the plant called "bolutiai", growing in the mathe, and
ref-ming cypenoides, which is carded like wool, with
a comb made of the bones of the sea-fowle, they make
various garments, which they ufe inefead of linen and wool-
en cloths. The nettle furnpies the place of hemp and flax,
and serves in the manufacture of their fishing-nets.

The animals of this peninula are the common fox, the
float or ermine, the zibelline or fable, the ifaxis or arctic
fox, the varying hare, the mountain rat or earles marmot,
the weafel, the glutton or wolverene, the argali or wild
sheep, rein-deer, bears, wolves, and dogs. The dogs are very
numerous; and they are very ufeul in drawing the sledges,
which are the common vehicles of the country. The coaf-
and bays of this country are frequented by almost every fort
of northern sea-fowl; the rivers are stored with numerous
flocks of wild ducks of various species. In the woods are
eagles of a very large size; and of the hawk, falcon, and
bustard kind, there are great numbers. This country like-
wife affords wood-cocks, snipes, and two forts of grouse,
or Moor-gaune. Swans are also very plentiful, and generally,
in their entertainments, make a part of their repaft.

The sea-coat furnishes no amphibous animals, except seals, which
swarm in the bay of Awtakka, where they pursue the fishman,
that are collected there in shoals in order to afford the rivers.
They are also found in moat of the lakes, which comu-
nicate with the sea. The sea otters resemble those of Nootta
found; but since the Russians have opened a trade for their
skins to China, where they are sold at a price above that of
any other kind of fur, they have been hunted almost entirely
out of the country. Thofe of the Kurile iflands are of a
superior quality to thofe of Kamtschatka, or the American
coaf. Fish may be considered as the fapple article of food,
with which providence hath supplied the inhabitants of this
peninula. Whales are frequently seen, both in the sea of
Ochotsk, and on the ifle of the eaftern ocean, and when
caught, are converted to various ufees. Of the skin they make
the foles of their shoes, and trops and thongs for various
other purpoifes. The flesh they eat, and the fat is floored
up, both for kitchen ufe and for their lamps. The whif-
kers are ufed for fewing together the foams of their canoes,
and for making nets; and with the under jaw-bones their
fledges are froid. They work the bones into knives; the
intertines are cleaned, and blown like bladders, for containing
their oil and greafe; and of the nerves and veins, they make
excellent flares. Flat-fish, trout, and hernings are abun-
dant; the seaon for the latter begins in May, and they do
not remain long on the coaft; they are fine and large. They
have alfo cod of a large fize; but their principal dependence
is on salmon, which they lay up in flore for their winter
provisions. The seaon of flifing, for this fpecies, lafts
from the middle of May till the end of June.

The preffent inhabitants of Kamtschatka are of three
forts; the natives, or Kamtschadales; the Russians and
Coffacks; and a mixture of thofe two by marriage. The
tue Kamtschadales, are, according to Steller, a peeplic
of very great antiquity, and have for many ages inhabited this
peninula; and he fays, that they are originally defcended
from the Mungilians, and not either from the Tungui-
ian Tartars, fome, or the Japanese, as others have imagined.
Many words, he fays, in their language have terminations
dififeen to thofe of the Mungilian Chinefe, and the fame
principle of inflexion or derivation obtains in both languages.
They are, in general, under-aged, as are the Mungilians;
their complexion, like theirs, is rathery; they have black
hair, little beard, the face broad, the nose flat and flat,
The eyes small and fink, the eye-brows thin, the belly
pendant, the legs small; all which are peculiarities that are to
be found among the Mungilians. As the refult of the
whole he inures, that they flid for safety to this peninula,
from the rapid advances of the eaftern conquerors; as the
Lapllanders, Sanoifds, &c. were compelled to retreat to the
extremities of the north by the Europeans. The
Russians, having extended their conquests, and efitablihed
ports and colonies along that immense extent of coaft of the
Frozen sea, from the Jenfei to the Anadyr, appointed com-
mifaries for the purpose of exploring and inhabiting the
countries still farther eafward. They soon became ac-
quainted with the wandering Koriahs inhabiting the N. and
N.E. coaft of the sea of Ochotsk, and without difficulty
KAMTSCHATKA.

made them tributary. These being the immediate neighbours of the Kamtschadale, and likewise in the habit of bartering with them, a knowledge of Kamtschatka followed of course. The honour of the first discovery is ascribed to Fedor Alexeief, a merchant, who is said to have failed from the river Kowmna, round the peninsula of the Tichtikk, in company with seven other vessels, about the year 1648. Being separated from the rest by a storm, near the Tchekotkino-be, he was driven upon the coast of Kamtschatka, where he wintered; and in the summer following coaled round the promontory of Lopatska, into the sea of Ochotsk, and entered the mouth of the Tigil; but he and his companions were cut off by the Koriaks, in endeavouring to pass by land from thence to the Anadirsk. But as these discoverers did not live to report what they had done, Volodimir Atlaffoff, a Coiffack, is reputed the first discoverer of Kamtschatka. This person, under the quality of commissary, penetrated, in 1790, with about 60 Russian soldiers, and the fame number of Coiffacks, into the heart of the peninsula, gained the Tigil, and levying a tribute of furs, proceeded to crofs over to the river Kamtschatka, on which he built the higher Kamtschatka Oltrog, called Verchnei, where he left a garrison of Coiffacks, and returned to Jakutik in 1700, with an immense quantity of rare and valuable tributary furs. Upon his arrival at Moscow, he was appointed commander of the fort of Jakutik, with farther orders to repair again to Kamtschatka. But as he advanced towards the Anadirsk, he fell in with a bark on the river Tunguska, laden with Chinese merchandise, which he pillaged; but in consequence of a remonstrance from the fullerers to the Russian court, he was feized at Jakutik, and thrown into prifon. During the diligence and trial of Atlaffoff, several preceding commissaries were sent into Kamtschatka; but at length Atlaffoff was reinstated in his command, and appointed to conduct a fecond expedition into Kamtschatka; however, in this service he was guilty of oppression and cruelty, which, occasioned a mutiny among the Coiffacks, and they succeeded in getting him displaced, and feized upon his effects. Accustomed to plunder, they were reduced to military discipline and subjection with great difficulty. The history of this country, from that period till the grand march of the Kamtschadale in 1731, preserves one inquirer detail of misfortunes, revolts, and savage fan- guinary encounters between small parties, from one end of the peninsula to another. When peace was established, the country remained tranquil till the year 1719, when a few Russians lost their lives in a tumult; and except an insurrection which occurred at Bolchereffk in 1770, there has been no disturbance since.

After the rebellion of 1731 was quelled, the country recovered itself, and became more populous than ever; when, in the year 1767, the small-pox, brought by a folder from Ochotsk, threatened the total extirpation of its inhabitants. It has been computed that near 20,000 died of this disorder in Kamtschatka, the Kareli country, and the Kurile islands. The inhabitants of whole villages were swept away, and their habitations left desolate. In the diminished state of the natives, with fresh supplies of Russians and Coiffacks perpetually pouring into the country, and intermixing with them by marriage, it is probable, that in less than half a century there will be very few of them left. According to major Behn's account, there were not, in 1770, more than 3000 who paid tribute, the Kurile islands included. Capt. King underflood that in the year above-mentioned, there were in the five forts of Nichein, Verchnei, Tigil, Bolcher- retsk, and St. Peter and St. Paul, about 400 Russians and Coiffacks, and near the fame number at Ingagi, which, though to the N. of the peninsula, was then under the command of Kamtschatka; to these may be added the Russian traders and emigrants, whose number is not very considerable.

The Russian government, established over this country, though military, is in a high degree mild and equitable. The natives are permitted to choose their own representatives among themselves, in the way and with the same powers to which they had ever been accustomed. One of these, under the title of "Toioi," presides over each "oltrog," who refers merely cases of difficulty, or crimes of peculiar malignity, to the decision of the governor of Kamtschatka. The Toioi has likewise the appointment of a civil officer, called a corporal, who assists him in the execution of his office, and in his absence acts as his deputy. By an edict of the late empress, no crime whatever can be punished with death; but it is said, that, in cases of murder, the punishment of the "knout" is administered with much severity, that the offender generally dies under it. The only tribute exacted, as an acknowledgment of the Russian dominion, consists, in some districts, of a fox's skin, in others of a fable's, and in the Kurile islands of a sea-ottar. The tribute are collected by the Toioi in their several districts. The Russians, it is said, have taken great pains in converting the Kamtschadale to Christianity, and they have so far succeeded, that there remain few idolaters among them. The religion taught and professed is, of course, that of the Greek church. Schools are likewise established in many of the oltrogs, where the children of both the natives and the Coiffacks are gratuitously instructed in the Russian language.

The commerce of this country, as far as concerns the exports, is entirely confined to furs, and carried on principally by a company of merchants, inftituted by the late empress. Besides these, there are many inferior traders (particularly of the Coiffacks) scattered through the country. The principal merchants, during their stay in the country, reside at Bolchereffk, or the Nihinei oltrog, in which two places the trade almost wholly centres. The articles of importation are principally European, but not restricted to Russian manufactures; many are English and Dutch; several likewise come from Siberia, Bucharia, the Kalmucks, and China. They consist of coarse woollen and linen clothes, yarn flockings, bonnets, and gloves; thin Perian silks; cottons, and pieces of nankeen, silk and cotton handkerchiefs; brass coppers and pans, iron fitives, files, guns, powder, and shot; hardware, such as hatchets, bills, knives, scissors, needles, looking-glasses; flour, sugar; tanned hides, boots, &c. It has been observed, that these articles in general are sold for more than the price they might have been purchased for in England; and though the merchants have so large a profit upon these imported goods, they have a still larger upon the furs at Kiska, upon the frontiers of China, which is the great market for them. The beet sea-ottar fkins fell generally in Kamtschatka for about 30 roubles a-piece; at Kiska the Chinese merchant buys them at double that price, and sells them again at Pekin at a considerable advance, where a profitable trade is made with some of them to Japan. All furs exported from Kamtschatka across the sea of Ochotsk, pay a duty of ro per cent. and fables a duty of 12; and all furs of merchandise imported from Ochotsk pay half a rouble for every pound (36 pounds English). The duty on exports and imports is paid at Ochotsk; and the tribute, which amounted, in 1770, to 10,000 roubles annually, is collected at Bolchereffk. Six vessels, from 40 to 50 tons burthen, were employed by the late empress between Ochotsk and Bolchereffk; five for the transportation of fables and provisions from the former to the latter place, and one...
as a packet boat for conveying dispatches. Besides these, there are about 14 vessels employed by the merchants in the fur trade, among the islands to the eastward. The most commodious and valuable part of the fur trade is carried on with the islands that lie between Kamtschatka and America.

The houses in Kamtschatka are of three sorts, viz. jouts, balagans, and log-houses, called there jbars. The first are their winter, and the second their summer habitations; the third are altogether of Russian introduction, and inhabited only by the better and wealthier sort. A town of Kamtschatka is called an "offrog," and consists of several of the three sorts of houses above-mentioned; but the balagans are the most numerous. St. Peter and St. Paul consists of seven log-houses, 19 balagans, and three jouts. Paratouma is of about the same size. Karatchin and Natchekin contain fewer log-houses, but full as many jouts and balagans as the former. The outermost garment of the men is of the shape of a carter's frock. Tho's worn in summer are of nankeen; in winter they are made of linens, most commonly of the deer or dog, tanned on one side, the hair being left on the other, which is worn innermost. Under this is a close jacket of nankeen, or other cotton stuff, and beneath that a shirt of thin Persian silk, of a blue, red, or yellow colour. The remaining part of their dress consists of a pair of tight trousers, or long breeches, of leather, reaching down to the calf of the leg; of a pair of dog or deer-skin boots, with the hair innermost; and of a fur cap, with two flaps, which are generally tied up close to the head, but in bad weather are let to fall round the shoulders. On ceremonial occasions the Toia's wear a fur dress. The dresses of the women consist of a full loose robe of white nankeen, gathered close round the neck, and fastened with a collar of coloured silk. Over this they wear a short jacket without sleeves, made of differently coloured nankeens, and petticoats of a flight Chinese silk. Their shifts, which have sleeves down to the wrists, are also of silk; and coloured silk handkerchiefs are bound round their heads, concealing entirely the hair of the married women, whilst those who are unmarried, bring the handkerchief under the hair, and suffer it to flow loose behind.

The Kamtschadals amuse themselves with singing and dancing. Their dancing they seem to have learned from the bears, which is intended to represent the awkward and clumy gestures of this animal. The body was always bowed and the hands bent, whilst the arms were used in imitating the tricks and attitudes of that animal. Cook's Third Voyage, vol. iii. Took's Russian Empire, vol. i. Cox's Russian Discoveries.

Kamtschatkoi Nose, the southern cape of Kamtschatka. N lat 55° 3'. E. long. 163° 20'.

Kamtschatko, Neriei or Lower, a town or offrog of Ruffia, on the E. side of the peninsula of Kamtschatka, about 20 miles from the river Kamtschatka; containing two churches and about 150 houses, and having a citadel with magazines, an arsenal, guard-house, and barracks. It is the seat of two tribunals, one for matters of government, and another for theof of commerce; 143 miles E.S.E. of Ochotik. N. lat. 56° 40'. E. long. 150° 14'.

Kamtschatko, Verchnei or Upper, a town or offrog of Ruffia, in the peninsula of Kamtschatka, governed by a ferryman, and containing about 600 houses; 60 miles N.N.E. of Bolcheshchuko. N. lat. 53° 57'. E. long. 157° 39'.

KAN, a river of Ruffia, which runs into the Enlets, near Blichuzko, in the government of Kolovan.—Allo, a river of China, which rises in the S. part of Kiang-fu, and runs into the lake Po-yang; 20 miles N. of Tschang.

KAN, or Khan. See Khan.

KANA, in Geography, a town of Arabia, in the province of Hedjaz; 40 miles E.S.E. of Hajer.

KANAAAP, a town of Hindooitlin, in Bahar; 47 miles S.S.W. of Patna.

KANADEL, a town of Ruffia, in the government of Simbirik; 22 miles S.S.W. of Simbirik.

KANAGA, one of the Androanoffiie islands, between Kamtschatka and America, which has a high smoking mountain.

KANAHOOY, a town of Peria, in the province of Coholan; 100 miles W.S.W. of Nifabur.

KANAKI, a small island in the gulf of Eungin, near the W. coast of Core.

KANAMBADDY, a town of Hindooitlin, in Mycor; 8 miles W. of Soungapatam.

KANAN, a town of Africa, in the kingdom of Cavor, near the Atlantic. N. lat. 16° 40'. W. long. 13° 55'.

KANANIKOKOIII, a town of Ruffia, in the government of Upas; 52 miles S.W. of Sterlilantzk.

KANAR, a large lake, formed by an expansion of the river Devarah, in the country of Kamaon.

KANAREDERM, a town of Peria, in Farilitan; 97 miles S. of Shiroz.

KANANA, a town of European Turkey, in Bulgaria; 22 miles N.E. of Varna.

KANARY, a small island in the East Indian sea, surrounded by a number of islets, called by this name. S. lat. 14° 14'. E. long. 129° 54'.

KANAS, or Kangas, a town of Turkish Armenia; 60 miles S.E. of Erzerum.

KANASTER, is a name given in America to baskets of rushes or cane, in which they put the tobacco which they sell into Europe; hence arises the name of kanner tobacco, the belt of which comes from Laskaroub.

KANAZAVA, in Geography, a town of Japan, in the island of Niphon; 130 miles N.E. of Meaco.

KANCABA, a town of Africa, in the kingdom of Mandingo, seated on the Niger, a mart for slaves; 16 miles S.E. of Kamalia.

KANDA, a town of Africa, in the kingdom of Congo; 30 miles N.E. of St. Salvador.—Allo, a town of Japan, in the island of Xucoco; 16 miles S.E. of Ovutil.

KANDABAGA, mountains that form part of the boundary between Ruffia and Chinee Tartary, a part of the great chain W. of the river Oka. See Sayane Mountains.

KANDABIL, a town of Peria, in the province of Mcoran, 285 miles S. of Candahan. N. lat. 28° 28'. E. long. 67° 20'.

KANDAL, a town o. the N. coast of the island of Java, S. lat. 6° 48'. E. long. 110° 18'.—Allo, a town of Abyfisia, near the coast of the Red sea. S. lat. 14° 30'. E. long. 41° 15'.

KANDALAKS, a town of Ruffia, in the government of Archangel, on the N. coast of the White sea; 140 miles S.S.E. of Pola.

KANDARPA, a name of Kama, the Hindoo god of love. See Hanuma.

KANDERHIIL, in Geography, a town of Hindooitlin, in the Carnatic, formerly the capital of a kingdom, called Narbaga, and the residence of a Hindoo king, whose dominions extended over Tanjore and Madura. In 1640, a descendant of the reigning prince permitted the English to form a settlement at Madras. It is distant 70 miles N.W. from Madras. N. lat. 13° 40'. E. long. 79° 24'.

KAMDEIL-RAO, or KANDUBA, in Hindoo Mythology.
KAN

an avatar or incarnation of Siva; his confort, Parvati, having been also incarnated, under the name of Mafala, to accompany her lord in this manifestation, which is said by some to have occurred in the Carnatic, for the purpose of destroying a giant named Manimal. A magnificent temple is dedicated to the worship of Siva, in this incarnation, at Jeyur. It is described under that article; and by some it is said, the incarnation happened there. The incarnated pair are generally represented together on horseback, with a dog, he being four armed. Images and pictures of them are very common in the Madrasha country, where Kandeh Rao is a popular deity, and is very extensively propitiated. Several engravings of the subject of this article are given in Moor's Hindu Pantheon.

KANDEK, in Geography, a town of Asian Turkey, in the province of Natal; 48 miles E. of I'mid.

KANDEL, in Botany. See RHIZOPHORA.

KANDERI, in Geography, a town of Asian Turkey, in Natalia; 44 miles N. of I'mid.

KANEKING, a town of the Arabian Ira; 22 miles N.N.E. of Shehrban.

KANEM, a city of Africa, in the way from Fessan to the capital of Bornoon. The inhabitants of the adjacent country are composed of Medes and Pagnas, and are employed in breeding cattle, and raising innumerable horses for the service of the king; 135 miles N. of Bornoon. N. lat. 34°. E. long. 27°. 40'.—Also, the name given by the geographer Ediff to the kingdom of Bornoon; which see.

KANG, or Chinesa Stoves, is a kind of flove that is heated by means of a furnace, which calls all its heat into it. The furnace is adapted to the fire of the flove which it is intended to heat, and it may be placed either in a room that is used, or an adjoining room, or on the outside of the house. The heat of this furnace, impelled by the outward air, rushes through a flint into the tube or conductor; and passing through this into another pipe or channel at right angles to it, living under the middle of the floor of the flove, spreads through the flove by vent-holes in this last pipe, and is communicated to the bricks which form the pavement of the flove, and from them through the whole room. The smoke is carried off by funnels at both ends of the floves. See a drawing and description of this kind of flove in Phil. Trans. vol. lxi. p. 1. art. 7.

Any kind of fuel is used in the heating furnaces, but coal is generally used: it is observed, that in order to draw off the noisome vapours of the air, equally heated by the coal fire, the Chinese always keep bowls of water in the rooms, and occasionally renew them; and the emperor's apartments in the palace are decorated with flower-pots, and little orange-trees, &c. which, as the Chinese philosophers allege, is the best way of sweetening the air, and absofbing the fery particles dispersed in it.

KANGA, in Geography, a sea-port of Africa, in the kingdom of Loango, situated in a sandy bay of the Atlantic, where vessels may ride at anchor within mulet-shot of the shore, in fair or five fathoms water.

KANGANPAA, a town of Sweden, in the government of Stockholm; 27 miles N.E. of Borghorpe.

KANG-NI, a town of Hindostan, in Mysore; 25 miles W of Tademer.

KANGASAK, a town of West Greenland. N. lat. 62°. W. long. 48°.

KANGASALA, a town of Sweden, in the province of Tavalland; 30 miles N. of Tavallland.

KANGASALM, a town of Sweden, in the province of Tavalland; 30 miles N.W. of Tavallland.

KANGCHIAN, a town of Corea; 16 miles E. of Kange人身.

KANGLE, a town of Africa, in the kingdom of Kaffo; 33 miles S.E. of Koominkary.

KANGELANG, an island in the East Indian sea, about 25 miles from east to well, indented on the south coast with two or three considerable bays. S. lat. 6°. E. long. 15° 44'.

KANGIS, a town of Sweden, in Veil Bodhia; 80 miles N. of Turin.

KANG-TCHEOU, a town of Corea, in Kinchon; 170 miles S.E. of Peking. N. lat. 35° 46'. E. long. 121° 40'.

KANG-TCHEOU, a city of China, of the first rank, in the province of Kiang-su; situated on a river of the same name. Its river, port, riches, and population, serve to attract strangers. Near the walls of the city is a very long bridge, composed of 130 boats, joined together by strong iron chains. The custom-house is upon this bridge, where a receiver constantly resides, to visit all barks, and examine if they have paid the necessary duties. Two or three moveable boats are so placed, that by their means the bridge can be opened or shut, to give or stop a passage; and no barks are suffered to pass that have not been examined. In the territory belonging to this city, a great number of those valuable trees grow, from which varnish diills. Its district is extensive, and contains twelve cities of the third class. N. lat. 25° 32'. E. long. 114° 20'.

KANG-TCHIN, a town of Corea; 48 miles S.W. of Koang-techeou.

KANGUROO, in Zoology, an animal on the coast of New Holland, which, when full grown, is as big as a sheep, and in form resembling the jerboa. The head, neck, and shoulder, are very small in proportion to the other parts of the body; the tail is nearly as long as the body, thick near the rump, and tapering towards the end: the fore-legs of one of them measured only eight inches in length, and the hind-legs twenty-two: the progress is by successive leaps or hops of a great length, in an erect posture: the fore-legs are kept bent close to the breast, and seem to be of use only for digging. The skin is covered with a short fur, of a dark mouse or grey colour, excepting the head and ears, which bear a light resemblance to those of a hare. Hawkeworth's Voyages, &c. vol. in. p. 174.

KANHAWA, in Geography, a large mountainous county of America, on the western side of Virginia, having the Ohio river on the north-west, and Kentucky on the west. The population consists of 3508 free inhabitants, and 24 slaves. About seven miles from the mouth of Elk river, in this county, is a burning spring, sufficiently capacious to hold forty gallons. A bituminous vapour constantly issues from it; and on presenting a torch with a wick of twenty inches of its mouth, a column of flame ascends to the height of three or four feet, and about eighteen inches in diameter, which burns sometimes for ten minutes, and at other times continues three days.

KANHAWAY, a river of Virginia, the head waters of which, are in the western part of North Carolina, in the most easterly ridge of the Alleghay or Appalachian mountains, and south of the thirty-sixth degree of latitude. Their head branches encircle those of the Hol- lown, from which they are separated by the iron mountain, through which it passes ten miles above the head mines. About forty miles from Little river it receives Green Bear river. About forty miles below the mouth of Green Bear river in Virginia, in the Kanhaway, is a remarkable cataract, the
the water falling over a rock that traverses the bed of the river about fifty feet perpendicularly. The obstacles to the navigation of this river are the Great Falls, ninety miles above its mouth; and from these falls to the mouth of Green Brier is a distance of 100 miles. Its mouth, where it falls into the Ohio, in the north-west part of Virginia, (N. lat. 38° 55' W. long. 82° 15') is 280 yards wide.

KANAWAY, Little, a small navigable river of Virginia, 150 yards wide at its mouth in the Ohio, (N. lat. 39° 6' W. long. 81° 53') and navigable only ten miles.

KANJA, Yansia, or Tanja, a town of Persian Armenia, on a small river which runs into the Kur; 150 miles E.N.E. of Erivan.

KANJEE, a town of Hindooftan, in Berar; 20 miles N. of Notehaugon.

KANIK, a town of Africa, in the kingdom of Bambarra, seated on the Niger; 100 miles S.W. of Sego.

KANLOW, a town of Russian Poland, in the plateau of Kiev, on the Dnieper; 50 miles E. of Bialacekew.

KANISS, a town of Africa, in Nubia, on the well side of the Nile; 25 miles E. of Dongola.

KANITZ, a town of Moravia, in the circle of Brunn; 10 miles S.W. of Brunn. N. lat. 49° 4'. E. long. 16° 21'.

KANKANAN, a town of Hindooftan, in Lahore; 12 miles S.E. of Lahore.

KANKARKA, a town of Africa, in Mandingo. N. lat. 12° 20'. W. long. 5° 45'.

KANKERARA, a town of Hindooftan, in the circuit of Kottah; 32 miles W. of Kottah.

KANKY-LADY, a town of Africa, in the country of Fouta. N. lat. 10° 65'. W. long. 16° 5'.

KANNAKA, a town of Hindooftan, in the country of Kattack, at the mouth of the river Brumne; 15 miles N.W. of Point Palmiras.

KANNCOONGAN POINT, a cape on the east coast of Borneo. N. lat. 1° 3'. E. long. 119'.

KANNETHI, a town of Hindooftan, in the circuit of Sumbul; 15 miles N. of Ndjeabad.

KANNYA, a town of Hindooftan, in Rohileund; 35 miles S. of Bereily.

KANOOREA, a town of Hindooftan, in Goondwanah; 75 miles N.N.E. of Napppour.

KANOON, a town and fortrefs of Hindooftan, in the country of Mewat; 70 miles S.W. of Delhi. N. lat. 28° 3'. E. long. 76° 20'.

KNOUG, Little, or KNOOUNGLEY, a town of the Birman empire, on the Irrawaddy, in the vicinity of which are plantations of various fruit trees, and fields well fenced and regularly laid down; with every aspect of industry and plenty.

KNOOUNG, Great, or KNOOUNGGERE, a long town, situated like the preceding, with a good quay, and well constructed wooden flais, confulting of 100 steps, defending to the water's edge. The population in the neighbourhood of this and the forementioned town is confiderable.

KNOOWLY, a town of Hindooftan, in the country of Vifapur; 22 miles E.S.E. of Poonah.

KANA, in Hindu History, the uncle of Krishna, whom, as his predilected delrover, Kaafa made many vain attempts to put to death. After several fruitless efforts, Kaafa ordered all male infants to be slain; in a manner that reminds us of the cruelty of Herod on a similar occasion. See KRIFHAW.

KANSAKI, in Geography, a town of Japan, in the island of Ympou; 28 miles S.W. of Mecoe.—Allo, a town of Japan, in the island of Ximo; 15 miles S.W. of Ikna.

KANSEZ, a river of Louisiana, which runs into the Missouri, N. lat. 38° 45'. W. long. 95° 35'.

Kanez, Little, a river of Louisiana, which runs into the Missouri. N. lat. 38° 17'. W. long. 04° 53'.

Kanse, a town of Louisiana, seated on the river Kan- sz; 240 miles W. of Genevieve. N. lat. 38° 5'. W. long. 95° 54'.

KANSKOEI, a town of Russia, in the government of Koliva, on the Kan, in which is carried on a considerable trade in furs; 140 miles E. of Kraf-noark.

KANSON, an island in the Red sea, about twenty miles long, and from two to five broad. N. lat. 16° 44'. E. long. 42° 40'.

KANSZILLI, a town of European Turkey, in Baffa- rabia; 28 miles S. of Bender.

KANT, in Biography. See Kantism.

KANTAMATI, a name of Radhia, the wife or mistress of Krishna. See Radha.

KANTERA, Et, in Geography, a town of Africa, in the kingdom of Tunis; 14 miles N. of Tunis.

KANTISM, or philosophy of Emanuel Kant, in the History of Literature, is the denomination of a system of metaphysical science, invented and propagated with great avidity on the continent in the close of the eighteenth century. It is now, even in its birth-place, much neglected; and will probably, in another half century, fall into utter oblivion. The celebrity, however, to which it attained, requires that a pretty full account should be given of it, in a work devoted to the illustration of the principles espoused and vindicated by men endowed with superior talents and ardent tempers. We shall, accordingly, first give a biographical sketch of the philosopher, and then endeavour to unravel and develop the secrets of his system.

Emanuel Kant was born April 22d, 1724, in the suburbs of Konigberg, in Prufia. His father, John George Kant, was a tailor, born at Memel, but originally descended from a Scotch family, who esp't their name with a C; but the philosopher, the subject of this article, in early life, converted the C into a K, as being more conformable to German orthography. Emanuel, the second of six children, was indebted to his father for an example of the strictest integrity, and the greatest industry; but he had neither time nor talent to be his instructor. From his mother, a woman of found sense and ardent piety, he imbibed sentiments of warm and animated devotion, which left, to the latest periods of his life, the strongest and most reverential impressions of her memory on his mind. He received his first instructions in reading and writing at the charity school in his parish; but soon gave such indications of ability and inclination to learn, as induced his uncle, a wealthy shoe-maker, to defray the expense of his further education and studies. From school he proceeded to the college of Fridericianum. This was in the year 1740; and his first teacher was Martin Kautzen, to whom Kant was strongly attached, and who devoted himself with no less zeal to the instruction of his pupils, and contributed very greatly to the unfolding of his talents. His favourite study at the university was that of mathematics, and the branches of natural philosophy connected with them. On the completion of his studies, he accepted a situation as tutor in a clergyman's family. In this, and in two other similar situations, he was not able to satisfy his mind that he did his duty so well as he ought; he was, according to his own account, too much occupied with acquiring knowledge to be able to communicate the rudiments
KANTISM.

ments of it to others. "I always," said he, "valued the
usefulness of instructing of young people; but I could never
love myself to their infant capacities." Having acted in
the capacity of a tutor for nine years, he returned to Königberg,
and maintained himself by private instruction, that he might
be ready to embrace the first opportunity that offered
of being introduced to a higher sphere of action in the uni-
versity. In 1746, at the age of twenty-two, he began his
literary career with a small work, intituled, "Thoughts on
the Elevation of the Animal Powers, with Strictures on
the Proofs advanced by Leibnitz and other Mathematicians
on this Point; to which are annexed, various Reflections
on the Powers of Bodies in general." In 1754, he pub-
lished "An Examination of the Prize Question of the Berlin
Society,—Whether the Earth, in turning round its Axis, by
which the Sucecession of Day and Night was produced, had
undergone any Change since its Origin? What could be
the Causes of it? and how we could be affur'd of it?"
This work acquired him great reputation as a philosopher,
and paved the way to his long-deferred promotion to a degree
in the university. In the year 1755, he was chosen mem-
ber of arts, and entered immediately upon the task of lecturing,
which he performed to his own satisfaction, and the enthusi-
astic approbation of a very crowded audience. During the
space of fifteen years, which he continued in this office,
he published a variety of tracts on the different branches of
science. Among these may be mentioned, 1. "An uni-
versal Natural History and Theory of the Heavens, or an
Essay on the Conflation and mechanical Structure of the
whole Globe, according to the Newtonian System."
On this subject his biographer says, "that the justice of Kant's
theory was, thirty years afterwards, evinced by the prac-
tical investigation of Herschel." 2. "Principiorum
priorum Cognitionis Metaphysicae nova Dilucidation.", 3. In
1758, he gave the world "New Principles of Motion and
Rest, and the Reflets connected with them in the Funda-
amentals of Natural Philosophy." This work excited very
much notice, and was afterwards instated more at large in
his later writings. 4. In 1759, he published "Considera-
tions on Optimism." And, 5. In 1763, "The only pos-
fible Grounds for a Demonstration of the Deity." In the
latter mentioned work, the author wished to throw that with
out pre-supposing the independent existence of ourselves, or
that of other spirits, something is possible; and on that
proof alone refts the grounds by which to demonstrate the
existence of a Deity. This piece contributed very much to
establish his literary character. The first traces of that
metaphysical system, which has given much celebrity to
the name of Kant, are to be found in his inaugural disserta-
tion, "De Mundi sensibilis atque intelligibilis Forma et Prin-
cipis," which was written in the year 1773, when he was
appointed to a professorial chair in the university of
Königberg. He had, prior to that, the kind offer of prefer-
ment, which he declined. His reputation and literary char-
acter had been long known to the Prussian monarch, who
had made him repeated offers of a professorhip in the uni-
versities of Jena, Erlangen, Munich, and Halle; and also to
have invested him with the character of privy councilor.
He declined all these honors, from an attachment to his natu-
ral place. He wished to labour and to be useful on the
spot where he had received his physical and mental exist-
ces; and it was not till March 1757 that the metaphysical
department at Königberg became vacant, which was imme-
diately bellowed upon him. The situation required his whole
attention to metaphysical subjects, and his succeeding pub-
lications were almost entirely of this nature. He pursued
this study with the most virtuous ardor, and entered
Vol. XIX.
the feet of the German Gamaliel. Truth was the object of his research, and liberality was the result. He wished to establish all human knowledge on the firm basis of reason; and rejected all principles as visionary, which did not admit of a fundamental explanation. He conceived, however, of religion as an inherent quality of the soul, which panted after some higher object than this transitory existence. It demanded no proof from without; it flowed of itself from within ourselves. Hence he was accused by some of mysticism, and by others of infidelity: but it seems certain from the testimony of his best friends, and from the whole tenor of his works, that he was a firm believer in the existence of a great First Cause, in a future state of rewards and punishments, and in Christianity. In his political opinions, he held that all men were originally born free; but, though a citizen of the world, he was, at the same time, a friend to peace and good order, and deprecated every violent effort which was made to acquire that freedom to which all men are by nature entitled; and in his own private conduct, he always testified due respect and submission to established authority. His biographers, M. Charles Villers, Kant is represented as having never withdrawn, in a life of eighty years, from his native city; contenting himself, in the true simplicity of a sage, with the occupations of study, and the society of a few favoured friends. It is not merely as a metaphysician that he claims to be considered; for there is scarcely a science which he has not endeavoured to illustrate. He is a mathematician, an astronomer, a chemist; in natural history, in physics, in physiology, in history, in languages, and literature, and the arts; in all the details of geography, as they relate to the exact situation of the parts of the globe, their inhabitants, and productions, every thing is familiar to him. The prominent feature in Kant's intellectual character was the accuracy with which he analysed the most complex ideas. Nothing escaped the scrutiny of his intellectual eye. Whatever was barely perceivable to others in the moral and physical world, became manifest to him. He discovered, therefore, very easily the congruities of other men's sentiments, and traced with perfect precision their errors to their true source. He had likewise the faculty of unfolding the most abstruse principles, and digelling single and individual sentiments into a systematic order. He placed the originality of his mind. He viewed the world through the medium of his own happy temper, and found every thing around him agreeable and alluring. He is said to have united in the happiest degree two qualities so rarely combined in one person; — the greatest acuteness of reasoning, with the polit of a gentleman. He possessed the enviable talent of making every thing interesting upon which he spoke, and of being able to speak upon every subject. Such was professor Kant. We shall now touch upon his theory as a metaphysician.

Before entering a vast number of words of his own invention, chiefly derived from the Greek language, Kant uses expressions, which have long been familiar to metaphysicians, in a sense different from that in which they are generally received; and hence a large portion of time is requisite to enable the most sagacious mind to ascertain with precision the import of his phraseology. He divides all our knowledge into that which is "a priori," and that which is "a posteriori." Knowledge "a priori" is conferred upon us by our nature; and knowledge "a posteriori" is derived from our sensations, or from experience; and it is, in this system, denominated "empirical." Kant does not, as this division would seem to imply, intend to revive the doctrine of innate ideas. He considers all knowledge as acquired: he maintains that experience is the produceer of all knowledge, and that without it we could not have had a single idea. Our ideas "a priori," he says, are produced with experience, but not by it, or do not proceed from it. They exist in, and are forms of the mind. They are distinguished from other ideas by two marks, which are easily discerned: they are universal and necessary; they admit of no exception, and their converse is impossible. Ideas which we derive from experience have no such characters. We can imagine that what we have seen, or felt, or heard once, we may see, or feel, or hear again; but we do not perceive any impossibility in its being otherwise. Thus, if I see a building on fire, I am certain of this individual fact; but it affords no general knowledge. But if I take twice two small balls, and learn to call twice two four, I shall immediately be convinced that any two bodies whatever, when added to any other two bodies, will constantly make the sum of bodies four. Experience affords the opportunity of acquiring this knowledge; but it has not given it: for how could experience prove that this truth should never vary? Experience must be limited, and cannot teach what is universal and necessary. His is an experience which discovers to us that we shall always have the surface of a whole pyramid, by multiplying its base by the third part of its height; or, that two parallel lines extended "in infinitum" shall never meet.

All mathematical truths, according to Kant, are "a priori;" thus, that a straight line is the shortell of all possible lines between two given points; that the three angles in any plane triangle are always equal to two right angles, are propositions which are true "a priori." Pure knowledge "a priori," is that which is without any mixture of experience. Two and two make four, is a truth of which the knowledge is "a priori;" but it is not pure knowledge, because the truth is particular. The ideas of substance, and of cause and effect, are "a priori;" and when they are separated from the objects to which they refer, they form, according to this system, "void ideas." It is our knowledge "a priori," that is, the knowledge which precedes experience, as to its origin, which renders experience possible. Our faculty of knowledge has an effect on our ideas of sensation, analogous to that of a veil which gives its own form to the liquor with which it is filled. Thus, in all knowledge "a posteriori," there is something "a priori," derived from our faculty of knowledge. All the operations of our minds, all the impressions which our senses receive and retain, are brought into effect by the conditions, the forms, which exist in us by the pure ideas "a priori," which alone render all our other knowledge certain. Time and space are the two essential forms of the mind; the first, for impressions received by the internal senses; the second, for those received by our external senses. It is by means of the form space, that we are enabled, "a priori," to attribute to external objects imperceptible, indivisibles, &c.; and it is by means of the form time, that we attribute to any thing duration, succession, &c. Arithmetic is derived from the internal senses, and geometry from that of our external. Our understanding collects the ideas received by the impressions made on our organs of sense, consorts on those ideas unity by a particular energy "a priori," and thereby forms the representation of each object. Thus a person is successively struck with the impressions of all the parts which form a particular garden. His understanding unites these impressions, or the ideas resulting from them; and in the unity produced by the act, it acquires the idea of the whole garden. If the objects which produce the impressions, afford also the matter of the ideas, then the ideas are "empirical;" but if the objects only unfold the forms of the thought, the ideas are "a priori."

*Judgment*
Judgments are divided into two species; analytic and synthetic. An analytic judgment is one in which the attribute is the mere development of the subject, and is found by the simple analysis of the perception, as, a triangle has three sides. A synthetic judgment is one in which the attribute is connected with the subject by a cause or basis taken from the faculty of knowledge, which renders this connection necessary, as, iron is heavy; wood is combustible; the three angles of a plane triangle are equal to two right angles.

The forms of the understanding are, in this system, quantity, quality, relation, modality. Quantity is distinguished into general, particular, and individual; quality, into affirmation, negation, infinite; relation, into categoric, hypothetic, and disjunctive; and modality, into problematic, certain, and necessary. M. Kant adds likewise to the properties of the four principal forms of the understanding a table of categories, or fundamental ideas, "a priori."

Pure reason is the faculty of tracing our knowledge "a priori," to subject it to principles, to trace it from its necessary conditions, till it be entirely without condition, and in complete unity. The great work of Kant is divided into several parts, under the titles, "Of Analytical Transcendentals;" "Of Transcendental Logic;" "Of the pure Ideas of the Understanding;" "Of the Transcendental Judgments;" "Of the Paralogism of pure Reason," &c.

We cannot, from the nature of our work, discuss all the parts of the system; but may observe, that the author contends that we know objects only by the manner in which they affect us; and as the impressions which they make upon us are only certain apparitions or phenomena, it is impossible for us to know what an object is in itself. Hence the system of Kant has been compared with that of Berkeley, which maintains that sensations are only appearances, and that there is no truth, only in our reason. But Kant does not go to this length. According to his theory, the understanding, when it considers the apparitions or phenomena, acknowledges the existence of the objects themselves, in so much as they serve for the bases of those apparitions; though we know nothing of their reality, and though we can have no certainty but in experience.

Trust, according to our author, confides in the agreement of our notions with the objects, in such a manner as that all men are obliged to form the same judgment: belief confides in holding a thing to be true, in consequence of a persuasion which is entirely personal, and has not its basis in an object submitted to experience. There is a belief of doctrine; as, that "there are inhabitants in the planets," which is not the same as moral belief; because in moral belief there is something necessary. The ordinary mode of teaching the existence of God belongs to the belief of doctrine; and it is the same with regard to the immortality of the soul; nevertheless, the author was a firm believer in the existence of God, and a future state; because, said he, "this persuasion renders immovable my moral principles,—principles which I cannot reject, without rendering myself contemptible in my own eyes. I wish for happiness, but I do not wish for it without morality; and as it depends on nature, I cannot wish it with this condition, except by believing that nature depends on a Being who causes this connection between morality and happiness. This supposition is founded on the want or necessity of my reason, and not on my duty. We have, however," says Kant, "no certainty in our knowledge of God; because certainty cannot exist, except when it is founded on an object of experience. The philosopher acknowledges that pure reason is too weak to prove the existence of a being beyond the reach of our senses.

The necessity of believing in God is, therefore, only subjective, although necessary and general for all those beings who conform to their duty. The proofs of natural theology, taken from the order and beauty of the universe, are proofs only in appearance. They resolve themselves into a bias of our reason to suppose an infinite Intelligence, the author of all that is possible; but from this bias it does not follow that there really is such an author. To say, that whatever exists must have a cause, is a maxim, "a priori;" but it is a maxim applicable only to experience; for we know not how to subject to the laws of our perceptions that which is absolutely independent of them. It is impossible to know that God exists; but we can comprehend how it is possible to act morally on the supposition of the existence of an intelligent Creator,—an existence which practical reason forces theoretical reason to adopt. This proof not only persuaded, but even acts on the conviction, in proportion as the motives of our actions are conformable to the law of morality. Religion ought to be the means of virtue, and not its object. Man has not in himself the idea of religion, as he has that of virtue. The latter has its principle in the mind; it exists in itself, and not as the means of happiness; and it may be taught without the idea of God, for the pure law of morality is "a priori." He who does good by inclination, does not act morally. There are compassionate minds, which feel an internal pleasure in communicating joy around them, and who thus enjoy the satisfaction of others; but their actions, however just, however good, have no moral merit, and may be compared to other inclinations,—to that of honour, for example, which, while it meets with that which is just and useful, is worthy of praise and encouragement, but not of any high degree of esteem. According to Kant, we ought not even to do good, either for the pleasure which we feel in doing it, or in order to be happy, or to render others happy; for any one of these motives would be empirical, and injure the purity of our morals. We ought to act after the maxims derived "a priori," from the faculty of knowledge, which carry with them the idea of necessity, and are independent of all experience; after the maxims which, it is to be wished, could be erected into general laws for all beings endowed with reason.

Such seem to be the leading principles of the philosophy of Kant. It is not our business to enter into a critical examination of them; but the reader will find this very able done in the first volume of the Edinburgh Review, said to have been written by Mr., now Lord, James Mackintosh.

Kant, there is no doubt, was very sincere in all the opinions which he maintained. He was a most decided enemy to faith and creed of every kind. He never could consider himself as unlike an unbeliever, and in his own language, he was meritorious to avoid every thing that could convey a false idea of himself. Nothing could draw him into a temporary renunciation or qualification of his sentiments; but whenever a free declaration of his opinions was not found agreeable, he was careful never to appear. He wished, in all his actions, to show himself to the world simply as he was, unvarnished by any false art whatever; and he even condemned the attempts to conceal one's merit under a forbidding appearance. He had a high sense of his own dignity, as an individual in the scale of existence; and he had no fear of being every man, as an independent and thinking being, and ensued their sentiments by a respectful deportment towards all. For men under every form, and in every person, whether of his own or contrary sentiments, he testified the most unequivocal esteem.

After the death of Mr. Kant, a beautiful medal was executed by M. Abbeauon of Berlin, as a memorial of his great
KAO

talents. Go one side is a striking likeness of the philosopher, with the inscription "Immanuel Kant nat. 1724." On the reverse, the artist has attempted to express the forces which Kant has rendered to speculative philosophy, by afflicting limits to its emprise, and to flew, at the same time, the madness of attempting to pass those limits. This he has represented by a Minerva seated, and holding an owl in her right hand, which prevents from flying, with the inscription, "Alius volantem arcuit." Monthly Magazine, 1804. Edinburgh Review, vol. i. Supp. to Encyc. Brit.

KANTO, in Geography, a town of Japan, in the island of Nipon; 140 miles W. of Macao.

KANTOR, a country of Africa, on the south side of the Gambian, with a capital of the same name.

KANTREFF, or Kantree, See Cantred.

KANTURK, in Geography, a market and port-town of the county of Cork, province of Munster, Ireland, situated on the river Dalua; 123 miles S.W. from Dublin, and 4 miles S.E. from Newmarket.

KANWARAH, a town of Hindoostan, in the circuit of Gurrah; 30 miles S. of Mahur.

KAO, one of the Friendly islands, in the South Pacific ocean, called also Aghaoo or Chacao, and Kaybay. S. lat. 19 17'. E. long. 152° 5'.

KAO-CHAN, a small island in the Chinese seas, and the most westernly of those called Mus-tau; 18 miles N.W. of Tung-teboon.

KAOLIN, the name of one of the two substances which are the ingredients of china-ware. The other, which is called petunite, is easily vitrifiable, and this kaolin is scarce at all; whence the fire composes from a mixture of them both a semi-vitrification, which is china-ware. See Porcelain.

The kaolin, used in the composition of porcelain, requires less labour than the petunite. There are large mines of it in the bosoms of certain mountains, the exterior strata of which consist of a kind of red earth. These mines are very deep, and the kaolin is found in small lumps, that are formed into bricks, after having undergone the same process with the petunite; which see. Father d'Entrecalles thinks that the earth called terre de Matte, or St. Paul's earth, has much affinity to the kaolin, although it has not those small fining particles which are intermixed in the latter.

M. Reaumur had an opportunity of examining this substance, not in its native state, but only in form of small bricks, made out of the pale of the powder of the native kaolin and water. He found it of a white colour, and sprinkled all over with fine glittering particles; but these did not judge to be fragments of a different substance mixed among the bricks, as are the small flakes of tale in our clays and licks; but that the whole mass was composed of some stone reduced to powder, and made into a paste with water, and that these larger flakes were only coarser particles of the powder; the examination of which he promised himself would discover what the stone was of which they were formed. And this was the more worthy of a diligent inquiry, since the petunite might easily be supplied by many of our own earths and clays: nothing being required of that but a substance easily running into a white glass. But the difficulty of vitrifying this other ingredient renders it a thing much more difficult to be supplied by one of the same nature among our clays. The comparison of these, with other mineral substances, soon proved that they were of the nature of tale; or, in other words, that kaolin was tale powdered, and made up into a paste with water. And to be asked whether the whole mass was tale powdered, or any thing else with a mixture of tale, he separated the particles of the kaolin by water, and found the small ones wholly the same with the larger; and that the larger, when reduced to powder alone, made with water a paste, wholly the same with the kaolin. It is well known, that the fragments of tale have a great resemblance to the partly part of some shell fishes; and hence unquestionably has arisen the opinion of porcelain being made of sea shells; ignorant persons having seen the tale of kaolin, and taken it for a shelly matter. Tale has not yet been successfully used in any of our European manufactures of porcelain; but it is easy to see, from many unanswerable reasons, that since China porcelain is made of a mixture of vitrifiable and unvitrifiable matter, nothing is so likely to succeed with us in the place of the last of these as tale.

1. We know no substance in the fossil world so difficult to reduce to glafs as tale, which, if put into the forge, of our fires, in a crucible, is not to be vitrified, nor even calcined. 2. We know no substance which keeps so much brightness after having passed the fire as tale, or that is so pure a white; whence we may also learn that it is not to the petunite alone, that the china-ware owes its whiteness, but that the kaolin is instrumental to the giving it that colour. 3. Tale is transparent, and, in some degree keeps its transparency after the action of the most violent fire. If we are to make porcelain of a vitrifiable and unvitrifiable matter mixed together, yet it is necessary that the unvitrifiable one should retain its transparency, otherwise it would obscure the mass; and tale is therefore the only known substance qualified for this purpose. Persons who have been at the china works, say, that the porcelain is made of equal quantities of petunite and kaolin, and it is therefore a just and exact semi-vitrification. 4. Tale is well known to have a great flexibility or toughness, and as it is found to preserve this even after it has passed the fire; it is very probable, that it is owing to this property of the kaolin that the china-ware is so much less brittle than glafs. Mem. Acad. Par. 1727.

It has been before observed, that we may easily, in Europe, be provided with different substances, which will, in our porcelain manufactures, supply the place of the petunite of China, and tale appears equally qualified to serve instead of the kaolin. For this purpose we may use the common Mufcovy tale, or linoglas, used by our miniature-painters to cover their pictures instead of glafs, and, by the curious, to preserve objects for the microscope; or perhaps the Venetian tale of the druggists would succeed even better; at least the process is so rational, as to be extremely well worth trying.

But this kaolin is more probably an argillaceous earth, from its forming with water a mass tenacious enough to be made into the leaves into which it is brought over. M. Bo- mare says, that by analysing some Chinese kaolin, he found it was a compound earth, consisting of clay, to which it owed its tenacity; of calcareous earth, which gave it a mealy appearance; of sparkling particles of mica, and of small gravel or particles of quartz crysals. He says, that he has found a similar earth upon a stratum of granite, and conjectured that it may be decomposed granite. This conjecture is the more probable, as kaolins are frequently found in the neighbourhood of granites. See Clay, Holand, and Porcelain Earth.

KAO-TCHEAU, in Geography, a city of China, of the first rank, in the province of Queng-tong, situated in a delightful and fertile country, on a river, about 36 miles from the sea. The tile ebb and flows as far as this town, and serves for bringing up to it the Chinese barks. It has in
KAP

KAR

KAPAR, a town of Prufia, in the circle of Smalnad; 10 miles W. of Konigberg.

KAPAW, a town of the island of Bornco, near the E. coast; 100 miles E.S.E. of Nagara.

KAPL, an officer in the eastern countries for gate.

KAPILA, in Biography, a very eminent literary character among the Hindus, and founder of one of their philosophical schools, having many tenets in common with the theories introduced to Europe by Pythagoras, especially that of the unawakened slaying animals to eat, under pretense of a sacrifice; as seemed to have been very extensively practiced in India. This benevolent doctrine became so approved, that the grateful Hindus have defined Kapila; affirming that he was an incarnation of the god Vishnu, under the name of Vafdeva, as Kapila is called in their sacred romances, the Puranas. His theory is named Sankya, which seems a modification of that called Mimana, which corresponds with the Platonie. These points are slightly touched on in Moore's Hindu Pantheon, and the same writer, in a peculiar work, (Hindoos Infanticide) says that 'Kapila expounded to the Hindus the same tenet (the immortality of things) modified, to give it the attraction of variety and novelty. He, as Epicius did after him, tricked out his theory in so meretricious a style, as to have provoked, from more sober reasoners, the opprobrium of atheism. See Mimansa and Sankya.

KAPLANIK, in Geography, a town of European Turkey, in Macedonia; 60 miles N.E. of Akrada.

KAPLITZ, a town of Bohemia, in the circle of Bechin; 9 miles S.E. of Crmania.

KAPOS, a town of Hungary. — Alto, a river which runs into the Danube, six miles from Mohacs.

KAPOSVAR, a town and capital of Hungary, formerly very strong, but now much reduced; 12 miles W. of Altenburg; N. lat. 46° 20'. E. long. 17° 51'.

KAPPAS, a tribe of Illinois Indians, in Louisiana, formerly very numerous. Their country is now ppopulous. — Alto, a town of Louisiana, on the Mississippi; 130 miles N.W. of New Madrid, N. lat. 34° 30'. W. long. 91°.

KAPPAS Old Fort, situated in Louisiana, at the mouth of the river St. Francis, and built by the French, principally for a magazine of stores and provisions, during their wars with the Chickasaws, by whom their Indian attacks were attacked and destroyed.

KAPRIAN, a town of European Turkey, in Moldavia; 60 miles E. of Jaffa.

KAPSBERGER, JOHANNES HIERONYMI, in Biography, a German of noble birth, celebrated by Luther (Murina), and by many others, was not more famed for the number and variety of his compositions, than for his exquisite skill in performing upon almost every species of instrument; but more particularly on the theorbo lute, which seems to have been a new invention in the 17th century. The author's name has not been recorded; but it is said to have been of Neapolitan extraction. The difference between the common lute and theorbo was in the latter having two necks, and thence called in Latin Citara viyuga.

Kapfberger, who affixed Kircher in compiling many parts of his Musurgia, is highly praised by that laborious, but often credulous and visionary author; but, according to Bapt. Doni, Kapfberger was equiasious and presumptuous. The truth is, that the practical musician and the dilettante theorist were rivals in the favor of cardinal Barbini; afterwards Urban VIII., a lover and patron of music. Both the disputants were reformers, but with different views: Doni, a credulous believer in the miraculous powers of the music of the ancients, without understanding the modern; and Kapfberger, an innovator, who wished to have the compositions of Palestrina banished the church, in order to make way for his own. The feats of musicians and their parties are seldom worth recording; as it often happens that they are unable to explain to the public the cause of their difference.

KAPS DORF, in Geography, a town of Hungary; 26 miles N.N.W. of Caffow.

KAPTSCHAK, a large and well compacted state, which Banty, the kinsman of the great Tchinigis or Zingfikhan, founded, about the year 1245, fell, in the year 1444, into four khanates, viz. Kazan, Altracstan, Kaptschak, and the Krim. The fall of these were, somewhat more than 100 years afterwards, conquered by the Russians; but the fourth of these states preferred its independence above 250 years longer: At present, however, they altogether form a part of the Russian empire. The khanate of Kaptschak, which, from the time of its separation in 1444, has had its principal seat in the plain, which is now called the Altrakhan-lobpe, fell first. So long ago as the year 1526, it lost its last khan, and was divided among the sovereigns of Kazan, Altrakhan, and the Krim, on which at length it came to Russia by the conquest of the two former states. These repeated subjugations had reduced the Kaptschaks Tartars to an insignificant residue, which, now removed from its ancient home-head, dwells among Bashkirs and Kirghises, though still retaining its appellation, and the memory of its origin.

KAR, a town of Peria, in the province of Irak; 156 miles N. of Ippahn.

KARA, a river of Russia, which runs into the Karskoi sea, at Kankoi. — Alto, a town of Hindooistan, in Guzerat; 50 miles S.W. of Gogo. — Alto, a town of Hindooistan, in Berar; 8 miles N. of Chaidi.

KARA-AG A TZ, a town of European Turkey, in Romanis; 6 miles S. of Andrespol.

KARA BAG N, a town of Asiatic Turkey, in Natolia; 24 miles N. of Milesi.

KARA PHAIL, or the Black Garden, a mountainous province of the principality of George, south of the river Aras.

KARABAS, a mountain of Grand Bucharis; 70 miles N.W. of Samarkan. — Alto, a town of Persia, in the province of Irak; 70 miles S.W. of Ippidan.

KARA BARSAR, a town of Russia, in the government of Turan; 55 miles N.E. of Bazaray.

KARA.
KAR

KARABAZARI, a town of Asiatic Turkey, in Natolia; 20 miles W. of Kiangari.

KARABEE. See Carabbe.

KARABEI-SHEH, in Geography, a town of Persia, in the province of Mazanderan, on the coast of the Caspian Sea; 60 miles E. of Fehrabad.

KARABINAR, a town of Asiatic Turkey, in Caramania; 20 miles S. of Akfern.

KARABIOW, a town of Poland, in Podolia; 12 miles N. of Kamienie.

KARADOA, a town of Asiatic Turkey, in Natolia; 24 miles W. of Artaki.

KARABOGAS, a bay on the E. side of the Caspian Sea, 40 miles long and 25 broad, the water of which is very bitter. N. lat. 45° 15'. E. long. 54° 44'.

KARABOULAKI, a town of Georgia, in the province of Cardnel; 45 miles S. of Gori.

KARABUNAR, a town of Asiatic Turkey, in Caramania; 40 miles E. of Cogni.

KARAC, a town of Arabia Petraea, on the river Safa; 90 miles S. of Jerusalem. N. lat. 30° 44'. E. long. 33° 45'.

KARACAL, or CARACALLA, a town of Valachia; 60 miles S.W. of Bucharest.

KARACUZ, a town of Persian Armenia; 23 miles E.S. of Erivan.

KARADERA, a town of Asiatic Armenia; 16 miles S.S.E. of Merdin.

KARADEHLAR, a town of Asiatic Turkey, in Natolia; 36 miles S.W. of Cattamena.

KARADJUK, a town of Natolia; 20 miles S.E. of Derghin.

KARADRO, a town of Asiatic Turkey, in Caramania; 50 miles S.W. of Slefske.

KARADSHELAR, a town of Natolia; 40 miles N. of Angora.

KARAEVIAN, a town of Russia, in the government of Perm; 64 miles S.S.W. of Ekaterinograd.

KARAGANSKOI, Cape, a cape on the E. coast of the Caspian Sea. N. lat. 44° 20'.

KARAGINSKOI, an island in the N. Pacific ocean, near the N.E. coast of Kamtschatka, about 80 miles in circumference. N. lat. 59°. E. long. 162° 14'.

KARAGODE, a town of the island of Ceylon; 86 miles S. of Candy.

KARAGOL, a town of Grand Bucharia, seated on a lake; 24 miles S.W. of Bucharia.

KARAH, a town of Arabia, in the province of Nedsjed; 300 miles E. of Mecca.

KARAHAM, a town of Bengal; 13 miles N.W. of Teree.

KARAHISSAR, a town of Asiatic Turkey, in Caramania; 38 miles S. of Yurup. See Apion, &c.

KARAHOTUN, a town of Tartary, in the country of the Monguls; 120 miles N.W. of Peking. N. lat. 41° 16'. E. long. 121° 53'.

KARAJIN, a town of Poland, in the palatinate of Braclaw, near the Dog; 50 miles S.E. of Braclaw.

KARALIS, a town of Sweden, in the province of Svalcas; 45 miles N.N.W. of Nyfflot.

KARAITES. See Caraites.

KARAKHAI, in Geography, a town of Georgia, in the province of Kakhet; 80 miles S.E. of Tediria.

KARAKKOULA, a bay on the W. side of the island of Owyhee, one of the Sandwich islands, situated in a district called Akona. It is about a mile in depth, and bounded by two low points of land, at the distance of half a league, and bearing S.S.E. and N.N.W. from each other.

KARAKOL, the N. point, which is flat and barren, stands on the island of Kowrowa; and in the bottom of this bay, near a grove of tall cocoa-nut trees, there is another village of a more considerable size, called Kakooa; between their runs a high rocky cliff, inaccessible from the sea-shore. On the S. side, the coast, for about a mile inland, has a rugged appearance; beyond which the country rises with a gradual ascent, and is overcast with cultivated ineloreas, and groves of cocoa-nut trees, where the habitations of the natives are scattered in great numbers. The shore, all round the bay, is covered with a black coral rock, which makes the landing very dangerous in rough weather, except at the village of Kakooa, where there is a fine sandy beach, with a " morai," or burying-place, at one extremity, and a small well of fresh water at the other. This bay, appearing to Capt. Cook a proper place to rest the ships, and lay in a fresh supply of water and provisions, he called them to move on the N. side, about 4 of a mile from the shore, Kowrowa bearing N.W. This was in January 1779. The natives came from the shore in astonishing numbers, and expressed their joy by singing and shouting, and exhibiting a variety of wild and extravagant gestures. Capt. Cook was received by the chiefs of the island with a respect, approaching to adoration; and the natives, though they manifested a propensity to pilfering, treated him and his companions with a great degree of hospitality. On the 4th of February, the ships unmoored and failed out of the bay, being followed on their departure by a great number of canoes. It was the design of Capt. Cook to finish the survey of this island before he visited the other islands, in hopes of finding a road better sheltered than the bay which was now left. But the weather becoming equally and tempestuous, it was found necessary to return to this bay; where the natives manifested a very different disposition from that which they had discovered on the first visit. They now appeared hostile, and adverse to every exercise of hospitality. Several circumstances occurred, which served to widen the breach between the islanders and Capt. Cook; and it was found necessary to recur to the use of arms. For subsequent particulars, and an account of the unfortunate death of the commander, see his biographical article.

KARAKALPAK, a tribe of Tartars settled in Russia, who called themselves Kara-Kiptchaks, and inhabit the districts on the Syr Darya, a considerable river springing from the lake Aral. They divide themselves, according to their position, into the upper and the nether horde. Previous to the origin of the Kazanian khanate (see Kazan), they removed to the Volga; where, prevailed by the Nogays, they marched like the Chinvtes, not as other nations did to the west, but back towards the east, into their present seats. About the year 1742 the nether horde, then consisting of 30,000 kibitkas, implored the Russian protection; but the Kirghizes, against whom they were delicious of securing themselves, took such fantastic vengeance, that the greater part of them was exterminated, and those who remained were obliged to return to the upper horde. As they seldom have the courage to face from the Kirghizian captivity, their number in Russia is very small. Tooke's Ruif. Emp. vol. i.

KARAKAN, a town of Curdiatán; 10 miles S.W. of Bethlis.

KARAKECHIS, a town of Russian Armenia; 48 miles N.E. of Erivan.

KARAKERMAN, a town of European Turkey, in Bulgaria; 36 miles S.S.E. of Isfand. N. lat. 44° 45'. E. long. 29° 58'.

KARAKITA, a small island in the East Indian sea, belonging
longing to the king of Ternate. N. lat. 3° 16'; E. long. 125° 24'.

KARAKUM, or the Black Sand, the name of a great desert, which forms the northern boundary of Khorsak and modern Persia.

KARAKUMBOODY, a town of Persia, in the province of Schirvan; 23 miles S. of Scamachie.

KARALANSKA, a town of Russia, in the government of Iruttik, on the Tungulka; 72 miles N.W. of Ilímik.

KARALEIJANGO, a town of Africa, in Kaarta. N. lat. 14° 26'; W. long. 34° 20'.

KARALUKALX, a town of Turkish Armenia, in the government of Erzerum; 30 miles E. of Erzerum.

KARAMAN, a town of European Turkey, in Bulgaria; 35 miles E.S.E. of Nicopoli.

KARAMEISCHEVO, a town of Russia, in the government of Tver; 72 miles N. of Tver.

KARAMIT, a town of Natalia; 30 miles E.S.E. of Macri.

KARAMUSAI, a town of Natalia, on a bay of the sea of Marmora; 36 miles N.N.E. of Bușa.

KARAN, a town of Africa, in Bennu, in which is a manufacture of fine cloth.

KARKALKA, a town of Africa, in Kaarta; 10 miles W. of Kemmoo.

KARANSEBES, a town of Hungary, on the Temis; 38 miles E.S.E. of Temiważ.

KARASZAG, a town of Persian Armenia; 174 miles E.S.E. of Erivan.

KARASM, or CHIRASM, a country of Asia, bounded on the N. by Turkistan, on the E. by Grand Bucharia, on the S. by Khorsak, and on the W. by the Caspian sea; about 320 miles from N. to S. and about as much from E. to W. The country is in general fertile, and is divided among several Tartar princes, one of whom takes the title of khan, assuming pre-eminence over the rest. The capital is Urkönje, which is the usual residence of the khan in winter; but in summer he usually encamps on the sides of the river Amol; his camp being called Khiva. He is said to be able to raise forty or fifty thousand horsemen. This country was formerly full of cities, towns, and castles, strong and populous; it was then a province of the Persian and Arabian empires; but it was probably more flourishing, when it subsisted as an independent kingdom, under the family of the Karasmin kings, who by conquest annexed to it the whole of Iran, or Persia at large, and Turan, or the countries N. of the Gihon or Amu, thus forming a great empire, of which Urkönje was the capital. At present its cities are few, and much reduced by the devastating power of the Ubeckes, who have introduced poverty and robbery wherever they have settled.

KARASU, a town of Asiatic Turkey, in Caramania; 100 miles S.E. of Yurcupo—also, a river of Persia, called Karasun, which rises in the N.W. part of the province of Irak, and runs into the Tigris, near Bafforah, called Eulisus and Chosipes. Also, a river of Asiatic Turkey, called Korenes, which rises near Kaiarich in Caramania, and runs into the Euphrates near Ilíja.

KARAT, a town of Arabia, in the province of Oman; 100 miles S.W. of Mafca.

KARAT. See Carat.

KARATA, by some called carazagua mosa, a kind of aloe growing in America; whose leaves, when boiled, are made into a thread, of good use for making cloth, fishing nets, &c. Its roots or leaves, thrown into the water, rapidly fill the fishes to that degree, that they are easily taken with the hard; its stalk, when dried and burnt, serves for tinder; and when briskly rubbed on a harder wood, it takes fire, and consumes itself.

KARATAS, in Burton, Plum. Gen. 10. t. 35, the West Indian name of a fine plant referred by Linnaeus to Bromelia; see that article, p. 2.

KARATCHIN, in Geography, a Russian orthog, in the peninsula of Kantoelchakia; fifty miles from Bolchertoff. It is pleasantly situated by the side of the river Awatka, and consists of three log-houses, three jorots, or houses made under ground, and nineteen balangams, or summer habitations. The inhabitants are a singularly hospitable people.

KARATEPE, a town of Hami, in Chinese Tartary; 30 miles W. of Hami.

KARATIRIM, a town of Cordilían; 40 miles S.E. of Kerkuk.

KARATUN, a town of Peria, in the province of Irak; 40 miles N.E. of Neinaven.

KARALUNO1, a town of Russia, in the government of Kolivan, on the Geniec; 60 miles S. of Krafnoiark.

KARAYUN, a town of Hindoostan, in Douach; 40 miles W. of Pattiary.

KARBENING, a town of Sweden, in Wellmannland; 30 miles N. of Stromfloh.

KARY, a town of Sweden, in Wilt Botnia; 20 miles N. of Lulea.

KARCARA, a town of Persia, in Segeltan; 70 miles N.W. of Zareng.

KARCOJA, a town of Persia, in Segeltan; 21 miles N.W. of Zareng.

KARZOW, a town of the duchy of Warsaw; 10 miles S.W. of Czerik.

KARDAMA, in Hindoos Mythology, a being sometimes said to have been an avatar or incarnation of the god Siva, and to have been produced by Brahma's shadow; sometimes he is said to be one of the Rishis. See Rishi.

KARDANAH, in Geography. See Belus.

KARDGRA, the name of a short sword held in the hand of Hindoo deities of avenging character; the sacrificial weapon.

KARDUII, in Geography, a town of Persia, in the province of Kerman; 50 miles N. of Mathi.

KAREDJUK, a town of Asiatic Turkey, in Natalia; 20 miles S.S.W. of Degnițu.

KAREK, a town of Persia, in Segeltan; 50 miles S. of Fuheng.

KAREK, a town of Persia, in the province of Laritan; 42 miles S. of Lar.

KAREK, or GARAII, an island situated on the E. coast of the Persian gulf, between Abu Schechr and Bender Rieg, containing only a single village; but appearing, from its aqueducts cut in the rocks, to have been formerly more populous in proportion to its extent, which is about five leagues in circumference. The Dutch, who once had a settlement here, made the island famous, by carrying on a great trade from hence to Balia, under the direction of baron Kniphofen. But Mir Mahenna, prince of Bender Rieg, having made an unsuccessful attempt upon the island, at length concluded a peace with the Dutch governor, who was the second in succession to Kniphofen, and the Dutch trade for some time met with no interruption. At a subsequent period Mir Mahenna made a descent upon Karek, and besieged the town. The Arab, having outwitted Van Houting, the Dutch governor, entered the fort with a small re-
vis. This event happened in the end of December 1765; Vellels failing to Bailorah generally touch at this illand for a pilot. N. lat. 29°. E. long. 50°. 26'.
KAREMPE, Cape, Karempeharan, or Cape Pifello, a cape on the coast of Nacola, in the Black sea. N. lat. 42° 20'. E. long. 53° 10'.
KARENDAK, a town of Persia, in the province of Khorasan; 210 miles N. of Herat.
KARPOSS, a town of Ruffia, in the government of Archangel; 60 miles N.E. of Archangel.
KAREVON, a town of Persia, in Farfian; 35 miles N.E. of Pafs.
KAREZIN, a town of Persia, in Farfian; 60 miles S.E. of Bender Riga.
KAREF, a kind of cinnamon.
KARGALDZIN, in Geography, a lake of Ruffian Tartary, 60 miles in circuit; 340 miles S. of Orenburg.
KARGAPOL, a town of Ruffia, on the N. side of the lake Latcha. N. lat. 61° 30'. E. long. 38° 50'.
KARGHERD, a town of Persia, in the province of Khorasan; 16 miles N.W. of Fuheng.
KARGHERON, a town of Persia, in the province of Ghilan; 60 miles N.N.W. of Rezhd.
KARGI, a town of Asiatic Turkey, in Natolia; 27 miles N.E. of Kiangari.
KARGINICH, a town of Ruffia, in the government of Olonetz; 32 miles W. of Vitegra.
KARGO, a province of Africa, in the government of Lbang, famous for its mines of excellent copper.
KARIADEH, a town of Natolia, in the gulf of Smyrna; 48 miles W. of Smyrna.
KARJALA, a town of Sweden, in the government of Abo; 23 miles N. of Abo.
KARIATTAIN, a town of Arabia, in the province of Nedsjed, anciently Kirjathjirim; 300 miles E. of Medina.
KARTEAIN, a town of the desert of Syria; 60 miles S. W. of Palmyra.
KARIBAZARI, a town of Natolia; 18 miles W. of Kiangari.
KARIKAL, or CAPIKAL, a town of Hindooftan, on the coast of the kingdom of Tanjore, situated on one of the branches of the Cavury; ceded by the king of Tanjore to the French. It contains five mosques, 14 pagodas, and about 500 inhabitants. It was taken by the English in 1760, and retaken in 1779; it is 4 miles S. of Tranquebar.
KARINAS, a town of Sweden, in the government of Abo; 20 miles N.E. of Abo.
KARINKULA, a town of Africa, in Bambouk. N. lat. 13° 36'. W. long. 9°. 50'.
KARIS, a town of Sweden, in the province of Nyland; 10 miles N.N.E. of Eknaas.
KARISTOJ, a town of Sweden, in Nyland; 16 miles N.N.E. of Eknas.
KARK, a town of the Arabian Itrak, on the Tigris; 80 miles N.M.W. of Bagdad.
KARKA, a town of Asiatic Turkey, in the government of Sivas; 30 miles S. of Tacar.
KARKARLANG, a small island in the Pacific ocean, belonging to a cluster called Meangles. N. lat. 4° 45'. E. long. 126° 50'.
KARKI, an island in the Mediterraneen; 6 miles W. of Rhodes. N. lat. 37° 25'. E. long. 27° 19'.
KARKOLA, a town of Sweden, in Tavalland; 27 miles E. of Tavallhus.
KARKRONY, a building where the royal manufac-
tures of Persia are carried on.

Here are made their tapestris, cloth of gold, silk, wool, and brocadse, velvets, tafteties, coats of mail, fabric, bows, arrows, and other arms. There are also in it painters in miniature, goldsmiths, lapidaries, &c.

KARKU, in Geography, a town of Sweden, in North Finland; 35 miles S.E. of Birnoberg.

KARLANDA, a town of Sweden, in Warmeland; 42 miles W.W.N.W. of Carrlita.

KARLE, a Saxen word, used in our laws, sometimes simply for a man, and sometimes for a servant or slave.

Hence the Saxons call a feaman a by, and a domestic servant a bycar.

KARLE HEMP, a term used by our country people for the latter green hemp.

KARLEBY, GAMLA, in Geography, a feaport town of Sweden, in East Bohma, with a good harbour. It trades principally in hemp, flax, and ship building; 60 miles S.W. of Cajana. N. lat. 63° 50'. E. long. 23° 1'.

KARLEBY, Ny, a town of Sweden, in East Bohma, seated on the river Lappojock, about five miles from the sea, built in 1620 by Gustavus Adolphus; 70 miles S.W. of Cajana. N. lat. 63° 32'. E. long. 22° 26'.

KARLUTZKA, a town of Ruffia, in the government of Irkitik; eight miles E. of Niznie Udinsk.

KARLY, a village situated on the road between Bambay and Poona, having in its vicinity a lofty hill, in which are some excavations that have not, until within these few years, come under the notice of Europeans. The hill is named Ekvera, and is two or three miles to the N.E. of Karly, but the excavations are generally called by the name of the village. The late Mr. Wales, a very respectable artist, was the first European who explored this magnificent cavern-temple, of which he made several accurate sketches, and copied several inscriptions. The sketches have not been published, nor have, we believe, the inscriptions been hitherto explained. Lord Valentia has more recently visited Karly, and in his "Travels" describes the cave, of which a beautiful view and a ground plan are given; and Mr. Salt, who accompanied his lordship, has, in his elegant feries of oriental views, given two of this beautiful temple. Major Mooz, who has also frequently visited it, has given a plate of some of its sculptures in his Hindoo Pantheon.

There are many apartments scooped out of the rock in an elevated situation, having flat tops, as usual in most of the Indian excavations; but the grand apartment of Ekvera is arched, and of a most striking and magnificent description. "Its size, and the profuseness of its form," says Lord Valen- tia, "surprised me with the greatest astonishment. It consists of a vaulted building of an oblong figure, shaped, divided from the temple itself, which is arched and supported by pillars. The length of the whole is one hundred and twenty-six feet, the breadth forty-six feet. No figures of any deities are to be found within the pagoda, but the walls of the vault are covered with carvings, in alto-relievo, of elephants, of human figures of both sexes, and of Buddha, who is represented in four places as sitting cross-legged, in others he is erect, and in all attended by figures in the act of adoration; and in one place, two figures standing on the lotus are fanning him, while others hold a rich crown over his head. I think, therefore, that it is beyond dispute, that the whole was dedicated to Buddha." Travels, vol. ii. p. 162. (See BOODH.) The farther end of the cave is round, the sides slanting; a row of pillars, ten feet from the sides, support kneeling elephants, on which are seated human figures, all beautifully sculptured. From a cornice, running the whole length of the temple over the heads of the figures, spring ribs of wood forming an arch, and touching at its whole concavity the roof.
roof which they seem to support. This is a singularity not known to exist elsewhere. The wooden ribs are not more than three feet apart, and about two in depth, and nine inches thick, and have something the appearance of a ship's bottom, inverted. They run parallel to each other, forming a fine arch, from side to side of the apartment. The pillars are sixteen in number, each side, with a space between equal to the diameter of their ball, viz. about four feet. The pedestals are square, the shafts polygonal. Seven plainer columns continue the line at the end on them rests an architrave, an arch springs forwards, forming a roof over the altar, as it may be called, which is the Hindoo Pantheon is said to consist of a viat hemisphere of stone, resting on a round pedestal of greater diameter, and having its circumference furnished by a sort of canopy or umbrella of peculiar construction. The principal arched temple of Kenera is exactly the same plan of that here described, and the altar is alike in both. That at Ellora, described by Sir Charles Malet, in vol. vi. of the Asiatic Researches, is also exactly similar in respect to ground plan, but the principal object is different, being Buddha himself, with the semi globe on the round pedestal behind him. In neither of these three arches caves will, I think, be found any sculptures referring to the gods of the Brahmans; and these three are the only caves that I ever saw or heard of constructed with an arched roof. And I presume to hazard an opinion that they are of modern origin, relatively with other excavations at Ellora and on Elephantia, containing, with and without Buddha, many of the deities now worshipped by the Brahmans.

"What I would hence infer is, that in the older sculptures we find Buddha mixed with the other Hindoo gods: Elephantia and the flat-roofed Pantheonic temples at Ellora, I reckon among the oldest. In sculptures more modern, Buddha, as a deity, is often seen exclusively portrayed; the arched caves of Ellora, Karly, and Kenera, I judge to be of later date; and as to form and proportion, of more refined and elegant construction. May we not be allowed, from these premises, to deduce a farther confirmation of the idea that the Buddha incarnation of Vithn, and the sectarian deity of that name, exclusively worshipped by fo many different nations under fo many different forms and designations, are one and the same person? and that such exclusive worship, and its accompanying ceremonies and privations, is a heresy or reformation, or whatever it may be termed, of the more ancient Brahminical religion? Among European as well as Indian enquirers, this opinion will find the most numerous, but, like other majorities, not the most zealous supporters.

Sir Charles Malet's plate of Ellora gives exactly a representation of the temples of Karly and Kenera as far as regard ground plan and general design; and they must certainly have originated in the same period, as one has been taken from the other. The capitals of the interior pillars, from which the arched roofs spring, are different: at Ellora they appear to be men in the act of adoration; at Karly the entablatures are elegantly formed of figures of men and women seated on kneeling elephants, whose proboscis, joining at the angles, form in graceful curves, the volutes of the capitals." P. 245.

In Mr. Danieil's publications of oriental scenery, unrivalled in elegance by any production of the British press, are a series of views of Ellora, finished from the sketches of Mr. Wales. To these we refer such as define a doubtful picture of these truly wonderful excavations, of which some account occurs in an earlier volume, under the article Ellora. See also Elephantia, (in which article we will here see).

Vol. XIX.
KARNOW, a town of Africa, in the kingdom of Bornou.
KARNOCKI, SS. E. of Termeh.

KARNOCKI, Stanislaus, in Biography, celebrated as a Polish writer and statesman, was born in 1525. He was educated for the church, and obtained a baccalaureate about the year 1563, and upon the death of Sigismund Augustus, king of Poland, in 1572, he promoted the election of Henry of Valois, and, on his reception, made an eloquent harangue to him in the name of the states. After the abdication of this prince, Karnecki nominated Anne, the sister of the late Sigismund, queen of Poland, and crowned her husband, Stephen Bathoris, upon the refusal of the primate to perform this office. After this he placed the crown on the head of Sigismund III, prince of Sweden, who was acknowledged by the kingdom. He had already succeeded to the primacy, and, in 1592, he joined a party who were in opposition to the great chancellor, Zamoyski, and convoked an extraordinary assembly at Kiøw, in which he endeavoured to cancel the ordinances of the last diet. This step rendering him unpopular, he was obliged to seek a reconciliation with the chancellor. He died in 1603, at the age of seventy-eight, and was interred in the Jesuits' college at Kalish, which he had founded. As an instructor of youth he did much to reform the systems of education; but as an author he is known by "Hitoria Interregni Poloniæ," being a relation of the affairs of the interregnum succeeding the abdication of Henry of Valois; "De Juris Principiariis, Terraem, Civitatumque Praeconis;" "Epistole Illiiturum Vironum, lib. iii." This collection of letters is very rare, and is said to contain many important particulars relative to the history of Poland, from 1564 to 1577.

Karnowl, in Geography, a town of Hindoostan, in Bahar; 38 miles N. N. W. of Hajypour. N. lat. 26° 17'. E. long. 87° 11'.

Karoli, Jasper, in Biography, a Hungarian divine, who flourished towards the close of the sixteenth century, was held in high estimation for his talents as a philosopher, theologian, and philologist; and much admired as a preacher. His memory is greatly revered on account of his having translated the bible from the original Hebrew into his native language. This work was published at Hanover, in 1605, in the year 1608, and another impression of it was given to the public from the press at Frankfort, in Svo., by Albert Molnar. The work has been reprinted very frequently, in different countries, and is still held in high estimation.

Karolou-kala, in Geography, a town of Turkish Armenia; 42 miles E. of Erzerum.

Karop, a town of Russia, in the government of Novgorod Sieverskoi; 28 miles S. of Novgorod Sieverskoi.

Karos, an island in the Grecian Archipelago, six miles in circumference; 6 miles S. E. of Naxia. N. lat. 36° 53'. E. long. 25° 30'.

Karotita, a small island in the Pacific ocean, belonging to the cluster called Manges. N. lat. 5°. E. long. 126° 50'.

Karoull, a town of European Turkey, in Daffarabhat; 68 miles S. W. of Bender.

Karplax, a town of Sweden, in Tavafland; 14 miles N. E. of Jamfio.

Karpiowka, a town of Poland, in the palatinate of Kiev; 8 miles N. N. W. of Kiev.

Karriarpour, a town of the cirear of Ghoud; 16 miles N. of Ghoud.

Karrieth, a town of Arabia, in Yemen; 20 miles S. S. E. of Chamar.

Karroo, a Hottentot name given, in the colony of the Cape of Good Hope, to vast plains, which are interspersed between the great chains of mountains. Out of the impenetrable surfaces of clay, glistering with small crysalids of quartz, and condensed to perpetual drought and aridity, not a blade of grass, and scarcely a verdant twig, occurs to break the barren uniformity. The hills, by which these surfaces are sometimes broken, are chiefly composed of fragments of blue flate, or mases of feltarp, and agglomeraceous ironstone; and the surfaces of these are equally denuded of plants as those of the plains. Yet, Mr. Barrow observes, that wherever the Karroo plains are tinged with iron, and water can be brought upon them, the soil is found to be extremely productive. Barrow's Africa, vol. ii. p. 32.

Kars, a town of Asiatic Turkey, in Abladus; 25 miles N. N. E. of Adana.—Allo, a town of Perua, in the province of Kerman; 32 miles N. of Sirjan. This is the extreme town on the frontiers of Perua, and though an inaccessible place, is tolerably fortified.

Karsaboro, a town of Africa, in Bambarra. N. lat. 13° 10'. W. long. 5° 25'.

Karsamaki, a town of Sweden, in the government of Ulea; 65 miles S. of Ulea.

Karsesh, an island near the west coast of East Greenland. N. lat. 60° 35'. W. long. 43° 20'.

Karskagni, a fiery expiation among the Hindoos, of which the following account is taken from Moor's Hindoos Pautheon. "Cow-dung is a great purifier on several occasions. It is related in the Agépiruma, that a most wicked person, named Chanyaka, had exceeded every known poffibility of salvation. At the court of Indra were assembled gods and holy men; and as they were dicing on such enormities, Indra, in answer to a pointed question, said that nothing certainly could expiate them except the karshagni. It happened that a crown, named, from her friendly disposition, Mitra-kaka, was present; and she immediately flew and imparted the welcome news to the despairing sinner, who immediately performed the karshagni, and went to heaven. This expiation confHs in the victim covering his whole body with a thick coat of cow-dung, which, when dry, is set on fire, and confines both skin and humour. Until revealed by the crown, this potent expiation was unknown; and it has since been occasionally referred to, particularly by the famous Sankara-Charya. The friendly crown was punished for her indiscretion; and forbidden, and all her tribe, ascension to heaven, and was doomed on earth to live on carrion." P. 143. See Sankara-Charya.

Karsko, in Geography, a settlement of Ruffia, in the government of Archangel, at the mouth of the Kara; 600 miles E. N. E. of Archangel. N. lat. 68° 35'. E. long. 64° 14'.

Karskoi Sea, that part of the Frozen ocean which lies between the continent of Ruffia and Nova Zembia, extending from N. lat. 70° to 75°, and from E. long. 61° to 68°.

Karsko Gulf, is a large bay of the Frozen ocean, lying to the south of the Karfko Sea. N. lat. 69° to 70°. E. long. 62° to 69°.

Karsorup, a town of Sweden, in the province of Smaland; 48 miles S. E. of Jonkioping.

Karsula, a town of Sweden, in the government of Wafa; 85 miles E. of Wafa.

Karsun, a town of Ruffia, in the government of Simbirsk; 60 miles W. S. W. of Simbirsk.

Karsursuk, a town of East Greenland. N. lat. 61° 10'. W. long. 45°.

Karsysiauk, a town of East Greenland. N. lat. 60° 16'. W. long. 43°.

Kartal, a town of Asiatic Turkey, in Natolia, on the coast of the sea of Marmora; 40 miles W. of Hmid.

Kartan,
KAS

KARTAN, or Martan, four small islands in the Arctic sea, at the entrance of the gulf of Curia Muria, bounding it on the S.W. N. lat. 17° 30'. E. long. 54° 30'.

KARTASCHEK, a town of Ruffia, in the government of Tobolsk, on the Irritich; 45 miles S. of Sara.

KARTAB, a town of Asian Turkey, in Diarbekir; 46 miles W. N.W. of Diarbekir.

KARTERON, a town of Syria, on the Euphrates; 10 miles S. of Sara.

KARTES, a town of Africa, in the country of Whidah; 16 miles E. of Sahl.

KARTIKIA, in Hindu Mythology, the offspring of Siva, whose fruit falling through the hands of Agni, the god of fire, into the Ganges, has given rise to other names allusive to his birth, of a very extravagant nature: the literary, but which are mainly alchemical allegories; he is hence called Agni-bhuva, and Ganga-putra. Kumara, Srimana, and Skanda are others of his names. He arose, say the Punnam legends, on the banks of the Ganges, as bright as the sun, and beautiful as the moon; and it happened that the daughter of as many rajahs going to bathe, saw the boy; and each calling him her son, and offering the beast, the child affixed six mouths, and received nurture from all, whence he was called Sehti-matriya, that is, having six mothers. Other legends relate, that on the birth of the child he was delivered to the Pleads to be nourished. The Hinduos reckon but six bright stars in this constellation, which is named Kritika. These fix offering their breasts, "the six-headed was nourished, and named Kartikya, the descendant of the Kritikas." See Kritika.

KAS, El, or Kas Kafarem, a mountainous cape of Egypt, on the coast of the Mediterranean; 3 miles N. of Caiici; N. lat. 30° 58'. E. long. 33° 22'.

KASHI, a town of Syria, on the Euphrates; 25 miles E. of El Der.

KASHIYUKI, a town of Japan, on the island of Ximo; 22 miles E. S. E. of Taifero.

KASHAN. See CASHAN.

KASHIOAR. See CASHIAR.

KAST, a town of Africa, in the kingdom of Benguela.

KASCHIN, a town of Russia, in the government of Tver; 60 miles N.E. of Tver.

KASCHAIRA, a town of Russia, in the government of Tula; 50 miles N. of Tula.

KASCHKARANTZI, a town of Asia Turkish, Caramania; 55 miles S.W. of Cogni.

KASHAN. See CASHAN.

KASHEK, in the historic legends of the Hindoes, is the father of a very renowned ascetic and sage named Vihasana; which see.

KASHEmat, in Geography. See Charleston.

KASHI, or Kasi, sometimes written Kaeshi; a Saneriit name of the revered city of Benares; the latter popular name being probably a corruption of its classical appellation Varanasi, so called from two rivers that form a junction of waters and name near its site. See Benares.

KASI, a term in the East, applied to the fourth pontiff of Perlia, who is also the second lieutenant civil, and judge of temporal as well as spiritual affairs.

He has two deputies, who determine matters of less consequence; particularly quarrels arising in coffee-houses, which make a great part of their business.

KASILAX, in Geography, a town of Sweden, in the province of Savolax; 23 miles E. of Nyilov.

KASMOW, a town of Russia, in the government of Riazan, on the Oka, formerly the residence of a Tartar prince; 76 miles E. N.E. of Riazan.

KASKAREL MEHRAK, a town of the Arabian Iraq; 36 miles N. of Bagdad.

KASKAS, a part-town of Amelia, and the chief of Randolph county, on the S.W. bank of a river of the same name, 12 miles from the mouth of the river; containing about 200 houses, many of which are well built with stone; and 467 inhabitants, of whom 47 are slaves. Alto, an Indian nation near the river of this name in the Indiana territory. In 1774, they could furnish 530 warriors. Their nome is called Kaskastias, a village of Illinois Indians of the Kaskastias tribe, containing in 1774, about 310 persons and 60 warriors. They were formerly brave and warlike, but are now degenerated and debauched. In August 1823, Governor Hamilton concluded a treaty with the Kaskastias Indians, by which they ceded to the United States in full right the immense tract of country extending from the mouth of the Illinois river to the mouth of the Ohio; from thence to the mouth of the Saline creek, below the Wabash; thence bounded by the highlands, dividing the waters which run into the Wabash from those which run into the Saline creek; thence by the highlands dividing the waters which run into the Wabash from those which run into the Mississippi, until it reaches the river Kaskastias; thence, by the high-
lands, which divide the waters that fall into the Kafkallcia river from those which fall into the river Illinois, and from thence in a direct course to the mouth of the Illinois again; supposed to contain from 10 to 12 millions of acres. The whole was ceded in consideration of the annual addition of 500 dollars to a like sum, which by the treaty of Greenville, the Kafkallcia tribe receives every year from the United States, together with the reservation of 1500 acres near the village of Kafkallcia, for cultivation and domestic purposes. Morie.—Alto, a river of the north-west territory, which is navigable for boats 150 miles. Its course is S.S.W., and near its mouth it turns to the S.S.E. and falls into the Mississipi river, 84 miles from the Illinois. It runs through a rich country, abounding in extensive natural meadows, andumberlefs herds of buffaloes, deer, &c. Along the east side of the river lie high grounds, the banks being composed of lime-flour and free-flour, and from 100 to 150 feet high, divided in many places by deep cavities, through which many small rivulets pass before they fall into the Mississipi. The sides of these hills fronting the river are in many places perpendicular, and appear like solid pieces of mafon, of various colours, figures, and sizes. Morie.

KASKUNK, a town of the Delaware, between Great Beaver creek and Alleghany river, in Pennsylvania; 40 miles N. of Pittsburg.

KASKIRA, a town of Persia, in the province of Trask; 25 miles N. of Sawa.

KASKINOMPA, a small river which runs W. into the Mississipi from Teneffes, in N. lat. 36° 28'. On the north side of its mouth is an iron mine. KASKIS, a town of Sweden, in Taftahland; 30 miles E. of Tavathius.

KASCO, a small island in the gulf of Bothnin, near the coast of Finland. N. lat. 63° 16'. E. long. 90° 10'.

KASKOYAR, an island in the gulf of Bothnia. N. lat. 63° 16'. E. long. 90° 10'.

KASNICHT, a town of Persia, in the province of Khorr fan; 12 miles S. of Zouzan.

KASR, a town of Egypt; 6 miles N.W. of Ahmousen.

KASR ALMED, a town of Tripoli, on the coast; 100 miles E. of Tripoli. N. lat. 32° 4'. E. long. 15° 20'.

KASR KISCA, a town of Egypt, built on the ruins of the ancient Nacoplos, on the coast of the Mediterranean; miles N. of Alexandria.

KASSAN, a town of Africa, in the kingdom of Yami, on the N. side of the Gambia; 36 miles N.W. of Pifanias.

KASSAR, an island of the Baltic, to the south-w. of Dago, with a chapel, about 11 verfas long and between four and seven verfas broad.

KASSERAMANGALUM, a town of Hindooflan, in Baramaul; 17 miles S. of Coverioram.

KASSIOUE, a town of Hindooflan, in the Dooab; 24 miles N.W. of Patttary.

KASSENE, or CASHEO, a kingdom of Africa, situated N. of the river Nger, between Bornou and Tombuctoo. The two empires of Bornou and Kaffina extend northwards towards Nubaia, and comprehend a very considerable space. In both these empires, the sovereigns are Mahometans; but their subjects are said more generally to adhere to the ancient worship; that is to say, the lower orders are, almost universally, Negros. Kaffina, till lately, was esteemed the first in power; but though a thousand villages and towns are still included in its vast domains, this empire is now considered much inferior to Bornou. The circumstances of soil and climate, and those also which constitute political character, are nearly the same in both; their prevailing winds are the
sides by the sands of the vast desert of Bilmâ, where the ardent heat of the flaming sky is renewed by double iter¬
nes by the surface of the burning soil. A thousand camels, bred and maintained for the purpose, are said to compose the caravans which annually explore in the savage wilderness, the long line of this adventurous journey. Perilous however, and full of hardship as their labour is, the merchants find an ample recoupement in the profits of their commerce; for while the wretched villagers who inhabit the neighbourhood of the lakes, and collect the salt that congeals upon the shores, are contented to receive, or obliged to accept a scanty price, the value which the merchants obtain in the various markets of Caffina, Bannor, and of the countries S. of the Niger, is suited to the high estimation in which the article is held. The people of Agadex are equally anxious to avail themselves of the productions of their own country. Accordingly, being well apprised of the superior quality of the fenna, which grows upon those mountains, they demand and receive from the merchants of Fezzan a proportionable price. From Tripoli this fenna is conveyed to Turkey, Leghorn, and Malta. Of the other articles of sale which the extensive empire of Kaffina affords, the principal are gold dust, slaves, cotton cloths, which are the general manufacture of Caffina, Bannor, and the Negro Flates S. of the Niger, goat-skins of the red and yellow dyes, ox and buffalo hides, and skins; and in return for these, the inhabitants of Kaffina receive cloths, horns, and mares, red woollen caps, check linens, light coarse woollen cloths, baize, barakans or alhaks, small Turkey carpets, plain Mefurata carpets, flax, wrought and un wrought, taffines and brocades, fabric blades, Dutch knives, seifors, coral, beads, small looking-glasses, tiches, or a plate prepared in Fezzan, from dates and the meal of Indian corn, and which, whenever they travel, is in great request among the people of Fezzan; and Guoroor nuts, which are brought from the Negro flates on the S. of the Niger, and which impart a pleasant bitter to any liquid in which they are infuded.

The Fezzaniers, equally connected by their commerce with Caffina and Bannor, dispatch to the former as well as to the latter, and always at the same feaston, an annual carva¬
an. From Mossora, their capital, which they leave at the close of October, they take their course to the S.S.W. and proceed to the province of Hiats, the most barren, and the worst inhabited district of their country. From Hiats they cross the low mountains of Eyre, which separate the king¬
dom of Fezzan from the empire of Caffina, and next arrive at the town of Sanait, where they repose for two days. From thence, by a march of 19 days, during each of which they are exposed to the scourging heats of a thirsty desert, they pass on to the town of Assolda. On leaving Assolda, they traverse a delightful country, fruitful, and populous; and while the exhilarating light of Indian corn, and of frequent herds of cattle accompanies and cheers their passage, the eighth day introduces them to the large and populous city of Agadex, the capital of an extensive province. Distin¬
guished as the most commercial of all the towns of Caffina, and, like Assolda and Sanait, inhabited by Mahometans alone, Agadex naturally attracts the peculiar attention of the merchants of Caffan. Many proceed no farther; but the greatest part, committing to their agents the care of the cloths, cotton, and fenna, which they purchase in the course of a 10 days' residence, continue their journey to the south. In this manner, if the camels are completely loaded, 47 days, exclusive of those which are allotted to refreshment and necessary rest, are employed in travelling from Mossora to Agadex. At the end of three days more, amidst fields that are enriched with the luxuriant growth of Indian corn, and palisades that are covered with multitudes of cows; and with flocks of sheep and goats, the traveller reaches the small town of Bengem; from which, through a country of broad, whose dwelling are in clusters of huts; the second day conducts him to the town of Tejoumam. There, as he surveys the stony, uninhabited, desolate hills that form the ch stocks prospect before him, he calls a regretful eye on those verdant scenes that surrounded him the day before.

Employed for two days in the passage of these dreary heights, he depends on the third to a deep and searching sand, from which he emerges at the approach of the fine evening, and entering a beautiful country, as pleasingly diversified with the natural beauties of hills and vales and woods, as with the rich rewards of the hothouses and the shepherd's toil, he arrives in seven days more at the city of Caffina, the capital of the empire of which it bears the name, and the usual residence of its powerful sultan.

The river Niger traverses the empire of Caffina with such rapidity, that no vessel can ascend its currents; and such is the want of skill, and such the absence of commercial inducements among the inhabitants of its borders, that even with the current, neither vessels nor boats are seen to navigate. In one place, indeed, the traveller finds a passage for himself and his goods; but even there, though the ferrymen, by the indulgence of the sultan of Caffina, are exempted from all taxes, the boat which conveys the merchandise is nothing more than an ill-constructed raft; for the planks are fastened to the timbers with ropes, and the farms are closed, both within and without, by a platter of tough clay. The depth of the river, at the place of passage, which is more than 100 miles to the south of the city of Caffina, is elimated at 23 or 24 feet English. (Proceedings of the African Association.) The city of Caffina, or Kaffina, is distant 650 miles S.W. from Bouron, and 660 miles E.S.E. from Tomboutto. N. lat. 16° 30'. E. long. 11° 34'.

KASSON, a strong hilly country of Africa, of small ex¬
tent, bounded on the N. by the Moors of Jaffa, on the E. and S.E. by Kaarta, on the S. by the Senegal, and on the W. by Kajanga; about 50 miles from N. to S., and nearly the same from E. to W. N. lat. 14 to 15'. W. long. 8° to 9°.

KASSUTO, an African musical instrument, composed of a hollow piece of wood, about an ell long, covered with a plate cut into a kind of scale, upon which the negroes beat with a flick. See Mythio of the Negroes.

KAST, in Geography, a town of Persia, in Pegesian; 40 miles S.W. of Arakhe.

KASTANOVITZ, a town of Croatia, situated on an island in the river Unna; 50 miles S.E. of Carliat.

KASTHOLM, a town of Sweden, on the S.E. coast of the island of Aland.

KASTRICAR, Cape, a cape on the N.E. coast of the Company's island, in the North Pacific ocean. N. lat. 46° 30'. E. long. 151° 40'.

KASTRIL, in Zoology. See Kestrel.

KASYA, in Hindu Mythological History, was the Guru, or spiritual preceptor of Krishna, of whose wife the following legend occurs in the Padma Purana, and in the Sri Bhagavat among the various miracles recorded of this incarnate deity. She complained to Krishna that the ocean had swallowed up her children on the coast of Garda, or Gusz¬
rat, and supplicated their redemption. Krishna, proceeding to the coast, was assured by Varuna, the regent of the ocean, that not he, but the sea-monster, Sankaras, had stolen the children. Krishna sought, and after a violent conflict, flew the demon, and tore him from his belly, named Pancasikhya, which
which he bore away in memorial of his victory, and used afterwards in battle by way of trumpet. (See Sankara.) Not finding the children in the dominions of Varuna, he descended to the infernal city, Yama-puri, and founding his tremendous shank, or hell, (see Shank,) struck such terror into Yama, that he ran forth to make his proftrations, and reëlor the children of Kafya, with whom Krishna returned to their delighted mother.

Kasyapa, an important character, who, indifferent theories, affirms different lines of parentage and character. In the Siva-purana he is made the great-grandson of Brahma, Marichi and Bharigu being his immediate ancestors; and he is there feigned to have married thirteen of Daksha's sixty daughters, an astronomical allegory that has not yet been explained; but alluding, we apprehend, to a cycle of sixty years in all among the Hindoos. Sir William Jones suspected, and Mr. Wilford has proved the whole fable of Kafya to be astronomical, and the fame with the Cappoiai of the Greeks. Kafya, in some points, corresponds in character with Uranus; Marichi, the offspring of Brahma, being a perfonification of Light. Surya, or the Sun, is sometimes found mentioned as the sun or offspring of Kafya, and sometimes he is included in the list of the seven Rilhis; in other relations he is the husband of Diti, and the parent of Indra, Aruna, Garuda, and many of the minor deities. In Vishnu's avataar of Vaman, or the dwarf, he became incarnate in the person of Kafya's son, by Diti; and the Nakshatras, or lunar mantions, (see Nakshatra,) are, in the Institutes of Menu, attributed to "Kafya, the first production of Brahma's head."

Kataba, in Geography, a town of Arabia, in the province of Yemen, situated in a fertile country, near a river that runs into the sea at Aden, governed by a dala, and defended by a citadel; 75 miles N. of Aden. N. lat. 13° 54'. E. long. 44° 39'.

Katal, a town of Asiatic Turkey, in the government of Sivas; 18 miles S. of Sivas.

Kapatang, a small island in the East Indian sea, near the N. coast of Java. S. lat. 7° 39'. E. long. 113° 22'.

Kateren, a town of Arabia, in the province of Yemen; 60 miles S. of Saade.

Katenia, a town of Bengal; 80 miles N. of Dacca.

Kateresi, a town of the principality of Georgia; 12 miles W.S.W. of Tbilissi.

Katerinenschstat, a town of Russia, in the government of Saratov, on the Volga; 32 miles N.E. of Saratov.

Kathtpacumunck, an Indian village in America, on the N. side of Wabash river, at the mouth of Rippacooe town, and about 20 miles above the Lower Wabash town. In 1791, before its destruction by generals Scott and Wilkinson, it contained 120 houses, the belt of which belonged to the French traders. N. lat. 40° 20'. W. long. 87° 2'.

Katiff, a town of Arabia, in the province of Lachfa, of some magnitude, situated upon the coast, at the distance of about five German miles from the isle of Bahrein. The inhabitants earn their subistence by the pearl fishery; the sea for fishing is in the hotter months of the year, when the air is deemed to be very insalubrious.

Katimevole, a town of the island of Ceylon; 36 miles S. of Candy.

Katintum, a town of Russia, in the government of Pskov, on the Lena; 60 miles E. of Oickmink.

Katiri, a town of Natolia; 28 miles N. of Burfa.

Katisti, a town of Natolia, on the coast of the sea of Marmora; 36 miles S. of Contauintoipe.

Katkyn. See Catkin.

Katmandu, or Catmand, in Geography, the capital of Nepal or Nepal, in a province of the same name; called also Jingbu by the people of Thibet. It is placed by Rennell 195 geographical miles nearly N. from Maffy, that is, in latitude 28° 6'. It is 556 British miles from Laffii, or in horizontal distance 346 geographical miles. According to Giuseppe, it contains about 18,000 houses, probably yielding a population of 70 or 80 thousand. (See Nepal.) According to colonel Kirkpatrick's account it is seated on the easterm bank of the Bihmuty, along which it runs for a mile, with a breadth not exceeding half a mile. The most striking objects which it presents to the eye are its wooden temples, which are scattered over its environs, and particularly along the sides of a quadrangular tank or reevoir. The colonel says, "there are nearly as many temples as houses, and as many idols as inhabitants." The number of idols, according to his statement, amounts to 2733. Besides these wooden temples, Katmandu contains several others on a large scale, constructed of brick, with two or three floping roofs, diminishing as they ascend, and terminating in pinnacles, which, as well as some of the superior roofs, are splendidly gilt, and produce a very picturesque and agreeable effect. The houses are of brick and tile, with pitched roofs towards the street, frequently surrounnded by wooden balconies, of open carved-work, and of a singular fashion. They are of two, three, or four stories, and generally of a mean appearance. The streets are narrow and filthy. Katmandu, with its dependent towns and villages, according to Kirkpatrick, may contain about 22,000 houses; but the town itself, if ten people be allowed to each house, which he thinks to be a low computation, does not contain more than 50,000 persons. The next most considerable towns of Nepal are Patn, Bhetgong, and Khattpoor. Asiatic Ref. vol. ii. p. 307.

Katna, a town of Sweden, in Sudermanland; 30 miles S.W. of Stockholm.

Katnebelow, a town of Poland, in the palatinate of Kiev; 36 miles S. of Bihaarckiew.

Katniasantitz, a town of Russia, in the government of Irkutsk; 64 miles N.E. of Vitchinsk.

Katoene, a town of the island of Ceylon; 64 miles S. of Candy.

Katoucarva, in Botany, the name by which some authors have called the tree, whose leaves are the tnamala, or Indian leaf of the fops. See Malabatbhum.

Katoinden, the name given by the authors of the Hortus Malabaricus, to a genus of plants, called by some elate, and by Linnæus phaenix.

Katounserai, in Geography, a town of Asiatic Turkey, in Caramania; 12 miles S. of Cogni.

Katscher, a town of Moravia, in the circle of Preroua, with a lordship in Silisia, to which it once belonged; 12 miles W. of Ratibor. N. lat. 49° 59'. E. long. 17° 52'.

Katta, a town of Bootan; 15 miles S. of Bifinee.—Also, a town of Persia, in Farilitan; 30 miles W.S.W. of Yezd.

Kattah, a town of Arabia, in the province of Hefijas; 160 miles E.S.E. of Madian.

Kattayani, in Hindoo Mythology, a name of Parvati, comfort of Siva.

Kattron, in Geography. See Gatron.

Katuadi, a town of the Arabian Iraq; 12 miles S. of Bagdad.
KAU

KATUNSKAIA, a town of Russia, in the government of Kolaian; 12 miles S. of Biiils.

KATZA, a town of Germany, in the county of Henneberg; seven miles W.N.W. of Memungen.

KATZEMAUJE, in Mineralogy. See Caz's Eye.

KAU, in Geography, a town of Africa, in the kingdom of Longao.

KAUADI, an island of Egypt, in lake Bercolos; 13 miles N. of Faoune.

KAVARNA, a town of European Turkey, in Bulgaria, in the gulf of Varna; 22 miles N.E. of Varna. N. lat. 43° 21'. E. long. 28° 17'.

KAUBUL, a town of European Turkey, in Bessaria; 34 miles W. of Akerman.

KAUDER, a town of Hindoostan, in Lahore; 46 miles S.S.W. of Lahore.

KAUDEN, a town of Arabia, in the province of Hedjjas; 60 miles N.W. of Mecca.

KAVERZINA, a town of Russia, in the government of Tobol'sk, on the Tchuna; 20 miles E.S.E. of Emeltik.

KAUFFHEUREN, a town of Germany, situated on the Wutach, and till the year 1802, when it was given to the elector of Bavaria, imperial. The burgheers are partly Lutherans, and partly Roman Catholics; but its magistracy consists of eight Lutherans and four Roman Catholics. In the town-court and great council are also two Roman Catholic members, but the rest are all Lutherans; 62 miles E.N.E. of Constance. N. lat. 47° 42'. E. long. 10° 35'.

KAUFFMAN, MARY ANGELICA, in Biography, a lady who performed the talents and taste of a painter in a degree very unusual among her sex. She was a native of Coire, the capital of the Grisons, and born in 1740. Her father was an artist, who, perceiving the extraordinary capacity of his daughter, and how worthy it was of the best cultivation, conducted her, at the age of fourteen, to Milan, and afterwards to Rome; where her talents and accomplishments soon acquired her the most distinguished attention. It was the happy lot of lady Wentworth, the wife of the British resident at Vienna, to be the instrument of conveying Angelica to England in the year 1764. Here she was received in a very flattering manner; her works eagerly sought for; and her company solicited by the learned, the great, and the polite. She was honoured with royal attentions, and was esteemed and courted by artists. She was very industrious, and painted the lighter scenes of poetry with a grace and talent entirely her own; and happily formed to meet that of an engraver whose labour's highly contributed to the growth and perpetuity of her fame. Bartolozzi was the man, who, enjoying at the same time youth, health, and ingenuity, almost entirely devoted his talents between Angelica and Cipriani. The three were endowed with congenial feelings in arts; which, if not of the highest class, were certainly entitled to rank among the mostagreeable.

After some years residence here, she was unhappily deceived by a footman of a German count, who, coming to England, perfonned his master, contrived to be presented at court, and persuaded Angelica to marry him. The cheat was soon discovered, and the rascal had not the humanity to endeavour to soothe her disappointment by kindnefs, but treated her very ill. At last, however, by a payment made to him of 300l., he was induced to return to Germany, and promised never to molest her any more. He kept his engagement; and the lady not hearing of him for seven years, and concluding him dead, then married an Italian painter of the name of Zucchi, and having spent seventeen years in England, returned with him to her native country, and thence to Rome; where her house became the resort of genius and taste; all artists and cognoscenti taking pleasure in being admitted to her conversation; while amateurs endowed with rank and wealth were happy in finding employment for her agreeable talents, and in the possession of her works. She lived to the age of 67, and then fell by a gradual decay, under that power which pays regard alike to the great, the learned, the virtuous, and the profligate. She died in 1872, universally regretted, and was honoured by splendid public obsequies.

The talents of Angelica were of a pleasing rather than of a splendid kind. She excelled most, as was most justly to be expected, in the representation of female characters. Her figures of men want form and energy, and their faces and characters are all of the same mould. Grace, ease, and facility of expression, generally mark her women; and to single figures, such as "Calypso watching the Departure of Ulysses," or "Penelope weeping over her bow," the imparted the true interest of the story.

KAUGA, in Geography, a town of Africa, in a kingdom of the same name, S. of Bornou, traversed by the Niger. The town is situated on a lake, called by Ptolemy "Nubia Palus," in which some have supposed the Niger lost itself; 235 miles S.S.E. of Bornou. N. lat. 16° 10'. E. long. 24° 40'.

KAUGASNIEMI, a town of Sweden, in the province of Savolax; 35 miles N. of Christiana.

KAUHAJKI, a town of Sweden, in the government of Waffa; 24 miles E.N.E. of Christineland.

KAUHAVA, a town of Sweden, in the government of Waffa; 37 miles E. of Waffa.

KAUHAUT, in Biography, an excellent performer on the lute, and perhaps the last eminent musician who highly cultivated that instrument. Signor Colini was the last good performer on the lute in England. We believe that Kauhaut was a German; but he is enumerated by M. Laborde among French composers; he was in the service of the prince of Conti, and composed between 1768 and 1764 several comic operas for the Theatre Italien at Paris. But in 1772 we found him at Vienna, in high reputation as a lutenist.

KAUI, in Geography, a town of Persia, in the province of Adarbeiztan; 48 miles N.W. of Tabris.

KAUKEBAN, a small fortified town of Arabia, in Yemen, but situated on the summit of an almost inaccessible mountain. A cauesway has been formed, by which loaded camels can now advance up to the city; 18 miles W. of Sana. The country bearing this name is surrounded almost on all sides by the dominion of the Imam of Sana; only, on one side, it meets the territory of the confederated Scheichs of Hafehid-u-bekil. The reigning family are descendants from Mhomet, by Hadji, Imam of Saads. Although they have lost the title of Imam, they still retain sovereign authority over a considerable territory.

KAUKENEN, a town of Prussian Lithuania, on the Kauke, which runs into the Curich Haff; 12 miles W.N.W. of Tilit.

KAUMARI, in Hindu Mythology, is the faksi or conductor of Kumara, or Kartikya, and is represented riding on a gencrok, with a lance in his hand. See KARTIKYA and SAKTI.

KAUMBOLI, in Geography, a town of Hindoostan, in the circuit of Ellore; 12 miles S.S.W. of Ellore.

KAUNITZ, WENZEL ANTONY, in Biography, prince of the holy Roman empire, count of Rietberg, knight of the golden fleece, &c. was born at Vienna in 1711. Being a younger child of a large family he was brought up to the church, but on the death of his elder brothers he quitted the
the ecclesiastical profession to enter into the service of the state, in which his ancestors had made a considerable figure. He laid the foundation of his studies at Vienna, and in 1737, was made a councillor of state, and, two years after, imperial commissioneer at the diet of Ratibon. In the year 1742, he was appointed minister plenipotentiary to the court of Sardinia, which had entered into a new alliance with Austria. A treaty was brought to a conclusion by Kaunitz, which induced the court to confer on him offices of more importance. In 1744, he went to Brussels, to undertake the chief management of public affairs, which, at that time, required a man of talents, as the king of France had already declared war, and the Netherlands were the first part of the emperor's dominions exposed to the attack of the French army. In February 1745, he was appointed minister plenipotentiary, and in 1748, he took a part in the signing of the preliminaries of peace at Aix-la-Chapelle. On this occasion he acquired, by his great talents for negotiation, and the noble conduct which he displayed, the respect of all the ministers then present. When peace was concluded, the empress Mary Theresia conferred upon him the order of the Golden Fleece, and appointed him envoy to Paris. During his residence in that city, he laid the foundation of an alliance between France and Austria, which took place some time after. On the resignation of count Uhlisch, as chancellor of state, Kaunitz was appointed his successor, and recalled from Paris about the end of the year 1752, but at the same time was ordered to return to Brussels, to bring to an end the negotiations in regard to the barriers, which had been carried on a whole year without success. When he had completed this object he returned to Vienna in 1753, and entered upon the official duties of the chancellorship of state, in addition to those belonging to the supreme dictatorship of the affairs of the Netherlands and of Lombardy, with the rank of minister of state, which he retained till his death. In 1764, he was raised to the dignity of prince of the empire, with deference to his heirs male. He concluded the treaty of alliance between France and Austria in 1766, which put an end to that hostility which had prevailed for several centuries between the two countries. After this he had the sole management of all foreign affairs, and enjoyed the unlimited confidence of the empress Mary Theresia, and afterwards of Joseph II., Leopold II., and Francis II. He died in June 1794, in the 84th year of his age, leaving behind him a very high reputation. Gen. Biol.

KAUNITZ, in Geography, a town of Moravia, in the circle of Brunn; eight miles S.W. of Brunn.—Alfo, a town of Moravia, in the circle of Znaim; 11 miles N.W. of Znaim.

KAUNPORN, a town of Hindooftan, in Moultan; 15 miles N.E. of Moultan.

KABUNUDON, a town of Hindooftan, in Lahore; 20 miles N.E. of Cullborn.

KADO, one of the smaller Molucca islands, five miles S. of Machian. N. lat. 0° 5'. E. long. 127 24'.

KAUS, a town of Grand Bucharia; 65 miles N. of Sawarca.d.

KAUR, a town of Peria, in the province of Irak; six miles E. of Natun.

KAURABANG, a town of Candazar; 80 miles S.W. of Cabaul.

KAURESTAN, a town of Peria, in Lariian; 65 miles E.S.E. of Lar.

KAURYSOUPL, a body of soldiers who form the half of the five corps of the king of Peria's guards. They are in number two thousand, and are all horse, commanded by the constable, and in his absence by the captain of the watch. They keep watch in the night around the palace, strive to keep off the crowd when the sophi goes on horseback, keep silence at the audience of ambassadors, seize the khans and other officers when disgraced, and cut off their heads when the sophi commands it.

KAURZIM, in Geography, a town of Bohemia, and capital of a circle of the same name, on a river which runs into the Elbe; the circle supplies Prague and other places with timber; 24 miles E.S.E. of Prague. N. lat. 49° 56'. E. long. 15° 5'.

KAUSZAN, a town of Beliarabia, inhabited by Badziak Tartars; 12 miles S.S.E. of Bender.

KAUTEER, a town of Bengal; 14 miles E. of Toree.

KAUVERI, or KAVERI, in Hindoo Mythology, the fakri or comfort of Kuevra, the deformed god of riches. The river in Myore, in which is the island of Sri-Rangapatam, or Seringapatam, usually written Caveri, is named after this goddess. See KUYERA, and CAYVER.

KAWAH, in Geography, a town of Hindooftan; in the circar of Ellichipour; 20 miles E. of Omruntry.

KAWAR, or KWAR, a country of Africa, lying to the northward of Kuku and Boroon, and extending eastward to Al Wchat. It is bounded on the N. by that extensive desert which separates Egypt from Fezzen, and which is the proper desert of Libya; on the E. by Egypt, and on the W. by the desert of Birman.

KAWOMORAH, a town of Japan, in the island of Niphon; 160 miles N.W. of Meacco.

KAWTAH, a town of Hindooftan, in the circar of Singboom; 45 miles E. of Doefa.

KAWUCK, or KREWICK, the further, or most easterly, of the plains leading through Hindoo-Kho into the province of Cabil.

KAWUTZA, a town of Sweden, in the government of Abo; 25 miles S.E. of Bieronberg.

KAXHERTA, a town of Sweden, in the government of Abo, on an island in the gulf of Finland; five miles S. of Abo.

KAY, Key, or Qay, a wharf or place by the water-side, in a sea-port, for the loading and unloading of merchandise.

The verb cajors, in old writers, according to Scaliger, signifies to keep in or refrain; and hence came our term kay; the ground where keys are made being bound in with planks and polls.

The lawful keys and wharfs for the lading or landing of goods, belonging to the port of London are the following: viz. Cheker's Key, Brewer's Key, Galley Key, Wool Dock, Cutton-house Key, Bear Key, Porter's Key, Sab's Key, Wiggan's Key, Young's Key, Ralph's Key, Dice Key, Smart's Key, Samp's Key, Hammond's key, Lyon's Key, Botolph Wharf, Grant's key, Cock's Key, and Fresh Wharf; besides Billingsgate, for landing fish and fruit; and Bridgehouse in Southwark, for corn and other provisions; but for no other goods or merchandise. Dealboards, masts, and timber, may be landed at any place between Limehouse and Welfinister; the owner first paying or compounding for the customs, and declaring at what place he will land them.

KAYA, in Geography, a town of Cacango. S. lat. 2° 20'. E. long. 12° 10'.

KAYADERE, a town of Asiatic Turkey, near the W. coast of Natoia; five miles E.N.E. of Vouria.

KAYAGE, the money, or toll, paid for loading or unloading wares at kayes.

KAYANG, in Geography, a river of the island of Celebes, which
KAY

KAYCOON Point, a cape on the W. coast of the island of Cebu. S. lat. 11° 24'. E. long. 129° 30'.

KAYDANOW, a town of Lithuania, in the palatinate of Mindz; 16 miles S.S.W. of Mindz.

KAYE, a town of Africa, in the kingdom of Loango; 13 miles N.W. of Loango.

Kaye's Island, an island in the N. Pacific ocean, near the W. coast of North America, discovered by Capt. Cook in his third voyage, May 1778, and thus named in honour of Dr. Kaye, late dean of Lincoln. It is 11 or 12 leagues in length, in the direction of N.E. and S.W.; but its breadth is not above a league, or a league and a half, in any part of it. The S.W. point, which lies in lat. 59° 49', and long. 216° 58', is a naked rock, considerably elevated above the land within it. Towards the sea, the island terminates in bare sloping cliffs, with a beach, a few paces wide, of large pebble stones, intermixed here and there with a brownish clayey sand. Parts of the shore are interrupted by small vales and gullies; in each of which a torrent rushes down with violence, which is furnished by the melted snow. These vales are filled with pine-trees, extending from the entrance to about the middle part of the island. This island is covered with a broad girdle of wood, spread upon its side, included between the top of the cliffy shore, and the higher parts in the centre. The trees are of diminutive size. About the wood were observed a crow, and white headed and white breasted eagles; and fowls of various kinds were seen upon the water and near the shore. No animals were seen except a fox; nor were perceived any signs of inhabitants ever having been upon the island. Cooke's Third Voyage, vol. ii.

KAYEE, a town of Africa, in Kajaga, on the Senegal. N. lat. 14° 30'. W. long. 27° 35'.

KAYKIYA, in Hindo Mythological History, is one of the three wives of Dafarat, the father of Rama-chandra. About the period of the birth of the latter hero, Kaykiya, or Kahkiya, produced Lucins, his half brother, to assist him in the wars of Lanka or Ceylon, as detailed at great length in Runyanaga, which see.

KAYMEN, in Geography, a town of Prussia, in the province of Samland; 12 miles E.E. of Konigberg.

KAYMOURA, a town of Africa, in Bonjou; 15 miles S.S.W. of Fatteconda.

KAYNS, a race of mountaineers in the Birman empire, perfectly distinct from the Carinans, and speaking a language differing radically both from theirs and that of the Birmans. They were originally inhabitants of the Arracan mountains, whom the Birmans, since their conquest of that kingdom, have prevailed on, partly by force, and partly by mild treatment, to abandon their native hills, and settle on the plain. There are several small societies of these people established near the foot of the mountains further north. The Carinans are not to be found higher up than the city of Prane.

KAYOO, a town of Africa, in Bambarra, on the Niger. N. lat. 13°. W. long. 4° 59'.

KAYOR, or CAJON, a kingdom of Africa, near the sea-coast, between the rivers Gambia and Senegal.

KAYSERSWERT, a town of Germany, on the E. side of the Rhine, once fortified, but now without walls; for a long time annexed to the bishopric of Cologne, but in the year 1762, restored to the diocesan patrimony; 24 miles N. of Juliers, N. lat. 51° 16'. E. long. 6° 37'.

KAYUWAH, a town of Pegu, on the left bank of the Ava; 15 miles S. of Prane.

Vol. XIX.

KAYZEVAN, a town of Turkish Armenia; 69 miles S.W. of Erivan.

KAZAKOW, a town of Russia, in the government of Irkutsk; 12 miles W. of Northwick.

KAZAN, a city of Russia, and capital of a government of the same name, situated on the Volga. In the Turkish and Tartar languages, kazan signifies a cauldron large enough to contain victuals for many persons; and hence the name has been given by the Cim and Budzak Marfell tobacco-families of their subjects or vaftals, reckoning about 10 men to a kazan. This city consists of a strong fort, built with stone; the wooden town, as it is called; and several adjoining flobodes, or suburbs; and among these is one inhabited by Tartars, in which are four churches. Here are also several churches built with stone, and 17 convents in and near the town. The governor of the fort has the command of the garrisons and regiments; the garrison of the city consists of three regiments, for which a good hospital is provided. Kazan was also an archbishop's see. Here are also a manufacture of cloth, and a school, in which are taught the Russian and Latin languages, the principles of the Christian religion, and the elements of philosophy, in order to qualify preachers for the conversion of the nations to which they belong. This city was totally destroyed by fire in the years 1749 and 1752. Kazan was once the capital of a principal part of Tartary, and the seat of government, where the royal family resided. The Russians first made themselves masters of this important place on the 3d of October 1552; 400 miles E. of Moscow. N. lat. 55° 45'. E. long. 49° 3'.

This khanate (see KAPTSHAK) subsisted as a peculiar state till the year above-mentioned, 1552, when it was conquered by czar Ivan II., and incorporated for ever with the Russian empire. The city of Kazan had been built in the year 1257 by a son of Barty, nephew of Tchingis-khan; and this khanate asserted its independence about the same time (1441) when the Krim disjoined itself from Kaptchak. The present Kazan Tartars are but a feeble remnant of what they were, partly confining of those who remained in their old seats, and partly such as settled as fugitives, in other districts of Russia. They principally dwell at present in the governments of Kazan, Simbirsk, Riefan, Viatka, Perme and Ufa (particularly in the Orenburg district of that government); their number is upon the whole considerable, but in no degree proportionate to the idea we form of their ancient population, from historical accounts; for, as far as we are able to conclude from particular statements, they cannot amount to much above 100,000. These Tartars form the root of the native of Russia; being not only unmixed, but also of a superior civilization to most of the remaining branches of their brethren. Cooke.

KAZANOW, a town of Poland, in the palatinate of Sandmirz; 40 miles N.N.W. of Sandmirz.

KAZANSKAIA, a town of Ruffia, in the country of the Cossacks, on the Don; 100 miles S.S.E. of Veronet.

KAZANSKOE, or Government of Kazan, a government of Russia, bounded on the N. and N.E. by Viatkoe, on the E. by Uphimukoe, on the S. by Simbirkoe, and on the W. by Niznei-Gorodkoe; about 100 miles in length, and from 100 to 150 broad; the capital is Kazan.

KAZARON, a town of Persia, in the province of Far-sian; 55 miles W.S.W. of Schiras. N. lat. 29° 44'. E. long. 51° 28'.

KAZIKIRAN, a town of Persia, in the province of Ardberatan; 45 miles S.E. of Urmia.

KAZIMIERS, See Camniir.

KFA,
KEA, a town of Africa, in the kingdom of Bamburra; 65 miles N.E. of Sego.

KEADE, a poll-town of the county of Roscommon, province of Connaught, Ireland; 85 miles from Dublin.

KEADY, a market and poll-town of the county of Armagh, province of Ulster, Ireland, situated on the river Collan, along the banks of which, from Armagh to this place, are many considerable bleach greens, the linen manufacture being carried on here very extensively. Keady is 50 miles N. from Dublin; and six S. from Armagh.

KEASA, or Kashasa, is the name of the lieutenant of the chief officers of the Porte, or the superintendent of their particular currie.

KEALE, small fragments resembling chips or broken pieces of stone of various kinds; some of lime-stone, others of free-stone, and others of rag-stone, found mixed among the earth, of the upper stratum in many parts of this kingdom, and giving that soil the name of kealy; hence, some of these pieces of kealy are thin and flat like bits of slate.

KEALLY, soil, in Agriculture, is used by the husbandmen for a fort of land, plentifully chewed with kealy or kals.

KEANPAN HEAD, in Geography, a cape on the E. coast of the island of Lewis, forming the N.E. point of the peninsula of Aird. N. lat. 58° 15'. W. long. 6° 5'.

KEANGON, a town of Grand Duchass; 75 miles N.W. of Anderab.

KEARA, a town of Hindooftan, in Bahar; 50 miles S.S.W. of Patna.

KEAT, George, in Biography, an entertaining and miscellaneous writer, was born at Trowbridge, in Wilthire, in the year 1729. Having been educated at King's College, he repaired to Geneva, where he lived some years, and contracted an intimacy with Voltaire. He made the tour of Europe, and returning to his native country, entered himself as student in the Inner Temple, and was in due time called to the bar, and sometimes attended the courts in Westminster Hall, though he did not practise, either on account of his want of encouragement, or for want of a degree of application sufficient to make himself master of his profession. His first literary performance was entitled "Ancient and Modern Rome," a poem written at Rome in the year 1755. It was published in 1762, and was very well received by the public: he next produced "A Short Account of the Ancient History, present Government, and Laws of the Republic of Geneva." In 1766 or 69, he published "Ferney," an epistle to Voltaire, in which he introduced a fine eulogium on Shakspere, which procured for him the compliment, from the mayor and burgesses of Stratford, of a handsome mounted with silver, made out of the mulberry-tree planted by that illustrious bard. In 1770, he published "Sketches from Nature, taken and coloured in a Journey to Margate," in two vols. 12mo. This, though an avowed imitation of Sterne's "Sentimental Journey," contains so many just strictures on life and manners, enlivened by strokes of genuine humour and delicacy of sentiment, as to have been extremely popular, and it was thought that Sterne never had so happy an imitator as Keate. In 1781, he collected his poetical works, and published them in two volumes, which he dedicated to Dr. Heberden. The Ialt, and his ball production, and that which did most credit to his genius and liberality, was the "Account of the Pelew Islands," which he drew up and published in 1783. This work is written with great elegance, and compiled with much care: it had a considerable sale, but the author drew it up from the most disinterested motives, and received no advantage from it whatever. He died in the year 1797, having behind him several other publications besides those already noticed. Gentleman's and Monthly Magazines.

KEATING, Gruffudd, an Irish historian, was a native of Tipperary, and flourished in the earlier part of the seventeenth century. He was educated with a view to the duties of the Roman Catholic church, and having received at a foreign university the degree of doctor of divinity, he returned to his native country, and became a celebrated preacher. Being well versed in the ancient Irish language, he collected the remains of the early history and antiquities of the island, and formed them into a regular narrative. This work he finished about the time of the accession of Charles I. to the throne: it commences from the first planting of Ireland, after the deluge, and goes on to the fifth year of King Henry II., giving an account of the lives and reigns of one hundred and seventy-four kings of the Milesian race. From the above circumstances, our readers will readily suppose that this work is little better than fiction. Indeed the advocates of the author allege in his defence, that he has given his extraordinary relations merely as fables, and not as true history. It remained in MS. in the original language, till it was translated into English by Dermot O'Connor, and published in London in 1723. A new edition was published in 1758, with plates of the arms of the principal Irish families. Keating died about the middle of the seventeenth century.

KE-BAN, in Geography, a town of Aftatic Turkey, in the province of Divarbeek; 70 miles N. of Divarbeek.

KEEDER, the name of a sect among the Persians, who, in general, are rich merchants. See GARIB.

KEEBIT, in Geography, a small island in the East Indian Sea; its lat. 7° 15'. E. long. 130° 40'.

KEELA, or Kebel, Kebale, and Alka, among the Mussulman, denotes that point, or quarter, to which they turn themselves when they lay their prayers.

Mahomet, at first, durst not propose any other kebala to his followers but the temple of Jerusalem, which was the kebala of the Jews and Christians. In the course of time, however, being willing to bring them off from any communication in matters of religion, with the Jews and Christians, he appointed them, in the Koran, to turn themselves, at prayer, towards the temple of Mecca; from which time they called those two temples the Kebatia, or two kebalas.

Ricaut adds, that it is not the temple of Mecca, properly speaking, that the Turks call kebela, but rather the large square tower in the middle of the amphitheatre of that temple.

The kebala of the Jews was the temple at Jerusalem; that of the Sabians, the meridian; and that of the Magians, the rising sun. To this the prophet Ezekiel refers chap. v. 16.

KEBLA is also used for an altar; or rather a vehicle, as Ricaut calls it, which the Mahometians have in all their mosques, and which is placed very exactly on that side towards the temple of Mecca.

Hence also kebela comes to be used, metaphorically, for the object, or end proposed, in doing any thing.

Thus, the kebala of kings is their crown and authority; that of men of business, is money; that of gluttons, good cheer. &c.

KEBLA-NOMA, or KEBLEH-NOMA, a name which the Turks and Persians give to a little pocket-compases, which they always carry with them in order to place themselves more exactly when they go to prayer.

KEBLE, Joseph, in Biography, son of Richard Keble, esq. a lawyer of reputation at Irelwark, was born in London
KED

In 1632, and studied at Jesus and All-Souls colleges in Oxford. He was admitted a barrister at Gray's Inn, and attended with the utmost affinity at the king's bench for fifty years, though it is believed he never had a cause put into his hands; or, was called to make a motion. He died suddenly in 1710, as he was stepping into a coach at Holborn-gate, being in his 78th year. His publications were numerous; and chiefly on legal subjects. He published, however, an effay on "Human Nature;" and another on "Human Actions." At his death, it is said, his manuscripts amounted to one hundred folios, and more than fifty quartos, all in his own hand-writing. B. B. Brit.

Keele's Island, in Geography, an island in the Mergui Archipelago, about five miles long, and 11 broad. N. lat. 3° 56'.

Kebuck Head, a cape on the E. coast of the island of Lewis. N. lat. 53° 2'. W. long. 6° 15'.

KecKeman, Bartholomew, in Biography, a Prussian divine, was born at Danzig in the year 1571: here he received the elements of a learned education, and at the age of eighteen he was sent to the university of Wittemberg, and studied philosophy and divinity two years. From this seminary he went to the university of Leipsic, where he spent some time, and then removed to Heidelberg. At this place he took his degrees, and at length became a tutor in several branches of knowledge. The fame which he acquired, as professor of Hebrew, induced the senate of Danzig, in the year 1597, to invite him to become co-rector of the celebrated academical institution in that city, an office which he thought proper to decline. Four years afterwards the invitation was renewed, and he accepted it. The professorship to which he devoted his talents was that of philosophy, and he proposed to lead students to its inmost recesses by a more compendious method than had been before adopted. According to his plan, they were to complete their course of studies in three years. In the execution of his method he drew up a great number of treatises on almost all subjects that could claim the attention of the young; but by studying, writing, and teaching, he ruined his health, and fell a sacrifice to his industry in the thirty-eighth year of his age. His works have been published in two volumes, folio.

Keckle, on Board a Ship. When the cables gall in the hawse, or the bolt-rope do so against the ship's quarter, the seamen wind some small ropes about them; and this is called keeling.

Kedas, in Geography, a town of Bengal; 15 miles S.E. of Midnapore.—Aila, a town of Syria, on the river Jermuk; anciently called Cadara; 56 miles N. of Jermulam. Keede, or Quade, a town of Africa, in the country of the Foulahs; 40 miles W. of Kayor. Keda Farah, a town of Aisat Turkey, in the government of Sirus, on the Kedemzick; 30 miles W. of Samfoun. Kidge, or Kidge. See Grenada and Macran.

Kedgere, or Kedge-Anchor, in Ship. See Anchor.

Keding, a sea-term used when a vessel is brought up or down a narrow river by the wind, though the tide be contrary to it. To draw the seamen let their fore-bill, fore-top, and mizen, and let her drive with the tide, that they may flay her about. If she come too near the shore, they have a little anchor ready, called the kedger, or kedger-anchor, with a hawser fastened to it from the ship; and they drop the ship in the midst of the current, by which means they wind her head about; and this done, take up the anchor again.

Kedgoora, in Geography, a town of Hindoostan, in Bindaclound; 30 miles N.N.E. of Callingar.

Kedgree, a town of Hindoostan; 34 miles N.E. of Benares.

Kedham, a town of Upper Guinea, situated on the river Scherblo; 200 miles from its mouth.

Kedous, a town of Aisat Turkey, in Natolia; 32 miles W. of Kinhaja.

Kedrel, in Geography. See Cerdon.

Keelbe, John, in Biography, an eminent organist and harpsichord-player, who, in 1717, on Koecking being confirmed at St. George's, Hanover-square, on account of the derangement of his intellects, was appointed officiating organist of that church, upon half the salary, during the life of his predecessor. See Rosingrave.

Mr. Keble was the first performer on the organ at the opening of Ranelagh, and at the subscription concert established by Hickford at his room in Brewer's-direeet. (See Hickford.) He had likewise, to the end of his life, the best range of teaching of any master in London; and was so sure of pupils of rank and fashion, in the immediate vicinity of his own residence, in Prince's-direeet, Hanover-square, that he declined the attendance of any others.

This able and experienced master, besides his practical abilities, had a passion for theoretical studies, and spent his leisure hours, during many years, in the investigation of the music of the ancients, and the Harmonica, which he. He was supposed to die worth 30,000l. in 1786.

Keela, in Geography, a town of Africa, in Algiers; six miles N.E. of Tifla.

Keel, in Botany. See Carina.

Keel, the lowest piece of timber in a ship, placed in the bottom of her hull; one end thereof being let into the flern-poll, and the other into the stem.

If we compare the carcase of a ship to the skeleton of the human body, the keel may be considered as the back-bone, and the timbers as the ribs. It, therefore, supports and unites the whole fabric, since the stem and sternpost, which are elevated on its ends, are, in some measure, a continuation of the keel, and serve to connect and unite the extremities of the sides by tramsoms; as the keel forms and unites the bottom by timbers. The keel is generally composed of several thick pieces, placed lengthways, which, after being laced together, are bolted and clinched upon the upper side. When these pieces cannot be procured long enough to afford a sufficient depth to the keel, there is a strong thick piece of timber bolted to the bottom thereof, called the fajfe keel.

When a ship has a deep keel, she is said to have a rank keel; and this serves to keep her from rolling.

Keel is also a name given to a low flat-bottomed vessel, used in the river Tyne, to bring the coals down from Newcastle, and the adjacent parts, in order to load the colliers for transportation.

Keel, upon an iron, in Sea Language, denotes the position of a ship when her keel is parallel to the place of the horizon, so that she is generally deep in the water at both ends.

Keel-bucking, or Keel-raking, is a punishment inflicted at sea, in the Dutch navy, on very great offenders, who are drawn underneath the very keel of the ship. See Ducking.

Keel-rope, a hair rope running between the keelson and the keel of a ship, to clear the timber-holes when they are chocked up with ballast, &c.

Keelage, Killaghm, a privilege to demand money for the bottoms of ships rolling in a port or harbour.

4 U, Keelers,
KEE

KEELERS, in the Sea Language, small tubs to hold fluff to grave a ship's bottom.

KEELING, a name used in some English writers for the common cod-fish. See Askellus.

KELLISON is a keel with a side similar to that without, upon the floor timbers exactly over the keel of the same dimensions, but always oak, keeping their butts or scarfs clear of each other; thus the bottom of the ship becomes firmly united by bolts driven through every floor timber, from the upper side of the keelson to the under side of the keel.

KEEMA-KEDAN, in Geography, a cluster of small islands in the East Indian sea, near the W. coast of the island of Leyta. N. lat. 10° 30'. E. long. 125° 36'.

KEEMO, in Natural History, a large shell of the cockle-kind; probably, says Martlin (Hist. of Sumatra, p. 93) the largest in the world. It is found in the bay of Tappanooily, in Sumatra, chiefly, and likewise in other parts of the East. These shells are taken in deep water, by thrashing a long bamboo between the valves as they lie open, and by the immediate closure which follows they are made fast. The largest says Mr. Martin, which I have seen, was about three to four feet over. The shell is perfectly white, and is worked up like ivory by the natives.

KEENDUEM, in Geography, a river which rises in Thibet, and runs into the Irrawaddy, 40 miles below Ava. This great river comes from the N.W. and divides the country of Cassay from that of Ava. It is navigable, as far as the Birman territory extends, for vessels of burthen. The entrance of the Keendum is about a mile wide.

KEENE, EDMUND, in Biography, an English prelate, was born at Lynn, in Norfolk, of which place his father was alderman. He was educated at Catus college, Cambridge, and, in 1742, obtained the rectory of Stanhope, in the bishopric of Durham. In 1750, he was chosen master of St. Peter's college, and in a short time after he served the office of vice-chancellor, in which he promoted the regulations for improving the discipline of the university. In 1752, he was made bishop of Chelten, where he continued eighteen years, when he was translated to Ely. He died in the year 1781. He had a brother who was several years ambassadort at the court of Madrid. Gen. Biog. Dict.

KEEN, in Geography, a part-town of America, in New Hampshire, and one of the most flourishing in Cheshire county; incorporated in 1753, and containing, in 1800, 1645 inhabitants. It is 86 miles N.W. from Boston.

KEENEEBALOV, or ST. PETER'S MOUNT, a large mountain in the N. part of the island of Borneo, near which are a people called Oran, Idaen, and Maroots, who offer human sacrifices to their deity. It is said that they are acquainted with a subtle poison, in which they dip their small darts, and thus cause a wound which produces instant death.

KEEP, TO, in Sea Language, is a term used on various occasions: as To keep the land abroad, is, to keep within fight of land as much as possible. See Hold.

To keep the luff, is to continue close to the wind, or to fail with a course inclined to the direction of the wind as much as possible, without deviating to leeward. This is also called keeping the wind. See Close-hauled and Loof.

To keep off, is to fail off, or keep at a distance from the shore. See Owing.

KEEP, or DUNGEON, the strong tower of an ancient castle, commonly placed on a high natural or artificial mount, into which the garrison retired when the castle itself was taken. The lake or collar of such keep was generally used to confine prisoners in.

KEEPER of the Forest, otherwise called chief warden of the forest, is an officer who has the principal government of all things belonging to a royal forest, and the check of all the other officers.

The lord chief justice in eye of the forest, when he thinks fit to hold his justice fealt, sends out his general summons to the keeper forty days before, to warn all under-officers to appear before him, at a day assigned in the summons. See Justice of the forest.

Keeper of the Great-seal, is a lord by his office, and is styled lord keeper of the great-seal. He is one of the king's privy-council, through whose hands pass all charters, commissions, and grants of the king under the great-seal; without whom no seal, all such instruments, by law, are of no force: for the king is, in the interpretation of the law, a corporation, and passes nothing firmly but under the said seal; which, as the public faith of the kingdom, in the highest esteem and reputation.

The lord keeper has the same place, authority, pre-eminence, jurisdiction, execution of laws, and all other customs, commodities, and advantages, as the lord chancellor of England has for the time being. Both these officers cannot properly officiate at the same time, since the statute of 5 Eliz. The lord chancellor, or lord keeper, is superior in point of precedence to every temporal lord.

Keeper of the Privy-seal, is a lord by his office; through whose hands pass all charters signed by the king, before they come to the great-seal, and some things which do not pass the great-seal at all. He is of the king's privy council, and was anciently called clerk of the privy-seal; yet reckoned in the number of the great officers of the realm. 12 Ric. II. c. 11. 27 Hen. VIII. c. 11.

Keeper, Boat, in Sea Language, one of the rowers, who remains as a centinel in his turn, to take care of any boat and her contents, either when she lies by the shore, or along-side of the ship; or when she is towed a-tern of her.

Keeper, The, in Geography, a high mountain in the county of Tipperary, province of Munster, Ireland, which forms a Timipicus object to a great extent of country. It is seven miles S.S.W. from Nenagh.

KEEPING, in Painting, is a technical term, which signifies the peculiar management of those parts of the art, colouring and chiaro-true, which produces the proper degree of relieve in objects admitted into a composition; according to their relative positions in the imagined scene, and the degree of importance the artific attaches to them.

When he has chosen his subject, and arranged his figures, forms, and colours, his next task will be, to give each object its local situation, and to bring those forward in the picture which he intends should be most impresive on the beholder; or at least, so to manage the surrounding ones, that those which are principal in the subject and composition, should not fail of their effect. This may be effected either by fade or colour; either by throwing a shadow across the inferior objects, or tinting them with a colour less bright than that given to the others; and, even in very skilful hands, it may be done by the very reverse mode of practice to either of the above: but that is extremely difficult, and requires the knowledge and the hand of a great master in the art to execute it.

As the objects recede in the ground-plane of the picture, the hue of the atmosphere intermixing with their proper, or local colour, as it is termed, (though improperly so,) will assist in their keeping; i.e. will cause them to appear at their just distance from the front figures. Therefore there is less art required here, than in separating and rounding figures situated nearly in the same plane, and combining together
KEF

in Geography, a small island in the East Indian sea, near the S.E. coast of the island of Ceram. S. lat. 3° 28'. E. long. 131° 12'.

KEFIL, a village of the Arabian Hijaz, famous for the tomb of the prophet Ezekiel, annually visited by a multitude of Jews; 14 miles S. of Hejlah.

KEFKEBEH, a town of Natolia; 20 miles N.E. of Effiehrah.

KEFKEN, a small island in the Black sea, near the coast of Natolia. N. lat. 41° 6'. E. long. 36° 4'.

KEFREEN, a town of Syria, on a large plain to which it gives name, distinguished for the number of pigeons that are bred there; 15 miles from Aleppo.

KEFT, or KEFPIT. See COPTOS.

KEHEEP, a town of Hindooftan, in Lahore; 45 miles S. of Attok.

KEHEMEND, a town of Persia, in the province of Farilcan; 35 miles N. of Efikar.

KEHL, a fortress in the duchy of Baden. At the peace of Ryfwick in 1607, this fort was ceded to the emperor and empress, and declared an imperial fortress. In the war between France and Austria, it was often taken and retaken; 2 miles E. of Strafsburg. Keih was united to the French empire by a decree of the Conserative Senate in January 1808, and made a part of the department of the Lower Rhine.

KEHOA, a town of Asia, in Tonquin, near the coast. N. lat. 19° 12'. E. long. 105° 21'.

KEHRICZ, a town of Persia, in Khorasan; 70 miles N. of Herat.

KEIA-REGIAN, a town of Persia, in Irak; 60 miles W.N.W. of Hamadan.

KEFLINGE, a town of Sweden, in the province of Schonen; 6 miles N.E. of Lund.

KEI-GAM, a town of Corea; 50 miles S.E. of Cowen.

KEIGHLEY, a town of England, in the county of York, situated on a navigable canal, and having a market on Wednesday. In 1827, the population consisted of 5745 persons, of whom 4476 were employed in trade and manufacture; 12 miles N. of Halifax, and 269 N.N.W. of London.

KEIKEM, in the Materia Medica, a name given by the Arabian writers to a gum used in their time for making of varnish.

Gum lacca is generally said to be the substance meant by it, but Avicenna seems to express by it every thing that was used as varnish. Thus he sometimes means by it the gum fandarak, and sometimes amber. The gum caeexamun of the Greeks is also certainly often meant by it; but this is more correctly to be mentioned as an application of the word, it being almost as general a term as itself, and standing with many of the old authors for fandarak, gum lac, and amber, as well as for the gum properly expressed by it. In short, all the gums used in making varnish, are in general called by the names of any one of them, and thus vernix, fandarak, caeexamun, and lacca, are made synonymous words, and other names for each of the things signified by all the words.

KEIKIS, in Geography, a town of Sweden, in the government of Abo; 48 miles N. of Borneborg.

KEILAH. See CELIA.

KEILL, John, in Biography, a celebrated mathematician and philosopher, was born at Edinburgh in the year 1671; here also he received his early education, and at the university pursued his mature studies, and took his degree of M.A. He was particularly attached to Dr. Gregory,
who taught the mathematics, and read a course of lectures
on the Newtonian philosophy. Under him and by his aid
he was enabled to make himself master of the "Principia,"
which he regarded as the ground-work of his future studies.
In the year 1691, Mr. Keill went with his tutor to Oxford,
entered himself of Balliol college, and read lectures himself
in his own chambers upon natural and experimental phi-
losophy, by which he acquired considerable reputation. As
an author, he first appeared with an "Examination of Dr.
Burnet's Theory of the Earth," which led to a more ex-
tended controversy on the subject: in this he displayed very
commanding talents, and ably refuted the ingenious theories
of Dr. Burnet and Mr. Whitton. He readily admitted that
though the work, the errors of which he undertook to ex-
pose, was full of mistakes in philosophy, yet none ever
abounded with more beautiful fancies and surprising images
of nature. In 1700, he succeeded Dr. Millington, who was
appointed physician in ordinary to the king, as Sedleian pro-
fessor of natural philosophy, and read lectures in the public
schools. He now removed to Chrift-churh college, and, in
1702, he published his treatise, intitled "Introductio ad ve-
ram Physicum," containing the substance of several lectures
on the new philosophy. This work met with a favourable re-
ception in his own and in foreign countries, and was considered
as a good introduction to the Principia. In 1736, a new edi-
tion of it was printed in London at the will of M. Maupertius,
who subjoined to it a new hypothesis of his own concerning the
ring of the planet Saturn. In 1708, Mr. Keill was elected
a member of the Royal Society, of which he proved himself
a very useful member, and enriched the Transactions of
the Society with many valuable papers. In the following
year he made a voyage to New England, as treasurer of the
Palatines who were sent by government into that country,
and soon after his return, in the following year, he was
chosen Savilian professor of astronomy. Mr. Keill next
engaged in the controversy respecting Isaac Newton's
claim to the invention of fluxions: several letters passed on
the subject between M. Leibnitz and our author, till at
length a special committee of the Royal Society was ap-
pointed to examine the merits of the case, which committee
concluded their report with declaring, that they reckoned for
I. Newton the first inventor of the method in question, and
that they were also of opinion that Mr. Keill, in ascertaining
the fame, had been no ways injurious to M. Leibnitz. The
particulars of these proceedings may be found in a work to
which we have, in this Cyclopaedia, already more than once
referred, viz. the "Commerciwm Epilohicum" of Mr. Col-
llns. The dispute was carried on for some years in the
"Acta Eruditorum," and the "Journal Litteraire." It was
generally admitted that Mr. Keill conducted himself in these
countests with a great degree of firmness and spirit, and that
he successfully repelled the attacks upon the reputation of
our illustrious countrymen. In 1711, he published a paper
in the Philosophical Transactions, "On the Reality of Met-
ter, &c." in which he points out various phenomena which
cannot be explained upon the supposition of a plenum. About
this time queen Anne was pleased to appoint him to the office
of decipherer to her majesty, in which he continued till the
year 1716. In 1713, the university of Oxford conferred
upon him the diploma of doctor of medicine, and two years
afterwards he published an edition of Enclid, to which he
added two tracts on Trigonometry and the Nature of Logi-
critics. In the year 1718, Dr. Keill published at Oxford
his "Introductio ad veram Astronomiam," which was after-
wards translated by himself into English, at the request of
the duchess of Chandos, under the title of "An Introduction
to the true Astronomy," &c. The author did not long
survive this work. He died of a fever in the summer of 1721,
being only in the 50th year of his age.

Keill, James, an eminent physician, was born in Scot-
land on the 27th of March 1673. Having received the
early part of his education in his native country, he was
abroad with the view of completing it in the schools of
celebrity on the continent; and obtained such a degree
of knowledge as distinguished him soon after his return to
England. He had early applied to dissections, and pur-
fued the study of anatomy, under Davveney, at Paris;
whence he was enabled to give anatomical lectures, with
great reputation, in both the English universities. He
was honoured with the degree of M.D. by the university
of Cambridge. In 1703 he settled at Northampton, and
began the practice of his profession, in which he attained
considerable fame and success. In 1766 he published a
paper in the Philosophical Transactions, No. 369, contain-
ing "an account of the death and dissection of John Bayles,
of that town, reputed to have been 150 years old." The cir-
stances which he detailed very much reminded those that
were observed by the celebrated Harvey in the dissection of
old Parr. Dr. Keill, like his brother John, was well skilled
in mathematical learning, which he applied to the explana-
tion of the laws of the animal economy. His first pub-
lication was a compendium of anatomy, for the ufe of the
pupils who attended his lectures, and was entitled, "The
1698, and was taken chiefly from Cowper: it went through
many editions. In the year 1718, he gave the world a pro-
found work of his mathematical skill, in "An Account of Animal
Secretion, the Quantity of Blood in the Human Body, and
Mucular Motion," Lond. 8vo. This work was reprinted in
1717, with the addition of an essay, "Concerning the Force
of the Heart in driving the Blood through the whole Body;"
and under the title of "Essays on several Parts of the Ani-
mal Economy." He likewise published the same treatise
in Latin, with the addition of a "Medicina Statica Brita-
nica." The essay concerning the force of the heart drew
him into a controversy with Dr. Jurin, which was carried
on in several papers, printed in the Philosophical Trans-
tactions of the Royal Society, of which Dr. Keill had been
elected a member; and was continued to the time of the
deach of the latter, which took place at Northampton, on
the 16th of July 1619, in the vigour of his age. He had
for some time laboured under a very painful disorder, viz.
a cancer in the roof of his mouth, to which he had applied
the cautery with his own hands, in order, if possible,
to procure some relief, but in vain. Eloy. Dict. Hist. Hutchin-
son's Biog. Med.

Keillesay, in Geography, one of the smaller
Western islands of Scotland; 3 miles N.E. of Barray-
land. N. lat. 57° 2'. W. long. 7° 23'.

Keim-Hoyny, a town of Chinese Tartary, in the
government of Kinm. N. lat. 44° 45'. E. long. 129° 24'.

Keiran, in the Oriental Learning, the Persion and
Arabic name for the planet Saturn, according to Salmianv.
See Chums.

Keilberus, John George, in Biography, born at
Würtemberg, was at once a philosopher, poet, and musi-
cian. In 1691, he composed for the birth-day of the em-
peror Joseph I. a Latin poem, which he set to music in
a perpetual canon of 10 vocal parts, and 10 violin accom-
paniments, in a different melody; a piece of pedantry
much admired by professors and deep dilettanti at the lat-
ter end of the 17th century. He afterwards composed an-
other perpetual canon in eight parts, four violin gambas, two cou-
ter-tenors, and two tenors, with several other various and
complicated
KEIF

complicated conivances, as mystical, and as much respected at the time as the oracles delivered by the Pythias.

KEIS BAY, or Sinclair's Bay, in Geography, a bay on the E. coast of Scotland, in the county of Caithness. N. lat. 58° 28' W. long. 2° 5'.

KEISER, REINHARD, in Biographia, a German composer of the first class, for invention, ingenuity of accompaniments, and number of his works. This admirable musician was born in 1673, at Weissenfeld in Saxony, and, very early in his professional career, appointed maestro di cappella to the duke of Mecklenburg. Though his first attempt at dramatic music was a pastoral, called "Himmeli," for Wolfenbuttle, which he set in his 25th year, the year following he composed his opera of "Bailidis," which was performed in the theatre at Hamburg with very great applause; and he continued writing for that stage till the year 1739.

He was educated at Leipzig, where he was entered of that university. He began to study music in that city, but was chiefly his own master, forming himself upon the Italian school, by studying the best productions of that country. His second opera for Hamburg, "Adonis," established him in the favour of that city for the rest of his life. According to Mattheson, whatever words he set on the subject of love, his music was peculiarly excellent. His operas, in Hamburg alone, amounted to 178. But besides his dramatic productions, he composed divertimento, serenades, and canzonas innumerable. Indeed, this master was as fond of fancy and originality whenever he put pen to paper, as Haydn in his time. In a manuscript collection of near seventy cantatas by the greatest composers of his time, both of Italy and Germany, in which there are twelve by Keiser, in opening the book by chance, in any part of it where his cantatas are inserted, it instantly known to be his music, at the first glance; so new are the passages, and so different the arrangement of the notes from that of his companions in this collection, amounting to near thirty of the first order. For grace and facility we do not recommend him: indeed, these excellencies were little known or fought during his time; but for modulation, ingenuity, and new ideas, he had scarcely his equal.

In a conversation with the elegant and judicious Hassé at Vienna in 1772, he assured us that, according to his conceptions, Keiser was one of the greatest musicians the world ever saw. His compositions, he said, were more voluminous than those of Alessandro Scarlatti; and his melodies, though then 70 years old, were still, he thought, modern and graceful. Adding that this had been always his opinion; and he was not likely to be prejudiced in his favour, as Keiser was not his relation, his master, or even his acquaintance; but having lately looked at some of his works, he was astonished to see so much more elegance, clearness, and pleasing melody than are to be found in the productions of most modern masters, even now. "He composed, indeed, chiefly for Hamburg," Signor Hassé observed, "and, in general, to the German language, not being very well versed in that of Italy; so that he often blundered in setting Italian words; but he had always merit of other kinds to compensate for this defect."

At this time all our knowledge of this composer was traditional, as we were then totally unacquainted with his works; but we can now speak from demonstration, and our own examination of his works of various kinds, which manifest all the vigour of a fertile invention, and correctness of study and experience.

KEIKER'S RIVER, in Geography, a river of Africa, at the Cape of Good Hope, which descends from Table mountain.

KEISKAMMA, a river of Africa, which runs into the Indian sea. S. lat. 32° 4'.

KEITH, James, in Biography, a distinguished general, younger son of George Keith, Earl marshall of Scotland, by a daughter of Drummond, duke of Perth, was born in 1696, and educated at the college of Aberdeen. He was an adherent to the Stuart family, and engaged in their defence in the year 1715; but on the defeat of his party he was glad to escape from France, where he applied to all the branches of knowledge useful in the military profession. He was admitted a member of the Academy of Sciences on account of his great proficiency in mathematics. He travelled through many countries in Europe, lived 10 years in the Irish brigades in Spain, and afterwards entered into the Ruffian service, in which he was raised to the rank of brigadier-general. In the war between the Ruffians and the Turks he gave the most signal displays of courage and heroism, and was himself the first to mount the breach at the capture of Otehakof. He had a share in the war in Finland, between the Swedes and Ruffians, and, as instrument in placing the princess Elizabeth on the throne of Ruffia. At the peace of Abo in 1743, he was sent ambassador to the court of Stockholm, and on his return to Peterburgh he was rewarded with the marshall's staff; but as the emoluments of this office were insufficient for his support, he accepted an invitation from Frederick king of Prussia, by whom he was rewarded with considerable appointments, and with his own personal friendship. In the war of 1756 he entered Saxony in the quality of field marshall; and in 1758 he was killed, at the siege of the camp of Hochkirchen, by count Daun. He was reckoned a very able general, and was highly estimable in his private character. The king of Prussia honoured his memory with a fine monument at Potsdam.

KEITH, in Geography, a parish in the county of Banff, Scotland, contains four hamlets or villages: 1st, the city of Keith; 2d, the new town of Keith; 3d, the new town of New-Mill; and, 4th, the old town of New-Mill. The old town is nearly deserted by the inhabitants in consequence of the superior advantages of the new town. This was commenced in the year 1750, by the earl of Findlater, upon a barren moor, which was let in lots of 300 feet by 70. Here several manufacturers established themselves, and the place gradually increased in houseties and population. In 1791 there were 1275 of the latter; and in 1800 the whole parish contained 749 houses, and 3284 inhabitants. These are comprised within an area of about six miles in length, by six in breadth. Flax dressing, spinning, and weaving, are the chief branches of manufacture; a tannery, distillery, and bleaching field, are included within the parish. The parish church of Keith has been long noted for its able matters. Near old Keith, the river Fife, falling over some high rocks, forms a fine cascade, called the "Linn of Keith." James Ferguson, jealously celebrated for his astronomical and philosophical writings, was a native of this parish. Within the precincts of the parish are some Druidical remains. Sinclair's Statistical Account, vol. v. article written by the Rev. Alexander Humbry.

KEIFU, a town of Japan, in the island of Ximo; 15 miles N.N.W. of Naka.

KEIBO. See Fern.01.

KUKO, in Geography, a town of Hungary, with a castle; 15 miles S.E. of Koppoua.
KEL

KEL, or Quilla, a town of Africa, on the Slave coast, in the canton of Koto.

KELAIA, a town of Arabia, in the province of Hedjaz; 50 miles E.S.E. of Calaat el Moilah.

KELANG, or Klang, a small island in the East Indian sea, near the W. coast of the island of Ceram. S. lat. 3° 8'. E. long. 128°.

KELAR, a town of Persia, in Irak; 70 miles E.S.E. of Calatin.

KELAT, a town of Persia, in the province of Khurasan, at the edge of a mountain surrounded by rocks; it was taken by Timur Bec in 1382; 12 miles E. from Abi-berd.

KELES, a town of Asiatic Turkey, in Natalia; 28 miles E.N.E. of Ephesus.

KELHEIM, a town of Bavaria, situated on an island formed at the confluence of the Altmul and Danube; 46 miles N.N.E. of Munich. N. lat. 48° 52'. E. long. 11° 52'.

KELIB, or Calib, a town of Egypt, on the Ka- lit's Abu Meneggi, the capital of a district; 6 miles N. of Cairo.

KEL, in Rural Economy, a web, or kind of bag, in which infests are bred.

KELAH, in Geography, a town of Abyssinia; 75 miles E. of Aswan.

KELLER, John Balthazar, in Biography, a celebrated artist, was born at Zurich in 1648. Having learnt the art of a goldsmith, in which he displayed great ingenuity, he went to Paris by the invitation of his brother, who held the posts of cannon-founder, and commisary of artillery to the king of France. While in the French service he cast a great many cannon, together with several statues for the gardens of Versailles; but that by which he is chiefly celebrated is the grand equestrian statue of Lewis XIV. executed after the model of Giradon. He was made Inspector of the foundery at the arsenal, and died at Paris in the year 1702. Gen. Biog.

KELLER, Godfrey, a native of Germany, who settled in England about the beginning of the last century, and had much practice as a harpsichord master. In 1711, he published, at Amsterdam, six fantasies, engraved on copper-plates; of which the third were for two violins, a tenor, a trumpet or hautbois, and a bass: the third last for two flutes, two hautbois or violas, and a bass continuo. Thence the author dedicated to queen Anne. After this he and Finger published fantasies, jointly, in five parts.

As a composer, Keller was soon forgotten; but he was remembered a considerable time as the author of a polished treatise on thorough-bass, which he had finished, but did not live to publish. It was, however, printed, a short time after, by Cullen at the Buck, between the Temple gates and Fleet-street, with the following ample title: "A complete Method for the attaining to play a Thorough-Bass upon either Organ, Harpsichord, or Theorbo-Lute; by the late famous Mr. Godfrey Keller, with Variety of proper Leflons and Fugues, explaining the several Rules throughout the whole Work; and a Scale for tuning the Harpsichord or Spinet, all taken from his own Copies, which he did design to print."

This treatise, though meagre, was the best our country could boast, till Lamber, in 1737, published his "Plan and Compendious Method of teaching Thorough-Bass, after a most rational Manner, with proper Rules for practice: the Examples and Leflons curiously engraved on Copper-plates." Of this work we shall speak hereafter. See LAMPE.

KELLERAMPT, in Geography, a bailiwick of Switzerland; in the canton of Zurich, of which Bregenart is the principal place.

KELLEY, Edward, in Biography, the associate of Mr. Dee (to whose article the reader is referred), in his incantations, was born at Worcester in the year 1555. He was educated in grammar learning in his native city, and at the age of seventeen he was sent to the university of Oxford. According to Anthony Wood he left Oxford very abruptly, and in his peregrinations devoted himself to all, and committed to many foul matters, that at Lancaster he was for some offence deprived of his ears. After this he became acquainted with Mr. Dee, and, as we have seen, they set out for the continent. For some time Kelley lived in a very expensive style, supported, probably, by the contributions which he levied on the credulous, till he was ordered into confinement by the emperor Rudolph. He obtained his release, and conciliated the favour of the prince, who conferred on him the honour of knighthood. Fresh discoveries of his knavery occasioned a second imprisonment, and in attempting to escape from the place of his confinement, he met with an accident which put an end to his life in the year 1595. He was author of several works, of which "A Poem on Chemistry," and another on "The Philosopher's Stone," were infested in Ashmole's "Theatrum Chymicum Britannicum." He published at Harlequin, in 1676, a treatise, "De Lapide Philosophorum," which was authorized, like his, of "A True and faithful Relation of what passed, for many Years, between Dr. John Dee and some Spirits, &c." Several of his MSS. are still preserved in the Ashmolean Museum, at Oxford. Wood's Athen.

KELLEY, Hugh, a dramatic writer, was a native of Ireland, and bred a play-maker, whose profession he quitting when he came to London, and became writer to an attorney. He afterwards obtained a livelihood by his pen, and was author of the following pieces: "Faile Dolicacy:" "A Word for the Wife;" "The School for Wives;" "The Romance of an Hour." These, as their titles denote, are all comedies. He was author also of "Clementina," a tragedy; "Thepines," a poem; "Memoirs of a Magdalen;" "The Babbler;" and a collection of Epistles. He died in the year 1777.

KELLI, in Geography, a town and fortress of Hindoostan, in the country of Tanjore; 27 miles S. of Tanjore. N. lat. 10° 20'. E. long. 79° 7'.

KELLINORE, a town of Hindoostan, in the Carnatic; 10 miles N. of Pondicherry.

KELLS, a market and post-town of the county of Meath, province of Leinster, Ireland. It was in former times a city of note, and on the arrival of the English was walled and fortified with towers: a castle was built in 1178, and there were several religious houses. It was also a borough town, which, before the Union, sent two burgesses to parliament. Kells is 32 miles N.W. from Dublin on the river Blackwater, and nearly eight from Navan.

KELLY, Earl of, in Biography, an illusrious dilettante musician, in whom were united application, genius, and a powerful hand on the violin. This nobleman went through all the gradations of Italy necessary to form a profound contrapuntist. When he quitted Great Britain to make the tour of Germany, according to Pinto, he could scarcely tune his violin; but stopping at Manheim, he heard the best instrumental music in Europe, and that himself up with the elder Stamitz, whose originality and fire set his young pupil in a blaze, and so congenial were the table and disposition of the scholar and the master, that they seemed the growth of the same soul. The same energy and enthunaim
KEL

enthusiasm which had lifted Stanitz above his fellows of the Manheim school, stimulated the young earl to study composition, and practise the violin with such serious application, that, on his return to England, there was no part of theoretical or practical music in which he was not equally versed with the greatest professors of his time. Indeed, he had a strength of hand on the violin, and a genius for composition, with which few professors are gifted. His ear was so correct, and his perception so acute, that in the midst of a turbulent and tumultuous movement of a symphony in twelve or fourteen parts, if any instrument failed either in time or tune, though playing a different and difficult part himself, he instantly prompted the erroneous performer with his voice, by fingling his part without abandoning his own.

KELLYSBURG, in Geography, a township of America, in Chittenango county, Vermont, at the head of the north branch of the Moille river.

KELMEE, a town of Hindoostan, in the Baghla country, on the coal; 16 miles N. of Balfen.

KELMEDEK, a town of Natolia; 28 miles E. of Pingram.

KELMO, a town of Sweden, in East Gothland; 23 miles N. of Linkoping.

KELNAR, a town of Caramania, near the coast of the Mediterranean; 12 miles W. of Schichak.

KELNER, in Biography, a German musician, who came into England early in the last century, and performed on the double-bass in the theatres and concerts of the time. Having attached himself to Dr. Pepusch, his venerable countryman, it was found, at the doctor’s decease, that the most curious books and MSS. of his valuable library at the Charter-house, were bequeathed to Kelner and Travers, another of the doctor’s constant attendants, who both dying soon after their bequest was known, that, and the remainder of the most curious and inelegant musical library perhaps in Europe, were sold piece-meal, dispersed of and embazoned, in a manner difficult to describe or understand. See PEPSCH, and Musical Library.

KELP, in Agriculture a term applied to the mineral alkali in its more impure state; the kelp of commerce contains the ashes of the plant that affords it, and is found to be a good manure. See CARBONATE OF SODA.

KELSAI’S ISLAND, in Geography, a small island in the Mergui Archipelago, separated from the S.E. extremity of the island of St. Sufanna, by Alderney’s islands. N. lat. 10° 28’.

KELSO, a town in the county of Roxburgh, Scotland, is built on a spot where the rivers Tweed and Teviot unite their courses, and is nearly surrounded with eminences covered with trees. Hence the scenery is particularly picturesque and pleasing. The houses are arranged round a large square and on the sides of six streets, which diverge from the square in nearly a regular and uniform manner. The town house, with flaps and dome of the principal dwellings, are in the square. In the town are the parochial church and an episcopal chapel, which are described as handome structures. Among the public buildings are a dispensary, a public subscription library, and a public bridge over the Tweed, erected in the place of a former one, swept away by a flood in 1798. A church was founded here in 1153; and a monastery was transferred from Selkirk to this place by David I., who ‘‘confessed on the monks this village, with its lands and waters, free from all exactions.’’ David II., granted to the abbey a new-market here. ‘‘The town of Kelso shared the fate of the abbey during the hostile conflicts between the kindred nations in being often plundered and sometimes fired.’’ In the years 1522, 1532, and 1544, it was greatly damaged by the border warriors. The town was almost destroyed in 1686 by an accidental fire, and about the middle of the last century, it suffered great damage from the same cause.

David II. constituted the town of Kelso, with the barony of Bolden, and other lands, a free regality. This was converted, in 1607, into a lordship in favour of Robert Kerr, earl of Roxburgh. The dukedom of Roxburg is proprietor of the lands here. The principal trade of Kelso is the manufacture of woollen cloth, and drizzling of sheep and lamb’s fleeces, of which it is supposed that from 70,000 to 80,000 are annually exported. Great numbers of boats and flocks are annually made here. This place is much resorted to by gentlemen who attend the ‘‘Caledonian hunt,’’ and by others on account of the races. The abbey buildings of Kelso have been very extensive and grand. At present its ruined church presents many interesting fragments of Norman architecture. Mr. Pennant remarks, that the ‘‘environs of Kelso are very fine, and the inhabitants have much reason to boast of their prospects.’’ In the vicinity of the town are several seats of nobility and gentry: Fleur, ‘‘the magnificent seat’’ of the duke of Roxburgh; Springwell park, the residence of Sir George Douglas, bart.; Soflaw-tower, Mr. Proctor’s; Roebank, captain Scott’s; Palace-hill, Mr. Davidson’s; Woodman, Mr. Walker’s; Etc. In 1795, Kelso contained 275 houses, and 716 inhabitants. Chalmers’ Caledonia, vol. ii. Sinclair’s Statistical Account, vol. x. p. 376. Pennant’s Tour to Scotland.

KELTAN, a town of Thibet; 40 miles E. N. E. of Laffa.

KELTANPUSUACLIAIN, a town of Thibet; 52 miles W. of Suqatche.

KELTSCH, a town of Moravia, in the circle of Preuna; 14 miles E. of Preuna.

KELVAN, a town of Persia, in Farilian; 18 miles E. N. E. of Schiraz.

KELVEH, a town of Persia, in the province of Meconn, on the Neihk; 280 miles S.E. of Zavag. N. lat. 38° 50’. E. long. 65° 48’.

KELVIN, a river of Ireland, in the county of London-derry, which runs into the Roe, about 4½ miles S. from Newtown Limavaddy.

KELVIO, a town of Sweden, in the province of Ulica; 9 miles E. N. E. of Gamla Karleby.

KELWAY, Joseph, in Biography, the best extemporaneous performer on the organ, and most skilful harpischord player among the natives of our own country, during the middle of the last century. He had been, early in his life, apprenticed to a dancing-master at Bath; but having attempted the harpsichord, and received a few lessons from old Chilcott, he had made such a progress on that instrument, that Geminiani, happening to hear him, discovered a hand and disposition so promising, that he not only encouraged him to study music as a profession, but gave him instructions. And his style of playing ever after more resembled the compositions of Geminiani than those of Handel, which all other organists fervently copied. The broken phrasing and rhetorical flights of Geminiani were often more like voluntary playing than regular composition. Stanely’s voluntaries were too imitative and well-phrased, that they seemed pieces played by memory; but Kelway’s extemporaneous playing, in the style of Geminiani, never had the air of studied passages.

In removing from Bath to London, Kelway was soon noticed, and elected organist of St. Michael’s, Cornhill, where he did not long remain; for on the death of Weldon, he resigned the organ at St. Michael’s Church to Mr. –, afterwards
wards Dr. Boyce; and was elected organist of the king's parish church, St. Martin's-in-the-Fields, where, of a Sunday afternoon, it was the custom, not only for young organists, but the principal professed, to crowd under the organ-loft to hear his voluntaries; in which there was an original and masterly wildness, which long supported his character as a great player, in a style totally different from other organists; bold, rapid, and fanciful.

With his harpsichord playing we were unacquainted; but we have often been assured, that he constantly kept in high practice, Scarlatti's best and most difficult legons, which he executed in a manner peculiarly neat and delicate. As to composition, it is to be lamented that he did not exercise his pen and fancy more early in life, or that he ever attempted it at all: for on the arrival of Bach, and appointment at court as chamber-musician to the queen, to whom he dedicated his first publication in this country, Mr. Kelway thought it necessary, as music-master to her majesty, to publish a book of harpsichord legons, which are, perhaps, the most crude, awkward, and unpleasant pieces of the kind that have ever been engraved. There is a manifest want of facility and experience, which proves, that though he was old in practical music, he was young in its theory and in composition.

Handel, who used to go frequently to St. Martin's church to hear him play, always, when indisposed, requested Kelway to play the organ for him in his oratories.

This admirable performer, the most brilliant we ever heard, in point of fancy and linger, lived to a great age, but, unhappily, during the last years of his life, his intellects were somewhat deranged. He died in 1753, and was succeeded at St. Martin's church by Dr. Benjamin Cook, organist of Westminster Abbey.

KEMAR, in Geography, a town on the E. coast of the island of Celebes. N. lat. 1° 8'. E. long. 125° 2'.

KEMAR, in Natural History, a name given by Leo Africanus, and other writers of the African history, to a fort of subterranean production of the vegetable kind, greatly esteemed as a delicious food. The Arabian writers on medicine have often mentioned it, and that under names sufficiently resembling the modern African appellation, such as camel, camah, kemah, and cambo. They are not the roots of any plant, but a fine kind of subterranean mushroom, or truffle, white on the outside, and which lie generally pretty deep in the earth.

KEMAOON, in Geography, a small lake, which, with others, form a tract of country separated from Hindostan by lofty mountains, and situated to the N. of Oude and Rohilkund.

KEMAR, a town of Athisian Turkey, in Natolia; eight miles S. of Sinob.

KEMELA, a town of Sweden, in the government of Ulap; five miles S. of Uba.

KEMBERG, a town of Saxony; six miles S. of Wittenberg.

KEMER, a town of Athisian Turkey, in the government of Trebifond; 12 miles E.N.E. of Rizbeh.

KEMIGUR, a town of Hindostan, in Bahar; 27 miles N.N.E. of Durbunga.

KEMI, a town of Russia, in the government of Olenetz, at the mouth of the river Kem, on the W. of the White sea. N. lat. 64° 53'. E. long. 28° 38'.—Also, a sea port town of Sweden, in Earl Bothnia, situated on the right bank of the river Kem, which runs into the gulf of Bothnia, about three miles from its mouth; 10 miles E. of Tornen. N. lat. 68° 49'. E. long. 24° 27'.

KEMIJAN, a town of Hindostan, in Bahar; 31 miles S.S.W. of Patna.

KEMITRASK, a town of Sweden, in Earl Bothnia, at the N. extremity of a considerable lake formed in the river Kemi; 90 miles N.E. of Kemi. N. lat. 66° 42'. E. long. 27° 14'.

KEMILK, or Gimo, a town of Athisian Turkey, on the bay of the sea of Marmora; 20 miles W. of Thintik.

KEMMOO, a town of Africa, the metropolis of Kaarta; formerly large and populous, but desolated since it was visited by Mr. Park. N. lat. 14° 20'. W. long. 7° 46'.

KEMNAT, a town of Bavaria; 26 miles N. of Amberg. N. lat. 49° 53'. E. long. 11° 53'.

KEMNITZ, a town of Silecia, in the principality of Lauer, on a river of the same name, which runs into the Bocer; six miles W. of Hirschberg.

KEMPACH, a town of Tyrol; six miles N.W. of Schwaz.

KEMPFEN, a town of France, in the department of the Roer, and chief place of a canton, in the district of Creveldt; 15 miles N.E. of Raremond. The place contains 2870, and the canton 13,820 inhabitants, in 12 communes. It formerly contained a college and three convents, with some linen manufactures.—Also, a town of the duchy of Lorraine; 26 miles S. of Sireland.

KEMPFA', in Batany, so named by Houblon, in honour of Dr. Engelbert Kempfer, or rather Kemp, the celebrated traveller and naturalist. See Verbera, and Kempfer.

KEMPIS, Thomas a, in Biography, was born in the year 1480, at a village in the diocese of Cologne, whence he derived his surname. The circumstances of his parents were such as led them to seek for him an education on a charitable foundation. At this place he was distinguished for his talents, piety, and attachment to a contemplative life. He entered the monastery of Mount St. Agnes, received the habit in 1456, and was ordained priest in 1473. He occasionally filled very important posts of his order, though it was much against his will that he engaged in all the active duties of life. He died in 1471, at the advanced age of ninety-two. His works are chiefly devotional, and written in an animated style. The most complete edition of them is in three volumes, octavo, published at Antwerp in 1660, and in 1615. Many of them have been translated into a variety of languages, particularly that entitled "De Imitatione Christi," which is to be found in almost every known tongue in the world. The best English version is that by Dr. George Stanhope, which was printed in 1666, and has been several times reprinted. The learned are not agreed as to the real author of this celebrated work, though given to Thomas Kempis by general consent, many have offered reasons why he cannot be the writer. The quation was warmly agitated for sixty years, and gave rise to many curious discussions, an account of which is given by Dupin.

KEMPSVILLE, in Geography, a post-town of America, in Prince Ann county, Virginia; 243 miles from Washington.

KEMPTEN, a town of Bavaria, on the river Iller, lately Imperial. The burghers and magistracy profess Lutheranism, and in the town are a handsome parish church and a grammar school. In 1801, this town and its abbey were given to the elector of Bavaria; 30 miles S. of Augsburg. N. lat. 47° 43'. E. long. 10° 17'.—Also, a princely abbey, founded, or at least repaired and enriched, by Hildeser, wife of Charlemagne, in the 8th century. To this abbey belonged some towns and villages.
KEN

KEMSER, a town of Bengal; 15 miles S.S.E. of Cur- 
ruckpaur.

KEMSKOII, a town of Russia, in the government of 
Toflik. N. lat. 57° 25'. E. long. 92°.

KEN. THOMAS, in Biography, an English prelate, was 
born at Berkhamsted, in Hertfordshire, in the year 1637. 
He received his classical education at Winchester school, 
was elected scholar, and removed in due time to New-College, 
Oxford, of which he was chosen fellow. After taking his 
degrees he entered into holy orders, and became chaplain to 
lord Maynard, comptroller of the household to king Charles II. 
In 1666, he was chosen fellow of Winchester college, 
and in a short time afterwards was appointed domestic chap- 
lian to Dr. Morley, bishop of Winchester, from whom he 
received a presentation to the rectory of Brixton, in the Isle 
of Wight, and afterwards, in 1669, to a prebend in the 
church of Winchester. About the year 1673, the same 
friend and patron gave him the rectory of Woodley, in 
Hampshire, which, however, he soon resigned, conceiving 
that he ought to be satisfied with the emoluments which he had 
previously professed. In 1675, he went, in company with his 
nephew, Mr. Isaac Walton, to Rome, and on his return he 
used to say he was grateful for the effect produced by the 
journey, insomuch as he was more strongly confirmed in his 
belief of the excellence of the reformed religion, by witnessing 
the aburdities of the superstitions practiced abroad. In 
1679, he took his degree of doctor of divinity, and being 
appointed chaplain to the princes of Orange, he went to 
Holland. He discharged the duties of his office with so 
much prudence and zeal, as to secure the esteem and con- 
dence of his royal mistress, but he incurred the temporary 
displeasure of her consort, afterwards William III. of Eng- 
land, by obliging one of his favorites to full his engagement 
with a young lady of the princes's train, whom he had 
shed under a promise of marriage. On his arrival in 
England he was appointed chaplain to lord Dartmouth, who 
received a commission to demolish this fortifications of Tan- 
giers, and on his return from this expedition, he was imme- 
diately advanced to be chaplain to the king, by an express 
order from his majesty, who hoped thereby to render him 
subservient to his measures, and to the laxis of his morals. 
When the court removed to Winchestei, the sovereign de- 
ded Dr. Ken to admit into his prebendal house Eleano- 
r Guvy, one of the king's mistresses, but he positively refused 
to submit to an arrangement which might appear to give 
countenance to vice; and Charles, so far from being offended 
with this decisive proof of religious intrepidity, took an early 
opportunity of raising him to the episcopal bench, by pre- 
senting him with the see of Bath and Wells. Within a few 
days of this appointment the king was attacked by his late 
ilness, during which the bishop attended him in the most 
feulous manner, endeavouring, though, it is said, ineffectu- 
ally, to awaken the king's conscience to the sense of sorrow 
for his pait profligate life. Nevertheless the bishop did 
not hesitate to pronounce abolution over his majesty without 
receiving any declaration of repentance, for which he has 
been deservedly censured; though it is to be feared, that almost 
all death-bed repentances, being the effect of fear of the 
future, can avail the suppedo penitents very little with 
regard to a future state. The bishop was exemplary in per- 
morming the duties of his station, and was incessantly de- 
voing means for relieving the poor, and instructing the igno- 
ment. With this view he built the first workhouse at Wells, 
which has proved the model for numbers that have been 
erected since his time; and he established many schools in 
all the great towns of his diocese. To these, and many other 
similar objects, Dr. Ken devoted the principal part of the 
income of his see. He was a warm friend to the doctrine 
of passive obedience and non-reistance, and on that account 
was at first well received by James I., but when that prince 
endeavoured to introduce popery as the established religion 
of the country, he found it expedient to act upon more 
constitutional grounds, and to oppose the measures of the 
court with spirit and zeal. He was one of the seven bishops 
sent to the Tower for refusing to sign the monarch's dispensing 
power, and for petitioning in behalf of their own and the 
people's rights. The bishop and his brethren, though 
charged with high treason, were honourably acquitted, to 
the inexpressible joy of every friend to the country. At the 
Revolution he refused to transfer his allegiance to the new 
sovereigns, and, declining to take the oaths required of him, 
was deprived of his bishopric. He now lived a life of re- 
irement, but considered himself ill as bishop in right, 
though not in fact, conceiving that no human power could 
separate him from the relationship which he bore to his 
proceeds. Upon the death of his first successor, Dr. Kidd, he 
urged Dr. Hooper, who had been nominated to the vacant 
bishopric, to accept it, and ever afterwards signed himself 
"late bishop of Bath and Wells." From this time the queen 
settled with him a pension of 200/. per annum, which he enjoyed 
so long as he lived. He died, as he was on a journey to Bath, 
in March 1710-11, in the 73rd year of his age. He had 
been in the habit of traveling many years with his friend 
in his portmanteau, which he always kept on when attacked 
by ill-sorts of this he gave notice the day before his death, 
in order to prevent his body from being stripped. His works, 
which are all of a theological and practical turn, were 

KEN, in Geography, a town of Hindoostan, in the pro- 
vince of Behar; 20 miles N. of Behar.—Also, a small 
low island in the Persian gulf, in which are a few islands. 
N. lat. 27° 54'. E. long. 59° 56'.

KENAMOW, a town of Hindoostan, in Oude; 30 miles 
S.S.E. of Campour.

KENAPOOSSAN, a small island in the East Indian 
sea, in the Soloon Archipelago. N. lat. 5° 14'. E. long. 
122° 23'.

KENAREI-HAVAZ, a town of Hindoostan, in Moul- 
tan; 20 miles E. of Batmir.

KENAWAS, a town of Hindoostan, in the circuit of 
Kitchwara, 17 miles W. of Sheerqar.

KENCHESTER. See Archonius and Hereford.

KENDAL, or Kendale, a market town and parish 
in the ward of Kendal, and county of Westmorland, Eng- 
lund, is built in a pleasant valley on the western banks of 
the river Kent, over which there are three bridges. The 
town consists of one principal street running north and south, 
with several smaller ones branching off at right angles. Ken- 
dal has long been famed for its manufacture of cottons. In 
the year 1802, Houltman states that the town contained 12 
manufactories engaged in this business, and that about 12,000 
pieces of cotton were made weekly, each of which contained 
about 24 pounds of wool. The business was then increasing. 
Eight houses were also engaged in the linsey manufactures, 
and several other manufactures of less consequence are 
carried on. There are likewise a considerable number of per- 
fums employed in working and polishing marble, which, in 
the beauty and variety of its colours, is thought by many to be 
superior to that imported from Greece and Italy. Mr. 
Wakefield manufactures large quantities of gunpowder at 
his mills a little below the town. The public buildings of 
Kendal are the church, a large and commodious workhouse, 
and a bridewell. Near the church is a handsome house 
called Abbot-hall, the property of Sir Alan Chambre, etc.

N: 4
of the judges of the court of common pleas. To the east of the town are the remains of a castle, which is supposed to have been built by the first barons of Kendal. It was formerly a place of considerable extent and strength; but its towers and walls are much mutilated and reduced. Parts of two square and two round towers, however, still remain, as well as great part of the wall round the outer bailey. Another object of antiquity is an artificial mount, called by the inhabitants Castle-law-hill. In the town are chapels for Quakers, Methodists, Presbyterians, and Roman Catholics. The chief manufacturers and tradesmen of the town are united into twelve companies, each of which has a hall: viz. Merecers, Tanners, Glovers, Sheermans, Cordwainers, Taylors, Pewterers, &c. Kendal is 22 miles from Lancaster, and 160 N. of London. In the year 1800 it contained 14,924 houses, and 68,022 inhabitants. Nicholson and Burn's History of Wellingford, &c. two vols. 4to.; and Houfeman's "Descriptive Tour through various Northern Counties," 8vo. 1800.

KENDER, a town of Hindooftan, in Schaurampour; 10 miles N. of Schaurampour.—Also, a town of Curdivan; 28 miles S.W. of Beris.

KENDRICK's Island, an island which forms the W. side of Nootta Sound, into which there is an entrance from the W. by Malchofett's Sound, along the northern side of the island.

KENDUSKEAG, a river of America, which runs into the Penobscot at the town of Bangor, about two miles below the head of the tide; where is a thriving village of handfome houses, and a place of the greatest trade in the river.

KENDY, a town of Bengal; 50 miles N.N.E. of Ramgar. N. lat. 24° 16'. E. long. 85° 0'.

KENEX. See C. SAX and GHANA.

KENEF, a town of Peria, in the province of Khorasan; 45 miles N. of Herat.

KENERA, or KENEREL, a mountain on the island of Saffette, near Bombay, celebrated for the number and extent of its excavations. Its principal cavern is arched, in the style of a colonade, described under the article KARIY; and was evidently, from its style of sculpture, a temple of the god Bodha, or Boddhi. (See Boorn.) On each side of the wellstone are flanking figures of the god, in easy attitudes, of tolerable proportions, and well sculptured in alto-relievo, fourteen feet high. This cave and three figures are elegantly represented in Dand's fine series of oriental scenery. See KARIY.

KENFIG, or CYNHYG, a parish of Glamorganshire, South Wales, is noticed in this work, chiefly to correct the errors of other topographical writings; in none of which it is described as a town. Mr. Donavan, in his "Descriptive Excursions through South Wales," describes it as a poor, small village, inhabited mostly by sailors and fishermen, and represents thee as being particularly rude and inoffending to strangers. A cluster of mean cottages, grouped together, with a church on a ridge of rising ground, confitute this village. In this parish is Kenfig-pool, a lake of fresh water, which is embowered in a depression of an irregular form, in the midst of sands that have been apparently drifted upon this spot from the contiguous coall, and though lying within a very short distance of the sea at flood tide, inalterably retains its freshnes pure and untainted by the maritiac properties of the former. The circumference of this pool is estimated at a mile and three quarters. The depth is great in some places. Indeed it has the reputation of being, in many parts, unfathomable. It is traditionally said, that a town formerly occupied this spot, and that it was swallowed up by an earthquake. At a short distance from this lake, on an eminence, are some ruins, called Kenfig-estle, which was only a small fortrres. In 1820, this parish contained 156 houses, and 675 inhabitants.

KENHEVAR, a town of Peria, in Irak, on a river which runs into the Karafa; 240 miles N. of Ipahan. N. lat. 34° 20'. E. long. 47° 10'.

KENJAR, a town of Hindooftan, in Bahar; 30 miles S.W. of Patna.

KENILWORTH, a market town and parish in the hundred of Knightlow and county of Warwick, England, famed in the annals of the kingdom for its ancient castle, "which," says Dugdale, "was the glory of all these places, and for many respects may be ranked, in a third place at the leaft, with the most lately castles of England." This fortrres was built by Geoffrey de Clinton in the time of Henry I. He was chamberlain and treasurer to that monarch. By frequent kings and occupiers it was greatly enlarged and strengthened at different times: and in the various civil and domestic wars of England, it was particularly the object of contention with different monarchs and nobles. To detail such particulars would be foreign to the nature of this work; but the reader may find much curious and interesting information relating to the fame, in Dugdale's "Antiquities of Warwickshire." What remains of the buildings shew that the whoe was an immense and spacious place: consisting of an outer wall with bastion towers, a tilt-yard, with towers at each end; and several buildings within the bailey, or baile-court. The area within the walls confines of seven acres. There were four gatehouses, and the walls were from ten to fifteen feet in thickness. At a short distance from the castle was a priory for Black canons. Of the buildings, parts of the gateway and chapel remain. Near thie is the parish church, the weylens door-way of which is a curious specimen of ancient architecture. In the town are two meeting-houses, or chapels. Kenilworth is five miles from Warwick, and five from Coventry. In 1800, the town contained 418 houses, and 1668 inhabitants. Dugdale's Antiquities of Warwickshire.

KENKIRI, a town of European Turkey, in Livadia; 40 miles W. of Athens.

KENKS, in the Sea Phœbe, are doubings in a cable or rope, when it is handed in or out, so that it does not run smooth, or when any rope makes turns, and does not run smooth and clever in the block, they say it makes kensks.

KENMARE Town, called Nidan, in Geography, a poft-town of the county of Kerry, province of Munster, Ireland. It is situated at the north-east extremity of an extensive river or bay on the Atlantic ocean. Kenmare is 155 miles S.W. from Dublin, and 15 miles S. from Killarney.

KENMARE River, a river or arm of the Atlantic ocean, on the coafl of Ireland, which extends about 20 miles in length, and about three in breadth, situated at the south-west side of the county of Kerry. It affords a safe and capacious harbour, but little frequented. The mouth is situated in N. lat. 51° 40'. W. long. 5° 37'.

KENNEBECK, a river of America, which, next to Penobscot, is the finest in Maine. Three miles from the mouth, the waters of the river are divided by Swan island, seven miles in length; on both sides of which they are navigable: at the distance of 38 miles from the sea is the island Nahunkac, signifying the land where eels are taken. Within three miles of this island, a small river, issuing from ponds in the town of Winthrop, runs into the Kennebeck, and it is known by the Indian name Cobblelonec, denoting the place where flurges are taken. Six miles higher is the head of the navigable waters, which is a
Ke

bason four miles from the sea, and commodious for the anchorage of vessels. Where the navigation terminates stands Fort Western, erected in 1752. From this fort to Taconet Fall is a distance of 18 miles. On the eastern side of the river near the fall is Fort Halifax, erected in 1754, situated on the point of land where the Sabattacook makes an addition of one-third to the size of the Kennebec. Thirty miles above Halifax fort Sandy river flows into the Kennebec; and about 40 miles higher, the Kennebec takes a S.W. course; and 50 miles from Halifax fort it receives the eastern branch. The main branch of the Kennebec, in its course through the wilderens, forms several carrying places or portages. At about 100 miles distance from the mouth of the eastern branch, the source of the main or western branch extends to a great distance along the side of the Chaudiere, which carries the waters from the highlands into the St. Lawrence. The eastern branch issues from a body of waters which lie N., about 20 miles from the confluence of the two branches. These waters are called Moos pond, or lake. The tides of the lake are very crooked, so that it forms an irregular figure, containing three times as much water as Lake George. To the N. and W. of the lake are high mountains, from which waters run by many channels to the St. Lawrence. The Kennebec affords great quantities of lumber, and is inhabited, at different points, by several species of valuable fish; particularly salmon and sturgeon, fish, and alewives. This river forms the nearest sea-port for the people on the upper part of the river Connecticut. From the Upper Cohos, or Coos, on the latter river, to the tide water in Kennebec, is a distance of 90 measured miles.—Kennebec is also a county in the district of Maine, and the first inland county erected in this district. It was separated from the maritime county of Lincoln, by which it is bounded on the S. by Hancock county on the E., by Cumberland on the W., and by the Highlands on the N. It was incorporated in February 1759, and derives its name from the river, which, passing through it, divides it nearly in equal parts. It is about 40 miles wide and upwards of 100 miles long. The soil is better and more easily cultivated than that on the sea-coast. It contains 24,443 inhabitants.

KENEBUNK, a river of Maine, having at its mouth a good harbour, whence great quantities of lumber are shipped. This river divides the townships of Wells and Arundel. After running a short course, it discharges itself into the sea between Cape Porpoise and Nedick—Kennebunk is also the Indian name of the place, since called Wells, in Maine, about 33 miles below Portsmouth, in New Hampshire; in which is a post-office.

KENNEDY's CREEK, a river of Kentucky, which runs into the Ohio, lat. 38° 18'. W. long. 83° 36'.

KENNEL, a term used indirectly for a puddle, a water-course in the streets, a house for a pack of hounds, and the pack or cry of hounds themselves.

Among sportsmen, a fox is said to kennel, when he lies close in his hole.

On a presumption that a kennel for hounds is to be erected, its fice is thus described by Somerville:

"Upon some little eminence erected,
And fronting to the ruddy dawn its courts
On either hand wide opening to receive
The sun's all cheering beams, when mild he shines
And gilds the mountain tops."

However, this selection of a high situation is incompatible with a running brook; and as these two advantages cannot be united, water is to be preferred, with the aspect to

the morning sun as much attended to as possible. The number of its inmates will regulate the size of the kennel, and the architecture should be neat without being excessively expensive. The most magnificent is the house of Richmond's, at Goodwood, which cost 19,000£, and is sufficiently extensive for two packs of hounds. The building comprises five kennels; two by 15, three 20 by 15, and two feeding rooms 20 by 15 feet, with floors for warming the air when too cold. The huntsman and whippers-in have each a parlour, kitchen, and sleeping room. The kennel should be near the house, that it may be duly inspected; as cleanliness is no less essential than food. There should be room for two kennels under the same roof, for the convenience of keeping both clean, and for removing the hounds from one to the other, when they are washed. Besides, a second kennel will afford opportunity for drafting the hounds that are intended for hunting the next morning. Hounds will soon learn to answer to their names, and in drafting them, they may be easily counted into the hunting kennel. When the feeder first enters the kennel in the morning, he should let the hounds into the outer court; and the lodging room should be then thoroughly cleaned, the windows and doors opened, the litter well shaken, and the kennel be made sweet, before the hounds are again shut into it. The lodging room should be bricked, and flopped on both sides to the centre, and a gutter should be provided for carrying off the water, so that the floor, when washed, may be soon dried. It should be recollected, that nothing is more hurtful to hounds than damp, or more refreshing than warmth, after hard work. The kennel should have three doors, two in front and one behind; the latter having a lattice window in it with a wooden shutter, which is to be always kept closed, except in summer, when it should be left open during the whole of the day. The large central window should have a folding shutter, which, at night, according to the weather, may be wholly or partially closed, and thus the warmth of the kennel may be regulated according to circumstances, and as it may be judged necessary. The two great lodging rooms are exactly similar, and having a court belonging to each, are distinct kennels, situated at the opposite ends of the building; in the centre are the hodling house and feeding yard; a leek kennel, either for hounds that are drafted off, or those that are sick and lame, or for any other necessary purpose, is on each side; on the back of which, as it is but half the depth of the two larger kennels, are places for coals, &c. for the use of the kennel. There is also a small building in the rear for hot bitches. The inner court floors should be bricked or flagged, and flopped towards the centre, like those of the lodging rooms; and water brought in by a leaden pipe, should run through the channel in the middle. In the centre of each court is a well, large enough to dip a bucket to clean the kennel; to keep those from wanting repair, they should be faced with stone; to that of the feeding-yard a wooden cover should be fixed. The benches, which must be open to let the urine through, should have hinges and hooks in the wall, that they may fold up when the kennel is washed; they should be made as low as possible, that when a hound is tired, he may have no difficulty in jumping up, and at no time be able to creep under. A large brick court in front, having a grass court adjoining, and a brook running through the middle of it, completes the kennel. This court should be planted round; and also have lime and hornbeechnut trees near the centre for shade; some posts bound round with straw rubbed with galbanum, may be placed to prevent the hounds urming against the trees. The brook may be used as a cold bath for hounds lamed in the illness, and strained. A high pale should enclose the whole, which, to the height
of four feet, should be close, the other open two inches wide. At
the back of the kennel should be a thatched house, fenced
up at the sides, to contain at least a load of straw; a pit for
receiving the dung, and a gallows for the flesh. If a piece
of ground adjoining the kennel can be inclosed for such dog-
horses as may be brought alive, it will be very serviceable,
as the disorders of condemned horses are not always to be
discovered, and may be dangerous to others; the hounds
may also be brought into this field to employ themselves after
feeding; and the draft for the next day’s hunting can here
be more accurately made than when they are confined in the
kennel. Stoves are used in some kennels; but a good feeder,
and the mop properly applied, render them needless. Should
licks at any time be troublesome, the walls of the kennel should
be well washed; and if they are not thus destroyed, the walls
should be white-washed. When the hunting season is over,
onl kennel will suffice; the other, with the adjoining graz-
yard, may be allotted to the young hounds. If there be
convenience, the dogs should be kept separate from the
bitches during the summer months. When hounds are
very riotous, the feeder may sleep in a cot in the adjoining
kennel, and if they be well chafed at the first quarter, his
voice will be sufficient afterwards. A feeder in Oxfordshir
pulls a bell, the meaning of which he has taught the hounds
to understand; and it silences them immediately, without
his having the trouble to leave his bed. The farther removed
a kennel is from a road or pathway, the quieter will it be.

The interior regulations of a kennel comprehend the feeder,
the fortes of food, and the mode of preparing and adapting
it to the appetite of the hounds. A good feeder, young,
active, industrious, and good-tempered, is essential. The
exquisite sense of smelling peculiar to the hound, being
that on which the sport principally depends, should be care-
fully preserved; and nothing so much contributes to this
purpose as cleanliness. It is, therefore, of the greatest im-
portance that the kennel should be kept clean and sweet.
The heartiest and best food for hounds is oatmeal; which
should be preferred in beans or sugar cake instead; for the
older the meal is the better. The boiler should be of
caft iron; and in size proportioned to the number of hounds
in kennel. The flesh should be thoroughly boiled, and taken
out of the broth with the broth, before the oatmeal is put
into it. After about three quarters of an hour’s boiling, the
liquor may be taken off and left to cool, which will soon be-
come a strong jelly, and for hunting hounds it cannot be too
compact. Five or six pecks of good old oatmeal will thicken
a boiler of broth, sufficient for two feeds for 30 couple of
hounds. The meat should never be given to the hounds too
hot. The feeding troughs should be wide at bottom and
have wooden covers; nor should they be made too long, as
they are less convenient for being moved. After all,
great attention to the time and mode of feeding will be re-
quired on the part of the kennel huntsman. He should be
acquainted to call each hound by name, when he is fed; when
a hound is called, he should approach the huntsman, and
when he is touched with a stick, he should follow any where.
By thus using hounds to their names, they will learn obedi-
ence. The day before hunting the hounds should be fed at
eight in the morning, and three in the afternoon. Those
that are to hunt the next day should be drafted into the feeding-
yard, when about three buckets of thick mixed oatmeal
is prepared for them; and the tender and bad feeders should
have a handful of boiled flesh given to them afterwards.
If hounds be low in condition, and have far to go to cover,
they may all have a little thin lap again in the evening; but
this should never be given, if you hunt early. Hounds
should be sharp set before hunting, as in this state they run
the better. During the hunting season, hounds should have
one pound of sulphur given them in their meat, and when
the leaven is over, half a pound of antimony should be
added to the sulphur and well mixed with the meat. Greens
boiled in their meat, once a week, are likewise proper. A
horse killed and given to hounds whilst warm, after a very
hard day, is an excellent meal; but they should not hunt till
the third day after it. The bones broken are good for poor
hounds; sheep-trotters are very sweet food; and bullocks’
paunches may also be of service, in the scarcity of horse-
meat. Immediately when hounds return from hunting, they
should be fed; and if they have had a severe day, some
hours after they should be fed again. By turning them out
the the lodging-house to be fed, they will be refreshed,
and stretch their limbs; and besides the litter being shaken up,
and the kennel cleaned out, they settle themselves better on
the benches afterwards. At all times after being fed, the
hounds should be turned into the grafs-court to empty them-
selves; as this practice will not a little contribute to the
cleanliness of the kennel. Hounds should be shut up warm
at night after hunting. Daniel’s Rural Sports, vol. 1. See
HOODS and HUNTING.

KENNERY, in Geography, a small island near the coast of
Maine, surrounded with a wall and towers. N. lat. 42°.

KENNET, a river of England, which rises near a vil-
lage of the same name in Wiltshire, passes by Marlborough,
Hungerford, and Newbury; where it is made navigable to the
Thames, which it joins a little below Reading. See CANAL.

KENNET, a township in America, in Chealer county,
Pennsylvania.

KENNETH II., in Biography, king of Scotland, suc-
sceeded his father Alpin in 843. He made war upon the
Picts, and subdued their dominions in the north, which he
divided among his soldiers. He translated the stone chair
to Scone, where his successors were crowned, till it was re-
moved by Edward I. He died in the year 874.

KENNET III., son of Malcolm, subdued the Britons
of Strathclyde, and was equally successful against the Dunes,
who had invaded his dominions, but attempting to alter the
succession of his crown in favour of his family, he was assas-
sinated in 944.

KENNETS, in our Old Writers, a fort of coarse Welsh
cloth, mentioned in the lat. 32 Hen. VIII. c. 3.

KENNETS, in a ship, small pieces of timber, nailed to
the inside of the ship, into which the tacks and sheets are
belayed (as they call it), i.e. fastened.

KENNETT, White, in Biography, a learned English pre-
late, son of the REV. Basil Kennett, rector of Dimchurch,
in Kent, was born at Dover in the year 1665. He received
the early part of his education in the country, and made such
progrés in classical learning, that upon his being removed to
Westminster, he was admitted into the upper school. Im-
mediately after his admission he fell sick of the small pox,
which obliged him to wait another year before he could be
received into the school. During this period he undertook
the office of tutor to a gentleman’s son in the neighbourhood.
He entered himself at Oxford in 1678, and went through
the studies and exercises of the place with great reputation.
While he was an under-graduate, he was introduced to the
acquaintance of Anthony Wood, and employed by him in
collecting epitaphs, and other notices of eminent men, who
had been members of Oxford. Mr. Kennett was particularly
attached to the several branches of polite literature, connected
with antiquities and history. But his career as an author
commenced in the publication of a political tract while he
was under-graduate, entitled "A Letter from a Student at
Oxford
Ken

Oxford to a Friend in the Country concerning the approaching Parliament in Vindication of his Misl. the Church of England, and the University." It was written in defence of court measures, and supported principles which he

K E N

house of Hanover; he used to say, he was ready to hazard his life in defence of the glorious principles of the Revolution, and he would go out to fight, when he could no longer preach in defence of them. He warmly opposed the proceedings in the convocation against Dr. Hoadly, bishop of Bangor, on whose side he was deeply engaged in the Bangorian controversy. His zeal in the cause of civil and religious liberty was, in the year 1718, rewarded by the bishopric of Peterborough, which he enjoyed ten years. He died in 1728, in the sixty-ninth year of his age. His principal works are, 1. "The Life of William Somner," which was prefixed to Mr. Brone's edition of the famous antiquary's "Treatise of the Roman Ports and Forts in Kent." 2. A collection of English historians, under the title of "The Complete History of England," in three

vols, folio, the last of which was written by himself. 3. "Historical Account of Appropriations." Bishop Ken

dell distinguishes himself by preaching against Popery, though he did not engage in the famous Popish controversy. While he was out on a hunting party, he received a dangerous wound on his head, which obliged him to undergo an operation of trepanning: he, however, soon recovered, and was chosen lecturer at St. Martin's, Oxford: he was afterwards tutor and chaplain at Edinburgh Hall, where he lived in terms of friendship with the principal Dr. John Mill, who was at this time employed in preparing for the press the celebrated edition of the New Testament. In 1693, he obtained the rectory of Shottellbrook, in Berkshire, and, in 1695, he commenced D.D., and in the following year was presented to the living of St. Bokolph, Aldgate, having been already appointed archdeacon of Lincoln. In 1701 he engaged in a controversy on the rights of the convocation against Dr. Atterbury. In 1705, upon the advancement of Dr. Wake to the see of Lincoln, Dr. Kenneth was appointed to preach his consecration sermon; which was published at the desire of the archbishops and bishops, and was greatly admired by lord chief justice Holt, who declared that it contained more to the purpose of the legal and Christian constitution of the church of England than any volume of discourses. In 1707 he was made dean of Peterborough, but he was growing very unpopular on account of his Whig principles and his opposition to Dr. Sackville; nevertheless, in the same year, he was allowed to exchange his living in Aldgate for the rectory of St. Mary Aldermanbury, in order that he might have more leisure for study and meditation. The zeal which Dean Kenneth displayed in opposition to the claims of the high church clergy, and the sentiments of moderation which he discovered towards the Dissenters, as well as his attachment to the Protestant succession, and the interests of civil liberty, rendered him very obnoxious to the Tories, who took every method in their power to expel him, one of which was devised by Dr. Wilton, rector of Whitechapel, who was afterwards deprived of his living as a nonjuror. This clergyman presenting a new altar-piece, representing the Last Supper to his church, caused the figure intended for Judas Iscariot to be drawn as a likeness of the dean of Peterborough, with a black patch on his head, similar to one which Dr. Kenneth wore on the wound which he had formerly received. It was soon known for whom the caricature was intended, and people crowded to see it. But by all moderate people of both parties, it was regarded as an innocent and profane repro\n
K E N

a.jpg

tution of what was intended for the most sacred uses, and the bishop of London, without any interference on the part of the dean, ordered it to be taken down. After the accession of king George I., and when a rebellion was breaking out in Scotland, he preached with the utmost boldness in defence of the present settlement of the government of the
KEN

before the flatable period; and likewise was the means of obtaining for him a fellowship of Exeter college. When he was of a sufficient standing, he took the degree of M.A. and about the same period he was admitted to holy orders. In the year 1753 he laid the foundation of his great work, by publishing "The State of the Hebrew Text of the Old Testament considered; a Dissertation in two Parts."

The design of this publication was to overthrow the strange notion which had long prevailed among divines concerning what is called the integrity of the Hebrew text, viz. that the copies of it had been preferred absolutely pure and uncorrupt. This notion had been thrown out and vindicated by Capellus, but though his arguments were supported by the authority of the Samaritan Pentateuch, that of parallel passages, and the ancient versions, yet as he had no opportunity of consulting MSS. he could never prove his point. This talk was refused for Mr. Kennicott. His dissertation proved that there were many Hebrew MSS. extant, which, though they had hitherto been generally supposed to agree with each other, and with the printed Hebrew text, yet contained numerous and important various readings, and that from these considerable authority was derived in support of the ancient versions. This work was examined with great severity, both at home and abroad: many excellent and learned Chriftians imagined that it was opening wide a door to infidelity, and that the cause of their holy religion would be much injured by it; but by the generality of learned and candid biblical scholars, both natives and foreigners, its value was justly appreciated, and they were led to form high expectations of the author's future labours in the service of sacred criticism. Mr. Kennicott spent the next three or four years principally in searching out and examining Hebrew MSS. In 1759, he was presented to the vicarage of Culham, in Oxfordshire, and in the following year he published his "State of the printed Hebrew Text of the Old Testament considered." In this volume he vindicated the authority and antiquity of the Samaritan copy of the Pentateuch;—proved that the present Chaldee paraphrase has not been taken from MSS. To very ancient as has been generally supposed, and that it has been, in some cases wilfully, altered in conformity to the Hebrew text, where that text itself had been corrupted;—appealed to the testimonies of the Jews themselves on the subject of the Hebrew text, and gave a history of it from the close of the Hebrew canon, down to the invention of printing, and presented an account of all the Hebrew MSS. then known, with a collection of eleven Samaritan MSS., and a particular catalogue of 110 Hebrew MSS. in Oxford, Cambridge, and the British Museum. Mr. Kennicott now published proposals for collating all the Hebrew MSS. prior to the invention of printing, that could be found in Great Britain and Ireland, and for procuring as many collations of foreign MSS. of note, as the time and money he should receive would permit. In this undertaking he was supported with the most liberal subscriptions from persons of all parties, and of the very highest ranks in society, and he bent his whole powers to complete the very arduous undertaking. While he was proceeding in the work he was appointed keeper of the Radcliffe library; admitted to the degree of doctor of divinity; presented to a living in Cornwall, and rewarded by a canonry of Christ-church, Oxford. In the year 1776, Dr. Kennicott published the first volume of his Hebrew bible, and in the year 1780 the second volume, which completed the design, made its appearance. To the whole was prefixed a general dissertation, giving a full history of the nature of the design, and of the benefits likely to result from it. The various readings which are inserted in it are the result of a collation of six hundred MSS. Such a work, and so important to the best interests of mankind, reflects very high honour on the country in which it was first patronized and carried into execution. Within two years of his death, Dr. Kennicott resigned his living in Cornwall, from conscientious motives, on account of his not having a prospect of ever again being able to visit his parish. No one, however, capable of appreciating the author's labours, can doubt that they might properly have entitled him to retain this preference; still a conduct, so signal distinguished, deserves to be recorded and celebrated. He died at Oxford on the 18th of September 1785, at the age of sixty-five. At the time of his death he was employed in preparing for the press "Remarks on select Passages in the Old Testament," which were published as a pious work, accompanied by eight sermons, partly critical and partly practical. In private life, Dr. Kennicott furnished the character of a liberal, worthy, and friendly man: in company he appeared unaffected, good tempered, and cheerful. Ency. Brit. Monthly Review, and New Ann. Register. For a particular account of Dr. Kennicott's laudable undertaking, see the article Hebrew Bibles.

KENNINGTON, in Geography, an extensive and populous hamlet, annexed to the parish of Lambeth, Surrey, England. The manor formerly belonged to the duchy of Cornwall, and was provided with a palace, which was occasionally occupied by Edward the Black prince, and Henry IV., VI., and VII. On a common or open piece of ground the convicted felons of Surrey were formerly executed: around this spot several rows of houses and streets have been recently built: and Kennington may now be considered as constituting a part of the British metropolis. Lysons's Environs of London.

KENNIS, in Biography, a performer on the violin, with an uncommon power of execution. See LOUVAIN and CARRIONS.

KENNOMICK, Great, in Geography, a navigable river of America, in the N.W. territory, which empties itself into the S. end of the lake Michigan, N. lat. 42 14'. W. long. 86 52'. The waters of this river communicate, by a portage of 30 yards, with Little Kennomick, a short river which runs north-easterly into this lake.

KENPOU, a river of Thibet, which runs into the Sampoo, in the kingdom of Ava.

KENRICK, William, in Biography, the son of a citizen of London, was brought up to a mechanical employment, which he soon abandoned, and devoted himself to the cultivation of letters, by which he supported himself during the remainder of life. He was some time a flutist at Leyden, and, upon his return to England, he appeared as a poet, in "Epistles Philosophical and Moral." He wrote an avowed defence of infidelity while in prison for debt, and with a declaration, that he was less ambitious of the character of a poet than of a philosopher. He was for a considerable time a writer in the Monthly Review, but having a disagreement with Mr. Griffiths he began a new review of his own. He published, in a few days after the appearance of Dr. Johnson's edition of Shakspere, a review of it, in which the ignorance or inattention of that editor is exposed, and the poet defended from the perfections of his commentator, 1755." In the year 1766, he produced a comedy, entitled "Falstaff's Wedding," at first intended to have been given to the public as an original play of Shakspere, retrieved from obscurity; and it was admitted to be a tolerably good imitation of the great master of drama. Mr. Kenrick was continually involved in disputes, many of which were not creditable to his character. He translated the Eclogus and Eloisa of Rousset, and Millet's Elements of the History of England.
England. He was likewise the author of several dramatic performances, and other miscellaneous pieces. He was, in 1774, the editor of "The Poetical Works of Mr. Robert Lloyd," in two vols. 8vo. He died in the month of June 1777. Eng. Brit.

KENNINGTON, in Geography, a pleasant and populous village in the hundred of Oliphull, England, is about one mile and a half W. of Hyde Park Corner, and consisted, in 1822, of 1131 houses, which were occupied by 8556 inhabitants. This place is chiefly noted for its royal palace, which was first appropriated to the crown by King William III., who built a Lodge here; but that the gardens have been much altered and improved by succeeding monarchs. The parks are of considerable extent, and are laid out in gravel walks, plantations, &c. This is a favourite place of resort the gardeners for the inhabitants of London, particularly during the fine weather in summer. They are nearly four miles in circumference, and are separated, on the western side, from Hyde-park by a low wall. Through these gardens flows a small stream, which is made to fill a canal within the inclosure, and another much larger, called the Serpentine river, in Hyde-park. The palace is a fine irregular edifice, built at various periods, without harmony of design or beauty of architecture. Its state rooms consist of a full of 12 apartments, which contain several valuable and curious paintings by artists of eminence. The names of some of these are published in Boy's "Surveys of London;" and more fully in "The Ambassador," 1790, 1810. Besides several elegant villas in this parish, is a fine ancient mansion called Holland House, the seat and property of Lord Holland, for a view and account of which, see Architectural Antiquities of Great Britain, vol. 1.

KENNINGTON, a township of America, in Rockingham county, New Hampshire, about six miles S. of Exeter, and eight N. of Newbury port. It was incorporated in 1737, and contains 776 inhabitants.

KEN, a maritime county of England, forms the southern extremity of this island, and is bounded on the west by Surrey, on the north by the German ocean and the river Thames, which separates it from Essex, on the east by the Downs and the straits of Dover, and on the south by Sussex, and part of the same straits. The medium length of the district, thus encompassed, from east to west, is 66 miles, and its breadth about 26, whilst the circumference is nearly 154 miles. Its area, according to Boy's "Agricultural View," is about 813,000 acres.

Kent is primarily divided into five large districts, called Laths, viz. Sutton-at-Hone, Aylesford, Scray, Shipway, and St. Augustine—These are subdivided into bailiwicks, hundreds, and liberties. The whole county contains fourteen bailiwicks, sixty-three hundreds, fifteen franchises or liberties, the two cities of Canterbury and Rochester, and thirty-four market towns, though in some of these the market is discontinued. The number of hounds, according to the returns under the population act of 1828, amounted to 72,988; of which inhabitants to 367,564; of whom 151,374 were males, and 156,200 females. For local purposes, the county is nearly equally divided into East and West Kent. The former contains the laths of Sutton at Hone, Aylesford, and the southern part of Scray; the latter the northern part of the lath of Scray, and those of Shipway and St. Augustine. In each of these great districts, a court of feisin is held four times every year; twice originally and twice by adjournment: these for the eastern division at Canterbury, and for the western at Maidstone. The judicatures, though appointed for the whole county, generally confine their attention to that district in which they reside. The county town is Maidstone, where the assizes are held, and all the courts of the first class are situate. Kent returns nine members to parliament; viz. two for the county, and two each for Canterbury, Rochester, Maidstone, Queenborough, Dover, Sandwich, Romney, and Littlestone. The four royal parks are 2667 acres. The soil and products of the county are varied; it contains 281 parishes; the latter four dairies, containing 133 yards.

Ancient History.—This district is peculiarly interesting to the antiquary, not only from the numerous remains of castles, abbeys, and old churches still existing; but from its proximity to the continent. Many authors state, that it formerly joined the main land, by means of an isthmus; and adduce plausible arguments in support of such opinions. Strabo, Caesar, Polybius, and some other ancient writers, call this district Cantium; which word the ancients referred to Cant-qua-tant. In the Domesday Survey it is written Cheshut. All the transactions relating to Cantia's什么叫的 of Britain occurred in this county; for on this coast he made two descents, the 18, fifty-five years before the birth of Christ, and the 2d, in the following year. At this time Kent was governed by four British kings; who collected not only their own subjects, but a vast concourse of armed men from the neighbouring states, to oppose and repel the invading Romans. Their efforts and bravery were unavailing, and the foreign warriors ultimately compelled the Britons to pay an annual tribute. In the year A.D. 43, a third descent was made on this coast by Julius Flaviius, who, having afterwards joined to Claudius, effectuated a conquest over the Britons. Kent was now included in that division of Britain called Britania Prima; and was governed by Roman laws and Roman officers. Several permanent stations and temporary encampments were established in this county; and military roads were formed. Among the latter was the Wattle street, which extended from Dover, Dubris, to London, Londinium. On its course were the other Roman stations of Durobrivae, at Canterbury, Duroleum, Dubrovizia, at Rochester, Vagniacum and Noviomagus. Two other principal roads, at least, were formed in this county; one from Durobriva to Regulumbium or Reculorium, and the other from the first place to Rutupiae, or Richborough. Another road, called Stone-way, extended from Canterbury to Lincis, the Roman Portus Lemanis.

The first descent of our Saxon ancestors was made in this county, A.D. 449, when Hengest and Horsa, with about 1500 men, landed at Ebbsfleet, in the Isle of Thanet. After some battles with the Picts and Scots, Hengest was invested with the sovereignty of Kent; but wishing to engross the whole island, he was involved in a war with the Britons, and several battles were fought within this county and on its confines. The Saxons, however, prevailed, and Kent continued a distinct kingdom for many reigns. In this county Christianity was first established in Britain. See ST. AUGUSTINE, and Turner's History of the Anglo-Saxons, 2 vols. 410.

The present flourishing condition of Kent has partly originated from the peculiar custom by which the defect of landed property is here regulated, and which is comprehended under the term great-lind. The custom is of very remote date, and prevailed throughout England till the Norman conquest. It is evident that at that period the eldest son did not inherit to the exclusion of his brethren; the right of feisin, in preference to the divisible practice of inheritance, was then introduced by the Conqueror, as a specimen of the arbitrary domination intended to establish. The men of Kent zealously resisted the encroachment, and retained their ancient custom; while the other parts of the nation...
nation were gradually brought to acquiesce in the claim of
primogeniture.
The law of gravel-kind comprehends the joint inheritance
of all the sons to the estate of the father; and should the
father survive his sons, the inheritance devolves to his
grandsons, or to his daughters. The partibility of this
custom is not restrained to the direct line of contiguity;
for all brothers may jointly inherit the estate of a deceased
brother; and, agreeably to the same rule, nephews and
nieces, by the right of representation, are, in their degrees,
intitled to the same division of property. So predominant is
gavel-kind in Kent, that all lands are presumed to be sub-
ject to that usage, till the contrary is proved; and formerly,
luch lands only were exempted from it, as were helden by
knights' service. See Gavel-kind.

The general aspect of Kent is very beautiful; arising
from the inequality of the surface, the diversity of the
scenery, and the variety in the verdure. "The whole county,"
Mr. Hafted observes, "excepting the marshes and the Weald,
is a general cluster of small hills; two chains of which,
higher than the rest, run through the middle of Kent, from
weft to east, in general at about eight miles distance from
each other, (though at some places much lefs,) and extending
from Surrey to the sea." These are called the Upper
and Lower Hills, and are mostly covered with coppice
and woodlands. The northern range, and, indeed the whole
north side of the county, is composed principally of chalk
and flints, as well as a large tract on the eastern coa: the
southern range is chiefly of ironstone and rag stone; to the
westward, clay and gravel prevail on the eminences.
Mr. Boys, in the Agricultural Survey of this county,
has divided it into eight districts, according to the nature
of the soil and produce; these respectively comprehend the
Isle of Thanet; the upland farms of East Kent; the rich
flat lands in the vicinity of Faverham, Sandwich, and Deal;
the hop-gounds, &c. of Canterbury and Maidstone; the
Isle of Sheppey; the upland farms of West Kent the Weald
of Kent; and Romney Marsh. The Isle of Thanet forms the
north-eastern angle of Kent, from the main land of which
it is separated by the river Stour and the water called
the Nethergong; its length is about nine miles, and its
breadth about five. This district is in a very high state of
cultivation, and of very remarkable fertility; its soil,
though originally a light loam on a chalky bottom,
having been greatly improved by the inexhaustible store of
manure supplied by the sea. The whole isle contains about
3500 acres of excellent marsh land, and 23,000 acres of
arable; thefe of the latter, which border on the marshes,
are the most productive; though even the uplands are
rendered extremely fertile by the excellent modes of cultivat-
tion. The general routine of crops on the lighter soils is
fallow, barley, clover, and wheat; but a crop of peas is
occasionally introduced instead of the fallow; and sometimes
beans in the place of the clover. Where the round-tith
course is pursued in the rich sandy loam lands, the general
routine is barley, wheat, and barley. Canary-seeds are like-
wise grown here in great quantities, as well as radish, silphi,
mustard, cabbage, and other excellent plants for the London
markets. The marsh lands are principally applied to the
fattening of sheep and cattle. The upland farms of East
Kent may be described as including an open and dry tract of
land, lying between the city of Canterbury, and the towns
of Dover and Deal; and another tract, inclosed with woods
and coppice, extending from Dover, by Etham and Ashford,
to Rocheller, in length; and from the ifle of Sheppey to
Lenham, &c. in breadth. The former tract includes a
great variety of soils, scarcely those of any two farms being
similar. Still clays are principally met with on the tops of
the highest hills about Dover; farty tracts occur in the val-
leys in the fame neighbourhood, and about Stockbury near
Maidstone. The woodlands in East Kent are dispersed
chiefly between the great road from Rocheller to Dover,
and the chalk hill that runs from Folkestone, by Charing
to Detling. These furnish the adjacent country with fire-wood,
and the dock-yards with timber for ship-building; but the
most material part of their produce, is the immense quantity
of hop-poles cut out for the neighbouring plantations.
The wood is generally cut at from ten to fourteen years growth,
and its value is estimated by the quantity of hop-poles pro-
duced. The rich flat lands in the vicinity of Faverham,
Sandwich, and Deal, lie nearly on a level, are extremely
fertile, and excellently managed under a general sylvum.
They are almost entirely arable; the soils are a rich family
loam, intermixed with land, and a light wet clay. In the
vicinity of Sandwich are many orchards, which in some years
produce large quantities of good apples, the greater part of
which is conveyed by the coal vessels to Sunderland and
Newcastle. The hop-gounds, extending from Maidstone
and Canterbury to Sandwich, are very productive, and
under a good sylvum of management; though the soils are
different, as well as the kind of hops cultivated. The plant-
tations have of late years been greatly increased, particularly
in those parts contiguous to Maidstone, Faverham, and
Canterbury; the plantations called the City grounds, extend
through a circuit of two miles and a half round Canterbury,
and are estimated to include from 2500 to 3000 acres. The
hops grown here, and in the grounds running hence to Sand-
wich, are very rich in quality, and in much request for their
great strength; if well managed, they are also of a good
colour. Those grounds are found most productive, which
have a deep rich loamy surface, with a sub-foot of deep loamy
brick earth; and this kind of land forms the principal part
of the plantations of East Kent; though there are some
good grounds where the surface is very flinty. The pro-
cduce is subject to great fluctuation; in some years amount-
ing to fourteen or fifteen hundred weight per acre; in others
not exceeding two hundred. In drying hops, a small quan-
tity of brimstone is sometimes used, in order to suffocate
the insects, and occasion a more speedy evaporation of the
superfluous moisture; by the use of the sulphur, the hops are
thought also to be improved in colour. In the plantations of
Maidstone, and its vicinity, very great crops of hops are
grown; but they are inferior in quality to those of Canter-
bury and East Kent. The foil is what is locally termed
flone shatter; that is, there where is a mixture of small
pieces of flone and sand; the sub-foot is called Kentsh riff,
and burns into good lime. The hop plantations afford em-
ployment to great numbers of the poorer claffes, not only of
this, but of other counties; and the motley groups that
assemble to affift in hop-picking are truly amusing. Hops
are generally regarded as having been introduced into this
country about the time of Henry VI.; and in the year 1428,
were petitioned against as wicked weed. This, however,
can only refer to the use of them, for they are found
wild in almost every part of Britain. They came into more
general use in the reigns of Henry VIII. and Elizabeth.

Nearly one-fourth of the whole produce of the hop-duty in
England, is paid from the plantations of East Kent. Be-
sides the hop-gounds, the neighbourhood of Maidstone
is celebrated for apples, cherries, and filberts; many small
fields, of from one to fifteen acres, being planted with
different species of these kinds of fruit; it is also a common
practice to plant hops, apples, cherries, and filberts, all

In
KENT.

In plentiful years the cider fruit sells for fourteen-pence per bushel. The apples appropriated for domestic uses are sold to the fruiters, who lend them to London by the hoy, or to the north of England by the coal vessels. The cherries, which are of the white and black heart, Mercia or Kentish kind, are annually sold to higlers, who retail them on the coal-coast by the fiwe or hallet, containing forty-eight pounds each; or else they are sent by water to London, and configned to the fruit-factors. The plums are mostly disposed of in the same manner. The Isle of Sheppey is separated from the coast of Kent by an arm of the sea, called the Swale, which is navigable for vessels of 200 tons burthen. Its length is about eleven miles, and breadth eight; four-fifths of it consisting of marsh and fallure lands; the remainder is arable. The prevailing soil is a deep, strong, clay, through which the plough can hardly be forced. In the upland farms of Kent I include a great variety of soils, and are cultivated under various systems of husbandry. This district is more included than the eastern part, and produces greater quantities of timber and underwood, particularly on the upper or westermont side. The vale and common lands of this district form an extent of many thousand acres. The turnpike roads are mostly in good condition; but the roads are frequently impassable for carriages. The Weald of Kent is a considerable and remarkable tract, stretching along the south side of the county, from Romney Marsh, to Surry; on the north it is bounded by the range of hills which enter the county near Well-dreet, and extends, in nearly a due westerly direction, to Sutton and Egerton, and thence southward to Hythe; on the south it stretches to the confines of Sussex, and includes the Isle of Oxney. This district was in ancient times an immense wood or forest; wholly desolate of inhabitants, excepting swine and deer. By degrees, however, it became peopled, and is now every where intermixed with towns and villages; though it still contains some extensive and flourishing woodlands. Its present name is Saxon, and signifies a woody country; but the Britons called it Coit Andred, the great chase or forest. The whole was a demesne of the Saxon kings; and there are still certain privileges annexed to the possession of the lands, which induce the proprietors to contend for being within its limits. It is said, Mr. Hailey observes, "that within the Weald, the proof of woodlands having ever paid tythe, lies on the parson, to enable him to take tythe of it, contrary to the usual custom in other places, where the proof of exemption lies on the owner; nor are the lands in it subject to the licence of woods; nor has the lord walle within the Weald; the timber growing thereon belongs to the tenant. This latter custom of excluding the lord from the walle, is called land-parson." The Weald, when viewed from the adjoining hills, which command the whole extent, exhibits a most delightful landscape, intermixed with small eminences, highly cultivated, and animated by farm-houses, seats, and villages, proportionally scattered among towering oaks and other trees. Romney Marsh is an extensive level tract of rich marsh land lying on the southern coast, and comprehending, in itself, about 33,925 acres; but when described, as it frequently is, in connection with Walland Marsh, which adjoins it on the south-west, and Denge Marsh, which connects with the latter on the south-east, it includes about 43,326 acres; Walland Marsh containing 16,499, and Denge Marsh 29,121. The whole level, however, is yet more extensive; for Guildford Marsh, which adjoins Walland Marsh on the west, comprises 3265 acres; most of this latter tract is in Sussex. The beautiful appearance of these levels in the summer climate, when the entire surface is clothed with luxuriant verdure, and covered with numerous flecks of sheep and droves of cattle, cannot fail to excite considerable interest in every observer. The Marsh is defended against the violence of the sea by an immense bank of earth, of great strength, called Dunchurch-Wall, which extends above three miles in length. This wall is the sole barrier that prevents the sea from overflowing the whole extent of the level, and as it is for the general safety, so "is it supported," says Hailey, "as well as the three great fluxes through it, which are for the general drainage of the marshes, by feets levied over the whole of it; but the interior drainage, which is portioned out into a number of divisions, called waterings, is provided with fowers, and maintained at the expense of the respective land-holders, by a fow raised separately on each" in proportion to their own watering. In that portion of the Marshes within this county, are comprehended the two corporate towns of New Romney and Lydd, and sixteen other parishes. The inclusions are principally formed by ditches and a rail fence. The soil of these spacious levels has been almost wholly degrevated by the sea, and consists principally of a fine, soft, rich, loam and clay, with a greater or less proportion of sea-sand intermixed. The sub-soils consist of alternate layers of sand and clay, with sea-beach occasionally intervening. In many places throughout the Marsh, at the depth of three or four feet, have been frequently dug up oak leaves, acorns, &c., together with large trees lying in different directions; some across each other; some appearing with the roots to them, as if overturned by a storm, or other convulsion of nature; and others as if cut down with an axe or sharp instrument; the colour being as black, and the wood as hard, as ebony. These marshes are almost entirely appropriated to the grazing and fattening of sheep and cattle, but chiefly to the former, which are bred and fed here in immense quantities; their number, perhaps, exceeding that of any other district in the kingdom. Romney Marsh has generally been considered as unhealthy; and probably this opinion has operated to keep it thinly peopled. Of late, however, its fertile qualities have been greatly improved; a change attributed to the attention that has been given to keep the ditches free from stagnant and putrid water. The extent and rental of farms in Kent are uncommonly various, as must be evident when the peculiar customs of the county are considered in connection with the diversities of the soils and face. The number of freeholds in the county is stated, by Mr. Hailey, at about 9000; independent of the large clerical property of the churches of Canterbury and Rochester, and of various corporate bodies. The copyhold and customary tenants are very few. The general distribution of the freeholds, and their close intermixure with each other, occasion a very frequent intercourse between the gentry and the yeomen, and thus generate that equality of sentiment so favourable to the interests of individual right.

The manufactures carried on in Kent are various, though not particularly extensive. The clothing trade, which owe great importance to the growth of its inhabitants, is now nearly forgotten in the county. At Canterbury, muffins, brocaded silks, and stockings, are made; at Deptford and Whitley are large copperas works; at Stone, in the Isle of Thanet, and likewise in the Isle of Grain, salt is manufactured; at Olpring is a extensive manufactory for gunpowder, erected by government; and there is also another near Dartford; in the Weald, bordering on Sussex, are various iron furnaces, and at Dartford and Crayford, are mills for the manufacturing of iron; at the latter place also, are extensive works for the printing of calicoes, and spacious grounds for the bleaching of linen; at Seven Oaks are large silk mills; and at Boxley, near Maidstone, is the most extensive
tensive and curious manufacture of paper, perhaps, in Europe; paper is also made in the vicinity of Dartford, and some other places. The various dock-yards at Deptford, Woolwich, Chatham, &c. provide employment for numerous artisans in all the different branches of naval affairs; shipbuilding is also carried on at other places on the sea-coast.

The religious houses, or monastic establishments, in Kent, were formerly very numerous, and their net annual income, at the periods of their dissolution, amounted to £6000. Among them were two abbeys, three priories, and five nunneries of the Benedictine order; one priory of the Cluniac; one abbey of the Cistercian; of secular canons, five colleges; of regular canons, four abbeys and five priories, one of which was Premonstratensian; of friars, there was one priory and one monastery of Dominicans; two priories of Franciscans, one priory of Trinitarians, three priories of Carmelites, and four alien priories; there were also two commanderies of knights hospitallers of St. John of Jerusalem; and fifteen hospitals; besides various hermitages, chantries, and free chapels.

The number of castles that have been erected in Kent is very considerable; and many of them yet remain, in different degrees, almost perfect. Of these, the immense fortress of Dover is the principal; and this is now garrisoned with a strong force, as are also several others on the coast; but most of the castles in the interior of the county are dismantled and mouldering into ruins.

The principal rivers that intersect or bound this county are the Thames, the Medway, the Greater and Lesser Stour, the Medway, the Darent, the Cray, and the Ravensbourne. The Thames, the Tameths of Essex, which has a very important influence on the trade and commerce of this county, will be fully described in its place. (See Thames.) The Medway, which is more peculiarly a Kentish river, was called Vaga by the Romans, a name descriptive of its very famous course and many wanderings. The Saxons changed this appellation to Medwey and Medoway, of which the present name is a corruption. This river has four principal sources, of which only one is in this county; two being in Suffolk, and the other in Surrey. That branch which enters Kent from Surrey, rises in Bleckingley parish, and having been joined by several rills, flows on to Eaton bridge, How castle, and Penhurst, near which it receives one of the branches that rise in Suffolk, and proceeds to Tunbridge. A little above this town the river separates into several channels, one of which is navigable and is again joined by the other division about two miles below Tunbridge. At Yalding it receives the united waters of the other two principal branches, and flows in a winding direction to Maidstone, and gradually augmenting in depth and breadth, pursues its picturesque course to Rochester, where the scenery is particularly beautiful. Proceeding hence towards Sheerness, it passes Chatham, Upper Caile, and Gillingham Fort, and flows onward to the Thames, which it enters between the Isle of Grain and Sheppey, having first united its waters to those of the Swale. The Medway, with its numerous tributary streams, is calculated to overtop a surface of nearly thirty square miles in the very midst of Kent. The tide flows almost as high as Maidstone; but at Rochester bridge it is exceedingly strong and rapid; and below that, all the way to Sheerness, a distance of about twenty miles, the bed of the river is deep, and the reaches so convenient, that many of the largest line of battle ships are moored here, when out of commission, as in a wet dock, and ride as safely as in any harbour in Great Britain. The Medway was first made navigable to Tunbridge about the middle of the last century, under the provisions of an act of parliament passed in the year 1749; though an act had been procured for the purpose in the reign of Charles II. The Greater Stour has two principal branches, both of which rise in this county; the head at Well-street near Lenham; the other among the hills between Limmings and Polding. These streams unite near Ashford; whence the Stour proceeds to Canterbury, through which it flows in a divided stream, and again unites a little below that city. The Lesser Stour rises in the vicinity of Limmings, and directing its course northward, has its waters increased by several small rills, and sometimes by a temporary water called the Nillbourne, which, after continued rains or sudden thaws, issues from several springs and forms a strong current. The Rother, formerly called the Limme, rises at Gravel-hill, in the parish of Rotherfield, in Sussex, and flowing easterly becomes the boundary of this county below Sandhurst and Newenden. The Darent rises on the borders of this county and Sussex, near Waltham, whence flowing to the north-ea., it falls on to Riverhead, where it turns to the north, and flows in that direction to South Darent. The Cray, and the Ravensbourne, are only small streams; the former has its source at Newell, in Oppington parish, the latter rises on Kelton Downs, near an ancient Roman encampment. Halted's History and Antiquities of Kent, 12 vols. 8vo. Deans of England and Wales, vol. vii. 1807.

Kent, a county of America, in Maryland, on the east shore of Chesapeake bay, bounded E. by New castle, and part of Kent county, Delaware, and W. by Chesapeake bay; about 32 miles long, and 13 broad; containing 27,777 inhabitants, including 33,745 slaves. Its chief town is Chelford. Kent County, in Upper Canada, extends northward to the boundary line of Hudson's bay, including the whole territory to the westward and southwest of that line, to the utmost extent of the country known by the name of Canada.

Alto, a county of Rhode island, lying S. of Providence county, on the W. side of Narragansett bay; 20 miles long and 10 broad; divided into four townships, and containing 8,487 inhabitants. Alto, the middle one of the three counties of Delaware; 30 miles from N. to S. and 26 from E. to W.; containing 10,454 inhabitants, including 3,485 slaves. The lands in this county are esteemed the richest in the state. It is well watered by several small streams that empty themselves into the Delaware. The chief town is Dover. Alto, an island in Queen Ann's county, Maryland, and the largest in Chesapeake bay; 12 miles from N. to S. and 6.6 broad. It has a post-office. Alto, a township in Litchfield county, Connecticut, bordering on the state of New York, and 8 or 10 miles W. of Litchfield; containing 1,076 inhabitants.

KENTASSE, a ridge of mountains of Thibet, between the heads of the Ganges and the Sampoo rivers. N. lat. 20° 40'. E. long. 80° 49'.

KENTH, a town of Poland, in the palatinate of Cracow; 30 miles S.W. of Cracow.

KENTSHIAN, a mountain of Thibet; 3 miles E. of Sarangpour.

KENTUCKY, a crooked river of America, which rises in the state of the same name, and after a general N.W. course of 200 miles, falls into the Ohio, N. lat. 38° 37'. W. long. 85° 30'. It is sometimes called "Cattara." Its source is in the Laurel mountains, and it interlocks with Licking river. Its mouth, which is 250 miles wide, is 57 miles above the Rapids, and 626 below Pittsburg. The river is navigable 130 miles, though its current is rapid, the banks being high and rocky. It is said that black-led mines have been found on the head waters of this river. Little Kentucky river is 25 yards wide, and 3 miles W. of Kentucky river.

KENTUCKY, one of the United States of America, bounded
Kentucky is bounded N.W. by the river Ohio, W. by Cumberland river, S. by Tenent river, E. by Sandy river, and a line drawn due S. from its source, till it strikes the northern boundary of Tennessee. It lies between 36° 30' and 39° 30' N. lat., and between 81° and 89° W. long., is about 590 miles long, and 200 broad; and contains 50,000 square miles. It was well known to the Indian traders many years before its settlement: a map of it was made from their description in 1754; and it was farther explored in 1757 and 1760. But it was first settled by Col. Daniel Boone in 1773; erected into an independent state by act of Congress, in December 1792; and received into the Union in June 1792. Kentucky, which was originally divided into two counties, Lincoln and Jefferson, has since subdivided into 42, as in the following table.

In January 1790, the legislature passed an act, appointing representation, and distributing the state into senatorial districts. This act provides, that the house of representatives shall be composed of 62 members, elected from the several counties, according to the ratio of one for every 500 qualified electors; and that the senatorial branch of the legislature shall consist of 24 members.

The whole extent of the north-western side of Kentucky is washed by the river Ohio; the principal branches of which, that serve to water this fertile tract of country, are Sandy, Licking, Kentucky, Salt, Green, Tenneesee, and Cumberland rivers. These again branch out into rivulets and streams, which, pursuing different directions, serve to fertilize the whole country. In the dry season, however, many of them disappear, and the inhabitants are dired by wells and springs. The banks of these streams afford fine marble, being of the same texture, and found in great plenty. In this country there are few noted salt-springs or holes, which supply abundance of water for use and exportation. The whole county has upon a bed of fine-loam, generally about six feet below the surface, except in the valleys, where the soil is much thinner. A tract, about 20 miles wide, along the banks of the Ohio, is hilly, broken land, intersected with many fertile spots. The river is not subject to overflow, formed of gentle slants and declivities. The valleys are commonly narrow, and the soil thin and inferior in quality; and that along the ascending ground is frequently not much better; though it is sufficiently deep for vegetation, as the face of the tree indicates. The soil is either black or tinged with a brighter or deeper vermilion, or is of the colour of dark ashes. In many places there are appearances of potter's clay, and of coal in abundance. Although this country is generally hilly or mountainous, in many parts barren, it has various plains and tracts of land fit for pasturage and the rearing of cattle; and a project has been accomplished of cutting a road through the most mountainous part from Kentucky, to pass by the forest and plains in Virginia, and thence to Winchester, by which a saving is made of 200 miles in distance from the one to the other.

This country is well timbered. Of trees of the natural growth of the country we may reckon the elm, the beech, the ash, the juniper, the faggot, the cumber, the buckberry, and the cucumber. The two last are used for fuel, and bear a fruit of the size and shape of the cucumber. The coffee tree resembles the black oak, and bears a pod, that incloses a seed, of which is prepared a liquor not unlike coffee. Beside these there is the honey-bell, the black mulberry, and wild cherry, of a large size. The buck-eye, an exclusively soft wood, is the bane of fruit of Europe. The magnolia bears a beautiful blossom of a rich and exquisite fragrance. Such are the variety and beauty of the flowering shrubs and plants, which grow spontaneously in this country, that in the proper season the wildflowers appear in blossom. The accounts that have been given of the fertility of the soil in this country have, in some instances, exceeded belief, and probably have been exaggerated. However, it is allowed that some parts of Kentucky, particularly the high grounds, are remarkably good. The lands of the salt-rat, it is said, are too rich for wheat, and will produce 50 or 60, and in some instances 100 bushels of good corn per acre. In common, the land will yield 30 bushels of wheat or rye per acre. Barley, oats, flax, hemp, and vegetables of all kinds, common in this climate, yield an abundant increase. Cotton is sown, and with difficulty brought.
brought to perfection. Irish potatoes thrive well; but sweet potatoes are raised with difficulty. A species of rye was found by the first settlers growing wild in Kentucky, and on the lands near the Ohio. It had a bearded ear like the cultivated rye, the beard somewhat longer, and the grain fewer. The staple commodities in this state are wheat and tobacco; but as the circumstances of distance from a market, and the difficulty of navigating the Mississippi, render them unprofitable to the cultivators, they are turning their attention to the raising of hemp, for which the soil is well adapted. The rivers abound with fish of various sorts; and as swarms are rare in Kentucky, the reptiles which they produce, such as snakes and frogs, &c. are not numerous. The honey-bee may be called a domestic insect, as it is said not to be found but in civilized countries. Accordingly, it is a common saying among the Indians, when they see a swarm of bees in the woods, "Well, brothers, it is time for us to decamp, for the white people are coming." The quadrupeds, except the buffalo, are the same as in Virginia and the Carolinas. The climate, if we except a few places in the vicinity of ponds and low grounds, is healthy and delightful. Their inhabitants do not experience the extremes of heat and cold. In 1798 the greatest heat was 89 Fahrenheit. The weather in winter is fluctuating. Snow seldom falls deep or lies long. The winter begins about Christmas, and is never longer than three months, commonly two, and is so mild that cattle can subsist without fodder. Fahrenheit's thermometer seldom falls below 35 in winter, nor rises above 80 in summer. The approach of the seasons is gradual; the summer continuing till the middle of October, the autumn or mild weather till Christmas, and the spring appears to produce effect in March, and by the middle of April, the foliage of the forests is completely expanded. Kentucky has various minerals. A valuable lead mine has been discovered between Cumberland and Green rivers. Marble, chalk, gypsum, and ochres are found in different places. The country affords also iron, copper, sulphur, nitre, copperas, alum, &c. From the caves on Green river earth is collected for salt-pan; and many of the inhabitants manufacture their own gun-powder. Iron-works are established. Paper-mills, oil-mills, fulling-mills, saw-mills, and a great number of valuable grist-mills, are erected. Several valuable tanneries have been established in different parts of the country. Attempts are made, on a large scale, for the culture of vineyards, and the introduction of the cotton manufacture. The felt-works are more than sufficient for the supply of all the inhabitants, at a low price. Considerable quantities of sugar are made from the sugar trees. The amount of exports from this state, in 1801, was 626,673 dollars. Malt liquor, spirits distilled from corn and rye, and the juice of the sugar-tree, mixed with water, constitute the ordinary beverage of the country. No preference is given to any one religious denomination in this country. The Presbyterians, Baptists, and Methodists, are the most numerous. Among the natural curiosities of the country may be reckoned the banks of Kentucky and Dick's river. Here may be observed, 3 or 400 feet of solid perpendicular rocks, in some parts of the lime-tree kind, or in others of fine white marble, curiously chequered with strata of altiniferous sandstone. The rivers appear like deep artificial canals. Their high rocky banks are covered with red cedar groves. Caves have also been discovered in this country, several miles in length, under a fine lime-tree rock, supported by curious arches and pillars. Springs that emit sulphurous matter have been found in several parts of the country. Near Lexington are found curious sepulchres, full of human bones.

By the constitution of this state, formed and adopted in 1792, the powers of government are divided into three distinct departments: legislative, executive, and judiciary. The legislature is vested in a general assembly, consisting of a senate and house of representatives (see the beginning of this article); the supreme executive in a governor; the judiciary in the supreme court of appeals, and such inferior courts as the legislature may establish. The representatives are chosen annually by the people; the senators and governor are chosen for four years by electors appointed for that purpose; the judges are appointed during good behaviour, by the governor, with the advice of the senate. The declaration of rights affords the civil equality of all; their right to alter the government at any time; liberty of conscience; freedom of elections and of the press; trial by jury; the subordination of the military to the civil power; the rights of criminals to be heard in their own defence; the right of the people to petition for redress of grievances, to bear arms, and to emigrate from the state. It prohibits unreasonable searches and seizures; excessive bail; confinement of debtors, unless there be presumption of fraud; full pardon of habeas corpus writs, unless in rebellion or invasion; ex post facto laws; attendance by the legislature, standing armies; titles of nobility, and hereditary distinctions. The legislature of Virginia, while Kentucky belonged to that state, made provision for a college in it, and endowed it with very considerable landed funds. There has been since established a college at Lexington, called "Transylvania," regularly organized and well endowed, having a fund of 14,000 acres of land. The officers of the university are a president and two professors, in the literary departments; three medical professors, in the school of medicine; and a professor of law; a divinity professorship has been also contemplated. The library, supplied chiefly by liberal gentlemen in England, amounts to near 5000 volumes; and the philosophical apparatus is gradually enlarging. In Lexington there is also a circulating library of about 1000 volumes. Schools, in several towns, are liberally encouraged and supported. The distance from Philadelphia to Kentucky by land is from 7 to 800 miles; from Baltimore nearly 700; nearly 600 from Alexandria; and upwards of 500 from Richmond. 

KENTZINGEN, a town of Germany, in the Brifgau, about a mile from the east side of the Rhine; 13 miles N.W. of Friburg.

KENYON, LLOYD, in Biography, was born at Green- dungton, in Flintshire, in the year 1733. He was educated at Ruthin school in Denbighshire, at which he was attached to Mr. Tomlinson, an attorney at Nantwich, in Cheshire. When he had completed his clerkship, he entered himself a member of the society of Lincoln's Inn, and was called to the bar in 1761. He now began to practice as a conveyancer, and soon obtained a high reputation as a found lawyer, which was the means of introducing him to notice in the chancery court. Still, however, he made no figure at the bar, till the trial of lord George Gordon, in 1765, gave him an opportunity for a full display of his talents; and from this moment he was looked up to with respect by his brethren at the bar. In 1783, he was made attorney general, and chief justice of Chiltern; and, much of the fame time, he was instructed as speaker for Hindon in Wiltsire. In 1785, he was appointed to the office of master of the Rolls; and on the resignation of the earl of Mansfield in 1788, he was, by the zealous recommendation of lord Thurlow, raised to the office of chief justice of the king's bench, and ennobled with the title of baron Kenyon. He died at Bath in April 1802, leaving two sons, George the present lord, and the honourable Thomas Kenyon. Gent. Mag.
KEOGANG, in Geography, the most westerly of the branches or mouths of the river Ava, in Pegu, which runs into the sea near Cape Negrais.

KEOWE, or Krowee, the name given in America to the Savannah river, above its conflux with the Tigudo, the west main branch. Also, the ancient name of the populous town and territory of the Cherokee Indians, on the river of that name. The soil is fertile, and the adjacent heights, with little expense, be rendered almost impregnable. The fruitful vale of Keowe is seven or eight miles in extent, terminated by a high ridge of hills, and opening again to an extent of ten or twelve miles down to Sinca, and in breadth one or two miles. This was once a thickly inhabited settlement, well cultivated and planted. To the feeble remains of the once potent Cherokees it now exhibits a different spectacle.

KEOZEE, a town of Birmah, on the Irawaddy; 15 miles N.E. of Pagahan. This town is ornamented with several temples.

KEPEELDEE, a town of Hindooslan, in the country of the Nayas; 30 miles E. of Tellicerry.

KEPHER KENNA, a village of Palentine, said to be the ancient "Cana," where our Saviour changed the water into wine.

KEPLER, John, in Biography, a celebrated astronomer and mathematician, born at Weil, in the duchy of Wirttemberg, December 27th, 1571, was son of Henry Kepler, an officer in the army, who had served his country with distinction, but who, by misfortunes, was reduced to low and narrow circumstances. He gave his son the best education in his power, though the youth was subject to many difficulties, by being sent to different places, and by being put under different masters. His genius and avidity for knowledge animated him to surmount every obstacle, and to make a very rapid proficiency. He was sent to Tubingen in pursuit of his academic studies, and was admitted to the degree of bachelor in 1598, and to that of master of philosophy in 1591. He applied himself to mathematics and theology, and undertook the duties of the ministry for a short time. But his inclination being decided in favour of mathematics, he resolved to devote his whole time and strength to the science; and so high was his reputation, that in the year 1594 he was invited to Graz, in Stiria, to fill the mathematical chair in the university of that city. In the year 1596, he married a lady of a noble family; and in two years from this period he was driven from Graz by persecution, on account of his religious principles; though he was four reciUed by the states of Stiria: but not thinking himself safe, he accepted a pressing invitation from Tycho Brahe to settle in Bohemia, and removed thither with his family and books in the year 1600. Upon a close intimacy, Kepler was diffused with the conduct of Tycho, and complained of his unwillingness as well to promote his interest, as to communicate to him all his discoveries and improvements. Tycho, however, died in 1601; but previously to this, he introduced him to the acquaintance of the emperor Rudolph, who gave him a favourable reception, and appointed him his mathematician. This title of mathematician to his imperial majesty Kepler profited during the remainder of his life not only under the reign of Rudolph, but under his successors, Matthias and Ferdinand. Upon the death of Tycho, the emperor Rudolph ordered him to complete the tables begun by that great man, which were to be called the "Rudolphian Tables." Thence, notwithstanding the vigour with which he applied himself to them, were owing to unexpected difficulties, not completed and published till the year 1627. Having completed that work, he obtained the emperor's leave to go and reside at Sagan, in Sile sia, where he fulfilled much inconvenience from not having his pension regularly paid him. This circumstance obliged him to take a journey to Ratibon in 1630, to solicit for the arrears due. Here he died in November, at the age of 59 years. The account of the labours and discoveries of this great man has been given by Mr. Machaurn, in his work on the "Discoveries of Sir Isaac Newton," and from that we shall extract the following sketch. "To Kepler," says he, "we owe the discovery of the true figure of the orbits, and the proportions of the motions of the solar system. This astronomer had a particular passion for finding analogies and harmonies in nature, after the manner of the Pythagoreans and Platonists. Three things, he tells us, he anxiously sought after from his early youth: Why the planets were fix in number? Why the dimensions of the orbs were such as Copernicus had described from observations? And, what was the analogy or law of their revolutions? He sought for the reasons of the first two of these in the properties of numbers and plane figures, without success. But at length reflecting that while the plane regular figures may be infinite in number, the regular solids are only five, he imagined that certain mysteries in nature might correspond with this limitation inherent in the figures of things: he therefore endeavoured to find some relation between the dimensions of these solids and the intervals of the planetary spheres; and imagining that a cube inscribed in the sphere of Saturn would touch by its six planes the sphere of Jupiter, and that the other four regular solids in like manner fitted the intervals that are between the spheres of the other planets; he became persuaded that this was the true reason why the primary planets were precisely fixed in number, and that the author of the world had determined their distances from the Sun, the centre of the systems, from a regard to this analogy. Being thus, as he imagined, possest of the grand secret of the Pythagoreans, and pleased with the discovery, he published it in 1596, under the title of "Mysterium Cosmographicum." He sent a copy of this book to Tycho Brahe, who did not approve of the speculations contained in it, but wrote to Kepler, urging him to lay a solid foundation in observations, and then, by ascending from them, to strive to come at the causes of things: and to this advice we are indebted for the more solid discoveries of Kepler. This great man, soon after the death of Tycho, found that astronomers had erred from the first rise of the science, in ascribing always circular orbits and uniform motions to the planets; and he discovered that each of them moves in an ellipse, which has one of its foci in the centre of the Sun; that the motion of each is really unequal, and varies in such a manner, that "a ray supposed to be always drawn from the planet to the Sun describes equal areas in equal times." It was some years later before he discovered the analogy that there is between the distances of the several planets from the Sun, and the periods in which they complete their revolutions. He has, however, left it upon record, that on the 15th of May, 1618, he found that "the squares of the periodic times are always in the same proportion as the cubes of the mean distances from the Sun." When Kepler saw, according to better observations, that his disposition of the five regular solids among the planetary spheres was not agreeable to the intervals between their orbits, he endeavoured to discover other schemes of harmony. For this purpose, he compared the motions of the same planet at its greatest and least distances, and of the different planets in their different orbits, as they would appear viewed from the Sun; and here he fancied that he had found a similitude to the divisions of the octave in music.
Of these notions, which are wholly unfounded in nature, he was so fond, that hearing of the discovery of the four satellites of Jupiter by Galilei, he owns that his first reflections were from a concern how he could save his favourite scheme, which was threatened by this addition to the number of the planets. The same attachment led him into a wrong judgment concerning the sphere of the fixed stars; for being obliged, by his doctrine, to allow a vast superiority to the sun in the universe, he refains the fixed stars within very narrow limits; nor did he consider them as suns placed in the centres of their several systems, having planets revolving round them. Kepler's great sagacity, and continued meditations on the planetary motions, suggested to him some views of the true principles from which these motions flow. He speaks of gravity as of a power that was mutual between bodies; and says, that the earth and moon tend towards each other, and would meet in a point, so many times nearer to the earth than to the moon, as the earth is greater than the moon, if their motions did not hinder it. He adds also, that the tides arise from the gravity of the waters towards the moon. But not having notions sufficiently just of the laws of motion, he was unable to make the best use of these ideas; nor did he steadily adhere to them, for he in his "Epitome of Astronomy," published many years after, he proposes a physical account of the planetary motions derived from different principles. Kepler was author of several pieces besides those already mentioned, of which the following may be noticed: "Prodromus Dissertationum Cosmographicarum;" "De Stella nova in Pedc Serpentinum;" "Astronomia Nova, seu Physica Celestis, Tradita Commentarioris de Motibus Stellarum Martis ex Observationibus Tychonis Brahe;" "De Cometis libri tres." This great géométric and astronomer, in his "Harmonies Mundi," published at Linz, in Austria, in 1619, and dedicated to our James I, speaks on the subject of music like a man who had not only thought of it as a science subservient to the laws of calculation, but in the language of one who had studied it practically as an elegant art, and been truly familiar with its powers. And though the eloquent astronomer, Baily, says, in a pleasing decision, that "Kepler, from his veneration for Pythagoras and Plato, has plunged into musical ratios, and blended them with the movements, distances, and eccentricities, of the planets, in his visionary analogies; they contain not one single true ratio or refublance; in a crowd of ideas there is not a single truth." This severe cenure of M. Baily must be confined to the proportions and analogies between musical intervals and the distances of the heavenly bodies: as the ratios of Kepler are accurate, as far as concerns music.

Neither Maclear nor Dr. Hutton have expressed themselves so harshly on his fancied similitudes to the divisions of the octave in music; which they indeed call the dreams of this ingenious man, as the harmony of the spheres had been of Pythagoras and Plato long before.

This great mathematician and precursor of Sir Isaac Newton was so far from allowing to the ancients, much as he respected them, such harmony as is practised by the moderns, that he says, though Plato, in his "Republic," speaks as if something like it were in use, he supposes if they ever had any accomplishment to their melodies by way of base, it must have been such a one as is produced by the drone of a bagpipe. This is perhaps being as unjust to the ancient as tho' are to the moderns, who will not allow them to have made any progress in music, because they are unable, by their compositions and performances, to cure deafness, tame will beasts, or build towns.

Kepler's Laws, is a term used by astronomers to denote certain analogies between the distances of the planetary bodies from the sun, and their times of periodic revolution; as also between the rate of motion in any revolving body, whether primary or secondary, and its distance from the central body about which it revolves. The latter of these, which is generally called Kepler's first law, being that which he first discovered, is commonly expressed as follows, viz.

1. Equal areas are described in equal times; that is, if a line be supposed to join the central and revolving body, this line always passes over, or describes equal areas in equal times, whether the planet be in its aphelion, perihelion, or in any other part of its orbit.

2. The figures of the times of revolution of the planetary bodies are as the cubes of their respective distances from the sun.

These laws were first discovered by Kepler, the celebrated astronomer, whose name they bear—a name which will be perpetuated as long as the science of astronomy itself is known, and the sublimity of its laws have charms to captivate the minds of philosophers. The discovery of these analogies forms a most important epoch in the history of astronomy, as they may be considered as having paved the way to that sublime and universal system of attraction, the discovery of which has immortalized the name of Newton: for Kepler having deduced them from the comparison of actual observations, and therefore independent of any theory, they formed a very useful criterion for the correction of any particular hypothesis, as well as an important datum in the investigation of new theories.

In order to form a proper estimate of the value of these improvements, and the difficulty their author had to encounter in establishing them, we must look to the state of astronomy at that period. Copernicus had just revived the Pythagorean system, and Kepler was one of its ablest advocates: but still it was held as a sacred principle, that the motions of all the planetary bodies were performed in uniform circular orbits; to reconcile which to actual appearances, many ingenious contrivances were made use of, and which, it must be allowed, represented the planetary motion with considerable exactness.

The angular motion of each of the planets consists of two parts: one part increasing uniformly with the time; and another which is periodical, and acquires all degrees of magnitude within a certain limit, in the several parts of the orbit. Now every such motion was accounted for with a tolerable degree of accuracy, by the ancient contrivances of epicycles and deferents. Accordingly the ancient sytems represented, with considerable exactness, those observed places of the planets that depended only on the real angular motions; as at the oppositions. But they failed when applied to the other positions of the planets, and to the latitudes, where the apparent places depend not only on the angular motions, but likewise on the relative distances. It was here that all the ancient sytems were alike defective; and it was by a strict comparison of observation with theory, that Kepler at last found himself obliged to depart from that principle of uniform circular motion, which had been so scrupulously adhered to by all his predecessors.

The situation of the heavenly bodies, in respect to one another, depends upon their real angular motions, and their relative distances. But when a planet is in opposition, the apparent places, as seen from the earth and sun, are coincident, and it is position is effected only by the angular motions; and, therefore, observations in opposition, being the simplest and the least liable to inaccuracy, are of great use
KEPLER'S LAWS.

In astronomy. But in observing oppositions, a practice had been introduced, that in part defeated the purpose for which such observations had been preferred to all others. A planet was reckoned to be in opposition, when its place in the heavens was removed 180° in longitude, not from the real place of the sun, but from its mean place. It is evident, therefore, that by this practice the observer of the planet was situated in the same line with the sun and the planet, at the computed time of opposition; and, therefore, the apparent place of the planet was not entirely divested of the second inequality, excepting in the rare case when the true place of the sun coincided with his mean place. To this practice Kepler objected, and conceived the design of determining the orbit of Mars from real, instead of apparent oppositions; and he entertained the most fuzzy expectations of completely reforming the theory of the planets, by his projected innovation. Kepler's intended substitution of real for mean oppositions led him to examine the practice of astronomers in another important point. It very seldom happens that a planet is found in the plane of the ecliptic, in which the motion of the sun is performed; and in order to ascertain the place of the planet in its orbit at the time of observation, a reduction from the ecliptic to the plane of the orbit becomes necessary; and in examining the ancient methods of reduction, Kepler found them to be erroneous and inconscient; and his investigation ultimately established this important conclusion, that "the orbits of the planets are invariable plane, intersecting each other in lines pausing through the sun's centre." This was a most important improvement, and of greater consequence in simplifying the science of astronomy than any that had been introduced in all the preceding ages; and his successful and decisive establishment of its truth may be justly ranked among his greatest discoveries.

Kepler having overcome all the difficulties that opposed his projected innovation, at length completed a theory of Mars, derived solely from apparent oppositions; and its accuracy was unquestionable in representing the oppositions; but it totally failed when applied to the latitudes, and to the longitudes out of opposition. Disappointed in the high expectation he had formed of his new theory, he yet drew from its failure an important inference, the first step to emancipation from the ancient prejudice of uniform circular motion. For as the theory involved only two suppositions, viz. that the orbit of Mars was a circle, and that the motion of the planet was uniform about a fixed point in the line of apsides, he justly concluded that one at least of these two suppositions was false. He now prepared for further researches; but, still of all, judged it necessary to examine the circumstance that affected the theory of the earth's annual motion; for as the latitudes of the planets, and the longitudes out of opposition, (the phenomena which had hitherto rendered him attempts abortive), depended on the distances of the earth from the sun, it was requisite to be assured that no errors crept in from this quarter.

Nor was Kepler without suspicions of inaccuracy in the terrestrial orbit. He had early remarked it as an anomaly, that an equant was alligned to all the planets, the Earth or Sun excepted; and although the authority of all astronomers was against him, he even then prepared to doubt of the justness of the exception. Refusing the examination of this point on the present occasion, he established, by multiplied and undeniable proof, that the eccentricity was bisected in the orbit of the Earth or Sun, as well as in the orbits of the other planets. Kepler, in turning his attention to the solar theory, had also a farther improvement in view, viz. a method for deriving the equations of the planetary orbits from a less arbitrary and precarious principle than that of the equant, or a centre of uniform angular motion. He had remarked, that it is a general fact in the solar system, that the velocity of a planet diminishes as it recedes from the Sun, and increases as it approaches that luminar; and he concluded, that these two motions, as well as the planet, and its distance from the Sun, must be related according to some law, which, if discovered, would enable astronomers to calculate the rate of a planet's motion for all points of its orbit, and, of course, to determine the equation, or correction due to the mean motion in every such point. This was undoubtedly the conclusion of a man of genius and originality; for though we are now familiar with the motion, that whenever the variations of one quantity depend on the of another, the one of the quantities may be expressed by some functions of the other; yet, in the days of Kepler, it must have required no small effort of generalization to perceive this truth, and the important consequences which result from it. Great difficulties, however, flood in the way of the investigation; and Kepler had to struggle, not only with his own preconceptions, which frequently led him into error, but with the imperfections of the geometry of that age, which were great in all matters connected with the quadrature of curves.

His ingenuity and perseverance, however, at last prevailed. He found that the times of describing small arcs of the Earth's orbit, are as the distances from the Sun; that therefore the times of describing any arc whatever, must be as the sines of those distances; and having satisfied himself, from geometrical considerations, that the sum of the distances may be expanded (at least nearly) by the area contained between the arc and the radius drawn from its extremity to the centre, he inferred that the times of describing any arc whatever, are proportional to these areas, or which is the same, THAT equal areas are described in equal times. In consequence of this improvement, Kepler began to speculate on the nature of the force which produced such an adjustment; but the honour of this discovery was reserved for the genius of the immortal Newton. When he again reviewed the consideration of the orbit of Mars, he found a reason to conclude that this body described its orbit under the guidance of the same law that he had just found to hold on the Earth; viz. that the areas described by a line drawn from the planet to the Sun, are everywhere proportional to the time of description.

The attempt, however, of computing the equation of Mars's motion on this principle, was attended with much difficulty, on account of the great eccentricity of the orbit, but still more from that prejudice in favour of the old doctrine of circular orbits, which has been already mentioned. In his new method of computing the equations, Kepler supposed the orbit to be accurate; but the results, from the combination of the two principles, were such as could not be reconciled with the places of Mars, observed by Tycho Brahe. In this dilemma, finding that he must give up one of the principles which he had adopted in his calculation, he first proposed to sacrifice his own theory to the authority of the old syllem; thus giving one of the most memorable examples which has ever occurred, of the influence of candour and prejudice at the same moment. He soon found, however, that this sacrifice would not answer his purpose, and that, in order to make the calculus agree with observations, it was the old hypothesis, and not the new one, that must be abandoned.

Thus the idol was overthrown by which Kepler had been so long deceived, and the emancipation of astronomy was
achieved: but many difficulties were yet to be overcome, before the empire of truth could be firmly established.

It was proved, that the orbit of Mars was not circular, but its real form was yet undiscovered. The hypothesis which first presented itself was, that this orbit is an oval or ellipse, coinciding with the supposed circular orbit at the two apices, but falling very much within it in the middle between them; and Kepler having assigned the proportions of the longer and shorter axes of the curve, according to views that he thought found, but which proved to be extremely fallacious, proceeded to describe the ellipse, to obtain its quadratures, to cut its area in any given proportion, and to derive from thence the equations of the mean motion; all which was accompanied with such labour as nothing but his fortitude and perseverance would have been able to overcome. He compared the distances of Mars, thus computed for no less than forty different sets of anomaly, with the same as deduced from observation, and had the mortification to find, that they did by no means agree, but that the real places of the planet fell far short of the new orbit, as within the old circular orbit. After trying many different means of correcting these errors with incredible labour, and always falsifying each hypothesis to the severest test, he found, at length, that an ellipse, with the fun in one of its foet, and its greater axis equal to the mean distance of Mars, represented the whole motion of the planet with wonderful exactness. The planets, therefore, describe ellipses, having the sun in their common focus; and this is the second great discovery which delighted the mind, and has immortalized the name of Kepler.

His third discovery was that of a law of no less importance than either, the determination of equal areas, or the elliptic orbits of the planets; but it was made more easily than them, and without the fame elaborate deductions. His strong propensity to trace out laws and discover analogies in nature, set him eagerly at work to find out what relation subsists between the distances of the planets from the sun, and the times of their revolutions round him. The data here lay in a much smaller compass, and were much less various than in the two former researches; and Kepler, after making some fanciful comparisons between the distances of the planets, and the regular solids in geometry, and also between the name and the divisions of the monochord, thought at first of comparing the different powers of these quantities with one another, from which comparison, though not without some abortive attempts, this truth at last emerged, that the squares of the periodic times of the planets, are as the cubes of their mean distances from the sun. He expounded, in strong terms, the delight and astonishment he felt on the discovery of this simple and beautiful analogy. He has carefully marked the day on which the discovery was made, (24th May, 1618,) "and few," says a writer on this subject, "are the days in the history of the world that deserve fo well to be remembered."

After the happy idea of comparing the powers of the distances and times, the leap to the final result was extremely simple and easy; though it does not appear that Kepler employed any particular method for this purpose, but had recourse to various trials before the real law was discovered.

Suppose, for instance, \( D, d, \) and \( \bar{d} \), to represent the distances of any three planets, and \( T, t, \bar{t} \), the corresponding times of revolution; then, in order to ascertain whether any law subsists between these two series of quantities, let us assume the following proportions: viz.

\[
D^n : d^n : T^m : t^m
\]

\[
D^n : \bar{d}^n : \bar{T}^m : \bar{t}^m
\]

where \( m \) and \( n \) may represent any numbers whatever, either integral or fractional. Then

\[
m \log D + n \log d = m \log \bar{d} + n \log \bar{t}
\]

\[
m \log D + n \log d = m \log T + n \log t
\]

\[
m \log (D - d) = n (\log T - \log t)
\]

\[
m \log (D - \bar{d}) = n (\log \bar{T} - \log \bar{t})
\]

Whence again,

\[
\frac{m \log D}{d} = n \log T
\]

which equality must necessarily obtain if any law subsists, and it is remarkable that it should be totally independent of the law itself. Therefore, it was only necessary to submit the above equality to examination, in order to be assured of the existence or non-existence of any analogy; and having thus ascertained that some law must have place, the law itself is readily discovered from any of the above equations. Thus the equation \( m \log D = n \log T \) gives immediately

\[
\frac{\log D}{\log T} = \frac{n}{m}
\]

which fraction being reduced to the lowest terms will furnish the particular values of \( m \) and \( n \). At these formule are applicable to any two series of quantities, between which any law of this kind is suspected to obtain, they are not altogether unworthy of attention. We have thus given a slight sketch of the discoveries of this celebrated astronomer, which, had the limits of our article admitted of it, might have been extended to a much greater length; in the present instance, however, we can only refer the reader who wishes for more complete information on this interesting subject, to Dr. Small’s "Account of the Astronomical Discoveries of Kepler."

**Kepler’s Problem.** See Problem.

**Keppel, Augustus.** In Biography, a celebrated English admiral, the second son of William, earl of Albemarle, was born April 2d, 1725. He entered the sea-service while he was young, accompanied commodore Anson round the world, and by the zeal which he manifested in his profession, was raised to the first honours which it had to bestow. The most important occurrence in his life took place in 1776, when he had the command of the Channel fleet, to which he had been appointed at the personal and urgent solicitation of the king, and which he readily accepted, though he could not help observing, that "his forty years services were not marked by any favour from the crown, except that of its confidence in the time of danger." On the 12th of July he fell in with the French fleet, under d’Orvilliers, off Ushant: an engagement ensued, which, though partial, was very warm while it lasted. It was necessary to take a short time to repair the damages: which being done, the admiral made proper signals for the van and rear division to take their respective stations. This order was obeyed with great alacrity by sir Robert Harland of the van, but admiral sir Hugh Palliser of the rear took no notice of the signal, and refused to join his commander, till night prevented a renewal of the battle. The French, taking advantage of the darkness, escaped to their own coast. Admiral Keppel, willing to excuse
case Sir Hugh Palliser, at least to screen him from public re-ent-ment, wrote home such a letter as seemed even to imply great impropiety of behaviour in the commander himself. The con-duct, however, of the rear-admiral was attacked in the public papers; he demanded of his commander a formal disavowal of the charges brought against him, which Keppel indignantly refuted. He immediately exhibited articles of accusation against the commander-in-chief, for misconduct and neglect of duty, although he had a second time failed with him, and had never uttered a syllable to his prejudice. The lords of the admiralty, to the astonishment of the nation, instantly fixed a day for the trial of admiral Keppel; he was most honourably acquitted, and received the thanks of both houses of parliament for his services. Palliser was next tried, and escaped with a confinement only, but the refutation of the public was so great, that he was obliged to resign several offices which he held under government, and to vacate his seat in parliament. The acqutal of Keppel was celebrated with the most magnificent illuminations, and other marks of rejoicing which had never been known at that time in this country, and the houses of lord Sandwich, first lord of the admiralty, and sir Hugh Palliser, were with difficulty saved from destruction; the windows and much of the furniture being demolished by the fury of the populace. In 1782, admiral Keppel was raised to a peerage, with the titles of viscount Keppel, baron Elden: he was afterwards, at two different periods, appointed first lord of the admiralty. He died Oct. 3d, 1786, unmarried, and of course his titles became extinct. He was a thorough feaman, and a man of great integrity and humanity. Gent. Mag.

Keppel's Bay, in Geography, a bay of the South Pacific ocean, on the N.E. coast of New Holland. S. lat. 25° 28'. W. long. 150° 33'.

Keppel's Island, or Tryon's Island, an island in the South Pacific ocean. S. lat. 15° 55'. W. long. 172° 33' to 175° 13'.—Also, a small island on the N. side of the most westerly of the Falkland islands, in the S. Atlantic ocean. S. lat. 51° 24'. W. long. 60° 15'.—Also, one of those called queen Charlotte's islands, in the S. Pacific ocean. S. lat. 10° 15'. W. long. 134° 56'.

Keppel's Islands, a group of islands near Keppel's bay, on the N.E. coast of New Holland, discovered by Cook in the year 1770. N. near these islands the water, which was too shallow for fish, abounded with crabs, which were of two sorts, and both such as had not been seen before: one of them was adorned with the sibyl blue that can be imagined, in every respect equal to the ultramarine, with which all his claws and every joint were deeply tinged; the under part of it was white, and so exquisitely polished, that in colour and brightness it resembles the white of old China; the other was also marked with the ultramarine upon his joints and toes, but somewhat more sparingly, and his back was marked with three brown spots, which had a singular appearance. S. lat. 27° 8'. W. long. 209° 1'. Hawkeworth's Voyages of Cook, &c. vol. iii.

Kepea, a town of Soria, on the coast of the Mediterranean, and on the N. side of the mouth of the Oceites, about a mile from the sea: it brought, as it is supposed, on the site of the ancient Scandia, which fea.

Kepta, a town of Bucan; 24 miles S. of Tafila-fudon.

Keramiens, a heretical sect of Mahometans, the follow-ers of Mohammed Ebn Keram, called also Moijisemians, or Corporealists, who not only admitted a resemblance between God and created beings, but declared God to be corporeal. They were led to this notion by the literal acceptation of those passages in the Koran, which figuratively attribute

corporal actions to God, and of the word of Mahomet, when he said, that God created man in his own image, and that himself had felt the fingers of God, which he had on his back, to be cold.

Keram, in Geography, a town of Asiatic Turkey, in Natalia; 24 miles S.S.E. of Milas.

Kerana, a long sort of trumpet: somewhat in form of the speaking-trumpet used by the Perilans.

To the bound of this, they add a confused noise of hautboys, timbrels, drums, and other instruments, every evening at five o'clock, and two hours after midnight.

Kerati, in Geography, a town of Asiatic Turkey, in Caramania; 26 miles N.W. of Dethsbran.

Keratophytum, in Natural History, a species of Gorgonia; which see.

Keraun, in Geography, a town of Hindoostan, in Lahore; 15 miles W.N.W. of Gujurat.

Kerdah, a town of Natalia; 44 miles N.E. of Imid.

Kerroozia, a town of Hindoostan, in Lahore; 32 miles S.E. of Ateok.

Kerasea, a town of Africa, in Foz, on the coast of the Mediterranean; 45 miles E.S.E. of Tetuan.

Kercal, or Kercel, a fortified town of Rufflea, in the province of Tauris, on the channel between the Black sea and the sea of Azof. It was founded by a colony of Greeks from Miletus, and afterwards subdued by the kings of Bosphorus. In the year of Rome 869, it was taken by Mithridates, king of Pontus, who, in consequence of the rebellion of his son Pharamas, was besieged in the castle, and at his own request put to death by an officer of the Guards, who had forced the walls; 160 miles E.S.E. of Perekop. N. lat. 47° 16'. E. long. 36° 14'.

Kercha, a town of Peria, in Chufidan; 30 miles N.W. of Suiter.

Kerckring, Theodor, in Biography, a celebrated physician, was a native of Amsterdam. He had attained the age of eighteen, when he began the study of the Latin language under the tuition of Francis Van Ende, and soon afterwards applied himself to medicine with so much zeal and success, that he obtained a high reputation, both in the practice of the profession, and by his anatomical and chemical discoveries. He continued the exercise of his art at Amsterdam several years, and married the daughter of his preceptor, before mentioned; after which he settled at Hamburg in the year 1678, where, after having for a long time held the appointment of resident from the grand duke of Tuscany, he died in November, 1693. Anatomy was the favourite subject of his researches, and he formed an anatomical museum, which was long an object of admiration, and the resort of the curious, who visited that city. His principal writings were likewise upon anatomical subjects: they are as follows: 1. "Spielieum Amphitomeum," contains Observationem Anatomicae uranturae Cæteris unam, necnon Olfagenum Textum, in quo quidque officio sudd, accedit membrum, quidque decedat, & in eo quarto inventum tempore, accuratissime ossis subjicitur. Amst. 1672, 1673. 2. "Antrhopogenie ichoigra, seu, conformatorium Textus ab ovo ulitae ad efficacitatem principio, in Supplementum Olfagenum Textum." (ibid. 1671.) In this work the development of the fetus, at different periods of its age, is traced with great attention and accuracy. 3. "Commentarium in Currum Triumphalem Antinomiat Bat. Velatini." (ibid. 1671.) This is closely a translation of Barf Velatini's work, from the German.
German to the Latin. A prodigious collection of his anatomical writings was published at Leyden in 1717, with the title of "Opera omnia Anatomica." Eloy, Diet.

Kerr, in Geography, an island in the East Indian seas, about 80 miles in circumference, inhabited by the Malay. N. lat. of the north extremity 4° 28'. E. long. 126° 30'.

Kerda, a town of Sweden, in the province of Smaland; 33 miles W.N.W. of Wexio.

Keredcan, a town of Persea, in the province of Kerman; 25 miles N.W. of Sirjan.

Kerdistan, a town of Persia, in Chufistan; 50 miles E.S.E. of Suter.

Kerdiz, a town of Candahar, in Cabuflitan; 70 miles E. of Ghuzni.

Keredge, a town of Persia, in Irak; 75 miles S.W. of Sava.

Kerelo, a town of Transylvania, on the Mares; 20 miles W.N.W. of Scheburg.

Kerepbirun, called Cape Cranes, a cape on the N. coast of Natala, on a neck of land which projects into the Black sea. N. lat. 45° 45'. E. long. 23° 10'.

Keren, a town of Persia, in Irak; 55 miles W. of Kermantha.

Keresbania, a town of Transylvania; 14 miles S.S.W. of Colofvar. N. lat. 46° 16'. E. long. 22° 25'.

Keresoun, a town of Turkefl Armenia, at the mouth of a river of the same name, which runs into the Black sea, anciently a city of Pontus, called Cerasias; which see.

Kersen, a town of Transylvania; 36 miles N. of Scheburg.

Kerf, a town of Russia, in the government of Archangel, on the White sea; 145 miles S. of Kola.

Keretskoi, a town of Russia, in the government of Archangel, on the White sea; 32 miles N. of Archangel.

Kerf is the notch or slit that is made by the fowls between two pieces of wood, when they are sawing. Ander.

Kerfelen, in the Historia Medica, a name given by Avicenna, and others, to the wood of the clove-tree, as the wood of the cinnamon-tree was called kerfil durpin; and many others in the same manner.

Kergong, in Geography, a town of Hindoostan, in Canindeh; 45 miles S. of Indore.

Kerguelen's Land, otherwise called the Island of Deflation, an island in the Southern Indian ocean, first discovered in 1772, and afterwards visited, in 1773, by M. de Kerguelen, who, in his second voyage, discovered some other small islands in its vicinity. Kerguelen has, since the death of captain Cook, published the journal of his proceedings in these two successive voyages, and has annexed to his narrative a chart of the coasts of this land, as far as he had explored them in both voyages. M. de Pagès, much about the same time, favoured the public with another account of the second voyage, in more respects fuller than Kerguelen's own, on board of which ship he was then an officer. Captain Cook fell in with these islands in December 1776; and of the first he says, that it is an island of considerable height, and about three leagues in circuit. To this island Kerguelen had given the name of "Croy," or "Crouy;" and the view of it in his chart exactly corresponds with Cook's account of its being of considerable height. Cook observed another island of the same magnitude, one league to the eastward, which Kerguelen had call'd "Ille Rolando," after the name of his own ship, and of which he has given a view in his chart. Between these two islands Cook observed some smaller ones in the direction of S.E. In the direction S. by E. 1° E. from the E. end of the first island, a third high island was seen. This appears to have been Kerguelen's "Isle de Clugny," as marked on his chart. Another island in the N.E. direction was a high round rock, named by captain Cook "Bligh's Cap," which he justly concluded to be the same which M. de Kerguelen called the "Isle of Rendezvous," though Cook says "I know nothing that can rendezvous at it but fowls of the air; for it is certainly inacessible to every other animal." Bligh's Cap was ascertained to be in S. lat. 48° 29'. E. long. 68° 48'. The French and English navigators agree very nearly with respect to the latitude of this island; but they differ as to its longitude. The pilot at Teneriffe it was made only 65° 57'. E. from Paris, which is about 67° 16'. E. of London; or 1° 24'. more westerly than captain Cook's observations fix it. M. de Pagès says it is 66° 47'. E. from Paris, that is, 66° 6'. E. of London, or 26 miles more easterly than it is placed by captain Cook. Kerguelen himself only says, that it is about 68° E. long. The northern point of this land captain Cook erroneously concluded to be the "Cape Louis" of the first discoverers; whereas, by an inspection of Kerguelen's chart, this northern point described by Cook, is the same with that to which the French have given the name of "Cape Francois." The whole extent of coast lying between Cape Louis and Cape François, of which the French saw very little during their first visit in 1772, and which may be called the N.W. side of this land, they had it in their power to trace the position of in 1773; and they have assigned names to some of its bays, rivers, and promontories upon their chart. On the 25th of December (Christmas day), captain Cook anchored in the harbour from this circumstance denominated "Christmas Harbour," which see. On the 27th many of the ship's crew went on shore, and made excursions, in different directions, into the country, which they found barren and defolate in the highest degree. They brought with them a quart bottle, which was found fastened with wire to a projecting rock on the N. side of the harbour. This bottle contained a piece of parchment, with the following inscription: "Ludovico XV. Gallarum regis, et D. de Boynes regis secretis ad res maritimaeannis 1771 et 1773." Captain Cook, as a memorial of having been in this harbour, caused to be written on the other side of the parchment this inscription: "Naves Resolutio et Discovery de Regis Magnae Britanniae, Decembris 1771." This parchment was put again into a bottle with a silver two-penny piece of 1772; and the bottle, having been covered with a leaden cap, was placed on a pile of stones erected for the purpose, upon a little eminence on the N. shore of the harbour, near the place where it was first found. The Christmas harbour of captain Cook is the same with the "Baie de l'Oiseau" of the French, and Cape François, and not Cape St. Louis, is the northern point of this land; and the account of the S. point of the harbour given by M. de Pagès and captain Cook remarkably agree. The land on both sides of the inlet is high, and it runs in W., and W.N.W. about two miles. Its breadth is 1 mile, for more than half its length; above which it is only half a mile. The depth of water is 45 fathoms at the entrance, and varies, in proceeding farther inward, from thirty to five and four fathoms. The shores are steep, and the bottom is everywhere a fine dark sand, except near the shore, where are beds of sea-weed. The head of the harbour lies open only to two points of the compass; and even these are covered by islands in the offing, so that no sea can fall in to hurt a ship. It is high water here at the full and change days, about 10 o'clock; and the tide rises and falls about four feet. Captain Cook explored this island, and other islands adjacent.
to it, with a view of extending Kerguelen's discovery. After having anchored in another harbour, called " Port Pallier," and situated in S. lat. 49° 34'; E. long. 69° 37', and finding no encouragement to continue his researches, Captain Cook put to sea. The French discoverers, with some reason, imagined Cape François to be the projecting point of a southern continent. "The English have since proved that no such continent exists; and that the land in question is an island of no great extent, which, from its sterility," says Captain Cook, "I should, with great propriety, call the "Island of Desolation," but that I would not rob M. de Kerguelen of the honour of bearing his name." Kerguelen now pursues with Captain Cook as to its being an island: but he apprehends, that it is about 200 leagues in circuit; and he says, that he was acquainted with about 80 leagues of its coast. After all, it cannot but be remarked, that Kerguelen was peculiarly unfortunate in having done so little to complete what he had begun. He discovered, indeed, a new land, but, in two expeditions to it, he could not once bring his ships to an anchor upon any part of its coasts. Captain Cook had either fewer difficulties with which to struggle, or was more successful in furnishing them. From the account of Mr. Anderson, Surgeon to Captain Cook, who had no opportunity of searching the country in every direction, we make the following extract.

"Perhaps no place, hitherto discovered in either hemisphere, under the same parallel of latitude, affords so feanty a field for the naturalist as this barren spot. The verdure, which appears when at a little distance from the shore, would flatter one with the expectation of meeting with some herbaceous plant. But if this were so, we were much deceived. For on landing, we saw that this lively colour was occasioned only by a small plant, not much unlike some fome forts of faxifrage, which grows in large spreading tufts to a considerable way up the hills. It forms a surface of a pretty large extent, and grows on a kind of rotten turf, into which one sinks a foot or two at every step. This turf, dried, might, in cafes of necessity, serve for fuel; and it is the only thing we met with here that could possibly be applied to this use. There is another plant, plentifully enough scattered about the boggy declivities, which grows to the height of two feet, and not much unlike a small cabbage, when it has shot into heads. The leaves about the root are numerous, large, and rounded: narrower at the base, and ending in a small point. Thafe on the stalks are much smaller, oblong, and pointed. The stalks, which are often three or four, are all rife separately from the root, and run into long cylindrical heads, composed of small flowers. It has not only the appearance, but the watery acrid taste of the antiscorbutic plants, and yet differs materially from the whole tribe; so that we looked upon it as a production entirely peculiar to the place. We ate it frequently raw, and found it almost like the New Zealand seaweed, saxifrage. But it seemed to acquire a rank flavour by being boiled." In our gardens it might, by cultivation, so far improve as to be an excellent pot-herb. Two other small plants were found near the brooks and boggy places, which were eaten as salal; the one almost like garden cress, and very fiery; and the other very mild. This last, though but small, is in itself a curiosity; having not only male, but female, what the botanists call androgynous plants. A coarse fraft, which we cut down for the cattle, grows pretty plentifully in a few small spots about the sides of the harbour, with a smaller fort, which is rarer: and upon the flat ground, a fort of goose-grass, and another small plant much like it. In short, the whole catalogue of plants does not exceed sixteen or eighteen, including some sorts of moss, and a beautiful species of lichen, which grows upon the rocks higher up than the rest of the vegetable production.

Nor is there even the least appearance of a herb in the whole country. "Nature has been rather more bosomful in furnishing it with animals; though, strictly speaking, they are not inhabitants of the place, being all of the marine kind; and, in general, only using the land for breeding, and for a retreating-place. The most considerable are seals, or (as we used to call them) sea-bears; being that fort called the uriree seal. These come ashore to rest or breed; but they were not very numerous; which is not to be wondered at, as it is known, that these animals rather frequent rocky coasts, and little islands lying off coasts, than bays or inlets. They were, at this time, shedding their hair, and so tame, that we killed what number we chose. No other quadruped, either of the sea or the land kind, was seen; but a great number of birds, viz. ducks, petrels, albatrosses, flags, gulls, and sea-swallows." Penguins form by far the greatest number of birds here, and are of three sorts. The flags of this place are of two sorts: the lesser cormorant or water-crow, and another which is black above with a white belly; the same that is found in New Zealand, Terra del Fuego, and the island of Georgia. Another sort of white bird, flocks of which flew about the bay, is very singular: having the base of the bill covered with horny crust. It is larger than a pigeon, with the bill black and the feet white, made like those of a curlew. Some of the people put it in competition with the duck, as food. The leine was hauled once, but we found only a few fish about the size of a small haddock." "The only shell-fish are a few limpets and mussels, and, among the stones, a few small star-fish and sea-anemones were found.

"The hills are of a moderate height; yet many of their tops were covered with snow at this time, though answering to our June. Some of them have large quantities of stone irregularly heaped together at their foot, or on their sides. The lide of others, which form steep cliffs towards the sea, are rent from the top downward, and seem ready to fall off, having stones of a considerable size lying in the furrows. Some were of opinion, that frost might be the cause of these furrows, which I shall not dispute; but bow others of the appearances could be effected, but by earthquakes, or some other agents, I cannot say." — "It appears that rain must be almost constant here, not only from the marks of large torrents having rushed down, but from the disposition of the country, which, even on the hills, is almost an entire bog or swamp, the ground linking at every step. The rocks, or foundations of the hills, are composed chiefly of a dark blue, and very hard stone, intermixed with small particles of glimmer or quartz." "Another brownish brittle stone forms here some considerable rocks; and one which is blacker, and found in detached pieces, inflects bits of coarse quartz. A red, a dull yellow, and a purplish sandstone are also found in small pieces; and pretty large lumps of semi-transparent quartz, disposed irregularly in polyedral pyramidal crystals of long shining fibres. Some small pieces of the common fort are met with in the brooks, made round by attrition; but none hard enough to riff a file. Nor were any of the other stones acted on by aquafortis, or attracted by the magnet. Nothing, that had the least appearance of an ore or metal, was seen." S. lat. 49° 20'; E. long. 69° 30'. Cook's Third Voyage, vol. i.

**KER-Chetib.** are various readings in the Hebrew bible: keri signifies that which is read; and chetib that which is written. (See Chetib and Keri.) It is generally said by the Jewish writers, that these corruptions were introduced by Ezra; but it is most probable that they had their original
original from the mistakes of the transcribers after the time of Ezra, and the observations and corrections of the Maforsics. Those keri-chetits, which are in the sacred books written by Ezra himself, or which were taken into the canon after his time, could not have been noticed by Ezra himself; and this affords a presumption, that the others are of late date. These words amount to about a thousand; and Dr. Kennicott, in his "Differtato Generalis," remarks, that all of them, excepting fourteen, have been found in the text of manuscripts.

KERJE, or El KERDSJE, in Geography, a district of the province of Noged, or Nedsjed, in Arabia, lying on the S.W. part of this province, and of course on the frontiers of Yemen, extending along the east of Hadsjaz, or Hejaz, a considerate way to the N. In this district is the city of Imam, famous even before the days of Mahomet, for being the native city of Mozejlama, who let himself up as a prophet. This province also comprises other towns, among which is Salmny, on the confines of Yemen.

KERIGAR, a town of Hindooftan, in the soubah of Oude; 80 miles N. of Lucknow. N. lat. 28° 12'. E. long. 81° 24'.

KERIKERD, a town of Peria, in Chufifan, taken by Timur Bec in 1393; 15 miles N. of Cuffer.

KERMINGUNE, a town of Hindooftan, in Bahar; 24 miles E.S.E. of Hajypour.

KERION, a town of Thibet, 24 miles N.W. of Serang-pour. N. lat. 32° 35'. E. long. 83'.

KERI SONGAR, a lake of America, in the district of Maine, which sends its waters to Penobscot river.

KERIST, a town of Peria, in Farifilian; 106 miles S. of Schiras.

KERKA, a town of Peria, in Chufifan; 45 miles W. of Toftar.

KЕR КЕL, a town of Aifatic Turkey, in the government of Sivas; 30 miles W.S.W. of Amifich.

KЕRЕN, a small island near the E. coast of Tunis. N. lat. 34° 50'. E. long. 11° 12'.

KЕRК, a town of Aifatic Turkey, in Aladulla, on the Euphrates; 30 miles S. of Malatia.

KЕRКA, a town of Peria, in Chufifan, on the Karait; 15 miles N. of Cuffer.

KЕR КЕRDERE, JOHN GERARD, in Biography, a learned professor of the university of Louvain, was born in the neighborhood of Maltrichot, about the year 1578. He pursued his academical studies at Louvain, and distinguished himself during several years for his accurate and comprehensive knowledge of history and the belles-lettres. In 1578, he was appointed historiographer to the emperor Joseph I., and died in the year 1588. He was author of many works in general history and theology, of which the principal are entitled "De Monarchia Rome Pagana secundum Concordiam inter S. S. Prophetas Danielem et Joannes, &c. et" and "Prodomus Danielicus fives novi Conatus historici, critici, in collaboribus difficilis Historie veteris Testamenti." These pieces are distinguished by profound erudition and great critical acumen, and are said to throw much light on many obscure passages in the scriptures relating to history, chronology, and geography. He published a Latin grammar, and a number of Latin poems.

KЕR KIL, or GERRILL, in Geography, a town of Curdifian; 35 miles S.S.E. of Amadieh.

KЕR КИSA, or KЕR КИSILL, a town of Aifatic Turkey, in the province of Diarbeir, now decayed; eight miles N. of Rabba. N. lat. 35° 18'. E. long. 40° 10'.

KЕRКON, a town of Georgia; 25 miles S.W. of Telifis.

KЕR КУК, a town of Curdifian, the capital of a government, and residence of a pacha; surrounded with walls and defended by a califk; 150 miles N. of Bagdad. N. lat. 35° 50'. E. long. 43° 42'.

KЕR K WYCK, a town of Holland, in the department of Guelderland; two miles S. of Bremer.

KЕR L, JOHN GASPARD, in Biography, a native of Saxony, but having acquired in early youth great reputation as an organ player, he was called to Vienna by the archdeacon Leopold, and appointed organist at his court; and manifesting signs of extraordinary genius for composition, he was placed under Giovanni Valentini, maestro di cappella at the Imperial court, and afterwards sent to Rome to study under Carifiani. Upon his return to Germany, great offers were made to him from the elector palatine, if he would enter into his service; but he declined them, and preferred settling at Munich, where he became maestro di cappella to the elector of Bavaria, Ferdinando Maria. His principal work as a composer was his "Modulatio organica super Magnificum Octo Toniis Ecclesiasticis Refpoudens," engraved and published at Munich, in 1686. Kerl was esteemed one of the most able and skilful organists of his time. In a competition with some Italian musicians at the court of the elector of Bavaria, he is said by Walther to have composed a piece for the organ of wonderful contrivance, which none but himself could execute.

KЕR L, JACOB ME, canon of the cathedral of Cambray, from Ypres, was a very voluminous coniposer, contemporary with Gafpar. He published "P cepts specialis fuciellis," in 1569; "Cabinet Italica musicis modulis ornatis," 1579; "Cantiones facres, 5 & 6 vocum," 1591; in 400 parts. Venice, 1573; two, four, and five-part motets, and four and five-part mass, and a Te Deum.

KЕR LEH, in Geography, a circular of Hindooftan, in Berar, N.W. of Goomdwdana, and S.E. of Hindia and Dopaltol.

KЕR MAN, anciently Carmanita, a province of Peria, bounded on the N. by Segellan, on the E. by Mekran, on the S. by the Perian gulf, and on the W. by Farifian and Lariitan. The northern part is barren and almost desert, without rivers or brooks, and the air unhealthy; towards the S. the air is more pure, and the land fertile. This province contains a city of the same name (see Siringa); but some authors represent Yezd as the capital. (See Yezd.) The Guercs in this province are numerous; and are chiefly employed in manufactures of silks and fusts. Here are some mines of copper, lead, and iron. The great desert of Kerman joins with the Great Salino desert, by the Nawben Dejam, and extends about 350 miles. The Salino desert extends from the vicinity of Kom to that of the sea of Zuren, in a line from E. to W. of about 400 British miles; the breadth from N. to S. being about 250. These two extensive deserts may be considered as stretching N.W. and S.E. for a space of about 750 miles, by a medial breadth of about 200 (without including in the length other 200 miles of the desert of Mekran), thus interlinking the wide empire of Peria into two nearly equal portions. This vast extent is impregnated with nitre and other salts, which taint the neighbouring lakes and rivers.

KЕR MAN, See Siringa.

KЕR MANA, a town of Hindooftan, in Oude; 40 miles E. of Bahraitch.

KЕR MAN SHER, a town of Peria, in the province of Kerman; 150 miles S.E. of Siringa. N. lat. 25° 50'. E. long. 58° 50'.

KЕR M ANTSCHUK, a town of Circassia, near which the
the Magul Tartars were surpris'd by the Russians in 1783, and defeated with great loss.

Kermes, a town of Persia, in the province of Kerman: 166 miles S.E. of Shiraz.

Kermes, a kind of little animal, found in great plenty in many parts of Asia and the S. of Europe, on an evergreen of the oak kind, and forming excrecences, or tubes, of considerable use, both in physic and dyeing; that which was brought from Galatia and Armenia was formerly preferred; but at present it is chiefly gathered in Languedoc, Spain, and Portugal.

The kermes, called also scarlet grain, and by the Greeks κερμαια, by the Latins vermiculæ, by the French sometimes vermin, or grain de gale, or vermeil, is about the size of a juniper-berry, round, smooth, and glossy; of a beautiful red colour, and full of a musclagonous juice, of the same dye; it is found adhering to the bark on the stem and branches of a peculiar sort of scarlet oak. See Coccus lycis.

Kermes has been supposed to derive its name from an Arabic word, signifying a little worm, vermiculæ, whence it has been called verminum. Allude deduces the name from two Celtic words, one of which signifies an oak, the other an acorn.

This insect hangs to the tree from which it is gathered by means of a cottony down, which, according to M. Chappal, has many characteristics of the caoutchouc, being inflammable in alcohol, melting at the heat of boiling water, and burning with a flame on the coals. In Languedoc, about the middle of May, when this insect has attained to its proper size, and when in colour and shape it resemles a small floe, the harvest commences, and the peasants begin to gather it. This harvest continues till about the middle of June, or later, if the heat be retarded, or no violent rains fall; for one heavy storm of rain puts an end to the gathering for that year. The persons employed in this business are women, who set out early in the morning, with a lantern and a glazed earthen pot, so as to pick off the kermes from the branches before day, which is the most favourable time for this business. A single person may gather from one to two pounds a day. At the commencement of the harvest, the kermes weighs more, but fetches a less price than at the end, when it is drier and lighter.

According as the winter has been more or less mild, the harvest of kermes is the more or less plentiful; and the people always pride themselves a fine season, when the spring has been free from frosts and fogs. It is observed, that the lowest and oldest shrubs are always the fullest of this insect; and the kermes produced on those trees, which are in the neighbourhood of the sea, is always larger and finer than from the inland places.

It is no uncommon thing to have two harvests of kermes in a year. Those of the latter season are smaller and less valuable than those of the first, and are found not on the branches, but on the leaves of the shrub; which is just analogous to the custom of the gall-infected of all other kinds; all which, about this age, leave the branches to feed on the leaves, where their yet tender trunks can find an easier entrance.

From this analogy between the kermes, and other insects of the same clafs, it should seem worth while to try, whether some of those may not possess the same virtues in medicine, at least, if not in the arts. It is certain that the common oak produces a red-gall insect of the very shape of the kermes, and of the colour of the pale orange. See Teucrium. See the article Coccus.

The kermes is of a vinous smell, a bitter, rough, and pungent taste; and its pulp, or juice, is pregnant with numerous minute ova.

The annual retains thefe ova under her belly, till they hatch into a very numerous offspring.

Hence, when the kermes is dried, there comes out of it an infinite number of little insects, and flies, so small, that they are scarcely visible; and, indeed, that the whole inward substance seems converted into them. This shell is nothing but the body of the mother, disturbed by the growth of the eggs. To prevent this inconvenience, they usually steep the kermes in vinegar before it be dry; and thus prevent the exclusion of the ova, and kill such animals as are already hatched. It is afterwards dried on linen cloths. This operation gives it a colour like that of red wine. They draw the juice, or pulp, from the kermes, by pounding it in a mortar, and then straining it through a sieve; of this they make a syrup, by adding a sufficient quantity of sugar. Sometimes they dry the pulp separate from the husk; which pulp, thus dried, they call pellæ of kermes. If the living insect be bruised, it gives out a red colour.

The kermes was formerly of great use in physic: esteemed to be cardiac, defocative, and astringent; to fortify the stomach, and prevent abortion. Of this was made that celebrated confection called alkermes.

The astringent and corroborative confection that was sold in the shops, was prepared by diffusing, in the heat of a water-bath, six ounces of fine sugar, in six ounces, by measure, of damasc rose-water; then adding three ounces of the juice of kermes, warmed and strained; and after the whole had grown cold, mixing half a scruple of oil of cinnamon. This confection was taken, from a ferule to a dram, or more, either by itself, or in juleps, with which it mingles uniformly, without injuring their transparency.

The dried grains of kermes, if they have not been too long kept, give out, both to water and to rectified spirit, the same deep red colour, and nearly the same kind of smell and taste with those of the expressed juice. The infusitated extracts are considerably bitter, astringent, and of a kind of mild balsamic pungency.

It is, however, of greater use in dyeing scarlet; for which use, the manner of preparing it is as follows: the kermes being taken when ripe, they spread it on linen; and at first, while it abounds most in moisture, turn it twice or thrice a day, to prevent its heating, till such time as there appears a red powder among it: this they separate, by passing it through a sieve, and then again spread abroad the grain on the linen, till they perceive the same redness of powder, when they repeat the lifting: thus they proceed, while they discover any red powder on the surface of the grain, which is still passing through the fince, till it yield no more.

In the beginning, when the small red grains are found to move, as they will always do, they are sprinkled over with strong vinegar, and rubbed between the hands. Were not this precaution taken, out of every grain would be formed little insects, which would be of no use in dyeing.

The grain being quite emptied of its pulp, or red powder, by the process above-mentioned, is washed in wine, and then exposed to the sun; after this, it is put up into the hulks, formed into balls, and along with it the proportion of red dill that it had afforded.

According to M. Mariigh's experiments, made at Montpellier, the kermes has the effect of galls, when mixed with vitriol; and makes a good ink: mixed with oil of tartar, or lime-water, its colour turns from a vermeil to a crimson colour. In a decoction of turbinel flowers, it retains its proper colour. They have not been able to get any fixed essence from it; but a volatile oil it yields in abundance;
KERMES.

abundance; which, in M. Marigili's opinion, would have a better effect in medicine, if taken in a liquid, than when enclosed in conerves and confections, which hinder its action.

Wooden cloth, prepared with alum and tartar, acquires, on being boiled with dry kermes berries, a stable deep red colour, called scarlet in grain, from the kermes having been formerly supposed to be the grain or seed of the tree; and Venice scarlet, from the greatest quantities having been dyed there. This colour wants the lustre and fire of the cochineal scarlet now in vogue, but in return is far more permanent, nor subject to be drained by heat, or acrid liquors; and when spotted with water may be cleaned again without injury to the colour.

Mr. Hellot observes, that the figured cloths to be seen in the old tapestries of Brueghel, and the other manufacturers of Flanders, which have scarcely lost any thing of their liveliness in flandering for two hundred years, were all dyed with this ingredient; that, nevertheless, kermes is at present entirely in disuse among the European dyers, though said to be commonly employed in the Levant, and exported thither from Marouilles in considerable quantities: that when the kermes scarlet (now called an ox-blood colour) is wanted for tapestries, &c. our dyers endeavour to imitate it with cochineal; that as the colour is difficultly hit with cochineal alone, they generally add a portion of Brazil wood; and that the dyes thus produced, though at first more vivid than they ought to be, often lose their luster before a year is out, and turn white and grey in an extraordinary manner: that kermes might again be introduced to very good advantage, as its colour is of the most durable kind, and as fundry shades are obtainable from it with less trouble and expense than from other drugs.

The same author has given a great number of experiments upon kermes, with different salts and metallic solutions. The principal of these are as follow:

On adding to the decoction of kermes a small quantity of solution of tin, the dark colour of the liquor is immediately brightened, and prepared woollen dyed therein, inclines more to the orange than with the kermes alone. With this improvement of the colour, it receives the imperfections, though not all the beauty of the cochineal scarlet; all acalefcent substances staining the cloth, that is, destroying the effect of the acid solution.

Kermes, with cream of tartar, and as much of the solution of tin as is employed for the cochineal scarlet (without any alum) dyed unprepared cloth of an extremely vivid cinnamon colour. On dipping the cloth in a solution of alum, a part of the red re-appeared, but was not beautiful.

With cream of tartar, solution of tin, and alum in larger quantity than the tartar, this drug gives purplish colours, which vary according to the proportions of the ingredients.

If vitriolated tartar be substituted to the alum and tartar; and if after the kermes has been boiled in a solution of a small quantity of this salt, the stuff be boiled in this mixture for about an hour, the dye proves a beautiful kind of grey, in which the red is little perceived.

Glauber's salt, employed along with kermes, entirely destroys its redness, and gives an earthy grey colour. This dye is very perishable, on account of the particular nature of the fallacious substance, by means of which the tinging particles are applied; for Glauber's salt dissolves easily in cold water, and falls into a powder in the sun's heat. This obtains equally in all dyes; those drugs which afford most durable colours with tartar and vitriolated tartar, give very perishable ones with the more dissoluble and calcinable salts.

Green and blue vitriol, substituted separately to alum, but taken in conjunction with cream of tartar, destroy like- wise, or conceal the red colour of kermes, which in these two experiments has the same effect with galls, for it precipitates the iron of the green vitriol which tinges the cloth of a bright grey, and the copper of the blue, which gives a kind of olive dye. It likewise gave an olive dye with solution of copper made in aquafortis; a certain mark, that it poiffeys, like galls, an astringent precipitating quality. It is probably the astringency of kermes that renders its dye so durable; for all the barks, woods, roots, and other substances that are astringent, yield permanent colours.

White vitriol, employed with crystals of tartar, changes the red colour of kermes into a violet. A tincture of bit- muth ore, in spirit of nitre, and a solution of bismuth itself made leislyure in four times its weight of spirit of nitre, diluted with an equal quantity of water, gave also a violet dye upon white cloth. All acids convert it to a cinnamon colour, which inclines more or less to red, according as the acids are weak, and their quantity small. Alkalies render its colour dull and dry. See Neumann's Chemistry, by Lewis, p. 558, &c.

To dye spun worsted with kermes, it is first boiled half an hour in water with bran; then two hours, in a fresh bath, with one-fifth of Roman alum, and one-tenth of tartar, to which four water is commonly added; after which it is taken out, tied up in a linen bag, and carried to a cool place, where it is left some days to obtain a full colour. As much kermes as equals three-fourths, or even the whole of the weight of the wool, is put into a warm bath, and the wool is put in at the first boiling. As cloth is more dense than wool, either spun or in the fleece, it requires one-fourth less of the solids in the boiling, and of kermes in the bath. Less proportions of kermes will produce lighter and paler colours. If a succession of shades be wanted, we must, as usual, begin with the deepest. Hellot directs a small handful of cot or refuse wool to be thrown into the boiler in which the kermes is, and to let it boil a moment before the wool to be dyed is put in. This will absorb a kind of black dregs, and the wool afterwards dipped will take a better colour. Before the wool that is just dyed is taken to the river, it may be dipped in a bath of water a little warm, in which a small quantity of fat has been dissolved. In this way the colour will acquire more brightness, though it will be rendered a little roly, that is, will have a crimson cast. The colour imparted by kermes to wool, has much less bloom than the scarlet made with cochineal; whence the latter has been generally preferred, since the art of heightening its colour by means of solution of tin has been known. Hellot.

Kermes Mineral, or, in modern language, the hydrofulpheute of antimony. The kermes mineral was a preparation of Glauber, which the king of France bought of M. de la Ligerie, and made public in 1720. That receipt was in the following form: take a pound of Hungarian antimony, broken into thin pieces, according to the direction of its pincia; four ounces of nitre, fixed by charcoal; and a pint of rain water; boil them two hours; then filter the warm liquor, and when it cools, the kermes precipitates. The same antimony undergoes the same operations with the remaining liquor, in which three ounces of fixed nitre, and a pint of water are added. In a second boiling, two ounces of nitre, and a pint of water are to be added to the former liquor. The kermes thus obtained is about a drachm, and is well pulverized by washing it with water, and burning spirit of wine upon it; then it is dried for use.
Melt and to and then 6^65 are into monk, the adopted djfengage He is small-pdx, vent to to tion almoll as & the or der has powder which the line quantity of powder, which he us, feen its incorpora-tion, it should fliould the fliocs of urine, and other as adminiilered the blood, which may be served, it is proved, by putting a small piece of it into aquafortis, for this disolves the i pari, or cement, and the sand is left loofe.

KERNES, in our Latin, signify idle persons, or vagabonds.

KERNING, in Letter-Foundery. See Letter-Foundery. KERONA, in Geography, a town of Hindoostan, in the circon of Gobud; 15 miles N. of Dattah. KEROWLY, a town of Hindoostan, in the country of Agra; 74 miles S.W. of Agra. N. lat. 26° 27'. E. long. 77° 28'.

KER PEN, a town of France, in the department of the Ovez, and chief place of a canton, in the district of Cognois; 10 miles E.S.E. of Julliers. N. lat. 5° 25'. E. long. 4° 41'. The place contains 15,5, and the canton 10,419 inhabitants, in 36 communes.

KERRAH, a town of Hindoostan, in Guzerat, on the gulf of Cambay; 65 miles S.S.W. of Gogo.

KERRA, one of the smaller western islands of Scotland, near the coast of Argyle, where, in 1249, Alexander II. died, when he was endeavouring to wrest the island out of the possession of the Norwegians; 12 miles S. of Lismore. N. lat. 56° 33'. W. long. 5° 32'.

KERRI, a town of the Arabian Iraq, at the conix of the Tigris and Euphrates; 53 miles N.W. of Baghdad. KERROO, a town of Hindoostan, in Vипpar; 12 miles N.W. of Baudammy.

KERRY, a county of the province of Munster, Ireland, situated on the south-western coast of the island. It is bound on the north by the river Shannon, which divides it from the county of Clare; on the south-west by the counties of Limerick and Cork; on the south-east by the county of Kerry, and on the south-west and west by the Atlantic ocean. Its form is very irregular in consequence of two great projecting points of land, containing the barones of Iveragh and Coumanmore.
KER

Coreaguinny. It extends from north to south 53 (67 English) miles, and in the breadth part from east to west 41 (52 English) miles; and contains 1012 square miles; or 617,650 Irish miles, equal to 1,240,487 English acres. It thus appears to be the fifth county of Ireland in point of extent, though after Galway its population is the thinnest, and it is one of the most backward in point of culture. The number of houses, at the time Dr. Beaufort wrote, was, by return to the house of commoners, 19,925, which at 5½ to a house, would be 107,000. This, however, falls much short of the present population. The number of parishes is 83, all in the diocese of Ardfert and Aghadoe, but by unions they are reduced to 40 benefices, in which are 26 churches and only three glebe houses. Indeed, in this county the number of Roman Catholics is greater, in proportion to that of Protestants, than in almost any other. The number of members which represent this county in the Imperial parliament are three, two knights of the shire, and one member for the borough of Tralee. "It is not surprising," says Dr. Beaufort, "that this county should be thinly inhabited; barren mountains, and almost inaccessible rocks, render a large portion of it unfit for habitation and incapable of culture. Even the northern baronies, in which there is much good land, with few mountains, are far from level; and the cheerful aspect of cultivated fields and fine pastures, is frequently interrupted by bleak and rocky hills; while tracts of bog interfet the narrow plain that extends from Callanan harbour to the borders of the county of Cork, between the Mang and the Fleisk. Grazing is more attended to than tillage, and this part of Kerry supplies many fat beasts of good size, and great numbers of fine cattle; but the native breed of the country is extremely small, yet remarkably good for the pall, resembling the Alderney cow both in size and character; butter is consequently a considerable article among the exports of Kerry. The barony of Coreaguinny forms a peninsula between the bays of Dingle and Tralee, and terminates at Dunmore Head, the most western point of Ireland and of Europe. It is full of mountains, but the high promontory of St. Brandon is eminent above the rest, and the mountain of Callacore stands across the channel. Among the rough and high hills in the barony of Iveragh, and the southern part of Dunkeeran, fine pleasant valleys and improvable grounds are interpersed; and in the isle of Valentia, there are more inhabitants and a better culture than could be expected in so remote a spot. Glenscourt is entirely covered with exceeding high and rugged hills, and separated from the county of Cork by an immense and almost impassable ridge of rocky mountains; over which there is but one pass, and that very difficult, called the Iveragh's Leap; but the loftiest mountains in this county stand in a huge amphilence on the west and south of Killarney, half encompassing the lower, and entirely surrounding the upper lake. Of these, Mangerton is generally esteemed the highest, being 2302 feet above the sea, but it is doubted whether the craggy summits of Macgillicuddy's rocks do not far surpass it in altitude. In this defoliate tract, there are large herds of red deer, and abundance of game. To this account of Dr. Beaufort's, published almost 20 years ago, there is very little to be added. The state of agriculture is still very low, though a few gentlemen have turned their attention to the improvement of it. The barony of Iveragh, in particular, is in a very rude state. It should be noticed that the horses of Iveragh are much esteemed; they are a small but an excellent breed, climbing over the most rugged rocks, and both ascending and descending the steepest precipices, with great facility and safety. They are strong and durable, easily supported, and not ill-shap'd; so hardy as to stand abroad all winter, and will browse upon heath, furze, and other shrubs; and they have an easy, ambling gait. The principal lake is Lough Lane, generally called the lake of Killarney, for an account of which, see Killarney. Many fine rivers water this county. The Cashing, which is formed by the union of the Feele and the Gale, is navigable for eight or ten miles. The Lane flows out of the lake of Killarney, which receives the Fleisk. The Roughy pours its impetuous current into Kenmare river. The Mang, which is navigable to Castlemain, was the northern boundary of the ancient counts palatine of Desmond, and falls into Castlemain harbour, at the bottom of the great bay of Dingle, which can only admit vessels of moderate burden. Ventry bay, the roads of Dingle and Valentia, and Ballinnakelagh's bay, are small but commodious harbours. Kenmare river is a seare and capacious haven. The principal towns are Tralee, where the affizes are held, Killarney, Milltown, and Dingle, for which see the respective articles under those names. This county has several marble and slate quarries, and is not deficient of coal mines, but the abundance and cheapness of turf render them useless. The mice of copper, lead, &c. near Killarney will be noted under that head; iron was formerly obtained in great quantity, till the scarcity of timber put a stop to the works. The cider of Kerry, which is made of the cockagee apple, is highly prized, and brings a great price; yet orchards are not very numerous, and that valuable fruit, with another excellent apple, the Kerry pippin, are little propagated, and difficult to be procured. The original poisters of this county were the O'Connors, O'Sullivans, and, above all, the M'Carthys, who were kings of Munster. The English families of Fitzmaurice and Fitzgerald early obtained settlements in it, and the head of the latter, who was created earl of Desmond, had the part of the county south of the Mang erected into a county palatine. The power of this family became very great, and the earls were often in opposition to the English government. In queen Elizabeth's time an act of attainer was passed, and all the possesions of the house of Desmond were divided amongst English sethers. From these some of the principal Protestant families are defended. Beaufort's Memoir of a Map of Ireland. Smith's History of Kerry.

Kerry Head, a cape of Ireland, in the county of Kerry, at the north extremity of the mouth of the river Shannon. Near this, very fine quartz crystals, both white, and amethyst are found, and for some time the latter were in great request. A set of ear-rings, a necklace, and other jewels composed of these amethysts, were presented to queen Caroline. This cape is in N. lat. 52 24. W. long. 9 47'. This cape is sometimes called Ballykeigh Head. Smith, Beaufort.

Kerry Point, or, according to M'Kenzie, Kenry, a cape of the county of Down, Ireland. N. lat. 54 22'. W. long. 5 22'.

KERS, a town of Tyrol, on the river Inn; 12 miles N.E. of Laudeck.

KRERSCHAN, a town of Istria; 16 miles N.N.E. of Pedena.

KERSEY, John, in Biography, an able mathematician and philologist, who flourished towards the close of the seventeenth, and beginning of the eighteenth centuries, and is chiefly known in the scientific world by his "Elements of Algebra," in two vols. folio, which is an ample and complete work, containing a full explanation of the problems of Diophantus: he was author likewise of "Dictionarium Anglo-Britannicum, or General English Dictionary."
KERSEY, a kind of coarse woollen cloth, made chiefly in Kent and Devonshire.

KERSHAW, in Geography, a district of South Carolina, on Waterer river, which separates it from Richland district; 35 miles long, and 30 broad, containing 7340 inhabitants, of whom 2530 are slaves.

KERA, a town of Perlia, in the province of Kerman; 90 miles S.S.W. of Sirjan.

KERYKER, a town of Natalia; 28 miles S.W. of Aphon-kara-hilfar.

KERUN, a lake of Egypt, in a district forming a kind of excrecence to the west, about 30 miles long, and six broad, which has no appearance of being artificial.

KERY, a town of Hindoostan, in Baghla; 25 miles W. of Naffuck.

KESALAX, a town of Sweden, in the government of Kuopio; 84 miles S.S.E. of Kuopio.

KESAVA, in Mythology, a name of the Hindoo deity Vithuth, and of his principal avatar or incarnation of Krishna, and is said to refer to the beauty of his hair. The name is also written Kesia, and sometimes pronounced Keefa. Budha, or Vithuth in that avatar, is also sometimes addressed as Kesava.

KESAW, in Geography, a town of Hindoostan, in Bal- har; 48 miles S.S.W. of Patna.

KESBAH, a town of Bengal; 23 miles S.S.E. of Moorhedabad.

KESCIM, or Kesem, a sea-port town of Arabia, in the province of Hadramaut, and the residence of a foreign prince. Its inhabitants are said to be highly civilized, and to receive all strangers hospitably. The English sometimes visit this harbour. The fechick of Kesim is sometimes called king of Fartak; and his dominions comprehend a considerable number of cities, among which is that of Fartak. Besides his possessions on the continent, the fechick of Kesim is likewise head of the island of Soccatra, famous for its shoals. N. lat. 15° 20’S. E. long. 50° 21’.

KESELBAUDEN, a town of Bohemia, in the circle of Koniggratz; 18 miles N.N.E. of Gitschim.

KESLDERD, a town of Bohemia, in the circle of Koniggratz; 10 miles E. of Gitschim.

KESI, a city, or Site, a town of Grand Bucharia, and capital of a district, of which Timur Bece was governor in 1560. This town was famous on account of its university for the study of sciences and law. It was the ordinary summer residence of Timur, and declared by him to be the second seat of his empire: he embellished it with walls, and built a new palace in 1579. It was also called "Chamber-Seba," or the green city, from the verdure of the gardens and meadows celebrated for rare and beautiful plants; and also "Combret Elhmi Veladebe," which signifies the dome of science and virtue; and 30 miles S. of Samarcand. N. lat. 39° 10’S. E. long, 64° 10’.

KESHAM, a town of Grand Bucharia; 70 miles W.S.W. of Badaksham.

KESIH-DAG. See Olympus.

KESHO, Kesho, or Khecho, a city of Asia, capital of the kingdom of Tongquin and the royal residence, is situated upon the navigable river Songkoy, or San Koy, about 30 leagues from the sea, and about 21 N. lat. With regard to size, it may be compared with the most celebrated cities of Asia, and may at least equal that of Paris. On the 11th and 15th days of every moon are held great markets, which attract most of the inhabitants of the surrounding towns and villages to a considerable distance. The crowd is three to immense, that, though the streets be very wide, it becomes difficult to advance 100 paces in half an hour. Yet there order prevails, each merchantize and village having distinct streets for the exposure of their articles. The streets are paved with brick, except some parts which are left for the passage of horses, elephants, and the king's carriages. Two-thirds of the houses are of wood, others of brick, among which are the factories of foreign merchants, distinguished amidst a multitude of huts constructed of bamboo and clay. The palaces of the Mongolians, and the public buildings, which occupy large spaces of ground, are chiefly built with wood in a neat and solid manner, and decorated with sculptures and paintings. The roofs consist of tiles of different colours. The common houses are composed of a roof placed on wooden columns, commonly covered with straw, reeds, or large leaves of trees, which, accidents excepted, will last 30 or 40 years. These houses have no ceilings or storeies, but are divided by partitions, on a ground floor; and the numerous windows are covered with gauze, or fine muslin, glass being almost unknown. This construction being very liable to take fire, the police only permits it to be lighted during certain hours of the day. The trade is very considerable; and the great river is crowded with barks and boats, conveying the merchandise of the provinces to the capital. Each boat pays about two-pence for the right of anchorage, and this small tax forms a considerable revenue. The royal palace occupies a considerable space in the finest quarter of the city, situated amid groves, gardens, and canals, and difficult of access. The women and eunuchs never quit its precincts. Before a recent revolution, the triple walls of the ancient city and palace, the courts paved with marble, and other features of grandeur, displayed one of the most beautiful and vast edifices of Asia; for the circumference of the palace and gardens is said to have from five to seven French miles. At present, the capital is only defended by a quick hedge of bamboos. In the neighbourhood is quartered a body of draftry; the arsenal and other magazines of ammunition being on the banks of the river. On the other side is the Chinéte town, established by precaution; nor are other strangers allowed to enter the city without a special permission. Abbé Richard cited in Pinkerton's Geography, vol. ii.

KESI, in Hindoo Mythology, a monster slain by Vishnu, or Krishna.

KESIRMAK, in Geography, a town of Poland, in the palatinate of Braclaw, near the Dnieper; 72 miles S. of Braclaw.

KESITAH. This word is to be met with in Gen. 24, and in Job; and is translated in the Septuagint and Vulgate, sheep or lambs. But the Rabbinists and modern interpreters are generally of opinion, that Kesith signifies rather a piece of money. Bochart and Eugubinus are of opinion the Septuagint meant minas, and not lambea; in Greek lektrum monon, instead of minos. Now a mina was worth fifty Hebrew shekels, and consequently five pounds sixteen shillings and ten-pence halfpenny sterling; or nine pounds English, supposing, as Dr. Prudeaux does, that a shekel is worth three shillings. M. de Pelletier de Rouen is of opinion, that Kesith was a Perisan coin, stamped on one side with an archer, (Kestah, or Keseth, in Hebrew signifying a bow,) and on the other with a lamb; that this was a gold coin known in the East by the name of a Dara, and was in value about twelve livres and ten-pence French money. A Dara is a piece of gold, worth, as Dr. Prudexx says, five and twenty shillings English. Several learned men, without mentioning the value of the Kesith, say it was a silver coin, the imprefion whereof was a sheep; for which reason the Septuagint and Vulgate translate it by lektrum. Calmet is of opinion, that Kesith was a piece of gold, or silver. In the East they reckon at present by pence, a piece in Perlia consisting of 30 tomars, which make 25½ penny
KET

of French money. The word *ižka* in Chaldce signi-

fies a measure, or vessel. And Enathius says that *kifla*

is a Persian measure. Jonathan and the Targum of Jeru-

KESER, or Kurab, in Geography, a town of Periia, 

and the province of Ghilan, on the coast of the Caspian sea;

25 miles N.W. of Reshid.

KESCOTTY, a town of Tihb; 40 miles S. of 

Gangotri.

KESON, a town of Hindooftan, in Lahore; 25 miles 

E.N.E. Jullundur.

KESSELDORF, a town of Saxony, in the margina-

vate of Meiffen; eleven miles W. of Drefden.

KESTEN, a town of Syria; 25 miles W. of Aleppo.

KESTENUS, a town of Asiatic Turkey, in Pontia; 

20 miles S. of Amasus.

KESTREL, the English name of a hawk, called also the

*nestel* and the *windhover*, and by authors the *innumerus

cerus*. It builds with us in hollow oaks, and feeds on 

partridges and other birds.

KESWICK, in Geography, a market town in the 

ward of Allerdale, in the county of Cumberland, England, is 

situated near the lower end of Derwentwater, on the 

eastern side of the extensive and beautiful vale of Keswick.

The town consists of one long street; the houses are of 

stone, and were returned under the late population act at 

250; the number of inhabitants 1550. A cotton factory 

has lately been established here; coarse woollen goods, 

carpets, blankets, kerseys, and some linens are also manufac-

tured in the town and its vicinity. The chief trade is 

derived from the influx of travellers visiting the lakes:

by whom Keswick, from its central situation, is much fre-

quented; the number in one season, the summer of 1793,

amounting to 1540. A weekly market is held on Saturdays;

and a fair for cattle every fortnight from May to October.

In this town two moinetins, collected by private persons,

are open for public inspection; they contain specimens of 

almost every variety of the mineralogical substances of 

Cumberland, with many kinds of fossils, plants, antiques,

and other curiosities. Keswick is distant from London 291

miles.

About two miles to the south of the town, on an eminence 

called Castle Rigg, is a Druidical arrangement of stones,

facing in an upright, some fallen, and others leaning 

obliquely; the whole number is fifty; of which thirty are 
dispersed in an oval form, thirty paces by thirty-two in 
diameter; the other ten compose a recedes, but long square; within the area on the east side, in conjunction with the stones of the oval, this is seven paces in length, and three in breadth. One stone is more than seven feet high, others exceed five feet; but the greater number are smaller. Welt's Guide to the Lakes. Houcemann's Tour, Hutchinson's History, &c. of Cumberland. Beauties of England, vol. iii.

KET, William, in Biography, a Tanner of Norfolk, 

who, in the reign of Edward VI. instigated a revolt against 

the government. The populace were at first excited by the 

complaints against indoores, but finding their numbers in-

crease, and already amounting to 20,000 strong, they grew 
human, and proceeded to more exorbitant pretentions. They demanded the suppression of the gentry; the placing of new 
considerations about the king, and the re-establishment of the 
Parliament religion. Ket assumed the government over them, 
and exercised his brief authority with the utmost arrogance. 
Having taken possession of Mounfield-hill, near Norwich, he

KETAH, in Geography, a town of Hindooftan, in Alla-

habad; 11 miles N. of Jumprop.

KETALAH, in Geography, a town of Hindooftan, in Bahar; 74 miles S.S.W. of Patna. N. lat. 24° 38'. E. long. 84° 36'.

KETCH, in the Marine, is a vessel with two masts. The 

masts are placed and rigged with sails, as the main and 

mizzen-masts of a ship. Upon the bowsprit, and between 

that and the main-mast, they have staysails, and a very large 

jib. Formerly bomb-vessels and yachts were thus rigged, as 

ketches, but of late years as ships. At present only a few 

coafting vessels are rigged ketch fashion.

KETCHAR-TCHOU, in Geography, a town of 

Tibet; 10 miles S. of Giti.

KETCHENG-TASE TARTARS, a tribe of Tartars 

who inhabit the territory of Chinese Tartary, that lies on 

both the banks of the river Saghialen-ola, and extends as 

far as the eastern sea. Their country, which is almost 150 

leagues in length, contains only small villages, most of 

which are situated on the banks of the river. The language 

of these Tartars is different from that of the Mantechewas, 

and is distinguished by the name of "Fiatta." It is proba-

bly the same which is spoken by the other more northerly 

Tartars, who live beyond the mouth of the river Sagar-

laien.

The Tartars of Ketcheng-tase do not shave their heads, 

as other people of the empire. They wear their hair tied 

in a knot with a ribbon, or enclosed in a bag behind. 

They appear to be less clownish than the Yopi-tase Tartars. 

They employ much of their time in hunting fables, and are 

obliged to pay a certain number of their skins in tribute.

KETCHICTEN, or Kestschen, a country of Chinese 

Tartary, divided into two standars. N. lat. 43°. E. long. 

117° 38'.

KETEMBER, a small island in the East Indian sea. 

S. lat. 6° 12'. E. long. 132° 53'.

KETMEBEH, a town of Patna; 27 miles E. of 

Pergamo.

KETMIA, in Botany, the Syrian appellation of the 

shrub commonly called *Alkæa* *syrus*, *Hibiscus* *syrus*, 

of Linnæus. Tournefort, in his *Institutiones*, 99, t. 21, 

adopts it for the whole genus of *Hibiscus*; see that article. 

Some species of *Bombax* and *Hermannia* have also occasionally 

been called by this name.

KETO, in Geography, one of the Kurile or Kurilski 

islands, in the N. Pacific ocean. This island is 30 versts in 

length, and about 10 in breadth. On it is seen high moun-

tains, with their white rocky walls and summits; at the top 

of these, and in the valleys, are forests of birch, alder, 

tobacco, fuchia-acuparia, and several species of pines. 

The island nourishes white, black-hellet, and red foxes. 

The sea animals are not plentiful. It is uninhabited. N. lat. 

45° 45'. E. long. 153° 38'.

KETIAN, KITIAN, or *Alkænas*, a name given 

by some of the Arabian authors to the oil of cedar, called 

by the Greeks *cencas*. We have of later times formed 

the word *cedrus* upon this, and it has since been applied 

to the zopnata of the ancients, a compound made of pitch and
and wax melted together, and used for covering the bottom of ships.

KETTSIO, in Geography, a town of Sweden, in the province of Smaland; 49 miles N.W. of Wexio.

KETSKOL, a town of Rosino, in the government of Tobolost, seated on the river Kett, which runs into the Obi at Narim; 63 miles S.E. of Narim.

KETSKEMET, a town of Hungary; 92 miles E. of Canicifa.

Kettering is a populous market-town, situated on an easy ascent, in the hundred of Huxloe, Northamptonshire, England. In the time of the Saxons, it was called Cyantran and Cyritanges; the lordship was granted by King Edwy, in the year 976, to his fervant Elfrith. The church, which comprises a nave, north and south aisles, and a chancel, has a handsome tower and spire at the west end. The tower confists of three stories, in each of which are large windows, or window frames, of several compartments: the angles are flanked with double buttresses; the embattled parapet runs an ornamented fascia, and at each corner is raised a small hexagonal embattled turret; the whole surmounted by a handsome hexagonal crocketed spire, with three windows, diminishing in their size upwards, on the alternate sides. The following quaint prophetic promise is inscribed in this church: "Who so redi my name shall have Godys bylling and our lady; and my wyfis doo fye the fame." Exepting the church, Kettering has nothing to attract or interest the antiquary. Near the middle of the town is a spacious area, surrounded by some private houses and shops of respectable appearance. Here are a feffions-house, and a well endowed free-school; also an almshouse for six poor widows, and two differents meetings. By the returns made to parliament in 1831, the number of houses appears to be 643; of inhabidants, 3211; of which number 1770 were reported as employed in various trades and manufactures, and 241 in agriculture. The chief manufactures are those of lace-working, wool-combing, and the spinning and weaving of tammies and fathings. Kettering is 16 miles distant from Northampton, and 7 from London; has a well supplied weekly market on Fridays, and four annual fairs.

Kettering was the birth-place of Dr. John Gill, a differing minister of distinguished eminence, through the greater part of the last century. He was one of those felt-taught sons of genius, who, by overcoming what are too often called "affirmative objections" in literature, administered the world by the variety and extent of their acquisitions. See Gill, John.

In the vicinity of this town, to the westward, in a road called Staunch Lane, are found what are denominated kettles, a kind of bell-shaped flowers, apparently vitrifications. These, when boiled, are considered diugallly efficacious as a fopentic, and are consequently much esteemed. They are frequently dispersed over the floors of the ground, but more usually in the recesses near the old dray, dug for making brick. In a spot, named St Mary's, between Kettering and Wekeampo, in surveying a fittance, were found urns, bones, coins, and other curiosities. Bridge's History of Northamptonshire, 1778, vol. xii.

KETTLE FALLS, a waterfall on the river Utica, in Canada; 90 miles W. of Montreal.

KETTLE RIVER, a river of Canada, which rises in lakes Erie, N. Lat. 43.; W. Long. 78 51. See Map of Canada.

KETTLE, in the Act of 1671, 1672, 1673, to a battery of mortars, bow-shot in iron under ground.

KETTLE-DRUM. See Drum.
his arms from the rest of his monstrous body. That part of the neptaneous fluid, that he had time to swallow, secured his immortality; his trunk and dragon-like tail fell on the mountains of Malaya, where Min, or Brahman, carefully preferred them by the name of Ketu; and, as if a complete body had been formed from them, like a dismembered polype, he is said to have adopted Ketu as his own child. The head, with two arms, fell on the sands of Barbadoes, where Pitheus was then walking with his wife Sinthika; they carried the Daitya to their palace, and adopted him as their son. This extravagant tale is no doubt astronomical: Rahu and Ketu being the nodes, or what astrologers call the head and tail of the dragon. It is added, that they appeased Vifhnu, and obtained redemption of the firmament, but were no longer visible from the earth, their enlightened sides being turned from it; that Rahu strives, during eclipses, to wreak vengeance on the Sun and Moon who detected him; and that Ketu often appears as a comet, a whirlwind, a fiery meteor, or water-spout, or a column of sand. Fifty-six comets are said, in a book called Chintamani, to have sprung from Ketu; and Rahu had a numerous progeny of Grahas, or crocodiles." A plate of the Hindoo zodiac includes Rahu and Ketu, the latter appearing merely as a head of a black colour, handsomely ornamented, and rearing against a pillow. In a plate of the Indian zodiac, published by Sir W. Jones in the second volume of the Asiatic Researches, Ketu is mounted on a frog; the meaning of which, if it have any, has not been explained. See Rahu.

KETVER, in Geography, a town of Grand Bucharia, on a mountain, taken by Timur Bee in 1398; 100 miles S. of Badakhshan.

KETZIN, a town of Brandenburg, in the Middle Mark; 8 miles N.W. of Potzdam.

KETZLORF, a town of Bohemia, in the circle of Chrudin; 12 miles S.E. of Lentinischl.

KEVALCOTTY, a town of Tibet; 18 miles N.W. of Srinagur.

KEVEL of Buffon, in Zoology, Antelope Kewella of Linnaeus, Ahy of Kempfer, and flat-horned antelope of Pennant, has large horns, which are flattened, and bent in form of a lyre; the fur is yellowish, with pale streaks, and a dark coloured band runs along each side. This animal inhabits Barbary, Coreigo, and Peru. It is about the size of a small roe; lives in large flocks, and, like most species of the genus, is reckoned very delicate food, though it has a musky odour when alive. In both sexes the horns are surrounded with prominent rings, usually from 14 to 15, except the ends, which are smooth; they are bent in the same manner with those of the antelope dorcas, and in general the two animals resemble each other very much, except that the horns of this species are flattened, and have a greater number of rings.

KEVELS, or Chella, in a Ship, are two pieces of timber nailed to the inside of a ship, from whence the upper ends branch outward into arms or horns, serving to delay the great ropes, by which the bottoms of the mainmast and forecastle are extended.

KEUKER, in Geography, a town of Peru, in Faris- tan; 40 miles S. of Jedakht.

KEULA, a town of Germany, in the county of Schwartzburg; 11 miles N. of Mullhausen.

KEURBOOM River, in Geography, a river on the S. coast of the colony of the Cape of Good Hope, which, like the Knysna, runs up into the midst of tall forests, and might be navigated by boats to a considerable distance; but its mouth, in Plettenberg's bay, is completely fanded up by the almost perpetual rolling swell of the sea, from the south-eastward upon the sandy beach.

KEURN, a town of Swizter, in the government of Waf.; 90 miles S.E. of Waf.

KEWROI, a town of Ruffia, in the government of Archangel; 100 miles S.E. of Archangel.

KEUSCHEBERG, or Klade, a town of Saxony, remarkable for a victory obtained by Henry the Fowler over the Huns, in 933; 6 miles S.E. of Merseburg.

KEW, a village and parish in the hundred of Kingtong, and county of Surry, England, is pleasantly seated on the southern banks of the river Thames, at the distance of 64 miles westward of London. In the year 1800 it contained 84 houses, and 424 inhabitants. Previous to the year 1769, this place was only a hamlet to Kingtong, but in that year an act of parliament was obtained to unite this and Peter- sham in one vicarage. The neighbouring inhabitants then sublerbed to build a chapel on a piece of land given by queen Anne. In this is a tablet to the memory of Jer-emiah Meyer, a celebrated miniature painter; and in the adjoining cemetery repose the remains of Thomas Gain- borough, an artist of distinguished merit. (See GAIN- BOROUGH.) Over the Thames, at this place, is a handine flone bridge of seven arches, built from a design by Paine. It was opened in 1789, and is private property; to defray the expenses of which a toll is exacted from all persons, carriages, horses, &c. passing over it. In this village is one of the royal palaces, which is held on lease. It is a small house, in a bad style of architecture, and in a flat, confined situation; yet, from its contiguity to the line and interesting gardens of Kew, has continued a royal residence for many years. His present majesty, George III., has commenced a new palace upon a larger scale; but the works have been long suspended, and it is not improbable that both these structures may be utterly defaced by the next monarch. It is built from designs of James Wyatt, &c. The gardens of Kew are the pride and ornament of the place. They are comprised in 320 acres of land, and are planted with almost every species of exotic tree, shrub, and plant that can be preserved alive in this country. Sir William Chambers published a particular account of these gardens, and of the various ornamental buildings within them; but since Sir William's decease many additions and improvements have been made to the exotic garden. The late Mr. Aiton, gardener, gave some account of the rare plants, &c. cultivated here, in a work, entitled "Hortus Kewensis." The following are the names and dates of the different buildings erected by Sir William Chambers within these gardens: The Orangery, or Green- house, built in 1761, is 145 feet long, 50 feet wide, and 25 feet high. In the same year, and near the same building, was erected "The Temple of the Sun," partly resembling one of the temples of Balbec. In the Flower Garden is an "Aviary," and near it a "Menagerie," with a pavilion designed in imitation of a Chinese opening. Contiguous to this stands "The Temple of Belona," built in 1760, of the prodly kind, with portico tetrastyly Doric. In a solitary walk, near the lake, is "The Temple of the God Pan," of the monopteral kind, of the Doric order, built in 1758. On an eminence stands "The Temple of Eulalus," of similar figure with the preceding. Not far from this, at the head of the lake, is a Chines octagon, of two stories, called "The Houfe of Confucius," built from designs by Goup. Passing through a winding shady walk, the stranger is next conducted to a Corinthian colonnade, called "The Theatre of Augusta," built in 1760. "The Temple
Temple of Victory" is the next object, executed in 1759, in commemoration of a victory obtained by Prince Ferdinand of Brunswick, in that year. The Allindra is imitative of a morefque building; and the great Pagoda is built in imitation of the Chinese Taa. The bafe is a regular octagon of 49 feet in diameter, and the elevation is composed of 12 prisms, or 10 stories, and is 165 feet in height. The other buildings are the Mosque, the Gallery of Antiques, the Temple of Arethusa, and the Ruin. The Gardens at Kew are opened every Monday during the summer. Lyfons's Environs of London.

KEWAN, a town of Hindooslan, in the circar of Kichwara; 10 miles W. of Sheergur.

KEWHE, a town of Notalia, on the Sakaria; 24 miles E. of Fbnik.

KEXHOLM, a town of Russia, in the government of Viborg, built on two islands at the mouth of a river, on the side of lake Ladoga. The houses are conftucted of wood, but the town is well fortified, and defended by a citadel; 40 miles E.N.E. of Viborg. N. lat. 61°. E. long. 29°.

KEXLEBODA, a town of Sweden, in the province of Smalán; 36 miles S.S.W. of Wexin.

KEY, Great, a small island in the East Indian sea, about 50 miles long, and from 5 to 12 broad. S. lat. 5° 24'. E. long. 133° 28'.

KEY, Little, an island in the East Indian sea, about 60 miles in circumference. S. lat. 5° 52'. E. long. 133° 12'.

KEY, a little iron instrument for the opening of locks.

L. Molinus has a tratise of keys, "De Clavis Veterum," printed at Upl. He derives the Latin name clavis from the Greek σκληρος, claudo, I pity; or from the ad-verb clam, privately; and adds that the use of keys is yet unknown in some parts of Sweden.

The invention of keys is owing to one Theodore of Samos, according to Pliny and Polydor Virgil; but this must be a mistake, the use of keys having been known before the siege of Troy: mention even seems to be made of them in the nineteenth chapter of Genesis.

Molinus is of opinion, that keys, at first, only served for the attaching certain knots, wherein they actually secured their doors; but the Lazic keys, he maintains, were nearly akin in use to our own: they consisted of three tingle teeth, and made the figure of an E; of which form there are still fome to be seen in the cabinets of the curious.

There was also another key, called δασκαλι in fome principal perfon or thing, with which the discourse is referred, and which is always to be kept in view, that nothing unnatural and foreign to the subjedt may be brought in; to in every regular piece of music, there is one note, viz. the key, which regulates all the rest. The piece begins and ends in this; and this is, as it were, the musical subject, to which a regard must be had in all the other founds of the piece. Again, as in an oration there are feveral diftinguifhed articles, which refer to different subjedts, yet fo as they have a visible connection with the principal subjedt, which regulates and infiuences the whole; fo in music there may be various fubaltern subjedts, that is, various keys, to which the different parts of the piece may belong; but then, they must be all under the infiuence of the firft and principal key, and have a felable connection with it.

To give a more fubftantial notion of the key, we must observe, that the octave contains in it the whole principles of music, both with reaponf to concertone, or harmony, and fecution or melody; and if either scale be continued to a fubjeft, this to a double octave, there will, in that cafe, be feven different orders of the degrees of an octave, proceeding from the feven different letters, with which the terms of the scale are marked. Any given found, therefore, i.e. a found of any determinate pitch or tune, may be the key of the piece, by applying it to the seven natural sounds arising from the diuion of an octave, and repeating the octave above or below, at pleasure. The given found is applied as the principal note or key of the piece, by making frequent clofes or cadences upon it; and, in the progres of the melody, no other but thefe seven natural sounds can be admitted, while the piece continues in that key, every other found being foreign to the fundamental, or key.

For infiance, fuppofe a fong begun in any found, and carried on upwards, or downwards, by degrees and har-monical ditches, fo as never to touch any founds, but what are referrable to that firft found as a fundamental, i.e. the true founds of the natural scale proceeding from the fundamental; and let the melody be f0 conducted through those natural sounds, as to ftop and terminate in the fundamental, or any of its octaves above or below; that found is called the key of the melody, because it governs all the fubject, limiting them fo far, as that they muft be to it, in the rela-

M. Belidor makes the thicknes of the arch-foines of a bridge, one twenty-fourth part of the width of the arch; but Mr. Gautier, another experienced engineer, makes their length, in an arch twenty-four feet wide, two feet; in arches, forty-five, fifty, seventy-five, ninety wide, three, four, five, fix feet, refeptively; and it is obferved by Mr. Muller, that the thicknes allowed by Belidor is not suffi-

cient to prevent the weight of the arches from crushing the key-foines to pieces by their pressure against one another. Muller's Pract. Fortif. p. 253.

The name key-foines, or arch-foines, is sometimes also given to all the foines which form the sweep of an arch, or vault, answering to what the French more distinctly call voussoirs.

Ke is also used for the eccleflialical jurifedion; parti-
cularly for the power of excommunicating, and abfolving. The Romans in the pope has the power of the key,

and can open and shut paradise as he pleases; grounding their opinion on that expression of Jesus Christ, "I will give thee the keys of the kingdom of heaven." In St. Gregory we read, that it was the custom hereto-

fores, for the popes to fend a golden key to princes, wherein they always enclosed a little of the filings of St. Peter's chains, kept with great devotion at Rome; and that these keys were worn in the bosom, as being supposed to contain fome wonderful virtues.

Key, in Music, is a certain fundamental found, or tone, to which the whole piece, be it concerto, sonata, cantata, &c. is accommodated; and with which it usually begins, but always ends.

To get an idea of the use of the key, it may be observed, that as in an oration there is a subjedt, viz. some principal perfon or thing, to which the discourse is referred, and which is always to be kept in view, that nothing unnatural and foreign to the subjedt may be brought in; fo in every regular piece of music, there is one note, viz. the key, which regulates all the rest. The piece begins and ends in this; and this is, as it were, the musical subjedt, to which a regard must be had in all the other founds of the piece. Again, as in an oration there are feveral diftinguifhed articles, which refer to different subjedts, yet fo as they have a visible connection with the principal subjedt, which regulates and infiuences the whole; fo in music there may be various subaltern subjedts, that is, various keys, to which the different parts of the piece may belong; but then, they must be all under the infiuence of the firft and principal key, and have a felable connection with it.

To give a more diftinguifhed notion of the key, we must ob-
serve, that the octave contains in it the whole principles of music, both with reaponf to concertone, or harmony, and fecution or melody; and if either scale be continued to a double octave, there will, in that cafe, be feven different orders of the degrees of an octave, proceeding from the feven different letters, with which the terms of the scale are marked. Any given found, therefore, i.e. a found of any determinate pitch or tune, may be the key of the piece, by applying it to the seven natural sounds arising from the diuion of an octave, and repeating the octave above or below, at pleasure. The given found is applied as the principal note or key of the piece, by making frequent clofes or cadences upon it; and, in the progres of the melody, no other but thefe seven natural sounds can be admitted, while the piece continues in that key, every other found being foreign to the fundamental, or key.

For infiance, fuppofe a fong begun in any found, and carried on upwards, or downwards, by degrees and har-monical ditches, fo as never to touch any founds, but what are referrable to that firft found as a fundamental, i.e. the true founds of the natural scale proceeding from the fundamental; and let the melody be f0 conducted through those natural sounds, as to ftop and terminate in the fundamental, or any of its octaves above or below; that found is called the key of the melody, because it governs all the fubject, limiting them fo far, as that they muft be to it, in the rela-
tion to the seven essential sounds of an octave; and when any other found is brought in, it is called going out of the key.

From which way of speaking, viz. a song's continuing in, or going out of the key, it may be observed, that the whole octave, with its natural sounds, come under the idea of a key; though the fundamental or principal found is, in a peculiar sense, called the key.

In which last sense of the word key, (viz. where it is applied to one fundamental found,) another found is said to be out of the key, when it has not the relation to that fundamental of any of the natural sounds belonging to the continuous division of the octave.

Here too it must be added, with respect to the two different divisions of the octave, that a found may belong to the same key, i.e. it may have a just musical relation to the same fundamental in one kind of division, and be out of the key with respect to another.

Now a piece of music may be carried through several keys; i.e. it may be given in one key, and led out of that into another, by introducing some found foreign to the first, and so on to another; but a regular piece must not only return to the first key, but those other keys too, must have a particular connection with the first. It may be added, that those other keys must be those of the natural sounds of the principal key, though not any of them at pleasure.

As to the distinctions of keys, we have already observed, that to constitute any given note or found, a key, or fundamental found, it must have the seven essential or natural notes added to it; out of which, or their octaves, all the notes of the piece must be taken, while it keeps within the key, i.e. within the government of that fundamental. It is evident, therefore, there are but two different species of keys, which arise according as we join the greater or less third, these being always accompanied with the sixth or seventh of the same species; the third, for instance, with the fifth or seventh, &c. the third / with the sixth and seventh /.

This distinction is expressed under the names of sharp key, which is that with the third g, &c. and the flat key, which is that with the third l, &c.: whence it is plain, that how many different clohes forever there be in a piece, there can be but two keys, if we consider the essential difference of keys; every key being either flat or sharp, and every sharp key being the same, as to melody, as well as every flat one.

It must be observed, however, that in common practice the keys are said to be different, when nothing is considered but the different tone, or pitch of the found, in which the different clohes are made. In this sense, the same piece is said to be in different keys, as ording as it is begun in different sounds, or degrees of tone.

To prevent any confusion which might arise from using the word found in different senses, Mr. Malcolm proposes the word mode to be substituted instead of the word key, in the former sense; that is, when it expresses the melodious condition of the octave, as it consists of seven essential and natural sounds, besides the fundamental; and in regard there are but two species of it, he proposes, that that with a third less be called the greater mode: and that with a third more, the lesser mode: appropriating the word key to those sounds of the piece in which the cadence is made; all of which may be called different keys, in respect of their different degrees of tone.

To distinguish then accurately between a mode and a key, he gives us this definition; viz. an octave, with all its natural and essential degrees, is a mode, with respect to the constitution, or manner of dividing it; but with respect to its place in the scale of music, i.e. the degree or pitch of tone, it is a key; though that name is peculiarly applied to the fundamental.

Whence it follows that the same mode may be with different keys; i.e. an octave of sounds may be raised in the same order, and kind of degrees, which makes the same mode, and yet be begun higher or lower; i.e. be taken at different degrees of tone, with respect to the whole, which makes different keys; and vice versa, that the same key may be with different modes, i.e. the extremes of two octaves may be in the same degree of tone, yet the division of them be different.

Keys also imply those little levers in the fore-part of an organ, harpsichord, or piano-forte, by means of which wind is given to the pipes, and the jacks or hammers strike the strings of the instrument.

In large organs there are generally three sets of keys; one for the great or full organ, one for the choir organ, and one for the swell and echoes. The long keys used to be black, and the short, or flats and sharps, white; but a contrary practice took place about the beginning of the last century.

Keys, in Sta. Langus, a name given to certain rocks lying near the surface of the water, particularly in the Well Indies.

Key, a dry piece of tapering oak, driven into fears to set them close.

Key, in a Naval Sense. See Key.

Key, in Polygraphy, and Steganography, denotes the alphabet of a cipher; which is a secret known only to the person who writes the letter, and him who deciphers it. See ALPHABET and CIPHER.

Some ciphers have a single key, where the same characters are used throughout; in others ciphers, the characters are varied, and the key is doubled.

Keys, a denomination given to the seeds of the 8th.

KEY-Long, in Geography, a lake of Ireland, in the northern part of the county of Roscommon, near the town of Boyle. The river Boyle flows through this lake, which is a beautiful piece of water, interspersed with several islands, some of them well wooded, and others highly cultivated. It is sometimes called Kingston lough.

KEYNSHAM, a market town and parish in the hundred of Keynsam, and county of Somerset, England, is five miles east of Brilbo, and seven miles west of Bath, on the great public road between those cities. In the year 1800, the town consisted of 256 houses, and contained 1500 inhabitants. Here was formerly a celebrated woolen manufacturing, but at present the staple trade of the town is malting. An abbey was founded here, in 1170, by William earl of Gloucester; and at the dissolution was granted to Thomas Beav, some of whose descendants still have a right in the lands annexed to it. The sub-fluvium of the county is an immense rock; in which are imbedded vast quantities of cornal-ammonis, or snake bones. Many of these are very large, and by the common people are believed to have originated from some miraculous power. The church is a large building. Here are a weekly market, and two annual fairs. Collins's History, &c. of Somersetshire, 3 vols. 410.

KEYSBER, JOHN GEORGE, in Biography, a celebrated traveller, was born at Thurman, in the county of Giech, in the year 1683. He received a good education, and manifested, at an early period, a strong attachment to the sciences. At a proper time, and having laid in a good stock of elementary knowledge, he was entered at the University of Halle, where he studied jurisprudence, without neglecting the
KEY

the other branches of academic instruction. When he had finished his studies, he was invited to superintend the education of Charles Maximilian, and Christian Charles, counts of Giech-Buchan, with whom he repaired to Halle in 1717, and then accompanied them on their travels in foreign countries. In his journey he met with the celebrated Roland, who recommended to his attention the immense field of German antiquities, as yet almost untouched: he accordingly caught at the idea, and formed the resolution of undertaking something systematic on the antiquities of Germany, and the origin of its inhabitants. He went through the principal towns in Germany and the Low Countries, collectings, as they occurred, materials for his intended work. In consequence of the great reputation which he acquired in his first tour, M. Bernstorff, minister of his Britannic majesty in Hanover, an enlightened statesman, engaged him as a travelling tutor to his sons. After remaining two years in Hanover, he obtained permission, in 1718, to visit England for his own improvement. At London and Oxford, he met with a kind reception, but nothing, probably, pleased him more, than the honour of being elected a member of the Royal Society. He wrote some tracts at this period, one containing several curious observations on Stonehenge, and a dissertation on the consecrated milestones of the Druids; and on his return to Hanover in 1720, he published his immortal work, entitled "Antiquitates felicite Septentrionales et Celticae," in which the author is exceedingly happy in solving a great number of difficulties never before sufficiently explained. In 1727, Keyser's pupils, who continued under his care more than ten years, accompanied him to Tubingen, and, in 1729, they began their travels, which comprised the whole of Germany, Switzerland, Italy, Hungary, France, England, and Holland. On their return ample provision was made for the tutor, and they entreated him, at the same time, with a valuable library, their collection of medals and natural curiosities, and even gave him the chief management of their domestic concerns. M. Keyser, in the course of his travels, had made a valuable collection of books, antiques, &c., to which he added, by purchase, that of M. Eckardt, and to prevent the whole from being dispersed, he defined it after his death to be added to that of M. Bernstorff. He was of an open and communicative disposition, and ready to assist in their literary labours, all those who stood in need of his advice. He rendered M. Eckardt great service when about to publish his German Antiquities, after the model of the "Thesaurus Antiquitatum Graecarum et Romanarum," by Cavendish and Groevins. This work was never printed. In 1728, when M. Jark reprinted the work of Schedius, on the German deities, Keyser not only corrected it, but furnished him with considerable additions, and subjoined an ingenious dissertation "De cultu Solis." He died suddenly, in June 1743, at Stenlenbourg, an estate bequeathed to M. Bernstorff. His travels were translated into the English language from the second edition in German, and published in four vols. 4to. Gen. Biog.

KEYSERS [UL], in Geography, a town of Switzerland, in the county of Baden, on the river Rhine, with a wooden bridge to Schaffhausen; 9 miles N.N.E. of Baden. N. lat. 47° 37'. E. long. 8' 15'.

KEY-SIMA, an island of Japan, between Corea and the W. coast of Nippon.

KEY-WALELA, an island in the East Indian sea, about 45 miles in circumference. S. lat. 5° 37'. E. long. 138'.

KEYWAWA, a small island near Charlestown harbour, South Carolina. Vol. XIX.

KEYZER'S BAY, a bay on the S. coast of the island of Sumatra. N. lat. 5° 40'. E. long. 104° 58'.

KEZEMSKA, a town of Russia, in the government of Irkutsk, on the Angara; 40 miles S.W. of Tiumin.

KEZEREI, a town of Natalia; 40 miles E. of Cattama.

KEZIL, a river of Persia, which runs into the Caspian sea, near Rehd.

KEZIL-AGYES, or Kerezil, a river of Alia, which rises in the mountains of Bucharistan, E. of Samarkand, and formerly ran into the Caspian sea, but the Russians, in 1719, endeavoured to trace the stream, were put to death by the Tartars, who turned the current of the river into Lake Ars, by uniting it with the Gihon; but this change of the course of the Gihon has been disputed. See OXAE. See also KHERAM.

KEZIL-AGYES, a town of Persia, in the province of Gilan; 20 miles N. of Lamkeran.

KEZIL-KUJA, a town of Natalia; 25 miles S. of Ilharch.

KEZIN, a town of Poland, in Volhynia; 10 miles W. of Krzeminec.

KEZMA, a town of Russia, in the government of Irkutsk, on the Tongafield; 160 miles N.N.W. of Tiumin.

KEZUC, a town of Persia, Armenia; 4 miles S. of Erivan.

KHABUR, a river of Asiatic Turkey, which rises 20 miles E. of Harran, and runs into the Euphrates at Kerkitia—Allo, a river of Cordillan, which passes by Betin and runs into the Tigris; 15 miles S.E. of Gazara.

KHADARAH, El, or CHADRA, a town of Algiers, in the province of Tremecen, feated on an eminence near the river Shellif. Dr. Shaw concludes from its ruins, which are about three miles in circumference, that it was once a large place. According to Pliny, its ancient name was "Zuechabbaria," and according to Pliny "Succabari" and "Colonia Augusta." Eastward are the remains of a stone bridge, probably the only one ever built over the Shellif, though travellers are much inconvenienced, in the winter season, by waiting a whole month before they can ford it; 55 miles S.S.W. of Algiers.

KHALEKAN, EUS, in Biography, a celebrated biographer of illustrious Mufidmen, particularly of such as were distinguished by their proficiency in the sciences, was born in the year 608, and died in 681 of the Hegira. His work is entitled "Vafiat Alaien," or "The Lives of illustrious Men," and was undertaken by him at the city of Cairo, in Egypt, under the reign of Theban, a sultan of the Man-eke dynasty. Being appointed by that prince cadi of Damascus in the year 659, the duties of his new employment far interrupted his studies, that he was not able to finish his work before the year 672.

KHAM, in Geography. See HAM.

KHAMIES, BEA, a cluster of mountains belonging to the colony of the Cape of Good Hope, situated in the middle of the country, that was formerly inhabited by the Namaqua Hottentots, at the distance of five days' journey N.W. from the Hantam, (which lies,) over a dry land desert almost destitute of water. This cluster of mountains being the belt, and indeed almost the only habitable part in the Namaqua country, has been taken possession of by the wandering peafanty, who, to the advantage of a good grazing country, had the additional inducement of feeding their sheep, from the carry means of increasing their flock of sheep from the herds of the native Hottentots, who, however, are now reduced and scattered among the Dutch farms, at a distance to be considered a distinct tribe of people. The

134 copper
copper mountains commence where the Khamies-berg ends, the whole surface of which is said to be covered with malachite, the carbonate of copper, and cuprous pyrites. But the ores of these mountains, though abundant and rich, are of no great value on account of the total want of every kind of fuel to smelt them, as well as of their very great distance from the Cape, and from there being neither bay nor river, where they could be put on board of coaling vessels. In the Khamies-berg is also found, in large blocks, that beautiful species of stone, to which mineralogists have given the name of Prehnite.

KHAMIR. See Chamer.

KHAN, or KAN, the name of an officer in Persia, answering to that of governor in Europe. There are khans of provinces, countries, and cities, who have different additions to distinguish them. In the language of the north of Afa, this title expresses the full extent of the regal dignity.

KHANAKA, a town of Kharafsm, on the Gilan; 250 miles S.W. of Samarcand.

KHANGA, or, a town of Egypt, formerly enriched by the caravans which passed from Cairo to Syria, and containing about 1000 inhabitants; 12 miles N.E. of Cairo.

KHANUDUM, a large lake of Persia, in the province of Adirbeiztan, 60 miles long and 30 broad; called also the lake of Urma; 30 miles S.W. of Tabris.

KHARA, a malignant being, according to Indian legends, who commanded a legion of 14,000 demons, like himself, in the wars of Lanka, as Homerically described in the Rama-yana. He expelled the cause of Ravana, and was with his followers destroyed by Rama.

KHARASM, or, in Geography, a country of Afa, bordered on the N. by Turkestan, on the E. by Great Bucharla, on the S. by Chorasam, or Korasan, and on the W. by the Caspian sea; extending from the Gihon, or Amu to this sea, and terminating N. and S. in wide deserts. Its chief town is Khiva. This country is about 350 miles in length and breadth, and in the time of Zingis, was a powerful kingdom, including at that time Korasan, and a part of Great Bucharla. D'Anville supposes, that this country was the Chorasam of antiquity, and he supposes Korasan to have been the seat of the Parthians. In the 10th century, Ebn Haukal calls this country Khaurezm, and says that the river Gihon flows into the lake of Khaurezm, while he terms the Caspian the sea of Khoz. We have reason to believe, that the deserts, probably occasioned by the declination of hills of sand-stone, have increased in Khafarn; and these encroachments may be estimated from the historians of Zingis and Timur. At present this lake is almost restricted to the district of Khoza (which fee), the circuit of which may be performed on horseback in three days; but there are five walled cities or rather towns within half a day's journey of each other. The inhabitants are Turcomans and Uibeks, besides the Sarts, which perhaps is another name for the Tadjiks. The khan is absolute and altogether independent of any other power, except the Mulla Bohl, or high priest, by whom he is controlled. The Kievari or Kzirzgijes (which feo), but surpass them in cunning and treachery. Their manners are the same, only that the Kirgeze live in tents, whilst the others inhabit cities and villages. Their only trade consists with Bokhara and Persia, whether they carry cattle, furs, and hides, all which they have from the Kirgeze and Turcoman Tartars, who are often very troublesome neighbours to them. The place itself produces little more than cotton, lamb-furs of a very mean quality, and a small quantity of raw silk, some of which they manufature. Hanway, cited by Pinkerton. 1 (See Khiya.) The history of Khafarn has been well illustrated by its king, or khan, Abulghazi, in his general history of the Tartars, written about the year 1600. See his biographical article.

KHAREJIT, the first heretical sect of the Mahometans, which revolted from Ali in the 37th year of the Hegira; and hence their name, which signifies "reformers," or "rebels." This sect commenced with 12,000 men, who abandoned Ali and his cause, after having fought under him at the battle of Saffain, taking offence at his submitting the decision of his right to the caliphate, which Moawiyah disputed with him, to arbitration, though they themselves had first obliged him to do it. They were also called Mohakemites, or Judicarians; because the reason which they gave for their revolt, was, that Ali had referred a matter concerning the religion of God to the judgment of men, whereas the judgment, in such cause, belonged only to God. The heresy of the Kherjeites conflicted in two particulars; viz. 1. That they pronounced a man might be professed to the dignity of Islam, or prince, though he was not of the tribe of Koreish, nor even a freeman, provided he was a just and pious perfon, and endowed with the other requisite qualifications, and also held, that the Islam, if he turned aside from the truth, might be depofed or put to death, and that there was no abfolute necessity for any Islam at all in the world. 2. That they charged Ali with sin, for having left an affair to the judgment of men, which ought to have been determined by God alone; and went so far as to declare him guilty of infidelity, and to curse him, on that account. In the following year, viz. the 38th of the Hegira, all the Kherjeites, who perished in their rebellion, to the number of 4000, were cut to pieces by Ali. Nine of them are said to have escaped, two into Oman, two into Kerman, two into Sefgan, two into Mefopotamia, and one to Tel-Mawrun; and to have propagated their heresy in those places, the fame remaining there to this day. The principal feats of the Kherjeites, besides the Mohakemites already mentioned, are six; which, differing in other respects, agree in absolutely rejecting Othman and Ali, preferring the doing of this to the greatest obedience, and allowing marriages to be imparted on no other terms; that they account those who are guilty of grievous sins to be infidels; and that they hold it necessary to refit the Islam when he transgresses the law. Sale's Koran, Introd.

KHATANGA, or, in Geography, a river of Russia, that has its source in a lake in the government of Tobolick, about 68 N. lat. and 110 long.; and in 120 long. rushes into a large bay of the Frozen ocean, called Khatanikai Guba. This river pursues the greatest part of its course through a low and very morbid country; and the most considerable rivers which add to its waters are the Keta and the Potigan.

KHATOUN-SERAI, a town of Alatic Turkey, in Caramania; 12 miles S. of Cogn.

KHUAR, or Cheroen, a town of Persia, in the province of Irak, seated on a mountain, which terminates the province of Irak towards Mazarand, and gives name to a pass, called the Strait of Khuwar; 200 miles N. of Ispahan.

KHAUASH, a town of Persia, in Segistan; 18 miles N. of Zarang.

KHAUL, a small district of Arabia, in the province of Yemen; a few leagues S.E. of Sana. It is governed by an independent sheich, the representative of a very ancient family; who ordinarily refites at Beil Kodos, a small town in his own dominions. Several places which once belonged...
longed to the prince of Khalian have been gradually annexed to the dominions of the Imam.—Alto, a small district of Arabia, lying among the mountains wellward from Saade, upon the road from Sana to Mecca, four days journey from Hal, the extreme city upon that side of the Ichirri's territory. It has an independent feléce.

KHAZARES, the name of a bold and powerful Turkish tribe, which first occupied the island of Caucasus between the Caspian and the sea of Azof. In the seventh century they began to be famous, and till towards the middle of the ninth century their state was increasing and flourishing. About that time the empire of the Khazares extended from the Volga and the Caspian, across the Caucasian isthmus, the peninsula of the Crimea, and what is now the south of Russia, as far as to Moldavia and Walachia; and several Slavonian tribes, particularly the Polanes about Kief and on the Dnieper, the Severans, on the rivers Defina, Sem, and Sula, the Viattitches on the Oka, and the Radimitches on the Sotha, were tributary to them. But after the year 862, three nations effected their downfall: viz., the Russians, the Petchengrians, and the Uzès. The Varagan or Russian leaders, Olgoi and Dir, ravished from them the dominion over the Polanes; Oleg, in 864, reduced the Severans and the Radimitches to his authority. His successor, in 964, conquered the territory of the Viattitches and the near Khazaran countries on the isthmus of Caucasus. The Khazares left the residue of their dominion about 1010, to the combined forces of the Russians and Romans of the east. The nation, indeed, continued for some time longer, but they were subduing and tributary to the Russians. Tuoke's Russ. Emp. vol. 1.

KHAZINE, the grand seignior's treasury. See Trea-
sury, and Exchequer.

Here are kept registers of receipts, accounts of provinces, in drawers, marked with the years, and the places' names: here also is kept part of the emperor's wardrobe.

Every day of the divan this treasury is opened, either to take out, or put something in; and the principal officers, who have the charge of it, are all to attend at this opening. The tchachouch-bachi, in their presence, break the wax with which the key-hole had been sealed up, and carrying it to the grand vizir, that minister kisses it, and then draws out of his box from the grand seignior's gold seal. In the mean time he looks narrowly after the officer, who, when he has done his business in the treasury, locks and seals up the place, and returns the seal to the vizir with the same ceremony as before.

Besides this, there are other apartments for the money, where the officers are never allowed to enter with any clothes that have pockets in them.

KHEIR, in Geography, a town of Hindooftan, in the country of Yaffapour; 18 miles N. of Poonah.

KHEIVAN, a town of Arabia, in a district of the same name, in the extensive country of Ilachid-in-Bekil, is remarkable for having been the seat, first of the Hamjare monarchs, and afterwards of the Imans. Ruins of a very ancient palace are still to be seen there.

KHEMILASA, a large walled town of Hindooftan, adjoining to which is a fort, built upon a hill. It belongs to the district of Sages, which is distant about 17 miles to the south eastward.

KHEEBAR, or KEIBAR. See HEDJA.

KHEIVA, or KIVA, a district of Khurasan, which see. — A.fo. the capital of this district and of Khurasan, situated on a ridge ground, W. of the river Gihon, and having three gates, and a very thick, strong wall of earth, much higher than the houses, with turrets at small distances, and a broad deep ditch full of water. It occupies a considerable space, and commands a pleasant prospect of the adjacent plains, which the industry of the natives has rendered very fertile; but the houses are low, mostly built with mud, the roofs flat, and covered with earth. The city of Urgam, which was formerly the capital of Khurasan, is now in ruins, with only a moat remaining. The most southern town in the dominions of Khiva is Azar, or Hazaraft, which adjoins to the great defart, called Keramid, which is Khiva is said to stand at the distance of 17 days from the Caspian sea, and from Orenburg 31, completing the day's journey at 40 ver. equal, by Hanway's account, to 17 British miles; so that the distance of Khiva from the Caspian would be 459 British miles, and our maps scarcely allow 300.

In 1729, the Khan of Khiva assembled an army of 20,000 men, to oppose Nadir; but the city surrendered at discretion. According to the information of Pallas, the people of Khiva bring to Orenburg considerable quantities of raw cotton. But the coasts of the Caspian are held by some remains of Turkishmen in the north, and by Ulbeks in the south. A more considerable trade is maintained with Mangufak, which see. As the merchants of Khiva brought gold and gems to Afsharachan, probably from the two Bucharias, there was an idea of fuggedating to Peter the Great, that these precious products were found in Kharaam, in consequence of which he attempted a settlement. But the Russians, to the number of 30,000, advancing under the command of a Circassian prince, called Bekkawit, towards Khiva, were all cut off by the Ulbks. Upon this occasion, as it has been said, these Tartars changed the course of the Khefel or Kuhil, which formerly fell into the Caspian; but as this river is on the E. of the Gihon, it is clear that it could not pass that river to join the Caspian; and in the 10th century the Gihon is known to have flowed into the Aral. It is not improbable that, before the deferts encroached on Kharaam, one or two rivers might have run to the Caspian from the east; or perhaps these fables may have arisen from one or two small branches of the Amu having joined that sea. Pinkerton. Khiva is 260 miles N.W. of Samarcand. N. lat. 41° 32'. E. long. 58° 25'.

KHILLI, a cape on the N.B. coast of the island of Negropont. N. lat. 38° 36'. E. long. 24°.

KHILLIN, a town of Syria, governed by an Aga; which, some years ago, was created into a pachalic, to restrain the Arabs; but the pacha being defeated, it was again put under an Aga. It is situated at the foot of Mount Taurus, and is a celebrated market for cotton; 25 miles N.N.W. of Aleppo.

KIRTIPOOR, a town of Nepal, the reduction of which cost the conqueror so much trouble, that in resentment of the resistance made by the inhabitants, he cut off all the men's noses. Col. Kirkpatrick, at the distance of 33 years, was reminded of this act of barbarity, by observing that a great proportion of the people appointed to transport his baggage across the hills were deprived of their noses. To perpetuate this exploit, the sovereign ordered the name of the place to be changed to Nafkatipoor, which signifies "the town of men without noses."

KHOMDEMIR, in Biography, a celebrated Persian historian, who obtained the patronage of the emir Al Shir, a lover and protector of men of letters, whom he inspired with a passion for his own favourite pursuit, and with the desire of forming a collection of the principal writers in this class of science. The great object which Khondemir had in view, was to facilitate the study of history by drawing it up in a more
more methodical manner, than had been done by other
writers, and the result of his labours was a judicious com-
pendium of oriental history from the creation of the world to
the year 875 of the Hegira, under the title of " Kiielaftat
Alakhar fi Veian Ahiul Alakihar," that is, " A faithful
and correct Summary of what is valuable and interesting
in the most authentic and genuine Historys."
Khorasan, Korasan, Chorasan, or Gorazm, in
Geography, a province of Persia, situated in the N.E.,
and bounded on the N. by Kahraman, on the E. by Buchars
and Candahar, on the N.E. by the river Gihon or Oxus, on
the S. by the lake of Zurrarah, or Durrah, and Segelttan, and
on the W. by the province of Mazendaran and the Caspian sea.
This province comprehends the ancient countries of Mar-341
giana N. and Ariana S. Its length is estimated at 450 miles,
and its breadth at 420. This country was comprehended
within the dominions of Timur Bec, who conquered it in
1396, and granted it to his son Mirza Charoe, together with
M. zanderan and Segelttan. Its capital is Hrat.
Khorfakan, a sea-port of Arabia, in the province of
Oman, situated in the bottom of a bay of the Arabian
gulf, which is only open to the east. On the S.E. side is
a harbour for boats. The town is now in a reduced state,
consisting of a few men's houses, with few houses of
flour. N. lat. 21° 15'. E. long. 56° 14'.
Khorremab-ad, or Curremab-ad, a town of
Peria, in the province of Irak, situated on a river which
runs into the Karsu; 200 miles W.N.W. of Ifpahan. N.
lat. 34° 35'. E. long. 48° 5'.
Khoschah, a town of Arabia, in the province of
Hdjas; 26 miles S.W. of Medina.
Khouod, a town of Hindooistan, in Orissa; 35 miles
S. of Koomjoor.
Khillijant, a town of Hindooistan, in Guzerat;
20 miles N. of Surat.
Kia, a town on the E. coast of the island of Gilolo.
Kia, a town of Persia, in the province of Chüllitan,
on the Karasu; 100 miles N. of Baflora. N. lat. 32° 30'.
E. long. 47° 40'. Also, an Arabian tribe, called also by
the Persians "Lieb," who inhabit the furthest point upon
the side of the Persian gulf. The territory of this tribe
extends from the desert of Arabia to the country of the
Hindian, and northward to the principality of Havifa. It
is watered by several rivers, large and small. It abounds in
dates, rice, grain, and pasture. Its principal cities are
Damah, lying within Persia, Hafar, and Ghoban, the seat
of a schekk, near one of the mouths of the Euphrates.
Kia-King, a city of the first rank in China, in
the province of Tche-kiang. This city is large and populous,
and carries on a good trade; its suburbs are extensive,
and over the canals and ditches are several bridges, and
these is not a house in the town, in which fish-worms are
not bred. Canals are cut through all parts of the town;
and its streets are ornamented with beautiful piazzas, which
shelter passengers from the sun and rain. There are many triumphal
arches within and without the city, and 15 marble towers on
the sides of the canal that lies to the west of the city, by
which all the barks pass. Seven cities of the third class
are dependant upon it. N. lat. 30° 50'. E. long. 120° 14'.
Kia Kiluma, one of the small Japanese islands.
N. lat. 29° 50'. E. long. 132° 12'.
Kiaaka, or Kachita, a town of Russia, in the go-

dernment of Irkukts, situated on a small river which runs
into the Selenga; one of the places open, between the courts
of Peking and Petersburg, to private trade between the
subjects of both nations; the other is Tzuruchata, or Zu-

ruchait, on the Argania; according to a treaty, settled at
Kiaata, in 1728. In 1752, the emperors abolished the
imperial monopoly, and laid the fur trade open; since which
time, no caravans have been sent to Peking, and Kiaata
is become the centre of the Russian and Chinese commerce;
60 miles S. of Scengchik. (Coxe's Russian Discoveries,
p. 220.) Kiaata contains about 150 houses, inhabited solely
by merchants and commissaries. Opposite to it, about 120
yards distant, lies the Chinese village of Maimafchun, con-

aining about 200 houses. Kiaata is reckoned the third
trading city in Russia, and contains 307 verits S. of Irkutsk,
and 1532 from Peking, on a small stream of the same name.
The following goods are exported free of duty; viz. all
sorts of paper, Russian cloth (except the common cloth
used by peasants), and spirits distilled from fruits. Goods
imported, which are duty free, are raw and dyed wools,
glafs-coral, faile pearls, white lead, fans, sewing needles,
printed cottons, ginger, confectionary, rice, toys, musical
and other instruments, porcelain, earthen ware, lacquered
and enamelled goods, furniture, and ornamental articles.
The exportation of arms, warlike itumes, powder and lead;
specie, gold and silver in ingots, lathums, spices, hides, beaver-
hair, pot-ash, rubber, and hemp-yarn, is prohibited; as is also
the importation of falt, spirits, poisons, and copper coin.
Since the year 1754, the merchants of European Russia,
who traded with Kiaata, were allowed, on account of the
distance, to pay the duties there by giving drafts. An order
in 1704, extended this privilege to the Siberian merchants
likewise, under the following conditions; the drafts must be
given on Irkutsk, Tobolsk, Moscow, or Peterburgh, and
made payable there. Nine months' payment was allowed,
but 10 per cent. per annum were charged for this
allowance. The drafts must be drawn according to a
particular form, and guaranteed. The most important
articles of trade are peltry, partly imported to Peter-
burgh from North America, particularly Canada, Russian
manufactures, viz. hides, leather, coarse cloth, Russian
leather, Muscovian woollens and silks, linen, metal and glufs
wares, and ilngs; provisions, viz. sheep and cattle, falt
meat, &c. and tallow and glue, foreign manufactures,
particularly fine cloths. The principal articles imported,
are fine silver in stamped bars; raw and wrought filk; raw
and manufactured wool; tea; rhabarb, porcelain, tobacco,
provisions, and prefered fruits. The manner of conducting
the commerce of Kiaata is as follows. Barter is the grand
medium. The Chinese come to the Russian warehouses,
where the families are laid out, previously to make their
affortments. Bargains are often struck on the spot, but ge-

rally the Chinese go to the merchants' houes to settle
their business. At first the Russians state what Chinese
goods they will take in exchange; then the price is accur-
ately fixed by both parties; and when they are agreed,
they return to the warehouse, where the Chinese puts his
feal on the bales, and sometimes on the whole flock. Then
the Russian goes to the Chinese, examines the goods which
he is to receive in exchange, and if they answer the con-
tract the barter is concluded. For the conveyance of this mer-
chandize the Chinese mostly use camels, but sometimes
four-wheeled carts. When the caravans cross the desert in
winter, they carry with them tents made of felt; but in sum-
mer they have balagans, made of reeds, which fold up
and are put into a cafe. When the balagans are fixed, and
covered with fail-cloth, two persons can sleep in one of
them very commodiously. All the Chinese who trade to Kiaata
understand the Mogul language, which is also spoken by
the Russian merchants.
The state of the trade at Kiakta, from 1793 to 1797, was as follows:

<table>
<thead>
<tr>
<th>Imports</th>
<th>2,546,825 rubles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exports</td>
<td>2,543,755</td>
</tr>
<tr>
<td>Total</td>
<td>5,090,580</td>
</tr>
</tbody>
</table>

Zuruchaiti, another mart of the Russian and Chinese trade, though much inferior to Kiakta, is seated on the river Argun, and lies 1325 miles east of Irkutsk. When the Mongul troops are quartered on the frontiers during the summer, this place carries on a trifling bartering trade in articles of primary necessity, which are not worth the detail, as the trade is funk almost to nothing. From 1793, to 1797, the imports and exports amounted only to 74 rubles; whereas from 1773, to 1777, they amounted to 2985 rubles.

Kiajk, a town of Persia, in Ardebiztan; 50 miles N.W. of Urmia.

Kiam, a town of Egypt, on the right bank of the Nile; 20 miles S. of Girge.

Kiangari, a town of Natalia, and chief place of a faqiricate, defended by a castle on a rock; 256 miles E.S.E. of Constantinople. N. lat. 39° 34'. E. long. 34° 17'.

Kiang-nan, a province of China, reckoned to be the most fertile, commercial, and opulent in the whole empire. It is bounded on the W. by the provinces of Honan and Hoqong; on the S. by Tche-kiang and Kiang-si; on the E. by the gulf of Nan-king; the reft borders on the province of Chan-tong. The emperors long kept their courts in this province; but they have since made choice of Peking, because it is nearer to Tartary. This province is of vast extent, and contains 14 cities of the first class, and 93 of the second and third. These cities are very populous, and places of trade. Large banks can go to them from all places, because the whole country is interlocked by lakes, rivers, and canals, which have a communication with the great river Yang-tse-kiang, or Kian-kou, which runs through the middle of the province. Silk stuffs, lacquer-ware, ink, paper, and, in general, every thing that comes from Nan-king, as well as from the other cities of the province, are much more esteemed, and fetch a higher price, than those brought from the neighbouring provinces. In the village of Chang-lai alone, and the villages dependent upon it, there are reckoned to be more than 200,000 weavers, of common cotton cloths. The manufacture of these affords employment to the greater number of the women. In several places on the sea-coast there are found many salt pits, from which salt is distilled over the whole empire. Upon the whole, this province is fo abundant and so opulent, that it brings every year into the king's treasury about 32,000,000 taels, a tax being equal to an ounce of silver, worth, in China, about fix shillings sterling; exclusive of the duties upon exports and imports. The inhabitants, who, according to the estimate of Sir George Staunton, amount to 32 millions, are ingenious and doce; and hence many of them become eminent in literature, and rise by their abilities to offices of importance. This province is divided into two parts, each of which has a distinct governor. The governor of the eastern part resides at Souchow, that of the western at Nan-king, which is the capital of the province.

Groser.

Kiang-Ning. See Nan-king.

Kian-fe, or Tchiang-fei, a town of Thibet, near a river which runs into the Sanpoo. It is represented as a fine city with a fortresl, and a convent, so extensive, as to have the appearance of another city; 25 miles S.W. of Laffa. N. lat. 29° 58'. E. long. 90° 4'.

Kian-ki, Kiam, Kiang, or Yang-ife-kiang, one of the two great rivers of China, (the other being Hoan-bo, or Hoang, which lies) rises in the vicinity of the sources of the Hoan-ho; but according to the received accounts and maps about 100 miles further to the west, and winds nearly as far to the south as the Hoan-ho does to the north. After washing the walls of Nan-king, it enters the sea about 100 miles to the south of the Hoan-ho. The Kian-ku is known by various names through its long progress; and near its source is called by the Eluts Porticho or Petchou: the course is about equal to that of the former, these two rivers being considered as the longest on the face of the globe: they certainly equal, if they do not exceed, the famous river of the Amazons in South America, and the majestic course of the Ganges does not extend half the length. In the late embassy of Lord Macartney, the length of the Kian-ku is estimated at about 2000 miles; and it is observed, that these two Chinese rivers, taking their sources from the fame mountains, and passing almost close to each other, in a particular spot, afterwards separate from each other to the distance of 12 miles of latitude, or about 100 miles: and finally discharge themselves into the same sea, comprehending a tract of land of about 1000 miles in length, which they greatly contribute to fertilize. To these great rivers, many important freams are tributary.

Pinkerton.

Kiang-si, a province of China, bounded on the N. by that of Kiang-nan, on the W. by Hou-qang, on the S. by Yong-tong, and on the E. by Fo-kien and Tche-kiang. The country is very fertile, but it is so populous, that it can scarcely supply the wants of its inhabitants. The mountains of this province are covered with medicinal plants and trees, and contain in their bowels mines of gold, silver, lead, iron, and tin. The rice of this country is delicate, and several banks are loaded with it every year for the court. The porcelain, made principally at King-te-ching in this province, is the finest and most valuable of the empire; and the wine made from this rice is reckoned delicious by the Chinese. The river Kan-kiang divides the whole province into two parts; and it contains 13 cities of the first class, and 73 of the second and third. The capital is Nan-chang.

The population of the province, according to Sir George Staunton's statement, is 19,600,000.

Kiao-Ke, a town of Corea; 72 miles W. of King-k'i-foo.

Kiao-Tao, a small island of China, in the Hoan-ho, or Yellow river, near the coast of Corea. N. lat. 38° 13'. E. long. 124° 25'.

Kaire, a town of Persia, in the province of Irak; 30 miles S.W. of Caffon.

Kia-tchou, a town of Corea; 27 miles S.S.W. of Sing-te-chou.

Kia-tung, a city of China, of the second class, in the province of Se-tchouan, on the river Yang; great quantity of musk is collected in the environs of this city. N. lat. 29° 29'. E. long. 103° 30'.

Kiauten, a town of Prussian Lithuania, situated in a mountainous country, with an iron foundery, and a large manufacture of paper.

Kia-y-a-bey, an officer in the Ottoman empire, who is the lieutenant of the vizir, and momentarily discharges his functions when the latter happens to die. All affairs pass through his hands before they arrive at the vizir, and all orders emanating from the Porte receive their execution through the interpulse of the kia-a-bey. He is appointed by the grand vizir, on the presentation of the vizir.
is generally involved in the disgrace of his principal, and if
he do not lose his head as frequently as the other, his for-
tune always, in that case, runs the greatest risk. Although
he has no military rank, it may be said that he occupies the
second administrative place in the empire, considering the
importance and multiplicity of his functions. If the sultan
be dissatisfied with his services, he receives, on quitting his
office, the dignity of simple vassal, or pacha with three tads.
It seldom happens that he is given only the two tails when
he is sent to govern a province. See BEY.

KIBBLED, in Geography, a town of Africa, in Bornou; 150 miles S.E. of Bornou. N. lat. 18° 23'. E. long. 24° 16'.

KIBES See CHILBLAIN.

KIBITKA, a travelling carriage in Russia, which is a
small cart capable of containing two persons abroad, while
the driver sits on the farther extremity close to the horses'
tails. It is about five feet in length, and the hinder half is
covered with a semi-circular tilt, open in front like the top
of a cradle, made of laths, interwoven and covered with birch
or beech-bark. There is not a piece of iron in the whole
machine. It has no springs, and is fastened by means of
wooden pins, ropes, and thongs to the body of the carriage.
The Russians, when they travel in these kibitkas, place a
feather-bed in the bottom, admirably calculated to break the
intolerable jolts and concussions occasioned by the uneven
timber roads. With this precaution, a kibitka, though inferior
in splendour, equals in comfort the most commodious
vehicle. The traveller stretches himself at length upon the
feather-bed; and, if inclined, may doze away the journey
in perfect tranquillity.

KIBOLA, in Geography, a town of Mingrelia; 25 miles
S.E. of Anarghia.

KICKAPOO, a town of America, in the Western ter-
ritory. N. lat. 40° 20'. W. long. 87° 10'.

KICKAPOUS, an Indian nation, whose different tribes
inhabit near the entrance of lake Superior, where, some years
ago, they had 400 warriors; some reside at lake Michigan,
and between that and the Mississipi, near the Outagamies,
&c.; and another tribe near the Paukehaws, and on the
Wabash and its branches. The Kickapous and Kalkadias,
two Indian nations lately hostile, ceded lands to the United
States at the treaty of Greenville, Aug. 3, 1795. See KAS- 
KASKIAS.

KICKEMNIT, a river of America, being the north-
western arm of Mount Hope bay; about two miles long,
and half a mile broad. North-west of it lies the town of
Warren, in the rate of Rhode island.

KICKER, in Agriculture, a term applied to such horses
as have the habit of kicking; this should be particularly
guarded against in the rearing and managing of young
horses, especially those intended for team labour.

Kicker against the Spars, in the Magazine. See RA-
NINGEE.

KICKTOOL, in Geography, a town of East Greenland.
N. lat. 61° 15'. W. long. 47° 5'.

KICYDANI, a town of Lithuania, in the palatinate
of Vilna; 48 miles N. N.W. of Troki.

KID, a small island near the western coast of Ireland,
a little N. of Broadhaven; 3 miles S.W. of Browy Head.

Kid, a name applied to the young of the goat kind. See
GOAT.

Kid, in Rural Economy, a small faggot of under, or brush-
wood.

KIDARNAUT, in Geography, a town of Thibet; 100
miles N of Srinagar. N. lat. 32° 41'. E. long. 79° 12'.

KIDDER, Richard, in Biography, a learned English
prelate, of whose early life no account has come down to
us. In the year 1649, he was sent to Emanuel college,
Cambridge, where he took his degrees. Two years after-
wards, he was incorporated at the university of Oxford.
He was presented by his college to the vicarage of Stan-
ground, in Huntingdonshire, from which he was ejected
for non-conformity, under the Bartholomew Act, in 1662.
Either the fear of suffering, or some other motive, soon
brought him back to the bosom of the church, and he was,
in 1665, presented by the earl of Ely to the rectory of
Raine. Here he continued about ten years, elevated by
his connections, and in high reputation for learning, par-
ticularly for his extensive and deep knowledge of the oriental
languages. In 1674, he became rector in the metropolis,
and, in 1681, he obtained a prebendary in the cathedral
church of Norwich, which was succeeded by his nomination to
the deanery of Peterborough in the year 1689. About this
period he took his degree of D. D. and in 1691 he was con-
secrated bishop of Bath and Wells. In 1693, he preached
the lecture founded by Mr. Boyle, and afterwards inferred
his sermons on that occasion in his "Demonstration of the
Mollusks," of which work they constitute the first three
chapters in the second part. The bishop continued his lab-
bours as an author till he unhappily killed in his bed,
the fall of a stack of chimney in his palace at Wells, during
the great flern in the night of Nov. 26th, 1703. He was
elected one of the first divines in his time. His largest work,
next to that already mentioned, was "A Commentary on the Five Books of Moses,
with a Dissertation concerning the Author or Writer of those Books, &c," in 2 vols. 8vo. Bishop Kidder
was author of "The Life of Dr. Anthony Horneck," 1698:
"Critical Remarks upon some difficult Passages of Scripture
in a Letter to Sir Peter King," 1719, a polemical
publication; several practical tracts; tracts on the Popish

KIDDERMINSTER, in Domesday Book written Chidemin-
ninger, in Geography, a market town and parish in the
hundred of Halshire, and county of Worcester, England,
is seated on the river Stour, at the distance of 13 miles of
Worcester, and 126 N.W. of London. In the year 1800,
the town contained 1695 houses, and 8350 inhabitants,
the majority of whom were dependant on, or connected
with, the manufactures of the place. In the time of king
Henry VIII. Kidderminster was noted for its manufactures,
brit of broad cloths, afterwards of woollens, and subse-
quently of bombamines, crapes, and poplins. But early in
the last century the carpet business was introduced here, and
has continued, with increasing success, up to the present
time. In the year 1772, the town and its suburbs contained
no less than 250 looms, and since that time a larger number
has been employed. At first, the carpets made here were of
the Scotch and flat species, but soon cut carpets were invent-
ed, and this kind has since continued to be the distinguished
craft of Kidderminster. By sundry charters from Henry II.,
Richard II., Henry VI., and Henry VIII., the inhabi-
tants are granted an exemption from toll, pontage, and murage
throughout the whole kingdom; all these privileges are
also confirmed by a charter from queen Elizabeth. In this
town the lord of the manor, or his deputy, occasionally
holds a court-leet, principally for the prevention of encroach-
ments and public nuisances; here is also a court of requit
for recovery of debts under forty shillings. No county-
justice has a right to exercise any judicial authority in this
town, which is governed by a recorder and bailiff; the
latter is annually elected by his brother aldermen, twelve
in number, with the concurrence of twenty-five common-coun-
cilmen, who collectively are enabled by charter 12 Charles I.
KID

to make bye-laws for the government of the body-corporate and the trade of the town. It formerly lent members to parliament. A market is held on Thursdays for all sorts of grain; but this article is now chiefly dispensed by of fairs. This church, a large structure of great antiquity, is capable of containing more than two thousand persons. In the choir are several ancient monuments belonging to the Bowes and Cooks: also a crose-legged effigy of the late Sir Thomas Arvon. The tower is a strong and lofty one. The grammar-school, to which all the inhabitants have the privilege of sending their children free of expense, is at the east end of the choir of the church: the preceptors, one described in the charter as the high, the other as the low master, are elected by certain feoffees, to which the content of the bishop is always necessary; their annual stipend, upwards of 150L. arising from buildings and lands with which the school is endowed.

The town-hall, which is principally constructed of brick, is roomy and elegant; a portion of the lower part is used as a prison, but to the credit of the town, it is very rarely occupied; on what is called the ground-floor are erected stalls for the butchers; and, above, is the council-chamber for transacting the business of the corporation. Kidderminster, by the late inland navigation, has communication, by the junction of the Severn canal, with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c.; which navigation, including its windings, extends above five hundred miles. The river Stour rises in the celebrated groves of the Leafeows, near Hales Owen, distant from hence about twelve miles, and after forming a large reiver at a village called Cradely, proceeds through Stourbridge, Kinver, and Wolselely, and enters Kidderminster on the north side, tracing nearly its whole length, and thereby dividing it into two unequal parts. Over this little river, whose length is not more than twenty miles, part of which was once navigable, are now erected a great number of forges, flitting-mills, corn-mills, and other works of considerable utility; and to the fountains of its waters to the purpose of dyeing is attributed, in a considerable degree, the unequalled lustre of the colours of the yarn used in the several branches of the weaving manufactury here, which, on this account, is justly esteemed an inexhaustible source of wealth to the inhabitants. The Staffordshire and Worcestershire canal, completed in the year 1774, at the expense of 105,000L. crosses the Stour within one hundred yards from Kidderminster market-place. In this town are three respectable reading societies for cultivating the taste of the wealthier inhabitants; and the instruction of the poor is not forgotten; for, exclusive of several Sunday schools, no less than eight charity schools are established. Here are also twelve almshouses, and other charitable endowments. At Round-hill, in this town, is a chalybeate spring of great medical virtues; and in the vicinity are several others, of which at Sandburn is the strongest. Brit. Directory, vol. ii. The name of Baxter was long held in veneration in this town. See his article.

KIDDERS, those that badge or carry corn, dead victuals, or other merchandise, up and down to fai: every person being a common badge, kider, lader, or carrier, &c. says the lat. 5 Eliz. cap. 12. And they are called kidders, 13 Eliz. cap. 25.

KIDDE, or KIDZ, Kidillus, a dam or wrir in a river, with a narrow cut in it, for the laying of pots, or other engines to watch fish.

The word is ancient; for in Magna Charta, cap. 22, we read, "comes kidelli depensatar per Thameham & Medweyam & per totam Angliam, nil per colleram mari." And by king John's charter, power was granted to the city of London, "de kiddles amovendis per Thameham & Medweyam." A survey was ordered to be made of the woods, mills, banks, &c. in the great rivers of England, (Tlen. IV.) Fishermen of late corruptly call these dams kiddle; and they are much used in Wales, and on the seacoasts of Kent.

KIDDOW, in Ornithology, the most common English name of the common, a web-footed bird, common on our shores, and called in different places the eiderdum, or eider, and the fiskal and stout. See Cercophas Tylex.

KIDED, in Agriculture, it is term properly applied to the pods of legums.

KIDELLIA, in Geography, a town of Russia, in the government of Viborg, on the N. coast of lake Ladoga; 48 miles N.N.E. of Kielchow.

KIDEROW, in Rural Eeconomy, a term that signifies a place for keeping a flocking-calf.

KIDES, in Geography, a town of Sweden, in the government of Kielop; 83 miles S. E. of Kielopin.

KIDGE, a fortified town of Perria, in the province of Mckran. N. lat. 26° 30'. E. long. 61° 10'.

KINDAPPERS, Cape, a cape on the E. coast of New Zealand, discovered in 1769, and this named by captain Cook, from an attempt made by the inhabitants to carry a boy from the Endavour. It is remarkable for two white rocks like hay-stacks, and high white cliffs on each side. S. lat. 39° 43'. W. long. 182° 24'.

KINDAPPING, in Law, is the offence of a forcible abduction or stealing away of a man, woman, or child, from their own country, and putting them into another. This offence was capital by the Jewish law. (Exod. xxi. 16.) So likewise in the civil law, the offence of spirited away and stealing men and children, which was called "plagium," and the offenders "plagiarini," was punished with death, (Fr. 48. 154.) This is unquestionably a heinous crime, as it robs the king of his subjects, hampers a man from his country, and may in its consequences be productive of the most cruel and disagreeable hardships; and, therefore, the common law of England has punished it with fine, imprisonment, and pillory. (Raym. 474. 3 Show. 221. Skin 47. Comb. 10.) Also, if a master of a ship shall, during his being abroad, force any person ashore, or wilfully leave him behind, or refuse to bring home all such men as he carried out, if able and desirous to return, he shall suffer three months imprisonment. 11 & 12 W. III. c. 7.

KIDNEY, in Anatomy, a glandular body, situated in the abdomen, and secreting the urine.

The urinary apparatus consists of two secretory organs (the right and left kidneys), by which the urinary fluid is separated from the blood; of three membranous tubes (the ureters) by which this fluid is conveyed into a large muscular-membranous resevoir (the urinary bladder); and of a canal (the urethra) by which this resevoir is evacuated at various intervals. The latter conveys the urinary fluid also in the male subject; and is therefore described in the article GENERATION. The different arrangement and conformation of the female generative organs occasion the urethra to assume a very different form; it is here entirely unconnected with the generative functions, and we shall therefore describe it in the present article with the bladder.

The essential parts of the urinary apparatus correspond nearly to those of the bladder organs; but there are some remarkable differences. The bladder is always a single organ. There are almost constantly two kidneys. The proper portions of the secretory organ and the resevoir are inverted in the two cases; the bladder is to large as to exceed probably all the other glands in the body put together; the gall-bladder

15
is comparatively small: in the other case, the capacity of
the reservoir considerably exceeds the size of the glandular
organs. A part only of the bile pasies into the gall-bladder,
the remainder flowing directly into the duodenum; and this
secretion seems not to be very active in the intervals of the
digestive process. The kidneys, on the contrary, are always
active, and the whole of the fluid which they separate
paves into the urinary bladder.

Two small bodies, placed near the kidneys, and called the
renal capsulars, receive their vessels for the mott part from
the renal: we shall therefore unite their description with
that of the kidneys.

The kidneys are placed deeply in the lumbar regions,
at the sides of the vertebral column. They are usually
two, a right and a left; but the number is exposed to
occasional unimportant variations. Sometimes the two are
united by their upper or lower extremities, so as to form
a crescent, with the concavity upwards or downwards,
something like the figure of a horse-shoe, from which the
gland, in these cases, is sometimes named: or, there may
be an unusually large one on either side, with two ureters,
and a deficiency of the opposite gland: or, a small super-
numerary kidney on the front of the vertebral column.
Other deviations from the accustomed structure have been
registered by anatomists; but all these varieties are unim-
portant in physiology.

They are surrounded by a large quantity of fat, of a
peculiar structure and properties. This sub stance is con-
tained in a loose and easily lacerable cellular texture, which
connects it to the kidney; it forms a complete case, isolat-
ing these organs from the surrounding parts. Its quantity
varies remarkably in different subjects, being so abundant
as to hide the organs where the individual is very fat, and
very sparing in the opposite state. This fat is remarkable
for growing hard when it is cold, particularly in the rumi-
nating herbivorous animals, where it is distinguished by
the name of suet.

On account of the different bulk of the liver and spleen,
the two organs, which are placed immediately above the
kidneys, the latter are somewhat differently situated on the
two sides of the body, the right being rather lower than the
left: the difference in this respect may amount to an
inch, but it is not constant. They both lie deeply buried
behind the abdominal vasaera; the right having above it the
renal capsulae and the liver, and in front the colon and
eaeum, the duodenum, and the other small intestine; the left
being covered by the spleen and pancreas, iliumac, colon,
and small intestine.

The figure is fairly compared to that of the kidney bean,
with the concavity placed forwards. It is elongated from
above downwards, convex in the greatest part of its cir-
cumference, and rather broadest at its upper end. The size
varies considerably, from four ounces in the adult to five,
six, or even a pound; often one is considerably larger than
the other.

In order to describe more exactly the external form and
the relations of the kidney, we divide it into two surfaces
and a circumference. The anterior surface is slightly convex:
sometimes completely covered by the periosteum, with the
interception of a stratum of variable thickness of fat and
loose cellular substance; and sometimes in more or less im-
mediate contact with the corresponding part of the colon:
for in some subjects the membrane simply paves in front of
the intestine, and binds it to the kidney, while in others
there is a more or less loose fold, called the lumbar mem-
ocolon. From the right kidney the peritoneum rises to the
liver above, and even to the diaphragm; below, it paves
to the colon and duodenum; on the left side it goes to the
colon and spleen. Cellular substance, containing more or
less fat, always connects the front surface of the kidney
to the membrane; so that the gland is behind the cavity
formed by that membrane, and would not be enumerated
among the abdominal viscera, if that epithelet were con-
fined to the parts contained within the cavity of the
membrane.

The posterior surface is nearly plane, and rests on a
thick layer of fat, which separates it from the lower part
of the diaphragm, from the anterior layer of the aponeurosis
of the transversus, where it covers the quadratus lumborum,
and from the piaus magnus.

Thus, there is placed behind the kidney the thick mafs
of soft parts, which extends from the pelvis to the chest,
protecting the organ from all external injury, and rendering
it nearly inaccessible to the knife of the surgeon. It is
also supported behind by the two or three left ribs. In
its longitudinal direction it corresponds nearly to the two
haft dorsal, and the two neighboring lumbar vertebrae.

The circumference of the kidney presents a thick and
rounded extremity above, covered by the concave bafs of
the renal capsule; a thinner and more elongated end below,
approaching more or less nearly to the crista of the ilium:
a convex, thick, and rounded edge, turned outwards, and
corresponding to the muscular paires of the abdomen and
the diaphragm: a deep excavation on the inside, called the
notch of the kidney. This notch has thick and rounded
edges, and contains some fat. The divisions of the renal
artery occupy the upper and front part, thofe of the
vein are placed behind: the pelvis occupies the deepest
portion, and the commencement of the ureter is seen below.

The conhience of the kidney is remarkably firm, ex-
ceeding, in this respect, all other glandular organs. Its
colour is reddish, with a tinge of brown; but the intensity
varies according to the quantity of blood contained in
the vessels. When an animal has died of hemorrhage, it is quite
pale. The structure of the organ comprehends a peculiar
 glandular titure, arteries, veins, lymphatics, nerves, excretory
tubes, and a peculiar membrane.

The proper tisue of the kidney is remarkable for its
firmness. It will be best understood by carrying a section
through the kidney, to as to divide it into an anterior and
a posterior half. We shall then be able to distinguish very
clearly two substances; an exterior, which is called the
cortical or arterial, and an interior, named the tubular or
uriniferous. All kidneys are not equally well fitted for this
examination: in some, without any alteration from diffae,
the two substances are confuned together. The contrast of
the two component parts is seen particularly clearly after
minute injection.

The section of the kidney prefers to us also, disposed in
a still more deeply seated stratum than the tubular part,
a series of small bodies, called papilla or manillae, which
are merely the apices of the small cones formed by the tubular
substance. Many anatomists describe these as a third sub-
stance, under the name of the manillar. Lastly, we observe
the infundibula or calyces, and the pelvis, besides the orifices
of divided vessels scattered here and there.

The cortical substance is so named because it covers the
exterior surface of the organ: it is about two lines in
thickness. Its colour is a palish red, inclining to yellow:
its consistence is less firm than that of the tubular, and is
about the fame with that of the liver, so that it may be torn
easily. It is smooth externally, and closely connected to
the proper membrane of the kidney. Internally it is con-
tinuous with the tubular substance, and it forms prolonga-
tions.
The tubular matter which fill the intervals of the different portions of the
urinary system have been called the tubular columns of the kidney: they grow thinner as they approach the pelvis, round which there is always found some adipose
substance. Their number depends upon that of the papillae.

The renal arteries are distributed almost entirely to the
cortical substance; injections thrown into these vessels
penetrate it most easily, and colour it throughout: hence it
has been concluded to be of a nature entirely vascular.

It will be observed that certain parts of the kidney, as the
under surface, are often confluent with the blood-vessels as
grapes are to their stalks; these are technically named acini.

On passing from the cortical substance, small granular masses
are observed on the surfece, and minute granular bodies
are seen in great abundance throughout this part of the
kidney, where it has been minutely injected. These are considered
as the glands in question, while some contend that they
are only convoluted blood-vessels. For an account of
the controversy on this matter, see GLAND.

The tubules or uriniferous, called also the filtrated sub-
stance, is lighter in its colour, more dense and solid than the
cortical. Injections do not penetrate it, but leave it in
general quite colourless.

It is composed of a vast number of small tubes (tubuli uriniferi) united into conical facici-
uli of unequal size. The rounded bases of these facici-
uli are turned towards the exterior of the kidney, and
present diverging slits, which are lost in the cortical sub-
stance; their apices are directed towards the notch. These
faciculi are everywhere surrounded by the cortical sub-
stance, except at their apices, which are embraced by the
minor dilatations. Each of these points forms a conical papilla,
pierced by numerous small apertures, which are the openings
of the tubules just mentioned.

The papillae, therefore, are simply the points of the cones
which constitute the tubular substance: their number varies
from five to eighteen. Generally there is a single papilla
for each cone; sometimes two cones are united by one
papilla, which is then larger; two papillae are very seldom
found on one cone. Their form and length are very var-
yous; they may be shorter and rounded, or long and pointed. They
are of a tolerably bright red colour, but sometimes rather
darker, while the rest of the tubular substance is redder, or even
a violet hue at the bases of the cones. Their surface is
smooth, flat to the touch, and probably covered by a fine
membrane. The orifices of the uriniferous tubes are seen
on it, and as there are much less numerous than the mass
of the tubular substance, probably several of the fine tubes
 unite together before they terminate. Compression of the
kidney causes the urine to exude at these pores; and
the urine may be expressed in like manner, when the papillae
have been divided by a fections perpendicular to the surface
of the tubes.

From the preceding description of the two substances
which compose the kidney, it appears, that the cortical
performs the secretion, and that the tubular, completely unac-
counted for this function, has the office of transmitting the
secreted fluid. This is different from all other glands of which the component substance is identical to that of
the tube.

This the uterine of the kidney are entirely distributed in
the cortex, and are connected with the renal arteries, whereas the
arterial, though from the same branches, which enter the kidney, and course in the
substance, are united to the hilus arteri. The
arterial are to be considered as the organs of
vascular connection between the renal and inter-
renal systems. The
arterial are the vessels which run through the
inter-nephric septa, to supply the inter-nephric
tissues, and though occasionally described as blood
tubes, they are really so few in number, that they cannot
be considered as connected with the arterial vessels of
the kidney.

The arteries, veins, and nerves of the kidney are the
branches of the lumbar, renal, and renal arteries, except
the veins of the hilus, which are proper branches of the
aorta. The nerves are the branches of the
nervi of the colli and inter-costi. The nerves
are the nerves of the collateral branches of the
nerves of the iliacs, and the sympathetic nerves of the
abdominal cavity.
The nerves, derived from the ganglia of the great sympathetic, constitute the renal plexus, of which the branches surround the blood-vessels, particularly the artery, and penetrate with it into the kidney. The kidnies seem to be hardly feasible in the natural state; but disease, as, for example, inflammation, develops their feasibility in a very high degree.

The external surface of the kidney is closely invested by a peculiar membrane, sometimes called the capsule, which adheres by means of short and very fine threads, but can be separated without much difficulty. It enters the notch, and is connected there to the calyces and blood-vessels. It is very dense and firm, semi-transparent, rather thicker than the peritoneum, and not divisible into laminae. Immerison in boiling water makes it curl up and become thicker.

The ureter is the tube denoted to convey the urine from the kidney, commencing from the inner and lower part of the pelvis of the kidney by a wide opening, sometimes called infundibulum, and continued thence in a defcending course to the inferior surface of the bladder, where it is not more than an inch distant from its fellow of the opposite side. Its ordinary size is about equal to that of a quill, except towards the lower extremity, where it is lightly contracted; but it varies in this respect in different subjects, and even in different parts in the same subject. Commonly there is one to each kidney, but sometimes it is double.

From its origin it goes obliquely inwards and downwards as far as the front of the sacro-iliac symphysis, where it is separated from the opposite one by the breadth of the base of the sacrum. In this part of its course the peritoneum and the spermatic vessels lie in front: the psoas muscle, which it crosses at a very acute angle, is behind it. Lower down it crosses the common iliac artery and vein. The right tubes lie parallel to the outer side of the inferior vena cava. Several small blood-vessels are distributed on it. At the base of the sacrum it passes forwards, downwards, and inwards through a large quantity of adipose substance, and advances towards the under surface of the bladder. Here it crosses the vas deferens, and is placed a little above and externally to the vasa deferentia, at which point it penetrates the bladder. It runs obliquely between the coats of that organ, passing for about an inch from without inwards and from behind forwards, between the muscular and mucous coverings, and then opening into the cavity by a very narrow orifice placed at the posterior angle of the triangular space near the neck of the bladder.

The course of these tubes is the same in the female; they present no peculiarities worthy of notice in the pelvis of this sex.

As the ureter is a continuation of the pelvis, we naturally expect to discover in it the same organization as in that bag. Anatomists describe three coats; an exterior, thin, transparent, and of a cellular nature; a middle, which is thicker, and gives to the part its colour and consistence; and an internal mucous covering, continuous with those of the pelvis of the kidney and bladder, and habitually moistened, like them, with a mucous fluid capable of defending it from the action of the urine. These strata are, however, so closely connected, that it is almost impossible to exhibit them distinct. The blood-vessels are derived from the renal, the spermatic, the aorta and vena cava inferior, and the iliacs.

The ureters, as well as the pelvis and calyces of the kidney, are very extensible: their ordinary functions probably require the exercise of such a property, as they must be subject to various conditions of plenitude and emptiness. But disease elucidates this point most clearly: when the natural passage of the urine is obstructed by a stone, or when it is disturbed by difficulties in the evacuation through the urethra, the ureters are often enlarged very considerably, even in some cases almost to the size of a small intestine, and the pelvis, with its dependencies, undergoes an analogous dilatation.

These parts do not seem to possess animal feasibility in their natural state; but that property is manifested in them to the highest degree, by the passage of a stone, which causes perhaps torture as exquisite as any diffuse of any organ in the body.

Their function of conveying the secreted urine from the kidney to the bladder, requires the exercise of tonic powers: the idea of this fluid finding its way by the force of gravity, is not only repugnant to the laws of the animal economy, but is irreconcilable with obvious phenomena. The adhesion of the fides of the tube, where it penetrates the coats of the bladder, presents an obstacle, which can be overcome only by the exertion of some force; and this obstacle is vastly increased in the dilated state of the bladder, during which the fluid is constantly finding its way into the receptacle. The only power in this case, by which the requisite end can be obtained, is a contraction of the canal.

Development of the Kidney.—In the fetus all parts of the urinary apparatus are remarkable for their considerable advancement; and some are distinguished by considerable peculiarities of structure and formation. The kidneys are very large, surrounded at first by a soft and reddish cellular tisue, but covered, before the end of utero-gestation, by a small quantity of granulated fat; this is most abundant behind, so that the peritoneum is almost immediately in contact with them in front. The external surface is tuberculated at this time: anatomists have sometimes described the organ, as if the cones of tubular substance were imperfectly connected together as yet, so that each kidney might be regarded as an assemblage of smaller kidnies. This representation is not correct; no traces of such distinction are visible in the interior; and the tubercles of the outside, which correspond to the bases of the cones, seem to depend on the cortical matter being not completely developed. Some animals, as those mammalia which either live in or frequent the water, have kidnies composed of small kidnies connected by cellular substance. There is in these cases a large number of cones, each surrounded by a stratum of cortical matter, and furnished with a calyx of its own; and these separate pieces are only united by cellular substance. We may conceive the human kidney to be formed in this way, except that the separate portions are blended into one mass; and the distinction is only external even in the fetus. A structure of a description quite opposite prevails in many other animals, particularly in all the fere of Linnaeus. The kidney in them consists of a single portion of tubular substance, with one papilla and calyx, and a single stratum of cortical matter.

While the kidney retains this tuberculated exterior, the proportion of cortical matter is smaller than in the perfect gland; but the distinction between it and the tubular is well marked: the papilla exhibit a very lively red colour. The gland at this time has considerable dimensions, particularly if compared to the liver or spleen. The capsule is very perfectly formed, and separates easily. The calyces, pelvis, and ureter are remarkable for their considerable progres: the latter, in particular, is nearly half as large as in the adult, in a fetus of seven or eight months. Its size may be more accurately estimated if it be compared to the vas deferens, which is like a slender nervous thread, recognizable on γ by its whiteneess.
No considerable change has taken place at the time of birth; although the kidneys are still tuberculated, their figure is more precisely determined, and the difference of the two confluent parts is strongly marked. There is nothing remarkable about the pelvis or ureter. In the subseuent years the connective tissue is more abundantly about the kidneys; these organs, by acquiring a thicker covering of cortical matter, lose their unequal surface, and gradually assume the form which characterizes them in the adult. The external membrane becomes more dense, and more closely connected to the surface. The other parts experience no further change except that they partake of the general growth. In old age the kidneys become soft and flaccid; and the surrounding fat is diminished in quantity. The external membrane presents occasionally points of a cartilaginous consistence.

**Physiology of the Kidneys** — The minute ramifications of the renal arteries, which compose to a great portion of the cortical substance of the kidneys, separate from the blood the urinary fluid, which is conveyed along the tubuli uriniferi, and deposited by their orifices in the calyces of the kidney. It then goes through the pelvis and ureter, and thus arrives at the bladder. The secretion goes on constantly, and the transmision into the bladder is equally constant; for there is a continual efflux, when a catheter is placed permanently in the bladder, as also in those examples of malformation, where the ureters open on the surface of the body. Ligatures placed on the ureters, or obstructions of those canals by other causes, as, for example, by stones, demonstrate this course of the urine; the tubes are deflected between the kidney and the obblache, and empty below.

That the urine is formed in the cortical substance of the kidney, is the amount of our knowledge concerning this part of the subject; the mode, in which the secretion takes place, is entirely unknown. This is the problem of secretion, towards the solution of which we have approached no nearer than the above general fact since physiology has been cultivated. In the present instance, indeed, it is not yet agreed whether the uriniferous tubules are continuous with the capillary arterial canals, or whether some organ be involved between them. Hence all attempts to explain the peculiar nature of the urine from the structure of the parts in which it is formed, and to shew how the properties of this fluid agree with the size, direction, curvatures, &c. of the canals, in which the secretion takes place, must be founded on grounds completely chimerical, although these reveries are fanctioned by the respectable authority of Haller.

(Elements. Physiol. lib. 26. sect. 4. § 5.) Another unaccountable error is committed by the same physiologist in his observations on this subject. He afferts that the urine is formed in the blood, and separated only by the action of the kidney; and defends the opinion by stating that this fluid goes off by perspiration, or by the stomach and intestines, when its ordinary passage is obstructed. This notion is completely irreconcilable with the present state of our knowledge concerning the chemical constitution of the blood and the urine; and the alleged facts, by which it is supported, are, to say the least, of a spurious nature.

We may establish, in the second place, this fact; that the kidneys are the only organs in the body capable of forming urine, and that the ureters are the only passages by which fluids can be conveyed into the bladder. Yet both of these points are contrary to the opinions of some physiologists. When the evacuation of the urine from the body is stopped, some suppose that it is separated by other organs. "It appears," says Haller (Elem. Physiol. lib. 26. sect. 4. § 123), "that the fraction of the circulation, and the heat of the fluids produce in the blood acid particles, tending to an alkaline nature, of which the more volatile are diffipated by inensible perspiration, while others, too large for the pores of the skin, can be separated by the kidneys only. For, in all cases of icterus, where these particles are not separated by the urine, either symptoms of armony take place in the whole body, or these matters are thrown off by other organs. Thus the sweat and perspiration have an umericous odour; or there is an urinous order of the whole body, or urine deposited in the cellular substance, with violent and fatal fever. In other instances urine has been discharged by the salivary organs; by the ears or nostrils, mixed with blood; by the uriniferous; or fluid; or it has become mixed with the fluid of the abdomen, or it has been deposited in the brain, causing cephalagia, blindness, delirium, eruptions, convulsions and apoplexy. When secreted into the stomach, it causes hic-ough and vomiting. Lastly, the congelion of earthy substances in the blood, caused by icterus, may produce sandy matter in the sweat." That a fluid, polishing such very peculiar properties as the urine does, consisting of such numerous and complicated elements, and separated finally in a very intricate cellular structure, should be formed also in almost every other kind of organic apparatus in the body; that it should be separated by the exhalants of the cellular substance, and of the kidneys, by those of mucous and ferosus surfaces, by the vesicles of the brain, as well as by glandular organs, is a position so completely at variance with all that we understand of the composition and actions of the animal frame, that we could not receive it without very unexceptionable evidence. The whole quotation exhibits credulity rather than the deliberate caution necessary for establishing to singular a fact, and the subjoined authorities are not at all calculated to remove our scruples. Perhaps an urinous odour has been sometimes observed in the perspiration; although we believe that even this has not been hitherto proved by very convincing evidence. Must we immediately conclude that the cutaneous exhalants have formed urine? When the biliary passages are obstructed, and varius fluids are tinged with bile, we explain the phenomena by the absorption of that fluid from its natural receptacles. Will not the same explanation suffice for the cases, if there are any sufficiently proved, of urinous properties in the other secretions and exhalations of the body?

That there is some more direct passage from the aliment canal to the bladder, than through the abdomen, in general circulation, and the kidneys, is an opinion that has been partially entertained even from the most ancient times. The very rapid manner in which the urinary secretion is augmented by copious draughts of fluids, and the communication, within a very short time, of particular properties to the urine, by certain substances taken into the stomach, are circumstances on which this opinion has been grounded.

Anatomical investigation has hitherto detected no such passage; no defector has met with any tube that could possibly serve the purpose of forming such a communication; while the experiment of tying the ureters corroborates this negative fact, by teaching us that no urine gains admittance into the bladder, when these tubes are obstructed. "Other," says Haller (Elem. Physiol. lib. 26. sect. 4. § 4.), "taught us long ago, that when the ureters are tied or divided in the living body, the urinary bladder is found empty, and that the animal evacuates no urine. This experiment has uniformly exhibited the same refult in the hands of several very practised and dextrous experimenters; and Rudolph repeated it on a dog, and found the kidneys swollen and full of
water, the papillae dilated, the ureters enlarged above the
ligature, and empty below, the bladder not containing a
single drop of urine." The phenomena of disease confirm
the conclusions to which these trials lead: obstructions of
the ureters, and suppression of the action of the kidneys,
etirely stop the urinary discharge, whatever quantity of fluid
the patient may drink.

The action of the existence of a short communication
between the stomach or bowels and the bladder, against
the evidence of anatomy and experiments, is founded on an af-
firmation which we consider to be highly questionable.
We are far from allowing that the absorbents and blood-veffels
are made quite to the explanation of the phenomena, that
we believe the very reverse to be true. We believe that the
great absorbing surface afforded by the alimentary canal,
together with the infinite number of absorbing veffels, and
the diameter of the thoracic duct, fully account for the
cessation of fluids into the blood, and that the large size
of the renal arteries, which must circulate the whole mass of
blood through the kidneys several times in the course of a
month, with the great number of the uninnervated tubes, very
nearly explain the secretion of urine in any quantity
of which we have examples. If these passages, which are
obvious to our senses, and large enough to allow a con-
siderable quantity of fluid to pass through them, cannot
transmit the urine with sufficient celerity, how shall we ex-
pect that a greater quantity can pass through canals, which
must be beyond all comparison smaller, since no diffeHent
even cavities that he has ever seen them? There is an-
other and still more fatal objection to these opinions: the
fluids voided in these cases are urine, of a very aqueous
kind indeed, but still urine;—still that peculiar animal fluid,
which is secreted only by a kidney. Now, if there be a
direct passage from the stomach to the bladder, we ought to
void, according to the nature of our drink, tea, wine,
peach, cider, &c. We must suppose, therefore, the ex-
istence of an unknown kidney to convey these different
fluids into urine, as well as of an unknown passage to con-
vey them to the bladder. The existence in the urine of par-
cular properties, derived from certain articles of food, will
prove nothing in this case, until we have been convinced
that they cannot have been imported by the medium of the
general circulation. Exposure of the body to the vapour of
turpentine will affect the urine, without its introduction in-
to the stomach. (See the experiments under the article
INTESTINES.) What are the secret passages by which
this is conveyed, in such a case?

The urine is regarded as a fluid entirely excrementsitious;
its confining of materials, which are either useless to the
animal economy, or which, if retained, would be actually
poisonous. The fluids which we drink dilute the fluid
food, reduce it to that flatus in which it constitutes the chyle,
and are absorbed with it. Probably a considerable portion
is taken up immediately from the alimentary canal, without
undergoing the previous change into chyle; hence copious
drinking often augments the urinary discharge much sooner
than the formation of chyle could be effected. The super-
fluous fluid, thus introduced into the blood, is separated by
the kidneys, and very specifically separated, when large quan-
tities are drunk: hence the chief component part of the
urine is water. The organs of the body are constantly un-
dergoing changes in their composition: they receive fresh
particles from the blood, while the absorbing sytem re-
"mes the old ones; so that there is a perpetual movement
over the whole body of combination and decomposition.
Again, a similar change is incessantly carried on in the ani-
mal fluids. The lymph of the cellular texture and the
forum of the circumseribed cavities are at all times in this
kind of circulatory motion. These old materials are con-
veyed into the blood by the absorbents, and separated from
it in the kidneys, in order to be thrown out of the body.
They separate it under the peculiar form denominated by
the French chemists urce; which matter exceeds in amount
by many times all the other faine substances dissolved in the
urine, and belows on that fluid its colour, odour,—in a
word, all its peculiar characters. We shall anticipate, from
this view of the matter, what the researches of modern chem-
istry have most clearly proved, that the component in-
gredients of urine are very numerous: it exceeds, in this
respect, all the other animal fluids. A particular account
of its sensible character and chemical composition will be
found under the article URINE; and that of the corrections
occasionally formed in the urinary passages under STONE.

No secretion exhibits such signal variations as this: the
term urine, therefore, is applied to fluids differing in almost
every circumstance from each other. The nature and pro-
portion of its ingredients are not alike in the same individual,
at the different periods of life. Peculiar characters distin-
guish it in the fetus, the boy, the adult, and the old sub-
cjed: they differ in the same day, according as a perfon
is exposed to heat or cold, as he is inactive or utes much
bodily exertion, according to the nature and quantity of the
food and drink, and the length of time after meals at
which it is voided; the state of health, particularly of the
stomach, and other digestive organs, and the passions of
the mind, have also considerable influence.

The kidneys and bladder of the fetus contain a very small
portion of fluid, which can hardly be deemed urine: it is al-
most entirely aqueous, rather vitreous and turbid, and has no
smell or taste. In the first years of life, the colour is not
dep; the acid and odorous properties are but slightly
marked. As the motion of composition prevails, in a most
all the organs, over that of decomposition, the quantity of
urine is small. The earthy phosphates, particularly that of
lime, are not present, or in very minute quantities. While
ossification is incomplete, this substance is required for the
development of the bony sytem. It becomes the adult, where
the growth of the body is complete, the residue of nutrition
is more abundant; all the properties of the urine are more
strong. It contains salts, earthy phosphates, phosforic
acid, urce, and uric acid, according to the description in
the articles already referred to. The salts and the animal
substance increase in the old subject; the phosphatc of lime
is very abundant.

The modifications produced in the urine by heat and cold,
which include also the effects of exercise, and the influence
of the fluids, are not the result of any direct action on the
kidneys, but arise from the operations of these cauves on
the cutaneous functions. The relations between the urine
and the external and internal exhalations are peculiar to this
secretion. In proportion as we perspire more abundantly,
the urinary evacuation is diminished; and the same circum-
stances is observed in considerable droppings. From this
character, which belongs exclusively to the function of the
kidneys, naturally arise the frequent variation in the quantity
of the urine; while the other secretions are nearly always in
uniform proportions. Exposure of the surface to cold, or
in captivity, is attended not only with an increased quantity
of urine, but with alterations of its other properties: it is pale,
not acrid, nor strong in its smell. Warmth, with free per-
spiration, or strong exercise, diminishes the quantity, and
renders it more highly coloured, acrimonious, and odorous.
Slighter changes of an analogous nature may be remarked
in winter and summer. (See INTESTINES.) When the
quantity
quantity of urine is so remarkably augmented in diabetes, the skin is parched and dry.

The quantity of food, and more particularly of drink, influences very greatly that of the urine: and several physiologists represent the two as nearly equal. The effect of aqueous drinks, however, will be considerably diminished by the state of the cutaneous discharge. If the individual be warm and from a great part of such drinks is diffused by the skin: in a weaker state of the body, combined with external cold, it is dispersed off by the kidneys. The diuretics in harvest will often drink gallons of liquor, while protecting their hard work under a hot sun, without any increased urinary discharge; the perspiration, however, is uncommonly copious, and its evaporation has a most favourable effect in leaving the body cool. This tenor which increase the urine most remarkably are those of an aqueous kind, such as water, vegetable infusions, weak beer, cider, &c., taken cold. Stimulating drinks, such as the stronger wines and spirits, and warm fluids, excite the system in general, and are more likely to be disposed of by the skin. The quantity of urine, ascertained by actual experiment, has varied considerably. The accounts of Hartman, Robinzon, De Gers, Kill, Rye, Home, Sanctoris, and Lining, give us the following number of ounces in twenty-four hours; 28, 31, 38, 48, 52, 64: the average of the whole will be 50 ounces.

The qualities of the urine are affected, in many instances, in a very obvious way by the nature of the food. As this secretion provides for the removal from the body of the residual and excrementitious part of our aliment, we cannot doubt that it must be very essentially influenced by the properties of the food. Rosebush, green root, radish, and other substances; as its colour, it appears to have a decided influence on the colour of the urine. Garlick and onions affect its smell: oil of turpentine gives it an odour resembling that of vinegar; and aspirin imparts to it a remarkable smell. Several other vegetables, such as fennel, caraway, parsley, &c., or wine, and other volatile bodies, affect its smell. A very striking instance of change in its properties, produced by an alteration in the food, is afforded in the treatment of the tabes dorsalis by animal diet. See DIABETES.

The alteration of the urine by the food is more particularly evident in individuals, whose digestive organs are not strong: hence the state of the urine is an important symptom in such cases.

Two or three kinds of urine are distinguished, according to the interval between their voiding and the state of translucency of the fluid. The first, a chambered within a very short time after drinking, is called urine of the drunk (urine potis), or crude urine. It is often eaten and so soon after drinking, and has so little of the distinguishing character of urine, that it has given rise to the notion already mentioned of a short communication between the stomach and bladder. It appears almost like a mere water, and has neither the smell, colours, nor weight of urine: it will be regarded as extremely diluted form of the fluid, in which the urine diffused in a very large proportion of water. The urine of digestion or concretion (urine chylis) is that evacuated two or three hours after a meal. Its colour and other urinous properties are more strongly marked than in the preceding; but it is not yet perfect urine. It is affected by the nature of the food. The urine of the blood (urina sanguinis) is voided seven or eight hours after eating, or in the morning after a night's sleep. It is highly coloured and acid, has a strong taste and smell, not that imparted by any purifying food, but the peculiar virous odour. The circumstances of digestion and the nature of the food either do not affect this, or affect it in a most visible manner. It contains a large proportion of salts and acids. Its character, in short, those described as belonging to urine; and it is always selected for the purpose of experiments on the chemical constitution of this fluid.

The passions have an influence on the nature of the fluid; fear, sorrow, and, in general, all emotions which are violently on the frame, often cause an abundant flow of effluvials and noxious urine, which seems to confound almost entirely of water.

But the effects of the causes which we have just considered, are very slight in comparison with the changes produced by disease. The alteration in this case goes deeper, and the variations are more numerous and characteristic. Since the earliest ages of medicine, physicians have drawn indications from this source concerning the nature, progress, and termination of diseases; and emetics have not overlooked to favourable an opportunity of laying a tax on public credulity. Careful analyses of the various morbid urines are still among those deficient, which provide very interesting results to the physiologist and pathologist. A few facts only have been collected on this subject. The quantity of the urine, at the termination of acute diseases, has been found to consist chiefly of uric acid. The coloured fluid exuded in nervous disorders, in phlegmatic paroxysms, &c., is little more than mere water. Pithoric and phlegomatic urine are not found in the urine during the paroxysm of gout; but the latter returns towards its inception, and is even more abundant than in the healthy state. In these ailments, in which the urine becomes acid, its urine has a large proportion of phosphatic of lime; the exhaled from the bodies is evacuated by the kidneys. During urination, this earthy felt is not found in the urine. For the remarkable qualities of this fluid in diabetes et cetera, see that article. The fecretions of the mucous membranes, over which the urine passes, may variously modify its properties; and diseases of these parts may occasion the admixture of blood, pus, mucus, &c.

The last circumstance we have to mention concerning the urin, is its secretion, distinguishes it from all others: that the secreted fluid is conveyed in no other function, but is entirely expelled from the body, after traversing the urinary passages. In other inferences the secreted fluids leave some office; the tears lubricate the surface of the eye; the return of the saliva in swallowing, in exertion, is very important; the bile and pancreatic juice appear in digestion. If we consider the alterations in the quality or quantity of these are followed by serious consequences; while the changes of the urine, particularly in quantity, are hardly observed.

The renal caudex (cardele impressionis, or arald fuse), rence truecettatis are two small bodies, a right and a left, placed above the upper extremities of the kidneys, which they cover to a certain extent, and behind the psoas. They are sometimes double on one or both sides. In size, varies much according to the age of the beast; in the firit months of the latter, they are at least as large as the kidneys, and are covered in the male by the last months of birth; but at this age it may be still seen that the kidneys that the proportionate sizes of the two organs are soon entirely changed, and become such as we find them in the adult. When they have acquired their greatest magnitude, they sometimes preserve it in the adult: but they are generally...
gradually diminished, and at last disappear almost entirely. Their figure does not much resemble any known object; it is somewhat triangular, and bent from above downwards. We may distinguish them in an anterior and a posterior surface, a superior and an inferior margin, an internal and an external extremity.

The anterior, which is also the broadest surface, presents, a little above its middle, a transverse groove, which receives the chief capillary vein; this corresponds, on the right side, to the inferior vena cava and the duodenum; on the left, to the spleen and pancreas. The posterior surface is in contact with the semi-lunar ganglion and the diaphragm. The inferior edge, which from its breadth has been described as a surface, is excavated obliquely from before backwards, and from above downwards, and embraces the superior end of the kidney. The superior margin, thin and convex, is rather inclined inwards, corresponding to the liver on the right, and to the spleen on the left side. In the extremities there is nothing remarkable: the inner is rounded and rather lower than the outer, which is more pointed. The whole exterior is unequal, with an appearance of small lobes, and adheres to the neighbouring parts by numerous velvets, by nerves and by a loose adipous subflance homogenous with that which surrounds the kidneys. This subflance in most cases nearly resembles the capsules themselves in colour, so that they may be easily overlooked in a superficial examination.

A kind of triangular cavity occupies the middle of the capsule, with an oblong eminence, caused by the course of a vein projecting into it below: the sides of this hollow often appear united by a kind of downy matter. It contains a fluid of a reddish colour in the fæetus, yellow in young subjects, and brown in the adult. Its consistence and quantity are variable; and it is coagulable by alcohol. It has been asserted that this cavity may be inflated by the capillary veins; but Haller could not succeed in accomplishing this in the human subject, although he accomplished it in animals. Some deny the existence of a cavity, and others have asserted that it is a vein. Haller saw it clearly nineteen times in the human subject; it was not observable in three instances.

The colour is a brownish-yellow, and deepest in the interior: it has more of red in the fæetus and in children. The form at that time is more rounded, the volume more considerable, and the fluid more abundant. Their consistence is moderately firm; more on the outside than in the internal portion, in the adult than in the child. They are composed of lobes divisible into lobules, which may again be reduced into smaller portions. The surrounding cellular subflance enters the organ and joins together these portions. In this respect the structure of the renal capsules resembles that of the conglomerate glands; but no excretory duct has been discovered in them.

Their arteries are numerous, and divided into superior, which come from the lower diaphragm, middle from the aorta or carotid artery, and inferior, which arise from the renal. They anastomose frequently, and seem to run on the surfaces without entering the subflance of the organs. The veins are less complicated. There is always a large one on each side, produced from the inferior vena cava on the right, and from the renal vein on the left side. It enters the groove of the anterior surface, and after running through it, passes into the neighbouring adipous subflance, and to the lower part of the diaphragm. The branches enter the subflance of the capsules, but probably do not open into the cavities, as some have supposed.

Lymphatic vessels arise from all points of these organs, and several join those of the kidney. On the right side they go to some lymphatic glands placed round the vena cava, below the liver; or they are united with the abortments of the liver, and proceed with them to the thoracic duct. On the left side they enter glands placed in front of the left crus of the diaphragm.

The nerves of the renal capsules come from the celiac ganglia and from the renal plexuses.

Physiology of the renal Capillaries.—The use of these bodies is entirely unknown: the physiologist or pathologist has not hitherto noticed one fact that can throw the smallest light on their office, or that can prove them to possess any connection with any function of the animal economy.

"From an attentive consideration of all circumstances," says Haller (Elem. Physiol. lib. xxvi. sect. 4, § 14.) "I can venture to affirm nothing further of these capillaries, than that they secrete a fluid, which is more necessary to the life of the fæetus than to that of the adult. I can draw nothing from comparative anatomy, except the probable conjecture, that they are made for important purposes, as they are found in so many animals. They are large, and have a large cavity in the carnivorous, as the tiger, and in some herbivorous animals. But in other herbivora they are small, and the cavity is small in the voracious fleshy.

"The urinary bladder, as a reservoir for the urine, is placed at the middle and anterior part of the pelvis, behind the bones of the pubes; before the rectum in man and the uterus in woman; below the small intestine, above the lower part of the rectum, the vasa deferentia and vesiculae in man, and the vagina in woman. This is the natural situation of the bladder in the adult, but age and various circumstances produce changes in this respect, which it is important to observe. In the fæetus the bladder is situated almost entirely out of the pelvis, and reaches nearly to the navel, in the midst of the cellular subflance, which occupies the lower and front part of the abdomen, externally to the peritoneum. Hence it follows, that at this age its anterior surface is covered by the peritoneum only at the upper part, and that in the rest of its extent it corresponds immediately to the osa pubis and the recti and transversi abdominis. It may accordingly be opened above the pubes, even in its empty state, without wounding the peritoneum. This peculiarity of position arises from the bladder being greatly developed in proportion to the neighbouring organs, and especially from its being very elongated, while the pelvis is small and very shallow; the upper aperture moreover is very oblique, and the rectum, distended by a large quantity of meconium, particularly towards the latter periods of pregnancy, almost entirely fills the pelvis. As the cavity of the latter is developed, the bladder links in it, and retires from the umbilicus. At three years of age it is said to rise hardly more than three fingers' breadth above the pubes, and at twelve this is reduced to about half an inch: at eighteen it is said to be completely hidden behind the bone. Haller, however, observes, that he has seen the length of the fæetus remaining even to the time of puberty, so that it still projected considerably above the pelvis. In the adult, where the pelvis is deep, and the bladder shorter, not exceeding the bulk of an egg in its undiluted state, it never rises above the pubes when empty; and even at other times is generally below the upper edge of the bone. But when it contains a large quantity of urine, it ascends and forms in the hypogastric region a very discernible tumour, which rises and increases gradually, in proportion as the quantity of contained fluid becomes greater. It may reach in these cases beyond the umbilicus. It is contained in the abdomen in the latter months of pregnancy. Perhaps it may be inclined rather more backwards in the supine position of the body. It has sometimes been contained
contained in an inguinal or vaginal hernia. Its situation is not always perfectly straight, but sometimes, as Celsus has observed, rather inclined to the left. It is retained in its situation by cellular substance, which surrounds it on all sides, and by other means, which will be described presently.

The capacity of the organ differs according to the age, sex, and diseases. It is much greater, in proportion to the size of the body, in children than in adults; it diminishes afterwards as it sinks in the pelvis. It is larger in persons who have the habit of retaining the urine for a long time, than in others; and on this account it may be larger in some females. In cases of retention of urine it sometimes is so enlarged as to hold several pints: and it is diminished in a corresponding degree in other affections, as when it is irritated by the conjunct presence of a stone, or by any other cause. We can hardly assign any particular capacity as the natural one, there is so much variety in different individuals: a healthy person may void, at one time, from half a pint or less to two pints.

The figure of the bladder, in an adult male, is nearly that of an oval, rather flattened from before backwards, with the large extremity placed downwards and a little backwards, and the smaller in the contrary direction. In females, and particularly in those who have had many children, it is not so high, but broader in the transverse direction. It is very elongated, and nearly cylindrical, in the fetus, at which time its extremity, formed by the urachus, approaches the navel: its length is three times its breadth, and its transverse diameter is nearly equal to the antero-polar. At no long period after birth these dimensions change, the bladder becomes more rounded, and affumes a somewhat pyramidal form; and, as the child grows, the figure approaches more and more to the oval. Several anatomists distinguish in the bladder a superior portion, which they call the fundus; a middle part, or body of the bladder; and an inferior division, comprehending the lower surfaces and the neck. We shall divide the organ into two surfaces, an external and an internal.

The external surface may be naturally divided into five regions: viz. an anterior, a posterior, a superior, an inferior, and two lateral, or right and left.

The anterior, which is slightly inclined forwards, is bounded above by the urachus, and below by the neck of the bladder. At its lower part are seen two small fibrous fasciculi, called anterior ligaments of the bladder. They have a horizontal direction, and are attached to the back of the symphysis pubis in front, to the superior portion of the neck of the bladder, and to the prostatic behind. This region then corresponds to the flattened posterior surface of the os pubis and their symphysis, to which it is connected by a loose cellular substance. When the organ is empty, or moderately filled, it does not ascend above the bone; but in the distended state it rises out of the pelvis, and corresponds immediately, without the interposition of the peritoneum, to the abdominal muscles. Hence, at this time it may be perforated by a trochar, or opened for the extraction of a stone, without exposing the patient to an effusion of urine in the abdominal cavity.

The posterior surface, slightly inclined upwards, is convex, smooth, entirely covered by peritoneum, contiguous to the rectum in the male, and to the uterus in the female subject, and to the inferior convolutions of the small intestine in both sexes.

The lateral regions, which are broader below than above, are covered by peritoneum in their posterior portion only: in front they are connected to the sides of the cavity of the pelvis by a large quantity of cellular tissue. The umbilical arteries, and the vasa deferentia, pass along them.

The superior region is commonly called the fundus of the bladder; it corresponds to the convolutions of the small intestine, and affords attachment to the superior ligament of the bladder. The latter is composed of the urachus and of the two umbilical arteries, each of which is here included in a small bladder portion of peritoneum. The urachus, occupying the middle of this ligament, appears in the adult under the form of a whitish fibrous cord, extended from the fundus of the bladder, on the external surface of the peritoneum, to the umbilicus, where it is contounded with the aponoeurosis of the transverse muscles. It is about as large as a small quill at the bladder, but it grows gradually smaller towards the navel. It encloses no interior cavity, and seems capable of no other use than that of fixt y the bladder in its situation. Indeed of being fold and ligamentous, it is said sometimes to form a true canal, by means of which the urine escapes at the navel: this unfail appearance, which we have never seen, is said to arise from obstruction at the neck of the bladder, and to cease as soon as the urine flows through the urethra.

The elongated figure and great elevation of the bladder in the fetus, make the urachus very short; it then forms a canal, beginning from the upper part of the bladder: thence it ascends to the umbilicus, becoming at the same time contracted. Lastly, it enters this ring with the umbilical arteries, and is continued into the cord: according to Haller, it may be filled with mercury for an inch, or an inch and a half. Further on, it is said to be divided into several filaments, which are left on the arteries: but Mr. Cruikshank states that it is continued, in the form of a very slender thread, throughout the cord. In quadrupeds it is manifestly hollow, and passes through the cord to a membranous bag called the allantois, in which it ends. Its diameter is variable: in general it is not more than one-third of a line in breadth, and it opens into the bladder by an orifice, which is so small and difficultly found, that many good anatomists have altogether denied its existence. Sometimes it is considerably larger in this situation. Haller says that he has expressed from it a drop of gelatinous lymph, and others speak of urine as contained in it. Its confluence is firm; it seems to be formed by a prolongation of the internal coat of the bladder, inclosed by long and hard fibres continued from the mucous coat. It is closed, and becomes solid and ligamentous some time before birth: its cavity is obliterated, thickened by the umbilical vessels, and it canister to contain a little dilated, or receive urine. Sometimes, however, it remains open: Haller introduced a bug's bristle into it in the adult, and he mentions gravel being contained in it in another instance. In 1787, says Boyer, I dissected the bladder of a man thirty-six years old, whose urachus formed a canal an inch and a half long, and contained twelve urinary calculi of the size of millet seeds. I ascertained that the containing tube was not a fasciculus or elongation of the internal coat through the muscular tunica. These examples of a hollow in the urachus of the adult are very rare.

As the existence of a canal in this part is sometimes denied, we subjoin the following express testimony of Haller on the subject. "Doubts have been entertained whether the urachus be hollow, since we often find that nothing passes into it, when the bladder is distended with air or mercury; and several good anatomists have found no canal. But the repeated investigations of this matter by myself, and by one of my pupils, have plainly shown that a foramen leading into the urachus exists at the top of the bladder in the human subject. When the surrounding cellular substance has
KIDNEY.

has been removed, and the fold, which is sometimes formed between it and the bladder, is destroyed, air, quicksilver, or a brisk fluid enter easily: I have also squeezed out a drop of gastric fluid, and others have found urine in the cavity. It may be demonstrated as far as the umbilicus.

Ellen. Physiol. lib. xxv. sect. 2.

The two umbilical arteries, which are confluently obliterated in the adult, form merely ligamentary cords of a cylindrical figure, placed at the sides of the urethra, and adhering like it with tolerable firmness to the peritoneum.

The process of the peritoneum are necessarily and mechanically produced by the reflexions of that membrane on the three ligamentary cords just described: they raise the membrane from the sides of the cavity, and make it project into the abdomen in the form of three small elongated folds, of which the middle surrounds the urethra, and the two lateral ones the umbilical arteries. They are broader below than above, and more strongly marked in the fetus than in the adult. They are united and blended at the neck, but separate as they descend: the middle, which is vertical, and corresponds to the linea alba, terminating on the fundus of the bladder, the lateral ones, which diverge on the sides of the organ.

The lower region, which is also called the basis of the bladder, is rather more extensive from side to side than from before backwards. It is subdivided into an anterior and a posterior portion: the former, rather more elevated than the latter, is narrow, shaped like a funnel, and called the neck of the bladder. It is embraced by the peritoneum, and corresponds to the posterior and inferior parts of the symphysis pubis. The posterior part is large and expanded: it is bounded behind by the kind of cul-de-sac which the peritoneum forms as it is reflected from the back of the bladder to the rectum. This part covers, in man, the vesicles feminales and vasa deferentia, which are united to it by cellular tissue, close in front near the prostate, and looser behind: in the triangular interval, separating the vasa deferentia, the surface of the bladder is in contact with the rectum, and connected to it by a loose abundant cellular subtile, containing fat and interposed with numerous blood-vessels, particularly veins. In the female this part of the bladder corresponds to the front of the vagina. The sides of this lower portion of the bladder are covered in both sexes, by the levatores ani, and correspond to the intervals between the anus and the tuberouits of the ischii.

The internal surface is polished and covered by an abundant mucous secretion. It presents a great number of wrinkles, more or less strongly marked, taking various directions, and formed by the internal membrane. These are very superficial when the bladder is empty and contracted, but are elevated almost entirely when it is dilated. They arise from the general contraction of the muscular and mucous coats, of which the latter confers a much less degree of contraction than the former. In some subjects there are few, and these wrinkles, elevated prominences, resembling in many points the muscular columns of the right ventricle of the heart. These are formed by the fibres of the muscular coat, disposed in large fasciculi, and elevating the mucous membrane to as to project towards the bladder. Corresponding depressions are left between these columns, which have given rise to a particular name in French (vesicles a colonnes), distinguishing the bladders with this appearance. Besides these depressions, there are sometimes cells or pouches of various size and number opening into the cavity. Stones may be contained in such cells, and are then called calcified.

The anterior, posterior, and lateral regions of the internal surface of the bladder, present nothing besides what we have just particularized. In the superior region there is a small pore in the falcus, often scarcely visible, and constituting the commencement of the urachus, which we have already spoken of. The inferior region offers to our view, in successiion from before backwards: 1st, the neck of the bladder; 2dly, the triangular space; 3dly, the inferior of the ureters; and, 4thly, the inferior surface or bottom of the bladder.

The neck of the bladder, or orifice of the urethra, is a tolerably large circular opening with thick sides, contracted a little to form the urethra properly so called. It occupies the most depending part of the bladder in the fetus, because the bottom of the organ (basford in French) is not developed at that time. In the adult, the neck of the bladder is rather higher than the inferior surface; so that there is a slight declivity from the former to the latter, directed from before backwards and from above downwards. The circular figure of the opening on the neck of the bladder is ordinarily interrupted by a feebly tubercle, arising from its lower portion, and called by Lieutaud, who first described it, luette vescicale, or uveula vesicae. Its size varies, insomuch that it is often scarcely visible. It is subject to enlargement, particularly in old persons, and then it forms an oblong tumour, rounded at its upper margin, and, by its situation, rendering the expulsion of the urine difficult. However, we sometimes find it wholly in the dead body when the bladder has not been distended. It seems to be chiefly formed by the internal membrane of the bladder, and to be merely the termination of the anterior angle of the triangular space. It is defended by Mr. Home, in a paper contained in the Philosophical Transactions, as a third lobe of the prostate gland (See the description of that gland in the article GENERATION.) In the natural state, the neck of the bladder is closed, except during micturition; and is only opened for the evacuation of the urine. It is surrounded externally by the prostatic gland. (See GENERATION.) The opening is larger in the female; where, if it depended on the prostatic, we should not expect to find a luette vesicale: yet Lieutaud ascribes equally to that sex.

The trigonum vesicale (trigonum vesicale in French) is a triangular portion, bounded by three openings, which mark its three angles. These apertures are distant from each other about an inch, or an inch and a half, and are, in front, the opening of the urethra already described, which forms the apex of the triangle; behind and laterally, the openings of the two ureters. The surface is a little inclined backwards, and just prominent enough to allow of the fact being observed. It is much less wrinkled than other parts of the bladder, and may also be distinguished by its colour, which is not the same in all subjects, but constantly different from that of the rest of the organ, and generally whiter. The anterior angle, or apex, which is contoured with the luette vesicale, is nearly three or four times its thickness; it grows thinner towards the base. Its thickness and colour, and the strong adhesion of the internal membrane, lead us to suppose that its organization is peculiar. It preserves nearly the same extent in the contracted bladder, and is then more prominent. It is more extensive in the female than in the male bladder.

The openings of the ureters, occupying the two posterior angles of the triangular space, are narrow, elongated, and directed obliquely forwards and inwards. Their diameter is much smaller than that of the ureters, and they often appear to be covered by small folds of the internal membrane, which it is necessary to elevate with a probe in order to see them clearly. The introduction of the probe moves the obliquity of the canals, and the extent of their course between
between the two coats of the bladder, a point which we have already mentioned in speaking of the ureters.

The bottom of the bladder is a large hollow situated behind the triangular space, and below the level of the neck; it is, in fact, the most depending part of the organ.

The fides of the bladder become thicker in proportion as the organ contracts, and they are rendered thinner when it is distended. They consist of a serous, a muscular, and a mucous coat.

The first of these invests only the posterior region, and a small portion of the lateral regions. In the fetus it covers also a small part of the front and upper portion of the organ. Its external surface is perfectly smooth, and strengthened by a serous secretion. The internal surface is connected to the mucous covering, by cellular substance, in such a way as to admit with tolerable facility of separation by dilatation. This covering is furnished by the peritoneum, which paffes from the front of the abdominal cavity, that is, from the recti muscles or the offia pubis, to the fundus of the bladder, then descends over the posterior to the inferior surface of the organ. Here it quits the bladder, and passes to the front of the rectum in men, to the anterior surface of the uterus in women. As it goes from one to the other of these organs, it forms on the sides the two folds improperly called posterior ligaments of the bladder, and in the middle a cul-de-sac, which is the lowest portion of the peritoneal cavity in the male subjéct. This part may become dilated with the fluid of affeétions; and, as the cul-de-sac just mentioned extends to within two or three inches of the anus in many subjécts, the paracentés of the abdomen might be performed, in the male subjéct, from the rectum; indeed this has been actually done in one instance. The cul-de-sac formed in the female, by the reflexion of the peritoneum from the vagina to the rectum, would allow a similar operation, in that sex, from the posterior part of the lower surface of the vagina.

Where this serous covering does not exist, the bladder is covered by a layer of cellular tissue, the thickness and appearance of which are not everywhere uniform. At the anterior region, behind the pubes, and on the lateral regions, it is very thick and abundant, and usually contains more or less fat. At the inferior surface it is less copious, but still loose, and containing little or no fat; a considerable number of vessels, particularly veins, is seen here. It is dense and whitish about the vesiculæ seminales and prostatic.

The muscular coat surrounds the bladder at all points; corresponding, by its external surface, to the serous tunic, and to the cellular substance; by its internal surface, to the outside of the mucous coat. It is composed of a thin stratum of pale fibres, disposed in fasciculi of various fizes, crossing each other in all directions, so as to form a very close network, of which the interlacements present every variety of size and figure. Ordinarily the mucous coat is completely covered by this muscular tunic; but sometimes there are small fpaces without any muscular covering. Through such spaces the mucous membrane may be protruded, so as to form the cells already mentioned, communicating with the cavity of the bladder.

An attentive examination of the muscular fibres shows us, that some have a longitudinal, others a nearly circular direction; that several are oblique, and that the rest compose an inextricable network. The longitudinal fibres, forming the external stratum, are directed from the neck to the fundus of the bladder. The anterior ones arise from the prostatic and its covering, and sometimes from the posterior and inferior part of the pubes, and the front ligaments of the bladder; in the female, from the point of union of the bladder with the urethra; they ascend over the front of the organ to its upper part, and afford to the uraeus the external covering already mentioned. The posterior fibres form more numerous and larger fasciculi than the anterior; they pass from the uraeus, over the posterior and inferior surfaces, to the prostatic in man, and to the junction of the bladder and vagina in woman. Both these portions send off fibres laterally, which cover the lateral regions, decussate with each other, and with those of the more deeply-seated flates. As all these fibres have their fixed points in the prostatic and neck of the bladder, they will draw the other parts of the organ, which are all more or less moveable, to the neck, and consequently press the urine against the orifice of the urethra.

The oblique fibres are less direct and more deeply-seated than the longitudinal; and are so blended with the others that it is almost impossible to observe any order in their distribution. Some have a transverse direction, and embrace the bladder almost in a circular manner: the more deeply-seated they are, the more they approach to this course; yet several longitudinal fasciculi may be seen in the interior of the organ. The contraction of these fibres diminishes the capacity of the organ in all its diameters, and tends to bring its fides in all directions towards their common centre. The urine, thus forced on all sides, will escape in the direction where there is the least resistance; that is, the neck of the bladder, against which it is moreover forced by the contraction of the longitudinal fibres.

From its office of expelling the urine, the muscular coat of the bladder is frequently described as a muscle, under the name of detrusor urinae. It will be readily understood, from the account which we have just given of its action, that the bladder is brought into a flattened state, and lies wholly just behind the pubes, when this covering has contracted. The fixed point of the organ is behind thoe bones; the prostatic and neck cannot move, and all the other parts are drawn towards them. In this state the organ is flattened before and behind, and has a triangular outline; the fundus forms the apex, the inferior surface the basis, and the lateral regions the two fides of the triangle.

In a distended bladder the muscular coat is thickest at the inferior surface and at the basis; in other situations it is often remarkably thinner. This difference arises from the circumstance, that the coats do not yield equally to dilatation in all directions; for, when we divide a contracted bladder, the thickest is nearly uniform throughout.

The description of the muscular fibres about the neck of the bladder is stated very differently by different writers. Some admit, and others deny the existence of a sphincter vesica, or circular muscle surrounding the opening, and closing it by its contraction. The fibres in this situation are pale, and mixed with several veins and cellular texture; they are certainly completely continuous on all sides with the rest of the muscular coat. It is observed by Haller, that a sphincter was assigned to the bladder, in the first instance, from the supposed necessity of such a structure to account for the functions, rather than from actual dilatation; hence Vealius places it in front of the prostatic. Santorini could find no circular fibres surrounding the mouth of the oræthra. Others reject altogether the notion of a sphincter; and Wind-\footnote{Vol. XIX.} flow refers the descriptions of such a part to fasciculi arising from the pubes. Haller gives the following description from his own observations. In men there are transverse and even archd fibres above, intricately connected together, and lying on the neck of the bladder, on the prostatic, and on the longitudinal fibres arising from the pubes. Others of an archd form, with the concavity towards the bladder, lie:
under the. In women he found fibres at the anterior part decussating at considerable angles, so as to form a kind of circle; in other instances they were more transverse. The inferior fibres are transverse, continuous with the circular stratum of the bladder, and covered by the prostatic. The effect of the contraction of these fibres, however flender and obscure they may be, must be that of contracting the opening about which they are placed.

The modern French anatomists will not allow the fibrous substance about the neck of the bladder to be of a muscular nature. "When the neck of the bladder," says Boyer, "is attentively dissected, we find under the external cellular stratum, and between that and the mucous membrane, only a whitish, thick, firm, and fibrous substance, continuous with the muscular coat, the fibres of which very manifestly end in it. There is no sphincter, since we see no distinct muscle, and the fibres of the neck are moreover continued with those of the general muscular coat. But the structure, which we have just described, communicates to the neck of the bladder a refilling power, which, although not produced by the action of any particular muscle, is still superior to the contractile tendency of the bladder." Traité complet. d’Anat. t. 4, p. 499.

The muscular coat of the bladder is proportionally thicker in the fetus and child, than in the adult. The irritability of the organ, and the force exerted in expelling its contents, seem to be greater in the early years of life.

The name of nervous coat has been given to a whitish stratum, placed between the muscular and mucous coats. The structure of this is completely cellular; it is looser towards the former, and more close towards the latter of the tunics. It is very extensible, and recovers itself after dilation, forming, in conjunction with the mucous membrane, the folds which we have described in the inner surface of the organ. It contributes considerably to the solidify of the sides of the bladder.

The internal or mucous coat lines the whole interior. It is continuous on one side, with the linings of the ureters; and on the other, with that of the urethra. To its external surface adheres the cellular stratum just described. Internally it is perfectly smooth, having no visible villi, nor any other inequalities except the rugae which arise from contraction of the muscular coat. Its surface is constantly covered by a mucous fluid, defined, in the opinion of physiologists, to protect it from the irritating qualities of the urine. This secretion must be perpetually removed by the urine and perpetually renewed. It is expelled in that fluid, and becomes sensible by chemical analysis. When any cause of irritation affects the bladder, as for example, when a calculus is contained in it, this mucous is voided in very large quantities, to the amount of some ounces at each time of making water; in such cases it often subsides and concretes into a tolerably firm jelly.

The sources of this secretion cannot be easily demonstrated; although, as Haller observes, the glands of the bladder are mentioned as familiarly as if they were visible on superficial inspection. Is the mucus poured out by the exhalants of the internal membrane, or secreted in a glandular apparatus? Sometimes, but rarely, says Haller, have I seen ample follicles on the external surface of the mucous coat, chiefly near the neck of the bladder; some round, like those of the cheeks, equal in size to milllet seeds, and in clusters in the female, others smaller. At other times I saw no follices, but mere pores." Element. Physiol. lib. 26. sect. 2.

The mucous membrane is thin and whitish, particularly towards the neck of the bladder; in other parts it has a somewhat red tint. We do not know much of its organization or properties. It is continuous, through the urethra, with the epidermis, and seems to resemble that part in being occasionally detached in threads, and renewed.

A whitish eminence is continued from the ureter on each side towards the mouth of the urethra, and sometimes seems connected to the verumontanum. It is a firm substance, connected to the mucous membrane, and it forms the trigonum vesica already described. According to Haller and Morgagni, these ridings are not confluent.

The arteries of the bladder are derived chiefly from the umbilical; some small ones come from other branches of the internal iliac. The epigastric sends twigs towards the fundus. They anastomose together, and form an elegant network between the muscular and mucous coats, extending alo into the latter. The veins, following the divisions of the arteries, terminate on each side in the obturator and internal iliac veins. They ramify chiefly on the lateral and inferior regions of the organ, where they form, together with those of the rectum, a considerable plexus.

The lymphatics arise from all points of the internal surface, and generally, follow the blood-vessels. They go through small glands in the course of the umbilical arteries, and end in the hypogastric plexus.

The nerves come from the sacral and from the great sympathetic.

The urethra of the male has been described in the article "Glandes urinaires"; we must insert in this place an account of that canal in the female. It is about an inch or a little more in length, but much larger and more susceptible of dilatation than in man. Its shortness and large diameter enable it to transmit stones of a considerable size; consequently, the operation of lithotomy is much less frequently performed on females than on males; and the former suffer, on the whole, much less from calculous complaints. It has been enlarged by sponge tents sufficiently to admit the finger and thumb. Its direction is nearly horizontal from the neck of the bladder, at which it begins, under the pubes and clitoris to the pudenda; but it describes a very slight curve, of which the concavity is turned upwards, and the convexity downwards. It corresponds above to the corpus cavernosum of the clitoris, adhering to it by a loose cellular substance.

Below it is very closely connected to the vagina, particularly in front, and forms a longitudinal projection, which is sufficiently conspicuous on the front of the canal. The anterior extremity is situated rather lower than the posterior, and terminates by an opening, called the meatus urinarius, at the lower part of the triangular space included between the nympha, and just on the front edge of the entrance into the vagina. This aperture, which is sometimes as large as the urethra, which it terminates, sometimes smaller, is irregularly rounded, and has a thick prominent margin, exhibiting the excretory ducts of certain mucous glands situated in the neighbourhood. In pregnancy, particularly towards the latter months, the meatus urinarius is rather drawn inwards, and not to be discovered without difficulty.

The structure of the canal is analogous to that of the male urethra. Externally it is covered by a thick layer of cellular and vascular matter, the nature of which has not been clearly ascertained, bearing considerable resemblance on a section to the vascular texture round the male urethra. This is not confined by any proper covering, as in the male, but is connected by loose cellular substance to the surrounding parts. At the front, the urethra and vagina are nearly conflidated into one substance, and are covered by a common layer of convoluted veins, called the plexus retiformis. The internal surface of the urethra is lined by a thin mucous membrane, continuous at one end with that of the bladder,
and at the other with the lining of the pudenda. It is marked by five or six longitudinal lines, in the intervals of which mucous lacunae open in rows. There may be from four to seven orifices in each of the grooves, leading to canals, which are continued obliquely into the spongy texture of the urethra, and capable of receiving bristles. On the tumid edge of the meatus urinarius two very large sinuses open, capable of admitting the end of a probe. The structure of these organs resembles entirely that of the lacunae in the male urethra. The mucous fluid secreted by them defends the surface of the urethra from the irritation of the urine; it seems also to be poured out more particularly in coition, or under the influence of strong desires.

Besides the difference of length and size in the urethra of the two sexes, arising out of the additional function belonging to this canal in the male, of conveying the fecundating fluid into the vagina, the want of prolate in the female is another remarkable distinction. There is no foundation whatever for the opinion of De Graaf concerning the female prolate.

Functions of the Urinary Bladder.—The urine secreted, as we have already observed, ineffectually by the kidneys, is transmitted, without interruption, through the ureters into the bladder, retained there for a certain length of time, and then expelled by an operation under the control of the will. The bladder, in its empty state, occupies a very small space, is concealed entirely within the pelvis, and has no relations to the surrounding organs reduced within a small extent. Its contracted coats are thick, but all of them are not equally concerned in producing this state of the organ. The tereus coat, and the cellular layer, have nothing to do with it; and the mucous membrane, incapable of a quick and considerable contraction, forms the numerous wrinkles of the internal surface, which may be seen both in living animals, and in the dead subject. The continued contraction of the muscular covering produces the state in which the empty bladder is found; and if its coats at this time are thicker than those of the stomach and intestines; it is because the muscular fibres are stronger and more abundant.

At this time there is, properly speaking, no cavity of the bladder. The urine, deposited drop by drop, dilates the organ intemperately, and makes it contract new relations to the surrounding parts. Although this distention takes place in every direction, except towards the front, it is most sensible in the long diameter, or from below upwards. Its balls prehends on the rectum in man, and the vagina in woman; but the natural limits which the connections of these parts offer, prevent it from extending much downwards. In the opposite direction there is no obstacle to prevent its enlargement: it rife freely above the pubes, the muscular coat is dilated, the wrinkles of the mucous membrane are effaced, and the whole organ is consequently rendered thinner.

The peculiar conformation of the ureters, at their entrance into the bladder, accounts for the urine not returning along these canals to the kidney. When the bladder is dilated with urine or air, the ureters are compressed between the mucous and muscular coats, in that portion which is included between these coverings: and the obstacle becomes more complete, in proportion as the dilatation of the bladder is increased. This mechanism does not depend on any vital properties: you may throw air or any fluid into the dead bladder, through the urethra, but not a drop will gain admission into the ureters; force the injection, and the bladder will burst. Hence, when the urethra is impassive during life, and the bladder is dilated far beyond its usual dimensions, the ureters are continually adding to the collection, stretching the organ so as to produce most severe pains, and ultimately causing rupture. If the muscular covering be diffused away, fluids escape immediately.

Thus, we have no difficulty in explaining why no urine passes in a retrograde course into the ureters: but the cause, which prevents it from entering the urethra, is not equally obvious. Although this be the natural course, the urinary fluid does not pass constantly through the urethra, as it does through the ureters: it is retained for a considerable time, both in man and in quadrupeds, and never escapes spontaneously, in either instance, in the healthy state. After a certain delay, a feme of inconvenience and pain produces a voluntary muscular exertion, by which it is expelled. As there is an uninterrupted flow of urine into the bladder, why does it not constantly escape? The voluntary act, by which we suddenly interrupt the stream in micturition, or refill an urgent desire to void the urine, is manifestly the contraction of the accelerator, which closes the bulb of the urethra, and consequentely intercepts the communication between the bladder and the front of the canal. But we inquire the cause which acts perpetually, not only independently of the will, but when we are not attending, even when we are asleep, in preventing the urine from flowing guttering through the urethra, as it arrives from the ureters.

It is the more interesting to discover this cause, since there seems to be in the bladder a natural tendency to contraction, in virtue of its irritable powers. Hence, when a direct opening is made into its cavity, when the refilling power of the neck is destroyed by paralysis, or when an open catheter is left in the urethra, the urine escapes constantly as it is secreted, and no accumulation takes place in the bladder. The effect cannot be produced by a sphincter, obedient to the action of the will, because it takes place in an infant unconscious of the usages of society and the laws of decorum, and in an animal which has never been trained to cleanliness. Both expel the urine at intervals, and in obedience to a stimulus, which seems to be the natural motive of the act. Moreover, the evacuation is so far from being spontaneous, that it requires a considerable effort.

Physiologists have commonly referred the closing of the urethra to the sphincter ventriculus, and have considered it analogous, in every respect, to the sphincter ani. But this is unsatisfactory, when the very existence of the part, as a muscle, is questioned. To the action of this, which he acknowledges to be inadequate to the effect, Haller joins the relative position of the bladder and urethra. He observes, that the inferior portion of the receptacle defends below the level of the urethra, and may consequently be dilated without the urine running off through that opening; and that a greater portion of the bladder is so placed when the organ is dilated. Hence, he adds, the bladder may be dilated, in some degree, in the dead subject, before its contents will escape by the urethra. The French anatomists seem to be of opinion that there is some peculiar contracéile and refilling power in the neck of the bladder; this is termed in the Anatomie Descriptive of Bichat, "le refrot ou la resistance organique du col;" t. v. p. 157. Boyer speaks of the "habitual contraction of the fibres surrounding the neck of the bladder, and the elastic force of the neck and prolate." Traite complet d'Anat. t. iv. p. 493.

We do not pretend to explain clearly the exact mode in which this influence is effected. We see no sphincter muscle adequate to the purpose, and the circumstance noticed by Haller will not at all account for the retention of the urine until the fundus of the bladder has ascended far into the abdomen. We must be contented to recognize the existence, without knowing the nature of a powerful contracéile property.
property in the neck of the bladder, retaining the urine, in ordinary circumstances, until the sense of inconvenience induces us to make the requisite voluntary exertion for its evacuation; and, in paroxysms of the muscular coat, and other states of disease, holding it until the bladder, enormously distended, spasm and bursts. The advantages of this arrangement, in enabling us to retain the urinary secretion, until it has accumulated in considerable quantity, and in securing us from the fetor, excoriation, and other annoyances, which a copious involuntary flow of urine produces, are too obvious to need a more particular detail.

Does the retention of the urine in the bladder produce any alteration in its qualities? Physiologists generally believe that the water is partly absorbed. The urine voided at different times possesses, as we have already remarked, very different properties: if, after emptying the bladder, we make water again in a short time, it is almost colourless and odorous; allow a long time to elapse, and it will be highly coloured, acid, and have a strong smell. The latter properties particularly characterize what is voided after a night's sleep. These circumstances are most easily explained by the agency of the lymphatics. The admixture of secretions from the surface of the bladder is another important source of modifications in the urine, particularly when the organ is irritated or diseased.

The increase in the quantity of urine accumulated in the bladder produces an unpleasant feeling, which soon amounts to pain, and ends, if the cance continues, in the most excruciating agonies. Many circumstances influence the length of time, during which the urine is retained, and the quantity that may be accumulated before the desire to expel it is felt. The qualities of the fluid, as being more or less irritating, and the quantity secreted in a given time, produce considerable differences: a much larger quantity can be retained, when introduced gradually, than when secreted very fast. Habit has considerable influence; and hence, women, from the usages of society, can generally support a greater dilatation than men. The bladder itself, without any disease, varies in its retentive power in the same individual, according to his state of health: the effect of age is also very perceptible; the irritable bladder of the child empties itself very frequently; in advanced age the contrary is observed. But the effects of disease are more obvious and important; in paralytic dilatation produces no feeling, and the natural stimulus to evacuation does not take place. When the organ is affected by any irritating cause, as the presence of a stone, it will hardly bear a few drops of fluid.

The evacuation of the bladder is the joint effect of two powers; viz. the action of the respiratory muscles, and that of the muscular coat of the organ. By the first we overcome the resistance of the neck of the bladder; and the operation is finished by the second. We begin, as in all similar efforts, by a deep inspiration; then, retaining this air in the chest, we exert also the abdominal muscles. The perpendicular position of the body subjects the bladder, in the most favourable way, to the downward pressure of the diaphragm: the biffines is accomplished more difficultly in the recumbent posture. The effort is always greater in proportion to the dilatation of the bladder: when the quantity of urine is small, the exertion may be slight; but inspiration in all cases precedes micturition. A few drops, or a very slender stream, come through the urethra first, proving that the orifice of the bladder is very completely closed in the healthy state. It then comes in a larger and larger current, and with increasing force; being propelled further in young than in old subjects. When it flows in a full stream, we remit the effort with which the operation began, and continue respiration in the ordinary manner: the process is completed by the powers of the bladder, which force out its contents in a continuous stream. We may still increase the impetus by renewing the effort; or we may project a portion of the fluid more forcibly by the assistance of the accelerator urine muscles. Perhaps the contraction of the bladder is the most important circumstance in the operation: for, when that is paralysed, we put the respiratory powers in action without effect.

Dilatation of the organ very much weakens its expulsive power; so that, when we have retained the urine beyond the proper time, we exert the abdominal muscles and diaphragm very violently for a considerable time without effect.

Towards the end of micturition, the urine again flows guttating, as at the beginning; and the last portions are thrown into the urethra with so feeble an effort, that they must be expelled from that tube by the accelerator urines.

Kidneys, Inflammation of. See Nephritis.

Kidneys, Calculus in. See Nephrocalcin.

Kidneys of Birds and Fishes. See Anatomy of Birds, and Fish.

Kidney-bean, in Gardening, a common name which is often applied to a particular sort of bean. See Phanoeolus.

Kidney-bean Tree. the common name of a particular kind of tree. See Glycine.

Kidney-vetch, the common name of a peculiar sort of vetch. See Anthyllis.

KIDONIA, or CIDONIA, in Geography, a province of Crete, or Candia, which has retained the name of the ancient city of the Cretans, produces oil, grain, cotton, flax, silk, honey, wax, some fruits, and a tolerably large quantity of cheede; its territory is in general extremely fertile. The nearest mountains which lie to the south, being more temperate and more cool than the territory of Crete, yield a great many fruits; but little wine, much oil, and some wheat and barley are produced in this province. See Candia.

KIDWELLY, or CIDWELLY, a market town and parish of Caermarthenshire, South Wales, is seated on the banks of the river Gwandaeth, over which is a bridge, connecting two portions of the town called the new and old town. In the year 1800, the parish contained 233 houses and 1382 inhabitants. Kidwelly has been for many ages a town of considerable traffic. "Its harbours were so well frequented as to render it the rival to Caermarthen; the fisheries of this port were considerable; its coal trade great, and it had besides a flourishing internal business in the clothing line. But the condition of the place has been for years on the decline. By virtue of its charter, the affairs of the town are regulated by a mayor, who is chosen annually. About the middle of the sixteenth century, Leland speaks of Caermarthen having increased in consequence of the decay of Kidwelly harbour, the entrance of which became suddenly intercepted by a dangerous sand-bank, driven up by the sea, that prevented vessels of large burden from failing up the river as before. It is worthy of remark, that this bar of sand, after lying for a long time in the situation above-mentioned, as to almost ruin the Kidwelly port, separated, a few years back, of its own accord, in the middle, and now affords a sufficient depth of water for the vessels commonly employed in the trade of this part of the country to come up the river. The old town, in the time of Leland, was nearly defolated, but the walls surrounding it appears, from his words, to have been entire, for he tells us, this part was "pretty walled," and that he saw "the gates there." The old town is at present inconsiderable. The castle, at one extremity of it, stands proudly elevated on an artificial mount, on the site of the marshes. It is allowed to be the most perfect building
of the kind in Wales; and, according to Mr. Donovan, "is certainly a magnificent remain of ancient military architecture. There is an air of solemn majesty in its appearance, that befits a noble origin." In the same author's "Descriptive Excursions," is a print of this castle, and a long note on the history of the building, controverts the assertions of Camden, Buck, and Grose, who affirm that "Kidwelly castle was built soon after the conquest by Maurice de Lannoy, one of the Norman knights, who conquered Glamorganshire." Instead of this, Mr. Donovan says it was built in 1189, by Rhys, Prince of Wales. Since that time it has undergone various alterations and enlargements. The present remains are carefully preserved from "every species of wanton depredation." The ground plan is nearly quadrangular, with four round towers at the angles; and smaller towers in the walls. At the west end is the chief entrance, between two other round towers. Several of the apartments are nearly perfect. The prospects from the summit are "uncommonly fine."

Near the church, in the new town, was a priory, or cell of Black monks. Donovan's "Descriptive Excursions through South Wales," 2 vols. 8vo. 1805.

KIE, or KEI, a town of Persia, in the province of Mekran; 100 miles N.N.E. of Kedge. N. lat. 27° 40'. E. long. 60° 8'.

KIEKERNES, a town of Prussia, in the province of Jamland, situated on an island in the Rurs; 19 miles N.W. of Tilt.

KIEL, a town of Sweden, in the lapmark of Afele; 55 miles S.S.E. of Afele.

KIEL, a town of the duchy of Holstein, situated at the bottom of a bay or gulf in the Baltic, and forming a convenient harbour. It contains 800 houses, three churches, an university founded in the year 1650 by Christian Albert, duke of Holstein-Gottorp, and considerably enlarged by the late king. It contains 24 professors, and when Mr. Coke visited it about 300 students. It has also a college established in 1768. The prosperity of this place very much depends upon an annual resort to it of the nobility and persons of wealth in Holstein and Sleswick, for the transfer and disposal of their monies; this pecuniary intercourse usually lasted eight days, at which time was held a considerable fair, which commenced by the ringing of a bell on Thursday, and terminated in the same manner on the eve of the Purification. It was formerly one of the Hanse towns, and the staple for all goods exported from or imported to Denmark. The district of Kiel is that portion of the duchy of Holstein, which descended to the line of Holstein-Gottorp, and belonged to Peter III. as part of his hereditary dominions. In 1773, the empress of Russia ceded it to the king of Denmark, in exchange for the counties of Oldenburg and Delmenhorst, which she gave to the prince bishop of Lubeck. This exchange was favourable to Denmark, as it possessed the whole duchy of Holstein. For an account of the canal of Kiel, see CANAL.

KIEL, Lake of, a lake of Norway, in the province of Flirthard; 16 miles N. of Christianfield.

KIELLE, or KIALE, a town of Austrian Poland, in the patrimat of Sandomirz, the seat of a bishop; 24 miles E. of Malogaz.

KIELO, a town of Peræa, in the province of Irak; 35 miles N.E. of Sultania.

KIEMI. See KENI.

KIEX, a town on the E. coast of the island of Ceram, one of the Molucca islands.

KIENG-HIEVER, a town of Peræa, in the province of Irak; 39 miles S.S.W. of Hamadan.

KIE-NING, a city of China, of the first class, in the province of Foo-kiên. To its district belong eight cities of the third class. It is situated on the river Muhlo, which renders it a place of considerable trade. At the time of the conquest of China by the Tartars, this city sustained two sieges, and refused to submit to the power of the conqueror; but some time after it was taken, and all the inhabitants were put to the sword. It was afterwards re-established by the Tartars, who destroyed it. N. lat. 27° 5'. E. long. 117° 2'.

KIE-TCHANG, a city of China, of the first class, in the province of Kiang-si, situated on the frontiers of the province of Foo-kiên. It has five cities under its jurisdiction. In the adjacent country, which is fertile, the common rice is used in making wine; and a reddish corn is used by the richer people for food. N. lat. 27° 35'; E. long. 118° 20'.

KIEO-CARPOU, a town of Corea; 500 miles N.W. of Peking.

KIEO-KIANG, a town of China, of the first class, in the province of Kiang-si, situated on the S. side of the river Yang-tse-kiang, or Kan-ku; it has five cities under its jurisdiction. This city is the rendezvous of all the barks which sail and repair from the other cities of this province, and the province of Kiang-nan and Hau-quang. Although it is 200 miles distant from the five larger towns of Corea, and doorstep, and surgeoons are taken in its river; which ebb and flow every new and full moon. N. lat. 29° 53'; E. long. 115° 45'.

KIERADY, a town of Hindostan, in Benares; 15 miles E.S.E. of Chunar.

KIE-MALI, a town of Turkish Armenia, on the coast of the Black sea, at the mouth of a river of the same name; 30 miles S.W. of Trebizond.

KIERE, a town of Peræa, in the province of Irak; 20 miles S.E. of Cañam.

KIERNOW, a town of Russian Lithuanis; 25 miles N.W. of Wilna.

KIERTENMIDNE, a sea-port town of Denmark, in the island of Funen, on the side of a large bay. The merchants of Odenée have warehouses in this town; eight miles E.N.E. of Odenée. N. lat. 55° 21'; E. long. 10° 40'.

KIESELSCHIEFER, in Mineralogy, a species of stone, which, according to Werner, comprehends the two following sub-species, viz. the Silicous schijus of Kirwan, and the bafinite of the same author. The principal colour of the former is ash-grey, blueish or greenish-grey, with occasional spots or drapes of red, and is often crossed by veins of quartz. It occurs in mafs, forming whole beds, or in smooth rounded pieces. Internally it is dull, rarely some what glistening. Its fracture in the great is imperfectly flat, and in the small intermediate between splintery and uneven, inclining sometimges to flat conchoidal. Its fragments are sharp-edged, indeterminate. It is opaque, occasionally somewhat translucent on the edges. It is hard, but not difficult to break, and is moderately heavy. Before the blow-pipe it becomes white and friable. It is found among transition mountains, in thick beds, in Bohemia, Saxony, Switzerland, the south of Scotland, and Siberia, &c. Wiedenmann supposes that this substance is argillite, containing a larger proportion than usual of silex. It is one of the numerous rock masses called by the Germans Hornschiefer. The second sub-species is the bafinite of Kirwan, the Lydian stone, or touch-stone. Its colour is greyish, passing into blueish-black. It occurs in masses and in rounded fragments, generally penetrated by veins of quartz. Internally it is glistening. Its fracture is even, approaching to conchoidal, and sometimes to splintery; in mafs it is generally
nerally flaky. Its fragments are indeterminate and sharp-edged, often trapezoidal. It is opaque, moderately hard, and easily frangible. Sp. grav. 2.4 to 2.8. It is found in similar situations with the preceding. It is used, on account of its hardness and colour, as a touchstone to ascertain the comparative purity of the various kinds of gold and silver alloys. (See Touch stone.) Humboldt ascribes its black colour to a portion of carbon. See Schinz.

**KIEV, KIEF, Kieff, or Kiev, in Geography,** a government of Russia, bounded on the N. and N.E. by the government of Tchernegef, on the S.E. by the government of Ekaterinov, on the S.W. and N.W. by Poland; about 148 miles long and 60 broad; situated for the most part on the left side of the Dnieper. Being part of the Ukraine, or Little Russia, it was once a duchy belonging to the great dukes, and Kief was their principal residence. This country was conquered by the Tartars, and came again into the possession of the great dukes; but was afterwards over-run and pacified by the Cossacks, under the protection of Poland. In 1614, the natives, discontented with John Casimir, king of Poland, submitted toRussia, and have ever since continued subject to that empire. The vast privileges enjoyed by the natives have been gradually abolished, and they are now reduced to the same estate as the other provinces of the Russian empire. The country is a continued plain, very fertile, and producing abundance of grain and pottage, honey, flax, tobacco, &c. Its capital is Kiev or Kief.

**KIEV, Kieff, or Kiev, the capital of the above government, and of the district belonging to it, is situated on the Dnieper, which is 20 miles wide.** It consists of three small towns, viz., the castle of Petherflcy, with its suburbs; the old city of Kief; and the town of Podol, which lies below the latter. These are partly inclosed by a common fortification, and communicate by a large entrenchment, carried on as the inequality of mountains would allow. The first mentioned castle stands on an eminence facing the south; and, besides barracks for the garrison, magazines, officers' houses, and some churches, includes a rich and flately monastery, founded in the eleventh century, and called 'Petherflcy,' because the monks formerly lived in a 'pefthera,' like a cavern, on the mountain where the convent now stands. In its subterraneous vaults, which resemble a labyrinth, and consist of cells, chapels, &c., are found great numbers of undecayed bodies, supposed to be the remains of saints and martyrs. The old city of Kief stands on an eminence facing the north, and is fortified, according to the mountainous nature of the country, with horn-works, &c. Here stands the cathedral. Podol lies below old Kief, in the plain on the banks of the Dnieper, and befores the university, churches, and convents, entirely consists of shops and tradesmen's houses. This city is the fee of a Greek archbishop; 420 miles E. of Cracow. N. lat. 50° 32'. E. long. 30° 56'.

**KIEUSK, a town of Notaia; 40 miles N.W. of Mogila.**

**KIEZVENSKOE, a town of Ruffia, in the government of Perm; 80 miles N. of Perm.**

**KIFANTAN, a town of Bootan; 64 miles N. of Dnagopour.**

**KIFFER, an island in the Ealt Indian sea, about 20 miles in circumference, near the north coast of the island of Timor. S. lat. 8° o'. E. long. 126° 20'.**

**KIFTELEK, a town of Hungary; 18 miles N.W. of Zedegi.**

**KIGELIA, one of the Fex-fshands, which fee. N. lat. 54°. E. long. 194° 28'.**

**KIGGELARIA, in Botany, was named by Linnaeus in honour of Francis Kiggelaar, a Dutchman, who imported many new and rare plants into Europe from America, and who published the Hortus Bequandiiens in 1690, and observations on Commodus' Hortus Amuldiamentum in 1697.**

Gen. Ch. Male. Cal. Perianth of one leaf, concave, divided into five lanceolate, concave segments. Cor. Petals five, lanceolate, concave, a little longer than the calyx, and forming with it a port of cup; nectary of five small, obtusely three-lobed, depressed, coloured glands, the middle lobe larger; each gland attached to the edge of a petal. Stam. Filaments ten, very small; anthers oblong, shorter than the calyx, opening at the tips by two perforations. —Female. Cal. and Cor. as in the male. Pfl. German superior, roundish; styles five, simple; stigmas obtuse, slightly cloven. Peric. Capsule leathery, globose, round, of one cell, and five valves. Seeds numerous, about eight, roundish, afterwards angulated, each covered with a tunic.

Eur. Ch. Male, Calyx five-crested. Corolla of five petals; glands five, three-lobed. Anther perforated at the tips. Female, Calyx and Corolla like the male. Styles five. Capsule of one cell, five valves, and many seeds.

1. K. africana. Linnaeus. Sp. Pl. 1460. Hort. Cff. 465. t. 29.—A native of the Cape of Good Hope. Its flowers in May and June, and were cultivated, fo early as 1650, in the Royal Garden at Hampton Court. This tree generally rises to the height of five or seven feet, and is very hard and woody. The bark of the branches is at first smooth and green, but afterwards purplish. Leaves on footstalks, alternate, lanceolate, serrated, spreading. On the male plant, panicles of flowers branched on branchlets, with white petals and yellow nectaries; on the female, each flower stands on a simple stalk. Capsule rugged, and pubescent on the outside, containing a reddish or rusty-coloured pulp, in which the seeds are imbedded. The fruit has attained its full size in Chelsea Garden, but the seeds rarely come to maturity in this country.

**Kigielaria, in Gardening,** comprises a plant of the ever-green shrubby kind, which is the African kigielaria, (K. Africana.)

**Method of Culture.**—Plants of this fort may be increased by seeds, layers, and cuttings; but the seed method is the best, as they root but sparingly in the other two modes.

The seeds should be sown in the early autumn, in pots filled with fresh loamy earth, being plunged in a hot-bed. After they have a few inches growth, they should be removed into separate small pots, re-plunging them in the hot-bed; and when well rooted, they ought to be gradually hardened to the effects of the open air. The layers should be made from the young shoots of the same year, putting them down in the summer months.

The cuttings of the young shoots should be planted in the spring, immediately before the plants begin to shoot, in pots filled with loamy earth, being plunged in a very moderate hot-bed, and covered with glass to exclude the air; due shade being afforded, and but little water given after the first planting. Such plants as strike root may be removed into separate small pots of loamy earth, and be exposed to the air, in a warm sheltered situation, until the autumn, when they should be placed under the protection of the green-houfe, and managed in the same mode as orange trees.
KI L

These plants afford variety among other plats of the green-house kind, that are in pots.

KIGLEY, or KIGHLEY, in Geography. See KIEGHLEY.

KIJASA, a mountain of Thibet; 25 miles S.E. of Giti.

KIKACCO, a town of Africa, in the kingdom of Congo; 38 miles S.E. of Pangua.

KIKALA, a town of Sweden, in South Finland; 40 miles E.S.E. of Abo.

KIKIANY, one of the small Japanese islands. N. lat. 29° 40'. E. long. 132° 17'.

KIKOV, a town of Japan, in the island of Niphon; 15 miles S.E. of Iwata.

KIKUKOVI, a town of Russia, in the government of Tobolisk; on the Tehulin; 64 miles N.W. of Astchinsk.

KIKUTZ, a town of Japan, in the island of Xino; 15 miles N.E. of Udo.

KIL, a town of Sweden, in the province of Warmeland; 12 miles S. of Chriflineham.

KILAN, a province of the south-calen part of Great Bucharia, deriving its name, like the other provinces of this country, from its chief city.

KILANG. See KELANG.

KILANOI, a town of Sweden, in Weft Bothnia; 105 miles N. of Tornea.

KILAR, a town of Perfin, in the province of Irak; 14 miles S.E. of Taferan.

KILBARCHAN, a small town of Renfrewshire, about 4 miles N.W. from Paisley, and nearly the same distance from Renfew. Kilbarchan is a thriving place, chiefly inhabited by the tradepeople employed in the various processes of the extensive cotton manufacturies carried on through the whole of this district. There are also considerable manufacturies of Scotch thread established here.

KILBEGGAN, a post-town of the county of Weffmeath, Ireland, which, before the union, had the privilege of sending members to the house of commons. It is a small town, on the river Brofra, and is remarkable for two old monasteries. It is on the road from Dublin to Galway; 44 miles W. from Dublin, and 15 E. from Athlone.

KILBIRNIE, a village of Renfrewshire, near Beith, where there is a fine loch or lake of water. It is a populous, thriving, little place, engaged, like most others in that part of the country, in the manufacturies of cotton goods and thread.

KILBRIDE, East, is a small village in Lanarkshire, about 10 miles S.E. from Glasgow. It is remarkable for some Roman antiquities, which have engaged the attention of antiquarians, who have published detailed accounts of various curiosities found and dug up in this neighbourhood. At present the great quantities of fine lime, which are worked in its neighbourhood, engage a considerably greater portion of attention, as is found of great advantage to the whole surrounding district, both for the purposes of agriculture and building.

KILBRE, Weft, is a small village contiguous to the firth of Clyde, in Ayshire.

KILBURG, a town of France, in the department of the Jarn, and chief place of a canton, in the district of Zum. The place contains 361, and the canton 4307 inhabitants, in 26 communes.

KILCH, in Ichthyology, a name used by some for a species of fish of the ahihba kind, caught in the lakes of Germany, of a fine firm flesh and delicate flavour, and feems very little, if at all, different from the serra.

KILCOCK, in Geography, a post-town of the county of Kildare, province of Leinster, Ireland, situated upon the river Blackwater. It is a small town, 14 miles W. by N. from Dublin, on the road to Mullinger.

KILCONNEL, a small post-town or village of the county of Galway, Ireland; 75 miles W. from Dublin, and almost 25 E. from Galway.

KILCULLEN, or KILCULLEN-BRIDGE, a post-town of the county of Kildare, province of Leinster, Ireland, situated on the river Liffey, over which it has a bridge. It is on the great southern road from Dublin, in consequence of which its inmates are much frequented. One mile and half south of it is the village of Old Kilcullen, where is a church, and resident clergyman. Here is a round tower, not exceeding 50 feet in height; and the shaft of a cross, of a single stone, 10 feet high. Kilculleen-bridge is 21 miles S.W. from Dublin. Caliife.

KILDA, St., or HITA, a remote islet among the Hebrides, or western islands of Scotland. It is seated in the Northern ocean, at the distance of about 60 miles from Harris, and 160 miles from the nearest point of the mainland of Scotland. This islet is small, being only three miles in diameter from east to west, and two miles in a transverse direction; the whole circumference is about ten miles. It is nearly surrounded with a perpendicular face of rock, which refe to a considerable elevation; a small bay or landing-place is found to the south-east. Mr. Macaulay, the historian of this islet, says, it may be ranked among the greatest curiosities of the British empire. The situation of the place, the genius of the inhabitants, their manners and customs, the constitution of their little commonwealth, that amazing dexterity with which they manage the most important branches of their biiiness, that unexampled courage with which they encounter dangers insurmountable to any other race of men, and that perhaps happy ignorance which renders them absolute strangers to those extravagant desires and endless pursuits which keep the great and active world in a constant agitation; all these, and some other extraordinary circumstances, taken together at one view, seem highly to merit the attention of the inquisitive. The surface of the island is mostly rocky; in some places are patches of moss, and in others grafs. The foil, though in many places well adapted to corn, is chiefly employed in paille; as the inhabitants are rather averse to agricultural pursuits. In the vicinity of the village a little corn is cultivate. The pâyre is richly manured. Barley and oats are only fown: potatoes and cabbages, and some other garden plants, have recently been introduced into the islet. Several springs issue from the hills, and form two small streams which run into the sea on the east and on the west. The village consists of two rows of houfes, which are situated about a quarter of a mile from the bay, and contains all the inhabitants of Kilda. In the year 1764, when Macaulay published his History, the islet contained only 88 persons; but he affirms that a contagious diftemper (the small-pox) swept away the great part of the people about four-and-thirty years ago." Martin found 180 persons, when he visited the islet at the time here alluded to, i.e. 1850. The dwellings are all low, common huts, or cottages; divided into two rooms each, and peculiarly flat in the roof. One of the apartments is appropriated to the dwelling and sleeping of the inhabitants, and the other for the cattle during winter. In these rooms they prepare the chief mauce for the lands. Besides these cottages, there are several cells or storehouses in different parts of the islet. These are composed wholly of stones, and are from 12 to 18 feet in length, by 7 feet in breadth and height. Fowl, eggs, and sheep are the principal objects of care and attention to the
the Kildarens, who entirely support themselves, and pay their rents with these. The inhabitants manifest particular skill and courage in obtaining the fish; for as their places of resort for rearing their young, for roofing, &c. are receivables in the lofty cliffs on the coast, it requires particular adroitness and courage to reach such spots. A fowling party consists of four men, who are provided with a firng rope made from thongs of raw cow-hide. One end of this is fastened on the top of the cliff, whilst two men defend it by means of the rope to various cliffs in the rock, where they search for eggs and young birds. Among these, the foland goose or guant is deemed the most valuable prize.

The laird of Macleod is proprietor of this island, and its dependents, rocks, &c. He lends his fieward annually to collect the rents, which are paid in sheep, butter, cheese, and wild-fowl. Around the island are several small infalluated rocks, which are of great value. Fowls, sparrows, and rock crabs are found on the north side of the island. This infalluated spot was certainly visited by religious persons at a remote period. Macaulay describes a circular arrangement of upright stones, which he calls a Druidical temple; with other remains of pagan worship and monastic rites. See his History of St. Kilda, Svo. 1764.

KILDARE, a county in the province of Leinster, Ireland, bounded on the north by Meath, on the east by Dublin and Wicklow, on the south by Carlow, and on the west by the King's county and Queen's county. It extends from north to south 31 Irish (42° English) miles, and from east to west 21 Irish (26° English) miles, forming an area of 243,245 plantation acres, or 369 square miles, equal to 369,198 English or statute acres. Of these, there are 41,025 acres of bog. The number of parishes is stated by Dr. Beaufort to be 113; of which, 57 parishes belong to the see of Dublin, and 56 to that of Kildare. From unions there are, however, only 39 benefices, and 23 churches. The number of houses stated in the return used by Dr. Beaufort is 11,205, from which the inhabitants are estimated at 56,000. This is a thin population for a county to bear the capital, and not all encumbered with mountains or hills: but besides the great proportion of bog it contains, upwards of 3000 acres are occupied by the Curragh; and although this beautiful plain affords pasture to an immense number of sheep, there are but a very few habitations scattered around its edges. This county is mostly flat, of fine arable soil, but much exhausted, as, from its vicinity to Dublin, it has been for centuries the country from which the capital has principally drawn its supplies of grain. "In a county where one-fifth is bog," says Mr. Rawlin in his Survey, "much water must lie on the surface: this, of course, attracts the rain from every passing cloud. It may be remarked in the summer season, that where a cloud passes over an extensive bog or river, it is arrested and drawn down. This causes the county to be subject to more moisture than any in Ireland; and this evil must continue until the kingdom be relieved by a general drainage act, which shall compel foolish occupiers and proprietors to come forward, and contribute to such extensive drainings, on a great public scale, as the legislature may in its wisdom direct, according to the benefit to be derived by each estate or property, through which such drains shall be pointed out." Since the preceding remarks were written, an act of parliament has been passed, and sums of money granted, for ascertaining the nature and extent of the various large tracts of bog in Ireland; and the reports of the engineers employed contain much valuable information.

For this step, preparatory to a more effective measure, if the legislature shall be induced to proceed, the country is indebted, as for many other advantages, to the right honourable John Fostler, late chancellor of the Irish exchequer: a gentleman who, though now often loaded with reproaches from a spirit of party, will in future times be numbered among the greatest benefactors of Ireland. The county of Kildare is full of springs and rivulets. The river Barrow forms its south-west boundary, and receives the Gres. The Liffey takes a circular course through the north-east of the county, and the river Boyne rises in the bog of Allen. The Barrow is navigable from Athy, where it meets the Grand Canal, which, from Dublin, passes through this county, crossing the Liffey on an aquaduct bridge, and then after branches off. Near Clane is a collateral cut to the Shannon. The Royal Canal also has been carried through the northern part of the county, so that great advantage is derived to the inhabitants from the cheap conveyance of their products to market. The principal towns are Naas, the affize town, Athy, Monalateran, and Kildare; for account of which, see the articles under the respective names. As there is no borough of sufficient extent to return a member to parliament, the county is represented by the two knights of the shire only; whilst, before the union, it had ten members. Kildare was part of the territory acquired by earl Strongbow, in right of his wife, Eva, daughter of Dermot, king of Leinster. From its neighbourhood to Dublin it was early colonized, and formed part of the English pale, when confined to four counties. There are in it the ruins of many castles and abbeys, some of which are mentioned in other parts of this work. It was also the scene of much distress during the rebellion of 1798; many battles having been fought in it, and a vast number of houses destroyed, both by the rebels, and by the military force sent to subdue them. Beaufort's Memoir. Rawlin's Statistical Account.

KILDARE, a post-town of the county of Kildare, Ireland. It is a small and ruined place, but it retains some vestiges of having been of more importance in former times. There is a very fine round tower 130 feet high, and the ruins of two abbey churches and of its cathedral. Except when there are races or encampments on the Curragh, which is very near it, it has no trade. It is 25 miles W.S.W. from Dublin.

KILDARE, a bishopric in the province of Dublin, founded about the end of the 9th century. It comprehends part of three counties, viz. Kildare, King's county, Queen's county, and contains 33,200 plantation acres, which are divided into 81 parishes. The crown is patron of 27, the bishop of 30, and different laymen of 24 parishes. In confluence of unions, however, there are but 31 benefices, and 28 churches. The bishop has no place of residence in his diocese, but being always dean of Christ-church, Dublin, resides in or near that capital. Beaufort.

KILDERKIN, a kind of liquid meaure, which contains two firkins, or eighteen gallons, beer-measure, and fourteen ale-measure.

Two kilderkins make a barrel, and four an hogshead.

KILDORRERY, in Geography, a small post-town of the county of Cork, province of Munster, Ireland; 107 miles S.W. from Dublin.

KILDUIN, a small island in the North sea. N. lat. 69°. E. long. 34° 14'.

KILDYSART, a small post-town of the county of Clare, province of Munster, Ireland, on the river Shannon; 122 miles S.W. from Dublin.

KILE, a town of Great Britain, in the country of Balk, in the North sea. N. lat. 37° 10'. E. long. 64° 30'.

KILFIT, a sea-port town of Nubia, on the Red sea, with
with a harbour, seven miles in circumference, safe from winds. N. lat. 51° 45'. E. long. 36° 40'.

KILGRUND, a small island on the E. side of the gulf of Bothnia. N. lat. 62° 5'. E. long. 21° 4'.

KILIA, or KILIA-NOVA, a town of European Turkey, in the province of Bessarabia, at the mouth of the Danube, near the Black sea; 20 miles E.N.E. of Ilnav. N. lat. 45° 28'. E. long. 30° 12'.

KILLOS, a town of Athisia Turkey, in Natolia, on the coast of the Black sea; 20 miles W.S.W. of Amailad.

KILKARE, a town of Hindoostan, in Marawar; 10 miles S.W. of Ramanadpoom.

KILKEALE, a poll-town of Ireland, in the county of Down, and province of Ulster. It is situated on the Irish sea, under the Mourne mountains, great part of which are in the parish of Kilkeale. It is 65 miles N. by E. from Dublin.

KILKENNY, the name of a county of Ireland, in the province of Leinster. The surface of it extends from 52° 14' to 52° 52' N. lat. and from 6° 56' to 7° 37' W. long from Greenwich. Its greatest length from N. to S. from the Slieveanier hills to the Suir is 36 Irish (413 English) miles; and its greatest breadth from E. to W. is about 19 Irish (24 English) miles, but in the narrow part is not above 12 miles. The area, according to Dr. Beaumont, is 305,550 Irish, equal to 483,446 English acres; but Mr. Tighe, in his valuable itatitical survey, from which this article is chiefly extracted, lays, that by a survey lately made for the use of the grand jury, they are rated at 314,249 Irish, which are equal to 510,582 English acres. The population, as calculated with great care by the Hearth returns in 1809, is about 308,000 in 17,212 houses. Dr. Beaumont, however, in 1793, rated the houses as 17,509, though he did not make the inhabitants exceed 100,000, and he observes that the houses are much fewer than what might be expected in a county which has been generally esteemed one of the most populous in Ireland. The latter writer states the number of parishes to be 127, of which 121, united in 45 benefices, are in the diocese of Ossory, and the remaining 6, forming four benefices, in that of Leighlin. The entire number of churches in the county is only 31, a very considerable proportion of the population being Roman Catholic. The position of a country strongly affects the climate. This is agreeably experienced in this county. The declivity from the northern to the southern boundary is about 500 feet, which conveys, with sufficient rapidity, the water that falls upon the surface; and the river Nore flowing through the centre, descends about 13 feet during the run of a mile. Besides this defect, which carries off the water, the surface of the country enjoys a favourable exposure to the south-east. There is little either of bog or marsh to contain stagnant water, and the greater part of the subsoilation is basaltic, birlitc, felucitus, or poros argillite, and only in a small part, a retentive clay. The vicinity of the ocean tends to render the climate mild, while the clouds, which are driven forward by the western and south-western winds, are not arrested here by high mountains, but passing over the low secondary hills and extended plains of this country, are attracted towards the lotty and primary ranges of rocks which rise on the north-east. From these circumstances the crops are earlier in general than in the tillage countries to the northward. The quality of the soil is in general excellent. The northern part rather bears the appearance of poverty, but by judicious management, and the present application of lime and lime-hom-gravel, it may be rendered far more productive in corn and grass. The southern part is more favoured by nature; and where the hills fall into plains or valleys, fertility is seen in all its native excellence. The Nore exhibits upon its banks the most delightful prospects and the most luxuriant fields. It is not difficult to trace the nature of the different minerals in this county. Here is a termination of a chain of granite hills which take their rise in Wicklow. The stone which usually joins the granite, appearing to be impregnated with siliceous felsicit, and lower down occurs with siliceous flint; but the surface of the lower grounds are found boulders of quartz, sometimes pure white, sometimes streaked with red, and sometimes enclosing yellow mica. In this granite district are also found a few beds of marble and limestone gravel near the foot of Brandon hill. Many of the lower hills consist of siliceous breccia, which is composed of siliceous cement enclosing rounded pebbles of quartz which have often a reddish tinge, and are from the size of a pea to two or three inches diameter. Such a breccia also forms many hills in the S. of Ireland, as the Galters and other mountains in Cork and Limerick, and at both part of Magdlibuddy's rocks in Kerry. This breccia, when of a fine grain, is worked for millstones. In the northern part of the county are excellent quarries for flags, especially that of Shankill. The flags raised here are sent to Dublin, Cork, and other places, where they chiefly go under the denomination of Carlow flags, being raised in the neighborhood of that county, and mostly sent through the town of Carlow. The colliers of Castlecomer have been worked for about a century, and are yet unexhausted. The coal found in them, and in other parts of the S. of Ireland, is unflammable, and is called Stone coal and Kilkenney coal, and when of inferior quality, culm. By Mr. Kirwan's analysis it contains 97.3 per cent. of pure carbon. Mr. Tighe has given a very full account of the accompanying flints, the manner of working, the expenses &c. The late Lord Waterford used to clear 6,000l. or 7,000l. a-year by these colliers, and sometimes more. They now belong to lady Ormonde. The excellent qualities of the Kilkenney coal are well known in Ireland; on this account it is sent to the north and the south, to Londonderry, to Belfast, to Cork, and to Waterford, as well as to Dublin. No fuel dries more to well, and this without any preparation; it is excellent for the forge, and for molten works in iron; in every manufacture where healthy heat is required devoid of smoke it cannot be excelled; nor docs it dirty the flues where it is used. Manganece, iron ore, lead ore, and some indications of copper ore, are perceived in different parts. As long as timber laked near Castlecomer, iron ore was wanted there; but it is now above seventy years since the forges have been used. In the limestone district of this county are many valuable marble quarries. The marble is black, though often with white marks, which appear more strong, and increase by long exposure to the air. That which approaches nearest to black is most valued. It contains a great variety of impurities, of madrepores, of bivalve, and of tuberous shells. By analysis, a specimen of the kind most usual in chimney-pieces with marks of bivalve shells, contained 58 per cent. soluble in marine acid, and left 2 per cent. of a black powder, which appeared to be carbon, and burned without leaving any ashes. On the whole, Kilkenny marble may be considered as containing 97 per cent. pure carbonate of lime, two per cent. carbon, and 1 per cent. magnesia and iron, of which the former is in the largest proportion. This marble is valuable for the making of chimneys. The quantity exported, notwithstanding the disadvantage of land carriage, is about 50,000 tons annually; if a canal were made it would certainly
ably increase the demand, by lowering the price. There is a mill near Kilkenny, by which the marble is fawed and polished, which makes the price of chimney-pieces on the spot very reasonable. There is a chalybeate spa at Ballyferriter, near Johnstown, the medical effects of which have been often celebrated, and which is much frequented. The rivers of this county excel both in utility and beauty. The following poetical account of them by the immortal Spenser presents an accurate, concise, and clear account of the origin, termination, and qualities of the three principal ones.

"And there the three renowned brethren were,
Which that great giant Blomius begot
Of the fair nymph Rheia wand'rering there,
One day as she to dun the season hot,
Under Slewbloom in shady grassy was got,
This giant-found her, and by force deflowered;
Whereof conceiving she in time forth brought
These three fair sons, which being thenceforth pour'd
In three great rivers ran, and many countries cour'd.

The first the gentle Shure, that making way
By sweet Clonmell, adorns rich Waterford;
The next the Rubburn Newre, whose waters grey
By fair Kilkenny and Rosse-pontie board;
The third, the goodly Barrow, which doth hoard
Great heaps of salmon in his deep bosom:
All which long fum'd, do at last accord
To join in one, ere to the sea they come,
So flowing all from one, all one at last become."

The Suir, which divides Kilkenny from Waterford, in a winding and majestic course of about 16 miles, conveys along the southern border of this county, the trade that passes between Waterford, Carrick, and Clonmell. The Barrow skirts the eastern borders for about 20 miles, dividing it from Wexford and part of Carlow. This river is navigable to the town of Carlow, and thence communicates with the grand canal. The Newre, or Nore, more peculiarly belongs to this county, flowing nearly through its central part, in a winding course of not less than 36 miles from the neighbourhood of Durrow to its junction with the Barrow, passing by the city of Kilkenny. This last river receives many tributary streams, and is navigable for small vessels to Inistioge. It is unnecessary to enter into a minute detail of the obvious advantages of these rivers, both to the external appearance of the country and to the accommodation of the inhabitants. The natural and local advantages of this county tend to promote the interests of agriculture, which flourish in great perfection in different places, and the easy conveyance by water affords a ready market for all the productions of the soil. The roads in general are in good repair, and their situation judiciously chosen.

"The county town is Kilkenny; besides, Callan, Inistioge, Thomastown, Gowran, Knocktopher, Graigne Durrow, Callancomer, and Freisford, are entitled to the name of towns, though, all of them are small ones. There are five round towers in this county, namely, at St. Canice, Tullolherin, Kilkree, Carraghy, and Aghaviller. The last is the most ruinous. These are all situated close to the churches, and whatever may have been their origin, appear admirably fitted for bell-ringers. Gramig, or Granditon castle, is one of the most considerable remains of antiquity; it is situated on the banks of the river Suir. The whole county is full of castles, having been one of the first in which the English settled. It became part of the property of Earl Strongbow, from whom it descended to the Marechals, earls of Pembroke. Isabella, one of the daughters and coheirresses of William, the last Earl, conveyed it to Gilbert Clare, Earl of Gloucester and Hereford. The greater part of it afterwards came into possession of the Butlers, earls and dukes of Ormond. The houses of some of the absentee bear evident marks of decay; these, however, are outweighed by the modern structures, many of which are ornamented by the taste of the proprietors. Tighe's Kilkenny; Beaumont's Memoirs; Robertson's Traveller's Guide.

KILKENNY, a city of Ireland, in the county of the same name, and province of Leinster, which, with the borough of St. Canice, forms one large town, surrounded by a district, called the county of the city of Kilkenny; it is delightfully situated on the river Nore, over which are two handsome bridges; it contains 2870 houses, and a population of nearly 16,000. There are many large and good buildings, among which, the most remarkable are the bishop's palace, the magnificent castle of the earl of Ormond, and the celebrated free school or college, where many learned men, among whom Swift, Berkeley, and Congreve were conspicuous, were educated. The inhabitants of Kilkenny have been long noted for the politeness of their manners.

In this city and its environs abundance of blankets and much coarse woollen cloth are manufactured. Kilkenny was formerly represented by four members, two for the city, and two for the borough of St. Canice. At present it has only one representative. In former times parliaments were often held here, and the famous constitutions of Kilkenny, made when Lionel, duke of Clarence, was chief governor, in the reign of Edward III., long continued to be regarded as of the utmost importance to the welfare of the English colony. Kilkenny was also the seat of the Catholic council during the civil war, that succeeded the insurrection of 1541. There are but two churches in the city, but there are several Roman Catholic chapels, each of which has congregations more numerous than both the churches. Kilkenny is 575 miles S.W. from Dublin. N. lat. 52° 38'. W. long. 7° 15'. Beaumont. Tighe.

KILKENNY, a town of America, in Grafton county, New Hampshire, incorporated in 1774, and containing 19 inhabitants.

KILKENNY Coal. See Coal, and KILKENNY, SOAP. KILKENNY Marble. A fine black marble full of shells, and coralloid bodies, and much used in chimney-pieces; &c. See Corallloid Marble, and KILKENNY.

KILKERRAN BAY, in Geography, an harbour of Ireland, in the county of Galway, in that part of it called Connamara; in it there is good anchorage for vessels of any burden, but the wild state of the country prevents its being of much ufe. Its entrance is in N. lat. 53° 15'. W. long. 9° 50'. Beaumont. M'Kenzie. KILKILA, a town of Perian Armenia; 26 miles N.W. of Kanja. KILL, an Irish word signifying a church or cemetery, which is used as a prefix to the names of many places in Ireland. There are two or three villages of this name, one on the great southern road, about 12 miles from Dublin. KILL, in Geography, a town of Peria, in the province of Meckran, on the coast of the Arabian sea; 60 miles W. of Tiz. N. lat. 25° 27'. E. long. 59° 20'. KILKILLAL, a town of Abyssinia; 100 miles S. of Minid. KILKALLAL, a sea-port and post-town of the county of Mayo, province of Connaught, Ireland. It is situated on the western coast of a bay of that name, opening into the Atlantic ocean, and is the seat of a bishop. There are some
some coarse linen and woollen cloths made in it, but fishing is the chief occupation of the inhabitants. The French landed at this place on the 22d of August, 1798, and took possession of it. A very interesting narrative of their proceedings, till their departure, was published by Mr. Stock, at that time bishop, who was a prisoner. Killila is 127 miles N.W. from Dublin, and 24 nearly N. from Casteb.

KILLALOE, a bishopric in Ireland, founded in the fifth century, which is united with Achonry, and is in the ecclesiastical province of Tuam. The united fees extend into the counties of Mayo and Sligo, the river May and the Ox mountains forming the boundary between them. They measure E. and W. 35 miles, and from N. to S. 21 miles. Large as this district is, there are only 25 benefices, each of which has a church, though only eight have glebe houses. The cathedral is small, but venerable for its antiquity; it is the only church in the parish, though a round tower at the other end of the town indicates the ancient site of another church, of which no vestige now remains. Beaufort.

KILLALOE, a small post-town of Ireland, in the county of Clare, and province of Munster, Ireland. It is situated on the Shannon, over which it has a bridge of 19 arches. Below the bridge is a ledge of rocks which prevents the navigation of the river: here is a considerable salmon and eel fishery; but there is nothing beautiful in the town except the situation: very near the town, in the midst of a fine demesne, on the western bank of the Shannon, the bishop has a handsome residence, lately erected. Killaloe is 86 miles S.W. by W. from Dublin, and 25 miles from Ennis.

KILLARE, a town of Hindooftan, in the Carnatic; 9 miles N.W. of Trichinopoly.

KILLARNEY, a market and post-town of Ireland, in the county of Kerry, and province of Munster. It is a neat and populous town, much frequented by strangers on account of the adjoining lakes, the picturesque beauties of which almost charm the beholder. Lough Lene, or as it is more frequently called, the lake of Killarney, consists of two lks. joined by a long narrow channel; in the lower and larger lake, the phæding and the sublime are most happily combined; the upper lake reflects a more solemn grandeur from the stupendous crags, with which it is encircled; but the prospects in both are infinitely diversified. The several islands, the white rocks of Mucruf, the groves of arbutus, the venerable woods, the variety of waterfalls, and the impending cliffs, are separately as delightful and interesting as their assemblage is infinitely grand and magnificent. Mr. Weld has published an interesting 4to, volume descriptive of the various objects that deserve the notice of the traveller, but as these cannot well be abridged, we must pass them over in this work. In the peninsula of Mucruf, cobalt and other minerals have been found, but they are not worked. In Rotuk, in the lower lake, is a valuable mine, containing copper and lead; of the former there is not only rich sulphuret, particularly the kind called purple ore, but also grey ore, which brings a high price. Kilarney is the residence of the Roman Catholic bishop of Kerry, and the population is chiefly of that religion. It is 144 miles S.W. from Dublin, and 58 W. from Cork.

KILBARD, in Natural History, a name given by the people, who dig in the mines of Cornwall, to a kind of greyish-white earth, which is of great hardness, and seems to approach very much to the nature of the ludus Helmontii of four kinds, only that it is less what left than that, and has nothing of the fepta or partitions that make the character of that fossil. This earth contains so great a quantity of spar, that it forms with acids very strongly, though that spar being once dissolved, and the earthy part of the substance only left, it will no longer act with their amendments; whence it is evident, that its terrestial matter is not alkaline, though the spar it contains is of it.

This is the certain character of what is called killas in many parts of Cornwall, where it lies in strata of two, three, or more feet thick, and often before this is laid on each side of the vein of tin or other ore. Its texture is either lamellar or coarsely granular; the lamellar is softer and less mithral than the rock silex; the specific gravity of it, from 2.63 to 2.666. Kirwan found 100 grains of the lamellar fort to contain about 60 of filex, 25 of argil, 9 of magnesia, and 6 of iron; the greenish fort contains more iron, and gives a greenish colour to the nitrous acid. In some other parts of England, the miners use the same word to express a kind of white, brittle, and shattery stone, somewhat like the flag-stone with which they cover houses in Northamptonshire, and many other counties.

KILLAS, in Geography, a parochial village in Stirlingshire, situated on the water of Forth, near its junction with Loch Lomond. Kileam is the birth-place of the celebrated historian and poet George Buchanan, whose history of Scotland, and Latin paraphrase of the Psalms of David, are to us universally known. A handsome pillar near Kirkam was lately erected as a monument to his memory. A small town of the same name is the only manufacturing establishment in this neighbourhood. The pure soft water of the Forth is indeed extremely well suited for all the operations of bleaching, dyeing, and printing, but the want of coal is an almost insuperable objection in point of economy to such works. The nearest are nearly twelve miles distant. In the neighbourhood is Buchanan house, the family mansion of the duke of Montrose.

KILLENADON, a post-town of Ireland, in the county of Tipperary, and province of Munster. The country around it is very fine. In the neighbourhood coal is found, of the same kind as that in the county of Killkenny. It is 725 miles S.W. from Dublin.

KILLERIES' HARBOR, a bay of the Atlantic, on the
the well coast of Ireland, between the counties of Mayo and Galway. A vast number of herring busses rendezvous here in the fishing season, from all parts of Galway and Mayo. N. lat. 53° 58'. W. long. 9° 46'.

KILLESANDRA, or KILLESANDRA, a poit-town of Ireland, in the county of Cavan, and province of Ulster. It is 61 miles N.W. from Dublin, and 8 miles S.W. from Cavan.

KILLFENORA, a village of the county of Clare, Ireland, which is the seat of a bishopric, united to Killaloe. It is four miles N.N.E. from Ennislavender, which is its poit-town.

KILLCRANKY, a village of Perthshire, in Scotland, near which is a famous road, cut in the side of a mountain, called "Killcrankie Pass"; on one side is a lofty mountain, and on the other a precipice of 150 yards; 12 miles N. of Dunkeld.

KILLIGRAY, a small island of Scotland, between Lewis and North Uist. N. lat. 57° 43'. W. long. 7° 34'.

KILLINCHY, a poit-town of Ireland, situated on Strangford Lough, in the county of Down. It is 92 miles N. by E. from Dublin.

KILLINES Point, a cape of Scotland, on the coast of the county of Wigtown, in Luce bay; 3 miles N. from the Mull of Galloway.

KILLING, See Homicide and Murder.

KILLINGA, in Botany. See KILLING.

KILLINGLY, in Geography, a town of America, in Windham county, Connecticut, situated in the north-eastern part of the state, bordering on Rhode island, and separated from Penfield by Quinnipiac river; about 18 miles E. of Windham; incorporated in 1708, and containing 2279 inhabitants.

KILLINGTON, now SHEERBUN, a mountainous township of America, in Rutland county, Vermont, having on the W. Medway, N.E. Barnard, S.E. Saltash, and containing 12 inhabitants. Killington peak is the highest land in Vermont, 3454 feet above the level of the ocean.

KILLINGFRINGAN BAY, a bay of Scotland, on the W. coast of the county of Wigtown. N. lat. 54° 58'. W. long. 5° 12'.

KILLINGWORTH, a poit-town of America, in Middlesex county, Connecticut, situated on Long island Sound; 9 miles E. of Guilford, from which it is separated by a stream called Hammontefit, the Indian name of the township. It was settled in 1605, incorporated in 1703, and contains 2020 inhabitants.

KILLISTINONEES, Indians who originally inhabited a territory N. of Lake Superior, and could furnish 250 warriors. They extend to the lake of the Hills, and N. to the lakes. According to Mr. Mackenzie, they were originally the same people with the Algonkins, or inhabitants of the Atlantic coast. Their manners are described by Mackenzie. See Omiata, KILLISTINONEES.

KILMACDUAGH, a village of the county of Galway, which is an old episcopal see, united to Confort. It is 21 miles from Gort, where is the parish church. Nothing but the walls of the cathedral remain, near which are the ruins of a monastery, and of several chapels. These, with a large round tower, of very ancient and rude masonry, denote the former confluence of this wretched village. It is 12 miles N. from Ennis.

KILMACTHOMAS, a fair and poit-town of the county of Waterford, on the road from Cappoquin and Dungarvan to Waterford. It is 83 miles S.S.W. from Dublin.

KILMALLOCK, a poit-town of Ireland, which formerly sent members to parliament. Two centuries ago, it was one of the best built inland towns in Ireland; the walls of many large houses of stone, and excellent workmanship, remain to this day, whilst the ruins of the churches and monasteries, walls and gates, denote its former splendour, and have procured for it the name of the Balbec of Ireland. It is often mentioned in the military history of Ireland, and there is an extensive district round it called the "Liberty of Killmallock." It is now, however, little more than a village; 4 miles from Charleville, 16 S. from Limerick, and 107 S.W. from Dublin. Beaufort, &c.

KILLMCHALE. PORT, a cape of Ireland, on the W. coast of the county of Wexford, in the Irish sea. N. lat. 52° 44'. W. long. 6° 9'.

KILLMORE, a village which gives name to a bishopric in Ireland, in the province of Armagh. The bishopric was founded in the 13th century, and in the 15th, changed its ancient name of Brefny, into Killmore. There is no cathedral, but a small parish church, 3 miles from Cavan. It is situated in four counties, but chiefly in Cavan and Leitrim. There are 39 parishes in 30 benefices, and 36 churches.

KILLOS, a name given by the miners of Cornwall to a stone of the slate kind, found in the mines there. See Growan.

KILLOUGH, in Geography, a village of the county of Down, Ireland, on a bay to which it gives name, on the Irish sea. Here is a remarkable well, called St. Scordin's well, which is highly esteemed for the extraordinary brightness of its water. It is 7 miles S.E. from Clough.

KILLOW, or CULLOW, an English name for a black earth of a very remarkable structure, seeping of a mixed nature between the marles, ochres, and clay; and usually containing a large quantity of the matter of the common vitriolic pyrites or iron-stone, which gives it a very sharp unpleasant taste, and makes it, when thrown on the fire, emit a yellow flame of a sulphurous smell, and calcine to a deep red. It is common in many parts of England, Wales, and Ireland. It is lighter than any of the other clays, though that is the genus to which it most properly belongs; and it is of an uneven surface, and shatter structure.

KILLREA, in Geography, a poit-town of Ireland, in the county of Londonderry; it is situated near the river Bann, and is 122 miles N. from Dublin.

KILLRUSH, a poit-town of Ireland, in the county of Clare, and province of Munster. It is situated upon the river Shannon, and is a place of some trade, some of the merchants of Limerick having agents residing here. It is 142 miles S.W. from Dublin.

KILLUCAN, a poit-town of Ireland, in the county of Weemshel, and province of Leinster; it is 28 miles W. by N. from Dublin.

KILLWORTH, a poit-town of Ireland, in the county of Donegal, and province of Leinster; it is situated on the river Finnean. It has given very much to decay, on account of the neighbourhood of Fermoy; it is 105 miles S.W. from Dublin, and 18 N.E. from Cork.

KILLYBEGS, a poit-town of Ireland, in the county of Donegal, which before the Union, was reprefented in parliament. It is situated on a creek, on the N. side of Donegal bay, and has an extensive herring-fishery; it is 124 miles N.W. from Dublin, and 13 miles W. from Donegal.

KILLY-ILLIM, one of the smaller Orkney islands; about half a mile N. of Egilsha.

KILLYLEAGH, a poit-town of Ireland, in the county of Mayo.
of Down, and province of Ulster. It is situated on the W. coast of Strangford lough, and has a safe harbour for small vessels. Here Sir Hans Sloane, the famous naturalist, was born, in 1660; it is 89 miles N. by E. from Dublin, and 15 S. S. E. from Belfast.

KILLYTH-STALLION, in our Old Writers, is where lords of manors were bound by custom to provide a stallion for the use of their tenants’ mares.

KILMARNOCK, in Geography, a very industrious, thriving, manufacturing town in Ayrshire, Scotland, 22 miles S. W. from Glasgow. Its principal articles of staple manufacture are coarse woollens and carpets, and low-priced gloves, besides a great number of weavers are employed in the cotton trade by the manufacturers of Glasgow and Paisley. Kilmarnock is situated in a very fertile part of the country, and is very plentifully supplied with coal from the extensive collieries of Sir William Cunningham of Craggan, which are in the immediate neighbourhood. Besides Sir William Cunningham, the chief landed proprietors in this neighbourhood are, the duchesses of Portland, and the counts of London and Moira, both of whom here possess very large estates in their own right. The immense castle of London, now building, will, when finished, be one of the noblest family-feats in Britain. Kilmarnock, not being a royal borough, has no elective franchise for a member of parliament. In 1801, it contained 8270 inhabitants, of whom 6757 were employed in trade and manufactures. N. lat. 55° 40'. W. long. 4° 27'.

KILMES, a town of Russia, in the government of Viatka; 28 miles N. E. of Malmédy.—Alfo, a river of Russia, which runs into the Viatka; 32 miles N. E. of Malmédy.
